Comment: NRC ignored or down-played water loss that can result from acts of malice, an accidental plane crash, an earthquake, a cask drop, accidental fires or explosions, or a severe accident in an adjacent reactor, and ignored the collapse of a spent fuel pool whereas Fukushima Unit 4 shows that it is a real possibility. (0556-5-13 [Lampert, Mary])

Comment: NRC incorrectly assumes that water loss is complete and ignores the greater risk of a partial drain-down, worse because the leftover water in the bottom of the pool, blocking air convection flow to help cool the assemblies, will lead to a faster build up of heat. Back in October 2000, NUREG-1738 reversed NRC's longstanding false position that total instantaneous drainage of a pool is the most severe case of drainage; nevertheless the staff of NRC continues to forget what they once knew. (0556-5-14 [Lampert, Mary])

Comment: NRC incorrectly downplays the risks of pool fires assuming that the surrounding populations will be successfully evacuated. (0556-5-15 [Lampert, Mary])

Comment: But NRC provides exemptions to licensees to do away with emergency planning as soon as 12 to 18 months post reactor shutdown. (0556-5-16 [Lampert, Mary])

Comment: The GEIS focus on probability analysis of Spent Fuel Fires cannot be sustained as complying with NEPA, since Indian Point and many other plants in the nation have not applied for an amendment to become 805 plants and therefore probabilistic fire protection analysis is

not permitted without public hearing and amendment process. This basic assumption of the GEIS cannot be used to evaluate the environmental risks of spent fuel fires when the other requirements of 805 license amendment have not been met. (0611-39 [Shapiro, Susan])

Comment: In addition the environmental impacts and costs of High Burn Up Fuel on Spent Fuel Fires has not been considered. NRC Chair Allison MacFarlane co-authored a study with Von Hippel and others, regarding significantly increased fire risk from densely packed spent fuel pools (see: Robert Alvarez, Jan Beyea, Klaus Janberg, Jungmin Jang, Ed Lyman, Allison Macfarlane Gordon Thompson, Frank N. von Hippel, Reducing the Hazards from Stored Spent Power-Reactor Fuel in the United States, Science and Global Security 11:1-51, 2003 Taylor and Francis DOI:10.1080/08929880390214124) (0611-41 [Shapiro, Susan])

Comment: The GEIS does not address the significantly increased risk of spent fuel fire due at Indian Point due to: Overly packed of Spent Fuel Pools; Location on Two intersecting fault lines; Inclusion of High-Burn up fuel in the spent fuels; Known un-located and repaired cracks in spent fuel pools; Defective fire insulation at Indian Point which only works for 24 minutes instead of the required 1-3 hours; Dilution of Boron in spent fuel pools to density; Close proximity to two natural gas pipelines without on-site shutoff; High Burn Up Fuels impact on densely pack spent fuel pools. (0611-43 [Shapiro, Susan])

Comment: Most importantly the GEIS does not address the lack of plan or knowledge by the nuclear industry as to how to control a spent fuel fire. Spent fuel fires at Fukushima and Chernobyl could no be controlled, yet Mr. Steets of Entergy continues to claim that in the event of a spent fuel fire Entergy plans to use fire hoses to put out a radioactive spent fuel fire. This didn't work at Fukushima and won't work here. The public is aware this is PR nonsense and the Waste Confidence Board cannot base storage of nuclear waste on this kind of fantasy. (0611-44 [Shapiro, Susan])

Comment: The GEIS states that there is a low probability of spent fuel pool fires, and therefore a low risk of causing harm. However, as we draft these comments, we are concurrently witnessing the incapacity of TEPCO in Fukushima to effectively handle damaged fuel pools and core reactor melt downs-let alone to properly assess the impacts of escaped radiation on workers, local communities, the Pacific ocean, and natural resources. (0622-4-11 [Vale, Karen])

Comment: Fukushima showed us that storing hot spent fuel in a fuel pool is inherently dangerous. If a pool drains, recently used fuel catches fire. Storing such fuel inside a nuclear plant makes any disaster more difficult to manage, as a reactor disaster may make it impossible for quite some time to continue to maintain a fuel pool, and vice versa. (0634-1 [Cato, Michael])

Comment: The consequences of a fuel pool fire in the event that a disaster drains a pool are just as serious as a meltdown. Once fuel catches fire the radiation release has the potential to make getting near enough to the fire to control it extremely hazardous, and with fuel pools typically stored near reactors, such an event obviously runs the risk of triggering other disasters, such as loss of cooling and control of a nuclear reactor. (0634-6 [Cato, Michael])

Comment: The consequences at worst of a fuel pool fire would be similar to those seen at Chernobyl, Fukushima and Three Mile Island, with large areas of productive land ruined, and the health of those affected by resulting fallout from a fire destroyed. Note that Lithuania detected plutonium from Fukushima, the fallout from a serious disaster with a burning spent fuel pool would undoubtedly affect a huge area. (0634-9 [Cato, Michael])

Comment: The NRC continues to minimize the threats posed to nearby populations from radiation release caused by events such as pool fires. At present nuclear utilities are authorized to store high-level waste in pools for decades after a reactor permanently shuts down. This is potentially very dangerous, but by doing this utilities can pad their present-day bottom lines by delaying the costly move from pools to dry cask storage. (0648-10 [Price, Scott])

Comment: TVA agrees with the conclusions in the DGEIS and is in compliance or currently addressing the NRC's various orders and requests, including those related to the Fukushima event. For these reasons, the conclusions in Appendix F regarding SFP fires are fully applicable to TVA's plants and demonstrate that environmental impacts of SFP fires during the short-term storage timeframe are small. (0694-3-16 [Shea, Joseph])

Comment: TVA also agrees with NEI's comment¹⁴³ [footnote 143 text: NEI comments.] that the NRC should update DGEIS Appendix F to reference the NRC's recent SFP "Consequence Study."¹⁴⁴ [footnote 144 text: Consequence Study of a Beyond-Design-Basis Earthquake Affecting the Spent Fuel Pool for a US Mark I Boiling Water Reactor (June 2013), available at ADAMS Accession No. ML 13256A342.] Based on this study and previous studies, the NRC continues to believe "that spent fuel pools protect public health and safety." ¹⁴⁵ [footnote 145 text: *Id.* at xii.] (0694-3-17 [Shea, Joseph])

Comment: Although the DGEIS already discusses the conservative nature of the SFP fires analysis, TVA requests that the NRC further highlight the significant conservatisms in that analysis that are discussed above to further support the small impacts from SFP fires. (0694-3-18 [Shea, Joseph])

Comment: Entergy agrees with the conclusions in the DGEIS and is in compliance or currently addressing the NRC's various orders and requests, including those related to the Fukushima event. For these reasons, and for the additional reasons stated in Section IV.C, below, the conclusions in Appendix F regarding SFP fires are fully applicable to Entergy's plants, and demonstrate that environmental impacts of SFP fires during the short-term storage timeframe are SMALL. ¹⁴⁷ [footnote 147 text: Entergy also agrees with NEI's comment that the NRC should update DGEIS Appendix F to reference the NRC's recent SFP "Consequence Study." Consequence Study of a Beyond-Design-Basis Earthquake Affecting the Spent Fuel Pool for a US Mark I Boiling Water Reactor (June 2013), available at ADAMS Accession No. ML13256A342. As concluded in that study, "spent fuel is only susceptible to a radiological release within a few months after the fuel is moved from the reactor into the spent fuel pool." *Id.* at vii.] (0697-3-4 [Bessette, Paul] [Kuyler, Raphael])

Comment: Although the DGEIS already discusses the conservative nature of the SFP fires analysis, Entergy requests that the NRC further highlight the significant conservatisms in that analysis that are discussed above to further support the SMALL impacts from SFP fires. (0697-3-5 [Bessette, Paul] [Kuyler, Raphael])

Comment: NRC downplays the risks of pool fires by assuming that surrounding populations will be successfully evacuated. But nuclear utilities are allowed to store high level radioactive waste in pools for many decades after reactors permanently shutdown, in order to defer the costs of dry cask storage as far off into the future as possible, despite the inherent risks. At the same time, NRC allows utilities, via exemptions from regulations, to do away with 10-mile radius emergency planning zones as soon as 12-18 months post-reactor shutdown despite the lingering risk of storing HLRW in pools at such shutdown reactor sites. How can populations be evacuated if EPZs have been dismantled? (0700-5 [Women's Action for New Direction, Georgia])

Comment: Further, with respect to a potential fire in a spent fuel pool containing high burnup fuel, please see NRDC's Appendix C, authored by Mr. Mark Leyse on high burnup fuel cladding, fuel cladding deformation, such as ballooning, fuel fragmentation, relocation, and dispersal, and hydrogen explosions which could occur in the event of a spent fuel pool ("SFP") accident (and possible concurrent reactor core accident). The NRC's "Waste Confidence Generic Environmental Impact Statement: Draft Report for Comment," NUREG-2157, Appendix F, "Spent Fuel Pool Fires," does not consider a number of phenomena that would increase the probability of a SFP fire in the event of either: 1) a complete SFP loss-of-coolant accident ("LOCA"), 2) a partial SFP LOCA, or 3) a SFP boil-off accident. (0706-3-20 [Fettus, Geoffrey])

Comment: Page F-1-F-16. Appendix F, *Spent Fuel Pool Fires*. NRDC Comments[:] We append the comments of Mr. Mark Leyse. Mr. Leyse states Appendix F "does not consider a number of phenomena that would increase the probability of a spent fuel pool (SFP) fire in the event of either: 1) a complete SFP loss-of-coolant accident ("LOCA"), 2) a partial SFP LOCA, or 3) a SFP boil-off accident. (0706-4-14 [Fettus, Geoffrey])

Comment: It is doubtful that the NRC's computer safety model MELCOR simulates how local heavy oxide and/or crud layers would partly impede the local steam or air "coolant" flow through the spent fuel assemblies in a SFP boil-off accident or complete SFP LOCA, respectively. (0706-5-15 [Fettus, Geoffrey])

Comment: 4. The NRC's "Waste Confidence Generic Environmental Impact Statement: Draft Report for Comment," NUREG-2157, Appendix F, "Spent Fuel Pool Fires," does not consider a number of phenomena that would increase the probability of a SFP fire in the event of either: 1) a complete SFP loss-of-coolant accident ("LOCA"), 2) a partial SFP LOCA, or 3) a SFP boil-off accident. (0706-5-7 [Fettus, Geoffrey])

Comment: Heat produced by the radioactive decay heating of the fuel rods would cause the SFP's water to boil away; the fuel rods would become uncovered by water and heat up, increasing their local temperatures. When local fuel-cladding temperatures reached approximately 677°C (1250°F) the fuel rods would start to balloon and burst,²⁸ [footnote 28 text: The fuel rods would balloon and burst between approximately 677°C (1250°F) and 877°C (1610°F). See S. Guntay, J. Birchley, "MELCOR Further Development in the Area of Air Ingress and Participation in OECDNEA SFP Project to Be Performed in the Time Frame 2009-2012," April 2009, p. 14.] "releasing noble gases, such as xenon and krypton," into the environment.²⁹ [footnote 29 text: Zachary I. Franiewski *et al.*, Pennsylvania State University, "Spent Fuel Pool Analysis of a BWR-4 Fuel Bundle Under Loss of Coolant Conditions Using TRACE," NucE431W S2013, May 2013, p. 2.] This would occur because the fuel rods that are used in reactor cores are pre-pressurized: at higher temperatures, the internal gas pressure increases to points at which the fuel cladding balloons and bursts. (0706-6-1 [Fettus, Geoffrey])

Comment: Interestingly, the 2004 OECD Nuclear Energy Agency report states that, *in a reactor LOCA*, "[t]here is a more uniform cladding temperature at high burn-up, which can lead to much larger cladding deformations and thus more pronounced flow blockage."⁴⁸ [footnote 48 text: *Id.*, p.5.] It is plausible that these same phenomena would occur in a SFP boil-off accident, because the fuel rods in the SFP would not have the pronounced *chopped-cosine axial heat flux distribution*⁴⁹ [footnote 49 text: The locations of the active length of the fuel rods are much hotter at the mid-elevation than at the upper and lower ends. The active length of a fuel rod is the length of the cladding containing the fuel pellets; it is approximately 12-feet long.] that the fuel rods have in operating reactor cores; the axial heat flux, albeit far less, would be far more evenly distributed in the fuel rods stored in the SFP. (0706-6-10 [Fettus, Geoffrey])

Comment: The coplanar blockage of sausage-like fuel-cladding balloons (sections with a substantial axial extension), and any points of local rod-to-rod contact, would impede the local cooling of the fuel assemblies; and local blockage-section surface temperatures could increase up the point at which the zirconium fuel-cladding began to rapidly chemically react with steam or air at approximately 1000°C (1832°F) or 900°C (1652°F),⁵⁰ [footnote 50 text: Allan S. Benjamin *et al.*, Sandia Laboratories, "Spent Fuel Heatup Following Loss of Water During Storage," NUREG/CR-0649, March 1979, p. 47.] respectively. (0706-6-11 [Fettus, Geoffrey])

Comment: Ballooning and bursting would also cause the fuel-cladding to lose the protection of preexisting oxide layers, as clean surface locations opened up, facilitating exothermic (heat-generating) oxidation and hydriding of zirconium (both of these reactions are discussed below). (0706-6-12 [Fettus, Geoffrey])

Comment: Additionally, local ballooning and bursting of zirconium fuel cladding at grid spacers will augment the cladding-to-grid contact. The NRC report, NUREG-2121, states that "[g]rid spacers may 'pin' rod ballooning... In bundle geometries, ballooning tends to occur such that all the balloons are coplanar, but ballooning is largely suppressed in the sections of fuel rods that cross a grid spacer."⁵¹ [footnote 51 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 75.] (0706-6-13 [Fettus, Geoffrey])

Comment: Regarding how fuel rod ballooning could *decrease* the time to the ignition of zirconium *in air* in a SFP accident, a 2009 paper about an OECD Nuclear Energy Agency SFP safety analysis project states: Fuel rod ballooning is an important phenomena expected to occur prior to ignition [of the zirconium fuel cladding in a SFP accident]. Rod ballooning has been shown to occur in the temperature range of 950 K to 1150 K [1250°F to 1610°F]. In the BWR 1x4 ignition test a peak clad temperature of 1050K [1430°F] was reached at 2.75 hrs and the rapid escalation to ignition began at 4.75 hrs at a peak clad temperature of 1200 K [1700°F]. Thus fuel rod ballooning is expected to occur during the crucial period prior to ignition *and could be expected to decrease the time to ignition by an hour or more*⁵² [footnote 52 text: S. Guntay, J. Birchley, "MELCOR Further Development in the Area of Air Ingress and Participation in OECD NEA SFP Project to Be Performed in the Time Frame 2009-2012," April 2009, p. 14.] [emphasis added]. (0706-6-14 [Fettus, Geoffrey])

Comment: It can be extrapolated that because fuel rod ballooning could decrease the time to the ignition of zirconium *in air* in a SFP accident, ballooning could also decrease the time to the ignition of zirconium *in steam* in a SFP accident. (0706-6-15 [Fettus, Geoffrey])

Comment: It is noteworthy that the NRC claims that "rod ballooning has a low impact on the timing to breakaway oxidation and the impact on the peak cladding temperature response was relatively insignificant."⁵³ [footnote 53 text: NRC, "Consequence Study of a Beyond-Design-Basis Earthquake Affecting the Spent Fuel Pool for a U.S. Mark I Boiling Water Reactor: Draft Report," June 2013, (ADAMS Accession No. ML13133A132), p. 26.] (0706-6-16 [Fettus, Geoffrey])

Comment: Creep failure of the fuel cladding could occur from incurring stress for approximately 10 hours at cladding temperatures between approximately 565°C (1049°F) and 600°C (1112°F) or greater.³⁰ [footnote 30 text: NRC, "Technical Study of Spent Fuel Pool Accident Risk at Decommissioning Nuclear Power Plants," NUREG-1738, February 2001 (ADAMS Accession No. ML010430066), Appendix 1B, p. A1B-5.] The NRC's NUREG-1738 states that "[w]hile failure of the cladding at these lower temperatures will lead to fission product release, such release is considerably smaller than that assumed for the cases where the

temperature criterion is exceeded and significant fuel heatup and damage occurs."³¹ [footnote 31 text: NRC, "Technical Study of Spent Fuel Pool Accident Risk at Decommissioning Nuclear Power Plants," NUREG-1738, February 2001 (ADAMS Accession No. ML010430066), Appendix 1B, p. A1B-5.] (0706-6-2 [Fettus, Geoffrey])

Comment: It is noteworthy that the NRC computer safety model "MELCOR does not have a fuel cladding deformation and strain model. It uses a value of 900°C for widespread cladding failure."³² [footnote 32 text: NRC, "Consequence Study of a Beyond-Design-Basis Earthquake Affecting the Spent Fuel Pool for a U.S. Mark I Boiling Water Reactor: Draft Report," June 2013, (ADAMS Accession No. ML13133A132), p. 26.] (0706-6-3 [Fettus, Geoffrey])

Comment: In a SFP boil-off accident, ballooning of the fuel cladding would most likely be in the form of sausage-type balloons, as occurred in the fuel-cleaning-tank accident at the Paks Nuclear Power Plant Unit 2 ("Paks-2"), in Hungary, in 2003.³³ [footnote 33 text: In 2003, at the Paks Unit 2 plant in Hungary, there was a fuel cleaning tank accident in which 30 fuel assemblies incurred severe damage. In the Paks-2 accident, the fuel rods ballooned—"long sausage balloon's with "very long ballooned areas." See Advisory Committee on Reactor Safeguards Reactor Fuels Subcommittee, September 29, 2003, located at: <http://www.nrc.gov/reading-rm/doc-collections/acrs/tr/subcommittee/2003/rf092903.pdf>, pp. 212-225.; see also IAEA, "OECD-IAEA Paks Fuel Project: Final Report," 2009, p. 12.] In the Paks-2 accident, 30 fuel assemblies were severely damaged and their fuel rods ballooned—"long sausage balloons"³⁴ [footnote 34 text: Advisory Committee on Reactor Safeguards Reactor Fuels Subcommittee, September 29, 2003, located at: <http://www.nrc.gov/reading-rm/doc-collections/acrs/tr/subcommittee/2003/rf092903.pdf>, pp. 212- 225.] with "very long ballooned areas."³⁵ [footnote 35 text: IAEA, "OECD-IAEA Paks Fuel Project: Final Report," 2009, p. 12.] At a 2003 Advisory Committee on Reactor Safeguards ("ACRS") Reactor Fuels Subcommittee meeting, at least one participant thought that such long balloons would occur in reactor large-break loss-of-coolant accidents ("LOCA"). (*This is pertinent to the characteristics of the fuel-cladding ballooning that would occur in SFP accidents*, because, in both types of accidents, fuel rods would heat up to the point at which their internal-pressure increases caused them to balloon; in both types of accidents, the external pressure would be far less than the internal pressure of the fuel rods.) (0706-6-4 [Fettus, Geoffrey])

Comment: In the ACRS meeting, Dr. Dana Powers (the lead author of "Cladding Swelling and Rupture Models for LOCA Analysis"³⁶ [footnote 36 text: D.A. Powers, R.O. Meyer, "Cladding Swelling and Rupture Models for LOCA Analysis," NUREG-0630, April 1980, (ADAMS Accession No. ML053490337).]) stated: "If you're trying to persuade me that we'll never see long sausage balloons in reactor accidents, give up now while you're ahead;" and "where I run into trouble is saying x or y can never happen. Simply because you've never seen it in an experiment you've done with one foot sections [of fuel cladding]; that's where I have real trouble."³⁷ [footnote 37 text: Advisory Committee on Reactor Safeguards Reactor Fuels Subcommittee, September 29, 2003, located at: <http://www.nrc.gov/reading-rm/doc-collections/acrs/tr/subcommittee/2003/rf092903.pdf>, pp. 217-218.] (0706-6-5 [Fettus, Geoffrey])

Comment: Experiments at Argonne Laboratories with segments of high burnup fuel rods—discussed in the same 2003 ACRS Subcommittee meeting—were conducted with 12 and 15 inch segments of fuel rods, with a "relatively uniform heating zone" *that was approximately five inches long*; hence, the ballooned locations of the fuel rods were not longer than five inches.³⁸ [footnote 38 text: Advisory Committee on Reactor Safeguards Reactor Fuels Subcommittee, September 29, 2003, located at: <http://www.nrc.gov/reading-rm/doc-collections/acrs/tr/subcommittee/2003/rf092903.pdf>, pp. 113, 181, and 195.] (0706-6-6 [Fettus, Geoffrey])

Comment: In a SFP boil-off accident, it is highly probable that the ballooned sections of the fuel rods would be coplanar (at the same elevation); with coplanarity, there would also likely be some degree of local rod-to-rod contact. When local cladding temperatures reached the point at which the fuel rods ballooned, such temperatures would tend to be at approximately the same elevation. Additionally, in SFP boil-off accident, the fuel assemblies that were most recently loaded into the SFP (the hottest assemblies) would be first ones to incur fuel-cladding ballooning. (0706-6-7 [Fettus, Geoffrey])

Comment: In addition to the Paks fuel cleaning tank accident there is further evidence that there could be long sausage-like ballooned areas of the fuel cladding in a boil-off SFP accident. (The experiments discussed in this paragraph are not SFP accident experiments; however, they apply to SFP accidents, because they are experiments in which fuel rod simulators were heated up to the point at which their internal pressure increases caused them to balloon.) For example: 1) the JAERI loss-of-accident tests had "axially extended contacts between rods (over more than cm [7.9 in]) in [49-rod³⁹ [footnote 39 text: European Commission: Nuclear Safety and the Environment, "Fuel Cladding Failure Criteria," September 1999, p. 88.]] bundle configurations;"⁴⁰ [footnote 40 text: Claude Grandjean, Institut de Radioprotection et de Sûreté Nucléaire (IRSN), "Coolability of Blocked Regions in a Rod Bundle after Ballooning under LOCA Conditions: Main Findings from a Review of Past Experimental Programmes," 2007.] 2) in the Materials Test 3 (MT-3), which had 12 full-length pre-pressurized fuel rods, "[t]he active strain [ballooned] region was spread over [a] ~2-[meter] (80-[in]) length" of the fuel rods⁴¹ [footnote 41 text: C. L. Wilson, G. M. Hesson, J. P. Pilger, L. L. King, F. E. Panisko, Pacific Northwest Laboratory, "Large-Break LOCA, In-Reactor Fuel Bundle Materials Test MT-6A," 1993, p. x.] (this does not mean that there was a continuous ballooned length of about 80.0-in; however, it indicates that there was excessive ballooning); 3) an Oak Ridge National Laboratory (ORNL) report states that for the CORA-16 experiment that there was *estimated* cladding strain (ballooning) on one of the fuel rods at the 550, 750, and 950 mm elevations, which indicates that the rod was estimated to have a ballooned length of at least 400 mm (15.75 in)⁴² [footnote 42 text: L. J. Ott, W. I. van Rij, "In-Vessel Phenomena—CORA: BWR Core Melt Progression Phenomena Program, Oak Ridge National Laboratory," CONF-9105173-3-Extd.Abst., Presented at Cooperative Severe Accident Research Program, Semiannual Review Meeting, Bethesda, Maryland, May 6-10, 1991.] (the CORA experiments, which simulated meltdown accidents, were conducted with zirconium alloy multi-rod bundles that were two meters long);⁴³ [footnote 43 text: P. Hofmann, S. Hagen, G. Schanz, G. Schumacher, L. Sepold, Idaho National Engineering Laboratory, EG&G Idaho, Inc., "CORA Experiments on the Materials Behavior of LWR Fuel Rod Bundles at High Temperatures," in NRC "Proceedings of the Nineteenth Water Reactor Safety Information Meeting," NUREG/CP-0119, Vol. 2, 1991, (ADAMS Accession No. ML042230460), p. 77.] 4) a second ORNL report states that for the CORA-33 experiment "the computed cladding strain [ballooning] was significant over 400 mm [15.75 in] of the rod length;"⁴⁴ [footnote 44 text: L. J. Ott, Siegfried Hagen, "Interpretation of the Results of the CORA-33 Dry Core Test," 1993.] and 5) the cladding balloons that occurred in the middle sections of the bundles from PWR FLECHT runs 2443 and 2544, which had unintended internal gas pressure increases,⁴⁵ [footnote 45 text: F. F. Cadek, D. P. Dominicis, R. H. Leyse, Westinghouse Electric Corporation, WCAP-7665, "PWR FLECHT (Full Length Emergency Cooling Heat Transfer) Final Report," April 1971, (ADAMS Accession No. ML070780083), p. 3-95.] were substantially longer than a few inches. (0706-6-8 [Fettus, Geoffrey])

Comment: Regarding assembly blockage in reactor LOCAs, resulting from newer zirconium fuel-cladding alloys like ZIRLO and M5, a 2004 OECD Nuclear Energy Agency report states that "[n]ew alloys have the tendency of being more ductile, which can increase ballooning size and thus increase blockage."⁴⁶ [footnote 46 text: OECD Nuclear Energy Agency, "Summary Record

of the Experts meeting on the proposed OECD-IRSN STLOC Project," NEA/CSNI/R(2004)1, January 13, 2004, p. 5.] Furthermore, the same report states that "it can be anticipated, due to this better ductility that, for modern alloys, *the rod balloons will be bigger and the resulting flow blockage geometry at burst higher with more radial and axial extension* than for Zy4 [an older zirconium fuel-cladding alloy] rods when experiencing the same conditions at burst"⁴⁷ [footnote 47 text: *Id.*, p. 17.] [emphasis added]. (As stated above, reactor LOCA fuel-cladding ballooning phenomena are pertinent to SFP accidents, because, in both types of accidents, fuel rods would heat up to the point at which their internal-pressure increases caused them to balloon; in both types of accidents, the external pressure would be far less than the internal pressure of the fuel rods.) (0706-6-9 [Fettus, Geoffrey])

Comment: A March 2012 NRC report, NUREG-2121, states that "[f]uel fragmentation refers to any separation of the fuel pellet into more than one piece, regardless of when or why it occurred." In the reactor core, during typical operation, the uranium dioxide (UO₂) "fuel pellets develop many cracks because of thermal stresses."⁵⁴ [footnote 54 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 3.] A 2011 IAEA report explains that "[d]ue to thermal gradients, fuel pellets tend to fragment early in life,"⁵⁵ [footnote 55 text: IAEA, "Impact of High Burnup Uranium Oxide and Mixed Uranium-Plutonium Oxide Water Reactor Fuel on Spent Fuel Management," No. NF-T-3.8, 2011, p. 37.] which can occur at fuel burnups "as low as a few megawatt days per metric ton uranium (MWd/MTU)."⁵⁶ [footnote 56 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 75. degree of additional fuel fragmentation would occur in a reactor LOCA; a SFP accident would perhaps incur a lesser degree of additional fuel fragmentation than a reactor LOCA.] It is likely that some degree of additional fuel fragmentation would occur in a reactor LOCA; a SFP accident would perhaps incur a lesser degree of additional fuel fragmentation than a reactor LOCA. (0706-7-1 [Fettus, Geoffrey])

Comment: Defining fuel dispersal, NUREG-2121 states that "[f]uel dispersal is the ejection of fuel fragments or particles through a rupture or opening in the cladding."⁶⁷ [footnote 67 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 3.] Rapid reactor LOCA transient phenomena, such as rapid external depressurization, could enhance the dispersal fuel fragments from ruptured locations of the fuel cladding; external depressurization would not occur in SFP accidents. (0706-7-10 [Fettus, Geoffrey])

Comment: Fuel dispersal during a reactor LOCA could occur with fuel that had a burnup lower than 62 GWd/MTU; previously it was believed that *significant* fuel dispersal during a reactor LOCA would not occur if the fuel had burnups lower than 62 GWd/MTU (average for the peak rod).⁶⁸ [footnote 68 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 1.] It seems probable that some degree of fuel dispersal would also occur in a SFP accident if the burnup were lower (or greater) than 62 GWd/MTU.) NUREG-2121 states that "[s]ome fuel dispersal has been observed in every case in which (1) rod rupture occurs, and (2) the fuel fragments are small enough to get through the rupture opening." And states that "[t]he amount of fuel that is dispersed can vary widely, from a puff of dust to large amounts of fragmented and pulverized fuel. Although evidence points to likely fuel dispersal in many tests, this phenomenon was not systematically investigated nor documented in the majority of test programs."⁶⁹ [footnote 69 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and

Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 75.] (0706-7-11 [Fettus, Geoffrey])

Comment: Radiological releases resulting from core damage would contaminate the nuclear power plant ("NPP") site and impede efforts to mitigate the accident, especially if radioactive debris were propelled throughout the site by hydrogen explosions, as occurred in the Fukushima Dai-ichi accident.⁷⁰ [footnote 70 text: Institute of Nuclear Power Operations ("INPO"), "Special Report on the Nuclear Accident at the Fukushima Dai-ichi Nuclear Power Station," INPO 11-005, November 2011, pp. 9, 12, 21, 24, 25, 32, 37, 79, 85, 86, 96.] After the Fukushima Dai-ichi site was contaminated, workers had to wear additional protective clothing and limit the time they spent, working to mitigate the accident.⁷¹ [footnote 71 text: Institute of Nuclear Power Operations ("INPO"), "Special Report on the Nuclear Accident at the Fukushima Dai-ichi Nuclear Power Station," INPO 11-005, November 2011, p. 9.] Efforts to mitigate a SFP accident would also be impeded (or possibly entirely prevented for significant time periods) by the radiologically-contaminated environment. (0706-7-12 [Fettus, Geoffrey])

Comment: In BWR Mark I and Mark II designs, SFPs are typically located at the level of the operating floor, approximately 100 to 150 feet above ground level,⁷² [footnote 72 text: NRC, "Regulatory Analysis for the Resolution of Generic Issue 82, 'Beyond Design Basis Accidents in Spent Fuel Pools'," NUREG-1353, April 1989, (ADAMS Accession No. ML082330232), p. 4.6.] in the reactor building (secondary containment). If either a BWR Mark I or Mark II reactor core melted down and the total amount of the zirconium in the core—approximately 76,000 kg—were to chemically react with steam, approximately 3360 kg of hydrogen would be generated.⁷³ [footnote 73 text: IAEA, "Mitigation of Hydrogen Hazards in Severe Accidents in Nuclear Power Plants," IAEA-TECDOC-1661, July 2011," p. 10 (hereinafter "Mitigation of Hydrogen Hazards in SA").] In the event of a severe accident at either a BWR Mark I or BWR Mark II, the Fukushima Dai-ichi accident scenario of hydrogen leaking from over-pressurized primary containments and/or hardened vent systems should be considered as likely to occur again. In the Fukushima Dai-ichi accident, BWR Mark I reactor buildings—essentially industrial buildings with design pressures of approximately 3.0 psig⁷⁴ [footnote 74 text: Sherrell R. Greene, Oak Ridge National Laboratory, "The Role of BWR Mark I Secondary Containments in Severe Accident Mitigation," Proceedings of the 14th Water Reactor Safety Information Meeting at the National Bureau of Standards, Gaithersburg, Maryland, October 27-31, 1986, Exhibit 6.]—were compromised by hydrogen explosions. BWR Mark II reactor buildings also have low design pressures. (0706-7-13 [Fettus, Geoffrey])

Comment: Hence, BWR Mark I and Mark II SFPs are vulnerable to the hydrogen explosions that can occur in reactor buildings. A June 2013 NRC report on how earthquakes could affect BWR Mark I SFPs states that "[t]he occurrence of a hydrogen combustion event from a concurrent reactor accident has the potential to generate debris which could impair SFP natural circulation air or steam cooling (should the fuel in the SFP become uncovered) for conditions in which the fuel might otherwise be cooled by means of these passive cooling modes."⁷⁵ [footnote 75 text: NRC, "Consequence Study of a Beyond-Design-Basis Earthquake Affecting the Spent Fuel Pool for a U.S. Mark I Boiling Water Reactor: Draft Report," June 2013, (ADAMS Accession No. ML13133A132), p.25.] Furthermore, if either a BWR Mark I or Mark II SFP were compromised by a hydrogen explosion, it could cause large radiological releases. (0706-7-14 [Fettus, Geoffrey])

Comment: If a BWR Mark I or Mark II reactor building were breached by a hydrogen explosion there would be more available oxygen to facilitate oxidation of the zirconium cladding of the fuel assemblies. A June 2013 NRC report on how earthquakes could affect BWR Mark I SFPs states

that if there were a hydrogen explosion in the reactor building, "damage could breach structures that would retain radioactive material, along with allowing more oxygen into the building, potentially increasing the severity of the spent fuel fire."⁷⁶ [footnote 76 text: NRC, "Consequence Study of a Beyond-Design-Basis Earthquake Affecting the Spent Fuel Pool for a U.S. Mark I Boiling Water Reactor: Draft Report," June 2013, (ADAMS Accession No. ML13133A132), p. ix.] The accelerated zirconium oxidation would contribute additional heat, causing a quicker fuel-cladding temperature escalation, releasing yet more heat, causing a more rapid axial and radial propagation of the SFP fire. This would cause increased radiological releases from the SFP. (0706-7-15 [Fettus, Geoffrey])

Comment: If the fuel assemblies were uncovered in either a SBO boil-off accident or a partial SFP LOCA, explosive hydrogen gas would be generated by the reaction of steam with the zirconium cladding of fuel rods. If enough hydrogen were generated, it could detonate.⁷⁷ [footnote 77 text: Juan J. Carbajo, Oak Ridge National Laboratory, "MELCOR Model of the Spent Fuel Pool of Fukushima Dai-ichi Unit 4," 2012, p. 1.] Computer analyses conducted at ORNL with the MELCOR computer safety model found that in a *hypothetical* scenario if Fukushima Dai-ichi Unit 4's SFP had boiled dry, a total of 1800 to 2050 kilograms ('kg') of hydrogen could have been generated. A 2012 ORNL paper states that "[i]n theory, it [would be] possible to generate up to 3.4 kg of hydrogen per assembly (from oxidation of [zirconium] in the fuel cladding and box), or a *total of 4,525 kg* from the hot 1331 assemblies stored in [Unit 4's SFP]. The hydrogen generated from oxidation of steel and B4C [boron carbide] in the racks [would] be additional"⁷⁸ [footnote 78 text: Juan J. Carbajo, Oak Ridge National Laboratory, "MELCOR Model of the Spent Fuel Pool of Fukushima Dai-ichi Unit 4," 2012, pp. 1-2.] [emphasis added]. (0706-7-16 [Fettus, Geoffrey])

Comment: It is noteworthy that in MELCOR BWR Mark I "SFP calculation[s], [hydrogen] ignition is assumed to occur in the reactor building when the hydrogen concentration exceeds 10 percent by volume. In addition, MELCOR checks to determine whether there is sufficient oxygen. The minimum oxygen mole fraction for ignition is 5 percent."⁷⁹ [footnote 79 text: NRC, "Consequence Study of a Beyond-Design-Basis Earthquake Affecting the Spent Fuel Pool for a U.S. Mark I Boiling Water Reactor: Draft Report," June 2013, (ADAMS Accession No. ML13133A132), p.103.] (0706-7-17 [Fettus, Geoffrey])

Comment: MELCOR SFP calculations of hydrogen combustion do not consider that significant deflagrations⁸⁰ [footnote 80 text: A deflagration is a combustion wave traveling at a subsonic speed (less than the speed of sound) relative to the unburned gas.] of hydrogen can occur when local hydrogen concentrations are lower than 10 percent by volume. For example, in the Three Mile Island Unit 2 ("TMI-2") accident, a hydrogen deflagration occurred when the hydrogen concentration was 8.1 volume percent;⁸¹ [footnote 81 text: Kahtan N. Jabbour, NRC, letter regarding Turkey Point Units 3 and 4, Exemption from Hydrogen Control Requirements, December 12, 2001, Attachment 2, "Safety Evaluation by the Office of Nuclear Reactor Regulation, Turkey Point Units 3 and 4," available at: www.nrc.gov, NRC Library, ADAMS Documents, Accession Number: ML013390647, p. 4.] the deflagration caused a rapid pressure increase of approximately 28 pounds per square inch ("psi") in the containment.⁸² [footnote 82 text: W. E. Lowry *et al.*, Lawrence Livermore National Laboratory, "Final Results of the Hydrogen Igniter Experimental Program," NUREG/CR-2486, February 1982, p. 4.] Of course, the volume of a PWR large day containment, such as TMI-2 had, is different than that of a BWR Mark I reactor building; however, it is clear that a significant hydrogen deflagration would compromise a BWR Mark I reactor building, which has a relatively low design pressure. (0706-7-18 [Fettus, Geoffrey])

Comment: PWR and BWR Mark III SFPs are typically located at ground level.⁸³ [footnote 83 text: NRC, "Regulatory Analysis for the Resolution of Generic Issue 82, 'Beyond Design Basis Accidents in Spent Fuel Pools'," NUREG-1353, April 1989, (ADAMS Accession No. ML082330232), p. 4.6.] In the event of a severe *reactor* accident, PWR and BWR Mark III SFPs would not be as vulnerable to the potential consequences of explosive hydrogen gas—generated from oxidized zirconium and other core materials—as BWR Mark I and Mark II SFPs. However, if the fuel assemblies were uncovered in either a SBO boil-off accident or a partial SFP LOCA, PWR and BWR Mark III SFPs, would be vulnerable to the explosive hydrogen gas that would be generated by the reaction of steam with zirconium and other materials in the SFP. (0706-7-19 [Fettus, Geoffrey])

Comment: NUREG-2121 states that "[a]t higher values of burnup, fission gas production and migration is postulated to generate a 'rim' region in fuel pellets that is highly porous;" and that "[t]he size of fuel fragments is not uniform but tends to become smaller with increasing burnup."⁵⁷ [footnote 57 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), pp. 3, 75.] (0706-7-2 [Fettus, Geoffrey])

Comment: For example, Indian Point Energy Center is located less than 25 miles north of New York City; more than 17 million people live within a 50-mile radius of Indian Point.⁸⁴ [footnote 84 text: Edwin S. Lyman, Union of Concerned Scientists, "Chernobyl on the Hudson?: The Health and Economic Impacts of a Terrorist Attack at the Indian Point Nuclear Plant," September 2004, p. 23.] On August 26, 2013, Indian Point Unit 2's SFP, which has a storage capacity of 1374 fuel assemblies, contained 1104 fuel assemblies (80 percent of capacity); and Indian Point Unit 3's SFP, which has a storage capacity of 1345 fuel assemblies, contained 1199 fuel assemblies (89 percent of capacity).⁸⁵ [footnote 85 text: NRC, "Summary of August 26, 2013, Meeting with Entergy Nuclear Operations, Inc. and Netco on Indian Point Unit 2 Spent Fuel Pool Management," September 24, 2013, (ADAMS Accession No. ML13256A086), p. 1.] (The fuel assemblies in a typical PWR core have approximately 26,000 kg of zirconium that, if completely oxidized, would generate a total of approximately 1150 kg of hydrogen.⁸⁶ [footnote 86 text: IAEA, "Mitigation of Hydrogen Hazards in Severe Accidents in Nuclear Power Plants," IAEA-TECDOC-1661, July 2011," p. 10 (hereinafter "Mitigation of Hydrogen Hazards in SA").] The cores of pressurized-water reactors, like Indian Point's, typically contain between 150 and 200 fuel assemblies.⁸⁷ [footnote 87 text: NRC, "Pressurized Water Reactors," (available at: <http://www.nrc.gov/reactors/pwrs.html> : last visited on 10/15/13).]) (0706-7-20 [Fettus, Geoffrey])

Comment: Indian Point's owner, Entergy, touts the safety of Indian Point Unit 2 and 3's SFPs, explaining that "[t]hey are constructed with concrete walls 4 to 6 feet wide and with a half-inch stainless steel inner liner" and that "the fuel pool for Indian Point 2 is completely underground and Indian Point 3[s] is nearly 100% underground, so they are protected on all sides by rock and gravel."⁸⁸ [footnote 88 text: Entergy, "Safe, Secure, Vital: Indian Point Energy Center," website, "Spent Fuel," (located at <http://www.safesecurevital.com/safe-secure-vital/spent-fuel.html>: last visited on October 12, 2013).] However, if there were a SFP fire at either unit (or at both), *thousands of kilograms of explosive hydrogen gas* could be generated by the oxidation (burning) of the tens of thousands kilograms of zirconium—the cladding material of the fuel rods—in storage. It is almost inevitable that hydrogen gas would detonate, breaching the barriers that are supposed to protect the public; releases of radiation could far exceed the quantity released by the Chernobyl Unit 4 accident. More land could be contaminated than the area encompassing the Chernobyl Exclusion Zone, with higher concentrations of radioactive cesium-137. The number of premature deaths from cancer and economic damages would perhaps be incalculable. (0706-7-21 [Fettus, Geoffrey])

Comment: An October 2011 Natural Resources Defense Council ("NRDC") report, "Nuclear Accident at Indian Point: Consequences and Costs," with analyses of the potential radiological consequences of *one full reactor core melt* at Indian Point, would perhaps help provide insight regarding the magnitude of the damages and suffering that would ensue from a SFP fire at Indian Point. The NRDC report states: An accident at Indian Point Unit 3 involving a full reactor core melt approaching the scale of Chernobyl could put people in New York City at risk for receiving a whole-body radiation dose greater than 25 rem, resulting in a 7 percent increase in risk of premature death from cancer for an average individual. An accident of this scale would require the administration of stable iodine throughout the New York City metropolitan area, and put thousands at risk for radiation sickness in and near the Hudson Valley....A release of radiation on the scale of Chernobyl's would make Manhattan too radioactively contaminated to live in if the city fell within the plume.⁸⁹ [footnote 89 text: Matthew McKinzie, NRDC, "Nuclear Accident at Indian Point: Consequences and Costs," October 17, 2011, Cover Sheet, p. 1.] (0706-7-22 [Fettus, Geoffrey])

Comment: It is noteworthy that a 2012 paper, "Oxidation Studies on Irradiated UO₂ Fuels," states that "[f]uel fragmentation would result in larger surface areas available for corrosion processes and radionuclide release."⁵⁸ [footnote 58 text: D. Papaioannou *et al.*, "Oxidation Studies on Irradiated UO₂ Fuels" Top Fuel 2012 Transactions, European Nuclear Society, September 2-6, 2012, p. 5.] (0706-7-3 [Fettus, Geoffrey])

Comment: Defining fuel relocation, NUREG-2121 states that "fuel relocation can be described as any physical movement of fuel pellets or fuel fragments within the cladding. ... *Radial* fuel relocation is the movement of the fuel outward toward the fuel cladding. ... *Axial* fuel relocation is the vertical movement of fuel fragments or particles within the cladding"⁵⁹ [footnote 59 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 3.] [emphasis not added]. (0706-7-4 [Fettus, Geoffrey])

Comment: Regarding *radial* fuel relocation, NUREG-2121 states that "fuel pellet cracking promotes an outward relocation of the pellet fragments that causes additional gap closure. This process is widely recognized in fuel performance analysis. It starts at beginning of life and quickly reaches equilibrium—by 5 GWd/MTU."⁶⁰ [footnote 60 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 3.] And regarding *axial* fuel relocation, NUREG-2121 states that "[u]nder normal operation, this process is usually limited by the fuel pellet immediately above or below the pellet in question." In experiments simulating reactor LOCAs, "voided regions of the cladding rod" and "additional fuel material [with]in the enlarged volume of the balloon region, or both" have been observed.⁶¹ [footnote 61 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 3.] (0706-7-5 [Fettus, Geoffrey])

Comment: Additionally, regarding the potential for the accumulation of relocated fuel fragments at the elevations of the spacer grids, NUREG-2121 states: Grid spacers may 'pin' rod ballooning, potentially acting as choke points for fuel relocation. In bundle geometries, ballooning tends to occur such that all the balloons are coplanar, but ballooning is largely suppressed in the sections of fuel rods that cross a grid spacer.⁶² [footnote 62 text: Patrick A.C. Raynaud, "Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident," NUREG-2121, March 2012, (ADAMS Accession No. ML12090A018), p. 75.] (0706-7-6 [Fettus, Geoffrey])

Comment: Regarding the fuel relocation which could occur in high burn-up fuel, in a reactor LOCA, a 2004 OECD Nuclear Energy Agency report states that "ANL [Argonne National Laboratory] tests have shown [the] potential for greater relocation at high burn-up due to increased fuel fragmentation. It is unknown if fuel-cladding bonding⁶³ [footnote 63 text: Regarding fuel-cladding bonding an October 2003 paper states: "Inner surface cladding oxidation and subsequent mechanical bonding between the fuel pellet and the cladding are well-known phenomena of high burnup and high duty fuels." See Sven Van den Berghe *et al.*, "Observation of a Pellet-Cladding Bonding Layer in High Power Fuel," presented at "Advanced Fuel Pellet Materials and Designs for Water Cooled Reactors: Technical Committee Meeting," 20-24 October 2003, p. 307.] delays relocation."⁶⁴ [footnote 64 text: OECD Nuclear Energy Agency, "Summary Record of the Experts meeting on the proposed OECD-IRSN STLOC Project," NEA/CSNI/R(2004)1, January 13, 2004, p. 5.] (This information is pertinent to the characteristics of the fuel-cladding ballooning and fuel relocation that could occur in SFP accidents, because, such phenomena could occur in both types of accidents.) The same report observes that larger fuel-cladding balloons—caused by "[n]ew alloys [that] have the tendency of being more ductile, which can increase ballooning size"—would be likely to facilitate a greater extent of fuel relocation and "the associated power generation increase."⁶⁵ [footnote 65 text: OECD Nuclear Energy Agency, "Summary Record of the Experts meeting on the proposed OECD-IRSN STLOC Project," NEA/CSNI/R(2004)1, January 13, 2004, p. 5.] (In a SFP accident any power generation increases caused by fuel relocation within fuel-cladding balloons would not be significant because the heat flux (rate of heat transfer from the fuel rods) would be relatively low.) (0706-7-7 [Fettus, Geoffrey])

Comment: As stated above, the 2004 OECD Nuclear Energy Agency report states that "it can be anticipated, due to this better ductility that, for modern alloys, the rod balloons will be bigger and the resulting flow blockage geometry at burst higher with more radial and axial extension than for Zy4 [an older zirconium fuel-cladding alloy] rods when experiencing the same conditions at burst."⁶⁶ [footnote 66 text: OECD Nuclear Energy Agency, "Summary Record of the Experts meeting on the proposed OECD-IRSN STLOC Project," NEA/CSNI/R(2004)1, January 13, 2004, p. 17.] (0706-7-8 [Fettus, Geoffrey])

Comment: The coplanar blockage of sausage-like fuel-cladding balloons (sections with a substantial axial extension) that had relocated fuel fragments, would impede the local cooling of the fuel assemblies; and local blockage-section surface temperatures could increase up the point at which the zirconium fuel-cladding began to rapidly chemically react with either steam or air at approximately 1000°C (1832°F) or 900°C (1652°F), respectively. (0706-7-9 [Fettus, Geoffrey])

