1. Introduction

Flow-Accelerated Corrosion (FAC) is a form of material degradation that results in thinning of the inside pipe wall in carbon steel piping and fittings under certain flow and chemistry conditions. Undetected FAC-induced wall thinning may cause a pipe to leak or rupture, potentially causing injury to plant personnel and/or plant shutdown. For these reasons, and in response to regulatory requirements, Indian Point 3 Nuclear Power Plant (IP3) has developed and implemented a program to monitor and mitigate FAC-induced wall thinning in high energy, large-bore piping systems [7.1].

This report uses plant design and operation information to document the CHECWORKS model for IP3. It documents the CHECWORKS Pass 1 analysis to generate a wear rate prediction for every piping component modeled in CHECWORKS. Component inspection data through the Refuel Outage 15 was imported to the model where available. A Pass 2 analysis was performed on all lines to provide wear predictions calibrated to the inspection data, as well as remaining life based upon measured wear rates for inspected components. The results of these analyses can be used to select components for inspection in order to mitigate pipe deterioration due to FAC.

This calculation replaces all previous CHECWORKS model calculations used to document the IP3 model. Previous CHECWORKS model calculations are listed in the References [7.2].

2. Purpose

The purpose of CHECWORKS SFA is to generate relative rankings by wear rate for piping components within the scope, to generate wear rate predictions calibrated to the inspection data, and to predict remaining life based upon predicted wear rate. The results of the CHECWORKS SFA model predictions can be used to select components for inspection in order to monitor pipe deterioration due to FAC.

The purpose of this calculation is to document the development of and updates to the CHECWORKS SFA model. Additionally, this calculation provides the results of the CHECWORKS SFA model Pass 1 and Pass 2 predictions and evaluates the accuracy of the predictions compared to actual measurements.

3. Scope

The large-bore FAC monitoring program has a clearly defined scope and has been in place for several years. The scope of the current FAC inspection program includes the following systems:

- Condensate
- Extraction Steam
- Feedwater
- Heater Drains
- Main Steam
- Moisture Preseparator Drains
- Moisture Separator Drains
- Reheater Drains

Selected lines from the above systems are modeled in the IP3 CHECWORKS Model. The scope of modelable lines was determined in the Indian Point Unit 3 System Susceptibility Evaluation Report [7.3]. The lines from these systems that are a part of the CHECWORKS Model scope are listed in Appendix D.

The CHECWORKS model reflects plant design and operation through Refuel Outage 15. All historical records (i.e. inspections, replacements, water chemistry, power levels, etc.) through Refuel Outage 15 were included in this analysis. Future updates to the FAC program (additional inspections, replacements, chemistry, power uprates, etc.) should be addressed in subsequent revisions of this document.

This analysis was performed using CHECWORKS SFA version 3.0 (build 150).

Assumptions and modeling decisions made during this analysis are documented in Section 4. The methodology employed during this analysis is detailed in Section 5. Results obtained are listed in Section 6 and in the Appendices. Finally, Section 7 includes a list of all references used in this analysis.

4. Assumptions and Modeling Decisions

The following assumptions and modeling decisions apply to the Indian Point Unit 3 CHECWORKS model. The assumptions and modeling decisions are categorized below based on the range of their influence. See Appendix A for all historical changes to the model.

4.1. Global Assumptions and Modeling Decisions

- 4.1.1. In general, when modeling decisions or matters of interpretation arise, the plant is modeled to reflect actual conditions as closely as possible. This information can be obtained from heat balance diagrams, PEPSE models, hydraulic analyses, sample data readings, input from system engineers, etc. This realistic approach results in the most accurate and realistic model possible, not necessarily one that results in a higher predicted wear rate for a particular component. Because the results of the model will be considered when deciding which components to inspect, and because only a finite number of the modeled components will actually be inspected, realistic and accurate modeling is imperative to the decision making process. For instance, entering an unrealistically high flow rate for a particular component will result in a high-predicted wear rate for that component. If the model consisted of only that one component, this could be considered a conservative approach. However, because the model consists of many components, artificially or unrealistically raising the predicted wear rate for one component may cause that component to be selected for inspection at the expense of another with a higher actual wear rate. Therefore, the plant was modeled as realistically as possible. If additional conservatism is needed, it can be built into the FAC program by increasing the size of the inspection sample.
- 4.1.2. All input information was assumed to be correct from the previously verified CHECMATE model. Where discrepancies were found, engineering judgment was used to model the system as realistically as possible.
- 4.1.3. Small taps and drains off the main piping that are <25% of the main outer diameter and <4" do not significantly affect the flow rate or cause a flow disturbance and were not modeled.
- 4.1.4. In multiple train systems, when one or more trains are in standby during normal operation, a duty factor is applied to the Wear Rate Analysis runs containing those lines. When one of these trains flow into or out of a header, a duty factor cannot be applied if the time of operation for portions of the header varies, which will usually be the case. Instead of applying a duty factor, the flow rate was scaled back, and the component was modeled to operate 100% of the time. For each component (or portion of

component in the case of tees), the average flow over time is calculated and entered. In this way, if a particular component experiences a flow of 1.2 Mlb/hr for one-third of the time, and no flow for the other two-thirds, the flow for that component is entered as 0.4 Mlb/hr. This process is the best possible option and is equivalent to the recommendation presented in option 3 of the section entitled “Cyclic Usage of Lines” of the EPRI Advanced CHECWORKS Training Manual [7.5].

- 4.1.5. Water Treatment for future operating cycles was assumed to match the most recent completed operating cycle. The current water treatment will be updated when the data becomes available.
- 4.1.6. Parallel trains of equal pipe diameter were assumed to have equal flow unless otherwise indicated.
- 4.1.7. For a number of lines on the Heat Balance Diagrams [7.6], thermodynamic and flow values (pressure, enthalpy, and flow rate) were listed separately for the steam phase and the water phase or for each train in a parallel train configuration. The overall flow rate, pressure, and enthalpy of these lines were calculated and entered in the CHECWORKS Steam Cycle (see Section 5.1.3). The combined flow rate was calculated as the sum of the liquid and steam flow rates (or the sum of multiple trains), the combined pressure was calculated as the average of all pressures, and the enthalpy was calculated as the weighted average of liquid and steam enthalpy (or the weighted average of multiple trains). These calculations were performed based on EPRI’s “Guidelines for Plant Modeling and Evaluation of Component Inspection Data” [7.7].
- 4.1.8. When hydrazine data was not available at the Steam Generator Outlet and MSR Drain, the “rules of thumb” [7.7] for a Recirculating Steam Generator were applied to all chemistry cycles. Based on the “rules of thumb”, the concentration of hydrazine at the Steam Generator Outlet was assumed to be 60% of the final feedwater concentration, while the concentration of hydrazine at the MSR Drain was assumed to be 120% of the final feedwater concentration.
- 4.1.9. The CHECWORKS Heat Balance Diagram (HBD) in the input model had the Boiler Feed Pump modeled as an electric pump instead of a steam driven pump. The CHECWORKS HBD was corrected to portray the Boiler Feed Pump as a steam driven pump.
- 4.1.10. Because the Boiler Feed Pump was remodeled as a steam driven pump, Steam Cycle Data was input for the original power level in addition to the Appendix K [7.6.2] and SPU [7.6.3] power levels for this location. Flow rate was obtained from the original HBD [7.6.1]. Feed Pump Turbine drain pressure and enthalpy was not shown on the original HBD; therefore, the

original pressure and enthalpy was assumed to be equivalent to the SPU pressure and enthalpy as shown on the SPU HBD [7.6.3]. Note that this assumption has little impact on the model as no components in the Feed Pump Turbine drain are modeled.

- 4.1.11. The flow rate in the Feedwater Pump Recirculation lines was shown as zero on the SPU Heat Balance [7.6.3] and Appendix K Heat Balance [7.6.2]. In general flow through such lines is not zero under normal operation, so a heat balance is not a good source for determining this flow. Therefore, an assumption was made that the flow rate under SPU and Appendix K conditions was equivalent to the flow rate under original pre-uprate conditions as defined in the input CHECWORKS model (the as-received model) [7.8]. Note that all components in these lines are constructed with FAC-resistant material, so this assumption has little to no impact on wear rate predictions.
- 4.1.12. Wear in valves and orifices with negative times to Tcrit was assumed to be documented and well-understood if the downstream extension of the component was inspected.

4.2. Component Assumptions and Modeling Decisions

4.2.1. General

- 4.2.1.1. Replaced components were added to the model with materials and schedule according to Addendum A to Spec. No. 6604-104-248-4 [7.3]. Replacement dates were input as the first day of the outage in which the replacement was made. As an exception, replacements made in 1994 was given a replacement date of 1/1/94.

4.2.2. Nozzles

- 4.2.2.1. In some cases, the imported CHECMATE data listed nozzle material as A234 WPB. When this occurred, the nozzle material was changed in CHECWORKS to A106 Grade B. The change was made because nozzles are generally fabricated from A106 Grade B, a piping material, rather than A234 Grade WPB, a fitting material. When the imported CHECMATE data listed nozzle material as other than carbon steel, the material code was left as-imported.
- 4.2.2.2. Nozzle materials SA508 CL3 and A240 TP321 were added to the material table.

- 4.2.2.3. When necessary for the calculation of the length of adjoining pipe, nozzles were assumed to have a length of 1/2 times the nominal pipe size. This has no effect on the predicted wear rate of the nozzle.

4.2.3. **Straight Pipes**

- 4.2.3.1. Pipe lengths were imported from the previously verified CHECMATE model when available. Pipe lengths were rounded to the nearest inch.

4.2.4. **Valves**

- 4.2.4.1. Valves were modeled with the material, thickness and diameter from the CHECMATE model.
- 4.2.4.2. When necessary for the calculation of the length of adjoining pipe, valves were assumed to have a length of 1.5 times the nominal pipe size. This has no effect on the predicted wear rate of the valve.

4.2.5. **Orifices, Flanges, and Expansion Joints**

- 4.2.5.1. Flow elements were assigned Geometry Code 6 with an orifice diameter equal to 90% of the inside diameter of the nominal pipe size. The downstream pipe was assigned Geometry Code 56.

4.2.6. **Elbows**

- 4.2.6.1. Elbows were assumed to be standard radius unless otherwise indicated.
- 4.2.6.2. Per EPRI recommendations [7.7], elbows cut to an angle between 0° and 45° were modeled as 45° elbows.
- 4.2.6.3. Per EPRI recommendations [7.7], elbows cut to an angle between 46° and 90° were modeled as 90° elbows.
- 4.2.6.4. Per EPRI recommendations [7.7], elbows cut to an angle between 91° and 180° were modeled as 180° returns.

4.2.7. **Tees, Crosses, and Headers**

- 4.2.7.1. All tees were left with the material that is associated to them from the CHECMATE model.
- 4.2.7.2. In cases where tees were modeled twice in CHECMATE, the branch component was deleted in this model and the associated information entered to the main component.

4.2.7.3. Per EPRI recommendations [7.7], crosses were modeled as type 11 tees with one main and one branch.

4.2.7.4. All tees were assumed to be fabricated when determining pipe material and schedule.

4.2.8. Piping Material and Schedule

4.2.8.1. Materials A217-C5 and A155 EFW Grade C55 Class 2 were added to the material library.

4.2.9. Design and Operating Conditions

4.2.9.1. The design pressures and temperatures were imported from the previously verified CHECMATE model.

4.3. UT Inspection Assumptions and Modeling Decisions

4.3.1. In cases where there was insufficient information regarding the direction the inspection was taken, it was assumed that the numbers were axial, parallel to flow, and letters were clockwise radial, perpendicular to flow.

4.3.2. Version 1.0F of CHECWORKS did not recognize UT data imported as the downstream extension of nozzles. To compensate for this, the calculated wear was entered as user-specified wear, at that time. This bug was corrected in Version 1.0G of CHECWORKS, and the calculated wear for the downstream extension of nozzles does not have to be user-specified.

4.3.3. Prior to 3RO13, inspections performed online during the final days of an operating cycle were imported to the first day of the following refueling outage. Note that this has a minimal effect on predicted wear rates and service life as the operating hours are off by a small margin.

4.3.4. A number of inspections were performed over a month prior to 3RO13. Because this was an extended period of time, these inspections were imported to Cycle 13, not to the upcoming outage. The operating hours were adjusted accordingly to account for any difference in predicted wear.

4.3.5. In cases where a counterbore was present, the counterbore was excluded from the calculation of lifetime wear. However, the lowest reading from the counterbore area was used for the calculation of time to Tcrit.

4.3.6. See Appendix F for any changes (excluding points, excluding counterbore rows, etc.) made to the UT data after importation.

4.3.7. For Outage RO14, any measured wear that was found to be less than 0.030" or 5% of Tnom was excluded in the calculation of the LCF. This check was performed automatically when the data was imported from

FAC Manager [7.9] to CHECWORKS SFA. In cases where this occurred, the wear was set to zero in SFA but the wear measurement was maintained in FAC Manager.

- 4.3.8. For Outage RO14, all inspection dates were set at the first day of the outage (March 7, 2007). This will have no impact on the time remaining to Tcrit since SFA uses in service hours to calculate remaining life.
- 4.3.9. For Outage RO14, only components that were found in CHECWORKS SFA were imported from FAC Manager. The other inspections that did not fit these criteria were assumed to not be in the official CHECWORKS model.
- 4.3.10. Subcomponents with the suffix “BR-DSX” in FAC Manager were imported to the branch extension in SFA.

5. Methodology

The development of the CHECWORKS model included inputting the Plant Global Data, Line Data, Component Data, and UT Inspection data.

5.1. *Plant Global Data*

CHECWORKS Plant Global Data pertains to the entire model, and includes the Heat Balance Diagram, Plant Power Level Data, Plant Steam Cycle Data, Plant Water Treatment Data, and Plant Period Data.

5.1.1. **Heat Balance Diagram**

The Indian Point 3 Heat Balance Diagrams were used to create the CHECWORKS HBD [7.8]. Represented on the HBD are all elements necessary to allow Water Chemistry Analysis to accurately calculate hydrazine and other constituent concentrations around the steam cycle. Also, the association of lines to the HBD allows the correct operating conditions to be applied to each line. Note that the CHECWORKS HBD numbering of the Feedwater Heaters, Reheaters, and Extraction Steam Lines proceeds from highest pressure item to lowest pressure item. However, IP3 uses the reverse order of the CHECWORKS HBD for the Feedwater Heaters. Therefore, IP3 items are not the same number as the CHECWORKS items. For example, IP3 #21 Feedwater Heater is the CHECWORKS #6 Feedwater Heater, IP3 #22 Feedwater Heater is the CHECWORKS #5 Feedwater Heater, and so on.

5.1.2. **Plant Power Level Data**

A Power Level was defined for each power level at which the plant has operated for a significant period of time or for a proposed level of operation. The power level corresponds to main generator output. A brief description of the fields in the CHECWORKS SFA Power Level form follows. The values input to the model and the reference from which the value was obtained is listed in Appendix C.

- **Power Level:** The Power Level can be defined as a percent between 0 and 200. The initial power level that the plant operated at was labeled as 100%. Later power levels were named as a percentage of power output relative to the initial power level. Table 5.1 lists the power levels and the operating cycles they apply to.

Table 5.1 CHECWORKS Power Levels

Power Level (%)	Power (MWt)	Operating Cycles	Notes
100.00	3045.3	Cycles 1-12A	Original Power Level
101.12	3079.0	Cycles 12B-13	Appendix K Uprate
104.95	3196.0 Cycle 14 to End of Life	Cycle 14 to End of Life	Stretch Power Uprate SPU

Data was entered for the new power levels on the Power Level Form in accordance with the CHECWORKS User's Guide [7.2].

- **Steam Rate:** The steam mass flow rate out of the Steam Generator was taken from the Heat Balance Diagrams [7.6].
- **Steam Generator/Reactor Vessel Pressure:** The pressure at the outlet of the Steam Generator was taken from the Heat Balance Diagrams [7.6].
- **Steam Generator/Reactor Vessel Temperature:** The temperature at the outlet of the Steam Generator was taken from the Heat Balance Diagrams [7.6].
- **Steam Generator Blowdown Rate:** The blowdown rate was taken from the Heat Balance Diagrams [7.6].
- **Carryover:** The carryover percentage was obtained from the Heat Balance Diagrams [7.6].
- **Feedwater Vent Rate:** This field is not used for a PWR plant.
- **Reheater Vent Rate:** This field is not used for a PWR plant.
- **Moisture Separator Carryunder:** This field is not used for a PWR plant.

5.1.3. Plant Steam Cycle Data

The following Steam Cycle Data is used by CHECWORKS to calculate dissolved oxygen concentrations during wear rate analysis. Steam Cycle Data was entered for each Heat Balance Item at each Plant Power Level. The values input to the model and the reference from which the value was obtained is listed in Appendix C.

- **Power Level:** A Power Level is selected from the pull down menu, which includes all of the power levels entered into the Plant Power Level data discussed in Section 5.1.2.

- **Flow Rate:** This is the flow rate taken from the HBD [7.6] in Mlb/hr. Flow rates were entered for the HBD Items when required.
- **Vent Rate:** Vent rates are not entered for PWR plants.
- **Quality:** The steam quality, from the HBD [7.6], was entered in this location as necessary.
- **Enthalpy:** The enthalpy, from the HBD [7.6], is required for the two-phase lines and was entered as necessary in this field in Btu/lb.
- **Temperature:** The temperature, from the HBD [7.6] was entered in this field as necessary in °F.
- **Pressure:** The pressure, from the HBD [7.6], was entered in this field as necessary in psia.
- **FWH Drain Temperature:** This field specifies the temperature for the drain line of the Feedwater Heater.

5.1.4. Plant Water Treatment Data

Water Treatment Data in CHECWORKS consists of name & title, cold pH, dissolved oxygen concentration, single amine, complex constituents, boron injection rate, hydrazine, and ammonia. The values input to the model and the reference from which the value was obtained is listed in Appendix C. Data is entered into the following Water Treatment Data fields:

- **Name & Title:** These two fields contain a descriptive name or title that allows the user to identify the chemistry period.
- **Cold pH:** The cold pH of the condensate is entered into this field if simple water chemistry is used.
- **Dissolved Oxygen:** The dissolved oxygen concentration in the condensate is entered into this field.
- **Single Amine:** If a single amine, rather than a combination of amines, is used, the amine type is entered here.
- **Complex Constituents:** If multiple amines are used, the amine type, their sampling locations, and their concentrations are entered here.
- **Boron Injection Rate:** If boron is injected, the injection rate, sampling location, and the concentration are entered here.
- **Hydrazine Treatment:** Separate sampling location and measured concentration data is entered for ammonia and hydrazine. In addition, hydrazine concentrations at the Steam Generator Outlet

and MSR Drain are entered (see Section 4.1.8).

5.1.5. Plant Period Data

CHECWORKS divides plant history into two types of periods: operating and maintenance. Whenever a significant change occurs in the power level or water chemistry for the unit, a new operating period should be defined. For any significant period of plant down time, a maintenance period can be created. The values input to the model and the reference from which the value was obtained is listed in Appendix C. For each period, data was entered to the following fields:

- **Period Name:** A user designated name for a Plant Period was entered in this field.
- **Period Begin Date:** The begin date of the Plant Period was entered in this field.
- **Period End Date:** The end date of the Plant Period was entered in this field.
- **Operating Hours:** The calculated operating hours per period were entered here.
- **Water Treatment:** The appropriate water treatment was selected for each period from a list of all water treatments in the CHECWORKS model.
- **Power Level:** The appropriate power level was selected for each period from a list of all power levels in the CHECWORKS model.
- **Period Type:** The appropriate period type, operating or maintenance was selected for each period.

5.2. Line Data

All components in the CHECWORKS model were grouped into lines. Lines containing components with identical thermodynamic and chemistry conditions are linked to the same CHECWORKS Heat Balance Diagram Line. A listing of all lines that appear in the CHECWORKS model can be found in Appendix D.

For full use of the Advanced Run Definition lines were divided where flow rates change. For conservatism, the tee where flow rate changed was associated to the line having the greatest flow rate (see Figure 5-1). Note that this will over predict the wear for some sections of tees.

Figure 5-1 Diagram of Line Grouping Convention

Components were grouped into lines by comparing the input CHECWORKS model [7.8] with FAC isometrics [7.10] and flow diagrams [7.11]. Lines were named according to the naming convention, below.

