Attorneys for Applicants
SOUTHERN CALIFORNIA EDISON COMPANY
and SAN DIEGO GAS & ELECTRIC COMPANY

UNITED STATES OF AMERICA

NUCLEAR REGULATORY COMMISSION

BEFORE THE ATOMIC SAFETY AND LICENSING BOARD

In the Matter of)	Docket Nos. 50-361-OL
)	50-362-OL
SOUTHERN CALIFORNIA EDISON)	RESPONSE AND OBJECTIONS
COMPANY, <u>et al.</u> (San Onofre)	OF SOUTHERN CALIFORNIA
Nuclear Generating Station,)	EDISON COMPANY TO INTER-
Units 2 and 3).)	VENOR FOE, <u>ET AL.</u> 'S FIFTH
)	<u>SET OF INTERROGATORIES</u>

TO INTERVENORS FRIENDS OF THE EARTH, MR. AND MRS. AUGUST
CARSTENS, MR. AND MRS. LLOYD VON HADEN, MRS. DONIS DAVEY AND
THEIR ATTORNEY OF RECORD:

Pursuant to 10 C.F.R. § 2.740b, Applicant Southern
California Edison Company hereby responds to "INTERVENOR, FOE ET
AL. FIFTH SET OF INTERROGATORIES TO SOUTHERN CALIFORNIA EDISON"
which were served by mail on Applicants on February 19, 1981.

INSTRUCTIONS AND DEFINITIONS

For purposes of the responses contained herein, the
following definitions and instructions shall apply:

DSO3
S
//

8103200664

G

1 (a) The term "these interrogatories" refers to "INTER-
2 VENOR, FOE ET AL. FIFTH SET OF INTERROGATORIES TO SOUTHERN
3 CALIFORNIA EDISON" which were mailed to Applicants on February
4 19, 1981.

5 (b) The term "FOE et al." refers jointly to the inter-
6 venors propounding these interrogatories; namely, Friends of the
7 Earth, Mr. and Mrs. August Carstens, Mr. and Mrs. Lloyd Von
8 Haden, and Mrs. Donis Davey.

9 (c) The term "Applicants" refers jointly to the co-
10 owners of San Onofre Nuclear Generating Station, Units 2 and 3,
11 Southern California Edison Company and the San Diego Gas &
12 Electric Company.

13 (d) The term "SONGS 2 and 3" refers to the San Onofre
14 Nuclear Generating Station, Units 2 nd 3.

15 (e) The term "SCE" refers to the Southern California
16 Edison Company. The term "SDG&E" refers to San Diego Gas &
17 Electric Company.

18 (f) The term "NRC" refers to the United States Nuclear
19 Regulatory Commission.

20 (g) The term "FSAR" refers to the "Final Safety Anal-
21 ysis Report, San Onofre Nuclear Generating Station, Units 2 and
22 3," which Applicants believe is currently available to the public
23 in the Public Documents Room of the Mission Viejo Public Library.

24 (h) Applicants occasionally refer to "Response to NRC
25 Questions, San Onofre Nuclear Generating Station, Units 2 and
26 3." The Responses are formal submittals prepared by Applicants
27 in response to formal written questions of the NRC. The Re-
28 sponses are found in four separate volumes and are included as

1 part of the FSAR. Applicants believe that the Responses are
2 currently available to the public in the Public Document Room of
3 the Mission Viejo Public Library.

4 (i) In all instances, SCE in response to these inter-
5 rogatories has provided such relevant, unprivileged, non-confi-
6 dential information that is responsive to each of these interro-
7 gatories and that has either been submitted to the NRC by or on
8 behalf of SCE or is available from SCE files and personnel.

9 (j) Where the interrogatories ask whether Applicants
10 have "analyzed" a document or subject, Applicants have defined
11 analysis to be where Applicants or its consultants have reveiwed
12 the document or subject in the context of SONGS 2 and 3 and have
13 submitted a report of that review.

14 (k) The term "PSAR" refers to the "Preliminary Safety
15 Analysis Report, San Onofre Nuclear Generating Stations, Units 2
16 nd 3" which Applicants believe is currently available to he
17 public in the Public Documents Room of the Mission Viejo Public
18 Library.

19 (l) Offshore Zone of Deformation ("OZD") as used in
20 this proceeding is a hypotherized zone of deformation which as
21 defined by the United States Geological Survey ("USGS") consists
22 of the Newport-Inglewood Zone of Deformation, the South Coast
23 Offshore Zone of Deformation and the Rose Canyon Zone of Deforma-
24 tion.

25 (m) The following named individuals have provided
26 answers to these interrogatories on behalf of the Applicants:

27 Interrogatory Nos. 1, 2, 3, 4, 5, 8, 9, 12, 13, 23,
28 and 24: Jay L. Smith;

1 Interrogatory Nos. 6, 18, 21, and 22: Hershel G.
2 Hawkins;

3 Interrogatory Nos. 7 and 10: Edward G. Heath;
4 Interrogatory Nos. 11, 14, 15, 16, and 17: Perry
5 Ehlig;

6 Interrogatory Nos. 19 and 20: John Barneich.

7 The objections have been asserted by Chickering &
8 Gregory, counsel for Applicants.

9 (n) Where the interrogatories ask Applicants to: (i)
10 state the substance of the facts and opinions to which you expect
11 the witness to testify; and (ii) summarize the factual and
12 theoretical basis, as well as any other grounds, for each opinion
13 to which the witness is expected to testify, unless otherwise
14 stated in Applicants response, it will be assumed that the
15 individuals listed as potential witnesses will testify to the
16 facts and opinions stated in the response to the specific inter-
17 rogatory.

18 INTERROGATORY NO. 1:

19 Define the following terms:

- 20 (a) structurally related
21 (b) wrench fault
22 (c) wrench fault system
23 (d) wrench fault tectonics
24 (e) active tectonic system
25 (f) branch or splay
26 (g) seismic gap
27 (h) en echelon
28 (i) plate boundary

1 RESPONSE TO INTERROGATORY NO. 1:

2 (a) Structurally Related - Applicants consider this
3 phrase to have the same meaning as "Structural Relationship"
4 which Applicants have defined as a close association in terms of
5 origin, tectonic style, or of a common source in space and
6 time. "Tectonic style," is the total character of a group of
7 related structures that distinguishes them from other groups of
8 structures, in the same way that a building or art object dis-
9 tinguishes it from others of different periods or influences.

10 (b) Wrench Fault - A steeply inclined strike-slip
11 fault.

12 (c) Wrench Fault System - A group of genetically
13 related, sub-parallel, wrench faults occurring within a zone of
14 crustal deformation. Members of the wrench fault system must all
15 have experienced the same sense of displacement within a single
16 tectonic regime but need not have formed at the same time nor
17 have been active during the same time interval.

18 (d) Wrench Fault Tectonics - Crustal deformation
19 resulting from strike-slip displacement along a deep-seated
20 wrench fault. In the area of interest, the deformation typically
21 involves sedimentary formations that were deposited across the
22 top of the wrench fault.

23 (e) Active Tectonic System - Is a descriptive phrase
24 rather than a technical term. Applicants construe the phrase to
25 be a group of interrelated, large structural elements of the
26 earth's crust characterized by demonstrable current or recurrent
27 movement or seismic activity.

