ADDENDUM 6.1-A

r

RESTORATION ACTION PLAN

WITH FINANCIAL ASSURANCE ESTIMATE

PREAMBLE

This preamble is intended to provide NRC staff with a brief legal and regulatory discussion of the contents of the attached restoration action plan (RAP) for Strata Energy, Ltd.'s (Strata) proposed Ross in-situ leach uranium recovery (ISR) project near Oshoto in the State of Wyoming. Strata is submitting this RAP as a stand-alone document so that NRC staff reviewing Strata's license application will be able to address relevant decommissioning and decontamination (D&D) requirements and related financial assurance cost estimates associated with aquifer restoration and surface reclamation at the proposed Ross ISR Project in one document rather than having to search the entirety of the license application for all relevant D&D and financial assurance information. In addition, preparation of the attached RAP is in accordance with the NRC's requirements for ISR licensing as defined in 10 CFR Part 40, Appendix A, Criterion 9 and all regulations deemed to apply to ISR site D&D. Given that as discussed below previous RAPs were submitted as stand-alone documents, Strata has determined that submission of a stand-alone RAP is appropriate.

Under the Commission's regulations, RAPs find their origin in the Commission's interpretation of 10 CFR Part 40, Appendix A, Criterion 9 in the Hydro Resources, Inc. (HRI) administrative litigation regarding HRI's proposed ISR project at Church Rock and Crownpoint, New Mexico (hereinafter the Crownpoint Uranium Project or "CUP"). Beginning in 1997, HRI and several interveners entered into administrative litigation before NRC's Atomic Safety and Licensing Board (Licensing Board) to determine whether several aspects of HRI's CUP license application and NRC Staff review of that application satisfied the Atomic Energy Act of 1954 as amended (AEA) and the NRC's implementing regulations pursuant thereto. During this litigation, in 1998, NRC staff issued HRI License SUA-1508 to construct and operate the proposed CUP. After concluding the initial litigation regarding the Licensing Board's determination that the proposed CUP adequately addressed groundwater restoration and

TR Addendum 6.1-A

financial assurance, in 2000, the NRC considered an appeal to that decision. In 2000, the NRC determined that a license applicant for an ISR project must have an NRC-approved RAP, including a detailed financial assurance calculation methodology and preliminary cost estimates, prior to being issued a license to operate any proposed ISR project. Importantly, while it determined that a license applicant must have the aforementioned RAP in place prior to being issued a license, the NRC also determined that the actual financial assurance mechanism (e.g., surety bond, letter of credit, cash deposit, etc.) need not be in place until the licensee is prepared to commence licensed operations. Accordingly, when submitting a license application for a new ISR project, a license applicant is required to prepare and submit a detailed financial assurance calculation methodology and preliminary cost estimates based solely on the information permitted to be obtained pre-license issuance by the applicant under NRC regulations; however, a license applicant is not required to have a final financial assurance cost estimate and a financial assurance mechanism in place until right before it is ready to commence licensed operations and after issuance of an NRC license.

The HRI litigation also provided ISR license applicants with additional guidance on the methodology for preparing RAPs and for calculating preliminary financial assurance cost estimates for such RAPs. For example, the Licensing Board, the NRC, and the United States Court of Appeals for the Tenth Circuit all have agreed that 10 CFR Part 40, Appendix A, Criterion 9 permits ISR license applicants to account for and rely upon the use of existing site equipment such as the central processing plant (CPP), existing wellfields, wellfield equipment, and other already-available site equipment when calculating financial assurance cost estimates for groundwater restoration. The NRC's interpretation logically implements the provisions of Criterion 9 as independent contractors likely will rely on the availability of existing wellfields, the CPP, and other site facilities to initiate and/or continue and complete groundwater restoration at an ISR site. In addition, existing 11e.(2) byproduct material storage areas and site equipment such as front-end loaders will be

required to complete site D&D, including surface reclamation tasks such as soil cleanup in accordance with 10 CFR Part 40, Appendix A, Criterion 6(6).

The HRI decision also permits licensees to utilize qualified site employees for the performance of multiple, unrelated site tasks during the course of groundwater restoration and site D&D in developing financial assurance cost estimates. ISR sites are highly automated, and standard industry practices dictate that a single site employee can perform multiple tasks based on the training they receive and expertise they possess.

In addition to the aforementioned requirements, NRC regulations at 10 CFR Part 40, Appendix A, Criterion 9 also require that a licensee submit updates to its financial assurance cost estimates on an annual basis and that such estimates must account for a variety of economic and site-specific factors such as inflation (Consumer Price Index), changes in costs of materials and for personnel, changes in costs of 11e.(2) byproduct material or other waste disposal, changes in costs of required site processes such as well plugging, and changes in site-specific factors such as the level of effort and duration required for groundwater restoration (e.g., pore volumes). This requirement is intended to ensure that all financial assurance mechanisms posted by a licensee remain current and sufficient to perform required groundwater restoration and site D&D as required and in a timely fashion. Based on this requirement, ISR license applicants also are only required to present financial assurance cost estimates in license applications that account for the first year of proposed activities or the first stage of licensed operations, including construction of the CPP and the initial wellfield(s). To require otherwise would be unnecessary as an ISR license applicant will not proceed beyond certain initial site activities in the first year and given the aforementioned NRC interpretation that a financial assurance mechanism need not be in place until the commencement of operations and that an ISR licensee will be required to update its initial financial assurance cost estimates from its license application prior to posting its financial assurance mechanism and commencing licensed operations. Accordingly, ISR licensees will continue to post adequate financial assurance

cost estimates in accordance with NRC's mission of protecting public health and safety and the environment.

To comply with the NRC's directive above in the HRI litigation, HRI proposed four (4) RAPs, one for each of its proposed CUP ISR sites and each of which was approved by NRC staff subject to minor adjustments by the Licensing Board. Each of these RAPs, with the Licensing Board's adjustments, was approved by the NRC and the Tenth Circuit over the full course of that litigation.

