CHAIR SCHULTZ: [presiding] The meeting will now come to order.

This is a meeting of the Advisory Committee on Reactor Safeguards, Subcommittee on Fukushima. I am Stephen Schultz, Chairman of the Subcommittee.

Members in attendance are Sam Armijo, Sanjoy Banerjee, Dennis Bley, Michael Corradini, Harold Ray, Joy Rempe, Michael Ryan, Bill Shack, Jack Sieber, Dick Skillman, and John Stetkar.

The purpose of today's meeting is to receive a briefing and hold discussions with the NRC staff on the plans for implementation of the Near-Term Task Force Tier 3 recommendations. The Subcommittee will gather information, analyze relevant issues and facts, and formulate proposed positions and actions as appropriate for deliberation by the full Committee.

Antonio Dias is the Designated Federal Official for the meeting.

The rules for participation in today's meeting have been announced as part of the notice of this meeting previously published in The Federal Register on May 15th, 2012.

A transcript of the meeting is being kept

NEAL R. GROSS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 and will be available, as stated in The Federal Register
2 notice. It is requested that speakers first identify
3 themselves and speak with sufficient clarity and volume,
4 so that they can be readily heard.

5 Due to the many different topics that will
6 be covered during this one-and-a-half-day meeting, we
7 are planning to allow public comments to be provided
8 at the end of each Tier 3 topic. We have received no
9 written comments or requests for time to make oral
10 statement from members of the public regarding today's
11 meeting. But, as I just mentioned, we will have
12 opportunity for comments as desired.

13 We will now proceed with the meeting, and
14 I call on John Monninger from the Japan Lessons Learned
15 Directorate to open the presentations today.

16 **MR. MONNINGER:** Thank you, Dr. Schultz and
17 fellow ACRS members.

18 My name is John Monninger. I am the
19 Associate Director for the NRC's Japan Lessons Learned
20 Directorate. I am leading up our efforts on the Tier
21 3 activities which is the focus of today's discussion.

22 I would also like to introduce Mr. David
23 Brown, who is with me today. He is Senior Project
24 Manager, also within NRR's Japan Lessons Learned Project
25 Directorate.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 I think one thing that it is important to
2 highlight or to recognize is that David is actually an
3 NRO employee, but he is on loan to the Japan Lessons
4 Learned Directorate. So, our organization I think is
5 very reflective of the agency coming together, whether
6 it is staff from NRR, staff from NRO, staff from
7 Research, NMSS, the regions, et cetera, to address these
8 various issues.

9 Dave had the lead for the February paper
10 which provided the Tier 1 orders and also has the lead
11 for the July paper which is coming forth.

12 As you mentioned, we will discuss our plans
13 and approach for addressing the Tier 3 regulatory
14 actions. And also, as part of that, we will do a brief
15 refresher on what the tiers mean and what is Tier 1,
16 Tier 2, et cetera.

17 We are very much interested in your feedback
18 and comments. We are still at the formative stages of
19 our plan. These are our draft plans.

20 However, with that said, they have been
21 reviewed and approved by our Steering Committee for
22 engagement of stakeholders. We have had three public
23 meetings on these draft plans. In advance of the public
24 meetings, we have released the plans to facilitate
25 public dialog.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 We are very much interested in the ACRS's
2 views. To that extent, we are interested in a letter
3 from the Committee on the Tier 3 recommendations. We
4 think the direction from the Commission, as part of our
5 normal business, we should always do that, but it has
6 especially been highlighted by the Commission, the need
7 for ACRS engagement. And that is what we are here today
8 to do.

9 While we are working on the Tier 3 actions,
10 I do have to note that the agency's focus and priority
11 continues to be on the Tier 1 issues. So, to a certain
12 extent, we are working the Tier 3 issues, but the
13 priority and the resources are being applied first to
14 the Tier 1 and Tier 2 issues.

15 So, if I could please have the second slide?

16 Just briefly, though we are going to be
17 talking the Tier 3 activities, which are to a certain
18 extent longer-term, I think it is very important to sort
19 of baseline us into all the things that the agency has
20 done. Hopefully, I will be able to do it rather quickly.

21 But when the event occurred, the agency very
22 quickly went into monitoring mode. And the initial
23 focus, then, was on our material licensees within
24 potentially Hawaii, Alaska, the West Coast and, also,
25 the power plants on the West Coast, Diablo, San Onofre,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 et cetera.

2 Very shortly after that, we started to
3 engage with our counterparts within Japan, our
4 regulatory counterparts, as we started monitoring the
5 events. We stood up the Operations Center, and,
6 eventually, over that weekend and the following Monday,
7 we sent an expanded team over to Japan that was stationed
8 within the U.S. Embassy there. And we probably had
9 staff in Japan for six, eight months or so. So, it was
10 a very significant agency effort.

11 In addition to that, very shortly, within
12 a week, we issued an Information Notice. A lot of
13 information was already out there, but we wanted, of
14 course, to highlight it to our licensees. And that was
15 the Information Notice issued on March 18th.

16 We subsequently issued two Temporary
17 Instructions, and a Temporary Instruction is direction,
18 direction to our inspectors, our inspectors out in the
19 field, to begin to look at things, to see how do U.S.
20 operating nuclear power plants size up to these types
21 of challenges.

22 The focus of one of the TIs was on the
23 potential ability to respond to large fires, explosions,
24 station blackouts, et cetera. It was a lot of the stuff
25 that was done in response to B.5.b. Is the equipment

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 there? Are the strategies there? Has training been
2 undertaken?

3 Approximately a month or so after that, we
4 issued a second TI. And that second TI was at the request
5 of the task force that was put in place to come up with
6 recommendations. That second Temporary Instruction,
7 it was focused on looking at SAMGs, Severe Accident
8 Management Guidelines, and do the procedures exist?
9 What type of training and equipment is available out
10 there for licensees to respond?

11 Ultimately, in May of 2011, we issued a
12 bulletin to further follow up on the extent of compliance
13 with the NRC's requirements within Part 50 for
14 responding to aircraft impacts and large fires and
15 explosions.

16 If I could have the next slide?

17 Then, the Commission, in March,
18 approximately two weeks after the event, the Commission
19 issued directions to the staff to establish the
20 Near-Term Task Force. The Task Force and the report
21 was led up by Charlie Miller, and it was to conduct a
22 systematic review of the lessons learned from the event.

23 It is from this Task Force report that we begin to pick
24 up on our Tier 3 items that are going to be the focus
25 of the next day-and-a-half discussions.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 If I could have the next slide?

2 Where are we? This is, on here, this is
3 the conclusion from the Task Force, and this is also
4 a conclusion that the Commission reached: that a
5 similar sequence of events that had occurred in Japan
6 was unlikely to occur within the U.S., within the nuclear
7 power plants within the U.S. And that, also, we had
8 confidence that there are existing mitigation measures
9 that could be used to reduce and mitigate the potential
10 of a severe accident. As a result, there was no imminent
11 risk from continued operation and licensing activities.

12 Nevertheless, the Near-Term Task Force and the
13 Commission highlighted a significant list of areas that
14 warranted further enhancements in our safety posture
15 for U.S. nuclear power plants.

16 So, if we could have the next slide?

17 The Task Force issued the report last July.

18 The Commission directed the staff to evaluate that
19 report, evaluate the recommendations within the report,
20 and propose a disposition. The staff came up with
21 something they called the Tiers, the Tier 1, the Tier
22 2, the Tier 3. Today, we will chat about the Tier 3.

23 But, just as a refresher, the Tier 1
24 recommendations were those that should be started
25 without unnecessary delay. That was the focus of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 staff's paper in February and the orders and the requests
2 for information and the rulemakings that began this past
3 March.

4 The Tier 2 issues were issues in which
5 further technical assessment was needed or issues where
6 we may not necessarily have the availability of critical
7 skill sets at the immediate time. So, the notion was,
8 once some of the Tier 1's activities move on and as
9 resources become available, the Tier 2 activities would
10 then be worked on.

11 And the third group is the Tier 3 items.

12 These recommendations were binned Tier 3 for one of
13 various reasons. Either it required further staff
14 study to support a regulatory action or the need for
15 a regulatory action would be one case or there was a
16 potential that there was a shorter-term action that
17 needed to be completed in order to inform the longer-term
18 action, or some of these Tier 3 items, first, depended
19 upon completion of maybe a Tier 1 or a Tier 2 item, or
20 they were dependent on resolution of another
21 recommendation.

22 So, that is sort of the grouping or the logic
23 behind the various tiers. To a certain extent, I think
24 to myself, the Tier 3, it is the basis. It is sort of
25 a catchall for the rest of the recommendations.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 In November of last year, the Commission
2 agreed with the tiering process and directed the staff
3 to proceed with the Tier 1 actions. Subsequently, the
4 orders and requests for information went up in February,
5 and the staff issued those in March.

6 So, then, we have three orders, three Tier
7 1 orders that did go out in the March timeframe. The
8 first one was the need to develop strategies and procure
9 additional equipment to address beyond-design-basis
10 external events and multi-unit events. The staff is
11 working, not only for this one, but for all of the orders,
12 is working on the guidance development and engaging with
13 all our stakeholders out there on these particular
14 technical topics.

15 The second order that was issued was for
16 Mark I and Mark II plants or those plants with Mark I
17 and Mark II containments. The order required the
18 installation or the upgrading of existing vent paths
19 to provide a reliable hardened vent.

20 And later today, there is a subset of action
21 relating to this order that you will also hear about
22 today. There is sort of an IOU due to the Commission
23 on this particular topic that you will be hearing about.

24 And the third topic was an order requiring
25 the installation of accurate spent-fuel pool

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 instrumentation. The strong basis behind that was
2 there was a considerable distractor in terms of the exact
3 status of the spent-fuel pools. So, the notion was,
4 for proper resource allocation, it would be quite
5 beneficial for licensees to have much better information
6 on the exact status of the spent-fuel pools in the event
7 of an accident.

8 So, the next slide.

9 Requests for information. We issued
10 three-four requests for information. The first one,
11 the focus was on seismic and flooding hazard
12 reevaluation. The notion was that the standards
13 throughout the years have changed, and for licensees
14 to do an assessment of their current plants against the
15 most recent flooding and seismic standards out there.

16 In addition to that, licensees were to do walkdowns
17 of their facilities, to once again verify compliance
18 with the design basis at their plant.

19 In addition, there was a request for
20 information issued requesting assessment of the current
21 communication systems and equipment to be used in
22 response to an emergency and to ensure that you have
23 sufficient staffing available for multi-unit events.

24 The next slide.

25 Rulemaking. The staff has issued two

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Advance Notices of Proposed Rulemaking, one on station
2 blackout and the other on emergency procedures
3 integration. The station blackout rule or the proposed
4 rulemaking is intended to modify the existing one to
5 provide enhanced capability to respond to a station
6 blackout event.

7 And the second one is to try to provide a
8 better integration amongst the various procedures out
9 there. You have operating procedures, off-normal
10 procedures, emergency procedures, SAMGs, and Extensive
11 Damage Mitigation Guidelines out there.

12 So, the notion was to see if there is some
13 way in which the procedures could be pulled together
14 in a much better integrated manner, such as transitions
15 from one set of procedures to the next set of procedures
16 could be taken without distraction to operations.

17 So, that is a lot of the good background
18 as to what the agency did. We mentioned the Tier 2,
19 and we are going to roll into the Tier 3 recommendations,
20 which is the focus of today's discussion.

21 So, if we just continue, then, onto slide
22 No. 10.

23 Last year, in SECY-11-0117, the Commission
24 or the staff proposed a charter for the longer-term
25 review, and the Commission ultimately approved that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 charter. Within that charter was the establishment of
2 a Steering Committee, a Steering Committee composed of
3 the various Office Directors, the Program Office
4 Directors, plus two Regional Administrators. They were
5 to oversee the implementation of the Tier 1 and Tier
6 2 activities and, also, guide the Tier 3 activities
7 underway.

8 So, what we have done for the Tier 3
9 activities, given that they are longer-term-type
10 activities, there was a view that they should really
11 be owned within the Program Offices; they should be owned
12 within the Division and the Branch that has the lead
13 for that particular topic, as opposed to the JLD, the
14 Japan Lessons Learned Directorate, which is essentially
15 a project management organization.

16 So, for each of the recommendations that
17 you will hear about, we have an SES manager assigned
18 to that topic, and we have brought about subject matter
19 experts across the agency, be it NRO, NRR, Research,
20 NMSS.

21 The Japan Lessons Learned Directorate, we
22 are providing a facilitation, essentially, for the rest
23 of the agency. We are providing the services and
24 pulling together the Commission paper, the
25 recommendations, the public meetings, essentially, all

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of the project management functions. The notion is
2 that, ultimately, the JLD will most likely disappear.

3 The timing of these recommendations and
4 assessments and evaluations, we wanted to ensure that
5 there was clear ownership for the long-term within an
6 organization. So, that is why the focus of having these
7 activities worked out of the technical organizations
8 was pursued.

9 So, to me, this is sort of a very key slide,
10 the focus on the longer-term review. So, we will talk
11 about hydrogen. We will talk about spent-fuel movement
12 from pools to casks. We will talk about
13 instrumentation, et cetera.

14 So, the question is, in pulling together
15 these plans, what is within the scope of these plans?

16 What is the purpose of these plans? What we tried to
17 do is really define what are the key issues that need
18 to be addressed and what are the real information needs
19 out there to support a recommendation on the need for
20 regulatory action. We are not trying to pull together
21 a 10-year research program on a particular technical
22 topic. We are driving towards a plan that will support
23 our needs for a regulatory decision, a regulatory
24 decision meaning additional orders or a decision meaning
25 no action is needed.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 So, that is what we want our plans to do,
2 is drive us to a clear decision where we can come back
3 to you individuals and we can engage back with the
4 Commission and say we have thought about this issue.

5 We have pulled together a plan. We have pulled together
6 the information. We did whatever research analysis
7 testing is needed. And as a result of that, we recommend
8 rulemaking order or we recommend this particular topic
9 can be closed out, based on the following technical
10 assessment.

11 That doesn't necessarily mean that the NRC
12 will stop evaluating that particular technical topic
13 for the next five-ten years or so. That just gets us
14 past the point of saying, is there a need for
15 definitively regulatory action in the near-term?

16 So, with that said, the last thing, our
17 planning framework is taking us up to that decision point
18 on the need for regulatory action or not. We are not
19 presupposing upfront that all these activities will lead
20 to a rulemaking. So, our plans don't necessarily
21 include -- some of them do -- but don't necessarily
22 include rulemakings, orders, et cetera, because we are
23 currently just evaluating the technical issues and
24 determining whether the issues merit that regulatory
25 action or not.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 So, that is one of the slides I actually
2 enjoy a lot.

3 (Laughter.)

4 I think it is important; you know, what is
5 our focus? My background is in severe accidents and
6 PRA. And as an example, hydrogen, the NRC has had a
7 very active hydrogen research program, more active in
8 the past years than present. But the purpose of our
9 plans is not to reopen a 10- or a 15-year hydrogen
10 research plant. Our purpose is to look at what happened
11 at Fukushima, pull together that information, and
12 decide, hey, does 50.44 need to be revised? Does
13 something have to happen with igniters?

14 MEMBER CORRADINI: Since you picked that
15 example --

16 MR. MONNINGER: Shall I pick a different
17 one?

18 (Laughter.)

19 MEMBER CORRADINI: No, no. That is a good
20 example.

21 If we took that example further, that
22 doesn't also change things around or that doesn't also
23 preclude the need for, by one of the -- I can't remember,
24 one of your slides; it is not important. The subject
25 matter expert feels they need information, that they

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 have to go get the information to appropriately come
2 up with either a decision to have an action or not have
3 an action?

4 MR. MONNINGER: Right. No, the question
5 is the extent of detail in the plant. But if they believe
6 they need technical information to reach a decision for
7 action or not, we should be including that.

8 For hydrogen -- and hydrogen will be a very
9 good discussion, and Fred will lead it up to us -- but
10 we are going to look at it, various issues, as just
11 starting out with the basic how is hydrogen produced.

12 Is it consistent with our understanding? How much
13 hydrogen is produced? Is it consistent with our
14 understanding? Is the timing of hydrogen produced
15 consistent with our understanding? What is the threat
16 of hydrogen and the potential pathways in which it can
17 be migrated?

18 But some of those issues, you know, we are
19 also mindful of the Commission's desire for completing
20 or closure of these issues within five years. So, some
21 of the information, if there is a long-term pulling apart
22 of the Fukushima Dai-ichi reactor, some of that
23 information that would really give you insights on the
24 extent of core damage, where is the core, how much
25 hydrogen was or how much zirconium was reacted, or how

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 much potential core-concrete interaction, that may not
2 be known for five-ten years or so.

3 So, whatever information is available out
4 there and additional analysis -- so, it is meant to be
5 within the staff's and our contractors' capabilities.

6 MEMBER CORRADINI: The reason I am glad you
7 used this example is because I am pretty sure the
8 Committee has -- I can't remember the letter -- has some
9 words to this effect: that it is pretty clear you have
10 a source for it.

11 MR. MONNINGER: Yes.

12 MEMBER CORRADINI: It is pretty clear it
13 got out.

14 MR. MONNINGER: Yes.

15 MEMBER CORRADINI: Therefore, if one
16 worries about effects within the building, not the
17 containment but within the building, one may have to
18 think about distribution, analysis of distribution,
19 decide if things need to be done to essentially mitigate
20 combustion events in the building.

21 So, I understand what all you are saying,
22 but, on the other hand, I wanted to just make sure,
23 though, that if things are needed to be done, part of
24 this is the line organization of the expert would go
25 back and say we need to get A, B, and C done.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. MONNINGER: Right.

2 MEMBER CORRADINI: And with all due respect
3 to schedules, regardless of the schedule, we don't want
4 to rush into something. We want to get it so we have
5 it right before we try to do something.

6 MR. MONNINGER: One of the things you won't
7 see in your package, and it was deliberate, is schedules.
8 We deliberately did not provide you with our schedules,
9 and we did not our provide our public stakeholders with
10 the staff's draft schedules because our intent was to
11 do exactly that, to come up with the correct plan, the
12 correct approach.

13 So, we wanted the focus to be more on what
14 we propose to do than the particular timing. We did
15 not want that to be a distraction to defining what work
16 needs to be done.

17 MEMBER REMPE: So, something else I didn't
18 see information provided to us was anything on
19 Recommendation, I see it sometimes referred to as 2(f)
20 about what data are needed from the plants.

21 And hydrogen, again, is a good example.
22 If I look at some of the information for Recommendation
23 6, it talks about getting insights if the seals leak,
24 data that are needed to go forward. And I don't see
25 anything about that explicitly in the packages that have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 been prepared. And we have said, be proactive; start
2 thinking about what data you need to make appropriate
3 actions. Some actions may be taken earlier, but in the
4 long-run the NRC needs to start planning ahead and
5 identifying what information is needed, so our insights
6 about severe accidents improve.

7 MR. MONNINGER: Right, right.

8 MEMBER REMPE: And I was interested in your
9 viewpoints on why that was totally neglected.

10 MR. MONNINGER: So, the question is, was
11 it neglected or is it a level of detail?

12 MEMBER REMPE: Uh-hum.

13 MR. MONNINGER: You know, is it a level of
14 detail in our plants or neglected? I can't speak to
15 the particular one. Once we get into that area, we can
16 discuss it and go back and forth.

17 If you bring up hydrogen -- and I don't want
18 to steal Bret's thunder --

19 MEMBER CORRADINI: You did it; we didn't.

20 (Laughter.)

21 MR. MONNINGER: The interesting thing is
22 the interrelationship. You talk about migration into
23 the potential reactor building. Well, the
24 interrelationship of hydrogen and successful venting,
25 you know, if you have successful venting through a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 hardened vent or through a potentially-filtered vent
2 or a severe accident event, et cetera, will you obviate
3 the potential migration from primary containment to the
4 reactor building?

5 So, these issues, even though there is a
6 recommendation A, B, and C, to a large extent, many of
7 these issues relate or link to each other. That is one
8 of the things that we have tried to do. We call them
9 dependencies, but I am not quite sure if that is the
10 right word, or interrelationships. We have tried to
11 highlight some of those.

12 So, anyway, this is a listing, and you will
13 have a briefing on each and every one of these issues
14 over the next day and a half. It continues to the next
15 page up through to the third item there.

16 Then, there are four additional items that
17 were identified in previous Commission papers. The
18 staff recommended that they go forth and prioritize
19 these issues and assess them. So, these are four
20 additional issues that have been added to the
21 traditional Tier 3 items. So, these are within our
22 scope also.

23 MEMBER REMPE: But, again, I don't see
24 anything about a proactive approach, about getting the
25 data from Fukushima, which the instrumentation one, for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 example, came from ACRS, but that one is not listed here.

2 Is there a reason?

3 MR. MONNINGER: Yes. The only thing I can
4 really say is these were the explicit recommendations
5 that went up to the Commission and this is, essentially,
6 the approved list. The actual disposition, you know,
7 I would have to go back and read the disposition of,
8 I guess it was, ACRS Recommendation 2(f).

9 MEMBER REMPE: I believe that is how it is
10 characterized a lot of times.

11 MR. MONNINGER: Yes. So, I would have to
12 go back and re-read that. But if it is not on this list,
13 it is currently not part of our activities. That is
14 not to say that some --

15 MR. BROWN: It may not be as a separate
16 item; it may have been, the argument may have been that
17 the staff is already pursuing research in the area of
18 forensics, getting data from Fukushima that will support
19 future actions.

20 But, like John, I would need to refer to
21 our February paper to see exactly how we --

22 MEMBER REMPE: I have heard that sometimes,
23 but, again, doing the analysis is not starting to
24 identify what information is needed and making plans
25 for it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. MONNINGER: Yes. You know, to a
2 certain extent, I personally believe that there is a
3 wealth of information out there, and not to say it is
4 an experimental facility, but the information to be
5 gained out there is much better than some small-scale
6 experimental laboratory experiment or international
7 program or a bunch of code runs, et cetera.

8 But, with that said, the focus of the
9 actions that we are working on are those that would lead
10 to a regulatory action, a rule, order, et cetera. So,
11 there could be a long-term program, a long-term
12 international program, to evaluate the facility for the
13 best information on source-term distribution, et
14 cetera, but it wouldn't necessarily be within our plans
15 for assessing issues for our regulatory decision.

16 Does that --

17 MEMBER REMPE: I understand.

18 MR. MONNINGER: Yes.

19 MEMBER REMPE: I just want to make sure it
20 doesn't get lost --

21 MEMBER CORRADINI: It doesn't get lost --

22 MEMBER REMPE: -- because it was assigned
23 to the Tier 3.

24 MEMBER ARMIJO: John, I would like to ask
25 a question.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. MONNINGER: Yes.

2 MEMBER ARMIJO: One of the recommendations
3 that the ACRS made was related to shared ventilation
4 and shared stacks, that that should be included. And
5 the staff response at that time was that you would
6 include it in some sort of an enhancement. I don't see
7 it on this list.

8 MR. MONNINGER: So, I would assume the
9 shared ventilation/shared stack goes back to the
10 hydrogen in --

11 MEMBER ARMIJO: Yes, in unit --

12 MR. MONNINGER: -- units 3 and 4, et cetera.

13 MEMBER ARMIJO: Right.

14 MR. MONNINGER: We issued the order in
15 March for 5.1, and then it had various criteria.

16 MEMBER ARMIJO: It was in that?

17 MR. MONNINGER: It may not have been within
18 the criteria. But, then, from the criteria, you go to
19 a document we call an ISG, Interim Staff Guidance. That
20 is, essentially, where we would address that type of
21 issue.

22 MEMBER ARMIJO: Okay.

23 MR. MONNINGER: I mean, that issue is very
24 integral to the issue of venting.

25 MEMBER ARMIJO: Okay. Okay. So, it is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 actually, even though it was a Tier 3 recommendation,
2 it got into a Tier 1 or Tier 2 activity?

3 MR. DIAS: The ACRS recommendation on
4 shared ventilation, that was ACRS 2C, and that is
5 included in Tier 3, Recommendation 6.

6 MEMBER ARMIJO: Yes, right. But it is
7 actually being addressed in a higher tier.

8 MR. MONNINGER: So, Recommendation 6 is for
9 hydrogen, and venting is Recommendation 5.1.

10 MEMBER ARMIJO: Okay, as long as it is being
11 addressed.

12 MR. MONNINGER: What I would say is, since
13 we have a day and a half -- (laughter) -- we can come
14 back.

15 MEMBER ARMIJO: But it is being addressed?

16 MR. MONNINGER: Yes. And my thought still
17 takes me back to 5.1 and the reliable hardened vent and
18 the design criteria for that. I do recognize that it
19 says it would be addressed within Recommendation , but
20 we will have to come back to you.

21 MEMBER ARMIJO: Yes, you could have
22 reliable hardened vents, but --

23 MR. MONNINGER: Right.

24 MEMBER ARMIJO: -- if you haven't done a
25 good job of systems engineering, when you have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 multiple-unit failures, and one guy is venting and the
2 other one is failed open, you pump hydrogen into his
3 plant -- that is not a good idea.

4 MR. MONNINGER: Or, even if all the
5 hydrogen is gone, just the source-term, so it is not
6 just limited.

7 Okay. Initially, we tried to come up with
8 a flowchart as to how we would look at these issues.

9 And the notion was that we could come out in one of
10 three different paths. It didn't quite turn out exactly
11 this way. There are some hybrids between them.

12 But the notion is you are coming in with
13 a Tier 3 recommendation, whether it is hydrogen,
14 spent-fuel pools, instrumentation, whatever. Does the
15 staff have sufficient information to make a regulatory
16 decision? If so, then we would go to our left and we
17 would develop an implementation plan, develop a plan
18 to issue an order or a rulemaking, et cetera.

19 If the staff had sufficient information and
20 they believed regulatory action was needed, that is what
21 the top left was, develop an implementation plan. On
22 the other hand, if the staff evaluated, if there was
23 sufficient information and they didn't believe
24 sufficient safety or risk/benefit was there, they would
25 develop a proposed assessment that would recommend

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 closeout of that particular issue.

2 MEMBER CORRADINI: Okay. So, closeout
3 means do nothing?

4 MR. MONNINGER: Do nothing. But we would
5 have to fully document what the original issue was, what
6 did the staff look at, and what was the basis. And you
7 don't have any of those within your package. But that
8 was a potential.

9 Then, if we needed additional information,
10 were there dependencies upon other issues, explicit
11 dependencies? And one of them that comes up that is
12 pretty straightforward is Recommendation 12.1 or 12.2,
13 the one that says, for the agency to revise the reactor
14 oversight process, to incorporate the defense-in-depth
15 approach that the Task Force had envisioned within
16 Recommendation 1.

17 Well, Recommendation 1 is on a totally
18 separate track. So, the staff can't really proceed with
19 revising the ROP for that until Recommendation 1
20 proceeded.

21 So, we were still going to include that,
22 but we coined something we call a status summary. You
23 won't see a full plan for those particular issues.

24 MEMBER CORRADINI: Maybe this is the wrong
25 place to ask the question, but then you can just postpone

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 it. But you have this risk-informed regulatory
2 framework report that came out of Commissioner
3 Apostolakis' Task Force.

4 MR. MONNINGER: Yes.

5 MEMBER CORRADINI: You have that combined
6 with Recommendation 1. What you said, it is not the
7 same, but seemingly very intermingled, and that is a
8 long time scale, as you have said, there.

9 Are you going to use any of the pieces of
10 what is recommended either in that Task Force or in
11 Recommendation 1 to address these issues?

12 MR. MONNINGER: Well, my current knowledge
13 of Commissioner Apostolakis' Task Force report, we are
14 aware of it; we have looked at it. The staff is still
15 awaiting a tasking for the particular report. Whether
16 it is combined within the staff's assessment of
17 Recommendation 1, we have to wait for direction for that.

18 MEMBER CORRADINI: Okay.

19 MR. MONNINGER: But, regardless of that,
20 the Commission basically said proceed with
21 Recommendations 2 through 12 and have Recommendation
22 1 on a separate track.

23 MEMBER CORRADINI: Okay. But I am asking
24 my question; I guess I am probably not framing the
25 question correctly. But you used hydrogen, so we will

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 just go back to that one, just for the sake of that.

2 It seems to me there has got to be some sort
3 of risk-informed thinking process in all these little
4 blue boxes. I am asking myself the question, what is
5 the process? How do I determine when something is a
6 closeout versus an implementation plan? It has got to
7 be based on risk.

8 MR. MONNINGER: It could be a risk-informed
9 approach or the staff could come up with some type of
10 deterministic safety assessment.

11 MEMBER CORRADINI: So, buried in all of
12 this is going to be some sort of not protocol, but
13 thinking process. I am curious, is the Task Force work
14 informing any of this at all?

15 MR. MONNINGER: Yes.

16 MEMBER CORRADINI: Or is too high-level at
17 this point?

18 MR. MONNINGER: Yes, so let's go back to
19 vents. Well, it was hydrogen before. But, as an
20 example, for vents, the staff currently has in front
21 of them an action item to evaluate filtered vents. And
22 the staff --

23 MEMBER CORRADINI: Uh-hum. We are going
24 to talk about it today, in fact.

25 MR. MONNINGER: You are going to talk about

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 that today.

