RE: **DOCKET 03-005222**
AMENDMENT REQUEST FOR RADIOACTIVE MATERIAL LICENSE #29-00139-02

Dear Ms. Ullrich:

E. R. Squibb & Sons LLC, a division of Bristol-Myers Squibb Company, has been granted radioactive material license #29-00139-02 which authorizes possession and use of radioactive materials at four New Jersey facilities: the New Brunswick facility (at One Squibb Drive, New Brunswick, NJ), the Lawrenceville facility (at Route 206 and Provinceline Road, Lawrenceville, NJ), the Hopewell facility (at 311 Pennington-Rocky Hill Road, Pennington, NJ) and the Hamilton facility (at Three Hamilton Health Place, Hamilton, NJ). E.R. Squibb & Sons ceased all licensed activity at the Hamilton facility in April 2005.

E.R. Squibb & Sons hereby requests an amendment to its license for the unconditionally release of the Hamilton facility from license control. A final status survey of this facility was completed by AME and is enclosed for your review. The results of this survey document that affected areas of the facility satisfy the requirements for decommissioning.

If you require additional information, please contact Michael Vala at Michael.vala@bms.com or (732) 227-5096.

Thank you for your assistance.

Sincerely,

Michael J. Vala, CHP
Radiation Safety Officer/Manager, EHS

FINAL STATUS SURVEY
for
Bristol Myers Clinical Research Center
Hamilton, New Jersey

Survey Date:

July 2005

Surveys performed by:

Joel Antkowiak
Robert Mahoney

Report prepared by:

Joel Antkowiak

Reviewed and Approved by: _____

Date: _____

8/8/05

Introduction

This report documents the decommissioning survey results of the radioactive materials use areas of the Bristol Myers Squibb Clinical Research Center (BMS) facility in Hamilton, New Jersey. BMS ceased all licensed operations at the site in early 2005. The facility is a shared facility with Robert Wood Johnson (RWJ) and all future licensed activities will be performed under the RWJ NRC license.

There are 3 radioisotopes that were used at the facility: carbon-14, tritium, and iodine-125. Iodine was only used in radioimmunoassay kits. Carbon-14 and tritium were used sparingly. Therefore, no residual contamination was expected to be found.

The decommissioning project was managed and performed by Antkowiak and Mahoney Enterprises, Inc. (AME). The AME task manager for this project was Joel Antkowiak. The surveys were performed in July 2005 by Joel Antkowiak and Robert Mahoney.

Objective

The purpose of this project is to survey the radioactive materials use areas of the BMS facility to demonstrate levels of residual radioactivity sufficiently low to release the building for unrestricted use. There are 6 rooms that are of concern: 150, 162, 164, 180, 195C and 242. As a precaution, the hallways throughout the laboratory area were also surveyed. The surveys were performed by Antkowiak and Mahoney Enterprises, Inc. (AME) under the Bristol Myers Squibb radioactive materials license in order to meet the release criteria of Regulatory Guide 1.86 for the isotopes of concern.

Survey Methodology

The following equation was used to determine the minimum detectable activity of each instrument used:

$$MDA = \frac{2.71 + 4.65 \sqrt{Br \times t}}{t \times E \times A/100}$$

where:

- MDA = activity in dpm/100 cm²
- Br = background rate in counts per minute
- t = counting time in minutes
- E = detector efficiency in counts per disintegration (4π)
- A = probe area or area wiped in cm²

Direct Radioactive Contamination Surveys

Surveys were performed using guidance provided in NUREG 1575, "Multi-Agency Radiation Survey and Site Investigation Manual", or MARSIMM. All decommissioning surveys consisted of 100% scans of the floors, bench tops, drawers and cabinets in the room. Walls were surveyed to a height of six feet.

Measurements of direct radiation were made on all laboratory surfaces using the instruments described in table 1. The survey meter and detectors were checked for operational viability each day prior to use and following re-charging of the gas proportional detectors. This included battery and high voltage checks as well as a one minute count of a dedicated check source to ensure that the detection efficiency of the meter was within a predetermined range. Scans were conducted by moving the probe at a rate of one to two probe widths per second less than 1 centimeter from the surface being surveyed. The audio output of the meter was used to identify areas of contamination.

