DIRECTION TO TRAINEE:

TASK TO BE PERFORMED IN SIMULATOR:

I will explain the initial conditions and state the task to be performed. All control room steps shall be performed for this JPM, including any required communications. I will provide initiating cues and reports on other actions when directed by you. Ensure you indicate to me when you understand your assigned task. To indicate that you have completed your assigned task, return the handout sheet I provided you.

INITIAL CONDITIONS:

I am the Shift Supervisor and you are the unit RO. The unit has been operating on RHR with the RCS drained to flange level for approximately 10 days with "A" RHR pump in service on both the "A" and "B" RHR heat exchangers. A lightning strike has caused disturbances in the RHR system. We just received annunciator B-G-6, RHR HX LO FLOW.

INITIATING CUES:

I need you to respond to this event.

JPM LEGEND:

Bold	Highlighted JPM Headings and notes/ provides emphasis (used extensively for Examiner's cues).
Italics	Highlight Examiner's cues.
Asterisks	Identify actions or subactions which must be performed correctly to complete critical task steps.

Critical Step Justification:

Substeps within the critical step block are designated with an asterisk (critical component of the step) or no asterisk (Not a critical component).

STEP # 4 RNO

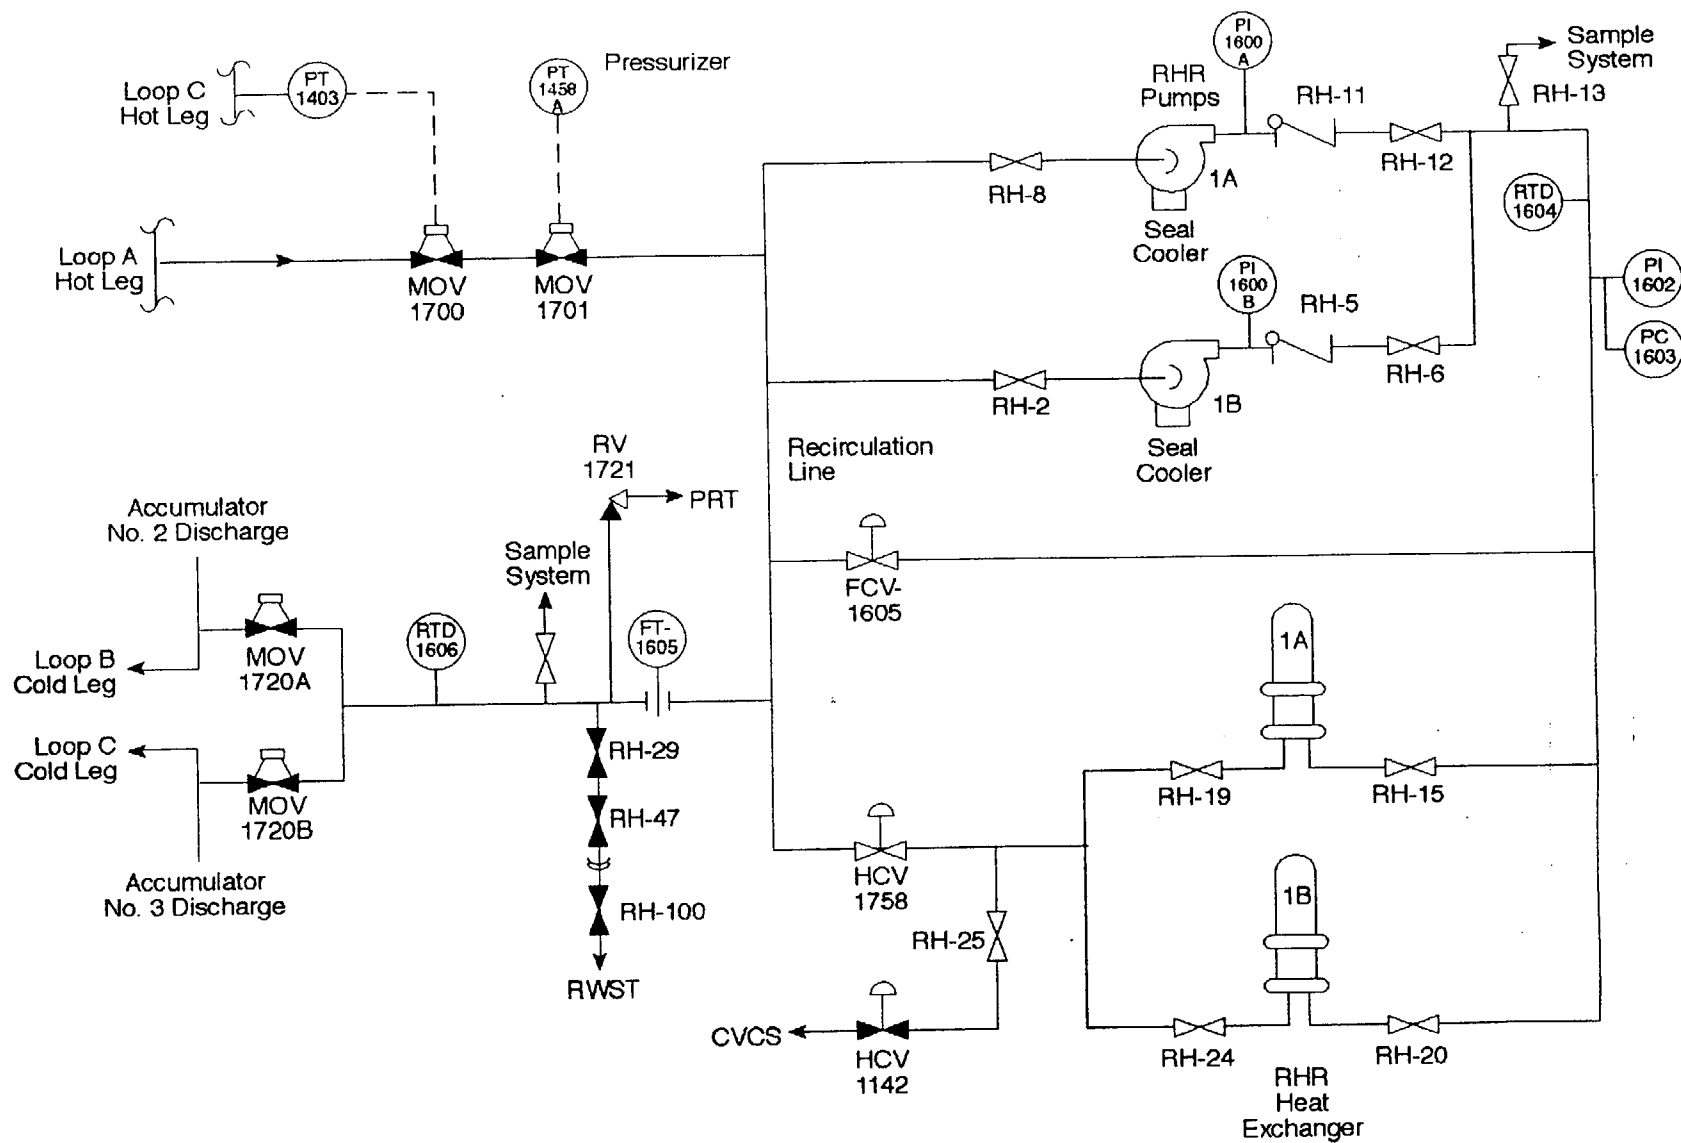

- Isolation of the RHR Heat Exchanger bypass line by closing 1-RH-FCV-1605 and isolation of the RHR Heat Exchanger Discharge line by closing 1-RH-HCV-1758 is necessary to prevent damage to the RHR System while starting a RHR pump (excessive starting current, water hammer, cavitation, vortexing, etc.).
- The only operable pump 1-RH-P-1B must be started to provide the motive force for reactor coolant flow in the RHR system.
- 1-RH-FCV-1605 and 1-RH-HCV-1758 must be opened to establish flow of reactor coolant through the RHR system.

STEP # 12

- 1-CC-TV-109A or 1-CC-TV-109B must be opened to allow component cooling water, the heat sink for the RHR system, to flow through one of the two parallel heat exchangers.

