Re: Docket No. 40-6622, License No. SUA-442 - Shirley Basin

Dear Mr. McConnell:

Enclosed please find two copies of the semi-annual ground water monitoring report as required by SUA-442 license condition 47C. This report presents data through the second quarter, 2011; historical data are included in the concentration versus time plots that are required by condition 47C.

Sincerely,

A handwritten signature of R. Mark Owens.

R. Mark Owens
General Manager

1.0 Introduction and Summary of Results

This semi-annual report presents the results of ground-water monitoring and surface-water monitoring through June 2011 for Pathfinder Mines Corporation's Shirley Basin mill and tailings facility. This report is the tenth in the series of semi-annual reports required by NRC License SUA-442, License Condition 47.C.

The following table lists the site standards that are in effect for POC wells NP01 and RPI-19B which are located to the east of the Shirley Basin tailings facility. The tabulation also lists the measured May 2011 concentrations for the POC wells. All of the present concentrations in the POC wells are at levels below detection or are significantly below the corresponding site standards.

TABLE 1. GROUND-WATER PROTECTION STANDARDS AND MAY 2011 WATER-QUALITY DATA FOR POINT-OF-COMPLIANCE WELLS NP01 AND RPI-19B.

CONSTITUENT	POC WELL NP01	WELL NP01	POC WELL RPI-19B	WELL RPI-19B
	SITE STANDARD	MAY 2011	SITE STANDARD	MAY 2011
ARSENIC	0.05	0.003	0.05	0.002
BARIUM	1.00	0.10	1.00	0.10
BERYLLIUM	0.02	<0.01	0.02	<0.01
CADMIUM	0.01	<0.01	0.01	<0.01
CHROMIUM	0.05	<0.05	0.05	<0.05
GROSS ALPHA	15	1.30	15	1.20
LEAD	0.05	<0.001	0.05	<0.001
MOLYBDENUM	0.10	<0.1	0.10	<0.1
NICKEL	0.05	<0.05	0.05	<0.05
RA-226 + RA-228	12.70	3.20	13.76	1.4
SELENIUM	0.158	0.012	0.163	0.003
THORIUM-230	5.53	0.10	5.76	0.03
URANIUM	4.40	1.300	4.45	1.230
CHLORIDE	3275	880	3712	1240
TDS	11529	3610	12641	4260
SULFATE	4612	1000	5056	1000

NOTE: All concentrations in mg/l except for radium, thorium, and gross alpha in pCi/l.

There are generally increasing trends in constituent concentrations for wells in close proximity to the reclaimed tailings. These increasing concentrations are consistent with expectations, although the magnitude of trends in key wells such as the POC wells is somewhat less than predicted and the increases in concentration are lagging predictions. The lagging is due in part to extension of corrective action efforts beyond the original plans, but may also reflect some conservatism in the prediction of seepage migration. The water quality data also reflect significant seasonal recharge effects that cause fairly dramatic swings in constituent concentrations in some wells.

2.0 Piezometric Data

The water-level data collected from 2008 through mid 2011 are presented in Table 2 to provide some indication of recent trends. Figure 1 presents the piezometric surface of the Surficial aquifer in the area between the tailings and Spring Creek. Figure 2 presents plots of the water-level elevation versus time for wells MC-14, NP01, RPI-14, RPI-19B, and RPI-18A. The corresponding water-level elevation or constituent concentration is posted adjacent to the well location on the plan view figures of the area (such as Figure 1). Water-level elevations after 2004 and 2005 have reflected some decay of the ground-water mounds in the area of the recharge lines following discontinuation of the recharge injection operations. Recent water-level elevation changes are more reflective of seasonal

recharge and the piezometric surface appears to be approaching a relatively steady condition with a general gradient from the tailings area to Spring Creek.

3.0 Water-Quality Data

License Condition 47.A requires monitoring of water quality from the POC wells, other selected wells, and from surface water sites for the constituents presented in Table 1. There was insufficient water in well RPI-20A in July 2006, September 2007, and June 2008 to collect a sample.