Table 1: Instruments Used

Instrument	Serial Number	Minimum Detectable Activity
Ludlum Model 12 w/Model 43-68 probe	195030 PR 178507	500 - 550 dpm/100 cm ²
Ludlum Model 12 w/Model 43-68 probe	193772 PR 178433	500 - 550 dpm/100 cm ²
Ludlum Model 12 w/Model 43-37-1 probe Floor Monitor	193772 PR 136363	175 - 200 dpm/100 cm ²
Keithley Model 36155	36025	0.01 mR/hr (10 µR/hr)
Ludlum Model 12 w/Model 44-92 probe	193772 PR 178541	For 20 minute scalar readings, <100 dpm/100 cm ²

In addition to the 100% surface scans, 1 minute scalar readings were taken at locations that were determined based on the level of survey that was required of the area (level 1, level 2, or level 3). All areas are considered to be class II for this survey. The results of these measurements are presented in Appendix II.

Survey for Removable Radioactive Contamination

Sampling for removable activity was conducted by wiping approximately 100 cm² area with a two inch diameter dry filter paper. The samples were then placed directly into a scintillation vial in a specific location of a uniquely identified rack or tray. The position numbers are then described on the scintillation counter log sheet. The samples remain in the specified container and position throughout sample preparation and analysis. This reduces the risk of mislabeling or cross contamination among the many samples taken during this project.

The samples were analyzed by setting three energy windows on the liquid scintillation counter. The low energy channel (channel 1) is set for optimal tritium efficiency, the second window (channel 2) is set for optimal carbon-14 efficiency, and the third window (channel 3) is set for higher energy beta emitters. Because of the potential for I-125 contamination, the samples were counted for 5 minutes to reduce the minimum detectable activity for the counter.

Each day samples are analyzed, NIST traceable tritium and carbon-14 sources are also analyzed at the end of each "batch". The daily counts for both tritium and carbon-14 were within the specified ranges. The minimum detectable activity (MDA) for the counter used (Beckman model 5000 TD; serial number 7040372) is as follows:

Channel 1 MDA = 19 dpm

Channel 2 MDA = 13 dpm

Channel 3 MDA = 12 dpm

For purposes of free release of the rooms, the removable activity exhibited in all three channels is combined to determine compliance with the release criteria. The results are presented in Appendix I.

Additional Sampling

In addition to the smear samples taken at the locations indicated on the diagrams, samples were also taken on all equipment that was in the rooms. The equipment will be left behind for the use of RWJ personnel. The results of these equipment surveys are presented in a separate report. All equipment was found to be free of radioactive contamination.

**Antkowiak and Mahoney
Enterprises, Inc.**

Survey Results – Final Status

No areas exceeded the background radiation exposure rate.

No removable radioactive contamination was found in the rooms surveyed.

No direct radioactive contamination was found in the rooms surveyed.

The final survey results for each of the surveyed areas are presented in Appendices I and II. Copies of the meter calibration certificates are presented in Appendix III.

Understanding the Appendices

The appendices presenting the results of the removable contamination surveys show diagrams of each area surveyed. On each diagram, if two smears are shown to be taken on one item (drawers, cabinet, etc.), the odd numbered smear was taken on the outside of the item. The inside is represented by the even numbered smear.

The appendices that present the data from the scaler measurements refer to the numbers of the smear on the pictures of Appendix I as appropriate. For example, reading number one taken in Room 162, view A corresponds to the location represented in the picture for the removable activity. For Class II rooms, there is approximately 1 reading for every 4 removable samples. Where readings are indicated on drawers and cabinets, the odd numbered reading was taken on the outside of the item, and the even numbered reading represents the inside. For drawers and cabinets, the inside reading was taken inside the drawer, or on the shelf nearest, the location of the number on the diagram.