Using these RAPs as guidance and considering that NRC staff does not currently have guidance for the composition of stand-alone RAPs, Strata is proposing a RAP for its proposed Ross ISR Project that closely follows the HRI RAPs' format. However, Strata has used updated assumptions reflecting current standard industry practices and included the work required and associated costs to reclaim all facilities associated with the CPP and the first five (5) wellfield modules, rather than just the first year's estimated construction. This is conservative in that uranium recovery operations are unlikely to occur in five modules during the first year of licensed activities. In the attached RAP, Strata is including a comprehensive site D&D plan, including aquifer restoration for the first five wellfield modules and D&D of the CPP and all other site activities required to be completed to return the Ross site to unrestricted use. These activities include D&D of site equipment, demolition of the CPP, reclamation of the initial wellfield modules, and off-site disposal of all wastes, including 11e.(2) byproduct material. The RAP also includes preliminary financial assurance cost estimates for all site D&D activities.

As can be seen from the RAP, Strata has accounted for all NRC interpretations offered in the HRI case to reflect the most current NRC practices for financial assurance. Strata believes that this RAP provides NRC staff with a user-friendly, stand-alone guide to Strata's approach to site D&D and financial assurance.

TR Addendum 6.1-A

Strata Energy, Inc. RESTORATION ACTION PLAN License No: SUA-+++ December 2010

RESTORATION ACTION PLAN

A. INTRODUCTION

The following summarizes the Restoration Action Plan for the CPP, first five (5) wellfield modules and all related facilities anticipated to be constructed during the first year of licensed activities of the Ross ISR Project near Oshoto, Wyoming. The estimate puts the costs of restoration to be performed by an independent contractor at \$9,672,068.85 over an approximately 3-year period during which the CPP, the initial five (5) wellfield modules, and associated infrastructure would be reclaimed to a condition agreed upon by NRC that would return the site to unrestricted use. The RAP encompasses the full cycle of activities necessary for:

- Facility decommissioning,
- Aquifer restoration and well plugging,
- Radiological survey and environmental monitoring,
- Project management and miscellaneous costs, and
- Labor and equipment overhead and contractor profit.

Strata's submittal presented herein employs assumptions that are based on best professional judgment given the data currently available. Annual reviews would provide the iterative format by which NRC can continually update the financial assurance amount based on work completed at the site and newly available information.

B. FINANCIAL ASSURANCE MECHANISM

The financial assurance mechanism to be used by Strata is shown in Attachment RAP-1.

C. CONSOLIDATION OF STATE, EPA AND NRC FINANCIAL ASSURANCE INSTRUMENTS

In addition to being crafted to comply with NRC criteria, Strata's proposed financial assurance estimate is designed to address the U.S. Environmental Protection Agency (EPA) Underground Injection Control criteria and the Wyoming Environmental Quality Act requirements for a reclamation performance bond. These multi-compliant sureties will require multi-agency concurrence as to amounts and surety forms. The bond examples shown in Attachment RAP-1 are designed to be consistent with 10 CFR Part 40, Appendix A, Criterion 9 (Financial Criteria) which allows for consolidation of State and Federal financial or surety arrangements established to meet restoration, reclamation, and decommissioning costs provided that "the portion of the surety which covers the decommissioning and reclamation of the mill, mill tailings site and associated areas is clearly identified and committed for use in accomplishing these activities." Absent a mill or tailings, essentially all of the process facility, wellfield, and ancillary components of the operations would be subject to the decommissioning requirements of the Wyoming Department of Environmental Quality, U.S. Environmental Protection Agency and the NRC.

D. COST DETAILS FOR RESTORATION AND RECLAMATION ACTIVITIES

1. Introduction

Attachment RAP-2 contains details concerning cost basis figures and assumptions, calculations and methodologies used in deriving cost estimates for the full cycle of groundwater restoration, well plugging and abandonment, surface decommissioning and reclamation, closure and ultimate license termination. Cost references are provided in Attachment RAP-3. This information is designed to be descriptive enough for the NRC staff to determine the acceptability of Strata's proposed cost figures and is based on the estimated costs for an independent contractor to perform the decommissioning and reclamation work in accordance with 10 CFR Part 40, Appendix A, Criterion 9 and the Wyoming Environmental Quality Act and its accompanying rules and regulations and guidelines. Strata has developed its cost estimates to address all items in Appendix C of the NRC's "Standard Review Plan for In Situ Leach Uranium Extraction License Applications" (NUREG-1569, dated June 2003).

The following tabulation summarizes the costs necessary to hire an independent contractor to assume all decommissioning and reclamation activities required after full development of the CPP, first five (5) wellfield modules and associated facilities. Descriptions of the work are provided below, and detailed costs estimates for each major item of work are provided in attachments RAP-2(A) through (G).

Item	Cost
Aquifer restoration	\$ 2,866,412.03
Facilities area reclamation	\$ 2,344,689.50
Wellfield equipment & disposal	\$ 1,653,423.27
Well abandonment	\$ 1,030,261.08
Radiological surveys	\$ 37,857.50
Revegetation	\$ 66,000.00
Misc. reclamation activities	<u>\$ 268,082.14</u>
Subtotal	\$ 8,266,725.52
Project management @ 2%	\$ 165,334.51
Contingency @ 15%	<u>\$ 1,240,008.83</u>
Total	\$ 9,672,068.86

2. Aquifer Restoration

2.1. Introduction

Aquifer restoration costs for the first five wellfield modules are presented in Attachment RAP-2(A). The costs are broken down into separate phases of work:

- Groundwater sweep,
- Reverse osmosis (RO) with permeate injection,
- Groundwater recirculation,
- Monitoring,
- Labor, and
- Miscellaneous.

