IE INFORMATION NO. 82-23: MAIN STEAM ISOLATION VALVE (MSIV) LEAKAGE

Addressees:

All boiling water power reactor facilities holding an operating license or a construction permit.

Purpose:

This information notice is provided as notification of events that may have safety significance. It is expected that recipients will review the information for applicability to their facilities; however, no specific action or response is required at this time.

Description of Circumstances:

IE has completed a survey of MSIV performance at BWRs for the years 1979 through 1981. IE found that 19 of 25 operating BWRs had MSIVs which failed to meet, during one or more surveillance tests, the limiting condition for operation (LCO) which specifies the maximum permissible leak rate. The number of MSIV test failures exceeded 151 and occurred with MSIVs supplied by all three MSIV vendors, i.e., Atwood & Morrill, Crane, and Rockwell.

Measured leak rates which exceeded the LCO ranged from greater than 11.5 standard cubic feet per hour (scfh) to 3427 scfh. Twelve stations had 57 MSIV tests with results greater than 11.5 scfh and less than 100 scfh, and five stations (nine units) had 66 MSIV tests with results between 100 and 3500 scfh. Four other licensees had more than 24 test failures but did not measure, estimate, or report the magnitudes of the leak rates. These results are summarized in Attachment (1) and are shown in detail in Attachment (2).

This information indicates that some MSIVs may not adequately limit release of radioactivity to the environment if called upon to do so. NRC is considering the need for improved MSIV maintenance, more frequent MSIV testing or installation of leakage control systems.

				151+		

Notes:

- (1) Test pressure (unknown) could not be achieved.
- (2) Poppet out of round.
- (3) Ridges in seating surface.
- (4) Poppet would not seat.

- (5) Marks in seating surface.
- (6) In determining the distribution of leak rates, the following assumptions were made:
 - (a) For a pair of MSIVs each shown as leaking at $<x$, it was assumed that one was leaking at x and one was not leaking, and
 - (b) For an MSIV shown as leaking at $>x$, it was assumed that it was leaking at x .
