Subject: TA Briefing Input: Decommissioning Reactors

George,
My input is given below. Thanks,
Goutam

Seismic Check List: Based on a study of existing plant seismic hazards, NRC staff had proposed that seismic vulnerability of a reactor for decommissioning can be screened out provided it can be determined that catastrophic failure of the pool structure is not likely at earthquakes 3 times the SSE. NEI has provided a preliminary check list and the staff has indicated that the list is useful and will suggest some augmentation after it receives input from its consultant made available through RES assistance.

Simple bullets:

NEI input is useful for seismic screening of spent fuel pools, some simple augmentation will be suggested by the NRC staff very soon.

Additional clarification could be finalized through conference call within the next 2-3 weeks.