For each phase of work, the estimated number of pore volume displacements (PVDs) required to complete that phase is provided in the attachment. The tables also provide the assumptions and unit prices for all the work necessary to complete each phase of work for the first five wellfield modules. A summary sheet is provided showing the total costs for each phase, followed by detailed calculation sheets to show how the total costs were derived. For the first five wellfield modules, the PVDs of water to be handled and the aquifer restoration costs are estimated to be as follows:

Item	<u>PVDs</u>	<u>Cost</u>
Groundwater sweep	0.5	\$ 52,669.28
RO with permeate injection	7.0	\$ 521,579.74
Groundwater recirculation	1.0	\$ 12,613.01
Monitoring		\$ 94,500.00
Labor		\$1,943,550.00
Miscellaneous		<u>\$ 241,500.00</u>
Total for groundwater restoration	8.5	\$2,866,412.03

Restoration progress is typically measured on the basis of the number of PVDs processed during each phase of groundwater restoration. A pore volume is a term used by the ISR industry to define an indirect measurement of a unit volume of aquifer affected by ISR recovery or restoration (ISR GEIS, NRC 2009). This report distinguishes between the *in-situ* pore volume (PV) and the pore volume displacement (PVD), which is used to describe the volume of water displaced during ISR uranium recovery and aquifer restoration. Following industry standard, Strata proposes to calculate a PVD as follows:

PVD = thickness x wellfield area x porosity x flare x conversion factor

The **thickness** is the average completion thickness for the recovery and injection wells. Based on exploration drilling, the ore zone thickness ranges from 5 to 30 feet and averages approximately 9 feet across the proposed project area. The average completion thickness is typically about 20% greater than the average ore zone thickness and is expected to average approximately 11 feet. This method of calculation is consistent with currently permitted and operating ISR production facilities (COGEMA 2008, CBR 2000).

The **wellfield area** is the surficial area of the injection and recovery well patterns for each wellfield module. Based on the delineation of recoverable

resources within the proposed project area, the average area per wellfield module is estimated to be 248,000 square feet.

The **porosity** or pore space is defined as the collective open spaces of the formation or a measure of the amount of liquid or gas that may be absorbed or produced by a particular formation (ISR GEIS). The porosity of the ore zone within the proposed project area was determined by laboratory analysis of core samples collected during exploration drilling. The porosity is estimated to average 34% across the proposed project area.

The **flare** is a proportionality factor that estimates the amount of aquifer water outside of the pore volume that has been affected by lixiviant flow during the recovery phase (GEIS). Flare estimates usually include a horizontal and vertical flare factor. The horizontal flare is the volume of water affected by lixiviant outside the edge of the wellfield pattern. The vertical flare is the volume of water affected by lixiviant above and below the completion interval. Strata estimates the horizontal flare at 35% and the vertical flare at 20%. This is consistent with other ISRs as described in TR Section 6.1.6. The horizontal flare estimate is also supported by the results and simulations presented in the groundwater model report as described in TR Addendum 2.7-H.

An estimate of the PVD of a typical wellfield module is calculated as follows, where 7.48 is the conversion factor for cubic feet to gallons of water:

PVD = 11.0 feet x 248,000 ft² x 0.34 x 1.62 x 7.48 = 11.2 million gallons

The duration of the aquifer restoration phase was based on the processing and circulation of 8.5 pore volumes of groundwater at the liquid processing rates specified in the calculation work sheets for each phase in Attachment RAP-2(A). The financial assurance will be maintained at this level until the number of pore volumes required to satisfactorily complete each phase has been demonstrated.

Strata will adjust the financial assurance budget for aquifer restoration during each annual update review to reflect experience gained from actual

operation. Because the restoration equipment such as wellfield pumps, lined retention ponds, the deep disposal wells, the RO units, laboratory equipment, trucks, and field equipment will have been incurred for production process operations, they are considered operational capital and are not included as capital requirements in any of the RAP budget items. NRC will be able to verify the availability of the restoration equipment during routine inspections.

2.2 Description of Work

The first stage of aquifer restoration is groundwater sweep, in which groundwater is pumped from the wellfield module with no reinjection. This causes water from the formation surrounding the wellfield module to sweep through the wellfield toward the recovery wells. Based on the anticipated aquifer restoration schedule (refer to S-1 in Attachment RAP-3), during most aquifer restoration normal operations, when some wellfield modules are undergoing groundwater sweep while others are in RO treatment with permeate injection, the water removed from the groundwater sweep is taken to the RO units (see below) and the purified water (RO permeate) is reinjected into the wellfield module(s) undergoing RO treatment with permeate injection. The brine from the RO units is taken to the lined retention ponds and then to a deep disposal well. For the first wellfield module undergoing groundwater sweep, it is assumed there are no wells concurrently in RO treatment with permeate injection. Thus, the groundwater from the groundwater sweep will be taken to the RO units, the high-quality permeate will be discharged (assuming a temporary WYPDES permit can be obtained) and the brine will be taken to the deep disposal wells. It is estimated that the groundwater sweep will remove about 0.5 PVD from the wellfield at a rate of 75 gpm per wellfield module. Only one wellfield will typically be in this phase of restoration at one time. The duration of the sweep will be about two months per module.

RO is a water treatment process whereby the majority of dissolved ions, which are too large to pass through a filter that passes pure water molecules, are concentrated into brine. The product water that passes through the filter

typically meets drinking water standards and during most restoration activities is reinjected back into the wellfield. This reinjection of relatively pure water mixes with formation water and helps bring the quality of the underground solutions toward baseline quality. During restoration the brine is pumped to a surge tank or lined retention pond to level out flow rates and then pumped to one of the disposal wells. Groundwater recovered from a depleted portion of the ore zone will be treated with an antiscalant and/or sulfuric acid to prevent fouling; these are the only pretreatment chemicals budgeted. The water will also pass through a pre-filtration system for particulate removal. To achieve RO purification, the pretreated solution is pressurized and directed to the first step of a two-stage RO process. Approximately 70 percent of the total feed volume will be converted to product water in the first stage. The brine water of the first stage will then act as the feed for the second stage, which yields an overall permeate recovery rate of approximately 85 percent. The RO equipment is sized to operate at a nominal capacity of 1,100 gpm. This is sufficient to treat the approximately 515 gpm from each of two modules typically in the RO treatment with permeate injection phase and one module in the groundwater sweep phase. It is estimated that each module will require RO treatment with permeate injection for about 4 months. With two modules at a time undergoing RO treatment with permeate injection for a 4-month period, the time to sequentially complete this process for the five initial wellfield modules will be about 12 months. The total time for groundwater sweep plus RO treatment with permeate injection is anticipated to be 14 months (refer to reference S-1 in Attachment RAP-3).

The third phase of aquifer restoration is groundwater recirculation, which begins after completion of the RO treatment with permeate injection phase. In this phase, water from the production zone will be pumped from recovery wells and recirculated into injection wells in the same module. This recirculation will homogenize the groundwater and help reduce the risk of "hot spots," or areas of unusually high concentrations of dissolved constituents. The only treatment that will occur during recirculation will be filtration and/or

uranium/vanadium removal. It is expected that one PVD will be removed from the wellfield during this phase, at a rate of 300 gpm per module. The total duration of active aquifer restoration (groundwater sweep, RO treatment with permeate injection, and groundwater recirculation) is estimated to be 15 months for the first five wellfield modules.