28 (f) Branch fault - A minor fault abutting against or

1 branching from a major one. Syn: Auxiliary fault. A splay
2 fault, on the other hand, is one of a series of minor faults at
3 the extremities of a major fault, representing the dying-out of a
4 fault by dispersal into a number of smaller breaks.

5 (g) Seismic gap, has essentially two definitions.
6 Specifically, it is an area along an active plate boundary that
7 has not experienced a large thrust or strike-slip earthquake for
8 more than 30 years (McCann and others, 1978). It has been more
9 generally applied as a segment of an active fault zone that has
10 not experienced a principal earthquake during a time interval
11 when most other segments of the zone have (AGI, 1980).

12 (h) En echelon is the term used to describe geologic
13 features that are in an overlapping or staggered arrangement,
14 e.g. faults, each is relatively short, but collectively they form
15 a linear zone in which the strike of the individual features is
16 oblique to that of the zone as a whole; a steplike arrangement.

17 (i) Place boundary - The border or limit where two
18 plates come together.

19 INTERROGATORY NO. 2:

20 For each of the terms listed in Interrogatory No. 1:

21 (a) Identify each and every document written authority
22 or communication upon which you rely in defining each term;

23 (b) Identify each and every person, expert or other-
24 wise, upon whom you rely in defining each term; and

25 (c) Identify any writings, opinions, or testimony of
26 the person(s) you have listed in Interrogatory No. 2(b) upon
27 which you rely in defining each term.

28 ///

26 American Language, Second College Edi-
tion, D.B. Guralnik, Ed.; William Col-
lins-World Publishing Co., Inc.

27 (b) and (c) The authors of the above plus Perry
28 Ehlig and Jay L. Smith.

1 INTERROGATORY NO. 3:

2 Do you contend that the Cristianitos Fault does not
3 extend southward for a distance greater than 6000 feet offshore
4 from its coastal expression? If so,

5 (a) State each and every fact upon which you base this
6 contention;

7 (b) Identify each and every document or communication
8 upon which you base this contention;

9 (c) Identify each and every person with knowledge of
10 the factual basis or bases for this contention, or on whose
11 writings, opinions, or testimony you base this contention; and

12 (d) Identify each and every person, expert or other-
13 wise, whom you expect to call as a witness at the hearing before
14 the Atomic Safety and Licensing Board in support of this con-
15 tention, and as to each potential witness so identified provide
16 the following information:

17 (i) State the substance of the facts and opinions
18 to which you expect the witness to testify;

19 (ii) Summarize the factual and theoretical basis,
20 as well as any other grounds, for each opinion to which the
21 witness is expected to testify.

22 RESPONSE TO INTERROGATORY NO. 3:

23 Yes.

24 (a) Applicant's position is based on the following:

25 (1) Seismic reflection profiles showing no evi-
26 dence of faults having comparable characteristics and which are
27 aligned with the Cristianitos fault beyond about 6000 feet from
28 its coastal exposure;

1 (2) Surface and subsurface geologic mapping in the
2 Capistrano Embayment indicating the style of movement on the
3 Cristianitos fault is such that its greatest displacement is near
4 its midpoint, approximately 10 miles north of SONGS, and dies out
5 toward the south; and

6 (3) The maximum displacement of about 3000-4000
7 feet near its midpoint, when taken with only 600 feet of dis-
8 placement to the south near the seacliff indicates that the
9 Cristianitos fault should die out completely within a few thous-
10 and feet offshore.

11 (b) Appendix No. 1 - List of References is attached
12 hereto and by this reference incorporated herein. Said Appendix
13 lists and numbers many of the documents relied upon by Applicants
14 in these responses. In response to Interrogatory 3(b), Appli-
15 cants rely on document Nos. 1, 2, 7, 11, 14, 17, 20, 29, and 31.

16 (c) The authors of the above plus David G. Moore, Perry
17 Ehlig and Jay L. Smith.

18 (d) David G. Moore, Perry Ehlig, Jay L. Smith.

19 INTERROGATORY NO. 4:

20 What do you contend is the minimum age of last dis-
21 placement on the Cristianitos Fault?

22 (a) State each and every fact upon which you base this
23 contention;

24 (b) Identify each and every document or communication
25 upon which you base this contention;

26 (c) Identify each and every person with knowledge of
27 the factual basis or bases for this contention, or on whose
28 writings, opinions or testimony you base this contention; and

1 (d) Identify each and every person, expert or other-
2 wise, whom you expect to call as a witness at the hearing before
3 the Atomic Safety and Licensing Board in support of this con-
4 tention, and as to each potential witness so identified provide
5 the following information:

6 (i) State the substance of the facts and opinions
7 to which you expect the witness to testify;

8 (ii) Summarize the factual and theoretical basis,
9 as well as any other grounds, for each opinion to which the
10 witness is expected to testify.

11 RESPONSE TO INTERROGATORY NO. 4:

12 (a) The minimum age of last ground displacement on the
13 Cristianitos fault is greater than 125,000 years, based on the
14 Stage 5e marine terrace platform and deposits of that age which
15 are not disrupted across the fault. In view of the fault's
16 formation during a tectonic regime different from the modern one,
17 and in a depositional environment that ceased during Late
18 Pliocene time, the Cristianitos fault has probably not moved
19 during the last 3 million years. At places where younger move-
20 ment was suspected, investigation by trenching and mapping
21 disclosed the absence of displacements of Holocene or older
22 surficial deposits by the Cristianitos fault.

23 (b) These contentions are based on the following
24 documents listed in Appendix No. 1; 1, 2, 7, 10, 11, 15, 16, 17,
25 20, 21, 30, 31 (I).

26 (c) Persons having knowledge of the factual bases for
27 these contentions are the authors of the above plus Jay L. Smith,
28 Perry Ehlig and Roy Shlemon.

1 (d) Potential witnesses at hearing are Jay Smith, Perry
2 Ehlig, and Roy Shlemon

3 INTERROGATORY NO. 5:

4 Do you contend that the Cristianitos Fault is not a
5 "capable fault". If so,

6 (a) State each and every fact upon which you base this
7 contention;

8 (b) Identify each and every document or communication
9 upon which you base this contention;

10 (c) Identify each and every person with knowledge of
11 the factual basis or bases for this contention, or on whose
12 writings, opinions, or testimony you base this contention; and

13 (d) Identify each and every person, expert or other-
14 wise, whom you expect to call as a witness at the hearing before
15 the Atomic Safety and Licensing Board in support of this con-
16 tention, and as to each potential witness so identified provide
17 the following information:

18 (i) State the substance of the facts and opinions
19 to which you expect the witness to testify;

20 (ii) Summarize the factual and theoretical basis,
21 as well as any other grounds, for each opinion to which the
22 witness is expected to testify; and

23 (e) Identify each and every event upon which you base
24 this contention.