Comment: B. NRC's Assessment of the Impacts of Nuclear Waste Storage in the DGEIS Fails to Account for These Critical Site-Specific Concerns[.] 1. Indian Point Site-Specific Factors are Highly Relevant to Assessing Spent Fuel Pool Accident and Fire Risks and Consequences[.] The NRC's analysis of spent fuel pool fires in Appendix F of the DGEIS employs a generic approach that improperly fails to consider or "bound" the impacts that could occur in light of the site-specific factors discussed above. In particular, in light of the site-specific factors explained above, a spent fuel pool-related accident and/or fire at Indian Point may result in more broad-ranging, intense, and severe impacts than have been "studied" or accounted for in the DGEIS. It is well-established that the environmental impacts of catastrophic spent fuel pool fires, resulting from any of a variety of unforeseen circumstances, can be quite severe and encompass enormous geographic areas, and last for decades.⁴⁰ [footnote 40 text: See Dr. Jan Beyea, *Report to the Massachusetts Attorney General on the Potential Consequences of a Spent-Fuel Pool Fire at the Pilgrim or Vermont Yankee Nuclear Plant* (May 25, 2006), available

at, <http://pbadupws.nrc.gov/docs/ML1209/ML12094A181.pdf>; NRDC, Nuclear Accident at Indian Point: Consequences and Costs, *available at*, http://www.nrdc.org/nuclear/indianpoint/files/NRDC-1336_Indian_Point_FSr8medium.pdf; Thompson, Risk-Related Impacts; see also German Reactor Safety Org., *Protection of German Nuclear Power Plants Against the Background of the Terrorist Attacks in the U.S. on Sept. 11, 2001* (Nov. 27, 2002) (finding that large jetliners crashing into nuclear facilities under different scenarios could cause uncontrollable situations and the release of radiation); Lyman, Chernobyl on the Hudson, *supra* Note 30.] Thus, if a spent fuel pool accident and/or fire occurred at Indian Point, given the unique circumstances surrounding the plant, the impacts would be considerable. For example: the high population density surrounding Indian Point, coupled with the complete inadequacy of emergency evacuation procedures, means that the public health impacts of a severe, beyond design basis radiological release would be severe and potentially catastrophic. Moreover, because Indian Point is located near NYC, i.e., an area encompassing high value real estate, a spent fuel pool-related accident would result in severe economic impacts to the New York City metropolitan area and quite possibly the nation as a whole. Dr. Edwin Lyman has explained that the “radiological exposure of the population and corresponding long-term health consequences” from a catastrophic release of radioactive material “could be extremely severe, even for individuals well outside of the 10-mile emergency planning zone”; Dr. Lyman calculated “that over 500,000 latent cancer fatalities could occur under certain meteorological conditions” and that “even in the case of 100% evacuation within the 10-mile EPZ and 100% sheltering between 10 and 25 miles, the consequences could be catastrophic for residents of New York City and the entire metropolitan area” and that “[t]he economic impact and disruption for New York City residents . . . could be immense, involving damages from hundreds of billions to *trillions* of dollars, and the *permanent displacement of millions of individuals*.”⁴¹ [footnote 41 text: Lyman, Chernobyl on the Hudson, *supra* Note 30, at 23, 54 (emphasis added).] A 2011 analysis by the Natural Resources Defense Council conducted after the Fukushima Daichi disaster explains that “[a]n accident at one of Indian Point’s reactors on the scale of the recent catastrophe in Japan [which involved spent fuel pool failures] could cause a swath of land down to the George Washington Bridge to be uninhabitable for generations due to radiation contamination.”⁴² [footnote 42 text: NRDC, Nuclear Accident at Indian Point: Consequences and Costs, *available at*, http://www.nrdc.org/nuclear/indianpoint/files/NRDC-1336_Indian_Point_FSr8medium.pdf.] The economic and social significance of rendering the NYC metro area *uninhabitable*, as well as drinking water supplies unusable, cannot be overstated. Moreover, a SFP accident could also devastate the unique critical and significant surrounding ecosystems of the historic Hudson River. (0710-14 [Brancato, Deborah] [Musegaas, Philip])

Comment: B. NRC’s Assessment of the Impacts of Nuclear Waste Storage in the DGEIS Fails to Account for These Critical Site-Specific Concerns[.] Despite the inherent uniqueness of the risks at Indian Point, the DGEIS bases its generic spent fuel pool fire analysis on a single pool fire at the Surry Nuclear Plant in Virginia.⁴³ [footnote 43 text: See DGEIS, Appendix F (citing Technical Study of Spent Fuel Pool Accident Risk at Decommissioning Nuclear Power Plants (NUREG-1738), *available at*, <http://www.nrc.gov/reading-rm/doc-collections/nuregs/staff/sr1738/>).] The differences between the Indian Point and Surry reactor sites could not be more stark. For example, the Environmental Report for Surry’s license renewal review states that less than 400,000 people live within 20 miles of the reactor, equating to 294 persons per square mile.⁴⁴ [footnote 44 text: Applicant’s Environmental Report – Operating License Renewal Stage Surry Power Station Units 1 and 2 Virginia Electric & Power Company License Nos. DPR-32 and DPR-37, *available at*, http://www.nrc.gov/reactors/operating/licensing/renewal/applications/northanna-surry/surry_env.pdf (last accessed Dec. 19, 2013).] Surry has less than two million people living

within a 50 mile radius.⁴⁵ [footnote 45 text: *Id.*] In contrast, the EIS for Indian Point's license renewal states that, over one million people live within 20 miles, and approximately 17 million people live within a fifty mile radius.⁴⁶ [footnote 46 text: Generic Environmental Impact Statement for License Renewal of Nuclear Plants: Regarding Indian Point Nuclear Generating Unit Nos. 2 and 3 (NUREG-1437, Supplement 38), *available at*, <http://pbadupws.nrc.gov/docs/ML1033/ML103350405.pdf>, at p.2-124; see also Bill Dedman, *Nuclear Neighbors: Population Rises Near US Reactors*, NBC New.com, http://www.nbcnews.com/id/42555888/ns/us_news-life/t/nuclear-neighbors-population-rises-near-us-reactors/#.UrNSx8Kx7IU last accessed Dec. 19, 2013).] Within Indian Point's twenty mile radius, the population density is 886 persons per square mile, nearly three times as many as live near Surry. The NRC ignores this enormous population difference entirely in the DGEIS, and inexplicably relies on the Surry Plant as a generic baseline site for its spent fuel pool fire risk and consequence analysis. Clearly, the consequences of a spent fuel pool fire would be much more severe at Indian Point than they would at Surry, given the potential numbers of people living in proximity to Indian Point. In addition, the Surry base case utilized by NRC assumes a single pool fire, despite the fact that Indian Point and many other reactor sites have multiple reactors operating in close proximity.⁴⁷ [footnote 47 text: In New York, for example, the Nine Mile Point and Fitzpatrick nuclear power plants are located on adjacent sites.] Yet the NRC utterly fails to provide any rationale for its reliance on a single unit pool fire at a reactor with relatively low population density in surrounding communities.⁴⁸ [footnote 48 text: In fact, the NRC appears to be relying on Surry simply because the pool fire consequence analysis in the DGEIS is largely drawn from NUREG-1738, a spent fuel pool severe accident study. However, that study is particularly unhelpful since it was completed prior to the 9/11 attacks, and thus does not consider a scenario in which a spent fuel pool loses cooling water or is otherwise damaged due to terrorist attack.] (0710-15 [Brancato, Deborah] [Musegaas, Philip])

Comment: Thus, NRC's spent fuel pool fire impact analysis is factually and legally deficient for failing to encompass within its analysis, or otherwise consider, the reasonably foreseeable impacts that could occur as a result of a spent fuel pool accident and/or fire at Indian Point. NRC's generic approach to considering the consequences of spent fuel pool accidents is insufficient, and site-specific assessment is necessary and warranted. In addition, NRC should have also considered the unique, site-specific safety and security issues facing Indian Point, as well as seismic risks, in relation to assessing the *risk* of future spent fuel pool-related fires. That is, the circumstances present at Indian Point increase the risks of such accidents, yet such factors were not "bounded" or considered by NRC. Instead, the NRC continues to rely on a generic probability risk analysis that is largely inapplicable to Indian Point, particularly when it comes to the risk of a pool fire resulting from a terrorist attack. This also renders NRC's assessment in the DGEIS inadequate. (0710-16 [Brancato, Deborah] [Musegaas, Philip])

Comment: Tons of highly radioactive "spent" fuel are building up at every nuclear reactor site in the country, stored at high density in water-filled pools in buildings that could not withstand a hostile action and also offer no containment of radioactivity in the event of a procedural accident or natural disaster. If pools are even partially drained they pose a risk of catastrophic fire. (0711-14 [Olson, Mary])

Comment: NRC staff have not addressed the realities implied in the short statement above. By choosing to take a "reference" reactor approach, by failing to apply the full extent to which multiple factors may influence outcomes, and also failing to re-contextualize the calculations to include the over 100 existing sites and how this changes probability, we reject the work offered in NUREG 2157 on fuel pool fires completely. We offer questions on this in the QUESTIONS

attachment. NRC appears to have avoided the court's order to assess the consequences of fuel pool fires; we do not accept the idea that low probability is the same as no consequence. (0711-15 [Olson, Mary])

Comment: How long do pyrophotic properties persist? Are pyrophoric properties a function of time? Are pyrophoric properties a function of burn-up? (0711-32 [Olson, Mary])

Comment: What is the (total) probability in any given year of a fuel pool fire in the USA with 100 operable reactors? In the world? (0711-33 [Olson, Mary])

Comment: If you apply reactor-years to the probability assessment for fuel pool fire, what is the projected probability of a fuel pool fire SOMEWHERE in the USA during the period of existing nuclear licenses? (0711-41 [Olson, Mary])

Comment: The dangers of major radioactive releases from spent fuel pools have been underestimated for decades. The precarious state of the spent fuel pool in Unit 4 at the Fukushima Dai-ichi nuclear station has focused the world's attention on the issues at stake. Calculations have shown that the inventory of radioactive cesium in that spent fuel pool alone is more than 80 times the total amount of radioactive cesium released during the Chernobyl disaster in 1986. Massive radioactive releases from the irradiated fuel in a spent fuel pool could result from a prolonged loss of cooling, an accidental criticality accident [nuclear fission] brought about by a shift in the geometry of the spent fuel assemblies in the pool, or in the case of an extreme situation of overheating, a spent fuel fire igniting the zirconium cladding in adjacent irradiated fuel assemblies. (0714-2-1 [Edwards, Gordon])

Comment: In 2001, NRC issued a technical study called NUREG-1738 that examined the risk of spent fuel pool fire.³⁰ [footnote 30 text: Nuclear Regulatory Commission, NUREG-1738, *Technical Study of Spent Fuel Pool Accident Risk at Decommissioning Nuclear Power Plants*, ("NUREG-1738") ML010430066 (Feb. 2001).] That study found that, if a pool lost enough water to uncover the spent fuel assemblies, the spent fuel could heat to the point where the fuel's zirconium cladding might catch fire.³¹ [footnote 31 text: *Id.* at 2-1 to 2-3, A1A-1 to A1A-6. For an illustrated explanation of how a zirconium fire could occur, see The New York Times, Hazards of Storing Spent Fuel, (Mar. 18, 2011), *available at*: <http://www.nytimes.com/interactive/2011/03/12/world/asia/the-explosion-at-the-japanese-reactor.html?ref=asia>.] A zirconium fire could generate a radioactive plume causing thousands of deaths from cancer.³² [footnote 32 text: *Id.* at Appendix 4A, Attachment 1; *NAS Report* at 49-50.] Other studies submitted to NRC reached the same conclusion about the adverse consequences of a zirconium fire.³³ [footnote 33 text: Robert Alvarez, et al., *Reducing the Hazards from Stored Spent Power-Reactor Fuel in the United States*. Science and Global Security, Vol. 11:1-51, at 7-11 ("*Reducing the Hazards*") (Jan. 22, 2003); Beyea, Lyman, von Hippel, *Damages from a Major Release of 137Cs into the Atmosphere of the United States*, Science and Global Security, Vol. 12:125-136 ("*Damages from a Major Release*") (Jan. 21, 2004).] The graph below, taken from NUREG-1738, shows that for decay times of less than about 2 years for pressurized water reactors ("PWRs") and 1.5 years for boiling water reactors ("BWRs"), "it would take less than 10 hours for a zirconium fire to start or for significant fission product releases to begin once the fuel was fully uncovered and the fuel was cooled by an air flow of about two building volumes per hour. The figure also shows that after 4 years, PWR fuel could reach the point of fission product release in about 24 hours."³⁴ [footnote 34 text: NUREG-1738 at A1A-4.] [Figure inserted] NUREG-1738 also found that "[h]eat removal is very sensitive to" plant- specific factors, including "fuel assembly geometry" and "rack configuration," and is "subject to unpredictable changes after an earthquake or cask drop that drains the pool."³⁵

[footnote 35 text: *NUREG-1738* at x.] Following the release of *NUREG-1738*, NRC's Director of Operations issued a memorandum acknowledging that "a zirconium fire event can have public health and safety consequences similar to a severe core damage accident with a large offsite release" and "that the possibility of a zirconium fire cannot be dismissed even many years after final reactor shutdown."³⁶ [footnote 36 text: Nuclear Regulatory Commission, SECY-01-0100, NRC Policy Issue (Notation Vote) Memorandum from William D. Travers, Executive Director for Operations to NRC Commissioners, *Policy Issue Related to Safeguards, Insurance, and Emergency Preparedness Regulations at Decommissioning Nuclear Power Plants Storing Fuel in Spent Fuel Pools* (WITS 200000126), at 5, 2 (June 4, 2001).] (0718-1-14 [Sipos, John])

Comment: Similarly, in the relicensing proceeding for the Pilgrim nuclear power plant in Massachusetts, Dr. Gordon R. Thompson of the Institute for Resource and Security Studies submitted a report in June 2011 discussing the significant new information coming from Fukushima.⁹⁸ [footnote 98 text: *See Thompson 2011 Report.*] Thompson explained that the "Fukushima experience shows clearly that the operators' capability to mitigate an accident . . . can be severely degraded in the accident environment."⁹⁹ [footnote 99 text: *Id.* at 20.] One example of this was the operators' inability to add water to Unit 4's spent fuel pool for several days following the hydrogen explosion. (0718-2-6 [Sipos, John])

Comment: The authors of *NUREG-1738* were very careful to spell out the limitations of their generic approach for decommissioning plants. Subsequent documents like DGEIS and the Denial of Rulemaking Petitions in 73 Fed. Reg. 46,204 do not repeat these warnings. The following are examples of limitations that are identified in *NUREG-1738*. Regarding the age of the fuel beyond which a spent fuel pool fire can be ruled out (USNRC 2001, p. 2-1): "*...the revised analyses show that it is not feasible, without numerous constraints, to define a generic decay heat level (and therefore decay time) beyond which a zirconium fire is not physically possible. Heat removal is very sensitive to these constraints, and two of these constraints, fuel assembly geometry and spent fuel pool rack configuration, are plant specific.*" See also SECY-01-0100. Regarding the pool fire frequencies for all initiators (US-NRC 2001, p. 3.7): "*Plant-specific frequency estimates in some cases could be as much as an order of magnitude higher or lower because of the seismic hazard at the plant site.*" Regarding the possibility for air cooling following damage caused by severe weather (US-NRC 2001, p. 3-10): "*For loss of offsite power events caused by severe weather, the staff assumed a 90 percent partition for the high airflow case. This is based on a staff assumption that openings in the SFP building (e.g., doors and roof hatches) are large enough that, if forced circulation is lost, natural circulation cooling will provide at least two building volume of air per hour to the SFP. This assumption may need to be confirmed on a plant-specific basis.*" Regarding the low initiating event frequency⁵ [footnote 5: Throughout this report, the terms probability and frequency are used. Frequency is simply probability, expressed on a per-year basis. Thus, the event frequency is the probability that an event will occur within one year.] for the loss of pool inventory (US-NRC 2001, p. 3-12): "*These assumptions may be non-conservative on a plant-specific basis depending on SFP configuration and commitments for configuration control.*" Regarding the likelihood of loss of cooling, loss of inventory, and loss of off-site power (US-NRC 2001, p. 3-12): "*Initiating event frequencies for loss of cooling, loss of inventory, and loss of offsite power are based on generic data. In addition, the probability of power recovery is also based on generic information. Site-specific differences will proportionately affect the risk from these initiating events.*" Regarding the assumption that leaks are self-limiting (US-NRC 2001, p. A2A-67): "*For the loss of inventory event tree, the assumption that the leak is self-limiting after a drop in level of 15 feet, may be a more significant assumption that, on a site specific basis may be non-conservative, and requires validation.*" (0718-3-11 [Sipos, John])

Comment: In addition, NUREG-1738 relies on a series of Industry Decommissioning Commitments (IDC) and Staff Decommissioning Assumptions (SDA) that are spelled out and are assumed to apply generically to all plants (US-NRC 2001, p. 4-11 and 4-12). NUREG-1738 bases its analysis on the assumption that these commitments and assumptions are met. If they are not, the analysis carried out in NUREG-1738 may not be valid at a specific site. By contrast, the authors of the DGEIS use less definite language (US-NRC 2013, p. F8): *"In general, health impacts could be higher than the values reported in these studies if the amount of spent fuel involved in a fire (and, thus, the amount of radioactive material that could be released) was higher than assumed in these studies or the total population and population density were higher."* Later, in the DGEIS (US-NRC 2013, p. F-7): *"As with health impacts, the economic impacts would vary for different facilities. For example, higher total population or population density could result in higher relocation costs, and land use (e.g., whether land is used as farmland or not) could also impact decontamination and condemnation costs."* (0718-3-12 [Sipos, John])

Comment: In summary, it seems that the US-NRC's critique in the Denial of the Petition for Rulemaking of petitioners' assertion that fuel will burn regardless of age, quoted below (US-NRC 2008), is equally applicable to the conclusions of the DGEIS: *"This conclusion, however, was in no sense a statement of certainty and was made in order to reach a conclusion on a generic basis, without relying on any plant-specific analyses."* Likewise, US-NRC's assessment of spent fuel pool fire risk in the DGEIS Appendix F and determination that such risk is "small" is in no sense a statement of certainty regarding the risk at any given plant. (0718-3-13 [Sipos, John])

Comment: With respect to site specific characteristics, it should be noted that as of 1990, the Indian Point site had 15.1 million people living within 50 miles of the site – more than twice the number that lived within 50 miles of the Zion site. (US-NRC 1996, p. 2-2 to 2-8 stating that Indian Point had "almost 2000 persons per square mile"). These population totals have increased since 1990. US-NRC reports that as of 2000, 16.8 million people lived within 50 miles of Indian Point (US-NRC 2013, p. 3-8), and that as of 2010 approximately 17 million people lived within 50 miles of Indian Point.⁶ [footnote 6 text: The population within 50 miles of Indian Point is based on 2010 census data obtained from reference (US-NRC 2012b).] To ISR's knowledge, US-NRC has not disclosed or released the results of any site-specific MACCS2 analysis of a severe accident at the Indian Point spent fuel pools. Thus, it is not possible to compare the results of the Zion assessment to an Indian Point-specific assessment, and determine whether the differences are significant. (0718-3-15 [Sipos, John])

Comment: Section E.3 of the DGEIS discusses historical data on spent fuel pool leaks. It discusses the 13 sites where occurrences of spent fuel leaks that have been documented. However, the DGEIS does not include an exhaustive look at event reports and accidents precursors that should inform the assessment of environmental risks from the spent fuel pools. Since the publication of NUREG-1275 in 1997, there have been many event reports that could inform the DGEIS, and that should be described in the DGEIS. As an example, one of the assumptions included in the DGEIS is that pool drainage is not credible, based on the configuration of spent fuel pools. NUREG-1738, p. 3-5 (and again on p. 3-11, p. 3-15): *"Plants do not have drain paths in their SFPs that could lower the pool level (by draining, suction, or pumping) more than 15 feet below the normal pool operating level, and licensees must initiate recovery using offsite sources."* NUREG-1738, p. 3-6: *"IDC #6 Spent fuel pool seals that could cause leakage leading to fuel uncover in the event of seal failure shall be self-limiting to leakage or otherwise engineered so that drainage cannot occur."* These assumptions may not

be compatible with the configuration of some of the spent fuel pools, as the event report shown in Figure 1 shows. (0718-3-18 [Sipos, John])

Comment: While NUREG-1738 is clear that plants that do not pass the seismic checklist would not qualify for the exemptions on emergency preparedness (EP), indemnification or security, the DGEIS is far from clear on what would happen in a specific plant could not meet some of the conditions listed in NUREG-1738. Neither the DGEIS, nor NUREG-1738, lists exactly which plants meet the NUREG-1738 conditions and which plants do not. (0718-3-19 [Sipos, John])

Comment: NUREG-1738 was published before both the September 11 terrorist attacks and the severe accident at the Fukushima Dai-ichi nuclear power plants. Since the DGEIS relies on NUREG-1738 for the assessment of the consequences of a spent fuel pool fire, the quantitative analysis of consequences in the DGEIS does not include lessons learned from these two later events. (0718-3-8 [Sipos, John])

Comment: The DGEIS Appendix F qualitatively discusses NRC's orders following the September 11 terrorist attacks and the "lessons learned" NRC is developing and implementing in response to accident at Fukushima Dai-ichi. NRC's consideration of these safety enhancements is solely in the context of the probability that a spent fuel pool fire would occur. See DGEIS at F-12 ("These measures further reduce the probability of a spent fuel pool fire, and thus further increase the conservatism of NUREG-1738."). The DGEIS, however, does not quantify the reduction in probability or clearly explain which post-September 11 or post-Fukushima measures generically reduce the probability. (0718-3-9 [Sipos, John])

Comment: Two different seismic hazard estimates have been developed for U.S. reactor sites, one developed by Lawrence Livermore National Laboratories (LLNL) and one by the Electric Power Research Institute (EPRI). Using the site-specific LLNL seismic hazard estimates, the mean spent fuel pool failure probability for the sites analyzed by LLNL is about 2×10^{-6} per year and covers a range 6×10^{-7} per year to 1.5×10^{-5} per year (US-NRC 2001, p. 3-22). For the EPRI hazard estimates, the mean value of the pool failure frequency is about 2×10^{-7} per year and it covers the range 3×10^{-9} per year to 2×10^{-6} per year (US-NRC 2001, p. 3-21). The plants that have the lowest and highest seismic risks are not identified in the analysis. (0718-4-1 [Sipos, John])

Comment: As detailed in Section C.2.12 of COMSECY-13-0030, which adopts the Consequence Study, a sensitivity analysis was carried out as part of the Consequence Study to analyze the effect of population density on the offsite consequences. A summary of this analysis is shown in Table 2 below. The COMSECY contains the following warning regarding the Consequence Study's results: "*...the results are not representative of any specific site because site specific meteorology for these sites is not used.*" (US-NRC 2013a, p. 99) Despite this disclaimer, the conclusion of the COMSECY's sensitivity analysis is that population density is not a key parameter, i.e., US-NRC has decided that population density is not a variable that can significantly affect consequence calculation results (USNRC 2013a, p. 21). (0718-4-11 [Sipos, John])

Comment: Because many plants are located in low population areas, Peach Bottom's population may be representative of some plants. Given the combination of Indian Point's population and predominate wind direction, the results of US-NRC's Peach Bottom analysis are not applicable to Indian Point. As shown in Figure 3 below, the population density within 50 miles of the Indian Point site is far greater than even those considered in the Consequence Study's sensitivity analysis.⁷ [footnote 7 text: The population density within 50 miles of the Indian

Point site is derived from the 2010 census data presented in reference (US-NRC 2012b).] With the combination of higher population and a dominant wind direction toward the most populated areas, it is reasonable to expect that the consequences to the public surrounding Indian Point may be over 100% greater than the base case used in the Consequence Study. This increase is equally applicable for the calculation of economic costs, which does not appear to be included in the sensitivity analysis for population density. (0718-4-12 [Sipos, John])

Comment: There are several factors that must be considered alongside a significantly larger population, such as those who reside within 50 miles of the Indian Point reactor; building density is one such factor. With a larger building density than that of the reference site used in the Consequence Study, there are many more surfaces in urban environments that effectively deplete the amount of contamination in an airborne plume. This results in higher levels of contamination and thus greater radiological and economic costs (e.g., the cost of decontamination). Annex B provides a discussion of surface roughness as it relates to deposition velocity of radioactive particulate in urban environments. (0718-4-13 [Sipos, John])

Comment: The Consequence Study's value of nonfarm wealth (VALWNF) includes all public and private property not associated with farming that would be unusable if the region was rendered either temporarily or permanently uninhabitable. This value includes the cost of land, buildings, infrastructure, and the cost of any non-recoverable equipment or machinery (MACCS2 manual). The value chosen for the Consequence Study, which uses the Peach Bottom site as the reference case, is \$210,000/person (2012 USD). By its definition, this value is site-specific. As a comparison, in its submission for a licence renewal for Indian Point Units 2 and 3, the operator of the Indian Point reactors, Entergy, calculated VALWNF to be \$209,000/person (2004 USD) for the site. Entergy's value is approximately \$250,000/person in 2012 USD, which is 20% higher than the value used in the Consequence Study. As a further comparison, the corresponding value for VALWNF deemed appropriate in ISR Report 13014-01-01 is approximately \$284,000/person (2004 USD).⁸ [footnote 8 text: Appropriate value for Indian Point derived from ISR Report 13014-01-01: Review of Indian Point Severe Accident Off Site Consequence Analysis (Dec. 21, 2011) (ML12334A761) as modified in Revisions to Tables in ISR Report 13014-01-01 (Jun. 28, 2012) (ML12340A648).] In 2012 USD, this equates to \$345,000/person, which is 64% higher than the value used in the Consequence Study. (0718-4-14 [Sipos, John])

Comment: The Consequence Study's per capita cost of long-term relocation (POPCST) takes into account both personal and corporate income losses, as well as moving expenses, for a transitional period. The value chosen for the Consequence Study is \$12,000/person (2012 USD). This value is site-specific. For example, in the state of New York, the average per capita income is approximately \$32,000 (2011 USD). Using an interdiction period of 140 days as recommended in NUREG/CR-4551, the total amount of lost wages is \$12,500/person (2012 USD). With the addition of corporate income losses and moving expenses, this amount for Indian Point is expected to be higher than the value used in the Consequence Study. (0718-4-15 [Sipos, John])

Comment: In the Consequence Study, the decontamination time for both decontamination levels is entered as one year. The selection of one year differs from the decontamination times used in NUREG-1150 of 60 and 120 days for light and heavy decontamination, respectively. The Consequence Study does not explain why one year was selected instead of 60 and 120 days. In any event, decontamination time is also site-specific and the decontamination efforts required particularly for urban areas could increase the decontamination time beyond one year. Furthermore, the Consequence Study should have discussed and considered the unfolding

experience of decontamination following the 2011 Fukushima accident. As of the date of this report (December 2013), the Fukushima decontamination has not been completed even though two and a half years have passed since the accident occurred. Indeed, it is expected to take several more years. Thus, it is questionable to use one year for the TIMDEC input for both light and heavy decontamination in the Spent Fuel Consequence Study MACCS2 analysis; the decision to use one year should be explained and substantiated. (0718-4-16 [Sipos, John])

Comment: The DGEIS uses the risk assessment from NUREG-1738, which relies on a series of Industry Decommissioning Commitments (IDC) and Staff Decommissioning Assumptions (SDA) that are spelled out and are assumed to apply generically to all plants (US-NRC 2001, p. 4-11 and 4-12). Since Indian Point Unit 2 and 3 have not been decommissioned, it is not known which of these assumptions are actually met in the operating plants. The consequences of not meeting these assumptions should be spelled out in the DGEIS. (0718-4-18 [Sipos, John])

Comment: The DGEIS uses an average site seismicity corresponding to a frequency of exceeding 1.2 g of 2×10^{-7} per year to 2×10^{-6} per year. The actual frequency of exceeding 1.2 g at the Indian Point site is not quoted in the DGEIS or NUREG-1738; although the data shown in Figure 10 of COMSECY-2013-0030 (p.81) suggests that this frequency is greater than 2×10^{-6} per year. The recent US-NRC GI-199 report (US-NRC 2010, p. B-7) reports the safe shutdown earthquake, SSEPGA = 0.15 g for the Indian Point site, and the high confidence of a low probability of failure, HCLPFGA = 0.3 g for IP-2 and 0.15 g for IP-3. The safe shutdown earthquake is the largest earthquake that must be considered in the design. The high confidence of a low probability of failure earthquake takes into account the fragility of the plant. Chapter 9 of the IP2 and IP3 Final Safety Analysis Reports (FSARs) indicates that the SFP structures are classified as Seismic Category I. The IP2 FSAR is specific regarding the design criteria, and indicates that the IP2 SFP was designed in accordance with the provisions of American Concrete Institute (ACI)-318, "Building Code Requirements for Reinforced Concrete" (see Section 9.5.2.1.4 of the IP2 FSAR). The 1989 license amendment issued for IP3 SFP re-rack indicates that the design criteria used to evaluate the SFP structure are based on the provisions in ACI 349-80, "Code Requirements for Nuclear Safety-Related Concrete Structures." Based the classification of these structures indicated above, they are required to be designed against bounding loading combinations which include loads due to a safe shutdown earthquake. As such, the structural analyses are performed to ensure that the SFPs will remain functional during and after a safe shutdown earthquake (Boska 2011). (0718-4-19 [Sipos, John])

Comment: Based on the frequencies listed in Table 3.7-3 (US-NRC 2001, p. 3-35) the frequency of boil down events does not seem to consider loss of offsite power, and internal fire triggered by seismic events. NUREG-1738 considers the risk contribution of earthquakes that damages pool support systems in the seismic risk of pool fire (US-NRC 2001, p. 3-9, A2B-3). The return frequency of the earthquakes is assumed to be 1 : 4000 years and a failure to obtain off- site resources in a timely manner is assumed to be 1×10^{-4} . If loss of offsite power and internal fires triggered by seismic events were considered at the same earthquake return frequency as for the damage to pool support systems, the probability of these initiating events could increase. (0718-4-2 [Sipos, John])

Comment: Section 3.4.3 of this report discusses the importance of various MACCS2 input parameters in determining the offsite population dose cost and offsite economic cost following a severe accident at a spent fuel pool. The following table summarizes those input parameters and values used in the Consequence Study that are site-specific to the Peach Bottom reference plant and compares them to appropriate values for Indian Point. Table 3: Summary of site-specific MACCS2 input parameters relevant to Indian Point [table inserted] *The ISR Report and

updated tables submitted in the context of the Indian Point relicensing proceeding provided a suggested range of appropriate values for each of these parameters. For the sake of simplicity, and for illustrative purposes in this DGEIS proceeding, only the minimum value is represented here in Table 3. Values were CPI-adjusted to 2012 USD. The reader is directed to ISR Report 13014-01-01: Review of Indian Point Severe Accident Off Site Consequence Analysis (Dec. 21, 2011) (ML12334A761) as modified in Revisions to Tables in ISR Report 13014-01-01 (Jun. 28, 2012) (ML12340A648) for a complete discussion of site-specific input parameters for Indian Point, which also include higher input values. Furthermore, the DGEIS uses the population density around the Zion plant, 860 people per square mile, while the population density surrounding Indian Point is over 2100 people per square mile. (0718-4-20 [Sipos, John])

Comment: The total probability of pool drainage from NUREG-1353 (2×10^{-6} events per year) is based on best estimates of the frequency of various event sequences, and is dominated by the seismic risk of structural failure (US-NRC 1989, p. 4-36). It should be noted that NUREG-1738 uses the average probabilities for the seismic events (p. 3-9) and acknowledges that site-specific values could be ten times higher or lower (p. 3-7). The DGEIS relies upon these average probabilities from NUREG-1738, reporting them in Table F-1 (US-NRC 2013, p. F-4). The DGEIS, however, does not include the caveat from NUREG-1738 that site-specific probabilities could vary by a factor of ten. Nor does the DGEIS provide examples of sites that would have higher or lower probabilities, or explain how or if the probabilities reported in NUREG-1738 conservatively bound the range of accident probabilities. (0718-4-3 [Sipos, John])

Comment: For the cask drop event, NUREG-1738 bases the calculation of the probability of pool failure on Navy data and NUREG-0612 heavy loads evaluation (US-NRC 1980). For single failure-proof system, the frequency of catastrophic pool failure is 2×10^{-7} events per year. The frequency of catastrophic pool failure for non-single failure-proof system is 2.1×10^{-5} events per year, which exceeds the proposed pool performance guideline of 1×10^{-5} events per year. US-NRC believes that the frequency of pool failure can be reduced by performing a comprehensive and rigorous load drop analysis. For this reason, NUREG-1738 (Table 3.1, p. 3-9) and DGEIS quote the probability of cask drop as 2×10^{-7} events per year and ignores the calculation of the probability of cask drop for non-single failure-proof system. The US-NRC needs to show how the load drop analysis will change the human error rate calculation and reduce the frequency of cask drop events. In addition, the calculation presented on page 3-17 of NUREG-1738 is unclear. (0718-4-4 [Sipos, John])

Comment: For the single-failure-proof handling system, the load drop frequency is 9.6×10^{-6} y⁻¹ and the catastrophic failure is 2×10^{-7} y⁻¹, for a ratio of $2.08 \times 10^{-2} = 0.13 \times 0.16$. This matches the description given in the text. For non-single-failure-proof handling system the frequency of load drop is 3.4×10^{-4} y⁻¹ and the mean value for the catastrophic failure rate is 2.1×10^{-5} y⁻¹. The ratio is 6.2×10^{-2} catastrophic failure per transfer. How US-NRC arrived at this value is not clear. (0718-4-5 [Sipos, John])

Comment: The calculation of the societal risk quantities, including collective dose, collective early fatality, and latent fatality, as well as total economic costs is heavily dependent on the population density surrounding a particular site. The values in Table 1 were all calculated for the Zion site, using a population density of 860 people per square mile surrounding the site, as reported in US-NRC's 1996 GEIS for License Renewal. Zion's population density is not representative of some sites such as Indian Point, which had a population density of "almost 2000 persons per square mile," as reported in US-NRC's 1996 GEIS for License Renewal (US-NRC 1996, p. 2-2 to 2-8). Because Indian Point is surrounded by more than double the population density of Zion, the accident consequences would most certainly be significantly

higher for Indian Point than the consequences reported for Zion in Table 1. The DGEIS does not discuss differences in population density among sites, or calculate the effect those differences would have on the consequence calculations. (0718-4-6 [Sipos, John])

Comment: Table F-2 (p. F-8) of the DGEIS presents a comparison of frequency-weighted consequences from severe reactor accidents and spent fuel pool fires. For spent fuel pool fires, Table F-2 multiplies the consequences presented in Table 1 by the average frequency for accident presented in Table 1, to produce frequency-weighted consequences. Multiplying the average values for the frequency and the consequences is acceptable if the probability distributions are un-correlated (see elaboration provided in Annex A). If the same plants that have a higher frequency of severe earthquakes also have the highest density of population around the site, the values calculated in Table F-2 of the DGEIS may under-represent the average risk. (0718-4-7 [Sipos, John])

Comment: US-NRC should calculate the correlation coefficient between the frequency of seismic events for the Zion site and the density of the population around the Zion site and use this correlation coefficient to correct the frequency-weighted probabilities presented in Table F-2 of the DGEIS. Alternatively, the US-NRC should calculate the collective dose- risk and the economic cost-risk for each site and re-calculate the average. (0718-4-8 [Sipos, John])

Comment: Ensure that the conclusions of the DGEIS are based on actual practices and conditions at spent fuel pools at various sites around the U.S. Explicitly list and describe those sites that have spent fuel pools that do not meet an assumption or condition included in the DGEIS or documents relied upon by the DGEIS. (0718-5-1 [Sipos, John])

Comment: The DGEIS should either employ conservative bounding or direct site-specific review for certain plants like Indian Point. (0718-5-2 [Sipos, John])

Comment: Document explicitly how the assessment of event frequencies includes the contribution of seismic events to loss of offsite power and internal fire. (0718-5-5 [Sipos, John])

Comment: Show how the load drop analysis required for non-single failure proof cranes changes the human error rate calculation from 2.1×10^{-5} per year to 2×10^{-7} per year for cask drop events. (0718-5-6 [Sipos, John])

Comment: Revise the calculation of the societal risk-dose and the economic risk-cost to account for the possible correlation between the seismic risk and the population density. (0718-5-7 [Sipos, John])

Comment: Include an analysis of the impact of new monitoring, and post-accident response measures put in place for intentional, malevolent actions since 9/11 and the Fukushima event, listing which plants have implemented which measures and quantify how those measures affect risk. (0718-5-8 [Sipos, John])

Comment: Why not pay heed to what the Court ordered? The Court said, "Even though the Commission engaged in a more substantial analysis of fires than it did of leaks, that analysis is plagued by a failure to examine the consequences of pool fires in addition to the probabilities. Petitioners, citing *Limerick Ecology Action, Inc. v. Nuclear Regulatory Commission*, 869 F.2d 719, 739 (3d Cir. 1989), argue that the Commission could only avoid conducting an EIS if it found the risk of fires to be "remote and speculative." The Commission, citing *Carolina Environmental Study Group v. United States*, 510 F.2d at 799, argues that it did not need to

examine the consequences of fires because it found the risk of fires to be very low. We disagree with both parties. As should be clear by this point in our opinion, an agency conducting an EA generally must examine both the probability of a given harm occurring and the consequences of that harm if it does occur. Only if the harm in question is so "remote and speculative" as to reduce the effective probability of its occurrence to zero may the agency dispense with the consequences portion of the analysis. See *Limerick Ecology Action, Inc.*, 869 F.2d at 739. But, contra petitioners, the finding that the probability of a given harm is non-zero does not, by itself, mandate an EIS: after the agency examines the consequences of the harm in proportion to the likelihood of its occurrence, the overall expected harm could still be insignificant and thus could support a FONSI. See *Carolina Env'tl. Study Grp.*, 510 F.2d at 799 ("Recognition of the minimal probability of such an event is not equatable with non-recognition of its consequences."). Here, however, the Commission did not undertake to examine the consequences of pool fires at all. Depending on the weighing of the probability and the consequences, an EIS may or may not be required, and such a determination would merit considerable deference. *C.f.*, *City of New York*, 715 F.2d at 751-52 (deferring to an agency's weighing of a "catastrophic" harm against an "infinitesimal probability"). But unless the risk is "remote and speculative," the Commission must put the weights on both sides of the scale before it can make a determination. (0723-7 [Shadis, Raymond])

Comment: The pools are filled and most now contain decades of accumulated waste, multiple atomic reactor cores-worth of ultra-hazardous irradiated nuclear fuel. Instead of emptying most of the irradiated fuel to dry casks to restore the pools to their original designed low-density configuration, most nuclear plants have kept pools as full as possible regardless of the potential high risk of a pool fire. (0757-2 [Lynch, Laura])

Comment: NextEra agrees with the NRC's ultimate conclusion that the environmental impacts of spent fuel pool leaks and the probability-weighted consequence of spent fuel pool fires would be small. (0808-4 [Petro, James])

Comment: According to a 2011 Time magazine story, in-ground pools are located in buildings next to operating reactors at 73 U.S. sites; attic pools, like the ones at Fukushima, are used at 31 plants. Each pool is a massive radiological dirty bomb waiting to ignite. A 1997 Brookhaven National Laboratory study said such a disaster at one irradiated fuel pool could result in 138,000 deaths and contaminate 2,000 square miles. The NRC dismisses this sort of catastrophe by claiming it has calculated the possibility of such an event to be vanishingly small, because of multiple redundant safeguards. Such calculations were also used to prove the possibility of meltdowns at Fukushima was vanishingly small. These calculations of risk are reminiscent of the flawed fault-tree analysis calculations of the discredited MIT Rasmussen Reactor Safety Report of the 1970's. (0815-2 [Gunter, Keith] [Izant, Carol])

Comment: The NRC continues to downplay and inadequately address the vulnerability of spent fuel pools to accidents, attacks, and fires despite the fact that every reactor continues "re-racking" spent fuel in high density configurations. The NRC justifies its position, in part, by assuming that populations in the 10 mile Emergency Planning Zones (EPZs) will be successfully evacuated in the event of a fire. This ignores the fact that spent fuel can and will remain in pools long after reactor closure because this option is less expensive than dry casks. At the same time, the NRC can exempt utilities from maintaining EPZs within a mere 12-18 months after reactor shutdown. How can populations be evacuated if EPZs have been eliminated? (0819-10 [Kline, Connie])

Comment: Furthermore, spent fuel pools are not under the robust/redundant containment of the reactor, itself, making accidents or attacks more likely to release radiation. The NRC has admitted that even irradiated fuel that has been cooled for decades in pools could spontaneously combust if overheated due to loss of coolant, partial drainage, or contact with air resulting from loss of power, pump circulation failure, pool puncture from loading dry casks (see below) or a terrorist attack. These scenarios would result in disastrous releases of radioactivity into the environment. (0819-11 [Kline, Connie])

Comment: This is especially true when Section F.2.2 entitled probability-weighted consequences of a Spent Fuel Pool Fire is considered where the NRC states that the probability-weighted consequence of a severe nuclear reactor accident is equated to the probability-weighted consequence of a spent fuel pool accident. Under NUREG 2157 the surrounding community could have to live with the possibility of an accident equal in consequence to a severe nuclear reactor accident for up to 60 years after the plant is shut down. While the plant owner/operator decommissions the plant with the spent fuel in the pools rather than in dry casks. (0826-16 [Morgal, Rick])

Comment: Confidence is fostered through knowledge and preparation. To date the NRC has been less than forth coming to the public about known possible consequences associated with a spent fuel fire and its potential impacts on the surrounding community. A prime example of the NRC knowingly covering up the potentially catastrophic outcome of a spent fuel pool fire is found in Draft NUREG-2157's Table F-1 where it is estimated that there would be 191 Collective Early Fatalities from a spent fuel fire. My sense of confidence in the NRC's risk evaluation process is lost with such unreasonably low predictions. (0826-23 [Morgal, Rick])

Comment: In Appendix F of the draft GEIS, the NRC has continued to follow this approach appropriately in assessing the environmental impacts of spent fuel pool fires. Fully addressing the Court's remand, the discussion in Appendix F confirms the extremely remote probability at any site, but potentially severe consequences, of a spent fuel pool fire. The NRC's assessment is based on a substantial technical record that has been developed on this issue over many years by the NRC and its contractors. The NRC has presented data on both short-term and long-term health effects, as well as economic consequences (including evacuation and relocation costs, property damages, and cleanup and decontamination costs). The draft GEIS assessment supports a conclusion of low overall risk and therefore no significant environmental impact. NEI agrees that the environmental impacts associated with a spent fuel pool fire would be small based on the probability-weighted consequences of such an event at all existing reactor sites. In particular, NUREG-1738, "Technical Study of Spent Nuclear Fuel Pool Accident Risk at Decommissioning Nuclear Power Plants" (2001) finds that the probability of a spent fuel pool fire is very low. Regulatory requirements imposed since the study was conducted make a spent fuel pool fire even less likely.⁷⁴ [footnote 74 text: See Draft GEIS at F-11 - F-12.] (0827-2-13 [Ginsberg, Ellen])

Comment: NEI also agrees with the NRC's conclusion that the probability-weighted population doses and economic consequences would be comparable to the values calculated for a reactor accident, as estimated in the 1996 and 2013 License Renewal GEIS. Furthermore, mitigation measures implemented by reactor licensees (including measures adopted or being adopted after the Fukushima event of March 2011) further reduce these consequences, supporting the conclusion that environmental impacts of storage would be small. In total, the analysis of spent fuel pool fires in the draft GEIS is exactly as the Court required - it assesses the consequences of this very low probability of this type of event and the overall impact based on a risk assessment. (0827-2-14 [Ginsberg, Ellen])

Comment: Lastly, NEI strongly encourages the NRC to update Appendix F to reference the NRC's recent spent fuel pool "Consequence Study."⁷⁵ [footnote 75 text: *Consequence Study of a Beyond-Design-Basis Earthquake Affecting the Spent Fuel Pool for a US Mark I Boiling Water Reactor*, June 2013.] The study represents a significant addition to the body of work currently cited and further confirms NRC's conclusion that the impacts of spent fuel pool fires would be small. The most notable conclusion of this more recent study is that, for the scenario examined, "spent fuel is only susceptible to a radiological release within a few months after the fuel is moved from the reactor into the spent fuel pool."⁷⁶ [footnote 76 text: *Id.* at vii.] (0827-2-15 [Ginsberg, Ellen])

Comment: The risks and perils of storing nuclear waste at reactor sites continue to be ignored. This creates false confidence. Spent fuel is highly flammable and radioactive, yet is primarily stored in densely packed pools of water that contain several times more radioactive fuel than in the nuclear reactor itself. If the cooling system of a fuel pool fails, fuel rods could be exposed and catch fire, resulting in the release of massive quantities of radioactive material. (0840-10 [Taylor, Tom])

Comment: The economic cost estimates of a spent fuel pool accident in the draft generic EIS appear to be very low, perhaps because it is assumed that spent fuel pool accidents will not occur along with reactor accidents or other events. (0851-5 [Thatcher, Tami])

Comment: The NRC considers the risk of spent-fuel pool fires "inconsequential"-but for residents nearby, they would be disastrous. (0864-4 [Gellert, Sally Jane])

Comment: Each nuclear power plant in the United States has different design characteristics since the United States did not pursue a common design approach to NPP. This variability includes the spent fuel pools (SFP). Of concern is what may occur in the event the SFP loses coolant or the consequences of a fire in the pool in which the zirconium casing of the spent fuel catches fire. Significant releases of radiation can result, only if the heat from spent fuel exceeds the capacity to remove heat from the pool. The NRC has examined the frequency of events leading to water loss from the SPF. Despite real world variability inherent in U.S. NPP, the NRC staff has concluded that a generic analysis of SPF is appropriate. Still the NRC itself has questioned such assumptions. Its own documents suggest this when stating: "In its thermal-hydraulic analysis, documented in Appendix 1A, the staff concluded that it was not feasible, without numerous constraints, to establish a generic decay heat level (and therefore a decay time) beyond which a zirconium fire is physically impossible. Heat removal is very sensitive to these additional constraints, which involve factors such as fuel assembly geometry and SFP rack configuration. However, fuel assembly geometry and rack configuration are plant specific, and both are subject to unpredictable changes after an earthquake or cask drop that drains the pool. Therefore, since a non-negligible decay heat source lasts many years and since configurations ensuring sufficient air flow for cooling cannot be assured, the possibility of reaching the zirconium ignition temperature cannot be precluded on a generic basis" (NUREG 1738). This passage suggests that some portions of the NRC staff do not believe that it is possible to generically assess the risks to spent fuel pools. (0867-3-17 [Griffin, William])

Comment: In fact, the DGEIS flouts both NEPA and the Court's application of NEPA in *New York*, 681 F.3d 481 (D.C. Cir. 2012) in multiple ways: The DGEIS asserts that the environmental impact of pool fires is "SMALL," i.e., insignificant. In reaching this conclusion, the NRC uses a flawed concept of risk that is inappropriate to the consideration of potentially catastrophic environmental impacts. The DGEIS also ignores a range of pool fire causes, including the potential for an attack, the substantial cumulative frequency of fires, and the

possibility that the risk environment will become more adverse in the future. If these factors are considered, the environmental impact of accident-induced pool fires is not SMALL, but LARGE. (0897-1-11 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Another significant deficiency in the DGEIS' risk analysis is its failure to consider the relationship between pool fires and operating reactors. Pool storage of spent fuel, as considered in the DGEIS, could occur, and probably will occur, at locations near operational reactors. Risk linkages among spent-fuel pools and operational reactors at a site could be manifested in a cascading sequence of incidents that preclude mitigating actions needed to maintain pools in a safe state. Mitigating actions could be precluded by, for example, a radiation field arising from the release of radioactive material. NRC has never, to Dr. Thompson's knowledge, published a credible technical analysis of a cascading sequence of incidents of this type, or publicly stated that it has performed such analysis in secret. The present state of knowledge suggests that risk linkage among pools and operational reactors leads to an under-estimate of risk by at least one order of magnitude (i.e., factor of 10). Accordingly, the DGEIS should have carefully considered the potential linkage of radiological risk among pools and operational reactors at each site. The DGEIS has not considered this matter. Thompson Declaration, Section X. (0897-6-18 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Importantly, the draft GEIS substantially underestimates the consequences of a pool fire. Those consequences could include the long-term displacement of millions of people, economic damage measured in trillions of dollars, and adverse social and political outcomes. A pool fire yielding these consequences would be a national disaster of historic dimensions. Thompson Declaration, Section X. And as discussed above, very large consequences are qualitatively different than smaller ones. As Dr. Thompson's declaration shows, the nature of pool fire risks is such that a meaningful environmental impact estimate cannot be yielded by simply multiplying probability times consequences. First, some of the key factors are not easily quantifiable; for instance, it is difficult to quantify the probability of an attack, which is easily the greatest threat to a spent fuel pool. As Dr. Thompson suggests, the element of prudence should pay a significant role where a facility is as attractive a target as a fully laden fuel pool. Second, the NRC does not have a full picture of all the factors that could cause a pool fire. For instance, in footnote 5 on page F-9 of the DGEIS, the NRC admits that the seismic risk analysis on which it based its consequence analysis did not include reactors in the western United States, presumably because of the fact that they have been studied less than eastern earthquakes. Third, the NRC has not aggressively pursued research or open public debate about the behavior of spent fuel in pools. As a result, there is not a significant body of rigorous scientific research that can be relied upon, as is more the case with reactor studies. And finally, the consequences of an accident or successful attack on a fuel pool could be catastrophic on a massive scale. Measuring potential damages in billions of dollars is not sufficient to account for the social, economic and political upheaval that such an event may cause. Thus, the NRC's estimate that spent fuel pool fires have insignificant impact is not defensible. In fact, a reasonable assessment of pool fire impacts would conclude they are significant. (0897-6-19 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Health and property damage impacts provide another example. The Draft GEIS acknowledges that population densities are highly variable and that the environs of the Indian Point nuclear plant has the highest density of all. Yet, the consequences of a spent fuel pool fire are considered for the Surry plant, where the density is much lower. Moreover, the analyses cited are all more than a decade old and cannot therefore reflect the impact of growing amount of high burnup fuel in spent fuel pools.¹³⁸ [footnote 138 text: NRC 2013a, Appendix F, Table F-2 (p. F-8). The most recent document cited in the notes to this table dates from 2002.] It is

possible to bound impacts of such accidents by focusing on high density population sites with high property value concentrations. But the Draft GEIS has not done this. (0898-5-10 [Curran, Diane] [Makhijani, Arjun])

Comment: (VIII-20) Morris et al describe the use of the VISAC code to analyze the impact of a large aircraft on the containment of a reactor.⁷⁹ [footnote 79 text: Morris et al, 2006.] They note that the hard parts of the aircraft - notably, the jet engine rotors - might not fully penetrate the containment. They consider, however, the entry of a small fraction (apparently, 1 percent) of the aircraft's jet fuel into the annular space between the inner and outer walls of the containment. Perusal of Figure VIII-2 shows analogous spaces in that reactor design. Vaporization and ignition of the jet fuel in this confined space would, with high conditional probability, lead to a violent fuel-air explosion. Morris et al describe VISAC analyses that show, in all cases, significant damage to the containment from this explosion, with holes in both the inner and outer walls. They go on to say:⁸⁰ [footnote 80 text: Morris et al, 2006, page 206.] "While the damage is significant, subsequent events are most likely responsible for most of the radioactive release predicted. It is unlikely that the staff inside the control room adjacent to the containment building will survive the smoke and toxic fumes resulting from the fire, even if they managed to survive the direct consequences of the crash of the airplane. In view of the fire engulfing the containment building and adjacent structures, it seems unlikely that the separately located auxiliary control room could be reached by the staff members originally located in the main control room. Therefore, even if those in the control room should be unaffected by the air fuel explosion, the additional fire hazard outdoors will prohibit the surviving operators from shutting down the plant in a controlled manner from the auxiliary control room." (VIII-21) The potential events that Morris et al describe can be viewed as stages in a cascading sequence of incidents. First, the aircraft strikes the containment. Second, some jet fuel enters a confined space. Third, a fuel-air explosion breaches the containment and causes other damage. At some point during stages 1-3, or subsequently, the control room, the auxiliary control room, and their personnel are rendered nonfunctional. Fourth, radioactive material is released from the reactor to the interior of the containment, or directly to the external environment. Fifth, radioactive material passes from the interior of the containment to the external environment. Sixth, the cascade could proceed to one or more pool fires, as discussed in the following paragraph. (0916-1-21 [Curran, Diane] [Thompson, Gordon R.]