Figure 3 presents the May 2011 chloride concentrations for the Surficial aquifer and in Spring Creek at the surface water sampling sites. The chloride concentration is greatest at well RPE-10 which is located approximately 1200 feet east of the tailings in the southern portion of the monitoring area. Chloride concentration is moderately elevated at wells closer to the reclaimed tailings, and there is a general increasing trend in wells in the Mine Creek area including RPI-14, RPI-16A, and RPI-18A. There is also an increasing trend in concentration at wells RPI-10 and RPI-21B. Chloride concentration in well MC-14, and in the surface water samples is not significantly elevated over natural levels. Figure 4 presents the plots of chloride concentration versus time for wells MC-14, NP01, RPI-14, RPI-19B, and RPI-18A. Chloride concentration at POC well NP01 increased through early 2009, dropped in mid 2009, and then increased until early 2011. Chloride concentration in POC well RPI-19B has also been somewhat erratic, and this is attributed to seasonal recharge. There has been a general increasing chloride concentration trend in well RPI-19B since early 2007. Figure 5 presents the plots of chloride concentration at surface water sampling locations SW-1A, SC-2 and POE-DS. The chloride concentration at surface water sites is below levels of concern.

Figure 6 presents the May 2011 Ra226 + Ra228 activities for the Surficial aquifer and in Spring Creek at the surface water sampling sites. Measured radium, thorium, and gross alpha activities are typically more erratic than other constituents, and therefore iso-concentration contours are less reliable indicators of the extent of seepage impacts. Figure 7 presents the plots of Ra226 + Ra228 activity versus time for wells MC-14, NP01, RPI-14, RPI-18A and RPI-19B. The greater variability of measured activity for Ra226 + Ra228 is reflected in the plots. Figure 8 presents the plots of Ra226 + Ra228 activities at surface water sampling locations SW-1A, SC-2 and POE-DS.

Figure 9 presents the May 2011 selenium concentrations for the Surficial aquifer and in Spring Creek at the surface water sampling sites. Selenium concentration is slightly greater than general background at wells MC-10, NP01, RPI-10, RPI-16A, RPI-21B and P-6. In general, the selenium concentration is more indicative of natural variability and selenium concentration in residual recharge injection water than a discernable level of seepage impacts. Figure 10 presents the plots of selenium concentration versus time for wells MC-14, NP01, RPI-14, RPI-19B, and RPI-18A. Figure 11 presents the plots of selenium concentration at surface water sampling locations SW-1A, SC-2 and POE-DS.

Figure 12 presents the May 2011 sulfate concentrations for the Surficial aquifer and in Spring Creek at the surface water sampling sites. Sulfate concentrations in well RPI-18A show a significant increase from 2007 to early 2010, then a recent decreasing trend into mid 2011. Concentrations in RPI-20A are showing a somewhat erratic increasing trend. The sulfate concentrations in well RPI-18A are somewhat anomalous and may reflect some mobilization due to seasonal water-level fluctuations. June 2008 sulfate samples for wells MC-14 and P-6 were reanalyzed by the laboratory, and previously reported erroneous values were replaced with corrected values. Figure 13 presents the sulfate concentrations in wells MC-14, NP01, RPI-14, RPI-18A and RPI-19B. Each well except