2 And we would proceed using our existing
3 framework. One of the existing frameworks is the
4 regulatory analysis guidelines where you look at PRAs
5 and you look at risk numbers, and you look at delta
6 consequences.

7 So, that is an existing tool that the staff
8 would use. If the staff wanted to proceed with any of
9 these items here, if they want to pursue regulatory
10 action, they have to try two things: adequate
11 protection or the cost-beneficial safety enhancement.

12 And the cost-beneficial safety is heavily influenced
13 or heavily based on PRA. It is based on the safety goals,
14 based on risk-informed regulation.

15 MEMBER ARMIJO: John, following up on that,
16 if the Tier 1 actions which are going forward, the
17 rulemaking on station blackout, all of those activities,
18 unless they are completed and somehow incorporated into
19 a PRA, how do you make a decision on whether you really
20 benefit from a filtered vent or not?

21 MR. MONNINGER: Yes, and that is a good
22 question. That is one that the staff is currently
23 addressing or -- I won't say struggling to address, but
24 that is one that we are currently addressing. When we
25 do a regulatory analysis, you are supposed to include

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the plant and how it is operated and operational data
2 and requirements and voluntary initiatives, et cetera.

3 So, you have the order under 4 for
4 essentially the flex program, well, the order on what
5 industry has proposed, the flex program. It has an
6 impact, most likely has an impact on --

7 MEMBER ARMIJO: All of these --

8 MR. MONNINGER: -- core damage.

9 MEMBER ARMIJO: -- all of Tier 3.

10 MR. MONNINGER: Right. So, we are trying
11 to work through that particular issue now.

12 MEMBER CORRADINI: But I guess, I mean just
13 to follow up Sam's point, and then I will stop at least
14 on this, I appreciate his question because, in some
15 sense, you have made the deterministic judgment that
16 it is important to have a hardened vent on Mark Is and
17 Mark IIs, granted. And so, now there will be something
18 there that will be consistent, integrated, tested, and
19 watched. Then, performance or some estimation of this
20 performance has got to be included in all the Tier 3s,
21 or at least the ones that that would affect.

22 MR. MONNINGER: Yes, and that was some of
23 the, we used the word, dependencies or the
24 relationships. We are trying to talk about the
25 influence of one on the other.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 The example is venting and hydrogen, and
2 the migration of hydrogen from the primary containment
3 to the reactor building. You know, there is a stream
4 of thought that says, well, if you have successful
5 venting for severe accident conditions, do you need to
6 address this? So, we are trying to -- we understand
7 we have to do that.

8 MEMBER CORRADINI: Okay.

9 MEMBER SHACK: You mentioned regulatory
10 analysis. I understand the staff is preparing a new
11 SECY paper on land contamination. I assume that will
12 impact or could potentially impact regulatory analysis.

13 So, can you tell us anything about what
14 might be going into that?

15 MR. MONNINGER: Yes.

16 MEMBER CORRADINI: Is that part of the last
17 one there?

18 MR. MONNINGER: No.

19 MEMBER SHACK: No, that is a separate
20 thing.

21 MR. MONNINGER: So, economic consequences
22 or land contamination or offsite property damage, you
23 know, there is various terminology that is out there.
24 And the staff is currently pulling together a
25 Commission paper. It is scheduled to be issued in the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 July timeframe.

2 Its intent, it really has two purposes.
3 As a matter of fact, we have a public meeting later this
4 week, on Thursday of this week. But its intent is to
5 lay out to the Commission how do we currently consider
6 property damage, land contamination, economic
7 consequence within our regulatory analysis guidelines
8 or within the reactor area, within the fuel-cycle area,
9 et cetera. So, its intent is to very clearly provide
10 an assessment of how the agency currently does in all
11 the various arenas.

12 And then, the staff is also considering
13 development of options. They haven't finalized on any
14 particular options yet.

15 But, going back to your question, we would
16 not or we could not use that. The issue is, say, for
17 example, if the staff came up with a proposal to the
18 Commission to change it over here. We have current
19 activities that we have to proceed with. You have to
20 use your existing regulatory framework. You know, if
21 we are pursuing some type of regulatory action, we have
22 to evaluate it within our framework, as opposed to
23 guessing which way this particular issue may or may not
24 come out. We could potentially do sensitivity studies
25 over here to evaluate alternatives, but we always have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 to go back to our existing regulatory framework.

2 MEMBER SHACK: But filtered vents, in
3 particular, could be very sensitive to what you thought
4 about land contamination.

5 MR. MONNINGER: Well, my thought is, all
6 these features -- you know, if you prevent the accident
7 in the first place, there is not going to be land
8 contamination. So, all the various preventative and
9 mitigation features can have an impact on land
10 contamination, but we have to use our current regulatory
11 process. That is what we are proposing to do.

12 MR. BROWN: Which includes consideration
13 of land contamination.

14 MR. MONNINGER: Which includes
15 consideration in a way.

16 MEMBER RYAN: Do you have a time and a place
17 for that public meeting?

18 MR. MONNINGER: Yes, I do. It is this
19 Thursday, the 24th, from 1:30 to 3:30. And it is
20 probably in your room. It is in Two White Flint 2B3.

21 So, whether it is this room or it is the next one --

22 MEMBER RYAN: Thank you.

23 MEMBER RAY: It just struck me to ask this
24 question. 10.2 has to do with qualification of
25 decisionmakers --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. MONNINGER: Right.

2 MEMBER RAY: -- through training, and so
3 on. And it is in Tier 3 here, I guess under this heading,
4 "Additional EP Topics".

5 MR. MONNINGER: Right.

6 MEMBER RAY: Are we going to talk about that
7 any further?

8 MR. MONNINGER: Yes. So, you will have a
9 presentation from NSIR.

10 MEMBER RAY: Okay.

11 MR. MONNINGER: And they have wrapped up
12 the various EP issues, but that is part of one of the
13 discussions that you will have.

14 MEMBER BLEY: They have wrapped up?

15 MR. MONNINGER: Well --

16 MEMBER BLEY: Or put them in package?

17 MR. MONNINGER: They have put them in a
18 package, yes.

19 MEMBER SKILLMAN: It is 10 and 8.3 or
20 something like that worked together.

21 MEMBER RAY: Yes, that's right. I was
22 looking for the other one. Is it 8.3?

23 MR. BROWN: All 9.1 through 11, all now
24 packaged together as one proposed rulemaking.

25 MEMBER RAY: Yes, that is what I was trying

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to discern here, if that was the case. It was a little
2 hard for me to parse that out here quickly. But that
3 is going to be the upshot and we will talk about it
4 tomorrow then.

5 MR. BROWN: We will talk about that, it
6 looks like tomorrow, scheduled for 10 o'clock.

7 MEMBER RAY: Okay.

8 MR. MONNINGER: And then, just getting back
9 to our flowchart, the majority of the items came to the
10 big rectangular box at the bottom, the program plan.

11 And that is the majority of the plans that were pulled
12 together.

13 With that, as I mentioned upfront, we are
14 very interested in your thoughts, comments, and
15 recommendations. You know, the plans are still in the
16 formative stage. We had had the three various public
17 meetings. We are considering the comments that came
18 back from the public and whether any changes are needed
19 to the particular plans.

20 We do have a full Committee schedule with
21 you next month in the beginning of June.

22 MR. DIAS: June 6th. June 6th at 10:15.

23 MR. MONNINGER: Yes, yes.

24 MEMBER SKILLMAN: John, I would ask this
25 question: after the TMI-2 accident, NUREG-0737 came

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 out.

2 MR. MONNINGER: Yes.

3 MEMBER SKILLMAN: And in the years that
4 followed NUREG-0737, there was a substantial amount of
5 industry challenge, were some of these items too hasty?

6 MR. MONNINGER: Right, right.

7 MEMBER SKILLMAN: What governance do you
8 have with your directorate to prevent from falling into
9 that haste trap again?

10 MR. MONNINGER: I think if you just look
11 at the notion of putting together the Task Force in the
12 first place, of very senior agency managers to
13 deliberately consider the various issues out there, I
14 mean, I am not sure if the hundreds of issues that came
15 out of TMI, I mean, this is a very focused, what I would
16 call a very focused, concise list. So, they have been
17 deliberate in trying to identify the issues and ensuring
18 that there is a direct relationship back to the accident.

19 At any time, the one block up top, if the
20 staff goes through the plans, they pull together the
21 technical information, they do an assessment, a
22 regulatory analysis, a risk-informed assessment or a
23 deterministic safety assessment. If they don't believe
24 that there is significant benefit to be gained from one
25 of these particular recommendations, we would provide

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 that assessment that to the Commission and that
2 recommendation for that particular item to be closed
3 out. So, there always is the potential that one or more
4 of these items may not result in regulatory action.

5 I am not sure if that helps.

6 MEMBER SKILLMAN: It does. Thank you.

7 MR. MONNINGER: Yes.

8 MEMBER SKILLMAN: Thanks.

9 MR. MONNINGER: I mean, the staff is very
10 receptive, too.

11 MEMBER SKILLMAN: Thank you.

12 MEMBER CORRADINI: And I guess just to
13 follow up on Dick's question, so, then, that decision
14 would be based on -- maybe you said it and I missed it.

15 What is the criteria that is going to decide between
16 developing an implementation plan and recommended
17 closeout? In other words, it could be risk-informed,
18 but it is not going to be risk-based. So, that isn't
19 it.

20 MR. MONNINGER: Right.

21 MEMBER CORRADINI: So, what is it?

22 MR. MONNINGER: You know, it is going to
23 be dependent upon the team and when they evaluate the
24 particular --

25 MEMBER SHACK: The greater decisionmaking

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 process, no doubt.

2 MR. MONNINGER: Yes.

3 MEMBER CORRADINI: Oh, that helps a lot.

4 (Laughter.)

5 MR. MONNINGER: And all these issues, I
6 would assume that we will come back to the ACRS. Whether
7 we are proposing an order, a rulemaking, or if we are
8 proposing to close it out, the intent is to clearly
9 document our assessment and our basis. So, for one
10 reason or another, if we do recommend closeout and the
11 Commission approves that, someone can come back in 10,
12 15, 20 years and determine what was the regulatory basis
13 for that. Whether it is a risk-informed approach or
14 some other criteria, you know, we would have to pull
15 together that logic.

16 I mean, it works both ways. If we recommend
17 to go forth, we have to provide the basis. So, it sort
18 of cuts both ways.

19 MEMBER CORRADINI: So, let me ask about
20 orders and Mark I and Mark II. Is there a basis there?

21 I mean, the legalities of it escape me. So, let's put
22 those aside. Is there a basis there that one can look
23 at and say, "Gee, that basis made sense. We should apply
24 that sort of approach to develop criteria to decide that
25 you have to go forth with orders for these things that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 are not necessarily orders, but might be some sort of
2 an implemented regulatory guidance for action."?

3 MR. MONNINGER: Yes.

4 MEMBER CORRADINI: I am trying to get at,
5 I know what you said to me.

6 MR. MONNINGER: Yes.

7 MEMBER CORRADINI: It sounds a bit fuzzy,
8 but, of course, everything is a bit fuzzy at this point.

9 I am just trying to work back to what you have already
10 done, and under the assumption it wasn't done in haste,
11 what is the criteria you used so that you could replicate
12 it or the protocol you used to replicate it?

13 MR. MONNINGER: I think the Mark I is,
14 actually, one of the easier ones to go back and come
15 up with the technical basis. Because it essentially
16 said we want to make a regulatory requirement, what the
17 staff wanted back in Generic Letter 89-16. So, you can
18 go back to the Containment Performance Improvement
19 Program, back in the eighties, and the various
20 recommendations that came out of that, if you can find
21 the documents.

22 MEMBER CORRADINI: No, I have them. Those
23 documents I have got.

24 MR. MONNINGER: But, you know, it was very
25 clear that one of the potential dominant contributors

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 to risk for the Mark Is was the TW sequence, the transient
2 with loss of containment cooling. And there were
3 numbers back then, delta CDF, delta core damage
4 frequency of an order of magnitude or more. So, that
5 is a risk-informed basis back in our regulatory history
6 for the hardened vents for at least the Mark Is.

7 MEMBER CORRADINI: Okay.

8 MEMBER SHACK: For an AC-powered unit.

9 MR. MONNINGER: Yes. But what the staff
10 did say, though, was for industry, for licensees to look
11 as part of the IPE program, of venting under station
12 blackout conditions back then.

13 MEMBER SHACK: But the current guidance
14 says to look at it to prevent core damage, which sort
15 of implies to me that you would accept an AC-powered
16 one.

17 MR. MONNINGER: Within the criteria within
18 the rule, it says that they have to design it to be
19 operable under station blackout conditions, whether it
20 is additional accumulators, batteries, whatever. So,
21 the current order addresses not only the TW sequence,
22 but it addresses other sequences.

23 CHAIR SCHULTZ: John, before we get into
24 a detailed discussion there, it is a nice lead-in to
25 the next topic probably, which is Recommendation 5.1

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 and 5.2 on hardened and filtered vents with the Mark
2 I and II. So, can we transition to that now?

3 MR. MONNINGER: Yes.

4 CHAIR SCHULTZ: You will be available for
5 the discussions --

6 MR. MONNINGER: For the next day and a half.

7 CHAIR SCHULTZ: -- in the next day and a
8 half?

9 MEMBER CORRADINI: I didn't even know I was
10 going there half a week.

11 (Laughter.)

12 MR. MONNINGER: So, there is a little
13 nuance or a little curve ball.

14 CHAIR SCHULTZ: Go ahead.

15 MR. MONNINGER: You know, 5.1 and 5.2, 5.2
16 is clearly a Tier 3 issue. And everything else you are
17 going to hear is a Tier 3 issue, except for 5.1.
18 Recommendation 5.1 was the orders for the Mark Is and
19 IIs which the staff issued, the agency issued in March.
20 There was an IOU to the Commission to look at the need
21 for venting, considering severe accident conditions
22 and, also, the need for filter vents for Mark Is and
23 IIs.

24 So, this piece here is actually a Tier 1
25 issue, but we are taking advantage of this meeting.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER CORRADINI: I guess I don't
2 appreciate what you just -- I'm sorry.

3 MR. MONNINGER: So, the Tier 1 issues, the
4 agency issued the orders, issued the requests for
5 information, and the NPRMs as a result of the staff's
6 paper in February and the orders, et cetera, that went
7 out in March. However, within that paper that went up
8 to the Commission in February, the staff said we are
9 still evaluating the merits of venting for mitigation
10 of severe accidents. Should the design of the reliable
11 hardened vent consider severe accident conditions, what
12 would that result in?

13 And in addition to that, the Commission
14 directed the staff to look at filter vents while we were
15 addressing the 5.1 issue. So, we identified to the
16 Commission within the February paper that there are
17 various technical and policy issues that we are still
18 currently evaluating, and we indicated to the Commission
19 we would get back to them in the July timeframe.

20 So, we are going to have, actually, two
21 papers going up. Actually, more than two. But one
22 paper will have all the Tier 3 stuff, and then there
23 will be a separate paper on venting, severe accident
24 venting and filter vents for Mark Is and IIs.

25 So, this particular first issue is the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 remains of one of the Tier 1 issues.

2 MEMBER SHACK: But you don't put SBO into
3 the severe accident? That is really addressed in the
4 current guidance?

5 MR. MONNINGER: Yes, because we talk the
6 current vent for prior to core damage, the prevention
7 of core damage.

8 MEMBER RAY: When you say "SBO," Bill, you
9 are talking about Extended SBO?

10 MEMBER SHACK: Yes. Not SBO, as John
11 points out to me, in the legal sense, but the SBO where
12 you have lost all AC.

13 MEMBER RAY: Well, and it does ultimately
14 produce a severe accident.

15 MEMBER SHACK: Well --

16 MEMBER RAY: Ultimately?

17 MEMBER CORRADINI: But I guess I asked you
18 to repeat it and I thought I got it, but now with your
19 question -- you are still, though, the current
20 regulation is, though, prior to damage, the current
21 order?

22 MR. MONNINGER: The current order.

23 MEMBER CORRADINI: I'm sorry, I said
24 "regulation". I'm sorry. The current order is prior
25 to --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. MONNINGER: You know, the design specs
2 are written out based on prevention of core damage.
3 If a feature is there, licensees would most likely still
4 try to use it. They would try to use any resources
5 available at their site. But the NRC's regulatory
6 footprint currently is just on the prevention.

7 The question is, should we go the next step
8 in potentially changing that design for however it may
9 be changed for the source-term and the hydrogen, and
10 everything else to come out following a severe accident?

11 Or should we potentially consider putting a filter on
12 the end of it? So, that is the piece that is still
13 underway. And that is also recommendations to the
14 Commission in the July timeframe.

15 MEMBER ARMIJO: Well, is a filtered
16 containment venting system exclusively for BWRs with
17 Mark I and Mark II containments? Or is this across the
18 board for the fleet?

19 MR. MONNINGER: Right now, we are looking
20 at it just for the Mark Is and Mark IIs. Recommendation
21 5.2, which is a Tier 3 issue, asks the staff to look
22 at other containment designs. And I don't want to steal
23 the group's thunder, but the notion is the bang for the
24 buck is probably upfront with the Mark Is and IIs. So,
25 that is where the current focus is, on the Mark Is and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Mark IIs. There is limited resources, and that is where
2 the staff currently is focused. And dependent upon the
3 outcome of that, the staff would, then, proceed with
4 the other containment designs.

5 MEMBER ARMIJO: We had better talk about
6 it since it is now a Tier 1.

7 MR. MONNINGER: So, I guess we have Bob and
8 company coming up.

9 MR. FRETZ: Good afternoon. Good
10 afternoon, Dr. Schultz and the Committee. Thank you
11 for having us here to talk about the issue that John
12 Monninger I guess did a great job of helping introduce.

13 And that is the topic of filtered containment venting
14 systems.

15 My name is Bob Fretz, and my card is a little
16 bit wrong. I am supposed to be Office of Enforcement,
17 but I was put on loan to NRR for the Japan Lessons Learned
18 Project Directorate. So, I am helping them out with
19 the issues related to containment venting as well as
20 the filtered vents issue.

21 And joining me today is Bob Dennig. He is
22 the Branch Chief from the Containment Ventilation Branch
23 within NRR, as well as Tim Collins, who is Senior Advisor
24 for the Office of Nuclear Reactor Regulations.

25 So, we are here to discuss the Tier 1 issue

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 that John talked about relating to the filtration of
2 containment events.

3 The next slide. We can just go over our
4 agenda real quickly.

5 Again, as John Monninger introduced, he
6 briefly introduced the topic, but we will try to provide
7 a little bit more background relating to this topic as
8 well as take a look at the staff actions as a result
9 of the Commission's direction, as guided by the Japan
10 Lessons Learned Steering Committee.

11 But the primary focus of our talk to this
12 morning is to primarily talk about some of the foreign
13 experience with filter containment venting systems, as
14 well as go over a little bit about some of the stakeholder
15 input we have received to date.

16 MEMBER ARMIJO: Before you do that, could
17 you just give me an overview of where these filtered
18 vents would be used? You can vent from the BWR Mark
19 I. You can vent through the wetwell expression chamber
20 or the drywell. And is there any difference?
21 Everything would go through this one filtered
22 containment vent? Or could you just describe where the
23 problem is and where the most benefit is?

24 MR. FRETZ: Okay. Yes. Primarily, the
25 focus of the staff efforts right now are related to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 BWR Mark I and Mark II containments only, as John talked
2 about earlier. We are, indeed, looking at the various
3 aspects on where the location of where we might be
4 venting, whether through the wetwell or through the
5 drywell. So, we are looking at both aspects.

6 MR. DENNIG: If you consider a filter, an
7 external filter, and you are not tied to the wetwell
8 as your primary scrubber, then you can consider a drywell
9 vent.

10 MEMBER ARMIJO: Well, if you filter it
11 through the wetwell, you have a scrubber right there,
12 but a drywell is a different situation. And I can see
13 where that might have a benefit. But I just wondered
14 exactly what the thinking was as to where it would be
15 used and how you would evaluate the benefits of a
16 filtered vent.

17 MR. DENNIG: Right. As Bob said, the
18 current idea is that you would put an external filter
19 on the wetwell vent, and the basis or rationale for doing
20 that is additional scrubbing, whatever you have got,
21 and to a certain extent a way of dealing with any
22 uncertainty in the degree of scrubbing that you would
23 get in the wetwell, the idea being that you would have
24 an engineered system that was designed basically for
25 decontamination; whereas, the wetwell, there are a whole

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 lot of parameters that determine how much you are going
2 to get out of that.

3 There is also the consideration that if you
4 are using venting to assist in flooding up, that you
5 could flood over the vent-line if you are venting from
6 the wetwell. If you have a vent from the drywell, you
7 are not limited in that way.

8 MEMBER ARMIJO: You know, the wetwell, the
9 suppression pool is very effective in decontaminating
10 the vent and venting gases. The drywell is the last
11 place in the world you really want to vent from, but --

12 MR. DENNIG: Well, oddly enough, they put
13 the filter on the drywell vent, is how they do it.

14 MEMBER ARMIJO: Well, yes.

15 MEMBER SHACK: But I thought you said that
16 your primary consideration was to put it on the wetwell
17 vent.

18 MEMBER ARMIJO: Yes.

19 MEMBER SHACK: It would seem to me more
20 logical to put it on the drywell vent.

21 MR. DENNIG: We are looking at the options,
22 but we have got to start someplace and go someplace.

23 But we are aware of the different configurations. The
24 fact that Mark IIs are starting from scratch, they could
25 put a vent wherever they would like. Some Mark IIs have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 vents from both places. They have a drywell vent and
2 a wetwell vent. And a lot of Mark Is just have the
3 wetwell vent. We are not entirely certain to what
4 extent that existing vent in its pathway, in its
5 integrity, is going to meet the needs of having a
6 reliable hardened vent.

7 So, there is all this going on as far as
8 how you do this, yes.

9 MEMBER ARMIJO: Since there are so many
10 different designs, at some point it would be good if
11 we could hear the details of the plumbing, where it makes
12 a difference, where it is really a big benefit, and,
13 also, what we have learned from Fukushima, how much
14 decontamination happened when they vented, because there
15 has got to be information there.

16 MR. DENNIG: They vented in an undesirable
17 way.

18 MEMBER ARMIJO: I understand that. I
19 understand that, but that wasn't an issue of whether
20 you had filtered venting or not filtered venting, just
21 ability to vent. So, somewhere along the line you have
22 got to look in to address what actually happened at
23 Fukushima.

24 MEMBER BANERJEE: They had hardened vents,
25 but they couldn't get to them, right?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER ARMIJO: Yes, they couldn't open
2 them up.

3 MEMBER BANERJEE: Or could they?

4 MR. DENNIG: They had vents that couldn't
5 be operated under SBO conditions.

6 MEMBER BANERJEE: Right. But they had
7 hardened vents.

8 MR. DENNIG: And they couldn't get to them
9 to operate them locally. So, they had a pipe or some
10 pipe with rupture discs and valves on it, and I
11 understand that their rupture disc was set very high,
12 not near the design pressure, but up toward the
13 ultimately failure pressure, which turned out to be a
14 problem. When they got below that pressure, they
15 couldn't open it.

16 MEMBER BANERJEE: So, they had to manually
17 open it?

18 MR. DENNIG: They tried to manually open
19 it.

20 MEMBER ARMIJO: Okay. Go ahead. I just
21 would like to understand where it is going because, I
22 will tell you, in Japan they are going to put filtered
23 vents on everything, PWRs, BWRs. I just hope we don't
24 do the same thing here because I would like to see some --

25 MR. DENNIG: Well, that is not the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 intention. The Tier 1 is Mark Is and Mark IIs. And
2 your Tier 1, because of Mark I failure at Fukushima and
3 there is a significant amount of research on Mark Is
4 that basically says that they are very highly likely
5 not to contain severe core damage; and that, thus, the
6 original hardened vent. And so, you have a sense from
7 the analytical side that this is probable or possible.

8 And now, you have operating experience that says yes,
9 indeed, you are right in terms of your postulations.

10 And that is why that is Tier 1.

11 MEMBER SHACK: Yes, but it is Tier 1 only
12 to prevent core damage.

13 MR. DENNIG: Well, that is where the IOU
14 comes in.

15 MR. COLLINS: No, it is Tier 1 to consider
16 filters, not necessarily put filters on. It is Tier
17 1 to put in an unfiltered vent. That is the order.
18 Okay? That is Tier 1. But it is also Tier 1 to examine
19 filters.

20 MEMBER CORRADINI: For the BWR?

21 MR. COLLINS: For the BWR, Mark I and Mark
22 II.

23 MEMBER SHACK: But, you know, a hardened
24 vent to prevent core damage, you keep talking about how
25 useful it is in severe accidents, which I would agree

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 with, but is it really --

2 MR. DENNIG: Step 2 is that we were tasked
3 to start with the notion of, before core damage,
4 prevention of core damage, now look at making it
5 serviceable under severe accident conditions. And
6 then, the next step, if it is going to be operated and
7 you intend to operate it during severe accidents, do
8 you or do you not want to put an installed filter on
9 it?

10 MEMBER SHACK: Okay. I guess it is doing
11 that in the sequency affair that somehow seems like it
12 might lead to additional effort. I mean, just tell them
13 to go ahead and put in a hardened vent that will work
14 under severe accident conditions.

15 MR. DENNIG: It does make for additional --

16 MR. COLLINS: Well, it depends on what you
17 mean by work.

18 MEMBER SHACK: Right.

19 MR. COLLINS: Right?

20 MEMBER SHACK: I realize that there is
21 always a problem.

22 MR. COLLINS: When you talk about a vent
23 that is unfiltered, working means you remove the heat,
24 period. If you are talking about a vent that is
25 filtered, working means you remove the heat and you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 maintain the containment integrity at the same time.

2 You maintain the integrity by capturing the fission
3 products in the filter. Okay?

4 Remember, the containment is there not to
5 contain heat. It is there to contain fission products.

6 So, it is very confusing when you talk about these two
7 different vent concepts. One removes the heat; the
8 other one removes the heat and maintains the containment
9 integrity at the same time. That is why the second one
10 is being considered to filter it. Do we really want
11 to strengthen the containment or do we just want to
12 remove the heat, hoping to prevent core damage?

13 MEMBER ARMIJO: But you do both if you vent
14 through the suppression chamber.

15 MR. DENNIG: That is one of the
16 considerations. That is one of the considerations.

17 MEMBER ARMIJO: One of the things, you
18 know, that is confusing to me is many people say we
19 already have hardened vents. I don't know that is true
20 or not. But there are a variety of different designs
21 in the BWR Mark Is and IIs. Part of the thing that would
22 help me, and maybe the other members, can we at some
23 point, just to answer the question, do we have hardened
24 vents in the United States in BWRs or not, and which
25 are the ones that are really super-good, in your opinion,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 and which are the ones that need upgrading?

2 MR. DENNIG: We have asked for the details
3 of what the as-installed is on maybe half a dozen
4 occasions. The BWR Owners' Group has that information,
5 but they have not shared with us. So, in terms of the
6 details of what is in there, we really don't know what
7 they have in there.

8 MEMBER CORRADINI: But they will need to
9 probably in all this effort. Is that not true?

10 MR. DENNIG: At some point, they are going
11 to submit a design that meets whatever the requirement
12 is.

13 MEMBER CORRADINI: For the order? For the
14 order?

15 MR. DENNIG: For the order. And we may or
16 may not see the starting point for that. They might
17 not say, "Here's what we started with. Here's the mod,
18 and here's why it is okay."

19 MEMBER CORRADINI: Okay.

20 MR. DENNIG: We could just get the whole
21 thing and say, "This is what we are going to do."

22 MEMBER CORRADINI: Right. Okay. Thank
23 you.

24 MR. FRETZ: Okay. Shall we go on to the
25 next slide?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 (Laughter.)

2 So, I can quickly go through the next couple
3 of slides because we have essentially touched on both
4 of them, but it will maybe help.

5 MR. DENNIG: These are all good questions.

6 MR. FRETZ: Last fall, in the Staff
7 Requirements Memorandum for SECY-11-0137, the
8 Commission directed the staff to take certain actions
9 that relate to the hardened vents issue. First of all,
10 they supported the Near-Term Task Force recommendation
11 to pursue the order, that I think we have touched on
12 earlier, relating to the hardened vent for the BWR Mark
13 Is and IIs. And that was a Tier 1 issue. Okay?

14 In addition, they also tasked the staff to
15 perform the long-term evaluation, which is binned as
16 a Tier 3 issue, that we will be talking about a little
17 bit later, related to venting for other containment
18 designs. And so, we will talk about where we are with
19 that plan.

20 But included in the SRM to the staff was
21 that they did tell us to consider the issue of filtration
22 in containment events. That is really what brings us
23 here today, is to really talk about some of the progress
24 we have made relating to our efforts to study that issue,
25 to determine whether or not additional requirements

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 should be made on the Mark I and Mark II containments.

2 Okay. Slide 4, please.

3 MEMBER CORRADINI: I know you are going to
4 go through history. I was just looking ahead. Does
5 your history include what John Monninger mentioned about
6 in the eighties in the containment performance research
7 that was done specifically on filtered vents?

8 MR. DENNIG: Not today.

9 MEMBER CORRADINI: But you are aware of it
10 and are looking at it?

11 MR. DENNIG: Oh, yes. Oh, yes. Oh, yes.
12 But not today. Today the emphasis is on what we learned
13 at other regulators, other utilities.