AA-BB.CC D

AA = System Abbreviation
 BB.CC = Multi-digit code to identify a plant line or location
 D = Brief line description

Note that the AA-BB.CC portion of the line name corresponds to the plant line name and component name prefix as taken from the flow diagrams [7.11] and FAC isometrics [7.10]. New line names were created as required by CHECWORKS, not where plant line names changed. Therefore, some lines contain components with different component name prefixes, but in general the component prefix and line name agree. Note that if the AA-BB.CC portion of the line name was not unique for CHECWORKS purposes, an underscore followed by a 1, 2, 3 etc. was added to this portion of the line name.

For example, line name “CD-01.1A FWH 31A to FWH 32A” is plant line name CD-01.1A in the Unit 3 Condensate system from Feedwater Heater 31A to Feedwater Heater 32A.

In addition to the line name, the following information was entered in the Line Data Form.

- **System:** The name of the system in which the line belongs was entered in this field. This field is optional.
- **Phase:** This is a pull-down menu with three choices: All Water, All

Steam, or Wet Steam. This field is optional.

- **Line Group:** This field is used to sort and display the lines. This field is optional.
- **Notes:** A full description of the line and the P&ID that the line is on is entered in this field.
- **Heat Balance Association:** Each modeled line was linked to the appropriate Heat Balance Diagram line, except Z-type lines (see Section 5.8.7). This allows the calculated chemistry, thermodynamic data, and flow rate to be correctly associated to the lines of the model. Please note that this association is not shown on the Line Data Form. Instead, Heat Balance Association appears on the CHECWORKS HBD (see Section 5.1.1).

5.3. Component Data

Component data within CHECWORKS was entered in the Component Data Form, which contained two tabs: the Main Tab, and the Optional Tab. All component input data is presented in Appendix E.

5.3.1. Component Data Form, Main Tab

The Component Data Form, Main Tab contains key information about the component, including its name, geometry, size, material, operating conditions, and design conditions.

- **Component Name:** Component names are based upon the unique identification system employed at Indian Point 3. The component naming convention includes the system, a numerical identifier, and a letter representing geometry type (“P” for pipe, “T” for tee, “N” for nozzle, etc.). Components in the IP3 model were named according to the convention below:

AA-BB.CC-DDE

AA	Abbreviation of the system (ex: CD = Condensate, EX = Extraction Steam, etc.)
BB	Subsystem Number
CC	Segment Number
DD	Component Number within Segment
E	Component Type Code

- **Geometry:** The geometry was selected from a pull-down menu with a description of the component type (e.g., “STRAIGHT PIPE”). The component type was obtained from isometric drawings [7.10].
- **Geometry Code:** The component type was obtained from the isometric drawings [7.10]. The component geometry code was entered in accordance with the CHECWORKS SFA User’s Guide [7.2].

- **Pipe Size:** A pull-down menu contains outside pipe diameter, nominal wall thickness, and schedule. These were determined from piping specifications [7.3].
- **Material:** The material is selected from a pull-down menu containing material choices. Material was determined from piping specifications [7.3]. The material of replacements was taken from the FAC isometrics [7.10] and documentation from IP3 personnel [7.12].
- **Wear Rate Analysis (WRA) Options:** The option selection determines whether or not inspections on the component will be used to calibrate the model. There are four options. “Use Measured Wear for LCF” allows CHECWORKS SFA to use inspection data for the component in the Pass 2 Wear Rate Analysis. “Do Not Use Measured Wear” eliminates the inspection data for the component from the Pass 2 Wear Rate Analysis. “Exclude From Analysis” eliminates the component itself from Wear Rate Analysis. The option “Use Measured Wear for LCF” is the default option and was selected for the majority of components. Based on the interpretation of inspection data, the option “Do Not Use Measured Wear” was selected if appropriate (see Appendix F). The option “Exclude From Analysis” was generally not used. Selection of the fourth option “Use D/S Ext. from Prev. Comp” is discussed in Section 5.5.2.2.
- **Operating Data** Pressure, enthalpy, quality, and temperature can be entered for the component (only two of four required). These values were entered on the component form for cases where operating conditions did not change due to power level changes. See Appendix D for the lines that use the Component Form as the source of operating conditions. The HBDs were used as a first priority [7.6]. When data was not available on the HBD, the flow diagrams were used [7.11].
- **Design Data:** Design pressure and temperature were obtained from the flow diagrams [7.11].
- **Flow Rate:** Flow rate was entered on the component form for cases where operating conditions did not change due to power level changes. See Appendix D for the lines that use the Component Form as the source of operating conditions. The HBDs were used as a first priority [7.6]. When data was not available on the HBD, the flow diagrams were used [7.11].
- **Orientation Angle:** Component orientation angle was determined from the isometrics [7.10] in accordance with the CHECWORKS SFA User’s Guide [7.2].
- **Orifice Size:** Orifice size is the inside diameter of the orifice and is entered for all orifices, components modeled as orifices, and for all piping immediately downstream of an orifice. Orifice size was

obtained from drawings [7.10] or an assumption was made (see Section 4.2.5).

- **Valve Size and Valve Coefficient:** The valve opening size (Valve Size) and valve flow capacity (Valve Coefficient) is entered in these fields. These fields may be used for lines utilizing Network Flow Analysis (see Section 5.6).
 - **Pipe Roughness:** This field specifies the absolute internal roughness for the component. Only lines utilizing NFA use this field (see Section 5.6).
 - **Branch or Small End Diameter (Br./S.E. OD):** Entered in this field is the outside branch diameter for tees, or the small end diameter for reducers, expanders, reducing elbows, or expanding elbows. This data was obtained from the isometrics [7.11].
 - **Branch or Small End Nominal Thickness (Br./S.E. T_{nom}):** Entered in this field is the nominal pipe thickness for the branch of tees, or the small end of reducers, expanders, reducing elbows, or expanding elbows. This data was obtained from piping specifications [7.3].
 - **Branch/Bend Angle:** The Branch/Bend Angle may be used to specify the angle between the main run and the branch in the case of a lateral. This data is not used in calculating wear rates and was not entered.
- Elbow R/D :** For elbows, the radius to diameter ratio was entered in this field. This data was obtained from the isometrics [7.10] where available. If the Elbow R/D could not be determined from the isometrics, an assumption was made (see Section 4.2.6.1).
- **User Defined Field (1):** This field was not used.

5.3.2. Component Data Form, Optional Tab

The Optional Tab of the Component Data Form contains information on component size, critical thickness, insulation, location, installation, adjacent equipment, and notes.

- **Length:** The pipe length can be entered in this field. This field is optional for all lines that do not utilize Network Flow Analysis (NFA). For lines utilizing NFA, only the length of straight piping is needed. This data was obtained from the isometrics [7.10].
- **Nominal Thickness:** The nominal thickness of extensions was entered if appropriate. The extension thickness was set equal to the appropriate main component thickness (upstream main, downstream main, or branch). This data is used during UT Analysis wear calculation.

- **Initial Thickness:** The initial thickness was set equal to the nominal thickness.
- **Screening Thickness:** This field can be used to determine color-setting thresholds in the UT Analysis displays. Since this is not used in the prediction of corrosion rate no value was entered.
- **Critical Thickness:** CHECWORKS SFA allows the user to define the Component Critical Thickness (T_{crit}). The T_{crit} field is used to establish the critical thickness criteria for calculating all components' remaining life.

Since a true engineering calculated T_{crit} value is not available for all components in the CHECWORKS SFA model, generally only for inspected components, engineering calculated values of T_{crit} were not entered into the CHECWORKS SFA model. Instead a uniform method for estimating T_{crit} was established, which would account for both inspected and non-inspected components. This was done to level the field when ranking components by remaining life to T_{crit} , so that the ranking of inspected components was not skewed compared to the ranking of non-inspected components.

In this model, T_{crit} was set equal to the greatest of T_{long} , an assumed minimum thickness for longitudinal stresses, T_{hoop} , the pipe wall thickness determined from hoop stress allowables, or an administrative limit of 0.100”.

T_{hoop} was calculated using the following equations:

$$T_{hoop} = \frac{(D_o \cdot P_D)}{2[S_A + (P_D \cdot Y)]} \quad [7.13]$$

where:

D_o = Outside Diameter

P_D = Design Pressure

S_A = Allowable Stress

Y = (0.4) constant

T_{long} was an assumed value for the longitudinal stresses. For safety related components it was assumed that T_{long} was equal to 87.5% of the nominal thickness. For non-safety related components, it was assumed that T_{long} was equal to 70% of the nominal thickness.

- **Drawing Name:** This field lists the isometric that the component appears on.
- **Insulation:** The insulation type and insulation thickness fields can be entered for lines utilizing NFA (see Section 5.6).

- **Installation and Replacement Dates:** The dates components are installed or replaced are entered in these fields. When the install date field is empty, the install date is set equal to the plant start date. When the replacement date field is empty, the component is currently in operation.
- **Location and Adjacent Equipment:** Information on component location, and adjacent equipment can be entered in these fields. This information is not required in order to calculate predicted wear rate and was not entered.
- **User Defined Field (2):** This field was not used.
- **User Defined Field (3):** This field was not used.
- **Notes:** Comments and notes were entered into this field as appropriate.

5.3.3. Replacement records (outage and material) were obtained from the information submitted to CSI from personnel at Indian Point Unit 3 [7.12]. Where replacement material or replacement date was unknown, an assumption was made (see Section 4.2.1.1).

5.4. Component Connectivity

The component connectivity feature tells the CHECWORKS SFA code what the modeled component is connected to. To define component connectivity, components were assigned to flow segments; similar to the way they were assigned to lines. Components were assigned to flow segments in flow order starting where flow began, such as the outlet nozzle of a heater, and terminating where flow ended, such as the inlet nozzle of a heater. Flow segments were further divided where flow changed or could potentially change, such as the upstream main, downstream main, or branch of tee.

Component connectivity is used in Network Flow Analysis run definitions, in the Advanced Run Definition, and in reporting results.

Component connectivity consists of one form, the Flow Segment form. Data was entered on the Flow Segment form as described below.

- **Flow Segment Name:** Flow segments are essentially a further breakdown of CHECWORKS SFA lines. Therefore, flow segments were named by taking the line name, followed by the letters “SEG”, and then a sequential numbering 01, 02, 03, etc. For example, line “EX-01.3 HP EXT FWH 36 HEADER” was broken down into flow segments named “EX-01.3 HP EXT FWH 36 HEADER SEG01”, “EX-01.3 HP EXT FWH 36 HEADER SEG02”, etc.
- **Component Name:** Entered in this column is the component name. Components were assigned to flow segments in flow order starting

where flow began and terminating where flow ended, changed, or could potentially change, such as at a nozzle or tee.

- **Line Name:** The CHECWORKS SFA line that the component is grouped in appears in this column.
- **Section Code:** Entered in this field is the section of the component (upstream main, downstream main, or branch) that lies on the flow segment. If the last component or first component in a flow segment is a tee, this field is used to specify how the tee is connected to the other components in the flow segment.

For example, a type 10 tee with flow from the branch to the upstream main and downstream main should appear in three flow segments, one for each section. The branch of the tee will be the last component in one segment, while the upstream main and downstream main will be the first component in the remaining two flow segments.

5.5. UT Inspection Data

UT inspection files may contain grid readings for a main component and extensions. Inspection files for tees may be present in the following subcomponents: main, branch, main downstream extension, main upstream extension, and branch extension. Inspection files for reducers and expanders may be present in the following subcomponents: large end of main, small end of main, main downstream extension, and main upstream extension. For all others, inspection files may be present in the following subcomponents: main, main downstream extension, and main upstream extension.

Once imported to CHECWORKS, the inspection files for the main runs of tees were partitioned into upstream main and downstream main portions. The inspection files for the large end and small end for any reducer or expander are partitioned into large end and small end. All importation was done in accordance with the CHECWORKS User Guide [7.2].

Appendix F contains a listing of all UT inspection data that has been imported. UT inspection data was received as UT examination reports [7.14] and electronic UT grid files [7.15]. For each inspection the following data is listed:

- Line Name
- Component Name
- Period inspection was taken
- Inspection Report Number
- Section of the component that was analyzed

- Wear Method used in analysis
- Tinit value, or Tnom when Tinit was not defined in CHECWORKS
- Measured Wear
- Whether or not the inspection was used in the calculation of the LCF, and the reason it was not used

Note that in cases where a component or subcomponent has UT data from multiple outages, only one wear value for that component or subcomponent (if any) is used in the calculation of the LCF. The wear data used comes from the most recent inspection available. For example, consider an elbow that was inspected in RFO8 and RFO9, and both inspections were available for use in the LCF. In this case, only the wear from RFO9 would be used. Since the RFO8 inspection is technically still “available” for use in the calculation of the LCF, the decision was made to label the table in Appendix F with “Yes” in the Used in the LCF column for both inspections.

5.5.1. CHECMATE Measured Wear Data

CHECWORKS stores measured data as a grid of wall thickness measurements. However, CHECMATE stores only the initial thickness (T_{init}) and the minimum measured wall thickness (T_{DAT}). During the CHECMATE conversion process, values of measured thickness (T_{DAT}) and initial thickness (T_{init}) were transferred to CHECWORKS. Where CHECMATE had a single field, “ T_{nom} ”, to account for both the initial thickness and the nominal thickness, CHECWORKS has separate fields for both. Therefore, for components with T_{init} in CHECMATE, the values were imported to the T_{init} field in CHECWORKS, and the nominal wall thickness was entered to the T_{nom} field. T_{DAT} was converted to measured wear by subtracting T_{DAT} from T_{init} , the resulting value was automatically imported to the “Measured Wear” field in CHECWORKS during importation, and manually checked to ensure accuracy. Inspected components with imported T_{DAT} values are listed in Appendix F.

A potential bug exists in CHECWORKS, for each component where the main component is partitioned into upstream and downstream main portions (i.e., reducers and tees). If user-specified wear (TDAT) is imported to one main portion and not the other for a reducer, or to only 1 out of 3 (U/S main, D/S main, or branch) subcomponents for a tee, CHECWORKS does not recognize this wear in the calculation of the LCF. On the other hand, if user-specified wear (TDAT) is entered to both main portions, or a main and a branch, both values are recognized by CHECWORKS.

5.5.2. UT Inspection Data

UT inspections in the CHECWORKS database were reviewed for correct importation. The grid data manipulation options of transpose, reverse rows, partition, offset, and clockwise/counterclockwise were used to manipulate the CHECWORKS UT grid to match the hardcopy packets as needed. All grid data manipulation techniques were used in accordance with EPRI guidelines [7.7].

5.5.2.1. Upstream and Branch Extensions

In some cases, UT data was taken on an upstream extension or branch extension. Inspection data was imported to the appropriate component section. However, since CHECWORKS FAC does not use these subcomponents in the calculation of an LCF, the “Do Not Use MW” option is not required to be selected for these subcomponents and the data is stored for archival purposes only.

5.5.2.2. Downstream Extensions

Downstream extensions are used in the calculation of an LCF. The fourth WRA option on the Component Data Form, “Use D/S Ext. from Prev. Comp” was selected for instances where both of the following were true:

- Wear calculation data was available for the downstream pipe extension of a particular main component; and
- The downstream pipe extension is represented in the CHECWORKS FAC model by a piping component immediately following the main component.

This option is selected for the pipe component downstream of the main component containing the UT data.

5.5.3. Single Outage Wear Calculation

Single outage wear is used for components with only one outage of inspection data, for the first outage of components with multiple outage inspection files but no baseline file, for components with multiple outage inspection files without the same grid structure, or based on engineering judgment. The CHECWORKS Wear Calculation Module is accessible from the UT Analysis Form and allows single outage wear to be calculated by three different methods. In the model, single outage wear is calculated by all three available single outage methods. Note, however, that the result of only one of the methods, if any, is used to calculate the LCF during WRA.

5.5.3.1. Band Method

The Band Method calculates the wear for each circumferential band of a component in the range specified. The wear for the entire component is set equal to the maximum value calculated in the range. By default, the range is equal to the entire component, but the range may be altered if regions of the grid are seen to contain questionable or inaccurate readings. For a particular band, wear is calculated as the difference between the minimum thickness and either the maximum thickness or the initial thickness, whichever is larger. If initial thickness is not entered, the greater of maximum thickness or nominal thickness (T_{nom}) is used.

5.5.3.2. Area Method

The Area Method calculates the wear for a rectangular range specified for a component. The wear for the entire component is set equal to the wear calculated for the area. By default, the area is equal to the entire component, but the range may be altered if regions of the grid are seen to contain questionable or inaccurate readings. For the area, wear is calculated as the difference between the minimum thickness and either the maximum thickness or the initial thickness, whichever was larger. If initial thickness is not entered, the greater of maximum thickness or nominal thickness (T_{nom}) is used.

5.5.3.3. Moving Blanket Method

The Blanket Method repeatedly calculates the wear for a rectangular region, called a blanket. The blanket is first located at the “upper left” corner of the grid. The blanket is then moved one grid step at a time down the grid. Having reached the bottom of the grid, the blanket returns to the top, one grid step to the right. This motion continues until the entire grid has been blanketed. At each position of the blanket, wear is calculated as the difference between the greater of the average of the two highest readings or T_{init} and the average of the two lowest readings. By default, the blanket size is three grid steps in the longitudinal direction and one third of the component diameter in the circumferential direction. Calculated wear for the component is determined by the greatest blanket wear.

5.5.4. Multiple Outage Wear Calculation

Multiple outage wear, also known as Point-to-Point wear, can be calculated for a component between the inspections from two outages, or between baseline data and the first outage inspection. For components with multiple outage wear calculations, two methods are available in

CHECWORKS FAC for calculating the component's lifetime wear. "Max. Point to Point + Past Wear" combines the lifetime wear calculated upon the first selected outage and the maximum measured difference between the two selected outages. "Avg. Point to Point + Past Wear", on the other hand, combines the lifetime wear calculated upon the first selected outage and the average measured difference between the two selected outages. The "Max. Point to Point + Past Wear" method was generally used in multiple outage wear calculations.

The option "Treat Neg. Wear as Zero" was selected to eliminate calculated negative wear caused by variances in measurements.

5.5.5. Exclusion of Measured Wear

The option "Do Not Use MW" or "Do Not Use Measured Wear" was selected given any of the conditions in the list below. A complete list of reasons appears in Appendix F.

- The component was not an elbow, bend, reducer, expander, tee, nozzle, or pipe.
- Measured Wear was less than or equal to 0.030" or 5% of nominal thickness.
- Measured wear was not representative of actual FAC wear.
- The component material was not susceptible to FAC wear.
- Inspection removed based on engineering judgment.
- The component operated at non-susceptible conditions (no flow).
- The component was small bore.
- Inspection was performed on a nozzle or tee and there was not sufficient correlation between these data points and those of components with other geometry types.

Nozzles and tees were examined on a case-by-case basis to determine whether they should be included in the calculation of the LCF. If there is sufficient correlation between these data points and those of components with other geometry types, the measured wear was used. Otherwise, the "Do Not Use Any Measured Wear" option was selected on the Component Data Form.

5.5.6. Minimum Measured Thickness (T_{meas})

The Minimum Measured Thickness (T_{meas}) value is involved in predicting thickness and remaining service life. A lower value results in a shorter remaining service life.

CHECWORKS SFA allows a number of options to determine the value of the minimum measured thickness (Tmeas) of an inspected component. “Min. Meas Thickness from Region of Max. Wear” (GW) uses the smallest thickness value from the region that has the highest wear. This option is selected by default if the wear calculation uses the band, blanket, or area methods. The second option used, “Minimum Measured Thickness” (MT), uses the smallest thickness value from any region. MT was chosen for subcomponents that had counterbore, for baseline inspections, when wear was calculated using the point-to-point method, and when the MT value was over 0.040” less than the GW value.

Since the MT method uses the minimum reading from the entire UT inspection grid and the GW method uses the minimum reading from the region where wear is maximum, the Tmeas value calculated by MT will be less than or equal to the value calculated by GW in all cases. Thus MT is the more conservative method. However, conservatism is not always the best option in the CHECWORKS model. Because the CHECWORKS model contains many components, using an overly conservative method to calculate the remaining life of one component may cause that component to be selected for inspection at the expense of another. Therefore, the method used was to model components as realistically as possible. See Section 4.1.1 for further discussion on conservatism in the CHECWORKS model.

For inspected components, the Tmeas value listed in the “Wear Rate Analysis: Wear Predictions Report” in the Pass 2 Analysis, Appendix I, may not match the measured minimum thickness from the UT readings. In all cases, the Tmeas values should not conflict by more than 0.040”. Note that the “Wear Rate Analysis: Wear Predictions Report” in Appendix I lists the Tmeas method, MT or GW, that was used.

