Energy Efficiency & Renewable Energy

Solar Energy Technologies Program

The Prospect for $1/Watt Electricity from Solar

$1/W Workshop
August 10, 2010

John Lushetsky

Program Manager

Solar Energy Technologies Program (SETP)

Department of Energy

Office of Energy Efficiency and Renewable Energy

Disclaimer

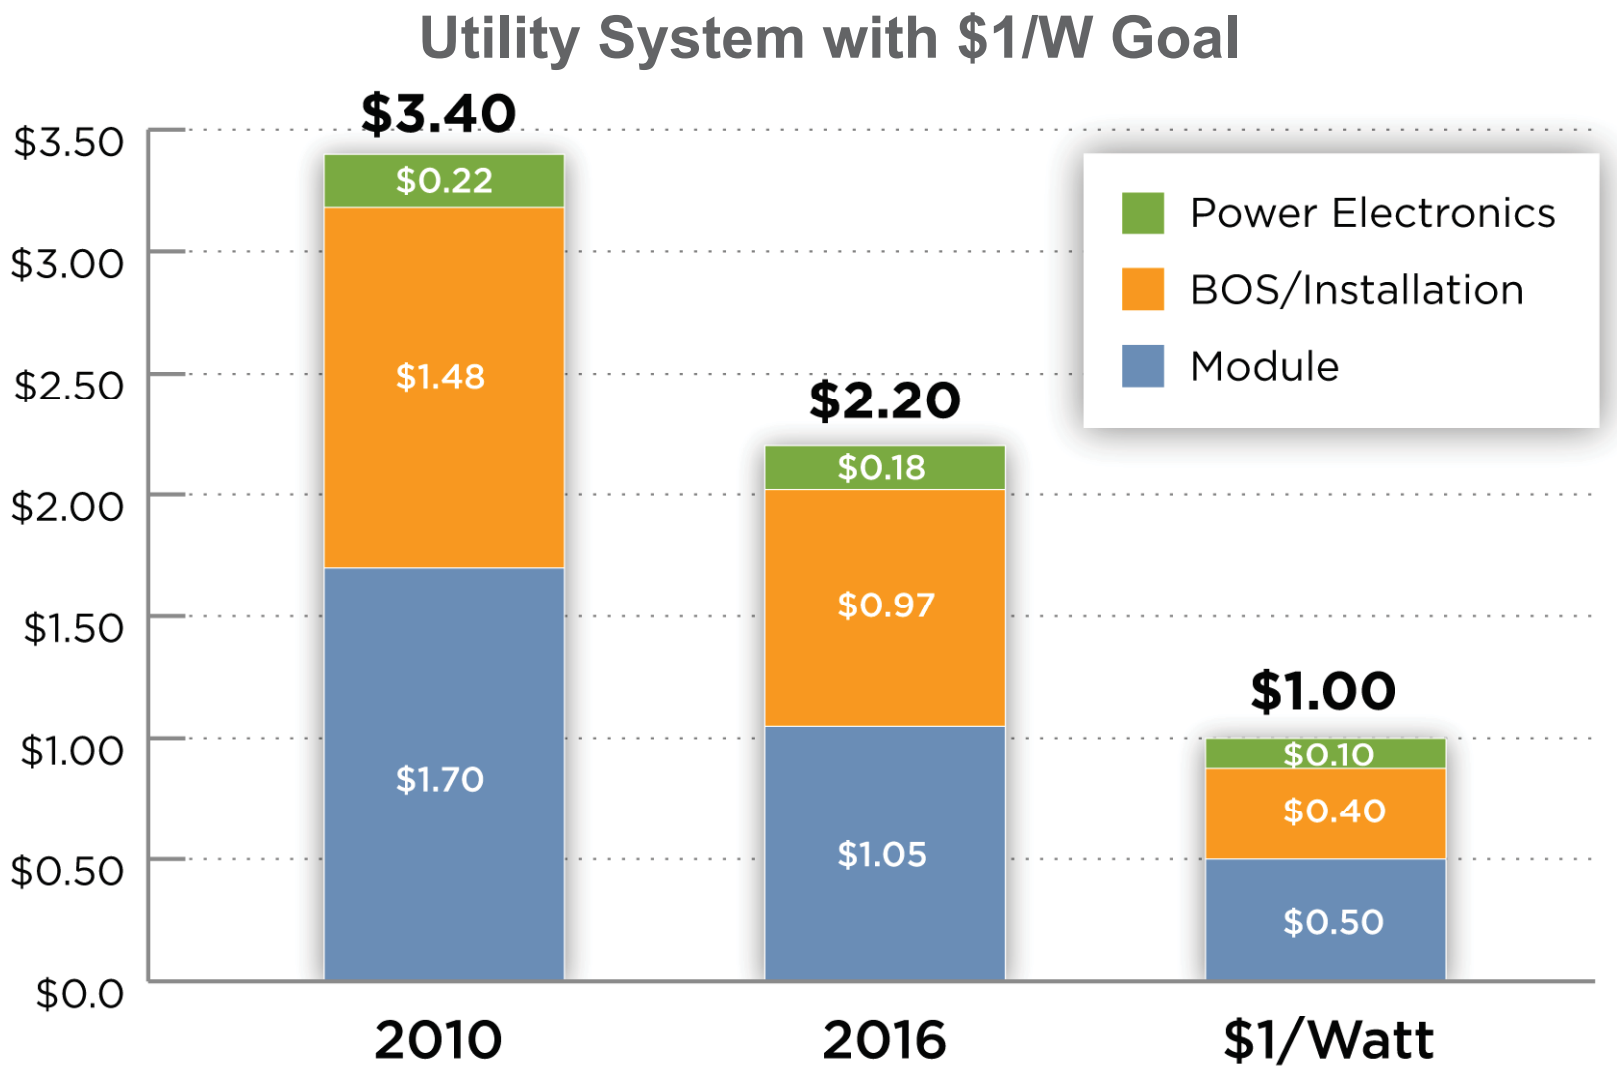
U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy

"It's tough making predictions, especially about the future."

- Several sources

Reaching Cost Reduction Targets will require advances in all PV system components

U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy



Utility PV: LCOE Targets

U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy

Financing Conditions

- Low: 8.2% after-tax WACC
- High: 9.9% after-tax WACC

Geographic Locations

- Phoenix, AZ
- Kansas City, MO
- New York, NY

2015

- With the 30% ITC, PV is broadly competitive with wholesale electricity rates under all conditions
- With the 10% ITC, PV is equal to or below the CA MPR under most conditions and competitive with high wholesale electricity rates under the best insolation and financing conditions

2030

- With the 10% ITC, PV is broadly competitive with wholesale electricity rates under all financing and insolation conditions

	2009	2010	2015 (est.)	2020 (est.)	2030 (est.)
PV LCOE with 30% ITC *	10 - 19	**9 - 16**	5 - 8	N/A	N/A
PV LCOE with 10% ITC *	17 - 29	**14 - 24**	7 - 12	7 - 11	6 - 10
Wholesale Electricity Rates ‡	4 - 8	**3 - 7**	4 - 8	4 - 9	5 - 10
CA Market Price Referent §	10 - 12	**10 - 12**	10 - 13	11 - 13	11 - 13

* Assumes IOU or IPP ownership of PV, and thus the LCOE includes the taxes paid on electricity generated. Includes 5-year MACRS but not state or local incentives. The range in utility PV LCOE is due to different insolation and financing conditions. For a complete list of assumptions, see DOE Solar Cost Targets (2009 – 2030), in process.

‡ The electricity rate range represents one standard deviation below and above the mean U.S. wholesale electricity prices.

§ The 2009 CA MPR includes adjustments by utility for the time of delivery profile of solar (low case: SDG&E, mid case: PG&E, high case: SCE).

Residential PV: LCOE Targets

U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy

Financing Mechanisms

- Home Mortgage (80% financing, 6.0% interest, 30-year term)
- Home Equity Loan (100% financing, 7.75% interest, 15-year term)

Geographic Locations

- Phoenix, AZ
- Kansas City, MO
- New York, NY

2015

- Without the ITC, PV is broadly competitive with residential electricity rates under all financing and insolation conditions

2030

- Without the ITC, PV has levelized costs that are lower than most residential electricity rates

	2009	2010	2015 (est.)	2020 (est.)	2030 (est.)
PV LCOE with 30% ITC *	16 - 25	**15 - 22**	8 - 12	N/A	N/A
PV LCOE without ITC *	23 - 33	**21 - 30**	11 - 15	9 - 13	7 - 10
Residential Electricity Rates‡	8 - 14	**7 - 14**	8 - 15	8 - 15	9 - 18

* No state, local or utility incentives are included. The range in residential PV LCOE is due to different insolation and financing conditions. For a complete list of assumptions, see DOE Solar Cost Targets (2009 – 2030), in process.