14 MEMBER CORRADINI: Okay. Fine. Thank
15 you.

16 MEMBER BLEY: You are reporting to us on
17 your information-gathering kind of so far?

18 MR. DENNIG: Right. This is a trip report.

19 MR. FRETZ: And we will anticipate that we
20 will have another opportunity to talk about the results
21 of our review and our recommendations, about where we
22 are going with that.

23 But, again, in response, the staff sent a
24 Commission paper up that included the proposed order
25 for the reliable hardened vent. And again, like we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 talked about earlier, the design requirements were there
2 simply for the prevention of core damage, and there were
3 absolutely no requirements relating to severe accident
4 service.

5 Again, the paper touched upon that aspect
6 in that we essentially set up the IOU that we would look
7 at severe accident service and filtration as a separate
8 issue, and that we would report back to the Commission
9 sometime this summer, in July.

10 Next slide, please, slide 5.

11 Now some of the staff actions we have taken,
12 we did issue the order on March 12th for the reliable
13 hardened vent. And again, that was for prevention only.

14 To address the other issues, I guess we call
15 it kind of like a Tier-1-plus, issues relating to the
16 severe accident service and filtration issues. We
17 assembled a team of experts from around the agency.
18 We have members of the staff from the technical branches,
19 the Containment and Ventilation Branch. We also have
20 folks from the Reg Analysis group that will help us with
21 our regulatory analysis to address those issues, the
22 current process that we use for evaluating potential
23 backfits.

24 We also assembled a team from the Office
25 of Research, Regulatory Research, that will help us

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 understand some of the insights from Fukushima as well
2 as doing code runs that would help us understand the
3 accident a little bit better. In addition, we do have
4 other members from other offices, such as the Office
5 of New Reactors, that will help us with those insights.

6 Again, the staff is currently reviewing the
7 myriad of issues that relate to this whole issue of
8 whether or not additional requirements are needed for
9 the hardened vents that we ordered in March and related
10 to severe accident service or filtration.

11 MEMBER SHACK: Let me just harp on this one
12 more time --

13 MR. FRETZ: Sure. Please.

14 MEMBER SHACK: -- to make it clear to
15 myself.

16 MR. FRETZ: Okay.

17 MEMBER SHACK: This vent that is going to
18 be installed under the order, will it be operable
19 remotely without AC power? Will that be one of the
20 design requirements?

21 MR. DENNIG: It will be operable remotely
22 without dependence on emergency or normal AC, yes. That
23 is part of the SBO fix.

24 MEMBER STETKAR: Be careful about your
25 words. I'm an electrical engineer. No AC power

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 means --

2 MR. DENNIG: No. It is not DC -- no, that
3 isn't part of it. No, it is not limited to DC.

4 MEMBER STETKAR: Will it be operable if you
5 no alternating current power available in the plant?
6 No alternating current power available in the plant,
7 I am asking for a yes or a no.

8 MR. DENNIG: Yes.

9 MR. FRETZ: I think it is yes.

10 MEMBER STETKAR: Okay.

11 MR. FRETZ: Because there is a requirement
12 that the system be capable of operating under a prolonged
13 station blackout condition.

14 MEMBER STETKAR: But some people define a
15 station blackout as power available from a
16 non-safety-related alternate AC generator. That is,
17 alternating current is available in the plant under
18 those conditions. That is why I would like to know if
19 it must be available with no alternating current
20 anywhere.

21 MR. FRETZ: I believe the answer is yes.

22 MEMBER STETKAR: Okay. Whether it is DC
23 power or mechanical, manual, that is a different issue.
24 At least let's get the AC power straightened out.

25 CHAIR SCHULTZ: Go ahead.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. FRETZ: Okay. Thanks.

2 In addition, part of our review will be
3 taking a look at some of the past regulatory actions.

4 You know, Containment Performance Improvement Program
5 is, indeed, among the many items we will be looking at.

6 We will also be looking at establishing insights from
7 Fukushima and, then, informing our recommendations and
8 decisions under that.

9 Again, like we touched upon earlier, we will
10 be using the NRC's Regulatory Analysis Guidelines to
11 inform our decision and recommendations, as well as,
12 like I say, what we want to talk about today is experience
13 with filter containment venting systems pretty much
14 exclusively overseas, and that we did take a look at
15 some of the systems that are installed overseas to help
16 us, essentially, gain an understanding or the reasons
17 why the various regulators required filter containment
18 venting systems there, what their basis was, some of
19 the design considerations that they considered with
20 respect to the design and the decontamination factors.

21 We also wanted to take a look at the
22 constructability issues, you know, whether or not
23 something like this is even practical over here, as well
24 as get an idea of the cost and essentially some of the
25 things of what it would take to actually do something

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 over here.

2 With that, I wanted to turn the rest of the
3 presentation over to Bob Dennig, who will help talk about
4 our foreign experience and the insights we gained from
5 that.

6 MR. DENNIG: First, as far as the current
7 order, you would probably be very interested in the
8 development of the Interim Staff Guidance, which is now
9 moving along on the assumption that the hardened vent
10 will be able to operate during prolonged SBO, but not
11 necessarily under accident conditions. So, the
12 operation of that and the equipment involved in that
13 is being developed in detail in the Interim Staff
14 Guidance.

15 MR. DIAS: The ACRS will be briefed on the
16 three ISGs being developed on June 20th.

17 My name is Tony Dias.

18 The ACRS will be briefed -- sorry for
19 this -- on June 20th on the three ISGs being developed
20 to support the orders that were issued.

21 MEMBER ARMIJO: Okay. The date?

22 MR. DIAS: June 20th.

23 MR. DENNIG: I am going to talk about what
24 we learned on a trip to review foreign regulatory
25 decisionmaking and implementation of the filtered

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 containment venting system. The motivation for this
2 trip came out of staff's review in the immediate time
3 after the Fukushima accident, looking at alternative
4 designs and alternative ways of doing things in terms
5 of containment venting. And it turns out that in Europe
6 a reliable hardened vent with an external filter is
7 pretty much a standard feature for containment, and it
8 became so prior to the mid-nineties. So, it seemed to
9 make sense to find out more about that and what their
10 motivations were, and how they think it makes things
11 better.

12 MEMBER ARMIJO: You say Europe, and you
13 have got two countries there, Sweden and Switzerland.

14 Do you know if the Germans --

15 MR. DENNIG: Yes.

16 MEMBER ARMIJO: And the Finns?

17 MR. DENNIG: Yes.

18 MEMBER ARMIJO: All of them?

19 MR. FRETZ: We considered all the
20 countries. We wanted to get a diversity of what is
21 really out there. Essentially, the Finns have
22 essentially the next generation of what the Swedes put
23 in. And in Switzerland, their technology is very
24 similar to what the Germans put in. So, there are
25 essentially two different types.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Now, obviously, there is the French, and
2 they have their type of filter. We did not choose to
3 go there. And again, the Swedes and the Swiss did
4 respond to our request to be able to look at their
5 facilities.

6 MEMBER BANERJEE: They are all ABB plants?

7 MR. FRETZ: Yes.

8 MEMBER ARMIJO: No. No, no, no.
9 Muhleberg is a GE plant.

10 MR. DENNIG: Leibstadt is a GE Mark III and
11 Muhleberg is a GE Mark I.

12 MEMBER BANERJEE: Leibstadt is?

13 MR. DENNIG: A GE Mark III.

14 MR. FRETZ: It is a BWR/6 with a Mark III
15 containment.

16 MEMBER ARMIJO: And then, there are a
17 couple in Spain. Do they use filtered vents?

18 MR. DENNIG: No.

19 MEMBER ARMIJO: In Nuclenor and --

20 MR. DENNIG: No. There is a Mark I in Spain
21 that is --

22 MEMBER ARMIJO: That is Nuclenor.

23 MR. DENNIG: -- going to be operating for
24 a short time, as I understand it, before they are going
25 to permanently shut down. The last I knew, the Spanish

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 regulator had decided to put filtered containment vents
2 on PWRs but not BWRs, but was urging that that be done.

3 MEMBER ARMIJO: Okay. Okay. But you
4 visited these guys?

5 MR. DENNIG: Yes.

6 MEMBER ARMIJO: Okay.

7 MR. DENNIG: Okay. We visited. We had
8 talks with the Swedish Radiation Safety Authority, with
9 the regulator, and we visited Forsmark Unit 2 and
10 Ringhals Unit 1, which are similar to Mark II in
11 containment. We also visited Switzerland and their
12 regulator, the Swiss Federal Nuclear Safety
13 Inspectorate. And then, we had planned visits to
14 Leibstadt, which, as previously has been said, is a Mark
15 III containment, and Muhleberg, which is similar to a
16 Mark I.

17 Next slide, please.

18 We were tasked to find out what we could
19 about the regulatory and technical bases for the
20 filtered containment venting systems. What we learned
21 was that, in response to TMI, Sweden issued a report
22 by the Swedish Government Committee on Nuclear Reactor
23 Safety, two major recommendations following TMI, that
24 the plants be able to mitigate the consequences of a
25 severe accident by strengthening containment and reduce

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the risks that could result in radiation fatalities or
2 high-radiation dose from ground contamination. Out of
3 that direction, the regulator and the industry engaged
4 in a joint project to develop specifically an external
5 filter for filtered containment venting systems.

6 Next slide, please.

7 In the energy bill of 1980 and 1981, the
8 government specified, basically, a two-step process.

9 First, that they expedite a filtered containment
10 venting system for Barseback, which is located near
11 Copenhagen, and consider filtered containment venting
12 systems for Forsmark, Ringhals, and Oskarshamn, and,
13 also, identify any alternatives to filtered containment
14 venting systems that would accomplish the same purposes
15 of strengthening the containment and reducing the risks,
16 as I mentioned on the previous slide.

17 By way of an outcome, Barseback did have
18 installed a first-of-a-kind, basically, a gravel
19 filter, quite large, almost the size of the containment
20 building. That was not used or duplicated anywhere
21 else, but the first one was very expensive.

22 And then, the other part of the decision
23 is that, going forward, there is a second generation
24 of filter containment venting systems which are
25 water-based, liquid-based, that are used at Forsmark,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Ringhals, and Oskarshamn.

2 MEMBER ARMIJO: Bob, you didn't discuss
3 that cost/benefit issue that is on your chart. What
4 is the point there?

5 MR. DENNIG: Oh, that is a point that was
6 a question that we asked because of the cost/benefit
7 interests, what role did that play in the
8 decisionmaking. And in terms of the details of how that
9 was done or how they do it, we don't have any specific
10 information.

11 MEMBER BANERJEE: So, you mean that the
12 benefits of not contaminating the ground was not
13 considered? Is that it? Double-negatives.

14 MR. DENNIG: No. No, the benefits were
15 considered, but the cost was not.

16 MEMBER BANERJEE: But cost was not?

17 MR. DENNIG: It was not.

18 MEMBER ARMIJO: So, it is not really a
19 cost/benefit ratio.

20 MEMBER CORRADINI: May I ask another
21 question? Because I can see you have a number of slides
22 on kind of the history of what led to what they put in.

23 Did you see calculations as to the
24 effectiveness of what they put in? I am very curious
25 about curves that say what is released when it works,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 what is the release when it doesn't work, what is the
2 release when it goes through the wetwell. Did you see
3 those sorts of analyses?

4 MR. DENNIG: No.

5 MR. COLLINS: Wait a minute. We did see
6 a curve of contamination of land as a function of using
7 the filter. Remember, they showed us that plot where
8 they had the land contamination.

9 MR. DENNIG: Oh, yes. Yes.

10 MR. COLLINS: Yes. Do, we did see that.

11 MEMBER CORRADINI: Well, but where I am
12 going with the question is that I am trying to look at
13 the delta effect of these systems. And I am just
14 curious, were you able to get analyses that investigated
15 the delta effect of the systems in differences of,
16 essentially, venting through a wetwell? I am kind of
17 backwards saying this.

18 MR. COLLINS: No, they didn't compare
19 venting through a wetwell.

20 MEMBER CORRADINI: Okay. Thank you.

21 MEMBER BANERJEE: The first-of-a-kind in
22 Barseback was hooked up?

23 MR. DENNIG: Yes.

24 MEMBER BANERJEE: For five years? Is that
25 it?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. DENNIG: I think the last unit went out
2 of business in 2005.

3 MEMBER BANERJEE: Okay. And you said this
4 was almost as big as the containment. Was it gravel
5 beds? It was sort of in a silo or something?

6 MR. COLLINS: I wish we had a picture of
7 that with us.

8 MR. DENNIG: Yes, it was a very large silo.

9 MEMBER BANERJEE: Okay. And full of
10 gravel?

11 MR. DENNIG: Full of gravel.

12 MEMBER BANERJEE: And the other ones were
13 what? Just tanks of water or --

14 MR. DENNIG: The ones that are used now?

15 MEMBER BANERJEE: Yes.

16 MR. DENNIG: I have some pictures that will
17 show you what they are using.

18 MEMBER SKILLMAN: The gravel was resin of
19 some sort?

20 MR. COLLINS: I think it was plain gravel.

21 MR. DENNIG: Basically, it was just sand
22 and gravel.

23 MEMBER CORRADINI: I had two other
24 technical questions, and you can postpone them, but at
25 least I want to ask them. What is the logic of venting

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the drywell versus directing the flow to the wetwell
2 and then using its suppression, its filtering
3 capability. That is question one.

4 Question two is, I read through the history.

5 Is the Swedish regulatory emphasis to deal with severe
6 accidents or to deal with design-basis events that could
7 lead to severe accidents? In other words, you were very
8 clear in operating, removing heat, and then,
9 essentially, looking at the venting system if it goes
10 into the realm of severe accidents, and then looking
11 at its capability and then filtering for fission
12 products. What was the history here?

13 MR. DENNIG: They addressed severe
14 accidents.

15 MEMBER CORRADINI: So, these were designed
16 for severe accident performance?

17 MR. DENNIG: Yes.

18 MEMBER CORRADINI: Okay. Fine. Thank
19 you.

20 MR. DENNIG: They were backfit on all
21 plants for severe accident purposes --

22 MEMBER CORRADINI: Okay.

23 MR. DENNIG: -- for mitigation purposes.

24 MEMBER CORRADINI: Okay. And then, my
25 other question about why would you vent through a drywell

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 and not force the flow through the wetwell?

2 MR. DENNIG: Well, it is basically there
3 are some advantages to having, if you are going to have
4 a vent and you do have a filter, so that you are not
5 limited, if you will, to using the wetwell. There are
6 heat-removal advantages from taking the heat out higher
7 up and having a vent that allows you to flood up without
8 fouling the vent. What else?

9 MR. COLLINS: The last one was the one they
10 expressly mentioned to us, the ability to flood up.
11 If you cover the vent when you are flooding up, then
12 you can no longer vent through that path. So, they
13 wanted to be able to use the vent for a flood-up
14 possibility as well.

15 MR. DENNIG: Again, for pressure control.

16 MR. COLLINS: Right.

17 MEMBER CORRADINI: Okay. Thank you.

18 MR. DENNIG: Okay. Let's see. After a
19 program involving PRA and PSA and Level 1 and Level 2,
20 worked with the industry. The regulatory decided that
21 "the filter containment venting system was required for
22 defense-in-depth purposes, given uncertainties in the
23 analysis and the PRA." And that is a quote.

24 They wound up with a filter containment
25 venting system from the drywell. It is required for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 slow overpressurization, for use in feed-and-bleed and
2 flood-up by an additional independent containment spray
3 system. They have a reliable drywell spray to flood
4 up the containment, a reliable means to flood under the
5 pedestal, and a feature that we don't have for an
6 accident we don't analyze is a large-break LOCA with
7 a break in a downcomer tube in a Mark II, which is
8 basically a loss of heat sink. There is an unfiltered
9 vent that opens for 10 minutes following a high-pressure
10 signal and then closes.

11 MR. FRETZ: It is a much bigger vent line
12 and it is unfiltered.

13 MR. DENNIG: It is meant for a pressure
14 spike, an early pressure spike, and then the thing is
15 sealed up. And that is done automatically.

16 MEMBER BANERJEE: How? Just a valve opens
17 and closes?

18 MR. FRETZ: It is a rupture disc.

19 MEMBER BANERJEE: Okay.

20 MR. FRETZ: Go ahead.

21 MR. COLLINS: The valves in the line, there
22 are motor-operated valves that are normally open in that
23 line. And the rupture disc will rupture on a
24 very-high-pressure signal, and the valves will close
25 10 minutes later.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. DENNIG: If it does or does not rupture,
2 the valves still close.

3 MR. COLLINS: Yes, whether or not the
4 rupture disc opens, right.

5 MEMBER CORRADINI: In other venues here we
6 ask the licensee about testing these systems. Were
7 these systems tested before installed or replicates or
8 scale models of these systems tested before they were
9 installed to verify performance?

10 MR. FRETZ: The protective filters?

11 MEMBER CORRADINI: Yes.

12 MR. FRETZ: Yes, the filters were
13 extensively tested.

14 MEMBER CORRADINI: Okay. But I am
15 thinking of the plumbing aspects of this. I am
16 listening to all this and it seems complex, more complex
17 than I first would have imagined. So, these systems
18 were tested in terms of systems interactions?

19 MR. DENNIG: Well, there are no systems
20 interactions because they were built entirely
21 independent of any systems on the site.

22 MEMBER BANERJEE: They are external,
23 right?

24 MR. DENNIG: They put in another path for
25 drywell spray. That goes to the fire system.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER CORRADINI: Okay.

2 MR. DENNIG: They put in a means to flood
3 under the pedestal, in addition to the spray. That is
4 independently-powered and has its own instrumentation,
5 dedicated batteries. So, there is no systems
6 interaction just because there are no systems tie-ins.

7 MEMBER CORRADINI: All right. Thank you.

8 MEMBER BANERJEE: How do they test them?
9 I mean, Mike asked the question; they were tested.
10 What did they do to test them?

11 MR. DENNIG: To test the filters
12 themselves?

13 MEMBER BANERJEE: Yes. And the whole
14 system.

15 MR. DENNIG: The whole system?

16 MR. FRETZ: Well, they do periodic valve
17 stroking to make sure that the valves remain operable.
18 But when they do their version of like the ILRT, they
19 do vent through the system to depressurize the
20 containment following that test. So, they actually
21 validate --

22 MEMBER BANERJEE: They do the whole flow
23 path?

24 MR. DENNIG: Yes?

25 MEMBER BANERJEE: Everything?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. DENNIG: Yes.

2 MR. COLLINS: They have tech specs. They
3 have tech specs on it.

4 MR. DENNIG: Yes.

5 MEMBER BANERJEE: How often do they do
6 that?

7 MR. FRETZ: I believe they said in Sweden
8 that they do that test, the full system test, about once
9 every five years. It is on the order of that.

10 MEMBER SKILLMAN: What is the filter media?

11 MR. DENNIG: It is chemically-treated
12 water.

13 MEMBER SKILLMAN: Okay. Thank you.

14 MEMBER BANERJEE: The stuff just bubbles
15 through the sparger.

16 MR. FRETZ: Using the multi-venturi
17 effects.

18 MR. DENNIG: This is the holistic concept,
19 if you will, for severe accident management that
20 Vattenfall and other Swedish plants have installed.
21 You have the filter for pressure relief of the
22 containment. You can also accomplish hydrogen control.
23 The plants are inerted. Not the Mark III, but the
24 Mark-II-likes are inerted. You can use it for hydrogen
25 control.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Containment sprinkling is containment
2 spray. That is an independent system, has its own
3 supply and its own pump.

4 Core-melt cooling is accomplished through
5 the flooding-up with the containment spray, and then
6 heat removal with feed-and-bleed with the filter
7 containment venting system.

8 The reliability is credited largely because
9 of the independence. The filter containment venting
10 system itself will operate passively for up to 24 hours
11 without any intervention. At 24 hours, you have to go
12 put some more water into the tank for the filter.

13 MEMBER BANERJEE: It just evaporates? Is
14 that --

15 MR. DENNIG: Well, the heat is going
16 through there and it --

17 MEMBER BANERJEE: It evaporates?

18 MR. DENNIG: Yes.

19 MEMBER BANERJEE: When you said it has got
20 a multi-venturi, is it like a venturi with the water
21 coming? It is almost like an ejector for the gas,
22 sucking water into the venturi? Or what did you mean
23 by multi-venturi?

24 MR. FRETZ: I wish we had a picture of our
25 candelabra with holes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER BANERJEE: Oh, it is just a straight
2 set of venturis? It doesn't suck water through the
3 narrow part of the venturi? Not like an ejector?

4 MR. FRETZ: I think that is part of it.

5 MEMBER SKILLMAN: It sounds like what you
6 have described is a set of spargers with venturis.

7 MR. FRETZ: Yes.

8 MEMBER BANERJEE: Just a sparger with
9 venturi?

10 MR. FRETZ: It is submerged in the water,
11 yes.

12 MR. COLLINS: It is a submergence effect
13 with an overlying body of chemically-treated water that
14 does the scrubbing. I think that that is what you are
15 talking about.

16 MEMBER BANERJEE: So, why have a venturi?
17 What does it do for you?

18 MR. FRETZ: Well, it helps optimize the
19 bubbling.

20 MR. COLLINS: Flushes the gas and it
21 optimizes bubbles, is what it should do.

22 MR. FRETZ: In fact, it is like a V-shaped
23 thing. So, depending on what the containment pressure
24 is, it allows more venturis to come into play to maintain
25 a constant bubbling effect. So, they get the most

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 efficient way to scrub the effluent from the
2 containment.

3 The next time we meet, we will make sure
4 we provide a better picture.

5 MEMBER BANERJEE: Yes, it would be nice to
6 see a picture.

7 MR. DENNIG: Forced effervescence. We
8 have a set of slides with basically the designs that
9 we can share.

10 Next slide, please.

11 Let's kind of start at the bottom, if you
12 will, in terms of the decontamination factor
13 requirements. To get a DF of 100 for aerosols and a
14 comparable figure for iodine, if you have that, then
15 you are considered to have met the criteria that is above
16 that, which is that there is no release, no more than
17 .1 percent core inventory cesium-134, -137, and iodine
18 from the equivalent of an 1800-megawatt thermal reactor.

19 And then, if you meet that, then you are
20 considered to meet the criteria above that, which is
21 a limited area first-year dose from ground contamination
22 with rain of greater than 50 millisieverts.

23 And the limited area is on the order of equal
24 to or less than 50 square kilometers. We are trying
25 to get the details of that calculation.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 And then, in terms of the decontamination
2 factor as installed, as it was explained to us, to hit
3 the target of 100 with uncertainties, it was designed
4 on paper for 500 and it tested out at 1,000 for aerosols,
5 and there was no particular reason to make it not work
6 that well.

7 MEMBER SIEBER: All these performance
8 factors are calculated values, right? Has it ever been
9 tested to prove those decontamination factors?

10 MR. FRETZ: No, this was tested.

11 MEMBER SIEBER: Oh, it is tested?

12 MR. FRETZ: Yes.

13 MR. DENNIG: They told us, but everybody
14 is very much interested in the details of the testing.
15 So, I think we are going to go find out the details
16 of the testing.

17 MEMBER BLEY: You have not seen those yet?

18 MR. DENNIG: No. No. We were only there
19 for two weeks.

20 MEMBER STETKAR: Bob, I think I heard you
21 say -- I am not familiar with Sweden, but I am assuming
22 they have at least a Level 2, if not a Level 3, PRA for
23 this plant.

24 MR. DENNIG: Yes.

25 MEMBER STETKAR: You didn't ask them what

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the net benefit to release categories was from filter
2 versus no filter? Not vent versus no vent. Filter
3 versus no filter?

4 MR. DENNIG: Right. Do we ask them for the
5 calculations behind what --

6 MEMBER STETKAR: No, no, no. I understand
7 this is design.

8 MR. DENNIG: Uh-hum.

9 MEMBER STETKAR: In the risk assessment,
10 they ought to be able to give you results for release
11 categories, filter versus no filter. Did you ask them
12 for that?

13 MR. DENNIG: We asked them for that, and
14 they said they hadn't done it.

15 MEMBER STETKAR: They hadn't done it?

16 MR. DENNIG: Right.

17 MEMBER ARMIJO: Why? That is hard to
18 understand.

19 MEMBER STETKAR: I will ask the same
20 question when we get to Switzerland.

21 (Laughter.)

22 MEMBER CORRADINI: Why? Did you do them?

23 MEMBER STETKAR: Back in the nineties, yes.

24 MEMBER ARMIJO: Sure.

25 MEMBER STETKAR: But they have redone them.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER CORRADINI: Can we ask you, then,
2 the answer?

3 MEMBER STETKAR: Nope.

4 (Laughter.)

5 MR. DENNIG: Next slide, please.

6 Okay. A summary of the design. It is
7 passive filter. It is inerted with nitrogen. The
8 achieved decontamination factor for aerosols is 1,000.

9 The heat-removal capability is calculated to be 1
10 percent. It is acknowledged as a vent for hydrogen.

11 So, there are no ignition sources, and it is vented
12 to a safe location.

13 The seismic design is the same as the
14 containment seismic design: 24-hour passive
15 operation. You can operate it actively if you so
16 choose, if you want to intervene or control it after
17 the rupture disc opens.

18 Valves are operable from the control room,
19 have independent electrical and pneumatic supplies.
20 In the case of Forsmark, they have a local manual station
21 where you can turn wheels to operate the valves.

22 The instrumentation has its own independent
23 batteries. And as I said before, the connection is from
24 the drywell. The vent is from the drywell.

25 MEMBER SHACK: And the pressure they vent

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 at? Or the pressure for the rupture disc?

2 MR. DENNIG: It is like 25 percent above
3 design pressure.

4 MEMBER SHACK: Design?

5 MR. DENNIG: It is fairly close to design
6 pressure.

7 Next slide, please.

8 This is an arrangement at Forsmark, some
9 of the arrangement. And containment is on the right,
10 and there is a single pipe on the other side. It branches
11 into two.

12 The bottom line is the one that has the
13 rupture disc in it, and then followed by two
14 normally-opened valves. The top line is for active
15 control. That valve is normally closed, and there are
16 additional control valves to the left off of the picture.

17 And then, you can obviously close these normally-open
18 valves to stop the flow through the rupture-disc line.

19 MEMBER BANERJEE: Why are the control
20 valves there? What is it supposed to control?

21 MR. DENNIG: Well, this is flow through the
22 vent. These are isolation valves on a penetration.

23 MEMBER BANERJEE: Right. I mean, the
24 rupture disc is on the line which is the lower line,
25 right?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. DENNIG: Uh-hum.

2 MEMBER BANERJEE: And then, it has got
3 valves to close it off?

4 MR. DENNIG: Yes.

5 MEMBER BANERJEE: Right?

6 MR. DENNIG: Uh-hum.

7 MEMBER BANERJEE: I am talking about the
8 line on top. What is the function of that line?

9 MR. DENNIG: You can actively vent --

10 MEMBER BANERJEE: For control vent?

11 MR. DENNIG: Yes. You can control the
12 pressure through that before the rupture disc goes, if
13 you wish. If you want to vent earlier than the rupture
14 disc, then you can use that.

15 MEMBER BANERJEE: Okay. And that runs off
16 what, DC power or?

17 MR. DENNIG: Air.

18 MEMBER BANERJEE: Yes, but air comes --

19 MR. DENNIG: And then, the nitrogen
20 bottles.

21 MEMBER BANERJEE: Oh, off nitrogen
22 bottles?

23 MR. DENNIG: Yes, that is in the picture
24 next to it.

25 MEMBER BANERJEE: Okay.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. DENNIG: The bank of nitrogen bottles
2 for the pneumatic supply for those valves, again,
3 dedicated to the operation of those valves.

4 MEMBER BANERJEE: So, just solenoids have
5 to open?

6 MR. DENNIG: Right. Uh-hum.

7 MEMBER ARMIJO: But it doesn't matter which
8 line you vent through it? It goes through the filter
9 somewhere downstream?

10 MR. DENNIG: Yes. Yes.

11 MEMBER ARMIJO: Okay.

12 MEMBER SHACK: And how big is that vent
13 line?

14 MR. DENNIG: It's 10 inches?

15 MR. FRETZ: Ten inches, something like
16 that.

17 MEMBER BANERJEE: These are
18 seismically-qualified and everything?

19 MR. DENNIG: Yes.

20 MEMBER SKILLMAN: That is a Monroe shock
21 absorber.

22 MEMBER BANERJEE: Yes, that is a shock
23 absorber. Okay.

24 MR. DENNIG: Okay. Next slide.

25 MEMBER BANERJEE: And to what sort of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 earthquakes is this supposed to be?

2 MR. DENNIG: Whatever the containment is.

3 MR. FRETZ: Whatever the containment is
4 designed for, the system is designed the same.

5 MR. DENNIG: Next slide, please.

6 This gives you an idea of the size of the
7 installation in Forsmark and Ringhals. They chose to
8 put a building outside, so that it wouldn't interfere
9 with operation of the plant. They could do this mostly
10 with the plant running. They could use their allurgist
11 to do the tie-ins. So, there wasn't any impact on
12 production while the system was backfit.