Comment: (VIII-22) The spent-fuel pool that serves the afflicted reactor, and the cooling and water makeup systems that serve that pool, could be damaged by the aircraft impact or by the fuel-air explosion. That damage could be sufficient to initiate a zircaloy fire in the pool. A nearby spent-fuel pool, built to serve another reactor, could suffer similar damage, resulting in a zircaloy fire in that pool. Deposition of radioactive material released from the afflicted reactor would create an intense radiation field around the reactor. The radiation field could extend in all directions, because the fire accompanying this disaster would create intense turbulence in the local atmosphere. The radiation field could preclude personnel access for days or weeks, thereby precluding mitigating actions that might prevent the initiation of zircaloy fires in the affected pools. In that situation, a nearby pool that was not affected directly by the aircraft impact could boil dry, leading to a fire in that pool. (VIII-23) NRC has never, to my knowledge, published a credible technical analysis of a cascading sequence of incidents of this type. Nor, to my knowledge, has NRC ever publicly stated that it has performed such analysis in secret. Until such analysis is done, and done properly, NRC will not be able to complete an adequate GEIS on the environmental impacts of storing spent fuel. (0916-1-22 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-17) Now, in its Tier 3 analysis, the NRC staff seeks to close off any further inquiry into the risk of a pool fire. The staff recommends:¹⁰⁰ [footnote 100 text: Satorius, 2013b, page 10.] "The staff's assessment concludes that the expedited transfer of spent fuel to dry cask storage would provide only a minor or limited safety benefit, and that its expected implementation costs would not be warranted. Therefore, the staff recommends that no further generic assessments be pursued related to possible regulatory actions to require the expedited transfer of spent fuel to dry cask storage and that this Tier 3 Japan lessons-learned activity be closed." (0916-2-11 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-18) The Tier 3 analysis relies heavily upon NRC's consequence study.¹⁰¹ [footnote 101 text: Barto et al, 2013b.] I provided a critical review of that study in the Thompson draft consequence declaration.¹⁰² [footnote 102 text: Thompson, 2013a.] I concluded that NRC's consequence study is fundamentally and irredeemably flawed, and recommended:¹⁰³ [footnote 103 text: Thompson, 2013a, Section VIII.] "(VIII-7) NRC's Draft Consequence Study should be scrapped. (VIII-8) In addressing the pool-fire issue, NRC should focus its initial attention exclusively on establishing a solid technical understanding of phenomena directly related to a potential pool fire. To do this, NRC would start with a clean slate and use the best available modeling capability backed up by experiment. This modeling and experimental work would be done according to scientific principles. Further recommendations regarding such work are provided in Section IV, above. (0916-2-12 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-19) I recommend additional investigation of pool-fire phenomena because, more than three decades after the potential for a pool fire was recognized, NRC has not yet established a solid technical understanding of relevant phenomena. Thus, the NRC staff's recommendation to cease investigation of pool-fire issues is imprudent. Apparently, the NRC staff believes that acquisition of a solid understanding of pool-fire phenomena is unnecessary. The staff has not articulated a clear position on this matter. Such a position has, however, been articulated by Dr. Dana Powers, a member of NRC's Advisory Committee on Reactor Safeguards (ACRS), in a written commentary on the Thompson draft consequence declaration.¹⁰⁴ [footnote 104 text: Armijo, 2013, Enclosure 3.] That commentary, with associated documents, accompanies this declaration as Exhibit #40. Dr. Powers' commentary includes the statement:¹⁰⁵ [footnote 105 text: Armijo, 2013, Enclosure 3, page 4 (emphasis added).] "Much of Section IV of Dr. Thompson's report is devoted to outlining an extensive study of accident phenomenology for spent fuel events. The intent seems to be to establish a very comprehensive understanding to a scientific certainty in this phenomenology. Dr. Thompson does not make it clear why this should be done if, in fact, it can be shown that partial drain events are easily remediated with high confidence and that complete drain events are highly improbable. Nor does he provide a ranking of the use of resources for the purposes of studying spent fuel pools in preference to other safety issues. On the basis of results presented to ACRS thus far, it would appear that a systems engineering evaluation would suggest the best use of available resources would be to assure that mitigation of partial drain events was assured and that complete drain events were highly improbable. This would obviate the need for a detailed understanding of accident phenomenology. Should a decision be made to conduct confirmatory research, examination of the Dr. Thompson's list of topics might be useful starting point in the identification of possible avenues of investigation." (X-20) Dr. Powers' statement is instructive. He and I view the pool-fire problem from opposite perspectives. His confidence regarding the efficacy of mitigating measures, and the validity of probability estimates, is such that he sees no need for a thorough understanding of relevant phenomena. In my judgment, however, there is compelling evidence that: (i) mitigation of loss of water from a pool could not be assured in many potential situations; and (ii) complete or partial loss of water from a pool has a significant probability. Moreover, the consequences of a pool fire could be severe. Accordingly, given

present knowledge of pool-fire phenomena, prudence dictates a high-priority action - the rapid elimination of high-density racks from all pools. A thorough investigation of pool-fire phenomena, conducted in parallel with that action, might yield knowledge that somewhat reduces the urgency and scope of the action, thus reducing its cost. I recommend such an investigation. (0916-2-13 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-22) In April 2000, the Chairman of ACRS wrote a letter to the Chairman of NRC, discussing some pool-fire phenomena.¹⁰⁶ [footnote 106 text: Powers, 2000.] That letter accompanies this declaration as Exhibit #41. The letter discussed a number of phenomenological issues that had not been properly considered by NRC. I focus here on one of those issues. That issue is the influence of zirconium hydrides on the ignition of exposed spent fuel. As part of its discussion of that issue, the ACRS letter said:¹⁰⁷ [footnote 107 text: Powers, 2000, page 3 (emphasis added).] "We also have difficulties with the analysis performed to determine the time at which the risk of zirconium fires becomes negligible. In previous interactions with the staff on this study, we indicated that there were issues associated with the formation of zirconium-hydride precipitates in the cladding of fuel especially when that fuel has been taken to high burnups. Many metal hydrides are spontaneously combustible in air. Spontaneous combustion of zirconium hydrides would render moot the issue of "ignition" temperature that is the focus of the staff analysis of air interactions with exposed cladding. The staff has neglected the issue of hydrides and suggested that uncertainties in the critical decay heat times and the critical temperatures can be found by sensitivity analyses. Sensitivity analyses with models lacking essential physics and chemistry would be of little use in determining the real uncertainties." (X-23) Given the trend of driving nuclear fuel to ever-higher burnups, one could reasonably expect that NRC would seriously address the concern expressed by ACRS. The ACRS letter did stimulate the preparation of an NRC internal memorandum.¹⁰⁸ [footnote 108 text: Eltawila, 2001.] That memorandum, with its attached draft report, accompanies this declaration as Exhibit #42. The memorandum and its attached draft report discussed factors that could influence the ignition of zircaloy when exposed to air or steam. Those factors included the presence of hydrides. They also included the ballooning and burst of fuel cladding, a matter I return to below. The draft report attached to the memorandum contained the statement:¹⁰⁹ [footnote 109 text: Eltawila, 2001, attached draft report by Chung and Basu, page 9 (emphasis added).] "It would be necessary to conduct actual ignition tests on either spent fuel or pre-oxidized and hydrided cladding to generate experimental data to understand these various effects and to determine unambiguously the potential for autoignition. For lack of such experimental data, the potential for autoignition after ballooning and burst cannot be ruled out at this time." (0916-2-14 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-24) Ignition tests on actual spent fuel would be problematic because the fuel's large inventory of radioactive material would have to be shielded and contained. NRC did sponsor ignition tests on pre-oxidized cladding, as described in the report NUREG/CR6846, published in 2004.¹¹⁰ [footnote 110 text: Natesan and Soppet, 2004.] That report accompanies this declaration as Exhibit #43. At the time of publication of NUREG/CR-6846, NRC had not sponsored tests on hydrided cladding. Those tests were promised at some future time, as follows:¹¹¹ [footnote 111 text: Natesan and Soppet, 2004, Foreword (by Farouk Eltawila), page xvii.] "The effect of pre-existing hydrides, formed on the cladding surface during in-reactor operation and relevant, in particular, for high burnup operation, is being investigated under a follow-on program at the Argonne National Laboratory. This latter study will be reported separately." (X-25) NRC's consequence study was published in 2013. In that study, the theoretical model used to represent zircaloy ignition and combustion is drawn directly from NUREG/CR-6846. The model reflects the ignition tests on pre-oxidized cladding that are mentioned in the preceding paragraph. The study notes that this model shows accelerated

combustion compared with previous models, and that this effect is confirmed by experiment.¹¹² [footnote 112 text: Barto et al, 2013b, pages 93 and 94.] Thus, the tests on pre-oxidized cladding that are described in NUREG/CR-6846 were a useful step toward simulating the ignition and combustion of actual spent fuel. Moreover, this step revealed that combustion would be more vigorous than previously expected. Yet, NRC's consequence study does not mention the effects of hydrides on cladding ignition and combustion, despite ACRS's highlighting of this issue in 2000 and NRC's promise in 2004 to sponsor appropriate tests. Thus, it seems that a key aspect of the ignition and combustion behavior of actual spent fuel, arising from the presence of hydrides, has been ignored by NRC. Moreover, accumulation of hydrides increases with burnup, and there is a trend of driving nuclear fuel to ever-higher burnups. (0916-2-15 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-26) As discussed in paragraph X-23, above, factors that could influence the ignition of zircaloy include the ballooning and burst of fuel cladding. It is well known that cladding can balloon (i.e., swell) and ultimately burst at temperatures substantially above the normal operating temperature. During the ballooning phase, the cross-sectional area for axial fluid flow through a fuel assembly could be reduced, thereby reducing heat transfer from the fuel. At the time of burst, unoxidized cladding would be exposed to air or steam, which could promote zircaloy ignition. The MELCOR code used in NRC's consequence study lacks a capability to model the ballooning and burst of fuel cladding.¹¹³ [footnote 113 text: Barto et al, 2013b, Table 3, page 26.] MELCOR has been "benchmarked" against tests involving the ignition of electrically heated structures simulating fuel assemblies, as described in the report NUREG/CR-7143.¹¹⁴ [footnote 114 text: Lindgren and Durbin, 2013.] That report accompanies this declaration as Exhibit #44. Apparently, the tests did not involve ballooning and burst of cladding, perhaps because the simulated fuel rods were not sealed. Thus, neither MELCOR nor these tests provides any information about the implications of cladding ballooning and burst for zircaloy ignition. NRC's consequence study alludes to secret studies that address this matter, but provides no citation.¹¹⁵ [footnote 115 text: Barto et al, 2013b, Table 3 (page 26).] (X-27) An April 2003 accident at the Paks-2 nuclear power plant in Hungary shows how overheated nuclear fuel will balloon and then burst. The accident and a subsequent simulation are described in a 2007 conference paper that accompanies this declaration as Exhibit #45.¹¹⁶ The accident occurred while fuel was undergoing chemical cleaning inside a tank submerged in the plant's spent-fuel pool. Cooling water was supplied to the tank by a pump submerged in the pool. On this occasion, the water flow was inadequate, reportedly due to design defects and operating deficiencies. As a result, a steam bubble formed in the tank and fuel temperature began to rise. The zircaloy fuel cladding experienced extensive ballooning, followed by cladding burst and zirconium-steam combustion. This accident did not lead to a substantial release of radioactive material to the atmosphere, because it occurred inside a closed tank submerged in a pool. Nevertheless, this accident provides real-world evidence of the significance of phenomena such as cladding ballooning and burst. Regrettably, NRC's consequence study has not accounted for all relevant phenomena.¹¹⁶ [footnote 116 text: Windberg and Hozer, 2007.] (0916-2-16 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-32) The discussion in Section V, above, regarding the limitations of PRA, suggests that the actual frequency of a pool fire may be substantially higher than is asserted in the draft GEIS. Here, I focus on an issue that reinforces that suggestion. That issue is the linkage of pool risk and reactor risk. As discussed in Section VIII, above, NRC has never done a credible analysis of this linkage. Moreover, there is persuasive evidence, including the Fukushima accident, that a reactor accident could be part of a cascading sequence of incidents that preclude mitigating actions needed to maintain nearby pools in a safe state. Finally, as discussed in Section VIII, pool storage of spent fuel, as considered in the draft GEIS, will

probably occur at locations near operational reactors. (X-33) As discussed in paragraph V-21, above, direct experience of reactor accidents suggests that the frequency of accident-induced severe core damage may be in the vicinity of 3.2×10^{-4} per reactor-year. Let us now consider the conditional probability of a pool fire, given severe core damage at a nearby reactor. Experience suggests that this conditional probability is less than 1, because there have been 5 core melts and 0 pool fires at commercial facilities. Given the present state of knowledge, selecting a value of 0.1 for this conditional probability is prudent. Thus, a reasonable estimate for the frequency of an accident-induced pool fire, associated with an accident at a nearby reactor, is $0.1 \times 3.2 \times 10^{-4} = 3.2 \times 10^{-5}$ per pool-year.¹¹⁹ That value is 13 times higher than the pool-fire frequency (i.e., 2.4×10^{-6} per pool-year) at the upper end of the range asserted by the draft GEIS, and 55 times higher than the frequency (i.e., 5.8×10^{-7} per pool-year) at the lower end of the range. ¹¹⁹ Here, I make the simplifying assumption that each reactor has a risk linkage with one nearby pool other than its own pool, and vice versa. (X-34) The discussion in the three preceding paragraphs can be structured in terms of the equation that is set forth in paragraph V-31, above. In that context, “PRA finding” is the pool-fire frequency asserted by the draft GEIS. The present state of knowledge suggests that “Reality factor #1” has a value of about one order of magnitude (i.e., factor of 10) at the upper end of the draft GEIS’s frequency range. That value reflects the fact that the PRA-type analyses cited in the draft GEIS did not account for linkage of pool risk and reactor risk. (0916-2-17 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-42) NRC’s consequence study, which is not cited in the draft GEIS, provides some quantitative estimates of pool-fire consequences.¹²² [footnote 122 text: The pool fire considered in NRC’s consequence study would begin in recently-discharged fuel. In this declaration, I consider older spent fuel that falls under the ambit of the draft GEIS. However, the consequences that I discuss would be determined primarily by the magnitude of release of comparatively long-lived radio-isotopes, principally Cs-137. Thus, the consequences predicted by NRC’s consequence study are applicable to the situation that I consider.] These estimates do not appear in the draft GEIS. I discuss these estimates because they help to show that the draft GEIS substantially under-estimates the potential consequences of a pool fire. These estimates are specific to a potential fire at the Peach Bottom site in Pennsylvania. The particular estimates shown below are for an atmospheric release containing 330 PBq (i.e., 8.8 MCi) of the radioactive isotope Cs-137. That is a minor fraction of the inventory available for release. There are two operational reactors at the Peach Bottom site. Each reactor has its own spent-fuel pool, and each pool now contains about 2,180 PBq (i.e., 59 MCi) of Cs-137.¹²³ [footnote 123 text: Satorius, 2013b, Enclosure 1, Table 72 (page 133).] The quantity (i.e., mass) of fuel in each pool is equivalent to 5 reactor cores. For a postulated release of 330 PBq of Cs-137, NRC’s consequence study predicts the following average outcomes of a pool fire, on a per-event basis:¹²⁴ [footnote 124 text: Barto et al, 2013b, Table 33 (page 162).] [1]] Collective radiation dose of 350,000 person-Sv across a population living within an unspecified distance. [2]] Land area interdicted (i.e., rendered unfit for habitation) of 24,300 square km (i.e., 9,400 square miles).¹²⁵ [footnote 125 text: The relationship between the estimated average area of interdicted land and distance is as follows: 1,200 square miles within a 50-mile distance; 3,100 square miles within a 100-mile distance; and 9,400 square miles within a 500-mile distance. (See: Barto et al, 2013b, Table 35.)] [3]] Long-term displacement of 4.1 million people.¹²⁶ [footnote 126 text: The relationship between the estimated average number of displaced people and distance is as follows: 780,000 people within a 50-mile distance; 2.0 million people within a 100-mile distance; and 4.1 million people within a 500-mile distance. (See: Barto et al, 2013b, Table 36.)] (X-43) The numbers shown in paragraphs X-41 and X-42 begin to show the scale of the national disaster that could arise from a pool fire. Long-term displacement of 4.1 million people, which is an average case and not a worst case, would be a disaster of historic magnitude.¹²⁷ [footnote 127 text: For a given atmospheric release, the

estimated number of displaced people varies with wind direction, atmospheric stability, precipitation, and other factors. NRC's consequence study presents an average case.] As discussed in paragraph IV-16, above, this event would cause substantial political stress and other adverse consequences. The social, political, and economic consequences would be diverse and difficult to predict, but would undoubtedly be severe. Moreover, the estimates described in paragraph X-42 assume a release of only 7% of the inventory of Cs-137 in the two pools at the Peach Bottom site. A larger release could occur. (0916-2-20 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-45) Beyea et al considered two potential, atmospheric releases. One release would consist of 130 PBq (i.e., 3.5 MCi) of Cs-137, and the other release would consist of 1,300 PBq (i.e., 35 MCi) of Cs-137. These releases represent two possible outcomes of a pool fire. The larger release would represent 60% of the Cs-137 inventory now in each of the two pools at the Peach Bottom site. Beyea et al estimated offsite economic damage for the two releases, at each of five nuclear-power-plant sites. For the 130 PBq release, the estimated offsite economic damage, averaged across the five sites, was \$91 billion. For the 1,300 PBq release, the estimated offsite economic damage, averaged across the five sites, was \$385 billion.¹³⁰ [footnote 130 text: Beyea et al, 2004, Table 3 (page 131).] Both values are substantially higher than the economic- damage estimate of \$56 billion to \$58 billion, covering both onsite and offsite damage, that is set forth in the draft GEIS. Yet, Beyea et al did not consider a full range of contributors to offsite economic damage. Nor did they consider onsite economic damage. (X-46) A more comprehensive set of contributors to economic damage was considered by IRSN. Their findings are set forth in Table X-1, drawing from IRSN's 2007 report. That report was secret when first prepared, but was leaked to the press in early 2013 and, soon thereafter, was published by IRSN. The report considered an atmospheric release from a reactor at the Dampierre site in France. Economic damage was attributed primarily to the presence of 100 PBq of Cs-137 in the release. Thus, IRSN's findings are applicable to a pool fire. This pool fire would not be a worst-case event. A release of 100 PBq of Cs-137 would represent only 5% of the Cs-137 inventory now in each of the two pools at the Peach Bottom site. (X-47) The cost (i.e., economic damage) estimates shown in Table X-1 are in Euro. Here, I use a currency conversion of US\$1.40 per Euro. With that conversion, Table X-1 shows that IRSN's base-case estimate of economic damage from a release of 100 PBq of Cs-137 in France is \$1,060 billion (760 billion Euro). The low-case estimate is \$410 billion (290 billion Euro), and the high-case estimate is \$8,060 billion (5,760 billion Euro). For comparison, the GDP of the United States in 2012 was \$15,700 billion.¹³¹ [footnote 131 text: World Bank website, "GDP (current US\$)", accessed on 13 December 2013 at: <http://data.worldbank.org/indicator/NY.GDP.MKTP.CD>] (X-48) A cost study of the type done by IRSN would yield different results if done for a US nuclear site. There is no reason to expect, however, that the estimated economic damage would be substantially lower in the US case. The damage could be higher. Thus, IRSN's 2007 analysis provides, until a better estimate becomes available, a reasonable default estimate of economic damage from a pool fire in the United States that would release 100 PBq (2.7 MCi) of Cs-137. I am not aware of any other analysis that considers all of the cost contributors that are considered in the IRSN analysis. The draft GEIS's estimation of economic damage, as shown in paragraph X-41, is derived from analysis that is substantially inferior to the IRSN analysis. (0916-2-21 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-49) The economic damage estimated by IRSN would be only part of the consequences of a pool fire. The accompanying social and political consequences would be diverse and difficult to predict, but would undoubtedly be severe. Thus, a pool fire could be a national disaster of historic dimensions. That is why IRSN analysts, whose work is described in paragraphs IV-11 through IV-13, above, said in their 2012 paper that a massive release of

radioactive material would be “an unmanageable European catastrophe”.¹³² [footnote 132 text: Pascucci-Cahen and Patrick, 2012.] In their 2012 paper, these analysts did not disclose the magnitude of a “massive” release. I assume that this release would contain no more than 100 PBq of Cs-137, the amount considered in IRSN’s 2007 report. That report was secret when the IRSN analysts presented their 2012 paper. (0916-2-22 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-50) Japan’s experience with fallout from the 2011 Fukushima accident is instructive. The pattern of radioactive fallout across Japan is complex, as shown in Figure V-4. That fallout contained about 6 PBq of Cs-137, as shown in Table V-1. This amount of Cs-137 is comparatively small in the context of a potential release from a pool fire. Yet, the impacts of the Fukushima fallout on Japan are diverse and significant. For example, it is reported that 160,000 people were displaced from land contaminated by the Fukushima accident, and about one-third of this population remains in temporary housing. There is considerable uncertainty about the number of people who may be able to return to their homes.¹³³ [footnote 133 text: Knight and Slodkowski, 2013. Determination of radiological risk and environmental impact] Also, all of Japan’s nuclear power plants remain shut down, due to public concern about their operation. (0916-2-23 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-4) In paragraph VIII-13, above, and elsewhere in this declaration, I discuss NRC’s consequence study.⁸⁵ [footnote 85 text: Barto et al, 2013b.] That study, published in draft form in June 2013 and final form in October 2013, is NRC’s most recent technical analysis of pool fires. Yet, that study is not cited in Sections 4.18 and 4.19 and Appendix F of the draft GEIS, which was published in September 2013. That omission is significant from several perspectives. For example, as discussed in paragraphs VIII-14 through VIII-16, above, NRC’s consequence study identified an important issue that has not been considered in the draft GEIS. That issue is the linkage of pool risk and reactor risk. (0916-2-5 [Curran, Diane] [Thompson, Gordon R.]

Comment: (X-5) The NRC staff incorporated the findings of NRC’s consequence study into a staff recommendation regarding the expedited transfer of spent fuel from pools to dry storage. The staff recommended against expedited transfer in a November 2013 document that I refer to hereafter, following NRC practice, as the “Tier 3 analysis”.⁸⁶ [footnote 86 text: Satorius, 2013b.] That document accompanies this declaration as Exhibit #36. The Tier 3 analysis describes its connection to the draft GEIS as follows:⁸⁷ [footnote 87 text: Satorius, 2013b, page 9.] “Within this Tier 3 analysis, the staff has considered the agency’s activities on the waste confidence generic environmental impact statement (GEIS) and rulemaking, and it has ensured that the availability of these documents and interactions with stakeholders are coordinated to facilitate the public’s involvement in these activities. Although this Tier 3 analysis was not specifically referenced in the draft GEIS, those who prepared the draft GEIS were aware of the conclusions in this Tier 3 analysis, and the staff has coordinated this activity with the relevant sections of the draft GEIS. To facilitate the public’s ability to provide input, a draft of the October 2013 SFP study was released for public review and comment on July 1, 2013. Additionally, the draft evaluation of this Tier 3 issue was released to the public on September 26, 2013, well before the draft GEIS public comment period ends on December 20, 2013.” (X-6) Omission of the Tier 3 analysis from the citations in the draft GEIS is significant because the Tier 3 analysis sets forth an NRC staff position on the radiological risk of pool fires. The draft GEIS does not address that position. Yet, according to the statement quoted in the preceding paragraph, the preparers of the draft GEIS were aware of the conclusions in the Tier 3 analysis, and the two documents were “coordinated” in some manner. Thus, the Tier 3 analysis had a substantial but undocumented influence on the draft GEIS.⁸⁸ [footnote 88 text: One illustration of a likely influence is the draft GEIS’s assertion that air cooling of spent fuel would prevent a pool fire at a

point much earlier following fuel offload from a reactor than was considered in the study NUREG-1738. (See: NRC, 2013b, Appendix F, page F-11.) The Tier 3 analysis and NRC's consequence study represent NRC's most recent analysis of pool-fire issues such as the role of air cooling, but are not cited in the draft GEIS.] The lack of documentation of this influence handicaps those who seek to comment on the draft GEIS. (0916-2-6 [Curran, Diane] [Thompson, Gordon R.])

Comment: (X-9) If water were lost from a pool equipped with high-density racks, the racks would inhibit heat transfer from the exposed fuel. Thus, spent fuel in the pool would increase in temperature, potentially leading to ignition and sustained combustion of zircaloy cladding in air or steam. To a technically trained observer, it should be obvious that ignition could be more likely if residual water were present in the pool, other factors being equal. Residual water would block the flow of air from below, thus reducing heat transfer from the exposed portion of the fuel. Figure X-2 illustrates this phenomenon. As a result, spent fuel with a comparatively high age after discharge from a reactor could burn if residual water were present. The initial phase of "burning" would, in this case, be a steam-zircaloy reaction. (0916-2-7 [Curran, Diane] [Thompson, Gordon R.])

Comment: (X-10) As discussed in paragraph VI-4, above, NUREG-0575 dismissed the potential for a pool fire, arguing that spent fuel aged more than one year would not burn if water were lost from a pool.⁸⁹ [footnote 89 text: NRC, 1979, page 4-21.] NUREG-0575 was by NRC in 1979. NRC held a similar position in 1989, when it published the pool-fire study NUREG-1353.⁹⁰ [footnote 90 text: Throm, 1989.] That study accompanies this declaration as Exhibit #37. NUREG-1353 stated:⁹¹ [footnote 91 text: Throm, 1989, page 1-1 (emphasis added).] "A typical spent fuel storage pool with high density storage racks can hold roughly five times the fuel in the core. However, since reloads typically discharge one third of the core, much of the spent fuel stored in the pool will have had considerable decay time. This reduces the radioactive inventory somewhat. More importantly, after roughly three years of storage, spent fuel can be aircooled. The spent fuel need not be submerged to prevent melting, although submersion is still desirable for shielding and to reduce airborne activity." (X-11) Thus, from 1979 to 1989, NRC failed to understand the significance of residual water for zircaloy ignition. NRC's belief that comparatively old fuel would not ignite derived from NRC's mistaken assumption that the worst case of water loss from a pool would be total, instantaneous drainage. This erroneous belief continued into 1999 and 2000, while NRC was preparing a pool-fire study that was eventually published, in February 2001, as NUREG-1738.⁹² [footnote 92 text: Collins and Hubbard, 2001.] That study accompanies this declaration as Exhibit #38. Preliminary versions of NUREG-1738 were published by NRC in June 1999 and February 2000. (0916-2-8 [Curran, Diane] [Thompson, Gordon R.])

Comment: Before publishing NUREG-1738 in February 2001, NRC had published several studies related to pool fires. These studies, like NUREG-1353, contained erroneous statements about the potential for ignition of comparatively old fuel. They also contained other substantial deficiencies.⁹⁶ [footnote 96 text: Thompson, 2009, Section 5.] For example, NUREG-1353 did not consider storage of BWR spent fuel in high-density racks, even though such storage has been common practice for many years.⁹⁷ [footnote 97 text: Throm, 1989, pages 4-9 and 4-10.] Yet, NRC has neither retracted nor repudiated NUREG-1353, despite its clear obsolescence. Indeed, the draft GEIS cites NUREG-1353 as a major source of information on the probability and consequences of a pool fire.⁹⁸ [footnote 98 text: NRC, 2013b, Table F-1 (page F-4).] (0916-2-9 [Curran, Diane] [Thompson, Gordon R.])

Comment: The draft GEIS significantly under-estimates the probability of an accident-induced pool fire, in part because it does not consider the linkage of pool risk and reactor risk. The present state of knowledge suggests that the under-estimate is by at least one order of magnitude (i.e., factor of 10). (0916-3-20 [Curran, Diane] [Thompson, Gordon R.])

Comment: The draft GEIS substantially under-estimates the consequences of a pool fire. Those consequences could include the long-term displacement of millions of people, economic damage measured in trillions of dollars, and adverse social and political outcomes. A pool fire yielding these consequences would be a national disaster of historic dimensions. (0916-3-22 [Curran, Diane] [Thompson, Gordon R.])

Comment: Moreover, if such an event occurred, citizens would experience significant consequences even if they did not suffer from substantial, immediate injury such as displacement from their homes. The economic, social, and political consequences of this event would be felt by everyone residing in the United States, and by many people outside its borders. This pool fire would be a national disaster with international implications. (0916-3-3 [Curran, Diane] [Thompson, Gordon R.])

Comment: (X-60) The draft GEIS asserts that the environmental impact of accident-induced pool fires is SMALL.¹³⁷ [footnote 137 text: NRC, 2013b, Table 4-2 (page 4-91).] However, as shown above, the draft GEIS indicates that the cumulative frequency of such fires could be 0.024 events per century. Also, NRC's consequence study shows that the consequences of a pool fire could be severe, with outcomes such as the long-term displacement of 4.1 million people. IRSN's analysis shows that outcomes could include economic damage measured in trillions of dollars. Therefore, the environmental impact of accident-induced pool fires is not SMALL. Instead, it is LARGE. This finding does not account for linkage of pool risk and reactor risk. If that linkage is accounted for, as is appropriate, the cumulative frequency of accident-induced pool fires could be 0.32 events per century. In that case, it is even more evident that the environmental impact of accident-induced pool fires is not SMALL. Instead, it is LARGE. Thus, the draft GEIS substantially under-estimates the environmental impact of accident-induced pool fires. Also, the draft GEIS ignores the possibility that the risk environment will become more adverse in the future. In addition, the draft GEIS uses a flawed definition of risk – the arithmetic definition. (0916-3-5 [Curran, Diane] [Thompson, Gordon R.])

Comment: For its analysis of spent fuel pool fires, Exelon recommends that the NRC use existing information to the extent possible. The NRC has previously compiled numerous technical studies regarding the risks and environmental impacts of onsite spent fuel storage that it can rely upon in assessing both the probabilities and consequences of spent fuel pool fires. Exelon agrees that the environmental impacts associated with a spent fuel pool fire would be small based on the probability-weighted consequences of such an event at all existing reactor sites. (0942-12 [Helker, David P.])

Comment: It is noted in the reference information that the likelihood of spent fuel pool fires is very low and diminishes to zero as fuel cools. The data indicates that only freshly discharged (less than four months) fuel has the ability to create a spent fuel pool fire. This effectively eliminates most of the spent fuel being considered, and certainly all of the fuel for plants who have terminated their license. The NRC should carefully weigh this important fact during its consideration of the risk of spent fuel pool fires. (0942-13 [Helker, David P.])

40. Comments Concerning Spent Fuel Pool Leaks

Comment: Regarding pool leaks, there is a long list of pool leaks that have already occurred -- at Dresden Unit 1, due to a broken pipe; at Hatch in Georgia; at BWX Technologies in Lynchburg, Virginia; at Indian Point 1 and 2 on the banks of the Hudson River upstream of New York City; at Salem Unit 1 in New Jersey; at Connecticut Yankee. All NRC licensees. There has also been a pool leak at a Department of Energy pool, the high flux beam reactor at Brookhaven National Lab on Long Island. (0030-2-6 [Kamps, Kevin])

Comment: He mentioned a number of reactors where there were spent fuel pool leaks, all of them considered in this EIS, all of the impacts meeting the definition of small because the right steps were taken. (0030-6-7 [McCullum, Rod])

Comment: A growing list of radioactive leaks from HLRW storage pools have already occurred in the U.S. This has taken place at the following NRC-licensed facilities: Dresden, IL; Hatch, GA; BWX Technologies, VA; Indian Point 1 & 2, NY; Salem 1, NJ; Connecticut Yankee; and Davis-Besse, OH. A pool leak has also occurred at a U.S. Department of Energy licensed facility, the High Flux Beam Reactor at Brookhaven National Lab on Long Island, NY. (0034-6 [Wagner, Jim and Virginia])

Comment: I can only imagine how the next generation and the generations after that are going to feel when the amount of nuclear waste has grown even larger and they are dealing with the inevitable problems of dangerous leaking old fuel pools (0163-34-4 [Azulay, Jessica])

Comment: We heard from nuclear storage engineer earlier tonight. Do you think there's a conflict of interest there. He testified unequivocally that storage systems for spent nuclear fuel work, that they are tight, and that there is no possible way for these systems to leak. Well, I have news for all the other engineers who have worked on these systems. They are leaking. Vermont Yankee closed in part because it was leaking and it was too expensive to dig up all the miles of pipes to figure out where the leak was. Indian Point is leaking. There are plants across the country leaking as we speak. This is what scares me the most. Engineers make questionable assumptions to support their designs. Designs that may be built under conflict of interest, that is to support the nuclear industry. (0163-48-5 [Meyer, Bill])

Comment: The other main issues regarding Indian Point that are false and misleading is that all the spent fuels currently -- that we have leak-detection systems or administrative controls to monitor the spent fuel pools. We know that in 2005 that the leaks at Indian Point were only found by accident. They were only found because an independent contractor saw wet on the ground. There is no actual monitoring of the spent fuel pools. In fact, there is no actual monitoring of the releases of radiation and I am now carrying a Geiger counter (indicating), and I would hope that the NRC provides all of us with Geiger counts so that we can actually create a monitoring program. The reality is the spent fuel pool two, which is known to be leaking, only 40 percent of it has been inspected. 60 percent of it, which we know is leaking, they don't know where the leak is. It has not been inspected. That's a false assumption of this GEIS. The other basic false assumption is that the leaks are emptied into a drain that can be monitored and then they'll be treated and cleaned up. When in fact, the leak -- the NRC stopped cleanup of the Indian Point site. They said "You know what, we're just going to let it seep into the ground, into the effluent and into the ground." (0163-7-7 [Shapiro, Susan])

Comment: According to an article in Science Journal, "fuel in U.S. spent fuel pools is packed four times as densely as it was 25 years ago". Obviously, this could pose serious health risks if

there was any leakage or terroristic attacks (Kintisch, 2011). Highlighted by the recent disaster in Fukushima, Japan, nuclear waste leakage can present a variety of problems. Nuclear waste that leaks from storage pools or casks can contaminate the surrounding earth and groundwater . In addition to potential physiological issues such as cancer, the threat of potential contamination can severely tax people's psychological health (Revkin, 2012). Because nuclear energy is still misunderstood by many people, the fear of the unknown often dictates their mindsets. Even if any potential contamination in the ground is so minimal that it becomes negligible, the public does not know or necessarily understand that. As history has shown, it is easy to scare the public with threat of potential nuclear waste leakage. Obviously, keeping the public comfortable and happy is important; living in constant fear that on-site storage containers, like the concrete pools and casks, could be leaking will not help achieve this goal at all. (0205-19 [Lyons, Laura])

Comment: Additionally, concrete-lined pools are not 100% percent foolproof. They can leak wastes into the ground which can contaminate ground water (Harnett, 2013). (0205-7 [Lyons, Laura])

Comment: One other fact check, and then I will wrap up, Miriam. It is -- it wasn't mentioned that the HFBR reactor experience wasn't considered in here. And I've heard that before and that really gets to me because I have personal experience on that one. First of all, it's a bit out the scope because, you know, it was a DOE, not a commercial reactor, it was an unlined spent fuel pool, which is not typical in our industry. But, yes, it was a spent fuel pool leak. The leakage was detected very early by onsite wells, not offsite wells. The Department of Energy, and I was involved in this, went through some very proactive efforts to make sure that nobody's drinking water supply was harmed. And in fact this is consistent with the facts that I reviewed for the other spent fuel pool leaks that are considered in this EIS. We have in place groundwater-detection and mitigation strategies, that if there is a small leak in a pool, we take care of it. We are in our safety culture and we know what to do. So, again, that HFBR example is entirely consistent with the facts that are cited in the GEIS. (0244-11-13 [McCullum, Rod])

Comment: I note that Appendix E of the draft GEIS provides a detailed discussion of the environmental impacts of spent fuel pool leaks during short-term storage time frame. The draft GEIS describes the current regulatory regime to avoid and respond to spent fuel pool leaks, including the NRC's requirements and industry initiatives for groundwater monitoring and remediation of contaminated groundwater. Importantly, the NRC does not simply rely on its regulatory oversight to conclude that the environmental impacts of spent fuel pool leaks during the short-term time frame will be small. The draft GEIS, in fact, discusses spent fuel pool design and maintenance, operational practices, site hydrogeological characteristics, and radionuclide transport properties to establish the Agency's basis for concluding that there is a very low likelihood that an undetected leak from a spent fuel pool will migrate offsite. These considerations are all generic and they obviate the need for site-specific assessment. Furthermore, in the unlikely event that a spent fuel pool leak were to migrate offsite, the draft GEIS assesses the potential for impacts on groundwater, surface water, soils, and public health using a bounding approach. Therefore, contrary to some of the views presented at this meeting and others, we believe there is ample support for the draft GEIS conclusions that the potential impacts involving spent fuel pool leaks will be small. (0246-14-3 [Ginsberg, Ellen])

Comment: [N]or does it discount the very real and present threat of all the leaks that are currently occurring in radioactive waste dumps. (0250-39-4 [Richards, Kitty Katherine])

Comment: So this idea that we should ignore the issue of this high-density wet storage that exists and what it's going to take to reduce the dangers from that alone, let alone deal with the permanent and ongoing problems of the continued generation of additional waste. There's a severe problem with the way the analysis so far has been done on aboveground leak detection, as there are a number of recorded incidences in which existing wet pool leakages have not been detected for many years and whether significant volumes of radioactive waste have been released. (0329-12-7 [Paddock, Brian])

Comment: Fuel tank radiation leaks can occur, sometimes unnoticed, through corrosion of the stainless steel liner caused by pool chemistry and emissions from the fuel elements, as well as micro-cracks in the concrete support structure. On-site discoveries of boric acid penetration as well as large tritium contamination outside the pool structures have been reported, which prove silent pool leakage. The problem with tritium is that it migrates relatively easily off-site with the liquid drainage from pool leaks or by evaporation as water vapor. (0410-13 [Nelson, Dennis])

Comment: The NRC's flawed environmental study is based on a number of unrealistic assumptions that must be reconsidered. In NRC's view, because past spent fuel pool leaks have allegedly caused only minor impacts, NRC assumes that future leaks will "also" be "insignificant." As a result, NRC's has provided a grossly inadequate and incomplete impact assessment related to pool leaks. (0465-5 [Commenters, Multiple])

Comment: In addition, the NRC relies heavily on a purely voluntary industry initiative to justify its finding that future spent fuel pool leaks will be "handled" and "addressed" sufficiently. (0465-6 [Commenters, Multiple])

Comment: As discussed above, the DGEIS "assumes that spent nuclear fuel . . . is removed from the pool within 60 years of the end of the reactor's licensed life for operation." DGEIS at E-1. Therefore, the DGEIS looks only at spent fuel pool leaks that occur within sixty years from the end of plant operation, which is referred to as the "short-term" timeframe. As discussed above, there is no basis for NRC's assumption that all waste will be moved from pools to dry cask by sixty years after licensed life. The D.C. Circuit found that "a proper analysis of the risks [of leaks] would necessarily look forward to examine the effects of the additional time in storage." New York, 681 F.3d at 481. It gave the NRC one option only for concluding that no analysis of spent fuel pool leaks is necessary: "Only if the harm in question is so 'remote and speculative' as to reduce the effective probability of its occurrence to zero may the agency dispense with the consequences portion of the analysis." Id. at 482. Since NRC cannot predict with certainty that all spent fuel will be removed from pools within sixty years, it must look at the consequences of leaving fuel in pools beyond that timeframe. For example, NRC must examine the effects of aging on spent fuel pool structural integrity and how this will affect leaks throughout the entire period covered by the EIS, including the short-term, long-term, and indefinite timeframes. As shown by the data provided in Appendix E, spent fuel pool leaks have occurred at numerous plants during the reactors' initial licensing terms. DGEIS at E-19 to E-21. In addition, a study cited in the DGEIS concluded: "As nuclear plants age, occurrences of degradation of spent fuel pools (SFPs), reactor refueling cavities, and the torus structure of light-water reactor nuclear power plants (NPPs) are occurring at an increasing rate, primarily due to environment-related factors." Copinger et al., Summary of Aging Effects and Their Management in Reactor Spent Fuel Pools, Refueling Cavities, Tori, and Safety-Related Concrete Structures, NUREG/CR-7111 (2012) (ML12047A184). This raises concerns that the structural integrity of the spent fuel pools may diminish significantly during the long-term and indefinite timeframes, increasing the likelihood and severity of leaks. Moreover, the aging management programs relied on by NRC Staff (DGEIS at E-4 to E-5) to monitor spent fuel pool structural integrity were designed to cover

only the twenty-year period of extended operations, not the sixty-year period after operations have ceased. These programs may therefore be inadequate to provide a long term assurance of pool structural integrity. (0473-15-1 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: In fact, short-term, high-volume spent fuel pool leaks have occurred at U.S. reactors. For example, in 1986, the spent fuel pool at Edwin I. Hatch Unit 1 released an estimated 141,500 gallons of contaminated water, 124,000 gallons of which was released into a swamp that drains into the Altamaha River. NRC, Liquid Radioactive Release Lessons Learned Task Force Final Report, at 5, (Sept. 1, 2006) (ML062650312). Moreover, while NRC states that licensees will mitigate the impacts of high-volume leaks before noticeable off-site environmental impacts will occur, it does not set forth a mitigation plan for such leaks or present evidence that past mitigation measures have proven successful. This may be because NRC regulations do not require the immediate mitigation of spent fuel pool leaks and often, NRC allows licensees to simply monitor leaks rather than remediate them. See *id.* at 3-10. An agency may forego an analysis based on "specific mitigation measures which completely compensate for any possible adverse environmental impacts," *Cabinet Mountains Wilderness/ Scotchman's Peak Grizzly Bears v. Peterson*, 685 F.2d 678, 682 (D.C. Cir. 1982), but those measures must be supported by "substantial evidence" showing their adequacy, *Nat'l Audubon Soc'y v. Hoffman*, 132 F.3d 7, 17 (2d Cir. 1997). NRC must either explain how mitigation measures can prevent environmental impacts from short-term, high-volume leaks or look at the probability and consequences of such leaks. This includes examining how human error, severe accidents, natural disasters, climate change, and sabotage or terrorism may increase the likelihood of short-term, high-volume spent fuel pool leaks in the future. (0473-15-10 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: Furthermore, as fuel remains in spent fuel pools during the long-term and indefinite timeframes, the outer cladding material encasing the fuel may degrade, thereby allowing fission products to be released from the fuel into the pool water.³⁸ [footnote 38 text: 38 See NRC, Liquid Radioactive Release Lessons Learned Task Force Final Report at i (2006) (ML062650312); Robert Alvarez, Spent Nuclear Fuel Pools in the U.S.: Reducing the Deadly Risks of Storage, at 2 and 16 (May 2011); National Academy of Sciences, Safety and Security of Commercial Spent Nuclear Fuel Storage: Public Report, The National Academies Press, at 19, FN 10 (2006).] This may cause the radioactivity of the spent fuel pool water to increase over time, further contributing to the severity of leaks in the long-term and indefinite timeframes. Since NRC cannot predict with certainty that all spent fuel will be removed from pools within sixty years, it must examine the probability and environmental consequences of leaks after that time, as well as techniques for managing the aging of spent fuel pools in order to prevent such leaks. (0473-15-2 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: The D.C. Circuit directed NRC to examine past leaks in a manner "that would allow the Commission to rule out the possibility that those leaks were only harmless because of site-specific factors or even sheer luck." *New York*, 681 F.3d at 481. Despite this command, the NRC failed to undertake a detailed examination of past leaks. Similar to the 2010 Waste Confidence Update which "has no analysis of those possibilities other than to say that past leaks had 'negligible' near-term health effects,"³⁹ [footnote 39 text: 39 *New York*, 681 F.3d at 481.] the DGEIS simply lists the occurrence of past leaks, the dose from past leaks, and the Groundwater Task Force finding that no past leaks have affected the health of the public. See DGEIS at E-20 to E-22. The DGEIS fails to examine why these leaks did not affect public health or whether they were "harmless" because of site-specific factors. Moreover, despite

acknowledging that at least seven leaks have resulted in inadvertent liquid radioactive releases to the environment, the DGEIS does not examine whether those leaks caused any type of environmental impact other than a public health impact. Nor does the DGEIS explain how the impacts of past leaks give any indication of the potential for future leaks. Such an analysis would be a standard procedure in the kind of "root cause analysis" that NRC requires its licensees to undertake whenever there is radiation release. See e.g. Standard Review Plan for the Review of a License Application for the Tank Waste Remediation System Privatization (TWRS-P) Project Final Report, NUREG-1702 (Mar. 2000) at Section 11.8. Such an analysis requires ascertaining the underlying cause of the problem and taking measures to fix the cause so it will not recur. The DGEIS includes no such root cause analysis of the many spent fuel pool leaks and thus provides no reasoned basis to conclude that such leaks will not continue or that they will not be more severe in the future. For example, if the root cause of the leaks is the aging of the spent fuel pools, which were never meant to be long-term storage solutions, then the prospect for even greater and more damaging leaks in the future is far more serious than the DGEIS's optimistic assumption. The D.C. Circuit specifically noted: "Even setting aside the fact that near-term health effects are not the only type of environmental impacts, the harm from past leaks--without more--tells us very little about the potential for future leaks or the harm such leaks might portend." New York, 681 F.3d at 481. The DGEIS should take a more detailed examination of the causes of past leaks and explain whether or not aging will increase such causes. Without providing more detailed analysis of past leaks, the DGEIS cannot predict the impacts of future leaks. (0473-15-3 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: NRC further limits its evaluation of spent fuel pool leaks to "long-term, low-volume undetected" leaks, based on its assumption that this is "the most probable scenario where spent fuel pool leakage would lead to an offsite environmental impact." DGEIS at E-10. NRC states that it does not need to examine the environmental consequences of short-term, high-volume leaks in the DGEIS because "licensees would likely identify and mitigate, if necessary, the impacts from any significant short-term water loss before noticeable offsite environmental impacts would occur." DGEIS at E-9 to E-10. However, NRC does not find that short-term, high-volume leaks could not occur in the future, nor does it cite any studies or reports to support the assumption such leaks will not cause offsite environmental impacts. Effectively, NRC asserts that short-term, high-volume leaks will not affect the environment because NRC and licensees are "on duty." But, as the D.C. Circuit found, "merely pointing to the compliance program is in no way sufficient to support a scientific finding that spent-fuel pools will not cause a significant environment impact during the extended storage period." New York, 681 F.3d at 481. Also, NRC's compliance program is voluntary--there is no NRC requirement that licensees conduct onsite groundwater monitoring. Instead, NRC allows licensees to rely on a voluntary groundwater monitoring initiative set forth by industry. DGEIS at E5-E6. (0473-15-9 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: It does not take into account the likelihood of past and future leaks, nor fully consider the consequences of the leaks. (0531-1-4 [Morgan, Sally])