Critical Step Sequencing:

START TIME: _____

STEP 1: REVIEW CAUTIONS: THIS PROCEDURE IS NOT VALID FOR REALIGNMENT OF A CONTROL ROD IF REACTOR IS SUB CRITICAL; REALIGNMENT SHALL BE PERFORMED WITH REACTOR POWER HELD CONSTANT AT LESS THAN OR EQUAL TO 75%. (BEFORE STEP 12)

___ SAT

___ UNSAT

STANDARD:

- (a) Notes that this procedure is NOT valid for realignment of a control rod if the reactor is subcritical. Recalls from instructions and by observation that the reactor is at power.
- (b) Notes that realignment SHALL be performed with power held constant at less than or equal to 75%. Recalls from the instructions and by observation that the reactor is at 57% power.

EXAMINER'S CUES:

EXAMINER'S CUES:

COMMENTS:

Examiner's Note: N-41, 42, & 44 have a dropped rod signal present. N-43 on the other side of the core from the dropped rod does not.

STEP 3: RESET NUCLEAR INSTRUMENTATION SYSTEM (NIS) DROPPED ROD SIGNAL. (STEP 13)

STANDARD:

- (a) Takes POWER RANGE TEST Switch for all affected NIS channels from NORMAL to RESET, verifies DROPPED ROD window light goes out, and then returns switch to NORMAL.

COMMENTS:

___ SAT

___ UNSAT

STEP 4: TRANSFER ROD CONT MODE SEL SWITCH TO AFFECTED BANK. (STEP 14)

STANDARD:

- *• Rotates ROD CONT MODE SEL SWITCH from the MANUAL to the CBA position.

EXAMINER'S CUES:

COMMENTS:

Examiner's Note: Rods may step if the switch is moved to slowly due to the $\pm 1.5^\circ F$ difference between Tare + Tag

CRITICAL STEP

___ SAT

___ UNSAT

**STEP 5: ALIGN LIFT COIL DISCONNECT SWITCHES FOR AFFECTED BANK.
(STEP 15)**

**CRITICAL
STEP**

STANDARD:

- (a) Proceeds behind Vertical Board 1-2 to Lift Coil Disconnect Switch Panel and opens panel door.
- * (b) Places all disconnect switches for affected bank in "ROD DISCONNECTED" or OPEN position.
 - * F-2
 - * B-10
 - * K-14
 - * P-6
 - * K-2
 - * B-6
 - * F-14
 - * P-10
- (c) Places disconnect switch for K-14 in "ROD CONNECTED" or CLOSE position.
- (d) Requests alignment of Lift Coil Disconnect Switches to be independently verified.

___ SAT

___ UNSAT

EXAMINER'S CUES: When asked, Lift Coil Disconnect Switches have been independently verified.

COMMENTS:

STEP 6: RECORD AFFECTED BANK POSITION. (STEP 15)

___ SAT

STANDARD:

Records Group 1 and Group 2 Step Counter readings for Control Bank "A" at 226 steps.

___ UNSAT

COMMENTS:

STEP 7: READS CAUTION: THE AFFECTED WITHDRAWAL RATE DURING REALIGNMENT IS LIMITED TO $2/P$ (P =FRACTION OF CORE POWER WHERE 100% IS EQUAL TO 1.0) STEPS PER HOUR IF AFFECTED ROD REMAINS MISALIGNED FOR MORE THAN 12 HOURS OR THE DURATION OF MISALIGNMENT CAN NOT BE DETERMINED; THE WITHDRAWAL RATE LIMITATION MAY BE RELAXED WITH AUTHORIZATION FROM THE REACTOR ENGINEER OR NUCLEAR ANALYSIS AND FUELS. (BEFORE STEP 17)

___ SAT

___ UNSAT

STANDARD:

- Recalls from the instructions that the rod has been dropped for less than 12 hours; therefore, there is no reduced limit on rod withdrawal speed.

EXAMINER'S CUES: If asked, Reactor Engineering has authorized that the $2/P$ rod speed limit be relaxed. No limit on rod speed is required.

COMMENTS:

**STEP 8: RECORDS REACTOR POWER AND ROD WITHDRAWAL RATE.
(STEP 17)**

STANDARD:

- (a) Checks reactor power by monitoring loop delta T meters, Benchboard 1-2 power range meters, Turbine Load meters on VB 1-2, meters on the NIS power range drawers, etc. and records value in the appropriate blank at step 17 (reactor power is approximately 57% by RCS loop delta Ts).
- (b) Determines rod withdrawal rate of 48 spm and records value in the appropriate blank at step 17.

EXAMINER'S CUES: *If asked, instruct RO to not exceed 60% power, a 1 dpm SUR, or RCS average temperature >563°F during dropped rod recovery.*

COMMENTS:

___ SAT

___ UNSAT

STEP 9: READS NOTE: ANNUNCIATOR 1G-A6, ROD CONT SYS URGENT FAILURE, WILL ALARM WHEN THE AFFECTED ROD IS WITHDRAWN INDICATING THAT THE LIFT COILS OF THE REMAINING RODS IN THE BANDK ARE DENERGIZED. (BEFORE STEP 18)

STANDARD:

- Reads note.

EXAMINER'S CUES:

COMMENTS:

___ SAT

___ UNSAT

STEP 10: CHECK AFFECTED ROD ON BOTTOM. (STEP 18)

STANDARD:

- Checks control rod K-14 on core bottom (Individual Rod Position Indication K-14 at 0 and rod bottom light lit).

EXAMINER'S CUES: If asked, I&C has verified that the rod is on the bottom by taking voltage readings in the relay room (search coils are no longer available having been disconnected). Rod K-14 is on the bottom.

COMMENTS:

___ SAT

___ UNSAT

STEP 11: RESET AFFECTED GROUP STEP COUNTER TO 0. (STEP 19)

STANDARD:

- *Pulses down or resets to zero the Group Step Counter for CONT BANK "A" GP 1 from fully withdrawn height to a reading of 000 steps.

EXAMINER'S CUES: If candidate pulses or resets to zero CONTROL BANK "A" GP 2, then a follow-up question is warranted to explore candidate's system knowledge concerning which control rods make up group one and group two. This is recoverable if corrected prior to initiation of rod movement.

EXAMINER'S NOTE: If candidate pulses down Control Bank "A" GP 1 and then subsequently verbalizes the error then tell the candidate, "I understand that you should not have "zeroed" this step counter. I will contact I&C to look at resetting this counter and I will review Technical Specifications. Proceed with dropped rod retrieval."

COMMENTS:

**CRITICAL
STEP**

___ SAT

___ UNSAT

STEP 12: RESET AFFECTED BANK P/A CONVERTER TO 000. (STEP 20)

STANDARD:

- (a) Contacts Inside Service Building or another auxiliary operator.
- (b) Directs watchstander/operator to go to Unit 1's P/A converter in Unit 1 Relay Room (just off Unit 1 ESGR).
- *(c) Directs watchstander/operator to reset Control Bank "A" P/A converter (pulse P/A converter for CBA from fully withdrawn down to 000 steps).
- (d) Acknowledges the following annunciators:
 - G-G-5 (ROD BANK A LO LIMIT)
 - G-H-5 (ROD BANK A EXTRA LO LIMIT).
- (e) Identifies trend recorder TR-1-409A (BANK A ROD POSITION AND INSERTION LIMIT) pen 2 (ROD POSITION) tracks to 0.

EXAMINER'S CUES: Once requested by the applicant the P/A convertor for the requested bank will be set to 000 by the booth operator.

COMMENTS:

**CRITICAL
STEP**

___ SAT

___ UNSAT

STEP 13: REALIGN AFFECTED ROD TO ITS BANK POSITION RECORDED IN STEP 16. (STEP 21)

STANDARD:

- *(a) Places SHUTDN AND CONT ROD CONT SWITCH to the OUT position.

temperature, reduction in reactor power, rod bottom lights, and
IRPI.
- (c) Informs the Unit SRO of multiple dropped control rods.

*EXAMINER'S CUES: If asked, acknowledge RO's communications and

STEP 15: MANUALLY TRIP REACTOR.

STANDARD:

- *(a) Momentarily depresses reactor trip pushbutton on Benchboard 1-1.
- (b) Initiates 1-E-0, Reactor Trip or Safety Injection, immediate actions.