5.5.7. Pass 2 Wear Rate Analyses (WRA) and Line Correction Factor (LCF)

Pass 2 Wear Rate Analysis was performed on the Wear Rate Analysis Runs as defined with one change: the Analysis Option, “Do Not Use Measured Wear” was deselected. As in Pass 1 WRA, Pass 2 WRA will generate for each component a predicted wear rate, and a predicted remaining service life. During Pass 2 WRA, CHECWORKS also generates a Line Correction Factor (LCF) for each WRA Run in the following way. For each inspected component in the run where the option “Do Not Use for LCF” is not chosen, CHECWORKS generates a ratio of the calculated wear to the predicted wear. The LCF for a run is defined as the median value of these ratios. CHECWORKS multiplies the Pass 1 wear predictions by the LCF to generate the Pass 2 wear predictions.

The LCF indicates the degree to which CHECWORKS over or under-predicts wear. A reasonable LCF should be between 0.5 and 2.5 [7.7]. An

LCF outside this range may be the result of inaccuracies in the model (e.g., incomplete chemistry history) or non-representative inspection data.

5.6. Network Flow Analysis

Network Flow Analysis (NFA) is a module within CHECWORKS that can be used to calculate pressure, flow rate, enthalpy, and quality at each component. If used, the results of the analysis are available for access by CHECWORKS during the Wear Rate Analysis to predict corrosion rates.

NFA should be used where a thermodynamic quantity of interest is unknown or unavailable. For example, if flashing across a control valve or orifice is considered possible; NFA can be used to calculate the steam quality at each component. This is necessary for accurate prediction of the FAC wear rate. For lines where thermodynamic conditions are known and the potential for flashing is small, NFA is not needed because the results would not increase the accuracy of the Wear Rate Analysis.

The Indian Point Unit 3 model does not contain any Network Flow Analysis run definitions.

5.7. Water Chemistry Analysis

Water Chemistry Analysis uses the Plant Global Data (Heat Balance Diagram, Power Level Data, Steam Cycle Data, Water Chemistry Data, and Plant Period Data) to determine the pH levels and chemical concentrations at various locations around the steam cycle. These values strongly affect FAC rates.

The Water Chemistry Analysis calculates the pH levels and constituent concentrations, for each line on the Heat Balance Diagram. The appropriate values are then used in the calculation of predicted wear rates for each component through the association of its database line to the HBD.

Water Chemistry Analysis can also be performed independently from Wear Rate Analysis. The resulting chemistry levels around the HBD are the same as they are when calculated as part of the Wear Rate Analysis. However, when the Water Chemistry Analysis is run alone, CHECWORKS also generates a report displaying the water chemistry results, as well as critical global data. A Water Chemistry Analysis was performed on every Water Chemistry Period in order to review the results to ensure that they are reasonable; the reports are presented in Appendix G.

5.8. Wear Rate Analysis

Wear Rate Analysis (WRA) calculates a predicted wear rate for each component as well as the predicted time before the component wall thins to T_{crit} . WRA automatically takes into account all global input through the use of the Water Chemistry Analysis results.

5.8.1. Run Name and Title

Wear Rate Analysis Runs were given a Name and a Title as listed in Appendix B.

5.8.2. Ending Period

The ending period is used by CHECWORKS to calculate the current wear rates based on current conditions. The ending period selected was the current operating cycle, Cycle 16.

5.8.3. Lines to Analyze

Each run was composed of lines from the CHECWORKS model. Every line was included in a run. The runs and lines defined for this CHECWORKS model are presented in Appendix D.

5.8.4. Analysis Options

The CHECWORKS model allows the user to specify the source of component operating conditions. Component operating conditions can come from one of four locations: the CHECWORKS HBD, the Component form, an NFA, or the ARD. During wear rate analysis, CHECWORKS can use the operating conditions stored at the component level ("COMP"), determine the operating conditions based upon steam cycle data and Advanced Run Definition Flow Factors ("HBD"), use the operating conditions entered on the Advanced Run Definition form only ("ARD"), or to use the operating conditions calculated using an NFA ("NFA"). For all cases, the option "NFA->HBD->ARD->COMP" was selected. This directs CHECWORKS to preferentially use Network Flow Analysis first (if it exists for the line), followed by the ARD (for Z-type lines), the HBD (for all remaining lines), and finally the component. The option "NFA->HBD->ARD->COMP" was selected for all lines since the model includes multiple power levels.

5.8.5. Duty Factor

The duty factor is used to specify the fraction of the total plant operating hours that a given line was in operation. For full-time lines, the duty factor is 1.0. For part-time lines, the duty factor is set to a value less than one based on operation. For example, if a line has full flow half of the time and zero flow half of the time, then the lines would be modeled with full flow and the duty factor would be set to 0.5. Use of the duty factor is in accordance with the recommendations of the EPRI Guidelines for Plant Modeling and Evaluation of Component Inspection Data [7.7].

Duty factors were taken from the input CHECWORKS model [7.8]. Duty factors for each line appear in Appendix D.

5.8.6. Advanced Run Definition

The Advanced Run Definition (ARD) function allows operating conditions to be entered at different times throughout plant history. Use of this function is necessary for plants operating with more than one power level (see Section 5.1.2). In addition, the ARD allows for entry of operating and chemistry conditions for lines not modeled on the heat balance diagram (COLA and Z-type lines), as well as part-time lines and parallel trains. The operating conditions listed below (flow factors, duty factors, pressure, temperature, enthalpy, quality, flow rate, and chemistry conditions) can change from cycle to cycle.

- **Flow Factor:** On the CHECWORKS SFA HBD level, flow rates are expressed in totals rather than for each train. For example, feedwater flow rate might be entered as 10 million pounds per hour, where each train of a three train system sees 3.33 million pounds per hour. As a result, flow multipliers had to be entered to the lines so that the actual flow rate is used to calculate wear rate at the component level. Thus for each flow segment a flow multiplier, or flow factor, was calculated. The flow factor is used to adjust the CHECWORKS SFA HBD calculated flow rate. The calculated flow factor for each flow segment was entered on the ARD form.

There are some possible exceptions to the use of flow factors. The first is for lines and flow segments where NFA or the Component form would be used to calculate operating conditions and flow rate. For these the train flow is directly entered in the NFA definitions or the Component form. Therefore, for these lines the assigned flow factor is 1.0. Other exceptions are made for some lines and flow segments where the ARD form is used as the source of operating conditions. If the input source (PEPSE or HBD) already listed flow rate per train, then the flow factor is set to 1.0 and the train flow rate is entered.

Flow factors were calculated by consulting the CHECWORKS SFA HBD, the plant heat balance diagrams [7.6], and the flow diagrams [7.11].

If the ARD is not used, the flow factor is 1.0 by default.

- **Duty Factor:** The duty factor is used to specify the fraction of the total plant operating hours the lines in this run were in operation. For full-time lines, the duty factor is 1.0. For part-time lines, the duty factor is set to a value less than one based on operation. For example, if a line has full flow half of the time and zero flow half of the time, then the lines would be modeled with full flow and the duty factor would be set to 0.5. Use of the duty factor is in accordance with the recommendations of the EPRI Guidelines for Plant Modeling and Evaluation of Component Inspection Data [7.7].

If the ARD is not used, the Global Duty factor is used.

- **Thermodynamic Data:** Thermodynamic data (operating pressure, enthalpy, temperature, and quality) were entered on the ARD form for Z-type lines (see Section 5.8.7) and COLA lines (see Section 5.8.8) only. These fields were left blank for all other cases. Only two out of four values are needed to define the thermodynamic conditions (pressure and enthalpy preferred) [7.7]. Data entered in these fields is used as a priority over the CHECWORKS SFA HBD.
- **Flow:** Flow rate was entered on the ARD form for Z-type lines (see Section 5.8.7) and COLA lines (see Section 5.8.8) only. These fields were left blank for all other cases. Data entered in this field is used as a priority over the CHECWORKS SFA HBD.
- **Chemistry Data:** Chemistry data (cold pH, oxygen concentration, and hydrazine concentration) was entered for Z-type lines only. These fields were left blank for all other cases. Data entered in this field is used as a priority over chemistry conditions calculated during Water Chemistry Analysis.

5.8.7. Z-Type Lines

Lines not associated to the CHECWORKS SFA heat balance diagram are called Z-type lines. Because they are not associated to the HBD, CHECWORKS SFA cannot automatically calculate chemistry and operating conditions for these lines. Therefore, when using the ARD function, the user must input not only flow factors and duty factors but also thermodynamic conditions, flow rate, and chemistry conditions for each operating cycle.

Z-type lines are used when the site has chemistry data for a specific line that is more accurate than the chemistry data calculated by CHECWORKS SFA.

5.8.8. Chemistry Only Line Association (COLA)

Chemistry Only Line Association (COLA) lines were created due to limitations in the CHECWORKS SFA HBD. In these cases, the computer model does not obtain the data from the correct location on the HBD, or the CHECWORKS SFA program did not allow the correct data to be entered.

COLA lines are associated to the CHECWORKS SFA HBD, like all other non Z-type lines in the model, but this association is to obtain chemistry data only. The values of pressure, temperature, enthalpy, quality, and flow rate were entered on the ARD form directly.

6. Results

6.1. Water Chemistry Analysis Results

The results of the Water Chemistry Analysis are presented in Appendix G. A report was generated for each combination of power level and water treatment that the plant was operated. Water Chemistry Analysis results were input to Wear Rate Analysis.

6.2. Pass 1 Analysis Results

The results of the Pass 1 WRA are presented in Appendix H. For each WRA Run, the following reports are presented:

- Wear Rate Report (sorted by average wear rate)
- Wear Rate Report (sorted by flow order)
- Service Life Report (sorted by remaining service life)
- Service Life Report (sorted by flow order)

6.3. Pass 2 Analysis Results

A summary of the results of the Pass 2 WRA is presented in Appendix B. The Pass 2 reports appear in Appendix I with the exception of the Wear Plots which are located in Appendix J. For each WRA Run, the following reports are presented:

- Wear Rate Report (sorted by average wear rate)
- Wear Rate Report (sorted by flow order)
- Service Life Report (sorted by remaining service life)
- Service Life Report (sorted by flow order)
- Wear Report (sorted by flow order)
- Wear Plot (Comparison of Wear Predictions)

6.4. Discussion of Pass 2 Results

A CHECWORKS predictive model was developed. Input was performed in accordance with the CHECWORKS User Guide [7.7] and the latest EPRI recommendations. No error messages were encountered during the execution of the Wear Rate Analysis, and the output was reviewed and found to be reasonable.

The Pass 2 Wear Rate Analysis results of each WRA run were reviewed to determine the relationship between measured wear and predicted wear. Based on this relationship, a WRA run was classified as Calibrated or Not Calibrated. For

Calibrated WRA runs, the Pass 2 Wear Rate Analysis results of predicted wear rate and remaining service life can be used with reasonable confidence. For runs classified as Not Calibrated, Pass 2 Wear Rate Analysis results should not be used. Instead, Pass 1 Wear Rate Analysis results should be used to determine relative rankings only. In particular, remaining service life (Time to T_{crit}) should not be used as an estimate of remaining component life.

The criterion used to classify a WRA run as Calibrated or Not Calibrated is discussed in the sections below. No single criterion is definitive in classifying a WRA run as either Calibrated or Not Calibrated. Instead, engineering judgment was used to weigh each criterion to determine calibration status.

A summary of the Pass 2 evaluation for each WRA run appears in Appendix B.

- **Number of Inspection Locations:** EPRI recommends that at least three to five locations be included in a Pass 2 Analysis to provide reasonable confidence in the results [7.7 & 7.15]. In this context, a “location” is a CHECWORKS component and all of its component sections. Thus an inspection on an elbow and the downstream extension of the elbow would count as a single inspection location, even though two components were inspected. Note that this inspection location would be represented by two points on the Wear Plot, one per section.
- The more inspections used in calculating the LCF, the more likely that the run can be considered properly calibrated. For runs in which less than three locations have been included in the calculation of the LCF, the results should be considered preliminary and used with caution because there is insufficient UT data to provide high confidence in the Pass 2 results. Therefore, for all runs identified below as requiring additional inspections, the lines in the run should not be considered properly calibrated Pass 2 models, and the results should be used as relative rankings only. In particular, Time to T_{crit} should not be used as an estimate of remaining life until properly calibrated Pass 2 analyses are complete.
- **Line Correction Factor (LCF) Value:** If perfect agreement between the CHECWORKS Pass 2 predictions and measured wall thickness existed, the analysis of each run would result in an LCF of 1. The range considered reasonable for LCFs is from 0.5 to 2.5 [7.7]. If the LCF is outside this range, additional attention should be paid to the results to understand why there is such a significant difference between predictions and measurements.
- **Wear Plot Correlation:** The plot scatter or the correlation between predicted and measured wear is generally the most important factor when determining calibration status. Good correlation will allow a run with a low number of inspection points and/or a poor LCF to be

considered properly calibrated. Generally, a run with a poor LCF should not be considered a properly calibrated Pass 2 analysis. However, a high number of inspection points, a good correlation, and a low percentage of outliers may allow the run to be considered calibrated.

Poor: The inspection data exhibits significant scatter that does not adhere to the 45° line or a significant number of outliers are present.

Moderate: The inspections points are within the $\pm 50\%$ wear boundaries with few outliers, but the inspection points do not form tight clusters around the 45° LCF line.

Good: The inspection points adhere well to the 45° LCF line. There are very few outliers present.

- **Parallel Train Coverage:** EPRI's "Recommendations for an Effective Flow-Accelerated Corrosion Program" advises that inspections be performed on parallel trains [7.7]. As a consequence, there must be adequate train coverage to categorize a run as calibrated.
- **Inspections on Control Valves and Orifices:** NSAC-202L states that special consideration should be given to locations immediately downstream of orifices and control valves [7.15]. Thus for a line to be calibrated, an inspection must be performed immediately downstream of these locations.
- **Number of Outliers:** The number of outliers (points on the Wear Plot that fall outside the lines 50% above and below the central diagonal) is generally considered on a percentage basis in relation to the number of inspections. If a relatively large percentage of the inspections are outliers, then the CHECWORKS results should not be considered properly calibrated. In general, the number of outliers should not exceed 25%.
- **Geometry Coverage:** Finally, for a run to be considered calibrated, there should be a representative sample of the different geometries in the run. For example, a run that was calibrated with inspections on 90° elbows may correctly predict the wear for other elbows, but it may do a poor job of predicting the wear for a reducer.

The specific results obtained for each Wear Rate Analysis run are discussed in Appendix B. The results of the Pass 2 Analysis should be used to pick inspections for calibrated runs only. Runs not calibrated should use the results of the Pass 1 Analysis to pick inspections based on relative ranking.

6.5. Discussion of Negative Times to Tcrit

The Service Life Report for each run in Appendix I gives a calculated value for remaining service life for each component. This value is shown in the

“Component Time to Tcrit (hrs)” column. When this value is negative, it indicates that the calculated component wear is greater than the allowed wear. In some cases, this value is accurate, and the component should be inspected to ensure the component still meets industry standards. Other times, the wear can be understood in other ways. Often times, negative times to Tcrit occur on components that cannot be accurately inspected with UT methods, for example, valves and orifices. If UT cannot be taken on a component, CHECWORKS cannot use an inspection to adjust the calculated wear of a component. Wear in valves and orifices with a carbon steel downstream pipe, elbow, tee, or nozzle can be approximated by inspecting the downstream component. When this is not possible, inspections should be handled with alternate inspection methods as per plant procedure. In some cases, an inspected component will show a negative time to Tcrit because inspections on the component have been omitted from the Pass 2 calculation. This occurs for various reasons given in Appendix F. If an inspection exists on one of these components, the wear in that component is assumed to be understood, and reinspections should be driven through analysis of previous inspections.

Appendix K lists the components in the Indian Point Unit 3 CHECWORKS model that have a negative time to Tcrit. Components with an understood wear should be inspected based on analysis of previous inspections. Components where wear is not understood should be prioritized and inspected when possible using the appropriate methods.

Appendix A
CHECWORKS Model Change History

Table of Contents

	<u>Page</u>
Updates prior to 3RO14	A-2
Update for 3RO14	A-14
Update for 3RO15	A-17

Updates prior to 3R014

Global

- The steam lines between the pre separators and the separators were represented on the CHECWORKS Heat Balance Diagram (HBD) as a dummy high-pressure extraction line, as recommended in the Guidelines for Plant Modeling and Evaluation of Component Inspection Data [7.6]. The enthalpy for this CHECWORKS HBD line was assumed to be the same as the line from the pre separator, as shown on the heat balance diagrams [7.5].
- For MSEP 1 on the CHECWORKS HBD, the steam cycle enthalpy was entered as the combination of the pre separator and the separator drains to the drain tank. The steam cycle pressure was taken from the previously verified CHECMATE model, and translated to psia from psig.
- For RHTR 1 on the CHECWORKS HBD, the steam cycle pressure was taken from the previously verified CHECMATE model, and translated to psia from psig.
- The blowdown rate for the steam generator operated at 0.1000 Mlb/hr for the majority of plant life. However, after refueling outage 9 the rate was cut to 0.0750 Mlb/hr.
- The blowdown pressure was assumed to be equal to the pressure at the outlet of the steam generator. The blowdown enthalpy was assumed to be the enthalpy of saturated water at this pressure.
- The Steam Generator Moisture Carryover Percentage was left at the default value of 0.25%.
- The Blowdown Tank venting rate was entered as 0% [7.5.1].
- The Heater Drain Tank venting rate was entered as 0%. This does not necessarily represent actual operating conditions but is used to obtain reasonable oxygen concentration values.

Condensate

- For component CD-06.2-01R, the design pressure was reduced to 625 psig. This was done to reduce the value of Tcrit so that it is less than the value for Tnom. This is acceptable since the operating pressure is 156.4 psig.
- The sketch for components CD-02.8B-03P, CD-02.6-03T, and CD-02.8B-02E for the 1997 outage is unclear. It was assumed that these components were inspected in a manner similar to components CD-02.7-02T, CD-02.8A-03P, and CD-02.8A-02E for the 1997 outage, which is of a similar configuration.
- CD-02.5-04T has downstream pipe inspected for the 1992 refueling outage. However, CD-02.6-01T is a fabricated tee immediately downstream of CD-02.5-04T. Therefore, the first 5

rows of data from file CD254TDP.dat were imported to the main of CD-02.6-01T, and the remaining three rows were imported as its downstream extension. A 180 degree offset was used for the downstream tee since both tees were inspected using the same grid even though their branches are 180 degrees opposed.

- The initial thickness of 0.845 inches imported from CHECMATE for CD-5.1C-10T was significantly greater than the nominal thickness of 0.688 inches. This would have resulted in CHECWORKS over-predicting the wear since CHECWORKS calculates wear based upon initial thickness versus measured thickness. Therefore, this value was removed from the model.
- Point (J,2) was deleted from the refueling outage 9 inspection of CD-02.12-05P (report 97UT101), imported as the D/S extension of CD-02.12-04V, since this point was obviously inaccurate.
- CHECWORKS point (L,4), which corresponds to point (L,9) in report 97UT044, was removed from the branch of CD-02.6-03T for refueling outage 9 since the reading was unrealistically high.
- CD-02.5-04T's branch was not used in the calculation of the LCF since the measurements are not due to actual wear for both refueling outage 8 and 9.
- Point (F,4) was removed from the refueling outage 9 inspection of CD-02.1A-13R (report 97UT053) due to an unrealistically high reading.
- The initial thicknesses of 0.678 and 0.671 inches, respectively, imported from CHECMATE for CD-02.8B-02E and CD-02.8C-02E were significantly greater than the nominal thickness of 0.438 inches. This would have resulted in CHECWORKS over-predicting the wear since CHECWORKS calculates wear based upon initial thickness versus measured thickness. Therefore, this value was removed from the model.
- Point (F,1) was deleted from the Cycle 10B inspection of CD-02.1C-12T (report 99UT074), imported as the U/S Main, since this point was determined to be inaccurate by engineering judgment.