Comment: The NRC continues to maintain that the risk to groundwater and drinking water is low, despite previous studies by the NRC itself that previous leaks "did, or potentially could, impact groundwater resources relative to established EPA drinking water standards" (0531-1-7 [Morgan, Sally])

Comment: It does not take into account the likelihood of past and future leaks, nor fully consider the consequences of the leaks. (0531-2-4 [Morgan, Sally])

Comment: The NRC continues to maintain that the risk to groundwater and drinking water is low, despite previous studies by the NRC itself that previous leaks "did, or potentially could, impact groundwater resources relative to established EPA drinking water standards" (NRC, Liquid Radioactive Release Lessons Learned Task Force Final Report¹³ (2006); as cited in the courts decision of New York vs. NRC) (0531-2-7 [Morgan, Sally])

Comment: The same comments made under the heading of Surface-Water Quality and Use apply here. There are so many "likely", "unlikely" and "likelihood" modifiers used that a high degree of uncertainty attaches to the assurances that nothing bad will happen if the pools leak. The statement that the small number of leak releases of contaminants to the environment, "based on the available data, have not affected the health of the public" is less than reassuring, especially if only impacts on humans is looked for. (0553-10 [Wilshire, Howard])

Comment: Water Quality. The Draft GEIS does not address impacts to drinking water quality. Instead, it discounts them. For instance, while NRC notes that onsite contamination in excess of drinking water standards exists, it minimizes the significance of these instances because the contamination has not migrated offsite. Given that (a) the NRC's goal is to release all decommissioned sites for unrestricted use, and (b) 10 C.F.R. § 20.1402 requires reduction of radiological emissions from decommissioned sites to 25 mrem from all sources including drinking water, the impact of contamination caused by spent fuel pool leakage to drinking water must be addressed. (0556-3-2 [Lampert, Mary])

Comment: Past Leaks. The GEIS underestimates the likely frequency of past leaks and does not fully consider the consequences of such leaks. NRC failed to adequately assess the likelihood of future leaks because it did not consider at least two important past leaks. A Yankee Rowe leak released approximately 2 million gallons of contaminated water. Some of this leakage made its way into the Deerfield River.²⁴ [footnote 24 text: See Yankee Atomic Electric Company (YAEC). 2006. *Groundwater Protection – Data Collection Questionnaire*. Rowe, MA. July 19. Online at <http://pbadupws.nrc.gov/docs/ML0620/ML062080156.pdf>.] In 1997, ground water samples taken by Brookhaven National Labs (BNL) revealed concentrations of tritium at twice the allowable federal drinking water limits. Some samples taken later were 32 times the standard. The tritium was found to be leaking from the High Flux Beam Reactor's spent fuel pool into the aquifer that provides drinking water for nearby Suffolk County residents.²⁵ [footnote 25 text: See General Accounting Office (now called the Government Accountability Office) (GAO), Department of Energy: *Information on the Tritium Leak and Contractor Dismissal at the Brookhaven National Laboratory*. GAO/RCED-98-26 (1997). Online at <http://pbadupws.nrc.gov/docs/ML1209/ML120960692.pdf>.] DOE's and BNL's investigation of this incident concluded that the tritium had been leaking for as long as 12 years without their knowledge.²⁶ [footnote 26 text: *Ibid.*] (0556-3-3 [Lampert, Mary])

Comment: Leak Detection. NRC's leak detection analysis fails to consider difficulties associated with leak detection, especially with long-term, low-volume leaks. Several spent fuel pool leaks have gone undetected for prolonged periods of time despite NRC's assurance that measures are in place to ensure timely detection. This undercuts NRC's conclusion that it is unlikely for leaks to occur and go undetected long enough to result in significant impacts to the environment. The Yankee Rowe and BNL leaks went undetected for longer than one year and perhaps as long as twelve years. At Salem, a leak thought to be only a few gallons per day turned out to be about 100 gallons per day. The volume and significance of this leak were NOT detected by the spent fuel pool water level instrumentation or the installed leak detection system because of a clogged drain in the monitoring system.²⁷ [footnote 27 text: See NRC, Spent Fuel

Pool Leakage to Onsite Groundwater, Information Notice 2004-05 (March 3, 2004). Online at <http://www.nrc.gov/reading-rm/doc-collections/gen-comm/info-notices/2004/in200405.pdf>] (0556-3-4 [Lampert, Mary])

Comment: No Quantitative Assessment. NRC's analysis of pool leak impacts is devoid of any quantitative assessment. The Draft GEIS does not consider the numerical limits of impactful spent fuel pool leaks in terms of volume and duration. A quantitative analysis of spent fuel pool leak detection is necessary for a forward- looking spent fuel pool leak analysis, as required by the Court in *New York v. NRC*. (0556-3-5 [Lampert, Mary])

Comment: Inapplicable Regulations and Guidelines. The Draft GEIS inappropriately relies on inapplicable regulations and guidelines. NRC incorrectly relied on spent fuel pool monitoring requirements that are only applicable during the movement of spent fuel from one storage facility to another. NRC also incorrectly relied on groundwater monitoring and inspection programs that are not mandatory or not applicable. (0556-3-6 [Lampert, Mary])

Comment: Inadequate Regulatory Program. NRC failed to consider the inadequacy of its regulatory program to detect future leaks. NRC failed to consider the significant reduction in regulatory oversight and regulation of spent fuel storage that occurs after reactors shut down. NRC also failed to consider the future implications of the probability and consequences of past leaks, leak detection difficulties, and difficulties that arise with monitoring and inspections. Therefore, NRC failed to properly determine the significant impacts of spent fuel pool leaks because it did not conduct a forward-looking analysis. (0556-3-7 [Lampert, Mary])

Comment: In characterizing the impacts of short and long-term storage on groundwater quality and use as SMALL, the GEIS admits that "continued storage of spent fuel could result in nonradiological and radiological impacts to groundwater quality, including tritium contamination." (ES. 13.1.8, p. xxxvii) It assumes, however, that monitoring programs would "ensure that impacts from spent fuel pool leaks would be unlikely." In practice, however, there has been little, if any, monitoring, and even if there has been monitoring, nothing has been done to fix the leaks in the spent fuel pools at Indian Point. As discussed abCove, tritium and strontium 90 have shown up in water intended for drinking water drawn 3.5 miles downstream from the leaks, as well as in Hudson River fish. These clearly seem to be impacts of "sufficient quantity and duration to affect offsite locations." (0604-5 [Pisha, Gayla])

Comment: The Second inaccurate and misleading fundamental assumption is about leaks detection and monitoring since the GEIS states that that: "All spent fuel is currently in operation "have either leak detection system or administrative controls to monitor the spent fuel pools liner." This assumption is in direct contradiction to the situation that currently exists at Indian Point. Spent fuel pool #2 has been known to be leaking since at least 2005, yet to date only 40% of the spent fuel pool have been inspected. Instead of requiring a design basis inspection of a known leaking spent fuel pool the NRC granted Entergy exemptions from inspection because it was too difficult to inspect due to construction limitations. Exacerbating this failure the leaks from Spent Fuel Pool #2 were not detected by "leak detection" or, by "administrative controls", but by accident when an independent contractor happened to notice a wet spot on the ground outside the spent fuel pool #2 walls. It remains undetermined how long the leak existed or how much radioactive effluent has been discharged into the ground and groundwater before its accidental discovery. (0611-34 [Shapiro, Susan])

Comment: Another basic false fundamental assumption of the GEIS is that: "Leakage empties into drains that be can be monitored", and "directed into a sump, liquid radioactive waste

treatment system or other cleanup or collection system." At Indian Point leakage the leaks have not been monitored and there is no collection and treatment system. Instead at Indian Point the NRC made a determination to halt clean up of the large underground lake of radioactive effluent under Indian Point, laced with radioactive cesium, strontium, tritium and cobalt. Shockingly the NRC decided to leave the radioactive effluent in the fractured bedrock under Indian Point and allow the radioactive effluent to leach into the historic Hudson River. This decision was made in 2007 when after accidentally discovery of the leaking spent fuel pools an attempt to clean up the site was made, but soon discontinued. The GEIS does not address this ongoing failure to contain and clean up radioactive active waste. In addition Indian Point #1, which was shuttered for many years, is proof that SAFSTOR isn't safe. Indian Point 1 was known to be leaking radioactive effluent for years without remediation. (0611-35 [Shapiro, Susan])

Comment: Section 4.8 of the DGEIS states that storage of spent fuel in spent fuel pools could result in radiological impacts on groundwater quality, but it is "very unlikely" that a leak from a spent fuel pool would go undetected and reach the offsite environment. However, undetected leakage from spent fuel pools and other reactor components has plagued reactor licensees and communities for decades. As mentioned above (see our "Surface-Water Quality and Use" comments), there have been several cases where fuel pool leakage and other leaks of radioactive material have occurred undetected for extended periods of time. For instance, Pilgrim has been leaking tritium into the ground at least since the 1990s, when the Massachusetts Department of Public Health first started using groundwater testing wells on the site. The tritium leaks at Pilgrim have been ongoing, and are still of unknown source(s).¹⁶ [footnote 16 text: MA Department of Public Health. June 13, 2012. PNPS: Tritium in Groundwater Monitoring Wells.

<http://www.mass.gov/eohhs/docs/dph/environmental/radiationcontrol/tritium/2012-updates/pnps-update-6-13-12.pdf>] Additionally, Yankee Rowe Nuclear Station in Massachusetts leaked about 2 million gallons of contaminated water from a spent fuel pool in the mid-1960s, which contaminated the Deerfield River.¹⁷ [footnote 17 text: Yankee Atomic Electric Company. July 19, 2006. Groundwater Protection Data Collection Questionnaire <http://pbadupws.nrc.gov/docs/ML0620/ML062080156.pdf>] (0622-2-11 [Vale, Karen])

Comment: In Appendix E of the DGEIS, the NRC describes the general method used to remediate tritium leaks as "monitored natural attenuation." However, at no point does the DGEIS address the conditions at Pilgrim where tritium is regularly entering the groundwater and being allowed to discharge into Cape Cod Bay for "natural attenuation" without environmental monitoring (in addition to above-normal concentrations of cobalt-60 and cesium-137 that have been found in soil samples by the Massachusetts Environmental Radiation Laboratory, which can spread easily in the environment due to high water solubility).¹⁹ [footnote 19 text: Pilgrim Nuclear Power Station (PNPS): Tritium in Groundwater Monitoring Wells. MA Dept of Public Health. Oct 18, 2013.] It is a failure of regulatory oversight that allows this unabated contamination of the environment at Pilgrim. Release and presence of tritium in the groundwater and soil must be addressed more robustly by the NRC. Given that there is a general lack of knowledge on the impacts of tritium on aquatic organisms, and there has been little effort to test or monitor the release at Pilgrim, we cannot evaluate the harm that is being done. (0622-2-16 [Vale, Karen])

Comment: Section 4.6 of the DGEIS also states most soil contamination from spent fuel pool leaks would remain onsite and, therefore, offsite soil contamination is unlikely to occur. However, this depends on many factors, including soil type, groundwater flow, and the size of the leak. For example, at Entergy's Pilgrim plant in Plymouth, Massachusetts, it has been assessed that the groundwater flows toward Cape Cod Bay.⁸ [footnote 8 text: Entergy Nuclear

Generation Company. 2006. Appendix E. Pilgrim Nuclear Power Station, Applicant's Environmental Report, Operating License Renewal Stage. 261 pp.] Additionally, Pilgrim is located on the Plymouth-Carver Sole Source Aquifer,⁹ [footnote 9 text: U.S. EPA. Plymouth-Carver Sole Source Aquifer Map.] which is characterized by highly permeable soils.¹⁰ [footnote 10 text: Executive Office of Energy and Environmental Affairs. 2007. Plymouth Carver Sole Source Aquifer Action Plan Final Report. Prepared for the EOEEA by Fuss & O'Neill, Lakeville, MA. See Section 2.2.2 - Soil Types.] Considering these factors, contaminants that enter the soil would likely migrate to the Aquifer and/or Cape Cod Bay. According to the 2007 Plymouth-Carver Sole Source Aquifer Action Plan Final Report, the "course-grained soil, the sand and gravel glacial outwash deposits that comprise the PCA are more susceptible to the infiltration and migration of contaminants than less permeable soils typical of non-potentially productive aquifers."¹¹ [footnote 11 text: Executive Office of Energy and Environmental Affairs. 2007. Plymouth Carver Sole Source Aquifer Action Plan Final Report. Prepared for the EOEEA by Fuss & O'Neill, Lakeville, MA. See Section 2.2.5 - Aquifer Susceptibility.] The report also states that contaminants entering into the soil and groundwater would not be impeded from migration into the Plymouth-Carver Aquifer without human intervention. (0622-2-4 [Vale, Karen])

Comment: The DGEIS also states that it is unlikely that a spent fuel pool would leak continuously (24 hours per day, 365 days per year) undetected and unimpeded to local surface waters, and that the quantities of radioactive material discharged to nearby surface waters would be comparable to values associated with permitted, treated effluent discharges from operating nuclear power plants; therefore the NRC concludes that the impact of spent fuel pool leaks on surface water would be "SMALL". However, there have been several cases where fuel pool leakage and other leaks of radioactive material have occurred continuously undetected and unimpeded. For instance, Pilgrim has been leaking tritium into the ground at least since the 1990s, when the Massachusetts Department of Public Health first started testing the groundwater. The leaks have been ongoing, and are still of unknown source(s).¹³ [footnote 13 text: MA Department of Public Health. June 13, 2012. PNPS: Tritium in Groundwater Monitoring Wells. <http://www.mass.gov/eohhs/docs/dph/environmental/radiationcontrol/tritium/2012-updates/pnps-update-6-13-12.pdf>] Another example is Yankee Rowe Nuclear Station, also in Massachusetts, which leaked about 2 million gallons of contaminated water from a pool between 1963 and 1965, some of which made it to the Deerfield River.¹⁴ [footnote 14 text: Yankee Atomic Electric Company. July 19, 2006. Groundwater Protection Data Collection Questionnaire] Also, Brookhaven National Labs located in Long Island, New York, leaked tritium into the drinking water aquifer from its fuel pool.¹⁵ [footnote 15 text: U.S. General Accounting Office. 1997. Information on the Tritium Leak and Contractor Dismissal at the Brookhaven National Laboratory] These cases certainly did not cause "SMALL" impacts. The NRC should accurately assess the impacts of pool leaks and other leaks of radioactive material being discharged into surrounding ground and surface waters. (0622-2-9 [Vale, Karen])

Comment: In addition, the draft GEIS claims the impacts of spent fuel pool leaks to be insignificant, but fails to take into account the significance of past leaks, which have plagued communities for decades. (0646-21 [Hanson, Courtney])

Comment: Appendix E to Draft NUREG-2157, "Waste Confidence Generic Environmental Impact Statement" (DGEIS), describes the environmental impacts of spent fuel pool leaks that may occur during the short-term storage timeframe. Section E.3 reviews the history of spent fuel pool leaks at commercial nuclear power plants. Table E-4, "Occurrence of Spent Fuel Pool Leakage at U.S. Nuclear Power Plants." lists sites at which spent fuel pool leakage has occurred based on data and information available to the NRC. Salem Unit 2 is incorrectly listed as having released radioactive liquid to the environment from spent fuel pool leakage. As noted

in NUREG/CR-7111, "A Summary of Aging Effects and Their Management in Reactor Spent Fuel Pools, Refueling Cavities, Tori, and Safety-Related Concrete Structures," in 2-10, evidence of a small leak was noted to be present in the Unit 2 telltale drain system. The Unit 2 spent fuel pool leakage is properly characterized as contained within spent fuel pool leakage-collection system. DGEIS Table E-4 should be revised accordingly. (0647-1 [Duke, Paul])

Comment: Surface Water, Groundwater, Aquatic Species --In general the GEIS assumes that radioactive leaks are small, monitored and controlled under regulatory control. No major ongoing leaks are analyzed. Nor are situations in which there is a major loss of spent fuel pool water from a leak analyzed, or in which water use has to be dramatically increased in order to prevent a spent fuel fire by providing makeup water. (0693-4-1 [Warren, Barbara])

Comment: DGEIS Table E-5 states that the maximum tritium contamination detected within the site boundary for the WBN SFP leak was 30,000 pCi/L.¹²⁷ [footnote 127 text: *Id.* at E-21.] This value appears to be inconsistent with the WBN-2 FES, which states: "The highest concentration of tritium detected in 2005 was approximately 20,400 Bq/L (550,000 pCi/L)."¹²⁸ [footnote 128 text: WBN-2 FES at 2-13. See also TVA June 2007 FSEIS at 53 ("The highest amount of tritium detected was approximately 550,000 pCi/L.")]. TVA requests that the NRC review its source of the WBN information in DGEIS Table E-5 and correct it if necessary to be consistent with the WBN-2 FES. Changing this value has no impact on the SMALL impact conclusion, particularly because there are no further indications of leakage from the WBN SFP and the value is bounded by other values in DGEIS Table E-5.¹²⁹ [footnote 129 text: DGEIS at E-21.] (0694-3-15 [Shea, Joseph])

Comment: •As noted in DGEIS Sections 4.6, 4.7, and 4.8, SFP leaks could result in radiological contamination of soils, groundwater, and surface water.⁹⁶ [footnote 96 text: *See Id.* at 4-20 to 4-28.] TVA agrees that the environmental impacts of continued spent fuel storage at its nuclear plants, including WBN-2, on these environmental areas would be SMALL. (0694-3-4 [Shea, Joseph])

Comment: •As noted in DGEIS Sections 4.6, 4.7, and 4.8, SFP leaks could result in radiological contamination of soils, groundwater and surface water. Entergy agrees that the environmental impacts of continued spent fuel storage at its nuclear plants, including IPEC, on these environmental areas would be SMALL. (0697-2-13 [Bessette, Paul] [Kuyler, Raphael])

Comment: Next, Mr. Lochbaum notes the Draft GEIS relies on the availability of spent fuel pool leakage detection system and a regulatory system for groundwater monitoring measures, but the Draft GEIS omits any meaningful discussion that spent fuel pool water level instrumentation is not required to be functioning except when irradiated fuel is being moved within the pool and that groundwater monitoring measures are entirely voluntary. (0706-4-10 [Fettus, Geoffrey])

Comment: In direct contradiction of the direction from the DC Circuit, NRC fails to identify how the spent fuel pool leaks listed in Table E-4 were detected. By not identifying the means of detecting these past leaks, the WC DGEIS fails support its assumption that leaks will be readily detectable. Instead, the WC DGEIS leaves open the possibility that the leaks were only detected through sheer luck. The WC DGEIS must explicitly identify the means by which past leaks were detected and ensure that regulatory requirements will retain these means throughout the 60-year short-term storage period. Otherwise, the NRC has no basis for a finding of reasonable assurance that the methods on which it relies will detect future leaks. (0706-4-11 [Fettus, Geoffrey])

Comment: Most important, Mr. Lochbaum observes NRC fails to recognize that both regulatory requirements and its oversight regime are significantly scaled back when nuclear power reactors cease operation. For example, the aging management measures supporting renewal of reactor operating licenses only apply during the period of extended reactor operation—not the six decades of spent fuel pool storage that follow. And Mr. Lochbaum submits significant evidence that NRC's inspection effort in the shut-down period is drastically reduced. (0706-4-12 [Fettus, Geoffrey])

Comment: In short, NRC has serious gaps in its analysis and has failed to present evidence supporting its conclusion spent fuel pool leaks will be detected or have little impact on the environment. (0706-4-13 [Fettus, Geoffrey])

Comment: Pages E-1 to E-26. Appendix E Analysis of Spent Fuel Pool Leaks[.] NRDC Comments[:] NRDC's concern with spent fuel pool leaks are not whether spent nuclear fuel "can" be stored safely for some period of time appropriately cooling in a pool. The issue is whether spent fuel "will" be stored safely for extended periods of time and whether applicable regulatory controls are adequate. There is little in Appendix E to allay our substantive concerns and even less here to satisfy the directions of the D.C. Circuit. See, *New York et al.* at 481. For a thorough treatment of the concerns of NRDC and many others in the environmental and safety community, we recommend and concur with the concerns and observations expressed by Mr. David Lochbaum of the Union of Concerned Scientists with respect to NRC's analysis of spent fuel pool leaks in this Draft GEIS.⁴⁵ [footnote 45 text: See *Critique of the Analysis of Safety and Environmental Risks Posed by Spent Fuel Pool Leaks in the NRC's Draft Waste Confidence Generic Environmental Impact Statement*, December 13, 2013, Declaration of David Lochbaum, Director, Nuclear Safety Project, Union of Concerned Scientists.] The task the DC Circuit set for NRC with respect to the analysis of spent fuel pool leaks was straightforward. In discussing what the agency had before it with the last iteration of the Waste Confidence Decision, the Court wrote: The WCD Update seeks to extend the period of time for which pools are considered safe for storage; therefore, a proper analysis of the risks would necessarily look forward to examine the effects of the additional time in storage, as well as examining past leaks in a manner that would allow the Commission to rule out the possibility that those leaks were only harmless because of site-specific factors or even sheer luck. The WCD Update has no analysis of those possibilities other than to say that past leaks had "negligible" near-term health effects. *Id.* A study of the impact of thirty additional years of SNF storage must actually concern itself with the extra years of storage. (0706-4-8 [Fettus, Geoffrey])

Comment: *Id.* Specifically, the Court was concerned with a "*proper analysis of the risks would necessarily look forward to examine the effects of the additional time in storage, as well as examining past leaks in a manner that would allow the Commission to rule out the possibility that those leaks were only harmless because of site-specific factors or even sheer luck.*" As Mr. Lochbaum makes clear, while the Draft GEIS concedes long-term, low-volume spent fuel pool leaks could exceed public health regulatory limits and impact groundwater resources, it fails to provide meaningful support such leaks are unlikely to happen.⁴⁶ [footnote 46 text: See Sections IV and VIII of Mr. Lochbaum's Declaration.] Indeed, to the contrary, Mr. Lochbaum presents numerous examples NRC has failed to include in its analysis.⁴⁷ [footnote 47 text: See discussion in Lochbaum Declaration from 10-18 and "NRC did not consider the leaks that occurred from the spent fuel pools at the Brookhaven National Laboratory and the Yankee Rowe nuclear plant. The BNL spent fuel pool leaked radioactively contaminated water into the ground for up to 12 years. Four tests for leakage from the spent fuel pool over a seven year period failed to detect the leak. And numerous monitoring wells already existing or added to the site failed to detect the leaked water for many years or attributed leak indications other sources. But this event was not

included among the past events NRC considered for the WC DGEIS. Likewise, the NRC failed to consider in the WC DGEIS the two million gallons that leaked from the Yankee Rowe nuclear plant.” Lochbaum Declaration at 46.] (0706-4-9 [Fettus, Geoffrey])

Comment: Leaks from the Unit 1 spent fuel pools were also first discovered in the 1990s.³⁶ [footnote 36 text: For a discussion of Indian Point Unit 1 spent fuel pool leaks, see generally Riverkeeper Post-Hearing Brief on Radiological Materials at 30-33.] The previous owner of Unit 1 attempted to manage the leakage with a collection system. However, in 2006, Entergy discovered that this system had been failing and allowing highly toxic radioactive contaminants, including Strontium-90, Cesium-137, Nickel-63, and Cobalt-60, to be released to the environment at a rate of about 70 gallons/day. This rampant leakage only ceased at the end of 2008 when Entergy completed moving the fuel out of, and draining, the leaking Unit 1 pool. Entergy’s hydrogeologic investigation, spurred by the discovery of Unit 2 spent fuel pool leakage, uncovered that the leaks from the Unit 1 pools that began in the 1990s and continued until the end of 2008 had resulted in an extensive additional plume of contamination in the groundwater at Indian Point containing the aforementioned radionuclides. This plume commingles with the tritium plume generated by the Unit 2 spent fuel pool leaks. Moreover, despite the fact that no *new* radionuclides are being introduced from the Unit 1 pool, the previous contamination is retained in the subsurface, and will continue to be released into the groundwater, and subsequently into the Hudson River, indefinitely. (0710-10 [Brancato, Deborah] [Musegaas, Philip])

Comment: In addition, over the course of Indian Point’s over 40 years of operation, numerous radiological leaks and spills have occurred and resulted in releases of radioactivity. This includes, but is not limited to the following:³⁷ [footnote 37 text: See Riverkeeper Post-Hearing Brief on Radiological Materials at 33-38.] •In 1988, 8,400 gallons of radioactively contaminated water was released to the Hudson River as the result of a crack in the condenser blowdown line Unit 2; •In 2009, a Unit 1 distillation tank valve leaked enough radioactivity to cause noticeable increases in a groundwater monitoring well; •In 2009, a refueling water storage tank spilled radioactive water, causing greatly elevated levels of radioactivity in the groundwater wells for several months; •In 2009, a plant worker “discovered” that a pipe buried eight feet underground had sprung a leak when he found himself standing in a puddle of water; the leak resulted in an estimated 100,000 gallons of radioactive water to be released to the environment; •In 2009, Entergy discovered radioactive “washout” occurring at Indian Point, i.e., airborne tritium releases caused by radioactive leaks that evaporate, release via vents, and then condense and deposit in the environment; and •In 2011, Entergy identified elevated levels of radioactivity in the groundwater; it took Entergy months to discern that the cause was a leak in a recirculation pump. Inadvertent radiological leaks at Indian Point have resulted in two large commingled groundwater contamination plumes containing a number of different dangerously toxic radionuclides. Notably, Strontium-90 is a radionuclide that is absorbed by and concentrates in bone, while Cesium-137 is absorbed by muscle; tritium behaves like, and cannot be filtered out of, water, and can be ingested, inhaled, or absorbed through skin. (0710-11 [Brancato, Deborah] [Musegaas, Philip])

Comment: The levels of contamination in the groundwater at Indian Point persist at high levels.³⁸ [footnote 38 text: For a general discussion of the persistent nature of contamination plumes at Indian Point, see Riverkeeper Post-Hearing Brief on Radiological Materials at 38-56.] For example, since groundwater monitoring started at Indian Point, Entergy has regularly detected levels of radionuclides in the groundwater beneath Indian Point in excess of maximum contaminant levels (“MCLs”) established by the U.S. Environmental Protection Agency (“EPA”) for radionuclides in drinking water. This is a trend that is likely to continue. Indeed, the levels of

contamination in the groundwater will periodically increase even in the absence of new radioactive leakage due to episodic releases of radionuclides that are stored in the subsurface. Moreover, any new radioactive leaks that may occur in the future will indisputably add to the existing groundwater contamination, prevent the groundwater plumes from decreasing over time, and/or increase the overall levels of the plumes. To be sure, future radiological leaks from varying plant components are highly likely at Indian Point due to combination of factors, including the following: (1) Entergy has a completely inadequate program for managing and preventing leaks from buried components, which the U.S. government has explained are increasingly aging and likely to corrode and leak in the future; (2) Entergy employs a completely reactive approach to the management of radiological leaks at Indian Point, relying on groundwater monitoring to detect leaks *well after* they occur, which essentially ensure that leaks enter the environment, and/or waiting until critical circumstances arise to address operational leakage related events; and (3) Entergy has deficient, inadequately funded maintenance programs which result in insufficient leak management. Thus, the continued operation of Indian Point will foreseeably lead to additional radioactive leaks from plant systems, structures and components, and, as a result thereof, persistent and ever-accumulating contamination in the groundwater beneath the site. (0710-12 [Brancato, Deborah] [Musegaas, Philip])

Comment: Notably, it is undisputed that the groundwater contamination at Indian Point already migrates and releases to the Hudson River, regularly contributing to the levels of radioactivity present in the river.³⁹ [footnote 39 text: For a general discussion of the movement of the radiological contamination at Indian Point, see Riverkeeper Post-Hearing Brief on Radiological Materials at 56-60.] In fact, Entergy relies on monitored natural attenuation (“MNA”) to “manage” the radiological contamination at Indian Point, and will continue to do so *at least* throughout Entergy’s proposed license renewal periods for Indian Point. This means that the existing, as well as any future, new groundwater contamination will remain in the groundwater until it flushes out into to the Hudson River or decays. Entergy’s approach ensures that radioactive groundwater contamination will release to the Hudson River for upwards of centuries. Notably, Entergy has refused to extract the contamination so as to better minimize the impact of the groundwater contamination on the environment, despite the fact that such a remediation approach is technically feasible and advisable. (0710-13 [Brancato, Deborah] [Musegaas, Philip])

Comment: 2. Indian Point Site-Specific Factors are Highly Relevant to Assessing Spent Fuel Pool Leak Risks and Consequences[.] As an initial matter, the analysis in Appendix E of the DGEIS is deficient and fails to comply with NEPA or the Court Ruling because it inexplicably limits the analysis to offsite impacts only⁴⁹ [footnote 49 text: See DGEIS, Appendix E at pgs. E-1, E-8.] and relies on “institutional controls” to purportedly ensure the safe management of spent fuel onsite for an indefinite period of time in the future, without conducting an actual assessment of the efficacy of the regulatory controls being relied upon to prevent or mitigate the effects of long term storage. In Appendix E, the NRC assumes that existing decommissioning regulations will ensure that all onsite contamination will be remediated during the sixty year timeframe, thereby obviating the need for any assessment of onsite impacts from future spent fuel pool leaks. This is in direct contravention of the Court Ruling, which explicitly warned the NRC against continuing to rely on existing regulations as a basis for determining future impacts. The Court Ruling states: With full credit to the Commission’s considerable enforcement and inspection efforts, *merely pointing to the compliance program is in no way sufficient to support a scientific finding that spent-fuel pools will not cause a significant environment impact during the extended storage period.* This is particularly true when the period of time covered by the Commission’s predictions may extend to nearly a century for some facilities.⁵⁰ [footnote 50 text: *New York v. NRC*, 681 F.3d at 481 (emphasis added).] (0710-17 [Brancato, Deborah] [Musegaas, Philip])

Comment: In any event, as with spent fuel pool accidents, the NRC's analysis of spent fuel pool leaks in the DGEIS also employs a generic approach that improperly fails to consider or "bound" the impacts that could occur in light of the site-specific factors discussed above. The NRC's generic approach to future pool leaks makes no sense when viewed in light of the completely opposite conclusion regarding the need for site specific impact assessment reached in the NRC Staff's recent revision to the Generic Environmental Impact Statement pertaining to nuclear power plant license renewal ("License Renewal GEIS"). In the License Renewal GEIS, the NRC included a new "Category 2" issue, i.e., an issue for which it is necessary for the agency to conduct a site-specific assessment, related to "radionuclides in groundwater."⁵¹ [footnote 51 text: Generic Environmental Impact Statement for License Renewal of Nuclear Plants, NUREG-1436, Volume 1, Revision 1 (May 2013), *available at*, <http://pbadupws.nrc.gov/docs/ML1310/ML13106A241.pdf>, at pp.S-7, 1-24 ("Category 2 issues are those that do not meet one or more of the criteria of Category 1, and therefore, require additional plant-specific review").] In this context, NRC explained as follows: This new Category 2 issue evaluates the potential contamination and degradation of groundwater resources resulting from inadvertent discharges of radionuclides into groundwater from nuclear power plants. Within the past several years, there have been numerous events at power reactor sites which involved unknown, uncontrolled, and unmonitored releases of radionuclides into the groundwater. The number of these events and the high level of public controversy have made this issue one that the NRC believes needs a "hard look" as required by NEPA. (0710-18 [Brancato, Deborah] [Musegaas, Philip])

Comment: As a voluntary action, NEI 07-07 [*Industry Ground Water Protection Initiative-Final Guidance Document*; NEI 2007] cannot be enforced by the NRC. As such, no violations can be issued against a licensee who fails to comply with the guidance in NEI 07-07. Furthermore, the NRC cannot rely on a voluntary initiative as a basis to ensure that the nuclear power industry will have adequate information available for the NRC to determine whether a documented leak or spill does or does not have an adverse impact on groundwater resources. Regarding the magnitude of impact, the NRC bases its determination of SMALL to MODERATE impact on a review of existing plants have had inadvertent releases of radioactive liquids. Even though the NRC expects impacts for all plants to be within this range, a conclusion of LARGE impact would not be precluded for a future license renewal review based on new and significant information if the data support such a conclusion. As reflected in the final GEIS and rule, "Radionuclides released to groundwater" remains a Category 2 issue.⁵² [footnote 52 text: *Id.* at p.1-24.] (0710-19 [Brancato, Deborah] [Musegaas, Philip])

Comment: Further proof of the NRC Staff's arbitrary approach in the DGEIS can be found in testimony that was provided to the NRC Commissioners prior to the finalization of the License Renewal GEIS. In this testimony, a staff member of the NRC, Andy Imboden (who is notably also involved in the waste confidence DGEIS), explained that "[i]n a NEPA context, radionuclides in groundwater as projected over the period of extended operation and their impact to the groundwater resource, makes radionuclides and groundwater an issue that is appropriately discussed in an Environmental Impact Statement," and that "given the various sources of radionuclides, such as from the spent fuel pool, buried pipe, et cetera, unique hydrological feature for each plant, the staff concluded that a *site-specific review is required*."⁵³ [footnote 53 text: Transcript, Briefing on Proposed Rule to Revise the Environmental Review for Renewal of Nuclear Power Plant Operating Licenses, January 11, 2012 (ML120180209) at 63-64 (emphasis added).] Yet, here in the context of the DGEIS related to "waste confidence," NRC is content to rely upon the same exact referenced industry guidance and generically dispose of spent fuel pool leakage concerns. There is no basis whatsoever for NRC's conflicting positions. Notably, the License Renewal GEIS was directly concerned about spent fuel pool leaks, and

several of the reactor site leaks discussed in the License Renewal GEIS involved spent fuel pool leaks, such as Indian Point.⁵⁴ [footnote 54 text: See, e.g. Generic Environmental Impact Statement for License Renewal of Nuclear Plants, NUREG-1436, Volume 1, Revision 1 (May 2013), *available at*, <http://pbadupws.nrc.gov/docs/ML1310/ML13106A241.pdf>, at 4-52 (“The majority of the inadvertent liquid release events involved tritium, which is a radioactive isotope of hydrogen. However, other radioactive isotopes, such as cesium and strontium, have also been inadvertently released into the groundwater. The types of events include leakage from spent fuel pools, buried piping, and failed pressure relief valves on an effluent discharge line.” (emphasis added)).] It is inconsistent, arbitrary, and illogical for the NRC to require site specific assessment of radionuclide releases to groundwater during license renewal timeframes, and conversely find that future spent fuel pool leaks will be insignificant, and not require site specific assessment for spent fuel pool leaks during the 60-year post-operating license timeframe. For the same reasons stated in relation to the License Renewal GEIS, radionuclide leaks from the spent fuel pools and related components should also be examined in a site-specific manner during the post-operating timeframes contemplated in the DGEIS. Not doing so would violate NEPA and the Administrative Procedure Act, and serves to create regulatory confusion regarding the need to assess the impacts of spent fuel storage in the future. Importantly, site-specific consideration is critical in light of the unique impacts posed by spent fuel pool leaks at Indian Point. That is, NRC limited analysis in the DGEIS did not consider or otherwise somehow bound or encompass the unique and potentially considerable impacts that can occur at Indian Point from spent fuel pool leaks due to site-specific factors discussed above. (0710-20 [Brancato, Deborah] [Musegaas, Philip])

Comment: Moreover, NRC should have also considered the unique, site-specific issues facing Indian Point, in relation to assessing the *risk* of ongoing and/or additional spent fuel pool leaks occurring in the future during the post-operating license timeframe. For example: newly assessed and heretofore unaccounted for increased risks of earthquakes in the area may affect the structural integrity of the Indian Point spent fuel pools, which could exacerbate existing, or cause new leaks. Likewise, ongoing and future inadequate plant maintenance and management, especially in relation to spent fuel pool leaks and leakage detection (as is already highly evident at Indian Point as discussed above), may result in inadvertent, undetected ongoing or new leakage and unacceptable releases to the environment. Notably, NRC’s dependence on purported institutional controls, voluntary programs, and current alleged regulatory “requirements,” is completely misguided in light of the fact that the plant operators at Indian Point do not even detect and/or manage spent fuel pool leaks properly now, while the plant operates.⁵⁷ [footnote 57 text: See *generally* Comments by Environmental Organizations on Draft Waste Confidence Generic Environmental Impact Statement and Proposed Waste Confidence Rule And Petition to Revise and Integrate All Regulations Related to Back End of the Uranium Fuel Cycle (December 20, 2013) and Declaration of David Lochbaum, Critique of the Analysis of Safety and Environmental Risks Posed by Spent Fuel Pool Leaks in the NRC’s Draft Waste Confidence Generic Environmental Impact Statement, attached thereto.] In sum, the site-specific circumstances facing Indian Point increases the risks of such spent fuel pool leaks and consequences thereof, yet such factors were not “bounded” or considered by NRC. This renders NRC’s assessment in the DGEIS inadequate. (0710-23 [Brancato, Deborah] [Musegaas, Philip])

Comment: Accidental radiological leaks and spills have been a rampant and pervasive problem at Indian Point for decades, and will likely continue as long as the reactors operate and spent fuel is stored in the facility’s aging pools.³⁴ [footnote 34 text: A thorough factual record relating to the long and persistent history of inadvertent radiological releases at Indian Point is discussed in a post-hearing brief submitted by Riverkeeper in a proceeding pending before the

New York State Department of Environmental Conservation concerning the request by the owner of Indian Point, Entergy, for a Water Quality Certification pursuant to Section 401 of the Federal Clean Water Act; in that proceeding, an issue related to whether radiological releases from Indian Point are consistent with State water quality standards was raised. See Post-Hearing Closing Brief of Intervenors Riverkeeper, Natural Resources Defense Council, and Scenic Hudson Regarding Issue for Adjudication No. 3 – Radiological Materials (April 27, 2012), *available at*, <http://www.riverkeeper.org/wp-content/uploads/2012/12/2012.04.27.Indian-Point-401-SPDES-Proceedings-Riverkeeper-Closing-Brief-Radiological.pdf> (hereinafter cited as “Riverkeeper Post-Hearing Brief on Radiological Materials”). This brief supports the factual statements herein related to radiological leakage issues at Indian Point, and is hereby incorporated by reference in its entirety into the record of this NEPA review.] Leaks from Indian Point’s Unit 2 spent fuel pool started occurring in the 1990s.³⁵ [footnote 35 text: For a discussion of Indian Point Unit 2 spent fuel pool leaks, see generally Riverkeeper Post-Hearing Brief on Radiological Materials at 24-29.] In 2005, Entergy “discovered” that the Unit 2 pool was cracked and actively leaking. A follow-up hydrogeologic investigation, during which additional leakage sources from the Unit 2 pool were found, uncovered an extensive groundwater plume of tritium, from which it could be gleaned that the Unit 2 pool had been leaking radioactivity to the groundwater for years. Despite Entergy’s representations that it “fixed” the Unit 2 spent fuel pool leaks, in 2010 yet another, *new*, active leak source from the pool was discovered. Moreover, Entergy has never been able to inspect about 40% of the liner of the Unit 2 pool due to the density of the fuel, and Entergy concedes that other active leaks are likely ongoing. It is highly likely that the Unit 2 spent fuel pool will continue to leak radioactivity into the environment as Indian Point continues to operate: Entergy has no intention of ever conducting any full inspections of the Unit 2 spent fuel pool liner, or even any additional partial inspections that could detect potential leak sources; the pool has no “tell-tale” drain collection system which allows any leaks to be collected and monitored; the Unit 2 pool will continue to age and degrade since it is subject to the bathtub curve effect; and the owner of Indian Point, Entergy, employs a purely reactive approach that will discover leaks from the pool only *after* they occur. (0710-9 [Brancato, Deborah] [Musegaas, Philip])

Comment: The GEIS discloses that tritium moves quickly, and other radionuclides more slowly, where is the analysis of the existing soil contamination over time? Where is the projection for additional soil contamination? Even if all reactors close, decommissioning has the possibility of creating more soil contamination. If reactor operations continue, likely the activities that created existing contamination will also continue. Where is that analysis? (0711-36 [Olson, Mary])

Comment: Although NRC has described spent fuel pools as “leak tight,” the experience has shown that description to be inaccurate. In 2005, Indian Point identified leakage of radionuclide-contaminated water from cracks in two different spent fuel pools and subsequently discovered tritium, strontium, and other radionuclides in groundwater underneath the site.⁴⁹ [footnote 49 text: Nuclear Regulatory Commission, NRC Talking Points Slide Entitled, “Tritium at Nuclear Power Plants in the United States, Slide 3: Background,” ML063260464 (Nov. 7, 2006); Nuclear Regulatory Commission Office of Nuclear Reactor Regulation, *Ground-Water Contamination Due to Undetected Leakage of Radioactive Water*, NRC Information Notice 2006-13, at 3-4 (“Ground-Water Contamination”) ML060540038 (July 10, 2006).] Strontium and tritium from Indian Point’s spent fuel pools have reached the Hudson River.⁵⁰ [footnote 50 text: *Ground-Water Contamination* at 3-4; Entergy, Indian Point License Renewal Application, Environmental Report at 5-4, ML071210530 (Apr. 23, 2007).] Existing radioactive leaks at Indian Point have already far exceeded national drinking water standards.⁵¹ [footnote 51 text: See GZA GeoEnvironmental, Inc., *Hydrogeologic Site Investigation Report, Indian Point Energy Center*, at

90, 126, ML080320540 ("GZA Report") (Jan. 7, 2008); see also 40 C.F.R. § 141.66 (establishing drinking water standard for tritium at 20,000 pCi per liter and strontium at 8 pCi per liter).] All fresh groundwater in New York State is Class GA, the best use of which is as a source of potable water supply.⁵² [footnote 52 text: 6 N.Y.C.R.R. § 701.15.] Indian Point groundwater concentrations have exceeded national drinking water standards for tritium in six locations, sometimes by more than four times the tritium concentrations considered harmful to human health, and exceed national drinking water standards for Strontium-90 in ten locations, by almost five times in some locations.⁵³ [footnote 53 text: *GZA Report* at 125-26.] While NRC has recently acknowledged tritium leaks, it has been reluctant to acknowledge leaks of strontium and other radionuclides. In November 2010, the State of New York sought to draw the Commission's attention to the fact that radionuclides in addition to tritium have leaked from reactors.⁵⁴ [footnote 54 text: State of New York Comment Letter on Groundwater Task Force Report, Docket ID NRC-2010-0302, 75 Fed. Reg. 57987 (Nov. 1, 2010) ML103080060.] Moreover, the subsurface radiation plumes have exceeded EPA drinking water standards.⁵⁵ [footnote 55 text: *Id.*] The concerns outlined in the State's 2010 letter further support treating groundwater contamination as a site-specific environmental impact. (0718-1-17 [Sipos, John])

Comment: In 2002, water from a spent fuel pool at Salem Nuclear Power Plant in New Jersey was discovered to have leaked into a narrow seismic gap between two buildings, and further investigation revealed tritium in the groundwater near one of the buildings.⁵⁶ [footnote 56 text: Nuclear Regulatory Commission Office of Nuclear Reactor Regulation, *Spent Fuel Pool Leakage to Onsite Groundwater*, NRC Information Notice 2004-05 (Salem, New Jersey, Nuclear Generating Station), ML040580454 (Mar. 3, 2004).] These leaks occurred during the reactors' initial licensing term, calling into question the structural integrity of spent fuel pools as many reactors approach the end of their initial terms and seek license renewals. Radioactive water has also leaked from spent fuel pools at the Seabrook Nuclear Power Station in Seabrook, New Hampshire in 1999, at the Tennessee Valley Authority's Watts Bar Nuclear Generating Station in Spring City, Tennessee in 2002, and at Palo Verde Nuclear Generating Station, Unit 1 in Wintersburg, Arizona in 2005.⁵⁷ [footnote 57 text: Nuclear Regulatory Commission, *Liquid Radioactive Release Lessons Learned Task Force Final Report*, at 9, 24, and 35, ("Radioactive Release Lessons Learned") ML062650312 (Sept. 1, 2006).] In 1997, groundwater samples taken by Brookhaven National Laboratories in Long Island, New York revealed concentrations of tritium at twice the allowable federal drinking-water standards.⁵⁸ [footnote 58 text: General Accounting Office, Report to Congressional Requesters, Department of Energy, *Information on the Tritium Leak and Contractor Dismissal at the Brookhaven National Laboratory* (GAO/RCED-98-26), at 1-9 ("Tritium Leak and Contractor Dismissal") (Nov. 1997).] Subsequent samples were found to contain thirty-two times the standard.⁵⁹ [footnote 59 text: *Id.* at 4.] The tritium was leaking from the spent fuel pool serving the laboratory's nuclear reactor into the aquifer that provides the sole source of drinking water for nearby Suffolk County residents.⁶⁰ [footnote 60 text: *Id.* at 7-9; 43 Fed. Reg. 26,611, 26,612 (June 21, 1978) (EPA designation of sole source aquifer).] The Department of Energy's and laboratory's investigations concluded that the tritium had been leaking for as long as twelve years without the Department's or laboratory's knowledge.⁶¹ [footnote 61 text: *Tritium Leak and Contractor Dismissal* at 9.] A subsequent federal investigation concluded that Brookhaven employees did not aggressively monitor its spent fuel pool for leaks—even postponing an agreed-upon monitoring-well system—so that years passed before tritium contamination was discovered in the aquifer near the spent fuel pool.⁶² [footnote 62 text: *Id.* at 9-12.] (0718-1-18 [Sipos, John])

Comment: In 1986, in an "acute unmonitored release of large volumes of contaminated liquids to onsite ground surfaces and surface waters," 124,000 gallons of water containing 0.20 curies of tritium and 0.373 curies of mixed fission products leaked from the spent fuel pool at the Edwin

I. Hatch nuclear power plant in Baxley, Georgia to a nearby swamp and into the Altamaha River.⁶³ [footnote 63 text: *Radioactive Release Lessons Learned* at 5, 14; 55 Fed. Reg. 38474 (page 54) (Sept. 18, 1990).] The plant's owner did not calculate the maximum possible offsite doses, because no regulation required it to do so, but NRC found that the accident "demonstrated a lack of insistence on procedural adherence and attention to detail." and levied a civil monetary penalty.⁶⁴ [footnote 64 text: *Radioactive Release Lessons Learned* at 34.] NRC acknowledged this Hatch leak in its 1990 waste confidence findings and also that on August 16, 1988 a seal on a fuel pool pump failed at the Turkey Point nuclear plant near Miami, Florida causing approximately 3,000 gallons of radioactive water to leak into a nearby storm sewer, contaminating the shoes and clothing of approximately 15 workers.⁶⁵ [footnote 65 text: 55 Fed. Reg. 38474, (p. 54) (Sept. 18, 1990).] (0718-1-19 [Sipos, John])