EXAMINER'S CUES:

EXAMINER'S NOTES:

Reactor Trip Pushbutton on Benchboard 1-2 does not function which will require candidate to use pushbutton on Benchboard 1-1 to successfully trip the reactor.

1-E-0 immediate actions are not being evaluated. Once the candidate has manually tripped the reactor, the Examiner can have the simulator placed in FREEZE.

The candidate can perform a reactor trip procedurally by entering 1-AP-1.00 after identifying additional control rods have dropped. 1-AP-1.00 step 5 Response Not Obtained column requires a reactor trip if more than one rod is affected.

The candidate can perform a reactor trip procedurally by entering 1-AP-1.01 after identifying additional control rods have dropped. 1-AP-1.01 step 1 Response Not Obtained column requires a reactor trip if more than one rod is affected.

The candidate recalls from memory that the reactor can remain at power during a dropped rod condition if only one rod is affected (Technical Specification 3.12.C)

Critical Step Justification:

Substeps within the critical step block are designated with an asterisk (critical component of the step) or no asterisk (Not a critical component).

- **STEP # 4 -** Rotates the rod control switch to the affected bank's (CBA) position to prepare the rod control system for dropped rod recovery. If another bank is selected and subsequent steps are performed, actual rod misalignment will result due to inappropriate operator action.
- **STEP # 5 -** Places all disconnect switches for the unaffected rods in the affected bank to the "ROD DISCONNECTED" position (dropped rod disconnect switch must be in "ROD CONNECTED" position at end of step). This ensures that only the dropped rod is lifted during the recovery process. If all unaffected rod disconnect switches are not in the "ROD DISCONNECTED" position, then subsequent operator actions will result in unanticipated rod motion and rod misalignment.
- **STEP # 11 -** Pulses group step counter for CONT BANK A GP 2 to 000 to coincide with the dropped rod position in the core. This allows the operator to adequately monitor the dropped rod rod position during rod recovery in subsequent steps as required by reactivity management guidelines.
- **STEP #12 -** Directs watchstander/operator to reset Control Bank "A" P/A converter (pulse P/A converter for CBA from fully withdrawn down to 000 steps). Failure to perform this action would result in an artificially high P/A reading which would prevent G-G-5 (ROD BANK A LO LIMIT) and G-H-5 (ROD BANK A EXTRA LO LIMIT) from alarming at their true setpoint, thus removing valuable alarm indications from the unit reactor operator. (Reactivity Management concern)
- **STEP #13-** Places SHUTDN AND CONT ROD CONT SWITCH to the OUT position. Withdraws affected rod towards required position. This action is required by the operator to begin actual recovery of the dropped rod and return it to its programmed position in the core.
- **STEP #15-** Manually trip reactor. With multiple dropped control rods, procedures require the reactor to be tripped to prevent operation outside of current safety analysis.

Critical Step Sequencing:

Steps 4, 5, 11 & 12 (any order) before step 13 to ensure the dropped rod and rod position indicators are adequately prepared for rod recovery. This ensures only one rod will step out and that the RO can monitor its movements during rod recovery.

TASK TO BE PERFORMED IN THE PLANT:

I will explain the initial conditions, and state the task to be performed. All in plant steps, including any required communications, **shall be simulated** for this JPM. Under no circumstances are you to operate any plant equipment. I will provide initiating cues and reports on other actions when directed by you. Ensure you indicate to me when you understand your assigned task. To indicate that you have completed your assigned task return the handout sheet I provided you.

INITIAL CONDITIONS:

I am the Shift Supervisor. Unit 1 is operating at 100% power, Unit 2 is at CSD for refueling. Fuel Building is on filtered exhaust using the 58 A and B fans due to Fuel Shuffling being performed. There has been a Fuel Handling accident in the Fuel Building. The Fuel handling crew has placed the leaking fuel assembly in a safe condition and has evacuated the Fuel Building.

INITIATING CUES:

- I need you to respond to this event from memory (without procedure(s)).

- (d) Determines all Main Station Batteries are not on a freshening charge by asking the Shift Supervisor.

EXAMINER'S CUES:

Critical Step Justification:

Substeps within the critical step block are designated with an asterisk (critical component of the step) or no asterisk (Not a critical component).

- STEP # 4 - Dampers 1-VS-MOD-103C and D must be closed in order to isolate the MCR. MCR isolation is essential for a positive pressure to be built up in the MCR.
- STEP # 5 - Damper 1-VS-MOD-103A must be closed which releases bottle air pressure into the MCR.

Critical Step Sequencing:

Step 4 before Step 5.

CANDIDATE CUE SHEET
(TO BE RETURNED TO EXAMINER UPON COMPLETION OF TASK)

INITIAL CONDITIONS:

I am the Shift Supervisor. Unit 1 is operating at 100% power, Unit 2 is at CSD for refueling. Fuel Building is on filtered exhaust using the 58 A and B fans due to Fuel Shuffling being performed. There has been a Fuel Handling accident in the Fuel Building. The Fuel handling crew has placed the leaking fuel assembly in a safe condition and has evacuated the Fuel Building.

INITIATING CUES:

I need you to respond to this event from memory (without procedure(s)).

Critical Step Justification:

Substeps within the critical step block are designated with an asterisk (critical component of the step) or no asterisk (Not a critical component).

- **STEP # 8 -** Placing the COMPARATOR CHANNEL DEFEAT Switch to the N41 position removes the failed input to the power range comparator section and allows alarm reset. The comparator section monitors the difference between the highest and lowest reading power range channels to indicate possible quadrant power tilt. The circuitry inputs to an alarm circuit if the difference exceeds 4% to inform the operator of an abnormal condition. Failure to clear this alarm removes monitoring deviation between operable channels.
- **STEP # 9 -** Placing the ROD STOP BYPASS Switch to the BYPASS PR N41 position ensures manual and automatic control rod capability when the failed channel is placed in trip. The UPPER and LOWER SECTION Defeat Switches are selected to the failed channel to remove failed channel input to the quadrant power tilt annunciator. Technical Specifications identify allowable Quadrant Power Tilt as 2.0%. Failure to bypass results in loss of automatic and manual rod withdrawal.
- **STEP #10 -** The failed power range instrument fuses are pulled to place the channel in trip to comply with Technical Specifications. Failure to place the channel in trip would lead to an LCO violation.

Critical Step Sequencing:

8 before 9 before 10.

SIMULATOR SETUP INSTRUCTIONS:

1. Recall protected IC for CSD conditions.
2. Place simulator in RUN.
3. Stabilize unit . Place the simulator in freeze.
4. Run simulator for 10 minutes to determine nuisance annunciators, then place the simulator in freeze.
5. Recall JPM saved conditions and override all nuisance annunciators to minimize trainee distractions.
6. Recall JPM saved conditions.
7. Place simulator in run when directed by the examiner.

SIMULATOR OPERATOR INSTRUCTIONS:

JPM Step 1 – When asked as HP tell the applicant that the PRT sample indicates $\leq 5 \times 10^{-2}$ $\mu\text{Ci/ml}$.

JPM Step 12 – When asked for a MISCellaneous GrounD BATCH release permit then tell the candidate that it is on the way.

JPM Step 14 - When asked to connect a poly hose securely from 1-RC-ICV-5025, PRT PT-1472 VENT (-3 foot elev), to the nearest Containment Purge exhaust ductwork vent (-27 foot elev). Then inform the candidate that time compression has occurred and the poly hose is attached to the Containment Purge Exhaust ductwork.

JPM Step 16 – When asked to throttle open 1-RC-ICV-5025, PRT PT-1472 VENT, while keeping release rate low enough to not allow Radiation Monitors beyond ALERT. Then decrease Simloch variable RCM921 (PRT nitrogen mass) one unit every few seconds while monitoring RCP911 (PRT Nitrogen Pressure in psia) to simulate purging the PRT. Stop decrease when the candidate informs you to stop.

TOOLS / EQUIPMENT / PROCEDURES NEEDED:

- 1-OP-RC-011, Pressurizer Relief Tank Operations
- MISC GRD BATCH Release Permit

DIRECTIONS TO APPLICANT:

I will explain the initial conditions and state the task to be performed. All control room steps shall be performed for this JPM, including any required communications. I will provide initiating cues and reports on other actions when directed by you. Ensure you indicate to me when you understand your assigned task. To indicate that you have completed your assigned task, return the handout sheet I provided you.