There will be up to five deep disposal wells at the Ross ISR Project used for disposal of brine and any other waste water that does not meet criteria for discharge. However, only three deep disposal wells are anticipated to be installed during the first year of licensed activities. The capital costs will have been borne by Strata during construction of the plant facilities, but there will be operating and maintenance costs and costs for antiscalant and corrosion inhibitors. The lined retention ponds will be used to store the water until it is ready for deep well disposal. Ponds will have excess capacity to handle variations in water production, since the capacity of each deep disposal well will be relatively fixed by formation characteristics.

The final step in aquifer restoration will be the stability monitoring phase, which will be used to ensure that chemical species of concern do not increase in concentration subsequent to restoration. The stability monitoring phase is described in Section 6.1.2.5 of the TR and includes well sampling, data analysis and reporting. If the stability monitoring indicates that one or more dissolved parameters in the restored wellfield is trending above the target restoration value (TRV) for that parameter, it may be necessary to repeat one or more of the active restoration phases (groundwater sweep, RO with reinjection, or recirculation).

3. Facilities Area Decommissioning and Reclamation

Following wellfield restoration and stability monitoring, when it is certain that the water treatment equipment is no longer needed, reclamation can begin on the surface facilities. Procedures are fully described in Sections 6.2 and 6.3 of the TR. Detailed cost estimates for the facilities area decommissioning and

reclamation are provided in Attachment RAP-2(B). The following tabulation shows a summary of the major cost items for this phase of work.

Item		<u>Cost</u>
Buildings	\$	411,373.56
Equipment	\$	516,538.25
Concrete	\$	860,964.28
Ponds	\$	170,195.09
Earthwork	\$	385,618.32
Total Facilities Reclamation Cost	\$2	,344,689.50

3.1 Buildings

Structures and equipment will be decontaminated or deposited at an NRC or agreement state approved waste facility site. Details regarding disposal of structures and equipment are discussed in Section 6.3 of the TR. Buildings CPP. be removed include the to chemical storage building, warehouse/maintenance building, administration building, and security building. Decontamination of salvageable building materials, equipment, pipe, and other materials to be released for unrestricted use will be accomplished by completing a preliminary radiological survey to determine the location and extent of the contamination and to identify any hazards as described in Section 6.3.3 of the TR. Processing and water treatment equipment, including tanks, filters, IX columns, pipes, and pumps, will be prepared, including decontamination if necessary, for use at another location or dismantled and disposed of in accordance with applicable regulations. Materials contaminated with other industrial constituents will be disposed of at an appropriately licensed facility. Decontaminated and non-contaminated materials will be removed for salvage or disposed of at an appropriately licensed solid waste facility. Structures will be decontaminated, if necessary, and moved to a new location and salvaged or disposed at an appropriately licensed solid waste facility. Concrete flooring, foundations, and foundation materials will be decontaminated, if necessary, broken up, and disposed of at an appropriately licensed facility.

3.2 Ponds

Work required to reclaim the ponds will include brine disposal in the deep disposal wells, removal of the liner and brine residue to a licensed 11.e(2) disposal site, disposal of all non-11.e(2) solid waste from the leak detection piping to an approved landfill, regrading to restore original topography, topsoil replacement and revegetation. This work is described in Section 6.2 of the TR and the detailed quantities and unit prices used to estimate the reclamation costs are provided in Attachment RAP-2(B).

3.2 Earthwork

After the buildings and ponds are demolished and removed, the entire site will be regraded to restore the original topography, topsoil will be replaced to approximate its original depth, and the area will be regraded. Earthwork costs to complete the regrading of the CPP, parking areas, and access roads are provided in Attachment RAP-2(B). The work is described in detail in Section 6.2 of the TR.

3.3 Containment Barrier Wall

The containment barrier wall (CBW) surrounding the CPP will be reclaimed to the extent necessary to restore the flow pattern of shallow groundwater. Reclamation of this wall will be accomplished by creating a series of breaches, also known as finger drains, along the up-gradient and down-gradient reaches of the CBW. A "one-pass" trencher, very similar to that used to construct the CBW, will be utilized to install the finger drains. Each finger drain will consist of a 1.5 ft wide by ~25 ft long trench that is cut through the CBW at a right angle and to a depth that is ~2 ft below the lowest historical ground water level. During the "one-pass" operation, gravel will be placed in the trench from the bottom to a point ~2 ft above the highest recorded ground water level such that a highly permeable flow path is created through the CBW. The remaining trench will be backfilled with topsoil and seeded.

This method of CBW reclamation was selected as a means of effectively restoring the ground water flow system in the CPP area, while minimizing surface and environmental disturbance. The cost estimate for this phase of work is included in Attachment RAP-2(B).

4. Wellfield Equipment Removal and Disposal

Decommissioning and reclamation of the wellfields will include removal of the module buildings and all pipes and utilities connecting the wells to the module buildings and the CPP, shredding or chipping the solid materials to reduce the volume, and disposing of these materials in an approved municipal landfill or licensed 11e.(2) waste site as appropriate, and reclaiming the surface as described for the other surface facilities. The unit quantities and prices for each item of work in this task are included in Attachment RAP-2(C). The costs for this phase of work are summarized as follows:

Item	Cost
Wellfield piping	\$1,480,069.23
Module buildings	\$ 80,643.90
Valve manholes	\$ 53,560.40
Wellheads	\$ 14,910.00
Access roads	<u>\$ 24,239.74</u>
Total wellfield reclamation cost	\$1,653,423.27

5. Well Abandonment

All injection, recovery and monitor wells will be cemented from total depth to the surface as described in TR Addenda 2.6-E and 4.2-A. This work includes reclamation and abandonment of the 450 wellfield wells, 162 monitor wells and the 3 deep disposal wells that will be constructed during development of the initial five wellfield modules. The unit quantities and prices for each item of work in this task are included in Attachment RAP-2(D). The costs for this phase of work are summarized as follows:

Item	<u>Cost</u>
Recovery, injection and monitor wells	\$ 717,931.08
Deep disposal wells	<u>\$ 312,330.00</u>
Total well abandonment cost	\$1,030,261.08

6. Radiological Surveys

During equipment decontamination, smear samples of building and equipment surfaces will be collected and analyzed for radiological contamination. The results of these samples will drive decontamination efforts. Following removal of all structures and regrading of the site to approximate original contours, and before topsoil is spread on the regraded area, a gamma survey and soil sampling will be conducted as described in Section 6.4 of the TR. Soils will be cleaned up in accordance with the requirements of 10 CFR Part 40, Appendix A, including consideration of ALARA goals and the chemical toxicity of uranium. The proposed limits and ALARA goals for cleanup of soils are summarized in section 6.4-3 of the TR. Any areas which do not meet these limits will be remediated by removing contaminated soils to an appropriately licensed site and regraded. This process will be repeated until all sites meet the ALARA goals for cleanup. The unit costs and areas subject to these surveys are provided in Attachment RAP-2(E). The total cost for this item of work is estimated to be \$37,857.50.

7. Revegetation

At the completion of the previous tasks, and after topsoil has been spread across all regraded areas, all of the disturbed lands will be seeded with vegetation species that will return the lands to their pre-project conditions. The surface reclamation plan goals will be to return the land to equal or better condition than existed prior to uranium recovery, thus making it available for "unrestricted use." The reclaimed land will be capable of supporting livestock grazing, dry land farming and wildlife habitat. Baseline soils, vegetation, and radiological data will be used to guide the reclamation activities. Unit prices and the area to be revegetated are provided in Attachment RAP-2(F). The estimated cost to revegetate the area is \$66,000.

8. Miscellaneous Reclamation Activities

Costs for miscellaneous reclamation activities not covered in the preceding sections are provided in Attachment RAP-2(G) and are summarized as follows:

Item		<u>Cost</u>
Fence removal	\$	36,361.62
Overhead power line removal	\$	0.00
Buried electrical line removal	\$	89,100.00
Buried gas line removal	\$	49,686.00
Transformer removal and disposal	\$	14,080.00
Surface water monitoring sta. removal	\$	7,035.60
Air quality/met. sta. removal	\$	6,205.36
Culvert removal	\$	5,613.56
Chipper/shredder rental/operation	<u>\$</u>	60,000.00
Total miscellaneous costs	\$2	268,082.14

Average wellfield module area	248,000	sq-ft	Refer to RAP text
Average wellfield module area	5.7	ac	Calculated
Average completed thickness	11	ft	Refer to RAP text
Affected volume			
Vertical flare factor	20%		Refer to RAP text
Horizontal flare factor	35%		Refer to RAP text
Porosity	34%		Refer to RAP text
Gallons per cubic foot	7.48		Conversion factor
Gallons per pore volume displacement (PVD)	11,239,316	gal	Calculated
Total number of wellfield modules	5		Refer to RAP text
Number of injection, recovery, and monitor wells			
Average recovery wells per module	36		Preliminary wellfield design
Average injection wells per module	54		1.5 injection wells: 1 recovery well
Average recovery/injection wells per module	90		Calculated
Total recovery/injection wells per 5 modules	450		Calculated
			Assumes all monitor wells will be installed for both
Monitor wells (total all modules)	162		mine units
Total recovery/injection/monitor wells	612		Calculated
Average well depth	500	ft	TR Table 6.1-7 (OZ depth = 410-700 ft)

GROUNDWATER SWEEP COST ESTIMATE PE	ROUNDWATER SWEEP COST ESTIMATE PER MODULE								
Operating Assumptions			-	References					
Flow rate			gpm	TR Table 6.1-4					
PVDs required		0.5	PVD	Refer to RAP text					
Total groundwater sweep volume		5,619,658		Calculated					
Total groundwater sweep volume		5,620	kgal	Calculated					
Duration of Groundwater Sweep									
Minutes		74,929	min	Calculated					
Days		52	days	Calculated					
Recovery Well Pumping Costs	<u> </u>			· · · · · · · · · · · · · · · · · · ·					
Average flow rate per pump	 	17	gpm	Estimated average recovery rate based on aquifer tests					
Number of pumps required		5		Calculated					
Power input per pump		4.0	kW	Reference P-1					
Electrical requirement	1	20.0	kW	Calculated					
Electrical consumption		24,976	kWh	Calculated					
Power cost	\$	0.04	/kWh	Tiered rate is \$0.03 to \$0.04 per PRECorp					
Total Recovery Well Pumping Cost	\$	999.05		· · · · · · · · · · · · · · · · · · ·					
Recovery Booster Pumps									
Average flow		75	gpm						
Electrical requirement			kW	Reference P-2; reduced by 75% due to muc lower flow rate					
Electrical consumption		6,244	kWh	Calculated					
Power cost	\$	0.04	/kWh	Tiered rate is \$0.03 to \$0.04 per PRECorp					
Total Recovery Booster Pumping Cost	\$	249.76							
Reverse Osmosis Treatment									
2-Stage RO treatment cost	\$	0.88	/kgal	Reference RO-1					
Total RO Treatment Cost	\$	4,945.60							
Permeate Disposal		• • •							
Permeate volume after Stage 1 RO		3,934	koal	70% recovery (TR Fig. 3.1-13)					
Permeate volume after Stage 2 RO		4,777		50% recovery (TR Fig. 3.1-13)					
Excess permeate Module 1*		100%	<u> </u>						
Excess permeate Modules 2-5*		0%

*From WDEQ/LQD Guideline 12, Standardized Reclamation Performance Bond Format and Cost Calculation Methods, November 2010 Subject: SULFURIC AND ANTI-SCALENT From: JRaffelson@brenntag.com Date: Thu, 30 Dec 2010 15:10:46 -0700 To: jfritz@wwcengineering.com CC: bfjelstad@brenntag.com, JSTALEY@brenntag.com

Jack,

I was able to get a price for the sulfuric acid. We will quote \$327.50/Ton delivered to the mine site. I wasn't able to get a price for the anti-scalent as we don't have enough information to quote that yet.

If you have any questions, please give me a call.

