Subject: Uranium Recovery GEIS

2007 SEP -4 PM 4: 43

(33)

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Erika Parker

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Francisco Costa

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Jon Brookstone

Subject: Uranium Recovery GEIS

2007 SEP -4 PM 4: 41

(48)

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Steven Alderson

Subject: Uranium Recovery GEIS

(55)

2007 SEP -4 PM 4: 41

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

RECEIVED

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Mike Turner

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in-situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Alex McLean

Subject: Uranium Recovery GEIS

2007 SEP -4 PM 4:40

(62)

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in-situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Amy Holt

Subject: Uranium Recovery GEIS.

2007 SEP --4 PM 4:39

(69)

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Holly Henderson

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Kevin Stephens

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Paul Palmer

RULES AND DIRECTIVES
BRANCH
ISNRC

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Bobby Andrew

Subject: Uranium Recovery GEIS

2007 SEP -4 PM 4: 37

(91)

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Jack Stansfield

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Subject: Uranium Recovery GEIS

2007 SEP -4 PM 4: 25

(107)

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Beryl Landau

Subject: Uranium Recovery GEIS

2007 SEP -4 PM 4: 24

(114)

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

RECEIVED

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Gina Hafner

RECEIVED

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Thomas Conroy

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

James Nagy

Date: Wed, Aug 29, 2007 6:33 PM
Subject: Uranium Recovery GEIS

(129) 2007 SEP -4 PM 4: 22

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS"), for in situ leach ("ISL") uranium mining.

RECEIVED

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Jessie Allen-Young

135

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Elaine Fischer

Subject: Uranium Recovery GEIS

(136)

2007 SEP -4 PM 4:21

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

RECEIVED

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Gordon Messling

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

RECEIVED

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Ervin Jindrich

Subject: Uranium Recovery GEIS

2007 SEP --4 PM 4: 20

(143)

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Philip Simon

2007 SEP -4 PM 4:19

To Whom It May Concern:

Please consider this letter to you as extremely important. Water at each site will be different. Western States water availability is different at each site.

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Subject: Uranium Recovery GEIS

2007 SEP -4 PM 4:19

(150)

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Joyce Abraham

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Delwin Goss

(158)

2007 SEP -5 PM 4: 50

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

RECEIVED

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Amanda Carter

To: <nrcprep@nrc.gov>
Date: Wed, Aug 29, 2007 6:50 PM
Subject: Uranium Recovery GEIS

(163)

To Whom It May Concern:

We are responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

We have just learned of this proposed action and frankly are horrified.

We strongly oppose a GEIS for many reasons..

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, it appears that the NRC has already concluded that a GEIS should be drafted. Even if its scope is very limited, we still feel it would be unwise, lead to unsafe and unhealthy conditions and would be undemocratic. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

We have been under the apparently mistaken impression that the purpose of NRC and EPA is to protect the public from unsafe and unhealthy conditions brought about by mining processes that should instead be prohibited. Instead, this proposal appears to protect the mining companies from those restraints.

We strongly urge you to heed our concerns and scrap this proposal. The health of many is at stake.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Gladwyn d'Souza

RECEIVED

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Nancy Thompson

Subject: Uranium Recovery GEIS

172

2007 SEP -5 PM 4: 53

To Whom It May Concern:

I am responding to the U.S. Nuclear Regulatory Commission's Federal Register notice dated July 24, 2007 regarding the scope of the proposed Generic Environmental Impact Statement ("GEIS") for in situ leach ("ISL") uranium mining.

RECEIVED

I write to oppose a GEIS. The reasons are many.

First, the process by which the NRC arrived at its conclusion to draft a GEIS is fundamentally flawed. There was no public input about whether a GEIS is needed or desirable. Given the site-specific nature of ISL operations, the usefulness of a GEIS is dubious at best.

This process gives the impression that drafting a GEIS that would expedite the ISL licensing process was a foregone conclusion.

Second, the scoping process itself has been deeply flawed. Only two public meetings have been scheduled on this matter - one in Casper, Wyoming and one in Albuquerque, New Mexico. Additionally, a special meeting with the National Mining Association was held in Washington, D.C.

None of these communities is the site of any proposed ISL mining operations. Communities that face proposed ISL mining such as Grants, Gallup, Crownpoint and Church Rock, New Mexico, were ignored. Additionally, the NRC has ignored entire states, such as Utah, Arizona, Colorado and South Dakota, where ISL mining is proposed.

The NRC should, at a minimum, extend the comment period and schedule public meetings in communities that will be affected by ISL mining.

Third, if the NRC has concluded, as it appears to have already done, that a GEIS should be drafted, its scope should be very limited. ISL mining is inherently constrained by site specific considerations. To conclude that the hydrology, water quality, geology, socio-economics, and cultural resources in places as diverse as northwest New Mexico and south Texas - where ISL mining is ongoing and proposed - can be evaluated in a generic manner is absurd on its face. These issues can only be evaluated on a site specific basis with a site specific environmental impact statement.

Finally, relegating these important site specific issues to evaluation in an environmental assessment ("EA") is unacceptable. The public participation and environmental analysis requirements under the National Environmental Policy Act are much less stringent for EAs than for EISs.

Because the site specific issues are so central to assessing the environmental impact of proposed ISL operations, meaningful public participation and a rigorous environmental analysis are critical. Such issues should not be left for an EA. In fact, in the August 13, 2007 issue of the Gallup Independent, the NRC's Office of Federal and State Materials and Environmental Management Programs Branch Chief Gregory Suber stated that "the potential for fewer public meetings is there" with the EA process.

Thank you for the opportunity to submit my comments on this matter, and please keep me apprised of developments with regard to the GEIS.

Sincerely,

Kenneth Bird