INITIAL CONDITIONS:

I am the Shift Supervisor and you are the unit RO. The unit is in CSD with all RCS loops isolated and drained to flange level, Containment vacuum is broken and Containment Purge is in Operation. All leakage paths to the PRT have been isolated. All Pressurizer Safety Valves and PORV's are installed. Chemistry has taken a sample of the PRT gas and it has been delivered to HP for analysis and appropriate permit generation one hour ago.

INITIATING CUES:

I need you to purge the PRT to the Vent Vent system in accordance with 1-OP-RC-011 starting at Step 5.5. I have personnel standing by to perform necessary steps outside the control room. When you have completed the task please inform me.

START TIME: _____

Venting/Purging the PRT to the Vent Vent System**STEP 1: OBSERVES CAUTION (BEFORE STEP 5.5.1)**

- HP must be notified prior to the start or re-initiation of a PRT release to Vent Vent. (Reference 2.4.1)
- If the PRT gas sample indicates Xe-133 activity greater than or equal to $5 \times 10^{-2} \mu\text{Ci/ml}$, the release shall be made to the Overhead Gas System.

3.0 INITIAL CONDITIONS

4.0 PRECAUTIONS AND LIMITATIONS

- 4.1 Extreme care must be used when the N₂ transfer valves are being opened. The large ΔP between the PRT and the N₂ makeup source can generate a very high flow rate.
- 4.2 The Process Vent and Vent Vent radiation monitors must be watched closely when PRT vent/purge flow is being established.
- 4.3 If using an SI Accumulator as the nitrogen source for the PRT, SI Accumulator pressure will decrease. To prevent making the SI Accumulator inoperable, pressure must be maintained above the 600 psia limit specified in Tech Spec 3.3.A.2 when the Accumulator is required to be operable.
- 4.4 The hose used in Subsections 5.7 and 5.8 to vent the PRT to the Overhead should be stainless steel flex braid rated for at least 150 psig.
- 4.5 HP must be notified concerning the status of the PRZR PORVs to account for the additional gas from the RCS if the PORVs are open. (Reference 2.4.2)
- 4.6 To assure accurate accounting of discharged radioactivity, Health Physics personnel must periodically sample Vent-Vent or Process Vent as appropriate during the release of a PRT. HP must be notified prior to the start OR reinitiation of such a release (Reference 2.4.1).
- 4.7 If the PRT gas sample indicates Xe-133 activity greater than or equal to $5 \times 10^{-2} \mu\text{Ci/ml}$, the release shall be made to the Overhead Gas System.
- 4.8 If any unisolated leakage path exists into the PRT, the release shall be made to the Overhead Gas system.

5.3 Draining the PRT

- CAUTION:**
- If the Pressurizer relieves to the PRT with the PRT level below the sparger, and the PRT spray is not available, a rapid increase in PRT pressure will occur. To maintain PRT pressure control, the 1-RC-HCV-1519B, PRT MAKEUP, flowpath must remain available until the RCS temperature is less than 190°F.
 - PRT pressure must not be allowed to decrease to less than 2 psig while the PRT is being drained unless the PRT is vented to the Process Vent System.

5.3.1 Notify the STA that Unit 1 PRT will be drained.

5.3.2 Verify either a positive pressure is present in the PRT or the PRT is vented to the Process Vent System. IF required, THEN perform Subsection 5.4 to establish a positive pressure before continuing.

- CAUTION:**
- To prevent an unplanned RCS dilution, PRT draining is prohibited during Unit 1 or Unit 2 stripper degas evolutions.
 - If Overhead Gas System pressure is high and the PRT is vented to the Process Vent System, then an unmonitored release may occur when the PRT drain is opened.

5.3.3 Open 1-RC-HCV-1523, PRT DRAIN, to begin draining the PRT.

NOTE: If the PRT level is greater than 10%, N₂ flow from the PRT to the Pressurizer will be restricted.

5.3.4 IF preparing to drain to Reactor Vessel Flange level in 1-OP-RC-004 or Mid-Nozzle in 1-OP-RC-005, THEN drain to between 5 percent and 10 percent level. Otherwise, enter N/A.

READ TO OPERATOR

DIRECTION TO TRAINEE:

I will explain the initial conditions, and state the task to be performed. All in plant steps, including any required communications, **shall be simulated** for this JPM. Under no circumstances are you to operate any plant equipment. I will provide initiating cues and reports on other actions when directed by you. Ensure you indicate to me when you understand your assigned task. To indicate that you have completed your assigned task return the handout sheet I provided you.

INITIAL CONDITIONS:

This task is to be SIMULATED. Do NOT turn switches, manipulate controls or reposition valves. I am the Shift Supervisor. There is a major Service Water leak in #3 MER with level indicated at 50 inches. Here is a copy of 0-AP-13.00, Turbine Building or #3 MER Flooding, steps 33 and 34. 1-SW-P-10B and 2-SW-P-10B have been secured. 1-VS-E-4A, 4B, and 4C have been secured.

INITIATING CUES:

I need you to isolate Service Water to #3 MER in accordance with steps 33 and 34.

EXAMINER'S CUES: *When asked, the valve is as you see it (this is a normally open valve).*

When asked, if the candidate attempts to turn the valve handwheel in the clockwise direction, the handwheel will not move.

EVALUATOR'S NOTE:

- Alternate Path Starts with this step.
- **Safety concern:** *Trainee does not have to crawl across pipes to check the valve labels at the East end of the #4 MER. They can identify which valve label they are looking at, and the evaluator can state the label reads "2-SW-477" if the correct label is identified. The trainee can then describe the required actions to complete valve manipulation from the west end of #4 MER.*

- (c) Pulls pin from handwheel actuator.
- *(d) Closes 2-SW-11 by rotating valve handwheel in the clockwise direction.

EXAMINER'S CUE: When asked, the valve is initially as you see it (this is a normally open valve).

When asked, after the handwheel is rotated in the clockwise direction, the position indication pointer rotates from the OPEN to the CLOSED position.

Under no circumstances are you to operate any plant equipment. I will provide initiating cues and reports on other actions when directed by you. Ensure you indicate to me when you understand your assigned task. To indicate that you have completed your assigned task return the handout sheet I provided you.

INITIAL CONDITIONS:

You are the Outside Service Building Watchstander.

A sustained fire in the Unit 2 Emergency Switchgear Room (ESGR) and subsequent loss of offsite power has caused the loss of all MCR chillers.

Unit 1 is shutdown and offsite power is unavailable, but the AAC Diesel Generator is loaded onto the 1J Emergency Bus.

The "E" MCR Chiller (1-VS-E-4E) is tagged out for extended maintenance.

Here is a copy of 0-FCA-19.00, Alternate Power Feed to MER 5, and an Appendix "R" Key.

INITIATING CUES:

I need you to energize the "D" MCR Chiller (1-VS-E-4D) in accordance with 0-FCA-19.00 steps 1-18. I have personnel standing by to perform steps 13 and 14. When you have completed the task, the Inside Service Building Watchstander will align and start the "D" MCR Chiller.

EXAMINER'S CUES: When properly operated, breaker 1H-1B-2A control lever rotates to the RESET/OFF position and the key can now be removed from the keyswitch when rotated counterclockwise to the 12 O'clock position.

The "Kirk" key will not turn until the breaker is opened. Once the breaker is opened the key may be manually turned counterclockwise from the 2:00 o'clock to the 12:00 o'clock position. The key can now be withdrawn.

___ UNSAT

EXAMINER'S CUES:

- When breakers are opened properly by rotating the breaker control lever **CLOCKWISE** to the RESET/OFF position, the breaker control levers remain in the RESET/OFF position.
- **SAFETY – do not allow the candidate to go inside 1-EP-CS-101 once its door is opened.**
- When 1-EP-CS-101 cabinet door is opened and the alternate power source throwover switch is slowly rotated **COUNTERCLOCKWISE**, the candidate should watch the pointer pass through the star (accompanied by an audible "clunk") to open the **NORMAL** transfer switch breaker, then through the color division (accompanied by another "clunk") to close the Alternate transfer switch breaker.
- When breaker 1-EP-BKR-1H-1B-2D is closed properly by rotating the breaker control lever **COUNTERCLOCKWISE** to the ON position, the breaker control lever remains in the ON position.

