AVAILABILITY OF REFERENCE MATERIALS IN NRC PUBLICATIONS

NRC Reference Material

As of November 1999, you may electronically access NUREG-series publications and other NRC records at NRC's Public Electronic Reading Room at <http://www.nrc.gov/reading-rm.html>.

Publicly released records include, to name a few, NUREG-series publications; *Federal Register* notices; applicant, licensee, and vendor documents and correspondence; NRC correspondence and internal memoranda; bulletins and information notices; inspection and investigative reports; licensee event reports; and Commission papers and their attachments.

NRC publications in the NUREG series, NRC regulations, and *Title 10, Energy*, in the Code of *Federal Regulations* may also be purchased from one of these two sources.

1. The Superintendent of Documents
U.S. Government Printing Office
Mail Stop SSOP
Washington, DC 20402-0001
Internet: bookstore.gpo.gov
Telephone: 202-512-1800
Fax: 202-512-2250
2. The National Technical Information Service
Springfield, VA 22161-0002
www.ntis.gov
1-800-553-6847 or, locally, 703-605-6000

A single copy of each NRC draft report for comment is available free, to the extent of supply, upon written request as follows:

Address: U.S. Nuclear Regulatory Commission
Office of Administration
Publications Branch
Washington, DC 20555-0001

E-mail: DISTRIBUTION.SERVICES@NRC.GOV

Facsimile: 301-415-2289

Some publications in the NUREG series that are posted at NRC's Web site address <http://www.nrc.gov/reading-rm/doc-collections/nuregs> are updated periodically and may differ from the last printed version. Although references to material found on a Web site bear the date the material was accessed, the material available on the date cited may subsequently be removed from the site.

Non-NRC Reference Material

Documents available from public and special technical libraries include all open literature items, such as books, journal articles, and transactions, *Federal Register* notices, Federal and State legislation, and congressional reports. Such documents as theses, dissertations, foreign reports and translations, and non-NRC conference proceedings may be purchased from their sponsoring organization.

Copies of industry codes and standards used in a substantive manner in the NRC regulatory process are maintained at—

The NRC Technical Library
Two White Flint North
11545 Rockville Pike
Rockville, MD 20852-2738

These standards are available in the library for reference use by the public. Codes and standards are usually copyrighted and may be purchased from the originating organization or, if they are American National Standards, from—

American National Standards Institute
11 West 42nd Street
New York, NY 10036-8002
www.ansi.org
212-642-4900

Legally binding regulatory requirements are stated only in laws; NRC regulations; licenses, including technical specifications; or orders, not in NUREG-series publications. The views expressed in contractor-prepared publications in this series are not necessarily those of the NRC.

The NUREG series comprises (1) technical and administrative reports and books prepared by the staff (NUREG-XXXX) or agency contractors (NUREG/CR-XXXX), (2) proceedings of conferences (NUREG/CP-XXXX), (3) reports resulting from international agreements (NUREG/IA-XXXX), (4) brochures (NUREG/BR-XXXX), and (5) compilations of legal decisions and orders of the Commission and Atomic and Safety Licensing Boards and of Directors' decisions under Section 2.206 of NRC's regulations (NUREG-0750).

ABSTRACT

This report describes a new seismic source characterization (SSC) model for the Central and Eastern United States (CEUS). It will replace the *Seismic Hazard Methodology for the Central and Eastern United States*, EPRI Report NP-4726 (July 1986) and the *Seismic Hazard Characterization of 69 Nuclear Plant Sites East of the Rocky Mountains*, Lawrence Livermore National Laboratory Model, (Bernreuter et al., 1989). The objective of the CEUS SSC Project is to develop a new seismic source model for the CEUS using a Senior Seismic Hazard Analysis Committee (SSHAC) Level 3 assessment process. The goal of the SSHAC process is to represent the center, body, and range of technically defensible interpretations of the available data, models, and methods. Input to a probabilistic seismic hazard analysis (PSHA) consists of both seismic source characterization and ground motion characterization. These two components are used to calculate probabilistic hazard results (or seismic hazard curves) at a particular site. This report provides a new seismic source model.

Results and Findings

The product of this report is a regional CEUS SSC model. This model includes consideration of an updated database, full assessment and incorporation of uncertainties, and the range of diverse technical interpretations from the larger technical community. The SSC model will be widely applicable to the entire CEUS, so this project uses a ground motion model that includes generic variations to allow for a range of representative site conditions (deep soil, shallow soil, hard rock). Hazard and sensitivity calculations were conducted at seven test sites representative of different CEUS hazard environments.

Challenges and Objectives

The regional CEUS SSC model will be of value to readers who are involved in PSHA work, and who wish to use an updated SSC model. This model is based on a comprehensive and traceable process, in accordance with SSHAC guidelines in NUREG/CR-6372, *Recommendations for Probabilistic Seismic Hazard Analysis: Guidance on Uncertainty and Use of Experts*. The model will be used to assess the present-day composite distribution for seismic sources along with their characterization in the CEUS and uncertainty. In addition, this model is in a form suitable for use in PSHA evaluations for regulatory activities, such as Early Site Permit (ESPs) and Combined Operating License Applications (COLAs).

Applications, Values, and Use

Development of a regional CEUS seismic source model will provide value to those who (1) have submitted an ESP or COLA for Nuclear Regulatory Commission (NRC) review before 2011; (2) will submit an ESP or COLA for NRC review after 2011; (3) must respond to safety issues resulting from NRC Generic Issue 199 (GI-199) for existing plants and (4) will prepare PSHAs to meet design and periodic review requirements for current and future nuclear facilities. This work replaces a previous study performed approximately 25 years ago. Since that study was

completed, substantial work has been done to improve the understanding of seismic sources and their characterization in the CEUS. Thus, a new regional SSC model provides a consistent, stable basis for computing PSHA for a future time span. Use of a new SSC model reduces the risk of delays in new plant licensing due to more conservative interpretations in the existing and future literature.

Perspective

The purpose of this study, jointly sponsored by EPRI, the U.S. Department of Energy (DOE), and the NRC was to develop a new CEUS SSC model. The team assembled to accomplish this purpose was composed of distinguished subject matter experts from industry, government, and academia. The resulting model is unique, and because this project has solicited input from the present-day larger technical community, it is not likely that there will be a need for significant revision for a number of years. See also Sponsors' Perspective for more details.

Approach

The goal of this project was to implement the CEUS SSC work plan for developing a regional CEUS SSC model. The work plan, formulated by the project manager and a technical integration team, consists of a series of tasks designed to meet the project objectives. This report was reviewed by a participatory peer review panel (PPRP), sponsor reviewers, the NRC, the U.S. Geological Survey, and other stakeholders. Comments from the PPRP and other reviewers were considered when preparing the report. The SSC model was completed at the end of 2011.

LIST OF FIGURES

Figure 1.3-1 Map showing the study area and test sites for the CEUS SSC Project.....	1-15
Figure 2.3-1 CEUS SSC Project organization	2-33
Figure 2.3-2 Lines of communication among the participants of the CEUS SSC Project.....	2-34
Figure 2.4-1 Essential activities associated with a SSHAC Level 3 or 4 project (Coppersmith et al., 2010).....	2-35
Figure 3.2-1 Areal coverage of the primary earthquake catalog sources. Top: GSC catalog (Halchuk, 2009); bottom: USGS seismic hazard mapping catalog (Petersen et al., 2008). Red line denotes boundary of study region. Blue line denotes portion of each catalog used for development of project catalog.....	3-57
Figure 3.2-2 Histogram of M_L magnitudes from the GSC SHEEF catalog for the time period 1600-1899 and the region east of longitude -105° and south of latitude 53°	3-58
Figure 3.2-3 Histogram of M_L magnitudes from the GSC SHEEF catalog for the time period 1900-1929 and the region east of longitude -105° and south of latitude 53°	3-59
Figure 3.2-4 Histogram of M_L magnitudes from the GSC SHEEF catalog for the time period 1930-1979 and the region east of longitude -105° and south of latitude 53°	3-60
Figure 3.2-5 Histogram of M_L magnitudes from the GSC SHEEF catalog for the time period 1980-2007 and the region east of longitude -105° and south of latitude 53°	3-61
Figure 3.2-6 Histogram of M_L magnitudes from the revised catalog with GSC as the source for the time period 1928-1979	3-62
Figure 3.2-7 Map of the CEUS SSC Project catalog showing earthquakes of uniform moment magnitude $E[M]$ 2.9 and larger. Colored symbols denote earthquakes not contained in the USGS seismic hazard mapping catalog.	3-63
Figure 3.3-1 Illustration of equivalence of the M^* and γ^2 corrections to remove bias in earthquake recurrence relationships estimated from magnitudes with uncertainty	3-64
Figure 3.3-2 Approximate moment magnitudes from Atkinson (2004b) compared to values of M given in Table B-2 in Appendix B for earthquakes in common	3-65
Figure 3.3-3 Approximate moment magnitudes from Boatwright (1994) compared to values of M given in Table B-2 in Appendix B for earthquakes in common	3-66
Figure 3.3-4 Approximate moment magnitudes from Moulis (2002) compared to values of M given in Table B-2 in Appendix B for earthquakes in common.....	3-67
Figure 3.3-5 Difference between M_N reported by the GSC and M_N or $m_{Lg(f)}$ reported by the Weston Observatory catalog as a function of time.....	3-68
Figure 3.3-6 Spatial distribution of earthquakes with body-wave (m_b , m_{bLg} , M_N) and M magnitudes in the CEUS SSC Project catalog for the Midcontinent region. Color codes indicate the source of the body-wave magnitudes.....	3-69
Figure 3.3-7 m_b - M data for the earthquakes shown on Figure 3.3-6. Red curve shows the preferred offset fit $M = m_b - 0.28$	3-70

Figure 3.3-8 Residuals from offset fit shown on Figure 3.3-7 plotted against earthquake year	3-71
Figure 3.3-9 Spatial distribution of earthquakes with body wave (m_b , m_{bLg} , M_N) and M magnitudes in the CEUS SSC Project catalog for the northeastern portion of the study region. Color codes indicate the source of the body-wave magnitudes.	3-72
Figure 3.3-10 m_b - M data for the earthquakes shown on Figure 3.3-9. Red curve shows the preferred offset fit $M = m_b - 0.42$	3-73
Figure 3.3-11 Residuals from offset fit shown on Figure 3.3-10 plotted against earthquake year	3-74
Figure 3.3-12 Residuals for GSC data from offset fit shown on Figure 3.3-10 plotted against earthquake year.....	3-75
Figure 3.3-13 Residuals for WES data from offset fit shown on Figure 3.3-10 plotted against earthquake year.....	3-76
Figure 3.3-14 Residuals for data from sources other than GSC or WES from offset fit shown on Figure 3.3-10 plotted against earthquake year	3-77
Figure 3.3-15 Difference between body-wave magnitudes reported by LDO and those by other sources as a function of year	3-78
Figure 3.3-16 Spatial distribution of earthquakes with reported GSC body-wave magnitudes. Red and blue symbols indicate earthquakes with both m_b and M magnitudes for $m_b \geq 3.5$. Dashed line indicates the portion of the study region considered the “Northeast” for purposes of magnitude scaling.....	3-79
Figure 3.3-17 M - m_b as a function of time for m_b data from the GSC shown on Figure 3.3-16	3-80
Figure 3.3-18 Plot of magnitude differences $m_{bLg} - m(3 \text{ Hz})$ for the OKO catalog.....	3-81
Figure 3.3-19 Final m_b - M data set. Vertical dashed lines indicate the magnitude range used to develop the scaling relationship. Diagonal line indicates a one-to-one correlation.	3-82
Figure 3.3-20 Spatial distribution of earthquakes in the CEUS SSC Project catalog with instrumental M_L magnitudes.....	3-83
Figure 3.3-21 Spatial distribution of earthquakes in the CEUS SSC Project catalog with instrumental M_L magnitudes and M magnitudes	3-84
Figure 3.3-22 M_L - M data from the CEUS SSC Project catalog and robust regression fit to the data	3-85
Figure 3.3-23 Relationship between M_N and M_L for the GSC data	3-86
Figure 3.3-24 Data from the northeastern portion of the study region with M_L and M_C or M_D magnitude from catalog sources other than the GSC	3-87
Figure 3.3-25 Data from the northeastern portion of the study region with M_L and M magnitudes from sources other than the GSC.....	3-88
Figure 3.3-26 Spatial distribution of earthquakes in the CEUS SSC Project catalog with $M_S \geq 3$ magnitudes	3-89
Figure 3.3-27 M_S - M data from the CEUS SSC Project catalog and quadratic polynomial fit to the data	3-90
Figure 3.3-28 Spatial distribution of earthquakes in the CEUS SSC Project catalog with $M_C \geq 2.5$ magnitudes	3-91

Figure 3.3-29 Spatial distribution of earthquakes in the CEUS SSC Project catalog with $M_C \geq 2.5$ and M magnitudes	3-92
Figure 3.3-30 Spatial distribution of earthquakes in the CEUS SSC Project catalog with $M_D \geq 3$ magnitudes	3-93
Figure 3.3-31 Spatial distribution of earthquakes in the CEUS SSC Project catalog with both M_D and M magnitudes	3-94
Figure 3.3-32 M_C - M data from the CEUS SSC Project catalog and linear regression fit to the data	3-95
Figure 3.3-33 Spatial distribution of earthquakes with reported M_C and M_D magnitudes	3-96
Figure 3.3-34 Comparison of M_C and M_D magnitudes for the LDO and WES catalogs	3-97
Figure 3.3-35 Comparison of M_C with M_D for at least one of the two magnitude types reported in the OKO catalog	3-98
Figure 3.3-36 Comparison of M_C with M_D for at least one of the two magnitude types reported in the CERI catalog	3-99
Figure 3.3-37 Comparison of M_C with M_D for at least one of the two magnitude types reported in the SCSN catalog	3-100
Figure 3.3-38 Comparison of M_C with M_D for at least one of the two magnitude types reported in other catalogs for earthquakes in the Midcontinent portion of the study region	3-101
Figure 3.3-39 Relationship between M and M_C , M_D , or M_L for the Midcontinent portion of the study region	3-102
Figure 3.3-40 Comparison of M_C and M_D magnitudes with M_L magnitudes for the region between longitudes 105°W and 100°W	3-103
Figure 3.3-41 Comparison of m_b magnitudes with M_L magnitudes for the region between longitudes 105°W and 100°W	3-104
Figure 3.3-42 Comparison of m_b magnitudes with M_C and M_D magnitudes for the region between longitudes 105°W and 100°W	3-105
Figure 3.3-43 Spatial distribution of earthquake with $\ln(\text{FA})$ in the CEUS SSC Project catalog	3-106
Figure 3.3-44 Catalog $\ln(\text{FA})$ - M data and fitted model	3-107
Figure 3.3-45 Spatial distribution of earthquakes in the CEUS SSC Project catalog with reported values of I_0	3-108
Figure 3.3-46 I_0 and M data for earthquakes in the CEUS SSC Project catalog. Curves show locally weighted least-squares fit (Loess) to the data and the relationship published by Johnston (1996b).	3-109
Figure 3.3-47 I_0 and m_b data from the NCEER91 catalog. Plotted are the relationships between I_0 and m_b developed by EPRI (1988) (EPRI-SOG) and Sibol et al. (1987)	3-110
Figure 3.3-48 Categorical model fits of I_0 as a function and M for earthquakes in the CEUS SSC Project catalog	3-111
Figure 3.3-49 Results from proportional odds logistic model showing the probability of individual intensity classes as a function of M	3-112
Figure 3.3-50 Comparison of I_0 and m_b data from the CEUS SSC Project catalog for those earthquakes with reported values of M (M set) and the full catalog (full set). Locally weighted least-squares fits to the two data sets are shown along with the	

relationship use to develop the EPRI (1988) catalog and the Sibol et al. (1987) relationship used in the NCEER91 catalog	3-113
Figure 3.3-51 Linear fits to the data from Figure 3.3-50 for $I_0 \geq V$	3-114
Figure 3.3-52 Comparison of I_0 and m_b data from the project, with m_b adjusted for the difference in m_b to M scaling	3-115
Figure 3.3-53 Linear fits to the data from Figure 3.3-52 for $I_0 \geq V$	3-116
Figure 3.3-54 Composite I_0 – M data set used for assessment of I_0 scaling relationship	3-117
Figure 3.3-55 Linear and inverse sigmoid models fit to the project data for $I_0 > IV$	3-118
Figure 3.4-1 Illustration of process used to identify clusters of earthquakes (from EPRI, 1988, Vol. 1): (a) local and extended time and distance windows, (b) buffer window, and (c) contracted window	3-119
Figure 3.4-2 Identification of secondary (dependent) earthquakes inside the cluster region through Poisson thinning (from EPRI, 1988, Vol. 1)	3-120
Figure 3.4-3 Comparison of dependent event time and distance windows with results for individual clusters in the project catalog	3-121
Figure 3.5-1 Earthquake catalog and catalog completeness regions used in EPRI-SOG (EPRI, 1988)	3-122
Figure 3.5-2 CEUS SSC Project earthquake catalog and modified catalog completeness regions	3-123
Figure 3.5-3 Plot of year versus location for the CEUS SSC Project earthquake catalog. Red lines indicate the boundaries of the catalog completeness time periods	3-124
Figure 3.5-4 (1 of 7) “Stepp” plots of earthquake recurrence rate as a function of time for the individual catalog completeness regions shown on Figure 3.5-2	3-125
Figure 3.5-4 (2 of 7) “Stepp” plots of earthquake recurrence rate as a function of time for the individual catalog completeness regions shown on Figure 3.5-2	3-126
Figure 3.5-4 (3 of 7) “Stepp” plots of earthquake recurrence rate as a function of time for the individual catalog completeness regions shown on Figure 3.5-2	3-127
Figure 3.5-4 (4 of 7) “Stepp” plots of earthquake recurrence rate as a function of time for the individual catalog completeness regions shown on Figure 3.5-2	3-128
Figure 3.5-4 (5 of 7) “Stepp” plots of earthquake recurrence rate as a function of time for the individual catalog completeness regions shown on Figure 3.5-2	3-129
Figure 3.5-4 (6 of 7) “Stepp” plots of earthquake recurrence rate as a function of time for the individual catalog completeness regions shown on Figure 3.5-2	3-130
Figure 3.5-4 (7 of 7) “Stepp” plots of earthquake recurrence rate as a function of time for the individual catalog completeness regions shown on Figure 3.5-2	3-131
Figure 4.1.1-1 Example logic tree from the PEGASOS project (NAGRA, 2004) showing the assessment of alternative conceptual models on the logic tree. Each node of the logic tree represents an assessment that is uncertain. Alternative branches represent the alternative models or parameter values, and the weights associated with each branch reflect the TI Team’s relative degree of belief that each branch is the correct model or parameter value.	4-40
Figure 4.1.1-2 Example logic tree from the PVHA-U (SNL, 2008) project showing the treatment of alternative conceptual models in the logic tree	4-41

Figure 4.2.1-1 Master logic tree showing the Mmax zones and seismotectonic zones alternative conceptual models for assessing the spatial and temporal characteristics of future earthquake sources in the CEUS.....	4-42
Figure 4.2.2-1 Example of a logic tree for RLME sources. Shown is the tree for the Marianna RLME source.	4-43
Figure 4.2.2-2 Map showing RLME sources, some with alternative source geometries (discussed in Section 6.1).	4-44
Figure 4.2.3-1 Logic tree for the Mmax zones branch of the master logic tree.....	4-45
Figure 4.2.3-2 Subdivision used in the Mmax zones branch of the master logic tree. Either the region is considered one zone for purposes of Mmax or the region is divided into two zones as shown: a Mesozoic-and-younger extension (MESE) zone and a non-Mesozoic-and-younger zone (NMESE). In this figure the “narrow” MESE zone is shown	4-46
Figure 4.2.3-3 Subdivision used in the Mmax zones branch of the master logic tree. Either the region is considered one zone for purposes of Mmax or the region is divided into two zones as shown: a Mesozoic-and-younger extension (MESE) zone and a non-Mesozoic-and-younger zone (NMESE). In this figure the “wide” MESE zone is shown	4-47
Figure 4.2.4-1(a) Logic tree for the seismotectonic zones branch of the master logic tree	4-48
Figure 4.2.4-1(b) Logic tree for the seismotectonic zones branch of the master logic tree	4-49
Figure 4.2.4-2 Seismotectonic zones shown in the case where the Rough Creek Graben is not part of the Reelfoot Rift (RR), and the Paleozoic Extended Zone is narrow (PEZ-N)	4-50
Figure 4.2.4-3 Seismotectonic zones shown in the case where the Rough Creek Graben is part of the Reelfoot Rift (RR-RCG), and the Paleozoic Extended Zone is narrow (PEZ-N)	4-51
Figure 4.2.4-4 Seismotectonic zones shown in the case where the Rough Creek Graben is not part of the Reelfoot Rift (RR), and the Paleozoic Extended Crust is wide (PEZ-W)	4-52
Figure 4.2.4-5 Seismotectonic zones shown in the case where the Rough Creek Graben is part of the Reelfoot Rift (RR-RCG), and the Paleozoic Extended Crust is wide (PEZ-W)	4-53
Figure 5.2.1-1 Diagrammatic illustration of the Bayesian Mmax approach showing (a) the prior distribution, (b) the likelihood function, and (c) the posterior distribution. The posterior distribution is represented by a discrete distribution (d) for implementation in hazard analysis.	5-72
Figure 5.2.1-2 Diagrammatic illustration of the Bayesian Mmax approach showing (a) the prior distribution, (b) the likelihood function, and (c) the posterior distribution. The posterior distribution is represented by a discrete distribution (d) for implementation in hazard analysis.	5-73
Figure 5.2.1-3 Median values of $m_{\max-obs}$ as a function of maximum magnitude, m^u , and sample size N , the number of earthquakes $\geq M$ 4.5.....	5-74
Figure 5.2.1-4 Histograms of $m_{\max-obs}$ for extended and non-extended superdomains	5-75

Figure 5.2.1-5 Histograms of $m_{\max-obs}$ for Mesozoic-and-younger extended (MESE) superdomains and for older extended and non-extended (NMESE) superdomains	5-76
Figure 5.2.1-6 Histograms of $m_{\max-obs}$ for Mesozoic-and-younger extended (MESE) superdomains and for older extended and non-extended (NMESE) superdomains using age of most recent extension for the age classification	5-77
Figure 5.2.1-7 Histograms of $m_{\max-obs}$ for Mesozoic-and-younger extended (MESE) superdomains and for older extended and non-extended (NMESE) superdomains using final sets indicated by asterisks in Tables 5.2.1-1 and 5.2.1-2	5-78
Figure 5.2.1-8 Histograms of $m_{\max-obs}$ for combined (COMB) superdomains using final sets indicated by asterisks in Table 5.2.1-3	5-79
Figure 5.2.1-9 Bias adjustments from $m_{\max-obs}$ to m^u for the three sets of superdomain analysis results presented in Table 5.2.1-4	5-80
Figure 5.2.1-10 Results of simulations of estimates of Mmax using the Bayesian approach for earthquake catalogs ranging in size from 1 to 1,000 earthquakes. True Mmax is set at the mean of the prior distribution	5-81
Figure 5.2.1-11 Comparison of the Kijko (2004) estimates of m^u for given values of $m_{\max-obs}$ and N , the number of earthquakes of magnitude ≥ 4.5 . Also shown is the median value of $m_{\max-obs}$ for given m^u obtained using Equation 5.2.1-2	5-82
Figure 5.2.1-12 Behavior of the cumulative probability function for m^u (Equation 5.2.1-9) for the K-S-B estimator and a value of $m_{\max-obs}$ equal to 6	5-83
Figure 5.2.1-13 Example Mmax distribution assessed for the Mesozoic-and-younger extended Mmax zone for the case where the zone is "narrow" (MESE-N). Distributions are shown for the Kijko approach and for the Bayesian approach using either the Mesozoic-and-younger extended prior distribution or the composite prior distribution. The final composite Mmax distribution, which incorporates the relative weights, is shown by the red probability distribution.	5-84
Figure 5.2.1-14 Example Mmax distribution assessed for the Northern Appalachian seismotectonic zone (NAP). Distributions are shown for the Kijko approach and for the Bayesian approach using either the Mesozoic-and-younger extended prior distribution or the composite prior distribution. Note that the Kijko results are shown in this example for illustration, even though they have zero weight. The final composite Mmax distribution, which incorporates the relative weights, is shown by the red probability distribution.	5-85

Figure E-43 GIS map of Newburyport, Massachusetts, and surrounding region showing preferred age estimates and measured widths of sand dikes. Map projection is USA Contiguous Albers Equal Area Conic, North America Datum 1983.	E-110
Figure E-44 Map of Charlevoix seismic zone and adjacent St. Lawrence Lowlands showing mapped faults and portions of rivers along which reconnaissance and searches for earthquake-induced liquefaction features were performed. Charlevoix seismic zone is defined by concentration of earthquakes and locations of historical earthquakes northeast of Quebec City. Devonian impact structure in vicinity of Charlevoix seismic zone is outlined by black dashed line. Taconic thrust faults are indicated by solid black lines with sawteeth on upper plate; lapetan rift faults are shown by solid black lines with hachure marks on downthrown side (modified from Tuttle and Atkinson, 2010).	E-111
Figure E-45 GIS map of Charlevoix seismic zone and surrounding region showing locations of liquefaction features, including several soft-sediment deformation structures, for which there are and are not radiocarbon data. Note the location of 1988 M 5.9 Saguenay earthquake northwest of the Charlevoix seismic zone. Map projection is USA Contiguous Albers Equal Area Conic, North America Datum 1983.	E-112
Figure E-46 GIS map of Charlevoix seismic zone and surrounding region showing locations of liquefaction features that are modern, historical, or prehistoric in age, or whose ages are poorly constrained. Map projection is USA Contiguous Albers Equal Area Conic, North America Datum 1983.	E-113
Figure E-47 GIS map of Charlevoix seismic zone and surrounding region showing preferred age estimates of liquefaction features; features whose ages are poorly constrained are excluded. Map projection is USA Contiguous Albers Equal Area Conic, North America Datum 1983.	E-114
Figure E-48 GIS map of Charlevoix seismic zone and surrounding region showing measured widths of sand dikes. Map projection is USA Contiguous Albers Equal Area Conic, North America Datum 1983.	E-115
Figure E-49 GIS map of Charlevoix seismic zone and surrounding region showing preferred age estimates and measured widths of sand dikes. Map projection is USA Contiguous Albers Equal Area Conic, North America Datum 1983.	E-116
Figure E-50 Photograph of moderate-sized sand blow (12 m long, 7 m wide, and 14 cm thick) that formed about 40 km from epicenter of 2001 M 7.7 Bhuj, India, earthquake (from Tuttle, Hengesh, et al., 2002), combined with schematic vertical section illustrating structural and stratigraphic relations of sand blow, sand dike, and source layer (modified from Sims and Garvin, 1995).	E-117
Figure E-51 Tree trunks buried and killed by sand blows, vented during 1811-1812 New Madrid earthquakes (from Fuller, 1912).	E-118