13 You can see the stack for the filter at the
14 top of the box, the red box. On the right is the top
15 of the moisture separator MVSS filter. The spargers
16 are down below. The inlet line runs into the center
17 of the tank, through the spargers, exits through the
18 line behind the individual there, up through a moisture
19 separator that is basically a gravel filter, around and
20 then out through the plant stack. And this thing, while
21 it is in standby, it inerted. There is another rupture
22 disc in the discharge line that keeps the nitrogen in
23 the system while it is in standby.

24 Next slide, please.

25 Again, Forsmark. On the left you see

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 basically the severe accident control panel where you
2 can control and monitor the filter containment venting
3 system if you want to operate that actively, you want
4 to know the status of it. There is also radiation
5 instrumentation.

6 You can activate and operate the
7 under-vessel flooding system and, also, the same thing
8 with the drywell spray, from this particular panel.
9 So, all that is together in one place.

10 With respect to the flood-up drywell spray,
11 on the right you can see coming from the floor, heading
12 straight up on the lefthand side of the picture is the
13 fire system, and that is the normal path of supply.
14 It has a diesel-powered fire pump. And then, should
15 that not be operable, there is another line, as you see
16 with the hookups, where you can bring in a portable pump
17 or a fire truck and hook it up to those hookups.

18 Below is the Ringhals configuration -- next
19 slide, please -- similar to the hookup, the fire pump,
20 the fire truck. They have a specially-designed vehicle
21 that has units that it can drop at -- I think two units
22 they have. You can back out. I think the legs go down
23 and you have a generator and a pump, and you can hook
24 it up to the inlets, that are shown in the little circle
25 below, from outside the containment. And then, there

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 are some power hookups that are available, should you
2 lose the dedicated battery power.

3 MR. COLLINS: They did a failure modes and
4 effects analysis on this, and they found it was the
5 battery, starting battery, for the truck that was the
6 limiting component. So, they put in a second battery.

7 MEMBER BANERJEE: How long have they had
8 this, pre-Fukushima or post-Fukushima?

9 MEMBER SIEBER: It is a pretty old truck.

10 MEMBER BANERJEE: It looks like an old
11 truck, yes.

12 MR. DENNIG: Good question. I don't think
13 it is --

14 MEMBER SHACK: Well, it doesn't wear out.

15 MR. DENNIG: Okay. So, more details about
16 the regulatory aspects and costs. The final guidance
17 was issued in 1986. The required backfits were
18 implemented by 1988, and that includes the independent
19 water systems.

20 MEMBER SIEBER: Twenty-six years ago.

21 MR. DENNIG: It is really worked on that
22 power; use the allurgist for tie-in. From an
23 engineering perspective, because it was all
24 independent, it wasn't very difficult.

25 These costs are not in 2012 dollars. So,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 you know, we have yet to translate them into anything,
2 and I am not sure that we are going to use them other
3 than as ballpark numbers anyway.

4 MEMBER BANERJEE: When did they find out
5 about the second battery? How long ago?

6 MR. FRETZ: How long ago?

7 MR. DENNIG: I don't know. The second
8 truck battery?

9 MEMBER BANERJEE: Yes. I hope they didn't
10 put the same type of battery.

11 (Laughter.)

12 If it was failing due to the cold or
13 something, they will both fail.

14 MR. FRETZ: They didn't say.

15 MR. DENNIG: Annual maintenance, 10,000
16 and 30,000. It gets pretty much the standard for a
17 standby system inspection testing maintenance regime
18 as another standby system.

19 MEMBER ARMIJO: Bob, did they tell you how
20 they test these things? What constitutes a good test
21 for a system like this?

22 MR. DENNIG: Well, I don't think --

23 MEMBER ARMIJO: I know they can open a
24 valve.

25 MR. DENNIG: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 MEMBER ARMIJO: But how do you say, well,
2 this thing is really --

3 MR. DENNIG: Whether they do a flow test
4 or whatever --

5 MEMBER ARMIJO: Yes, yes.

6 MR. DENNIG: -- I know they do that.
7 Whether they have a test line, I don't have the details
8 and I don't know. I am assuming that they can do it
9 in a way that doesn't interfere with anything else.

10 And some more bullets, and then on to
11 Switzerland. Next slide, please.

12 The Swiss acted on this later than the
13 Swedish authorities. They benefitted from the Swedish
14 development efforts. Basically, they adopted the
15 Swedish approach as a standard, and they did that
16 following Chernobyl. Before that, they had done some
17 things to provide a more secure source of injection
18 water, and so on and so forth, in a bunkered system with
19 its dedicated diesels.

20 But, following Chernobyl, the authority
21 asked the licensees to evaluate FCVS. And they do that
22 in the context of their law which says that "Licensees
23 are required to backfit as appropriate, in response to
24 operating experience and consistent with available
25 technology, to further reduce risk to people and the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 environment."

2 So, one can infer that the availability of
3 the wet-filter technology in Chernobyl met the
4 requirements for the request, and so they went forward
5 with it.

6 Next slide, please.

7 I wanted to show how the filter venting was
8 integrated with SAMG implementation. This is at
9 Muhleberg, which is like a Mark I. In 1992, they put
10 the venting system into service.

11 MEMBER CORRADINI: Did you say it, and
12 maybe I missed it, this is a drywell filter vent for
13 Muhleberg?

14 MR. DENNIG: No, Muhleberg --

15 MEMBER BANERJEE: Mark I.

16 MEMBER CORRADINI: I know that, but I am
17 trying to understand, where do they take a vent --

18 MEMBER ARMIJO: It is a BWR/4 Mark I. It
19 probably looks a lot like the ones we have here.

20 MR. DENNIG: Yes, it is from the drywell.

21 MEMBER CORRADINI: So, it is a drywell
22 filter vent.

23 MR. DENNIG: Yes. They have this --

24 MEMBER CORRADINI: Well, that is okay.
25 That's all.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. DENNIG: That is part of the torus.
2 Part of the containment is on in the reactor building.
3 It is already there. It is like a suppression pool
4 outside primary containment. That was there. So, they
5 put their spargers down into that ring of water.

6 MEMBER ARMIJO: The torus, yes.

7 MR. DENNIG: Well, into their --

8 MEMBER ARMIJO: Outer torus.

9 MR. DENNIG: -- outer torus.

10 MR. FRETZ: They have an inner torus and
11 an outer torus.

12 MR. DENNIG: The they have two toruses.

13 MEMBER ARMIJO: Two?

14 MR. DENNIG: Yes.

15 MR. FRETZ: An inner torus and an outer
16 torus.

17 MR. DENNIG: Yes, there is one that is part
18 of primary containment and then there is an other torus
19 that is part of secondary containment.

20 MEMBER CORRADINI: Oh. And that is where
21 the drywell filter vent --

22 MR. DENNIG: Goes to.

23 MEMBER CORRADINI: Okay.

24 MR. DENNIG: Yes. Instead of a separate
25 tank, they just use the existing torus.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. FRETZ: They didn't have to buy the
2 tank.

3 MR. DENNIG: They didn't have to buy the
4 tank, right.

5 MEMBER CORRADINI: Okay. Thank you.

6 MR. DENNIG: Next slide, please.

7 This is pretty much a repetition of the
8 Swedish situation. A development of guidance. The
9 features are basically the same as the Swedish features.

10 Next slide, please.

11 Some more pictures. This is Leibstadt.
12 Again, you see this branching. You have an inboard
13 valve that is open, an outboard valve that is closed
14 on the bottom line, and then the rupture disc is in the
15 top segment that bypasses the closed outboard valve.

16 The rupture disc is the containment boundary, and then
17 you can open and close the vent outboard valve and the
18 vent inboard valve to control the flow actively or shut
19 off the flow after the rupture disc has ruptured and
20 you don't want it anymore.

21 The filter itself you can see at the right.

22 Those are turbine building and reactor building
23 buildings. They have two filters, basically, two wet
24 filters. They are 9 feet by -- what? -- 27 feet high.

25 They are located there because it is a location that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 is inaccessible and basically shielded. So, they took
2 advantage of that particular location to minimize the
3 cost of having to build a shielding building.

4 MEMBER ARMIJO: And inside there is
5 basically water and some structures?

6 MR. DENNIG: Yes, it is the same. Yes,
7 yes. We will get to the slides that address the things.

8 Again, some information that is basically
9 the same as the Swedish case. Ballpark figures for
10 installation. Again, the thing was designed so that
11 they could do it at power, and there wasn't any impact
12 on production.

13 They do have technical specifications, and
14 neither they nor the Swedish authorities or the Swedish
15 utilities thought that there was any safety tradeoff
16 in putting this in, that somehow they were introducing
17 something that degraded safety and that there was some
18 tradeoff. They didn't think there was anything like
19 that.

20 MEMBER BANERJEE: What do you mean by the
21 last statement?

22 MR. DENNIG: "No stated negatives for FCVS
23 - utility representatives considered FCVS
24 cost-beneficial as designed." I use the term "value"
25 for money. Given the decision to make the containment

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 sturdier, to beef up the containment, that filter
2 containment venting system was a good way to do it in
3 terms of how much it cost to do it.

4 MEMBER BANERJEE: Compared to what else?

5 MEMBER STETKAR: Bob, you were there at the
6 host of ENSI?

7 MR. DENNIG: At the what

8 MEMBER STETKAR: You were hosted by ENSI --

9 MR. DENNIG: Yes.

10 MEMBER STETKAR: -- not the utilities?

11 MR. DENNIG: Yes.

12 MEMBER STETKAR: You might get a different
13 answer on that last bullet if you talked to the
14 utilities.

15 (Laughter.)

16 MR. DENNIG: Well, we did. We did meet
17 with the utilities.

18 MEMBER BANERJEE: It says "utility
19 representatives".

20 MR. DENNIG: Yes, we did meet with the
21 representatives, yes. Yes. And I understand your
22 point in retrospect.

23 (Laughter.)

24 MR. COLLINS: We asked the utility
25 representatives were there any negatives to this system.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. DENNIG: Well, no. If you are going
2 to do this, if you decide that you want to do this, that
3 you want to strengthen the containment, this is a good
4 way to do it. And it was an engineering solution that
5 the engineers agreed on.

6 MEMBER ARMIJO: Right, but the question
7 Mike asked about land contamination without filters or
8 with filters -- the question that John Stetkar refused
9 to answer, did you ask them --

10 MR. COLLINS: No, we didn't ask.

11 MEMBER ARMIJO: -- the benefit in that --

12 MR. COLLINS: Oh, we did. I asked that
13 question.

14 MEMBER ARMIJO: Okay. All right.

15 MR. DENNIG: I was going to say they have
16 done a risk study on installing filters.

17 MR. FRETZ: Oh, this is Muhleberg. Yes.

18 MEMBER ARMIJO: Muhleberg is fine.

19 MR. COLLINS: I asked them the same
20 question, and they said they had done one and they had
21 submitted it to their regulatory authority, but they
22 didn't think they were free to release to us because
23 of security reasons, or whatever. So, we have asked
24 their authority if we could get a copy of it. And that
25 is where it stands now. We have not yet gotten an answer

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 to that. But they said they had done one.

2 MEMBER ARMIJO: Well, if you get a copy,
3 can we --

4 MR. COLLINS: Well, we are hoping. I mean,
5 we asked them formally if we could get the copy, and
6 we haven't gotten an answer yet.

7 MR. DENNIG: Okay. Next slide, please.

8 Just a summary reiteration of some of the
9 things that we have already said.

10 And then, I am going to turn it back over
11 to Bob Fretz for discussion of stakeholder input and
12 5.2.

13 MEMBER ARMIJO: Just a real quick one. I
14 saw on your slide this new chemistry for iodine
15 retention.

16 MR. DENNIG: Uh-hum.

17 MEMBER ARMIJO: Can you expand on that a
18 little bit?

19 MR. DENNIG: Not too much beyond some
20 names. We have some details. It is called aliquot
21 chemistry. The other chemistry is a pH control, a basic
22 pH control. This aliquot is a proprietary chemistry
23 that Paul Scherrer Institute has developed and is
24 marketing.

25 MEMBER ARMIJO: Okay.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER SIEBER: Interesting.

2 MR. FRETZ: Okay. I guess next slide.

3 As part of our process for evaluating
4 whether or not we should impose requirements related
5 to severe accident service as well as filtration of these
6 hardened vents, we have held a number of public meetings.

7 Specifically relating to this issue, we held two public
8 meetings during the month of May to discuss the issue
9 of filter vents.

10 In addition, I know the Nuclear Energy
11 Institute has sent Chairman Jaczko a letter. It was
12 actually dated the 15th of May. That is a typo on there.

13 But it was dated the 15th of May, asking consideration
14 for other alternatives relating to that. And now we
15 are looking at that letter, and we hope to inform our
16 decision based upon some of the ideas that are being
17 presented to us from the industry.

18 But during the public meetings, again, some
19 of the sense we get is the public is very engaged in
20 this issue. In fact, at our last meeting on the 14th,
21 we probably entertained about anywhere from four to five
22 hours of comments from members of the public regarding
23 this issue. We find all that very helpful. And so,
24 we hope to use that to help inform some of our
25 decisionmaking.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Next slide.

2 I guess the next steps. We still have a
3 little bit more work to do regarding this issue. There
4 is still a lot of work to do.

5 Research is going to continue to do some
6 analyses that related to Fukushima. They have done a
7 number of MELCOR --

8 MR. DENNIG: And they are doing them with
9 and without calculations on the wetwell --

10 MR. FRETZ: Yes.

11 MR. DENNIG: -- to look at the benefit.

12 MR. FRETZ: Yes. Yes, and so that is
13 primarily to help us to inform our regulatory analysis
14 of this issue.

15 We hope to soon finalize the various options
16 and recommendations. Again, like we mentioned earlier,
17 we are considering the various stakeholder input.

18 All this will need to be reviewed by our
19 Japan Lessons Learned Steering Committee to gain their
20 alignment with our various recommendations. Our plans
21 are to come back to the ACRS to share with you our
22 recommendations and the various options that we may or
23 may not consider, you know, depending on what the outcome
24 of our review is.

25 And again, you, the Commission, we provide

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 them a paper in July. And so, we are still working toward
2 that goal. And again, we will include various options
3 and recommendations. That is our intent, is to take
4 a look at some of the various options that might be
5 considered.

6 Next slide.

7 Again, as John Monninger mentioned earlier,
8 there is a Tier 3 activity relating to the issue of
9 containment venting for containment designs other than
10 the Mark I and Mark II containment designs. And so,
11 I will briefly tell you where we are going with that.
12 And again, we can discuss the various ways we are
13 approaching this.

14 Again, as a part of background, the
15 Near-Term Task Force made a recommendation that the
16 staff evaluate the need for hardened vents in the designs
17 other than the Mark I and Mark II. This was prioritized
18 as a Tier 3 issue in SECY-11-0137. And again, the
19 Commission did agree with that Tier 3 prioritization.

20 Again, I guess as we have touched upon
21 during our presentation, the primary concern with
22 containment venting has been focused on the Mark I and
23 the Mark II containment designs. The analyses in the
24 past have shown that the Mark I and Mark II designs are
25 susceptible to overpressurization if it a means to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 remove heat from the containment is lost. And so,
2 again, that same analyses has shown that the other
3 containment designs are less susceptible to
4 overpressurization concerns.

5 Next slide, please.

6 So, with that, again, with our focus on the
7 Tier 1 activities, there are just limited resources
8 within the staff. That includes Research as well as
9 the Office of Nuclear Reactor Regulation in this area.

10 So, we are going to recommend that further
11 consideration of venting for designs other than the BWR
12 Mark I and Mark II be deferred, at least at this time,
13 until a decision is essentially made on the Mark I and
14 Mark II filter issue, severe accident service issue,
15 that we hope to get settled really this summer or later
16 on.

17 Next slide, please.

18 That is the end of our presentation. We
19 obviously are here to take any questions concerning the
20 Tier 3 issue as well as the Tier 1 issue.

21 CHAIR SCHULTZ: Other comments or
22 questions by the Committee?

23 MEMBER ARMIJO: I guess I have a question
24 on the filter containment venting. Basically, I was
25 surprised that in Japan they are really considering or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 may likely install it in big containments, in PWR
2 containments. Does the staff have a technical reason
3 why that is, other than availability of expertise? But
4 is there another better reason than that, since you
5 really don't need it for PWR containments?

6 MR. DENNIG: We currently are not concerned
7 about the PWRs in large drys. And I don't know the basis
8 for which they decided to do that.

9 MEMBER ARMIJO: Yes, I am looking for some
10 expert input.

11 MR. DENNIG: Because of the size and the
12 overpressure vulnerability is why we are dealing with
13 Mark Is and Mark IIs.

14 MR. LEE: Dr. Armijo, this is Richard Lee
15 from Research.

16 MEMBER ARMIJO: Yes?

17 MR. LEE: About Japan, when we read that
18 boiling water reactors were going to install these
19 vents, I did ask the staff from the Atomic Energy
20 Commissions what is the technical basis for doing such
21 implementation. The answer from that is that the
22 utility designed it to take that action. The government
23 has not told them to do anything, and there is no
24 technical basis coming from the Atomic Energy
25 Commissions.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER ARMIJO: Well, I don't want to
2 debate it, but I was in Japan a few weeks ago, and the
3 utility guys had a different view of that, who said what.

4 But I just was looking for a technical reason. Is there
5 something fundamentally-good about a big containment
6 that somehow takes out particles in the aerosols, so
7 you wouldn't benefit from a filtered --

8 MR. COLLINS: No. I think it just gives
9 you more time to respond. Ultimately, you have got to
10 arrest a core-damage event by reestablishing heat
11 removal from the containment.

12 MEMBER ARMIJO: Right.

13 MR. COLLINS: And what the filtered vent
14 would, hopefully, do in the Mark Is and Mark IIs better
15 than in a bigger containment is -- the time is shorter
16 in the Mark Is and Mark IIs, okay? So, if you can extend
17 the time available to arrest a core without having a
18 release, that is a better state. In the PWR large drys,
19 you have got more time available just by virtue of the
20 volume in the containment.

21 MEMBER ARMIJO: But if you have got a
22 severe -- well, let me talk to my severe core accident
23 colleagues sometime later, and they can explain it to
24 me. I just don't understand.

25 MR. MONNINGER: Dr. Armijo, this is John

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Monninger from the staff.

2 MEMBER ARMIJO: Yes.

3 MR. MONNINGER: I think it is also
4 important to recognize the fundamental difference
5 within the U.S. in the designs of BWRs versus PWRs for
6 these accident sequences. The BWRs, you are
7 essentially dumping your heat into your suppression pool
8 and you are isolated.

9 MEMBER ARMIJO: Right.

10 MR. MONNINGER: Right? What do our PWRs
11 do? Within the PWRs for these equivalent-type
12 sequences, you are running your aux feedwater into your
13 steam generator and you are dumping to the environment.

14 So, there is a fundamental difference in the management
15 of decay heat between the BWRs and the PWRs for these
16 equivalent accident sequences. BWRs are bottled up.

17 You are dumping it into your suppression pool and you
18 are heating it up. The PWRs, through aux feedwater,
19 you are dumping it to the environment.

20 So, that is why the historical emphasis or
21 focus has been on venting for the BWRs. So, there is
22 a technical basis here.

23 If you look at your potential weaknesses
24 in your containments for a PWR, it is typically steam
25 generator tube rupture or some type of ISLOCA or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 something like that. So, there is a technical basis.

2 And what the staff is trying to say here -- I
3 won't say please don't divert us -- but, hey, we think
4 the biggest bang for the buck, if there is one, is to
5 focus on the Mark Is and IIs, and there is a basis to
6 pursue these plants first.

7 MEMBER ARMIJO: Okay.

8 MR. MONNINGER: I am not sure if that helps
9 or not.

10 MEMBER ARMIJO: Yes, it does. It does.
11 Thanks, John.

12 CHAIR SCHULTZ: Other comments from the
13 Committee?

14 (No response.)

15 I would like to ask if there are any comments
16 from members of the public. I understand the phone
17 lines are open. If you would like to make a comment,
18 please identify yourself and make your comments to the
19 Committee or the staff.

20 (No response.)

21 Hearing no comments, we have a comment here.

22 MR. DUBE: Yes, Don Dube, the Office of New
23 Reactors. Just some thoughts for the Committee's
24 consideration.

25 And Dr. Shack was kind of hinting at this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 about an hour and a half ago. In an ideal world, one
2 would put the horse before the cart in the sense of,
3 if you look at the new reactor designs, first, the
4 Commission started with a policy on core damage
5 frequency, large release frequency, condition of
6 containment, failure probability, as well as the
7 industry with the utility requirements document. And
8 then vendors designed reactors to meet those goals.

9 Here the logical process would be, first,
10 to have a policy statement on land contamination and
11 offsite property damage. From that, it would set, based
12 on protective action or something, what the land
13 contamination levels would be in terms of becquerels
14 per square meter or curies per square meter, from which
15 one could back off what is the decontamination factor
16 of the filter have to be to meet that, and then work
17 in reliability of the filter, and so forth.

18 Here we have a concern on my part that we
19 may be out of phase in the sense of we are going to have
20 a recommendation to the Commission on a filter, but the
21 policy statement on land contamination may be several
22 years away. And hopefully, the policy on land
23 contamination will fit what the filtered vent
24 decontamination factor will be.

25 So, it is just some consideration for the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Committee and the staff as well. Are we getting out
2 of phase with regard to timing?

3 MEMBER RAY: Yes, and I would think that
4 is the kind of thing we might comment on at the
5 appropriate time.

6 CHAIR SCHULTZ: Other comments? Yes?

7 MR. GUNTER: Thank you.

8 My name is Paul Gunter. I am with Beyond
9 Nuclear.

10 I guess, first of all, as has been
11 indicated, there has been lots of public contact and
12 interaction with these staff meetings. And I just
13 wanted to convey that there is, at least within the
14 public interest community, there is a lot of concern
15 with regard to separating out the issue of the filtered
16 containment vent and the whole accident mitigation
17 process.

18 I think a lot of that stems from the
19 demonstration of Fukushima. And so, for many in the
20 public, there is this disconnect that the process that
21 is moving forward has essentially separated out what
22 was demonstrated and that we had containment failure,
23 we had vent failure stemming from a severe accident.

24 So, why aren't we looking at the severe
25 accident issue in sequence rather than separating it

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 out? And frankly, there is a lot of concern that this
2 is moving toward political and financial considerations
3 rather than public health and safety.

4 So, I just wanted to make that as a
5 bottom-line statement. That is not just coming from
6 me, but from the Natural Resources Defense Council, from
7 a whole host of public interest communities.

8 Also, with regard to the whole idea of the
9 current DTVS and the adequacy of the scrubbers in the
10 torus, one of the public comments -- I guess there have
11 been several instances of this -- reference a 1988 study
12 that was basically, apparently, a trip report from a
13 specialists' meeting on filtered venting containment
14 systems in Paris, France, from 1988.

15 So, we are a little puzzled by the fact that
16 we have got this demonstrated history. We have now got
17 a demonstrated event. And we are proposing again to
18 debate this issue further when, in fact, at page 4 of
19 this report it does state, quote, "Within the United
20 States, the only commercial reactors approved to vent
21 during severe accidents are boiling water reactors
22 having water-suppression pools. The pool serves to
23 scrub and retain radionuclides.

24 "The degree of effectiveness has generated
25 some debate within the technical community. The

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 decontamination factor, DF, associated with the
2 suppression-pool scrubbing can range anywhere from, 1,
3 no scrubbing, to well over 1,000, 99.9 percent
4 effective. This wide band is a function of the accident
5 scenario and composition of the fission products, the
6 pathway to the pool through spargers, downcomers, et
7 cetera, and the conditions in the pool itself.
8 Conservative DF values of 5 for scrubbing in Mark I
9 suppression pools and 10 for Mark II and Mark III
10 suppression pools have recently been proposed for
11 licensing review purposes. These factors, of course,
12 exclude considerations of noble gases which would not
13 be retained in the pool."

14 So, for quite some time now, the public has
15 not shared confidence in the scrubbing qualities in the
16 torus. And this has been backed up by not only the report
17 back from the NRC, but what is being demonstrated now
18 by the service that has already been put into these
19 foreign reactors.

20 So, again, we are concerned that we are
21 moving along this separate track, rather than what we
22 believe should be a direct outcome of the Fukushima
23 accident, which is what was demonstrated.

24 But, you know, I just want to add one note
25 as well. We continue to make this plea that what we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 see here is a fundamental problem that the regulator
2 is not recognizing the license conditions under General
3 Design Criteria 16, which would seem to us o be a
4 fairly-definitive definition of containment integrity
5 and a strong containment.

6 So, when you talk about strengthening
7 containment by temporarily defeating it, that doesn't
8 speak to General Design Criteria 16, which says you shall
9 have an essentially leak-tight containment. So,
10 another disconnect here with what we see as the license
11 condition and the track that the agency is on with regard
12 to public health and safety.

13 But I guess, more particularly, the
14 questions that I would like to ask: with regard to the
15 current filtration systems that you saw in Europe, how
16 did they evaluate the filtering-out of noble gases?
17 Was there any way of --

18 MR. DENNIG: It is excluded. That is not
19 included.

20 MR. GUNTER: It is excluded, right.

21 MR. DENNIG: It is excluded, yes.

22 MR. GUNTER: So, then, there are the
23 daughter products of cesium-137 and strontium-90.
24 These would be the daughters of xenon and krypton. And
25 so, it seems like, there again, I think this speaks to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 the land contamination issue as these products are being
2 excluded from any evaluation.

3 And also, with regard to 5.2, I just wanted
4 to get some sense of, on slide 28, when you say, "Other
5 containment designs are less susceptible to
6 overpressure," are you addressing the Westinghouse ice
7 condenser in this category?

8 MR. DENNIG: Yes.

9 CHAIR SCHULTZ: Thank you for the comments,
10 Paul. We appreciate that.

11 Hearing no other comments at this time --

12 MR. KRAFT: Excuse me. Sorry.

13 CHAIR SCHULTZ: Yes? Go ahead.

14 MR. KRAFT: Steven Kraft from the Nuclear
15 Energy Institute.

16 There is a reference that Robert made to
17 our letter that we sent in the other day. Here it is.

18 If you don't have copies of it, I am more than happy
19 to make it available to you.

20 The point of our letter was to really pick
21 up what I thought I heard a lot of the members here asking
22 and in a reference that Dr. Gunter made to the need for
23 holistic analysis, if I could use what is becoming an
24 overused word. Yes, there was a containment failure
25 at Fukushima, but that is the point, that we have to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

1 look at all of those processes, all of those scenarios,
2 all of those potentialities when assessing how you, in
3 fact, not vent filters versus not venting or not
4 filtering, but how do you manage a molten core? And
5 that is what we are looking at.

6 In our letter, we point out that the kinds
7 of analysis we are doing, we are looking at containment
8 sprays and flood-up and the venting, and all the things
9 that you saw on the pictures from the international work
10 that we would like to know a heck of a lot more about.

11 We have a series of questions that we gave
12 Dr. Dennig. I am curious to know when we might see some
13 response to that. They were questions we had, maybe
14 about two dozen of them, about the European experience
15 that we would like to learn from.

16 MR. DENNIG: Yes, those were on the table
17 when we had the meeting. So, we will dig that out.

18 MR. KRAFT: Thanks very much.

19 And really, what we are asking for here is
20 we recognize that there is a possibility that if we go
21 forward with the reliable hardened vent at the Mark I
22 and Mark II containments, that if the Commission
23 ultimately turns around and says, "Well, look, let's
24 revise that order and put in filters," there is potential
25 for rework. We understand that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 But the industry is willing to accept that
2 to gain some time to do the proper analyses, so that
3 we know that we are doing things correctly and not just
4 running to put a vent on the end of a pipe, a filter
5 on the end of a vent pipe.

6 Thank you.

7 MR. LEYSE: Can you hear me?

8 CHAIR SCHULTZ: Yes, we can.

9 MR. LEYSE: Am I on?

10 CHAIR SCHULTZ: Yes. Bob, please identify
11 yourself for the record.

12 MR. LEYSE: Yes. Yes, this is Bob Leyse,
13 and I will be damned brief because I have said this
14 before.

15 In terms of a holistic approach, this
16 2200-degree Fahrenheit criterion that many plants run
17 under, for example, Palo Verde, the Baker-Just equation
18 is based on specimens, zircaloy specimens, that you can
19 handle, walk around with in your pocket as pocket change.

20 In contrast to that, NRC is funding a huge
21 program at Sandia in which bundles of fuel rods, 49-rod
22 bundles, and earlier I guess some BWR bundles, are tested
23 in air only. For a fraction of the cost of that stuff,
24 you could do the kind of tests that would show in terms
25 of U.S. data that the 2200-Fahrenheit limit is too high.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

1 End of comment.

2 CHAIR SCHULTZ: Thank you, Bob.

3 Other comments?

4 MR. MONNINGER: Dr. Schultz?

5 CHAIR SCHULTZ: Yes?

6 MR. MONNINGER: If I could maybe either
7 help or confuse the ACRS, you just heard a discussion
8 on a Tier 1 issue and a Tier 3 issue.

9 CHAIR SCHULTZ: Yes.

10 MR. MONNINGER: The staff's desire is, of
11 course, a letter from the ACRS, preferably a positive
12 letter, at this time or in the near future on the Tier
13 3 items. So, that would not include our discussion at
14 the current time on the filter vents.