25 RESPONSE TO INTERROGATORY NO. 5:

26 Yes.

27 (a) Applicants' position is based on the facts that:

28 (1) There is demonstrable evidence in the seacliff

1 of no movement in at least the last 125,000 years,

2 (2) There is regional evidence of no movement
3 during the last 3 million years,

4 (3) There is no historic seismicity associated
5 with the fault,

6 (4) The Cristianitos fault is not structurally
7 related to capable faults in the region, and it formed in an
8 ancient tectonic environment and stress regime quite different
9 from the modern one, and

10 (5) The mechanism of the fault's formation
11 (listric normal, or gravity gliding westerly into the Los Angeles
12 Basin) is no longer operating, and sediments filling the Basin
13 effectively preclude further movement of the Cristianitos fault.

14 (b) Applicants position is based on the following
15 listed in Appendix No. 1; 1, 2, 7, 10, 11, 15, 16, 17, 18, 20,
16 21, 30 and 31(1).

17 (c) Persons having knowledge of the factual basis of
18 Applicants' position are the authors of the documents listed in
19 (b), above, as well as Perry Ehlig, Roy Shlemon, Stewart Smith
20 and Shawn Biehler.

21 (d) Potential witnesses at hearing are Perry Ehlig, Jay
22 Smith, Roy Shlemon, Stewart Smith and Shawn Biehler.

23 INTERROGATORY NO. 6:

24 Do you contend that the OZD is the controlling geologic
25 structure for seismic design of SONGS 2 and 3? If so:

26 (a) State each and every fact upon which you base this
27 contention;

28 (b) Identify each and every document or communication

1 upon which you base this contention;

2 (c) Identify each and every person with knowledge of
3 the factual basis or bases for this contention, or on whose
4 writings, opinions or testimony you base this contention; and

5 (d) Identify each and every person, expert or other-
6 wise, whom you expect to call as a witness at the hearing before
7 the Atomic Safety and Licensing Board in support of this con-
8 tention, and as to each potential witness so identified provide
9 the following information:

10 (i) State the substance of the facts and opinions
11 to which you expect the witness to testify;

12 (ii) Summarize the factual and theoretical basis,
13 as well as any other grounds, for each opinion to which the
14 witness is expected to testify.

15 RESPONSE TO INTERROGATORY NO. 6:

16 Yes. Applicants' position is based on the following:

17 (a) (1) The OZD is the closest, nearby geologic
18 structure that can reasonably be associated with the Newport-
19 Inglewood Zone of Deformation.

20 (2) The OZD has been assumed capable of generating
21 very large earthquakes ($M_s = 7.0$)

22 (3) The OZD controls the peak spectral values as
23 well as the peak ground acceleration.

24 (4) When compared to other sources of seismic
25 activity in the region, the relative contribution from the OZD to
26 the total probability of exceedance was 84-99%.

27 (5) Predicted MM intensities at SONGS from a major
28 earthquake on the OZD are significantly higher than those from a

1 major earthquake on other nearby faults including the San
2 Andreas.

3 (b) Applicants' position is based on the following
4 documents listed in Appendix No. 1; 17 and 29. Additional
5 references are:

6 (i) U.S. Atomic Energy Commission, 1972, Safety
7 Evaluation Report, San Onofre Nuclear Generating Station,
8 Units 2 and 3.

9 (ii) U.S. Nuclear Regulatory Commission, 1981,
10 Safety Evaluation Report, San Onofre Nuclear Generating
11 Station, Units 2 and 3.

12 (iii) Woodward-Clyde Consultants, 1980, Develop-
13 ment of Instrumental Response Spectra with Equal Probability
14 of Exceedence for SONGS, Units 1, for Southern California
15 Edison Co.

16 (iv) U.S. Geological Survey, 1980, Scenarios of
17 Possible Earthquakes Affecting Major California Population
18 Centers, with Estimates of Intensity and Ground Shaking,
19 Open-File Report 81-115.

20 (c) The authors of the above reports plus David Moore
21 and Edward G. Heath.

22 (d) Potential witnesses are David Moore and Edward G.
23 Heath.

24 INTERROGATORY NO. 7:

25 What do you contend is the maximum magnitude earthquake
26 that could occur on the OZD?

27 (a) State each and every fact upon which you base this
28 contention;

1 (b) Identify each and every document or communication
2 upon which you base this contention;

3 (c) Identify each and every person with knowledge of
4 the factual basis or bases for this contention, or on whose
5 writings, opinions or testimony you base this contention; and

6 (d) Identify each and every person, expert or other-
7 wise, whom you expect to call as a witness at the hearing before
8 the Atomic Safety and Licensing Board in support of this con-
9 tention, and as to each potential witness so identified provide
10 the following information:

11 (i) State the substance of the facts and opinions
12 to which you expect the witness to testify;

13 (ii) Summarize the factual and theoretical basis,
14 as well as any other grounds, for each opinion to which the
15 witness is expected to testify.

16 RESPONSE TO INTERROGATORY NO. 7:

17 (a) The Applicant has concluded that a magnitude of
18 M_s 6-1/2 is a reasonable maximum earthquake magnitude consistent
19 with the geologic and seismologic features of the NIZD. Because
20 the NIZD is considered to conservatively represent the earthquake
21 potential of OZD, transferring M_s 6-1/2 to the OZD provides a
22 degree of conservatism for the maximum magnitude estimate for the
23 OZD opposite the site. Based on incorporation of additional
24 conservatism through evaluation of ranges in slip rate data and
25 review of other elements for assessing the degree of fault
26 activity of the hypothesized OZD, the most conservative maximum
27 magnitude is M_s 7. A larger earthquake is inconsistent with the
28 geologic and seismologic features of the hypothesized OZD.

1 (b) Applicants rely on the references in Appendix
2 No. 1; 9 and 18 as well as

3 (i) Response to NRC Questions 361.37 through
4 361.52, 361.60, 361.61, 361.66 and 361.67.

5 (ii) Statements and supporting data presented to
6 the NRC Geoscience Branch at a public hearing at the Quality
7 Inn, Los Angeles, Ca. on March 4, 1980.

8 (iii) U.S. Nuclear Regulatory Commission, 1981,
9 Safety Evaluation Report for San Onofre Nuclear Generating
10 Station, Units 2 and 3.

11 (c) The authors of the above referenced documents and
12 more specifically, Edward G. Heath, Paul D. Guphill, Lloyd Cluff,
13 W.U. Savage, Paul Sommerville, (all of whom are associated with
14 Woodward-Clyde Consultants) David Hadley of Sierra Geophysics,
15 and Karen McNally.

16 (d) Probable witness would be Edward G. Heath.

17 INTERROGATORY NO. 8:

18 What do you contend is the maximum magnitude earthquake
19 that could occur on the geologic structural relationship between
20 the OZD and the Cristianitos Zone of Deformation?

21 (a) State each and every fact upon which you base this
22 contention;

23 (b) Identify each and every document or communication
24 upon which you base this contention;

25 (c) Identify each and every person with knowledge of
26 the factual basis or bases for this contention, or on whose
27 writings, opinions or testimony you base this contention; and

28 (d) Identify each and every person, expert or

1 otherwise, whom you expect to call as a witness at the hearing
2 before the Atomic Safety and Licensing Board in support of this
3 contention, and as to each potential witness so identified
4 provide the following information:

5 (i) State the substance of the facts and opinions
6 to which you expect the witness to testify;

7 (ii) Summarize the factual and theoretical basis,
8 as well as any other grounds, for each opinion to which the
9 witness is expected to testify.

