General Information

Florida grasshopper sparrows are small, short-tailed birds, about 13 centimeters (5 inches) long. Dorsally, they are much darker than the eastern race of the species (*A. s. pratensis*). They are mostly black and gray and lightly streaked with brown on the nape and upper back. Ventrally, adults are whitish and unstreaked, with some buff on the throat and breast. The breast is streaked in the juvenile plumage. The stripe over the eye is ochraceous, and the bend of the wing is yellow; the feet are flesh colored. There are no obvious sexual differences in the plumages. The Florida grasshopper sparrow is a well-marked subspecies, universally accepted as valid since its description by Mearns in 1902.
