RE: 0536-E

Ms. Lou Roberts (6EN-AT)  
U.S. Environmental Protection Agency – Region 6  
1445 Ross Avenue, Ste 1200  
Dallas, TX 75202-2733

Subject: Final PCB Remediation Report  
Sequoyah Fuels Corporation

Dear Ms. Roberts:

Attached for your information is a Final Remediation Report dated May 2005 that describes the completion of remediation activities associated with historical leaks of PCB oils at the Sequoyah Facility. The remediation activities were conducted in accordance with the PCB Cleanup Plan dated October 1994 that was submitted to EPA-Region 6 prior to commencement of soil removal.

If you have any questions regarding the attached report please feel free to contact me at 918-489-5511, extension 13.

Sincerely,

John H. Ellis, President  
Sequoyah Fuels Corporation

xc: Saba Tahmassebi, Engineer Manager  
Oklahoma Dept. of Environmental Quality

Jeannine Hale

# **Final Remediation Report Historical PCB Contamination**

Sequoyah Fuels Corporation  
Gore, OK

## **I. Overview**

Sequoyah Fuels Corporation (SFC) has completed remedial activities at their closed uranium-processing facility near Gore, Oklahoma for contamination associated with historical leaks of PCB oils. The remediation activities were conducted in accordance with the *PCB Cleanup Plan*<sup>1</sup> submitted to EPA-Region 6 prior to the commencement of soil removal. All soils with concentrations above the target level of 25 ppm were removed from the project site. Chris Thompson and Tom Blachly of Cinnabar Environmental Services, along with Bill Reid with Omega Project Services, managed the remediation project. This report was prepared to summarize the activities leading up to the remediation (slab removal and site characterization) and to document the methods and procedures utilized for removal and disposal of contaminated soils, confirmation sampling and analysis, and the backfilling/reclamation of the project area.

## **II. Background**

The project site is located at Sequoyah Fuels Corporation (SFC), a uranium processing facility near Gore, Oklahoma. The facility is presently owned by General Atomics of La Jolla, California, which purchased the plant in 1988 from Kerr-McGee Corporation. The facility ceased operations in 1993 and is currently undergoing decommissioning under the oversight of the Nuclear Regulatory Commission, and RCRA/Corrective Measures under EPA-Region 6. Kerr-McGee Corporation operated electrical rectifiers and transformers in the project area which leaked PCB oils (Aroclor 1260) onto concrete slabs and soil in the project area in the late 1970's.

## **III. Site Location**

The SFC facility is rurally located on Carlile Road (SH 10) in Sequoyah County, Oklahoma

---

<sup>1</sup> *PCB Cleanup Plan*, Sequoyah Fuels Corporation, Cinnabar Environmental Services, October, 2004

and is completely surrounded by agricultural land owned primarily by SFC. (See Area Map in Appendix A).

The project site is located on the east side of the Main Process Building, and consists of an approximate 1,600 square foot area inside the Restricted Area. A Site Location Map (Appendix B) depicts the location of the project site within the facility.

#### **IV. Slab Removal and Site Characterization**

Slab removal and site characterization activities occurred in August, 2004. Two (2) concrete slabs overlaid the project site prior to the initiation of this project. Kerr McGee had previously coated both slabs with gray epoxy paint and attached labels indicating the slabs contained PCB-contamination. Slab removal was necessary prior to site characterization and remediation activities.

The concrete slabs were first sampled and analyzed which verified PCB contamination. They were then cut into manageable size pieces, loaded into 20-yard roll-offs, manifested, and shipped offsite for disposal at a TSCA Landfill.

Subsequent to the concrete slab removal, a site characterization was performed at the project site. A sample grid was established over the site to identify boring locations. Twenty-eight (28) soil borings were advanced to refusal using a truck-mounted direct-push drilling rig. Samples were continuously collected from the borings. Eighty-six (86) soil samples were then analyzed for PCB, with two (2) samples being scanned for volatile and semi-volatile organic compounds (VOCs and SVOCs).

The organics scan indicated the presence of elevated levels of 1,2,3- and 1,2,4-trichlorobenzene as well as methylene chloride. A report<sup>2</sup> is available from SFC that offers details on the slab removal and site investigation results.

The subsurface investigation delineated the PCB contamination and allowed the construction of PCB plume maps. A drawing depicting the boring locations, analytical results, and estimated plumes are attached in Appendix C. Because of an inability to

---

<sup>2</sup> *PCB-Contaminated Concrete Pads Removal and Subsurface Investigation*, Sequoyah Fuels Corporation, Cinnabar Environmental Services, September, 2004.

advance borings deeper than 10 to 12 feet, the full vertical extent of the PCB contamination was not determined prior to excavation. In addition, utilities located along the eastern border of the project site inhibited the ability to define the eastern extent of the contamination as well.

## **V. Remediation Activities**

Soil excavation activities were performed in December, 2004 and January, 2005. Using the plume maps generated from the site characterization, PCB contaminated soils were excavated with a hydraulic excavator (track hoe) and stockpiled on sheets of poly liner, followed by loading into rolloff containers for transport to the disposal site by truck. Soil samples were collected periodically from the excavation and analyzed for Aroclor 1260 utilizing field screening methods (EPA Screening Test Method 9078) as well as occasional laboratory analysis (EPA Method 3550B/8082) to check the progress of the remediation. The final excavation was irregular in shape, being approximately 36 ft long x 20 ft wide with an additional 8 ft wide x 14 ft long trench off the southeast corner. The excavation was approximately 18 ft deep with the exception of the westernmost 12 feet, which was only 7 ft deep. An excavation map is shown in Appendix D.