EVALUATOR'S NOTE:

- Alternate path begins during Step 16 when operator identifies 1-VS-E-4E is not to be placed in service.
- 1-EP-CS-101 consists of two breakers operated through a gear and cam arrangement by a common operating handle. The handle is designed with a ratchet mechanism such that the gear train turns only if the handle is turned counterclockwise. Clockwise rotation will not damage the unit, but will not operate the transfer switch breakers. Furthermore, the transfer switch is designed as a break-before-make to prevent inadvertent cross connect of the normal and alternate power supplies. However, if the transfer switch is operated too quickly, the indicator can travel past the proper location.

TIME STOP: _____

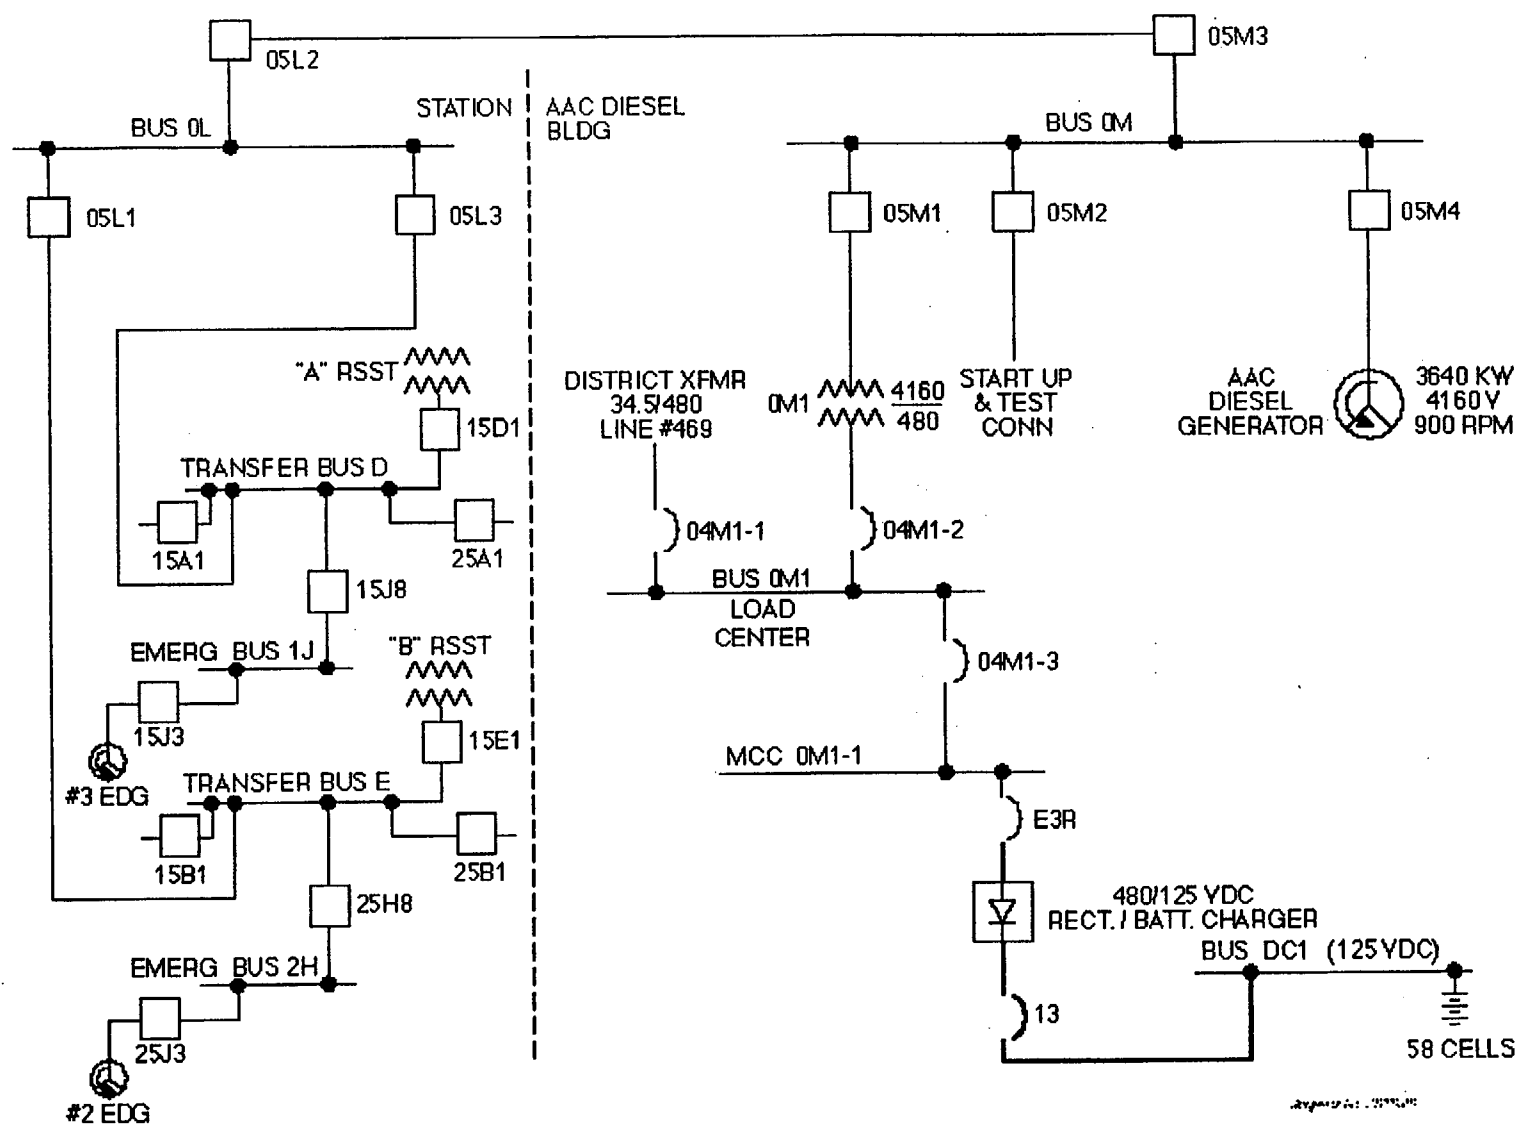

Critical Step Justification:

Substeps within the critical step block are designated with an asterisk (critical component of the step) or no asterisk (Not a critical component).

- **STEP # 4 -** Placing keyswitch to Appendix "R" position defeats interlocks which allow breaker 15A1 closure with Transfer Bus "D" supply breaker 15D1 open. Keyswitch position also allows defeat of breaker 05L3 trip open interlock with breaker 15A1 closure when "D" Transfer Bus is supplied by the AAC DG. With existing plant conditions breaker 15A1 will not close unless keyswitch is in the Appendix "R" position.
- **STEP # 5 -** Stripping Switchgear 14A1 minimizes load placed on the AAC DG. The only load to be energized during this electrical lineup via breaker 15A1 is the "D" MCR Chiller. Any additional loads aligned for supply power via breaker 15A1 will run the risk of overloading the AAC DG.
- **STEP # 7 -** Stripping Bus 1A2 except for the supply breaker (14A2-7) and MCC 1A2-3 feeder breaker (14A2-6) ensures electrical power supply for the "D" MCR Chiller while minimizing loads placed on the AAC DG via breaker 15A1.
- **STEP #8 -** Stripping MCC 1A2-3 minimizes the load placed on the AAC DG via breaker 15A1 and minimizes the possible overloading of the AAC Diesel Generator.
- **STEP # 10 -** Opening breaker 1H-1B-2A isolates the normal power supply to MCC 1H-1B. Opening 1H-1B-2A allows the "Kirk" key to be removed from the main power feed disconnect switch to MCC 1H-1B. This key will be required to align the alternate power source to MCC 1H-1B (this key interlock prevents the inadvertent paralleling of the "A" Station Service Bus and the 1H Emergency Bus power sources).
- **STEP # 11 -** Stripping MCC 1H-1B of the support components for 1-VS-E-4E minimizes the load placed on the AAC DG via breaker 15A1 and minimizes the possible overloading of the diesel. Closing breaker 1H-1B-2D aligns the alternate power supply to the "D" MCR Chiller.
- **STEP #12 -** Closing breaker 1A2-3-7A aligns the power supply from the AAC Diesel Generator to MCC 1H-1B to power the "D" MCR Chiller.
- **STEP # 13 -** Inserting the "Kirk" key from 1H-1B-2A (normal supply) into breaker 1H-1B-1A allows the closing of breaker 1H-1B-1A which is the alternate feed to MCC 1H-1B. Closing breaker 1H-1B-1A aligns alternate power from the AAC DG to MCC 1H-1B to power the "D" MCR Chiller.

