¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

▪ this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and:

▪ The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and:

▪ a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and;
- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and;
- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and;
- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, **representing only about 1% of the plant's critical systems.** These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and;
- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

▪ this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and:

▪ The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and:

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

▪ this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, therefore,

▪ The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, therefore;

▪ a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition**TO:** The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts**FROM:** The undersigned citizens of Vermont, New Hampshire, and Massachusetts**WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and**

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, therefore,

- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, therefore;

- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.1. FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

▪ this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, therefore,

▪ The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, therefore;

▪ a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

▪ this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and:

▪ The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and:

▪ a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

▪ this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and:

▪ The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and:

▪ a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

▪ this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and:

▪ The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and:

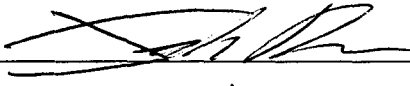

▪ a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

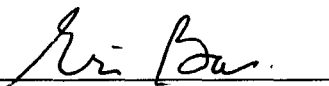

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

A Citizen Petition**TO:** The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts**FROM:** The undersigned citizens of Vermont, New Hampshire, and Massachusetts**WHEREAS, Louisiana-based Entergy Corporation** has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, therefore,

- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, therefore;

- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

▪ this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and:

▪ The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and:

▪ a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and;
- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and;
- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

A Citizen Petition**TO:** The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts**FROM:** The undersigned citizens of Vermont, New Hampshire, and Massachusetts**WHEREAS,** Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and;

- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and;

- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

Please return this form to: New England Coalition • PO Box 545 Brattleboro, VT 05302 • (802) 257-0336 • www.necnp.org

A Citizen Petition**TO:** The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts**FROM:** The undersigned citizens of Vermont, New Hampshire, and Massachusetts**WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and**

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and:

- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and:

- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.1. ¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

274

A Citizen Petition**TO:** The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts**FROM:** The undersigned citizens of Vermont, New Hampshire, and Massachusetts**WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and**

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and;
- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and;
- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

Shaw

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts**FROM:** The undersigned citizens of Vermont, New Hampshire, and Massachusetts**WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and**

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and;

- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and;

- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

▪ this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and:

▪ The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and:

▪ a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

¹ According to the definitions and parameters provided in the report: Independent Safety Assessment of Maine Yankee Atomic Power Company, October 1996, by the Nuclear Regulatory Commission. This study shall: (1) independently assess the conformance of Vermont Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; (2) independently assess operational safety performance giving risk perspectives where appropriate; (3) evaluate the effectiveness of licensee self-assessments, corrective actions, and improvement plans; (4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

A Citizen Petition

TO: The Governors and Elected Officials of Vermont, New Hampshire, and Massachusetts

FROM: The undersigned citizens of Vermont, New Hampshire, and Massachusetts

WHEREAS, Louisiana-based Entergy Corporation has applied to super-load nuclear fuel in the Vermont Yankee Nuclear Power Plant at Vernon to 120% of the reactor's original 1973 license, and

- this increase will place new stress on Vermont Yankee's aging components increasing risk of accidents and plant blackouts that could affect the entire state, and;
- The recent NRC Engineering Team Inspection identified 8 significant problems in only 45 systems examined, representing only about 1% of the plant's critical systems. These results indicate that the other 99% of the plant's systems may contain hundreds of other problems that remain unidentified, and;
- a full top-to-bottom examination of Vermont Yankee is prudent, protective and conservative, therefore,

WE NOW SAY, join us in calling for an Independent Safety Assessment of Vermont Yankee¹, similar to those already conducted at aging nuclear plants in Maine and Connecticut.

Protect New England from Nuclear Jeopardy

[View Current Signatures](#) - [Sign the Petition](#)

To: Governors and Elected Officials of VT, NH, MA

Whereas Entergy Corporation has applied to super-load Vermont Yankee with nuclear fuel and "run it" at 120% of its 1960's era design capacity without submitting to a comprehensive Independent Safety Assessment! This reactor is sited at Vernon, VT and stands less than 12 miles from the borders of MA & NH.

Because of A FAILURE OF THE NUCLEAR REGULATORY COMMISSION TO DO ITS JOB, the people and landscape of New England are being needlessly jeopardized.

To wit, the Nuclear Regulatory Commission has failed to give the citizens of New England adequate protective services in the form of a comprehensive safety inspection at the Vermont Yankee Nuclear Power Plant.

This aging, 1960's era power plant is of serious concern to all people's of New England -- even as it stands. The proposed "uprate", which will demand 20% more of the reactor than it was designed for, makes the NRC's failure a CRISIS issue!

Join us in calling for a full Independent Safety Assessment of Vermont Yankee!

Independent Safety Assessment (ISA) shall: 1)independently assess the conformance of VT Yankee to its design and licensing bases including appropriate reviews at the site and corporate offices; 2)

independently assess operational safety performance giving risk perspectives where appropriate; 3) evaluate the effectiveness of license self-assessments, corrective actions, and improvement plans; 4) determine the root cause(s) of safety-significant findings and draw conclusions on overall performance.

Similar assessments were completed at Millstone Nuclear Power Station, D.C. Cook Power Station & Maine Yankee Atomic Power Station circumstances called for it. Why should the people of VT, NH, MA and the surrounding region be afforded less protection than the people of CT, MI or ME?

Sincerely,

The Undersigned