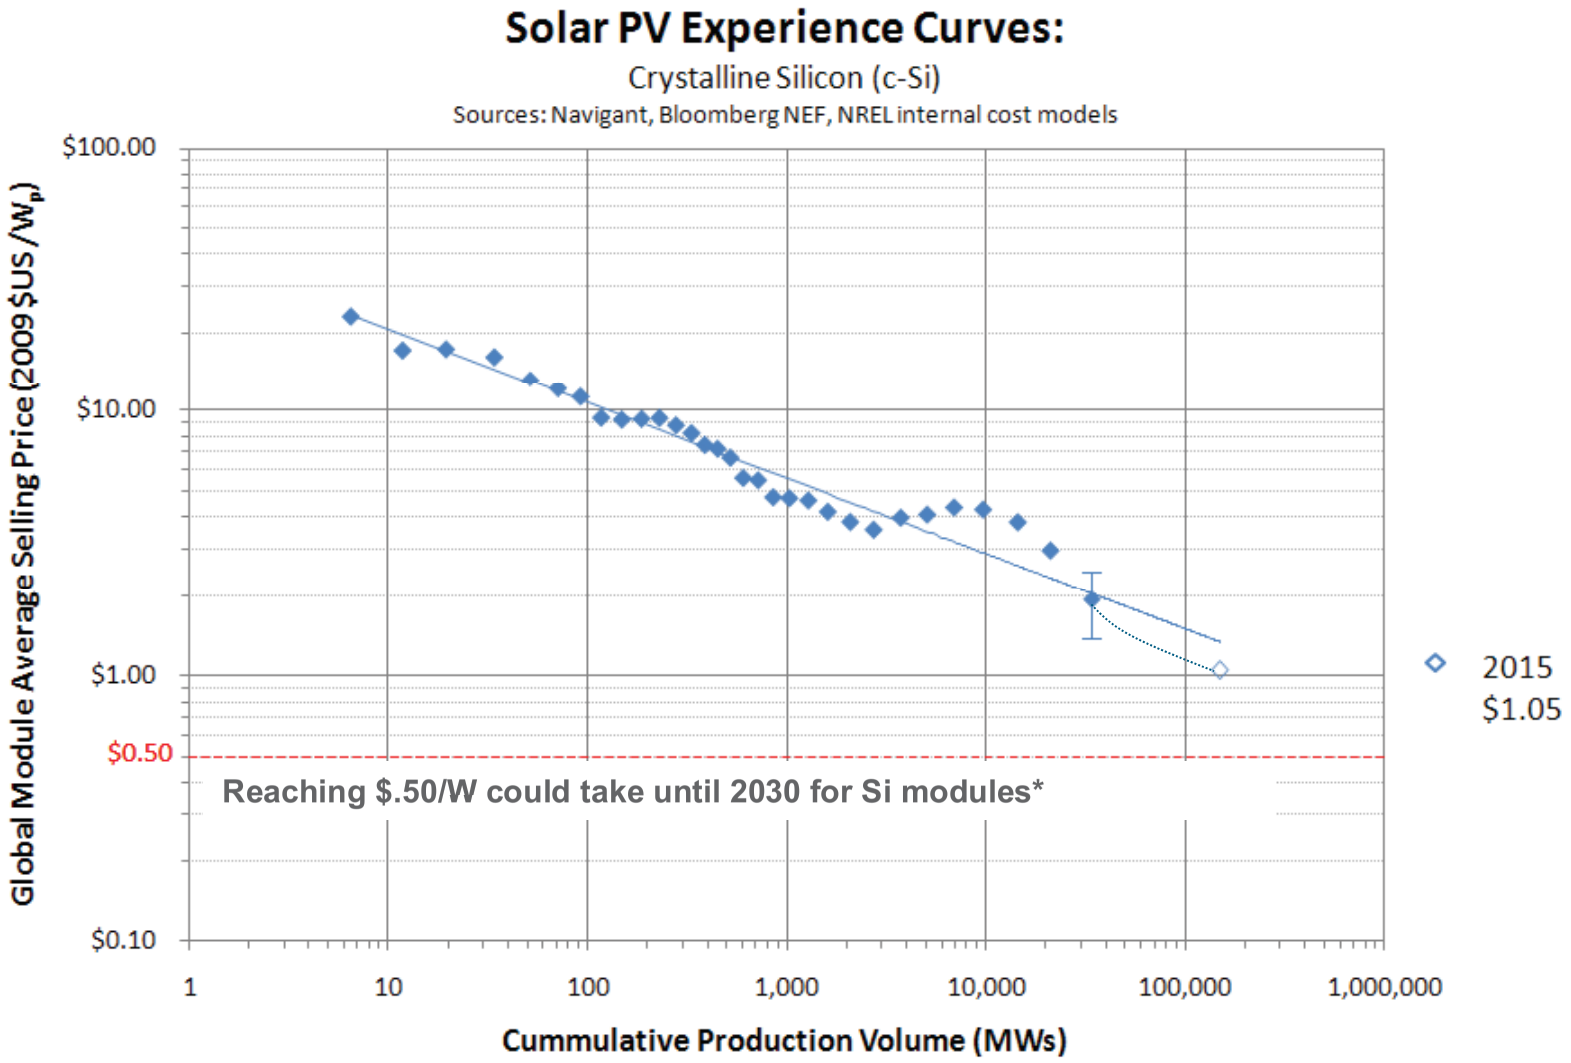
‡ The electricity rate range represents one standard deviation below and above the mean U.S. residential electricity prices.

§ Property Assessed Clean Energy (PACE) Financing assumes 100% financing at 5.0% interest with a 20-year payback schedule

† Cash purchase assumes a discount rate of 9.2% (nominal), equal to the long term return on the S&P 500

Solar PV Cost Reduction Progress, Potential of Known Technology Pathways

U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy

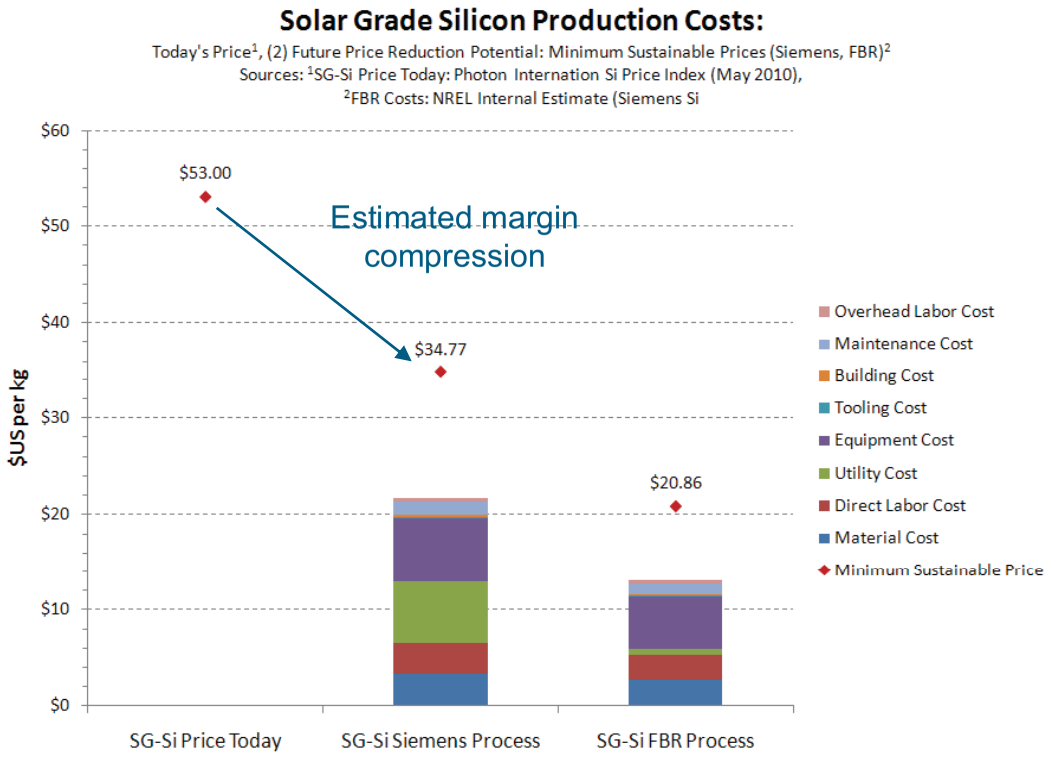


Manufacturing Cost Model Scope: Crystalline Silicon PV

- Detailed cost models developed for each step:
- Evaluate Technical (Cost) Improvement Opportunities
  - Simulate discrete manufacturing operations
- Sensitivity to independent process, material properties
- Margins at each step in the value chain
  - Intermediate product sales opportunity
  - pro forma income statement
  - Minimum sustainable: eliminate market noise from projections
- Collaborations with stakeholders from throughout the Industry critical to model development

Cost reduction of silicon feedstock to be led by introduction of FBR process

U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy



- By 2015, margin compression expected to drive SG-Si price to minimal sustainable.
- By 2030, 20% expected from FBR
- Additional driver for FBR will come from advanced cell architectures.

FBR process cost advantages:

- Better silane gas utilization
- Lower temperature (energy)
- Improved yield (rates)
  - Capital utilization
- Total cost benefit: ~40%

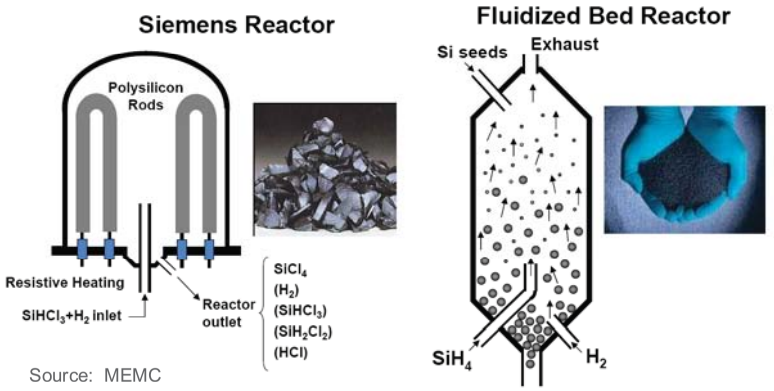
Material quality:

- Fewer metal, O_2 impurities

Crystal growth advantages:

- Multiple recharge (i.e. semi continuous Cz-growth)

Polysilicon Manufacturing Methods

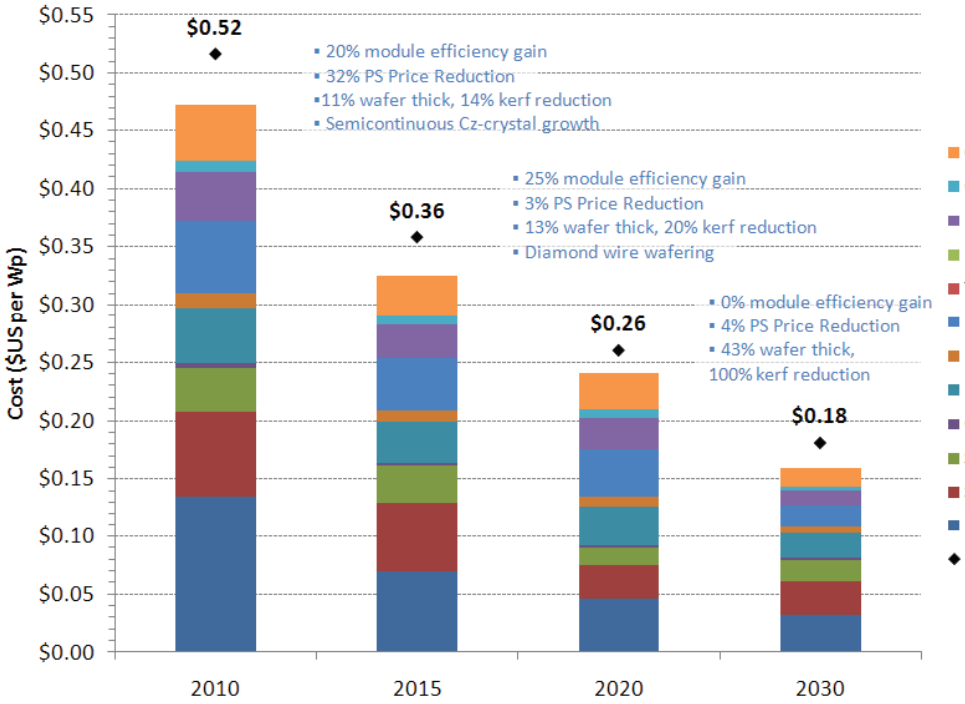


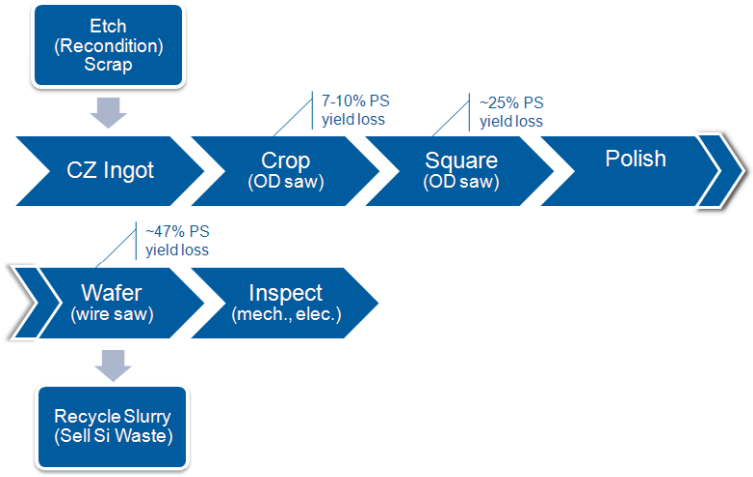
Source: MEMC

Cost Reduction Opportunities: c-Si Wafers

U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy

Mono Crystalline Silicon (c-Si) Crystallization and Wafering Costs:
Summary of Technical Improvement Strategies