10 RESPONSE TO INTERROGATORY NO. 8:

11 (a) Applicants object to Interrogatory No. 8 on the
12 ground that it is ambiguous and unintelligible. Said Interroga-
13 tory calls for assessment at a maximum magnitude earthquake that
14 would occur on a "relationship." Earthquakes do not occur on
15 "relationships." In order to expedite the licensing process,
16 Applicants construe the interrogatory to call for an estimate of
17 the maximum magnitude earthquake that could occur on the postul-
18 ated Cristianitos Zone of Deformation. As so construed, Appli-
19 cants contend that there is no geologic structure which relates
20 the OZD to what intervenors postulate to be a Cristianitos Zone
21 of Deformation and that there is no such structure capable of
22 generating significant earthquakes.

23 (b) Applicants position is based on the totality of
24 geologic evidence gathered as a part of the review of this site,
25 none of which evidences a capable "Cristianitos Zone of Deforma-
26 tion."

27 (c) The person best able to address the issue on behalf
28 of Applicants is David Moore.

1 (d) David Moore would be Applicants principal witness
2 on the subject of offshore geology.

3 INTERROGATORY NO. 9:

4 What do you contend is the minimum age of last dis-
5 placement on the South Coast Offshore Zone of Deformation portion
6 of the OZD?

7 (a) State each and every fact upon which you base this
8 contention;

9 (b) Identify each and every document or communication
10 upon which you base this contention;

11 (c) Identify each and every person with knowledge of
12 the factual basis or bases for this contention, or on whose
13 writings, opinions or testimony you base this contention; and

14 (d) Identify each and every person, expert or other-
15 wise, whom you expect to call as a witness at the hearing before
16 the Atomic Safety and Licensing Board in support of this con-
17 tention, and as to each potential witness so identified provide
18 the following information:

19 (i) State the substance of the facts and opinions
20 to which you expect the witness to testify;

21 (ii) Summarize the factual and theoretical basis,
22 as well as any other grounds, for each opinion to which the
23 witness is expected to testify; and

24 (e) Identify each and every event upon which you base
25 this contention.

26 RESPONSE TO INTERROGATORY NO. 9:

27 (a) The minimum age of last ground displacement on the
28 South Coast offshore fault is probably Pleistocene, and possibly

1 Holocene (within about the last 11,000 years). This is based on
2 the fact that in some places the fault extends upward to the
3 seafloor. The age of the seafloor and its sediments along the
4 SCOZD is not known absolutely, but is probably Holocene. The
5 SCOZD anticline developed during late Miocene through Pliocene
6 time, with minor amounts of axial elevation during Pleistocene
7 time, based on the pinch-outs of post-Monterey formations
8 (Capistrano equivalents) against the anticline and on the ap-
9 parent absence of all but the most recent marine terrace platform
10 on the flanks and of crest at the anticline.

11 (b) Applicants rely on the documents listed in Appendix
12 No. 1; 1, 2, 7, 11, 14, 17, 20, 29, and 31.

13 (c) The authors of the above plus David G. Moore, Perry
14 Ehlig and Jay L. Smith.

15 (d) David G. Moore, Perry Ehlig, Jay L. Smith.

16 INTERROGATORY NO. 10:

17 What do you contend is the minimum age of last dis-
18 placement on the Newport Inglewood Zone of Deformation portion of
19 the OZD?

20 (a) State each and every fact upon which you base this
21 contention;

22 (b) Identify each and every document or communication
23 upon which you base this contention;

24 (c) Identify each and every person with knowledge of
25 the factual basis or bases for this contention, or on whose
26 writings, opinions or testimony you base this contention; and

27 (d) Identify each and every person, expert or other-
28 wise, whom you expect to call as a witness at the hearing before

1 the Atomic Safety and Licensing Board in support of this con-
2 tention, and as to each potential witness so identified provide
3 the following information:

4 (i) State the substance of the facts and opinions
5 to which you expect the witness to testify;

6 (ii) Summarize the factual and theoretical basis,
7 as well as any other grounds, for each opinion to which the
8 witness is expected to testify; and

9 (e) Identify each and every event upon which you base
10 this contention.

11 RESPONSE TO INTERROGATORY NO. 10:

12 (a) The latest displacement on faults of Newport-
13 Inglewood zone of deformation occurred in the subsurface in
14 association with the M_s 6.3 earthquake on March 11, 1933. The
15 main shock and aftershock sequence from the 1933 earthquake have
16 been assigned to the Newport-Inglewood zone of deformation.
17 Appendix E of the Woodward-Clyde Consultants June 1979 report
18 (see (b) below) analyzes the displacement which occurred during
19 the 1933 event.

20 (b) Woodward-Clyde Consultants' 1979 Report of the
21 Evaluation of Maximum Earthquake and Site Ground Motion Para-
22 meters Associated with the Offshore Zone of Deformation, San
23 Onofre Nuclear Generating Station, Appendix E; prepared for
24 Southern California Edison Company, Rosemead, California.

25 (c) W. U. Savage, P. Sommerville, Edward G. Heath, and
26 P. D. Gupta from Woodward-Clyde Consultants; K. C. McNally from
27 California Institute of Technology; and D. Hadley from Sierra
28 Geophysics.

1 (d) It is our present intention that Edward G. Heath
2 and D. M. Hadley may be called as witnesses on this subject in
3 the ASLB hearing.

4 (e) The March 11, 1933 earthquake centered near the
5 Newport Beach occurred on the Newport-Inglewood zone of deforma-
6 tion.

7 INTERROGATORY NO. 11:

8 What do you contend is the minimum age of last dis-
9 placement on the Rose Canyon Fault Zone portion of the OZD?

10 (a) State each and every fact upon which you base this
11 contention;

12 (b) Identify each and every document or communication
13 upon which you base this contention;

14 (c) Identify each and every person with knowledge of
15 the factual basis or bases for this contention, or on whose
16 writings, opinions or testimony you base this contention; and

17 (d) Identify each and every person, expert or other-
18 wise, whom you expect to call as a witness at the hearing before
19 the Atomic Safety and Licensing Board in support of this con-
20 tention, and as to each potential witness so identified provide
21 the following information:

22 (i) State the substance of the facts and opinions
23 to which you expect the witness to testify;

24 (ii) Summarize the factual and theoretical basis,
25 as well as any other grounds, for each opinion to which the
26 witness is expected to testify; and

27 (e) Identify each and every event upon which you base
28 this contention.

1 RESPONSE TO INTERROGATORY NO. 11:

2 (a) The oldest sediments reported to be not offset by
3 the Rose Canyon fault were in San Diego where Ferrand and others
4 (1981) reported that soils deposited 7800 + 500 years B.P. were
5 not offset by the fault zone. The youngest sediments reported to
6 be offset by the Rose Canyon fault zone are in the Mission Bay
7 area where Liem (1977) reported fault separation younger than
8 27,000 years on the basis of radiocarbon dating.