During remediation activities, heavy rains occurred which allowed storm water to collect in the excavation hole. The rainfall event occurred after the majority of contaminated soils had already been removed. Inflow to the excavation resulted from roof drains associated with the Main Process Building which had been severed during excavation, allowing inflow under the excavation cover. Samples were taken from the collected rainwater on December 5<sup>th</sup> and 6<sup>th</sup>, 2004 and delivered to the laboratory to determine the level of PCB contamination. Laboratory results are shown in Appendix F and indicated that PCB levels were below the laboratory detection level in all samples. Following receipt of the laboratory analysis, the collected storm water was pumped through Outfall 001 under the facility OPDES permit.

## VI. Confirmation Sampling

Confirmation of completion of remediation was determined by soil and groundwater analysis. Though groundwater sampling is not required by the PCB regulations, those additional samples were taken because of the close proximity of existing wells to the remediation project location. Five wells located within a few feet of the remediation excavation, both up and downgradient, were sampled on December 3, 2004 and sent to a commercial laboratory for uranium and PCB analysis. Results (shown in Appendix F) indicated that PCB levels were at or below the laboratory detection level.

When contaminated soils were thought to be fully excavated, confirmation sampling was performed. Sample collection procedures, as well as the sampling scheme, followed accepted industry practices as well as the requirements of 40 CFR Part 761.130. The sampling scheme called for the collection of samples in a grid pattern from each wall and each of the two (2) floor levels in the main excavation. Between five (5) and nine (9) individual aliquots from each area were collected and mixed together to make each composite sample statistically valid and reproducible. Because of their smaller size, all three walls in the trench area were sampled and composited together while the trench floor was sampled separately. Sample locations are depicted on the diagram attached in Appendix E. Based on historical information, the sampling area was greater than 20% larger than the original area of contamination. Based on the number of samples composited and the size of the excavation, the sampling scheme used ensures against false positives.

Samples were collected with a hand auger to a depth of approximately 3 inches below the exposed surface. Sampling equipment was decontaminated prior to commencement of sampling and as needed following the collection of each composite sample using an Alconox® detergent and potable water wash followed by a potable water rinse.

Soil samples were containerized in laboratory-supplied glassware, preserved, chain of custody prepared, and delivered to Outreach Laboratory in Broken Arrow, Oklahoma for analyses. Soil samples were analyzed for Aroclor 1260. Laboratory reports and executed chain of custodies are attached in Appendix F.

As shown in the following table, all final confirmation sample results were below the target cleanup level of 25 ppm.

## Confirmation Soil Sample Results

Date Sampled	Sample ID	Sample Location	PCB (ppm)
12/21/04	J-H/6-8	Main Excavation Floor at 7-foot depth	3.3
12/29/04	C/F/(16)	Main Excavation Floor at 18-foot depth	11.0
12/30/04	C/EW/0	Main Excavation – East Wall	6.9
12/30/04	C/SW/K	Main Excavation – South Wall	5.0
12/30/04	C/WW/6	Main Excavation – Lower West Wall	0.4
12/30/04	C/WW/8	Main excavation – Upper West Wall - Initial (Note: because of elevated PCB concentrations found following remediation, an additional 4 feet of soil was removed from the wall and then re-sampled (Sample ID C/WW/9))	142
1/7/05	C/WW/9	Main Excavation – Upper West Wall - Final	3.1
1/7/05	C/Trench Floor	Trench Floor	1.2
1/7/05	C/Trench Walls	Trench Walls	1.4

\*PCB results were for Aroclor 1260

## VII. Disposal

Two (2) discrete wastes were generated during this project:

1. PCB contaminated concrete and sand from the slab removal.
2. PCB contaminated soil from the excavation.

The concrete/sand waste was placed into eight (8) 20-yard roll-offs. Six (6) of the roll-offs were transported by a licensed waste hauler under hazardous waste manifests to the Clean Harbors waste collection facility in Coffeyville, Kansas. Clean Harbors then loaded the concrete and sand into railcars for transport to the company's TSCA waste disposal facility in Utah (Grassy Mountain Facility - UTD #991301748). The other two (2) roll-offs were transported, also under hazardous waste manifests, to Clean Harbor's Lone Mountain Facility in Wynoka, Oklahoma (OKD #065438376). The total weight of concrete and sand material shipped off site is 231,140 pounds (115.6 tons). Copies of the manifests can be found in Appendix G.

As stated in Section V, excavated soil was temporarily stored on a poly liner prior to disposal. Select stockpiles were sampled and analyzed at Outreach Laboratory to confirm that methylene chloride concentrations were below the land ban restriction of 30 mg/Kg for disposal at RCRA waste disposal sites. Soils were then placed in 20-yard roll-off containers, and transported under hazardous waste manifests to the Clean Harbor's Lone Mountain Facility referenced above. A total of thirty-eight (38) shipments of soil were shipped off-site totaling 1,424,674 pounds (712.3 tons).

The table in Appendix H summarizes all shipments of PCB-contaminated material from the start of this project.

#### **VIII. Backfilling/Reclamation**

The excavation was backfilled to grade with clean soils that were obtained from a location on the SFC property, outside of the Restricted Area.

#### **IV. Conclusions**

Sequoyah Fuels Corporation has completed remediation activities associated with a historical release of PCB oils from transformers/rectifiers located on the east side of the Main Processing Building. Concrete and soil containing concentrations of PCBs in excess of 25 ppm have been removed and disposed of in accordance with all state and federal regulations. Because of the level of remediation achieved, no further monitoring or administrative actions are required, and the site is considered to be remediated for unconditional use under the State and Federal PCB rules and regulations.