Comment: NRC recently acknowledged that "leaks can develop in [spent fuel pools] and go undetected for long periods of time absent appropriate monitoring, resulting in the contamination of onsite groundwater and the potential for undetected, unevaluated releases of radioactivity to an unrestricted area."⁶⁶ [footnote 66 text: *Ground-Water Contamination* at 5.] The NRC has also acknowledged that its current regulations do not require groundwater monitoring and that licensees typically initiate groundwater monitoring only in response to known leaks.⁶⁷ [footnote 67 text: *Id.* at 5-6.] But NRC has not required plants to monitor for, assess, or remediate leaks, instead relying on voluntary initiatives undertaken by industry.⁶⁸ [footnote 68 text: Nuclear Regulatory Commission, *Senior Management Review of Overall Regulatory Approach to Ground Water Protection*, SECY-11-0019 (Feb. 9, 2011); *Ground-Water Contamination* at 5-7.] (0718-1-20 [Sipos, John])

Comment: In regard to "waste management," a leak in one of the spent fuel pools was accidentally discovered by a workman on the site. Since this discovery, the source of the leak has not yet been found; and water from this crowded spent fuel rod pool continues to leak into the surrounding area - ground, groundwater and river. (0762-5 [Skopic, Catherine])

Comment: Appendix E provides an analysis of spent fuel pool leaks. However, it does not contain any analysis of mitigation including a description of the emergency preparedness or what will be required in the event of a pool leak. In short, the Appendix does not provide the necessary support for an appropriate NEAP analysis on mitigation. (0783-3-23 [Harlan, Thomas])

Comment: p. 4-25 to 4-27, Groundwater Quality and Use "...The impacts 1 of a spent fuel pool leak on offsite groundwater depend on many factors, including the volume and rate of water released from the spent fuel pool, the radionuclide content and concentration and water chemistry of the spent fuel pool water, the direction of groundwater flow, the distance to an offsite groundwater receptor, the velocity or transport rates of radionuclides through the subsurface, and radioactive decay rates. A recent revision to the NRC's regulations that explicitly requires monitoring of subsurface areas will further ensure leaks are detected. Besides these measures, the hydrologic characteristics associated with typical nuclear power plant settings (see Section E.2.1.3)--such as their location near large waterbodies (due to cooling requirements), shallow water table flow direction toward these waterbodies, flat hydraulic gradients in the shallow water tables, large distance to local groundwater users, and the likelihood that local groundwater usage is in deeper confined aquifers--will act to impede the offsite migration of future spent fuel pool leakage. Finally, current and future spent fuel pool sites are required to have routine environmental monitoring programs in place that should take samples at offsite groundwater sources (e.g., potable or irrigation) in areas where the hydraulic gradient or recharge properties are suitable for contamination (NRC 1991c,d). Further, any detection of onsite contamination would likely result in additional monitoring, including additional

sampling of any nearby private wells, as part of an expanded environmental monitoring program. With these measures and characteristics in place, it is unlikely that offsite migration of spent fuel pool leaks will occur or go undetected. Based on resulting from a spent fuel pool leak during the short-term timeframe would be SMALL." Comment: The same comments made under the heading of Surface-Water Quality and Use apply here. There are so many "likely", "unlikely" and "likelihood" modifiers used that a high degree of uncertainty attaches to the assurances that nothing bad will happen if the pools leak. The statement that the small number of leak releases of contaminants to the environment, "based on the available data, have not affected the health of the public" is less than reassuring, especially if only impacts on humans is looked for. (0805-10 [Wilshire, Howard])

Comment: Too many proposed low impact leaks and transport difficulties classified as SMALL importance. (0817-1 [Munson, Marcia])

Comment: Through incompetence, negligence, non-disclosure, and falsification, the nuclear industry ignored or hid spent fuel pool leaks (especially tritium) into soil and groundwater from virtually every reactor unit in the U.S. The NRC acknowledges these leaks and admits that onsite contamination exceeds drinking water standards, but minimizes the danger and health risk of radioactive effluent from these aging, deteriorating, buried, inaccessible pipes as insignificant and unlikely to migrate offsite, while indiscriminately issuing reactor license extensions and allowing tons more spent fuel to be produced. (0819-8 [Kline, Connie])

Comment: The DGEIS reference to radioactive spill and leak detection is completely unsatisfactory. It ignores NRC's own records of undetected leaks and the understatement and underestimates of the volume of leaks which have been found. (0821-10 [Paddock, Brian])

Comment: Safety of future drinking water from each leak of radioactive contamination depends upon seriously addressing all leaks and stopping their migration immediately-not sitting back doing nothing and waiting for the leak to get worse and to spread offsite. It is unacceptable to not require each leak to be stopped as soon as it is discovered, including if it requires plant shut-down and eliminates profit margins. The environmental and public safety requires the highest value on the decision tree in all NRC decisions and rules, including over that of investor profits and the financial and timing preferences of reactor owners. Unanticipated leaks have become commonplace at every nuclear reactor. The NRC is too often not enforcing and mandating leaks to be completely stopped and cleaned up. This shows that environmental and public safety are inaccurately not being given the highest values in the complete oversight decision tree. (0823-42 [Michetti, Susan])

Comment: The Draft Generic EIS unacceptably uses a flawed approach to assess and analyze leaks, particularly in terms of actual specific past leaks at each and every nuclear power plant, as well as fails to consider the full impacts of these leaks. (0823-43 [Michetti, Susan])

Comment: Massachusetts' Yankee Rowe leaked 2 million gallons radioactive water that unacceptably contaminated the Deerfield River[.] For example, Yankee Rowe leaked and released about 2 million gallons of radioactive water that flowed into the Deerfield River, as identified in Yankee *Atomic Electric Company's Groundwater Protection- Data Collection Questionnaire*, July 19, 2006, Rowe, MA. Brookhaven National Labs' spent fuel pool leaked tritium into Suffolk County drinking water aquifer[.] In another example, Brookhaven National Labs measured ground water samples in 1997 and later that violated the allowable federal drinking water limits for tritium ranging from 2 to 32 times the standard. This leak originated from the High Flux Beam Reactor's spent fuel pool and unacceptably migrated into the drinking water

aquifer for nearby Suffolk County residents, as identified in US GAO, *Department of Energy: Information on the Tritium Leak and Contractor Dismissal at the Brookhaven National Laboratory*, GAO/RCED-98-26 (1977). Leaks beyond one year duration show unacceptable complacency and inadequate safety enforcement[.] The DOE and Brookhaven National Labs found evidence that more than a decade had passed without their knowledge of this unacceptable leak (GAO/RCED-98-26 (1977), *DOE: Information on the Tritium Leak and Contractor Dismissal at the BNL*). The finding that the timeframe for which this leak was unknown demonstrates that scientific assessment, methods, and practices are being too speedily conducted and without the thoroughness and rigor required. Such failure to meet scientific thinking at the oversight level requires immediate correction. In view of the NRC's claims that safety measures are in place for timely leak detection, it becomes more troubling that at least two spent fuel pool leaks were undetected for prolonged time periods in excess of one year. It is disturbing that such safety claims contradict actual reality more than once. Such inaccurate safety assurances by the NRC result in the NRC decision-making process displaying unreliability, undependability, and untrustworthiness. Such contradictions between promised assurances and facts are unacceptable. The NRC assures inaccurately that it is unlikely for leaks to go undetected for time periods that enable pollution of the outside environment significantly; such leaks have already occurred at Yankee Rowe nuclear plant and at BNL for longer than one year and perhaps longer than a decade, for examples. A leak reported as only a few gallons a day at spent fuel pool at Salem consisted of 100 gallons a day. Quicker observation, more thorough initial investigation, and accuracy of reporting in a timely way are required and need improvement. (0823-44 [Michetti, Susan])

Comment: It is disturbing that the volume and significance of this leak were not detected by instrumentation as well as not detected by the leak detection system. It is disturbing that a clogged drain in the monitoring system could cause failures, upon which safety depends. Failure in the maintenance of a clogged drain is an indicator that the NRC's safety assurances are flawed at the level of sufficient maintenance necessary to provide complete safety to the public and the environment. (0823-45 [Michetti, Susan])

Comment: It is unacceptable for the NRC's "scientific" analysis, by definition, of spent fuel pool leak impacts to fail to contain required quantitative assessment. The Draft Generic EIS fails to provide measurements, particularly of volume, speed, and duration, that define the mathematical measurable limits of significant spent fuel pool leaks. In all leaks, the identification of each radioactive elemental isotope should be provided as well as the concentration of quantity in the leaked water. Impacts should be determined through assessments of the factors of volume of leak, duration of leak, speed of leak, and isotope identification and concentration, as the minimum information upon which to base significant impacts. This is not a complete listing. (0823-46 [Michetti, Susan])

Comment: What is the measurable amount of leakage that defines NRC's significant contamination criteria? All leaks require sufficient enforcement action. Leaks not stopped within a reasonable time at the maintenance level with sufficient repairs and remodeling require stricter enforcement and fines. When enforcement action and fines do not successfully stop the leaks within less than a year, it is prudent to require shutdown of all operations for safety. The causal complacency needs to be tightened to an extremely rare exception when leaks are fully contained internally and do not escape into the environment outside of the building. (0823-47 [Michetti, Susan])

Comment: It is unacceptable for the Draft Generic EIS to depend upon groundwater monitoring and inspection programs to monitor leaks, particularly when those programs are not mandatory.

Such information should be considered auxiliary or supplemental ways to support more primary data. More primary measurements should be required to increase earlier leak detection as well as source location of a leak. (0823-50 [Michetti, Susan])

Comment: Appendix E of the draft GEIS sets forth a detailed discussion of the environmental impacts of spent fuel pool leaks during the short-term storage timeframe. NEI believes that the NRC adequately addressed the leaks issue and correctly concluded that the GEIS satisfies the Court's remand, as well as the NEPA "hard look" standard. Leaks are not an issue in the long-term storage scenario because the NRC has reasonably assumed that spent fuel will be moved to dry storage during the short-term timeframe. The draft GEIS appropriately describes the current regulatory regime for spent fuel pool leaks, including the NRC's requirements and industry initiatives for groundwater monitoring and remediation of contaminated groundwater. NRC, in Section E.3, has done a thorough job of compiling and examining industry's historical experience with spent fuel pool leakage and has, importantly, noted that none of these events are known to have resulted in contamination of drinking water.⁶⁵ [footnote 65 text: Draft GEIS at E-21] In accordance with NRC requirements, industry will maintain the capability to detect and mitigate any spent fuel pool leakage - as was done in the cases examined - as long as the pools are operational. However, the NRC does not simply rely on its ongoing regulatory oversight to conclude that the environmental impacts of spent fuel pool leaks during the short-term storage timeframe will be small. The draft GEIS discusses the minimum requirements for spent fuel pool design and maintenance, operational practices, site hydrogeological characteristics, and radionuclide-transport properties that apply at all sites and that provide reasonable assurance that there is a very low likelihood that an undetected leak from a spent fuel pool will migrate offsite.⁶⁶ [footnote 66 text: See, e.g., 10 C.F.R. § 50.65 (maintenance rule) and 10 C.F.R. § 100.20(c) (siting criteria).] These considerations are all generic, and obviate further site-specific assessments. Furthermore, in the unlikely event that a spent fuel pool leak migrates offsite, the draft GEIS assesses the potential for impacts on groundwater, surface water, soils, and public health using a bounding approach. The draft GEIS concludes that the environmental impacts of a spent fuel pool leak during continued storage would be small.⁶⁷ [footnote 67 text: Draft GEIS at Iviii - lix.] (0827-2-10 [Ginsberg, Ellen])

Comment: Based on operating experience, NEI agrees that impacts to groundwater would be small because it is highly unlikely that a leak of sufficient quantity and duration could occur without detection, or that migration of such a spent fuel pool leak would proceed at a rate that could not be mitigated before there would be any contamination of drinking water. Similarly, the impacts of spent fuel pool leaks on surface water would be small because, even in the highly unlikely event that undetected spent fuel pool leakage flowed continuously and unimpeded to local surface waters, the quantities of radioactive material discharged to nearby surface waters would be comparable to values associated with permitted, treated effluent discharges from operating nuclear power plants. This is assured by programs put in place to meet the requirements of a 2007 industry groundwater protection initiative that addresses "inadvertent releases" that "are well below the NRC's limits that ensure protection of the public health and safety."⁶⁸ [footnote 68 text: NEI 07-07 "Industry Ground Water Protection Initiative - Final Guidance Document," Aug. 2007.] With respect to the impacts on soil, the NRC correctly concludes that the leakage would be detected or absorbed onsite before migrating offsite, assuring that environmental impacts would be confined and small.⁶⁹ [footnote 69 text: Draft GEIS at E-18.] Lastly, as a result of the low probability of a leak affecting offsite groundwater sources, the impacts to public health resulting from a spent fuel pool leak during the short-term timeframe also would be small. In sum, the NRC has collected substantial data on the effects of spent fuel pool leaks. The draft GEIS extensively discusses factors that affect the likelihood that spent fuel pool leaks will migrate offsite and impact offsite resources. Although past experience

does not guarantee future results, operating experience is important. Experience is the basis for many of the upgrades and initiatives that have been put in place across all U.S. reactor sites. Moreover, experience is a useful predictor of future performance: it allows the industry and the NRC to project realistic risks as opposed to highly speculative, hypothetical risks. Coupled with continued regulatory oversight, there is ample support for the NRC's conclusions in the draft GEIS that the potential impacts involving spent fuel pool leaks would be small. (0827-2-11 [Ginsberg, Ellen])

Comment: In fact, the DGEIS flouts both NEPA and the Court's application of NEPA in *New York*, 681 F.3d 481 (D.C. Cir. 2012) in multiple ways: The DGEIS violates the Court's decision in *New York* by failing to analyze the significance of past spent fuel leaks for future risks, by making unsupported assumptions about its future ability to detect leaks, and by relying on inapplicable or nonexistent regulatory requirements for future prevention of leaks. (0897-1-10 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The Proposed Rule's Determination That Spent Fuel Can Be Safely Stored in Pools for an Indefinite Period is Not Based on an Adequate Environmental Analysis of Spent Fuel Pool Leaks[.] NRC's analysis of spent fuel pool ("SFP") leaks in the DGEIS violates NEPA. NEPA requires agencies to take a "hard look" at all reasonably foreseeable impacts of the proposed action. 42 U.S.C. 4332(2)(C); *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1989) (quoting *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n. 21 (1976)); see also 40 C.F.R. §§ 1502.1, 1502.8 (agencies must include a "full and fair discussion" of direct, indirect, and cumulative environmental impacts). As the Court concluded in *New York v. NRC*, this means "[u]nder NEPA, an agency must look at both the probabilities of potentially harmful events and the consequences if those events come to pass." 681 F.3d at 478-79 (citing *Carolina Envtl. Study Grp. v. U.S.*, 510 F.2d 796, 799 (D.C. Cir. 1975)). Only if the probability of an environmental impact is so low as to be "remote and speculative," can an agency avoid analyzing the impacts of an action. *Id.* (citing *City of New York v. Dep't of Transp.*, 715 F.2d 732, 738 (2d Cir. 1983) ("The concept of overall risk incorporates the significance of possible adverse consequences discounted by the improbability of their occurrence.")). Thus, the Court held that the NRC must evaluate both the probability and the consequences of environmental impacts resulting from SFP leaks before finalizing the Waste Confidence Decision. In reaching this conclusion, the Court in *New York v. NRC* found NRC's previous analysis of SFP leaks underlying the 2010 waste confidence decision lacking. The Court faulted the NRC for failing to "look forward to examine the effects of the additional time [spent fuel will be held] in storage [pools]," and failing to "examin[e] past leaks in a manner that would allow the Commission to rule out the possibility that those leaks were only harmless because of site- specific factors or even sheer luck." 681 F.3d at 481. The Court went on to fault the NRC for relying on untested improvements to SFPs to conclude leak impacts would be insignificant and relying entirely on monitoring and compliance programs as a buffer against pool degradation. *Id.* The Court then reached the seemingly obvious conclusion, that "[a] study of the impact of thirty additional years of SNF storage must actually concern itself with the extra years of storage." *Id.* Regrettably, the NRC's new SFP leaks analysis in the DGEIS suffers from the same flaws as the vacated 2010 waste confidence decision. Seemingly without regard to NEPA or the *New York v. NRC* Court's decision, the NRC concludes SFP leaks will not have significant impacts without conducting the requisite analyses required by the remand and NEPA. (0897-4-19 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: First, the NRC again fails to evaluate the relevance of past leaks to future risks, other than to say past leaks were not large enough to adversely impact public health. This is exactly the kind of backward-looking thinking the Court disapproved in *New York v. NRC*. As

the Court unequivocally provided, “the harm of past leaks—without more—tells us very little about the potential for future leaks or the harm such leaks might portend.” (0897-4-20 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Second, the NRC again inappropriately relies almost exclusively on compliance programs to support its scientific finding that significant impacts will not occur. See DGEIS at E-9, 4-26 (The NRC states that “stainless-steel liners and leakage-collection systems . . . and . . . monitoring and surveillance of SFP water levels[,] make it unlikely that a leak will remain undetected long enough to exceed any regulatory requirement . . .” and further asserts that required groundwater monitoring provides an additional layer of protection.). As the Court warned the agency in *New York v. NRC*, “merely pointing to the compliance program is in no way sufficient to support a scientific finding that spent-fuel pools will not cause a significant environmental impact during the extended storage time.” See 681 F.3d at 481 (The NRC cannot merely assert that “leaks will not occur because the NRC is ‘on duty.’”). (0897-4-21 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The DGEIS also violates NEPA. It fails to consider many reasonably foreseeable impacts, including off-site impacts that do not exceed the NRC’s radiological exposure limits, on-site impacts, and certain social and economic factors including licensee longevity, property devaluations, and cleanup costs. It also fails to fully evaluate cumulative impacts. See *generally Robertson*, 490 U.S. at 350. (0897-4-23 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The NRC’s SFP leaks impact analysis violates NEPA and the Court’s decision in *New York v. NRC* because it does not evaluate the relevance of past leak events to the probability and consequences of future leaks[.] In its SFP leak impacts analysis, the NRC must “examin[e] past leaks in a manner that would allow the Commission to rule out the possibility that those leaks were only harmless because of site-specific factors or even sheer luck.” *New York v. NRC* 681 F.3d at 481. Without such an examination, the NRC cannot rely on “a finding that past leaks have been harmless [to reach] a conclusion that future leaks at all sites will be harmless as well.” *Id.* But this is exactly what the NRC attempts to do in its DGEIS – it provides a list of past leaks without meaningfully evaluating the circumstances surrounding leak detection or the leak impacts. And, the list is incomplete: the NRC fails to mention significant past SFP leaks at the Yankee Rowe nuclear plant and Brookhaven National Laboratories (“BNL”) that grossly exceeded the U.S. Environmental Protection Agency (“EPA”) drinking water standard of 20,000 picocuries per liter (pCi/l) for tritium. Lochbaum Declaration, pars. 4.3-4.6, 4.7-4.17. The occurrence of these leaks not only undermines the NRC’s conclusion that past SFP leaks were “harmless,” but the fact that such large leaks progressed undetected for years undermines the NRC’s assurances that all future SFP leaks will be detected before causing harm, based on the assumption that existing regulatory requirements are sufficient to meet this goal. NEPA requires a more complete evaluation of the relevance of past leak events to the probability and consequences of future leaks. (0897-5-1 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: [footnote] 12 Not only should the NRC have included a postulated leak analysis, it should have quantified that analysis. The NRC must conduct a quantitative analysis to the extent practicable. See 10 C.F.R. § 51.71(d). A discussion of how a quantitative analysis could have been conducted can be found in the Lochbaum Declaration, pars. 6.32 to 6.34.12 Not only should the NRC have included a postulated leak analysis, it should have quantified that analysis. The NRC must conduct a quantitative analysis to the extent practicable. See 10 C.F.R. § 51.71(d). A discussion of how a quantitative analysis could have been conducted can be found in the Lochbaum Declaration, pars. 6.32 to 6.34. (0897-5-10 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: In conducting a sufficient NEPA analysis, the NRC should have analyzed examples of shut down reactors and the regulatory scheme that applies to them. For example, the Zion and Dresden Unit 1 nuclear plants are shut down and have greatly reduced regulatory programs. Lochbaum Declaration, pars. 7.22-7.36 (At the shutdown Zion nuclear plant, works or inspectors “seeking to ascertain whether ‘spent fuel in a safe condition’ is reasonably assured . . . need only evaluate whether protections against a fuel handling accident and a significant reduction in SFP water inventory are adequate.”) (At the shutdown Dresden reactor the licensee turned off the SFP cooling and cleanup system in 1983 and the owner had no leak detection program or water level inventory program.). The NRC’s claims that leaks will be detected before significant impacts are caused because it is “on duty” not only violate NEPA and the Court’s decision, but they are also untrue. The NRC should have conducted an analysis that discussed regulations and programs that are in place throughout the storage period. And, the NRC should have analyzed the impacts of SFP leaks should these limited regulations and programs not result in prompt leak detection. (0897-5-11 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: NRC’s SFP leaks impact analysis violates NEPA and the Court’s decision in *New York v. NRC* because it fails to meaningfully consider the impacts of additional storage time[.] “[A] proper analysis of the risks [of SFP leaks] would necessarily look forward to examine the effects of the additional time in storage . . .” because the “WCD . . . seeks to extend the period of time for which pools are considered safe for storage.” *New York v. NRC*, 681 F.3d at 481. In vacating the 2010 waste confidence decision, the court held that “[a] study of the impact of thirty additional years of SNF storage must actually concern itself with the extra years of storage.” *Id.* An analysis of the extra storage time is especially relevant, “when the period of time covered by the Commission’s predictions may extend to nearly a century for some facilities.” *Id.* In the proposed rule 10 C.F.R. § 51.23, there is no delineated time frame for storage (“it is feasible to safely store spent nuclear fuel following the licensed life for operation of a reactor”), and as such, it could be indefinite. Regardless of whether NRC claims fuel will only be in pools for 60 years or indefinitely, NRC has not considered the impacts of the additional time in pool storage. While implementation of aging management programs is required by the NRC during a facility’s operating life, and period of extended operation, there is no such requirement during the 60 year post –shutdown period, or beyond. Lochbaum Declaration, pars. 7.37-7.43. As a result, further aging degradation in the absence of such programs will eventually cause an increase in the failure rate of certain plant structures or systems, including SFPs, based on the use of the “bathtub curve.” See Lochbaum Declaration, pars. 7.37, 7.42. The NRC’s SFP leaks analysis fails to explain the increase in failure rate or provide support for its conclusion that extra time in storage will not cause significant impacts if and when future leaks occur. As such, it flies in the face of NEPA and the Court’s decision. (0897-5-12 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: NRC’s analysis violates NEPA because it fails to consider certain reasonably foreseeable significant impacts altogether[.] As discussed at the outset of this Section, the NRC must take a “hard look” at all reasonably foreseeable impacts of the proposed action. 42 U.S.C. 4332(2)(C); *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1989) (quoting *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n. 21 (1976)). Further, as the *New York v. NRC* Court noted, this goes beyond merely looking at human health impacts. 681 F.3d at 481 (noting that “near-term health effects are not the only type of environmental impacts”). NRC’s analysis violates NEPA because it fails to evaluate certain significant impacts altogether and fails to fully consider cumulative impacts related to SFP leaks. As explained in greater detail in the Lochbaum Declaration, the NRC fails to evaluate offsite impacts from leaks when the contamination does not exceed federal radiological standards, onsite leak impacts, and social and economic impacts related to property devaluation and licensee longevity. See *generally* Lochbaum Declaration, Section VIII. For example, in the DGEIS, the NRC considers

radiological impacts “small” if releases do not exceed standards in NRC’s regulations. DGEIS at 4-64, E-18. However, significant environmental impacts can and do occur even with contamination below NRC’s radiological standards. See Lochbaum Declaration, pars. 8.2-8.7 (explaining that while the contamination from the Salem nuclear plant SFP leak has not violated federal standards for drinking water, it resulted in a sizable cleanup cost; and noting an effluent pipe leak at Braidwood nuclear plant in Illinois had significant consequences even though it did not exceed offsite radiological standards—e.g., bottled water was provided to about 420 homeowners and the licensee purchased contaminated property and reimbursed some 14 property owners for devaluations from the leak). The NRC also excludes any analysis of onsite impacts from SFP leaks. DGEIS at E-8 (asserting that onsite impacts are outside the scope of the DGEIS). But significant impacts, such as costly cleanups, could occur onsite for SFP leaks, and should be analyzed in the DGEIS. Lochbaum Declaration, pars. 8.2-8.7 (e.g., an underground pipe leak at New Jersey’s Oyster Creek nuclear plant cost millions of dollars to cleanup even though it remained onsite). (0897-5-13 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: In addition, an assessment of the foreseeable impacts of SFP leaks on surface waters must also consider the potential for such leaks to interfere with recreational enjoyment of such waters (such as swimming, fishing, boating, etc.), with regard to the fact that such waters may be legally designated as suitable for such purposes by State agencies. (0897-5-16 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: NRC’s analysis of past leaks in Tables E-4 and E-5 is incomplete[.] As discussed above, the NRC must look at both the probability and consequences of SFP leaks. *New York v. NRC*, 681 F.3d at 478-79 (citing *Carolina Env’tl. Study Grp. v. U.S.*, 510 F.2d 796,799 (D.C. Cir. 1975)). To do this, the NRC claims to have looked at past leaks to “establish a baseline for the analysis of future impacts and provide context to those impacts.” DGEIS at E-19. Information about the occurrence of past leaks is contained entirely within Table E-4 in the DGEIS, which lists 16 past leaks at 13 reactors sites. DGEIS at E-20. However, this table is incomplete, and fails to discuss the BNL and Yankee Rowe nuclear plant SFP leaks. Without assessing these leaks, the DGEIS underestimates the prevalence of past leaks and thus the likelihood of future leaks. See Lochbaum Declaration, par. 4.2. These omitted leaks have important implications (discussed below) and must be considered. (0897-5-2 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: NRC’s analysis violates NEPA because it fails to consider relevant measures to mitigate adverse environmental consequences of SFP leaks[.] NEPA mandates that in undertaking environmental reviews, agencies must “discuss the extent to which adverse effects can be avoided” so that “the agency [and] other interested groups and individuals can properly evaluate the severity of the adverse effects.” *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 351-52 (1989) (citations omitted).²¹ [footnote 21 text: See also *id.* (“One important ingredient of an EIS is the discussion of steps that can be taken to mitigate adverse environmental consequences. . . Implicit in NEPA’s demand that an agency prepare a detailed statement on ‘any adverse environmental effects which cannot be avoided should the proposal be implemented,’ is an understanding that the EIS will discuss the extent to which adverse effects can be avoided. More generally, omission of a reasonably complete discussion of possible mitigation measures would undermine the ‘action forcing’ function of NEPA. Without such a discussion, neither the agency nor other interested groups and individuals can properly evaluate the severity of the adverse effects. . . Recognizing the importance of such a discussion in guaranteeing that the agency has taken a ‘hard look’ at the environmental consequences of proposed federal action, CEQ regulations require that the agency discuss

possible mitigation measures in defining the scope of the EIS, in discussing alternatives to the proposed action, and consequences of that action, and in explaining its ultimate decision.”] Without such a discussion, it is patent that the agency has failed to take the requisite “hard look” at the environmental consequences of a proposed action. *See id.* Regulations implementing NEPA are likewise instructive. In particular, federal regulations require that reviewing agencies consider and assess mitigation measures in an EIS. 40 C.F.R. § 1508.25(b)(3); *see also* 10 CFR Part 51, Subpart A, App. A (“appropriate mitigating measures of the alternatives will be discussed”). These regulations define mitigation as: (a) Avoiding the impact altogether by not taking a certain action or parts of an action. (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment. (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action. (e) Compensating for the impact by replacing or providing substitute resources or environments. (0897-5-20 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Yet, the DGEIS fails to include an assessment of all relevant measures that may mitigate adverse environmental consequences of future SFP leaks and any contamination of the environment resulting therefrom. Various feasible measures are available that could avoid, minimize, rectify, reduce, or eliminate the environmental impacts of future radiological SFP leaks and contamination associated with such leaks. The EIS should include an assessment of the feasibility and efficacy of all reasonable measures to mitigate the impacts of future SFP leaks on the environment, including, but not limited to, the following: • Immediate clean-up activities associated with groundwater contamination resulting from SFP leakage. NRC must fully consider the degree and extent to which immediate clean-up activities may reduce environmental impacts of future SFP leakage. In particular, NRC must assess the feasibility and efficacy of extracting (via extraction wells) any contaminated groundwater, treating and/or excavating any contaminated soil, and any other remedial clean-up measures that could address contamination resulting from future SFP leaks. For example, NRC must analyze the degree to which groundwater extraction may prevent the migration of radiological contamination into adjacent surface waters and thereby avoid impacts to aquatic ecologies. Notably, NRC should not simply accept, or draw conclusions based upon, activities licensees may have (or have not) already taken in response to previous radiological leakage and groundwater contamination circumstances. Instead, NRC should evaluate the efficacy of groundwater extraction, soil remediation, and other clean-up measures on an independent basis. • Mandatory comprehensive groundwater monitoring. NRC must assess the efficacy of *mandatory* groundwater monitoring for minimizing the environmental harm of any future SFP leaks. NRC currently has no plans to impose any such mandatory requirements, but instead continues to rely on a purely voluntary industry program.²² [footnote 22 text: SECY-11-0019, Policy Issue, Senior Management Review of Overall Regulatory Approach to Groundwater Protection, (February 9, 2011), *available at*, <http://www.nrc.gov/reading-rm/doccollections/commission/secys/2011/2011-0019scy.pdf>, at 3-4.] The benefits of mandatory monitoring are patent. Mandatory, as opposed to voluntary, monitoring can potentially assist in minimizing the impacts of potential future SFP leaks, and, therefore, must be fully considered in the DGEIS.²² SECY-11-0019, Policy Issue, Senior Management Review of Overall Regulatory Approach to Groundwater Protection, (February 9, 2011), *available at*, <http://www.nrc.gov/reading-rm/doc-collections/commission/secys/2011/2011-0019scy.pdf>, at 3-4. (0897-5-21 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: • Preventative measures to proactively find SFP leaks before they occur and potentially cause measureable environmental impacts. The degree to which licensees are currently committed to, or will be required to, inspect SFPs is suspect. *See* Lochbaum

Declaration at Paragraphs 6.38-6.44, 7.13-7.25, 7.33-7.35, 9.6. NRC must assess the feasibility and efficacy of mandatory regular inspections of SFPs during the post- operation pool storage timeframes. NRC should consider the practicality and usefulness of physical/mechanical inspections of SFP liners, walls, floors, transfer canals, and other portions, at recurring frequencies. To the extent spent fuel is too densely packed to allow for full inspection, NRC must assess the feasibility and efficacy of reducing the density of pools to allow for such full inspections. • Measures to prevent initiation or exacerbation of future SFP leaks. NRC should analyze the feasibility and efficacy of measures that could be undertaken to enhance the integrity or robustness of SFP structures and prevent the initiation or exacerbation of SFP leaks. NRC should consider newer technologies, materials, or “upgrades” that may minimize the potential for SFP leaks and environmental contamination as a result thereof. For example, NRC should consider whether existing SFPs have “tell-tale” drain collection systems that prevent environmental harm, and, to the extent SFPs do not have such systems, the efficacy of retrofitting SFPs with such systems. NRC should also consider the impacts of new seismological information on the integrity of SFPs in the event of earthquakes in the future and available “upgrades” to account for such circumstances. • Preventative measures to proactively prevent future leaks from leaking non-SFP components. NRC must assess the steps that it could take to prevent or reduce future leaks from non-SFP components (e.g., other plant systems, structures, and components such as buried pipes), which, if not addressed are likely to result in cumulative environmental impacts in conjunction with future SFP leaks. NRC should also consider all reasonable measures that licensees could take to reduce or minimize the likelihood of future component leaks and impacts to groundwater, such as the feasibility and efficacy of moving buried pipes and structures above-ground so as to be able to better monitor such components, and substantially increasing the number of inspections of components that are known to be prone to leakage. (0897-5-22 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: • Measures to mitigate impacts to aquatic ecologies in adjacent affected waterways. NRC must give due consideration to the fact that aquatic ecosystems may be exposed to contamination from SFP leaks for centuries. Even low levels of any such contamination may result in impacts over time. Therefore, NRC must fully assess all measures that will minimize environmental harm to aquatic ecologies resulting from radiological SFP leaks. This includes, but is not limited to, an assessment of the feasibility and efficacy of enhanced/robust environmental monitoring of the impacts of future SFP leaks to these ecosystems. NRC cannot simply assume that existing NRC radiological effluent and environmental monitoring programs are adequate to capture all environmental impacts that may occur as a result of future SFP leaks. NRC should consider the degree to which enhanced programs will be able to more accurately detect any impacts, and, therefore assist in minimizing environmental harm. NRC should consider a wide portfolio of monitoring measures that licensees may not currently undertake, including, but certainly not limited to, the analysis of fish bone and shellfish shells in order to monitor for certain “bone seeking” radionuclides such as strontium-90, the sampling of benthic organisms, sampling at additional control locations, sampling of specific species as opposed to only opportunistic sampling, sampling more frequently, and sampling of additional analyses to ensure detection of particular radionuclides. • Measures to increase public access to information concerning future SFP leaks and groundwater contamination that occurs as a result. NRC must fully analyze the extent to which more openness and transparency regarding SFP leaks and groundwater contamination will reduce environmental impacts. That is, an assessment of the significance of an environmental impact includes the degree to which it is highly controversial. 40 C.F.R. § 1508.27(b). To the extent SFP leaks may be considered controversial,²³ [footnote 23 text: For example, since leaks at Indian Point were “discovered,” there has been a high level of public concern, which continues today. See Liquid Radioactive Release Lessons Learned Task Force Final Report,

September 1, 2006, at ii, *available at*, ADAMS Accession No. ML062650312.] they are “significant” as contemplated by NEPA. Thus, measures to alleviate public concern would assist in minimizing the overall impacts of any future SFP leaks. Accordingly, NRC should consider mitigation measures related to openness and transparency in relation to SFP leaks. For example, NRC should consider the feasibility and efficacy of full and regular public disclosure and publication of licensee radiological groundwater monitoring results to keep the public fully informed of existing circumstances. This is in relation to any results that are not already currently made publicly available via NRC’s ADAMS. NRC should contemplate the usefulness of such disclosures as results are generated, i.e., on a monthly or quarterly basis, depending on specific circumstances. In addition, measures to provide the public with easier access to site-specific annual radiological monitoring reports, which are available in NRC’s document system, ADAMS, should also be considered. NRC has the unequivocal obligation to *consider and discuss* relevant mitigation options that are available, and to weigh the costs and benefits of such options. *See Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 351-52 (1989). Thus, pursuant to the basic tenets of NEPA, NRC must assess the foregoing measures, as well as any and all other relevant potential mitigation measures. (0897-5-23 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: NRC also fails to discuss the actual probability of past leaks in its analysis of future leaks. NRC asserts that SFP leaks “seldom occur due to stringent design features and operational controls.” DGEIS at E-9. This is blatantly false. SFP leaks occur often, as demonstrated by NRC’s own chart acknowledging that at least 16 leaks have occurred at 13 reactor sites (out of approximately 100), and also by the above discussion of several leaks that NRC failed to consider. *See* DGEIS at E-20. Basic math tells us that more than 10-15% of SFPs in the United States have already leaked. And those are just the leaks that have been detected. As discussed in the following subsection it is clear that many leaks go undetected for long periods of time and as such, it is reasonably likely that additional leaks are occurring or have occurred at operating reactors that are currently unknown to the NRC. (0897-5-3 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: NRC does not discuss the circumstances and implications of past leaks[.] Not only does the NRC fail to fully consider the probability of future SFP leaks as noted above, but the NRC also fails to properly assess the circumstances within which past leaks were detected, and the environmental and economic impacts of past SFP leaks (including those leaks listed in Table E-4, the BNL leak, and the Yankee Rowe leak). NEPA requires such consideration. *See New York v. NRC*, 681 F.3d at 478-79 (citing *Carolina Env’tl. Study Grp. v. U.S.*, 510 F.2d 796, 799 (D.C. Cir. 1975)). “Only if the harm in question is so ‘remote and speculative’ as to reduce the effective probability of its occurrence to zero may the agency dispense with the consequences portion of the analysis.” *New York v. NRC*, 681 F.3d at 482 (citing *Limerick Ecology Action, Inc. v. NRC*, 869 F.2d 719, 739 (3d Cir. 1989)). As is more fully set forth in the accompanying Lochbaum Declaration, many past leaks directly refute the NRC’s underlying conclusion in the DGEIS that leaks will be detected promptly and not cause significant harm. For example, the Yankee Rowe and Salem nuclear plant leaks demonstrate how a leak of over 100 gallons per day (gpd) can occur for long periods of time without detection. Lochbaum Declaration, pars. 4.3-4.7, 4.18-4.23. Each of these leaks caused harm. Lochbaum Declaration, pars. 4.3-4.7, 4.18-4.23 (at Yankee Rowe “approximately two million gallons of radioactively contaminated water leaked for perhaps as long as three years before [the leak] was detected,” with nearby surface water having tritium concentrations of over 1,000,000 pCi/L) (the Salem leak leached into surrounding soil and groundwater below the reactor site, causing the need for a massive cleanup in which, so far, “over 28 million gallons of groundwater have been recovered and processed”). Leaks at BNL and Indian Point demonstrate that smaller leaks

can likewise go undetected and contaminate the environment. Lochbaum Declaration, pars. 4.7-4.17, pars. 4.24-4.31 (the BNL leak went undetected for 12 years and contaminated groundwater, causing tritium levels between 2 and 32 times the federal drinking water standard) (at Indian Point, a leak went undetected, leaching into the soil and groundwater for about 2 years and resulting in exceedances of drinking water standards for tritium and strontium-90). The NRC failed to consider the consequences of these, or any other leaks listed in Table E-4, in its SFP leaks analysis. (0897-5-4 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Moreover, the NRC does not describe how the leakage was ultimately detected for any of the SFP leak events listed on Table E-4 in the DGEIS. Lochbaum Declaration, pars. 4.3-4.17. As noted in the Lochbaum Declaration, several of the SFP leaks (including Salem, BNL, and Indian Point) were detected by “sheer luck.” Lochbaum Declaration, pars. 4.7-4.17, 4.18-4.23, 4.24-4.31 (at Salem, because of a clog in the leak detection system, a 100 gpd leak went undetected until water from the leak seeped through concrete and formed a puddle on the floor of an adjacent building at the reactor site) (at BNL, despite discovering contamination in the groundwater in the 1980s, a SFP leak was not detected in four inspections or through water level monitoring for 12 years; eventually, during a fifth test in 1997, the leak was discovered) (at Indian Point, a SFP leak that started in the 1990s went undetected for years until it was discovered during the investigation of a subsequent leak in 2005; the 2005 leak was only discovered when workers noticed moisture forming on a concrete wall during construction related excavation). Before concluding that future leaks will not cause significant environmental impacts, the NRC was required to consider the impacts of past leaks and describe how past leaks were detected. It failed to do so. And, because of that failure it could not then assess whether past detection methods can ensure that future leaks will likewise be detected. In fact, as described above, many past leaks were discovered literally by accident, or due to random occurrences that were entirely unconnected to NRC regulatory requirements and controls in place at the time. Common sense dictates that the thorough, careful analysis of past leaks required by NEPA must necessarily examine how the past leaks were detected, in order to determine whether existing and future controls are sufficient. Because the NRC cannot reasonably rely on luck, NEPA requires it to analyze impacts of future leaks that go undetected. Without such an analysis, the DGEIS violates NEPA and the Court’s order in *New York v. NRC*. (0897-5-5 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The NRC’s SFP leak impacts analysis violates NEPA and the Court’s decision in *New York v. NRC* because it inappropriately relies almost entirely on compliance programs to support its scientific finding that significant impacts will not occur[.] In the DGEIS, the NRC concludes that leaks will be prevented and detected before causing significant impacts. DGEIS at xxxvii, 4-26, E-9–10, E-15–16. To reach this conclusion, (a) the NRC claims that all leaks of greater than 100 gallons per day will be promptly detected, and (b) the NRC relies on inapplicable leak detection regulations, voluntary programs, and programs that are substantially reduced in scope after reactors shut down. NRC cannot, without more, simply assert that “leaks will not occur because the NRC is ‘on duty.’” *New York v. NRC*, 681 F.3d at 481. Relying almost entirely on monitoring and regulatory compliance programs, many of which are inapplicable once a reactor shuts down, to conclude that future leaks will be detected before causing significant impacts is not sufficient. See *id.* (Despite NRC’s enforcement and inspection efforts, “merely pointing to the compliance program is in no way sufficient to support a scientific finding that SFPs will not cause a significant environment[al] impact during the extended storage period.” This is especially true when the NRC’s predictions span nearly a century at certain facilities.). NEPA requires the NRC to consider the reasonably foreseeable impacts that could result if these monitoring and regulatory compliance programs fail to detect a significant leak. (0897-5-6 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The NRC fails to explain the importance and usefulness of its 100 gallon per day leak detection threshold[.] In the DGEIS, the NRC claims that leaks equal to or greater than the average evaporation rate, 100 gallons per day (gpd), will be promptly detected—100 gpd is the average SFP evaporation rate. DGEIS at E-10 (According to the DGEIS, “[t]o go undetected, a leak would need to be less than the fluctuations in water level of a SFP lost to evaporation.”). This assumption, however, is simply not true. As noted above in Section VI.D.1.B, leaks great than 100 gpd have gone undetected by monitoring systems in the past for long periods of time (e.g., the Yankee Rowe leak, which went undetected for somewhere between 1 and 3 years, and released 2 million gallons of contaminated SFP water; the Salem leak which went undetected for a long period of time due to a clog in the telltale drain of the leak detection system). Lochbaum Declaration, pars. 4.4-4.5, 4.21. And, the NRC did not even evaluate leaks less than 100 gpd. As described above, past leaks of less than 100 gpd have also gone undetected for long periods of time (e.g., the Indian Point leaks went undetected for long periods of time, including one for over 2 years in the 1990s; the BNL leak went undetected for 12 years despite abnormally high tritium levels in the groundwater and repeated SFP tests). Lochbaum Declaration, pars. 4.17, 4.25. The NRC’s claim that it is on duty and that it will promptly detect leaks of over 100 gpd and that lesser leaks will not cause significant impacts is unsupported. Because past leaks have occurred both above and below the threshold, it is reasonably foreseeable that similar leaks could occur in the future. NEPA requires the NRC to analyze the impacts of such future leaks in its DGEIS. (0897-5-7 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The NRC improperly relies on inapplicable regulations, voluntary programs, and programs that are greatly reduced in scope after reactors shut down[.] In concluding that all leaks will be detected before causing significant impacts, the NRC repeatedly relies on inapplicable and voluntary compliance and monitoring programs. See Lochbaum Declaration at Sections VI and VII. For example, the NRC claims SFP water levels are being “constantly measured by instrumentation.” DGEIS at E-10. This is false. Water level instrumentation is not required to be in pools at all times; rather, it is required only during the short time when spent fuel is being moved. Lochbaum Declaration, par. 6.19. The NRC also claims that licensees are required to perform groundwater monitoring at reactor sites for support of its conclusion that leaks are unlikely to migrate off site. DGEIS at E-10. This is also false. The NRC has no general groundwater monitoring requirements, either for operating reactors or decommissioning reactors. Lochbaum Declaration, par. 6.40. To support its claim, the NRC relies on the Decommissioning Planning Rule (DGEIS at E-5, E-8); however, that rule allows licensees to choose whether or not to conduct groundwater monitoring. Lochbaum Declaration, Section VI.D, par. 6.41. And the NRC relies on the Groundwater Protection Initiative as support for its conclusions about SFP leaks. DGEIS at E-6. Unfortunately, the Groundwater Protection Initiative is voluntary and as such, cannot be relied upon to ensure future leaks will be promptly detected. Lochbaum Declaration, pars. 6.42-6.44 (noting further that this voluntary program has only been audited at operating reactors, never at shutdown reactors). Further, there is no requirement that licensees analyze a postulated leak of any magnitude of contaminated water from a SFP, even though that type of NRC requirement exists in other contexts (e.g., during the licensing process for the liquid waste management system).¹² [footnote 12 text: Not only should the NRC have included a postulated leak analysis, it should have quantified that analysis. The NRC must conduct a quantitative analysis to the extent practicable. See 10 C.F.R. § 51.71(d). A discussion of how a quantitative analysis could have been conducted can be found in the Lochbaum Declaration, pars. 6.32 to 6.34.] Lochbaum Declaration, pars. 6.25-6.30. Because these programs are voluntary or inapplicable, NRC has no basis for relying on them to conclude that leaks will be detected before causing significant impacts. (0897-5-8 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: In support of its conclusion, NRC also assumes that current monitoring requirements, oversight procedures, and other programs will remain effective after reactors shut down. DGEIS at 1-15, 1-17, E-4. This assumption is unsound because the scope of many of these requirements, procedures, and programs will be greatly reduced. Lochbaum Declaration, par. 7.2. For example, shut down reactor licensees do not receive important safety communications and enforcement orders that are issued to operating reactor licensees. Lochbaum Declaration, Pars. 7.3-7.10 (e.g., after the March 2011 Fukushima disaster in Japan, an order requiring installation of monitoring equipment at SFPs was sent to reactor licensees, but no record of the order exists for the shutdown Zion nuclear power reactors). Similarly, NRC relies upon the Maintenance Rule to ensure leak detection. DGEIS at E-5. However, it is greatly reduced in scope after reactors shut down. Lochbaum Declaration, pars. 7.20-7.21 (Under the Maintenance Rule, “licensees can and do legally omit structures, systems, and components needed to detect and mitigate SFP leaks . . . from the scope of their maintenance programs.”). NRC also relies on its aging management program to ensure SFPs remain structurally sound during storage. DGEIS at E-5. However, that program, like so many others, is reduced in scope after reactors shut down. Lochbaum Declaration, pars. 7.37-7.43 (explaining that aging management is only required during the period of extended operation, not throughout the entire 60-year storage period). The NRC’s analysis fails to evaluate how this reduction in aging management protects against the bathtub curve effect—demonstrating an increase in failure rate over time. Lochbaum Declaration, par. 7.42. (0897-5-9 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: David Lochbaum’s declaration shows that NRC relies on nonexistent or inapplicable regulatory requirements to prevent or detect future leaks at decommissioned reactors. Given the large volume and radioactivity of some undiscovered pool leaks in the past, and given NRC’s failure to show that they will be detected and prevented in the future, environmental impacts of pool leaks are significant. (0897-7-4 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The conclusion in the WC DGEIS that spent fuel pool leak impacts are insignificant is based on three key assumptions. First, the WC DGEIS assumes that any leak rate greater than 100 gallons per day (gpd) will be readily detected. The NRC explains the basis for this assumption in the WC DGEIS as follows: *Based on operational experience, the model leak used for analysis here is assumed to correspond to a leak rate of approximately 380 L/day (100 gpd). . . . In analyzing the impacts of a spent fuel pool leak, the NRC assumed a leak rate similar to the rate of water lost due to evaporation, which would effectively double the makeup rate to the spent fuel pool. A leak of this magnitude would likely be identified in an expeditious manner because of licensee monitoring and surveillance.* (NRC 2013b, page E-10, lines 9-14) As discussed in Sections IV, V and VI below, this assumption is flawed because past spent fuel pool leaks suggest that leaks of up to and perhaps greater than 100 gallons per day may not be detected within weeks, months, or even years. Licensees are not even legally required to have functioning spent fuel pool water level instrumentation or groundwater monitoring systems during the 60-year short-term storage period, except during very limited and special situations. In addition, this assumption is not supported by any evaluation showing that leaks smaller than 100 gallons per day would be detected before causing significant impacts. (0899-1-1 [Curran, Diane] [Lochbaum, David])