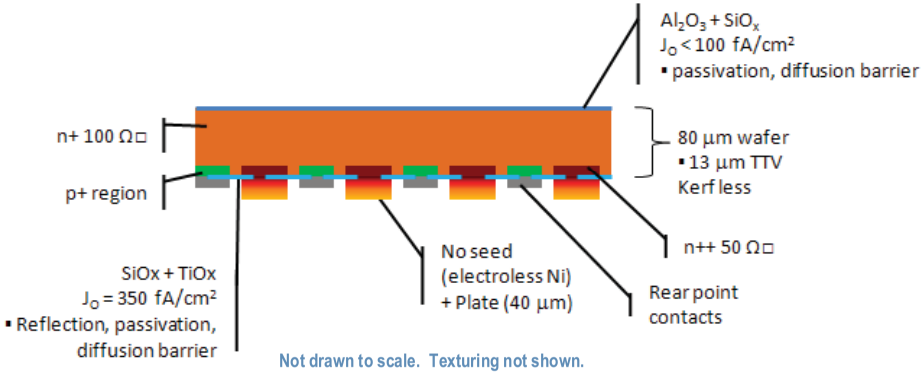
- Key innovations
  - Semi-continuous CZ-crystal growth
  - Diamond wire wafering
  - Kerfless wafer (80 microns)

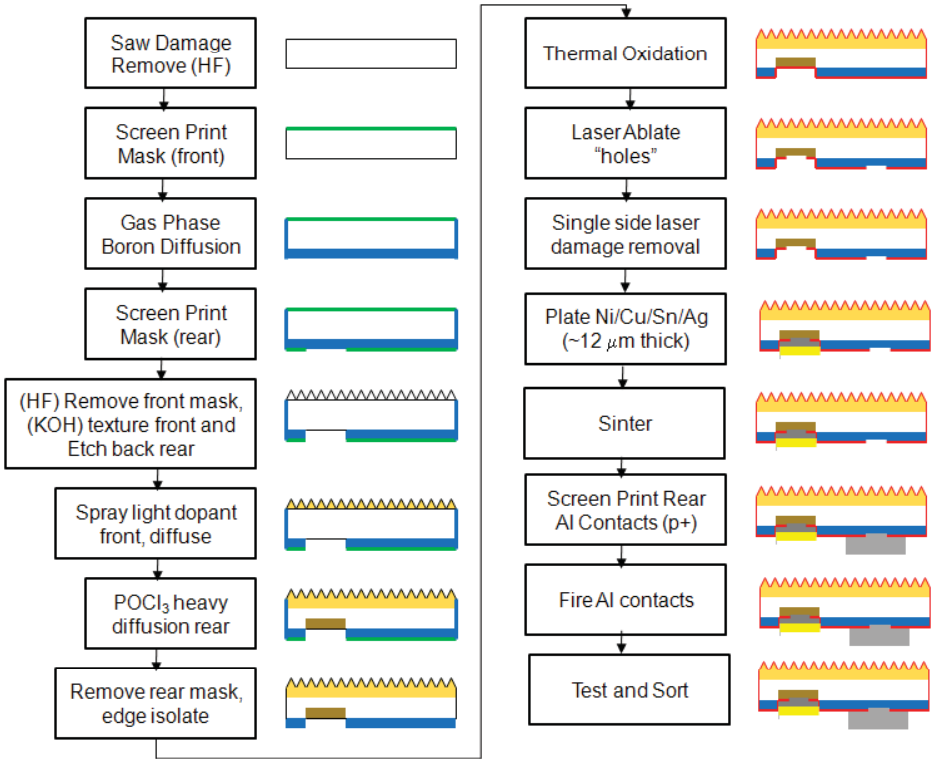
Source: Sigen

c-Si Cell Description: 2030

*Based on publicly disclosed (literature) cell designs, not intended to depict proprietary architectures

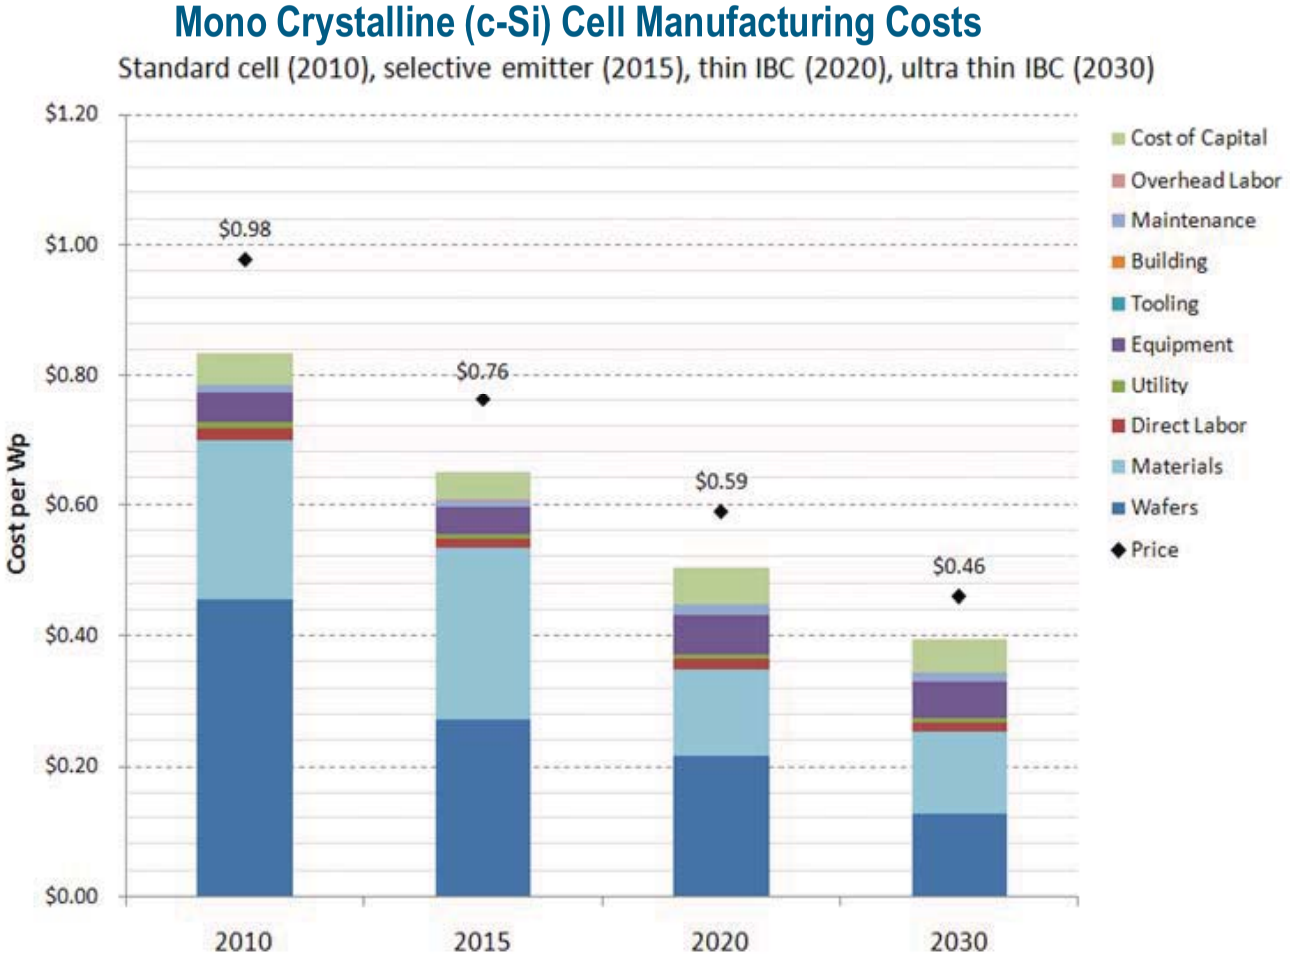
U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy





- All Rear (Interdigitated) Contacts
- High lifetime (n- type) wafer
- Ultra thin (80 microns) kerfless wafers
- High quality surface passivation
- Plated emitter contacts
  - Electroless nickel barrier, Cu plating
- Base point contact absorbers
  - Printed Al contacts

c-Si Cell Costs



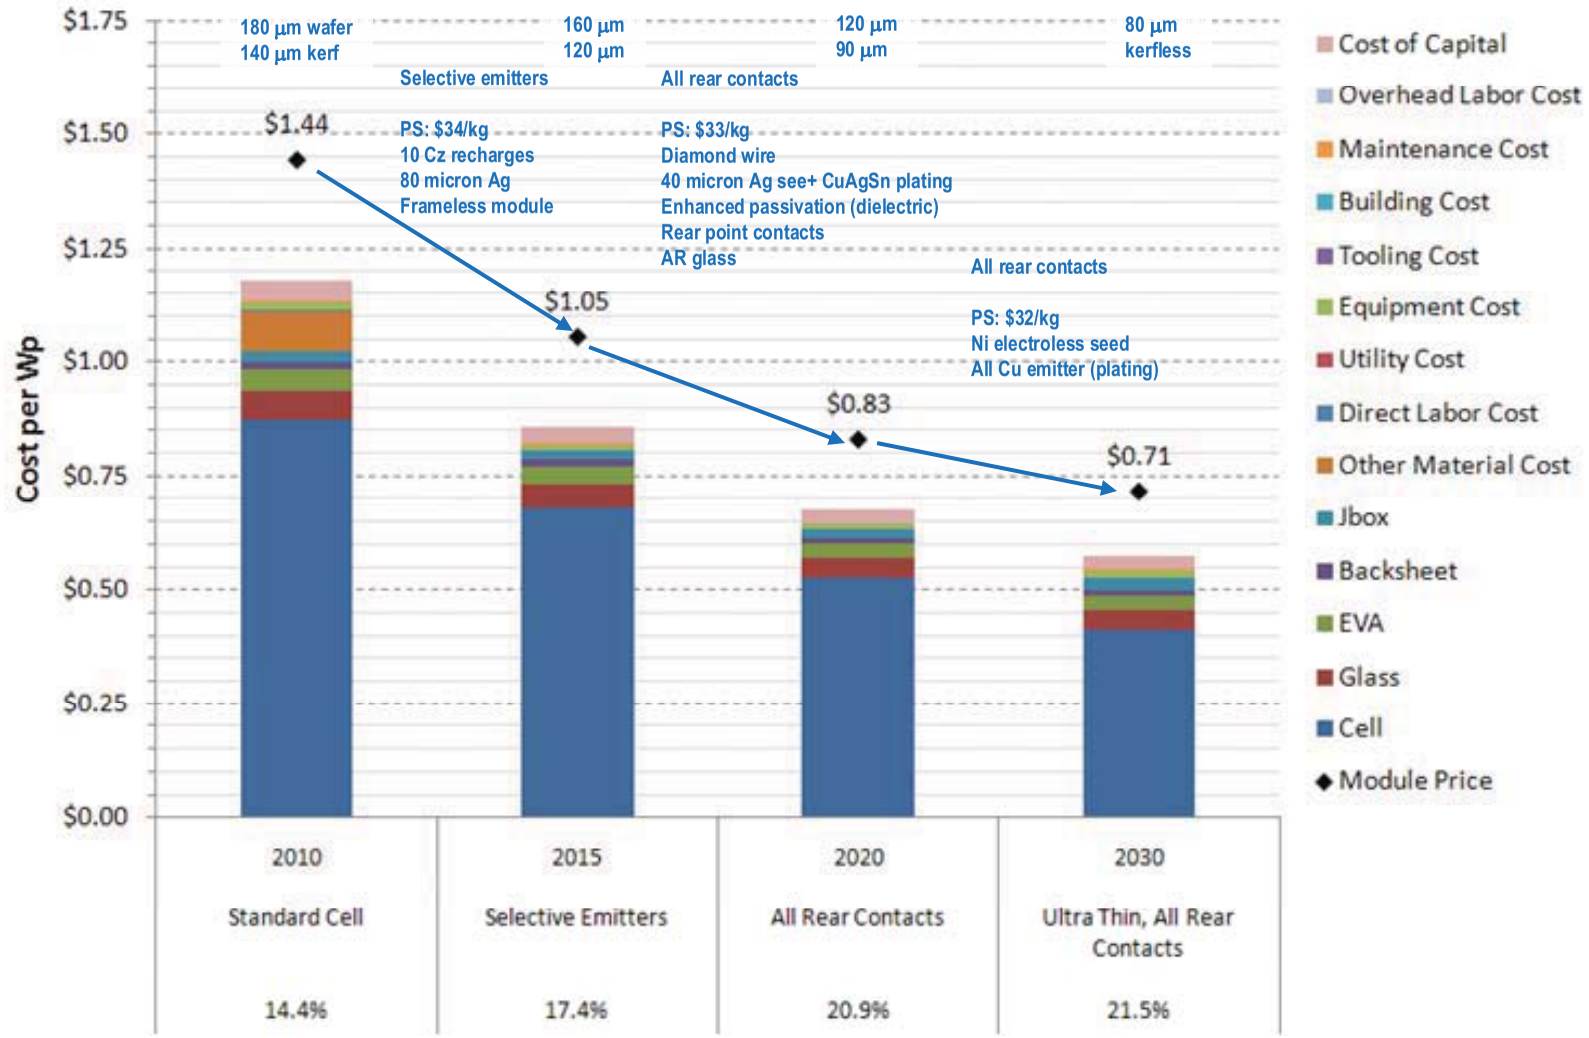
- Silicon PV approaching practical performance limit
  - 2030 case: 24% production average cell, 21.5% module

c-Si Module Costs

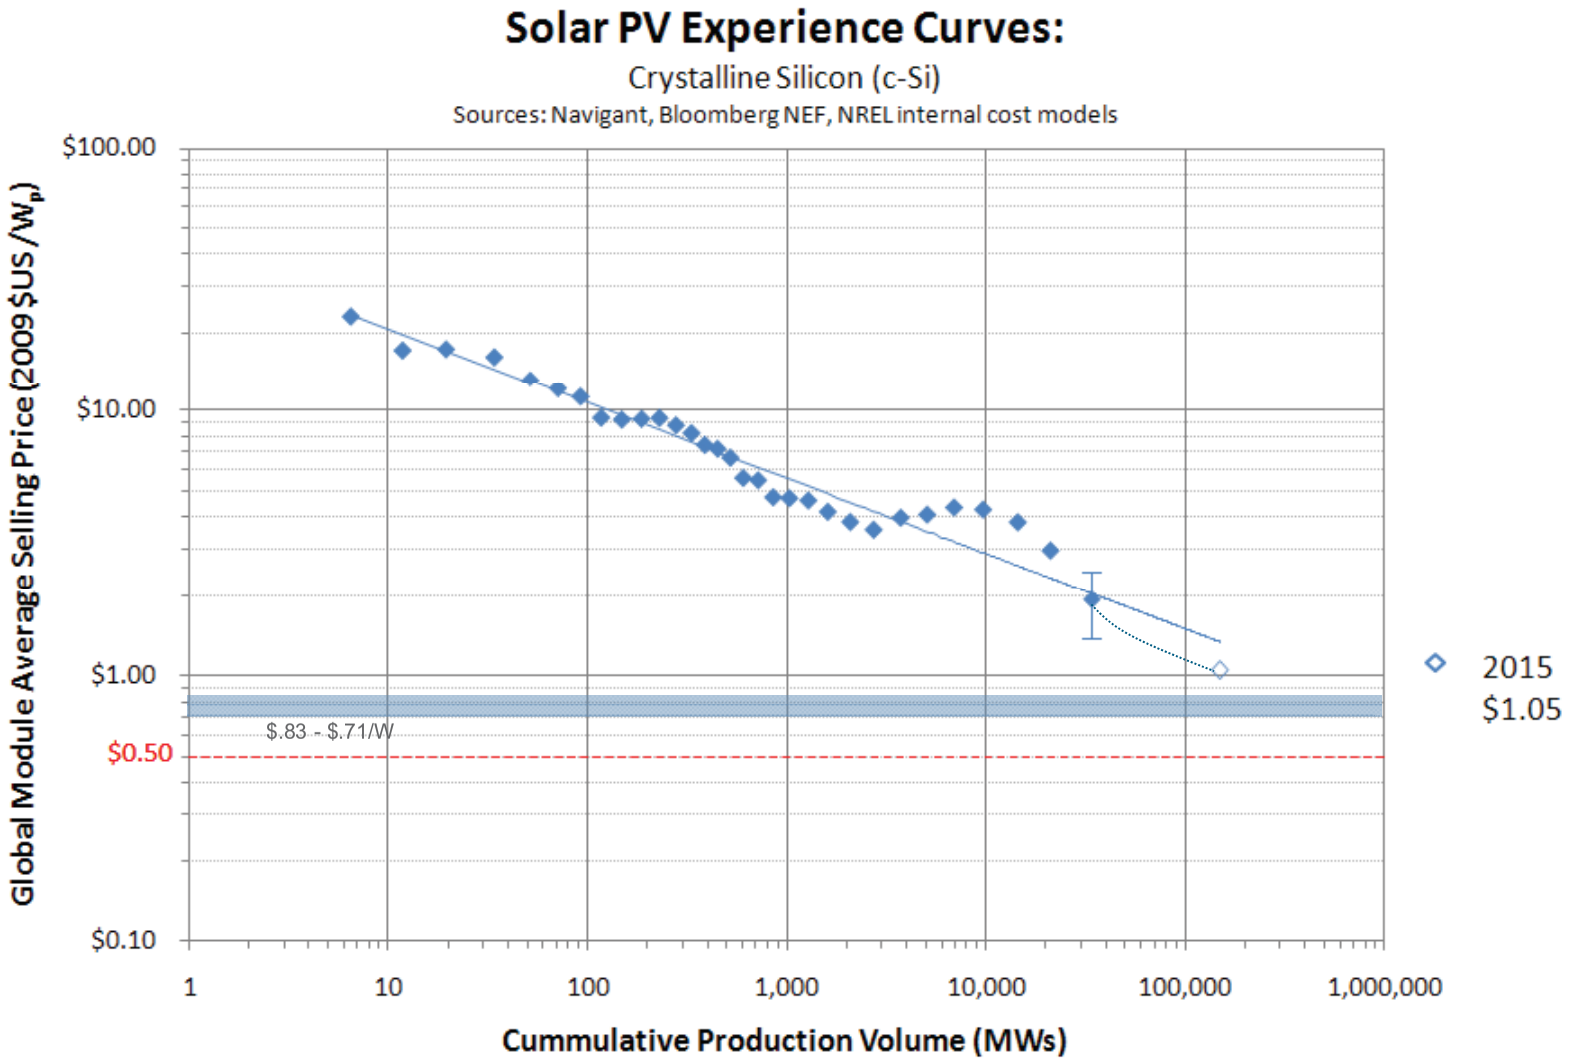
U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy

Mono Crystalline (c-Si) Module Manufacturing Costs

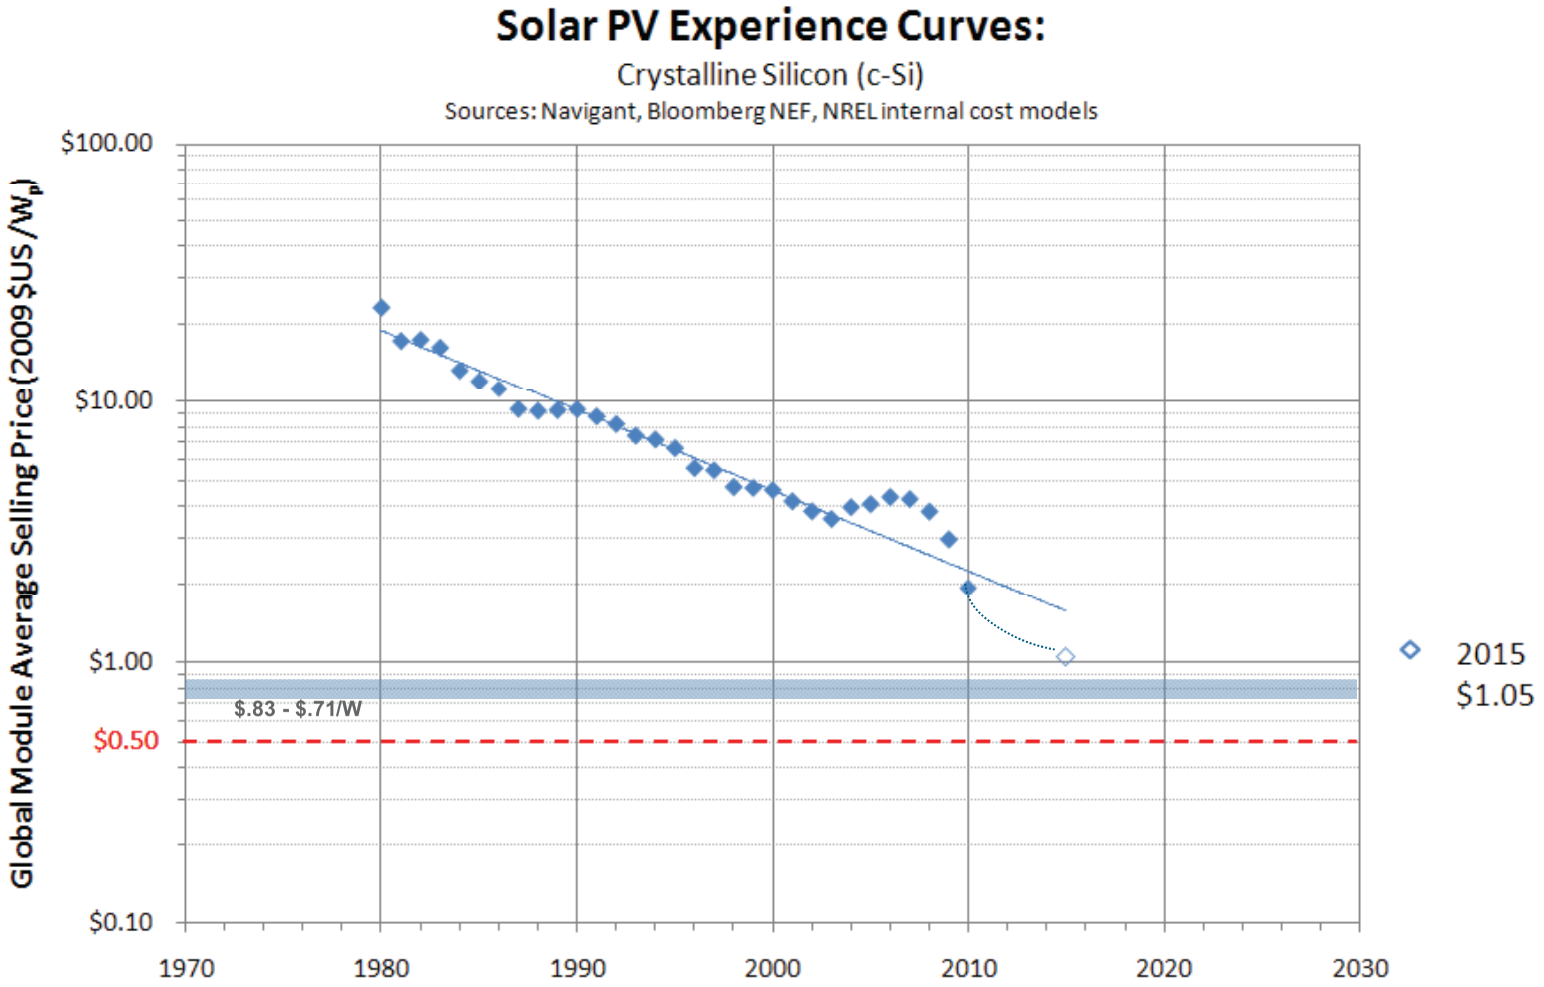
Technical (Cost) Improvement Opportunities