Moorcroft Landfill

MOORCROFT LANDFILL:

The Moorcroft Landfill is located approximately 5 miles east of Moorcroft off Interstate 90 on the Wind Creek exit, then 1 mile north. The Summer hours are:

TUESDAY, WEDNESDAY & FRIDAY:1:00 pm - 7:00 pmSATURDAY:11:00 am - 7:00 pm

LANDFILL RATES:

ALL GARBAGE HAULED TO THE MOORCROFT LANDFILL WILL BE CHARGED \$2.84 PER 100 POUNDS WITH A MINIMUM \$5.00 FEE.

All vehicles entering the landfill must stop at the landfill scale building to receive dumping instructions. All vehicles leaving the landfill must stop at the office to pay for the load.

ALL VEHICLES MUST WEIGH IN AND OUT EVERY TRIP.

All loads must be secured during transport. An additional fee of \$15.00 will be assessed for dumping of loads which arrive unsecured.

(139,392 Ft ² /Hour)/(43,560 Ft ² /Acre)	3.2 Acres/Hour	
(3.2 Acres/Hour)x(0.83 Efficiency Factor)	2.66 Acres/Hour	
Operating Costs		
(\$182.49/Hour)/(2.66 Acres/Hour)	\$68.61 Per Acre	

Appendix H Cost Estimates for Handling Wire Fencing and Electrical Power Lines

FENCI	FENCING	
Construction 4-Strand Barbed	Overall Average - \$1.87/LF	Wyoming Highway Department Weighted Average Bid Prices, 2009
Removal	Overall Average - \$0.31/LF	Wyoming Highway Department, Average Bid Prices, 2009
	Power Line Removal	
Distribution Lines: Transmission Lines:	No Charge No Charge	From: Tri-County Electric From: Tri-County Electric

Note: Cost estimates for power line removal are based on phone contact with Tri-County Electric. Distribution lines are owned by Tri-County Electric and would be removed upon request at no charge by Tri-County Electric. Transmission lines (lines which go from the main metering point to various electrical substations and are not owned by Tri-County Electric) would be removed by Tri-County Electric at no cost for their salvage value.

Appendix I Cost Estimate for Ripping Asphalt Using a Caterpillar D9R Dozer

	INPUT, UNIT AS INDICATED	COMMENT/ SOURCE
Caterpillar D9R Dozer With 3 Shank Ripper	·····	
Speed in Miles Per Hour	1 Mile/Hour	СРН 40
Width of Ripping Pass	3 Feet	СРН 40
Feet Per Mile	5,280 Feet	
Square Feet Per Acre	43,560 Sq. Ft.	
Operating Efficiency Factor 50 Min./Hr.	0.83 %	СРН 40
Operating Costs	\$160.66 Per Hour	100% of E-W
Labor Costs	\$40.92 Per Hour	WYDOT-WDD
Supervision Labor Costs	\$5.74 Per Hour	1/8 of WYDOT-WDD
Supervisor Transportation	\$2.84 Per Hour	1/8 of 100% of E-W
Total Hourly Costs	\$210.16	
Ripper Productivity	······	
(1.0 Mile/Hour)x(5,280 Ft./Mile)x(3 Ft./Pass)	15,840 Ft ² /Hour	
(15,840 Ft ² /Hour)/(43,560 Ft ² /Acre)	0.36 Acres/Hour	
(0.36 Acres/Hour)x(0.83 Efficiency Factor)	0.299 Acres/Hour	
Operating Costs		
(\$210.16/Hour)/(0.299 Acres/Hour)	\$702.87 Per Acre	

Asphalt Ripping (3"-4" Mat)

Appendix J Cost Estimate for Culvert Removal

Culvert Removal		
	INPUT, UNIT AS INDICATED	COMMENT/ SOURCE
Average Length of CMP Section	20 Feet	
Assumed Culvert Diameter	48 Inches	
Time to Cut One Band	10 Minutes	
Time to Load One 20' Section (2 People)	20 Minutes	
Average Haul, Dump and Return Time	30 Minutes	
Number of Sections of CMP Per Load	2	
Operating Efficiency Factor 50 Min./Hr.	0.83 %	
Labor	\$40.92 Per Hour	WYDOT-WDD
Dump Truck (10-12 yd ³)	\$64.33 Per Hour	100% of E-W
Caterpillar 980G Front-End Loader	\$106.06 Per Hour	100% of E-W
Cost to Remove One 20' Section of CMP		
Labor Cost x Time to Cut One Band	\$6.82	
+ ((Labor Cost x 2) + FEL Cost) x Time to Load 1 Section	\$62.57	
+ (Labor Cost + Truck Cost) x Haul Time	\$52.63	
Cost to Remove One 20' Section of CMP (not including dirt removal)	. \$122.02	

Note: Culverts may be smashed and buried in place when feasible.

Appendix K Cost Estimates for Demolition and Removal of Railroad Spurs and Facilities Buildings

TASK	COST PER UNIT (\$)	REGIONAL COST ADJUSTMENT ¹	ADJUSTED COST PER UNIT (\$)
Track Removal	8.57/lin. ft.	95.7%	8.20/lin. ft.
Ballast Removal	4.12/cy	95.7%	3.94/cy
Building Demolition and Disposal ^{1, 2, 3}			
Mixture of Types	$0.26/ft^{3}$	95.7%	0.249/ft ³
Explosive Demolition, Concrete or Steel	0.24/ft ³	95.7%	0.230/ft ³
Disposal (Average)	8.48/cy	95.7%	8.12/cy
City Landfill Dump Charges	\$100.00/ton	95.7%	\$95.70/ton
Concrete Footings and Foundations	· ·		
6" Thick With Rebar	5.28sq. ft.	95.7%	5.05/sq. ft.
Footings - 2' Thick, 3' Wide	18.95/lin. ft.	95.7%	18.14/lin. ft.
Concrete Disposal On-Site	7.28/cy	95.7%	6.97/cy

Note: Operators may also provide a verifiable cost estimate from a qualified contractor for these demolition tasks. This estimate may be used for one to three consecutive years, assuming few substantial changes in mine facilities.