Comment: 4.21 The leak was finally detected when water leaked through a concrete wall and puddled on the floor of an adjacent room. Thus, the leak of up to 100 gallons per day from the Salem spent fuel pool was *not* detected by the spent fuel pool water level instrumentation or the system installed specifically to detect such leakage. (Salem was an operating reactor at the time

with hundreds of workers present to limit the amount of time the puddle remained undetected. Had Salem instead been in the short-term storage period, it is less certain that the much smaller work force making far less frequent trips through the permanently closed plant would have found this leak as quickly. The WC DGEIS must explicitly identify the regulatory requirements that remain in place during the 60-year short-term storage period that provide reasonable assurance that future leaks similar to the Salem spent fuel pool leak--or worse---cannot result in significant impacts.) 4.22 Making matters worse, the leak detection system at Salem not only failed to promptly detect leakage from the spent fuel pool, it caused that leakage to reach the environment and contaminate surrounding soil. Had the leak detection system not become blocked, water leaking from the spent fuel pool would have flowed through the tell-tale drain lines to a collection tank. The leakage would have been monitored and stored in a tank specifically designed to hold radioactively contaminated water. Instead, the radioactively contaminated water leaked through concrete walls into the neighboring soil. 4.23 The State of New Jersey compelled Salem's owner to remediate the contaminated soil. On February 16, 2005, workers began pumping water out of extraction wells at the Salem site. The campaign was to process this groundwater to remove radioactivity from it, essentially recovering the radioactivity that had leaked from the spent fuel pool. As of September 2011, over 28 million gallons of groundwater had been recovered and processed (Arcadis, 2012). It represents 28 million reasons not to believe that spent fuel pool leaks will be detected before causing significant impact. (0899-1-10 [Curran, Diane] [Lochbaum, David])

Comment: D. Indian Point leaks[.] 4.24 Leaks from the spent fuel pools at two of the three reactors at the Indian Point nuclear plant in New York are listed in Table E-4 of the WC DGEIS, but their circumstances are not discussed in much detail. As with the other leaks discussed above, the Indian Point leaks contradict the WC DGEIS in important ways. 4.25 The owner of the Indian Point nuclear plant in New York informed the NRC about leakage from the Unit 2 spent fuel pool (SFP) in the 1990s: *It is believed that SFP water leaked out of the construction joint at a rate of about 50 gallons per day for about 2 years, leaking into the underlying ground water.* (Entergy 2008) 4.26 Workers inadvertently punctured the stainless steel liner inside the Indian Point Unit 2 spent fuel pool while modifying the storage racks for spent fuel inside the pool. The hole was repaired, but water collected in the space between the liner and the concrete walls and floor of the pool. The plant's owner estimated that approximately 36,500 gallons of radioactively contaminated water flowed from this location to a construction joint (seam) in the concrete. Water leaked past this joint into the soil and "underlying groundwater" (Entergy 2008, page 2). 4.27 This leak remained undetected until another leak from the same spent fuel pool was discovered in 2005. At that time, workers were excavating the ground outside the Unit 2 fuel handling building and noticed moisture forming on the exposed concrete wall. That discovery prompted an investigation that revealed this ongoing leak through the concrete wall and led to the discovery of the earlier leak through the construction joint (Entergy 2008). (0899-1-11 [Curran, Diane] [Lochbaum, David])

Comment: 4.28 The leak rate of water from the spent fuel pool through the construction joint was estimated to be 50 gallons per day. That leak remained undetected while it was occurring--the leak was only identified and quantified long after the fact. For the WC DGEIS, the NRC assumed that a leak rate of 100 gallons per day would be readily detected. But the NRC failed to evaluate a longstanding leak of less than 100 gallons per day. In other words, if this undetected leakage of 50 gallons per day had continued leaking throughout the 60-year short-term storage period instead of only two years, it might have resulted in significant impacts. 4.29 In addition, according to a recent evaluation by a consultant retained by Indian Point's owner, leakage from the Unit 2 spent fuel pool may be continuing at a rate of between 10 and 30 gallons per day (GZA 2012, footnote 6). If such leakage persists for 60 years, 219,000 to

657,000 gallons will leak. The inability to determine whether past leakage has been stopped also casts considerable doubt on the ability to definitively conclude whether future leakage has started. After all, contamination measured in a groundwater well can easily be attributed to the old source and not initiate an investigation for a new, and perhaps more significant, source. 4.30 Such masking factored heavily into the reactor vessel head degradation near-miss at the Davis-Besse nuclear plant when workers and the NRC misdiagnosed boric acid accumulation on the outer surface of the reactor vessel head as coming from control rod drive mechanism flange leakage, a recurring problem at this site across several years. When later leakage occurred through the control rod drive mechanism itself--a significantly larger potential hazard--the owner and the NRC missed opportunities to detect and correct it in a timely manner. Boric acid accumulation was falsely blamed on the old, recurring benign source instead of to the new, emerging malignant source (NRC 2002). 4.31 The WC DGEIS fails to conclusively show either that smaller leak rates (e.g., less than 100 gallons per day) can be detected in a timely manner or that smaller leaks cannot possibly result in significant impact. The WC DGEIS must explicitly identify the regulatory requirements that remain in place during the 60-year short-term storage period that provide reasonable assurance that future leaks similar to the Indian Point spent fuel pool leaks--or worse--cannot result in significant impacts. (0899-1-12 [Curran, Diane] [Lochbaum, David])

Comment: Pattern of Not Discussing Causes of Spent Fuel Pool Leaks in the WC DGEIS[.] 4.32 As discussed above for the Salem and Indian Point spent fuel pool leak events, the NRC does not describe in the WC DGEIS how the leakage was ultimately detected. This is also true for all the other spent fuel pool leak events listed on Table E-4 in the WC DGEIS. Obviously, it is also true for the Yankee Rowe and BNL spent fuel pool leak events since the NRC does not mention them at all in the WC DGEIS. 4.33 By failing to explicitly describe how these past spent fuel pool leaks were detected, the NRC also fails to demonstrate how future spent fuel pool leaks would be discovered. In the WC DGEIS, the NRC must explain how past leaks were detected and identify the regulatory requirements that remain in place during the 60-year short-term storage period that provide reasonable assurance that future leaks will be detected. (0899-1-13 [Curran, Diane] [Lochbaum, David])

Comment: V. THE WC DGEIS FAILS TO PROPERLY CONSIDER THE DIFFICULTIES INHERENT IN SPENT FUEL POOL LEAK DETECTION[.] 5.1 The NRC's analysis for the WC DGEIS of spent fuel pool leak detection is flawed because it fails to consider the inherent difficulties associated with leak detection and because its 100 gallon per day threshold for effective leak detection lacks solid foundation. The WC DGEIS simply fails to demonstrate that leaks with greater or less than 100 gallons per day will be detected before causing significant impacts. 5.2 The NRC assumes in the WC DGEIS that spent fuel pool leakage equal to the average evaporation rate of water from spent fuel pools would be promptly detected and therefore could be promptly stopped and remediated. The WC DGEIS explains the basis for this assumption as follows: *Based on operational experience, the model leak used for analysis here is assumed to correspond to a leak rate of approximately 380 L/day (100 gpd). ...In analyzing the impacts of a spent fuel pool leak, the NRC assumed a leak rate similar to the rate of water lost due to evaporation, which would effectively double the makeup rate to the spent fuel pool. A leak of this magnitude would likely be identified in an expeditious manner because of licensee monitoring and surveillance.* (NRC 2013b, page E-10, lines 9-14) 5.3 This assumption is flawed in the following respect. When a spent fuel pool leaks onto the floor or into a surrounding plant area, the puddle formed helps assure timely detection (see paragraph 4.21 of this declaration for such an example). But when a spent fuel pool leaks into the ground, detection becomes more complicated and timely detection less certain (see paragraphs 4.25 to 4.28 of this declaration for such an example). As the NRC noted in a separate study on leaks of

radioactively contaminated water into the groundwater: *SFP [spent fuel pool] leak detection may require special techniques since SFPs have an evaporation rate up to several hundred gallons per day. This evaporation rate may mask small leaks in the SFP liner and make small leakage rates difficult to detect by evaluation of make-up rates within a water balance calculation. (NRC 2006a, page 6) (0899-1-14 [Curran, Diane] [Lochbaum, David])*

Comment: 5.4 In the WC DGEIS, the NRC assumes that the spent fuel pool will leak at a rate equal to an evaporation rate of 100 gallons per day. As discussed in paragraph 4.5 of this declaration, the leak rate at the Yankee Rowe plant significantly exceeded 100 gallons per day and yet remained undetected until two million gallons had been released. But the NRC neither lists this reported leak in Table E-4 of the WC DGEIS nor discusses it anywhere within the report. The Yankee Rowe leak undermines-if not totally refutes-the validity of the NRC's assumption that spent fuel pool leaks of 100 gallon per day or greater would be discovered in a timely manner. 5.5 Likewise, potential leakage of 100 gallons per day from spent fuel pool at Salem might not have been detected in a timely manner (see paragraphs 4.19 to 4.21 of this declaration). 5.6 Thus, the WC DGEIS is flawed because the NRC wrongly assumes that spent fuel pool leaks of 100 gpd and larger would be detected and stopped in a timely manner and that the leaked water would pose no significant impacts. 5.7 The WC DGEIS is also flawed because it fails to show that spent fuel pool leak rates of less than 100 gpd will be detected before causing significant impacts. As previously described in paragraphs 4.7 to 4.17 of this declaration, workers eventually discovered that the spent fuel pool at BNL had been leaking at a rate of 6 to 9 gallons per day for over a decade. Four prior spent fuel pool leak tests at BNL failed to properly account for evaporation rates and missed opportunities to detect a leak. And as discussed in paragraph 4.29 above, the Unit 2 spent fuel pool at the Indian Point nuclear plant may still be leaking at 10 to 30 gallons per day. 5.7 The WC DGEIS cannot summarily dismiss that significant impacts might result from spent fuel pool leaks smaller than 100 gallons per day. Instead, the NRC must either (a) show that smaller leaks cannot result in significant impacts even when undetected throughout the 60-year short-term storage period, or (b) identify the regulatory requirements providing reliable assurance that a smaller leak would be detected before it has significant impact. The WC DGEIS cannot merely wish significant impacts away. 5.8 A showing that smaller leaks for prolonged periods cannot result in significant impacts could be made by evaluating potential consequences from the most vulnerable location (i.e., the site where leakage is most likely to have significant impacts due to factors such as the geology, hydrology, population demographics, etc.) against acceptance criteria coupled with confirmatory checks before reactors enter the 60-year short-term storage period that the sites are not more vulnerable. An alternative to this bounding evaluation would be a regulatory requirement that all licensees conduct site-specific evaluations prior to their reactors enter the 60-year short-term storage period. (0899-1-15 [Curran, Diane] [Lochbaum, David])

Comment: THE WC DGEIS RELIES ON INCORRECT ASSUMPTIONS ABOUT THE COVERAGE AND APPLICABILITY OF MONITORING REQUIREMENTS[.] 6.1 In concluding that spent fuel pool leaks will be detected in a timely manner, the WC DGEIS relies on the current existence and continuing applicability of a robust set of regulatory requirements for monitoring spent fuel pool water levels and monitoring the groundwater at the site for radioactive contamination, as well as maintenance of spent fuel pools. These assumptions are simply wrong. The requirements are neither robust nor continuing. Even during the more vigilant period of reactor operation, the key requirement on which NRC relies-monitoring of spent fuel pool water levels-applies only in very limited circumstances. And there is no requirement in NRC regulations at all for regular groundwater monitoring during reactor operation and after the reactor permanently shuts down. While the nuclear industry has developed a voluntary groundwater monitoring program, such voluntary measures could be terminated at any time, at

the discretion of the industry. And while NRC inspectors have audited the implementation of the voluntary measures at reactors that are presently operating, they did not audit the measures at the reactors that have already permanently shut down and have no stated plans to conduct further audits anywhere. Therefore, the NRC has no basis for relying on these voluntary measures during the 60-year short-term storage period. Thus, a close look shows that the assumption in the WC DGEIS about strong regulatory oversight—an essential underpinning of the NRC's risk and impact prediction for spent fuel pool leaks—is tenuous at best and an illusion at worst. (0899-1-16 [Curran, Diane] [Lochbaum, David])

Comment: Limited Spent Fuel Pool Water Level Monitoring Requirements[.] 6.2 According to the WC DGEIS, during the short-term storage period: *Significant short-term water loss from a spent fuel pool is likely to be identified due to licensee monitoring of spent fuel pool water levels.* (NRC 2013b, page E-9). But this conclusion is undermined by gaps in the NRC's regulatory requirements governing spent fuel pool water level monitoring. 6.3 When the NRC issues an operating license for a nuclear power reactor, an appendix to the license contains the technical specifications. The technical specifications establish the minimum complement of equipment needed for safety, the testing and inspections required to assure reliability of this equipment, and the remedial measures to be taken when necessary equipment is unavailable. 6.4 The NRC developed Standard Technical Specifications for reactors designed by the different vendors (e.g., Westinghouse, Combustion Engineering, Babcock & Wilcox, and General Electric). Many owners have formally obtained NRC permission to tailor the Standard Technical Specifications to their reactors. In any case, the custom technical specifications for the remaining reactors are comparable in technical content; the primary difference being in the organization and presentation of that technical content. 6.5 The minimum complement of equipment is defined by Limiting Conditions for Operation (LCOs) and applicability statements. For example, an LCO might require two safety pumps to be available when the reactor is operating but only one safety pump when the reactor is shut down. (0899-1-17 [Curran, Diane] [Lochbaum, David])

Comment: 6.6 LCO 3.7.8 of the NRC's Standard Technical Specifications covers the minimum water level necessary for safety in the boiling water reactors manufactured by General Electric: LCO 3.7.8 *The spent fuel pool water level shall be > [23]⁹* [footnote 9 text: The number in brackets is a convention used within the Standard Technical Specifications to denote a value determined by reactor-specific calculations. For the majority of reactors, the bracketed value will be retained—for some reactor, the site-specific value may be slightly higher or lower as dictated by individual designs.] ft over the top of irradiated fuel assemblies seated in the spent fuel storage pool racks. (NRC 2012b, page 3.7.8-1) 6.7 The associated applicability statement defines when the water level must satisfy this LCO: *APPLICABILITY: During movement of irradiated fuel assemblies in the spent fuel storage pool.* (NRC 2012b, page 3.7.8-1) 6.8 Thus, there is a regulatory requirement that the water level be above a certain level in the spent fuel pool only when irradiated fuel assemblies are being moved within the pool. 6.9 The reason for this minimum spent fuel pool level and when it is applicable is described in the Bases document developed by the NRC for the General Electric Standard Technical Specifications: *BACKGROUND The minimum water level in the spent fuel storage pool meets the assumptions of the iodine decontamination factors following a fuel handling accident.* (NRC 2012c, page B 3.7.8-1) *LCO: The specified water level preserves the assumptions of the fuel handling accident analysis. As such, it is the minimum required for fuel movement within the spent fuel storage pool.* (NRC 2012c, page B 3.7.8-1) *APPLICABILITY: This LCO applies during movement of irradiated fuel assemblies in the spent fuel storage pool since the potential for a release of fission products exists.* (NRC 2012c, page B 3.7.8-1) (0899-1-18 [Curran, Diane] [Lochbaum, David])

Comment: 6.10 The minimum spent fuel pool water level requirement protects against radiation released during a fuel handling accident such as when an irradiated fuel assembly drops onto other irradiated fuel assemblies damaging fuel rods and releasing radioactive gases and particles. This exclusive role for the required water level is reinforced by the measures mandated in the Standard Technical Specifications should the requirement not be met: ACTIONS A. *Spent fuel storage pool water level not within limit.* REQUIRED ACTION A.1 *Suspend movement of irradiated fuel assemblies in the spent fuel storage pool.* (NRC 2012c, page 3.7.8-1) 6.11 It is, therefore, not required that the water level in the spent fuel pool be restored to above the minimum level or even that a declining water level be halted--all that is required is that the movement of irradiated fuel assemblies within the spent fuel pool be halted. 6.12 For the minimum spent fuel pool water level requirement specified by LCO 3.7.8 to be satisfied, another provision in the Standard Technical Specifications requires that the instrumentation used to measure the level be functional. Specifically, the definition of OPERABLE¹⁰ [footnote 10 text: The capitalization of this word is a convention used within the Standard Technical Specifications for terms defined within Section 1.1. This convention alerts users to the fact that the terms have explicit meanings.] in Section 1.1, Definitions, of the Standard Technical Specifications states: *A system, subsystem, division, component, or device shall be OPERABLE or have OPERABILITY when it is capable of performing its specified safety function(s) and when all necessary attendant instrumentation, controls, normal or emergency electrical power, cooling and seal water, lubrication, and other auxiliary equipment that are required for the system, subsystem, division, component, or device to perform its specified safety function(s) are also capable of performing their related support function(s).* (NRC 2012b, page 1.1-4) (0899-1-19 [Curran, Diane] [Lochbaum, David])

Comment: The conclusion in the WC DGEIS that spent fuel pool leak impacts are insignificant is based on three key assumptions.[...] Second, the WC DGEIS assumes that: *A strong regulatory framework that includes both regulatory oversight and licensee compliance is important to the continued safe storage of spent fuel.* (NRC 2013b, page B15, lines 27-28)****The analyses in this draft GEIS are based on current technology and regulations.* (NRC 2013b, page 1-17, line 21) As discussed in Section VII below, this assumption is flawed because it relies on regulatory requirements and measures in place for operating reactors without considering the significant reduction in regulatory requirements and oversight that occurs during storage after reactors cease operating. (0899-1-2 [Curran, Diane] [Lochbaum, David])

Comment: 6.13 This definition of OPERABLE applied to LCO 3.7.8 means that REQUIRED ACTION A.1 is invoked whenever the measured water level in the spent fuel pool drops within [23] feet of irradiated (spent) fuel assemblies in the pool's storage racks or whenever the water level instrumentation is unavailable to provide the measured level. 6.14 The relationship between the definition of OPERABLE and the APPLICABILITY statement in LCO 3.7.8 means that the instrumentation used to measure the water level in the spent fuel pool is only required to be available when irradiated (spent) fuel assemblies are being moved in the spent fuel pool. At all other times, the spent fuel pool water level instrumentation can be unavailable (i.e., non-functional) without invoking any out-of-service deadlines or required compensatory actions. 6.15 The NRC's regulatory requirements for water level inside spent fuel pools at pressurized water reactors are comparable: LCO 3.7.15 The fuel storage pool water level shall be > 23 ft over the top of irradiate fuel assemblies seated in the storage racks. (NRC 2012d, page 3.7.15-1) APPLICABILITY: *During movement of irradiated fuel assemblies in the fuel storage pool.* (NRC 2012d, page 3.7.15-1) ACTIONS A. *Fuel storage pool water level not within limit.* REQUIRED ACTION: *Suspend movement of irradiated fuel assemblies in the fuel storage pool.* (NRC 2012d, page 3.7.15-1) BACKGROUND *The minimum water level in the fuel storage pool meets the assumptions of iodine decontamination factors following a fuel handling accident. The*

specified water level shields and minimizes the general area does when the storage racks are filled to their maximum capacity. The water also provides shielding during the movement of spent fuel. (NRC 2012e, page B 3.7.15-1) LCO The fuel storage pool water level is required to be > 23 ft over the top of irradiated fuel assemblies seated in the storage racks. The specified water level preserves the assumptions of the fuel handling accident analysis. (NRC 2012e, page B 3.7.15-1) APPLICABILITY The LCO applies during movement of irradiated fuel assemblies in the fuel storage pool, since the potential for a release of fission products exists. (NRC 2012e, page B 3.7.15-2) (0899-1-20 [Curran, Diane] [Lochbaum, David])

Comment: 6.16 Limiting the applicability of the minimum water level in the spent fuel pool to only when irradiated fuel assemblies are being moved decreases the likelihood that spent fuel pool leakage will be detected. When these LCOs are not applicable (i.e., when irradiated fuel assemblies are not being moved), it is not required that the instrumentation used to monitor the spent fuel pool water level be in service. Consequently, if the spent fuel pool water level instrumentation broke, there would be no regulatory requirement to return it to service. As a practical matter, under current regulations, the water level instrumentation-and the associated audible, visual, and computer alarms that are generated when water level drops too low-could remain out of service until just before the next planned movement of irradiated fuel assemblies within the spent fuel pool. Because irradiated fuel assemblies are seldom moved within the spent fuel pools, especially within spent fuel pools at reactors that have been permanently shut down, the water level instrumentation could be legally out of service for the overwhelming majority of the time. This reality undermines reasonable assurance that a low-volume spent fuel pool leak would be readily detected. 6.17 In the procedure used when examining spent fuel pools at permanently shut down nuclear power reactors, the NRC inspectors are tasked to: *Review and evaluate whether the SFP instrumentation, alarms and leakage detection systems are adequate to assure the safe wet storage of spent fuel.* (NRC 1997, Section 02.02) 6.18 The NRC's Standard Technical Specifications and their Bases define "safe wet storage of spent fuel" as being when at least 23 feet of water exists above the top of the storage racks when irradiated fuel is being moved. When irradiated fuel is not being moved, no regulatory requirement governs the amount of water in the spent fuel pool or the availability of water level instrumentation. Consequently, if an NRC inspector finds the spent fuel pool water level instrumentation out of service or water level inside the pool far below normal, he or she lacks regulatory leverage to compel either condition to be remedied. 6.19 Thus, these LCOs, which are inapplicable during storage because they only apply when spent fuel is being moved, are not supportive of NRC's conclusion that spent fuel pools are being constantly monitored and maintained. The WC DGEIS cannot place much weight on equipment and conditions unless they are required to be in place. (0899-1-21 [Curran, Diane] [Lochbaum, David])

Comment: 4.7 NRC has failed to consider the longstanding leakage of radioactively contaminated water from the spent fuel pool at the Brookhaven National Laboratory (BNL) on Long Island, New York.⁶ [footnote 6 text: The BNL and its spent fuel pool are not licensed or regulated by the NRC. It is regulated by the U.S. Department of Energy (DOE). But this spent fuel pool leak should be known to the NRC, evidenced by the 1997 GAO report residing within the NRC's electronic library.] The BNL leak is important because a leak went undiscovered for over a decade, despite extensive, focused monitoring and inspection programs. The NRC did not consider the BNL spent fuel pool leak in the WC DGEIS and therefore failed to demonstrate how the factors that contributed to the BNL leak remaining undetected for such a prolonged period could not also allow a larger and/or longer leak from a spent fuel pool during the 60-year short-term period following permanent reactor shutdown. 4.8 According to a 1997 report by the U.S. General Accounting Office, now called the Government Accountability Office, (GAO) found within the NRC's Agencywide Documents Access and Management System (ADAMS): *In*

January 1997, ground water samples taken by BNL staff revealed concentrations of tritium that were twice the allowable federal drinking water standards--some samples taken later were 32 times the standard. The tritium was found to be leaking from the laboratory's High Flux Beam Reactor's spent fuel pool into the aquifer that provides drinking water for nearby Suffolk County residents. (GAO 1997, page 1) (0899-1-22 [Curran, Diane] [Lochbaum, David])

Comment: 4.9 The NRC relies on spent fuel pool water level monitoring and groundwater monitoring in concluding in the WC DGEIS that spent fuel pool leaks could not possibly remain undetected for a long period of time. But both these measures failed to prevent such an outcome at BNL: *DOE's and BNL's investigation of this incident concluded that the tritium had been leaking for as long as 12 years without DOE's or BNL's knowledge. (GAO 1997, page 1) Tests conducted after the tritium leak was discovered more accurately accounted for evaporation rates and concluded that the pool was leaking 6 to 9 gallons per day. (GAO 1997, page 10)* 4.10 That the BNL leak remained undiscovered for over a decade clearly illustrates that detection of radioactively contaminated water in monitoring wells or the surrounding soil does not necessarily lead to finding a leaking spent fuel pool. According to the GAO's report: *In January 1997, ground water samples taken by BNL staff revealed concentrations of tritium that were twice the allowable federal drinking water standards--some samples taken later were 32 times the standard. The tritium was found to be leaking from the laboratory's High Flux Beam Reactor's spent fuel pool into the aquifer that provides drinking water for nearby Suffolk County residents. (GAO 1997, page 1) (0899-1-23 [Curran, Diane] [Lochbaum, David])*

Comment: The conclusion in the WC DGEIS that spent fuel pool leak impacts are insignificant is based on three key assumptions.[...] Third and last, the WC DGEIS assumes that potential adverse consequences from spent fuel pool leaks will be minimal. As discussed in Section VIII below, this assumption is not valid because the NRC failed to properly consider consequences like property devaluations and remediation costs that could occur when spent fuel pools leak. (0899-1-3 [Curran, Diane] [Lochbaum, David])

Comment: THE WC DGEIS FAILS TO FULLY AND PROPERLY APPLY EXPERIENCE FROM PAST SPENT FUEL POOL LEAKS IN ASSESSING FUTURE SPENT FUEL POOL LEAK RISKS (0899-1-4 [Curran, Diane] [Lochbaum, David])

Comment: The WC DGEIS fails to include at least two important spent fuel pool leak events: the Yankee Rowe nuclear reactor leak and the Brookhaven National Laboratory leak. By omitting these leaks from the WC DGEIS, NRC has failed to consider all past spent fuel pool leaks and formed an inaccurate picture of the potential for future leaks. (0899-1-5 [Curran, Diane] [Lochbaum, David])

Comment: Yankee Rowe Leak[.] 4.3 The WC DGEIS fails to consider the spent fuel pool leak at the Yankee Rowe nuclear plant in Massachusetts. The Yankee Rowe leak is important because approximately two million gallons of radioactively contaminated water leaked for perhaps as long as three years before it was detected. Some of this radioactive contamination made its way into nearby springs that flow into the Deerfield River. 4.4 The plant's owner reported this leak to the NRC in July 2006 along with other leaks and spills of radioactively contaminated water at the site. The owner's submittal highlighted the spent fuel pool leak: *The most noteworthy release that is believed to be the predominant source of tritium in groundwater, occurred between 1963 and 1965 and involved a leak from the Spent Fuel Pool -- Ion Exchange Pit structural interface. This leak is estimated to have resulted in the release of over two million gallons of water to the soil. Tritium concentrations exceeding 1,000,000 pCi/L were measured in Sherman Spring at the time of the leak. The spring discharges on licensed property and flows*

into the Deerfield River. (YAEC 2006)³ [footnote 3 text: The owner--s report did not indicate whether the water leak from the spent fuel pool or the ion exchange pit or from both places. Regardless, this event demonstrates that radioactively contaminated water can leak at large rates for a long time without being detected--directly contradicting the assumption in the WC DGEIS being challenged in this declaration.] 4.5 This Yankee Rowe leak resulting in measured tritium concentrations exceeding one million picocuries per liter⁴ [footnote 4 text: For context, EPA's regulatory limit for tritium in drinking water is 20,000 picocuries per liter.] with flow into a nearby river should have been evaluated by the NRC in the WC DGEIS. The leak was reported to have occurred between 1963 and 1965--indicating a maximum duration of three years and perhaps lasting less than one year. Two million gallons leaking over a three-year period translates into an average leak rate of 1,826 gallons per day.⁵ [footnote 5 text: Calculated by dividing 2,000,000 gallons by 1,095 days.] If the duration was two years, the average leak rate was 2,740 gallons per day. If the duration was only one year, the average leak rate was over 5,479 gallons per day. (For this leak rate to have been "only" 100 gallons per day, the leak would have had to span 54 years, 9 months, and 16 days.) In the WC DGEIS, the NRC assumes that spent fuel pool leakage of 100 gallons per day and greater will be readily detected. The Yankee Rowe leak strongly suggests that leak rates far greater than 100 gallons per day can remain undetected for a long time. The WC DGEIS must explicitly identify the regulatory requirements that remain in place during the 60-year short-term storage period that provide reasonable assurance that future leaks similar to the Yankee Rowe leak--or worse--cannot result in significant impacts. 4.6 By failing to evaluate this Yankee Rowe leak, the NRC has also failed to establish how this leak was detected. If the leak was detected fortuitously rather than by a formal monitoring process, the WC DGEIS should have considered potential impacts had this leak remained undetected for a longer duration. (0899-1-6 [Curran, Diane] [Lochbaum, David])

Comment: 4.12 Radioactively contaminated water was detected in monitoring wells during the 1980s, but because the spent fuel pool is not the only potential source of such contamination, it was not considered to be the source: *Higher than expected levels of tritium were first discovered in a drinking water well about 500 feet from the reactor in 1986. BNL officials at the time reasoned that the tritium came from local sewer lines and did not suspect the reactor's spent-fuel pool as a source. Sewer lines were a known source of tritium. Tritium originated from condensation that forms inside the reactor building and eventually reached the laboratory's sewer system. No further samples were taken from this well, which was closed because of high levels of other nonradioactive contaminants.* (GAO 1997, pages 7-8)[.] 4.13 Workers tested the spent fuel pool for leaks in January 1989, July 1994, January 1995, and March 1996. Each test concluded was that the spent fuel pool was not leaking. In January 1997, workers conducted a fifth spent fuel pool leak test. This time leakage was detected. These tests were essentially self-fulfilling prophecies, showing no leakage when no leakage was believed to be occurring and finding leakage after monitoring well results suggested leakage was happening. *BNL officials acknowledge, in retrospect, that these tests were not carefully conducted because laboratory staff failed to accurately measure the spent-fuel pool's evaporation rate. Tests conducted after the tritium leak was discovered more accurately accounted for evaporation rates and concluded that the pool was leaking 6 to 9 gallons per day.* (GAO 1997, page 10)[.] Using BNL's data as support, a 1993 DOE report noted that the spent-fuel pool was not leaking. The report also noted, however, that there was no reliable means of determining if the spent-fuel pool was leaking. (GAO 1997, page 8)[.] 4.14 In the summer of 1989, workers installed two additional monitoring wells near the reactor and its spent fuel pool. Samples from these wells did not indicate a leak was in process; not because a leak was not occurring but because they were not in locations to detect an underground plume: *BNL officials also relied on well-sampling results to reinforce their position that the spent-fuel pool was not leaking, but these samples did not*

provide adequate coverage of the area surrounding the reactor where the spent-fuel pool was located. (GAO 1997, page 10) (0899-1-7 [Curran, Diane] [Lochbaum, David])

Comment: 4.15 Workers at BNL conducted leak tests of the spent fuel pool and installed monitoring wells to detect radioactively contaminated water leaking into the ground. But rather than causing timely detection of a leaking spent fuel pool, these measures instead gave BNL officials false confidence, and thereby enabled the leakage to continue unabated: *Reliance on incomplete tests of water level in the spent-fuel pool and on sample data from monitoring wells scattered around the site led Brookhaven and DOE officials to give low priority to a potential tritium leak. (GAO 1997, page 2)***To allay the [Suffolk] country's concerns, BNL said that the pool did not leak because it had successfully passed a leak test in 1989. BNL also said that two monitoring wells that were installed in 1989 near the reactor did not indicate any leaking from the reactor's spent-fuel pool. Although BNL officials later told us that the leak test was not accurate and that the two monitoring wells they installed earlier were in the wrong location to detect the tritium contamination, BNL officials relied on these data as the basis for their confidence that the spent-fuel pool did not leak. (GAO 1997, page 8)[.]* 4.16 It is important to recognize that at BNL, a long-term, low-volume leak from the spent fuel pool occurred due to unreliable water level instrumentation, misplaced monitoring wells, and misdiagnosed monitoring well results. This event and its contributing factors cast extreme doubt on the NRC's spent fuel pool leak evaluation in the WC DGEIS: *As a result, this evaluation considers a long-term, low-volume undetected leak from a spent fuel pool as the most probable scenario where spent fuel pool leakage would lead to an offsite environmental impact. To go undetected, a leak would need to be less than the fluctuations in water level of a spent fuel pool due to evaporation. This is so because the spent fuel pool water level is constantly measured by instrumentation and monitored routinely by the reactor operators. Also, licensees must perform routine inspections of leak-detection systems and physically inspect the spent fuel pool area for leakage. (NRC 2013b, page E-10, lines 1-8)[.]* 4.17 If the BNL spent fuel pool leaked at 6 to 9 gallons per day for 12 years, then 26,280 to 39,420 gallons of radioactively contaminated water reached the ground before being detected and terminated. This longstanding leak is an important example that NRC should have considered in the WC DGEIS. The WC DGEIS must explicitly identify the regulatory requirements that remain in place during the 60-year short-term storage period that provide reasonable assurance that future leaks similar to the BNL spent fuel pool leak--or worse--cannot result in significant impacts. (0899-1-8 [Curran, Diane] [Lochbaum, David])

Comment: C. Salem Leak[.] 4.18 An event at the Salem nuclear plant in New Jersey is a compelling example that an undetected spent fuel pool leak close to the maximum evaporation rate of about 100 gallons per day (gpd) might not be promptly detected. In other words, this event contradicts the conclusion stated in the WC DGEIS that leaks of this magnitude would be promptly detected. 4.19 Like the majority of U.S. nuclear power reactors, the spent fuel pools for Salem's two reactors have reinforced concrete walls and floors. To prevent outward leakage through the porous concrete, each spent fuel pool is equipped with a stainless steel liner. The small space between the liner and the concrete collects spent fuel pool water leaking through the liner. The tell-tale drain routes this water to collection tanks for treatment and then either re-use or release.⁷ [footnote 7 text: In the WC DGEIS (NRC 2013b, page E-19), this is labeled the leak chase system.] The tell-tale drain lines became nearly fully obstructed at Salem. Instead of leaking water flowing through the tell-tale drain lines to the collection tank, spent fuel pool water leaked into the space between the stainless steel liner and the concrete. Some of the spent fuel pool water then leaked outward through the concrete. When blockage of the tell-tale drain lines was finally noticed, workers were sent to clean out the lines. When the tell-tale drain line blockage was removed, the measured and indicated leak rate increased: *After the cleaning*

effort [for the tell-tale drains], the leak rate from the tell-tale drain increased from about 19 liters per day (5 gallons a day) to about 380 liters per day (100 gpd). (NRC 2004, page 2) 4.20 Some, or all, of this 100 gallon per day flow could have been radioactively contaminated water leaking from the spent fuel pool.⁸ [footnote 8 text: It was not reported how much of this flow was attributed to inward leakage of groundwater through the concrete and how much of it was spent fuel pool water outward through the stainless steel liner.] (0899-1-9 [Curran, Diane] [Lochbaum, David])

Comment: Limited Spent Fuel Pool Water Level Record-keeping Requirements[.] 6.20 The NRC presumes in the WC DGEIS that its inspectors will review records such as those prepared by plant workers for tasks like providing makeup water to the spent fuel pool to compensate for evaporation and periodically logging the spent fuel pool water level, and will detect any spent fuel pool leakage (if the workers own efforts have not already discovered leakage). An NRC inspection procedure for examining spent fuel pools at permanently shut down nuclear power reactors appears—at first blush—to support this assumption by stating: *The SFP water level instrumentation and alarms should ensure that any significant loss of inventory will be promptly detected by operations personnel. ... Operator rounds and control room logs should provide a data base sufficient to identify spent fuel pool leakage problems.* (NRC 1997, Section 03.02) 6.21 As discussed in paragraphs 6.6 to 6.16 of this declaration, however, there are no regulatory requirements in place during the short-term storage period that ensure spent fuel pool level instrumentation will routinely be available. Consequently, the NRC's assumption that routine spent fuel pool water level monitoring and record-keeping will detect spent fuel pool leakage is invalid. Again, the WC DGEIS cannot place much weight on equipment and conditions unless they are required to be in place throughout the 60-year short-term storage period. (0899-2-1 [Curran, Diane] [Lochbaum, David])

Comment: 7.4 Owners of reactors that have permanently shut down nuclear power reactors and who have certified to the NRC that all irradiated fuel has been removed from the reactor vessel did not formally receive the warning from the NRC about spent fuel pool leakage. If information is power, the NRC leaves these owners powerless to prevent similar leaks from their spent fuel pools. 7.5 The NRC's failure to send such warnings to owners of permanently shut down reactors has implications beyond merely keeping individual storage sites in the dark. Operating experience programs adopted throughout the nuclear power industry in the wake of the March 1979 accident at Three Mile Island are used to review incoming correspondence such as NRC's Information Notices and screen them for applicability to the site. Applicable documents are routed to appropriate departments for review and action. Applicable documents are thus formally incorporated into training programs and procedures. But the NRC's decision to exclude owners of permanently shut down nuclear power reactors about a spent fuel pool leakage problem robs them of the operating experience opportunity to capture this information in appropriate in-plant procedures and programs—the very procedures and programs the NRC improperly takes full credit for in the WC DGEIS. 7.6 The NRC also fails to require licensees of permanently shut down reactors to implement safety upgrades, even those upgrades directly related to spent fuel pool safety. For instance, on March 12, 2012, the NRC issued three orders requiring licensees to implement lessons it learned from the March 2011 accident at Fukushima in Japan. One of the orders issued that day required the installation of reliable instrumentation to monitor the water level inside spent fuel pools: *The lack of information on the condition of the spent fuel pools contributed to a poor understanding of possible radiation releases and adversely impacted effective prioritization of emergency response actions by decision makers.* (NRC 2012f, attachment 1, page 3) *** *During the events in Fukushima, responders were without reliable instrumentation to determine water level in the spent fuel pool.* (NRC 2012f, attachment 1, page 6) *** *...the Commission has determined that all power reactor licensees*

and CP [construction permit] holders must have a reliable means of remotely monitoring wide-range spent fuel pool levels to support effective prioritization of event mitigation and recovery actions in the event of a beyond-design-basis external event. (NRC 2012f, attachment 1, page 7) (0899-2-10 [Curran, Diane] [Lochbaum, David])

Comment: 7.7 This NRC order to install reliable spent fuel pool water level instrumentation was issued to: *All Power Reactor Licensees and Holders of Construction Permits in Active or Deferred Status* (NRC 2012f, page 1) 7.8 A search performed on August 27, 2013, of ADAMS, the NRC's online electronic library of publicly available agency records, failed to identify any such order issued by the NRC on or after March 12, 2012, for the permanently shut down Zion nuclear power reactors.

7.9 The NRC confirmed its intention not to impose these safety upgrades on permanently shut down reactors after the Crystal River Unit 3 reactor in Florida shut down in early 2013. Its owner had received the March 2012 order from the NRC to install reliable spent fuel pool water level instrumentation. The owner asked the NRC to rescind the order because the reactor would not resume operation (Duke 2013). The NRC granted the request and approved the removal of (or lack of installation of) reliable spent fuel pool instrumentation from this permanently shut down reactor (NRC 2013c). 7.10 After the Kewaunee reactor in Wisconsin shut down later in 2013, its owner also requested that the NRC rescind its order requiring reliable spent fuel pool water level instrumentation to be installed (Dominion 2013). (0899-2-11 [Curran, Diane] [Lochbaum, David])

Comment: 7.11 Another example of the regulatory requirement shrinkage involves groundwater monitoring. According to the WC DGEIS: *In April 2011, the NRC evaluated industry performance in "Summary of Results from Completion of NRC's Temporary Instruction on Groundwater Protection, TI-2515/173 Industry Groundwater Protection Initiative."* ... *This report was based on inspections conducted between August 2008 and August 2010 at all nuclear power plant sites.* (NRC 2013b, page E-7, lines 1-4) 7.12 The WC DGEIS is correct that TI-2515/173 was written to apply to all nuclear power reactors: *This Temporary Instruction (TI) applies to all holders of operating licenses for nuclear power reactors, including those plants which have permanently ceased operations.* (NRC 2008) 7.13 But the statement in the WC DGEIS that NRC's report was based on inspections of groundwater monitoring "at all nuclear power plant sites" is patently false. Instead, inspections were only performed at some nuclear plants sites; namely, the sites with operating nuclear power reactors. Sites with only permanently shut down nuclear power reactors were not inspected between August 2008 and August 2010 as is clearly evident from Tables 1, 2, 3, and 4 from NRC 2008 found in Appendix A. 7.14 These tables clearly show that, while the NRC inspected the voluntary programs implemented under the Groundwater Protection Initiative at operating nuclear power plants, it did not inspect the programs implemented at permanently shut down plants like Zion and Humboldt Bay.¹² [footnote 12 text: A search of the NRC's ADAMS library on August 29, 2013, failed to produce any publicly available records indicating that the NRC had, or plans to, conduct groundwater protection initiative inspections using the Groundwater Protection Initiative, TI-2515/173, at permanently shut down nuclear power reactors.] The WC DGEIS cannot place weight on voluntary measures that have never been inspected by the NRC. 7.15 Regarding its inspections at operating nuclear power plants that someday will permanently shut down, the NRC's position is that: *Licensees that have implemented a groundwater monitoring program consistent with the Nuclear Energy Institute Groundwater Protection Initiative are considered to have an adequate program for the purposes of the Decommissioning Planning Rule.* (NRC 2013b, page 3-10, line 37 to page 3-20, line 1) 7.16 Based on the successful results from the one-time Groundwater Protection Initiative inspection at operating nuclear power plants, the NRC apparently considers the voluntary groundwater monitoring program to be adequate over

the entire 60-year short-term storage period at shutdown plants in the WC DGEIS. This assumption is illogical and contrary to the NRC's experience periodically inspecting mandatory—not voluntary—regulatory requirements at operating nuclear power plants.

7.17 The industry's Groundwater Protection Initiative is a voluntary measure that is currently not being routinely inspected by the NRC at either operating or permanently shut down nuclear power plants. As such, the WC DGEIS cannot credit this non-mandatory, non-inspected program with detecting and correcting leaks during the 60-year short-term storage period. (0899-2-12 [Curran, Diane] [Lochbaum, David])

Comment: 7.18 Further evidence of lessened regulatory oversight after a reactor permanently shuts down is provided by the NRC's Reactor Oversight Process (ROP). Under the ROP, the NRC conducts routine and reactive inspections at operating nuclear power plants to verify compliance with regulatory requirements or identify non-compliances warranting correction. Appendix B lists the ROP's baseline inspection procedures and the associated frequencies with which they are conducted. The baseline inspections examine a wide range of areas, from fire protection to radiation protection to maintenance to security, over a three-year period. The NRC conducts some baseline inspections every quarter. The least frequent baseline inspection is conducted at least once every three years. 7.19 Recent ROP inspection results as posted on the NRC's website on August 28, 2013, are contained in Appendix C. The numerous green, white, yellow, red, and greater-than-green inspection findings clearly demonstrate that plant owners do not always comply with regulatory requirements, even in areas routinely examined by NRC inspectors. All results labeled with any colored box indicate noncompliance with regulatory requirements. The NRC cannot assume in the WC DGEIS that owners will conform to voluntary measures (such as the Groundwater Protection Initiative) when their track record demonstrates repetitive non-compliance with mandatory regulatory requirements. 7.20 Similarly, the scope of the Maintenance Rule—on which the NRC relies for its finding of no possibility of significant impact (see WC DGEIS, page E-5, lines 1-13)—shrinks after a nuclear reactor permanently shuts down. Decades ago, the NRC promulgated the Maintenance Rule to establish regulatory requirements for maintenance and testing of safety related components (NRC 1991). But the rule does not provide protection against spent fuel pool leaks: *Maintenance at Nuclear Power Plants, "requires monitoring the performance or condition of structures, systems, or components (SSCs). For licensees who have submitted the certifications for cessation of operation and for permanent fuel removal specified in 10 CFR 50.82(a)(1), this section applies only to the extent the licensee monitors the performance or condition of the SSCs associated with the storage, control, and maintenance of spent fuel in a safe condition and in a manner sufficient to provide reasonable assurance that such SSCs are capable of fulfilling their intended functions* (see 10 CFR 50.65(a)(1)). (NRC 2000, page 1.184-12)

7.21 As described in paragraphs 6.3 to 6.15 of this declaration, the safety analysis reports and technical specifications establish "spent fuel in a safe condition" as entailing protection against a fuel handling accident. The safety analysis reports and technical specifications do not impart protection against long-term, low-volume leaks from the spent fuel pool as part of "spent fuel in a safe condition." Thus, licensees can and do legally omit structures, systems, and components needed to detect and mitigate spent fuel pool leaks (e.g., water level instrumentation, water makeup pumps, leakage detection systems, etc.) from the scope of their maintenance rule programs. The WC DGEIS simply cannot take credit for measures its regulations allow licensees to remove. The WC DGEIS must only credit measures that regulations compel licensee to retain. (0899-2-13 [Curran, Diane] [Lochbaum, David])

Comment: Zion – A Case Study[.] 7.22 The permanently shut down nuclear power reactors at the Zion nuclear plant in Illinois illustrate regulatory requirement shrinkage: *In March 1998, Com*

*Ed certified per 10CFR50.82 that the company had permanently ceased power operation and that all fuel was in the Spent Fuel Pool. This is a permanent, non-revocable certification that changed the Zion Station licensing basis. (ComEd 1998, attachment B, page 1) *** The most significant effect of this licensing basis change was to eliminate nuclear safety functions for the majority of the structures, systems, and components (SSC's). Those SSC's, which had only performed a reactor safety function (i.e., SSC's that do not support spent fuel or radiation protection function), need no longer be maintained under nuclear grade controls. (ComEd 1998, attachment B, page 1) 7.23* The scope of maintaining "spent fuel in a safe condition" at Zion was also redefined to narrow its scope:

Radioactive Release from a Subsystem or Component: All accidents, with the exception of the Fuel Handling accident in the Fuel Building, were deleted. ... Added section with new accident analyses for Spent Fuel Pool Accident, loss of Spent Fuel Pool Cooling, and HIC Drop Accident. (ComEd 1998, attachment B, page 15) However, two aspects of the pool design would allow the inventory to be significantly reduced in the event of a failure. These are, 1.A seal failure of a fuel transfer canal removable weir gate, and 2.A rupture of the spent fuel cooling water pump return line. (ComEd 1998, page 5-4) 7.24 Any worker or NRC inspector seeking to ascertain whether "spent fuel in a safe condition" is reasonably assured at Zion need only evaluate whether protections against a fuel handling accident and a significant reduction in spent fuel pool water inventory are adequate. As described in VI of this declaration, protection against a fuel handling accident is defined to be maintaining the water level at least 23 feet above the spent fuel storage racks when irradiated fuel assemblies (or the HIC cask) are being moved; otherwise, any spent fuel pool water level is acceptable. As described in ComEd 1998, protection against a significant reduction in spent fuel pool water inventory involves the fuel transfer canal's weir gate seal and the spent fuel pool cooling water pump discharge piping. Protection against a long-term, low-volume spent fuel pool leak is neither directly nor indirectly associated with these regulatory requirements. 7.25 The WC DGEIS cannot credit regulatory requirements that are entirely silent on the matter to provide protection against long-term, low-volume spent fuel pool leaks during the 60-year short-term storage period. (0899-2-14 [Curran, Diane] [Lochbaum, David])

Comment: Dresden – A Case Study[.] 7.26 Dresden Unit 1 in Illinois provides another important example of the breakdown in monitoring programs and regulatory oversight after reactors permanently shut down. This example undermines the NRC's assumption stated in the WC DGEIS that: *Even though the reactor is no longer operating during the short-term storage timeframe, a licensee is still bound by the terms and conditions of its operating license until the license is terminated. As a result, the NRC assumes that spent fuel pool maintenance requirements that are in place during the operating period of the reactor will remain in place during the short-term timeframe and will stay in place even if the license is modified during the short-term timeframe.* (NRC 2013b, page E-4, lines 13-17) 7.27 The NRC is, or should be, aware of past events such as that at Dresden rendering this assumption tenuous at best, outright invalid at worst. On January 25, 1994, workers discovered about 55,000 gallons of water on the floor of the basement of the reactor building for the Unit 1 reactor at the Dresden nuclear plant in Illinois. Its owner had permanently shut down the reactor on October 31, 1978. The NRC dispatched a special inspection team to Dresden to investigate this event. The NRC's team discovered (NRC 1994a): • The owner stopped providing heating for the reactor building in 1989. The lack of heating led to cold temperatures inside the building that froze the water inside a pipe of the service water system causing it to burst. Leakage from this ruptured pipe was found on the basement floor. The lack of heating could also have frozen and ruptured the fuel transfer tube, allowing the spent fuel pool water to drain down and expose the top several feet of irradiated fuel in the storage racks. Had this occurred, the drained water would have reduced shielding and created high radiation levels onsite. • The owner had turned off the spent fuel pool

cooling and cleanup system in 1983. By 1987, the water quality inside the spent fuel pool degraded to the point where an influx of microorganisms had developed. Records showed that the conductivity of the spent fuel pool water was two times the limit in the operating license. • The poor quality of the spent fuel pool water could have adversely affected the seating surfaces and gaskets for the spent fuel pool gate. • The owner had no spent fuel pool leak detection program, nor did the owner have a water inventory program that might have detected leakage from the spent fuel pool via increased makeup additions to it. (0899-2-15 [Curran, Diane] [Lochbaum, David])

