OBJECTIVE

The purpose of this calculation is to summarize the hourly on-site meteorological data collected at the PFSF facility in Skull Valley, Utah during the period from December 19, 1996 to May 29, 1997.

ASSUMPTIONS

1. The prevailing wind directions are based on an arithmetic average of the wind directions in degrees azimuth as an approximation given the predominance of winds from SE to SW.
2. The statistics for the parameters monitored during December are for the period December 19 through December 31, 1996 and those for May are for the period May 1 through May 29, 1997.

METHOD

The hourly on-site meteorological collected in accordance with Ref. 1 are summarized using the statistical functions available in an Excel spreadsheet in which the data are stored (Ref. 2). The statistics computed include the average, maximum, and minimum values of each parameter using the Excel functions "AVERAGE", "MAX", and "MIN". The parameters monitored include: wind speed, wind direction, sigma theta, dry bulb temperature, relative humidity, barometric pressure, solar radiation, soil temperature, and precipitation.

The meteorological database was created in accordance with Ref. 3 and validated in accordance with Ref. 4. The validation process did not identified any parameter values that were unreasonable or did not meet the validation criteria of Ref. 4.