9 (b) Ferrand, G. T., Bemis, C. G., and Jansen, L. T.,
10 Radiocarbon Dates of Alluvium, Rose Canyon Fault Zone, San Diego
11 Co., Abstracts with Programs, 1981. G.S.A. International Meet-
12 ing, March 25-27, 1981, Hermosillo, Sonora, Mexico. T. J. Liem,
13 1977, Late Pleistocene Maximum Age of Faulting, Southeast Mission
14 Bay Area, San Diego, California, in, Farrand, G. T., (ed.)
15 Geology of Southwestern San Diego County, California and North-
16 western Baja California; San Diego Association of Geologists
17 Guidebook; and in Gastill, R. G., Kies, R., and Melius D. J.,
18 1979, Active and Potentially Active Faults: San Diego County and
19 Northernmost Baja California, in, Abbott, D. L., and Elliott,
20 W. J., 1979, Earthquakes and Other Perils, San Diego Region,
21 prepared for Geological Society of America Field Trip by San
22 Diego Association of Geologists, November, 1979.

23 (c) The authors of the above documents plus Daryl
24 Streiff of Woodward-Clyde Consultants and Perry Ehlig.

25 (d) The principal witness on this subject would be
26 Perry Ehlig.

27 INTERROGATORY NO. 12:

28 Is it your contention that the postulated zone of

1 deformation which extends from the coastal exposure of the
2 Cristianitos Fault toward the OZD dies out before reaching the
3 OZD? If so:

4 (a) State each and every fact upon which you base this
5 contention;

6 (b) Identify each and every document or communication
7 upon which you base this contention;

8 (c) Identify each and every person with knowledge of
9 the factual basis or bases for this contention, or on whose
10 writings, opinions or testimony you base this contention; and

11 (d) Identify each and every person, expert or other-
12 wise, whom you expect to call as a witness at the hearing before
13 the Atomic Safety and Licensing Board in support of this con-
14 tention, and as to each potential witness so identified provide
15 the following information:

16 (i) State the substance of the facts and opinions
17 to which you expect the witness to testify;

18 (ii) Summarize the factual and theoretical basis,
19 as well as any other grounds, for each opinion to which the
20 witness is expected to testify.

21 RESPONSE TO INTERROGATORY NO. 12:

22 (a) As stated in the response to Interrogatory No. 8,
23 we contend there is no Cristianitos Zone of Deformation as
24 postulated by Intervenor. There are discontinuous gentle folds
25 and short intraformational faults that trend north to northwest
26 offshore between the coast and the SCOZD, but these: 1) are not
27 extensions of the Cristianitos fault, 2) they veer southeastward
28 to parallel the SCOZD before reaching it, and 3) their closest

1 approach to the South Coast Offshore fault is about 3000 feet.
2 These folds and faults do not extend northerly to be exposed in
3 the seacliff or elsewhere onshore indicating that they either die
4 out landward or they are older than the San Mateo Formation (4-11
5 million years).

6 (b) For the factual bases of these contentions, and the
7 documents and persons relevant to them, see responses to Inter-
8 rogatory Nos. 3(b), 4(b), 5(b), and 8(b).

9 (c) The authors of the above references as well as
10 David Moore, Perry Ehlig, Jay L. Smith, and Roy Shlemon.

11 (d) The principal witnesses would be David Moore, Perry
12 Ehlig, Jay L. Smith and Roy Shlemon.

13 INTERROGATORY NO. 13:

14 Do you contend that there is not a structural relation-
15 ship between the Cristianitos Fault and the OZD? If so:

16 (a) State each and every fact upon which you base this
17 contention;

18 (b) Identify each and every document or communication
19 upon which you base this contention;

20 (c) Identify each and every person with knowledge of
21 the factual basis or bases for this contention, or on whose
22 writings, opinions or testimony you base this contention; and

23 (d) Identify each and every person, expert or other-
24 wise, whom you expect to call as a witness at the hearing before
25 the Atomic Safety and Licensing Board in support of this con-
26 tention, and as to each potential witness so identified provide
27 the following information:

28 (i) State the substance of the facts and opinions

1 to which you expect the witness to testify;

2 (ii) Summarize the factual and theoretical basis,
3 as well as any other grounds, for each opinion to which the
4 witness is expected to testify; and

5 (e) Identify each and every event upon which you base
6 this contention.

7 RESPONSE TO INTERROGATORY NO. 13:

8 (a) Applicants contend there is no structural relation-
9 ship between the Cristianitos fault and the OZD. This contention
10 is based on the following:

- 11 1. They are not connected;
- 12 2. They have different tectonic styles (dip-
13 slip/listric gravity glide vs. right-lateral slip);
- 14 3. Activity on the Cristianitos fault ceased
15 about 3-4 million years ago and has not recurred for at least
16 125,000 years; the South Coast Offshore fault of the OZD has been
17 active through Pleistocene and probably Holocene time;
- 18 4. The modern tectonic regime is dominated by
19 general north-south compression that is not compatible with
20 movement on the Cristianitos fault; and
- 21 5. Late Pleistocene/Holocene displacements on the
22 South Coast Offshore fault of the OZD have demonstrably not been
23 accompanied by movements on the Cristianitos fault for the last
24 125,000 years.

25 (b) The documents, communications and knowledgeable
26 persons relevant to this contention are referenced in sub-part
27 (b) to the responses to Interrogatory Nos. 1, 2, 3, 4, 5, 8, 9,
28 10, 12, 23, and 24.

1 (c) The authors of the documents referenced to in (b),
2 above as well as David Moore, Perry Ehlig and Jay L. Smith.

3 (d) The principal witnesses on this issue would be
4 David Moore, Perry Ehlig and Jay L. Smith.

5 (e) Not applicable.

6 INTERROGATORY NO. 14:

7 Do you contend that the OZD does not extend south of
8 the Rose Canyon Fault Zone? If so:

9 (a) State each and every fact upon which you base this
10 contention;

11 (b) Identify each and every document or communication
12 upon which you base this contention;

13 (c) Identify each and every person with knowledge of
14 the factual basis or bases for this contention, or on whose
15 writings, opinions or testimony you base this contention; and

16 (d) Identify each and every person, expert or other-
17 wise, whom you expect to call as a witness at the hearing before
18 the Atomic Safety and Licensing Board in support of this con-
19 tention, and as to each potential witness so identified provide
20 the following information:

21 (i) State the substance of the facts and opinions
22 to which you expect the witness to testify;

23 (ii) Summarize the factual and theoretical basis,
24 as well as any other grounds, for each opinion to which the
25 witness is expected to testify.

26 RESPONSE TO INTERROGATORY NO. 14:

27 Yes - the bulk of evidence for faulting at the south
28 end of the Rose Canyon fault zone consists of faults identified

1 by acoustic profiling in San Diego Bay and offshore of San
2 Diego. This evidence strongly suggests that the RCFZ extends
3 offshore of San Diego and not to the south through San Diego
4 Bay. The character of faulting within the RCFZ changes in the
5 southern portion of San Diego and becomes a wide zone of faulting
6 characterized primarily by dip slip displacement. Current data
7 indicates that the faulting within this wide zone dies out to the
8 southwest prior to reaching the offshore projection of the U.S. -
9 Mexican border (Moore and Kennedy, 1975, Kennedy and others 1977,
10 and Kennedy and Welday, 1980).

11 Refraction, gravity and ground magnetic surveys con-
12 ducted in the area south and southeast of San Diego Bay by
13 Kennedy and others (1977) found no significant anomalies across
14 possible southeast projections of fault mapped within the
15 R.C.F.Z. Thus there is no evidence that the R.C.F.Z. extends
16 south of San Diego Bay in the onshore area.

