X	Not Applicable

**SUBJECT: CONTAMINATION EVENT**

The Tennessee Division of Radiological Health (the Division) notified the NRC Operations Office on July 7, 2003, that the licensee had reported a contamination event at their Memphis, TN facility. Several licensee employees became contaminated on June 26, 2003, while sorting and segregating materials contaminated with low-level radioactive waste that came from a waste broker. Employees were surveyed for contamination prior to leaving the building at the end of the shift, and decontaminated as needed. One individual was reported to have had elevated levels of skin contamination. Following the event, the shop area was shut down for decontamination, and reopened on Sunday, June 29, 2003.

The Division conducted an on-site investigation on July 2 and 3, 2003. The Division reported that seven persons were contaminated, whole body counts were being performed, the personnel monitoring badges had been returned to the supplier for evaluation, and nasal swabs were being analyzed. Preliminary results from the licensee show that the person with the elevated skin contamination had a positive nasal swap, the skin dose was calculated to be 976 millirads, and the whole body dose was 4 millirem from internally deposited cobalt-60. The Division is continuing their investigation of the event.

Region II received initial notification of this occurrence from the NRC Operations Office on July 7, 2003. This information has been discussed with Tennessee, and is current as of 3:30 p.m., Tuesday, July 8, 2003.