Figure E-52 Large sand-blow crater that formed during 2002 M 7.7 Bhuj, India, earthquake. Backpack for scale. Photograph: M. Tuttle (2001).	E-119
Figure E-53 Sand-blow crater that formed during 1886 Charleston, South Carolina, earthquake. Photograph: J.K. Hillers (from USGS Photograph Library).	E-120
Figure E-54 Photograph of sand blow and related sand dikes exposed in trench wall and floor in New Madrid seismic zone. Buried soil horizon is displaced downward approximately 1 m across two dikes. Clasts of soil horizon occur within dikes and overlying sand blow. Degree of soil development above and within sand blow suggests that it is at least several hundred years old and formed prior to 1811-1812 New Madrid earthquakes. Organic sample (location marked by red flag) from crater fill will provide close minimum age constraint for formation of sand blow. For scale, each colored intervals on shovel handle represents 10 cm. Photograph: M. Tuttle.....	E-121
Figure E-55 Sand dikes, ranging up to 35 cm wide, originate in pebbly sand layer and intrude overlying diamicton, These features were exposed in cutbank along Cahokia Creek about 25 km northeast of downtown St. Louis (from Tuttle, 2000).	E-122
Figure E-56 Photograph of small diapirs of medium sand intruding base of overlying deposit of interbedded clayey silt and very fine sand, and clasts of clayey silt in underlying medium sand, observed along Ouelle River in Charlevoix seismic zone. Sand diapirs and clasts probably formed during basal erosion and foundering of clayey silt due to liquefaction of the underlying sandy deposit. Red portion of shovel handle represents 10 cm (modified from Tuttle and Atkinson, 2010).	E-123
Figures E-57 (A) Load cast formed in laminated sediments of Van Norman Lake during 1952 Kern County, California, earthquake. Photograph: J. Sims (from Sims, 1975). (B) Load cast, pseudonodules, and related folds formed in laminated sediment exposed along Malbaie River in Charlevoix seismic zone. Sand dikes crosscutting these same laminated sediments occur at a nearby site. For scale, each painted interval of the shovel handle represents 10 cm (modified from Tuttle and Atkinson, 2010).	E-124
Figure E-58 Log of sand blow and uppermost portions of related sand dikes exposed in trench wall at Dodd site in New Madrid seismic zone. Sand dikes were also observed in opposite wall and trench floor. Sand blow buries pre-event A horizon, and a subsequent A horizon has developed in top of sand blow. Radiocarbon dating of samples collected above and below sand blow brackets its age between 490 and 660 yr BP. Artifact assemblage indicates that sand blow formed during late Mississippian (300–550 yr BP or AD 1400–1670) (modified from Tuttle, Collier, et al., 1999).	E-125
Figures E-59 (A) Photograph of earthquake-induced liquefaction features found in association with cultural horizon and pit exposed in trench wall near Blytheville, Arkansas, in New Madrid seismic zone. Photograph: M. Tuttle. (B) Trench log of features shown in (A). Sand dike formed in thick Native American occupation horizon containing artifacts of early Mississippian cultural period (950–1,150 yr BP). Cultural pit dug into top of sand dike contains artifacts and charcoal used to constrain minimum age of liquefaction features (modified from Tuttle and Schweig, 1995).	E-126
Figure E-60 In situ tree trunks such as this one buried and killed by sand blow in New Madrid seismic zone offer opportunity to date paleoearthquakes to the year and season of occurrence. Photograph: M. Tuttle.	E-127

Figure E-61 Portion of dendrocalibration curve illustrating conversion of radiocarbon age to calibrated date in calendar years. In example, 2-sigma radiocarbon age of 2,280–2,520 BP is converted to calibrated date of 770–380 BC (from Tuttle, 1999).	E-128
Figure E-62 Empirical relation developed between A horizon thickness of sand blows and years of soil development in New Madrid region. Horizontal bars reflect uncertainties in age estimates of liquefaction features; diamonds mark midpoints of possible age ranges (from Tuttle et al., 2000).....	E-129
Figure E-63 Diagram illustrating earthquake chronology for New Madrid seismic zone for past 5,500 years based on dating and correlation of liquefaction features at sites (listed at top) across region from north to south. Vertical bars represent age estimates of individual sand blows, and horizontal bars represent event times of 138 yr BP (AD 1811-1812); 500 yr BP \pm 150 yr; 1,050 yr BP \pm 100 yr; and 4,300 yr BP \pm 200 yr (modified from Tuttle, Schweig, et al., 2002; Tuttle et al., 2005).	E-130
Figure E-64 Diagram illustrating earthquake chronology for New Madrid seismic zone for past 2,000 years, similar to upper portion of diagram shown in Figure E-63. As in Figure E-63, vertical bars represent age estimates of individual sand blows, and horizontal bars represent event times. Analysis performed during CEUS SSC Project derived two possible uncertainty ranges for timing of paleoearthquakes, illustrated by the darker and lighter portions of the colored horizontal bars, respectively: 503 yr BP \pm 8 yr or 465 yr BP \pm 65 yr, and 1,110 yr BP \pm 40 yr or 1055 \pm 95 yr (modified from Tuttle, Schweig, et al., 2002).....	E-131
Figure E-65 Maps showing spatial distributions and sizes of sand blows and sand dikes attributed to 500 and 1,050 yr BP events. Locations and sizes of liquefaction features that formed during AD 1811-1812 (138 yr BP) New Madrid earthquake sequence shown for comparison (modified from Tuttle, Schweig, et al., 2002).	E-132
Figure E-66 Liquefaction fields for 138 yr BP (AD 1811-1812); 500 yr BP (AD 1450); and 1,050 yr BP (AD 900) events as interpreted from spatial distribution and stratigraphy of sand blows (modified from Tuttle, Schweig, et al., 2002). Ellipses define areas where similar-age sand blows have been mapped. Overlapping ellipses indicate areas where sand blows are composed of multiple units that formed during sequence of earthquakes. Dashed ellipse outlines area where historical sand blows are composed of four depositional units. Magnitudes of earthquakes in 500 yr BP and 1,050 yr BP are inferred from comparison with 1811-1812 liquefaction fields. Magnitude estimates of December (D), January (J), and February (F) main shocks and large aftershocks taken from several sources; rupture scenario from Johnston and Schweig (1996; modified from Tuttle, Schweig, et al., 2002).	E-133
Figure E-67 Empirical relation between earthquake magnitude and epicentral distance to farthest known sand blows induced by instrumentally recorded earthquakes (modified from Castilla and Audemard, 2007).....	E-134
Figure E-68 Distances to farthest known liquefaction features indicate that 500 and 1,050 yr BP New Madrid events were at least of M 6.7 and 6.9, respectively, when plotted on Ambraseys (1988) relation between earthquake magnitude and epicentral distance to farthest surface expression of liquefaction. Similarity in size distribution of historical and prehistoric sand blows, however, suggests that paleoearthquakes were comparable in magnitude to 1811-1812 events or M \sim 7.6 (modified from Tuttle, 2001). EXECUTIVE SUMMARY

The Central and Eastern United States Seismic Source Characterization for Nuclear Facilities (CEUS SSC) Project was conducted over the period from April 2008 to December 2011 to provide a regional seismic source model for use in probabilistic seismic hazard analyses (PSHAs) for nuclear facilities. The study replaces previous regional seismic source models conducted for this purpose, including the Electric Power Research Institute–Seismicity Owners Group (EPRI-SOG) model (EPRI, 1988, 1989) and the Lawrence Livermore National Laboratory model (Bernreuter et al., 1989). Unlike the previous studies, the CEUS SSC Project was sponsored by multiple stakeholders—namely, the EPRI Advanced Nuclear Technology Program, the Office of Nuclear Energy and the Office of the Chief of Nuclear Safety of the U.S. Department of Energy (DOE), and the Office of Nuclear Regulatory Research of the Nuclear Regulatory Commission (NRC). The study was conducted using Senior Seismic Hazard Analysis Committee (SSHAC) Study Level 3 methodology to provide high levels of confidence that the data, models, and methods of the larger technical community have been considered and the center, body, and range of technically defensible interpretations have been included.

The regional seismic source characterization (SSC) model defined by this study can be used for site-specific PSHAs, provided that appropriate site-specific assessments are conducted as required by current regulations and regulatory guidance for the nuclear facility of interest. This model has been designed to be compatible with current and anticipated ground-motion characterization (GMC) models. The current recommended ground-motion models for use at nuclear facilities are those developed by EPRI (2004, 2006a, 2006b). The ongoing Next Generation Attenuation–East (NGA-East) project being supported by the NRC, DOE, and EPRI will provide ground-motion models that are appropriate for use with the CEUS SSC model. The methodology for a SSHAC Level 3 project as applied to the CEUS SSC Project is explained in the SSHAC report (Budnitz et al., 1997), which was written to discuss the evolution of expert assessment methodologies conducted during the previous three decades for purposes of probabilistic risk analyses. The methodological guidance provided in the SSHAC report was intended to build on the lessons learned from those previous studies and, specifically, to arrive at processes that would make it possible to avoid the issues encountered by the previous studies (NRC, 2011).

The SSHAC assessment process, which differs only slightly for Level 3 and 4 studies, is a technical process accepted in the NRC’s seismic regulatory guidance (Regulatory Guide 1.208) for ensuring that uncertainties in data and scientific knowledge have been properly represented in seismic design ground motions consistent with the requirements of the seismic regulation 10 CFR Part 100.23 (“Geologic and Seismic Siting Criteria”). Therefore, the goal of the SSHAC assessment process is the proper and complete representation of knowledge and uncertainties in the SSC and GMC inputs to the PSHA (or similar hazard analysis). As discussed extensively in

the SSHAC report (Budnitz et al., 1997) and affirmed in NRC (2011), a SSHAC assessment process consists of two important sequential activities, *evaluation* and *integration*. For a Level 3 assessment, these activities are conducted by the Technical Integration (TI) Team under the leadership of the TI Lead. As described in NRC (2011),

The fundamental goal of a SSHAC process is to carry out properly and document completely the activities of evaluation and integration, defined as:

Evaluation: The consideration of the complete set of data, models, and methods proposed by the larger technical community that are relevant to the hazard analysis.

Integration: Representing the center, body, and range of technically defensible interpretations in light of the evaluation process (i.e., informed by the assessment of existing data, models, and methods).

Each of the assessment and model-building activities of the CEUS SSC Project is associated with the evaluation and integration steps in a SSHAC Level 3 process. Consistent with the requirements of a SSHAC process, the specific roles and responsibilities of all project participants were defined in the Project Plan, and adherence to those roles was the responsibility of the TI Lead and the Project Manager. The technical assessments are made by the TI Team, who carry the principal responsibility of evaluation and integration, under the technical leadership of the TI Lead. The Database Manager and other technical support individuals assist in the development of work products. Resource and proponent experts participate by presenting their data, models, and interpretations at workshops and through technical interchange with the TI Team throughout the project. The Participatory Peer Review Panel (PPRP) is responsible for a continuous review of both the SSHAC process being followed and the technical assessments being made. The project management structure is headed by the Project Manager, who serves as the liason with the sponsors and the PPRP and manages the activities of all participants. The SSHAC Level 3 assessment process and implementation is discussed in depth in Chapter 2 of this report.

Each of the methodology steps in the SSHAC guidelines (Budnitz, 1997) was addressed adequately during the CEUS SSC Project. Furthermore, the project developed a number of enhancements to the process steps for conducting a SSHAC Study Level 3 project. For example, the SSHAC guidelines call for process steps that include developing a preliminary assessment model, calculating hazard using that model in order to identify the key issues, and finalizing the model in light of the feedback provided from the hazard calculations and sensitivity analyses. Because of the regional nature of the project and the multitude of assessments required, four rounds of model-building and three rounds of feedback were conducted. These activities ensured that all significant issues and uncertainties were identified and that the appropriate effort was devoted to the issues of most significance to the hazard results. A comparison of the activities conducted during the CEUS SSC Project with those recommended in the SSHAC guidelines themselves (Section 2.6) led to the conclusion that the current standards of practice have been met for a SSHAC Study Level 3 process—both those that are documented in the SSHAC report and those that resulted from precedents set by projects conducted since the SSHAC report was issued.

The catalog of past earthquakes that have occurred in a region is an important source of information for the quantification of future seismic hazards. This is particularly true in stable continental regions (SCRs) such as the CEUS where the causative mechanisms and structures for the occurrence of damaging earthquakes are generally poorly understood, and the rates of crustal deformation are low such that surface and near-surface indications of stresses in the crust and the buildup and release of crustal strains are difficult to quantify. Because the earthquake catalog is used in the characterization of the occurrence of future earthquakes in the CEUS, developing an updated earthquake catalog for the study region was an important focus of the CEUS SSC Project. The specific goals for earthquake catalog development and methods used to attain those goals are given in Chapter 3.

The earthquake catalog development consists of four main steps: catalog compilation, assessment of a uniform size measure to apply to each earthquake, identification of dependent earthquakes (catalog declustering), and assessment of the completeness of the catalog as a function of location, time, and earthquake size. An important part of the catalog development process was review by seismologists with extensive knowledge and experience in catalog compilation. The result is an earthquake catalog covering the entire study region for the period from 1568 through the end of 2008. Earthquake size is defined in terms of the moment magnitude scale (Hanks and Kanamori, 1979), consistent with the magnitude scale used in modern ground-motion prediction equations (GMPEs) for CEUS earthquakes. A significant contribution of the CEUS SSC Project is the work conducted to develop an updated and consistent set of conversion relationships between various earthquake size measures (instrumental magnitudes and intensity) and moment magnitude.

The conceptual SSC framework described in Chapter 4 was developed early in the CEUS SSC Project in order to provide a consistent approach and philosophy to SSC by the TI Team. This framework provides the basic underpinnings of the SSC model developed for the project, and it led to the basic structure and elements of the master logic tree developed for the SSC model. In considering the purpose of the CEUS SSC Project, the TI Team identified three attributes that are needed for a conceptual SSC framework:

1. A systematic, documented approach to treating alternatives using logic trees, including alternative conceptual models for future spatial distributions of seismicity (e.g., stationarity); alternative methods for expressing the future temporal distribution of seismicity (e.g., renewal models, Poisson models); and alternative data sets for characterizing seismic sources (e.g., paleoseismic data, historical seismicity data).
2. A systematic approach to identifying applicable data for the source characterization, evaluating the usefulness of the data, and documenting the consideration given to the data by the TI Team.
3. A methodology for identifying seismic sources based on defensible criteria for defining a seismic source, incorporating the lessons learned in SSC over the past two decades, and identifying the range of approaches and models that can be shown to be significant to hazard.

Each of these needs was addressed by the methodology used in the project. For example, the need for a systematic approach to identifying and evaluating the data and information that underlie the source characterization assessments was met by the development of Data Summary

and Data Evaluation tables. These tables were developed for each seismic source to document the information available at the time of the CEUS SSC assessments (the Data Summary tables) and the way those data were used in the characterization process (the Data Evaluation tables). Given the evolution of approaches to identifying seismic sources, it is appropriate to provide a set of criteria and the logic for their application in the CEUS SSC Project. In the project, unique seismic sources are defined to account for distinct differences in the following criteria:

- Earthquake recurrence rate
- Maximum earthquake magnitude (Mmax)
- Expected future earthquake characteristics (e.g., style of faulting, rupture orientation, depth distribution)
- Probability of activity of tectonic feature(s)

Rather than treat these criteria as operating simultaneously or without priority, the CEUS SSC methodology works through them sequentially. Further, because each criterion adds complexity to the seismic source model, it is applied only if its application would lead to hazard-significant changes in the model. In this way, the model becomes only as complex as required by the available data and information.

The CEUS SSC master logic tree is tied to the conceptual SSC framework that establishes the context for the entire seismic source model. The master logic tree depicts the alternative interpretations and conceptual models that represent the range of defensible interpretations, and the relative weights assessed for the alternatives. By laying out the alternatives initially, the subsequent detailed source evaluations were conducted within a framework that ensures consistency across the sources. Important elements of the master logic tree are as follows:

- Representation of the sources defined based on paleoseismic evidence for the occurrence of repeated large-magnitude earthquakes (RLMEs, defined as two or more earthquakes with $M \geq 6.5$).
- Alternatives to the spatial distribution of earthquakes based on differences in maximum magnitudes (Mmax zones approach).
- Representation of uncertainty in spatial stationarity of observed seismicity based on smoothing of recurrence parameters.
- Representation of possible differences in future earthquake characteristics (e.g., style, seismogenic thickness, and orientation of ruptures), which lead to definition of seismotectonic zones in the logic tree (seismotectonic zones approach).

The methodologies used by the project to make the SSC assessments are discussed in Chapter 5. The heart of any SSC model for PSHA is a description of the future spatial and temporal distribution of earthquakes. Continued analysis of the historical seismicity record and network monitoring by regional and local seismic networks has led to acceptance within the community that the general spatial patterns of observed small- to moderate-magnitude earthquakes provide predictive information about the spatial distribution of future large-magnitude earthquakes. The analyses leading to this conclusion have focused on whether the observed patterns of earthquakes

have varied through time; therefore, in effect, this is an assessment of uncertainty in whether small- to moderate-magnitude earthquakes have been relatively stationary through time. However, the available data on larger-magnitude earthquakes and their relationship to the spatial distribution of smaller earthquakes based on the observed record are quite limited. These data are not sufficient to allow confidence in the predictions generated by empirical spatial models. For this reason, geologic and geophysical data are needed to specify the locations of future earthquakes in addition to the observed patterns of seismicity.

Detailed studies in the vicinity of large historical and instrumental earthquakes, and liquefaction phenomena associated with them, coupled with field and laboratory studies of geotechnical properties, are leading to a stronger technical basis for (1) placing limits on the locations of paleoearthquakes interpreted by the distribution of liquefaction phenomena and (2) defining their magnitudes. In some cases, the paleoseismic evidence for RLMEs is compelling, and the TI Team has included the RLME source in the SSC model. The locations of RLME sources notwithstanding, the spatial distribution of distributed seismicity sources has advanced in PSHA largely because of the assumption of spatial stationarity, and the SSC and hazard community uses approaches to “smooth” observed seismicity to provide a map that expresses the future spatial pattern of recurrence rates. The CEUS SSC model is based largely on the assumption, typical in PSHA studies, that spatial stationarity of seismicity is expected to persist for a period of approximately 50 years.

Estimating M_{\max} in SCRs such as the CEUS is highly uncertain despite considerable interest and effort by the scientific community over the past few decades. M_{\max} is defined as the upper truncation point of the earthquake recurrence curve for individual seismic sources, and the typically broad distribution of M_{\max} for any given source reflects considerable epistemic uncertainty. Because the maximum magnitude for any given seismic source in the CEUS occurs rarely relative to the period of observation, the use of the historical seismicity record provides important but limited constraints on the magnitude of the maximum event. Because of the independent constraints on earthquake size, those limited constraints are used to estimate the magnitudes of RLME. For distributed seismicity source zones, two approaches are used to assess M_{\max} : the Bayesian approach and the Kijko approach. In the Bayesian procedure (Johnston et al., 1994), the prior distribution is based on the magnitudes of earthquakes that occurred worldwide within tectonically analogous regions. As part of the CEUS SSC Project, the TI Team pursued the refinement and application of the Bayesian M_{\max} approach because it provides a quantitative and repeatable process for assessing M_{\max} .

The TI Team also explored alternative approaches for the assessment of M_{\max} that provide quantitative and repeatable results, and the team identified the approach developed by Kijko (2004) as a viable alternative. While the Kijko approach requires fewer assumptions than the Bayesian approach in that it uses only the observed earthquake statistics for the source, this is offset by the need for a relatively larger data sample in order to get meaningful results. Both approaches have the positive attribute that they are repeatable given the same data and they can be readily updated given new information. The relative weighting of the two approaches for inclusion in the logic tree is source-specific, a function of the numbers of earthquakes that are present within the source upon which to base the M_{\max} assessment: sources with fewer earthquakes are assessed to have little or no weight for the Kijko approach, while those with

larger numbers of events are assessed higher weight for the Kijko approach. In all cases, because of the stability of the Bayesian approach and the preference for “analogue” approaches within the larger technical community, the Bayesian approach is assessed higher weight than the Kijko approach for all sources.

A major effort was devoted to updating the global set of SCR earthquakes and to assessing statistically significant attributes of those earthquakes following the approach given in Johnston et al. (1994). In doing so, it was found that the only significant attribute defining the prior distribution is the presence or absence of Mesozoic-or-younger extension. The uncertainty in this assessment is reflected in the use of two alternative priors: one that takes into account the presence or absence of crustal domains having this attribute, and another that combines the entire CEUS region as a single SCR crustal domain with a single prior distribution. The use of the Bayesian—and Kijko—approach requires a definition of the largest observed magnitude within each source, and this assessment, along with the associated uncertainty, was incorporated into the Mmax distributions for each seismic source. Consideration of global analogues led to the assessment of an upper truncation to all Mmax distributions at 8¼ and a lower truncation at 5½. The broad distributions of Mmax for the various seismic source zones reflect the current epistemic uncertainty in the largest earthquake magnitude within each seismic source.

The CEUS SSC model is based to a large extent on an assessment that spatial stationarity of seismicity will persist for time periods of interest for PSHA (approximately the next 50 years). Stationarity in this sense does not mean that future locations and magnitudes of earthquakes will occur exactly where they have occurred in the historical and instrumental record. Rather, the degree of spatial stationarity varies as a function of the type of data available to define the seismic source. RLME sources are based largely on paleoseismic evidence for repeated large-magnitude ($M \geq 6.5$) earthquakes that occur in approximately the same location over periods of a few thousand years. On the other hand, patterns of seismicity away from the RLME sources within the Mmax and seismotectonic zones are defined from generally small- to moderate-magnitude earthquakes that have occurred during a relatively short (i.e., relative to the repeat times of large events) historical and instrumental record. Thus, the locations of future events are not as tightly constrained by the locations of past events as for RLME sources. The spatial smoothing operation is based on calculations of earthquake recurrence within one-quarter-degree or half-degree cells, with allowance for “communication” between the cells. Both *a*- and *b*-values are allowed to vary, but the degree of variation has been optimized such that *b*-values vary little across the study region.

The approach used to smooth recurrence parameters is a refinement of the penalized-likelihood approach used in EPRI-SOG (EPRI, 1988), but it is designed to include a number of elements that make the formulation more robust, realistic, and flexible. These elements include the reformulation in terms of magnitude bins, the introduction of magnitude-dependent weights, catalog incompleteness, the effect of Mmax, spatial variation of parameters within the source zone, and the prior distributions of *b*. A key assessment made by the TI Team was the weight assigned to various magnitude bins in the assessment of smoothing parameters (Cases A, B, and E). This assessment represents the uncertainty in the interpretation that smaller magnitudes define the future locations and variation in recurrence parameters. Appropriately, the penalized-likelihood approach results in higher spatial variation (less smoothing) when the low-magnitude

bins are included with high weight, and much less variation (higher smoothing) in the case where the lower-magnitude bins are given low or zero weight. The variation resulting from the final set of weights reflects the TI Team's assessment of the epistemic uncertainty in the spatial variation of recurrence parameters throughout the SSC model.

The earthquake recurrence models for the RLME sources are somewhat simpler than those for distributed seismicity sources because the magnitude range for individual RLMEs is relatively narrow and their spatial distribution is limited geographically such that spatial variability is not a concern. This limits the problem to one of estimating the occurrence rate in time of a point process. The data that are used to assess the occurrence rates are derived primarily from paleoseismic studies and consist of two types: data that provide estimated ages of the paleoearthquakes such that the times between earthquakes can be estimated, and data that provide an estimate of the number of earthquakes that have occurred after the age of a particular stratigraphic horizon. These data are used to derive estimates of the RLME occurrence rates and their uncertainty.

The estimation of the RLME occurrence rates is dependent on the probability model assumed for the temporal occurrence of these earthquakes. The standard model applied for most RLME sources in this study is the Poisson model, in which the probability of occurrence of an RLME in a specified time period is completely characterized by a single parameter, λ , the rate of RLME occurrence. The Poisson process is “memoryless”—that is, the probability of occurrence in the next time interval is independent of when the most recent earthquake occurred, and the time between earthquakes is exponentially distributed with a standard deviation equal to the mean time between earthquakes. For two RLME sources (Reelfoot Rift–New Madrid fault system and the Charleston source), the data are sufficient to suggest that the occurrence of RLMEs is more periodic in nature (the standard deviation is less than the mean time between earthquakes). For these RLME sources a simple renewal model can also be used to assess the probability of earthquake occurrence. In making an estimate of the probability of occurrence in the future, this model takes into account the time that has elapsed since the most recent RLME occurrence.

The CEUS SSC model has been developed for use in future PSHAs. To make this future use possible, the SSC model must be combined with a GMC model. At present, the GMPEs in use for SCRs such as the CEUS include limited information regarding the characteristics of future earthquakes. In anticipation of the possible future development of GMPEs for the CEUS that will make it possible to incorporate similar types of information, a number of characteristics of future earthquakes in the CEUS are assessed. In addition to characteristics that might be important for ground motion assessments, there are also assessed characteristics that are potentially important to the modeling conducted for hazard analysis. Future earthquake characteristics assessed include the tectonic stress regime, sense of slip/style of faulting, strike and dip of ruptures, seismogenic crustal thickness, fault rupture area versus magnitude relationship, rupture length-to-width aspect ratio, and relationship of ruptures to source boundaries.

Chapters 6 and 7 include discussions of the seismic sources that are defined by the Mmax zones and the seismotectonic zones branches of the master logic tree. Because of convincing evidence for their existence, both approaches include RLME sources. The rarity of repeated earthquakes relative to the period of historical observation means that evidence for repeated events comes

largely from the paleoseismic record. By identifying the RLMEs and including them in the SSC model, there is no implication that the set of RLMEs included is in fact the total set of RLMEs that might exist throughout the study region. This is because the presently available studies that locate and characterize the RLMEs have been concentrated in certain locations and are not systematic across the entire study region. Therefore, the evidence for the existence of the RLMEs is included in the model where it exists, but the remaining parts of the study region are also assessed to have significant earthquake potential, which is evidenced by the inclusion of moderate-to-large magnitudes in the Mmax distributions for every Mmax zone or seismotectonic zone.