15 You heard information on the filter vents,
16 but you didn't hear the staff's recommendation yet.
17 We have been talking with Antonio and Ed Hackett, et
18 cetera, with the need to re-engage your group further
19 on the Tier 1 issue on hardened vents, filter vents.

20 So, just trying to keep your books straight,
21 our hope or desire would be that you we would maybe have
22 two separate letters, the one letter which we will dialog
23 with you again in the future on the hardened vent and
24 the filter vents, and then a separate letter on all the
25 Tier 3.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 CHAIR SCHULTZ: We should discuss that
2 schedule --

3 MR. MONNINGER: Okay.

4 CHAIR SCHULTZ: -- separately, and we will
5 have more discussion at the full Committee related to
6 Tier 3.

7 MR. MONNINGER: Right.

8 CHAIR SCHULTZ: And we will have
9 opportunities later on in June, depending on your
10 schedule, for other discussions on the Tier 1 filter
11 venting issue.

12 MR. MONNINGER: Yes. Thank you.

13 CHAIR SCHULTZ: Thank you.

14 Hearing no further comments, I will declare
15 a recess until 10 minutes of 4:00, so we can continue
16 the dialog on Tier 3.

17 (Whereupon, the foregoing matter went off
18 the record at 3:40 p.m. and went back on the record at
19 3:53 p.m.)

20 CHAIR SCHULTZ: Okay. I would like to call
21 the meeting back into session following the recess.

22 The next presentation this afternoon is on
23 Recommendation 2.2, Periodic Reassessment of External
24 Hazards, and Jenise Thompson is going to make the
25 presentation for the staff.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Jenise, welcome.

2 MS. THOMPSON: Thank you.

3 Good afternoon.

4 My name is Jenise Thompson. I am a
5 geologist in the Office of New Reactors, Division of
6 Site Safety and Environmental Analysis, and I have been
7 part of the larger-scale team that has been addressing
8 Recommendations 2.1, 2.2, and 2.3, but I will just be
9 briefing you today on Recommendation 2.2, which is the
10 Periodic Reassessment of the External Hazards.

11 As I am sure you are all probably sick of
12 hearing, the Near-Term Task Force Report identified a
13 set of recommendations to be undertaken by the staff.

14 Recommendation 2.2 reads that, "The staff should
15 initiate rulemaking to require licensees to confirm
16 seismic hazards and flooding hazards every 10 years and
17 address any new and significant information; if
18 necessary, update the design basis for SSCs important
19 to safety to protect against the updated hazards." So,
20 that is the text of Recommendation 2.2.

21 This was put into Tier 3 because the staff
22 has been focusing its efforts on Recommendations 2.1
23 and 2.3. In Tier 1, the staff is focusing on the seismic
24 and flooding hazards for both Recommendation 2.1, which
25 is the reevaluation of the hazards at the site, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Recommendation 2.3, which are walkdowns at the sites,
2 which is the most near-term of the actions that we are
3 currently undertaking.

4 Based on some feedback that we have received
5 from ACRS, as well as the Consolidated Appropriations
6 Act language from Congress, other natural external
7 hazards were added to the scope of Recommendation 2.1,
8 and that is something that has been put into Tier 2,
9 based on resource limitations.

10 So, with respect to Recommendation 2.2, the
11 staff's approach, as of today, is to define and begin
12 some initial pre-rulemaking activities that we feel are
13 necessary to position us for a future rulemaking
14 activity to implement this recommendation. And that
15 would only be done as resources become available because
16 the staff is very heavily engaged with Recommendations
17 2.1 and 2.3 in the Tier 1 activities at this point.
18 So, we don't want to take away any resources, either
19 staff or contractor resources, for a Tier 3 item at this
20 point.

21 Also, we are looking at the scope of the
22 rulemaking. Currently, based on Recommendations 2.1
23 and 2.3, we have seismic and flooding based on what was
24 in the Near-Term Task Force. As I previously mentioned,
25 the ACRS and the Consolidated Appropriations Act

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 included other natural external hazards. So, the staff
2 is also assuming that those other natural external
3 hazards would be included in the scope of Recommendation
4 2.2 as well.

5 And a fourth possibility that is still under
6 discussion at this point amongst the staff is whether
7 or not to include other man-related external hazards,
8 such as transportation accidents. But, as I said, that
9 is something that is under discussion. So, your
10 feedback on that would be appreciated.

11 MEMBER SKILLMAN: Jenise?

12 MS. THOMPSON: Yes?

13 MEMBER SKILLMAN: What other natural
14 external hazards are on your platter right now, please?

15 MS. THOMPSON: Some of the examples would
16 be a transportation accident. So, if you are located
17 on a riversite or --

18 MEMBER SKILLMAN: Natural.

19 MS. THOMPSON: I'm sorry?

20 MEMBER SKILLMAN: Natural.

21 MS. THOMPSON: Oh, natural, I'm sorry.
22 Severe storms would be considered. High-wind effects,
23 tornadoes, those would fall into the natural external
24 hazards.

25 MR. CHOKSHI: Yes, we are looking at a slew

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of natural hazards, including tornado, temperature
2 extremes, some of the sand storms, all kinds of different
3 things, you know, what you typically look at, I think,
4 if you go to the PRA standard or something. But, you
5 know, there is a big list of the events, but then a few
6 of them are common to everybody, like wind and
7 tornado -- that comes to the first thing -- and the
8 temperatures.

9 MEMBER SKILLMAN: Well, certainly, those
10 are two that come to my mind. But I think around this
11 table some of us have experience with jellyfish, masses
12 of biomaterial in the Delaware River, and other natural
13 events that are truly aquatic biological that have a
14 tendency to kill the cooling water systems. And then,
15 for plants that have their own internal cooling water
16 systems -- Palo Verde is an example where you have got
17 great ponds of water that is susceptible to a great
18 amount of ultraviolet and infrared -- the ability to
19 grow material that fouls all the heat exchangers that
20 are essential for emergency core cooling.

21 So, it would seem to me that there is a body
22 of evidence that is readily available, and it is probably
23 in operating experience.

24 MR. CHOKSHI: Exactly, yes. In fact, I
25 think one of the things that right now we are looking

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 in the standard area is how to do the screening analyses
2 for this long list of events. And that operating
3 experience is one of the big things. We need to sort
4 of analyze through that and see what is applicable to
5 your site outlined.

6 But that is still being -- we started with
7 a long list of those kinds of events, and have done some
8 thinking, but haven't really --

9 MEMBER BANERJEE: So, do they include these
10 solar storms that we hear about?

11 MR. CHOKSHI: Yes. Well, that is magnetic
12 and lightning.

13 MEMBER BANERJEE: No, no, the --

14 MR. CHOKSHI: Yes, magnetic event storm
15 like some --

16 MEMBER BANERJEE: No, where a lot of
17 transformers like got burnt out in the twenties and
18 before that.

19 MR. CHOKSHI: Yes, there are quite a few
20 different things, yes.

21 MEMBER RYAN: I assume flooding covers
22 flooding from any source?

23 MR. CHOKSHI: Yes, flooding --

24 MEMBER RYAN: Rain, tornadoes, hurricanes?

25 MS. THOMPSON: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. CHOKSHI: Yes, those come as part of
2 the flooding, right.

3 MEMBER RYAN: Oh, okay, yes.

4 MS. THOMPSON: Yes, and all the points you
5 are mentioning also play into Recommendation 2.1 for
6 other natural external hazards. So, that is something
7 that, going forward with Recommendation 2.1 for other
8 external hazards as a Tier 2 item, the decisions on the
9 scope of the hazards to be considered, that would be
10 something that would feed into Recommendation 2.2, once
11 we get to that point.

12 MEMBER SKILLMAN: Okay. Could you give a
13 little briefing on what you see on the fourth bullet,
14 man-related external?

15 MS. THOMPSON: Man-related hazards would
16 be something like a transportation accident. So, if
17 you have a barge accident on a river near your intake
18 structure or if there is a chemical plant or some kind
19 of chemical site located near your power plant, what
20 would the impact of an accident there be to your site,
21 as well as if any large airports or air pathways have
22 been rerouted over the plant since it was licensed, you
23 would have to consider the effect of an aircraft impact
24 at or near the plant as well in your re-analysis.

25 MEMBER SKILLMAN: Thank you.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER BANERJEE: But you do already
2 consider a lot of these man-related hazards, right?

3 MS. THOMPSON: Right. The man-related
4 hazards -- and that is not my area of expertise -- but
5 my understanding from our staff who do deal with the
6 man-related hazards is that it is something that is
7 considered during the licensing process, but it is not
8 a requirement to update as your plant ages. So,
9 whatever was the licensing basis for the plant in terms
10 of other man-related external hazards --

11 MEMBER SKILLMAN: Right. Okay.

12 MS. THOMPSON: -- remains their licensing
13 basis to this day, and they have not reevaluated that
14 based on any changes made to transportation corridors
15 or anything along those lines.

16 MEMBER SKILLMAN: Thank you.

17 MS. THOMPSON: All right. So, the staff's
18 proposal for Recommendation 2.2 at this point is to begin
19 pre-rulemaking activities. As I mentioned before, a
20 lot of that is going to be information that we collect
21 as we proceed through the process of resolving
22 Recommendations 2.1 and 2.3.

23 As part of the scope of work for
24 Recommendation 2.1 and 2.3, we are also heavily engaged
25 with the external stakeholders and internal

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 stakeholders as well. So, trying to capture those
2 interactions as well to see how they would feed into
3 Recommendation 2.2. So, as you were bringing up some
4 of the examples of other natural or man-related external
5 hazards, that is something that will be addressed as
6 part of Recommendation 2.1. So, we want to make sure
7 that we are not making two different decisions, one for
8 2.1 and one for 2.2.

9 We want to capture the information as it
10 is being decided upon for Recommendation 2.1 or 2.3 and
11 applying that to Recommendation 2.2, once we get to that
12 point, which is why we are calling this the
13 pre-rulemaking activity and information-gathering. It
14 is primarily a lot of knowledge-capture on behalf of
15 the staff, so that we have all of the information at
16 our fingertips ready to go when we feel that we have
17 enough of it to support a rulemaking activity.

18 So, some of the things that we anticipate
19 will come up as we deal with Recommendation 2.1,
20 primarily 2.1 because 2.3 is that nearer-term action
21 that is going to feed a lot into 2.1. So, most of the
22 feedback for Recommendation 2.2, we are expecting that
23 from Recommendation 2.1.

24 One of the biggest questions is, what
25 constitutes new and significant information? That is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 something that the staff is grappling with with respect
2 to Recommendation 2.1, and we expect to capture that
3 decision and apply it to Recommendation 2.2 in the
4 future.

5 Also, the staff is having to decide what
6 are we going to do with the updated hazard information.

7 MEMBER SHACK: I thought that is why you
8 put 10 years; you wouldn't have to come up with that
9 criterion.

10 MS. THOMPSON: So, what will we do with the
11 updated hazard information? We will be using a
12 risk-informed approach to disposition that information
13 and to make decisions going forward. And how will the
14 staff determine if it is necessary to update the design
15 bases for SSCs important to safety? Do we need to
16 determine if there is a threshold for regulatory action
17 and, if so, what is that threshold for regulatory action.

18 And again, that is something that we expect
19 will come up in the process of dealing with
20 Recommendation 2.1, because we are expecting updated
21 hazard information. So, we will have to answer all of
22 these questions for Recommendation 2.1, and then we can
23 use that experience and apply it to Recommendation 2.2,
24 so that our rulemaking will be a much more focused
25 approach and we will know exactly what we want the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 end-product to be at the end of it.

2 And then, finally, there is a lot of
3 information from international practices, as well as
4 our own experience here in the U.S. We would like to
5 harness that information. We want to look at the ROP.

6 We want to look at the experience that international
7 regulators had with similar approaches.

8 A lot of the European regulators have a
9 periodic safety update. So, we would like to look at
10 what they have succeeded with in the past, what hasn't
11 necessarily worked as best as it could. And that is
12 going to take some time to dive into and to process with
13 the staff and see how can we best use that international
14 experience and our own domestic experience to really
15 make sure that the scope of our rulemaking for
16 Recommendation 2.2 gets us the information that we need
17 in the timeframe that we need it, and it is in a workable
18 format that will allow us to easily make regulatory
19 decisions going forward.

20 So, we have had one public meeting so far,
21 but that is because our staff has been very, very heavily
22 engaged with Recommendations 2.1 and 2.3. So, our
23 public meeting was on May 7th. We had very few
24 questions, I think because we have been having so many
25 interactions and people have been so focused on

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Recommendations 2.1 and 2.3.

2 But some of the questions that we received
3 from the public were: the nexus to Fukushima for the
4 inclusion of the other man-related external hazards.

5 This was something that we had discussed internally
6 pretty extensively with the Steering Committee as well.

7 For Recommendation 2.1, initially, the
8 thought was all external hazards, but because of the
9 nexus to Fukushima and putting it in Tier 2, for resource
10 limitation reasons, the other man-related external
11 hazards were removed from Recommendation 2.1. So, that
12 is something that, as I said before, is still under
13 discussion with the staff internally. We seek your
14 feedback on that, and the Steering Committee is still
15 discussing that as well.

16 There were also some concerns from the
17 public about old information that is newly-discovered.

18 The staff's opinion of that is that, if the information
19 has been previously identified and dispositioned, that
20 you wouldn't have to go back and rehash something. But
21 if the information is older information that has never
22 been assessed and dispositioned for the site, then that
23 may be included, if it meets the threshold for new and
24 significant information.

25 The date of the information isn't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 necessarily the focus, but it is the newly-discovered.

2 So, if it is newly discovered or recently brought to
3 their attention, then that may be something to consider.

4 MEMBER STETKAR: Do you have an example of
5 what that might be?

6 MR. CHOKSHI: Yes, I think the one example
7 was there are some new estimates of the tsunami waves'
8 heights from an Alaska earthquake of Good Friday.

9 MEMBER STETKAR: Okay.

10 MR. CHOKSHI: And so, that kind of things.

11 MEMBER STETKAR: Thanks.

12 MS. THOMPSON: One of the other questions
13 that we received was how to handle the information that
14 has been submitted as contentions to new reactor
15 licensing. As the new reactor sites are going through
16 their licensing process, some information is being
17 brought to light as contentions. And there was a
18 question from the public as to how we would handle that
19 information.

20 And again, that goes back to the previous
21 point of, it has already been dispositioned for that
22 particular site, then, no, it wouldn't fall within the
23 scope of this. But if it hadn't been considered at the
24 site, then it would fall within the scope of new and
25 possibly significant information. But, again, we would

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 have to determine what is new and significant, and if
2 the information meets that criterion, then, yes, it
3 would be included within the scope of Recommendation
4 2.2.

5 Another point that was brought to our
6 attention is that we have had very similar actions to
7 this in the past. It hasn't necessarily been a
8 rulemaking, but particularly with seismic hazards, the
9 GI program has been used as new and significant
10 information has come to the NRC's attention. So, there
11 was a question of whether rulemaking was the way to go
12 about this or could we rely on existing programs like
13 the GI program to handle new and significant
14 information.

15 And then, also, as I keep mentioning, the
16 staff is heavily engaged with Recommendation 2.1 and
17 2.3. There has always been a schedule concern that are
18 we going to start Recommendation 2.2 too soon. We may
19 get into schedule concerns where people are still so
20 busy with the work for Recommendation 2.1 and 2.3 that
21 we may not have the staff resources to start the work
22 on Recommendation 2.2. And that may be true for other
23 external stakeholders as well. So, that is something
24 that we are trying to be mindful of going forward, that
25 the schedule does play into this quite heavily.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER STETKAR: Jenise?

2 MS. THOMPSON: Yes?

3 MEMBER STETKAR: I want to ask, and I guess
4 I am still struggling with -- you have mentioned it four
5 or five times -- this wonderful phrase "new and
6 significant". Is that something that the staff has
7 imposed upon themselves?

8 MS. THOMPSON: The new and significant is
9 directly from the Near-Term Task Force recommendation.
10 It asked us to address any new and significant
11 information.

12 I can go back to the text, but --

13 MEMBER STETKAR: That is okay. I now know
14 where the quote comes from.

15 MS. THOMPSON: Yes, that is where it comes
16 from. That is one of the things that the staff is
17 considering, is do we have to define what constitutes
18 new and significant information and, if so, we need to
19 come to some consensus, both as an internal regulator
20 as well as with the industry to determine --

21 MEMBER STETKAR: I understand. I
22 understand.

23 MS. THOMPSON: -- what is new and
24 significant.

25 MR. CHOKSHI: Yes, I think there is a lot

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of new information out there, but not necessarily really
2 to go back and look at all of that, you know. Some of
3 that makes a difference.

4 MEMBER STETKAR: I would encourage you, and
5 you have mentioned it, to look at some of the European
6 regulatory --

7 MR. CHOKSHI: Exactly.

8 MS. THOMPSON: Right.

9 MEMBER STETKAR: -- experience of how they
10 treat that concept.

11 MR. CHOKSHI: Yes.

12 MS. THOMPSON: Right.

13 MR. CHOKSHI: Particularly, I think, you
14 know, what they do and how that gets incorporated into
15 the plant, the decisions that they make. Because I
16 think before we go forward, we need to lay out that whole
17 process, so people know what we are asking or what this
18 means.

19 MS. THOMPSON: Yes.

20 MR. CHOKSHI: So, we have been talking.
21 I was in India last week and we talked to them about
22 that periodic safety review. I think I have gotten some
23 information from them.

24 It is not clear that people have a
25 consistent process. And so, it is good to find out.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 I mean, some of them do, but there are a lot of questions.
2 What do you do with this? What regulatory actions?
3 You know, the NTTF report talks about extended design
4 basis and some of the different concepts. All of that
5 needs to be thought through and understood before we
6 embark on any kind of rulemaking activities.

7 MEMBER ARMIJO: Well, that is a very tough
8 problem.

9 MR. CHOKSHI: Exactly.

10 MEMBER ARMIJO: The Japanese had a perfect
11 example with the new tsunami hazard evaluation
12 techniques that were being proposed by Dr. Satake, and
13 they were being worked on, but nobody really took them
14 that seriously. And it might have helped.

15 MR. CHOKSHI: Yes. Exactly. I think that
16 whole decisionmaking process, once you have new
17 information, that is --

18 I think that was the presentation, right?

19 MS. THOMPSON: Yes. We went for brevity.

20 (Laughter.)

21 MR. MONNINGER: Dr. Schultz, are there
22 comments from the Committee?

23 CHAIR SCHULTZ: Oh, excuse me.

24 MR. MONNINGER: John Monninger.

25 So, one of my thoughts is, as we are going

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 through here, to sort of compare and contrast. So,
2 parts of this, you heard 5.2, which was other containment
3 designs. And there, no decision has been made with
4 regard to whether regulatory action is needed or not
5 for venting for other containment designs versus you
6 look at this issue here, 2.2, and the decision has
7 already been made, pursue rulemaking. That was
8 recommended by the Task Force and directed by the
9 Commission.

10 So, in this example, we are working in the
11 implementation phase. We won't get too far because the
12 rulemaking really isn't needed for 10 years, but it is
13 important to recognize that here the proposed regulatory
14 decision has been made. The agency should do
15 rulemaking. Now we are in implementation.

16 Versus when we talk about 5.2, it is study
17 the technical aspects of venting for other containment
18 designs. We may ultimately provide recommendations to
19 you on the Commission for an order or rulemaking or,
20 for that, we may recommend sunseting.

21 So, you are going to hear a bunch of
22 different things in the Tier 3 activities that, for one
23 reason or another, they go different directions.

24 CHAIR SCHULTZ: Thank you, John.

25 MEMBER SKILLMAN: Could I ask you to go back

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 to slide 19 for a minute, please?

2 At the last bullet, in my view, there are
3 two independent thoughts that are communicated. One
4 is the practice and one is the insight.

5 We heard in the previous presentation
6 regarding the filtered containment vent system that the
7 Swedes and the Swiss simply said, "Do it." after TMI;
8 whereas, in our country, we have agonized over what to
9 do with many of these things.

10 So, there is an example of where -- and I
11 would say the Germans probably did the same thing; the
12 Reaktor Sicherheits Kommission, they simply said there
13 is no question you are going to do this if you are going
14 to operate this plant. So, there is in those countries
15 a practice of the regulator giving very clear
16 instructions to the licensees, and the licensees comply.

17 To what extent will your product from 2.2
18 examine how the regulation is pumped out to the licensee
19 before the licensee is perhaps willing to take action?

20 MR. CHOKSHI: I think if I understood
21 correctly, that is one of the things we wanted to look
22 at the international practice, is what they have
23 mandated, and is their clear guidance on what to do
24 with -- first of all, how they judge what is significant
25 information. I am sure they have to answer that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 question.

2 The second thing is, what actions were
3 automatically triggered at what level? For example,
4 if they find a new seismic hazard type levels -- like
5 we do every so many years, USGS comes out with new maps
6 and things. Is there a practice that, okay, you have
7 to evaluate your plant or do maybe a risk-based analysis
8 and demonstrate that you can meet certain performance
9 goals?

10 So, we want to find out what are the
11 practices. You know, what triggers an action, either
12 regulatory or by a licensee?

13 So, that is the purpose of that, to
14 understand the practices outside. And then, you can
15 make a recommendation to the Commission on the program.

16 MEMBER SKILLMAN: To whom will you report
17 this output?

18 MR. CHOKSHI: Once we do this study?

19 MEMBER SKILLMAN: Uh-hum.

20 MR. CHOKSHI: I think before we -- and John
21 correct me -- but we have to write a SECY paper and we
22 explain the options to the Commission. You know, we
23 probably will have certain options, including one option
24 being no rulemaking, and then we will have probably a
25 couple of options, different rulemaking. And after we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 get all this information and form a position, that will
2 be the next step.

3 MEMBER SKILLMAN: Okay. Thank you.
4 Thank you.

5 MR. CHOKSHI: Does that answer your
6 question?

7 MEMBER SKILLMAN: Thank you. Uh-hum.

8 CHAIR SCHULTZ: Other comments from the
9 Committee or questions?

10 (No response.)

11 Thank you, Jenise, for the presentation.
12 We appreciate it very much.

13 John, we will change out for the next
14 presentation?

15 MR. MONNINGER: Yes.

16 CHAIR SCHULTZ: I was going to ask for
17 public comments after these two presentations.

18 Jenise, are you going to be here?

19 MS. THOMPSON: Unfortunately, I have to
20 leave at 4:30. Nilesh will be here.

21 CHAIR SCHULTZ: Then, I will ask for public
22 comments at that time. We had it on the agenda here
23 at the end of this segment.

24 So, we are now moving to Recommendation 3,
25 Potential Enhancements to the Capability to Prevent or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Mitigate Seismically-Induced Fires and Floods.

2 MR. COE: Thank you. I will just introduce
3 Kevin Coyne, Branch Chief in the Probabilistic Risk
4 Assessment Branch and Research. We have been assigned
5 this task, and Kevin will lead us through the
6 presentation today.

7 CHAIR SCHULTZ: Thank you, Doug.

8 MR. COYNE: Just some background on this
9 item. I think everyone is aware seismic events have
10 the potential to cause multiple failures of
11 safety-related SSCs and non-safety-related SSCs, induce
12 separate fires and flooding events in multiple locations
13 at the site, and degrade the capability of plant systems,
14 structures, and components intended to mitigate the
15 effects of fires and floods.

16 There is some operating experience that is
17 available on seismically-induced fires
18 post-earthquake. It has been things like breaker
19 cubicles, having a fire ignition event. You could also
20 imagine that transformers and things like that, that
21 could be impacted by the seismic event, could also
22 represent a fire ignition source in the plant.

23 From a flooding perspective, piping system
24 failures induced by a seismic event or tank failures
25 induced by the seismic events could represent a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 potential flooding hazard in the plant.

2 So, in the Near-Term Task Force Report, this
3 is Recommendation 3, which recommended, as part of a
4 long-term review, that there be an evaluation of
5 potential enhancements to the capability to prevent or
6 mitigate seismically-induced fires and floods.

7 The scope of this item pertains to internal
8 seismically-induced fires and floods. So, fires
9 involving things like breakers and transformers, floods
10 involving things like tanks and piping systems.

11 External seismically-induced fires and
12 floods are considered to be outside the scope of this
13 issue. Externally-induced fires are considered to be
14 a low-risk contributor, and external
15 seismically-induced floods are covered by
16 Recommendation 2.1, 2.2, and 2.3 activities. So, we
17 are not considering them within the scope of this
18 particular item.

19 In the SECY-11-0137 that came out in the
20 fall, the staff prioritized Recommendation 3 as a Tier
21 3 item. In the SRM that the Commission issued in
22 response to that SECY paper, the Commission agreed with
23 the Tier 3 prioritization of the overall recommendation,
24 but also directed the staff to initiate development of
25 a PRA method to evaluate potential enhancements as part

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of the Tier 1 activities.

2 So, as John indicated just a minute ago,
3 there is a lot of variety in the Tier 3 items. This
4 is somewhat unique in that the recommendation itself
5 is Tier 3, but there is a significant part of it that
6 the Commission elevated essentially to a Tier 1
7 activity, to initiate this PRA method development.

8 The basis for that was largely that there
9 was an understanding that preventing
10 seismically-induced fires and floods could be done using
11 existing deterministic methods, but to assess the
12 mitigation capability of equipment in the plant and
13 under these circumstances, we really needed the
14 knowledge of the accident context that you were
15 demanding these components to operate in.

16 And the systematic way to get an
17 appreciation for that context is using a PRA-type
18 approach. So, that was the motivation for elevating
19 the PRA item as a prerequisite activity for the eventual
20 resolution of this issue.

21 MEMBER STETKAR: Kevin, before you flip,
22 I am trying to keep all of the bits and pieces straight.

23 Seismically-induced external floods are treated where?

24 MR. COYNE: So, these would be things like
25 dam failures leading to onsite flooding. And those

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 would be treated under Recommendation 2.1, is my
2 understanding.

3 MEMBER STETKAR: How do I know that the
4 seismic event that fails the dam doesn't also fail
5 equipment in the plant, because the external flooding
6 in 2.1 just looks at a term called "external flooding" --

7 MR. COYNE: Right.

8 MEMBER STETKAR: -- which most people will
9 say, "Well, we will look at random dam failures" or "It
10 is my job to look at a dam failure, but I don't know
11 anything about the power plant."

12 The seismic event could fail the dam, cause
13 a flood, and also cause disruption of things inside the
14 power plant because the seismic event doesn't know that
15 it is supposed to be segregated that way.

16 So, I am not sure that 2.1 covers
17 seismically-induced external flooding. I can deal with
18 seismically-induced external fires. I will give you
19 that one. But it just not clear to me that it does.

20 MR. COYNE: I am looking at --

21 MEMBER STETKAR: It is not clear to me that
22 it doesn't, but it is not clear to me how it does, if
23 it does.

24 (Laughter.)

25 MR. COYNE: Now, John, again, your question

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 pertains more towards seismically-induced failure of
2 a structure that could cause external flooding. It,
3 presumably, would be covered by 2.1, but the combination
4 of having the external flood with seismic-induced damage
5 to the plant a la a typical seismic PRA doesn't appear
6 to be captured.

7 MEMBER STETKAR: Knitting the two
8 together.

9 MR. COYNE: Right.

10 Nilesh has a comment.

11 MR. CHOKSHI: Yes, I think you are
12 absolutely right. We are looking at the
13 seismically-induced dam figures, but they fall far from
14 the plant, not the vibratory effects on the other
15 seismic; that is not included.

16 We hadn't thought about that question until
17 you asked it. I don't think it is normally we combine
18 seismic and flood at the same time. An assumption is
19 probably it is the event which leads to the dam failure,
20 depending -- it is a good question. I mean, in the
21 external part, we are only looking at the flood effects.

22 MEMBER ARMIJO: It is too
23 compartmentalized when the seismic event can do the dam
24 failure --

25 MEMBER STETKAR: We talked about

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 fragmented earlier.

2 (Laughter.)

3 MEMBER ARMIJO: It is fragmented. But the
4 dam failures, station blackout, internal damage --

5 MR. COYNE: I agree with Nilesch. It is a
6 good question. To be honest with you, we are not sure
7 how to handle internal seismically-induced fires and
8 floods; the external places another element to it. We
9 will go back and look at that item and work with the
10 JLD. It is a good comment we will take back.

11 MEMBER SHACK: An earthquake big enough to
12 kill a dam is likely to do some damage.

13 MR. COE: Yes, depending on the location
14 of the earthquake, the location of the dam, and the
15 location of the plant.

16 MR. COYNE: Exactly. And induce fires
17 internally to the plant and/or flooding events.

18 MEMBER SHACK: It is all site-specific.

19 CHAIR SCHULTZ: But these, to us, look like
20 good Tier 3 activities.

21 MEMBER SKILLMAN: It appears as though the
22 bounds that you put around this on this slide are shaped
23 by the text of Chapter 4.1.2 in the NTTF.

24 MR. COYNE: Leading up to the
25 recommendation. Absolutely. Absolutely.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER SKILLMAN: I think the broader
2 approach is the wiser approach because this gives at
3 least those of us who are thinking about it the
4 impression of a very limited view of what can be a very
5 broad and significant nature event that affects a whole
6 lot of stuff.