Extraction Steam

- The orientation angle of component EX-04.1-07P was changed to 180 degrees.
- Expansion joints were modeled as orifices with the component number that was next in the series. An orifice diameter equal to 90% of the inside diameter of the pipe was used. Specifically, the components added were as follows:

EX-03.1A-42X	EX-03.1B-37X	EX-03.1C-41X
EX-04.1-08X	EX-04.8-08X	EX-04. 15-08X
EX-04.2- 10X	EX-04.9-10X	EX-04. 16-10X

- The following components were changed to geometry code 3, 45 degree elbow, and, where applicable, their downstream pipe was changed to geometry code 53:

EX-05.1A-03E	EX-05.1B-03E	EX-05.1C-03E
EX-05.2A-03E	EX-05.2B-03E	EX-05.2C-03E
EX-06.4A-02E	EX-06.4B-02E	EX-06.4C-02E

- The following components were changed to geometry code 1, 45 degree elbow:

EX-05.2A-05E	EX-05.2B-05E	EX-05.2C-05E
--------------	--------------	--------------

- The following components were changed to long radius elbows:

EX-04.2-07E	EX-04.9-07E	EX-04.16-07E
-------------	-------------	--------------

- The orientation angle of component EX-01.3-21E was changed to 90 degrees.
- Components EX-02.13-04E, EX-03.1A-20E, and EX-03.1A-24E were assumed to be short radius elbows based on overall line configuration.
- An orientation angle of 90 degrees was added for component EX-01.3-21E
- Components EX-01.5A-03E and EX-01.5A-09E were changed to geometry code 102, 90 degree elbow with counterbore.
- Lines ES: PRESEP 1A TO HDR 35, ES: PRESEP 2A TO HDR 35, ES: PRESEP 1B TO HDR 35, and ES: PRESEP 2B TO HDR 35 were newly installed during refueling outage 5, RO5 [7.29]. Therefore, the installation date for the components within these lines was set to the start date of RO5, 05/02/87.
- During Refueling Outage 9, all piping between the High Pressure Turbine and the 6 Heaters was replaced with the exception of the turbine exit nozzles, the feedwater heaters inlet nozzles, and all the valves. The replacement date used was the first day of Refueling Outage 9 or 5/14/97. The feedwater heaters inlet nozzles were internally given a stainless steel weld overlay. In order to accurately model the existing weld overlay within CHECWORKS, the feedwater inlet nozzles were also replaced. The valves and turbine exit nozzles were left as is.
- Components EX-02.16-08E, EX-02.17-05E, and EX-02.18-05E were replaced with carbon steel in 1985. Therefore, the material and WRA Option for these components were changed to A234/WPB and "Use Measured Wear for LCF", respectively.
- Type 12 tees with no flow in the upstream or downstream main and their corresponding downstream pipes were changed to the proper geometry code. The table below lists the component, current geometry code, applicable downstream pipe, and current geometry code for downstream pipe.

Tee Component Name	Current Geometry Code	D/S Pipe Component Name	Current Geometry Code
EX-02.1-06T	10	EX-02.5-01P	60
EX-02.8-08T	10	N/A	N/A
EX-04.1-06T	10	EX-04.3-01P	60
EX-04.8-06T	10	EX-04.10-01P	60
EX-04.15-06T	10	EX-04.17-01P	60

- Components EX-02.4-01T and EX-02.11-01T were removed from the model since the main run of these tees are on non-modeled lines.
- Component EX-01.3-18P was deleted from the model since the 1992 inspection of adjacent components revealed that no pipe actually exists.
- The original material of components EX-01.3-23T and EX-01.4-02T was A234 Grade WPB. This material was changed to A106 Grade B since tees were assumed fabricated.
- Piping specifications were unavailable for LP extraction lines to Heaters 31 and 32. These lines were assumed to have the same design pressure and temperature as well as piping schedule and material as the lines to the 33 Heaters.
- New material A691 EFW Grade 2 ¼ CR Class 22 was added as having 2.25% chrome and 0.70% molybdenum with an allowable stress of 15,000 psi. This material, A691/EFW/22, was used for replaced piping to the 35 Heaters.
- All components that were replaced during Refueling Outage 9 from the HP Turbine to the 6 Heaters have a current material of A-213/TP304L/TP3. This material is comparable in composition to the actual material installed. Since the current material is non-susceptible to FAC, all replaced components were selected as “Do Not Use Any Measured Wear”.
- The following components were replaced with chrome-moly during RO11. The replacement date for these components was assumed to be 04/28/01.

EX-02.16-02P	EX-02.16-06E	EX-02.17-03E
EX-02.16-03E	EX-02.16-07P	EX-02.17-04P
EX-02.16-04P		

- Components EX-01.1-03P and EX-01.2-10L had two inspections during RO8. The later of the two was imported.
- Component EX-02.3-03T is not in the model, therefore its RO8 inspection data could not be imported.
- In some cases, inspection data files did not match the hard copies. This data was not

imported. Affected components were EX-04.6-05E and, EX-02.14-32T for RO9.

- Data file EX042102.DAT was not imported for RO9 because it is an expanded view of the EX-04.21-04P that is already associated with inspection file EX042 1 00.DAT.
- The following data points were removed from RO8 on component EX-01.1-03P, the downstream extension of EX-01.1-02E, because of high readings: (H,3&4), (I,3&4), (M,3&4), (N,3&4), and (O,3&4).
- For component EX-01.1-08R in RO8 the data point (O,9) was removed from the downstream main section and rows 3 & 4 were excluded from the wear calculation for the upstream main section.
- For component EX-03.1C-13E in RO9 the data point (I,1) was removed from the main section.
- Data file EX 02.16 03EMICR was not imported for RO10 because it is an expanded view of elbow EX-02.16-03E that is already associated with inspection file EX02 1603 .DAT.
- Hot UT inspections taken on components EX-04.4-22T, EX-04.4-21P, and EX-04.6-01R during RO10P were repeated during RO10 to measure the difference between hot versus ambient temperature UT data. The RO10 UT data was not imported due to the lack of inspection data sheets.
- Data file EX 02.17 03E SUP was not imported for R10 because it is an expanded view of elbow EX-02.17-03E that is already associated with inspection file EX021701 .DAT.
- For Cycle 10B inspections of tee branches EX-04.20-16T and EX-04.4-22T blank UT data columns N-R were deleted and readings were assumed to be taken clockwise against flow (counterclockwise with flow). For component EX-04.4-22T the data point (K,3) was removed from the branch section.
- For component EX-02.16-06E data points (AA,1), (AB,1), (Y,2), and (AB,3) were removed from the downstream extension analysis.
- For component EX-03.1B-05T, the inspection was a partial grid on one section of the main. The grid was imported to CHECWORKS for historical purposes only and was therefore excluded from the calculation of the LCF.
- UT inspection data for component EX-02.7-02T for RO9 was not imported due to questionable readings and the component was only partially gridded.
- A number of inspections revealed piping components that had not been modeled previously. In each case, the component was added to the model in the correct location. The component name was obtained from the inspection packet. Pipe material and schedule was assumed to be identical as other piping components nearby. The following table lists the components that were added to the model.

Component	Inspection Report Number	Location
EX-02.9-07P	03UT141	Upstream of EX-02.9-07E
EX-02.9-10P	03UT141	Downstream of EX-02.9-09E
EX-02.13-03P	03UT086	Downstream of EX-02. 1 3-03E

- The table below lists Extraction Steam components which were replaced during this outage. These replacements are documented in inspection report number 03UT1 51. Line scan readings were performed prior to installation to obtain the minimum and maximum thickness of these components; however, no inspection was imported to the model as line scan readings cannot be used as a baseline exam by CHECWORKS.

EX-02.9-02P	EX-02.9-04P	EX-02.9-06P
EX-02.9-03E	EX-02.9-05E	

- The geometry code of components EX-02.13-04E and EX-02.13-05P was changed to 3 and 53, respectively.
- The nominal thickness of over fifty components was updated based on documentation from the Extraction Steam modification of 1987.
- Component EX-01.1-08R had no file or data for the downstream extension in RO8.

Feedwater

- The feedwater heaters inlet nozzles were internally given a stainless steel weld overlay. In order to accurately model the existing weld overlay within CHECWORKS, the feedwater inlet nozzles were also replaced. The valves and turbine exit nozzles were left as is.
- A straight pipe exists between components FW-03.1C-04B and FW-03.1C-05B. Therefore, components FW-03.1C-16P_1 and FW-03.1C-16P_2 were inserted as type 51 and type 9 respectively between those components.
- Component FW-02.5-05P was deleted from the CHECWORKS database. The inspection report 99UT269 shows that there is no pipe between tees FW-02.4-19T and FW-02.5-01T.
- Components FW-02.8A-25R, FW-02.8B-25R, FW-02.8D-24R, and FW-02.8C-24R were changed from Geometry Code 17 to Geometry Code 7.
- Component FW-03.1A-08B was changed to Geometry Code 4 from Geometry Code 3.
- Component FW-03.1C-05B was changed to Geometry Code 2 from Geometry Code 3.
- Tinit was deleted from component FW-02.8B-22T since it resulted in an unrealistic value for

calculated wear.

- Tinit was deleted from the small end of component FW-01.2B-27R since it resulted in an unrealistic value for calculated wear.
- The datasheet for the outage 9 inspection of component FW-01.3-09P listed FW013001.dat as the data file. However, file FW013001.dat was used for component FW-01.3-06E. File FW013001.dat was used instead. File FW013001.dat was slightly different than the datasheet and was modified to match by moving one data point and deleting another. To summarize, the data files for outage 9 were imported as follows:

Component	DAT File
FW-01.3-06E	FW013001
FW-01.3-05P	FW013002
FW-01.3-09P	FW013001
FW-01.3-18P	FW01310B
FW-01.3-08E	FW013001
FW-01.3-07E	FW013002

- The first and last bands were excluded from the analysis of component FW-03.1A-08B's outage 9 inspection due to counterbore. Point (I,15) was also removed from this component since it was unrealistically low and provided an unrealistic value for measured wear.
- Tinit was removed from the downstream main of component FW-02.8B-26R since it provided unrealistic calculated wear.
- Point (N,8) was removed from component FW-02.8B-26R's RO9 inspection since it was unrealistically low and provided an unrealistic value for measured wear
- Point (F,7) was removed from component FW-01.3-03E's outage 8 inspection since it was unrealistically low and provided an unrealistic value for measured wear.
- Component FW-02.5-0 1T's branch is actually an elbow, which is not modeled in CHECWORKS. The outage 10 inspection data was imported to the branch of FW-02.5-01T, however it was not used in the calculation of the LCF.
- The outage 10 sketch for the branch extension of component FW-02.4-19T is unclear as to which end of pipe the rows begin. It was assumed that the inspection rows begin downstream of flow and move towards the tee.
- Tinit was changed to 1.372 for the U/S and D/S Main of tee FW-02.5-01T to match with pipe FW-02.5-05P.
- Inspection report number 03UT123 revealed a piping component that had not been modeled previously. This pipe was named FW-01.6B-07P and was located downstream of FW-01.6B-

06E.

- The component name was obtained from the inspection packet. Pipe material and schedule was assumed to be identical as other piping components nearby.
- The initial thickness (Tinit) value of 1.3 12" was deleted for reducers FW-02.8C-25R and FW-02.8C-24R. The Tinit value was approximately 0.5" greater than Tnom. Removal of the Tinit value resulted in a significant reduction in calculated wear, around 0.3" less, and a more realistic calculated wear for the RO11 inspections.
- Component FW-02.4-15E showed high wear due to a cluster of low readings caused by a lamination. These low readings were deleted to give a more accurate wear value and minimum thickness value. The deleted readings were: (C8, 0.513); (C9, 0.539); (C10, 0.668); (C11, 0.815); (D8, 0.582); (D10, 0.751); (D11, 0.837); (D12, 0.906); (E9, 0.759); and (E10, 0.811).

Heater Drains

- Components HD-6.1A-35N, HD-6.1A-36N, HD-6.1B-30N, HD-6.1B-31N, HD-6.1C-26N, and HD-6.1C-27N were removed from the model. The isometric drawings change sheets at this location. The continuation symbol was mistakenly labeled as a nozzle.
- The 1997 inspection of component HD-01.2B-01R shows that there is no pipe between the elbow and reducer. Therefore, component HD-01.1B-08P was removed from the model.
- The expansion joints in the heater drain pump suction lines were modeled as orifices with the component number that was next in the series. An orifice diameter equal to 90% of the inside diameter of the pipe was used. Specifically, the components added were HD-10.2A-07X and HD-10.2B-06X.
- The IP3 P&IDs show a "Temporary Strainer" in the heater drain pump suction lines. This was not modeled previously. Therefore, it was assumed that it was not installed and does not significantly affect wear rates.
- Component HD-10.2B-01E was changed to Geometry Code 16 from Geometry Code 4.
- Component HD-12.4-19T was removed from the model since it was previously modeled in the Condensate system as component CD-06.1-01T.

Moisture Preseparator Drains

- The following is a list of components that required a material change:

Line Name	Component Name	Old Material	New Material
PD: DRNS FROM PRESEP 1B	PD-01.2-02B	A106/B/B	A53/B/S
	PD-01.2-03P	A106/B/B	A53/B/S
	PD-01.2-05P	A106/B/B	A53/B/S
	PD-01.2-07P	A106/B/B	A53/B/S

	PD-01.8-05P	A106/B/B	A53/B/S
	PD-01.8-07P	A106/B/B	A53/B/S
	PD-01.8-09P	A106/B/B	A53/B/S
	PD-01.8-11P	A106/B/B	A53/B/S
	PD-01.8-14O	A106/B/B	A53/B/S
PD: DRAINS TO HTR DRN	PD-02.1-01T	A106/B/B	A53/B/S
	PD-02.2-01T	A106/B/B	A53/B/S
	PD-02.4-22T	A106/B/B	A53/B/S
	PD-02.3-01T	A106/B/B	A53/B/S
	PD-02.4-01T	A106/B/B	A53/B/S
	PD-02.4-03P	A106/B/B	A53/B/S
	PD-02.4-05P	A106/B/B	A53/B/S
	PD-02.4-07P	A106/B/B	A53/B/S
	PD-02.4-09P	A106/B/B	A53/B/S
	PD-02.4-11P	A106/B/B	A53/B/S
	PD-02.4-13P	A106/B/B	A53/B/S
	PD-02.4-15P	A106/B/B	A53/B/S
	PD-02.4-17P	A106/B/B	A53/B/S
	PD-02.4-19P	A106/B/B	A53/B/S
	PD-02.4-20P	A106/B/B	A53/B/S

- Tinit was removed from component PD-02.4-02E since it provided unrealistic calculated

wear. Points (B,13) and (K,6) were also removed from the outage 8 inspection data because they were unrealistically high, and provided an unrealistic calculated wear.

- The table below lists the Preseparator Drain components in line PD: DRAINS TO HTR DRN TANK that were replaced or installed during the RO12 MOPS/SCRUPS Modification DCP 01-3-072.

Component	Status Due to RO12 Design Modification
PD-02.4-02E	Replaced (component ID number re-assigned)
PD-02.4-03P	Replaced (component ID number re-assigned)
PD-02.4-04E	Replaced (component ID number re-assigned)
PD-02.4-05P	Replaced (component ID number re-assigned)
PD-02.4-22E	Initial Installation
PD-02.4-23R	Initial Installation
PD-02.4-24P	Initial Installation
PD-02.4-25T	Initial Installation
PD-02.4-26P	Initial Installation
PD-02.4-27P	Initial Installation
PD-02.4-28E	Initial Installation
PD-02.4-06E	Replaced (component ID number re-assigned)
PD-02.4-29R	Initial Installation
PD-02.4-30V	Initial Installation
PD-02.4-31R	Initial Installation
PD-02.4-32P	Initial Installation

Moisture Separator Drains

- The Moisture Separator Drains from the Drain Tanks to the Heater Drain Tank were updated to reflect piping replacements during RO10. The installation date was entered as 10/1/99. Certain sections of piping were divided to reflect the changes in material. In such cases, the existing component name was changed, with a “_1”, “_2”, or “_3” suffix added as needed. Piping tolerances were ignored when calculating pipe lengths for use in CHECWORKS.
- The nozzles attached to the Moisture Separators are all at the same elevation according to the isometric drawings. However, the center tee is at a lower elevation than the outside tees. Therefore, a pup piece of pipe was added to the CHECWORKS model between the center nozzle and the center tee to account for this. The component was named with the next sequential number in the series.
- Pipe MSD-01.5B-32P was added to the model to reflect the installation of a new pup piece with the elbow. No length was entered, since the length was unknown.
- The inspection information on the D/S extension of MSD-0 1.1 5A- 1 7E was imported to component MSD-01.15A-18P since the pipe was inspected, replaced, and baselined.

- Tinit for component MSD-01.5A-01E was causing over-calculation of wear and was thus deleted.
- Point (L-11) was removed from the 1994 inspection of component MSD-01.5A-01E. This point was unrealistically high, and was providing inaccurate wear calculations.
- Point (D-1) was removed from component MSD-01.8B-07P's 1997 Refueling
- Outage inspection, since it was providing an unrealistic value for measured wear.
- Tinit for component MSD-01.15A-01E was removed since it was forcing an over-calculation of measured wear.
- The first and last bands were excluded from the analysis of component MSD-01.7A-01T's Cycle 10B inspection due to counterbore.
- The first and last bands were excluded from the analysis of component MSD-01.8A-01T's Cycle 10B inspection due to counterbore.
- The first and 7th band was excluded from the analysis of component MSD-01.8B-0 1T's Cycle 11 inspection due to counterbore.

Reheater Drains

- Component RHD02.5B-02R was replaced during refueling outage 10. Therefore, this component was replaced with an installation date of 10/18/99. This component was inspected during refueling outage 10 and the inspection was assumed to be prior to the replacement.
- Component RHD01.12A-01T, which is actually an elbow, was modeled as a Type 15 tee in CHECMATE. It was changed to a Type 12 tee, since flow is through the elbow.
- Points (A-4) and (M-6) were removed from the 1992 Refueling Outage inspection for component RHD01.8A-01R since they were obviously inaccurate.
- Row 3 was excluded from the analysis of the 1997 Refueling Outage inspection on component RHD01.3B-01N since it was obviously a counterbore and provided an unrealistic value of wear.
- Tinit for component RHD02.4B-02E was deleted since it provided an inaccurate value for measured wear using the 1992 Refueling Outage inspection data.
- Column J was removed from the downstream extension of the 1992 Refueling Outage inspection on component RHD02.3B-02R since it provided unrealistic values for measured wear.

- The 1999 Refueling Outage inspection data downstream of pipe RHD01.8A-02P was imported to the U/S Extension of Valve RHD02.3A-01V because the inspection data upstream of component RHD-02.3A-02R was previously imported to the Valve Main.
- Counterbore was excluded from the analysis of the D/S Main of component RHD02.5A-02R in RO11.
- Point (P2, 0.342) was deleted from the U/S Main of RHD-02.5B-02R in RO11. Counterbore was excluded from the analysis of the U/S Main as well.

Update for 3R014

The model was updated with all information necessary to run Wear Rate Analysis (WRA) for plant conditions through Refuel Outage 14 (3R014), such as updates to the plant period table, water chemical treatments, WRA run definitions, replacements, UT inspection data, etc.

Global Data Updates

- Operating Cycle 14 water chemistry was updated to reflect actual measured concentrations. This data appears in Appendix C.
- The plant period table was updated with the actual Operating Cycle 14 start date, end date, and operating hours. Refuel 14 outage actual start and end dates were updated. Operating Cycle 15 was updated with the actual start date, estimated end date, operating hours and water chemistry. This data appears in Appendix C.

UT Data Updates

- All 3R014 FAC inspections were imported to the appropriate component from FAC Manager. These inspections are listed in Appendix F. Only those components that were in the official CHECWORKS model were imported from FAC Manager.

Line and Component Data Updates

- The model was updated with the following 3R014 component replacements. The components were all replaced as-is.

System	Component	Geometry	Size
Reheater Drains	RHD02.15A-02E	Elbow	6"
Reheater Drains	RHD02.14B-14P	Pipe	6"
Reheater Drains	RHD02.6A-05P	Pipe	6"
Reheater Drains	RHD02.14B-02E	Elbow	6"
Reheater Drains	RHD02.15A-13P	Pipe	6"
Reheater Drains	RHD02.15A-11T	Tee	6"

In addition, the model was updated with replacements for the following components in RO13:

System	Component	Geometry	Size
Extraction Steam	EX-02.9-10P	Pipe	10"
Extraction Steam	EX-02.13-03P	Pipe	18"

- The following components were added to the model based on an email sent to CSI from Harry Hartjen at Indian Point Unit 3. The email can be found in its entirety in Attachment A. The component data was assumed to be the same as the components found elsewhere in the same flow segment.

Line Name	Component	Geometry	Size
RHD-02.14B B HDR to FWH 36C	RHD02.14B-14P	Pipe	6"
RHD-02.15A A HDR to FWH 36C	RHD02.15A-13P	Pipe	6"
EX-02.4 PSEP2A 14" to 35 HDR	EX-02.4-07P	Pipe	14"
EX-02.11 PSEP1B 14" to 35 HDR	EX-02.11-07P	Pipe	14"
EX-02.8 PSEP 2B 10" to 35 HDR	EX-02.8-09P	Pipe	10"

- The following components had their materials updated to a carbon steel material similar to other components. In the previous outage, the data was incorrectly set and are now set correctly as carbon steel.