In Chapter 6, each RLME source is described in detail by the following factors: (1) evidence for temporal clustering, (2) geometry and style of faulting, (3) RLME magnitude, and (4) RLME recurrence. The descriptions document how the data have been evaluated and assessed to arrive at the various elements of the final SSC model, including all expressions of uncertainty. The Data Summary and Data Evaluation tables (Appendices C and D) complement the discussions in the text, documenting all the data that were considered in the course of data evaluation and integration process for each particular seismic source.

Alternative models for the distributed seismicity zones that serve as background zones to the RLME sources are either Mmax zones or seismotectonic zones. The Mmax zones are described in Chapter 6 and are defined according to constraints on the prior distributions for the Bayesian approach to estimating Mmax. The seismotectonic zones are described in Chapter 7 and are identified based on potential differences in Mmax as well as future earthquake characteristics. Each seismotectonic zone in the CEUS SSC model is described according to the following attributes: (1) background information from various data sets; (2) bases for defining the seismotectonic zone; (3) basis for the source geometry; (4) basis for the zone Mmax (e.g., largest observed earthquake); and (5) future earthquake characteristics. Uncertainties in the seismotectonic zone characteristics are described and are represented in the logic trees developed for each source.

For purposes of demonstrating the CEUS SSC model, seismic hazard calculations were conducted at seven demonstration sites throughout the study region, as described in Chapter 8. The site locations were selected to span a range of seismic source types and levels of seismicity. The results from the seismic hazard calculations are intended for scientific use to demonstrate the model, and they should not be used for engineering design. Mean hazard results are given for a range of spectral frequencies (PGA, 10 Hz, and 1 Hz) and for a range of site conditions. All calculations were made using the EPRI (2004, 2006) ground-motion models such that results could be compared to understand the SSC effects alone. Sensitivity analyses were conducted to provide insight into the dominant seismic sources and the important characteristics of the dominant seismic source at each site. The calculated mean hazard results are compared with the results using the SSC model from the 2008 U.S. Geological Survey national seismic hazard maps and the SSC model from the Combined Operating License applications for new nuclear power reactors. The hazard results using the CEUS SSC model given in Chapter 8 are reasonable and readily understood relative to the results from other studies, and sensitivities of the calculated hazard results can be readily explained by different aspects of the new model. The TI Team concludes that the SSC model provides reasonable and explainable calculated seismic hazard

results, and the most important aspects of the SSC model to the calculated hazard (e.g., recurrence rates of RLME sources, recurrence parameters for distributed seismicity sources, M_{max}) and their uncertainties have all been appropriately addressed.

Presumably, the GMC model input to the PSHA calculations will be replaced in the future by the results of the ongoing NGA-East project. The calculated hazard at the demonstration sites in Chapter 8 comes from the regional CEUS SSC model and does not include any local refinements that might be necessary to account for local seismic sources. Depending on the regulatory guidance that is applicable for the facility of interest, additional site-specific studies may be required to provide local refinements to the model.

To assist future users of the CEUS SSC model, Chapter 9 presents a discussion on the use of the model for PSHA. The basic elements of the model necessary for hazard calculations are given in the Hazard Input Document (HID). This document provides all necessary parameter values and probability distributions for use in a modern PSHA computer code. The HID does not, however, provide any justification for the values, since that information is given in the text of this report.

Chapter 9 also describes several simplifications to seismic sources that can be made to increase efficiency in seismic hazard calculations. These simplifications are recommended on the basis of sensitivity studies of alternative hazard curves that represent a range of assumptions on a parameter's value. Sensitivities are presented using the test sites in this study. For applications of the seismic sources from this study, similar sensitivity studies should be conducted for the particular site of interest to confirm these results and to identify additional simplifications that might be appropriate. For the seismic sources presented, only those parameters that can be simplified are discussed and presented graphically. The sensitivity studies consisted of determining the sensitivity of hazard to logic tree branches for each node of the logic tree describing that source. The purpose was to determine which nodes of the logic tree could be collapsed to a single branch in order to achieve more efficient hazard calculations without compromising the accuracy of overall hazard results.

Finally, this report provides a discussion of the level of precision that is associated with seismic hazard estimates in the CEUS. This discussion addresses how seismic hazard estimates might change if the analysis were repeated by independent experts having access to the same basic information (geology, tectonics, seismicity, ground-motion equations, site characterization). It also addresses how to determine whether the difference in hazard would be significant if this basic information were to change and that change resulted in a difference in the assessed seismic hazard. This analysis was performed knowing that future data and models will continue to be developed and that a mechanism for evaluating the significance of that information is needed. Based on the precision model evaluated, if an alternative assumption or parameter is used in a seismic hazard study, and it potentially changes the calculated hazard (annual frequency of exceedence) by less than 25 percent for ground motions with hazards in the range 10^{-4} to 10^{-6} , that potential change is within the level of precision at which one can calculate seismic hazard. It should be noted, however, that a certain level of precision does not relieve users from performing site-specific studies to identify potential capable seismic sources within the site region and vicinity as well as to identify newer models and data. Also, this level of precision does not relieve users from fixing any errors that are discovered in the CEUS SSC model as it is

implemented for siting critical facilities. In addition, NRC has not defined a set value for requiring or not requiring siting applicants to revise or update PSHAs.

Included in the report are appendices that summarize key data sets and analyses: the earthquake catalog, the Data Summary and Data Evaluation tables, the paleoliquefaction database, the HID, and documentation important to the SSHAC process. These data and analyses will assist future users of the CEUS SSC model in the implementation of the model for purposes of PSHA. The entire report and database will be provided on a website after the Final Project Report is issued.

The TI Team, Project Manager, and Sponsors determined the approach for quality assurance on the CEUS SSC Project in 2008, taking into account the SSHAC assessment process and national standards. The approach was documented in the CEUS SSC Project Plan dated June 2008 and discussed in more detail in the CEUS SSC Report (Appendix L). Beyond the assurance of quality arising from the external scientific review process, it is the collective, informed judgment of the TI Team (via the process of evaluation and integration) and the concurrence of the PPRP (via the participatory peer review process), as well as adherence to the national standard referred to in Appendix L, that ultimately lead to the assurance of quality in the process followed and in the products that resulted from the SSHAC hazard assessment framework.

Gentlemen:

Reference: *Central and Eastern United States Seismic Source Characterization for Nuclear Facilities Project: Participatory Peer Review Panel Final Report*

Introduction

This letter constitutes the final report of the PPRP¹ (“the Panel”) for the *Central and Eastern United States Seismic Source Characterization for Nuclear Facilities Project* (the “CEUS SSC Project” or “the Project”). The eight Panel members (Jon P. Ake, Walter J. Arabasz, William J. Hinze, Annie M. Kammerer, Jeffrey K. Kimball, Donald P. Moore, Mark D. Petersen, J. Carl Stepp) participated in the Project in a manner fully consistent with the SSHAC Guidance.² The Panel was actively engaged in all phases and activities of the Project’s implementation, including final development of the Project Plan and planning of the evaluation and integration activities, which are the core of the SSHAC assessment process.

¹ Participatory Peer Review Panel

² Budnitz, R. J., G. Apostolakis, D. M. Boore, L. S. Cluff, K. L. Coppersmith, C. A. Cornell, and P. A. Morris, 1997. *Recommendations for Probabilistic Seismic Hazard Analysis: Guidance on Uncertainty and the Use of Experts* (known as the “Senior Seismic Hazard Analysis Committee Report,” or the “SSHAC Guidance”). NUREG/CR-6372, U. S. Nuclear Regulatory Commission. TIC; 235076. Washington, DC.

The Panel's involvement, described more fully later in this letter, also included review of analyses performed by the Project to support the evaluation and integration processes, review of interim evaluation and integration products, and review of the interim draft project report and the final project report. Additionally, panel members participated in specific analyses as resource experts, and panel members were observers in or participated as resource experts in eight of the eleven Technical Integrator Team (TI Team) working meetings held to implement the integration phase of the assessment process. We want to express our appreciation for the opportunity to participate in the CEUS SSC Project in this way.

In the remainder of this letter we provide our observations and conclusions on key elements of the project implementation process, and we summarize our reviews of the draft and final project reports. As we explain in our comments, assurance that the center, body, and range of the technically-defensible interpretations ("CBR of the TDI")³ have been properly represented in the CEUS SSC Model fundamentally comes from implementing the structure and rigor of the SSHAC Guidance itself. We are aware that the SSHAC Guidance is accepted by the Nuclear Regulatory Commission and the Department of Energy for developing seismic hazard models that provide reasonable assurance, consistent with the seismic safety decision-making practices of these agencies, of compliance with their seismic safety policies and regulatory requirements. For these reasons, we describe aspects of the SSHAC Guidance to provide context for our observations and conclusions.

Project Plan: Conformity to the SSHAC Assessment Process

The SSHAC Guidance recognizes that observed data, available methods, models, and interpretations all contain uncertainties. These uncertainties lead to alternative scientific analyses and interpretations. In other words, experts in the broad technical community do not hold a single interpretation. Accepting this scientific situation, the SSHAC assessment process is designed to engage the scientific community in an orderly assessment of relevant data, methods, models, and interpretations that constitute current scientific knowledge as the basis for development of a seismic hazard model that represents the CBR of the TDI.

The assessment process is carried out by means of two main activities: *evaluation* and *integration*.⁴ In implementation, the evaluation activities are structured to inform the integration activities. The evaluations are carried out by means of workshops in which the TI Team engages proponents of alternative interpretations that represent the range of relevant current community knowledge. Resource experts in the various relevant data sets are also engaged. The workshops have the dual purposes of, first, evaluating the degree to which alternative interpretations are supported by observed data and, second, defining uncertainties in the degree to which the interpretations are defensible, given the observed data. Integration is carried out by individual evaluator experts or evaluator expert teams (Level 4 process) or by a Technical Integrator (TI) Team (Level 3 process) who, informed by the evaluation activities, characterize the range of

³ See Section 2.1 in the CEUS SSC Final Report for discussion of concepts relating to the center, body, and range of the "technically-defensible interpretations" vs. the center, body, and range of the "informed technical community."

⁴ For an excellent discussion of this two-stage process, see *Practical Implementation Guidelines for SSHAC Level 3 and 4 Hazard Studies*, USNRC NUREG-XXXX, Draft for Review, Office of Nuclear Regulatory Research, May 2011.

defensible alternative interpretations in an integrated hazard model and assess the scientific uncertainty distribution. Based on our review of the Project Plan and our subsequent discussions with the Project Team, we concurred that the Plan conformed with the SSHAC Guidance, incorporating lessons learned from fourteen years experience using the Guidance, and that the planned implementation was structured to properly carry out the SSHAC assessment process for development of the CEUS SSC Model.

SSHAC Level 3 Assessment Process

The SSHAC Guidance describes implementation processes for four levels of assessment depending on the scientific complexity of the assessment and the intended use of the assessed hazard model. For an assessment such as the regional SSC model for the Central and Eastern United States, which will be used at many sites for making safety and licensing decisions for nuclear facilities, the SSHAC Guidance recommends using an assessment Level 3 or Level 4.

There are process differences between a Level 3 and Level 4 implementation, but the objective is the same: to obtain from multiple proponent experts information that supports an informed assessment of the range of existent relevant interpretations and associated uncertainties that together represent current community knowledge and to perform an informed assessment of the CBR of the TDI. We understand that within the SSHAC assessment process “technically defensible” means that observed data are sufficient to support evaluation of the interpretation and the corresponding uncertainty.

In a Level 4 assessment process a TI Team facilitates the assessment, identifying and engaging proponent and resource experts, performing supporting analyses, and conducting knowledge evaluation workshops and assessment integration working meetings. Multiple experts or teams of experts perform as evaluators of the range of existent interpretations and as integrators of the hazard model. The individual evaluator experts or evaluator expert teams take ownership of their individual or team assessments. In a Level 3 assessment all of these activities are consolidated under a single TI Team consisting of a TI Lead, multiple evaluator experts representing the scope of required scientific expertise, and experienced data and hazard analysts.

As we noted earlier in this report, assurance that the CBR of the TDI is properly represented in a hazard model comes from rigorously implementing the SSHAC assessment process itself. We note that an important lesson learned from multiple implementations of the SSHAC Guidance over the past fourteen years is that the Level 3 and Level 4 assessment processes provide comparably high assurance that the relevant scientific knowledge and the community uncertainty distribution are properly assessed and represented in the hazard model. The Level 3 assessment is significantly more integrated and cohesive and is more efficient to implement. These considerations led us to endorse use of the Level 3 assessment for implementation of the CEUS SSC Project in our Workshop No. 1 review letter. During the course of the Project we observed that the higher level of cohesiveness inherent in the Level 3 assessment process leads to significantly improved communication, facilitating the experts’ performance of their technical work.

Overall Project Organization

A complex project with multiple sponsors such as the CEUS SSC Project cannot be successful unless it is well organized and energetically managed so that the various participants understand the interconnectedness of their activities and perform their technical work as a cohesive group. In this regard the adopted project management structure allowed the Project Manager to provide integrated overall project leadership, manage the database development activities, and effectively maintain communication with the PPRP and project sponsors while allowing TI Team lead to concentrate on the structural and technical activities of the assessment as the Project unfolded. We conclude that the project organization was effective overall and particularly so with regard to facilitating the TI Team's implementation of the assessment process.

Implementing the SSHAC Level 3 Assessment Process

Irrespective of the level of implementation, evaluation and integration are the main activities of a SSHAC assessment. The evaluation activities aim to identify and evaluate all relevant available data, models, methods, and scientific interpretations as well as uncertainties associated with each of them. The integration activities, informed by the evaluations, aim to represent the CBR of the TDI in a fully integrated SSC model.

Evaluation

Consistent with the SSHAC Guidance the evaluation phase of the CEUS SSC project accomplished a comprehensive evaluation of the data, models, methods, and scientific interpretations existent in the larger technical community that are relevant to the SSC model. In significant part the process was carried out in three structured workshops, each focusing on accomplishing a specific step in the evaluation process.

The first workshop (WS-1) focused on evaluations of relevant geological, geophysical, and seismological datasets (including data quality and uncertainties) and on identification of hazard-significant data and hazard-significant SSC assessment issues. It became clear that a number of issues relating to the earthquake catalog, the paleoliquefaction data set, the potential-field geophysical data, updating procedures for assessing maximum earthquake magnitude, and development of procedures for assessing earthquake recurrence would require focused analyses. These analyses were appropriately carried out within the TI Team working interactively with appropriate resource experts recognized by the larger scientific and technical community.

WS-2 focused on evaluations of the range of alternative scientific interpretations, methods, and models within the larger scientific community and on corresponding uncertainties. WS-3 focused on evaluations of hazard feedback derived at seven representative test locations using a preliminary CEUS SSC model. Specifically, the workshop focused on the identification of the key issues of most significance to completing the SSC model assessment.

Experience has shown that evaluations to gain understanding of the quality of various data sets and uncertainties associated with them are essential for fully informing an SSC assessment. We observed that in WS-1 resource experts for the various data sets did a high-quality job of describing the data sets and giving their perspective about the data quality and associated uncertainties. We conclude that the understanding of data quality and uncertainties gained in WS-1 together with continued interactions between the TI Team and data resource experts

significantly informed the TI Team's evaluations. The TI Team's evaluations of the data quality and uncertainties are well documented in the innovative "Data Summary Tables" and "Data Evaluation Tables" included in the Project Report. Importantly, the TI Team continued to effectively engage data resource experts in productive analyses of potential-field geophysical data, the earthquake catalog, development of the paleoearthquake data set (including an integrated assessment of the paleoliquefaction data in order to extend the earthquake catalog), the development of methods for assessing maximum earthquakes, and the development of earthquake recurrence analyses. All of these focused analyses strongly informed the assessment process. Moreover, documentation of the analyses resulted in stand-alone products of the Project that will serve future users of the CEUS SSC Model.

The compilation and evaluation of potentially relevant methods, models, and alternative scientific interpretations representing the community knowledge and corresponding uncertainties must be considered the core process activity of any SSHAC assessment. This step was largely carried out in WS-2. Success in defining the community knowledge depends on fully engaging proponent experts representing the range of methods, models, and interpretations existent at the time. Full engagement means that the proponent experts completely and clearly describe their interpretations and the data that support them and provide their individual evaluations of corresponding uncertainties. We observed that the actions taken by the Project and TI Team to explain the workshop goals and to guide participants toward meeting those goals was very productive. We conclude that the workshop was highly successful in meeting the stated goals and that it fully met the expectation of the SSHAC Guidance with respect to evaluating the range of alternative scientific interpretations. The discussions during the workshop and between the TI Team and Panel following the workshop evolved the "SSC Framework" concept, which provided transparent criteria that framed the TI Team's systematic identification and assessment of seismic sources throughout the CEUS.

Feedback from hazard calculations and sensitivity analyses is an important step in a SSHAC assessment to understand the importance of elements of the model and inform the final assessments. For development of a regional SSC model to be used for site-specific probabilistic seismic hazard analyses (PSHAs) at many geographically distributed sites, feedback based on the preliminary model is particularly important. Following WS-2 a preliminary SSC model termed "the SSC sensitivity model," was developed and used for hazard sensitivity calculations that were evaluated in WS-3. While the SSC sensitivity model was clearly preliminary, the evaluation of sensitivity results that took place in WS-3 provided important feedback for completing analyses and for supporting the TI Team's development of the preliminary CEUS SSC model. The Panel was able to review the preliminary model and provide feedback in a subsequent project briefing meeting on March 24, 2010.

Together the three workshops provided the TI Team interactions with the appropriate range of resource and proponent experts. These experts were carefully identified to present, discuss, and debate the data, models, and methods that together form the basis for assuring that the CBR of the TDI have been properly represented in the hazard model. Experts representing academia, government, and private industry participated. The TI Team also reached out to a wide range of experts as they developed the database and performed the integration activities to develop the SSC model. The Panel participated throughout this process, and is satisfied that the TI Team fully engaged appropriate experts to accomplish the goals of a SSHAC Guidance.

Integration

Consistent with the SSHAC Guidance, integration is the process of assessing the CBR of the TDI and representing the assessment in the SSC model. Informed by the evaluation process, the integration process includes representation of the range of defensible methods, models, and interpretations of the larger technical community together with new models and methods developed by analyses during the evaluation and integration process.

For the CEUS SSC Project, development of the earthquake catalog, methods for assessing and representing maximum earthquake magnitudes, and methods for earthquake recurrence assessment continued during the integration process. The Panel reviewed all the analyses at various stages of development and provided comments and recommendations. The TI Team performed the integration process by means of eleven working meetings. Members of the Panel participated in most of these working meetings as observers or resource experts. The full Panel participated in the discussions during both feedback meetings and provided formal comments and recommendations following the meetings. We observed that the integration process was thorough and that it acceptably complied with the SSHAC Guidance. Based on our participation and observations we conclude that the integrated CEUS SSC Model appropriately represents the center, body, and range of current methods, models and technically defensible interpretations.

PPRP Engagement

Consistent with the SSHAC Guidance, the Panel was fully engaged in peer-review interactions with the TI Team and the Project Manager of the CEUS SSC Project throughout the entire project period—from development of the Project Plan in early to mid 2008 through production of the Final Project Report in mid to late 2011.⁵ The Panel provided both written and oral peer-review comments on both technical and process aspects at many stages of the Project's evolution. Key PPRP activities, leading up to this final report, have included:

- Review of the Project Plan.
- Formulation of a PPRP implementation plan, specifically for the CEUS SSC Project, to ensure adherence to the general guidance provided by SSHAC and NUREG-1563 for the scope and goals of a PPRP review.
- Involvement in *each* of the three Project workshops, including advising in the planning stage; participating collectively as a review panel during the workshop (and individually as resource experts when requested by the TI Team), providing timely comments on technical and process issues; and submitting a written report of the Panel's observations and recommendations following each workshop.
- Development and implementation of a process, together with the TI Team, to document the resolution of recommendations made in PPRP formal communications.
- Participation as observers (and occasionally as resource experts when requested by the TI Team) in eight of the TI Team's 11 working meetings.
- Peer-review and written comments, including several informal reports, on the TI Team's intermediate work products, particularly early versions of the CEUS SSC Model.

⁵ See CEUS SSC Final Report: Section 2.5, Table 2.2-1, and Appendix I

- Direct interaction with the TI Team and Project Manager in more than 20 teleconferences and four face-to-face briefings—in addition to the three workshops and eight working meetings of the TI Team noted above.
- Extensive, critical peer-review of the Project’s 2010 Draft Report and 2011 Final Report.

The Panel, collectively and individually, fully understood the SSHAC Guidance for a structured participatory peer review and the requirements for a Level 3 assessment process; had full and frequent access to information and interacted extensively with the TI Team and Project Manager throughout the entire project; provided peer-review comments at numerous stages; and, as documented within the Final Project Report, was fully engaged to meet its peer-review obligations in an effective way.

Project Report

The SSHAC Guidance makes clear that adequate documentation of process and results is crucial for their understanding and use by others in the technical community, by later analysis teams, and by the project sponsors. The Panel understood what was needed to conform to the SSHAC requirements, and it was committed to ensuring that the documentation of technical details associated with the CEUS SSC Model in the Project Report was clear and complete. The Panel was equally committed to ensuring the transparency of process aspects of the project, both in implementation and in description in the Project Report.

The Panel provided lengthy compilations of review comments (see Appendix I of the Project Report) for both the 2010 Draft Report and the 2011 Final Report. These included hundreds of comments, categorized as general, specific, relating to clarity and completeness, or editorial. The massive amount of detail provided by the TI Team in the Project Report and the intensiveness of the Panel’s review comments both reflect great diligence and a mutual understanding by the TI Team and the PPRP of the thoroughness and high quality of documentation expected in the Project Report.

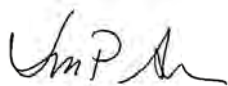

The Project Manager and the TI Lead provided review criteria to the Panel for both the draft and final versions of the Project Report. The criteria for reviewing the Draft Report⁶ covered the range of technical and process issues consistent with requirements of the SSHAC Guidance, including draft implementation guidance (see footnote #4). Key criteria, among others, include sufficiency of explanatory detail; adequate consideration of the full range of data, models, and methods—and the views of the larger technical community; adequate justification of the data evaluation process, logic-tree weights, and other technical decisions; proper treatment of uncertainties; and conformance to a SSHAC Level 3 assessment process. To be clear, the PPRP is charged with judging the adequacy of the documented *justification* for the CEUS SSC Model and its associated logic-tree weights. The TI Team “owns” the Model and logic-tree weights.

Criteria for reviewing the Final Report focused on reaching closure to comments made on the Draft Report and ensuring that no substantive issues remained unresolved. To that end, among its many review comments on the Final Report the Panel identified “mandatory” comments, which the TI Team was required to address in the final version of the Project Report.

⁶ See PPRP report dated October 4, 2010, in Appendix I of CEUS SSC Final Report

The Panel made thorough, extensive efforts in its documented reviews of the 2010 Draft Report and the 2011 Final Report (as well as in many related interactions with the TI Team) to ensure a high-quality Project Report that fully meets SSHAC requirements for clear, complete, and transparent documentation of all aspects of the CEUS SSC Project. We are pleased to confirm that implementation of the CEUS SSC Project fully conformed with the SSHAC Guidance and that the resulting CEUS SSC Model properly meets the SSHAC goal of representing the center, body, and range of technically-defensible interpretations.

This concludes our PPRP Final Report for the CEUS SSC Project.

PROJECT ACKNOWLEDGMENTS

This study was sponsored by the Electric Power Research Institute (EPRI) Advanced Nuclear Technology Action Plan Committee, the U.S. Department of Energy (DOE) Office of Nuclear Energy and Office of the Chief of Nuclear Safety, and the U.S. Nuclear Regulatory Commission (NRC) Office of Nuclear Regulatory Research. Technical experts from the DOE, NRC, U.S. Geological Survey, Defense Nuclear Facility Safety Board, industry, and academia participated in the study as part of the Technical Integration (TI) Team or as members of the Participatory Peer Review Panel (PPRP). Any statements, opinions, findings, conclusions, or recommendations expressed in this material are those of the authors and do not necessarily reflect those of the participating or sponsoring agencies.

Jeffrey F. Hamel was the EPRI Advanced Nuclear Technology Program Manager. Lawrence A. Salomone of Savannah River Nuclear Solutions, LLC, served as the Project Manager for the study. Kevin J. Coppersmith of Coppersmith Consulting Inc., served as the lead for the TI Team. J. Carl Stepp of Earthquake Hazards Solutions, and Walter J. Arabasz, Research Professor Emeritus of Geology and Geophysics at the University of Utah, served as Co-chairmen for the PPRP. The entire Central and Eastern United States Seismic Source Characterization Project Team and their roles are discussed in Section 2 and are shown on the project organization chart (Figure 2.3-1) of the report.

The authors of the report wish to acknowledge the contributions of the following people: the resource experts who participated in Workshop 1, the proponent experts who participated in Workshop 2, and the technical experts who provided valuable insights, perspective, and references throughout the study. The names of all these contributors are listed in Table 2.2-2.

In addition, the authors of the report appreciate the support of Geraldine Moore-Butler as administrative assistant and Nancy L. Sutherland as technical editor for the project. This report was assembled at AMEC.

SPONSORS' PERSPECTIVE

This report describes a new seismic source characterization model for the Central and Eastern United States (CEUS) for use in probabilistic seismic hazard analysis (PSHA) for nuclear facilities. PSHA has become a generally accepted procedure for supporting seismic design, seismic safety and decision making for both industry and government. Input to a PSHA consists of seismic source characterization (SSC) and ground motion characterization (GMC); these two components are necessary to calculate probabilistic hazard results (or seismic hazard curves) at a particular geographic location.

The 1986 Electric Power Research Institute and Seismicity Owners Group (EPRI-SOG) study included both an SSC and GMC component. Recent applications for new commercial reactors have followed U.S. Nuclear Regulatory Commission (NRC) regulatory guidance (RG 1.208) by using the EPRI-SOG source model as a starting point and updating it as appropriate on a site-specific basis. This CEUS SSC Project has developed a new SSC model for the CEUS to replace the SSC component of the EPRI-SOG study.

The CEUS SSC Project was conducted using a Senior Seismic Hazard Analysis Committee (SSHAC) Level 3 process, as described in the NRC publication, *Recommendations for Probabilistic Seismic Hazard Analysis: Guidance on Uncertainty and Use of Experts* (NUREG/CR-6372). The goal of the SSHAC process is to represent the center, body, and range of technically defensible interpretations of the available data, models, and methods. The CEUS SSC model is applicable to any site within the CEUS and can be used with the EPRI 2004/2006 GMC model to calculate seismic hazard at any site of interest. Long-term efforts to replace the EPRI 2004/2006 GMC model with the Next Generation Attenuation Relationships for Central and Eastern North America obtained from the NGA-East Project is scheduled for completion in 2014.