17 (b) Woodward-Clyde Consultants, June 1979, Report of
18 the Evaluation of Maximum Earthquake and Site Ground Motion
19 Parameters Associated with the Offshore Zone of Deformation, San
20 Onofre Nuclear Generating Station; Southern California Edison
21 Company and San Diego Gas and Electric, 1980, San Onofre Nuclear
22 Generating Station Units 2 and 3, Responses to NRC Questions
23 361.41, 361.60, and 361.66; other pertinent documents are dis-
24 cussed in the above-mentioned reports.

25 (c) Edward G. Heath, Daryl Streiff, Perry Ehlig, M. P.
26 Kennedy, E. E. Welday, G. W. Moore, H. G. Greene.

27 (d) The principal witnesses would be Perry Ehlig and
28 Edward G. Heath.

1 INTERROGATORY NO. 15:

2 Do you contend that there is no structural relationship
3 between the Rose Canyon Fault Zone and the Vallecitos Fault in
4 Baja, California? If so:

5 (a) State each and every fact upon which you base this
6 contention;

7 (b) Identify each and every document or communication
8 upon which you base this contention;

9 (c) Identify each and every person with knowledge of
10 the factual basis or bases for this contention, or on whose
11 writings, opinions or testimony you base this contention; and

12 (d) Identify each and every person, expert or other-
13 wise, whom you expect to call as a witness at the hearing before
14 the Atomic Safety and Licensing Board in support of this con-
15 tention, and as to each potential witness so identified provide
16 the following information:

17 (i) State the substance of the facts and opinions
18 to which you expect the witness to testify;

19 (ii) Summarize the factual and theoretical basis,
20 as well as any other grounds, for each opinion to which the
21 witness is expected to testify.

22 RESPONSE TO INTERROGATORY NO. 15:

23 (a) Yes - Field mapping shows that the Vallecitos fault
24 does not extend northwestward into the eocene bedrock terrane in
25 Northern Valle De Las Palmas. Based on this evidence the Val-
26 lecitots fault is either pre-eocene in age or terminates south of
27 the eocene terrane. This large separation in either time or
28 space precludes a structural relationship between the two zones.

1 (b) This conclusion is based on data and references
2 used in Responses to NRC Questions Nos. 361.41b, 361.60, and
3 361.66. Published documentation comes from references listed for
4 each of the above listed responses to NRC questions.

5 (c) Daryl Streiff, Perry Ehlig, Gordon Gastill, Ken-
6 nedy, M. P., R. P. Phillips, E. C. Allison, R. Kies, D. J.
7 Malius, E. E. Welday.

8 (d) The principal witness would be Perry Ehlig.

9 INTERROGATORY NO. 16:

10 Do you contend that there is not a structural relation-
11 ship between the Rose Canyon Fault Zone and the San Miguel Fault
12 in Baja, California? If so:

13 (a) State each and every fact upon which you base this
14 contention;

15 (b) Identify each and every document or communication
16 upon which you base this contention;

17 (c) Identify each and every person with knowledge of
18 the factual basis or bases for this contention, or on whose
19 writings, opinions or testimony you base this contention; and

20 (d) Identify each and every person, expert or other-
21 wise, whom you expect to call as a witness at the hearing before
22 the Atomic Safety and Licensing Board in support of this con-
23 tention, and as to each potential witness so identified provide
24 the following information:

25 (i) State the substance of the facts and opinions
26 to which you expect the witness to testify;

27 (ii) Summarize the factual and theoretical basis,
28 as well as any other grounds, for each opinion to which the

1 witness is expected to testify.

2 RESPONSE TO INTERROGATORY NO. 16:

3 (a) Yes - Field mapping indicates the San Miguel fault
4 terminates to the northeast of Valle San Rafael without affecting
5 Cretaceous dikes in this region. The northern termination of the
6 San Miguel fault is 54 miles from the southern terminous of the
7 Rose Canyon fault zone. This large separation of the two fault
8 zones precludes a structural relationship between them.

9 (b) This conclusion is based on data and references
10 used in Responses to NRC Questions Nos. 361.41b, 361.60, and
11 361.66. Transcript of Presentation to ACRS subcommittee on
12 January 31, 1981.

13 (c) Perry Ehlig, D. Streiff, Gordon Gastill, R. P.
14 Phillips, E. C. Allison, R. Kies, D. J. Melius, M. P. Kennedy, G.
15 Shor, E. E. Roberts.

16 (d) The principal witness would be Perry Ehlig.

17 INTERROGATORY NO. 17:

18 Do you contend that there is not a relationship between
19 the OZD and the San Andreas? If so:

20 (a) State each and every fact upon which you base this
21 contention;

22 (b) Identify each and every document or communication
23 upon which you base this contention;

24 (c) Identify each and every person with knowledge of
25 the factual basis or bases for this contention, or on whose
26 writings, opinions or testimony you base this contention; and

27 (d) Identify each and every person, expert or other-
28 wise, whom you expect to call as a witness at the hearing before

1 the Atomic Safety and Licensing Board in support of this con-
2 tention, and as to each potential witness so identified provide
3 the following information:

4 (i) State the substance of the facts and opinions
5 to which you expect the witness to testify;

6 (ii) Summarize the factual and theoretical basis,
7 as well as any other grounds, for each opinion to which the
8 witness is expected to testify; and

9 (e) Identify each and every event upon which you base
10 this contention.

11 RESPONSE TO INTERROGATORY NO. 17:

12 There is no structural relationship between the San
13 Andreas fault and the OZD. The San Andreas is a relatively
14 simple transform fault forming the boundary of the Pacific and
15 North American plates for a distance of 1100 km between the Gulf
16 of California spreading system and the Mendocino triple junction
17 (Atwater, 1970; Allen, 1981).

18 The OZD does not interconnect with the San Andreas
19 fault or the Gulf of California spreading system and is not part
20 of the present Pacific and North American plate boundary. The
21 northern end of the OZD terminates against reverse faults along
22 the Southern edge of the Santa Monica Mountains (Barrows,
23 1974). There is no interconnection between the southern termina-
24 tion of the OZD and the Gulf of California spreading system. The
25 OZD is a secondary feature within the Pacific plate and not part
26 of the San Andreas fault.

3 Tectonics for the Cenozoic Evolution of Western North America;
4 Geol. Soc. A. Bull., V.81, p.3513-3536.

5 (3) Barrows, A.G., 1974, A Review of The Geology
6 and Earthquake History of the Newport Inglewood Structural Zone,
7 Southern California; Calif. Div. Mines and Geology, Special
8 Report 114, 115 p.

9 (c) The authors of the above documents as well as Perry
10 Ehlig, Jay L. Smith and Edward G. Heath.

11 (d) The principal witness on this subject would be
12 Perry Ehlig.

13 INTERROGATORY NO. 18:

14 Do you contend that .67 g is the proper design ac-
15 celeration value for SONGS 2 and 3?

16 RESPONSE TO INTERROGATORY NO. 18:

17 As more fully discussed in Applicants response to
18 Interrogatory No. 19, Applicants consider .67g to be an overly
19 conservative design value for SONGS 2 and 3.