EX-02.14-02E	EX-02.14-06E	EX-02.14-08E
--------------	--------------	--------------

- Wear Rate Analysis run HD: HD PMP TO BFP HDR was changed to take advantage of the Advanced Run Definition due to incorrect values obtained from the HBD during analysis. Pressure, temperature and flow information were obtained from the three power level HBDs [7.5].
- The following table displays the lines had their component flow orders changed. It also includes components that were created

Component	Geometry	Size	Isometric Number
Transport steam from Preseparator 2A Xunder			
EX-02.4-02P	PIPE	14	EC-H-50071

Update for 3RO15

The model was updated with all information necessary to run Wear Rate Analysis (WRA) for plant conditions through Refuel Outage 15 (3RO15), such as updates to the plant period table, water chemical treatments, WRA run definitions, replacements, UT inspection data, etc.

Global Data Updates

- Operating Cycle 15 water chemistry was updated to reflect actual measured concentrations. This data appears in Appendix C.
- The plant period table was updated with the actual Operating Cycle 15 start date, end date, and operating hours. Refuel 15 outage actual start and end dates were updated. Operating Cycle 16 was updated with the actual start date, estimated end date, operating hours and water chemistry. This data appears in Appendix C.
- For Cycles 1-6, the Ammonia input was moved from the Complex Chemistry input to the Hydrazine Treatment input as per the CHECWORKS Modeling Guidelines.

UT Data Updates

- UT exams taken during 3RO15 were input to the model. All inputs were documented and appear in Appendix F.
- UT data for the U/S Main of EX-02.14-26P for RO12 and RO15 was removed because it was already in the model as the D/S Extension of EX-02.14-25E.
- UT data from RO8 for the D/S Extension of EX-01.2-10L was moved to the downstream pipe, EX-01.3-01P.
- UT data from RO15 for the D/S Extension of EX-02.16-01R was moved to the downstream pipe, EX-02.16-02P.
- UT data from RO9 and RO10 for the D/S Extension of MSD-01.10B-02E was moved to the downstream pipe, MSD-01.10B-03P.
- UT data from RO8 and RO10 for the D/S Extension of MSD-01.10B-07E was moved to the downstream pipe, MSD-01.10B-08P.
- The analysis method for RHD02.2A-02E for RO14 was changed from Max. Delta to Blanket. The new calculated wear is 0.098.
- The analysis method for RHD01.9B-01R was changed from Max. Delta to Band for both the U/S Main and D/S Main. The new calculated wear is 0.056 inches for the U/S Main

and 0.081 inches for the D/S Main.

- Several components imported measured wear from FAC Manager in 3RO14 were removed from CHECWORKS due to a measured wear that cannot be used in the LCF Calculation. These changes are reflected in the updated Pass 2 Results as well as Appendix F.
- Several changes were made to increase the quality of the Pass 2 Results. These changes are outlined in the table below:

WRA Run	Component	Changes Made	Reason
CD: HDR TO HTR 33	CD-02.8C-02E	Changed analysis method in FACManager from point to point to blanket for U/S Main.	Point to Point method did not show FAC wear. The grid appeared to show pitting.
CD: HDR TO HTR 33	CD-02.8C-02E	Changed analysis method in FACManager from point to point to band for D/S Extension.	Point to Point method did not show FAC wear. The grid appeared to show pitting.
CD: HTR 32 TO 33 HDR	CD-02.4-04E	Removed D/S Main inspection wear from RF08 (0.125").	There is no evidence of an inspection on the main of this component. The note in FACManager states that only extensions have been inspected.
CD: HTR 32 TO 33 HDR	CD-02.5-01P	Removed U/S Main inspection wear from RF08 (0.125").	No grid data exists for latest inspection in FAC Manager, thus wear cannot be verified. Used U/S Ext of elbow (downstream component) to estimate wear. Calculated wear is lower than 0.030 inches and should not be used in LCF.
CD: HTR 32 TO 33 HDR	CD-02.5-02E	Checked "Do Not Use MW" for U/S Extension to exclude from LCF.	Calculated wear was less than 0.030 inches.
CD: HTR 34 TO HTR 35	CD-04.1C-01N	Removed U/S Main inspection wear from RO14 (0.060").	Only one row of UT data. Calculated wear likely due to manufacturing variance.
CD: HTR 35 TO BFT HDR	CD-05.4-02P	Removed U/S Main inspection wear from RF08 (0.089")	No grid data exists for the latest inspection in FACManager, thus wear cannot be verified. Notes in FAC Manager state Tmin value is invalid. Data is not reliable and cannot be confirmed
CD: S/B BLWDN HX OUT	CD-02.11-04P	Changed analysis method of DSE from point to point to band	Point to point method is not reliable. Comparison of grid data showed significant changes in values that are not typical of FAC wear.

WRA Run	Component	Changes Made	Reason
ES: LP TO 32 HEATERS	EX-05.2C-06N	Removed U/S Main inspection wear from RO14 (0.032").	FACManager is unclear as to how wear was calculated. Wear value is unreliable.
ES: LP to 33 HEATERS	EX-04.13-01R	Checked "Do Not Use MW" for U/S and D/S Main to remove inspection wear from LCF calc.	Removed wear from LCF. Point to point showed wear less than 0.030 inches on the U/S Main and unrealistic wear on the D/S Main. The band method cannot be used due to differences in delta readings that are probably caused by manufacturing differences.
ES: PRESEP TO 35 HDR	EX-02.14-20E	Changed D/S Extension to read from RO15 data instead of RO12 data.	Current data is more reliable.
ES: PRESEP TO 35 HDR	EX-02.2-01N	Checked "Do Not Use MW" for D/S Main.	Component is Stainless Steel and should not be used to calibrate a Wear Rate Analysis run.
FW: BFP to 36 HTR	FW-01.1B-03R	Checked "Do Not Use MW" for U/S and D/S Main for RO15.	Only three rows of data exist on elbow. The grid is suspect because there are more grid rows on previous inspections.
FW: BFP to 36 HTR	FW-01.6A-01R	Checked "Do Not Use MW" for U/S Main.	The first two of the three rows are counterbore, leading to an unreliable wear calculation.
FW: SG HEADERS	FW-02.8B-26R	Checked "Do Not Use MW" for U/S Main.	Only two rows of data. Measured wear not indicative of FAC.
HD: HD PMP TO BFP HDR	HD-11.2B-01R	Checked "Do Not Use MW" for U/S Main.	Only two rows of data. Measured wear not indicative of FAC.
HD: HD PMP TO BFP HDR	HD-12.2B-04T	Removed USM and DSM from LCF calculation	Data shows manufacturing variances, not FAC.
HD: HTR 32 TO HTR 31	HD-09.1C-02R	Checked "Do Not Use MW" for U/S and D/S Main.	Only two rows of data. Measured wear not indicative of FAC.
HD: HTR 34 TO HTR 33	HD-05.1B-02R	Checked "Do Not Use MW" for U/S and D/S Main.	Calculated wear is not indicative of FAC due to extensive machining in this component.
MSD: MS 32 TO MSDT	MSD-01.6B-03P	Removed U/S Main inspection wear from RO8 (0.079").	No grid data exists for the latest inspection in FACManager, thus wear cannot be verified. Notes in FAC Manager state Tmin value is invalid. Data is not reliable and cannot be confirmed
MSD: MS 32 TO MSDT	MSD-01.7A-01T	Recalculated wear excluding first row of UT data.	This component is counterbored on the first row giving an unrealistic wear value.
MSD: MSDT 33 TO HDT	MSD-01.15A-01E	Recalculated wear excluding first row of UT data.	This component is counterbored on the first row giving an unrealistic wear value.

WRA Run	Component	Changes Made	Reason
RHD: RH 31 TO HDR	RHD01.1A-04N	Checked "Do Not Use MW" for U/S Main.	Only one row of UT data. Calculated wear likely due to manufacturing variance.
RHD: RH 31 TO HDR	RHD02.1A-02R	Recalculated wear excluding the counterbore for the U/S and D/S Main.	Wear calculations on machined areas yield unrealistic results.
RHD: RH 32A TO HDR	RHD01.3A-03N	Removed inspection wear from RO14 for U/S Main.	Unrealistic wear calculation due to manufacturing variances.
RHD: RH 32A TO HDR	RHD01.5A-01R	Checked "Do Not Use MW" for U/S and D/S Main.	Unrealistic wear calculation due to manufacturing variances.
RHD: RH 32A TO HDR	RHD02.3A-02R	Removed inspection wear from RO14 for U/S and D/S Main.	Unrealistic wear calculation due to manufacturing variances.
RHD: RH 32A TO HDR	RHD02.4A-02E	Checked "Do Not Use MW" for U/S Main.	This component has an incomplete grid that results in an unrealistic wear calculation.
RHD: RH 32B TO HDR	RHD02.3B-02R	Checked "Do Not Use MW" for U/S and D/S Main.	Unrealistic wear calculation due to manufacturing variances.
RHD: RH 32B TO HDR	RHD02.4B-01P	Checked "Do Not Use MW" for U/S Main.	Unreliable wear calculation due to questionable Tnom associated with downstream half of UT Data.
RHD: RH 33 TO HDR	RHD02.5A-02R	Checked "Do Not Use MW" for U/S Main.	Data shows manufacturing variances, not FAC.
RHD: RHD HDR TO HTRS	RHD02.11A-17T	Checked "Do Not Use MW" for Branch.	Only one row of UT data. Calculated wear likely due to manufacturing variance.
RHD: RHD HDR TO HTRS	RHD02.2B-06L	Checked "Do Not Use MW" for D/S Main and Branch.	Unrealistic wear calculation due to manufacturing variances.

Line and Component Data Updates

- The model was updated with the following 3RO15 component replacements. The components were all replaced with like for like components.

System	Component	Geometry	Size
Extraction Steam	EX-02.14-06E	Elbow	28"
Extraction Steam	EX-02.14-08E	Elbow	28"

- In addition, the model was updated with replacements for the following components in order to reflect the weld build-up repairs during 3RO15.

System	Component	Geometry	Size
Feedwater	FW-02.8A-25R	Reducer	18"

Feedwater	FW-02.8B-26R	Reducer	18"
Reheater Drains	RHD02.14B-10T	Tee	6.625"
Reheater Drains	RHD02.1A-02R	Reducer	6.625"

- As per the updated SSE, extraction steam lines to the #34 Feedwater Heaters were removed from the Wear Rate Analysis. These lines are superheated and non-susceptible to FAC [7.30]. The lines and flow segments were renamed with an "x" preceding the old name.
- Modelable lines found in the updated SSE [7.30] that were not previously modeled were placed in the model with temporary components. These lines do not have isometrics and could not be fully modeled. They should be walked down, modeled, and inspected to obtain the information needed to create an accurate prediction with CHECWORKS. The new lines are as follows:

WRA Run Name	Line Name	Comp. Name
HD: HTR 31 TO COND	HD-FWH 31A to Condenser 33	TEMP01
	HD-FWH 31B to Condenser 32	TEMP02

Appendix B

Pass 2 Wear Rate Analysis Summary

B.1 Pass 2 Wear Rate Analysis Summary

The Pass 2 Wear Rate Analysis results of each WRA run were reviewed to determine the relationship between measured wear and predicted wear. Based on this relationship, a WRA run was classified as Calibrated or Not Calibrated. For Calibrated WRA runs, the Pass 2 analysis results of predicted wear rate and remaining service life can be used with reasonable confidence. For runs classified as Not Calibrated, Pass 2 Wear Rate Analysis results should not be used. Instead, Pass 1 Wear Rate Analysis results should be used to determine relative rankings only. In particular, remaining service life (Time to Tcrit) should not be used as an estimate of remaining component life.

The criterion used to classify a WRA run as Calibrated or Not Calibrated is discussed Section 6.4 for the report. No single criterion is definitive in classifying a WRA run as either Calibrated or Not Calibrated. Instead, engineering judgment was used to weigh each criterion to determine calibration status.

These results can be found in Table B.1.

Table B.1 Pass 2 Wear Rate Analysis Summary

WRA Run Name & Run Note	Is Run Calibrated?	Inspection Locations	Outliers	Correlation (Scatter)	LCF	Average Current Wear Rate (mils/yr)	Geometry Coverage	Parallel Train Coverage	Insp. D/S of CVs & Orifices

B.2 Pass 2 Wear Rate Analysis Results

As each of the WRA Runs was analyzed, the results were reviewed and the conclusions for each run, as well as any pertinent information, are listed below.

B 2.01 CD: HDR TO BFP

The condensate header to the Boiler Feedwater Pump consists of 3 lines; all of which contain inspections. Inspections have been done downstream of both orifices in this run. It is suggested that an inspection be done on at least one of the two 45 degree elbows. Despite this, the geometry coverage in this run is distributed well. CD-06.2A-07V has a negative time to Tcrit. An inspection down stream of the valve is recommended. With an LCF of 1.153 and good correlation, this run is considered to be calibrated.

B 2.02 CD: HDR TO HTR 33

Three components in this run have a negative time to Tcrit. Inspections on nozzles CD-02.8A-08N and CD-02.8B-08N may improve their time to Tcrit as seen with inspected component CD-02.8C-08N on a parallel run, which has a Time to Tcrit of 296,773 hours. CD-02.8B-04V has a negative time to Tcrit. An inspection down stream of the valve is recommended. With an LCF of 1.260 and 10 inspection locations, covering 15 of the 26 components, this run may be considered calibrated.

B 2.03 CD: HTR 31 TO HTR 32

This run contains no inspection and is not considered calibrated; therefore, this run should be considered Pass 1.

B 2.04 CD: HTR 32 TO 33 HDR

The tees generally are to the “left” of the 45° line while the pipes and elbows tend to be to the “right” of the 45° line. All 5 lines in this run have had inspections. CD-02.4-02V has a negative time to Tcrit. An inspection down stream of the valve is recommended. CD-02.3-15T should be considered for inspection because of the low time to Tcrit and relatively high wear rate. To increase geometry coverage 90 degree elbows, 45 degree elbows, and the reducer should be inspected. This run has a high number of outliers to inspection location ratio (9:8) and an LCF of 1.043. The scatter pattern shows poor correlation. Due to the poor correlation and high outlier count, this run cannot be considered calibrated.

B 2.05 CD: HTR 32 TO HDR

The run, which consists of condensate lines from Feedwater Heater 32 to the header, requires more inspection locations. It is recommended to inspect more geometry types to improve the geometry coverage of the run. The nozzles in this run, CD-02.1A-01N, CD-02.1B-01N, and CD-02.1C-

01N, have negative times to Tcrit. Inspections on nozzles in other runs have been demonstrated to greatly increase the predicted time to Tcrit. This may be true in this case as well; however, at least one nozzle should be inspected to confirm that this is the case for this run. CD-02.1A-05V, CD-02.1B-07V and CD-02.1C-08V have negative times to Tcrit. An inspection down stream of the valves is recommended. This run cannot be considered calibrated.

B 2.06 CD: HTR 33 TO HTR 34

This run has three condensate lines from Feedwater Heater 33 to Feedwater Heater 34. Inlet nozzles and 45 degree elbow should be inspected for better geometry coverage. This run has good correlation between predicted and measured wear. Of the 39 components in this run, 9 inspection sites include 12 components. With an LCF of 0.601, this run can be considered calibrated.

B 2.07 CD: HTR 34 TO HTR 35

All three lines from Feedwater Heater 34 to Feedwater Heater 35 have had inspections. Of the 46 components, 12 components have been inspected over 9 inspection locations. Inspections are recommended on 45-elbows and inlet nozzles for this run. Despite the lack of coverage on these geometry types the run has an LCF of 0.508 and can be considered calibrated.

B 2.08 CD: HTR 35 TO BFP HDR

This run consists of lines from FWT 35 to the Boiler Feed Pump Header. All geometries types have been inspected. Tees are generally grouped to the “left” of the 45° line while the straight pipes and elbow fall to the “right.” There are five outliers and only four inspection locations. Because of the high number of outliers and poor correlation, this run cannot be considered calibrated. However, due to high number of inspections covered to low number of components, this line can be governed by re-inspections intervals rather than CHECWORKS predicted wear rates.

B 2.09 CD: HTR 35 TO HDR

Inspection of nozzles on any of the three lines in this run is recommended. Two nozzles, CD-05.1A-01N and CD-05.1B-01N, will reach zero time to Tcrit during Cycle 16 while three valves are at negative time to Tcrit around a value of -39,423 hours. Inspections on nozzles in other runs have been demonstrated to greatly increase the predicted time to Tcrit. This may be true in this case as well; however, at least one of these nozzles should be inspected to confirm that this is the case for this run. This run has an LCF of 0.620, good geometry coverage, and good correlation. This line can be considered calibrated.

B 2.10 CD: S/G BLWDN HX IN

The inlet piping to the Steam Generator Blowdown Heat Exchanger consists of one line with 27 components. Only four components, over three locations, have been inspected. Inspections on the tee or nozzle would help to obtain adequate geometry coverage for this run. More inspections are required to allow this run to be calibrated.

B 2.11 CD: S/G BLWDN HX OUT

The outlet piping from the Steam Generator Heat Exchanger consists of one line with 23 components. All geometry types have been inspected with the exception of an exit nozzle. All inspected elbows lay outside of the $\pm 50\%$ wear boundaries. Reinspecting these elbows could improve the correlation. With five outliers and only seven inspection locations, there are too many outliers to consider this run calibrated.

B 2.12 ES: BFPT DRN TO COND

This run contains lines that need to be modeled. There are no inspections and is not considered calibrated; therefore, this run should be considered Pass 1.

B 2.13 ES: HDR TO 35 HTRS

This extraction steam run contains 3 lines and 22 components. There are 10 inspection locations and 5 outliers. Several valves and a nozzle have a negative time to Tcrit. For example, Nozzle EX-02.16-09N has a negative time to Tcrit of -131,798 hours. However, inspecting this nozzle may improve its time to Tcrit as seen with inspected component EX-03.17-06N on a parallel run, which has a Time to Tcrit of 129,225 hours. All three valves have elbows downstream composed of CrMo. Inspections on these valves should be handled per plant procedure. It is important to note that current wear rates are greater than the average wear rates over the life of the plant, meaning the carbon steel components are wearing faster than would have been indicated by inspections that occurred before changing to the current power level.

B 2.14 ES: HDR TO 36 HTRS

This run contains lines from the Extraction Steam header to Feedwater heaters 36. Of the 48 components in this run, 45 components have been replaced with A-213 TP304L TP3, a non-susceptible material. The 3 remaining components, gate valves EX-01.5A-11V, EX-01.5B-09V, and EX-01.5C-09V, have not been replaced and have not been inspected. Inspections on these valves should be handled per plant procedure. Future inspections on the non-susceptible materials should also be governed by plant procedure for non-susceptible materials. This run can be considered calibrated.

B 2.15 ES: HTR 36 HEADER

All components, except for check valves, gate valves, and nozzles, have been replaced with stainless steel. Future inspections on the carbon steel components should be governed by plant procedure for non-susceptible materials. Inspection on nozzle EX-01.2-01N may improve its time to Tcrit as seen in other runs. This run has good correlation between measured and predicted wear, as well as good parallel train coverage. This run can be considered calibrated.

B 2.16 ES: LP TO 31 HEATERS

This run contains no inspection; therefore, this run should be considered Pass 1. Because this run shows moderate wear of 4.7 mils per year, inspections are highly recommended on any of the 12 lines and 54 components in this run. This run cannot be considered calibrated.

B 2.17 ES: LP TO 32 HEATERS

The 6 lines in this run are from the Low Pressure Turbine to Feedwater Heaters 32. Only 3 of the lines contain inspections used in the LCF calculation. Components in the other three lines should be inspected for adequate parallel train coverage. With a low LCF of 0.332 and a poor correlation this run cannot be considered calibrated.

B 2.18 ES: LP TO 33 HEATERS

The 15 lines in this run are from the Low Pressure Turbine to Feedwater Heaters 33. Only 8 of the lines have had inspections. It is recommended to conduct inspections the remaining uninspected lines. It is also recommended to conduct inspections on 45-degree elbows, the concentric expander, and exit nozzles. This run has an LCF of 1.807 and good correlation between predicted and measured wear. However, of the six orifices in this run, none have had inspections components directly downstream. EX-04.9-09T, EX-04.16-09T, and EX-04.2-09T have negative times to Tcrit. Inspections down stream of these tees are recommended. For this reason, along with poor parallel train coverage, this run cannot be considered calibrated. It is important to note that current wear rates are greater than the average wear rates over the life of the plant, meaning the carbon steel components are wearing faster than would have been indicated by inspections that occurred before changing to the current power level.