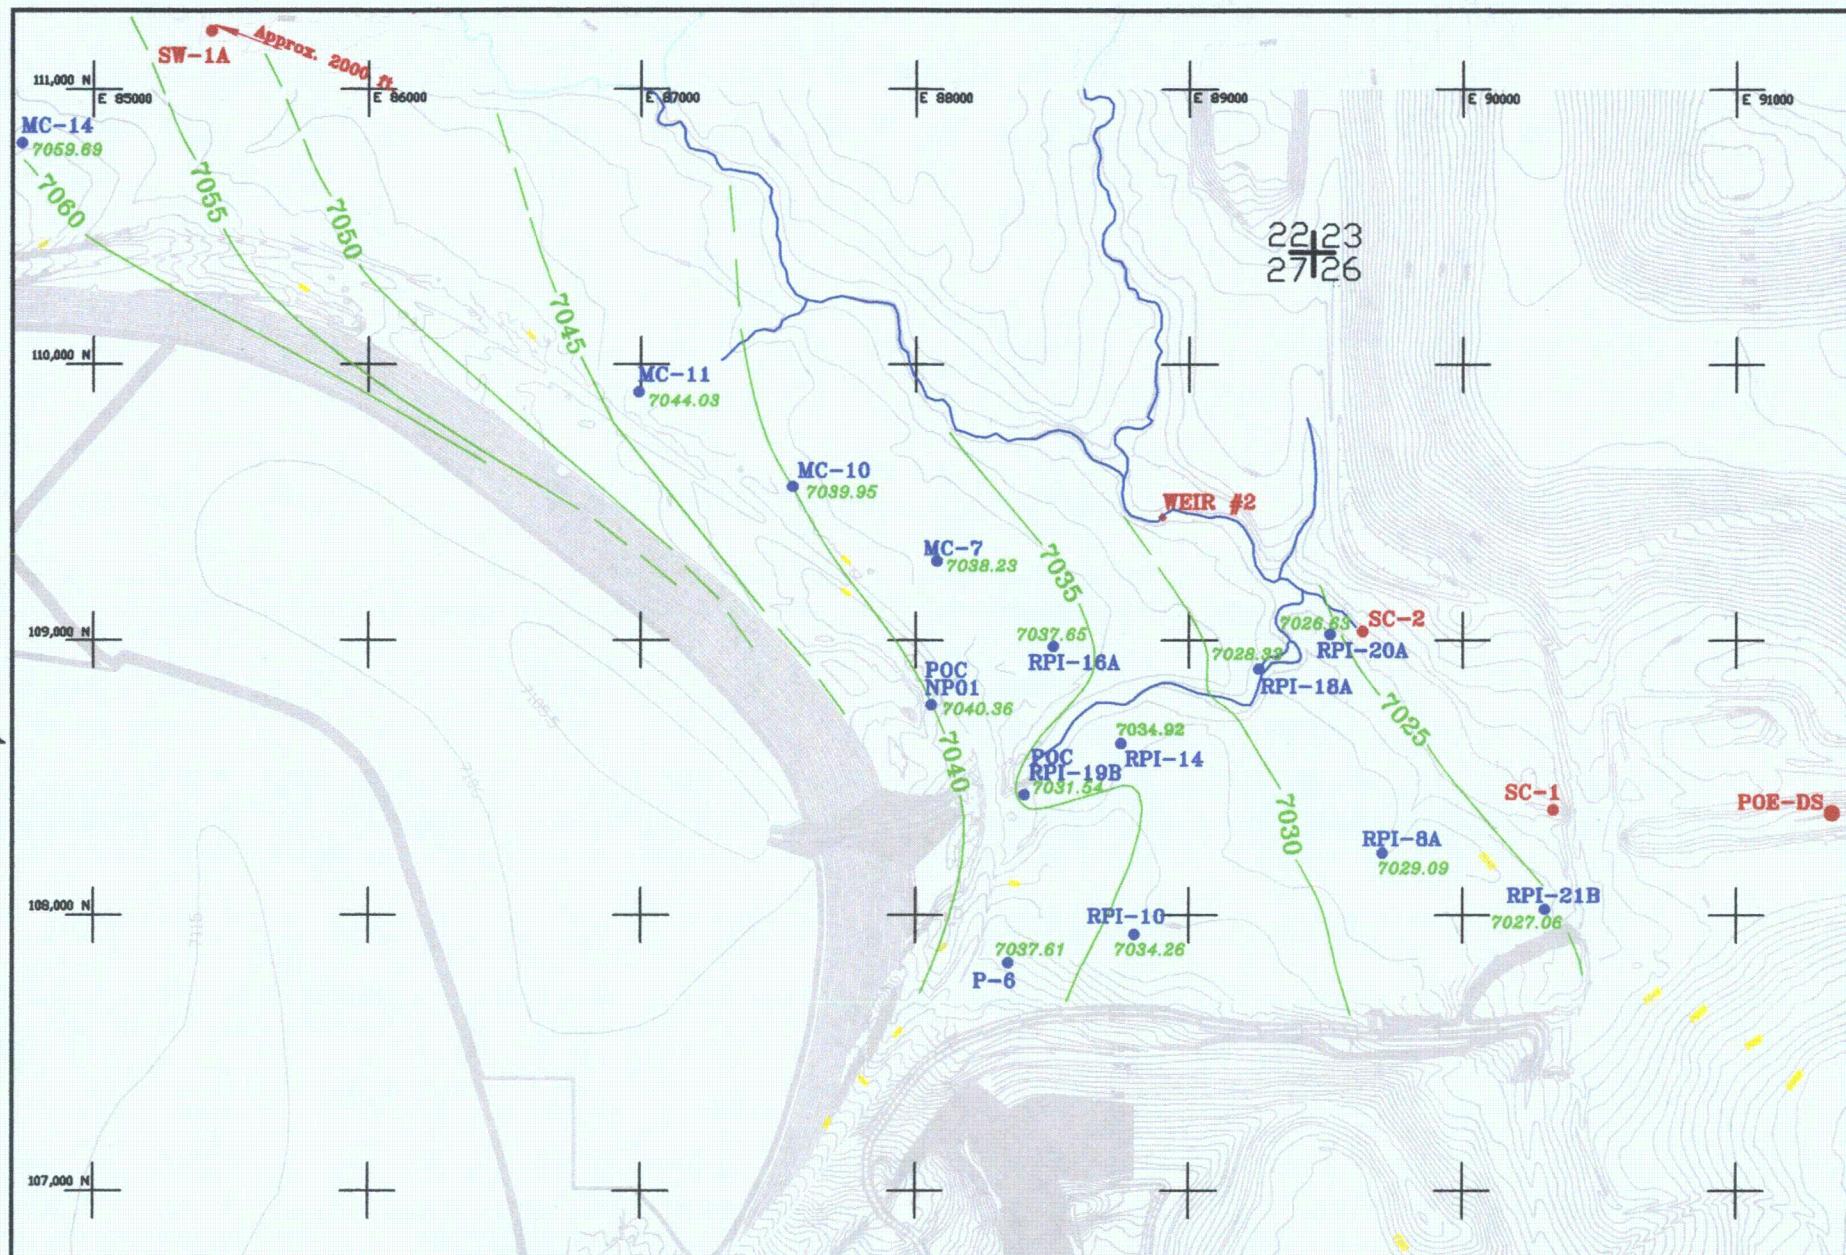

MC-14 has shown a noticeable rising trend since late 2006. Sulfate concentrations at all monitoring wells and surface water sampling locations are below the site standards at the POC wells. Figure 14 presents the plots of sulfate concentration at surface water sampling locations SW-1A, SC-2 and POE-DS.

Figure 15 presents the May 2011 thorium-230 activities for the Surficial aquifer and in Spring Creek at the surface water sampling sites. Thorium-230 activities in ground-water samples and surface-water samples are very near or below the typical detection level. Figure 16 presents the plots of thorium-230 activity versus time for wells MC-14, RPI-14, NP01, RPI-18A and RPI-19B. Figure 17 presents the plots of thorium-230 activity at surface water sampling locations SW-1A, SC-2 and POE-DS. The sample record for upgradient site SW-1A illustrates the variability of thorium-230 activity with occasional spikes interspersed in the typical below detection limit sample activity. Current analytical techniques for thorium-230 activity allow reporting of negative values that indicate levels below detection.

Figure 18 presents the May 2011 TDS concentrations for the Surficial aquifer and in Spring Creek at the surface water sampling sites. Recent TDS concentrations in well RPI-20A reflect the erratic and elevated sulfate concentration in this well since late 2005. Excepting MC-14, TDS concentration in the graphed wells shows an increasing trend for the last four years (see Figure 19). Recent TDS concentration has been erratic in wells RPI-19B and NP01. All TDS concentrations at the monitoring wells and surface water sampling locations are well below the site standards at the POC wells. Figure 20 presents the plots of TDS concentration at surface water sampling locations SW-1A, SC-2 and POE-DS.