The updated CEUS SSC model provides industry and government with the following: a new model for the commercial nuclear industry to perform PSHAs for future reactor license applications; the NRC to support its review of early site permit (ESP) and construction and operating license (COL) applications; and the U.S. Department of Energy (DOE) to support modern PSHAs to meet design and periodic review requirements for its current and future nuclear facilities. Specific benefits of the model are as follows:

- **Consistency:** For many sites, seismic sources at distances up to 300 km (186 mi.) or more significantly contribute to hazard at some spectral frequencies. Consequently, seismic hazard models for many sites have significant geologic overlap. If done separately, there is a likelihood of conflicting assessments for the same regions. A regional source model allows for consistent input into a PSHA. An updated conceptual SSC framework that provides a

consistent basis for identifying and characterizing seismic sources in the CEUS has been developed. The NRC will no longer need to review each time each applicant's regional SSC model when the accepted CEUS SSC model is used. This will avoid lengthy review of the regional SSC model in ESP and COL applications for sites within the CEUS that use the accepted regional CEUS SSC model to develop its site-specific SSC model.

- **Stability:** This CEUS SSC model was developed using the accepted state-of-practice SSHAC methodology that involved the following tasks:
 - Development of a comprehensive database and new tools for documenting the data consideration process.
 - Multiple workshops to identify applicable data, debate alternative hypotheses, and discuss feedback.
 - Multiple working meetings by the Technical Integration (TI) Team to develop the SSC model and fully incorporate uncertainties.
 - Technical advancements in a number of areas, such as developing a uniform earthquake catalog, developing an updated approach for assessing maximum magnitude, compiling data evaluation tables, incorporating paleoseismic data, and using spatial smoothing tools.
 - Participatory peer review, including four panel briefings, multiple interactions, and periodic formal feedback.
 - Proper documentation of all process and technical aspects of the project.

Experience has shown that stability is best achieved through proper and thorough characterization of our knowledge and uncertainties, coupled with the involvement of the technical community, regulators, and oversight groups.

- **Greater Longevity:** An explicit goal of the SSHAC methodology is to represent the center, body, and range of the technically defensible interpretations of the available data, models, and methods. Using the SSHAC process provides reasonable assurance that this goal has been achieved. Representing the center, body, and range of interpretations at the time of the study means that as new information is acquired and various interpretations evolve as a result, the current thinking at any point is more likely to be addressed in the study. As new information becomes available, an existing SSC will require periodic reviews to evaluate the implications of the new findings. The need for updates to a particular study is now better understood as a result of findings of the CEUS SSC Project sensitivity studies to determine the significance of source characteristics.
- **Cost and Schedule Savings:** The CEUS SSC model can be used to perform a PSHA at any geographic location within the CEUS. It is applicable at any point within the CEUS, subject to site-specific refinements required by facility-specific regulations or regulatory guidance. Having stable, consistent input into a regional PSHA will reduce the time and cost required to complete a commercial nuclear site's ESP or COL licensing application, prepare a DOE site's PSHA, and develop design input for new commercial and DOE mission-critical nuclear facilities.

- **Advancement of Science:** The CEUS SSC Project provides new data, models, and methods. This information was shared at three workshops with international observers as a means to provide technology transfer for application in other regions. The CEUS SSC earthquake catalog, which merges and reconciles several catalogs and provides a uniform moment magnitude for all events, and the CEUS SSC paleoliquefaction database provide a new baseline for future research and updates. New approaches used in this project for spatial smoothing of recurrence parameters, assessment of maximum magnitude, and systematical documentation of all data considered and evaluated also benefit future research and PSHA updates.

The sponsors of the CEUS SSC Project are utilities and vendors on the EPRI Advanced Nuclear Technology Action Plan Committee, the DOE Office of Nuclear Energy, the DOE Office of the Chief of Nuclear Safety, and the NRC Office of Nuclear Regulatory Research. Technical experts from the DOE, NRC, U.S. Geological Survey (USGS), and Defense Nuclear Facility Safety Board (DNFSB) participated in the study as part of the TI Team or as members of the Participatory Peer Review Panel (PPRP).

The product of the CEUS SSC Project is a robust peer-reviewed regional CEUS SSC model for use in PSHAs. This model will be applicable to the entire CEUS, providing an important baseline for future research and updates. The CEUS SSC Project demonstrates that a SSHAC Level 3 approach can achieve the goals of considering the knowledge and uncertainties of the larger technical community within a robust and transparent framework. The value of the new CEUS SSC model has been enhanced by the participation of key stakeholders from industry, government, and academia who were part of the CEUS SSC Project Team.

Looking forward, the NRC will publish NUREG-2117 (2012), *Practical Implementation Guidelines for SSHAC Level 3 and 4 Hazard Studies* that provides SSHAC guidance on the need to update a regional model. The guidance covers updating both regional and site-specific assessments. It addresses the “refinement” process of starting with a regional model and refining it for site-specific applications.

APPENDIX A

Description of the CEUS SSC Project Database

A

APPENDIX DESCRIPTION OF THE CEUS SSC PROJECT DATABASE

The purpose of compiling the CEUS SSC Project database was to organize and store those data and resources that had been carefully and thoroughly collected and described for the TI Team's use in characterizing potential seismic sources in the CEUS. An important goal for the development of this database was to document sources and dates for all information that was initially assessed for the CEUS SSC Project, specifying exactly what data and resources were considered, and provide for pertinent future data sets to be incorporated as they were generated for the project.

Development of the project database began at the inception of the project to provide TI Team members with a common set of data, maps, and figures for characterization of potential seismic sources. The database was continually updated during the course of the project through the addition of new references and data collected by TI Team members and project subcontractors, including information presented in project workshops and provided through PPRP review documentation.

This appendix presents the contents of the project database, as well as information on the workflow, development roles, database design considerations, data assessment tasks, and management of the database. Based on the CEUS Project Plan, the project database included, but was not limited to, the following general types of data:

- Magnetic anomaly
- Gravity anomaly
- Crystalline basement geology
- Tectonic features and tectonic/crustal domains
- Tectonic stress field
- Thickness of sediments
- Crustal thickness
- V_P at top of crystalline basement
- Seismic reflection data at Charleston, South Carolina
- Earthquake catalog
- Quaternary faulting and potential Quaternary features

- Mesozoic rift basins
- Paleoliquefaction sites
- Topography and bathymetry
- Liquefaction dates from published literature for the Wabash, New Madrid, and Charleston seismic zones
- Index map showing locations of published crustal scale seismic profiles and geologic cross sections

A table describing digital data layers included in the project database is presented at the end of this appendix (Table A-1), along with metadata summary sheets for each of the CEUS-scale data layers (Sheets A-1 through A-31).

A.1 Data Sources

The compilation and documentation of spatial geologic, seismic and geophysical data for the CEUS SSC Project required significant and continual effort to ensure that the geographic information system (GIS) data provided accurate and up-to-date information for use in seismic source characterization. Digital data were compiled from sources in the public domain, professional literature, private domain data developed as part of nuclear licensing activities, and available data in the academic sector. The database is designed to be available to the public for further use in seismic source zone characterization and assessment.

Digital data collection efforts focused on the CEUS SSC study area (Figure A-65, Sheet A-23). Digital and nondigital data were collected from a wide range of sources. For example, some data sets pertain to the conterminous United States (e.g., magnetic or gravity data), while others pertain to only a localized study area (e.g., paleoliquefaction studies). Digital data were not typically limited to the CEUS SSC study area extent unless it was necessary to reduce the file size of large data sets. In general, only selected features deemed to be the most pertinent were digitized from nondigital data.

Several new data layers were compiled specifically in support of this project and are included in the project database. These new data layers include the following information sets:

- Earthquake catalog (see Appendix B)
- Magnetic anomaly data
- Gravity anomaly data
- Paleoliquefaction features (see Appendix E)
- Mesozoic rift basins within the ECC-AM
- Maximum horizontal compressive stress data

A.2 Project Database Design and Management

The project database was compiled with input from the TI team, project subcontractors, and PPRP members. The GIS software used in the development of the database was Environmental Systems Research Institute's (ESRI) ArcGIS versions 9.3 and 9.3.1. The project database was compiled, maintained, and made available to team members on a server in the Fugro William Lettis & Associates (FWLA) Walnut Creek, California, office. Table A-1 presents the contents of the project database organized by the CEUS SSC study area, seismotectonic zone, and RLME zone. Subfolders organize data within these folders according to their similar subject matter or data theme.

The file-naming convention used in the project database allows for the quick identification of data type, geographic coverage, and author. For example, in the file name:

ROI_FeatureType_AuthorDate_Rev#.<file type suffix>

where *ROI* is the region of interest or source zone (e.g., CEUS, AHEX); *FeatureType* is the type of feature represented (e.g., GRAV for gravity; PL for paleoliquefaction features); *AuthorDate* is the author or organization and the year of publication; and *Rev#* is the revision number.

All project data began at revision 0 (R0) at the completion of this project and will be updated with consecutive revision numbers as the data are updated. Updated data will be made available via the project website as discussed in Section A.6. Providing a full file name reference allows data to be identified if removed from the organization of the project database.

During the course of the project, data were made available to TI Team members via a file transfer protocol (FTP) server established for the project in the FWLA Walnut Creek office. TI Team members were provided individual passwords to access the secured server. Updates to the project FTP server were provided by the project Database Manager.

A.3 Workflow and Data Assessment

Data were compiled by a staff of several geologists and analysts for CEUS-scale data. Processed and documented data were forwarded to the project Database Manager for inclusion in the database. Data were received in digital and nondigital forms. Digital data were in a GIS format compatible with ESRI's ArcGIS software, ASCII-delimited text files; databases, spreadsheets, or CAD layers. Nondigital data included hard copy drawings, maps, or other documents, including scans of hard-copy documents. The workflow and processes for compiling and documenting digital and nondigital data are outlined in the following sections.

A.3.1 Workflow

Project GIS data were collected by several TI Team members and the PPRP during the course of the project. Once received by the project Database Manager, data were reviewed prior to incorporation into the project database. Versions of data layers were

indicated to show when updates were completed. Project data were stored on a replicated, secure server. All data were backed up on a weekly basis to provide an off-site archive of project data.

A.3.2 Digital Data

Digital data published by the USGS and other sources comprise a significant portion of the project database. Digital data were collected in various ESRI GIS-compatible formats for vector and raster data (shapefile, coverage, GRID, ArcInfo Interchange, and personal and file geodatabase formats) or in ASCII-delimited text formats. All data received were reviewed to assess, at a minimum, the following factors:

- Completeness of the data
- Accompanying metadata, including completeness of documentation, source information, compilation scale
- Defined coordinate system
- Topological integrity

Compiled data were not altered beyond any routine conversion or coordinate transformation required for uploading to the project database. Example conversions include converting data from a different GIS or CAD format, projecting data from the source coordinate system into the project coordinate system, transforming the horizontal and vertical datum, and converting from ASCII-delimited text format to the project data format.

Occasionally, data were incorporated into the project database without alteration or renaming from the source data. For example, data that comprise the GIS layers of the Geologic Map of North America (Figure A-5) retain their original file names as provided on the USGS's website (<http://pubs.usgs.gov/ds/424/>), although they have been converted from the ESRI file geodatabase format to the ESRI shapefile format. Metadata accompanying the data in the project database contain information informing the user of what data are contained in each layer.

A.3.3 Nondigital Data

Some geologic or geophysical data requested for use in the CEUS SSC Project were provided in a nondigital format, including hard copy documents such as maps and figures in reports or research papers. GIS data created from these nondigital data formats underwent a review process to ensure data quality. The assessment was performed in the following review stages:

1. Review by the originating GIS analyst
2. Review by the geologist or analyst requesting the data
3. Review by the project Database Manager prior to submission to the project database

The review of GIS data layers that were produced from nondigital data involved the following steps:

- Visual inspection by comparison to source hardcopy documents
- Check of coordinate reference system
- Completion of metadata
- Development of database attributes for each layer, as appropriate
- Check for complete topology (spatial adjacency), as appropriate

For both digital and nondigital sources of data, scale is a significant consideration in the use of the project database. The consideration of the scale of data allows for the assessment of positional accuracy. Each data layer in the database contains in the accompanying metadata a notation about the scale at which the data were referenced or collected. For example, for vector data, a line that was digitized at a scale of 1:100,000 will have a greater positional accuracy than the same line digitized at a scale of 1:1,000,000. The scale of source information varies significantly in the project database. Whenever data are digitized based from hard-copy maps, error can be introduced. Although a GIS allows the display of data at any scale specified by the user, the accuracy of the same data will not change. Therefore, using digital data at a larger scale than that of the original source will not produce a more accurate map. When the layers in the project database are used, the source scale must be considered. In the course of developing this database, data were digitized at scales the same as, or larger than, that of the source to limit the error introduced through the digitization process.

A.4 Use of Project Database in Model Development

The project database (Table A-1) comprises many different types of data that were useful to the TI Team and PPRP members for understanding seismic, geologic, and geophysical conditions and for development of the seismic source model. The database includes geologic, geophysical, geodetic, seismic, tectonic, geomorphic, and earthquake information.

The project database was made available to TI and PPRP team members during the course of the project. During project working meetings, elements of the database were projected on a screen to facilitate discussions. TI Team GIS analysts were available to display elements of the project database at the request of TI Team members. For example, using a GIS, various types of requested data layers were shown for a particular area to identify geologic relationships. Team member inputs were gathered in real time during these discussions through the drawing of features into the GIS display. These features could then be incorporated into the seismic model immediately afterward.

A.5 Metadata

Metadata were compiled for each GIS data layer. All source reference documents used in preparing the data layer were noted to allow contributing data layers to be cited in future applications of the data. Additional primary documentation includes scale of the sources used, the scale at which the data were digitized and appropriate scales of use, coordinate reference system, and attribute library and domains. Metadata conform, wherever possible, to the Content Standard for Digital Geospatial Metadata established by the

Federal Geographic Data Committee (FGDC). This metadata standard is currently used by federal agencies for documenting geospatial data.

Included in this appendix are metadata summary sheets that present information for each data layer that covers the CEUS study area or similar regional coverage (Sheets A-1 through A-31). These one- and two-page sheets serve as quick references that summarize the data, the source of the data, the original publisher, the source and converted data formats, and disclaimers or noted constraints on the use of the data. Accompanying each summary sheet is a figure depicting the data in the CEUS SSC study area, often with topography and state boundaries provided for reference. More local data derived from detailed studies have also been included in the database. These local data sets typically include features digitized from a figure in a publication or other published map.

However, metadata summary sheets have not been developed for these large-scale data layers. All data layers and their accompanying metadata summary sheets (as appropriate) are listed in Table A-1.

A.6 Database Delivery Format

The project database includes both vector and raster data formats. Vector data formats represent features as points, lines, or polygons. Each type of vector class is suited for different types of features (i.e., points for spot features such as measurement locations, lines for features such as topographic contours, and polygons for area features such as mapped geologic units). A raster data format represents surfaces where each regularly spaced interval contains a discrete value. A digital elevation model (DEM) is an example of raster data.

The project database contains vectors and rasters depending on the type of data compiled. A goal of the project database was to make the data accessible to a large audience with minimal effort. The ESRI shapefile data format was selected for vector features because of the ubiquitous use of ESRI's ArcGIS software and the large number of other GIS software in use that can import this format. Raster data were compiled in a GeoTIFF format for similar reasons.

All data in the project database are provided in geographic (latitude/longitude) decimal degree coordinates using the North American Datum of 1983 (NAD83). This coordinate system can be read by nearly all GIS software packages and reprojected as necessary into other coordinate systems. As noted in Section A.3.2, data compiled from existing sources were provided in various coordinate systems. These data were reprojected as necessary to geographic coordinates on NAD83.

The database will be available on the CEUS SSC Project website (www.ceus-ssc.com) and will include the earthquake catalog plus all magnetic, gravity, and stress data compiled for the project. The CEUS SSC report, including all appendices, will also be provided on the website. All data are provided in a format that will allow other investigators to use the outputs of the CEUS SSC Project model for subsequent seismic hazard assessments. A more complete description of the CEUS SSC website is provided in Section 9.3.3 of the report.

Sheet A-1—CEUS SSC Project GIS Data Summary

General Bathymetric Chart of the Oceans (GEBCO)

CEUS_elev_GEBCO_R0.tif

Data Description: Data representing land elevation and ocean bathymetry. This layer was created from data provided by the British Oceanographic Data Centre (BODC) General Bathymetric Chart of the Oceans (GEBCO) 30-arc-second GEBCO_08 data set. This layer is continually updated by BODC.

Source (Internet URL, CD/DVD-ROM): <http://www.gebco.net>.

Author/Publisher/Year: The GEBCO Digital Atlas is published and maintained by the British Oceanographic Data Centre (BODC) of the Natural Environmental Research Council (NERC) on behalf of the International Hydrographic Organization (IHO) and the Intergovernmental Oceanographic Commission (IOC) of UNESCO, acting through the Joint IOC/IHO Guiding Committee for GEBCO. The contents of this data layer were published in November 2009, version 20091120.

Data Summary: Digital data in ESRI ASCII Grid format was exported into ERDAS Imagine .img raster format using ArcGIS 9.3.1. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: Data from the GEBCO's gridded data sets are not to be used for navigation or for any other purpose relating to safety at sea. The IHO, IOC, NERC, and BODC are not able to warrant the accuracy of the data and accept no responsibility whatsoever for determining the fitness of the data for their intended use or for any consequential loss, damage, or expense arising from such use. Users should be aware that most areas of the world's oceans have not been fully surveyed and that the GEBCO bathymetry is an interpretation based on random tracklines of data from many sources. The quality and coverage of data from these sources are highly variable.

Information on accessing the latest versions of the GEBCO data sets can be found on the GEBCO website: <http://www.gebco.net>.

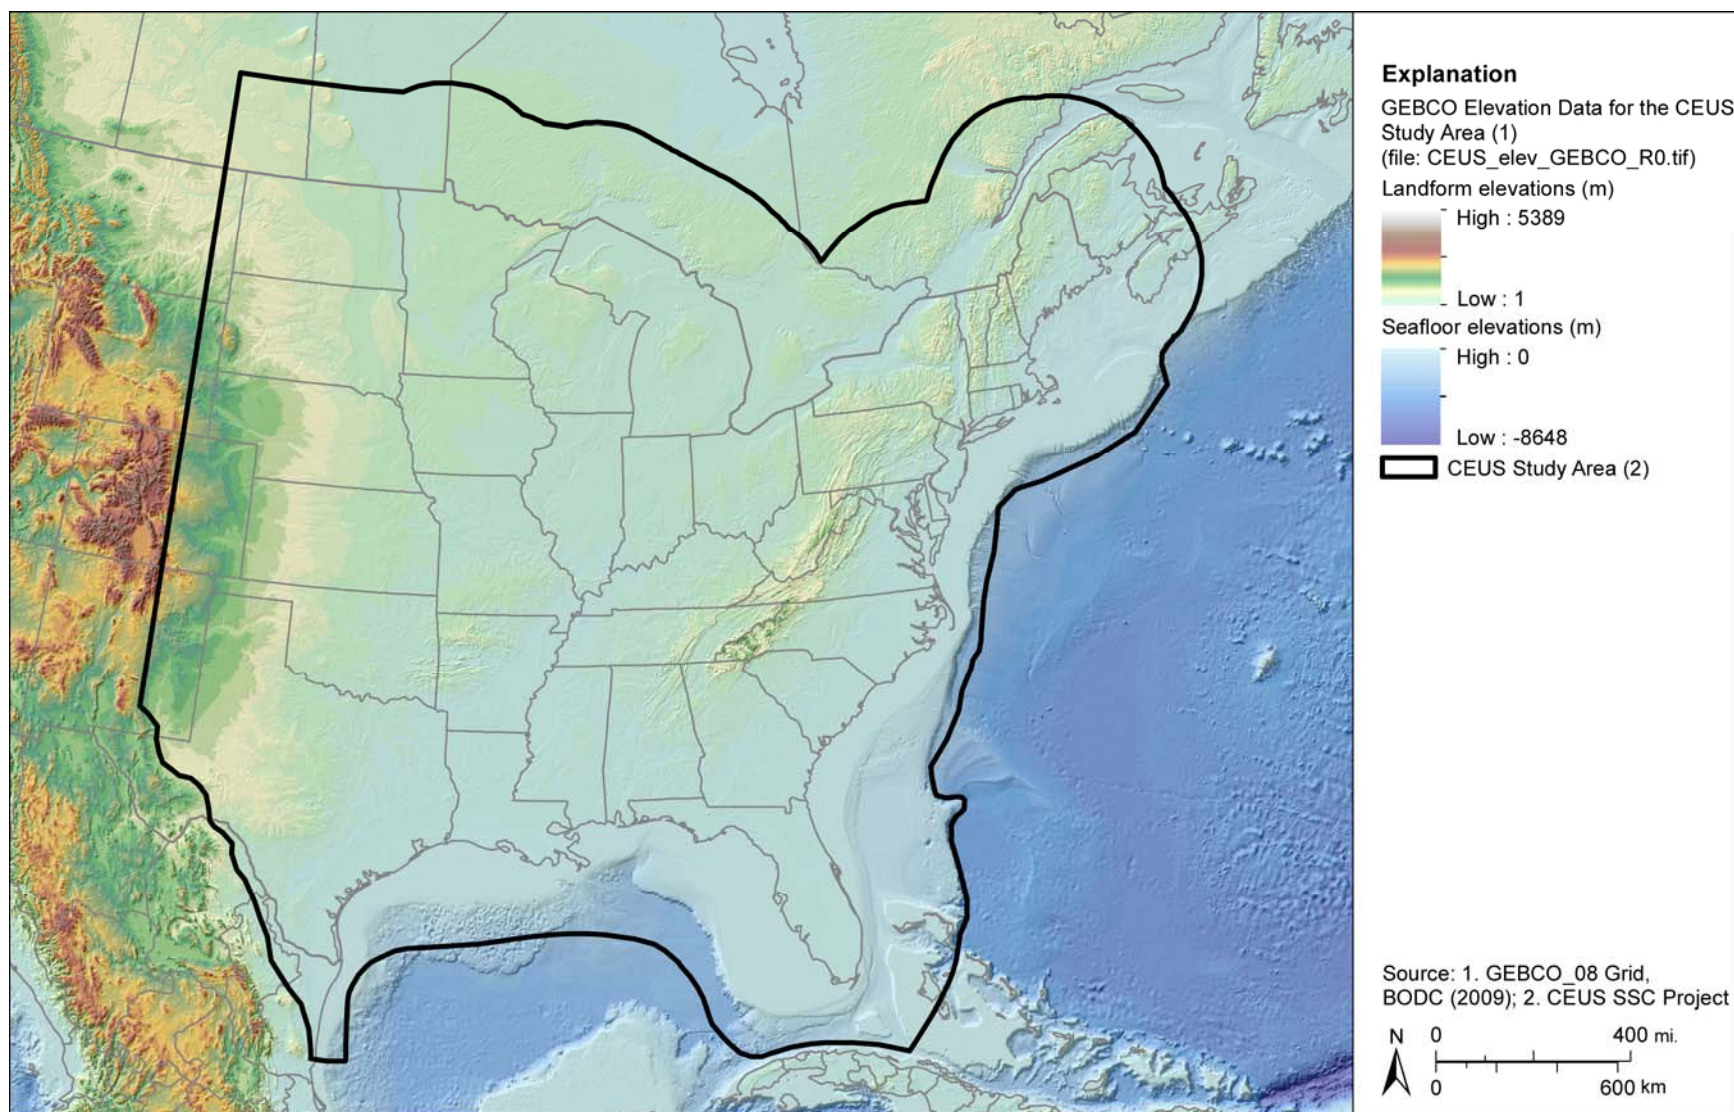

Figure A-1
GEBCO elevation data for the CEUS study area (BODC, 2009).

Sheet A-2—CEUS SSC Project GIS Data Summary

CEUS SSC Earthquake Catalog Compilation

CEUS_EQ_Catalog_R0.shp

Data Description: This map layer contains the earthquake catalog for the CEUS SSC Project. Source catalogs were merged to derive a preliminary catalog with duplicates and alternative estimates of location, magnitude, seismic moment, macroseismic intensity, and felt area. Relationships between the size measures presented in the source data were used to develop a common moment magnitude (**M**). The **M**-based catalog was then processed to identify and remove aftershocks using the methodology developed in EPRI-SOG (1988), thereby producing a catalog of independent earthquake events.

Source (Internet URL, CD/DVD-ROM): Records were obtained from several sources: USGS, GSC, NCEER, EPRI-SOG, ANSS, CERl, SUSN, SLU, Lamont-Doherty, Weston Observatory, NEDB, ISC, Jeff Munsey, Ann Metzger, Margaret Hopper, Sykes et al. (2008), and the Ohio Seismic Network.

Author/Publisher/Year: Several sources were compiled for this study. See accompanying metadata for complete reference list.

Data Summary: ESRI point shapefile with moment magnitude (**M**)

Disclaimer or Constraints on Use: No constraints have been identified.