Comment: 7.28 According to the NRC: *The inspection team concluded that the layup of the plant and storage of spent fuel at Dresden 1 was not well managed or maintained for a period of years and that weaknesses existed in the site quality audit and inspection programs. Further, safety reviews of changes to Dresden 1 systems such as termination of heating and ventilation for the containment were apparently not performed or not adequately reviewed to determine the safety consequences of the changes. Interviews with personnel at the Dresden site (which includes two operating units in addition to Dresden 1) showed that, in part, the weaknesses identified above were based on an incorrect belief that Dresden 1 could not cause a serious safety problem because it was permanently shut down. This belief resulted in audits and safety evaluations that were not rigorously implemented or that did not include the Dresden 1 systems and programs.* (NRC 1994a, page 3) The NRC imposed a \$200,000 civil penalty on the plant's owner for this event (NRC 1994a). 7.29 This event exposes the reality that the NRC's WC DGEIS fails to address the significant reduction in regulatory requirements that occurs after a reactor permanently shuts down. The NRC assumes in the WC DGEIS that all spent fuel pool maintenance measures will apply and be met during the short-term storage period. Yet, the NRC fined the owner of Dresden Unit 1 for inappropriate actions like turning off the spent fuel pool cooling and cleanup system 12 years prior to this event and allowing the water quality inside the spent fuel pool to violate operating license requirements for many years. The WC DGEIS is deficient by assuming this event is isolated and never to be repeated and not identifying reliable means to prevent recurrence. 7.30 The Dresden event also reveals the significant reduction in regulatory oversight that occurs after a reactor permanently shuts down. At the time of this event, the Dresden nuclear plant had two operating reactors and one permanently shut down reactor. Because of the operating reactors, the NRC had inspectors assigned full-time to the plant site supplemented by inspectors from its regional and headquarters offices. Clearly, those inspectors devoted almost all of their time and attention to the operating reactors; otherwise, they might have noticed that the owner turned off the Unit 1 spent fuel pool cooling and cleanup system 12 years earlier or had discontinued heating the Unit 1 reactor building 5 years earlier. Had Dresden Unit 1 not been adjacent to two operating reactors, the NRC would not have full-time inspectors assigned to the plant site. (0899-2-16 [Curran, Diane] [Lochbaum, David])

Comment: 7.31 The NRC inspection effort at Dresden is not unique. Shown above are the NRC inspection hours applied to various reactors in 1992. The Three Mile Island nuclear plant had one operating reactor and one permanently shut down reactor. Its Unit 1 reactor received nearly 3,700 inspection-hours of NRC attention while the permanently shut down Unit 2 reactor received about one-tenth of that attention, a scant 300 inspection-hours or so. In 1992, the Unit 1 reactor at the Browns Ferry nuclear plant had been shut down since March 1985 – not permanently shut down, but not expected to restart anytime soon (it did not resume operating until early 2007). NRC inspectors devoted less than 750 hours of attention to it during 1992. The permanently shut down Unit 1 reactor at Dresden was not even on the NRC's charts: the Dresden Units 2 and 3 reactors received over 3,000 NRC inspection-hours. 7.32 NRC Inspection Manual Chapter 0305, "Operating Reactor Assessment Program," is the agency's

overall guidance document outlining the frequency and scope of the inspections it conducts at nuclear power reactors. On October 18, 2013, the NRC revised Manual Chapter 0305 to add this sentence: *A power reactor is no longer subject to this manual chapter after a licensee submits a written certification to cease operation in accordance with 10 CFR 50.82(a)(1)(ii).* (NRC 2013a) 7.33 NRC Inspection Manual Chapters 0350, “Oversight of Reactor Facilities in a Shutdown Condition Due to Significant Performance and/or Operational Concerns,” and 0351, “Implementation of The Reactor Oversight Process at Reactor Facilities in an Extended Shutdown Condition for Reasons Other Than Significant Performance Problems,” cover nuclear power reactors that have been shut down for lengthy periods, but which are expected to eventually resume operations. These manual chapters do not apply to permanently shut down reactors. A review of the Inspection Manual Chapters¹³ [footnote 13 text: See <http://www.nrc.gov/reading-rm/doc-collections/insp-manual/manual-chapter/>] and associated NRC Inspection Procedures¹⁴ [footnote 14 text: See <http://www.nrc.gov/reading-rm/doc-collections/insp-manual/inspection-procedure/>] identified only one procedure applicable to permanently shut down nuclear power reactors (NRC 1997a). It focused on spent fuel pools. This sole procedure was developed in response to the 1994 event at Dresden Unit 1. According to the NRC, it is “estimated to require 32 onsite inspection hours semi-annually” (NRC 1997a). (0899-2-17 [Curran, Diane] [Lochbaum, David])

Comment: 7.34 And it appears that the NRC’s “semi-annual” spent fuel pool inspection expectations are actually being halfway met. According to the NRC’s online electronic library, ADAMS, the NRC conducted this spent fuel pool inspection of the spent fuel pools at the permanently shut down Zion nuclear plant and documented its findings in reports dated May 13, 2011, August 18, 2011, and August 7, 2012 – three inspections over the past three years. And for the reasons described in Section VI of this declaration, even these infrequent NRC inspections provide little assurance that spent fuel pool leaks will be detected and corrected in a timely manner. 7.35 In summary, the NRC’s WC DGEIS does not consider the reality that permanently shut down reactors receive less management attention (as evidenced by the Dresden Unit 1 event) and significantly less NRC oversight (as evidenced by the Dresden Unit 1 event and the inspection hour tabulation). This reality invalidates the NRC’s assumptions that licensee programs and NRC’s oversight will continue at the same levels after reactors shut down as existed when the reactors operated. 7.36 To meaningfully assess the impacts of spent fuel pool leaks in the WC DGEIS, the NRC must rely on regulatory requirements that will remain in place over the entire 60-year short-term storage period and not on regulatory requirements that are inapplicable or significantly reduced in scope after reactors permanently shut down. Only if the WC DGEIS achieves this can it provide reasonable assurance that spent fuel pool leaks will be detected before the leaked materials exceed public health regulatory limits and cause noticeable impacts to groundwater resources. (0899-2-18 [Curran, Diane] [Lochbaum, David])

Comment: Reduction in Aging Management Protections[.] 7.37 The WC DGEIS also fails to properly consider the significant reduction in scope for aging management regulatory requirements and associated supporting analyses that happens when nuclear power plants permanently shut down. Spent fuel pools and the piping and components connected to them are subject to aging degradation. Aging degradation does not magically cease when reactor operation ceases but continues on throughout the 60-year short-term storage phase. As depicted below in what is commonly called the “bathtub curve” due to its shape, aging degradation can cause the failure rate to increase: 7.38 The NRC has approved renewed operating licenses for the majority of the nuclear power reactors operating today.¹⁵ [footnote 15 text: See “Completed Application” list at <http://www.nrc.gov/reactors/operating/licensing/renewal/applications.html>] The NRC’s license renewal rule (10 CFR. Part 54) enables the NRC to renew the original 40-year operating license

for up to 20 additional years. The NRC will renew an operating license only after determining that the aging management program for in- scope passive systems, structures, and components is adequate: *For each structure and component identified in paragraph (a)(1) of this section, demonstrate that the effects of aging will be adequately managed so that the intended function(s) will be maintained consistent with the CLB [current licensing basis] for the period of extended operation.* (10 CFR. §54.21(a)(3)) As described in Section A2 of the NRC's Generic Aging Lessons Learned Report (NRC 2012a), the spent fuel pool and associated equipment are within the scope of the license renewal rule and therefore require adequate aging management programs during the period of extended operation. 7.39 But the period of extended operation only covers the duration of reactor operation, not to the end of the 60-year short-term storage period as clearly illustrated in Figure 2.4 of the WC DGEIS: (0899-2-19 [Curran, Diane] [Lochbaum, David])

Comment: Nonexistent Spent Fuel Pool Leak Analysis Requirements[.] 6.22 Returning to the procedure used by NRC inspectors when examining spent fuel pools at permanently shut down nuclear power reactors, the NRC states: *Within the scope of this inspection, the inspector should evaluate the tests or analytical calculations performed to determine SFP leakage and evaporation rates. The assumptions in these tests and calculations should be assessed and evaluated. For example, a licensee may bound their analyses by a worst-case situation and normalized environmental conditions.* (NRC 1997, Section 03.02) 6.23 But there is no regulatory requirement for licensees to ever calculate spent fuel pool evaporation rates or analyze reasonably foreseeable leakage scenarios. The WC DGEIS states:

The safety of spent fuel storage is established for each facility through a safety analysis report prepared by the licensee to support its application for an operating license and review by the NRC. Each safety analysis report includes a number of operational conditions and limitations important to safe spent fuel storage. These conditions and limitations are subject to regulations that restrict the changes that can be implemented without prior NRC approval. (NRC 2013b, page E-4, lines 18-22) 6.24 The NRC developed a Standard Review Plan (NUREG-0800) to guide its staff in reviewing safety analysis reports submitted by applicants for reactor operating licenses and determining whether all applicable regulatory requirements have been met. The Standard Review Plan also aides applicants in preparing their submittals to the NRC. 6.25 The spent fuel pool is not the only source of radioactively contaminated water at nuclear power plants. In fact, its water contains significantly lower concentrations of radioactivity than contained in other systems and components. For example, the liquid waste management system (LWMS) collects, stores, and processes highly radioactive liquids. Applicants for operating licenses evaluate the postulated failure of a large LWMS tank that results in most if not all its radioactive contents being released as described in Section 11.6 of the NRC's Standard Review Plan: *As a result, a gross failure of the LWMS is considered highly unlikely, e.g., such as a failure involving the near total loss of the system's inventory of radioactive materials. However, the malfunction of a tank and its components, a valve misalignment, tank overflow, or an operator error appear more likely and are assumed to be types of failures warranting an evaluation of their consequences. Although no specific types of system failures have been designated as being representative, it was considered that for the safety evaluation of the LWMS, the type of malfunction analyzed should be limited to the postulated failure of a tank or pipe rupture, located outside of containment. The evaluation considers the impact of the failure on the nearest potable water supply, and the use of water for direct human consumption or indirectly through animals (livestock watering), crops (agricultural irrigation), and food processing (water as an ingredient).* (NRC 2007, page BTP 11-6-2). (0899-2-2 [Curran, Diane] [Lochbaum, David])

Comment: 7.40 The applicant for a renewed operating license develops aging management programs for in-scope systems, structures, and components—including the spent fuel pool and associated equipment—that provide reasonable assurance that required margins will be maintained over the duration of extended reactor operation. Once the period of extended operation ends and the short-term storage period begins, no regulations require licensees to continue their aging management programs. 7.41 The short-term storage period of 60 years equals the operating lifetime of a nuclear power reactor obtaining only one renewal – the 40-year initial term plus the 20-year period of extended operation. The aging management programs prepared by the applicants and approved by the NRC only consider the 20-year period of extended operation. While the efficacy of these programs does not automatically expire along with the operating licenses, the fact remains that neither the plant owners nor the NRC have formally evaluated aging degradation mechanisms and reliable barriers against excessive degradation over the 60-year short-term storage period assumed in the WC DGEIS. 7.42 The bathtub curve shows that aging degradation will eventually cause the failure rate to increase. Regulatory requirements such as the maintenance rule and the aging management programs mandated by the license renewal rule guard against problems caused by structures, systems, and components being operated deep into the Increasing Failure Rate portion on the right end of the bathtub curve. In other words, these mandated measures require that equipment affected by aging degradation be repaired or replaced before safety margins are compromised. The lack of comparable regulatory requirements during the 60-year short-term storage period increases the likelihood that unchecked aging degradation causes problems. 7.43 In summary, the WC DGEIS must consider the significant reduction in the scope of regulatory requirements and oversight that occurs after reactors permanently shut down rather than the inflated levels that exist while the reactors operate. (0899-2-20 [Curran, Diane] [Lochbaum, David])

Comment: 6.26 Note that a LWMS tank failure and its potential consequences to the environment are required to be analyzed despite this scenario being “considered highly unlikely” by the NRC. 6.27 The Tennessee Valley Authority evaluated the postulated release of radioactively contaminated water from LWMS tanks at its Browns Ferry Nuclear Plant (BFNP) in Alabama. TVA reported: *In order to assess the impact of a liquid radwaste spill on the nearest potable water supply surrounding the BFNP site, a study was conducted to determine if the limits of 10CFR20, Appendix B, Table 2, Column 2 will be exceeded. The results of the study involving a postulated release of liquid radwaste from the worst offending tank indicates that the limits of 10CFR20 will not be exceeded. The worst offending tank identified is the waste collector tank with a maximum operating volume of 38,000 gallons and maximum activity of $1.4E+8$ microcuries.*¹¹ [footnote 11 text: $1.4E+8$ is scientific notation for 140,000,000.] (TVA 2003, page 9.2-7) 6.29 Studies of postulated releases from LWMS tanks serve two important purposes. First, the results demonstrate compliance with federal regulations on discharges of radioactivity to the environment. Second, they define the boundaries for future plant activities. 6.30 As discussed in paragraphs 3.2 to 3.4 above, postulated losses of water inventory from the reactor vessel must be postulated and evaluated, regardless of the low likelihood of occurrence. As discussed in paragraphs 6.25 to 6.28 above, postulated losses of water inventory from LWMS tanks must be postulated and evaluated, again regardless of their likelihood. These evaluations define the respective hazards that federal regulations require protection against. Their results essentially form the answer keys when determining whether a reactor’s design and procedures comply with federal regulations. Their results also establish boundaries for subsequent reactor operation. Before a license modifies the plant or revises its procedures, 10 CFR §50.59, Changes, tests and experiments, requires that the proposed activity be evaluated against the established boundaries. If an activity significantly increases the consequences or likelihood of a previously evaluated event, it cannot happen unless the NRC explicitly approves it. (0899-2-3 [Curran, Diane] [Lochbaum, David])

Comment: 6.31 Neither the NRC's Standard Review Plan nor any of the literally dozens of safety analysis reports submitted by plant owners analyze either a long-term, low-volume leak from a spent fuel pool or the rapid and complete loss of spent fuel pool water into the environment. The failure to analyze a spent fuel pool leak means that neither of the two purposes described in paragraphs 6.29 and 6.30 above is met. First, because the hazard is not defined, the adequacy of purported protective measures intended to manage the risk cannot be objectively assessed. Second, because a hazard evaluations results are not available to establish boundaries, there is no assurance that adequate protection will be sustained throughout the 60-year short-term storage period. 6.32 To illustrate the necessary role performed by hazard evaluations, consider a hypothetical case in which a spent fuel pool leak was postulated and evaluated. Suppose the results from that evaluation showed that a leak of up to X gallons per day could not cause significant impacts and that a leak of X gallons per day or greater could not cause significant impacts as long as it was detected within Y days. These results define how much water could be released via what specific pathways to facilitate objective determination whether NRC and EPA radiation protection standards will be met. 6.33 The results from the hypothetical hazard evaluation described in paragraph 6.32 above establish boundaries that provide assurance that risk continues to be properly managed into the future. For example, suppose the basis for concluding that leaks of up to X gallons per day not resulting in significant impacts relied on the combination of migration time required for leaked water to reach a source of drinking water and the filtering of radionuclides from the plume before it reached that source. The subsequent discovery that leaked water could enter an underground conduit and reach a drinking water source, effectively bypassing the delay and filtering functions of the geology/hydrology, would necessitate a re-evaluation to determine if the study's conclusion remained valid or required revision. As another example, suppose the means of detecting the X gallons per day or larger leak within Y days relies on weekly sampling from a close-in groundwater monitoring well. Before the frequency of sampling this well was relaxed to monthly or before this well was removed from service and replaced by a well three times more distant, an evaluation would need to conclude that a leak of X gallons per day or greater will still be detectable within Y days—otherwise, proper management of the risk of significant impacts is invalidated. (0899-2-4 [Curran, Diane] [Lochbaum, David])

Comment: 6.34 Absent the proper foundation afforded by a hazard evaluation, it is speculative to conclude that spent fuel pool leaks of 100 gallons per day will be detected before causing significant impacts. And even if such speculation was valid today, the conditions enabling that conclusion to remain valid throughout the short-term period are not explicitly defined. Consequently, owners could inadvertently undermine its validity by taking steps such as relaxing sampling frequencies, relocating wells, or removing water level instrumentation. 6.35 Risk management requires a hazard and its protections to both be defined as explicitly as possible. Doing so enables the risk to be properly managed now and into the future. By explicitly defining the hazard, one can determine when changing conditions increase the hazard, thus allowing protection levels to be increased accordingly. By explicitly defining protections credited against the hazard, one can make informed decisions whether proposed changes to the protections retain the necessary safety margins. 6.36 But there is simply no regulatory requirement that licensees analyze a postulated leak of any rate (small, medium, or large) of radioactive water from the spent fuel pool for any duration (short or long) for its postulated consequences to the environment. Neither the spent fuel pool leak hazard nor protections against it are explicitly defined. The conclusions expressed in the WC DGEIS that spent fuel pool leaks will be detected before causing significant impacts are therefore speculative and subjective. 6.37 In addition, the WC DGEIS provides no argument that a spent fuel pool leak is more "highly unlikely" than a LWMS tank failure. In fact, the WC DGEIS is silent regarding the relative likelihood of these two scenarios. Yet LWMS tank leaks must be analyzed for its

potential consequences to the environment while spent fuel pool leaks need not. This discrepancy is not justified. (0899-2-5 [Curran, Diane] [Lochbaum, David])

Comment: Nonexistent Groundwater Monitoring and Inspection Requirements.

6.38 The NRC in the WC DGEIS assumes that leaks of 100 gallons per day and greater from the spent fuel pool will be readily detected, corrected, and mitigated to prevent significant impacts. The NRC further assumes that groundwater monitoring will back up in-plant leakage detection processes so as to detect spent fuel pool leaks before significant impacts occur:

In addition to spent fuel pool design and operational controls, licensees are required, as described in Section E.1.2, to perform groundwater monitoring at nuclear power plant sites, which makes it unlikely that leakage from the spent fuel pool would remain undetected long enough for any contamination to migrate offsite. In addition, a groundwater-monitoring program based on a site characterization that conforms to standards (e.g., ANSI/ANS 2.17-2010) and a configuration of monitoring wells that takes into account the most likely leakage pathway (i.e., the spent fuel pool) would further reduce the likelihood that a leak would remain undetected long enough for contamination to migrate offsite. (NRC 2013b, page E-10, lines 15-22)

6.39 The foundation for this WC DGEIS assumption exists in the procedure used by NRC inspectors when examining spent fuel pools at permanently shut down nuclear power reactors:

The inspector should also review data from the licensee's environmental monitoring program, if applicable, to determine if there are indications of SFP leakage into the environment. (NRC 1997, Section 03.02)

6.40 But the environmental monitoring program is an illusion. There are no regulatory requirements for groundwater monitoring either at operating reactors or reactors during the 60-year short-term storage period:

Existing NRC regulations do not explicitly mandate routine onsite ground-water monitoring in the Restricted Area during facility operations. (NRC 2006a, page 5), (0899-2-6 [Curran, Diane] [Lochbaum, David])

Comment: 6.41 Although the WC DGEIS cites a recent Decommissioning Planning Rule that “requires all licensees to establish operational practices to minimize site contamination and perform reasonable subsurface radiological surveys” (NRC 2013b, page B-18, lines 17-18), in reality the rule allows licensees to choose whether or not to conduct groundwater monitoring their operations to minimize the introduction of residual radioactivity into the site, particularly in the subsurface soil and groundwater. There are a variety of monitoring methods to evaluate subsurface characteristics, and these are highly site specific with respect to their effectiveness. One or more licensees may find that compliance with the amendments will mean the installation of groundwater monitoring wells and surface monitoring devices at their sites. (Federal Register 2011, page 35561) (emphasis added) 6.42 Rather than enforceable, reliable, dependable regulatory requirements, the WC DGEIS instead relies on a voluntary industry program for groundwater monitoring: *For nuclear power plants licensed before August 20, 1997, which includes all currently operating reactors, NRC has found that, in general, groundwater monitoring conducted in accordance with the Groundwater Protection Initiative developed by the Nuclear Energy Institute, a nuclear industry consortium, is adequate to comply with these regulations. ... However, licensees may choose to develop groundwater-monitoring programs*

*with additional elements than those recommended by the Groundwater Protection Initiative. For nuclear power plants licensed after August 20, 1997, licensees are subject to the additional requirements of 10 CFR 20.1406(a)-(b), of which “monitoring and routine surveillance programs are an important part of minimizing potential contamination”. (NRC 2013b, page E-5, lines 38 to page E-6, line 9) *** The Nuclear Energy Institute developed its Groundwater Protection Initiative in 2006 in response to leaks containing radioactive material at several plants. The initiative is described in NEI 07-07, “Industry Ground Water Protection Initiative – Final Guidance Document”... All power reactor licensees have committed to follow the initiative, which identifies actions to improve licensee response to inadvertent releases, including releases from spent fuel pools that may result in low, but detectable, levels of plant-related radioactive materials in subsurface soils and water. (NRC 2013b, page E-6, lines 10-16) (0899-2-7 [Curran, Diane] [Lochbaum, David])*

Comment: 6.43 But the NRC’s reliance on such voluntary measures directly contradicts NRC’s conclusion that: *A strong regulatory framework that includes both regulatory oversight and licensee compliance is important to the continued safe storage of spent fuel.* (NRC 2013b, page B-15, lines 27-28) 6.44 The NRC’s insistence on a strong regulatory program as the basis for its environmental findings is reasonable. The industry’s Groundwater Protection Initiative is a voluntary measure that may be retracted or relaxed by the nuclear industry at any time without NRC review and approval. In addition, as discussed below in Section VII, it is currently not being routinely inspected by the NRC at either operating or permanently shut down nuclear power plants. As such, the WC DGEIS cannot credit this non-mandatory, non-inspected program with detecting and correcting leaks during the 60-year short-term storage period. (0899-2-8 [Curran, Diane] [Lochbaum, David])

Comment: VII. THE WC DGEIS FAILS TO ACCOUNT FOR THE SIGNIFICANT REDUCTION IN REGULATORY REQUIREMENTS AND OVERSIGHT THAT OCCURS AFTER A REACTOR CEASES OPERATION[.] 7.1 In reaching its conclusion that spent fuel leaks cannot have significant impacts, the WC DGEIS assumes the continued effectiveness of current monitoring requirements, oversight procedures, and other measures that are in place while the reactor is operating, rather than looking ahead to the fewer requirements, procedures, and other measures that will remain in place after reactors permanently shut down. As stated in the WC DGEIS: *For the purposes of the analyses in this draft GEIS, the NRC assumes that regulatory control of radiation safety will remain at the same level of regulatory control as currently exists today.* (NRC 2013b, page 1-15, lines 3-5) *** *The analyses in this draft GEIS are based on current technology and regulations.* (NRC 2013b, page 1-17, line 21) *** *Even though the reactor is no longer operating during the short-term storage timeframe, a licensee is still bound by the terms and conditions of its operating license until the license is terminated. As a result, the NRC assumes that spent fuel pool maintenance requirements that are in place during the operating period of the reactor will remain in place during the short-term timeframe and will stay in place even if the license is modified during the short-term timeframe.* (NRC 2013b, page E-4, lines 13-17) 7.2 This assumption is blatantly wrong. There is extensive evidence that the scope of regulatory requirements and associated regulatory oversight significantly shrinks after a nuclear power reactor permanently shuts down. This declaration presents some examples, although much more evidence exists. 7.3 For instance, standard NRC communications with licensees about safety problems and concerns are typically not sent to licensees of permanently shut down reactors, even when they contain relevant information. On March 3, 2004, the NRC issued Information Notice 2004-05 regarding the leak from the spent fuel pool at Salem that reached the soil. The NRC sent this warning notice to: *All holders of operating licenses for nuclear power reactors (except those who have permanently ceased operations and have*

certified that fuel has been permanently removed from the reactor vessel) (NRC 2004, page 1) (0899-2-9 [Curran, Diane] [Lochbaum, David])

Comment: VIII. THE WC DGEIS FAILS TO CONSIDER SOME SIGNIFICANT IMPACTS FROM A SPENT FUEL POOL LEAK[.] 8.1 The WC DGEIS is also inadequate because it fails altogether to consider a number of credible environmental impacts related to spent fuel pool leaks. (0899-3-1 [Curran, Diane] [Lochbaum, David])

Comment: 9.5 In the WC DGEIS, the NRC fails to identify how the spent fuel pool leaks listed in Table E4 were detected. By not identifying the means of detecting these past leaks, the WC DGEIS fails support its assumption that leaks will be readily detectable. Instead, the WC DGEIS leaves open the possibility that the leaks were only detected through sheer luck. The WC DGEIS must explicitly identify the means by which past leaks were detected and ensure that regulatory requirements will retain these means throughout the 60-year short-term storage period. Otherwise, the NRC has no basis for a finding of reasonable assurance that the methods on which it relies will detect future leaks. (0899-3-10 [Curran, Diane] [Lochbaum, David])

Comment: 9.6 In the WC DGEIS, the NRC fails to recognize that both regulatory requirements and its oversight regime are significantly scaled back when nuclear power reactors cease operation. For example, the aging management measures supporting renewal of reactor operating licenses only apply during the period of extended reactor operation-not the six decades of spent fuel pool storage that follow. And evidence shows that the NRC's inspection effort is drastically reduced, to almost drive-by inspection efforts, after a reactor permanently shuts down. (0899-3-11 [Curran, Diane] [Lochbaum, David])

Comment: 9.7 For the WC DGEIS, the NRC fails to properly consider impacts from leaks causing offsite contamination below federal health standards and onsite contamination. The Braidwood event, for example, reveals that leaks resulting in offsite contamination cause significant impacts while the Salem and Oyster Creek events reveal that leaks resulting in onsite contamination can also entail significant impacts. (0899-3-12 [Curran, Diane] [Lochbaum, David])

Comment: 9.8 The NRC lacks the regulatory backstop needed to validate assumptions made for the WC DGEIS about spent fuel pool leakage detection capabilities and leak impacts. Consequently, the conclusion in the WC DGEIS that spent fuel pool leaks cannot have significant impacts may not be relied upon. (0899-3-13 [Curran, Diane] [Lochbaum, David])

Comment: 9.9 The WC DGEIS must be revised to explicitly and properly:

- Identify the regulatory requirements in place throughout the short-term storage period that provide reasonable assurance that spent fuel pool leakage of X^{17} [footnote 17 text: In the WC DGEIS, the NRC assumed an X value of 100. Correcting the many deficiencies, errors, and shortcomings identified by this declaration may result in a final X value higher or lower than 100.] gallons per day or greater will be detected before causing significant impacts.
- Demonstrate by analysis applicable to all sites, or require site-specific analyses, showing that spent fuel pool leakage of less than X gallons per day of infinite duration cannot cause significant impacts. (0899-3-14 [Curran, Diane] [Lochbaum, David])

Comment: 9.10 Absent the failures and deficiencies identified in this declaration being adequately remedied, the WC DGEIS cannot support rulemaking and policies allowing irradiated fuel to be stored in spent fuel pools for up to 60 years following cessation of reactor operation. Past spent fuel pool leaks raise serious questions about safety and environmental risks from future leaks. Those questions must have sound and well-supported answers before

the NRC approves the storage of spent fuel in pools for 60 years following reactor operation. Otherwise, post-operational spent fuel storage is nothing more than a six-decade gamble. (0899-3-15 [Curran, Diane] [Lochbaum, David])

Comment: Offsite Contamination Below Standards and Onsite Contamination Excluded[.] 8.2 The WC DGEIS fails to consider environmental impacts other than contamination in excess of NRC and EPA standards. (NRC 2013b, page E-18, lines 31-32). It also excludes onsite contamination. As a result, the WC DGEIS fails to consider numerous instances in which onsite contamination resulted in costly cleanups, which were required regardless of whether the licensee had failed to comply with NRC standards. In other words, compliance with NRC standards was insufficient protection against significant impacts. 8.3 For instance, the leak from the Salem spent fuel pool is not significant under the WC DGEIS criterion even though millions of dollars have been spent remediating tritium contamination in the groundwater. As described in Section IV.C above, water leaked from the spent fuel pool at the Salem nuclear plant prompted the State of New Jersey to compel its owner to remediate the site to recover the radioactively contaminated water. Over 28 million gallons of water have been drawn from the soil around the plant, treated, and either re-used by the plant or legally discharged (Arcadis 2013). Salem's leaking spent fuel pool did not result in any measured level of radioactivity in drinking water that exceeded federal standards, but it resulted in a sizeable cleanup cost. Spent fuel pool leaks in the future could pose financial burdens on stockholders, ratepayers, or taxpayers—a factor that NRC seems to have overlooked in the WC DGEIS. 8.4 Similarly, an onsite leak at the Oyster Creek nuclear plant in New Jersey costs millions of dollars to remediate. In April 2009, radioactively contaminated water leaked from an underground pipe at the Oyster Creek nuclear plant in New Jersey. The State of New Jersey ordered the plant's owner to clean up the leak. New Jersey Department of Environmental Protection Deputy Commissioner Iren Kropp was quoted as saying "They don't get a court hearing. They have to act and do exactly what we say" under the state's Spill Act. A company manager estimated the costs to exceed \$13 million (Bates 2010). While this leak came from an underground pipe rather than the spent fuel pool, the contaminated water carried a hefty price tag even though it did not migrate offsite. The NRC fails to consider such onsite contamination consequences in the WC DGEIS. 8.5 And as discussed above in Section IV.D, Indian Point suffered a 50 gallon per day leak from the Unit 2 spent fuel pool that the owner believes to have lasted for over two years. This and other leaks discovered from the Unit 1 and Unit 2 spent fuel pools led to extensive and costly investigatory and assessment efforts at the site. Again, the WC DGEIS gives no indication that NRC considered such onsite contamination consequences. (0899-3-2 [Curran, Diane] [Lochbaum, David])

Comment: 8.6 While the source was an effluent pipe used to discharge radioactively contaminated water to the Kankakee River rather than the spent fuel pool, a leak discovered in 2005 at the Braidwood nuclear plant in Illinois had significant impact even though it did not result in any measured radionuclide concentrations in offsite groundwater used for drinking or in drinking wells in excess of EPA and NRC regulatory limits. Among the consequences from this leak: • Exelon Corporation, Braidwood's owner, agreed to purchase one property and reimburse 14 other property owners for devaluations stemming from the leak (Dow Jones, 2005). • The NRC's Chairman described the leak in his four-page transmittal letter for a monthly report to Congressional oversight committee Chairs and Ranking Members (NRC 2006c, page 2). Thus, leakage resulting in no offsite contamination above regulatory limits—considered insignificant in the WC DGEIS—was considered significant enough to promptly report it to the U.S. Congress. • The Illinois Attorney General and the Will County State's Attorney jointly filed a lawsuit against Exelon on eight counts related to the leaks (Illinois Attorney General, 2006). • Exelon agreed to provide bottled water to about 420 homeowners near the Braidwood nuclear plant (Associated

Press, 2006). • Exelon, the Illinois Attorney General, and the Will County State's Attorney settled the leak lawsuit on May 11, 2006. Per the agreement, Exelon agreed to reimburse the State of Illinois and Will County for all their costs related to the leak, to implement several remediation measures, and to take other measures intended to prevent future leaks (Twelfth Circuit Court, 2006). 8.7 In summary, the Salem, Oyster Creek and Indian Point cases clearly demonstrated that leaks contaminating the plant's property can have significant impacts. And the Braidwood case clearly demonstrates that leaks contaminated offsite properties below regulatory limits can also have significant impacts. The WC DGEIS cannot summarily dismiss this reality. (0899-3-3 [Curran, Diane] [Lochbaum, David])

Comment: B. Social and Economic Impacts[.] 8.8 The WC DGEIS does not properly consider the social and economic effects of contamination in nearby communities. These effects can be significant. 8.9 For example, during a workshop on groundwater protection conducted by the NRC on April 20, 2010, Bill Buscher of the State of Illinois Environmental Protection Agency pointed out that the millions of gallons of radioactively contaminated water that leaked from the Braidwood nuclear plant and migrated offsite and into people's drinking wells had serious implications even though the measured tritium concentrations were within the federal standards for drinking water. Buscher explained that several nearby residents were approaching retirement age and had planned to sell their properties and use the proceeds to relocate to live out their golden years. But the specter of radioactive contamination sent real estate prices spiraling downward. It is not clear from the WC DGEIS that the NRC considers potential property devaluations caused by spent fuel pool leaks. (0899-3-4 [Curran, Diane] [Lochbaum, David])

Comment: C. Licensee Longevity[.] 8.10 The WC DGEIS assumes that companies owning permanently shut down reactors are immortal. As of 2003, the companies comprising the Standard & Poor 500 stock index (S&P 500) had been publicly traded for an average of 25 years, with this average trending towards shorter values.¹⁶ [footnote 16 text: Per August 25, 2010, posting to <http://www.investopedia.com/stock-analysis/2010/the-average-lifespan-of-sp-500-companies-xom-aapl-pg-ibm-jnj0825.aspx>] The NRC assumes in the WC DGEIS that spent fuel pools could be around for up to 140 years (40 year original operating license period along with two 20-year license extensions followed by up to 60 years of short-term storage after reactor operation permanently ceases). The NRC thus assumes that the owner, or licensee, responsible for maintaining the spent fuel pool and monitoring against leaks will endure for 5.6 times longer than the average lifetime of the S&P 500 companies. The NRC apparently failed to consider, from a socioeconomic perspective, the fact that an owner no longer receiving revenue from a permanently retired generating plant may not survive for six decades. The WC DGEIS needs to either explain how bankruptcy, changes in ownership, takeover by the state, and other ownership issues cannot occur during the 60-year short-term storage period or explain how the spent fuel pool leak risk will be properly managed during and following such ownership issues. (0899-3-5 [Curran, Diane] [Lochbaum, David])

Comment: IX. Conclusions[.] 9.1 The WC DGEIS concedes that long-term, low-volume spent fuel pool leaks could exceed public health regulatory limits and impact groundwater resources. Although the WC DGEIS concludes that any such leaks are very unlikely to happen, it fails to provide solid, reliable support for this conclusion. (0899-3-6 [Curran, Diane] [Lochbaum, David])

Comment: 9.2 The WC DGEIS does not show that the NRC has considered all relevant spent fuel pool leaks. For instance, the NRC did not consider the leaks that occurred from the spent fuel pools at the Brookhaven National Laboratory and the Yankee Rowe nuclear plant. The BNL spent fuel pool leaked radioactively contaminated water into the ground for up to 12 years. Four

tests for leakage from the spent fuel pool over a seven year period failed to detect the leak. And numerous monitoring wells already existing or added to the site failed to detect the leaked water for many years or attributed leak indications other sources. But this event was not included among the past events NRC considered for the WC DGEIS. Likewise, the NRC failed to consider in the WC DGEIS the two million gallons that leaked from the Yankee Rowe nuclear plant. (0899-3-7 [Curran, Diane] [Lochbaum, David])

Comment: 9.3 In the WC DGEIS, NRC assumes that spent fuel pool leaks of 100 gallons per day or more would be readily detected before causing significant impacts. In making this assumption, the NRC relies on the availability of spent fuel pool leakage detection system and groundwater monitoring measures. But the WC DGEIS fails to properly consider that spent fuel pool water level instrumentation is not required to be functioning except during the very rare occasions when irradiated fuel is being moved within the pool and that groundwater monitoring measures are entirely voluntary. Thus, the NRC relies on measures that quite simply may be non-existent. In addition, the WC DGEIS fails to explain how leakage far in excess of 100 gallons remained undetected at Yankee Rowe until two million gallons of radioactively contaminated water had escaped into the soil. (0899-3-8 [Curran, Diane] [Lochbaum, David])

Comment: 9.4 In the WC DGEIS, the NRC fails to justify its conclusion that spent fuel pool leaks of less than 100 gallons per day either will be detected in a timely manner or will cause no significant impact if undetected for an extended period. The BNL and Indian Point leaks contradict the NRC's conclusion because each involved releases of tens of thousands of gallons, but at rates of less than 50 gallons per day. The WC DGEIS dismisses leaks smaller than 100 gallons per day, regardless of their duration, but without explicitly defining the hazard and protections credited against it (as discussed in paragraphs 6.31 to 6.37), this dismissal is speculative and subjective. (0899-3-9 [Curran, Diane] [Lochbaum, David])

Comment: Aquatic Resources -Groundwater and Surface Water[:] The description of potential impacts to groundwater does not consider potential leaks from spent fuel storage pools that could develop after reactors shutdown. *Recommendation:* Provide an analysis of potential leaks at spent fuel pools and potential impacts to ground and surface water sources. (0915-11 [Bromm, Susan E.])

Comment: On Page 2-11, NRC speaks confidently about high-level radioactive waste storage pools' robust design and structure, including "leak-detection systems." This begs the question, how then did so many pools, as are listed in Table E-4 on Page E-20, leak into the environment, sometimes for years, or even decades on end, without the nuclear utility nor even the NRC knowing about it? In short, NRC's confident claims about pools' robustness and leak-proof nature don't hold water. (0919-3-14 [Kamps, Kevin])

Comment: Re: footnote #1 on Page 4-7, where NRC states "Typically shutdown units that are co-located with operating units either have a small dedicated staff or have workers from the operating units assigned and dedicated to the shutdown unit (e.g., spent fuel pool maintenance and monitoring activities)."...It was fortuitous, as conveyed in David Lochbaum's expert witness commentary, that the worker at Dresden 1 in the mid-1990s happened to discover, by sheer luck while walking through the long shuttered Unit 1 building, a flood of leaking service water system water in the basement, due to a frozen pipe. Commonwealth Edison had decided to simply not heat the building, to save money. Had the irradiated nuclear fuel storage pool likewise sprung an unnoticed leak, a catastrophe could have unfolded! (0919-6-12 [Kamps, Kevin])

Comment: At Page 4-25, starting at line 29, NRC states "in the very unlikely event that a leak from a spent fuel pool goes undetected and the resulting groundwater plume reaches the offsite environment, it is possible that the leak could be of sufficient magnitude and duration to contaminate a groundwater source above a regulatory limit (i.e., a maximum contaminant level [MCL] for one or more radionuclides)." (highlight added)--VERY UNLIKELY EVENT?! What about all the leaks listed in this DGEIS's Table E-4 that NRC admits leaked radioactivity into the environment, sometimes for many years, without detection? What about the pool leaks at Brookhaven National Lab, as David Lochbaum asks, again a years-long, undetected leak? (0919-7-11 [Kamps, Kevin])

Comment: Re: Page 4-26, beginning at line 5, where NRC states "Further, as discussed in Appendix E, spent fuel pool design (e.g., stainless-steel liners and leakage-collection systems) and operational controls (e.g., monitoring and surveillance of spent fuel pool water levels) make it unlikely that a leak will remain undetected long enough to exceed any regulatory requirement (e.g., the NRC dose limit or EPA-mandated Maximum Contaminant Level) in the offsite environment. Although a small number of spent fuel pool leaks have caused radioactive liquid releases to the environment, based on the available data, none of these releases have affected the health of the public (NRC 2006a)."--Re: health impacts, what about the insights documented in Kelly McMasters' book *Welcome to Shirley: Memoir from an Atomic Town*?! Shirley, Long Island drank the groundwater contaminated with tritium and other radioactive poisons from the leaking pool at Brookhaven National Lab, which NRC didn't even bother to include in its Appendix E. As David Lochbaum comments, the Brookhaven National Lab pool leak must be added to this analysis, and its significant impacts on the health of downstream residents, especially children, taken seriously. (0919-7-12 [Kamps, Kevin])

Comment: NRC's answer to any ground water contamination at a nuclear power plant site is that the contaminated ground water will be detected by the monitoring wells, the contamination will only be in the water table aquifer and it will only flow to the surface water body at the plant. In New Jersey and many other areas the gradients and flow direction of ground water flow can be changed by pumping centers miles away from the rivers. (0920-10 [Foster, Ruth])

Comment: The report indicates for ground water quality and use the impacts would be SMALL since there is " ... a low probability of a leak of sufficient quantity and duration to affect offsite locations and (2) site hydrologic characteristics and monitoring programs ensure that impacts from spent pool leaks would be unlikely." When Table E-4, Occurrence of Spent Fuel Pool Leakage at U.S. Nuclear Power Plants, is compared to Table G-1, Capacity of Spent Fuel Pools for Operating Nuclear Power Reactors, it is clear that there is not a low probability of a spent pool leak since about 17% of the spent fuel pool has already had leaks, or 15 or 16 spent fuel pools (Table E-4) out of 104 reactors (Table G-1) with spent fuel pools. As indicated on Table E-4, eight of the leaks reached the environment (migrated out of the containment building). According to Table G-1 there are 94 spent fuel pools since some reactors share a spent fuel pool. (0920-16 [Foster, Ruth])

Comment: At one New Jersey facility two of the three nuclear power plants which had spent fuel pool leaks that reached the environment. It should be noted that none of the REMP ground water monitoring systems detected the tritium contamination in the ground water. The plumes of the tritium that contaminated ground water were initially delineated only after an extensive drilling program with monitoring wells placed at both plants. Only after extensive negotiations with the plant operator to drill deeper monitoring wells into the first confined aquifer below the plant, it has been confirmed that tritium contamination has migrated downward into the deeper aquifer. Since this deeper aquifer is confined the flow direction may not be in the same direction

as the water table aquifer. Studies are currently underway to determine the actual flow direction. At another New Jersey plant, a leak in a condenser pipe caused significant ground water contamination by tritium. In this case also, the REMP ground water monitoring wells never detected the tritium from the leak. After several years of negotiations, the company installed deeper monitor wells that indicated the tritium was moving downward into a deeper aquifer below a clay layer which the company's consultants indicated would protect the deeper aquifer. The part of the plume in the deeper aquifer has the potential to flow in the opposite direction as the water table aquifer. Without having additional wells drilled into the deeper zone, the true flow direction cannot be determined from the existing deep monitoring wells. At both Salem-Hope Creek and the Oyster Creek facilities, tritium contamination has migrated into aquifers below clay layers which both facilities indicated in their various reports would prevent any contamination from reaching the deeper aquifers at the plant sites. When they finally installed the deeper monitor wells the State requested, tritium was found in the deeper aquifer at both sites. Also at both of these sites there is a strong possibility that the flow will not be to the surface water body as NRC indicates always is the case. (0920-17 [Foster, Ruth])

Comment: [T]he NRC assumes the ground water system remains constant since the reactor was first designed. In New Jersey the ground water usage near the plants has increased by as much as a factor of ten. Modern regional ground water flow maps for many areas show that some rivers are now recharging the aquifers and not that the aquifers are always recharging the rivers as the NRC model indicates. (0920-18 [Foster, Ruth])

Comment: The first paragraph indicates that offsite impacts from a leak would be very low due leak monitoring, NRC oversight and groundwater monitoring. At the plants in New Jersey, for all of the known leaks (spent fuel pool and piping leaks) where the ground water was contaminated, none of the required routine monitoring (REMP) ground water monitoring wells at the facilities detected any of the leaks or the contamination of the ground water even though in the several of the plumes the tritium concentrations were < 1,000,000 pCi/liter. With routine ground water samples being taken yearly a leak or spill can be migrating in the subsurface for up to a year before sample was taken, and the sample would only show something if it was directly down gradient of the leak. A spent fuel leak detection system (under drain) showed up leakage at one plant, but that leak was likely undetected for several years before it was noticed since the tritium had migrated a significant distance from the believed site of the leak. (0920-20 [Foster, Ruth])

Comment: It is stated that the analyses in this draft GEIS are based on current technology and regulations. That may be true, but facility designs were based on the technology and science of 50 or more years ago. For example, as stated earlier, when the geology of many of these sites was assessed the theory of continental drift and plate tectonics was not accepted by the geologic community. The acceptance of this theory has allowed geologists to better understand fault origins, movements and even orientation. Current studies on faults and earthquakes such as Earth Scope are changing the earthquake hazard evaluation of many parts of the country. Studies into ground water movement and ground water contamination over the last 30 years have changed the way the resource is viewed and cleanups are conducted. For example, at both Oyster Creek and the Salem plants, underlying shallow clay units were identified in the original plant reports and it was indicated that these clays would prevent any contamination from moving below the water table aquifer into deeper aquifers at the sites. Tritium contamination at both of the plants has migrated down from the water table aquifer into deeper water bearing zones below the clay layers. At both sites, the deeper tritium contaminated aquifer has flow directions that are different than the water table aquifers. (0920-25 [Foster, Ruth])

Comment: Lines 30 to 33 indicate that current and future facilities are required to perform ground water monitoring to aid in determining the extent of existing and future contamination. In every case of leaks at the New Jersey facilities, the general monitoring well networks did not detect the plumes of tritium contaminated ground water. In lines 37 and 38 on this page and line 1, next page, it is stated that licensees that have ground water monitoring programs " ...consistent with Nuclear Energy Institute Groundwater Protection Initiative are considered to have an adequate program for the purposes of the Decommissioning Planning Rule (NRC 2011b)." Again the experience here in New Jersey has been that the facility general ground water monitoring well programs did not indicate any of the significant tritium (hundreds of thousands of pCi/L of tritium) leaks at the facilities. Furthermore, the contamination plumes tend to be very narrow. At Oyster Creek and Salem, contamination was found to drop from <100,000 pCi/L to less than detection limits in less than 100 feet between the monitoring points both on the sides of the plume and down gradient of the plume. (0920-28 [Foster, Ruth])

Comment: Licensees should not rely solely on the Groundwater Protection Initiative recommended by the Nuclear Energy Institute for developing monitoring programs to detect leaks. Groundwater protection programs should be supplemented by a more robust spent fuel pool and underground piping inspection and maintenance program to ensure that contaminated water from the spent fuel pool or buried piping does not leak into the environment. (0920-3 [Foster, Ruth])

Comment: According to Tables E-4 and G-1, about 17% of the spent fuel pools have already leaked. Some leaks were found fairly quickly and others, like Salem 1, were not found until several years after the leak started. The spent fuel leak at Salem 1 migrated down from the water table aquifer into a deeper confined aquifer. A tritium leak from piping at Oyster Creek has also migrated down from the water table aquifer through a local "confining clay" into a deeper aquifer. All the geologic/ground water reports used for the Oyster Creek plant design and operations indicate this clay layer would protect the deeper aquifer at the site, including the ones written after the leak was found. When contamination gets into deeper aquifers below local confining layers, the ground water flow does not have to be in the same direction as it is in the water table aquifer. (0920-30 [Foster, Ruth])

Comment: In this section it is stated when the plant closes there is less impact on the resource since the facility is using less water. This does not account for the fact that when the amount of ground water and surface water pumped at a site is reduced during and after closure of the power plant, the local ground water-surface water flow system at the site will definitely change. Also as people and industry move in to the area near the power plant a greater demand is placed on the local aquifers just off the plant site. In the case of Oyster Creek, the population, within 10 miles, went from 5,000 to 10,000 when construction started to over 150,000 before the first license extension. Now the population is approaching almost 200,000 people. With 100% of the population supplied by ground water, mainly from wells in the water table aquifer and shallow confined aquifers, local ground water flow is toward the pumping centers. (0920-33 [Foster, Ruth])

Comment: p. 4-26-- Lines 10 to 12 of the report indicate that a small number of spent fuel pool leaks have reached the environment and have not affected health of the public. According to Table E-4, 9 of the 16 plants listed had spent fuel pool leaks which reached the environment. This is not a small number. More than 55% of the pools that have leaked have reached the environment. (0920-34 [Foster, Ruth])

Comment: Chapter 8.0, p. 8-1---Lines 21 through 16 define SMALL, MODERATE and LARGE as related to the environmental effects on the important attributes of the resource. When Table 8-1 is examined, the impact of storage on groundwater quality and use is given as SMALL. Without knowing the demographics and water use around a plant; it is not possible to make a blanket assessment that the impact of a leak to the ground water would be SMALL. The reasoning is that spent fuel pools are designed not to leak, have monitoring systems in place that would detect any leak and there are monitoring wells at the plants to detect any ground water contamination. It is also indicated that any contamination will only affect the water table and migrate to the surface water body. (0920-39 [Foster, Ruth])