20 INTERROGATORY NO. 19:

21 If your answer to Interrogatory No. 18 is Yes:

22 (a) State each and every fact upon which you base this
23 contention;

24 (b) Identify each and every document or communication
25 upon which you base this contention;

26 (c) Identify each and every person with knowledge of
27 the factual basis or bases for this contention, or on whose
28 writings, opinions or testimony you base this contention; and

1 (d) Identify each and every person, expert or other-
2 wise, whom you expect to call as a witness at the hearing before
3 the Atomic Safety and Licensing Board in support of this con-
4 tention, and as to each potential witness so identified provide
5 the following information:

6 (i) State the substance of the facts and opinions
7 to which you expect the witness to testify;

8 (ii) Summarize the factual and theoretical basis,
9 as well as any other grounds, for each opinion to which the
10 witness is expected to testify.

11 RESPONSE TO INTERROGATORY NO. 19:

12 (a) Factual data upon which the conservatism of 0.67g
13 as a design basis have been summarized in the 31 January 1981
14 Advisory Committee for Reactor Safeguards (ACRS) subcommittee
15 meeting held in Inglewood, California, and the 5 February 1981
16 ACRS full committee meeting held in Washington, D.C. Specifi-
17 cally, Dr. McNeill's testimony in both meetings summarizes the
18 conservatism utilized in both meetings in developing the 0.67g
19 design acceleration and describes studies that have been carried
20 out over the past several years that test the conservatism of the
21 0.67g. Basically, the elements of conservatism were tested based
22 on three categories of study: (1) empirical data evaluations; (2)
23 deterministic evaluation by physical modeling; and (3) probabil-
24 istic consideration of the data. The results of these studies
25 unequivocally show the 0.67g acceleration to be a very conserva-
26 tive design basis for SONGS 2 and 3.

27 (b) The following documents are the basis for the above
28 stated contention.

1 1. Preliminary Safety Analysis Report (PSAR) for
2 Volume 2, 3, and 4, San Onofre Nuclear Generating Station, Units
3 2 and 3.

4 2. Final Safety Analysis Report (FSAR) for San
5 Onofre Nuclear Generating Station, Units 2 and 3, Volumes 4, 5,
6 6, 7, 9, and 10.

7 3. Responses to NRC question 361.52 through
8 361.59, 361.62, 361.64, 361.65, and 361.68 for San Onofre Nuclear
9 Generating Station, Units 2 and 3.

10 4. Report of the Evaluation of Maximum Earthquake
11 and Site Ground Motion Parameters associated with the Offshore
12 Zone of Deformation, San Onofre Nuclear Generating Station,
13 prepared by Woodward-Clyde Consultants, June 1979.

14 5. Evaluation of Peak Horizontal Ground Acceleration
15 Associated with the Offshore Zone of Deformation at San
16 Onofre Nuclear Generating Station, prepared by Tera Corporation,
17 July 1980.

18 6. Transcripts of the 31 January 1981 ACRS
19 subcommittee meeting and 5 February 1981 ACRS full committee
20 meeting.

21 7. Development of Instrumental Response Spectra
22 with Equal Probability of Exceedance for SONGS Unit 1.

23 (c) The authors of the above documents as well as J. A.
24 Barneich, K. W. Campbell, G. A. Frazier, I. M. Idriss, R. L.
25 McNeil, K. Sadigh, W. U. Savage, S. W. Smith, L. H. Wight.

26 (d) The principal witnesses on the above subject would
27 be R. L. McNeill, G. A. Frazier, I. M. Idriss, and S. W. Smith.

28 ///

1 INTERROGATORY NO. 20:

2 Do you contend that there is no possibility of ground
3 displacement within the plant site? If so:

4 (a) State each and every fact upon which you base this
5 contention;

6 (b) Identify each and every document or communication
7 upon which you base this contention;

8 (c) Identify each and every person with knowledge of
9 the factual basis or bases for this contention, or on whose
10 writings, opinions or testimony you base this contention; and

11 (d) Identify each and every person, expert or other-
12 wise, whom you expect to call as a witness at the hearing before
13 the Atomic Safety and Licensing Board in support of this con-
14 tention, and as to each potential witness so identified provide
15 the following information:

16 (i) State the substance of the facts and opinions
17 to which you expect the witness to testify;

18 (ii) Summarize the factual and theoretical basis,
19 as well as any other grounds, for each opinion to which the
20 witness is expected to testify; and

21 (e) Identify each and every event upon which you base
22 this contention.

23 RESPONSE TO INTERROGATORY NO. 20:

24 (a) Yes, we contend that, in the context of 10 CFR 100,
25 Appendix A, ground displacement within the plant site need not be
26 considered. The bases of this contention are as follows:

27 1. No capable faults exist within five miles of
28 the site;

1 2. No faults cut the San Mateo Formation, which
2 is the foundation rock at the site and is 4-11 million years old;

3 3. Fractures and joints in the San Mateo Forma-
4 tion are rare, but even those few existing at the site are closed
5 and tight rather than open and loose; and

6 4. Joints displaying small amounts of offset at
7 the site are confined to the San Mateo Formation and do not
8 extend into overlying terrace deposits, indicating their develop-
9 ment occurred more than 125,000 years ago, and probably several
10 hundred-thousands of years ago.

11 (b) The documents and communications on which this
12 contention is based are listed in Appendix 1 as follows: Nos. 1,
13 2, 3, 4, 7, 9, 12, 13, 17, 20, 31 (1, 2, 3, 5).

14 (c) The authors of the documents referenced to in (b),
15 above as well as David Moore, Perry Ehlig and Jay L. Smith.

16 (d) Witnesses Jay L. Smith, Perry Ehlig.

17 INTERROGATORY NO. 21:

18 Have you contracted with or contacted any consultants
19 to analyze any aspect of the Imperial Valley earthquake of
20 October 15, 1979? If so:

21 (a) Identify each and every consultant who has con-
22 ducted such analysis on your behalf.

23 (b) Identify each and every document, writing or
24 communication arising out of the analysis performed by your
25 consultants on the Imperial Valley earthquake which you expect to
26 use at the hearing on the seismic contention before the Atomic
27 Safety and Licensing Board;

28 (c) Summarize the substance of the findings and/or

1 conclusions of your consultants which they have derived from
2 their analysis of the Imperial Valley earthquake.

3 (i) with respect to SONGS 2 and 3

4 (ii) with respect to any other nuclear power plant
5 site in California; and

6 (d) Summarize the factual and theoretical bases as well
7 as any other grounds upon which your consultants base their
8 findings and/or conclusions on the Imperial Valley earthquake

9 (i) with respect to SONGS 2 and 3

10 (ii) with respect to any other nuclear power plant
11 site in California.

12 RESPONSE TO INTERROGATORY NO. 21:

13 (a) Yes; Woodward-Clyde Consultants, Tera Corporation,
14 Del Mar Technical Associates, Sierra Geophysics, Inc.

15 (b) 1. Del Mar Technical Assoc., 1980, Simulation of
16 Earthquake Ground Motions for San Onofre Nuclear Generating
17 Station, Unit 1, Supplement III, for Southern California Edison
18 Co.