B 2.19 ES: PRESEP TO 35 HDR

Five of the twelve lines contain no inspections. All lines except the header are made of stainless steel and are not included in the LCF calculation and therefore the five lines do not need any inspections. A significant number of components on line EX-02.14 FWH 35 Header, have a negative time to Tcrit now or will have a negative time at the end of Cycle 16. Inspections on these specific components are recommended to accurately predicted

time to Tcrit. Valve EX-02.14-10V is directly upstream of another valve. Inspections on this valve should be handled per plant procedure. Only one orifice was inspected, however all orifices are made of stainless steel and are non-susceptible to FAC. This line is not calibrated; however, it is difficult to calibrate a mostly non-susceptible line due to low predicted wear rates. Inspections should be used to determine wear rate on the remaining carbon steel components.

B 2.20 FW: 36 HTR TO SG HDR

This run has a high ratio of outliers to inspection locations (7:11). All geometry types in the run have been inspected. At 3.590, the LCF is slightly higher than the EPRI's recommended range. This run has moderate correlation between predicted and measured wear. Three valves have negative times to Tcrit, but one has a downstream inspection. The downstream extension of the other two valves, FW-02.1A-05V and FW-02.1C-05V, should be inspected. Nozzle FW-02.1A-01N also has a negative time to Tcrit and should be inspected. Run can be considered calibrated based on fulfillment of criteria.

B 2.21 FW: BFP TO 36 HTR

There are 9 lines and 105 components in this run. This run has good geometry coverage. The only types of geometry that have not had an inspection are exit nozzles and the reducer. All nozzles have been replaced with non-susceptible material. Seven valves have a negative time to Tcrit. Only one has been inspected downstream of the valve. Four valves should have the downstream inspected. The remaining two valves FW-01.2A-05V and FW-01.2B-07V are directly upstream of other valves. These should be inspected according to plant procedure. This run has a good LCF of 0.893; however, with poor correlation and a high ratio of outliers to inspection locations (17:30), this run cannot be considered calibrated.

B 2.22 FW: FW RECIRC

This run consists of 2 feedwater lines with a total of 85 components. These components have a low average current Pass 1 wear rate of 0.134 inches per year. This low wear rate is due to the non-susceptible materials used for all components in this run. This run contains no inspection and is not considered calibrated; therefore, this run should be considered Pass 1.

B 2.23 FW: SG Headers

This run consists of the Steam Generator Inlet Headers as well as the Steam Generator Inlet piping. This run has 40 inspection locations, which is a high number of inspection locations compared to the 190 components in this run. Although there are a high number of outliers, correlation between lines in this run is good. However, the LCF is slightly out of range at 3.423. This may be partially due to the nearly "horizontal" distribution of the elbow inspections on the wear plot generally to the

“right” of the 45° line. The tees are generally grouped to the “left” of the 45° line. The inspections for this run cover the included most geometry types, with the exception of only expanders and valves. One of the four control valves, FW-02.8B-06V has not been inspected. Due to industry experience, the downstream of this valve should be inspected.

A significant number of components in this run have a negative time to Tcrit while several others have a time to Tcrit less than the estimated operating hours until next refueling outage 16. The high LCF means that CHECWORKS was under predicting FAC wear rates. CHECWORKS originally predicted moderately low wear rates. Because of this, any measured wear used in the LCF calculation would tend to demonstrate a wear rate larger than the predicted. A low predicted wear rate will cause the LCF ratio to be fairly high, even if the absolute difference between predicted and measured is not that large. Because of the high LCF and uninspected control valve this run is not calibrated.

B 2.24 HD: HD PMP TO BFP HDR

These three lines run from the Heater Drain Pump to the Boiler Feedwater pump Header. There are 45 components and 12 inspection locations. This run has good correlation between predicted and measured wear.

Geometry coverage could be improved by inspecting more nozzles and 45 degree elbows. With an LCF of 1.037, this run can be considered well calibrated.

B 2.25 HD: HTR 32 TO COND

This run contains lines that need to be modeled. There are no inspections and is not considered calibrated; therefore, this run should be considered Pass 1.

B 2.26 HD: HTR 32 to HTR 31

This run consists of 9 lines from Feedwater Heater 32 to Feedwater Heater 31. There are only 2 inspection locations out of 66 components total for this run. In order to be calibrated, it is recommended that this run have at least 5 inspection locations. Inspections on more lines and different geometry types, such as pipes, elbows, and tees are suggested. These inspections are particularly important downstream of the control valves in the Heater Drain System. This run can not be considered calibrated.

B 2.27 HD: HTR 33 TO HTR 32

This run consists of three lines from Feedwater Heater 33 to Feedwater Heater 32. There are 11 inspection locations over 148 components in the run. There is good correlation between predicted and measured wear and only 2 outliers. Inspections are recommended on any of the seven 45-degree elbows and any of the six nozzles. All 3 lines in this run have inspections. This run can be considered calibrated.

B 2.28 HD: HTR 34 TO HTR 33

This heater drain run contains 3 lines and 91 components. There are 8 inspection locations and 2 outliers; both of which fall only slightly above or below the $\pm 50\%$ error lines. Inspections of 45-degree elbows, inlet nozzles, and exit nozzles are recommended to improve calibration. The downstream extensions of the 3 control valves in this run have been inspected. HD-4.2A-02V, HD-4.2B-02V and HD-4.2C-02V have negative times to Tcrit. However, the downstream component has been inspected in all cases. With good correlation and an LCF of 0.911, this run can be considered calibrated.

B 2.29 HD: HTR 35 TO HDT

This run includes lines from Feedwater Heater 35 to the Heater Drain Tank. This run consists of 3 lines with a total of 48 components. There are 7 inspections locations and 1 outlier which falls slightly above the $\pm 50\%$ error lines. More inspections are suggested on the “B” train to improve the diversity of the inspections on this line. With good correlation and an LCF of 1.487, this run can be considered calibrated.

B 2.30 HD: HTR 36 TO HDT

This run consists of 3 heater drain lines with a total of 43 components. There are 11 inspection locations and 3 outliers which are over predicted and therefore “left” of the 45° line. Inspections on any of the 3 exit nozzles and 13 pipes are recommended to improve calibration. These inspections are particularly important downstream of the control valves in the Heater Drain System. All downstream extensions of the 3 control valves in this run have been inspected. This run has poor correlation between predicted and measured wear and cannot be considered calibrated.

B 2.31 HD: HTR DN TO PUMPS

This run from the Heater Drains to the pumps contains only 2 inspection locations. Inspections should be performed on line HD-10.1B HD TK to HD PMP 32. A variety of component types should be inspected to improve geometry coverage. The nozzles of downstream of the orifices are of specific concern due to industry experience downstream of orifices. This run cannot be considered calibrated.

B 2.32 MS: HPTURB TO PRESEPS

This run contains lines that need to be modeled. There are no inspections and is not considered calibrated; therefore, this run should be considered Pass 1.

B 2.33 MS: PRESEPS TO MSR

This run contains lines that need to be modeled. There are no inspections and is not considered calibrated; therefore, this run should be considered Pass 1.

B 2.34 MSD: MS 31 TO HDT

This line from the Moisture Separator 31 to the Heater Drain Tank contains 107 components and 15 inspection locations. Of these components, 65 have been replaced. Inspections are recommended on exit nozzles and 45-degree elbows. Inspections are also recommended on lines which have not yet had inspections. The slightly high LCF of 2.791 may be due to the low average current wear rate of 0.399 inches per year. This low wear rate is due to the low flow rate in these 12 lines which allows for a long time to Tcrit. The high LCF may also be partially due to the nearly “horizontal” distribution of the elbow inspections on the wear plot. This indicates a consistent predicted wear but a wide range of measured wear for elbows. Overall, this wear plot has poor correlation between predicted and measured wear. This run cannot be considered calibrated.

B 2.35 MSD: MS 32 TO MSDT

Eleven sites have been inspected from the 32 components in this run from the Moisture Separator 32 to the Moisture Separator Drain Tank. The geometry is well covered with the exception of exit nozzles. These geometries are moderately correlated and are distributed adequately over the 45° line. Four valves had a negative time to Tcrit, MSD-01.8A-04V, MSD-01.8A-06V, MSD-01.8B-04V, MSD-01.8B-06V. Of these, two have not been inspected, MSD-01.8A-06V and MSD-01.8B-04V. Because one of each type of valve is inspected, it is understood that wear is comparable in the two locations. However, it is still recommended to inspect downstream of the two remaining valves to obtain a full understanding of the negative times to Tcrit.

The high LCF of 12.801 is due to the low average Pass 1 current wear rate of 0.287 inches per year. This low wear rate is due to the low flow rate in these ten lines. Until inspections are completed on components in uninspected trains this run cannot be considered calibrated.

B 2.36 MSD: MS 33 TO MSDT

This run includes 10 lines from Moisture Separator 33 to the Moisture Separator Drain Tank. There are a total of 36 components and 7 inspection locations. Of these components, geometries are well covered with the exception of nozzles. Pipes tend to lay to the “left” of the 45° line while 90-degree elbows fall to the “right.” These “groupings” of geometries shows that similar geometries are predicting and measuring similar wear.

The high LCF of 8.247 is due to the low flow rate in these components from all lines. Low flow causes a low wear rate which allows for a significant time to Tcrit in all components. Only 2 of the 10 lines in this run have had inspections. Although the remaining 8 lines do not have many components, ranging from 2-4 per line, inspections are recommended on these lines. This run cannot be considered calibrated.

B 2.37 MSD: MSDT 32 TO HDT

This run consists of 2 lines and 68 components. Of the 68 components, all but 11 components have been replaced and only 3 of these 11 which have been inspected. These replacements have been done with primarily non-susceptible materials. The slightly high LCF of 4.355 may be due to the low average Pass 1 current wear rate of 0.097 inches per year. The low wear rate, along with replacements of components with non-susceptible material, accounts for the great amount of time before Tcrit. There are 13 inspection locations and only 1 outlier which is slightly “above” the $\pm 50\%$ error line. These lines contain components which creates moderate correlation between predicted and measured wear, showing a slightly horizontal distribution of components. There have been no inspections on tees or 90-degree reducing elbows; however, all of these types of components have been replaced and have a long time to Tcrit. Although inspections are recommended on the exit nozzles which have not been replaced or inspected, this run can be considered calibrated.

B 2.38 MSD: MSDT 33 TO HDT

This run from the Moisture Separator Drain Tank 33 to the Heater Drain Tank consists of two lines and 64 components. Of the 64 components, all but 11 components have been replaced. Of these 11 components, six have been inspected. The slightly high LCF of 3.770 may be due to the low average current Pass 1 wear rate of 0.107 inches per year. The low wear rate, along with the replacement of components with non-susceptible materials, accounts for the great amount of time before Tcrit. There are 18 inspection locations and 6 outliers in this run. There are no inspections on 45-degree elbows, tees, or exit nozzles in this run. However, since all of the tees and 45-degree elbows have been replaced, it is suggested to inspect the exit nozzles. The correlation between the predicted and measured wear creates a poor scatter on the wear plot, as it tends to move horizontally rather than along the 45° line. This run cannot be considered calibrated.

B 2.39 MSD: MSDT TO DCT

This run contains lines that need to be modeled. There are no inspections and is not considered calibrated; therefore, this run should be considered Pass 1.

B 2.40 PD: PRESEPRTR DRAINS

The Preseparator Drain Lines consist of 87 components, with 6 inspection locations. These inspections were done on only 3 of the 7 lines in this run. Inspections are recommended on the uninspected lines. It is recommended to conduct inspections on concentric expanders, exit nozzles, or tees. Although this run has poor geometry and parallel train coverage, the correlation between predicted and measure creates a good plot along the 45° line with only one outlier. However, with an orifice, PD-01.2-100, with no inspection downstream and a high LCF of 3.643, this run cannot be considered calibrated.

B 2.41 RHD: RH 31 TO HDR

These lines from Reheater 31 to the header consist of 128 components with 15 inspection locations. Of the four lines that make up this run, 3 have had inspections; however, line “RHD-01.1B_1 RH 31B to TK 31,” with no inspections, has only 3 components total. Although inspections are not required on this line for calibration, they are recommended.

The distribution of components on the LCF plot seems to be geometry based. Geometries are grouped together in “horizontal” bands, showing similar predicted wear but a great change in measured wear. Pipes are generally predicted at 60 mils but have a measured wear from 33-134 mils. Elbows are predicted about 80 mils; however, are measuring wear from 50-162 mils. Inspections of tees are recommended to improve calibration of this run.

This run has a LCF of 2.231 which is within EPRI’s recommended range. However, with the poor correlation, this run cannot be considered calibrated.

B 2.42 RHD: RH 32A TO HDR

This run from Reheater 32A to the Header consists of 54 components which make up two lines. There have been 9 inspection locations and 5 outliers. The downstream extensions of RHD01.5A-03F and RHD02.3A-01V have been inspected.

Inspections are highly recommended on nozzles RHD01.3A-01N and RHD01.3A-04N, as they have never been inspected and have a negative time to Tcrit at -14,552 hours. Inspections on nozzles in other runs have been demonstrated to greatly increase the predicted time to Tcrit. This may be true in this case as well; however, at least one nozzle should be inspected to confirm that this is the case for this run. It is recommended to inspect more 90-degree elbows as the only inspection on a 90-degree elbow lies outside of the $\pm 50\%$ error lines.

This run has an LCF of 3.281. Although this run has good geometry coverage and good parallel train coverage, with poor correlation of predicted to measured wear and a slightly high LCF according to EPRI's recommended range, this run cannot be considered calibrated.

B 2.43 RHD: RH 32B TO HDR

The run consists of 2 lines from the reheater 32B to the Header. The run has 73 components, 24 inspection locations, and 19 outliers. However, inspections are heavily grouped by geometry type on the wear plot. The 90-degree elbows create a "horizontal" pattern across the 45° line. Concentric expanders fall to the "right" of the 45° line. This is creating a "shotgun blast" pattern on the wear plot. With this sort of pattern, inspections are not following along or close to the 45° line, which creates poor correlation. Additional reinspections could improve this problem. Also, to improve geometry coverage, tees and 45-degree elbows should be inspected. Every component in the "RHD-01.3B_1 RH 32B to TK 32B" line has been inspected. Reinspections on this line should be based on the results of the previous inspections.

With poor correlation and a high ration of outliers to inspection locations (19:24), this run cannot be considered calibrated.

B 2.44 RHD: RH 33 TO HDR

This run from reheater 33 to the heater has 4 lines and 120 components. There are 15 inspection locations with 5 outliers. Concentric expanders and 90-degree elbows are typically falling to the "right" of the 45° line, which may be one of the reasons for the LCF to be slightly high at 3.306.

Inspections are recommended on Line RHD-01.10A_1, specifically on nozzle RHD01.10A-01N, as it has a negative time to Tcrit. Inspections on nozzles in other runs have been demonstrated to greatly increase the predicted time to Tcrit. This may be true in this case as well; however, more nozzles should be inspected to confirm that this is the case for this run.

Despite the moderate correlation, good parallel train and geometry coverage allows this run to be calibrated.

B 2.45 RHD: RHD HDR to HTRS

This run from the Reheater Drain Header to the Heaters contains 28 inspection locations over 148 components total. The variances between measured wear of the elbows creates an unwanted pattern on the plots, driving the LCF in the wrong direction. Inspection of more components, specifically 45-degree elbows and concentric reducers, would help this run to be calibrated. This run cannot be considered calibrated.

x = No value entered (not required by CHECWORKS).

(1) The HBD Item name is automatically generated by CHECWORKS. Feedwater heaters are numbered sequentially in reverse flow order. Feedwater Heater 1 is the feedwater heater closest to the steam generator (equivalent to heater 36 at Indian Point 3). Extraction lines are numbered sequentially in order of decreasing pressure.

(2) MSEP 1 represents the conditions in both the moisture separator and moisture pre-separator drain lines as recommended by EPRI Guidelines [7.3].

(3) HPEXTLINE 1 is a fictitious high-pressure extraction line representing the steam lines between the pre-separator and main separator as recommended by EPRI Guidelines [7.3].

(4) Flow rate is for exiting steam flow was entered as zero as recommended by EPRI Guidelines [7.3]. Pressure and enthalpy were obtained from the HBD "F" [7.18.1].

(5) Enthalpy calculated as the weighted average of the steam and liquid phases. Steam phase enthalpy was obtained directly from the PEPSE diagram as the enthalpy after moisture removal in the LP Turbine. Liquid phase enthalpy was calculated as the enthalpy of saturated liquid at the pressure given on the PEPSE diagram. [7. 18.1]

(3) HPEXTLINE 1 is a fictitious high-pressure extraction line representing the steam lines between the pre-separator and main separator as recommended by EPRI Guidelines [7.3].

(4) Flow rate is for exiting steam flow and was entered as zero as recommended by EPRI Guidelines [7.3]. Pressure and enthalpy were obtained from the Appendix K PEPSE model [7.18.2].

(5) Enthalpy was calculated as the weighted average of the steam and liquid phases. Steam phase enthalpy was obtained directly from the PEPSE diagram as the enthalpy after moisture removal in the LP Turbine. Liquid phase enthalpy was calculated as the enthalpy of saturated liquid at the pressure given on the PEPSE diagram [7.18.2].

Table C.6 SPU Steam Cycle Input Data

HBD Item ¹	Location	Flow Rate (Mlb/hr)	Enthalpy (Btu/lbm)	Pressure (psia)	Temp (F)	Reference
FWHTR 1	Tube side outlet	x	x	x	430.4	7.18.3
FWHTR 2	Tube side outlet	x	x	x	377.3	7.18.3
FWHTR 3	Tube side outlet	x	x	x	298.3	7.18.3
FWHTR 4	Tube side outlet	x	x	x	245.2	7.18.3
FWHTR 5	Tube side outlet	x	x	x	198.0	7.18.3
FWHTR 6	Tube side outlet	x	x	x	156.9	7.18.3
SPUMP 1	Driven steam and drain enthalpy and pressure	0.160926	974.8	1.0	x	7.18.3
MSEP 1	Moist Sep & Moist PreSep Drains ²	1.097732	358.7	207.2	x	7.18.3
TANK 1	Heater Drain Tank exiting steam	0	342.5	203.3	x	Note 4
TANK 2	Blowdown tank exiting steam	0	502.8	760.4	x	Note 4
RHTR 1	Reheater Drain	0.870169	504.5	620.3	x	7.18.3
HPEXTLINE 1	Conditions in line (Presep Outlet to FWH 5) ₃	0.984482	1147.3	208.3	x	7.18.3
HPEXTLINE 2	Conditions in line to FWH 6	0.852604	1155.1	388.6	x	7.18.3
LPEXTLINE 1	Conditions in line to FWH 4	0.548842	1197.6	77.28	x	7.18.3
LPEXTLINE 2	Conditions in line to FWH 3	0.472533	1076.5	32.42	x	Note 5
LPEXTLINE 3	Conditions in line to FWH 2	0.475753	905.9	13.27	x	Note 5
LPEXTLINE 4	Conditions in line to FWH 1	0.790585	905.2	5.76	x	Note 5

x = No value entered (not required by CHECWORKS).

(1) The HBD Item name is automatically generated by CHECWORKS. Feedwater heaters are numbered sequentially in reverse flow order. Feedwater Heater 1 is the feedwater heater closest to the steam generator (equivalent to heater 36 at Indian Point 3). Extraction lines are numbered sequentially in order of decreasing pressure.

(2) MSEP 1 represents the conditions in both the moisture separator and moisture pre-separator drain lines as recommended by EPRI Guidelines [7.3].

(3) HPEXTLINE 1 is a fictitious high-pressure extraction line representing the steam lines between the pre-separator and main separator as recommended by EPRI Guidelines [7.3].

(4) Flow rate is for exiting steam flow and was entered as zero as recommended by EPRI Guidelines [7.3]. Pressure and enthalpy were obtained from the SPU PEPSE model [7.18.3].

(5) Enthalpy was calculated as the weighted average of the steam and liquid phases. Steam phase enthalpy was obtained directly from the PEPSE diagram as the enthalpy after moisture removal in the LP Turbine. Liquid phase enthalpy was calculated as the enthalpy of saturated liquid at the pressure given on the PEPSE diagram [7.18.3].