7 MR. COYNE: And I agree; it can be a very
8 broad event. And that is one of the challenges we face,
9 is putting some bounds on it, so we can come up with
10 a workable solution. That scope was driven largely by
11 the text of the NTTF report, which is somewhat narrow
12 in its application of where that recommendation was
13 playing.

14 But we will take the comment and go back
15 and take a look at it.

16 MEMBER SKILLMAN: Thank you.

17 MR. COYNE: As if to underscore the point,
18 and this is not meant to be a comprehensive list, but
19 just some of the things that are challenges with this
20 particular thing.

21 So, I think everyone understands we have
22 seismic PRAs; we have fire PRAs; we have flooding PRAs.

23 The challenge here is that we are looking at concurrent
24 and coupled events, the seismic event that leads to fires
25 that also leads to flooding.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 So, hazard definition and characterization
2 is always a challenge. In this case, we think it would
3 be even more so.

4 Seismic fragilities for SSCs, you know,
5 that is a known thing that we know how to do in general
6 for seismic PRAs, but we are talking about SSCs that
7 go beyond typically what we may consider. So, things
8 like fragility for fire protection piping, things that
9 may be needed for suppression of an event. Also,
10 looking at fragilities in different ways: what is the
11 seismic fragility of a breaker as a fire-ignition
12 source? The transformer is a fire-ignition source.
13 So, it is looking at fragilities in a different way than
14 we typically do under a seismic evaluation.

15 The modeling of concurrent and subsequent
16 initiating events, including the combinatorial effects
17 you could have. If you could get a seismically-induced
18 fire in one breaker cubicle, you could imagine getting
19 it in another breaker cubicle and another in another
20 location throughout the plant; similar with flooding.

21 So, getting a handle on these combination of events
22 that could be happening concurrently through the plant
23 and how to model them within the existing framework that
24 we use.

25 System interactions, obviously, could be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 important, the HRA challenges associated with seismic
2 events, and it is not lost us, the multi-unit risk
3 considerations for sites with multiple plants, that it
4 could be multiple units impacted by the hazard.

5 So, this was just meant to be laying the
6 foundation that this is a challenging problem, and the
7 scope considerations that were brought up earlier
8 underscore that even further.

9 So, the current status: earlier this year
10 in SECY-12-0025, the staff presented, I guess what we
11 would call, a plan for a plan, sort of a few pages in
12 that SECY paper, the last few pages, as a matter of fact,
13 that provided staff assessment of the issue in general
14 and provided sort of a framework for a pre-plan that
15 identified a few objectives the staff would consider.

16 And that includes things like what would
17 be the overall objective of a PRA method. This is
18 focusing mainly on the Tier 1 portion. The Commission
19 directed development of a PRA method. So, defining
20 objectives of the method: who would use the method?

21 Is it intended for NRC use, licensee use, or both?
22 Stakeholders that should be involved in the development
23 of the method and the review of the method.
24 Information-gathering activities, that includes the
25 traditional literature searches, but also interacting

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 with some of our international counterparts to determine
2 how this issue is treated in other countries.

3 Very important for this was the
4 coordination with other ongoing initiatives. As we
5 have heard in the last presentation, Recommendation 2.1
6 and 2.3 will bring a lot of information to bear that
7 is relevant to this issue. We want to make sure we remain
8 cognizant and engaged with these other items they are
9 developing and factor it in as appropriate into the PRA
10 method development activities.

11 And then, finally, the last portion of that
12 plan was develop some resource and schedule estimates.

13 The staff is currently drafting that plan. Our intent
14 is to make it available in a publicly-available memo
15 that will be referenced in the upcoming July SECY paper.

16 So, it wouldn't necessarily be part of the SECY paper
17 itself, but it would be available to anyone who was
18 interested to see what was in there.

19 MEMBER STETKAR: Kevin, the reason I asked
20 about the external dam failure thing was in the SECY
21 paper it explicitly calls out that the scope includes
22 external seismically-induced floods; for example,
23 upstream dam failures and seismically-induced losses
24 of heat sink, downstream dam failures.

25 So, I was curious whether an active decision

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 had been made to depart from that scope or --

2 MR. COYNE: It was a refinement of our
3 understanding of how the interaction between the various
4 NTTF --

5 MEMBER STETKAR: Of 2.1 --

6 MR. COYNE: Of 2.1 and the recognition that
7 GI 2.04 was closed to Recommendation 2.1. And it is
8 a good point that we will have to go back and take another
9 look at.

10 MEMBER STETKAR: Okay. Okay.

11 MR. COYNE: A number of key considerations:
12 you already heard about staffing and resource
13 limitations. This is an area where we have a very
14 limited number of staff with the requisite knowledge,
15 skills, and abilities, not only for PRA, but external
16 hazard evaluation, and adding to that method development
17 experience. So, it is more than just application of
18 existing methods. It is being able to actually develop
19 PRA methods that could be applied in a practical manner.

20 Based on the literature reviews we have done
21 and the information-gathering with some of our
22 international counterparts, it is our opinion that there
23 is no current consensus state-of-practice methods that
24 exist for seismically-induced fires and floods. That
25 is not to say that we haven't found examples where

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 methods have been applied to non-nuclear facilities.

2 There is at least one example we know of where it has
3 been applied to a nuclear power plant, but it is not
4 up to the level where we would consider it a
5 state-of-the-practice kind of application, where it has
6 been a demonstrated method. So, there is nothing we can
7 readily borrow that has already been developed.

8 The ASME/ANS Joint Committee on Nuclear
9 Risk Management has recently formed a working group to
10 address multiple concurrent events. This would
11 eventually go to the PRA standard. This is very early
12 in the process, but timely and a good opportunity for
13 the NRC to remain engaged in that activity. So, our
14 intent would be to continue our engagement in that
15 working group.

16 And then, finally, recognition of other
17 Tier 1 activities will provide substantial information
18 relevant to the issue. Some examples: obviously, the
19 2.1 and 2.3 issues; to some extent, the 4.2 mitigation
20 strategies issues, and probably of lesser importance
21 are the 5.1 and 7.1 issues that are currently working
22 their way through the process.

23 But it was our assessment that it would be
24 more efficient, before we tried to make substantial
25 progress on this issue, to wait until some of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 information from these activities became available to
2 factor that into the overall assessment of where we would
3 head with this.

4 That said, we recognize that there are
5 things that could be done right now. So, we plan to
6 engage the standards development organization, ANS and
7 ASME, and have one of our staff members participate in
8 the working group for looking at concurrent events.

9 We will maintain cognizance of what is going
10 on with some of the other NTTF recommendations and other
11 activities throughout the agency, and, in particular,
12 the Recommendations 2.1 and 2.3 activities, and then
13 continue PRA method development.

14 I would note on the standards development,
15 when we considered this, this really is an opportune
16 time to engage the standards development. It is an
17 opportunity we don't often get where the standards tries
18 to define what we should do with a method, and then the
19 method itself defines how to do that. And it seems,
20 in the timing of things, very rarely do we have the
21 opportunity to define what a method should do before
22 we go off and try to develop a method. So, this is
23 actually trying to do things in the right order. So,
24 I think it is going to be a very important part of our
25 overall activity.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

1 CHAIR SCHULTZ: Kevin, before you leave
2 that, John mentioned this earlier in the presentation,
3 that we weren't going to talk about schedules. But it
4 does seem here like you have got some connections that
5 at least you have drawn out between the activities that
6 are being relied upon to get to a conclusion --

7 MR. COYNE: Right.

8 CHAIR SCHULTZ: -- later on. Can you give
9 us a sense of what we might be talking about here in
10 terms of the dates of the industry-related, the ANS/ASME
11 activities. They are just talking about it at this
12 point in time? Or is there any schedule? I am not
13 talking about your schedule, but these other
14 activities --

15 MR. COYNE: Right.

16 CHAIR SCHULTZ: -- are they scheduled yet?
17 Or are they just being formulated?

18 MR. COYNE: I am pausing to remember a
19 conversation I just had with Mary Drouin, who is our
20 representative for that committee. That working group
21 hasn't taken off yet in the standards group, but they
22 are doing some preliminary work to set up the working
23 group. So, she is engaged with that. And then, our
24 intent is to have one of our senior reliability analysts
25 who is conversant in external hazard analysis to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 participate in that working group. My understanding
2 is that would be in the relatively near-term, months
3 rather than years from now.

4 CHAIR SCHULTZ: The initiation part?

5 MR. COYNE: The initiation of that.

6 The NTF recommendations, the Tier 1, the
7 schedule is fairly well-known from, say, the orders for
8 2.1. We are cognizant of that, but we think the
9 advantage we would have from getting some of the
10 information back from the sites on seismic and flooding
11 hazard information would be very valuable for the
12 development of the PRA method and knowing what the
13 current status of the information available to plants
14 would be. And that would speak to the feasibility and
15 practicality of any method we come up with through any
16 Recommendation 3 activities.

17 So, for example, it is not hard to imagine
18 it would be easier to apply an eventual PRA method for
19 this area if we were starting with a plant that had a
20 seismic PRA and a fire PRA. If we were starting from
21 nothing, it would be more difficult, you would think,
22 to make progress in that area. So, knowing what the
23 status of plants were as Recommendation 2.1 plays out
24 would be very useful going forward, so we have a better
25 sense of the environment.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 CHAIR SCHULTZ: Thank you.

2 MR. COYNE: Continuing on with the staff
3 recommendation on Recommendation 3, it is to continue
4 development of the PRA methodology, as we were directed
5 to in the Commission SRM to SECY-11-0137. And that
6 would involve two main activities: engagement with the
7 PRA standards organizations, as I described, and, also,
8 conducting what we are calling a feasibility study to
9 assess PRA approaches for evaluating multiple
10 concurrent events.

11 As we talked about in some of the challenges
12 of the method, we are talking about multiple events
13 happening in multiple locations throughout the plant,
14 potential dependencies between the events, things that
15 the linked fault-tree framework don't necessarily
16 handle well, not that it is impossible to handle these
17 concurrent types of events through that methodology,
18 but it is not a known thing that that is the best method
19 to evaluate this type of issue.

20 So, we would intend to do a feasibility
21 study to evaluate limitations and challenges with using
22 the current state-of-practice approaches for nuclear
23 plant PRA; also, looking at other potential methods that
24 may be better suited for handling these kinds of
25 interactive events of multiple fires being caused by

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 a seismic event, multiple floods, multiple areas of the
2 plant being impacted.

3 We would also want to look at potential
4 screening approaches that could help focus staff effort
5 on the more risk-significant scenarios. And then,
6 finally, look at how to best integrate the method into
7 an existing PRA framework, so that it can be more readily
8 adapted and used within the existing framework.

9 MEMBER REMPE: Could you elaborate a little
10 bit more about what you are thinking of doing for the
11 feasibility studies?

12 MR. COYNE: Not much more because we are
13 still in the planning. It is kind of too soon to tell
14 exactly.

15 MEMBER STETKAR: I guess I am curious why
16 the current methods wouldn't handle that; in other
17 words, why the staff feels that it is necessary to go
18 out and do research. If you have an integrated PRA
19 model, I can pretty easily think of ways of manipulating
20 that model to get multiple events in multiple locations
21 without going out and doing research on some of other
22 logic format that might go into three or four years of
23 National Lab contract dollars, for example.

24 MR. COYNE: Right. I think it is --

25 MEMBER STETKAR: It can be done because

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 people have done it. So, looking at the feasibility
2 of being able to do it, I can tell you it can be done
3 because people have done it. So, I am curious what you
4 are thinking about to see whether or not it can be done.

5 MR. COYNE: Well, first of all, if I stated
6 that the current methods couldn't be used for it, that
7 was misstatement on my part. I think it is too soon
8 to tell that.

9 As far as feasibility, you know, the
10 question of, is it practical and efficient to use the
11 existing framework to look at events where timing may
12 be very important, where you may have a potential -- I
13 don't want to use the word "explosion" -- but you have
14 this combination of events that could be more than just
15 ones and twos, depending on the dependency you have.

16 You could imagine if you had a breaker fire caused by
17 a seismic event, there would be a dependency among
18 multiple breakers throughout the plant, that it would
19 be more likely to see multiples potentially. I mean,
20 it is very early in this method development to get at
21 that, but it is to look at those issues.

22 MEMBER BLEY: If you have an earthquake,
23 there is dependency among all the breakers in the plant
24 already.

25 MR. COYNE: That's right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER STETKAR: And if you have a fire in
2 a cable area, you have got dependency among a bunch of
3 systems in the plant.

4 MR. COYNE: That's true, too, yes.

5 MEMBER STETKAR: And if you have a flood,
6 you have dependency among different things at different
7 elevations.

8 MR. COYNE: Right. And so, it would be a
9 question of how many areas you assume. I mean, you could
10 clearly assume every breaker catches on fire. That
11 gives you an answer that is probably pretty easy to
12 calculate.

13 MEMBER BLEY: But if you have got people
14 looking for multiple hot shots in PRA, I think you can
15 take on that --

16 MR. COYNE: Well, that is actually a good
17 analogy for this. Where do you stop the combinations?
18 And that is what the feasibility study is really looking
19 at. Is there a practical way to do it? Is the existing
20 framework adequate to do it? And what kind of
21 limitations will we have? And if there are smarter ways
22 to put this together.

23 MEMBER BLEY: How are you going to do that,
24 determine the feasibility? Are you going to do a study
25 or two here to see?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. COE: Actually, one way to phrase it
2 is -- and I know this is a topic that has been debated
3 already -- and that is, do you take a seismic PRA and
4 you burn it or do you take a fire PRA and you shake it?

5 I mean, in simple terms, you are using the same
6 methodology that Kevin is suggesting is the current
7 state of practice.

8 But you have got these combinations of how
9 do you assemble the model in a rational way that actually
10 addresses all of these dependencies and system
11 interactions. And then, you add flooding on top of
12 that. You could actually envision flooding as a
13 concurrent event with fire based on a seismic initiator.

14 So, as Kevin has tried to point out, it is
15 an exceedingly-complex task to try to envision how to
16 create a model that addresses all of these dependencies.

17 And so, that may lead us outside of what the current
18 event tree/fault tree approach is. We don't know yet.

19 MR. COYNE: But hopefully not.

20 MEMBER BLEY: How are you going to chase
21 the feasibility?

22 MR. COYNE: How are we going to chase it?

23 MEMBER BLEY: Yes. Sit down and think
24 about it or do a study or two trying to use tools you
25 have already got?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. COYNE: And I didn't mean to not answer
2 Dr. Rempe's question, but we are thinking about that
3 right now, how we would structure such a study and what
4 specific tasks we would look at.

5 I think we would have contractor
6 assistance. I am not sure which contractor we would
7 use at this point. It is a unique area. So, we would
8 have to structure what we are looking for in that study
9 carefully and then find an appropriate support
10 contractor to help us --

11 MEMBER BANERJEE: Are there analogies in
12 the chemical industry where they use cause/consequence
13 diagrams?

14 MR. COYNE: I am not the right person to
15 answer that question, unfortunately.

16 MEMBER BANERJEE: Because there are
17 approaches that I think we encounter.

18 MR. COYNE: Right. We have done some
19 literature searching, and at least for the application
20 in the nuclear power plant context, we haven't seen a
21 lot of examples where it has been done. We have seen
22 examples in things like, for lack of a better way to
23 put it, big-box stores where they have looked at
24 non-nuclear facilities.

25 MEMBER BANERJEE: Maybe more qualitative.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER ARMIJO: Look at the next chart.
2 Somebody has already --

3 MEMBER BLEY: I guess the reason I was
4 pressing you on that is I remember when PRAs first
5 started. Sometime -- I was going to say 30 years ago;
6 it is probably 35 years ago -- in this country we started
7 doing PRAs. The first ones weren't so great, but in
8 a few years we were doing some pretty decent, useful
9 ones.

10 There were some other countries that wanted
11 to get it all right before they did one, and 15 to 20
12 years later they finished their first one. Probably
13 the fastest way to get there is to --

14 MEMBER ARMIJO: Jump in.

15 MEMBER BLEY: -- start moving.

16 (Laughter.)

17 MEMBER STETKAR: And their first ones look
18 an awful lot like what we did 15 years before this
19 started.

20 (Laughter.)

21 MEMBER BLEY: I wasn't going to say, but
22 yes.

23 MEMBER STETKAR: Yes.

24 MR. COYNE: And also, that certainly isn't
25 our intent, to make this a multi-year effort. It is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 to be smart when we really get into the nuts and bolts,
2 as the other information becomes available from the
3 other recommendations, that we are doing the most
4 efficient thing we can do with that information to get
5 it into a PRA.

6 The last item is future reevaluation of
7 Recommendation 3, and that may end up with any of the
8 three bins that John had mentioned earlier in the day,
9 which was a recommendation for some form of regulatory
10 action, a recommendation for further evaluation, or a
11 recommendation for no action. So, that would be, as
12 we work through this process, after the feasibility
13 study, after we get some of the NTTF other recommendation
14 information in, we would look at doing that.

15 We have had one public meeting to discuss
16 this approach to Recommendation. That was on May 3rd.

17 There was, I will say, general agreement because after
18 the meeting we got a letter from Citizens' Environmental
19 Coalition with an additional comment on this, but
20 general agreement on the prioritization of the issue
21 as Tier 3. The Citizens' Environmental Coalition, in
22 a May 17th letter, noted that they felt that this issue
23 really should be included in Recommendation 2 items.

24 So, their feeling was that this should all be resolved
25 under Recommendation 2, and Recommendation 3 would be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 focused on a stronger qualitative assessment of the
2 plant relative to this issue.

3 They also noted that developing a PRA method
4 could be an outcome, but the focus should be on
5 qualitative methods. And they noted their belief that
6 sometimes PRA focuses too early on quantification and
7 not enough on a more qualitative assessment. So, I am
8 not sure how to read that, whether that was an agreement
9 on the prioritization of Tier 3 or whether they felt
10 that this would really be covered by, felt that it should
11 be covered by some of the higher-priority items.

12 MEMBER BANERJEE: Do you know the source
13 of that comment?

14 MR. COYNE: It was a letter from Barbara
15 Warren, I believe, from Citizens' Environmental
16 Coalition. She was at our public meeting, but this
17 comment came in after the public meeting.

18 We did get a comment at the public meeting,
19 and I think it is echoed by those earlier comments, that
20 a qualitative risk assessment approach should also be
21 considered. And I think that is not inconsistent with
22 the Commission's direction on developing the PRA method,
23 that one of the motivations was to understand the
24 accident context that the equipment would be operating
25 in, and a PRA method is a good way to systematically

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 do that. So, in my mind, that wouldn't rule out,
2 certainly, looking at qualitative approaches for this
3 resolution or for this method development activity.

4 And then, finally, ensuring that the PRA
5 method and its application include documentation of key
6 assumptions. And this came from a public comment that
7 the PRA can often be viewed -- and these are my
8 words -- as a black box, and some of the things going
9 on in the calculation aren't necessarily readily
10 available to a member of the public, but what is is the
11 assumptions that are made supporting that PRA
12 evaluation. So, a desire that whatever method we use
13 for the PRA would include good documentation of the
14 assumptions underpinning the method and the application
15 of the method.

16 MEMBER SKILLMAN: I would like to offer an
17 observation, then ask a question. In the older plants,
18 those that were granted construction permits through
19 the seventies, they were generally governed by emergent
20 Reg Guides, 1.26, 1.29, and a bunch of others. And the
21 Safety System Components, the SSCs, were commonly
22 reactor coolant system, pressure boundary, emergency
23 core cooling, that type of component. Fire equipment
24 was not part of that. Fire equipment was left to the
25 architect/engineers, and they basically went out and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 bought commercial grade. Just if you would hold that
2 thought for a minute.

3 In 2007, at KK7, the earthquake toppled part
4 of the transformers, set them on fire. The station was
5 unable to fight those fires, and they had to bring
6 offsite firefighting onsite.

7 A couple of years ago, D.C. Cook had a STAT
8 rotor explosion. The ground motion was so great, it
9 severed the fire service system. And they had to fight
10 that fire with alternate means, a hydrogen fire.

11 So, my question is, how much of the
12 complexity, Kevin, that you point to is the result of
13 an inadequacy on our part, industry's part, to make sure
14 that fire equipment is basically at that same
15 qualification level, the same mechanical robustness
16 level as emergency core cooling?

17 Do we have hardware deficiencies that we
18 are now trying to compensate for because we never really
19 buckled down and said, "By golly, firefighting is as
20 important as core cooling."?

21 MR. COE: If I may try to start, the current
22 plant design bases don't necessarily account for
23 multiple concurrent initiating events. That is an
24 artifact of the historical design and licensing process.

25 And so, today we are examining these kinds

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of complexities as an enhancement beyond that which the
2 plants have been licensed to. So, we are quite aware
3 of and sensitive to the fact that fire protection systems
4 are not seismically-qualified in general.

5 And so, that will go into the modeling that
6 we end up doing in terms of the fragilities and the
7 likelihoods of those failures. The challenges in terms
8 of modeling that Kevin has spoken of relate to this.

9 There are fire systems that will break, but may not
10 be needed. There are fire systems that will become
11 unavailable that are needed. And there are likelihoods
12 associated with all of that.

13 Proximities are also -- I mean, a fire
14 system is segmented. So, part of it could break and
15 part of it could not. And the part that broke might
16 be needed and it might not.

17 So, I mean, it is a multitude of
18 complexities here that the original design bases never
19 even envisioned. Or maybe they envisioned it, but they
20 chose to --

21 MEMBER SKILLMAN: Did not accommodate.

22 MR. COE: -- not address it because of the
23 low likelihood that was expected at that time.

24 Did you want to add to that?

25 MR. COYNE: Yes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MEMBER SIEBER: This is also driven by the
2 fire protection insurance companies who demanded a
3 commercial standard. You meet this and we will give
4 you the insurance.

5 And a lot of the difficulties with
6 separation on fire protection were solved by NRC action.

7 You know, for example, all the aux feed pumps in one
8 room, that required the addition of a separate aux feed
9 pump for a lot of plants, including our plants, and tie
10 wraps on cable trays, and so forth.

11 This has been going on for a long time.
12 So, there have been upgrades. On the other hand, you
13 still have cast fire mains, even though they are
14 loop-type that a break can be isolated, but they still
15 exist that way.

16 So, there are some deficiencies, but I think
17 the history behind where that all came from has left
18 us the artifact of meeting National Fire Protection
19 Association codes, but not necessarily safety-grade
20 nuclear standards. So, someplace along the line, the
21 staff and the insurance companies have decided that is
22 good enough.

23 MR. COYNE: Just to add, I am not in a
24 position to really say whether the design-basis fire
25 protection requirements we have are adequate or not.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 But the state that you had mentioned, that they are
2 subject to a different level of quality -- for instance,
3 Appendix R has its own quality assurance requirements
4 for fire protection equipment. That does make it
5 challenging for the analysis and getting things like
6 the fragilities for the fire protection piping and
7 factoring that in the PRA.

8 An observation is PRA is a good, systematic
9 technique for trying to evaluate these types of
10 beyond-design-basis issues of multiple things happening
11 or multiple equipment failures or fires with a degraded
12 fire suppression system. So, to me -- of course, I am
13 speaking to you as PRA Branch Chief -- to me, it seems
14 like a natural thing to use a PRA to look at this type
15 of issue for those kinds of concerns.

16 MEMBER SIEBER: Yes, the PRA can analyze
17 it and tell you roughly what that risk really is. I
18 mean, that is up to the licensee and the staff to decide
19 whether that risk is tolerable or not.

20 MR. COE: And I would add, exactly right,
21 but I would add, also, that the PRA will give us a better
22 appreciation for what is important in terms of those
23 interactions and what is not as important. We hope that
24 that is even a more important value or benefit from even
25 studying this from a PRA context than getting some kind

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 of an endpoint or best-estimate risk number. It is more
2 the insights that you draw from doing the modeling work
3 that I think really benefits the staff in the end.

4 MEMBER SKILLMAN: Okay. Thank you.

5 MR. COE: Yes.

6 CHAIR SCHULTZ: Dennis?

7 MEMBER BLEY: Let me ask you one thing.
8 I mean, what you are talking about is modeling. But
9 I remember -- I have been spending the last half-hour
10 trying to remember the name of the guy -- a guy ran a
11 seismic consulting firm up in San Francisco, a pretty
12 famous guy. And that group, whose name I forget, for
13 many years went all over the world investigating
14 earthquakes and sent out reports on all of the
15 earthquakes. And they especially looked at these kinds
16 of things, at earthquake-induced fires and
17 earthquake-induced floods, and identified when they
18 happened.

19 My memory from all this stuff I looked at
20 from them was that they were a lot more rare than we
21 think when we think about all the possibilities for how
22 they can happen.

23 They had quite a database and they shared
24 it publicly. Oh, Peter Yanev, yes. What was the name
25 of -- is he still around?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 PARTICIPANT: No, he is not around anymore.
2 Peter is around.

3 MEMBER STETKAR: EQU still --

4 MEMBER BLEY: Is EQU still maintaining the
5 data?

6 PARTICIPANT: No, EQU is no longer in
7 existence.

8 MR. CHOKSHI: EQU has --

9 MEMBER BLEY: Well, they are part -- yes,
10 but they are still there?

11 MR. CHOKSHI: Yes. And Peter has a new
12 company, and he is active. So, we can get --

13 MEMBER BLEY: I mean, it is worth looking
14 at real data a little bit to scope this problem, rather
15 than starting with high-powered analysis. We might get
16 a pretty good idea from looking at that data, and they
17 really had worked at keeping that pretty complete, and
18 especially on these kinds of issues. Their reports were
19 really nice on this stuff.

20 MR. CHOKSHI: This is Nilesh Chokshi,
21 Office of New Reactors.

22 MR. COE: And as part of the literature
23 review for this in addressing this recommendation, we
24 will pull the string on that. That could be valuable.
25 Thank you.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 MR. COYNE: That is very useful. There's
2 a handful of events that we are aware of, but that is
3 really what we wanted to look at.

4 MEMBER BLEY: Somewhere I have got a box
5 of all their old reports.

6 CHAIR SCHULTZ: And that is what I was
7 taking from Dick Skillman's remarks as well, not only
8 here, but other events that he mentioned earlier. These
9 are at least precursor events that ought to be mined
10 from the database that we currently have --

11 MEMBER SKILLMAN: Thank you.

12 CHAIR SCHULTZ: -- to determine how much
13 information that really provides to either support or
14 at least document any decisionmaking you might do in
15 terms of the complex analyses that could result, where
16 you are trying to answer should we move in that direction
17 or is there an alternative. As you had on the public
18 comment slide, there have been other alternatives
19 recommended or suggested.

20 MR. COE: Any other questions?

21 CHAIR SCHULTZ: Other comments from the
22 Committee?

23 (No response.)

24 I want to thank you very much for this
25 segment in the presentation.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

1 And I do want to at this point ask if there
2 are any other comments from the public related to the
3 last two presentations or any other items that have been
4 brought to the Committee in this afternoon's session.

5 Yes?

6 MR. HEYMER: Good afternoon.

7 Adrian Heymer from NEI.

8 I will take the discussion on 2.2 first,
9 and the topic in the discussion about new and significant
10 information. That is a term that is used in the
11 environmental, in NEPA space. We believe that is the
12 right approach. Not only is it new, but is it
13 significant?

14 Now the NRC staff were quite right to say,
15 "Well, okay, what does that mean? And we need to work
16 on that." But the industry really would lean towards
17 that approach rather than a rote, 10-year sort of
18 standard-review approach.

19 If you go back over 20 years and look at
20 what actions have been taken, both in response to
21 regulatory action initiatives as well as industry
22 action, you see that we have over time reduced the risk
23 from the plants as we have gone forward in time, without
24 the need for a 10-year sort of update, safety assessment,
25 or whatever.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 But we agree, and I think one of the lessons
2 learned from Fukushima is that there is new and
3 significant information. Not only should you start
4 evaluating it, but you should make people aware of it,
5 so that everybody in the structure, certainly within
6 a company, is aware of what is going on, and is aware
7 of what could be the potential significance of that.

8 So, I think that is one comment I had.

9 As regards the man-made hazards, that is
10 considered in the initial licensing. I think, as new
11 facilities are built in the vicinity of a nuclear power
12 plant, there needs to be at least a look at that from
13 the nuclear side as well as from the evacuation and what
14 threat that presents. So, I mean, I think we would
15 understand that, but it is considered in the licensing.

16 When we go on to the last discussion on
17 seismic-induced fires and floods -- and this leads into
18 sort of a more general comment overall -- that wasn't
19 really a Fukushima issue. Even the Near-Term Task Force
20 Report points to the fact that it was
21 Kashiwazaki-Kariwa. In that case, it was associated
22 with a non-safety-related transformer issue. And based
23 on that, Tokyo Electric Power Company made sure that
24 there were five trucks on each of its sites.

25 So, it wasn't safety-related. It didn't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 have a safety-related impact, but it was there. And
2 so, from our perspective, I think we have got to be a
3 bit careful with the amount of stuff we are stuffing
4 in the Fukushima bag. If this is an issue, there are
5 set processes that the NRC has in place today that it
6 could evaluate that and determine, okay, that is an
7 issue, whether it is a GSI or whatever, that we need
8 to look at or we need to move forward.

