SFP Analysis

- **SFP Background**
- **Analysis - Summary**
 - CFD
 - MELCOR Results
 - Separate Effects Model
 - Whole Pool Model
- **Modeling Issues/Uncertainties**
- **Testing**

SFP Analysis Background

- **NRC Vulnerability Project**

- Past work primarily limited to “early phase” heat-up calculations, no integrated severe accident analysis performed
- Most codes only analyzed potential for zirconium fire using “ignition temp” criteria

- **No Severe Accident Models**

- **Historical Tools Also Criticized for Modeling Limitations**

- Damage propagation
- Oxidant depletion
- FP release and transport modeling
- Heat transfer modeling
- Flow Mixing

- **Shortcomings can be overcome with severe accident modeling (MELCOR) + detailed T/H support (CFD)**

Spent Fuel Pool Analyses

- Analyses will address scenario characteristics (from different threats)
 - Partial Pool Drainage (Water Boildown)
 - Complete Pool Drainage (Air Natural Circulation)

Ex-
S [

]

- CFD Used to Evaluate
 - Details of Single Assembly in Air Circulation and Heat Flows
 - Flow and Mixing Behavior in Pool and Building
 - Provide Boundary Conditions for MELCOR Analyses

Ex-
S [

]

- MELCOR Will Analyze
 - Global Response of Pool and Assemblies,
 - Fuel Damage, Steam and Air Oxidation
 - Fission Product Source Term
 - Mitigation or Recovery Actions

MELCOR Modeling Approach

- **2 Model Approach - Separate Effects and Whole Pool/Reactor Building Models**

- Subdivided into 2 Types of Scenarios

- Complete Loss-of-Inventory

- Partial Loss-of Inventory

} Ex 5
Ex 5

- **Separate Effects Model**

- Developed First to Guide Full SFP Model Development

- Fast Running + Controlled Boundary Conditions

Ex. 5 [—
Ex. 5 [—

]

- Use Separate Effects Model to Develop Appropriate Modeling Approach

- Identify Sensitivities and Uncertainties

- Recommend Code Development.

- **Full SFP + Building Model**

- Integral Effects

- Whole SFP Source Term

Testing

- Testing performed at ANL to confirm MELCOR air oxidation kinetics
 - For Zircalloy and Zirlo testing confirmed general adequacy of correlation at low temp (<600 C)
 - Breakaway phenomena seen f (temp, time)
 - Testing underway to examine effect of hydriding on oxidation behavior for Zirlo

Figure 19. A comparison of the temperature dependence of the oxidation rate constant for air oxidation of steam-preoxidized Zircaloy-4 and Zirlo at 300-600°C derived from this project with those for Zircaloy-4, based on NuregI (Powers), NuregII, and CODEX.

Figure 20. A comparison of the temperature dependence of the oxidation rate constant (in post-breakaway region) for air oxidation of steam-preoxidized Zircaloy-4 and Zirlo at 400-900°C derived from this project with those for Zircaloy-4, based on NuregI (Powers), NuregII, and CODEX.

Figure 5. Weight change data during air oxidation of steam-preoxidized Zirlo capsule specimens.

Figure 13. Temperature dependence of rate constant for the air oxidation of steam-preoxidized Zirlo capsule specimens in the temperature range of 300-600°C.

Figure 14. Temperature dependence of rate constant for the air oxidation of steam-preoxidized Zirlo capsule specimens in the temperature range of 300-900°C.

Testing

- New testing proposed for confirming spent fuel pool modeling of T/H and accident progression
- Confirmation of modeling adequacy
 - Natural circulation flow – air flow case
 - Laminar flow losses (initial and degrading fuel conditions)
 - Base plate and bypass region modeling
 - Convective heat transfer
 - Radiation heat transfer
 - Transient oxidation behavior