Table C.7 Cycle 1 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	15.67	ppb	7.19.2
Ammonia	Final Feed Water	0.680	ppm	7.19.2
Hydrazine	Final Feed Water	20.000	ppb	7.19.2
Hydrazine	SG Outlet	12.000	ppb	7.19.2
Hydrazine	MSR Drain	24.000	ppb	7.19.2

Note: This water treatment was used for Cycle 1

See Assumption 4.1.6 concerning this water treatment.

Table C.8 Cycle 2 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	16.43	ppb	7.19.2
Ammonia	Final Feed Water	0.480	ppm	7.19.2
Hydrazine	Final Feed Water	20.000	ppb	7.19.2
Hydrazine	SG Outlet	12.000	ppb	7.19.2
Hydrazine	MSR Drain	24.000	ppb	7.19.2

Note: This water treatment was used for Cycle 2

See Assumption 4.1.6 concerning this water treatment.

Table C.9 Cycle 3 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	11.72	ppb	7.19.2
Ammonia	Condensate	0.760	ppm	7.19.2
Hydrazine	Final Feed Water	25.000	ppb	7.19.2
Hydrazine	SG Outlet	15.000	ppb	7.19.2
Hydrazine	MSR Drain	30.000	ppb	7.19.2

Note: This water treatment was used for Cycles 3

See Assumption 4.1.6 concerning this water treatment.

Table C.10 Cycle 4 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	9.13	ppb	7.19.2
Ammonia	Final Feed Water	1.260	ppm	7.19.2
Hydrazine	Final Feed Water	40.000	ppb	7.19.2
Hydrazine	SG Outlet	24.000	ppb	7.19.2
Hydrazine	MSR Drain	48.000	ppb	7.19.2

Note: This water treatment was used for Cycle 4

See Assumption 4.1.6 concerning this water treatment.

Table C.11 Cycle 5 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	2.83	ppb	7.19.2
Ammonia	Final Feed Water	1.290	ppm	7.19.2
Hydrazine	Final Feed Water	40.000	ppb	7.19.2
Hydrazine	SG Outlet	24.000	ppb	7.19.2
Hydrazine	MSR Drain	48.000	ppb	7.19.2

Note: This water treatment was used for Cycle 5

See Assumption 4.1.6 concerning this water treatment.

Table C.12 Cycle 6 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	2.53	ppb	7.19.2
Ammonia	Final Feed Water	1.290	ppm	7.19.2
Hydrazine	Final Feed Water	40.000	ppb	7.19.2
Hydrazine	SG Outlet	24.000	ppb	7.19.2
Hydrazine	MSR Drain	48.000	ppb	7.19.2

Note: This water treatment was used for Cycle 6

See Assumption 4.1.6 concerning this water treatment..

Table C.13 Cycle 7 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	3.00	ppb	7.19.2
Morpholine	Final Feed Water	4.500	ppm	7.19.2
Hydrazine	Final Feed Water	58.000	ppb	7.19.2
Ammonia	Final Feed Water	0.060	ppm	7.19.2
Hydrazine	SG Outlet	34.800	ppb	7.19.2
Hydrazine	MSR Drain	69.600	ppb	7.19.2

Note: This water treatment was used for Cycle 7

See Assumption 4.1.6 concerning this water treatment.

Table C.14 Cycle 8 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	4.00	ppb	7.19.2
Morpholine	Final Feed Water	4.500	ppm	7.19.2
Hydrazine	Final Feed Water	190.000	ppb	7.19.2
Ammonia	Final Feed Water	0.200	ppm	7.19.2
Hydrazine	SG Outlet	114.000	ppb	7.19.2
Hydrazine	MSR Drain	228.000	ppb	7.19.2

Note: This water treatment was used for Cycle 8

See Assumption 4.1.6 concerning this water treatment.

Table C.15 Cycle 9 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	9.00	ppb	7.19.2
Morpholine	Final Feed Water	4.500	ppm	7.19.2
Hydrazine	Final Feed Water	225.000	ppm	7.19.2
Ammonia	Final Feed Water	0.680	ppb	7.19.2
Hydrazine	SG Outlet	135.000	ppb	7.19.2
Hydrazine	MSR Drain	270.000	ppb	7.19.2

Note: This water treatment was used for Cycles 9A-9B

See Assumption 4.1.6 concerning this water treatment.

Table C.16 Cycle 10A Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	1.80	ppb	7.19.2
Morpholine	Final Feed Water	4.500	ppm	7.19.2
Hydrazine	Final Feed Water	180.000	ppb	7.19.2
Ammonia	Condensate	2.000	ppb	7.19.2
Hydrazine	SG Outlet	108.000	ppb	7.19.2
Hydrazine	MSR Drain	216.000	ppb	7.19.2

Note: This water treatment was used for Cycle 10A See Assumption 4.1.6 concerning this water treatment.

Table C.17 Cycle 10B Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	2.50	ppb	7.19.2
Ethanolamine	Final Feed Water	2.000	ppm	7.19.2
Hydrazine	Final Feed Water	225.000	ppb	7.19.2
Ammonia	Condensate	2.000	ppb	7.19.2
Hydrazine	SG Outlet	135.000	ppb	7.19.2
Hydrazine	MSR Drain	270.000	ppb	7.19.2

Note: This water treatment was used for Cycle 10B See Assumption 4.1.6 concerning this water treatment.

Table C.18 Cycle 11 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	3.3	ppb	7.19.2
Ethanolamine	Final Feed Water	2.400	ppm	7.19.2
Hydrazine	Final Feed Water	190.000	ppb	7.19.2
Ammonia	Final Feed Water	5.285	ppm	7.19.2
Hydrazine	SG Outlet	114.000	ppb	7.19.2
Hydrazine	MSR Drain	228.000	ppb	7.19.2

Note: This water treatment was used for Cycle 11 See Assumption 4.1.6 concerning this water treatment.

Table C.19 Cycle 12 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	0.69	ppb	7.19.2
Ethanolamine	Final Feed Water	3.558	ppm	7.19.2
Hydrazine	Final Feed Water	104.657	ppb	7.19.2
Ammonia	Final Feed Water	5.830	ppm	7.19.2
Hydrazine	SG Outlet	62.794	ppb	7.19.2
Hydrazine	MSR Drain	125.589	ppb	7.19.2

Note: This water treatment was used for Cycles 12A-12B See Assumption 4.1.6 concerning this water treatment.

Table C.20 Cycle 13 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	3.34	ppb	7.27.7
Ethanolamine	Final Feed Water	3.423	ppm	7.27.7
Hydrazine	Final Feed Water	98.400	ppb	7.27.7
Ammonia	Final Feed Water	4.886	ppm	7.27.7
Hydrazine	SG Outlet	58.100	ppb	7.27.7
Hydrazine	MSR Drain	116.200	ppb	7.27.7

Table C.21 Cycle 14 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	2.987	ppb	7.20.1
Ethanolamine	Final Feed Water	4.808	ppm	7.20.1
Hydrazine	Final Feed Water	53.730	ppb	7.20.1
Ammonia	Final Feed Water	3.600	ppm	7.20.1
Hydrazine	SG Outlet	33.440	ppb	7.20.1
Hydrazine	MSR Drain	66.880	ppb	7.20.1

Table C.22 Cycle 15 Water Treatment Data Input

Species	Sample Location	Concentration	Units	Reference
Dissolved Oxygen	Condensate	2.820	ppb	7.20.2
Ethanolamine	Final Feed Water	4.360	ppm	7.20.2
Hydrazine	Final Feed Water	61.000	ppb	7.20.2
Ammonia	Final Feed Water	3.620	ppm	7.20.2
Hydrazine	SG Outlet	36.600	ppb	7.20.2
Hydrazine	MSR Drain	73.200	ppb	7.20.2

Note: This water treatment was used for Cycles 15-16.

See Assumption 4.1.6 concerning this water treatment.

Table C.23 Plant Period Input Data

Period	Start Date	End Date	Type	Water Treatment	Power Level	Operating Hours	Reference
Cycle 1	6/27/1976	6/7/1978	Operating	Cycle 1	100	12117.6	7.19.2

Note: This report is based on the assumption that at least the component U/S Main is included in a flow segment.

Company : Entergy Nuclear Operations, Inc.
 Plant : Indian Point
 Unit : 3
 DB Name: IPEC3(v3)

Report Date : 09-Feb-2010
 Report Time : 14:30:36

CHECWORKS SFA Version: 3.0 (build 105)

In LCF Calc "No"	Description
1	EPRI recommends not to use any calculated lifetime wear less than or equal to 0.030" or 5% of Tnom.
2	CHECWORKS does not use the U/S Ext. or Br. Ext. in the calculation of the LCF.
3	The UT data readings do not provide an accurate representation of actual wear for this component.
4	CHECWORKS does not have a geometry code that accurately represents this component.
5	This inspection is a baseline inspection.
6	This section is modeled having no normal flow.
7	This wear is not indicative of FAC wear because wear readings are most likely due to manufacturing variances.
8	This component was only partially inspected and has an incomplete grid.
9	Inspection on tee or nozzle does not correlate well with inspections on other geometry types.
10	This component is an unusual geometry (valve, flange, orifice, etc.) and should not be used in calibration of the model.
11	Non-susceptible material
12	Scanned value imported for informational purposes only.
13	Two inspections were performed during the same outage. Only one was imported to CHECWORKS.
14	Inspected component is not modeled in CHECWORKS
15	No UT data package could be found for importation.
16	This component was inspected using Pulsed Eddy Current.
17	Due to a bug in CHECWORKS, inspections of tees with no data on the U/S Main are not used in the LCF
18	D/S Ext not used in LCF due to CHECWORKS bug involving downstream extensions of type14 tees
19	D/S Ext is not a pipe
20	Unable to exclude counterbore
21	Small-bore components
22	Suspicious Tnom inflating measured wear to an excessive level.

CHECWORKS SFA Version 3.0 (build 105)

Chemistry Analysis Report

Water Treatment : Cycle 1
 Power Level : 100.00%
 Plant Type : PWR

Chemistry Condition :

Condensate Dissolved Oxygen (ppb) :	15.670		
Concentration of 1st Constituent (ppm) :	0.000	, Sampling at	Not Used
Concentration of 2nd Constituent (ppm) :	0.000	, Sampling at	Not Used
Concentration of Ammonia (ppm) :	0.680	, Sampling at	Final Feed Water
Concentration of Hydrazine (ppb) :	20.000	, Sampling at	Final Feed Water
Hydrazine at SG (ppb) :	12.000	, Sampling at	Steam outlet
Hydrazine at MSR drain (ppb) :	24.000		
Concentration of Boron (ppm) :	0.000	, Sampling at	Not Used
Boron Injection Rate (lbm/hr) :	0.000		

Chemistry Analysis Results :

Notes:

- 1: For two-phase lines, the cold pH reported is for the mixture of steam and water, and the amine concentrations and hot pH are for the water phase only.
- 2: For Superheated steam, cold pH, hot pH and amine concentration are not reported since there is no water phase.

Notes:

- 1: For two-phase lines, the cold pH reported is for the mixture of steam and water, and the amine concentrations and hot pH are for the water phase only.
- 2: For Superheated steam, cold pH, hot pH and amine concentration are not reported since there is no water phase.

CHECWORKS SFA Version 3.0 (build 105)

Chemistry Analysis Report

Water Treatment : Cycle 7
 Power Level : 100.00%
 Plant Type : PWR

Chemistry Condition :

Condensate Dissolved Oxygen (ppb) :	3.000		
Concentration of 1st Constituent (ppm) :	4.500	, Sampling at	Final Feed Water
Concentration of 2nd Constituent (ppm) :	0.000	, Sampling at	Not Used
Concentration of Ammonia (ppm) :	0.060	, Sampling at	Final Feed Water
Concentration of Hydrazine (ppb) :	58.000	, Sampling at	Final Feed Water
Hydrazine at SG (ppb) :	34.800	, Sampling at	Steam outlet
Hydrazine at MSR drain (ppb) :	69.600		
Concentration of Boron (ppm) :	7.500	, Sampling at	Steam Generator Blowdown
Boron Injection Rate (lbm/hr) :	0.000		

Chemistry Analysis Results :

Notes:

- 1: For two-phase lines, the cold pH reported is for the mixture of steam and water, and the amine concentrations and hot pH are for the water phase only.
- 2: For Superheated steam, cold pH, hot pH and amine concentration are not reported since there is no water phase.

Notes:

- 1: For two-phase lines, the cold pH reported is for the mixture of steam and water, and the amine concentrations and hot pH are for the water phase only.
- 2: For Superheated steam, cold pH, hot pH and amine concentration are not reported since there is no water phase.

CHECWORKS SFA Version 3.0 (build 105)

Chemistry Analysis Report

Water Treatment : Cycle 10A
 Power Level : 100.00%
 Plant Type : PWR

Chemistry Condition :

Condensate Dissolved Oxygen (ppb) :	1.800		
Concentration of 1st Constituent (ppm) :	4.500	, Sampling at	Final Feed Water
Concentration of 2nd Constituent (ppm) :	0.000	, Sampling at	Not Used
Concentration of Ammonia (ppm) :	2.000	, Sampling at	Condensate
Concentration of Hydrazine (ppb) :	180.000	, Sampling at	Final Feed Water
Hydrazine at SG (ppb) :	108.000	, Sampling at	Steam outlet
Hydrazine at MSR drain (ppb) :	216.000		
Concentration of Boron (ppm) :	6.500	, Sampling at	Steam Generator Blowdown
Boron Injection Rate (lbm/hr) :	0.000		

Chemistry Analysis Results :

Notes:

- 1: For two-phase lines, the cold pH reported is for the mixture of steam and water, and the amine concentrations and hot pH are for the water phase only.
- 2: For Superheated steam, cold pH, hot pH and amine concentration are not reported since there is no water phase.

 Analysis Date/Time: 09-Feb-2010 2:55 pm

CHECWORKS SFA Version 3.0 (build 105)

Chemistry Analysis Report

Water Treatment : Cycle 12
 Power Level : 100.00%
 Plant Type : PWR

Chemistry Condition :

Condensate Dissolved Oxygen (ppb) :	0.690		
Concentration of 1st Constituent (ppm) :	3.558	, Sampling at	Final Feed Water
Concentration of 2nd Constituent (ppm) :	0.000	, Sampling at	Not Used
Concentration of Ammonia (ppm) :	5.830	, Sampling at	Final Feed Water
Concentration of Hydrazine (ppb) :	104.657	, Sampling at	Final Feed Water
Hydrazine at SG (ppb) :	62.794	, Sampling at	Steam outlet
Hydrazine at MSR drain (ppb) :	125.589		
Concentration of Boron (ppm) :	0.000	, Sampling at	Not Used
Boron Injection Rate (lbm/hr) :	0.000		

Chemistry Analysis Results :

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:43:24PM

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Run Name: CD: HTR 32 TO 33 HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:43:45PM

Run Name: CD: HTR 33 TO HTR 34
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Component Name	----- Thickness (in) -----				Component Predicted		Comp. Actual Service Time (hrs)

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:45AM

AnalysisDate/Time: 2/9/2010 3:45:50PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: ES: LP TO 31 HEATERS

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:46:47PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: ES: LP TO 33 HEATERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:46:47PM

Run Name: ES: LP TO 33 HEATERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Component Name	----- Thickness (in) -----				Component Predicted		Comp. Actual Service Time (hrs)

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:46:47PM

Run Name: ES: LP TO 33 HEATERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:45AM

AnalysisDate/Time: 2/9/2010 3:47:39PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: ES: PRESEP TO 35 HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:47:39PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: ES: PRESEP TO 35 HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:47:39PM

Run Name: ES: PRESEP TO 35 HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Component Name	----- Thickness (in) -----				Component Predicted		Comp. Actual Service Time (hrs)

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:45AM

AnalysisDate/Time: 2/9/2010 3:48:24PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: FW: BFP TO 36 HTR

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:48:24PM

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Run Name: FW: BFP TO 36 HTR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:48:24PM

Run Name: FW: BFP TO 36 HTR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:48:24PM

Run Name: FW: BFP TO 36 HTR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:48:47PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 0.020

Run Name: FW: FW RECIRC
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:49:42PM

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Run Name: FW: SG HEADERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:49:42PM

Run Name: FW: SG HEADERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report
Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:45AM
 AnalysisDate/Time: 2/9/2010 3:49:58PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: HD: HD PMP TO BFP HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:50:21PM

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Run Name: HD: HTR 32 TO HTR 31
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:50:21PM

Run Name: HD: HTR 32 TO HTR 31
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Component Name	----- Thickness (in) -----				Component Predicted		Comp. Actual Service Time (hrs)

 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:05AM

AnalysisDate/Time: 2/9/2010 3:51:03PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: HD: HTR 33 TO HTR 32

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:51:03PM

Run Name: HD: HTR 33 TO HTR 32
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:51:03PM

Run Name: HD: HTR 33 TO HTR 32
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:45AM

AnalysisDate/Time: 2/9/2010 3:51:31PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: HD: HTR 34 TO HTR 33

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:51:31PM

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Run Name: HD: HTR 34 TO HTR 33
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:51:31PM

Run Name: HD: HTR 34 TO HTR 33
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Component Name	----- Thickness (in) -----				Component Predicted	Comp. Actual Service Time (hrs)

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:51:31PM

Run Name: HD: HTR 34 TO HTR 33
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:53:08PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: MSD: MS 31 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:53:08PM

Run Name: MSD: MS 31 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:53:08PM

Run Name: MSD: MS 31 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:45AM

AnalysisDate/Time: 2/9/2010 3:54:08PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: MSD: MSDT 32 TO HDT

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:54:08PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: MSD: MSDT 32 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Component Name	Geom Code	Average Wear Rate (mils/yr)	Current Wear Rate (mils/yr)	Temp (F)	Velocity (ft/s)	Quality (%)	OD (in)	Hot pH	Oxygen (ppb)	Hydrazine (ppb)	Input Source

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:05AM

AnalysisDate/Time: 2/9/2010 3:54:39PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: MSD: MSDT 33 TO HDT

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM

AnalysisDate/Time: 2/9/2010 3:55:09PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: PD: PRESEPRTR DRAINS

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:55:09PM

Run Name: PD: PRESEPRTR DRAINS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Component Name	----- Thickness (in) -----				Component Predicted	Actual	Comp. Actual Service Time (hrs)

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:55:09PM

Run Name: PD: PRESEPRTR DRAINS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Note:
[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:45AM

AnalysisDate/Time: 2/9/2010 3:55:46PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: RHD: RH 31 TO HDR

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:05AM

AnalysisDate/Time: 2/9/2010 3:55:46PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: RHD: RH 31 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:55:46PM

Run Name: RHD: RH 31 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:55:46PM

Run Name: RHD: RH 31 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:45AM

AnalysisDate/Time: 2/9/2010 3:56:27PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: RHD: RH 32B TO HDR

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:05AM

AnalysisDate/Time: 2/9/2010 3:56:27PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: RHD: RH 32B TO HDR

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:45AM

AnalysisDate/Time: 2/9/2010 3:57:01PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: RHD: RH 33 TO HDR

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:05AM

AnalysisDate/Time: 2/9/2010 3:57:01PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: RHD: RH 33 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:57:01PM

Run Name: RHD: RH 33 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Component Name	----- Thickness (in) -----				Component Predicted	Comp. Actual Service Time (hrs)

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.