Figure 21 presents the May 2011 uranium concentrations for the Surficial aquifer and in Spring Creek at the surface water sampling sites. Uranium concentration for wells NP01, RPI-10, RPI-14, RPI-16A, RPI-18A and RPI-19B has generally increased (see Figure 22) and there have been minor increases or relative stability at other locations. There does appear to be some seasonal recharge effect in wells NP01 and RPI-19B. All uranium concentrations at the monitoring wells and surface water sampling locations are well below the site standards at the POC wells. Figure 23 presents the plots of uranium concentration at surface water sampling locations SW-1A, SC-2 and POE-DS. A small increase in uranium concentration was observed at all three surface water sites including the upgradient site. This small change is not thought to be due to the tailings seepage.

Figure 24 presents concentrations of major constituents and uranium for well P-6. The changes in water quality in well P-6 are reflective of the ongoing seepage from the tailings and the expected impacts on the area where the Corrective Action Program (CAP) had previously served to contain seepage and restore the Surficial aquifer quality. As indicated in Figure 24, chloride concentration at well P-6 increased dramatically through early 2006, but has been relatively steady through mid 2010. Recent chloride values have been more erratic. Uranium concentration also increased dramatically through mid 2006, but appeared to have somewhat stabilized through mid 2011 to levels similar to those in mid 2006. Present constituent concentrations at well P-6 are similar to those that existed prior to significant restoration by the CAP.