Critical Step Sequencing:

Steps 4, 5, 7, 8, 9a, and 9b must be performed before step 9c to minimize the load placed on the AAC Diesel Generator via breaker 15A1 to prevent its overloading. Step 11 must be performed before step 13 to minimize the load placed on the AAC Diesel Generator.

CANDIDATE CUE SHEET
(TO BE RETURNED TO EXAMINER UPON COMPLETION OF TASK)

INITIAL CONDITIONS:

You are the Outside Service Building Watchstander.

A sustained fire in the Unit 2 Emergency Switchgear Room (ESGR) and subsequent loss of offsite power has caused the loss of all MCR chillers.

Unit 1 is shutdown and offsite power is unavailable, but the AAC Diesel Generator is loaded onto the 1J Emergency Bus.

The "E" MCR Chiller (1-VS-E-4E) is tagged out for extended maintenance.

Here is a copy of 0-FCA-19.00, Alternate Power Feed to MER 5, and an Appendix "R" Key.

INITIATING CUES:

I need you to energize the "D" MCR Chiller (1-VS-E-4D) in accordance with 0-FCA-19.00 steps 1-18. I have personnel standing by to perform steps 13 and 14. When you have completed the task, the Inside Service Building Watchstander will align and start the "D" MCR Chiller.

This document should be verified and annotated to a controlled source as required to perform work.

___15. Verify open or open the following breaker control switches on the AAC Control Panel.

- 0-AAC-1-05M4, ACB 05M4 Generator Breaker
- 0-AAC-1-05M3, ACB 05M3 Bus M Tie to Bus OL
- 0-AAC-1-05L2, ACB 05L2 Bus OM Tie to Bus OL
- 0-AAC-1-05L3, ACB 05L3 Transfer Bus D Tie
- 0-AAC-1-05M1, ACB 05M1 Feed to Xfmr OM1
- 0-AAC-1-04M1-2, ACB 04M1-2 480V Alternate Feed

NOTE: If power to the AAC Building is being supplied from the Line 469, opening the 04M1-1 breaker will deenergize MCC OM1-1 resulting in a loss of building lighting.

___16. Verify open or open 0-AAC-1-04M1-1, ACB 04M1-1 480V Normal Feed.

- CAUTION:
- If oil pressure on the LUBE OIL PRESSURE gauge is not on scale, the diesel MUST be stopped using the EMERGENCY STOP on the Engine Control Panel button within 10 seconds after engine start.
 - If the AAC Diesel is stopped using the EMERGENCY STOP button, the red EMERGENCY STOP button should NOT be reset until the engine has come to a complete stop. The EMERGENCY STOP button should be reset by turning the button clockwise to release the button latch mechanism after the emergency condition is mitigated.
 - If a PLC FAILURE alarm (lower left hand corner) is indicated, the engine should not be operated. If the AAC Diesel is started with this condition, the following additional precautions should be considered:
 1. Automatic trip of the Diesel may not occur.
 2. Engine prelube will not take place.
 3. Automatic disengagement of the start motors will not occur at 170 rpm. As the engine approaches this speed, the Engine Start/Stop switch should be returned to Neutral.

___17. Start the AAC Diesel from the Engine Control Panel by placing and holding the ENGINE CONTROL switch in START for at least 5 seconds.

Wire cutters/tie wrap cutters.

READ TO OPERATOR

DIRECTION TO TRAINEE:

I will explain the initial conditions, and state the task to be performed. All in plant steps, including any required communications, **shall be simulated** for this JPM. Under no circumstances are you to operate any plant equipment. I will provide initiating cues and reports on other actions when directed by you. Ensure you indicate to me when you understand your assigned task. To indicate that you have completed your assigned task return the handout sheet I provided you.

INITIAL CONDITIONS:

You are the Auxiliary Building Operator.

We are currently experiencing a loss of all AC power on Unit 1.

Here is a copy of 1-ECA-0.0 step 11 and Attachment 6, "Establishing Charging Pump Crosstie".

INITIATING CUES:

I need you to perform 1-ECA-0.0 step 11 to isolate the Unit 1 RCP seals and then perform Attachment 6 to establish charging pump crosstie to Unit 1.

Asterisks	Identify actions or subactions which must be performed correctly to complete critical task steps.

START TIME: _____

**STEP 1: LOCALLY ISOLATE RCP SEALS BY SHUTTING RCP SEAL RETURN.
(STEP 11 ACTION/EXPECTED RESPONSE)**

STANDARD:

- (a) Operator proceeds to the Auxiliary Building Basement penetration area on the Unit 1 side and locates 1-CH-MOV-1381 (RCP seal return).
- (b) Identifies 1-CH-MOV-1381 OPEN (by observing the valve position indicating rod extended upward).
- *(c) Engages 1-CH-MOV-1381 manual operator by depressing the clutch mechanism (pushes in the direction of the clutch lever arrow).
- *(d) Manually shuts valve by turning handwheel in the clockwise direction.

EXAMINER'S CUES: 1-CH-MOV-1381 is initially OPEN as the valve position indicator is extended upward. The manual operator engages as the clutch mechanism is pushed in the direction of the arrow. As the valve handwheel is rotated in the clockwise direction the position indicator rod lowers until it is nearly flush with the motor housing and then the handwheel stops turning.

EVALUATOR'S NOTE:

1-CH-MOV-1381 is initially OPEN and can be manually shut.

STEP 2: LOCALLY ISOLATE RCP SEALS BY SHUTTING RCP SEAL INJECTION. (STEP 11 ACTION/EXPECTED RESPONSE)

STANDARD:

- (a) Operator locates 1-CH-MOV-1370 (RCP seal injection).
- (b) Identifies 1-CH-MOV-1370 OPEN (by observing the valve position indicating rod extended upward).
- *(c) Engages 1-CH-MOV-1370 manual operator by depressing the clutch mechanism (pushes in the direction of the clutch lever arrow).
- *(d) Manually shuts valve by turning handwheel in the clockwise direction.

EXAMINER'S CUES: *1-CH-MOV-1370 is initially OPEN as the valve position indicator is extended upward. The manual operator engages as the clutch mechanism is pushed in the direction of the arrow. As the valve handwheel is rotated in the clockwise direction the position indicator rod lowers until it is nearly flush with the motor housing and then the handwheel stops turning.*

**STEP 3: LOCALLY ISOLATE RCP SEALS BY SHUTTING SEAL INJECTION
NEEDLE VALVES. (STEP 11 ACTION/EXPECTED RESPONSE)**

**CRITICAL

- (a) Operator locates 1-CH-294 and cuts the tie wrap.
- * (b) Shuts 1-CH-294 by rotating the handwheel in the clockwise direction.
- (c) Operator locates 1-CH-297 and cuts the tie wrap.
- * (d) Shuts 1-CH-297 by rotating the handwheel in the clockwise direction.
- (e) Operator locates 1-CH-300 and cuts the tie wrap.
- * (f) Shuts 1-CH-300 by rotating the handwheel in the clockwise direction.

___ UNSAT

EXAMINER'S CUES: As the handwheel on 1-CH-294, 297, or 300 is rotated in the clockwise direction, the valve's handwheel moves and then stops as the valve is closed. The tie wrap must be removed for proper valve operation in the shut direction.

EVALUATOR'S NOTE:

Evaluator will provide wire cutters once the candidate identifies the need for them.

1-CH-294, 297 and 300 are initially throttled. Once the tie wraps are removed, the valves can be manually shut by rotating the handwheels in the clockwise direction.

- *(d) Opens 1-CH-728, CHG PUMPS XCONN TO UNIT 1 ISOL, by "ratcheting" the valve lever clockwise and then pushing to turn the valve lever in the counter-clockwise direction initiating valve movement.