- ¹ Costs From: 2011 Means Heavy Construction Cost Data & Building Construction Cost Data
- ² Based on Total Volume of Building, does not include disposal cost
- ³ Based on Concrete Structures Volume Only, does not include disposal cost

Appendix N

Cost Estimates for Demolition and Removal of One "Standard" Surface Water Monitoring Station

	INPUT, UNIT AS INDICATED	COMMENT/ SOURCE
Assumed Time to Remove One Station	8 Hours	
Labor	\$40.92 Per Hour	WYDOT-WDD
Dump Truck (10-12 yd ³)	\$64.33 Per Hour	100% of E-W
Caterpillar 980G Front-End Loader	\$106.06 Per Hour	100% of E-W
Cost to Remove One Surface Water Station = (Labor Cost x Time to Remove Station) + (Labor Cost + Truck Cost) x Time to Remove Station + (Labor Cost + Loader Cost) x Time to Remove Station	\$327.36 \$842.00 \$1,175.84	
Cost to Remove One Surface Water Station =	\$2,345.20	

Appendix O Cost Estimates for Demolition and Removal of One "Standard" Meteorological or Air Quality Monitoring Site

	INPUT, UNIT AS INDICATED	COMMENT/ SOURCE
Assumed Time to Remove One Station	4 Hours	
Labor	\$40.92 Per Hour	WYDOT-WDD
Dump Truck (10-12 yd ³)	\$64.33 Per Hour	100% of E-W
Caterpillar 430D (4WD) Backhoe Loader	\$31.53 Per Hour	100% of E-W
Cost to Remove One Meteorological or Air Quality Station = (Labor Cost x Time to Remove Station) + (Labor Cost + Truck Cost) x Time to Remove Station + (Labor Cost + Loader Cost) x Time to Remove Station	\$163.68 \$421.00 \$301.80	
Cost to Remove One Meteorological or Air Quality Station =	\$886.48	

LQD-P

(3.49 Acres/Hour)x(0.83 Efficiency Factor)	2.90 Acres/Hour	
OPERATING COSTS		
(\$182.49/Hour)/(2.90 Acres/Hour)	\$62.93	
	Per Acre	

Name:	Well Pumps
Location:	Inside recovery wells
Purpose:	Deliver recovery solution to the module buildings

Input Data:

Input Data:		Source
Flow rate:	20 gpm	High estimate per well
Inlet pressure:	4 psi	Assumes 10 feet min. water column above pump
Delivery pressure:	10 psi	Estimate of pressure required at delivery point
Maximum lift:	500 ft	Based on average 500 foot well depth
Friction head loss:	85 ft	Calculated as 83.6 ft from recovery well pump to module building
Pump efficiency:	85%	Estimate
Motor efficiency:	85%	Estimate
Specific weight:	62.4 lb/ft ³	Typical of water

Calculations:

$hn = \frac{Q\gamma H}{Q\gamma H}$	P _	hp
$np = 550e_p$	1 –	e _m

hp	=	Pump power input (hp)
Q	=	Flow rate (cfs)
γ	=	Specific weight of fluid (lb/ft ³)
ep	=	Pump efficiency
Р	=	Motor power input
e _m	=	Motor efficiency

Pressure head:	14 ft
Friction losses:	85 ft
Elevation head:	500 ft
Total dynamic head:	599 ft
Pump power input:	3.6 hp
Motor power input:	4.2 hp
	3.1 kW
For estimate	4.0 kW

Name:	Recovery Solution Booster Pumps
Location:	Inside module buildings
Purpose:	Deliver recovery solution from the recovery wells to the CPP

Input Data:

Input Data:		Source
Flow rate:	800 gpm	High estimate per module based on production
Inlet pressure:	10 psi	Residual pressure from recovery well pumps
Delivery pressure:	50 psi	High estimate of pressure required at delivery point
Pump elevation:	4200 ft	Typical module building elevation
Delivery elevation:	4150 ft	High estimate of final CPP elevation
Friction head loss:	50 ft	Calculated as 43 ft from Module 1 to CPP
Pump efficiency:	85%	Estimate
Motor efficiency:	85%	Estimate
Specific weight:	62.4 lb/ft ³	Typical of water

Calculations:

$hn = Q\gamma H$	P -	hp
np 550 e_p		<i>e</i> _m

hp	=	Pump power input (hp)
Q	=	Flow rate (cfs)
γ	=	Specific weight of fluid (lb/ft ³)
e _p	· =	Pump efficiency
Р	=	Motor power input
e _m	=	Motor efficiency
sure head:		92 ft

Pressure head:	92 ft
Friction losses:	50 ft
Elevation head:	-50 ft
Total dynamic head:	92 ft
Pump power input:	21.9 hp
Motor power input:	25.8 hp
	19.2 kW
For estimate	20.0 kW

Name:	Injection Booster Pumps
Location:	Inside module buildings
Purpose:	Deliver barren lixiviant to the injection wells during production or permeate during aquifer restoration

Input Data:

Input Data:		Source
Flow rate:	800 gpm	High estimate per module based on production
Inlet pressure:	20 psi	Residual pressure from CPP booster pumps
Delivery pressure:	140 psi	Max. injection pressure at module building (TR Section 3.1.2.3)
Pump efficiency:	85%	Estimate
Motor efficiency:	85%	Estimate
Specific weight:	62.4 lb/ft ³	Typical of water

Calculations:

hn -	QγH	
hp =	$\overline{550e_p}$	

P	=	hp
-		e _m

Where:

hp	=	Pump power input (hp)
Q	=	Flow rate (cfs)
γ	=	Specific weight of fluid (lb/ft ³)
ep	=	Pump efficiency
Р	=	Motor power input
e _m	=	Motor efficiency

Pressure head:	277 ft
Total dynamic head:	277 ft
Pump power input:	65.9 hp
Motor power input:	77.5 hp
	57.8 kW
For estimate	58.0 kW

ŧ,

Name:	CPP Permeate Pur	nps	
Location:	Inside CPP		
Purpose:	Deliver permeate to the module buildings		
Input Data:		Source	
Flow rate:	467.5 gpm	High estimate per module (see TR Figure 3.1-13 and assume 2 modules in RO treatment with permeate injection)	
Inlet pressure:	10 psi	Low estimate of residual pressure after RO	
Delivery pressure:	20 psi	High estimate of pressure required at delivery point	
Pump elevation:	4150 ft	High estimate of final CPP elevation	
Delivery elevation:	4200 ft	Typical module building elevation	
Friction head loss:	50 ft	Calculated as 43 ft from Module 1 to CPP	
Pump efficiency:	85%	Estimate	
Motor efficiency:	85%	Estimate	
Specific weight:	62.4 lb/ft ³	Typical of water	