9 Now, having said that, I think we would say,
10 yes, if we are going to go forward and look at something
11 in this area, that we need to look at development of
12 the methodologies or refinement of the methodologies
13 and build on some of the insights that were mentioned
14 in the discussion today about the SQUG program and
15 experience data to help inform our discussion.

16 So, as regards the development of a
17 methodology, it probably is a longer-term issue. I
18 think both of these, 2.2 and this later one on
19 seismic-induced fires and floods, Recommendation 3, are
20 appropriate to be a Tier 3. It is a long-term issue,
21 though I think on the seismic-induced fires and floods,
22 I don't think there is the Fukushima connection there.

23 So, I think that is where we stand on that as a comment.

24 But that leads to a broader statement that
25 I think is worthwhile making. If you take the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 Fukushima, the list of all the Fukushima
2 recommendations, both in the Near-Term Task Force Report
3 and the recent SECY documents, and look at the other
4 generic regulatory issues that are underway, there is
5 over 50 of these on the plate in the current timeframe.

6 And in the current timeframe, I am looking between now
7 and about 2017.

8 That presents the potential for a
9 significant distraction, both here at the NRC and at
10 the stations. Because a lot of these Fukushima issues
11 are associated with the power block, and we really need
12 to keep our focus on the safe operation of the 104 nuclear
13 power plants.

14 So, I think as we look at this, and I would
15 support some statements that were made, take a look at
16 that list. I know we took a first cut and we put them
17 into three bins of priority. But really take a look
18 at these Fukushima-related items and say, what is the
19 real safety significance associated with these? And
20 is it something we really need to push ahead with in
21 the next five years or not? And if it is not, then put
22 it in a parking lot. I am not saying take it off the
23 table entirely, but I think we have got to be careful
24 what we are focused on and what we are trying to do.

25 We have got Tier 1. If we try to do too

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 much beyond the Tier 1 issues, we are going to spread
2 our resources, which is only going to extend the time
3 that Tier 1 takes to implement. And it is the Tier 1
4 that provides the major safety significance and safety
5 improvement of these facilities.

6 So, with those three comments, Mr.
7 Chairman, I thank you for the opportunity.

8 CHAIR SCHULTZ: Thank you for the comments.

9 Other comments from the public?

10 (No response.)

11 I am looking around the room. Any members
12 of the public on the telephone who would like to make
13 a comment? Is the line open?

14 MR. DIAS: It is open.

15 CHAIR SCHULTZ: The line is open.

16 (No response.)

17 Hearing none, I would like to take this
18 opportunity to thank the staff for the presentations
19 all through the meeting we have had this afternoon.
20 The meeting will continue tomorrow.

21 So, we will recess until tomorrow morning.

22 If any of you have not yet picked up the
23 agenda, there are copies on the back table. Those are
24 the items that we will be discussing tomorrow as we
25 continue our discussion on the Tier 3 activities.

NEAL R. GROSS

UNITED STATES NUCLEAR REGULATORY COMMISSION

Protecting People and the Environment

Japan Lessons Learned Tier 3 Regulatory Actions

**ACRS Meeting of the Fukushima
Subcommittee**

Rockville, Maryland

May 22-23, 2012

Initial NRC Actions In Response to Fukushima

UNITED STATES
NUCLEAR REGULATORY COMMISSION
OFFICE OF NEW REACTORS
OFFICE OF NUCLEAR REACTOR REGULATION
WASHINGTON, DC 20555-0001

March 18, 2011

NRC INFORMATION NOTICE 2011-05: TOHOKU-TAIHEIYU-OKI EARTHQUAKE
EFFECTS ON JAPANESE NUCLEAR POWER
PLANTS

ADDRESSEES

All holders of or applicants for operating licenses for nuclear power reactors under the provision of Title 10 of the Code of Federal Regulations (10 CFR) Part 50, "Domestic Licensing of Production and Utilization Facilities," except those who have permanently ceased operations and have certified that fuel has been permanently removed from the reactor vessel.

All holders of or applicants for a standard design certification, standard design approval, manufacturing license, limited work authorization, early site permits or combined license issued under 10 CFR Part 52, "Licenses, Certifications and Approvals for Nuclear Power Plants."

PURPOSE

The U.S. Nuclear Regulatory Commission (NRC) is issuing this information notice (IN) to inform addressees of effects of the Tohoku-Taiheiyo-Oki Earthquake on nuclear power plants in Japan. The NRC expects that recipients will review the information for applicability to their facilities and consider actions, as appropriate, to avoid similar problems. Suggestions contained in this IN are not NRC requirements, therefore, no specific action or written response is required.

DESCRIPTION OF CIRCUMSTANCES

The following summary of events is provided based on the best information available at this time. The situation in Japan regarding recovery efforts for the Fukushima Daiichi Nuclear Power Station continues to evolve on an hourly basis.

On March 11, 2011, the Tohoku-Taiheiyo-Oki Earthquake occurred near the east coast of Honshu, Japan. This magnitude 9.0 earthquake and the subsequent tsunami caused significant damage to at least four of the six units of the Fukushima Daiichi nuclear power station as the result of a sustained loss of both the offsite and on-site power systems. Efforts to restore power to emergency equipment have been hampered or impeded by damage to the surrounding areas due to the tsunami and earthquake.

ML11070432

NRC INSPECTION MANUAL

TEMPORARY INSTRUCTION 2515/183

FOLLOWUP TO THE FUKUSHIMA DAIICHI NUCLEAR STATION
FUEL DAMAGE EVENT

CORNERSTONE: INITIATING EVENTS AND MITIGATING SYSTEMS

APPLICABILITY: This Temporary Instruction (TI) applies to all holders of operating licenses for nuclear power reactors, except plants which have permanently ceased operations.

2515/183-01 OBJECTIVES

The objective of this TI is to independently assess the adequacy of actions taken by licensees in response to the Fukushima Daiichi nuclear station fuel damage event. The inspection results from this TI will be used to evaluate the industry's readiness for a similar event and to aid in determining whether additional regulatory actions by the U.S. Nuclear Regulatory Commission are warranted. Therefore, the intent of this TI is to be a high-level look at the industry's preparedness for events that may exceed the design basis for a plant. If necessary, a more specific followup inspection will be performed at a later date.

2515/183-02 BACKGROUND

On March 11, 2011, the Tohoku-Taiheiyo-Oki Earthquake occurred near the east coast of Honshu, Japan. This magnitude 9.0 earthquake and the subsequent tsunami caused significant damage to at least four of the six units of the Fukushima Daiichi nuclear power station as the result of a sustained loss of both the offsite and on-site power systems. Efforts to restore power to emergency equipment have been hampered or impeded by damage to the surrounding areas due to the tsunami and earthquake. The following background information is current as of March 18, 2011.

Units 1 through 3, which had been operating at the time of the earthquake, scrambled automatically, inserting their neutron absorbing control rods to ensure immediate shutdown of the fission process. Following the loss of electric power to normal and emergency core cooling systems and the subsequent failure of back-up decay heat removal systems, water injection into the cores of all three reactors was compromised, and reactor water levels could not be maintained. Tokyo Electric Power Company (TEPCO), the operator of the plant, resorted to injecting sea water and boric acid into the reactor vessels of these three units, in an effort to cool the fuel and ensure the reactors remained shutdown. However, the fuel in the reactor cores became partially uncovered. Hydrogen gas built up in Units 1 and 3 as a result of exposed, overheated fuel reacting with water. Following gas venting from the primary containment to relieve

Issue Date: 03/23/11 1 2515/183

NRC INSPECTION MANUAL

TEMPORARY INSTRUCTION 2515/184

AVAILABILITY AND READINESS INSPECTION OF
SEVERE ACCIDENT MANAGEMENT GUIDELINES (SAMGs)

CORNERSTONE: MITIGATING SYSTEMS

APPLICABILITY: This Temporary Instruction (TI) applies to all holders of operating licenses for nuclear power reactors, except plants which have permanently ceased operations.

2515/184-01 OBJECTIVES

The objectives of this TI are to:

- Determine that the severe accident management guidelines (SAMGs) are available and how they are being maintained.
- Determine the nature and extent of licensee implementation of SAMG training and exercises.

2515/184-02 BACKGROUND

On March 30, 2011, the Executive Director for Operations chartered a task force to conduct a near-term evaluation of the need for agency actions following the events in Japan. During the task force's deliberations, the importance of severe accident management guidelines (SAMGs) has been highlighted. The SAMGs were implemented as a voluntary industry initiative in the 1990s and are not part of the agency's routine Reactor Oversight Program. In order to evaluate the current status of SAMGs onsite and determine the need for any further recommendations, the task force is requesting the enclosed information regarding SAMGs at operating power reactors be gathered, assessed, and summarized.

2515/184-03 INSPECTION REQUIREMENTS AND GUIDANCE

03.01 Assess the availability and readiness of the licensee's ability to access and implement the SAMGs at their facility. Answer the following questions by filling out the attached datasheet.

- When were the SAMGs last updated? Are controlled copies of the SAMG located in the technical support center (TSC) (Y/N), emergency operations facility (EOF) (Y/N), control room (Y/N)? For licensees that use one common EOF for multiple reactor sites, one review of the EOF will serve for all applicable sites.

Issue Date: 04/29/11 1 2515/184

UNITED STATES
NUCLEAR REGULATORY COMMISSION
OFFICE OF NUCLEAR REACTOR REGULATION
WASHINGTON, DC 20555-0001

May 11, 2011

NRC BULLETIN 2011-01: MITIGATING STRATEGIES

ADDRESSEES

All holders of operating licenses for nuclear power reactors, except those who have permanently ceased operation and have certified that fuel has been removed from the reactor vessel.

PURPOSE

The U.S. Nuclear Regulatory Commission (NRC) is issuing this bulletin to achieve the following objectives:

- To require that addressees provide a comprehensive verification of their compliance with the regulatory requirements of Title 10 of the Code of Federal Regulations (10 CFR) Section 50.54(h)(2).
- To notify addressees about the NRC staff's need for information associated with licensee mitigating strategies under 10 CFR 50.54(h)(2) in light of the recent events at Japan's Fukushima Daiichi facility in order to determine if 1) additional assessment of program implementation is needed, 2) the current inspection program should be enhanced, or 3) further regulatory action is warranted, and
- To require that addressees provide a written response to the NRC in accordance with 10 CFR 50.54(d).

BACKGROUND

Following the terrorist events of September 11, 2001, the readiness of NRC-regulated facilities to manage challenges to core cooling, containment and spent fuel pool cooling (CFC) following large explosions or fires was enhanced through a series of orders and imposition of license conditions. These requirements were formalized in the rulemaking of March 27, 2009, resulting in 10 CFR 50.54(h)(2).

The NRC conducted a comprehensive inspection of the implementation of the mitigating strategies developed by licensees in 2008. Subsequently the NRC incorporated this inspecable area into the baseline reactor oversight process on a sample basis as part of the biennial fire protection inspection.

ML11250360

IN 2011-05

TI 2515/183

TI 2515/184

BL 2011-01

NRC Lessons Learned Review

- Commission directed a methodical and systematic review of the safety of U.S. facilities in light of events in Japan
- Near-Term Task Force review completed July 2011
(www.nrc.gov)

U.S. Plant Safety

- Similar sequence of events in the U.S. is unlikely
- Existing mitigation measures could reduce the likelihood of core damage and radiological releases
- No imminent risk from continued operation and licensing activities

Identifying Lessons Learned

- July 2011
 - Near-Term Task Force (NTTF) report issued
- September/October 2011
 - NTTF recommendations prioritized into Tiers 1, 2, and 3
- February 2012
 - Draft orders and requests for information provided to the Commission
- March 2012
 - The NRC staff issued the Tier 1 orders and request for information on March 12, 2012

Orders

- The NRC staff ordered licensees to:
 - Develop strategies and procure additional equipment to address beyond-design-basis external events and multiunit events
 - Include a reliable hardened vent in Mark I and Mark II containments
 - Enhance spent fuel pool level instrumentation for beyond design basis accidents

Requests for Information

- The NRC requested that licensees provide information on:
 - the adequacy of facility design bases with respect to seismic and flooding hazards
 - whether facility configurations, as confirmed by seismic and flooding walkdowns, are in compliance with current facility design bases
 - current communications system power supplies and their availability during a prolonged SBO event
 - the required staffing necessary to respond to a multiunit, prolonged SBO event

Rulemaking Activities

- Station Blackout (SBO) Rulemaking
 - Modify the SBO rule to require enhanced capability to mitigate a prolonged SBO
 - Advanced Notice of Proposed Rulemaking issued
 - The Commission directed that SBO rulemaking be completed within 24-30 months
- Emergency Procedures Integration Rulemaking
 - Create a new rule requiring the integration of the emergency procedures
 - Advanced Notice of Proposed Rulemaking issued
 - The rulemaking is expected to be completed in 2016

Other Recommendations for NRC Action

- Tier 2 Recommendations – Could not be initiated in the near term due to factors that include the need for further technical assessment and alignment, dependence on Tier 1 issues, or availability of critical skill set limitations.
- Tier 3 Recommendations – Require further staff study to support a regulatory action, have an associated shorter-term action that needs to be completed to inform the longer-term action, are dependent on critical skill sets, or are dependent on the resolution of NTTF Recommendation 1.

Tier 3 Recommendations

- Commission-approve Charter
- Longer-Term Task Groups
 - Team Leader (SES or Branch Chief)
 - Subject Matter Experts
 - Japan Lessons-Learned Directorate
- Lead is with the Line Organizations
- Recommendation for action to the Steering Committee through the lead office

Focus of Longer-Term Review

- Identification and resolution of key issues and information needed to support a recommendation on the need for regulatory action
- Program plans to guide issue identification and resolution
- Planning framework will extend to decision point on whether regulatory action is needed, but not beyond

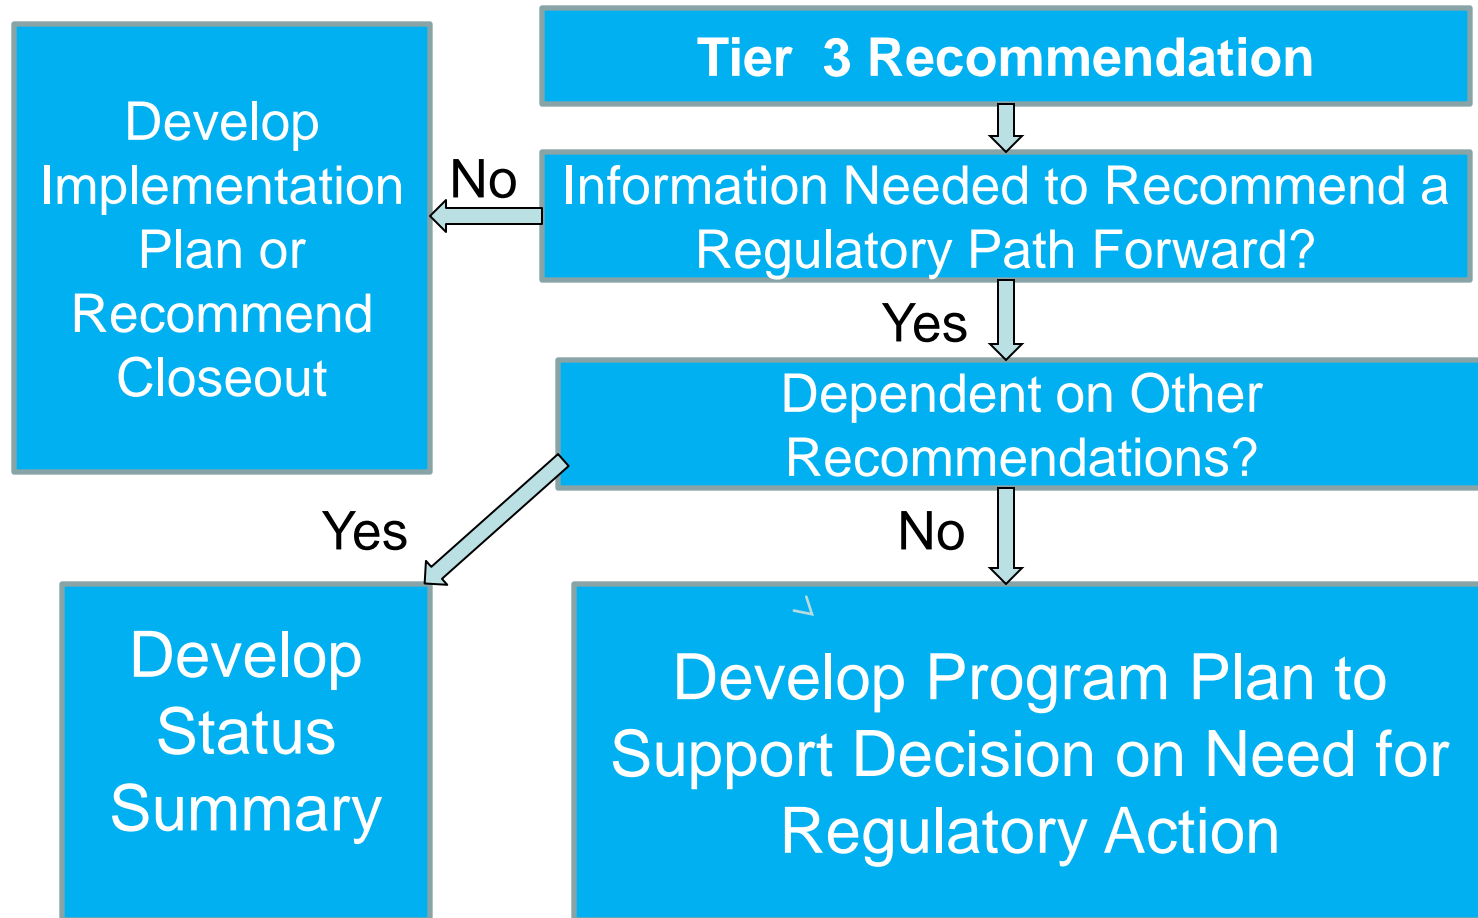

Tier 3 Recommendations

- 2.2 Periodic Confirmation of Seismic and Flooding Hazards
- 3 Potential Enhancement to the Capability to Prevent or Mitigate Seismically-Induced Fires and Floods
- 5.2 Reliable Hardened Vents for Other Containment Designs
- 6 Hydrogen Control and Mitigation Inside Containment or in Other Buildings
- 9.1/9.2 EP Enhancements for Prolonged SBO and Multiunit Events
- 9.3 ERDS Capability
- 10 Additional EP Topics for Prolonged SBO and Multiunit Events

Tier 3 Recommendations (cont.)

- 11 EP Topics for Decision-making, Radiation Monitoring, and Public Education
- 12.1 Reactor Oversight Process Modifications
- 12.2 Staffing Training on Severe Accidents and Resident Inspector Training on SAMGs
- Transfer of Spent Fuel to Dry Cask Storage
- Prestaging of Potassium Iodide Beyond 10 Miles
- Reactor and Containment Instrumentation Ability to Withstand Beyond Design Basis Conditions
- Basis of Emergency Planning Zone Size

Flow Chart for Tier 3 Recommendations

Questions?

U.S.NRC

UNITED STATES NUCLEAR REGULATORY COMMISSION

Protecting People and the Environment

Recommendation 2.2

Periodic Reassessment of External Hazards

Jenise Thompson

May 23, 2012

Background

- NTTF report asks staff to “initiate rulemaking to require licensees to confirm seismic hazards and flooding hazards every 10 years and address any new and significant information. If necessary, update the design basis for SSCs important to safety to protect against the updated hazards.”
- Recommendation 2.1 and 2.3 are currently underway for seismic and flooding hazards
- Recommendation 2.1 for other natural external hazards has not started work yet due to resource limitations.

Staff Approach

- **Define and begin the initial pre-rulemaking activities necessary to position the agency for a future rulemaking to implement NTTF Recommendation 2.2, as resources become available**
- **Scope of rulemaking to include external hazards**
 - **Seismic**
 - **Flooding**
 - **Other natural external hazards**
 - **Other man-related external hazards (under discussion)**

Pre-rulemaking Activities

- Collect information as it comes up for R2.1 and R2.3
- Engage with external stakeholders as appropriate
- What constitutes new and significant information?
- What will the staff do with the updated hazard information?
 - Use of risk-informed approach?
- How will staff determine if it is necessary to update the design basis for SSCs important to safety?
 - Threshold for regulatory actions
- Review of international practices and insights from Recommendation 2.1

Public Meeting – May 7, 2012

- Questions from public
 - Nexus to Fukushima for inclusion of other man-related external hazards
 - “old” information “newly” discovered
 - Handling of information submitted as contention to new reactor licensing
 - Similar actions in the past (GI program)
 - Schedule concerns

Questions?

U.S.NRC

UNITED STATES NUCLEAR REGULATORY COMMISSION

Protecting People and the Environment

NTTF Recommendation 3: Seismically Induced Fires and Floods

May 22, 2012

Kevin Coyne, RES/DRA

Background

- Seismic events have the potential to cause:
 - multiple failures of safety-related SSCs;
 - induce separate fires or flooding events in multiple locations at the site; and
 - degrade the capability of plant SSCs intended to mitigate the effects of fires and floods.

Background

- The NTTF recommended, as part of the longer term review, evaluation of potential enhancements to the capability to prevent or mitigate seismically induced fires and floods
 - Scope includes internal seismically induced fires (e.g., breakers, transformers) and floods (e.g., tanks, piping systems)
 - External seismically induced fires and floods are considered to be outside the scope of this issue
- Prioritized as Tier 3 in SECY 11-0137
 - Commission agreed with Tier 3 Prioritization, but
 - Directed the staff to initiate development of PRA method to evaluate potential enhancements as part of Tier 1 activities

Background (con't)

- PRA Method Challenges:
 - hazard definition & characterization
 - seismic fragilities for SSCs, including fire protection components
 - modeling concurrent and subsequent initiating events
 - treatment of systems interactions
 - human reliability analysis methodologies suitable for seismically induced hazards
 - multiunit risk considerations

Current Status

- Staff developed an initial plan for PRA method development in SECY 12-0025.
- PRA pre-planning activities include:
 1. Define objectives of method
 2. Identify relevant stakeholders
 3. Information gathering
 4. Coordination with other ongoing initiatives
 5. Resource and schedule estimate

Current Status (con't)

- Key Considerations
 - Limited number of staff with required knowledge, skills, and abilities
 - No current consensus state-of-practice methods exist for seismically induced fires and floods for NPPs
 - ASME/ANS Joint Committee on Nuclear Risk Management recently formed a working group to address multiple concurrent events
 - Other Tier 1 activities will provide substantial information relevant to this issue

Staff Assessment

- Results from several Tier 1 recommendations will better inform the this issue:
 - 2.1 Seismic and flooding hazard evaluation
 - 2.3 Seismic and flooding vulnerability walkdowns
 - 4.2 Mitigation Strategies
 - 5.1 Containment venting
 - 7.1 Spent fuel pool
- More efficient to wait until sufficient information becomes available from these efforts.

Staff Assessment (con't)

- Some work can be done now:
 - Standards development organization engagement
 - Assess results from NTTF
Recommendations 2.1, 4.2, 5.1, 7.1
and other activities
 - Continue PRA method development activities

Staff Recommendation

- Continue development of PRA methodology
 - Engagement with PRA standards development organizations
 - Feasibility study to assess approaches for evaluating multiple concurrent events
- Assess results from Tier 1 activities and other related work
- Future re-evaluation of Recommendation 3

Public Comments (May 3)

- Agreement on prioritization of issue as Tier 3
- Qualitative risk assessment approaches should also be considered
- Ensure that the PRA method (and its application) includes documentation of key assumptions.

Questions?

U.S.NRC

UNITED STATES NUCLEAR REGULATORY COMMISSION

Protecting People and the Environment

Hydrogen Control and Mitigation (NTTF Recommendation 6)

Brett Titus
Office of Nuclear Reactor Regulation

Background

- The NTTF recommended, as part of the longer term review, identification of insights about hydrogen control and mitigation
 - Scope includes generation, transport, distribution, and combustion of hydrogen
 - Primary areas of interest consist of containment and adjacent buildings (although other locations are not excluded)
- Prioritized as Tier 3 in SECY 11-0137
- Commission agreed with Tier 3 Prioritization

Staff Assessment- Recommendation 6

- Interdependencies with other NTTF Tier 3 recommendations.
 - Implementation of Rec. 4 (SBO)
 - Rec. 5 (Hardened Vents) greatly reduce the likelihood of hydrogen explosions
 - Filtered Vents- concurrent analysis
 - Outcome could impact the path forward for Rec 6
 - These efforts will be collaborative

Staff Assessment- Recommendation 6

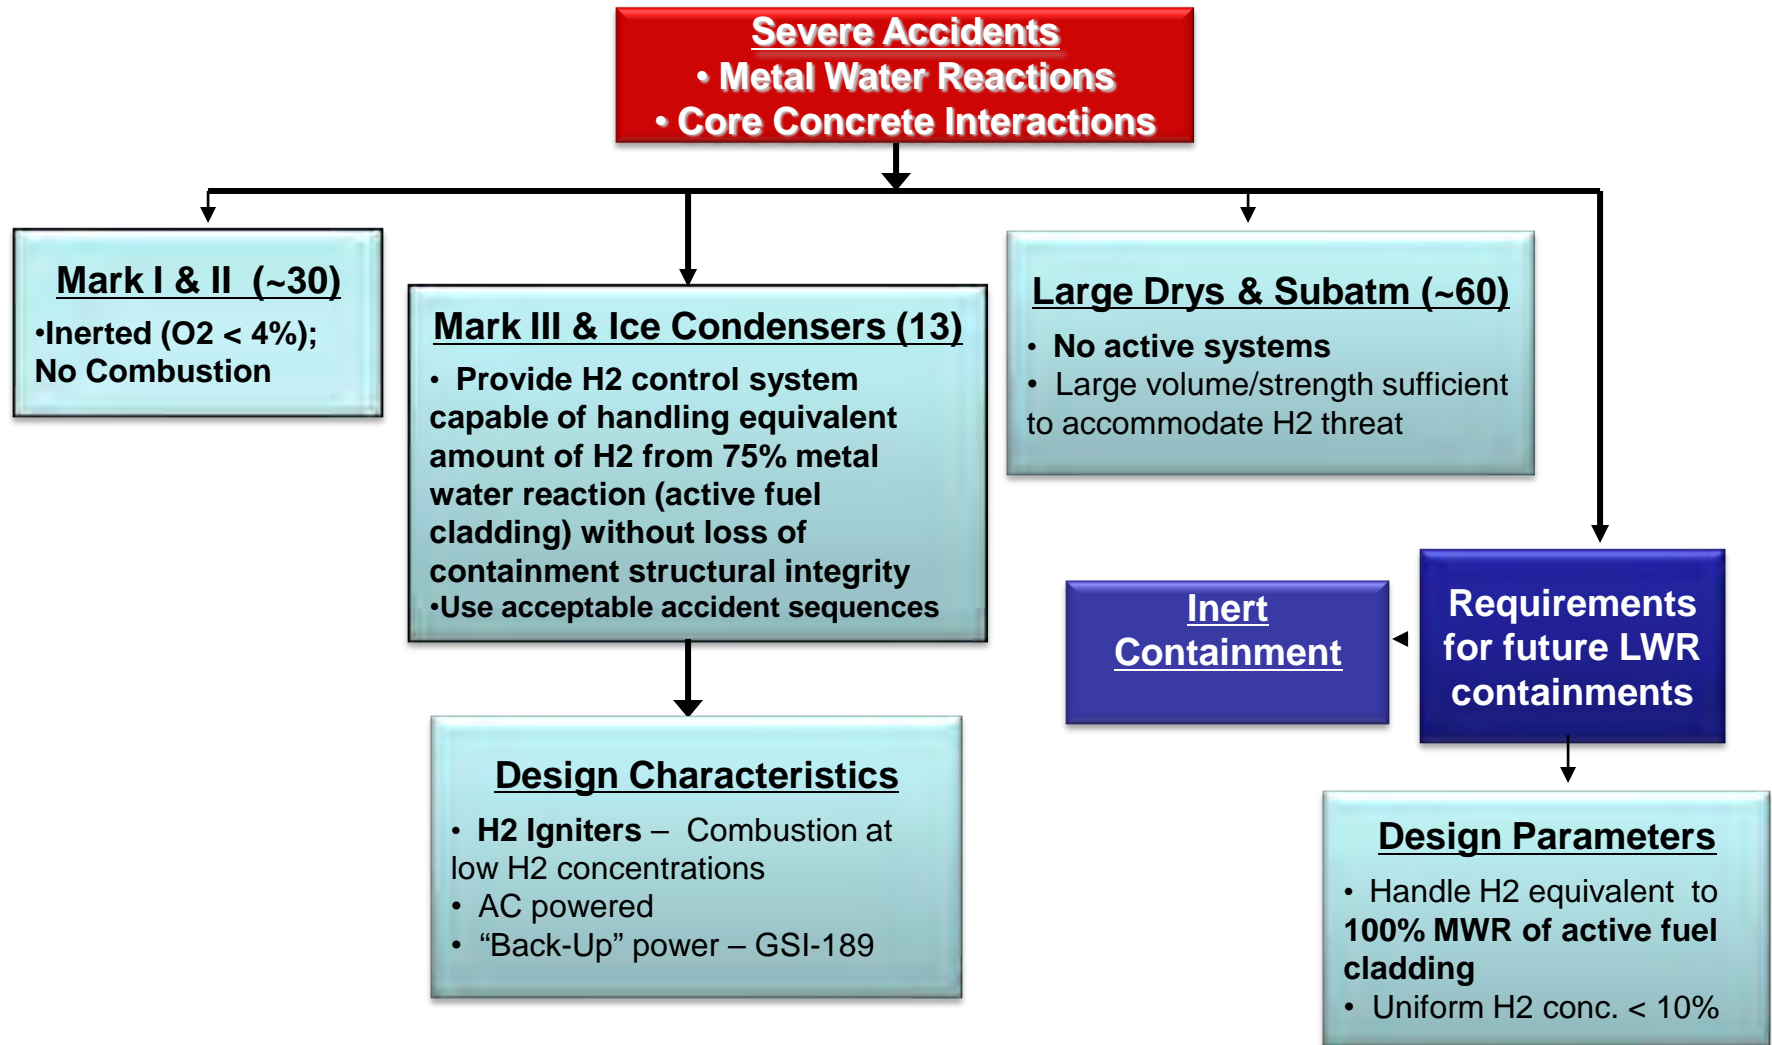

- Potential risk of hydrogen production and combustion is well known
 - Three Mile Island (1979)
 - Numerous Generic Issues and Generic Safety Issues
 - Many studies performed worldwide

Staff Assessment- Recommendation 6

- 10 CFR 50.44, “Combustible Gas Control for Nuclear Power Reactors” revised in 2003
 - Eliminated requirements for H₂ recombiners and relaxed monitoring rules commensurate with risk significance
 - Retained requirements for mixed atmosphere, inert MK I&II containments, maintained 75% clad-water H₂ reaction criteria (100% for New Reactors) in MK III and Ice Condensers

10 CFR 50.44

Combustible Gas Control for LWRs

Staff Assessment - Recommendation 6

- Key Questions to be Investigated
 1. Is there new information regarding H₂ in general?
 2. Was the failure of the buildings consistent with our understanding?
 3. Are there important gaps in our understanding of the threat from H₂ gas?
 4. Is there new information which conflicts with the current technical basis?
 5. Has new technical information been revealed to necessitate regulatory action?