EXAMINER'S CUE: The valve ratchet selector is as indicated.

Tell operator: If operator attempts to reposition valve with ratchet selector in the DOWN position, as he/she pulls down on valve lever, it will not move since valve is closed. If room exists to push up on valve lever, it will "click" (ratchet).

Tell operator: AFTER moving ratchet selector switch to UP position, valve lever "clicks" (ratchets) as it is moved down & valve moves counter-clockwise & begins opening as valve lever is pushed up (counter clockwise direction).

Tell operator: When 1-CH-728 properly operated, inform operator that flow noise is heard through the line.

When properly operated: Valve stem extends, operator ratchets the valve until valve no longer travels in the open direction and flow noise heard.

EVALUATOR'S NOTE:

Ratchet selector switch must be in the up position to allow counter clockwise motion to open the valve.

- STEP # 2 - RCP seal injection isolation valve must be manually shut to isolate the RCP seals to prevent seal damage when charging cross tie is established. Clutch must be depressed to properly operate the valve.
- STEP # 3 - RCP seal injection needle valves must be manually shut to isolate the RCP seals to prevent seal damage when charging cross tie is established.
- STEP # 4 - Component Cooling to the RCP thermal barrier must be manually shut to isolate the thermal barriers to prevent seal damage when Component Cooling water flow is established.
- STEP # 11 - 2-CH-447 must be opened successfully to establish charging crosstie flow to the core from Unit 2 during a loss of emergency coolant recirculation for long term core cooling. Proper operation of 2-CH-447 is vital to establish a method of long term core heat removal.
- STEP # 13 - 1-CH-728 must be opened successfully to establish charging crosstie flow to the core from Unit 2 during a loss of emergency coolant recirculation for long term core cooling. Proper operation of 1-CH-728 is vital to establish a method of long term core heat removal.

(Critical Step NOTE: Either step 2 or 3 isolates seal injection therefore only 1 MUST be performed.)

Critical Step Justification:

RCP Seals must be isolated prior to establishing Charging Crosstie.

4.5 Very Unusual Circumstance

An unlikely event is determined by Station Management for supporting evolutions such as critical maintenance activities, outages, or action statements.

4.6 Working Hours

Hours spent working at the Station or in direct support of Station activities. Compensable time not spent working at the Station or in direct support of Station activities (e.g., holiday pay, travel time) are not working hours.

5.0 RESPONSIBILITIES

5.1 Station Management

Station Management is responsible for authorizing deviations from the administrative limits established in 6.4 when very unusual circumstances arise, if the paramount consideration in such authorization is that significant reductions in the effectiveness of personnel would be highly unlikely. [**Commitment 3.2.2**

5.2 Supervisory Staff

The Supervisory Staff is responsible for:

- 5.2.1 Ensuring that, to the extent practicable, personnel are not assigned to shift duties while in a fatigued condition that could significantly reduce their mental alertness or their decision-making capability. [**Commitment 3.2.2**
- 5.2.2 Monitoring overtime hours of personnel they supervise on a daily basis.
- 5.2.3 Determining if safety related work is being performed.
- 5.2.4 Processing requests to exceed overtime limits.

5.4 Nuclear Personnel

Nuclear personnel are responsible for working assigned shift hours and for adhering to administrative requirements established by this procedure.

6.0 INSTRUCTIONS

6.1 Working Schedule

- 6.1.1 The normal work week consists of approximately 40 hours depending on work schedules.
- 6.1.2 Work requirements vary from department to department. Management may establish any schedule deemed appropriate to allow work to be performed in a safe, timely, and effective manner.
- 6.1.3 Schedules should meet the following requirements:
 - Be compatible with Station and company work flow and not disruptive to other departments
 - Allow work to be performed in a safe, timely, and effective manner
 - Comply with applicable laws, regulations, contracts, policies, and procedures
 - Be cost effective
 - Be consistent with department goals

6.2 Salaried Employee Schedules

- 6.2.1 The Nuclear Work Schedule consists of four 9 hour days and an 8 hour Friday (or Monday), then four 9 hour days and a Friday (or Monday) off.
- 6.2.2 Nuclear salaried employees can work five 8 hour days with approval of the respective manager.
- 6.2.3 10 hour day and 12 hour day schedules may only be established by the applicable Superintendent, Director, or Manager and approved by the cognizant Vice President or Senior Vice President.
- 6.2.4 Employees on the Nuclear Work Schedule who work extensive overtime during an outage can transition to 10 or 12 hour days. Employees must transition back to the Nuclear Work Schedule as soon as possible.

6.3 Hourly Employee Schedules

- 6.3.1 IBEW employee schedules shall be consistent with agreements established between Virginia Electric and Power Company and the Local Unions of the International Brotherhood of Electrical Workers (IBEW).

6.3.2 Outage work schedules shall be established with an agreement between Virginia Electric and Power Company and the IBEW.

6.3.3 Modifications to schedules require mutual agreement between the appropriate Manager and the Local 50 President and Business Manager.

6.4 Overtime Requirements

Overtime should not be routinely scheduled to compensate for an insufficient number of Station personnel to support normal facility operations. If overtime must be worked due to unanticipated or unavoidable circumstances, the following guidelines shall apply:

6.4.1 Overtime should be considered on an individual basis. Specific blanket approvals for very unusual circumstances may be authorized by Station Management on a case by case basis.

6.4.2 Station personnel who perform safety-related functions and activities important to safety, as defined in 4.2, shall not exceed the administrative limits established within this subsection without prior approval from Station Management. Personnel performing non-safety related functions and activities shall not exceed the administrative limits established within this subsection without prior approval from their Superintendent, Director, or Manager. Overtime hours required to be worked in excess of these limits shall be documented and approved on Approval To Exceed Overtime Limits (Attachment 1).

- a. Deviations may only be requested for very unusual circumstances. The paramount consideration in such authorization shall be that significant reductions in the effectiveness of personnel would be highly unlikely. [**Commitment 3.2.2**
- b. Deviations shall be requested only to cover a minimum shift complement *or as* described in paragraph 4.5.
- c. The need for the deviation and the name of the individual granting authorization shall be documented on Approval To Exceed Overtime Limits (Attachment 1). Authorization may be obtained verbally and the form signed at a later date.
- d. The completed form, Approval To Exceed Overtime Limits (Attachment 1), shall be transmitted to Records Management.

6.3 Adjusting NI Channels

- ✓
- 6.3.1 Compare each NI channel percent power indication with the Calorimetric percent power, which is the standard. (Each NI should be within + 2 % and - 0 % of the Calorimetric value if Reactor power is greater than or equal to 90%, OR within + 4 % and - 0 % of the Calorimetric value if Reactor power is less than 90%.)

CAUTION: Gain potentiometer adjustment can cause average flux deviation alarms as well as high flux rod stop alarms. This should be anticipated when adjusting gain potentiometers. (Reference 2.4.6)

- N/A ✓

SS
- 6.3.2 IF the NI Channel is within tolerance but adjustment will better align it with the calorimetric, THEN obtain Shift Supervisor concurrence and adjust NI Channel IAW Attachment 1 to the Reactor Power value calculated in Attachment 3. Record initials on Attachment 1. IF no NI adjustment is made, OR NI is NOT within tolerance, THEN enter N/A.

- N/A ✓

SS
- 6.3.3 IF NI channel is NOT within tolerance, THEN obtain Shift Supervisor concurrence and adjust the gain potentiometer on the front panel of each NI channel IAW Attachment 1 to the Reactor Power value recorded in Attachment 3. Record initials on Attachment 1. IF all NI channels are within tolerance, THEN enter N/A.

- 6.3.4 IF the front panel gain adjustment can NOT bring power of any channel within the required tolerance in Step 6.3.1, THEN perform all of the following. Otherwise, enter N/A.

- N/A ✓
- a. Obtain concurrence from the Reactor Engineer to adjust the Power Range NI channel using the coarse level adjustment potentiometer.