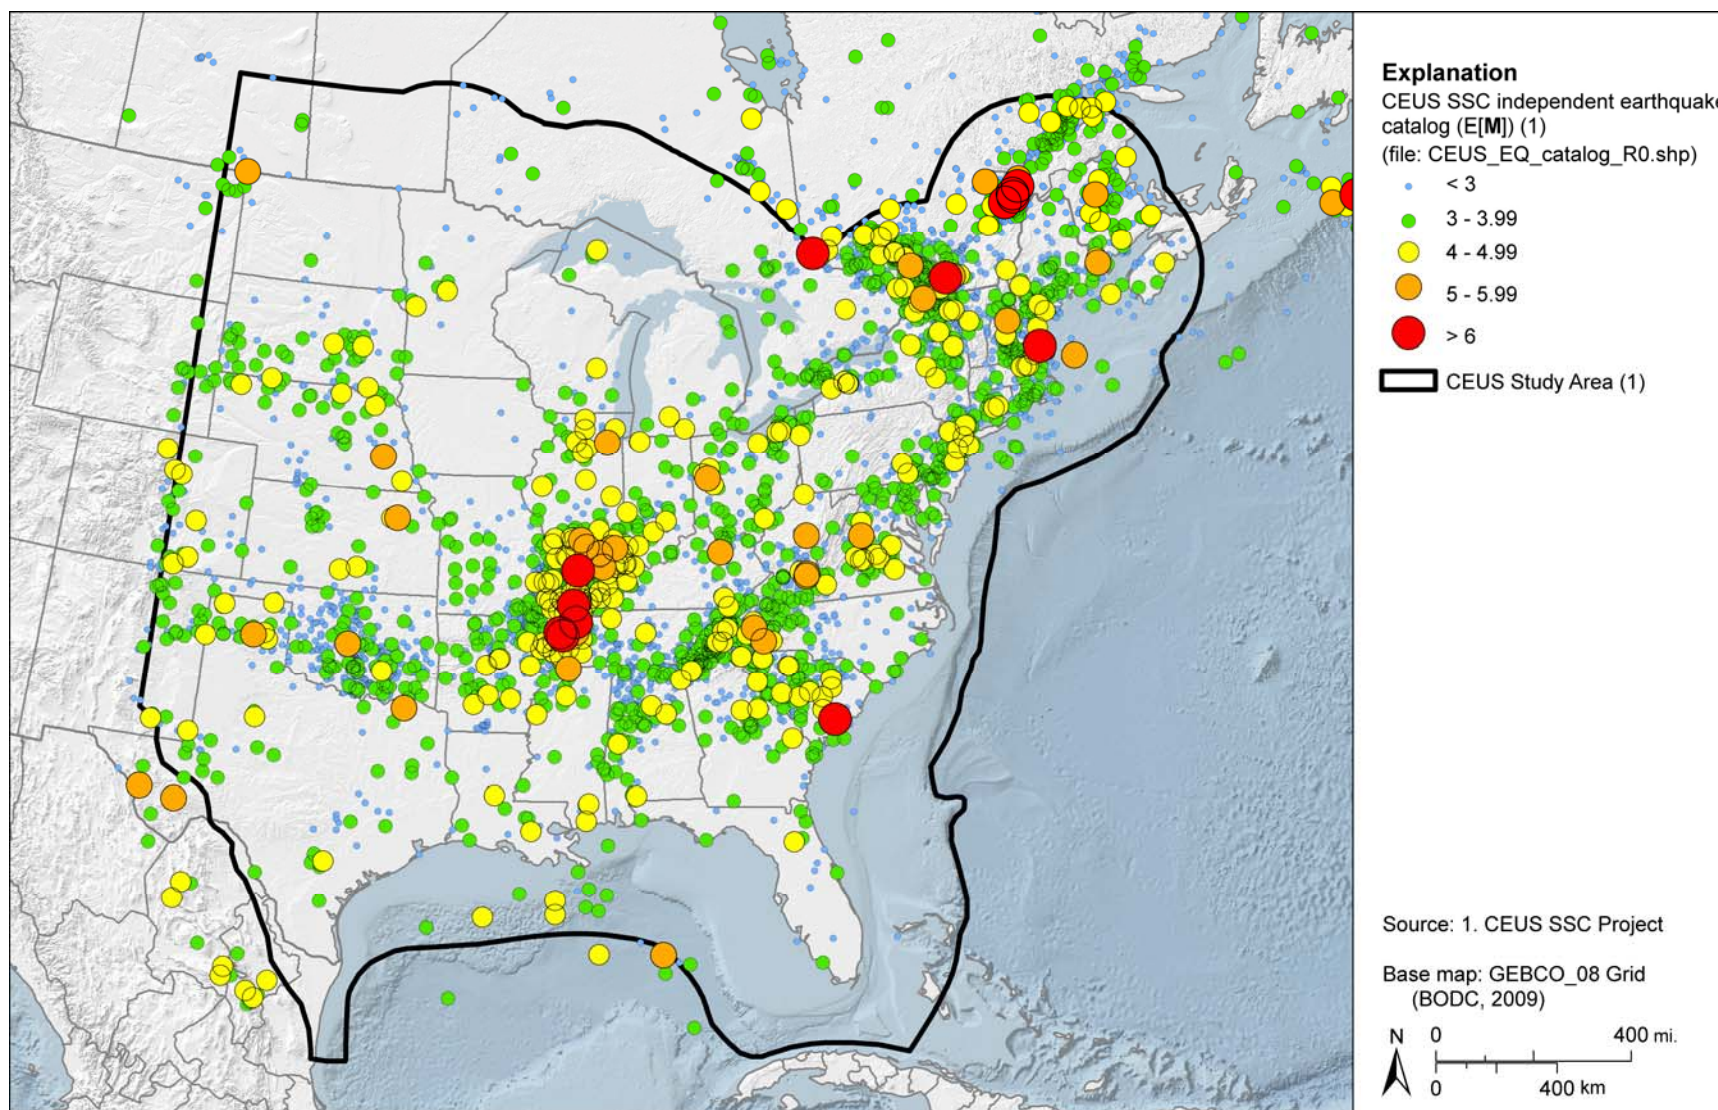

Figure A-2
 CEUS SSC independent earthquake catalog

Sheet A-3—CEUS SSC Project GIS Data Summary

Bedrock Geology and Extended Crust after Kanter (1994)

CEUS_bedrock_geol_Kanter1994_R0.shp

CEUS_ext_areas_Kanter1994_R0.shp

Data Description: The data includes polygons representing the age and exposure of bedrock geology and the presence of extended crust in the CEUS as mapped by Kanter (1994). The bedrock geology data covers the CEUS, and the extended crust covers the Atlantic coastal region.

Source (Internet URL, CD/DVD-ROM): Digitized from figure in published report.

Author/Publisher/Year: Kanter, L.R., 1994, Tectonic Interpretation of Stable Continental Crust: *The Earthquakes of Stable Continental Regions, Volume I: Assessment of Large Earthquake Potential—Final Report TR-102261-V1*, prepared for Electric Power Research Institute.

Data Summary: Two ESRI polygon shapefiles have been developed and are intended to be used together; one data set containing the bedrock geology and the other showing areas of extended crust.

Disclaimer or Constraints on Use: No constraints have been identified.

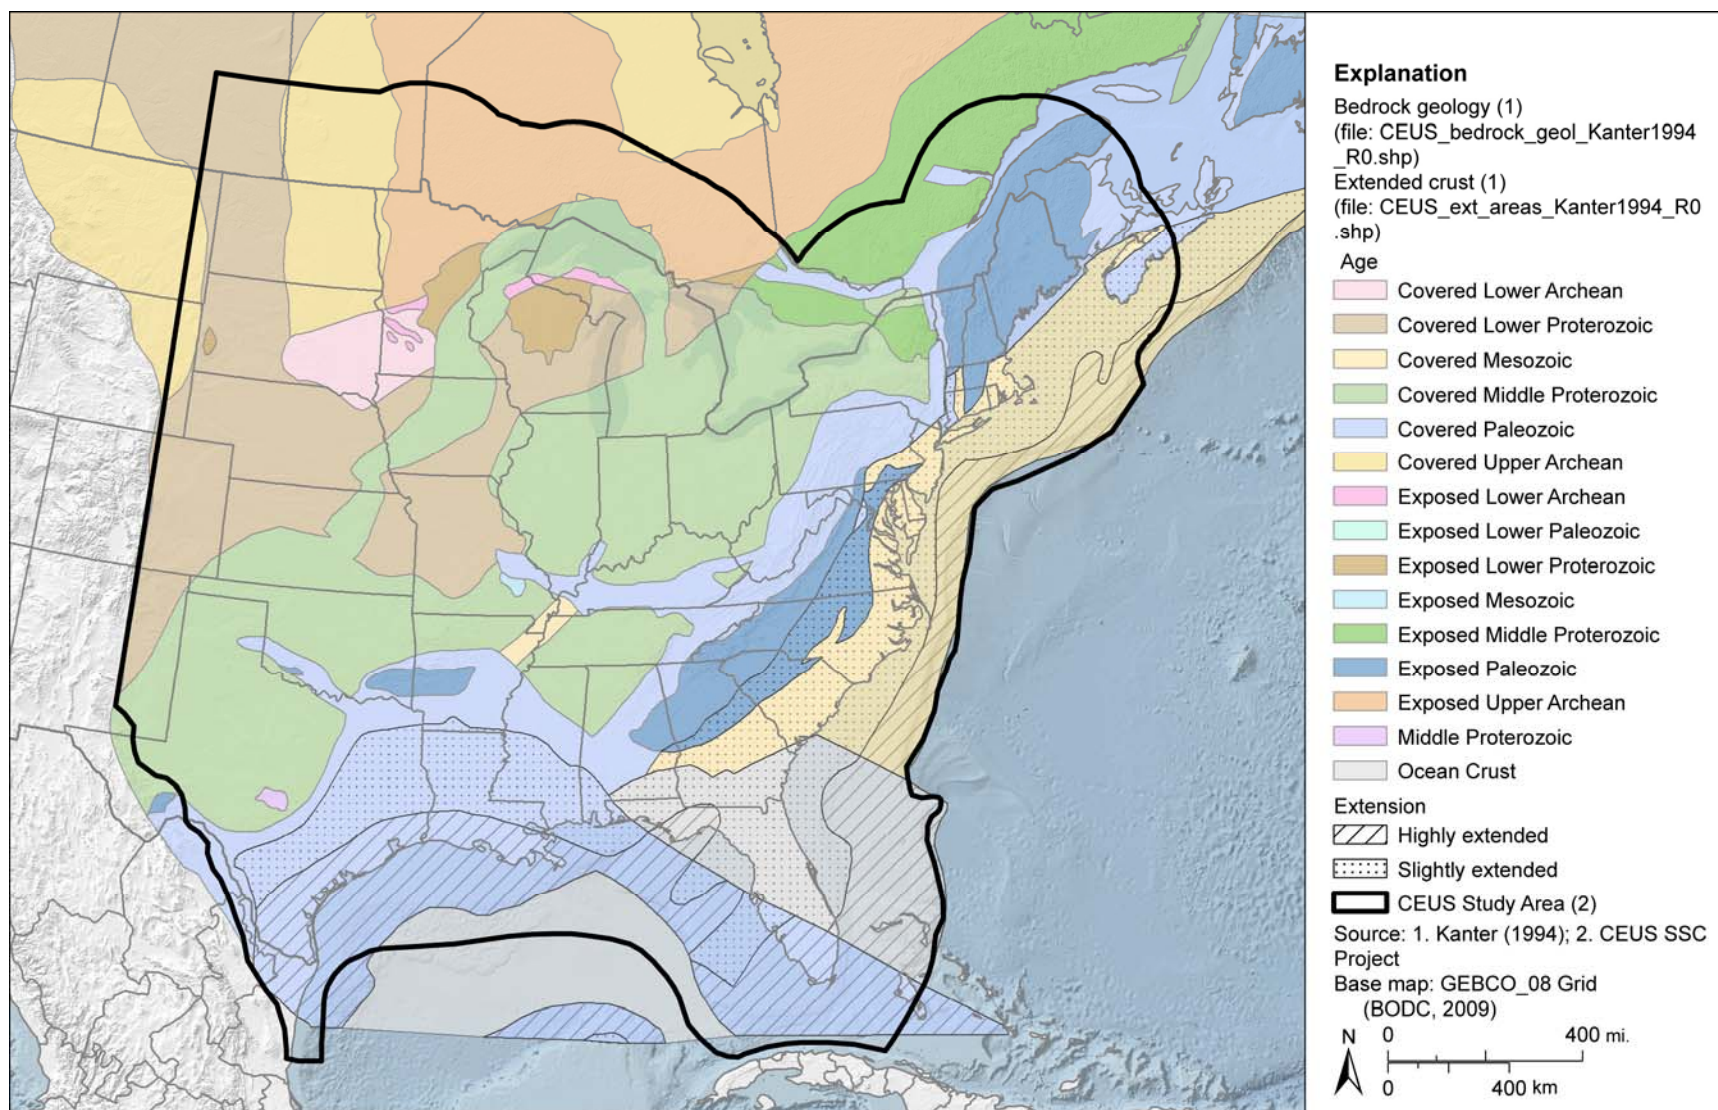

Figure A-3
Bedrock geology and extended crust after Kanter (1994)

Sheet A-4—CEUS SSC Project GIS Data Summary
Crustal Provinces after Rohs and Van Schmus (2007)
CEUS_pc_RohsVS2007_R0.shp

Data Description: Representation of crustal provinces, by age of crystallization, in the U.S.

Source (Internet URL, CD/DVD-ROM): Digitized after Rohs and Van Schmus (2007), Fig. 1, at a scale of 1:33,000,000 or larger.

Author/Publisher/Year: Rohs, C.R., and Van Schmus, V.R., 2007, Isotopic connections between basement rocks exposed in the St. Francois Mountains and the Arbuckle Mountains, southern midcontinent North America: *International Journal of Earth Sciences*, v. 96, pp. 599-611.

Data Summary: ESRI polygon shapefile representing crustal provinces. Each polygon is attributed according to the information presented in the source figure in Rohs and Van Schmus, 2007. Areas of empty polygon attributes represent areas of the conterminous U.S. that are not attributed in the source figure.

Disclaimer or Constraints on Use: No constraints have been identified.

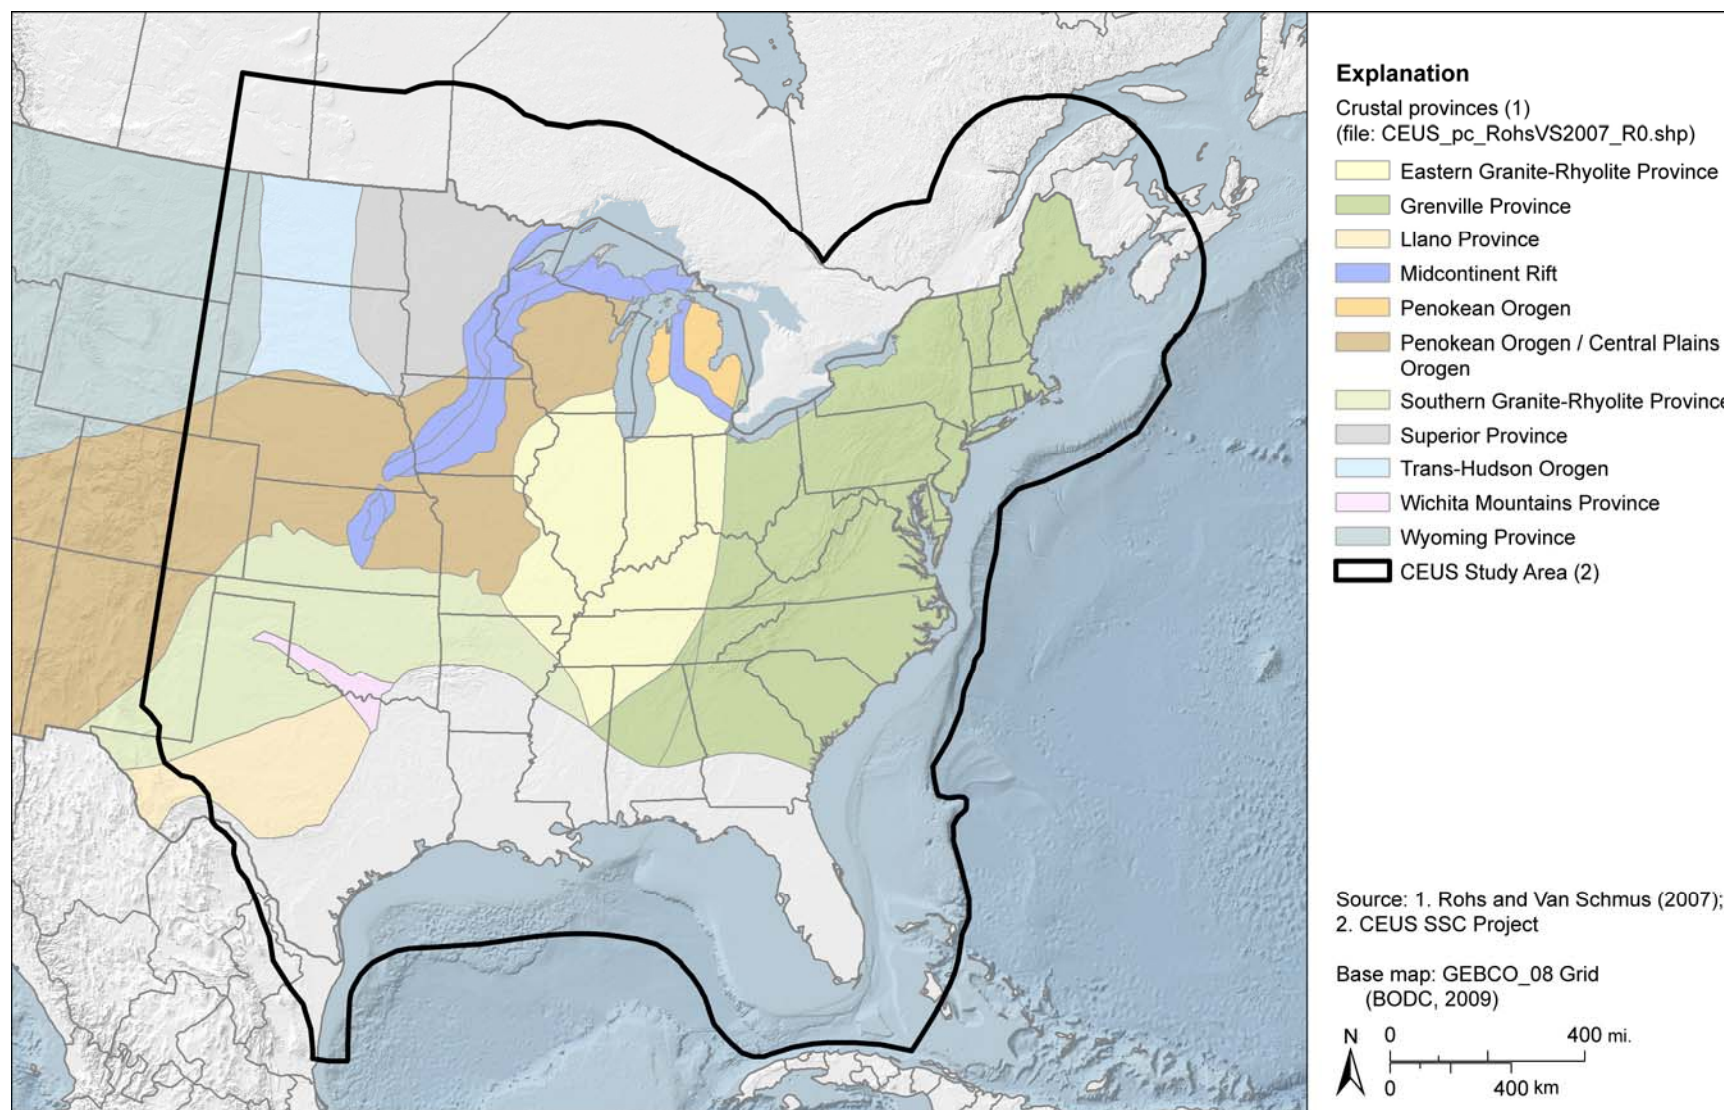

Figure A-4
Crustal provinces after Rohs and Van Schmus (2007)

Sheet A-5—CEUS SSC Project GIS Data Summary
Database of the Geologic Map of North America—
Adapted from by J.C. Reed, Jr. et al. (2005)

GIS Layer Contents

Base map features	Bathymetry.shp Cities.shp Drainage.shp GMNA_bound.shp Open_water.shp Political_boundaries.shp
Geologic unit features	Faults.shp Geologic_contacts.shp Geologic_overprints.shp Geologic_units.shp
Miscellaneous geologic features	Calderas.shp Diapiric_structure_trends.shp Diapiric_structures.shp Diapirs.shp Dikes_and_sills.shp Glaciation_extent.shp Impact_structures_greater_than_10KM.shp Impact_structures_less_than_10KM.shp Small_bodies_of_unusual_igneous_rocks.shp Volcanoes.shp
Special submarine features	Gas_fluid_seeps.shp Gas_oil_seeps.shp Hydrothermal_vents.shp Maganiferous_deposits.shp Phosphate_nodules_or_pavement.shp Polymetallic_sulfide_deposits.shp Rock_in_seafloor_sample.shp

Data Description: Database of the Geologic Map of North America. The data depicts the surface and submarine geology of North America and portions in the Atlantic and Pacific oceans at 1:5,000,000 scale. Digitized from Reed et al. (1993). GIS layers listed above are organized into subfolders (left column) and contain the ESRI shapefiles in the right column. A separate folder named Layer_files contains the ESRI layer symbology developed by the authors for the shapefiles listed above.

Source (Internet URL, CD/DVD-ROM): <http://pubs.usgs.gov/ds/424/>.

Author/Publisher/Year: Garrity, C.P., and Soller, D.R., 2009, *Database of the Geologic Map of North America; Adapted from the Map by J.C. Reed, Jr., and Others (2005)*; U.S. Geological Survey Data Series 424 (CD-ROM); <http://pubs.usgs.gov/ds/424/>.

Data Summary: The USGS source data has been converted to ESRI shapefile format from the ESRI file geodatabase format. ESRI map symbology layers accompany the data with standardized geologic map symbology and color palette. Layers have been converted from a custom transverse Mercator projection to geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: Data are not intended to be used at a scale larger than 1:5,000,000.

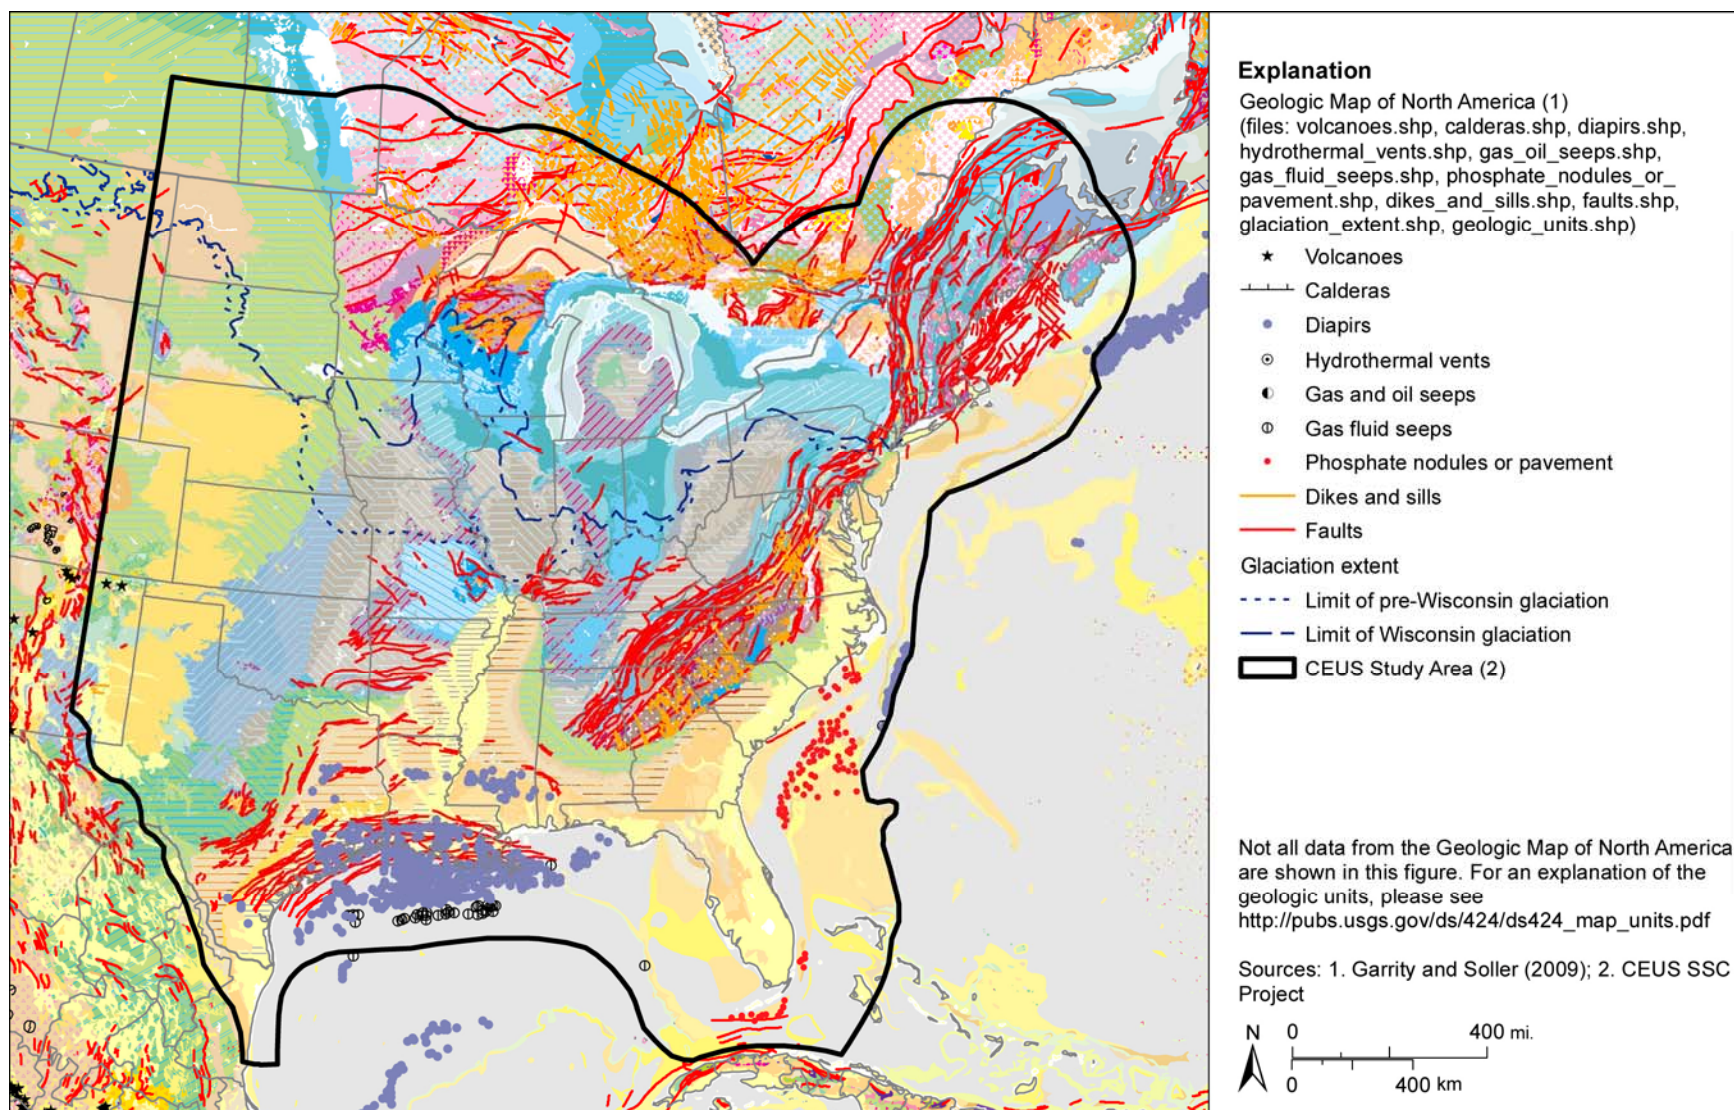

Figure A-5
Geologic map of North America

Sheet A-6—CEUS SSC Project GIS Data Summary

Compilation of Geologic Cross Sections

CEUS_geologic_cross_sec_loc_R0.shp

Data Description: Locations of published geologic cross sections across the CEUS. Several sources were used in compiling this data set. These lines depict the digitized locations of the geologic cross sections across the CEUS. Data set attribute table contains the sources for each geologic cross section profile location and the cross section identifiers for each cross section. Images of the cross sections are not included in the data set.