Plan for Addressing Recommendation 6

1. Examine additional H₂ control measures in adjacent buildings
 - Conduct stakeholder meetings for all existing containment types
 - Evaluate additional mitigation measures to improve robustness of reactor and auxiliary buildings
 - Quantify the impact on safety and risk

Plan for Addressing Recommendation 6

2. Evaluate the sources and timing of H₂ generation

- Review accident sequence info from Gov't of Japan, TEPCO, INPO, and international orgs
- Compare the actual accident timing and amounts of generated H₂ to analytical predictions
- Assess implications of results on the existing state of knowledge

Plan for Addressing Recommendation 6

3. Assess the potential migration/release pathways

- Review available forensic info from Gov't of Japan, TEPCO, INPO, and international org
- Use information (supplemented by reasonable assumptions) to conduct best estimate modeling to evaluate containment release pathways
- Assess implications of results on the existing state of knowledge

Plan for Addressing Recommendation 6

4. Review the Technical Basis for 10 CFR 50.44

- Considering the results of Tasks 1-3, confirm the validity of the existing basis or identify gaps and characterize their safety/risk significance
- Conduct stakeholder meetings for all existing containment types
- Determine if any regulatory action is needed

Challenges

- Very little reliable empirical data on H₂ has been reported since the accident
- Verifiable information on chain of events may not be available for 10+ years
- H₂ generation and control following a severe accident is a highly specialized technical discipline

Public comments

- Public meeting on May 14, 2012

Questions?

UNITED STATES NUCLEAR REGULATORY COMMISSION

Protecting People and the Environment

EP NTTF Recommendations Tier 2 & 3 Implementation

Kevin Williams

Office of Nuclear Security and Incident Response

NTTF EP Recommendations

Tier 2 Action

- NTTF Recommendation 9.3 - Emergency preparedness regulatory actions (the remaining portions of Recommendation 9.3, with the exception of Emergency Response Data System (ERDS) capability addressed in Tier 3)

Tier 3 Actions

- NTTF Recommendations 9.1/9.2 - Emergency preparedness (EP) enhancements for prolonged SBO and multiunit events (dependent on availability of critical skill sets)
- NTTF Recommendation 9.3 – ERDS capability (related to long-term evaluation Recommendation 10)
- NTTF Recommendation 10 - Additional EP topics for prolonged SBO and multiunit events (long-term evaluation)
- NTTF Recommendation 11 - EP topics for decision-making, radiation monitoring, and public education (long-term evaluation)

NRC Staff Commitments

- SECY-11-137 stated that the staff will initiate the Tier 2 actions associated with EP regulatory actions when sufficient technical information and applicable resources become available.
- SECY-11-0137 stated that the staff will provide assessments of the Tier 3 recommendations once it had completed its evaluation of the resource impacts associated with the Tier 1 and 2 recommendations.
- The staff will address the Tier 3 EP-related recommendations, schedules, and resources in the upcoming July SECY paper to the Commission.
- The staff will take regulatory action, as appropriate, after evaluating the licensee responses to the 50.54(f) letters (staffing and communication).
- The staff will continue to engage with stakeholders on the Tier 2 and Tier 3 EP-related recommendations.

Advanced Notice of Proposed Rulemaking

- The staff considers existing EP framework and regulations provide reasonable assurance of adequate protection of public health and safety in the event of a radiological emergency.
- The staff is considering an Advance Notice of Public Rulemaking (ANPR) to be utilized to determine if a technical-basis for rulemaking can be developed for EP-related NTTF Recommendations (9.1, 9.2, 9.3, 9.4, 10, and 11).
- Some of the recommendations may screen out to long-term studies.
- The staff would initiate the ANPR when sufficient resources become available which would include stakeholder engagement.
- The staff will address the ANPR and a completed evaluation of the resource impacts and scheduled in the upcoming July SECY paper to the Commission.

Emergency Planning Zones

- The staff considers that the existing Emergency Planning Zone (EPZ) size provides reasonable assurance of adequate protection of public health and safety in the event of a radiological emergency.
- EPZ size re-evaluation is a longer-term action that is already being assessed by existing activities.
- The staff will utilize insights from the current Level 3 Probabilistic Risk Assessment (PRA) study results to inform the process for evaluation of potential impact that a multi-unit event may have on the EPZ.
- Any changes to EPZs would be discussed with stakeholders in public meetings.

Potassium Iodide (KI)

- The staff considers that the existing KI framework and regulations provide reasonable assurance of adequate protection of public health and safety in the event of a radiological emergency.
- The staff has concluded that based on available data to date, it is unlikely that the FDA thyroid dose PAGs were exceeded beyond 10 miles as a result of the accident at Fukushima.
- The staff will continue to monitor and evaluate the results of the findings by the Japanese government from studies conducted in and around the Fukushima.

Public comments

- Public meeting on May 4, 2012

Questions?

Recommendation 12.1 Status

May 23, 2012

Tim Kobetz,

Chief, Reactor Inspection Branch
Office of Nuclear Reactor Regulation

Recommendation 12.1

Strengthen the Reactor Oversight Process (ROP) to more fully include defense-in-depth considerations

- Expand the scope of the annual ROP self assessment
- Expand the scope of the biennial ROP realignment

Dependent on Recommendation 1

This recommendation is dependent on Recommendation 1 which recommended establishing a logical, systematic, and coherent regulatory framework that balances defense-in-depth and risk considerations.

Plan

- The staff will continue to implement the ROP in accordance with current policy
- Staff will begin to consider potential changes to the ROP self assessment and realignment programs when an action plan for Recommendation 1 has been established.
- The staff does not envision any unique challenges.

Communications

- Periodic stakeholder interactions will take place as necessary during the NRC's routine monthly meetings with NEI and the industry on ROP topics.
- Update the Commission on the status of Recommendation 12.1 in 2013 annual ROP Self-assessment SECY paper (issued in spring 2014).

Public Meeting on May 7th

- No questions or comments were received

Staff Training on Severe Accidents and Severe Accident Management Guidelines

May 23, 2012

Joseph G. Giitter

Travis L. Tate

Purpose and Background

- Purpose
 - discuss the plan for Near-Term Task Force (NTTF) Recommendation 12.2 by describing the current level of NRC staff training on severe accidents and outline future training enhancements
- Background
 - SECY-11-0093 , NTTF Report – July 12, 2011
 - Staff Requirements Memorandum (SRM) for SECY-11-0093 – August 19, 2011
 - SECY-11-0137 – October 3, 2011
 - SRM for SECY-11-0137 – December 15, 2011

NTTF Recommendations

- Recommendation 12.2 (dependent on Recommendation 8)
 - “Enhance NRC staff training on severe accidents, including training resident inspectors on Severe Accident Management Guidelines (SAMGs)”
- Recommendation 8.4
 - “Initiate rulemaking to require more realistic, hands-on training and exercises on SAMGs and EDMGs for all staff expected to implement the strategies and those licensee staff expected to make decisions during emergencies, including emergency coordinators and emergency directors”

Severe Accident Training

- Accident Progression Analysis
 - post-core damage conditions
- Accident Consequence Analysis
 - transport from core damage
- Perspectives on Reactor Safety
 - overview (design for safety, defense-in-depth, ECCS rulemaking, severe accident and safety goal policy)
 - accident sequences
 - accident progression (vessel/containment)
 - radiological releases and consequences

Relevant NRC Training

- Emergency Operating Procedures (EOPs)
 - GE Emergency Procedure and Severe Accident Guidelines
 - Westinghouse Emergency Procedure Guidelines
 - B&W / CE Emergency Procedure Guidelines
- Westinghouse SAMGs (video)

Qualification Training

- Senior Reactor Analyst
- Reactor Technical Reviewer
- Reactor Risk Analyst
- Nuclear Safety Professional Development Program

Enhancements

- Near-term actions
 - Frequency of severe accident courses
 - Update courses based on Fukushima lessons-learned
 - Qualification Program severe accident courses
 - Stakeholder feedback
 - Public Meeting – May 7, 2012

Enhancements (cont.)

- Longer-term actions
 - Dependent on Recommendation 8
 - State-of-the-Art Reactor Consequence Analysis (SOARCA)
 - Level 3 Probabilistic Risk Analysis
 - Fukushima lessons-learned
 - Qualification Program SAMG courses
 - Potential new course development
 - Stakeholder feedback

Public comments

- Public meeting on May 7, 2012

Questions?

Reactor and Containment Instrumentation (ACRS Recommendation 2(e))

Bill Kemper

Office of Nuclear Reactor Regulation

Background

ACRS 2(e) – “Selected reactor and containment instrumentation should be enhanced to withstand beyond-design-basis accident conditions”

- Current Reactors –Implement Post-TMI instrument recommendations to address design basis accidents
- New Reactors—Implement Post-TMI instruments plus describe severe accident capabilities

Dependencies

- Seismic and Flooding Evaluations
- SBO Rulemaking
- Mitigating Strategies Order
- Spent Fuel Pool Instrumentation Order
- EOPs/SAMGs/EDMGs Integration Rulemaking

Staff Recommendations

- Ensure that the need for enhanced reactor, containment , and SFP instrumentation is being adequately considered during Tier 1 NTTF actions
- Review/participate in domestic & international efforts to study/develop severe accident info needs and identify instrumentation gaps
- Gather and review information results from higher Tier actions
- Determine needs for a regulatory framework for enhanced reactor and containment instrumentation

Stakeholder Feedback

- Public Meeting held on May 7
- NEI Feedback
- Public question

Public comments

- Public meeting on May 7, 2012

Additional Recommendation 5 Expedited Transfer of Spent Fuel to Dry Casks

Steve Jones

Office of Nuclear Reactor Regulation

Background

- In SECY 11-0137, the staff included an additional recommendation for expedited transfer of spent fuel to dry cask storage.
- Stakeholders have repeatedly requested such action as part of petitions for regulatory action based on the perceived potential to reduce the probability and consequences of overheated stored fuel.
- This issue has a nexus to the Fukushima Daiichi event because the potential for overheating of stored fuel, although unrealized, was a significant concern.

Staff Approach

- Complete validation of spent fuel safety with respect to the Commission Safety Goals, considering past evaluations and results of spent fuel pool scoping study.
- Analyze information using NRC Regulatory Analysis Guidelines to inform a recommendation.
- Identify any inconsistencies or gaps that may need additional research.
- Gather stakeholder input on staff analysis of information.
- Recommend course of action to the Commission.

Spent Fuel Pool Scoping Study

- Limited-scope consequence assessment
 - Specific to a single site configuration
 - Seismic initiator based on results of past studies
- Considers:
 - Configuration through 5 stages of operating cycle
 - High and low density fuel storage (racks unchanged)
 - Event progression with and without mitigation
- Supports:
 - Validation of seismic modeling
 - Validation of event progression modeling
 - Validation of consequence modeling

Identified Gaps

- Issues that increase value of transfer
 - Criticality (e.g., degraded neutron absorbers)
 - Multi-unit issues
- Issues that decrease value of transfer
 - Cask drop hazard (i.e., increased cask movement with hot fuel in pool)
 - Operational risks (e.g., radiation dose)
 - Industry limitations (e.g., cask production)
 - Repackaging for transportation and disposal

Related Issues

- Order EA 12-049: Mitigation Strategies
 - Enhances 10 CFR 50.54(hh) mitigation capabilities
 - SFP spray capabilities subject to further discussion
- Order EA 12-051: Spent Fuel Pool Instrumentation
- NTTF Recommendations 7.2-5 (Tier 2)
 - Safety-related makeup availability
 - Seismically-qualified spray capability

Stakeholder Feedback

- Category 3 Public Meeting held on May 14
- NEI Used Fuel Management Conference on May 8
- No specific feedback on program plan
- Stakeholder comments included:
 - Requests for immediate NRC action to require transfer of spent fuel to dry casks
 - Proposed areas of consideration/research to address the issue, which is already in the plan
 - Concern that the NRC is over-regulating spent fuel storage

Questions?

Filtered Containment Venting Systems

Briefing to the
Advisory Committee on Reactor Safeguards
May 22, 2012

Topic Agenda

- Background
- Steering Committee Tasking
- Foreign Experience with FCVS
- Stakeholder Input

Background

- In SRM-SECY-11-0137, the Commission directed the staff to take certain actions related to reliable hardened vents.
 - Supported the NTTF recommendation to pursue an order to include a reliable hardened vent in BWR Mark I and Mark II containments (Tier 1).
 - Perform a long-term evaluation on reliable hardened vents for other containment designs (Tier 3).
 - “...quickly shift the issue of ‘Filtration of Containment Vents’ from the ‘additional issues’ category and merge it with the Tier 1 issue of hardened vents for Mark I and Mark II containments...”

Background

- In response, SECY-12-0025 included:
 - Proposed order to require a reliable hardened vent for BWR Mark I and Mark II containment designs
 - Prevention of core damage
 - No requirements for severe accident service
 - Severe accident service and filtration treated as a separate issue from proposed order
 - July 2012 Commission Paper

Staff Actions

- Reliable Hardened Vent Order issued March 12, 2012
- Staff is currently reviewing issues relating to severe accident service and filtration
 - Review Past Regulatory Actions
 - Insights from Fukushima
 - Evaluate Under Existing Regulatory Framework
 - Foreign Experience Insights

Foreign Experience with FCVS

Organizations and Sites Visited

- Sweden
 - Swedish Radiation Safety Authority (SSM)
 - Forsmark Unit 2 (Vattenfall) – similar to Mark II
 - Ringhals Unit 1 (Vattenfall) – similar to Mark II
- Switzerland
 - Swiss Federal Nuclear Safety Inspectorate (ENSI/HSK)
 - Leibstadt (KKL) – Mark III
 - Mühleberg (BKW) – similar to Mark I

Foreign Experience with FCVS

Sweden – Regulatory and Technical Bases

- In response to TMI, Sweden issued “Report by the Swedish Government Committee On Nuclear Reactor Safety”
 - Mitigate the consequences of a severe accident by strengthening containment.
 - Reduce risks that could result in radiation fatalities or high radiation dose from ground contamination
- FILTRA Research Project – a joint regulator and industry effort

Foreign Experience with FCVS

Sweden – Regulatory and Technical Bases

- Energy Bill 1980/1981
 - Expedite FCVS for Barseback (Located near Copenhagen)
 - Consider FCVS for Forsmark, Ringhals and Oskarshamn and identify any alternatives to FCVS
 - Cost/benefit not applicable to ground contamination
- Outcome
 - Barseback “First-of-a-kind” FCVS (1980 – 1985)
 - “Second Generation FCVS” for Forsmark, Ringhals and Oskarshamn

Foreign Experience with FCVS

Sweden – BWR FCVS at Ringhals 1, Forsmark and Oskarshamn

- Regulator and industry alignment to thoroughly evaluate ways to strengthen containment
- SSM required defense-in-depth for acknowledged uncertainties in PRA
 - FCVS from drywell was required for slow over-pressurization, feed/bleed and flood up by additional independent containment spray
 - Reliable drywell spray to flood up containment
 - Reliable means to flood under pedestal
 - Separate early overpressure mitigation

Concept

Foreign Experience with FCVS

Sweden – FCVS DF Requirements

- No acute fatalities
- Limited area of first year dose from ground contamination (with rain) of greater than 50 mSv
 - 5 Rem, natural background in some areas of Europe, annual radiation worker dose
- Considered met if release of no more than 0.1% core inventory Cs-134, Cs-137, and Iodine of 1,800 MWth reactor, similar for other nuclides important to land contamination
- Required demonstrated minimum DF 100; MVSS designed for 500, tested at 1,000

Foreign Experience with FCVS

Sweden – BWR FCVS Design Summary

- Passive filter, inerted w/ N₂, achieved DF of 1,000.
- Heat removal capability 1%, vents hydrogen.
- Seismic design – same as containment.
- Single train, 24 hour passive operation, active operation for early venting.
- Valves operable from control room with independent electrical and pneumatic supplies. Forsmark has local manual operation from shielded station.
- Instrumentation with independent batteries
- Drywell connection

Foreign Experience with FCVS

Top right to left, containment penetration, seismic support, inboard low pressure early venting line.
Lower right to left – penetration, passive rupture disk, 2 normally open valves.

Local manual pneumatic supply operating station for containment vent valves and system inerting.

Forsmark

and Spray Controls

Containment Flooding System
Temporary Equipment Connections.

Foreign Experience with FCVS

Ringhals

Mobile Unit for
Containment Spray
and PMR (Electrical
System Power)

Foreign Experience with FCVS

Sweden – BWR FCVS Industry Experience

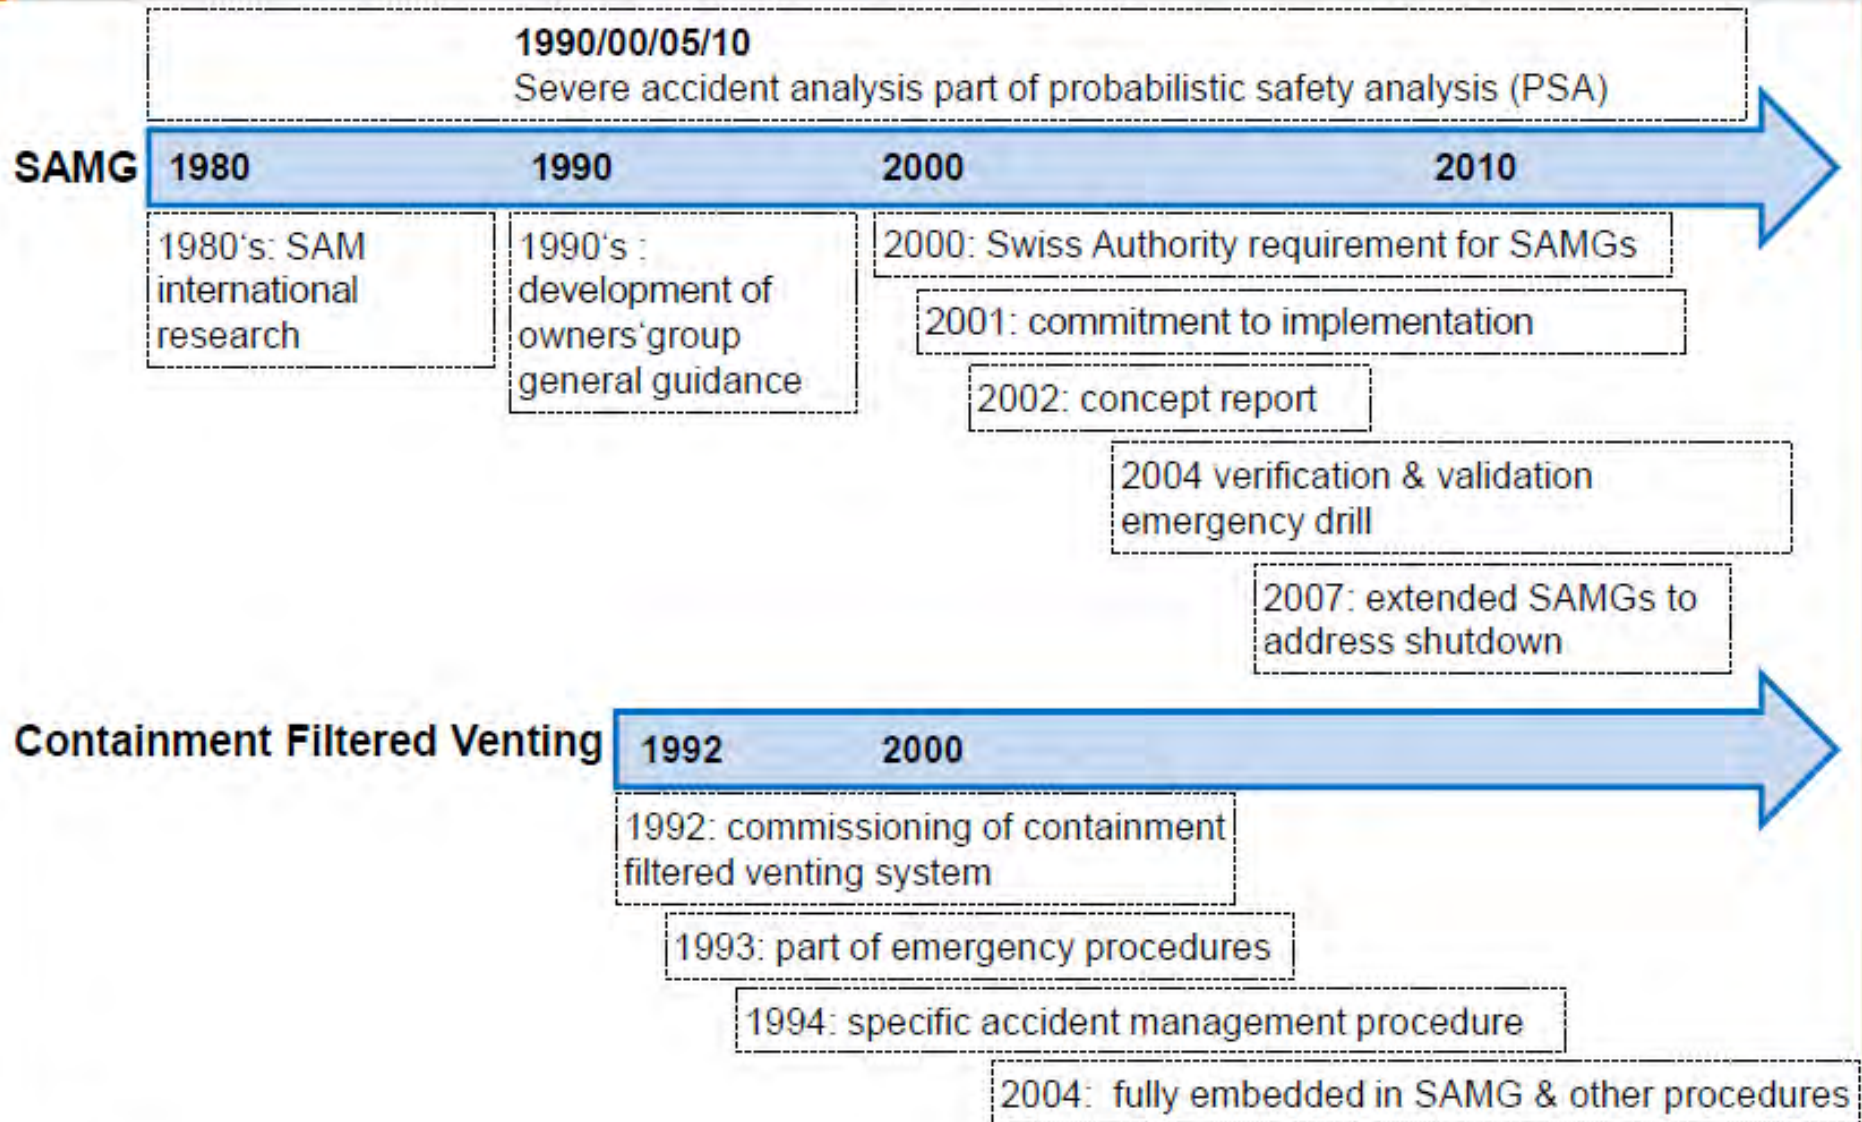

- Final SSM guidance 1986 – all required backfits, including FCVS, completed 1988
- Majority of work done at power, used outages for tie-in with no impact on production
- FCVS installation considered “not difficult”
- Installation costs (1988) estimated \$12.5 million per unit at Forsmark; Approximately \$9 million per unit at Ringhals
- Annual maintenance, testing, inspection not significant - estimate \$10,000-\$30,000
- FCVS in technical specifications; 30-Day AOT
- FCVS mature technology, no safety issues with use
- Utility representatives considered FCVS cost-beneficial

Foreign Experience with FCVS

Switzerland – FCVS Regulatory and Technical Bases

- Swiss Nuclear Energy Act requires licensees to backfit, as appropriate, in response to operating experience and consistent with available technology, to further reduce risk to people and the environment.
- Following TMI Swiss plants were required to install severe accident mitigation systems (e.g., SUSAN at Mühleberg).
- In response to the Chernobyl accident in 1986, HSK requested licensees to evaluate FCVS.

Accident Management & Containment Filtered Venting Timeline (example Mühleberg)

Foreign Experience with FCVS

Switzerland – FCVS Regulatory and Technical Bases (continued)

- HSK deterministic decision on FCVS based on need for defense-in-depth
- Regulator/industry developed draft guidance by 1988; installation 1989-1993; final regulatory guideline HSK R-40 1993
 - Heat removal capacity - 1% thermal power
 - Passive actuation via rupture disc; 24 hours
 - Operation from control room and manual local
 - Dedicated power for instrumentation and valve operation
 - Seismic Class 1
 - DF of 1,000 for aerosols, 100 for elemental/organic iodine (based on available technology)

Foreign Experience with FCVS

Leibstadt

Foreign Experience with FCVS

Switzerland – FCVS Industry Experience

- Leibstadt - \$11 million in 1993
- Mühleberg \$6 million in 1990 excludes filter vessel (not needed because MVS in unique secondary containment suppression pool)
- Majority of installation work performed at power, used outages for tie-in with no impact on production
- Maintenance Costs Considered “Not significant”
 - Estimated at \$50,000 to \$100,000/year
- Adopting new chemistry to improve iodine retention
- FCVS in Technical Specifications; 10-Day AOT
- No stated negatives for FCVS – Utility Representatives considered FCVS Cost-beneficial as designed

Foreign Experience with FCVS

Summary

- Mitigation of Severe Accidents required in Sweden and Switzerland
- FCVS required to preserve containment function
- No technical difficulties to install and maintain FCVS
- Counterparts emphasized that the installations did not extend scheduled refueling outage times
- Completed within 2 to 3 years
- FCVS considered cost-beneficial as designed

Stakeholder Input

- Public meetings held May 2nd and May 14th
- Nuclear Energy Institute letter May 25, 2012
- Public is very engaged – over 5 hours of input and comments received during public meetings.

Next Steps for FCVS Decision

- Staff Actions
 - Assess results of RES analyses of Fukushima
 - Finalize options and recommendations
 - Consider stakeholder input
 - Japan Lessons Learned Steering Committee review and approval
- ACRS Review
- July 2012
 - Response to Commission SRM due
 - SECY Paper to the Commission with options and staff recommendations

NTTF Recommendation 5.2: Reliable Hardened Vents for Other Containment Designs

Briefing to the
Advisory Committee on Reactor Safeguards
May 22, 2012

Background

- The NCTF recommended that the Commission direct the staff to reevaluate the need for hardened vents for other containment designs (other than BWR Mark I and Mark II containments)
- Prioritized as Tier 3 in SECY-11-0137
- Commission agreed with Tier 3 prioritization

Staff Assessment - Recommendation 5.2

- Historically, concern with containment venting has been on Mark I and II containment designs.
- Mark I and II designs are susceptible to over-pressurization if a means to remove heat from containment are lost.
- Other containment designs are less susceptible to over-pressurization.

Staff Assessment - Recommendation 5.2 (cont'd)

- There are limited resources (staff with specialized expertise) in this area.
- Staff recommends that further consideration of venting for other containment designs be deferred.
- Consideration of hardened reliable vents for other containment designs will resume when issues for Mark I and II designs are resolved.