19 2. Tera Corporation, 1980, Evaluation of Peak
20 Horizontal Ground Acceleration Associated with the Offshore Zone
21 of Deformation at San Onofre Nuclear Generating Station, for
22 Southern California Edison Company.

23 3. Woodward-Clyde Consultants, 1980, Examination
24 of Vertical Ground Motion Characteristics of the October 15, 1979
25 Imperial Valley Earthquake, for Southern California Edison
26 Company.

27 4. Southern California Edison Co., 1980, Response
28 to NRC Questions Nos. 361.55, 361.57 and 361.64.

1 5. ACRS, 1981, Transcripts of meetings Feb. 4,
2 1981 and Feb. 11, 1981.

3 (c&d) Consultants' conclusions are set forth in the
4 above documents which speak for themselves. Applicants object to
5 a request to summarize said reports and on that basis decline to
6 answer these subparts of this Interrogatory No. 21.

7 INTERROGATORY NO. 22:

8 Do you contend that the Cristianitos Fault is only
9 about 32 kilometers (20 miles) in length? If so:

10 (a) State each and every fact upon which you base this
11 contention;

12 (b) Identify each and every document or communication
13 upon which you base this contention;

14 (c) Identify each and every person with knowledge of
15 the factual basis or bases for this contention, or on whose
16 writings, opinions or testimony you base this contention; and

17 (d) Identify each and every person, expert or other-
18 wise, whom you expect to call as a witness at the hearing before
19 the Atomic Safety and Licensing Board in support of this con-
20 tention, and as to each potential witness so identified provide
21 the following information:

22 (i) State the substance of the facts and opinions
23 to which you expect the witness to testify;

24 (ii) Summarize the factual and theoretical basis,
25 as well as any other grounds, for each opinion to which the
26 witness is expected to testify.

27 RESPONSE TO INTERROGATORY NO. 22:

28 (a) No, the Cristianitos fault trends approximately

1 north 20 degrees west for a distance of about 42 kilometers (25
2 miles). The south end lies about 2 kilometers offshore and it
3 extends some 40 kilometers north of the coast. The last mapped
4 exposure of the faults is in Santiago Canyon where it juxtaposes
5 cretaceous against lower tertiary rocks, and is truncated by the
6 4-S Ranch fault.

7 (b) Morton, P.K., Miller, R.V., and Fife, D.L., 1973,
8 Geo-Environmental Maps of Orange County, California, Calif. Div.
9 Mines and Geology, Preliminary Report 15.

10 (c&d) Not applicable.

11 INTERROGATORY NO. 23:

12 Do you agree that the OZD is located 7 kilometers
13 offshore as described by Dr. Gary Greene and Dr. Michael Kennedy
14 in their report to the NRC in August 1980? If you do not agree,
15 state the basis for your disagreement including all documents on
16 which you rely and identify all expert witnesses on whom you rely
17 and the substance of their expected testimony.

18 RESPONSE TO INTERROGATORY NO. 23:

19 (a) In view of the large-magnitude earthquake assumed
20 to occur on this long (200 km) zone of deformation, it is reason-
21 able to consider that displacement would occur along pre-existing
22 faults rather than along folds, and would follow the main strand
23 or central portion of the distinctly-faulted part of the zone
24 rather than propagate along subsidiary branches. Furthermore,
25 for a zone of this dimension, the resolution of locating the
26 main, center or boundary faults of the zone are generally no
27 better than about 1 km, thus making an approximate assignment of
28 "about 5 miles", or 8 km. appropriate for the OZD's proximity to

1 SONGS as has been often stated.

2 The nature, width, and clarity or distinctiveness of
3 the OZD varies considerably along its overall length. In the
4 part offshore SONGS the main trace of the South Coast Offshore
5 fault on Horizon C (Western Geophysical, 1972) is a zone of
6 faulting that lies 9.2 km offshore opposite SONGS. A short
7 branch bounding an elevated block opposite the SONGS site lies
8 about 7 km from shore, but it is distinctly subsidiary to the
9 main break. In Horizon B (Western Geophysical, 1972) the same
10 elevated block is bounded by the main and subsidiary faults at
11 distances from shore of 8 km and 7.2 km, respectively. In this
12 vicinity of the OZD's closest approach to SONGS (see NEKTON,
13 1980, Plate 2) there are many short and discontinuous folds and
14 faults, very few of which can be extrapolated or extended across
15 two or more closely spaced profile lines. The closest of these
16 faults is 8.4 km from SONGS.

17 (b) Applicants rely on documents listed in Appendix 1
18 as follows: 1, 2, 7, 14, 17, 18, 29, and 31(2)

19 (c) Applicants would present witnesses David Moore,
20 Perry Ehlig, Jay L. Smith, Stewart Smith, G. Frazier, and Edward
21 G. Heath in support of various aspects of the position set forth
22 in Part (a), herein.

23 INTERROGATORY NO. 24:

24 Do you contend that the Cristianitos Zone of Deforma-
25 tion's structural relationship with the OZD is not the control-
26 ling geologic structure for the seismic design of SONGS 2 and
27 3? If so:

28 (a) State each and every fact upon which you base this

1 contention;

2 (b) Identify each and every document or communication
3 upon which you base this contention;

4 (c) Identify each and every person with knowledge of
5 the factual basis or bases for this contention, or on whose
6 writings, opinions or testimony you base this contention; and

7 (d) Identify each and every person, expert or other-
8 wise, whom you expect to call as a witness at the hearing before
9 the Atomic Safety and Licensing Board in support of this con-
10 tention, and as to each potential witness so identified provide
11 the following information:

12 (i) State the substance of the facts and opinions
13 to which you expect the witness to testify;

14 (ii) Summarize the factual and theoretical basis,
15 as well as any other grounds, for each opinion to which the
16 witness is expected to testify.

17 RESPONSE TO INTERROGATORY NO. 24:

18 (a) Applicants contend there is no structural relation-
19 ship between the postulated Cristianitos Zone of Deformations and
20 the OZD, as described in the responses to numerous of the pre-
21 vious Interrogatories. Applicants also contend that the postul-
22 ated Cristianitos Zone of Deformation is not the controlling

23 ///

24 ///

25 ///

26 ///

27 ///

28 ///

1 geologic structure for the seismic design of SONGS 2 and 3, as
2 described in responses to previous Interrogatories. The OZD is
3 the controlling structure.

VERIFICATION

DAVID R. PIGOTT, being first duly sworn, deposes and says:

1. That he is a member of the law firm of Chickering & Gregory, San Francisco, California.

2. That he is Counsel for Applicants Southern California Edison Company and San Diego Gas & Electric Company (hereinafter "Applicants") in this proceeding.

3. That he is authorized by Applicants to execute and verify the foregoing "RESPONSE AND OBJECTIONS OF SOUTHERN CALIFORNIA EDISON COMPANY TO INTERVENOR FOE, ET AL'S, FIFTH SET OF INTERROGATORIES".

4. That he is informed and believes and upon such information and belief affirms that the foregoing "RESPONSE AND OBJECTIONS OF SOUTHERN CALIFORNIA EDISON COMPANY TO INTERVENOR, FOE, ET AL'S, FIFTH SET OF INTERROGATOARIES" is true and correct.

DATED: March 10, 1981.

David R. Pigott

Subscribed and sworn to before me this 10th day of March, 1981.