Source (Internet URL, CD/DVD-ROM): Digitized cross section locations from various publications including AAPG geologic highway maps, DNAG plates, and Texas Bureau of Economic Geology maps.

Author/Publisher/Year: See metadata for complete reference list.

Data Summary: The source references were georeferenced and digitized at a scale equal to or larger than the published scale of the source. ESRI line shapefiles depict the locations of the geologic cross sections.

Disclaimer or Constraints on Use: No constraints have been identified.

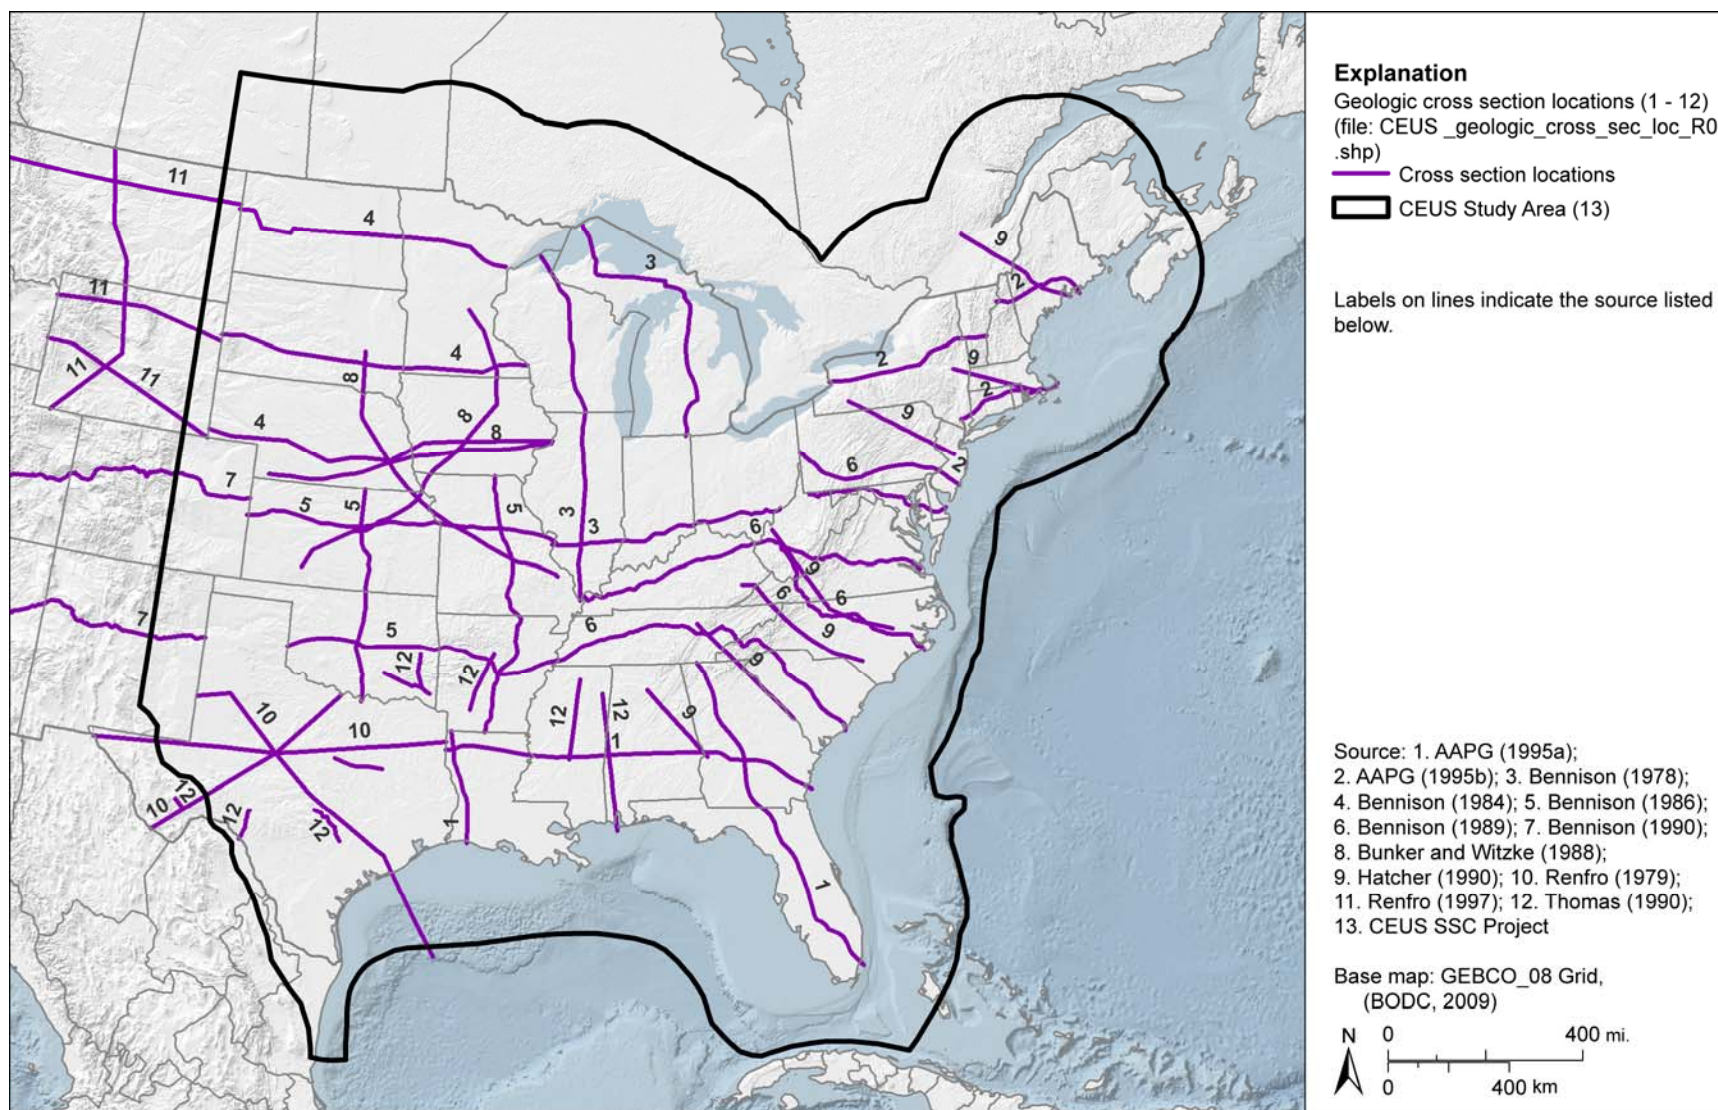

Figure A-6
 Locations of geologic cross sections in the CEUS

Sheet A-7—CEUS SSC Project GIS Data Summary

Precambrian Crustal Boundary by Van Schmus et al. (1996)

CEUS_crustal_boundary_VanSchmus1996_R0.shp

Data Description: Data set representing the inferred eastern limit of pre-1,600 million-year-old continental crust. Extends from southeastern Oklahoma to southwestern Ontario.

Source (Internet URL, CD/DVD-ROM): Digitized after Fig. 2 in Van Schmus et al. (1996).

Author/Publisher/Year: Van Schmus, W.R., Bickford, M.E., Turek, A., 1996, Proterozoic geology of the east-central mid-continent basement: in van der Pluijm, B.A., and Catacosinos, P.A. (editors), *Basement and Basins of Eastern North America*: Boulder, Colorado, *Geological Society of America Special Paper 308*, pp. 7-32.

Data Summary: This layer was digitized at a scale of 1:1,650,000 from authors' source figure (Fig. 2) with a published scale of approximately 1:14,085,000. Data are presented as an ESRI line shapefile.

Disclaimer or Constraints on Use: No constraints have been identified.

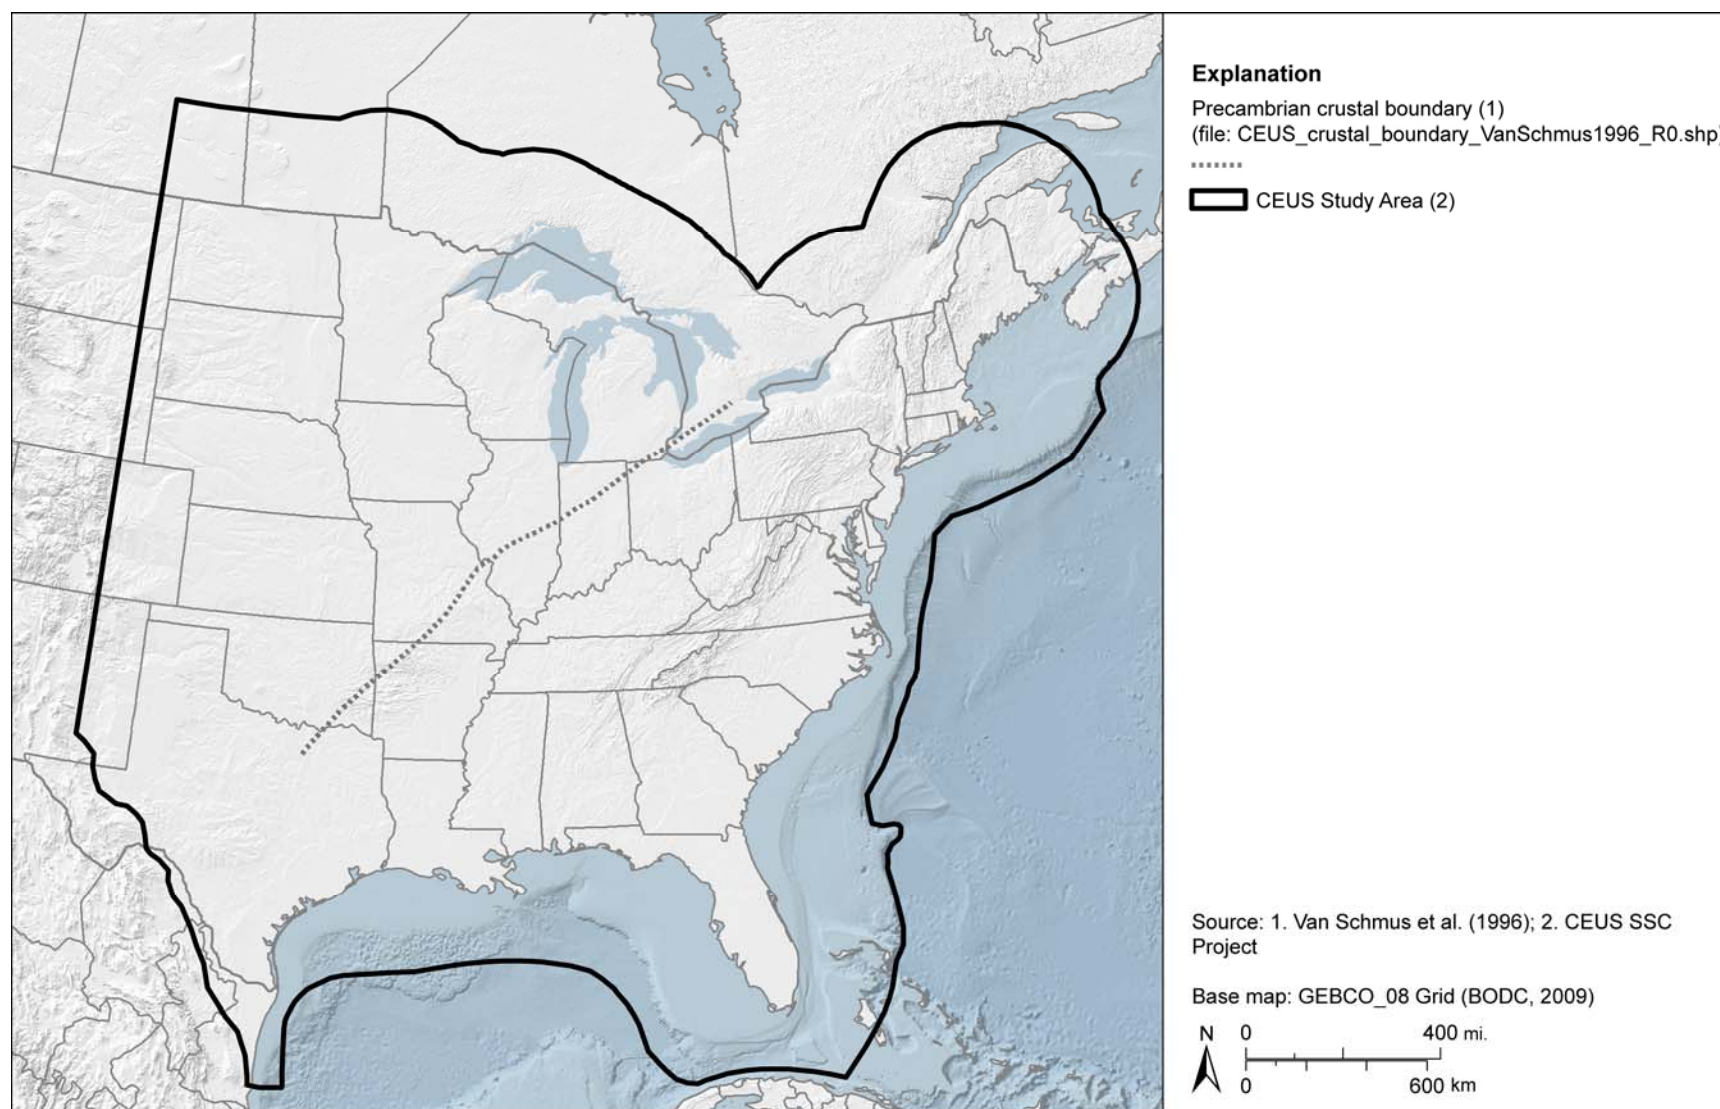

Figure A-7
Precambrian crustal boundary after Van Schmus et al. (1996)

Sheet A-8—CEUS SSC Project GIS Data Summary
Precambrian Geology and Features after Reed (1993)

CEUS_pc_AnomaliesDikes_Reed1993_R0.shp

CEUS_pc_FaultsContacts_Reed1993_R0.shp

CEUS_pc_Geol_Reed1993_R0.shp

Data Description: Data set created from Reed et al. (1993): Map of the Precambrian rocks of the Conterminous United States and Some Adjacent Parts of Canada. Faults, dikes, anomalies and geologic units are presented in separate shapefiles.

Source (Internet URL, CD/DVD-ROM): Digitized from published map.

Author/Publisher/Year: Reed, J.C., Jr., 1993, Map of the Precambrian rocks of the conterminous United States and some adjacent parts of Canada: in Reed, J.C., Jr., et al. (editors), *Precambrian: Conterminous U.S.*: Boulder, Colorado, Geological Society of America, Geology of North America, v. C-2, plate 1.

Data Summary: This data set was created by digitizing contacts, faults and other features to create lines representing faults, dikes, and other linear features, and polygons representing Precambrian geologic units. Faults and other features were attributed according to the information presented in the published map. Digitized at a scale of 1:5,000,000.

Disclaimer or Constraints on Use: No constraints have been identified.

Explanation of Precambrian geology and features after Reed (1993)

Sheet A-9—CEUS SSC Project GIS Data Summary
Precambrian Provinces after Van Schmus et al. (2007)
CEUS_pc_basement_VanSchmus2007_R0.shp

Data Description: Data set represents Precambrian basement provinces as mapped by Van Schmus et al. (2007). Data extent covers a rectangular area from northwest North Dakota to northwest South Carolina.

Source (Internet URL, CD/DVD-ROM): Digitized from source figure in Van Schmus et al. (2007).

Author/Publisher/Year: Van Schmus, W.R. Schneider, D.A., Holm, D.K., Dodson, S., and Nelson, B.K., 2007, New insights in the southern margin of the Archean-Proterozoic boundary in the north-central United States based on U-Pb, Sm-Nd, and Ar-Ar geochronology: *Precambrian Research* v. 157, pp. 80-105.

Data Summary: ESRI polygon shapefile attributed according to Precambrian basement geology. Digitized at 1:13,500,000. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified.

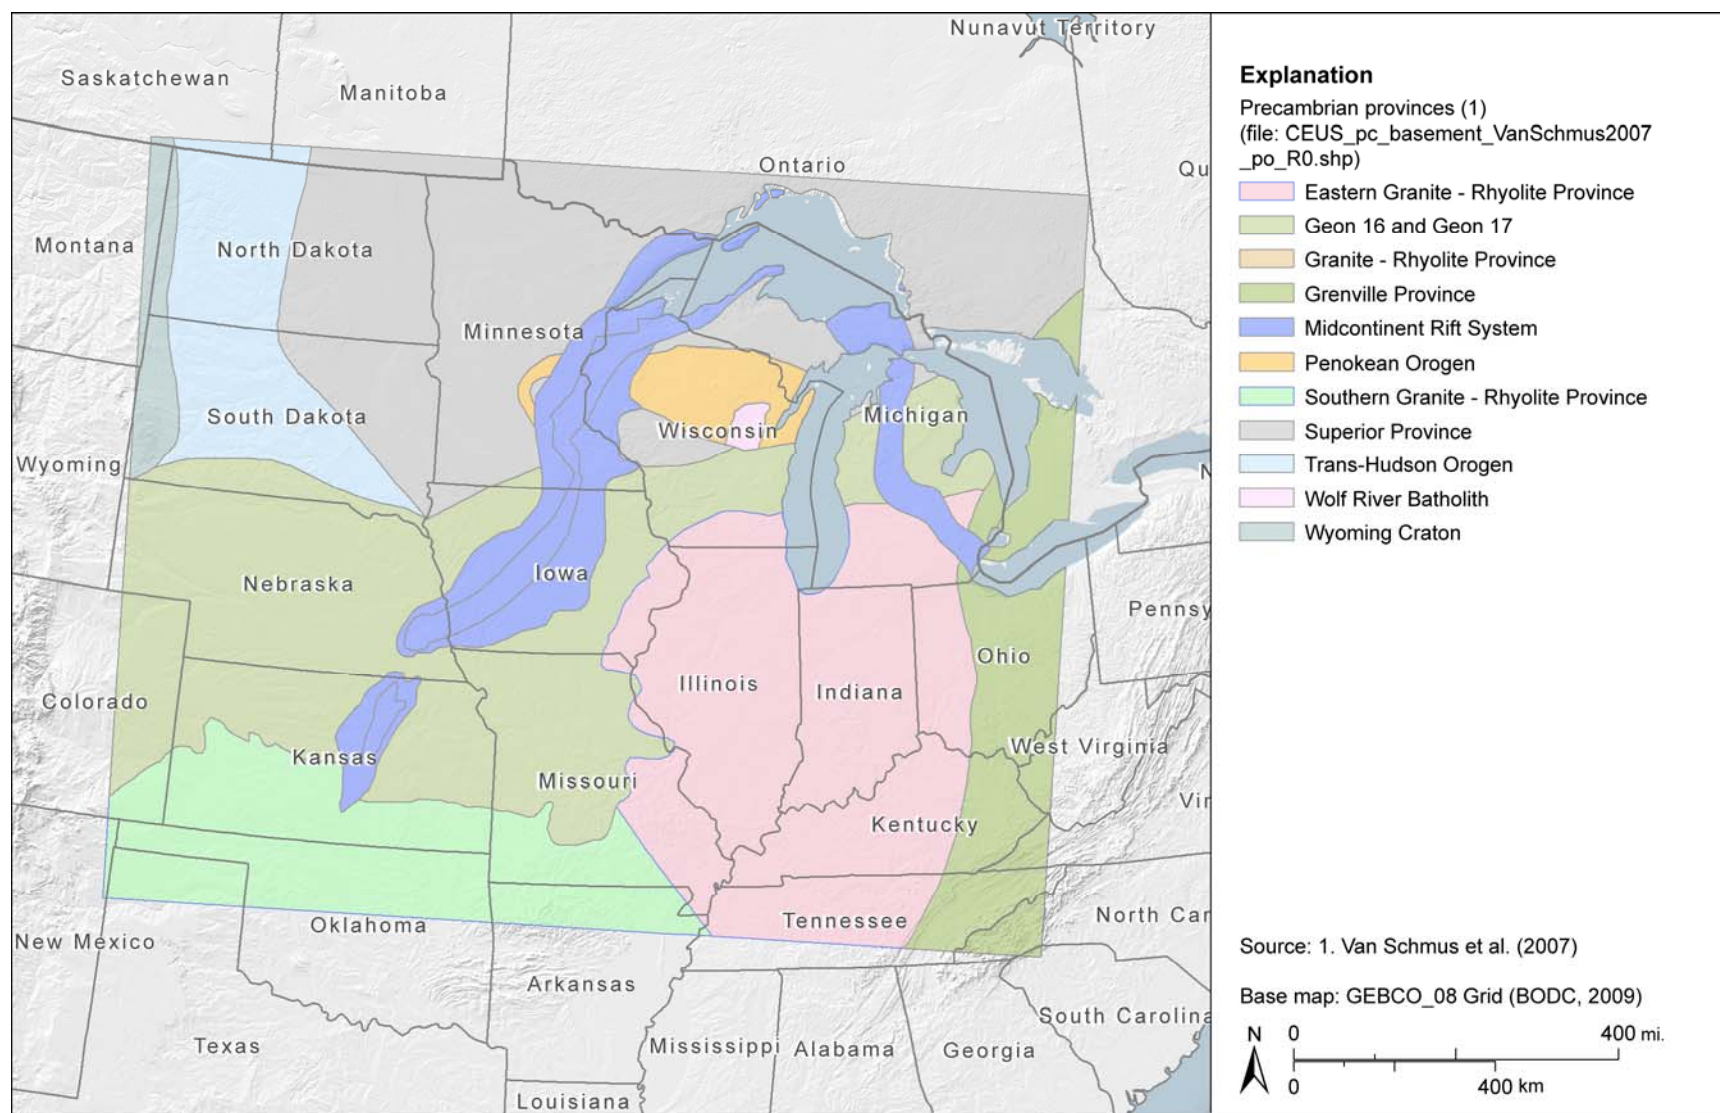

Figure A-9
Precambrian provinces after Van Schmus et al. (2007)

Sheet A-10—CEUS SSC Project GIS Data Summary
Precambrian Units after Whitmeyer and Karlstrom (2007)
CEUS_pc_Whitmeyer2007_R0.shp

Data Description: Data set represents a model for the tectonic growth of North America. Mapped units represent the ages of tectonic, accretionary, and depositional features.

Source (Internet URL, CD/DVD-ROM): Raster digital file provided by Steven Whitmeyer, 2008, personal communication.

Author/Publisher/Year: Whitmeyer, S.J., and Karlstrom, K.E., 2007, Tectonic model for the Proterozoic growth of North America: *Geosphere*, v. 3; no. 4, pp. 220-259.

Data Summary: ESRI polygon shapefile attributed as presented in the source figure. Digitized at 1:1,000,000. Data is presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified.

Precambrian units after Whitmeyer and Karlstrom (2007)

Sheet A-11—CEUS SSC Project GIS Data Summary

Surficial Materials in the Conterminous United States

Surficial_materials.shp, Contacts.shp, State_lines.shp

Data Description: These shapefiles represent the distribution of surficial materials in the conterminous U.S. The GIS database includes surficial materials (geologic units), contacts and state boundaries. Shapefiles were downloaded directly from the website below. A map by Soller and Reheis (2004; scale of 1:5,000,000; <http://pubs.usgs.gov/of/2003/of03-275/>) was originally published in PDF format. The included data is the GIS database that was used to prepare the above publication.

Source (Internet URL, CD/DVD-ROM): <http://pubs.usgs.gov/ds/425/>.

Author/Publisher/Year: Soller, D.R., Reheis, M.C., Garrity, C.P., and Van Sistine, D.R., 2009, *Map Database for Surficial Materials in the Conterminous United States*: U.S. Geological Survey, Data Series 425, scale 1:5,000,000; <http://pubs.usgs.gov/ds/425/>.

Data Summary: These layers were exported to ESRI shapefile format from the ESRI file geodatabase format provided by the USGS. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: The USGS compiled this from state-scale source maps. This results in some data discrepancies at state boundaries therefore limiting its usefulness.