- N/A^w
- N/A^w
- N/A^w
- b. Have a qualified Instrument Technician adjust the coarse level adjust potentiometer, R312, and the potentiometer on the front panel, until the front panel potentiometer is near mid-range and the Power Range NI channels are within + 2 % and - 0 % of the Calorimetric value if Reactor power is greater than or equal to 90%, OR within + 4 % and - 0 % of the Calorimetric value if Reactor power is less than 90%.
 - c. Note in the comment section any Power Range NI channel adjusted using the coarse level adjustment potentiometer.
 - d. IF the out-of-tolerance NI channel can NOT be properly adjusted, THEN declare the out-of-tolerance NI channel inoperable and comply with Tech Spec Table 3.7-1, Item 2.

READ TO THE TRAINEE

If you have any questions, ask them now and I will answer them. During the test, I cannot answer questions. When you complete all the steps correctly, you will pass this Job Performance Measure.

I will describe the general conditions for the task you will perform and provide the initiating cues.

INITIAL CONDITIONS:

1. Unit 1 has experienced a small break LOCA with a safety injection.
2. The Operating Team is attempting to place the Residual Heat Removal System in service, but they are unable to open 1-RH-MOV-1700 from the Main Control Room.
3. You have been tasked with entering Containment and locally opening 1-RH-MOV-1700.
4. Your allowable dose limit for this job is 1850 mr.
5. General area radiation levels have been manually estimated based on installed radiation monitor readings.
6. Survey maps of the Unit 1 Containment are available, showing dose rates and one way travel time to reach the valve for each of 3 possible routes.
7. Health Physics personnel are currently unavailable to provide assistance for dose determination.

INITIATING CUES:

You have been directed to determine:

- 1) Which roundtrip path would result in the lowest radiation exposure.
- 2) If 1-RH-MOV-1700 can be opened locally by you without exceeding your dose margin limit.

() ELEMENT: 1

Calculate exposure at valve.

STANDARDS:

__1. $(6 \text{ R/HR})(1000 \text{ MR/R})(1 \text{ HR/60 MIN})(5 \text{ MIN}) = 500 \text{ MR}$

EVALUATOR'S NOTES:

NOTE: The operator may perform the calculations in any order.

() ELEMENT: 2

Calculate exposure from using elevator.

STANDARDS:

__1. $(3 \text{ R/HR})(1000 \text{ MR/R})(1 \text{ HR/60 MIN})(2 \text{ MIN})(2 \text{ TRIPS}) = 200 \text{ MR. (Personnel Hatch to Elevator Door)}$

__2. $(36 \text{ R/HR})(1000 \text{ MR/R})(1 \text{ HR/60 MIN})(2 \text{ MIN})(2 \text{ TRIPS}) = 2400 \text{ MR. (Elevator ride to -3'6" and walk to the valve)}$

__3. $(200 \text{ MR}) + (2400 \text{ MR}) + (500 \text{ MR}) = 3100 \text{ MR TOTAL DOSE.}$

EVALUATOR'S NOTES:

Note: Total exposure via this path including time at the valve: 3100 mr.

() ELEMENT: 3

Calculate exposure from using stairway.

STANDARDS:

- ___1. $(4 \text{ R/HR})(1000 \text{ MR/R})(1 \text{ HR/60 MIN})(1 \text{ MIN})(2 \text{ TRIPS}) = 133 \text{ MR.}$ (Personnel Hatch to Stairway)
- ___2. $(12 \text{ R/HR})(1000 \text{ MR/R})(1 \text{ HR/60 MIN})(7 \text{ MIN})(2 \text{ TRIPS}) = 2800 \text{ MR.}$ (Stairway down to -3'6" and walk to valve)
- ___3. $(133 \text{ MR}) + (2800 \text{ MR}) + (500 \text{ MR}) = 3433 \text{ MR TOTAL DOSE.}$

EVALUATOR'S NOTES:

Note: Total exposure via this path including time at the valve: 3433 mr

() ELEMENT: 4

Calculate exposure from using spiral staircase.

STANDARDS:

- ___1. $(1 \text{ R/HR})(1000 \text{ MR/R})(1 \text{ HR/60 MIN})(2 \text{ MIN})(2 \text{ TRIPS}) = 67 \text{ MR.}$ (Personnel Hatch to Spiral Staircase)
- ___2. $(16 \text{ R/HR})(1000 \text{ MR/R})(1 \text{ HR/60 MIN})(6 \text{ MIN})(2 \text{ TRIPS}) = 3200 \text{ MR.}$ (Spiral Staircase down to -3'6" and walk to valve)
- ___3. $(67 \text{ MR}) + (3200 \text{ MR}) + (500 \text{ MR}) = 3767 \text{ MR.}$

EVALUATOR'S NOTES:

Note: Total exposure via this path including time at the valve: 3767 mr.

(Critical) ELEMENT: 5

Determine lowest exposure path.

STANDARDS:

- 1. Compared results of three calculations and determined the path using the elevator to be the lowest exposure.

EVALUATOR'S NOTES:

None

(Critical) ELEMENT: 6

Compare exposure to dose allowed for the job.

STANDARDS:

- 1 Compared exposure to dose allowed for the job and determined alignment could not be made within allowable dose of 1850 mr.

EVALUATOR'S NOTES:

TERMINATE JPM AT THIS POINT

Title:

Meteorological and Stability Class Determination

IAW

EPIP-2.01 Notification of State and Local Governments

* - indicates a critical step.

Read to the Operator

DIRECTION TO APPLICANT:

I will explain the initial conditions, and state the task to be performed. All steps shall be performed/simulated for this JPM. Ensure you indicate to me when you understand your assigned task. To indicate that you have completed your assigned task return the handout sheet I provided you.

INITIAL CONDITIONS:

An ALERT was declared 30 minutes ago due to a Unit 1 SGTR with Safety Injection required based on EAL Tab B-6.

An Initial Report of Emergency to State and Local Governments was completed 15 minutes ago with an update schedule of 30 minutes.

The SG PORV has just lifted on the ruptured SG and will not reseal. A release of radioactive material is presently occurring.

A follow-up message to the State and Local Governments is being prepared using Attachment 2 of EPIP-2.01. Steps 3 through 6 have been completed due to the changing plant conditions.

The Main Tower Lower Level wind direction recorder is OOS. The Main Tower Delta T recorder is OOS. The Main Tower Lower Level Wind Speed recorder is OOS.

INITIATING CUES:

The Unit 1 SRO has requested that you perform steps 7- 12 of EPIP 2.01, "Notification of State and Local Governments," to obtain Meteorological Data from the Met Panel.

Meteorological and Stability Class Determination	
<p>STEP 1: Observes Note prior to Step 7.</p> <p>STANDARD:</p> <p>_____ Wind direction is always given as the compass point the wind blows from. Example: Wind direction is from East North East (ENE).</p> <p>COMMENTS:</p>	<p>_____ SAT</p> <p>_____ UNSAT</p>
<p>STEP 2: GET METEOROLOGICAL INFORMATION: (Step 7)</p> <p>STANDARD:</p> <p>_____ Determines the Main Tower Lower Level Wind Direction recorder is not in service IAW the Initial Conditions and uses an alternate: Backup Tower, Main Tower Upper Level. (Step 7. a)</p> <p>Evaluator's Cue: Main Tower Lower Level Wind Direction recorder is de-energized and labeled OOS.</p> <p>COMMENTS:</p>	<p>_____ SAT</p> <p>_____ UNSAT</p>

I will explain the initial conditions, and state the task to be performed. All steps shall be performed/simulated for this JPM. Ensure you indicate to me when you understand your assigned task. To indicate that you have completed your assigned task return the handout sheet I provided you.

INITIAL CONDITIONS:

An ALERT was declared 30 minutes ago due to a Unit 1 SGTR with Safety Injection required based on EAL Tab B-6.

An Initial Report of Emergency to State and Local Governments was completed 15 minutes ago with an update schedule of 30 minutes.

The SG PORV has just lifted on the ruptured SG and will not reseal. A release of radioactive material is presently occurring.

A follow-up message to the State and Local Governments is being prepared using Attachment 2 of EPIP-2.01. Steps 3 through 6 have been completed due to the changing plant conditions.

The Main Tower Lower Level wind direction recorder is OOS. The Main Tower Delta T recorder is OOS. The Main Tower Lower Level Wind Speed recorder is OOS.

INITIATING CUES:

The Unit 1 SRO has requested that you to perform steps 7- 12 of EPIP 2.01, "Notification of State and Local Governments," to obtain Meteorological Data from the Met Panel.

* - indicates a critical step.
