UNITED NUCLEAR (MALLINCKRODT) JUNE 7 AND JULY 16, 1962, DOCKET 70-36

We have reviewed the July 16 letter supplying additional information in connection with the pelletizing of small quantities of 93% and 6.1% enriched UO_2 .

Our memorandum of June 25 and your letter to the applicant of June 29, 1962, requested additional information on storage procedures for incoming material and product. Raw material storage is consistent with presently approved procedures. Insofar as the storage of finished product is concerned, United Nuclear really does not tell us very much. I think the least that we should expect is that they would store in a manner consistent with previously approved procedures and subject to U-235 mass limitations we have approved for the storage area. Please request them to tell us so.

We have no further question with regard to mingling inasmuch as the subject material will be identified throughout the process and since (ref: June 7 letter) this material will be the only material in process in the pellet plant.