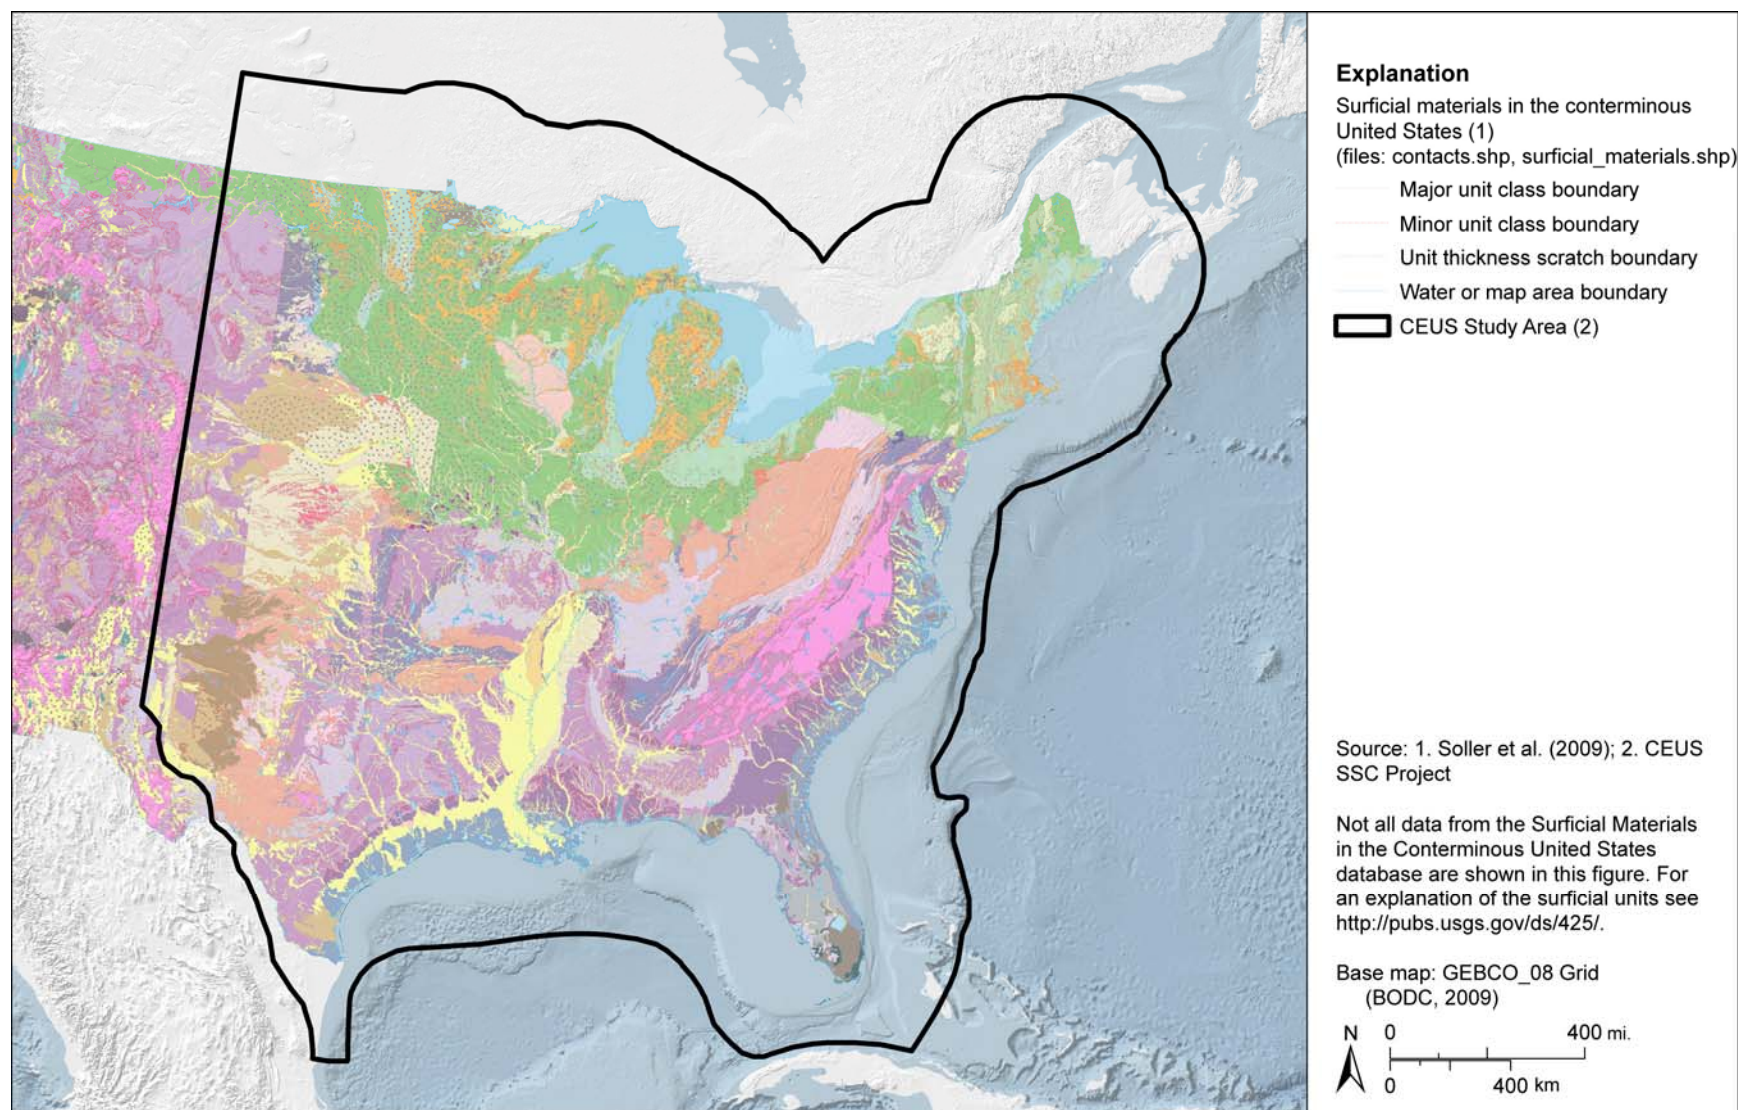

Figure A-11
 Surficial materials in the conterminous United States after Soller et al. (2009)

Sheet A-12—CEUS SSC Project GIS Data Summary
USGS Crustal Database—Seismic Properties of North America
and the Surrounding Ocean Basins
CEUS_crustal_db_USGS_R0.shp

Data Description: Data set of the USGS global structure database developed by Walter Mooney. Attributes include basement thickness, sediment thickness, heat flow values, V_p , and V_s . Sediment thickness, contained in the attribute “sed_thick”, was derived from the subtraction of basement thickness from thickness with sediment (“thickw_sed”). Values for V_p are extracted from the source data set for the first basement depth layer (below the sediment layers, if present). Values for V_s are not complete; only 150 of the 5,237 data points have values for V_s greater than zero. Values of V_s equal to “0.00” indicate no data entry. Values for heat flow are not complete in this version of the database provided by the USGS. Units of heat flow are milliwatts per square meter.

We expect continued updates of the database by the USGS. Check the website below for the most current version.

Source (Internet URL, CD/DVD-ROM): <http://earthquake.usgs.gov/research/structure/crust/nam.php>.

Author/Publisher/Year: USGS Crustal Database—Seismic properties of North America and the surrounding ocean basins. Data accessed April 24, 2008, from the above website.

Data Summary: ESRI point shapefile developed from ASCII-formatted data available at the above website. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints identified other than the limited V_s values and heat flow values noted above.

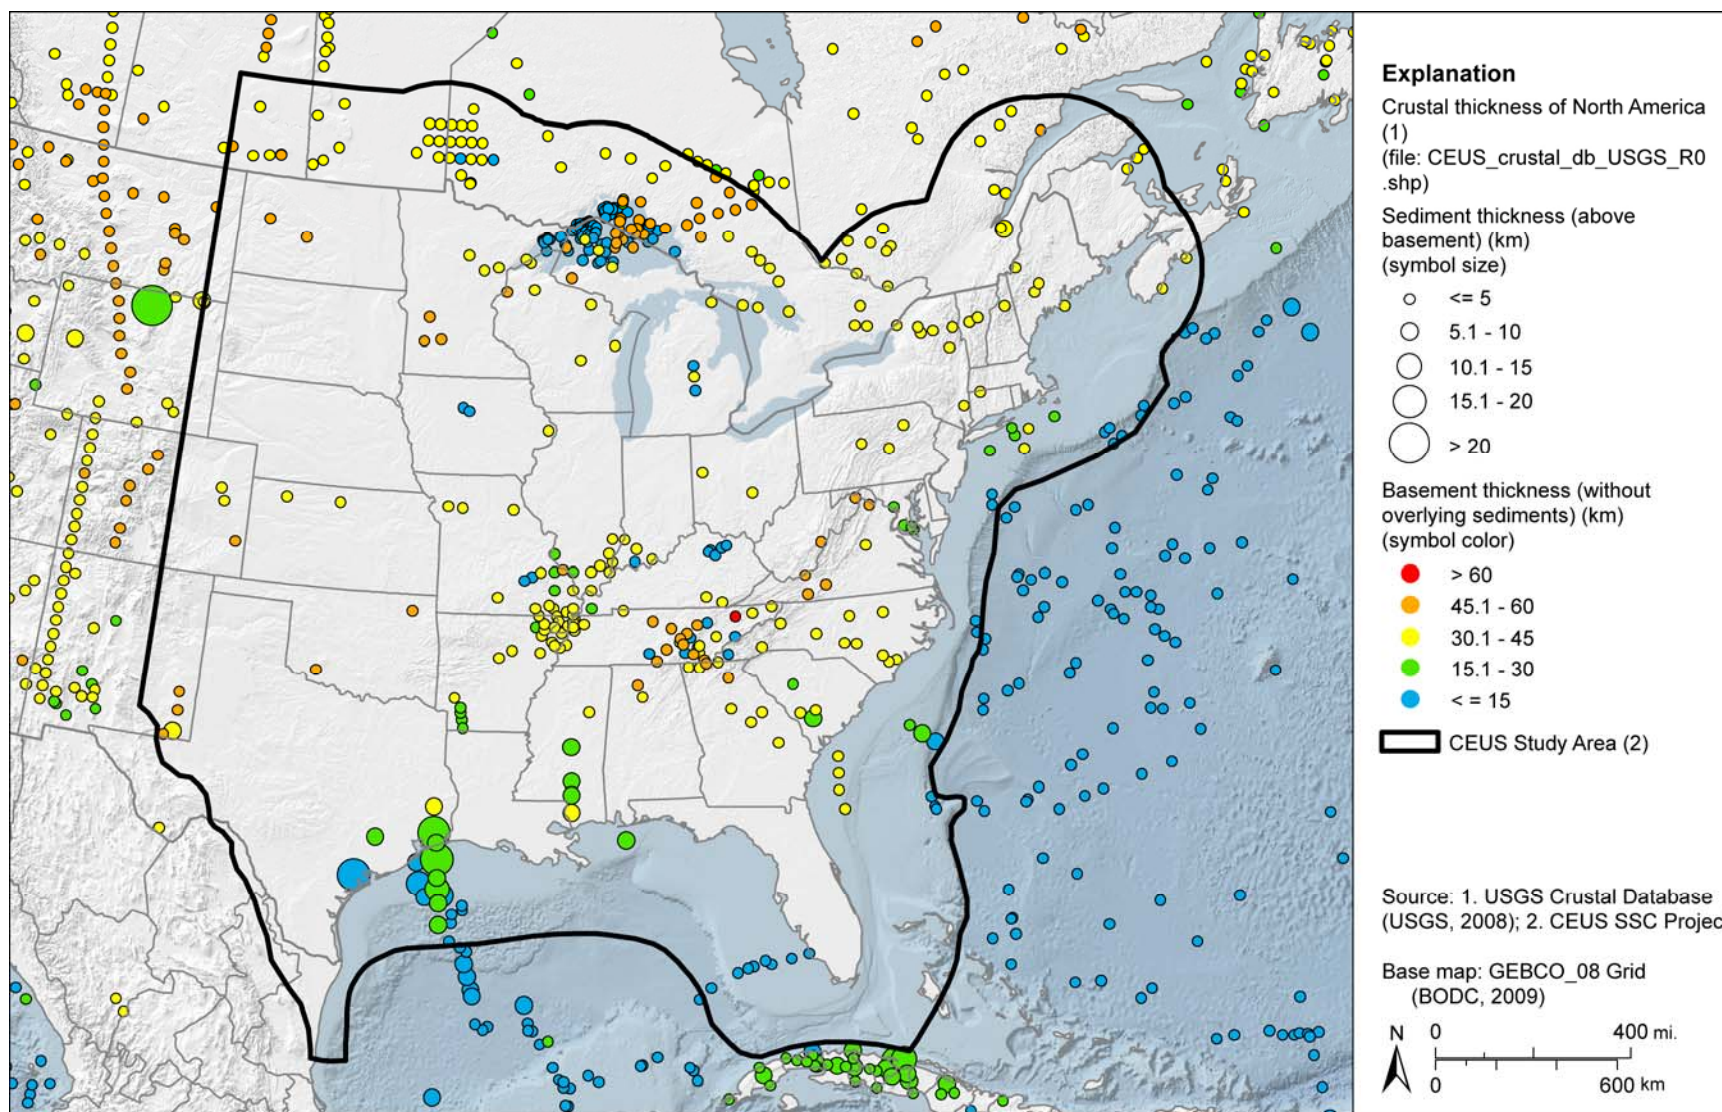

Figure A-12
Basement and sediment thickness in the USGS Crustal Database for North America. Symbol size represents overlying sediment thickness (km); symbol color represents basement thickness (km).

Sediment Thickness for North America and Neighboring Regions

CEUS_sed_thickness_USGS_R0.tif

Data Description: Surface depicting sediment thickness provided by W. Mooney. These are the digital data presented during Workshop #1 on July 22, 2008. These data were subsequently displayed in the article referenced below.

Source (Internet URL, CD/DVD-ROM): Figure of the sediment thickness data provided during a presentation by W. Mooney during Workshop #1, July 22, 2008. Digital data provided by W. Mooney on September 29, 2011.

Author/Publisher/Year: Mooney, W.D., 2011, personal communication. Data was presented as a figure in:

Mooney, W.D. and Kaban, M.K., 2010, The North American upper mantle: Density, composition, and evolution: *Journal of Geophysical Research*, v. 115.

Data Summary: Values in the GeoTIFF represent sediment thickness in km. Data are spaced at 30 arc-seconds (0.08333 degrees). Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: The author's citation should be referenced in all subsequent uses of this data.

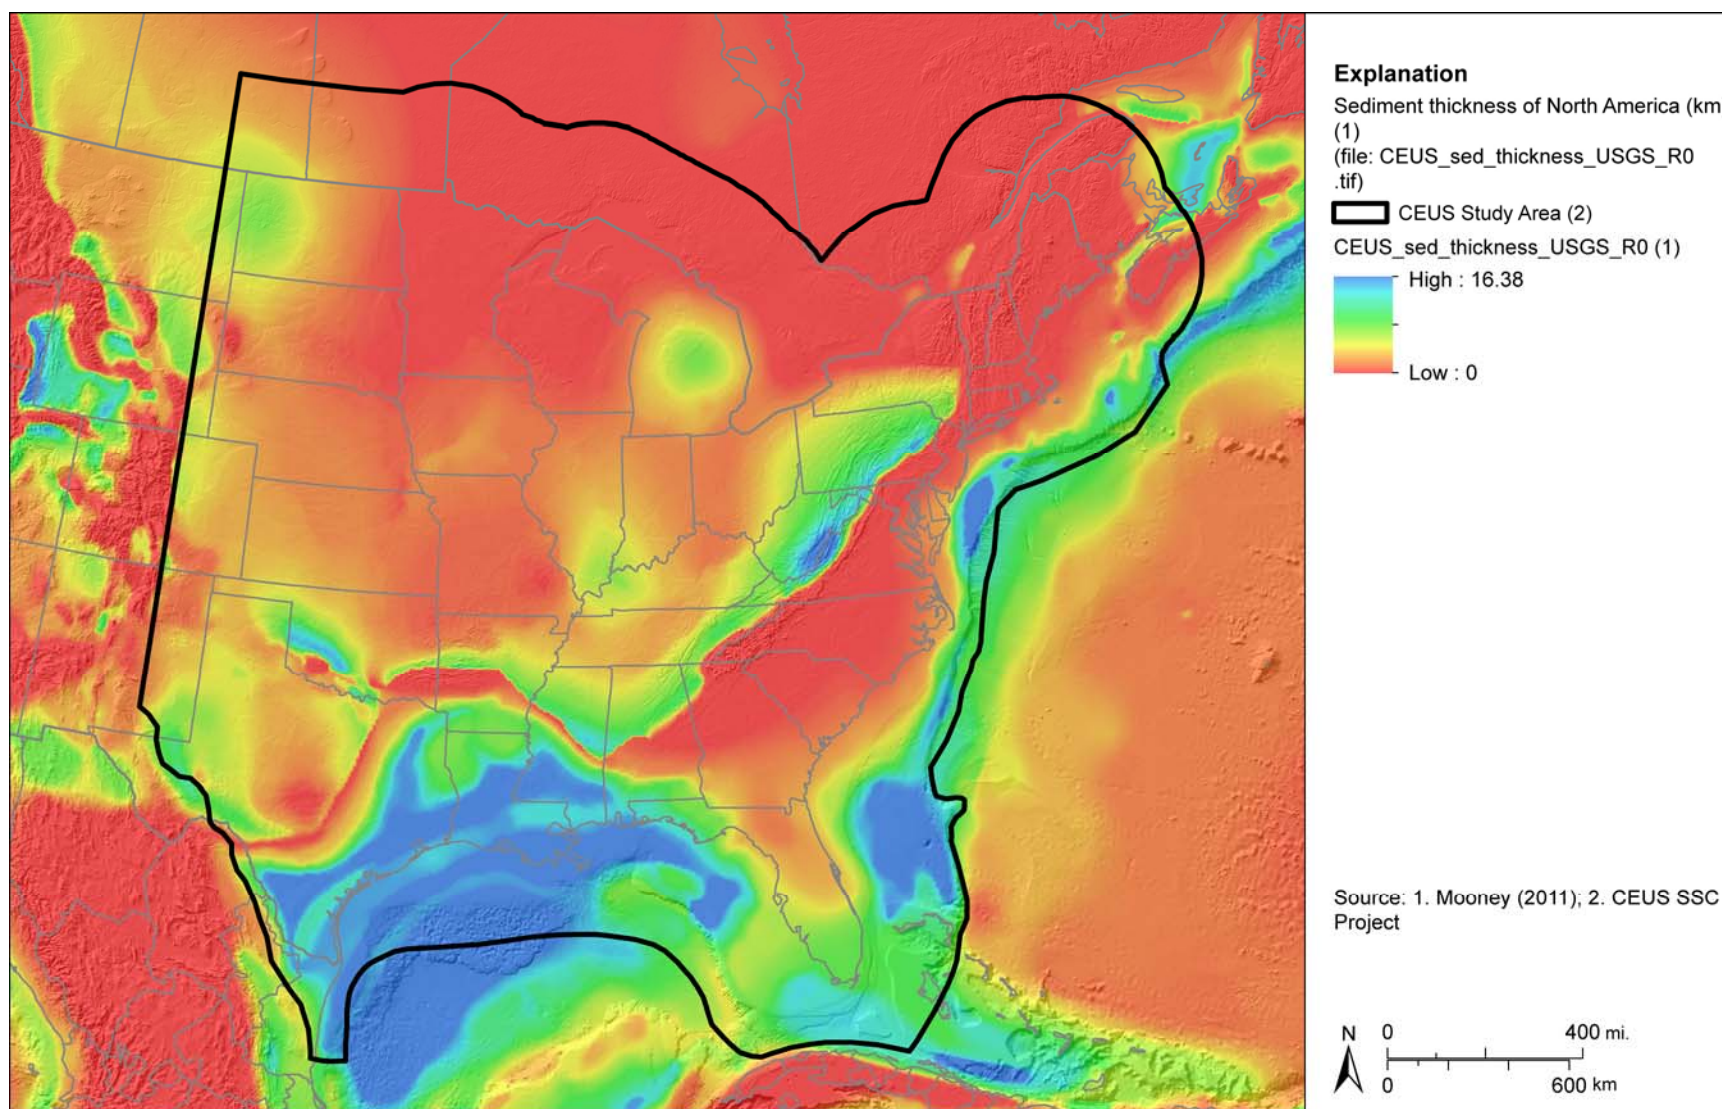

Figure A-14
Sediment thickness for North America and neighboring regions

Sheet A-14—CEUS SSC Project GIS Data Summary

USGS Physiographic Divisions of the Conterminous United States

CEUS_physio_USGS_R0.shp

Data Description: This data set is a polygon representation of Fenneman and Johnson's "Physiographic Divisions of the United States." This map divides the U.S. into eight major divisions, 25 provinces, and 86 sections representing distinctive areas having common topography, rock types and structure, and geologic and geomorphic history.

Source (Internet URL, CD/DVD-ROM): USGS (2002):
<http://water.usgs.gov/GIS/dsdl/physio.gz>.

Author/Publisher/Year: Fenneman, N.M., and Johnson, D.W., 1946, *Physiographic Divisions of the United States*, U.S. Geological Survey (USGS), Washington, D.C.,
<http://water.usgs.gov/GIS/dsdl/physio.gz>.

Data Summary: The source map was compiled as a GIS data set by the USGS and made available online at the website listed above. Features were digitized from a mylar base and presented in a polyconic projection. The scale of the data is 1:7,000,000. The data layer is an ESRI polygon shapefile. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: These data are most appropriate for small-scale (regional) analysis rather than for assessment for specific locations.

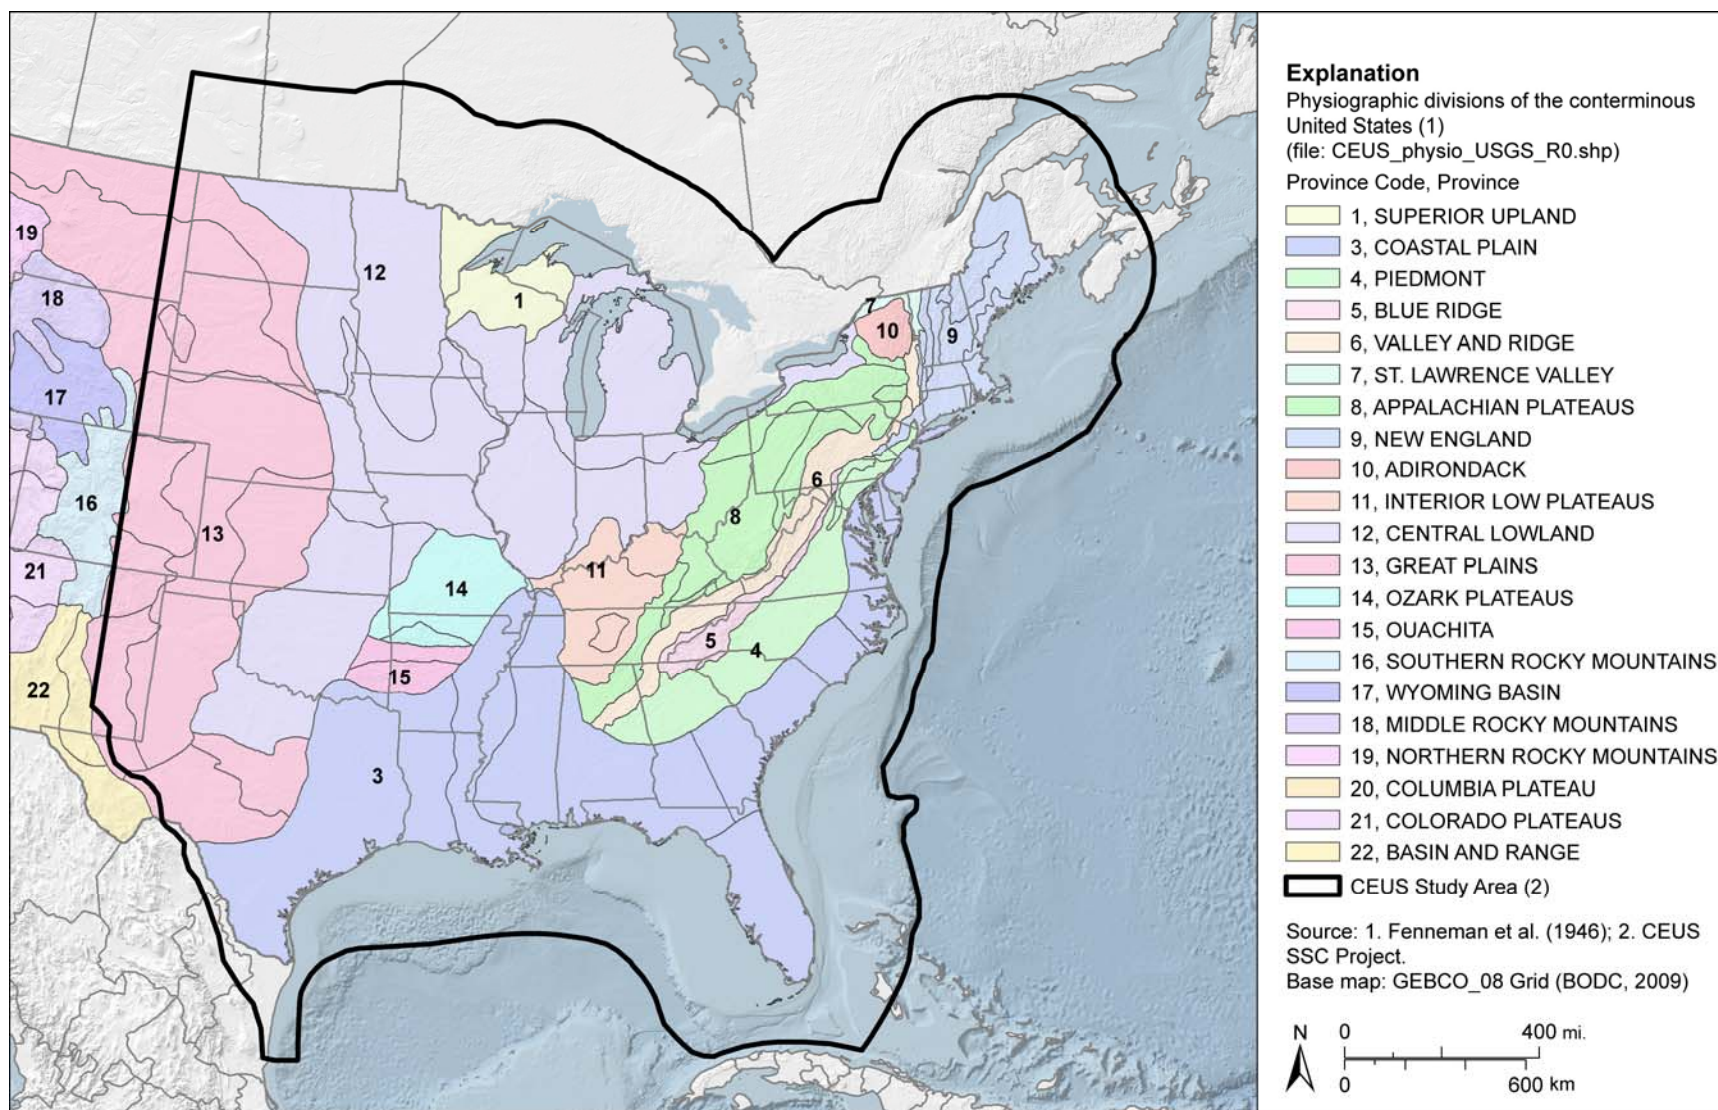

Figure A-15
 Physiographic divisions of the conterminous United States after Fenneman and Johnson (1946)

Sheet A-15—CEUS SSC Project GIS Data Summary

CEUS SSC Gravity Anomaly Database Grids

CEUS_GRAV_<varies>_CEUSSSC_R0.tif

Data Description: These data sets present gravity anomaly data compiled from several public-domain and unpublished sources for use in the CEUS SSC Project. Bouguer, free-air, isostatic, and various derivatives of these data sets are provided. Data are presented in milligals (mGal) or mGal per kilometer (mGal/km) as noted below.