Solar PV Cost Reduction Progress, Potential of Known Technology Pathways

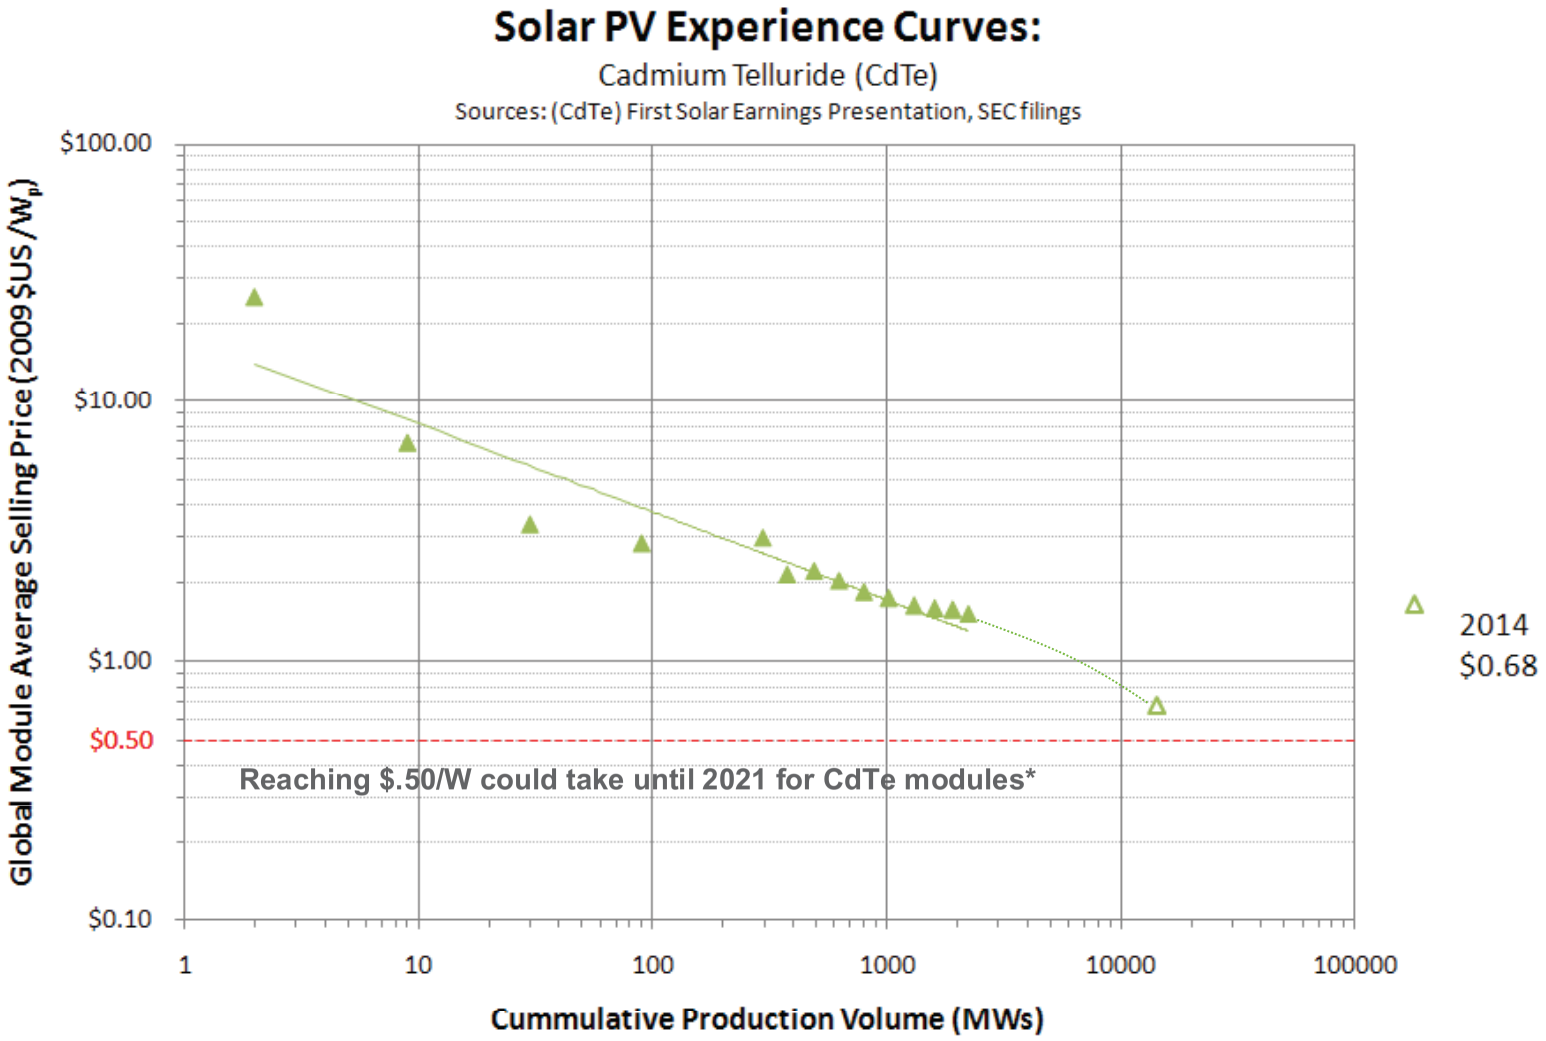


Solar PV Cost Reduction Progress, Potential of Known Technology Pathways



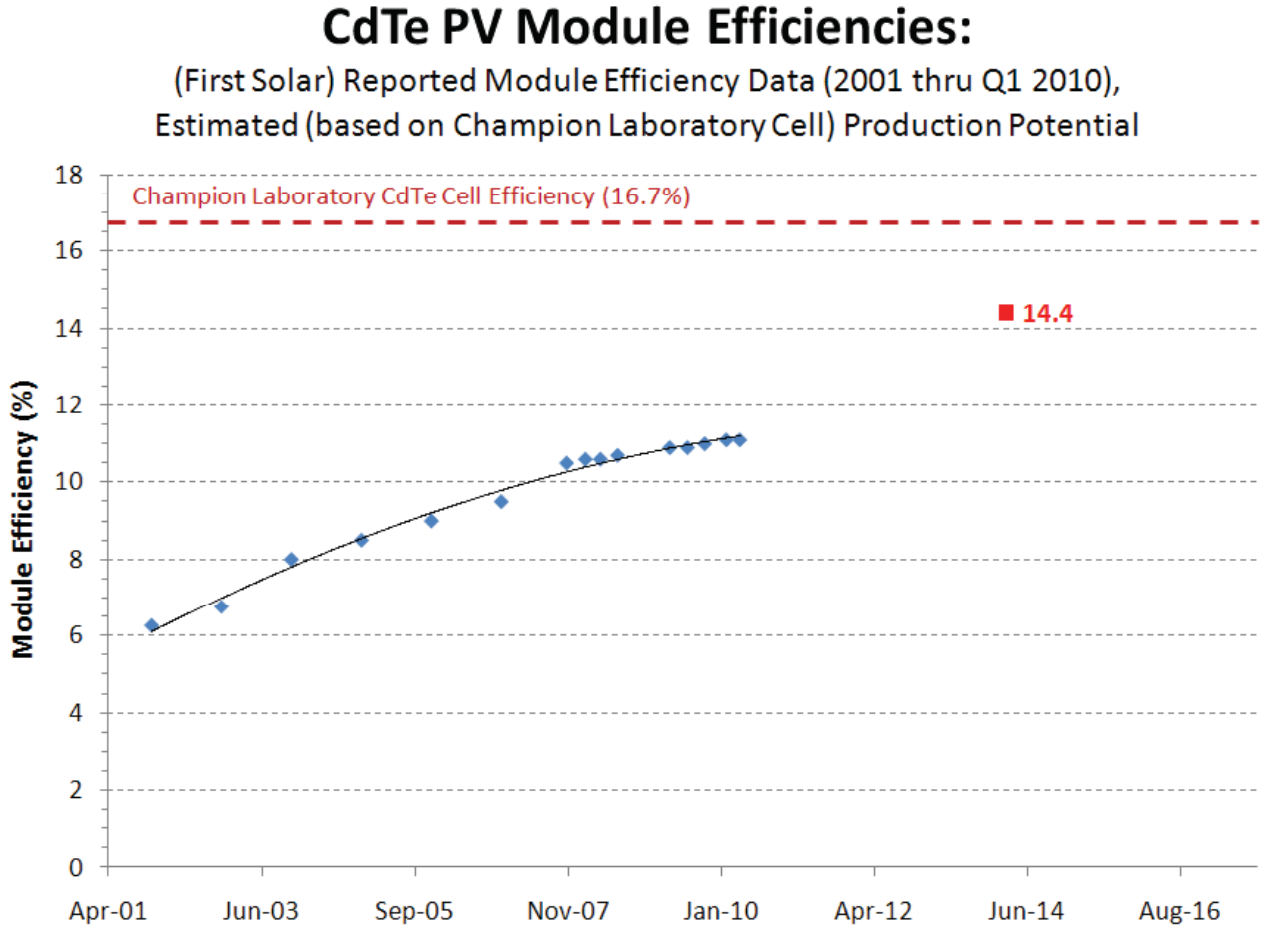
Solar PV Cost Reduction Progress, Potential of Known Technology Pathways

U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy



CdTe Efficiency Road Map: Innovation Remains an Important Factor

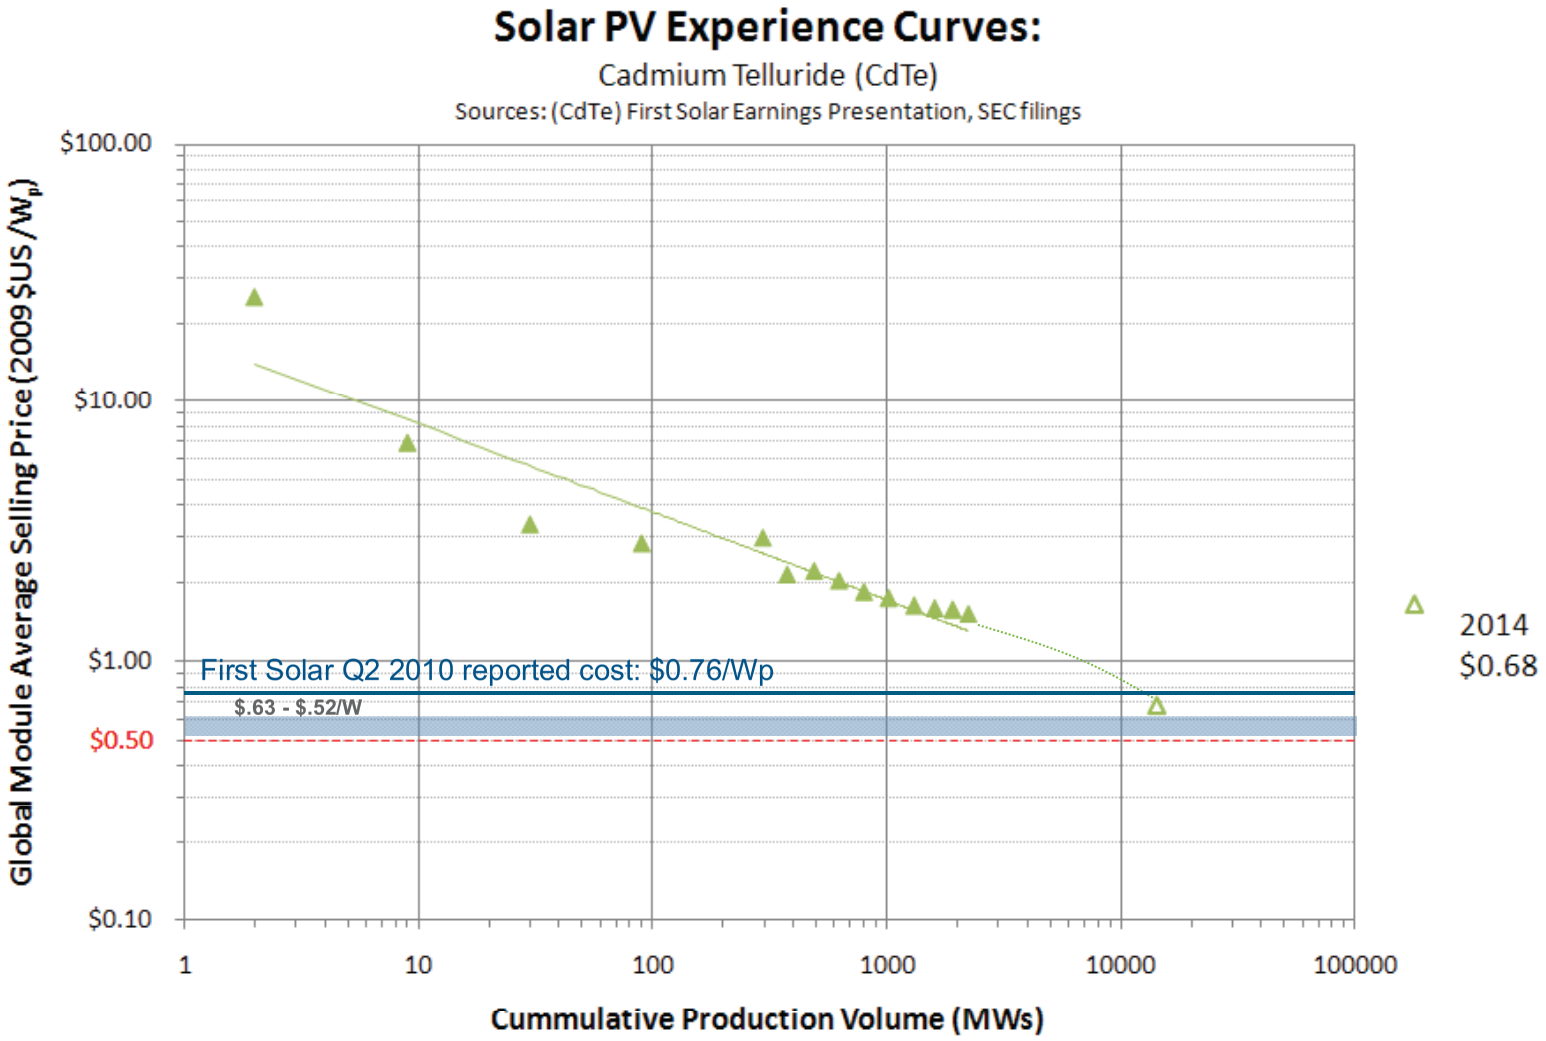
U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy



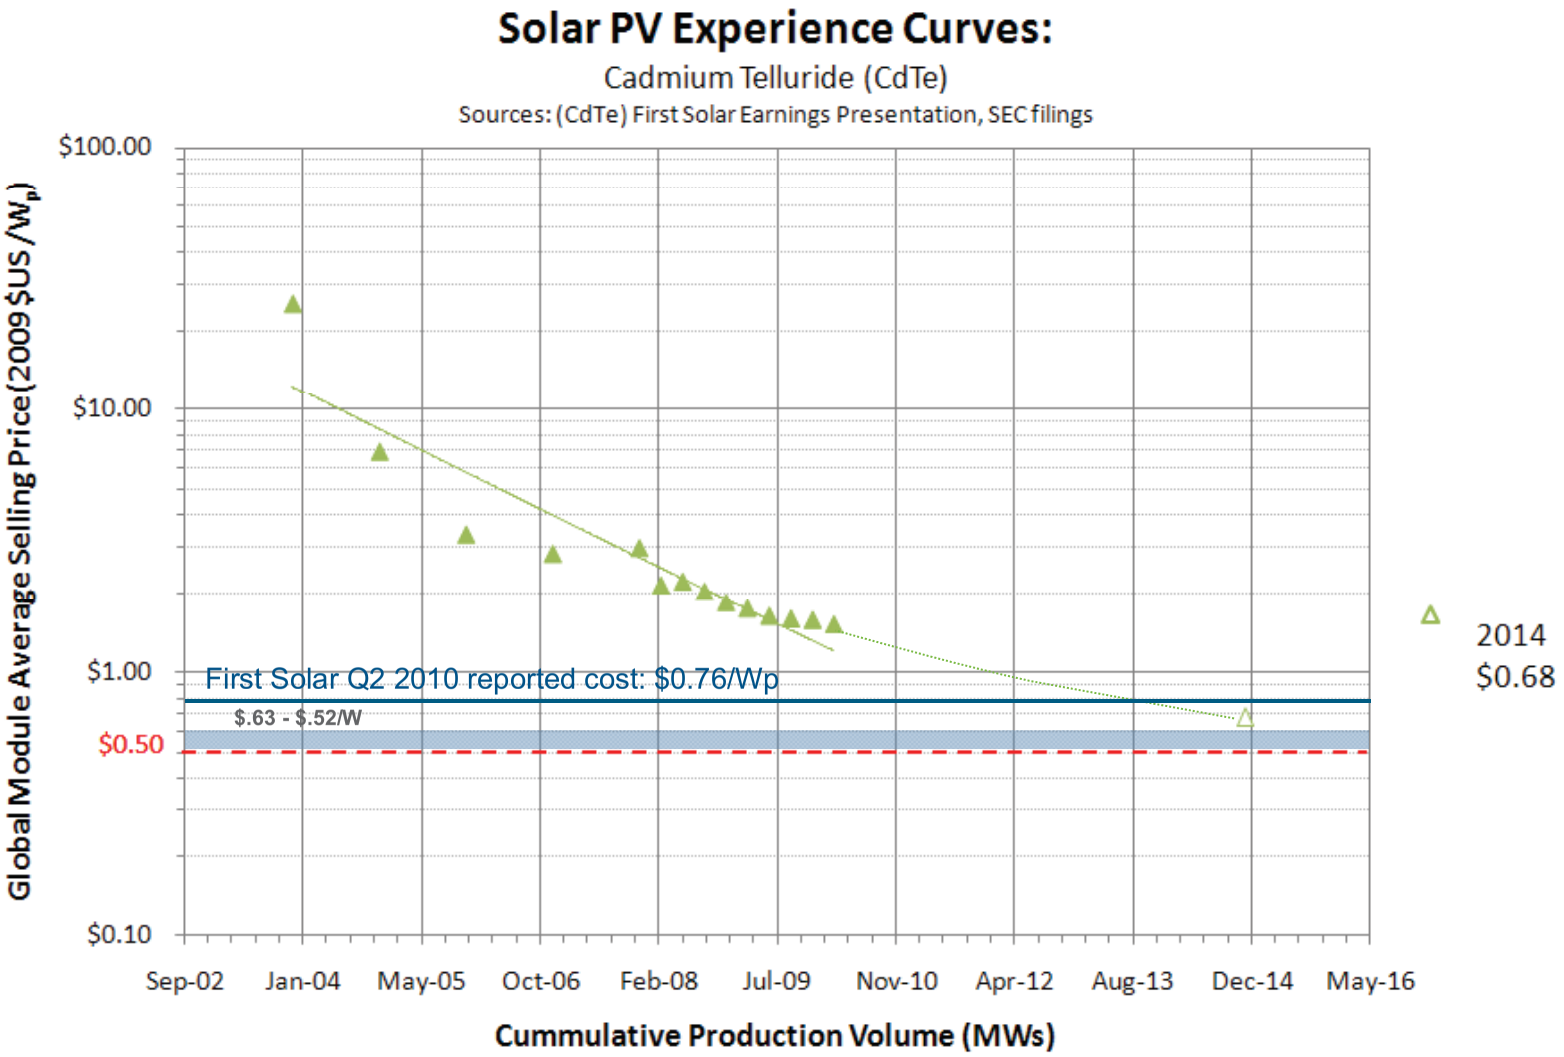
- First Solar stated (June 2009) goal for $.52/W cost ($.63/W price)
  - 14.4% implies a significant advancement in module technology (86% of current, or new 'champion cell')
  - Best in class c-Si module: ~79% of champion lab cell, many more years to close the gap

Solar PV Cost Reduction Progress, Potential of Known Technology Pathways

U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy



Solar PV Cost Reduction Progress, Potential of Known Technology Pathways



$0.50/W Module Challenge: Potential Breakdown of Module Costs

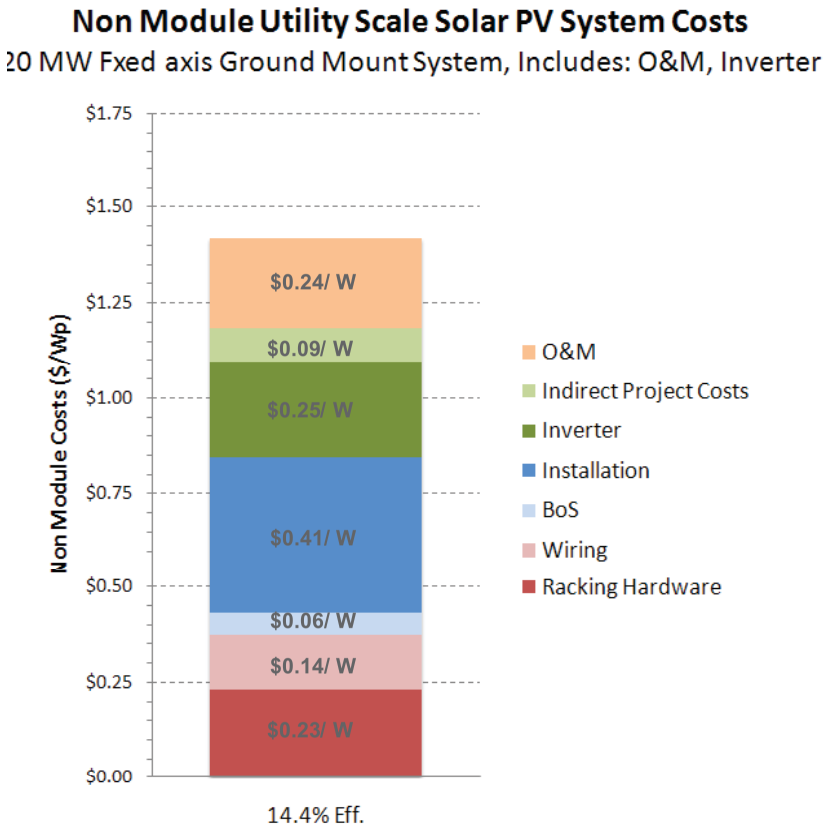
U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy

	2010	2015	$1/W Target	
	Cost	Cost	Cost ($/W)	Cost ($/m2)
Capital	$0.24	$0.20	$0.10	$28
Materials	$1.11	$0.49	$0.23	$68
Labor	$0.27	$0.12	$0.06	$17
Margin	$0.79	$0.24	$0.11	
Total Module	**$1.70**	**$1.05**	**$0.50**	

- In order to achieve $0.50/W module selling price
  - Capex of $0.70/W may be required.
  - Materials costs must be about $68/m^{2*}
    - Glass, EVA, and backsheet today costs about $18/m^2, about 25% of the budget for materials. Metallization next significant opportunity.
  - Manufacturing labor must account for less than $0.06/W
    - For 100 MW factory, equivalent to 120 FTEs at $50k/yr fully loaded

*$/m2 assumes 25% efficiency

Non-Module Solar PV Installation (BoS) Costs



- Glass module installation costs burdened by disaggregate systems (number of components)
  - Integrate components at factory?

'Installation' labor:

- Nearly 75% of labor hours skilled
  - Electrician wage premium
  - Grid connect, wiring, power, other electronics

'O&M' costs: reliability

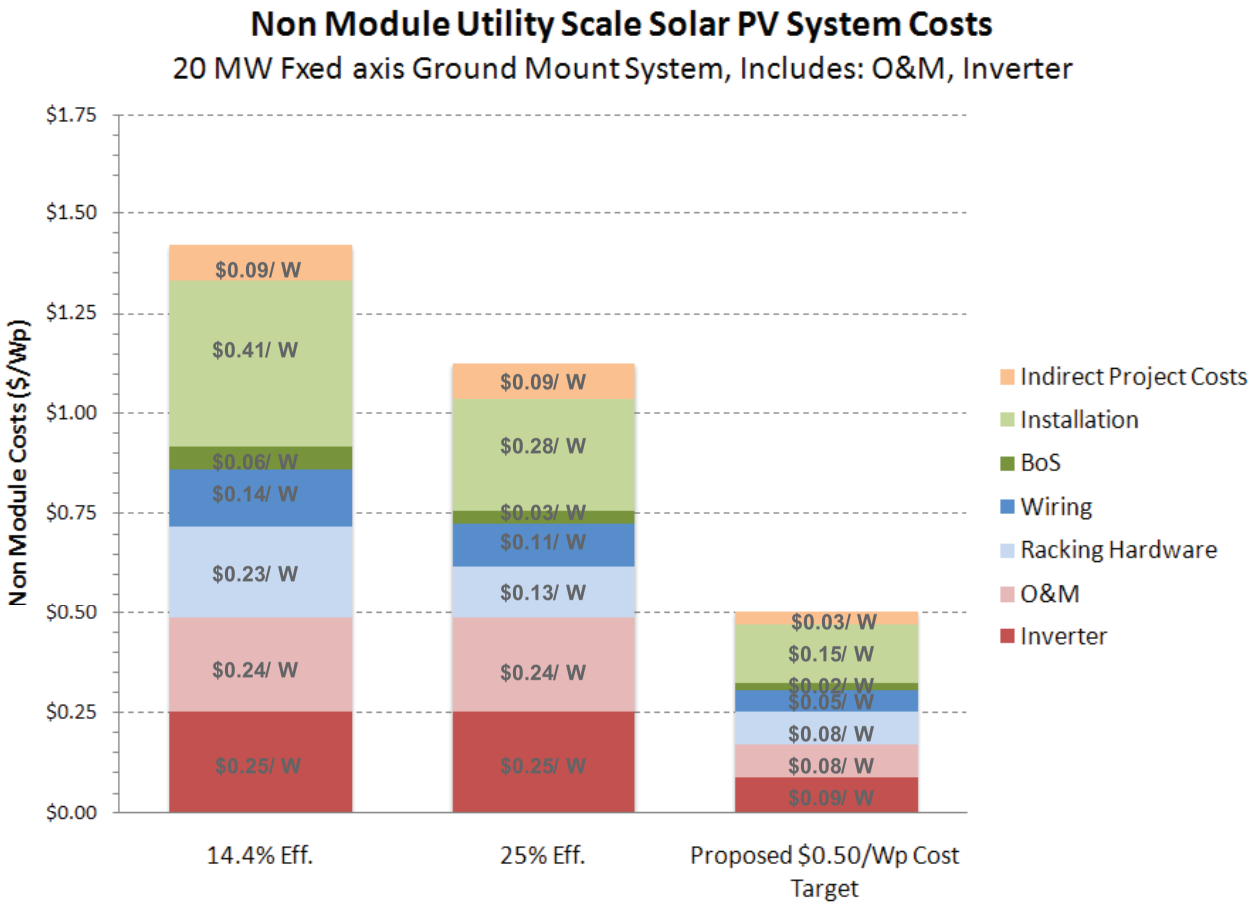
- Inverter reliability, repair costs
- System monitoring and preventative maintenance

'Indirect Project Costs' vary:

- Environmental review: $100K, up to $1 MM and 2 years
- Land prep.: <$0.10/Wp, depending on site selection
- Transmission interconnect: $1.0-$1.5 MM, up to $80 MM (prohibitive)