Calculations:

$hp = Q\gamma H$	Р	 hp
$550e_p$	-	e_m

Where:

hp	=	Pump power input (hp)
Q	=	Flow rate (cfs)
γ	=	Specific weight of fluid (lb/ft ³)
e _p	=	Pump efficiency
Р	=	Motor power input
e _m	=	Motor efficiency
sure head:		23.1 ft

Pressure head:	23.1 ft
Friction losses:	50 ft
Elevation head:	50 ft
Total dynamic head:	123.1 ft
Pump power input:	17.1 hp
Motor power input:	20.1 hp
	15.0 kW
For estimate	15.0 kW

Name:	Restoration RO Prefiltration Pumps
Location:	Inside CPP
Purpose:	Deliver recovery solution to guard column and RO prefiltration

Input Data:

Input Data:		Source		
Flow rate:	1100 gpm	Typical restoration flow from restoration recovery wells (see TR Figure 3.1-13)		
Inlet pressure:	50 psi	Delivery pressure from module buildings		
Delivery pressure:	130 psi	From preliminary RO design by Lyntek		
Pump efficiency:	85%	Estimate		
Motor efficiency:	85%	Estimate		
Specific weight:	62.4 lb/ft ³	Typical of water

Total dynamic head:	4144.6 ft
Pump power input:	61.6 hp
Motor power input:	72.5 hp
	54.1 kW
For estimate	55.0 kW

RO Operation Costs

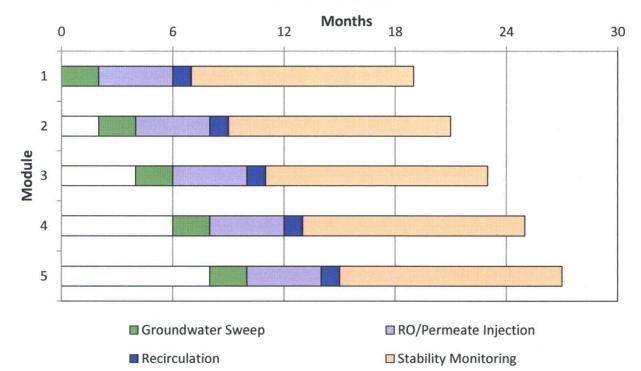

Name:	2-S	tage Restoratio	on RO			
Location:		Inside CPP				
Purpose:		at recovery solut	tion from wellfields during groundwater sweep			
			6			
Input Data:		1100	Source			
Stage 1 RO design feed rate		1100 gpm	See TR Figure 3.1-13			
Stage 2 RO design feed rate		330 gpm	See TR Figure 3.1-14			
Total groundwater sweep volume		28,098 kgal	0.5 PVD x 5 modules			
Total RO with permeate injection volume		393,376 kgal	7.0 PVD x 5 modules			
Total volume treated		421,474 kgal	7.5 PVD x 5 modules			
Months of operation	14 months		See reference S-1; 14 months total groundwater sweep plus RO treatment with permeate injection			
Average monthly Stage 1 feed rate		30,105 kgal/mo				
Average monthly Stage 2 feed rate		9,032 kgal/mo				
Sulfuric Acid (H ₂ SO ₄):						
H_2SO_4 concentration for Stage 1 RO		147 ppm	Modeled using Visual MINTEQ: reduce pH from 8.0 to 7.0			
H_2SO_4 concentration for Stage 2 RO	343 ppm		Modeled using Visual MINTEQ: reduce pH from 8.2 to 7.5			
H_2SO_4 grade		93%	Concentrated sulfuric acid			
H ₂ SO ₄ required for Stage 1 RO		2.59 kgal/mo				
H ₂ SO ₄ required for Stage 2 RO		1.81 kgal/mo	,			
Total H ₂ SO ₄ required		4.40 kgal/mo				
Unit H ₂ SO ₄ cost		327.50 /ton	Quote delivered from Brenntag chemical (see reference C-1)			
Monthly H ₂ SO ₄ cost		11,048 /month				
Monthly H ₂ SO ₄ cost per kgal feed	\$	0.37 /kgal				
Antiscalant:						
Antiscalant concentration for Stage 1 RO		3 ppm	Per recommendation from Avista Technologies			
Anti-scalant concentration for Stage 2 RO		4.4 ppm	Per recommendation from Avista Technologies			
Cost for Stage 1 RO antiscalant per kgal feed	\$	0.07 /kgal	Cost estimate for Vitek 3000 from Avista Technologies			
ost for Stage 2 RO antiscalant per kgal feed		0.10 /kgal	Cost estimate for Vitek 3000 from Avista Technologies			
Monthly Stage 1 RO antiscalant cost	\$	2,047 /month				
Monthly Stage 2 RO antiscalant cost	\$	903 /month				
Monthly antiscalant cost	\$	2,950 /month				
Monthly antiscalant cost per kgal feed	\$	0.10 /kgal				

Average power requirement	53	kW	Reference P-5
Electrical consumption per month	38,669	kWh	Calculated
Power cost	\$	/kWh	From PRECorp
Monthly pre-filtration pumping system cost	\$ 1,546.75		
Monthly cost per kgal feed	\$ 0.05	/kgal	
Pre-Filtration System Operating Costs:			
Monthly cost per kgal feed	\$ 0.01	/kgal	Estimate
Stage 1 RO Feed Pump			
Average power requirement	189	kW	Reference P-6
Electrical consumption per month	137,894	kWh	
Power cost	\$ 0.04	/kWh	From PRECorp
Monthly pre-filtration pumping system cost	\$ 5,515.78		
Monthly cost per kgal feed	\$ 0.18	/kgal	
Stage 2 RO Feed Pump			
Average power requirement	150	kW	Reference P-7
Electrical consumption per month	109,440	kWh	
Power cost	\$ 0.04	/kWh	From PRECorp
Monthly pre-filtration pumping system cost	\$ 4,377.60		
Monthly cost per kgal feed	\$ 0.15	/kgal	
Membranes:			
Monthly membrane cost	\$ 0.02	/kgal	Based on preliminary RO design by Lyntek