<i>File Name</i>	<i>Data Description</i>
CEUS_GRAV_Freeair_CEUSSSC_R0.TIF	Free-air anomaly (mGal)
CEUS_GRAV_Bouguer_CEUSSSC_R0.TIF	Complete Bouguer anomaly with free-air anomaly in marine areas (mGal)
CEUS_GRAV_RI_CEUSSSC_R0.TIF	Residual isostatic anomaly (mGal)
CEUS_GRAV_Isostatic_CEUSSSC_R0.TIF	Regional isostatic anomaly (mGal)
CEUS_GRAV_RI_1VD_CEUSSSC_R0.TIF	First vertical derivative of residual isostatic anomaly (mGal/km)
CEUS_GRAV_Bouguer_1VD_CEUSSSC_R0.TIF	First vertical derivative of Bouguer with free-air anomaly in marine areas (mGal/km)
CEUS_GRAV_Bouguer_LP_240km_CEUSSSC_R0.TIF	Complete Bouguer anomaly (with marine free-air) low pass filtered at 240 km (mGal)
CEUS_GRAV_Bouguer_HP_240km_CEUSSSC_R0.TIF	Complete Bouguer anomaly (with marine free-air) high pass filtered at 240 km (mGal)
CEUS_GRAV_Bouguer_HP_120km_CEUSSSC_R0.TIF	Complete Bouguer anomaly (with marine free-air) high pass filtered at 120 km (mGal)
CEUS_GRAV_Bouguer_UC_40km_CEUSSSC_R0.TIF	Bouguer anomaly with marine free-air anomaly upward continued to 40 km (mGal)
CEUS_GRAV_Bouguer-Bouguer_UC_40km_CEUSSSC_R0.TIF	Bouguer anomaly with marine free-air minus the Bouguer anomaly with marine free-air anomaly upward continued to 40 km (mGal)
CEUS_GRAV_Bouguer_UC_100km_CEUSSSC_R0.TIF	Bouguer anomaly with marine free-air anomaly upward continued to 100 km (mGal)
CEUS_GRAV_Bouguer-Bouguer_UC_100km_CEUSSSC_R0.TIF	Bouguer anomaly with marine free-air minus the Bouguer anomaly with marine free-air anomaly upward continued to

	100 km (mGal)
CEUS_GRAV_RI_HD_CEUSSSC_R0.TIF	Horizontal derivative of residual isostatic anomaly (mGal/km)
CEUS_GRAV_RI_HD_1VD_CEUSSSC_R0.TIF	Horizontal derivative of first vertical derivative of residual isostatic anomaly (mGal/km)

Shaded relief versions of the above shapefiles are presented where possible. The shaded relief of the gravity anomalies are provided in two versions. Those named with “315hs” in the file name present a shaded relief with a sun orientation of 315 degrees (45 degrees west of north) and a sun angle of 30 degrees above the horizon, while those with “180hs” in the file name present a shaded relief with a sun orientation of 180 degrees (south) and a sun angle of 30 degrees above the horizon.

Source (Internet URL, CD/DVD-ROM): Keller, G.R., 2010, personal communication.

Author/Publisher/Year: CEUS SSC Project.

Data Summary: Data provided at a grid resolution of 0.033 decimal degrees and converted to TIFF format. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified.

Sheet A-16—CEUS SSC Project GIS Data Summary

SMU Geothermal Laboratory Regional Heat Flow Database

CEUS_Regional_HeatFlow_SMU_R0.shp

Data Description: Geothermal heat flow data provided by the Southern Methodist University Geothermal Laboratory. These data contain regional or background wells for determining heat flow in the United States. Temperature gradients and conductivity were used to generate heat flow measurements. Some heat flow values from wells that are close together were averaged. Data include minimum and maximum temperatures, bottom-hole temperatures, gradients, thermal conductivity, heat flow, porosity, dates of drilling and logging measurements, water table depths, lithology and references.

Source (Internet URL, CD/DVD-ROM): Data were downloaded from <http://smu.edu/geothermal/> on April 9, 2008.

Author/Publisher/Year: Blackwell, D. and Richards, M. (editors), 2008, *SMU Geothermal Laboratory Regional Heat Flow Database*: Southern Methodist University, <http://smu.edu/geothermal>, accessed April 9, 2008.

Data Summary: Digital data in ASCII format (comma-separated values) were imported into Microsoft Access. Numeric database attributes with no data values were replaced with “-9999” to represent null values. These data were subsequently converted to ESRI ArcGIS shapefile format using the latitude and longitude values. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified. Access the most recent version of the SMU Regional Heat Flow Database at the SMU Geothermal Laboratory website.

Full-Spectrum Magnetic Anomaly Database for the Central and Eastern United States

CEUS_MAG_<varies>_CEUSSSC_R0.tif

Data Description: Data representing magnetic anomaly data in the CEUS. Data layers include:

CEUS_MAG_TMAG_CEUSSSC_R0.tif	Total intensity magnetic anomaly (nT)
CEUS_MAG_DRTP_CEUSSSC_R0.tif	Differentially reduced to pole magnetic anomaly data (nT)
CEUS_MAG_DEG_DRTP_TDR_CEUSSSC_R0.tif	Tilt derivative of differentially reduced to pole magnetic anomaly (geometric degrees)
CEUS_MAG_DRTP_HD_TDR_CEUSSSC_R0.tif	Horizontal derivative of tilt derivative (radians) of differentially reduced to pole magnetic anomaly
CEUS_MAG_DRTP_TDR_CEUSSSC_R0.tif	Tilt derivative of differentially reduced to pole magnetic anomaly (radians)
CEUS_MAG_TMAG_AAS_CEUSSSC_R0.tif	Amplitude of analytic signal (nT/m)

Source (Internet URL, CD/DVD-ROM): DVD-ROM provided by D. Ravat, University of Kentucky.

CEUS SSC Paleoliquefaction Database

CEUS_PL_DB_CEUSSSC_R0.shp

Data Description: Data representing paleoliquefaction information for large regional data sets in the CEUS. This data layer was compiled to aid in the development of the CEUS seismic source model. Regional data from published and unpublished sources were combined to help constrain magnitudes, locations, and recurrence rates of magnitude earthquakes, for use in the characterization of seismic source zones for the CEUS SSC Project.

Features in the data layer are assigned the location of their respective source regions (KEY attribute) as well as a site name, unique identifier, latitude and longitude, observation type, feature type, age estimates, and other geotechnical, stratigraphic, and chronologic information. Appendix E describes the attributes in the database in detail.

Source (Internet URL, CD/DVD-ROM): Developed as part of the CEUS SSC Project.

Author/Publisher/Year: CEUS SSC Project. Appendix E includes a complete list of the references and data sources cited in the database.

Data Summary: Digital data in Microsoft Excel format were converted into an ESRI point shapefile format. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified.

CEUS Compilation of Seismic Refraction/Reflection Lines, various authors

CEUS_SL_compilation_R0.shp

Data Description: A compilation of the locations of published seismic reflection or seismic refraction profiles in the literature. Attributes include the source of the publication and the type of profile, whether reflection or refraction. Attributes also include a cross-reference to the complete citation in the metadata.

Source (Internet URL, CD/DVD-ROM): Sources include profile lines digitized with reference to figures in publications and online databases. See the accompanying metadata for complete citation list.

Author/Publisher/Year: Layer compiled from profile locations depicted in several publications. See the layer's metadata for complete citation reference.

Data Summary: ESRI line shapefile compilation from figures provided at varying reference scales. Attributes include references to sources that are described in more detail in the accompanying metadata.

Disclaimer or Constraints on Use: No constraints have been identified.

ehpga2pc50.tif	Earthquake hazard: PGA 2% in 50 years
ehpga5pc50.tif	Earthquake hazard: PGA 5% in 50 years

Data Description: Uniform background zones, special zones, finite fault sources and hazard probability layers for the CEUS. These zones were defined for U.S. Geological Survey Open-File Report 2008-1128, *Documentation for the 2008 Update of the United States National Seismic Hazard Maps*. The TIFF-format surfaces present ground motions for various probability levels.

Source (Internet URL, CD/DVD-ROM): ASCII text files provided by Charles Mueller, personal communication, May 2009.

Author/Publisher/Year: Petersen, M.D., Frankel, A.D., Harmsen, S.C., Mueller, C.S., Haller, K.M., Wheeler, R.L., Wesson, R.L., Zeng, Y., Boyd, O.S., Perkins, D.M., Luco, N., Field, E.H., Wills, C.J., and Rukstales, K.S., 2008, *Documentation for the 2008 Update of the United States National Seismic Hazard Maps*: U.S. Geological Survey Open-File Report 2008-1128, 61 pp.

Data Summary: Data layers were compiled from source ASCII text files of latitude and longitude to define polygon and polyline boundaries. Text files that represent each uniform background zone were merged to create a single polygon GIS layer. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified.

Sheet A-21—CEUS SSC Project GIS Data Summary
Calais—Deformation of the North American Plate Interior
Using GPS Station Data

CEUS_GPS_NA_ITRF2000_Calais_R0.shp

Data Description: Surface deformation in the North American Plate interior using GPS-based station data. Surface deformation is measured by approximately 300 GPS stations. Deformation is best explained by a rigid rotation model and strain components consistent with that expected from glacial isostatic adjustment (GIA). Residual horizontal velocities show a north-to-south deformation gradient of 1 mm/yr mostly localized between 1,000 and 2,200 km from the GIA center.

Source (Internet URL, CD/DVD-ROM): Calais, E., 2008, personal communication.

Author/Publisher/Year: Calais, E., Han, J.Y., DeMets, C., and Nocquet, J.M., 2006, Deformation of the North American Plate interior from a decade of continuous GPS measurements: *Journal of Geophysical Research*, v. 111, B06402, doi:10.1029/2005JB004253.

Data Summary: Point data were obtained from the author in digital form and converted to ESRI point shapefile. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified.

Sheet A-22—CEUS SSC Project GIS Data Summary

World Stress Map of 2008 Updated by Owen Hurd, Stanford University CEUS_WSM_Hurd2010_R0.shp

Data Description: This GIS layer presents updated crustal stress data not previously found in the World Stress Map Project's (WSM) 2008 release. These 49 updates were found through a literature review by Dr. Owen Hurd of Stanford University. The data, in combination with the WSM 2008 release, covers the area of the CEUS. Stress indicators are taken from four general types of sources including: earthquake focal mechanisms, well bore breakouts and drilling-induced fractures, in situ stress measurements, and young geologic data (fault-slip analysis and volcanic vent alignments). Several ESRI symbology layers are provided to assist in the presentation of the attributes included with the data.

Summary of explanation labels in Figure A-63 and the GIS layer's attribute table:

Quality	Regime
A = S_H is within ± 15 degrees	NF = Normal faulting
B = S_H is within ± 20 degrees	SS = Strike-slip faulting
C = S_H is within ± 25 degrees	TF = Thrust faulting
	U = Unknown regime

where S_H is the maximum horizontal compressional stress. **Source (Internet URL, CD/DVD-ROM):** WSM 2008 release is available at <http://world-stress-map.org>. Updates from Dr. Owen Hurd obtained 2010 via personal communication.

Author/Publisher/Year: Heidbach, O., Tingay, M., Barth, A., Reinecker, J., Kurfess, D., and Müller, B., 2008, The World Stress Map database release 2008 doi:10.1594/GFZ.WSM.Rel2008.

Hurd, O., 2010, Stress Measurement Update for the Central and Eastern United States, 5 pp.

Data Summary: WSM 2008 data in Microsoft Excel (xls) format were converted to ESRI point shapefile using latitude and longitude values. Updated stress measurements from Dr. Hurd were provided in the same attribute layout as the WSM 2008 and converted to ESRI point shapefile.

Sheet A-23—CEUS SSC Project GIS Data Summary

CEUS SSC Study Area Boundary

CEUS_boundary_R0.shp

Data Description: The CEUS study area boundary was developed to include the area of the CEUS and adjacent portions of Canada and Mexico. The western limit was set to 105 degrees west longitude, roughly corresponding to the Rocky Mountains eastern extent, and extending 200 miles into Canada and the Atlantic Ocean, with modifications according to the edge of the Continental Slope and the edge of extended terrain. The southern and southeastern extent of the study area was modified to follow the assumed extent of Paleozoic accreted terrain and the oceanic crust boundary in the Caribbean Sea and Gulf of Mexico, respectively. The extent of the study area in Mexico follows the northeastern extent of the Sierra Madre Occidental range up to 105 degrees west longitude.

Source (Internet URL, CD/DVD-ROM): Study area extent was proposed for this study.

Author/Publisher/Year: CEUS SSC Project.

Data Summary: ESRI polygon shapefile created from geographic references and data developed during this study. Study area boundary is presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified.

Sheet A-24—CEUS SSC Project GIS Data Summary**Faults and Seismic Areas Associated with Quaternary Seismicity,
USGS Quaternary Fault and Fold Database**

CEUS_Q_faults_USGS_pl_R0.shp

CEUS_Q_faults_USGS_po_R0.shp

Data Description: The USGS Quaternary fault and fold database presents the locations of faults, associated folds and, in the CEUS, areas of faulting, Quaternary paleoseismic features and seismicity, that are believed to be the sources of magnitude 6 or greater earthquakes in the Quaternary period (less than 1.6 Ma). The USGS uses the database as a source for studies involving probabilistic seismic-hazard analyses. Data are compiled from published literature review and M.S./Ph.D. theses and dissertations. State geologic surveys assisted in the development of the database as well as National Earthquake Hazards Reduction Program (NEHRP) studies. The USGS continually updates this database. See the website for the most current data.

Source (Internet URL, CD/DVD-ROM): Data accessed February 16, 2009, from <http://earthquakes.usgs.gov/qfaults/>.

Author/Publisher/Year: U.S. Geological Survey (and supporting state agency if appropriate) Quaternary Fault and Fold Database for the United States: <http://earthquakes.usgs.gov/regional/qfaults/>; accessed June 9, 2008.

Data Summary: Obtained from the above website in ESRI shapefile format. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified.

Data for Quaternary Faults, Liquefaction Features, and Possible Tectonic Features in the CEUS

CEUS_Q_features_USGS_(pt/pl/po)_R0.shp

Data Description: This layer combines Quaternary tectonic features representing known or suggested Quaternary faults, folds, fields of paleoliquefaction features, seismic zones, and geomorphic features. Feature descriptions were obtained from Crone and Wheeler (2000), Wheeler (2005), and USGS features downloaded from the USGS Quaternary Fault and Fold Database for classes A through C. Locations of classes A & B features were obtained from USGS Quaternary Fault and Fold database or from original reference noted in Wheeler (2005). Location of Class C features were obtained from descriptions, latitude/longitude coordinates, or small-scale figures in Crone and Wheeler (2000), or from original references noted in Crone and Wheeler (2000) or Wheeler (2005). The attributes of the shapefiles note the reference information, location notes, and feature names.

Source (Internet URL, CD/DVD-ROM): USGS Quaternary Fault and Fold Database: <http://earthquake.usgs.gov/hazards/qfaults/>.

Author/Publisher/Year: Crone, A.J., and Wheeler, R.L., 2000, *Data for Quaternary Faults, Liquefaction Features, and Possible Tectonic Features in the Central and Eastern United States, East of the Rocky Mountain Front*: U.S. Geological Survey Open-File Report 00-0260, 342 pp.

Wheeler, R.L., 2005, *Known or Suggested Quaternary Tectonic Faulting, Central and Eastern United States— New Updated Assessments for 2005*: U.S. Geological Survey Open File Report 2005 1336, 40 pp.

USGS Quaternary Fault and Fold Database; website: <http://earthquake.usgs.gov/hazards/qfaults/>.

Data Summary: USGS Quaternary fault and fold database features as polylines and polygons were included with features digitized from the above references to create the ESRI shapefiles. Features were digitized at, or better, than the scale of the source figures. Data are presented in geographic coordinates on the North American Datum of 1983.

Disclaimer or Constraints on Use: No constraints have been identified.

APPENDIX B

Earthquake Catalog Database

B

APPENDIX EARTHQUAKE CATALOG DATABASE

This appendix contains descriptions of the earthquake catalog database assembled for the CEUS SSC Project. The earthquake catalog is described in Chapter 3 of the report; the database components are discussed in the following sections.

B.1 CEUS SSC Uniform Moment Magnitude Earthquake Catalog

The primary product of the earthquake catalog development described in Chapter 3 is a catalog of earthquakes for the CEUS in which earthquake size is reported as moment magnitude, M , as defined by Hanks and Kanamori (1979). The catalog forms the basis for the assessment of the earthquake recurrence rates for the distributed seismic sources, and it is used in the assessment of M_{\max} for those sources. The magnitudes are reported as $E[M]$, the expected moment magnitude given the uncertainty in its assessment. The development of the concept of $E[M]$ and its derivation from the observed size measures are described in Section 3.3.1. Also explained in Section 3.3.1 is the assessment of the equivalent count values N^* used to obtain unbiased earthquake recurrence parameters.

Table B-1 lists the CEUS SSC Project uniform moment magnitude catalog. The explanation of the fields in the table is given below.

TID	Unique identification number assigned in the project to each earthquake. These values are not necessarily sequential. Sequential numbering of earthquakes in the uniform magnitude catalog is provided by the EQNO field.
Year, Month, Day	Earthquake Date
Hour, Minute, Second	Earthquake Time. The times are assumed to be expressed in Coordinated Universal Time (UTC). During assembly of the catalog, UTC was selected when it was clear that various other time zone standards were used in the catalog sources. However, the reported times are based primarily on those reported in the source catalogs, and no attempt was made to verify that the time was UTC for the individual sources. The master catalog database contains all of the individual catalog entries with their individual times.

Latitude, Longitude	Earthquake Location (degrees). The precision of the reported location represents the precision reported for the preferred entry among the source catalogs. Variability in the precision in location among the earthquake entries is not an issue, as the earthquake recurrence rates are computed using grid sizes of $\frac{1}{4}$ - or $\frac{1}{2}$ -degree longitude and latitude.
Depth	Earthquake Depth (km)
ERH	Estimated Horizontal Location Uncertainty (km). This entry provides a measure of the uncertainty in location of the earthquake. The values represent a mixture of reported standard errors in location of instrumentally located earthquakes from various catalog sources and estimates of location uncertainty for locations based on felt effects (shaking intensity).
E[M]	Expected value of moment magnitude.
N*	Equivalent earthquake count. This value is used to account for the effects of magnitude uncertainty in computing unbiased earthquake recurrence parameters.
sig M	Standard error in the estimated moment magnitude, E[M]. It is used to compute N*.
EQNO	Earthquake number in the uniform moment magnitude CEUS SSC Project catalog.
Flag	Flag for dependent earthquakes. A value of 0 indicates an independent earthquake, and a value greater than 0 indicates a dependent earthquake. For dependent earthquakes the value of FLAG is the EQNO of the main shock of the cluster.

B.2 Moment Magnitude Data

The primary method for the development of the uniform moment magnitude measure was the use of conversion relationships developed by regression of reported moment magnitudes against other size measures for individual earthquakes. Table B-2 provides a list of the moment magnitude values obtained from the literature for earthquakes in the CEUS SSC Project database. The table gives the date, time, and location of an earthquake and the reported value of moment magnitude, \hat{M} . The M with a hat symbol denotes moment magnitude measured with uncertainty (see Section 3.3.1 for a discussion). The table also lists the source of the reported values. Multiple entries for individual earthquakes were factored into the overall uncertainty in the assessment of the moment magnitude and into the uncertainty in the assessment of moment magnitude from the conversion relationships.

B.3 Approximate Moment Magnitude Data

As discussed in Section 3.3.2.2, studies by Atkinson (2003), Boatwright (1994), and Moulis (2002) provide approximate estimates of moment magnitude. Listed in Table B-3 are the moment magnitude values reported by these authors for earthquakes in the CEUS SSC Project catalog. For each author, the data include (1) the magnitude reported by the author, (2) the value of estimated moment magnitude, $E[M]$, and (3) the standard error (denoted σ_M) in the $E[M]$ obtained using the conversion relationships shown on Figures 3.3-2, 3.3-3, and 3.3-4. Also listed in the table is the composite value of $E[M]$ and its standard error σ_M obtained from combining the individual estimates using Equations 3.3.1-9 and 3.3.1-10.

B.4 CEUS SSC Project Data

The composite listing of the earthquake catalog data gathered for CEUS SSC Project is contained in the master catalog data file `CEUS_SSC_Earthquake_Catalog_Data_Rev7.xls` located on the project website (www.ceus-ssc.com). The file contains all the entries from the individual catalog sources assembled to produce the earthquake catalog for the project. The master catalog data file also contains those entries that are identified as nontectonic events (e.g., nontectonic mechanisms such as explosions and false entries in the source catalogs) and entries for earthquakes with magnitudes smaller than those of interest for use in assessing earthquake recurrence rates for the CEUS SSC Project.

The primary purpose of including the master catalog database is to provide a basis for comparing the CEUS SSC Project catalog with additional information that may become available about the earthquakes included in the catalog and comparing catalog entries from other sources with the entries in the database.

The fields contained in the master catalog data file are described below.

Explanation of Entries in the CEUS SSC Project Earthquake Database

Column	Variable	Explanation
A	SortID	Line number in master catalog used for sorting entries (between 1 and 62,408).
B	TID	Unique ID number assigned to each earthquake or nontectonic event. Multiple entries for the same earthquake will have the same TID.
C	Project ID	ID number assigned to each earthquake in its source catalog. Entries for the same earthquake coming from two source catalogs will have the same TID but different Project IDs.
D	Year	Year
E	Month	Month
F	Day	Day
G	Hour	Hour. The entries reflect the times listed in the source catalogs; they are primarily UTC but some are local times.
H	Minute	Minute

I	Second	Second
J	Lat	Latitude (degrees N)
K	Long	Longitude (degrees E)
L through O	Depth1 through Depth2_Flag	Alternative depth estimates (in km) and depth flag. Depth types: ? = poor quality, F = fixed or assigned by analyst, D = obtained from analysis of regional depth phases
P through AG	Mag1 through Mag6, and Mag1t through Mag6t	Alternative magnitude values, magnitude types, and source. Explanation of magnitude types is tabulated below.
AH through AK	Mo1 through Source_Mo2	Alternative seismic moment values their sources
AL	MMI	Macroseismic intensity from source catalog
AM	MMIn	Macroseismic intensity for earthquake reported in NCEER91
AN	LNFA	Natural log of the felt area in km ²
AO	MMI_Hop	Macroseismic intensities from Margaret Hopper's catalog
AP	LNFA_Hop	Natural log of the felt area in km ² from Margaret Hopper's catalog
AQ	MMISmith	Macroseismic intensities from Smith (1962, 1966)
AR	ERH_SUSN	Horizontal location error in km from SUSN catalog
AS	ERH	Estimated horizontal location error in km
AT	RMB	m_b^* from EPRI-SOG catalog
AU	EMB	$E[m_b]$ from EPRI-SOG catalog
AV	SMAG	Sigma m_b from EPRI-SOG catalog
AW	FLAG	Aftershock flag (from source catalog)
AX	Source	Source catalog
AY	Type	Type of nontectonic event. Types are listed below.
AZ	Type_Source	Source of type of nontectonic event
BA	Region	Flag to indicate location of earthquake in U.S. or Canada
BB	NMT	Magnitude type number from NCEER91. 1 = instrumental, 2 = felt area, 3 = maximum intensity
BC through BI	AddCat1 through AddCat7	Identical records from other source catalogs
BJ	Comment	Comments on entry

Magnitude Types Contained in the CEUS SSC Project Earthquake Database

Variable	Explanation
M, Mw	Moment magnitude
mbFA	Felt-area magnitude
mbI0	Magnitude obtained from intensity
MI0(ML)	Magnitude obtained from intensity and nominally labeled ML (GSC catalog)
mb	Body-wave magnitude
mbLg	Original Nuttli (1973) magnitude
mLg(f)	Frequency-dependent Nuttli formula (Ebel, 1994)
MN	Modified Nuttli magnitude (short-period Lg waves)
Mc	Coda magnitude
Md	Duration magnitude
ML	Local magnitude
Ms	Surface-wave magnitude
ME	Energy magnitude
m3Hz	Magnitude 3 Hz from Oklahoma Geophysical Survey
unk	Unknown magnitude
?	Following a magnitude type indicates uncertain attribution

Nontectonic Event Codes Contained in the CEUS SSC Project Earthquake Database

Flag	Explanation
?	Doubtful reports, questionable
B	Blast
C	Cryoseism
DE	Duplicate event
E	Error
FE	False Event
I	Induced
L	Landslide
M	Mining related
N	Nonseismic
NS	Noise on seismograph
PB	Probable blast
PC	Probable cryoseism
PE	Probable error
PM	Probable mining event
PX	Probable explosion
RB	Rock burst
RF	Rock fall
RI	Reservoir-induced
S	Sonic boom
X	Explosion

8. PERFORMING ORGANIZATION - NAME AND ADDRESS (If NRC, provide Division, Office or Region, U.S. Nuclear Regulatory Commission, and mailing address; if contractor, provide name and mailing address.) U.S. Nuclear Regulatory Commission, Office of Nuclear Regulatory Research, Washington DC 20555 U.S. Department of Energy, 1000 Independence Avenue SW, Washington DC 20585 Electric Power Research Institute, 3420 Hillview Avenue, Palo Alto, CA 94304					
9. SPONSORING ORGANIZATION - NAME AND ADDRESS (If NRC, type "Same as above"; if contractor, provide NRC Division, Office or Region, U.S. Nuclear Regulatory Commission, and mailing address.) U.S. Nuclear Regulatory Commission, Office of Nuclear Regulatory Research, Washington DC 20555 U.S. Department of Energy, 1000 Independence Avenue SW, Washington DC 20585 Electric Power Research Institute, 3420 Hillview Avenue, Palo Alto, CA 94304					
10. SUPPLEMENTARY NOTES					
11. ABSTRACT (200 words or less) This report describes a new seismic source characterization (SSC) model for the Central and Eastern United States (CEUS). It will replace the Seismic Hazard Methodology for the Central and Eastern United States, EPRI Report NP-4726 (July 1986) and the Seismic Hazard Characterization of 69 Nuclear Plant Sites East of the Rocky Mountains, Lawrence Livermore National Laboratory Model, (Bernreuter et al., 1989). The objective of the CEUS SSC Project is to develop a new seismic source model for the CEUS using a Senior Seismic Hazard Analysis Committee (SSHAC) Level 3 assessment process. The goal of the SSHAC process is to represent the center, body, and range of technically defensible interpretations of the available data, models, and methods. Input to a probabilistic seismic hazard analysis (PSHA) consists of both seismic source characterization and ground motion characterization. These two components are used to calculate probabilistic hazard results (or seismic hazard curves) at a particular site. This report provides a new seismic source model.