Plant: Indian Point

Unit: 3

DB Name: IPEC3(v3).DB

Wear Rate Report**Pass 1 Analysis Exclude Measured Wear**

Report Date/Time: 2/10/2010 9:11:45AM

AnalysisDate/Time: 2/9/2010 3:57:50PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: RHD: RHD HDR TO HTRS

Ending Period: Cycle 16

Total Plant Operating Hours: 203,584

WRA Data Option: NFA->ARD->HBD->COMP

Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:57:50PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: RHD: RHD HDR TO HTRS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:57:50PM

Run Name: RHD: RHD HDR TO HTRS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) :1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 1 Analysis Exclude Measured Wear

Report Date/Time: 2/10/2010 9:11:05AM
 AnalysisDate/Time: 2/9/2010 3:57:50PM

Run Name: RHD: RHD HDR TO HTRS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/3/2010 9:41:38AM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: CD: HDR TO BFP
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.153

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/3/2010 9:41:38AM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: CD: HDR TO BFP
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.153

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/3/2010 9:41:58AM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: CD: HTR 31 TO HTR 32
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Duty Factor (Global) : 1.000

Component Name	Geom Code	Average Wear Rate (mils/yr)	Current Wear Rate (mils/yr)	Temp (F)	Velocity (ft/s)	Quality (%)	OD (in)	Hot pH	Oxygen (ppb)	Hydrazine (ppb)	Input Source

Component Name	Tinit	Total Lifetime Wear (mils)		In-Service Component Wear(mils)		In-Service Component Tmeas, Method, Time			In-Service Component Thickness (mils) [4]		Incremental Wear (mils) [5] PRWEAR	Time (hrs) Last Inspected
		Prd. [1]	Meas.	Prd. [1]	Meas.	(in) [3]	[2]	(hrs) [3]	Tp	Tm		

==>Grouped by Line:

Sorted By: Flow Order

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 TP = Predicted thickness at Tmeas.
 TM = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/3/2010 9:42:32AM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: CD: HTR 33 TO HTR 34
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 0.601

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 TP = Predicted thickness at Tmeas.
 TM = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
 TP = Predicted thickness at Tmeas.
 TM = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Sorted By: Flow Order

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
 [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
 [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
 [4] These two values are used for thickness plot.
 TP = Predicted thickness at Tmeas.
 TM = Last measured thickness (Tmeas).
 [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 TP = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Duty Factor (Global) :

Component Name	Tinit	Total Lifetime Wear (mils)		In-Service Component Wear(mils)		In-Service Component Tmeas, Method, Time			In-Service Component Thickness (mils) [4]		Incremental	Time (hrs)
		Prd. [1]	Meas.	Prd. [1]	Meas.	(in) [3]	[2]	(hrs) [3]	Thp	Tm	Wear (mils) [5] PRWEAR	Last Inspected

====>Grouped by Line:**Sorted By: Flow Order**

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
 [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
 [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
 [4] These two values are used for thickness plot.
 Thp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
 [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/5/2010 2:00:07PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: ES: LP TO 33 HEATERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.807

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM

AnalysisDate/Time: 2/5/2010 2:00:07PM

Run Name: ES: LP TO 33 HEATERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.807

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 10-Feb-2010 9:06 am

AnalysisDate/Time: 10-Feb-2010 9:07 am

Run Name: ES: LP TO 33 HEATERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.807

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:07:22AM
 AnalysisDate/Time: 2/5/2010 3:09:20PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: ES: PRESEP TO 35 HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.061

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/5/2010 3:09:20PM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: ES: PRESEP TO 35 HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.061

Duty Factor (Global) : 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/5/2010 3:09:20PM

Run Name: ES: PRESEP TO 35 HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.061

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/5/2010 3:41:04PM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: FW: BFP TO 36 HTR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 0.893

Duty Factor (Global) : 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/5/2010 3:41:04PM

Run Name: FW: BFP TO 36 HTR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 0.893

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time:

Run Name: FW: BFP TO 36 HTR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 0.893

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 10-Feb-2010 9:06 am

AnalysisDate/Time: 10-Feb-2010 9:07 am

Run Name: FW: BFP TO 36 HTR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 0.893

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:07:22AM
 AnalysisDate/Time: 2/3/2010 10:02:07AM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 0.020

Run Name: FW: FW RECIRC
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time:

Run Name: FW: FW RECIRC
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.000

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 0.020

Sorted By: Flow Order

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/5/2010 4:05:56PM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: FW: SG HEADERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.423

Duty Factor (Global) : 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/5/2010 4:05:56PM

Run Name: FW: SG HEADERS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.423

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Component Name	----- Thickness (in) -----				Component Predicted [1]		Comp. Actual Service Time (hrs)

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/5/2010 4:28:53PM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: HD: HD PMP TO BFP HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 0.976

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/8/2010 10:12:38AM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: HD: HTR 32 TO HTR 31
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.863

Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 10-Feb-2010 9:06 am

AnalysisDate/Time: 10-Feb-2010 9:07 am

Run Name: HD: HTR 32 TO HTR 31
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.863

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Component Name	Tinit	Total Lifetime Wear (mils)		In-Service Component Wear(mils)		In-Service Component Tmeas, Method, Time			In-Service Component Thickness (mils) [4]		Incremental Wear (mils) [5]	Time (hrs) Last

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/3/2010 10:04:32AM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: HD: HTR 33 TO HTR 32
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.045

Duty Factor (Global) : 1.000

Component Name	Geom Code	Average Wear Rate (mils/yr)	Current Wear Rate (mils/yr)	Temp (F)	Velocity (ft/s)	Quality (%)	OD (in)	Hot pH	Oxygen (ppb)	Hydrazine (ppb)	Input Source

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM

AnalysisDate/Time: 2/3/2010 10:04:32AM

Run Name: HD: HTR 33 TO HTR 32
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.045

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Component Name	----- Thickness (in) -----				Component Predicted [1]		Comp. Actual Service Time (hrs)

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time:

Run Name: HD: HTR 33 TO HTR 32
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 1.045

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/8/2010 10:27:49AM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: HD: HTR 34 TO HTR 33
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 0.911

Duty Factor (Global) : 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM

AnalysisDate/Time: 2/8/2010 10:27:49AM

Run Name: HD: HTR 34 TO HTR 33
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 0.911

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time:

Run Name: HD: HTR 34 TO HTR 33
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 0.911

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
 TP = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Wear Report

Report Date/Time: 10-Feb-2010 9:06 am
 AnalysisDate/Time: 10-Feb-2010 9:07 am

Run Name:
 Ending Period:
 Total Plant Operating Hours:
 WRA Data Option:
 Line Correction Factor:

CHECWORKS SFA Version:
 Duty Factor (Global) :

Component Name	Tinit	Total Lifetime Wear (mils)		In-Service Component Wear(mils)		In-Service Component Tmeas, Method, Time			In-Service Component Thickness (mils) [4]		Incremental	Time (hrs)
		Prd. [1]	Meas.	Prd. [1]	Meas.	(in) [3]	[2]	(hrs) [3]	Tp	Tm	Wear (mils) [5] PRWEAR	Last Inspected

==>Grouped by Line:

Sorted By: Flow Order

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/3/2010 10:06:50AM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: MSD: MS 31 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.791

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/3/2010 10:06:50AM

Run Name: MSD: MS 31 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.791

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Component Name	----- Thickness (in) -----				Component Predicted [1]		Comp. Actual Service Time (hrs)

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

5

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 10-Feb-2010 9:06 am

AnalysisDate/Time: 10-Feb-2010 9:07 am

Run Name: MSD: MS 31 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.791

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

[1] Predictions are for the time of last inspection (last known meas. wear).

[2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.

MT = Tmeas is component minimum thickness.

PW = Tmeas is Tinit - predicted wear.

US = Tmeas is user specified.

[3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.

Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.

[4] These two values are used for thickness plot.

TP = Predicted thickness at Tmeas.

TM = Last measured thickness (Tmeas).

[5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time:

Run Name: MSD: MSDT 32 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 4.355

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Wear Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 10-Feb-2010 9:06 am

AnalysisDate/Time: 10-Feb-2010 9:07 am

Run Name: MSD: MSDT 32 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 4.355

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Component Name	Tinit	Total Lifetime Wear (mils)		In-Service Component Wear(mils)		In-Service Component Tmeas, Method, Time (in) [3] [2] (hrs) [3]			In-Service Component Thickness (mils) [4]		Incremental Wear (mils) [5]	Time (hrs) Last Inspected
		Prd. [1]	Meas.	Prd. [1]	Meas.				TP	TM	PRWEAR

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/8/2010 2:41:15PM

Run Name: MSD: MSDT 33 TO HDT
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.770

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Component Name	----- Thickness (in) -----				Component Predicted [1]		Comp. Actual Service Time (hrs)

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Wear Report

Report Date/Time: 10-Feb-2010 9:06 am
AnalysisDate/Time: 10-Feb-2010 9:07 am

Run Name:
Ending Period:
Total Plant Operating Hours:
WRA Data Option:
Line Correction Factor:

CHECWORKS SFA Version:
Duty Factor (Global) :

Component Name	Tinit	Total Lifetime Wear (mils)		In-Service Component Wear(mils)		In-Service Component Tmeas, Method, Time (in) [3] [2] (hrs) [3]			In-Service Component Thickness (mils) [4]		Incremental Wear (mils) [5]	Time (hrs)
		Prd. [1]	Meas.	Prd. [1]	Meas.				Tp	Tm	PRWEAR	Last Inspected

==>Grouped by Line:

Sorted By: Flow Order

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/3/2010 10:09:00AM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: PD: PRESEPRTR DRAINS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.643

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM

AnalysisDate/Time: 2/3/2010 10:09:00AM

Run Name: PD: PRESEPRTR DRAINS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.643

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Component Name	----- Thickness (in) -----				Component Predicted [1]		Comp. Actual Service Time (hrs)

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time:

Run Name: PD: PRESEPRTR DRAINS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.643

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Wear Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 10-Feb-2010 9:06 am

AnalysisDate/Time: 10-Feb-2010 9:07 am

Run Name: PD: PRESEPRTR DRAINS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.643

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Component Name	Tinit	Total Lifetime Wear (mils)		In-Service Component Wear(mils)		In-Service Component Tmeas, Method, Time			In-Service Component Thickness (mils) [4]		Incremental Wear (mils) [5]	Time (hrs) Last Inspected

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
 TP = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/8/2010 3:09:15PM

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Run Name: RHD: RH 31 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.231

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/8/2010 3:09:15PM

Run Name: RHD: RH 31 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.231

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Component Name	----- Thickness (in) -----				Component Predicted [1]		Comp. Actual Service Time (hrs)

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 10-Feb-2010 9:06 am

AnalysisDate/Time: 10-Feb-2010 9:07 am

Run Name: RHD: RH 31 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.231

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
 Tp = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/3/2010 4:45:50PM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: RHD: RH 32B TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 2.932

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
 MT = Tmeas is component minimum thickness.
 PW = Tmeas is Tinit - predicted wear.
 US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
 Tmeas is used to determine Predicted Thickness and Component Predicted Time to Tcrit.
- [4] These two values are used for thickness plot.
 TP = Predicted thickness at Tmeas.
 Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/8/2010 4:22:57PM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: RHD: RH 33 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.306

Duty Factor (Global) : 1.000

Component Name	Geom Code	Average Wear Rate (mils/yr)	Current Wear Rate (mils/yr)	Temp (F)	Velocity (ft/s)	Quality (%)	OD (in)	Hot pH	Oxygen (ppb)	Hydrazine (ppb)	Input Source

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/8/2010 4:22:57PM

Run Name: RHD: RH 33 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.306

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time:

Run Name: RHD: RH 33 TO HDR
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.306

CHECWORKS SFA Version: 3.0 (build 105)
 Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Wear Rate Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time: 2/8/2010 4:39:44PM

CHECWORKS SFA Version: 3.0 (build 105)

Run Name: RHD: RHD HDR TO HTRS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.180

Duty Factor (Global) : 1.000

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM

AnalysisDate/Time: 2/8/2010 4:39:44PM

Run Name: RHD: RHD HDR TO HTRS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.180

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Note:

[1] Predictions are based on last Tmeas to analysis ending period.

Company: Entergy Nuclear Operations, Inc.
 Plant: Indian Point
 Unit: 3
 DB Name: IPEC3(v3).DB

Service Life Report

Pass 2 Analysis Include Measured Wear

Report Date/Time: 2/10/2010 9:06:37AM
 AnalysisDate/Time:

Run Name: RHD: RHD HDR TO HTRS
 Ending Period: Cycle 16
 Total Plant Operating Hours: 203,584
 WRA Data Option: NFA->ARD->HBD->COMP
 Line Correction Factor: 3.180

CHECWORKS SFA Version: 3.0 (build 105)

Duty Factor (Global) : 1.000

Notes:

- [1] Predictions are for the time of last inspection (last known meas. wear).
- [2] GW = Tmeas is minimum thickness from Band, Blanket or Area Method of greatest wear.
MT = Tmeas is component minimum thickness.
PW = Tmeas is Tinit - predicted wear.
US = Tmeas is user specified.
- [3] If no Tmeas has been determined from measured data, then Tmeas = Tinit and Time = current component installation time.
Tmeas is used to determine Predicted Thickness and Component Predicted Time to Terit.
- [4] These two values are used for thickness plot.
Tp = Predicted thickness at Tmeas.
Tm = Last measured thickness (Tmeas).
- [5] PRWEAR = Incremental wear from last Tmeas time to analysis ending period.

Email from Harry Hartjen (IP3) to Daniel R. Poe (CSI Technologies), dated 10/18/2004, regarding operational and configuration changes due to SPU, CSI Doc. No. 04071113.

Dan:

Attached is the response from our engineer, the Shaw Group to your request for a listing of all operational and/or configuration changes due to the SPU.
Note that there are no operational and/or configuration changes to IP2/IP3 due to the SPU.

This information was required for DDIR No. 6 and 7.

Per your request, a hard copy set of IP3 FAC isometric drawings will be mailed today to your attention. Note that drawing EC-H-50077 is not yet revised in this mailing. For correct piping configuration, see the information I sent you for the 3R1 2 Checworks update.

Included in this mailing is:

1. Flow Accelerated Corrosion Program Checworks Analysis Enhancement, Technical Report No. 001 30-TR-001 Revision 0 Volume 1 of 1. December, 2000. This report serves as the Unit 2 Checworks Model documentation. In addition to the Checworks Wear Rate Analysis Run Definitions listed in Table 1.0, there are the following two additions:
 - a. X-under w/exp joints
 - b. CND FWH 22 to FWH 23; this was added due to the SPU.

This information was required for DDIR No. 4

Subject: RE: RAI FAC-1

Harry,

There are no operational changes for Steam Plant Systems, such as use of additional trains or use of bypass lines not currently in operation, associated with uprate of IP2 / IP3. Changes due to the uprate which affect FAC are primarily changes in system flowrates and temperatures, which are documented in the Heat Balance calculations. Impact of these changes on piping velocities and temperatures is addressed in the

applicable sections of the BOP Uprate Engineering Reports, forwarded to Entergy for review.

Modifications associated with the uprate of IP2 / IP3 include: (1) MSR internal moisture separation system replacement, (2) HP Turbine rotor replacement, (3) HP turbine interstage drain piping modification, and (4) Relocation of HP turbine 1st stage pressure taps.

Regards, Glenn C.

Glen:

This is to confirm that the wear rate comparison will be completed by 12/31/2004.

As I mentioned to you we are having a contractor perform the update to our Checworks models. One of the inputs I have to provide to them is:

The listing of all Unit 2 and Unit 3 operational and/or configuration changes due to the power uprate (i.e., additional trains in operation, bypass lines operated at full power, etc.)

Do you have this information or can you direct my question to someone who has this information.

Thanks,

Harry Hartjen

To: Macina, Ron
Subject: Request for Additional HBDs

CSI Doc. No. 04071137

Ron,

Based on our discussion earlier today, it appears that we have some additional work to do on this end. We plan on modeling all three power levels (100% - the Original power level, ~1 01.4% - the Appendix K power level, and 105% - the SPU power level) for each unit. In doing this, we will capture plant conditions at each point in history.

To complete this task, we will need the following input:

- (1) Unit 3 PEPSE or HBD at ~1 01.4% power (the Appendix K power uprate)
- (2) Unit 2 Original PEPSE or HBD at 100% power (pre-Appendix K)
- (3) Unit 3 Start date for the Appendix K Uprate
- (4) Unit 2 Start date for the Appendix K Uprate

Please let me know if you have any questions. We will be contacting Harry to inform him of this plan.

Thank you,

Brian Trudeau

To: Gregory. M Lupia
Subject: RE: Component Replacement Question

Greg:

Attached is spreadsheet marked up in red. The components were rearranged in flow direction order, and additional as-built components are designated as New. This pipe replacement replaced all the carbon steel pipe with clad pipe upstream of reducer EX-02.13-06R and upstream of the branch of tee EX-02.7-02T.

In answer to your specific questions, EX-02.9-10P was replaced. EX-02.9-7P no longer exists. EX-02.1 3-03P is a pipe and was replaced. EX-02. 1 3-06R is a reducer and it was replaced along with EX-02.7-02T, RO8, 01/01/1994.

If you need anything else, let me know.

Email from Harry Hartjen (IP3) to Dan R. Poe (CSI Technologies), dated 8/2/2005, regarding Comments on Revision A of the IP3 R13 Pass 2 Calculation, CSI Doc. No. 050714c11

Dan:

I have reviewed the CHECWORKS Pass 2 Analysis for the Indian Point 3, 3R13 refuel outage and have the following three comments:

1. The following two extraction steam nozzles were not listed in Appendix F, UT Inspection Data: EX-05.1 B-01 N (05UT095) and EX-05.2B-01 N (05UT105). These two components have inspection data and should also be included in the model.
2. Components inspected in UT exam RHD-01 .10B-26F (05UT074) were not listed in Appendix F, UT Inspection Data. There is inspection data for two components RHD-01.10B-27P and RHD-01.10B-26E and should also be included in the model.
3. There is a warning for the Pass 2 analysis of component CD-02.8A-03P (Page I-12) indicating a conflict exists in LCF/Measured Wear option selected. This should be resolved in the model or explained in Appendix B.

After resolution of these comments, please issue for use. If you have any questions, just give me a call at 914-271-7239.

As always, CSI has produced a first-rate, high-quality CHECWORKS Pass 2 update for IPEC. Please extend my appreciation for a job well done to your staff.

Subject: IPEC3 Replacement Lists

Harry,

I am currently working on updating your SFA model with the latest plant period, chemistry, replacement, and inspection info. I just need a little clarification on what exactly you want us to do with some of the information that you provided on the FTP site.

- The EXCEL file called REPLACED COMPONENTS.xls contains the components that were replaced in this last outage (RO14). The second component in this list is RHD-02.14B-12T-DS. Does this mean that the pipe on the downstream main of this tee has been replaced? If this is true, the pipe on the downstream main of this tee is not a component that was modeled in SFA. The same is true for component RHD-02.15A-11T-DS. Or did you mean the tee itself?
[Each of these components is a pup piece downstream of the tee, and upstream of the feedwater heater nozzle. Please add these components to the model.](#)
- Component RHD-02.6A-06L in the same spreadsheet is said to have the geometry of a pipe. I just wanted to make sure that the tee was the replaced component and not the downstream pipe. So, which component is the replaced component?
- The component FAC-07-VCD-09 is an SNM component right? I just want to verify that it is not in the official CHECWORKS model.
[Yes this is a SNM component.](#)
- In the other EXCEL spreadsheet called Replaced Modeled Components 3R13 REV1.xls there are components that have their replacements documented in SFA. Tell me if this is right: you just want me to rearrange the components in SFA to how they are listed in that spreadsheet and also to do what the instructions say in the far right column of the sheet? The three isometrics you provided also visually show how the components should be ordered as well, right?
[Yes. The spreadsheet shows the correct component order.](#)

I just want to make sure I'm doing what you are asking us to do. I think I understand, but I just want to hear from you first.

If you have any comments or issues about my questions, please email or call me back at the

Subject: IPEC3 Replacement Lists

Harry,

I am currently working on updating your SFA model with the latest plant period, chemistry, replacement, and inspection info. I just need a little clarification on what exactly you want us to do with some of the information that you provided on the FTP site.

- The EXCEL file called REPLACED COMPONENTS.xls contains the components that were replaced in this last outage (RO14). The second component in this list is RHD-02.14B-12T-DS. Does this mean that the pipe on the downstream main of this tee has been replaced? If this is true, the pipe on the downstream main of this tee is not a component that was modeled in SFA. The same is true for component RHD-02.15A-11T-DS. Or did you mean the tee itself?
- Component RHD-02.6A-06L in the same spreadsheet is said to have the geometry of a pipe. I just wanted to make sure that the tee was the replaced component and not the downstream pipe. So, which component is the replaced component?
[You are correct. The pipe immediately downstream of RHD-02.6A-06L was replaced, not RHD-02.6A-06L](#)
- The component FAC-07-VCD-09 is an SNM component right? I just want to verify that it is not in the official CHECWORKS model.
- In the other EXCEL spreadsheet called Replaced Modeled Components 3R13 REV1.xls there are components that have their replacements documented in SFA. Tell me if this is right: you just want me to rearrange the components in SFA to how they are listed in that spreadsheet and also to do what the instructions say in the far right column of the sheet? The three isometrics you provided also visually show how the components should be ordered as well, right?
[Right. The spreadsheet and iso's show the correct component order. I wanted to make sure you had the correct field configuration to model this area correctly. How the components broken up and are assigned lines, I will leave to your expertise. There were other questions I had reviewing this area in a spreadsheet Presep Component comments.xls. This should be on the ftp site. I will attach a copy here. Mainly deals with components I could not find in the SFA model.](#)

I just want to make sure I'm doing what you are asking us to do. I think I understand, but I just

want to hear from you first.