Utility Scale Solar PV: Non Module Costs

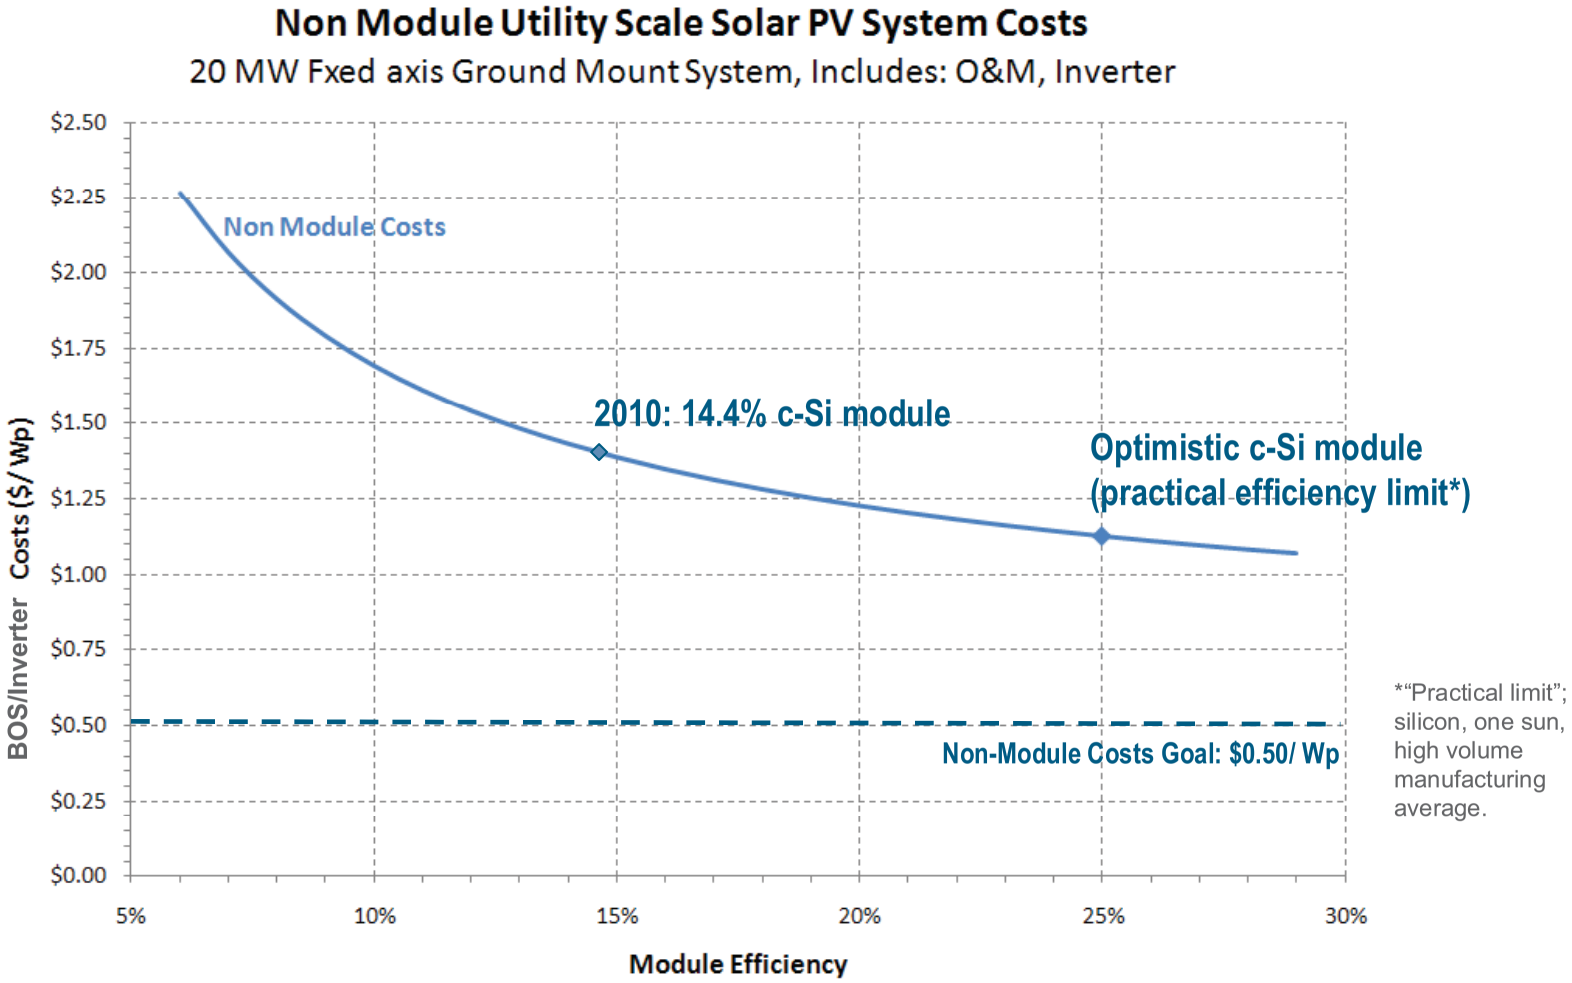
U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy



Relative to the 25% module efficiency scenario, the $0.50/Wp system must:

- Reduce fixed power costs (Inverter, O&M) by 66%
- Trim (short, long) wiring costs (content) and installation by 50%
- Decrease racking hardware, BoS components by 33%

Non Module Cost-Sensitivity to Efficiency

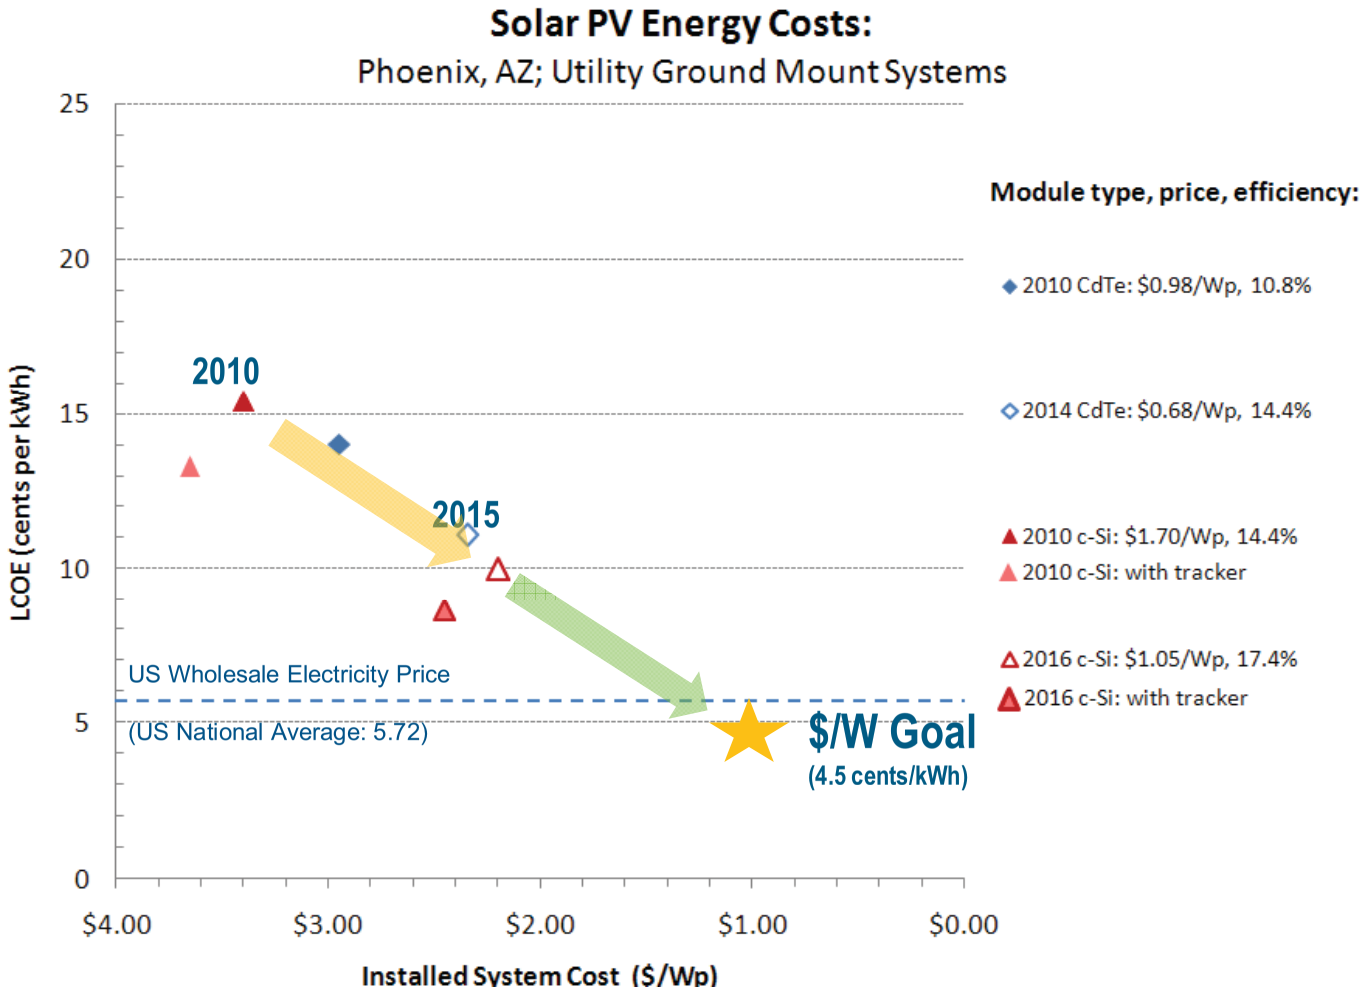


*"Practical limit"; silicon, one sun, high volume manufacturing average.

- Module efficiency alone is not adequate to achieve grid parity (non-module costs exceed $/W at practical limit; 25%)

Solar PV Energy Costs: Current and Projected, Leading Technologies

U.S. DEPARTMENT OF ENERGY | Energy Efficiency & Renewable Energy



- Unsubsidized Solar PV energy costs will remain >50% higher than US wholesale average (optimal solar resources)

Summary

- History of module cost reduction may not continue to be extrapolated
- Cost target for broad (unsubsidized) US adoption likely requires revolutionary technical innovations
  - Module cost and performance
  - Power electronics efficiency and reliability
  - BoS, installation costs
- Focus on high cost electricity markets may reduce the incentive for such industrial investments
- Success in the US market at $1/W will enable US companies to lead in other regions of the world

Thank You