Comment: The source of the initial concentrations of spent fuel pool radionuclides of concern is unclear. NRC (2006b) "Liquid Radioactive Release Lessons Learned Task Force Final Report" is cited as the source of the initial concentrations in this table however no data on the concentrations of radionuclides in spent fuel pools could be found in the cited report. (0920-4 [Foster, Ruth])

Comment: Currently in New Jersey there are four reactors at two sites, one on a site on an estuary and the other three on at a site on a major river. Both sites are underlain by gently dipping (<65 feet per mile) gravel, sand and clay formations which makeup the confining layers and aquifers of the New Jersey Coastal Plain. Tritium contamination has affected the water table aquifer and deeper confined aquifers at both sites. At Oyster Creek, the water table and locally confined shallow aquifer is the major ground water source and producer for the region with nearly 200,000 people living within the 10 mile radius of the plant. At Salem, the water table aquifer is an extremely poor water producer, but the confined shallow aquifer is hydraulically and stratigraphically connected to a major aquifer which is heavily pumped across the river in Delaware. A large cone of drawdown has reached under the river into New Jersey and is just to the south of the plant sites. As the drawdown cone expands, it will also migrate up dip toward the shallow confined aquifer at the Salem plant site, which has tritium contamination. (0920-40 [Foster, Ruth])

Comment: Appendix E, p. E-6--Lines 1 to 4 indicate the NRC has found that the ground water monitoring conducted by the facilities is adequate. The is not supported by the data from any of the New Jersey plants since the routine REM monitoring wells did not detect any of the tritium leaks. (0920-41 [Foster, Ruth])

Comment: Appendix E, p. E-7-Lines 5 to 10 and 24 to 27 indicate that the plants are developing ground water monitoring programs and the programs will have conceptual and subsequent numerical models for the basis of estimating the dispersion of radionuclide releases to the ground water. The issue is that the NRC does require the plants use updated geologic and ground water information. (0920-42 [Foster, Ruth])

Comment: Appendix E, p. E-9--Lines 11 and 12 indicate that spent fuel pool leaks have been detected at 13 plant sites. It seems like NRC is trying to downplay the number of leaks. Table E-4 lists 13 sites, but at those 13 sites there are 16 spent fuel pools leaking. In lines 16 to 18 it is indicated that in most cases the liner and leakage monitoring prevent the spent fuel pool water from leaking undetected into the environment. Table E-4 indicates that 9 of the 16 spent fuel pool leaks did reach the environment. It should be noted that at least one of those leaks, Salem I, must have been leaking for at least two years as evidenced by the distance the plume of contaminated ground water had moved by the time the leak was discovered. None of the routine ground water monitor wells at the have detected the tritium plume. (0920-44 [Foster, Ruth])

Comment: Appendix E, p. E-10---Lines 15 to 22 indicate that the ground water monitoring makes it unlikely that a leak would remain undetected long enough for the contamination to migrate off site. Again, based on experience here in New Jersey, the Salem 1 and Salem 2 spent fuel pool leaks were not detected by any of the routine ground water monitoring wells. Also, the tritium leak at Oyster Creek was not detected in any of the routine ground water monitoring wells. (0920-45 [Foster, Ruth])

Comment: The basis for the initial concentrations of spent fuel pool radionuclides of concern is unclear. For example, with regard to tritium, it is not unusual for spent fuel pool concentrations to be an order of magnitude higher than the 2.9×10^{-2} micro curies/ml reported in this table. Is this an average value? Would it be more useful to report a range of concentrations? (0920-5 [Foster, Ruth])

Comment: Based upon the information provided in the text regarding the methodology for calculating the annual discharge rate associated with spent fuel pool leakage of 100 gallons per day, the estimated spent fuel pool leakage (Ci/yr) should be two orders of magnitude higher than the values reported in this table. Was a dilution factor applied that is not discussed in the GEIS? (0920-7 [Foster, Ruth])

Comment: Please provide the historical data for Salem Unit 2 that characterized this event as an inadvertent liquid radioactive release to the environment resulting from the occurrence of spent fuel pool leakage, as indicated in Table E-4. (0920-8 [Foster, Ruth])

Comment: Please find attached a double-sided pamphlet written (in Dec. 2012, and updated in Nov. 2013) by Beyond Nuclear board member Kay Drey of St. Louis, MO, entitled "ROUTINE RADIOACTIVE RELEASES FROM U.S. NUCLEAR POWER PLANTS." I submit it as public comment on NRC's Waste Confidence Draft Environmental Impact Statement, because whether re: impacts on Groundwater (Section E.2 .2.1), Surface Water (Section E.2.2.2), Soils (Section E.2.2.3), or Public Health (Section E.2.2.4), as summarized in Section E.2.2.5 on Page E-19, NRC has determined, incredibly, that the impact of radioactivity leakage from high-level radioactive waste storage pools is "SMALL." We beg to differ. This pamphlet, while focused on "routine radioactive releases," also touches on "leaks"-which, because they happen so often, unfortunately, could be referred to as "routine" at nuclear power plants-although there is nothing "routine" or "small" about them, in terms of their impacts on the environment and human health. (0925-1 [Kamps, Kevin])

Comment: Please note that this ""ROUTINE RADIOACTIVE RELEASES FROM U.S. NUCLEAR POWER PLANTS" pamphlet, on its flipside, includes a map of the U.S., showing atomic reactor sites, and the surface waters into which their pools either already do leak or have leaked (as documented in NRC's Table E-4 on Page E-20, at Hatch in GA. Indian Point in NY, Palo Verde in AZ, Salem in NJ, San Onofre in CA, Seabrook in NJ, and Watts Bar in TN; as documented by David Lochbaum of UCS, in his comments to this proceeding, at Yankee Rowe in MA, as well as Brookhaven National Lab on Long Island, NY), or else could yet leak someday. The NRC WC DGEIS, as at Table E-4, currently lacks specific information, as to which surface waters pools have leaked into, are yet leaking into, or could someday leak into. (0925-4 [Kamps, Kevin])

Comment: PNPS has been without any DEP monitoring for almost twenty years. It too has leaked tritium into the groundwater and the source of the leak, untested for years, was only "accidentally" found as reported in the newspaper. For this plan to have its impact on the environment to be labeled as small is beyond logic and scientific basis. No two reactors are

alike-----no two reactors sites are alike; they vary on environmental impact and should be evaluated based on individual characteristics. (0933-9 [Anonymous, Janet])

41. Comments Concerning Cumulative Impacts

Comment: I would like to refer to the impacts of climate change on waste. And that in fact, the rules insufficiently address this matter in 6.4.5.1 as it relates to short-term, long-term and indefinite storage onsite and offsite. The NRC concludes that the relative contribution from indefinite, long-term, short-term onsite storage of spent fuel to greenhouse gas emission levels would be small, quote-unquote. As it relates to the cumulative impacts, the -- in Section 6.4.5.1 and 2, the conclusion is that the cumulative impacts will be noticeable but not destabilizing with or without the greenhouse gas emissions from continuous storage, so over a period of 240,000 or 250,000 years one has to wonder if they've -- these projections have actually been made in that context. And as it relates to what is the revision of the Waste Confidence GEIS and the rule for possible revision, this is warranted by significant events that may call into question the appropriateness of the rule, so at the same time, the GEIS analyzed reasonably foreseeable events, and did not consider worst-case scenarios. I think it's time to look at the worst-case scenarios given what has been taking place in Fukushima, elsewhere, climate change, floods, potential seismic issues and so forth. (0163-5-1 [Wilson, Annie])

Comment: I also consider that the DGEIS requires "connective actions" to be analyzed if it is to fulfill the responsibilities of NEPA. Although the document is addressing the storage of nuclear waste material by private energy generators, the generation of waste material is a "cradle to grave" event. However benign or dangerous nuclear material is "in-situ" (e.g. its natural geologic setting), once uranium is mined, ore processed, material enriched, fuels used, fuels spent, and waste disposed, citizens should expect safety to body and environment. Review of the DGEIS does not provide any quantitative understanding of environmental impacts or risks from earlier nuclear material activities, origin of nuclear materials or connection to foreign or defense related activities. I contend that, not only should the DGEIS provide connective actions to other nuclear industries so the reader has a clearer understanding of the full impact to our human environment, the document should include some mention of global activities since there is no safe level of radiation and all nations that potentially lose material have the potential to contaminate "down wind." The human use of nuclear material is a scant 100 years, fraught with problems of poor use, ignorance, contamination and death, and you ask the citizens of this nation to simply trust that the NRC can manage it for millennia (0219-9 [Olmstead, Stan])

Comment: Lastly, the one thing I'd like to also mention is that the EIS kind of looks at this scenario of one leaking fuel pool, but it doesn't look at the likelihood or the probability of multiple failures, and what are the cumulative effects of that, especially when you have multiple reactors, especially when you're in sites that are ecologically sensitive like that of around Turkey Point. (0244-8-4 [Totoiu, Jason])

Comment: And then the NRC has failed and continues to fail to recognize the long-term damaging effects of radiation from numerous sources. We encourage the NRC decision-makers this time to give full consideration to all of the inherent negative aspects of adding more radiation to an environment already forever polluted by the dropping and testing of nuclear weapons; routine or accidental releases from nuclear power plants and weapons complexes; enrichment facilities; and supporting operations; and the release of radiation during and after hurricanes, tsunamis, earthquakes, and other natural disasters. (0250-51-7 [Thomas, Ellen])

Comment: Centuries of storage at multiple sites would surely have measurable effects on dedicated land use and terrestrial resources, if nothing else. (0262-5 [Patterson, Karen])

Comment: Specifically in this region of the Great Lakes Basin, 20 percent of the world's surface fresh water is in jeopardy from 60 nuclear power plants, 37 of which are directly in the watershed, an accident at any one of which would render 20 percent of the world's precious surface fresh water unusable. And, yet, we go on and do it. (0327-2-3 [Keegan, Michael])

Comment: The GEIS utterly fails to integrate even the information it contains. Systems, conditions, effects, and impacts all get divided into various categories and then each is treated as if each operates within some imaginary bubble. Simply from the elementary perspective of basic math, even if one were to accept the preposterous assertions that every possible individually identified impact classification would be - to use the GEIS's favorite word, "SMALL" - that by no means indicates the total sum of various impacts would be small. And - again, just using third grade math here - it certainly does not mean that the multiplicative impacts are small. (0341-2-4 [Mermelstein, Richard])

Comment: The same failure to look at additive and multiplicative and accelerative factors infects all aspects of the NRC's analysis of human health and environmental damage impacts. After a long, laborious slog through hundreds of pages of the GEIS, one comes to the "Cumulative Impacts" section. At last, calculus would be made of all the risks to health and environment from decades of radioactive effluent releases from the entire nuclear operations (military, civilian, medical, etc) and the nuclear waste stream (military, civilian, medical, devise, etc), from the beginning of the nuclear age, through the decades of extended (and new) nuclear power operation, and then for the envisioned centuries ahead. One would anticipate a thorough analysis, to incorporate the most current medical research and environmental studies. The realities of water source depletion, dwindling fisheries, polluted and heated waterways, algae growth... the list goes on and on. Surely the GEIS would evaluate the added burdens of heat and radioactive effluents into the groundwater and surface water as an added stressor that might well constitute a tipping point to major environmental crisis. Added too would be the estimation of more accidental releases - large and/or small - during regular nuclear power operation, since that would be just the starting point for analysis. No? Without a doubt, the findings of the National Academy of Sciences and all the other studies attesting to the additional vulnerabilities of environmental justice populations and of women, adolescents, children, babies and babies in utero will be given due consideration. And, most assuredly, the analysis would carefully examine the totality of all the cumulative effects of the hundreds of different radionuclides (with so many different pathways and effects) that have been, are being, and will ineluctably be, disgorged. Increased human populations and exposures would, of course, be calculated. After all, there will be thousands of tons more waste and millions more people. Alas, we are still waiting. (0341-2-7 [Mermelstein, Richard])

Comment: Similarly, the DGEIS fails to acknowledge the indirect impacts of evacuation in a severe accident. In the context of license renewal, NRC Staff noted that "in the [license renewal] GEIS, sever[e] accidents have been determined to have small impact. So I think, too, a point that wasn't made is that when we look at the evacuation question, because the impact has already been determined from a severe accident to be small, the evacuation -- the probability of it occurring would make it most likely a small impact as well." Transcript of Proceedings, Briefing On Proposed Rule To Revise The Environmental Review For Renewal Of Nuclear Power Plant Operating Licenses (Part 51) (Jan. 11, 2012), ML120180209 at 73. Unlike in the license renewal context, however, where these issues may be addressed again, no further discussion of the indirect storage of nuclear waste will take place after promulgation of 10 C.F.R. § 51.23. These

impacts must be analyzed in the context of this rulemaking. (0473-10-16 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: NRC Staff dismiss ALL of the following points (one way or another) on the basis that it finds the probability of a fuel pool fire to be so low that it concludes that such an event is "inconsequential." The odds cited are about 1 in 60,000...but that is for any one year, at only one reactor. Meanwhile there are still 99 reactors operational in the USA, and each will continue operating for more than one year. The odds rise to 1 a few thousand. NRC dismissing an enormous hazard solely because it is a "low-probability" event does not constitute protection of the public health and safety as it is charged by law to provide. (0552-2-1 [Macks, Vic])

Comment: For example: given the fact that spent fuel pools have already leaked, and continue to leak at Indian Point, the prospect of decades of additional pool storage during the 60-year post operating license timeframe implicates potential long-term impacts to the surrounding environment. NRC has failed to adequately consider such impacts. Notably, Indian Point is situated adjacent to recognized critical aquatic ecosystems; radionuclides have in the past been detected in fish samples near Indian Point, and spent fuel pool leaks may impact aquatic organisms in the future, especially since the radioactivity from spent fuel pool leaks at Indian Point will be releasing to the Hudson River indefinitely, and certainly throughout the 60-year post operating license timeframe. Yet, NRC has boxed its analysis into narrowly defined impact criteria and, as a result, failed to assess in any meaningful way the impacts to aquatic organisms posed by such cumulative and future spent fuel pool leaks. Notwithstanding what NRC considers its analytical framework, under NEPA, a complete analysis is required since impacts to aquatic ecosystems are reasonably foreseeable. (0710-21 [Brancato, Deborah] [Musegaas, Philip])

Comment: Section 6.3.1, page 6-4 and running through 6-8, identifies general trends and activities upon which the cumulative impacts are analyzed. These trends, while identified and supportable, are insufficient for analysis. The primary reason for the deficiency is that they do not take into account the chilling or negative effect that continued storage of spent fuel has or will have on an immediate area. So while table 6-1 can provide guidance on positive future events there is no guidance on the negative aspect of continued spent fuel. This too needs to be identified and evaluated within the scope of the Draft GEIS. (0783-3-10 [Harlan, Thomas])

Comment: The deficiencies cited by the City [Red Wing, MN] with the Draft GEIS previously set forth in this letter carry forward and manifest themselves in the analysis of the cumulative impacts of continued storage. These include, without limitation, the failure to analyze the indirect impact of continued storage, the failure to address mitigation and emergency preparedness, the continued reliance upon the assumptions set forth in section 1.8.3 as well as the absence of any discussion on the chilling effect that continued storage will have upon future development in the area. It is this last deficiency that is particularly poignant in the Draft GEIS's analysis of cumulative impacts. For the City, the cumulative impact is quite simple: continued storage of radioactive material, for short or long-term, will not allow for the natural growth and progression of the City. Development in that area will either lag or become unrealized since no one will want to be located next to the storage facility. The facility, itself, will have a disproportionate drag on public safety services since readiness demands that the City be prepared for an incident involving a radiological release. At that same time, the tax revenue from development that could normally offset this obligation would decrease or not materialize at all thereby shifting the burden of public safety costs on the other citizens of the City especially after the PINGP ceases operations. Despite these clear impacts, an analysis of these in the Draft GEIS is missing. In

order to fully complete an analysis of the cumulative impact of continued storage to satisfy NEPA requirements, this analysis must be included in the Draft GEIS. (0783-3-9 [Harlan, Thomas])

Comment: The NRC has failed to examine the full impacts upon the complete physical world from all cumulative leaks, considering past, present, and future timelines. Analysis of these impacts are complicated by the need for accurate identification of leak detection difficulties as well as monitoring and inspection issues, particularly surrounding similar patterns of problems occurring at two or more sites. All spent fuel pool leaks will create definite significant impacts at the point in time where they migrate outside of the site or they contact other water. This undeveloped messy area must be addressed fully with sufficient data points and sufficient decision tree criteria in order to satisfy the required scientific analysis for the highest and best standards for safety, but this has not happened. The Waste Confidence Draft Generic EIS unacceptably fails the tests of scientific thinking, methodology, and practices at its most fundamental level. The NRC has developed a flawed tool, the Draft Generic EIS, that fails to adequately protect physical environment as well as people from unfortunate impacts. (0823-53 [Michetti, Susan])

Comment: Further, the NRC fails to fully evaluate cumulative impacts in its DGEIS. The Court of Appeals explained that “a proper analysis of the risks [of SFP leaks] would necessarily look *forward* to examine the effects of the additional time in storage, *as well as examining past leaks*.” *New York*, 681 F.3d at 481 (first emphasis in original; second emphasis added). Under NEPA, the NRC must consider the “impact on the environment that results from the incremental impact of [its] action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (Federal or non-federal) or person undertakes such other actions.” 40 C.F.R. § 1508.7; *see also* 10 C.F.R. §51.45(c); *see also* 10 C.F.R. § 51.75, 10 C.F.R. § 51.45. This is because cumulative impacts “can result from individually minor but collectively significant actions taking place over a period of time.” *See* 40 C.F.R. § 1508.7. As numerous courts have explained, a meaningful cumulative impact assessment must therefore identify (1) the affected area, (2) the expected impacts of the project, (3) other past, present, proposed, and reasonably foreseeable actions that are expected to have impacts in the same area, (4) the impacts or expected impacts from such other actions, and (5) the overall expected impact in light of the accumulation of the individual impacts. *See Grand Canyon Trust v. FAA*, 290 F.3d 339, 345-46 (D.C. Cir. 2002). In other words, the agency “cannot treat the identified environmental concern in a vacuum.” *Id.* at 346. However, NRC has demonstrably failed to fully assess cumulative impacts in relation to SFP leaks. To begin with, the NRC does not consider impacts from multiple SFP leaks in close proximity (e.g., sites such as Turkey Point where there are multiple SFPs) or impacts from combined contamination of groundwater in areas where other waste sites are nearby (e.g., Plant Vogtle is located just across the Savannah River from the Savannah River Site, which contains a large amount of nuclear waste). In addition, NRC has failed to analyze the cumulative impacts that may result from past, present, and reasonably foreseeable future radiological leaks from *non*-SFP systems, structures, and components. It can logically be expected that future (and/or existing) leaks and contamination from SFPs will interact with and cause cumulative impacts with any past, current, and likely future leaks from other, non-SFP components. As one NRC licensing board has aptly explained, “if releases from SFP leaks encounter groundwater, then the radionuclides would co-mingle and coalesce with any impacts that might be present from other sources” and “it is unlikely” that “concentration levels” in groundwater “can be parsed into relative contributions from the separate sources that contribute to the overall groundwater contamination at the site, and that “[b]y necessity”, “the impacts to groundwater from SFP leaks and the subsequent discharges into” adjacent surface waters must be considered “on a site-wide basis.” In the Matter of Entergy Nuclear Operations, Inc. (Indian Point Nuclear Generating Units 2 and 3), Docket Nos. 50-0247-LR and 50-286-LR,

ASLBP No. 07-858-03-LR-BD01, Order (Granting in Part and Denying in Part Applicant's Motions *in Limine*) (March 6, 2012), at 29, ADAMS Accession No. ML12066A170. Thus, such cumulative radiological leakage impacts must be fully assessed in NRC's DGEIS. (0897-5-18 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Non-SFP leaking plant components at facilities around the country have already contaminated on-site and off-site groundwater and public waterways.¹⁵ [footnote 15 text: See *generally* Liquid Radioactive Release Lessons Learned Task Force Final Report, September 1, 2006, *available at*, ADAMS Accession No. ML062650312; *see also* Riverkeeper and Hudson River Sloop Clearwater Initial Statement of Position Regarding Consolidated Contention RK-EC-3/CW-EC-1 (Spent Fuel Pool Leaks) (December 22, 2011), at 41-43, *available at* ADAMS Accession No. ML12335A617 (describing various non-SFP component leaks that have occurred at Indian Point).] As of June 2011, NRC reported that 42 of 65 reactor sites, i.e., 65%, have experienced problems with radiological leaks.¹⁶ [footnote 16 text: See Leaks and Spills of Tritium at U.S. Commercial Nuclear Power Plants, Rev 9 (June 7, 2012), ADAMS Accession No. ML101270439; *see also* Union of Concerned Scientists, *Groundwater Events Sorted by Date*, September 27, 2010, *available at*, http://www.ucsusa.org/assets/documents/nuclear_power/Groundwater-Events-Sorted-by-Date.pdf; Jeff Donn, Radioactive tritium leaks found at 48 US nuke sites (June 21, 2011), *available at*, http://www.msnbc.msn.com/id/43475479/ns/us_n] The trend of accidental radiological leaking can be expected to continue and even increase as America's original nuclear fleet continues to age. Indeed, the basic engineering principle of the "bathtub" curve (see Lochbaum Declaration, pars. 7.37-7.43) indicates that as these aging nuclear plants reach the end of their operating lives, problems, such as component degradation and resulting leaks, can be expected to sharply increase. Historically, U.S. nuclear power plants have had leakage problems with difficult to inspect buried pipes and components. The United States Government Accountability Office ("GAO") conducted a study that concluded in 2011 that, "[t]he occurrence of leaks at nuclear power plants from underground piping systems is *expected to continue* as nuclear power plants age and their piping systems corrode."¹⁷ [footnote 17 text: Liquid Radioactive Release Lessons Learned Task Force Final Report, September 1, 2006, at 22 *available at*, ADAMS Accession No. ML062650312 (emphasis added).] GAO confirmed that because "underground piping systems tend to corrode" and are "largely inaccessible and difficult to inspect," the "*severity of leaks could increase* without mitigating actions."¹⁸ [footnote 18 text: *Id.* at 1.] Plant owners' aging management programs and more recent industry initiatives that allegedly are designed to "handle" leaks from the miles and miles of buried and inaccessible buried components fall far short of providing the necessary assurances the radiological leaks will be properly detected and prevented in the future.¹⁹ [footnote 19 text: Plant programs and industry initiatives are simply not designed to identify or stop *all* potential radiological leaks; alleged "enhanced" inspection commitments still only cover a small fraction of total amounts of onsite buried piping. See, e.g., In the Matter of Entergy Nuclear Operations, Inc. (Indian Point Nuclear Generating Units 2 and 3), ASLBP # 07-858-03-LR-BD01, Docket # 05000247, 05000286, Exhibit # NYS000164-00-BD01, Pre-Filed Written Testimony of Dr. David J. Duquette, Ph.D Regarding Contention NYS-5, ADAMS Accession No. ML12334A699 (explaining deficiencies in the "aging management program" at Indian Point for preventing and detecting corrosion of buried pipes and components).] The NRC must consider and account for this in its DGEIS. In addition, accidental spills and releases caused by human error have also resulted in releases of radioactivity to the environment at nuclear power plants.²⁰ [footnote 20 text: Liquid Radioactive Release Lessons Learned Task Force Final Report, September 1, 2006, at 34, *available at*, ADAMS Accession No. ML062650312; Riverkeeper and Hudson River Sloop Clearwater Initial Statement of Position Regarding Consolidated Contention RK-EC-3/CW-EC-1 (Spent Fuel Pool Leaks) (December 22, 2011) at 42, 53, *available at* ADAMS

Accession No. ML12335A617; GZA, GeoEnvironmental, Inc. Final IPEC Quarterly Long-Term Groundwater Monitoring Report, Quarter Two 2010 (Report No. 10) (February 15, 2011), IPEC00227561, at p.1-2, ADAMS Accession No. ML12275A555 (hereinafter "GZA IPEC Quarter 2 Groundwater Report") (Entergy's vendor describing a spill from a Reactor Waste Storage Tank ("RWST"), that resulted in a marked increase in the tritium plume present at the Indian Point site that Entergy attributes to the Unit 2 SFP leaks; this spill resulted in an increase in radionuclide levels in the groundwater that lasted for many months).] Such incidents will likely continue to occur, and NRC must consider cumulative impacts that may result from such accidental spills and releases. It is reasonably foreseeable that non-SFP components will continue to contaminate the environment around U.S. nuclear power plants prior to as well as during post-operation timeframes, and it is patent that such other radiological leaks may affect the nature and impact of any future SFP leak, i.e., result in cumulative impacts. NRC must fully analyze such cumulative impacts. Because the NRC's analysis fails to consider several reasonably foreseeable impacts, it directly violates NEPA. (0897-5-19 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The NRC evaluates the environmental impacts of pool storage of spent fuel in two different contexts: during reactor operation (in the license renewal rule) and afterwards. The NRC makes no attempt to integrate these analyses or assess the cumulative impacts of storing massive amounts of spent fuel in high-density storage pools at every reactor site around the country. This division of environmental analysis makes no sense from a technical basis, and results in an understatement of environmental impacts. (0897-7-15 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: In Table 4-1 on Page 4-30, NRC shows that a reactor requires 1.152 BILLION gallons per day for once-through cooling: 800,000 gallons/minute X 60 mins/hr X 24 hrs/day = 1.152 billion gallons/day NRC also reveals that 10 BILLION BTUs per HOUR are discharged to environment, whether once-through cooling, or cooling towers, are used! These are, on their face, large impacts on the environment. But NRC yet again tries to present those large reactor impacts as somehow a justification for the smaller irradiated fuel pool impacts, of 2,800 gallons per minute water withdrawals for cooling, and discharge of 35 million BTU/hr of heat. But the pool impacts are in addition to the reactor impacts during operations. And even after the reactor permanently ceases operations, the ongoing pool impacts would be on top of the damage already done to the environment during 40, 60, or even 80 years of reactor (and pool) operations. As accumulative impacts, 60 additional years of pool impacts cannot be justified as "SMALL" by comparison. This is especially so given the radiological and other hazardous releases the pools are all too capable of. (0919-7-17 [Kamps, Kevin])

Comment: On Page 4-31, NRC continues its arguments that irradiated nuclear fuel storage impacts are small when compared to reactor operations. But exploiting the public's numbed "shock and awe" from by the damage already done by reactors does not justify or excuse additional, cumulative impacts from irradiated nuclear fuel storage. Two wrongs don't make a right. (0919-7-18 [Kamps, Kevin])

Comment: Table ES-5 indicates the cumulative effects range from small to moderate or to large in every category but three (public and occupational health and accidents both being small and climate change being moderate) with the impacts on socioeconomics; surface water, ground water, aquatic ecology, historical and cultural resources and waste management ranging up to large. This would imply that the environmental impact of each facility should be evaluated on its own, not lumped in a generic GEIS evaluation. (0920-19 [Foster, Ruth])

Comment: Specifically in this region of the Great Lakes Basin, 20 percent of the world's surface fresh water is in jeopardy from 60 nuclear power plants, 37 of which are directly in the watershed, an accident at any one of which would render 20 percent of the world's precious surface fresh water unusable. And, yet, we go on and do it. (0945-1 [Keegan, Michael J.]

42. Comments Concerning the Cost of Storage

Comment: I am also concerned about the sustainability of nuclear power. The EIS needs to evaluate the true costs of nuclear power after the subsidies are stripped away. The long-term costs of decommissioning need to be considered as well. The ongoing costs to US taxpayers should be transparent in this EIS. (0003-4 [Commenters, Multiple])

Comment: Inevitably, future transfer and replacement operations will be a financial burden for countless generations to come, so we should be committed to minimizing this burden. (0009-3 [Schwartzberg, Lora])

Comment: I am concerned that the true costs of the nuclear fuel cycle are not discussed in this document. The long-term social and monetary costs of the creation of radioactive waste are not evaluated, nor are the costs considered of potential accident or incident relating to spent fuel like a pool fire, pool leakage, long-term cask storage failure or transportation of radioactive waste. In addition, the costs of handling the existing on-site waste and restoration of the lands decimated by mining were ignored. (0030-12-3 [March, Leslie])

Comment: I'm proposing that the EIS meet its NEPA requirements by offering alternatives, considering each reactor site separately, and to evaluate all of the costs involved, not just how much it will cost to do an EIS, which is what it says right now. (0030-12-8 [March, Leslie])

Comment: What are the costs and risks and impacts of storing irradiated nuclear fuel for any period of time, let alone forevermore? Is having a new or extended reactor operating license worth the costs, risks, and impacts of storing high-level radioactive waste forever into the future? The answer to that question is no. Have these costs, risks, and impacts been mitigated? The answer to that is no. This generic environmental impact statement is completely devoid of this issue, which makes a mockery of the National Environmental Policy Act as well as the Court ruling on New York v. NRC. (0030-2-3 [Kamps, Kevin])

Comment: The true cost of nuclear power should be assessed in detail in the EIS, including the substantial front-end subsidies and the long-term costs of decommissioning and management of nuclear waste. Without the fuel cycle being included within the scope, the EIS will be derelict in its purpose and to the environment. The environmental, social, and economic costs associated with the fuel cycle need to be part of their report. Nuclear reactor owners and operators are not fully financially responsible for the disposal of their waste. Once the waste leaves the reactor site, the U.S. taxpayer is on the line for any accidents and liability. These long-term hidden costs must be made apparent and in full view and be a full cost accounting. (0030-21-4 [Carberry, Mike])

Comment: The economic analysis that was done in the environmental impact statement analyzes the cost of the analysis of the different options of which choice the EIS should choose, whether to look at -- the economic analysis is inadequate because it does not look at the real costs of managing the waste, and compare those costs. And there is no indication of where the costs for the long-term management will be. (0030-8-3 [D'Arrigo, Diane])

Comment: What is the cost of storing irradiated nuclear fuel for any period of time, let alone forevermore? ---- NRC does not even ask that question, let alone answer it, in this draft GEIS. Is having a new or extended reactor operating license worth all the costs, risks, and impacts of storing irradiated nuclear fuel? ---- The answer to that question is a resounding "NO"! (0034-2 [Wagner, Jim and Virginia])

Comment: I am also concerned about the sustainability of nuclear power. The EIS needs to evaluate the true costs of nuclear power after the subsidies are stripped away. The long-term costs of decommissioning need to be considered as well. The ongoing costs to US taxpayers should be transparent in this EIS. (0039-7 [Littlejohn, Nick])

Comment: As a financial professional I am concerned that the true cost of the nuclear fuel cycle are not discussed in this document. The long-term social and monetary costs of the creation of radioactive waste are not evaluated, nor are the costs related to the potential accident or incident related to fuel spent like pool fire, pool leakage, long-term cask storage, or transportation of radioactive waste. In addition, the costs of handling the existing on-site waste and restoration of the lands decimated by mining were ignored. (0045-11-5 [March, Leslie])

Comment: However, over the past few decades, American nuclear consumers have been forced to shoulder the increasing cost of nuclear waste management. Without a federal waste management system in place, utilities and consumers across the country have been shackled with the cost of maintaining nuclear waste on existing reactor sites, while continuing to pay \$750 Million Dollars annually, into the nuclear waste fund. (0045-4-2 [Martini, Shawn])

Comment: The National Environmental Policy Act requires consideration of all reasonably foreseeable environmental impacts of a proposed action from cradle to grave, yet in its Generic Environmental Impact Statement the NRC does not even consider the cost and risk of transporting and storing fuel (for any period of time, let alone forever) when making licensing and relicensing decisions. Given that cost (and risk), plus the cost of decommissioning, is nuclear power worth it, especially with the risk of terrorism? (0064-6 [Skud, Bruce])

Comment: New rules, yes! An Environmental Impact Statement and Rules that spell out the true unsubsidized costs of nuclear power, including decommissioning costs -- and that take full account of those true costs. (0075-1 [Hill, Barbara])

Comment: New rules, yes! An EIS that fully assesses the claims of nuclear power in terms of its claims to price competitiveness and environmental safety. (0075-5 [Hill, Barbara])

Comment: Obviously the costs of this ongoing HOSS are astronomical, and must be borne by the industry that generates the waste. Your responsibility is to deny licenses to new power plants unless they demonstrate how they will bear these future ongoing mitigation costs. If you had done this from the start, storage of these infinitely poisonous wastes that have been generated for many decades would not have become such an overwhelming problem. (0127-4 [Lee, Catherine])

Comment: The true costs of nuclear power should be assessed in detail in the EIS, including the substantial front end subsidies, and the long term costs of decommissioning and the management of nuclear waste. (0143-8 [Arauz, Jorge])

Comment: Even if there were, the net present cost would bankrupt the industry or the tax payers. (0155-2 [Preschle, Gus])

Comment: Nuclear energy is the most expensive to produce and the total costs of this dirty energy source skyrocket as the plants age and more waste is generated. (0158-2 [Payne, Joanne])

Comment: Why do we, as taxpayers, have to foot the bill of continued storage after Entergy sheds its corporate shell and walks away? (0163-15-9 [Garner-Ritter, Maureen])

Comment: And finally, I would just add, New Yorkers have paid, everyone in this room has paid \$4 billion for the state's nuclear waste to be in a repository taken from plants and put someplace else. That is something that we should be talking about and focusing on instead of rehashing the debate about Indian Point at a forum that has nothing to do with Indian Point. The rate payers of New York, the taxpayers of New York, deserve to get their money's worth and we would implore the NRC to be an advocate for solutions, be it Yucca Mountain or elsewhere, where this used fuel can go. (0163-19-5 [Steidler, Paul])

Comment: It costs billions to make. Where's the sense in us making some more. Who pays? Who pays for the waste? It's our taxes and kids. (0163-28-5 [Cypser, Betty])

Comment: [T]he biggest problem we [Radiation Public Health Project] have with the GEIS is a lack of cost considerations. It states that every hundred years the spent fuel -- the dry cask, if we get everything into dry cask, are going to be replaced. How is that going to be funded? We all just went through a government shutdown because we almost de-funded the government. How in the world can the NRC, in this GEIS, guarantee that there will be funding in the future. (0163-7-9 [Shapiro, Susan])

Comment: Looking at a more economic viewpoint, the cost for nuclear waste disposal is a big factor in this. As Joseph A. Lieberman states, "More money probably has been spent, and more scientific and technological effort concentrated, on facilities, operations, and research and development with regard to this industrial waste than on any other industrial contaminant we have know" (Lieberman, 1957). Although this was written in 1957, this statement is most definitely still on point today as nuclear energy is being used more than ever nowadays. If one were to look at the normal trends of technology, as times passes, the efficiency of said technology decreases. As efficiency decreases, the less productive the technology is. In this case, that means that the technology will not dispose the waste as much as it could in the past, so this means more money is needed to keep the technology running at full performance. This updated EIS can give the means to new technology, thus creating a less costly way to dispose of waste. The upfront cost of new technology is never cheap, but its long-term productivity is much higher, which means less money needed in the future, which makes it worth the upfront cost. (0192-9 [Einhorn, Jeremy])

Comment: I am also concerned about the sustainability of nuclear power. The EIS needs to evaluate the true costs of nuclear power after the subsidies are stripped away. The long-term costs of decommissioning need to be considered as well. The ongoing costs to US taxpayers should be transparent in this EIS. (0198-5 [Cerrito, Robert])

Comment: No honest estimates are provided for costs of storing spent fuel, ever. It is a scam. (0198-7 [Cerrito, Robert])

Comment: Taxpayers should not bear the financial burden of a permanent storage facility. Power companies should be taxed with the entire responsibility of the life of spent fuel until it becomes non-hazardous. (0202-3 [Hill, Jack])

Comment: Dedicate funding to local and state governments to independently monitor the sites: Funding for monitoring the HOSS facilities at each site must be provided to affected local and state governments. The affected public must have the right to fully participate. (0222-19 [Zeller, Lou])

Comment: At the same time, another thing of interest is, what are your assumed costs? Like, what is a small cost for progress? What are we putting on the line here? You guys are all pushing for progress and, you know, we want to bring this energy; however, at the cost of what? What are we sacrificing? (0244-15-10 [Zuccarini, Ana])

Comment: The plant owners and operators should pay for the long-term costs. They're the ones who profited from this disgusting mess they've gotten us into. It should not be citizens' and taxpayers' responsibility. (0244-6-5 [Steorts, Tim])

Comment: Currently, the Federal government is paying very large fines to utilities because of its failure to accept spent fuel for long-term storage by 1988. In other words, because Yucca Mountain was not finished, the Federal government is, they have to pay fines. Once spent fuel comes under Federal control, the government no longer will be required to pay these fines. (0245-29-2 [Shineflug, Marilyn])

Comment: How much will it cost to contain, watch over, move, clean up leakage for hundreds of thousands of years? Enough! Everything, everything leaks. (0245-42-4 [Rorem, Bridget])

Comment: I would like the NRC to actually look at the cost of this waste handling not 10, 50, even 100 years down the road. Let's have an in-depth analysis of the cost at 50,000 years. Let's not even go out to the life of the waste. Let's look at 50,000 years. But 65,000 years is actually how long this present human family has been on the face of this earth. We have a government installed now that has only been existence for 400, a colonization of this country that has only been in existence for 400 years. How can you folks be thinking that you can understand the cost of this 50,000 years from now? Under what monetary system? What government? What method? Where? How? What maintenance system? We are being sold a technology that we have now way of knowing what is going to cost us. So please, consider these finances. (0246-24-4 [McCune, Chuck])

Comment: This industry is broke and now they are panhandling out in the taxpayer base and in the world global economy to continue sucking the money out of these economies for a technology that we cannot even conceive of how much it is going to cost. (0246-24-6 [McCune, Chuck])

Comment: Those containments are financially ridiculous. (0246-29-3 [Hoffman, Ace])

Comment: But let me take that off the table, because the nuke is a way of nuclear welfare. What I'm saying it's not your dollars; it's all of our taxpayers' dollars. When you get to the point where you have to dig in your own pockets, then you'll come up with something better. (0250-8-5 [Utley, Charles])

Comment: Who will pay for the supervision of the nuclear waste after PG&E closes? (0291-3 [Mauter, Nancy])

Comment: Properly disposing of waste is worth whatever monetary cost. (0295-2 [Collier, Grant])

Comment: [W]hat I hear is everybody wants something, but who's going to pay for it? And I tell you who's going to pay for it, the people sitting here and the rest of the country because it's not going to be Sempra, and it's not going to be SDG&E or Pacific Gas and Electric, it's going to be us. And it's going to be us either through electrical rates or through taxes, because Sempra is going to sue the government for failing to build their underground depository. And who's going to pay? Well, the taxpayer is going to pay, or the rate payer is going to pay. So, what we've got to think about is how risky is this really in the big scheme of things. How much money do you want to spend? And if you spend all that money on this, you don't have that money to spend on something else. (0325-32-1 [Lord, Stephen])

Comment: All I'm trying to say is that we've got to look at the costs, and you've got to look at the tradeoffs. It's just like, you know, in my house my wife wants to put a new sink in the kitchen. Okay. Well, if we put that in, we don't do something else. And here we are, if we put all these safety precautions that aren't really needed, then we don't do something else. So, what I would like to encourage the NRC to think about is as it puts these things together, it thinks about what the cost is going to be. (0325-32-3 [Lord, Stephen])

Comment: [B]ut someone has got to pay the piper, and it's going to be us. (0325-32-6 [Lord, Stephen])

Comment: Secondly, I did a search on the document. I searched the word fiscal. It only brought up fiscal year. I searched the word fiduciary. No results. Searched the word responsibility, only in relation to the word environmental responsibility. Searched the word rate payer. No results. Brings up the question, you discussed costs, how much it'll cost; there is no mechanism for paying it. How can we assume the utility remains whole and fiscally solvent to maintain even the security that is required, the training, the workforce, that is required? What rate payer mechanism do they think the state will put in place to charge us money to guard something 100 years after the last kilowatt of revenue generating power left the facility? Who is going to pay for this? And I know there might be saying and feeling that the public utilities commissions are corrupt, for example, will pass on these charges, but I think at a certain point in the future, the realism will set in. You're creating what may be the largest unfunded government mandate associated with our energy program, and that needs to be addressed. (0326-13-2 [Weisman, David])

Comment: The issue of cost is often raised in the NRC's background reports about conversion to dry casks. Your own studies show that over a long period of time, the cost of security for storage in pools is about twice as much as the cost for storage in dry casks. Now, if you're on the customer side of the equation of nuclear power, you recognize that the Federal government is obligated by contract to take delivery of this waste, and we've been successful in securing hundreds of millions of dollars in court judgments to store the waste while we're waiting for the Federal government. From a cost standpoint, there's no question as to the benefit to rate payers from storing in dry casks. I ask you to give serious consideration to the recommendations from the state. (0326-7-2 [Geesman, John])

Comment: What is the cost of constructing nuclear waste facilities and maintaining them for 200,000-plus years? Are these costs included in the calculation of today's nuclear energy? (0327-30-2 [Parker, Bob])

Comment: The premise in the GEIS that the costs that need to be considered are the regulatory costs of environmental review is not the kind of costs that the GEIS should be addressing. The GEIS should be addressing what are the costs of long-term nuclear waste

storage, and how do we support the utilities in determining what those guidance, what those costs might be, and how to assure long-term funding for storage. (0328-12-5 [Eide-Tollefson, Kristen])

Comment: [O]r better yet, financing or money to pay for the storage over the periods of time analyzed in the GEIS is simply too important to assume. The GEIS, or better, the NRC should not assume that this is the case, but rather to start to require that power companies and other generators of spent fuel to create a reserve separate from the decommissioning fund to ensure that there is sufficient resources to meet these obligations. (0328-2-8 [Rauterkus, Ralph])

Comment: We don't know. And who's going to pay for this monumental construction and engineering activity every 100 years? One month ago today Xcel testified in its Minnesota Public Utilities Commission rate case that its installed per cask cost at Prairie Island is \$5.96 million, \$5.96 million per cask, which includes the cost for cask fabrication, loading, and licensing cost. That's \$372 million in today's dollars for the 63 additional casks that will be needed to store all of the waste generated during the PINGP's next 20-year license extension. And that would amount to another \$584 million in today's dollars to reload all 98 casks in 100 years. The plant is only licensed to operate another 20 years. Have these costs been factored into Xcel's rates? Have these costs been factored into the plant's decommissioning cost? (0328-3-5 [Mahowald, Philip])

Comment: Nationwide at the end of 2011, the United States commercial spent nuclear fuel inventory had reached about 224,000 fuel assemblies. I'm going to make my own assumptions. I'm not an economist so they're a little bit rough, but I think it gives you a sense of what we're talking about. I'm going to use the Prairie Island model for these assumptions. So, assuming 40 assemblies per cask, that amounts to about 6,000 casks. And I'm further going to assume that Xcel's per-cask cost at \$5.96 million can be multiplied by those casks, so we're talking about \$33.6 billion in today's dollars to reload those casks. Who knows what the cost will be in 100 years? But looking back 100 years, \$33.6 billion in 1913 dollars would cost \$794 billion today. And that's just for the first 100-year replacement. On what basis can the NRC assume that utilities will pay these costs? Have these costs been factored into the rates for all nuclear power plants around the country? And on what basis can the NRC assume that the United States Government, already more than \$17 trillion in debt, will expend or be able to expend these incredible sums every 100 years? (0328-3-6 [Mahowald, Philip])

Comment: What does it cost to do so? None of that's in here. There's no mention of it. We just assume we're going to do it. That's preposterous. (0328-7-6 [Crocker, George])

Comment: There's also the problem that the reactor operations by TVA are troubled elsewhere. For example, Browns Ferry 1 is the only red-tag reactor in the entire United States. And TVA has a severe question as to its financial stability. TVA has sold less energy year after year since 2008, and it is now completely abandoning, almost completely abandoning all plans to either engage in generation of renewable energy or to undertake further energy efficiency, even after it's closed down part of its coal fleet, which it's in the process of doing. In this situation, with declining annual revenues and annual deficits, it is hard to make a serious decision on a generic basis, and I think the NRC cannot do so. That, in fact, reactor operators will have the financial stability not only to finance cask storage but to refinance it and re-do it every hundred years or whatever interval seems to be necessary. (0329-12-4 [Paddock, Brian])

Comment: ALARA, lowest reasonably achievable does not refer to keeping costs down. If the nuclear industry cannot find a cost-effective way to resolve the waste problem, so be it. Then

the nuclear industry is not cost effective, and I think that's an okay thing. I think that would be a good thing. (0329-16-3 [Hoffman, Ace])

Comment: One unequivocal conclusion from my review of the NRC's analysis is that the financial cost of indefinite continued storage of spent nuclear fuel is unpredictable and unknowable and potentially astronomical. That is a category of confidence that is even worse than uncertain and open-ended, thus making the long-term business model of the nuclear industry unsustainable and absurd. (0329-7-5 [Schonberger, David])

Comment: I am also concerned about the sustainability of nuclear power. The GEIS needs to evaluate the true costs of nuclear power after the subsidies are stripped away. The long-term costs of decommissioning need to be considered as well. The ongoing costs to US taxpayers should be transparent in this EIS. (0336-12 [Lish, Christopher])

Comment: There is no wondrous solution. There is no clean solution. There is no solution that will not impose a massive financial burden upon the nation's treasury. (0341-1-3 [Mermelstein, Richard])

Comment: One would think that somewhere in the GEIS would be a frank acknowledgement of the estimated costs to the American public of the whole shebang. These costs include all the federal, state, and locality costs entailed in safety and security. The costs include government management and oversight of all the massive construction activities and all the transportation-related activities the GEIS notes. The costs include publically financed R&D for things such as trying to find out what the heck to do with the high-burnup fuel. The costs include all the potential financial and risks transferred to the public. The costs include all the potential remediation costs for past, present, and future toxic effluents. One would think. But one would think wrong. (0341-2-14 [Mermelstein, Richard])

Comment: The true costs of nuclear power should be assessed in detail in the EIS, including the substantial front end subsidies, and the long term costs of decommissioning and the management of nuclear waste. (0357-7 [Daily, G. Allen])

Comment: Unfair, Unethical, Immoral Financial Injustice: NRC abandons public interests with this scheme to transfer all the astronomical costs and endless financial responsibility for nuclear wastes onto taxpayers; The nuclear industry made a fortune producing lethal high-level radioactive wastes. They should be held financially responsible to store their own wastes on the site where it was produced in the safest way possible. Why should taxpayers be forced to foot the bill for massive amounts of nuclear waste transport, and endless storage and security, virtually forever? EPA set a million year health standard for a nuclear dump. Any nuclear plant owner who refuses should have its operating permit revoked immediately. (0377-2-16 [Cuthbert, Lewis])

Comment: Dry-cask storage facilities cost as much as \$20million to build and \$7 million a year to maintain. These dry-casks have to be rebuilt every 100 years. That is a lot of money to be paid by taxpayers for 500,000 years. Don't you think that wind, water and solar power is much cheaper to build and operate? (0406-4 [Gerleman, Douglas])

Comment: The report talks about evacuations but it doesn't say where the people will live and work and what they will do for a living afterwards. It doesn't even consider if an evacuation is possible at all from urban areas in the short time-frame required, or who will pay to set the people up with new lives in their new location. In my opinion, this insurance issue is the most

important political consideration in the future siting of any depository; and any truly public process for approving a site is bound to go nowhere without this assurance. Simply stating that the Government will bear the responsibility for compensation is not a convincing argument because of trust issues related to its performance after past contaminations. (0410-30 [Nelson, Dennis])

Comment: we as citizens are not billed for the ill advised investment in this technology. Those who invested need to be the ones to foot the bill. (0411-3 [Krumm, Paul])

Comment: In sound finance, the cost of future cleanup is estimated and actuarially amortized as an ongoing accrual expense, and thus, there are contingency funds available to help defray these enormous cleanup jobs. The nuclear industry is not being truthful about the amount of risk that is being passed on to future generations. This nuclear waste is an unfunded liability which governments are forced to assume after allowing these plants to operate. We need to demand a conversation about the finance of SAFE waste storage and attach the present value of this storage to the electric rate today. If nuclear energy generation is economically viable; let the cost of production reflect, collect, and pay for the full cost of safe storage, for the duration of the liability 100,000 years. The equity market collapse of 2007, occurring with 30 year mortgage instruments should teach us to look critically at financial models that are not sustainable, and are coupled to longer time horizons. One could argue that these unfunded cleanups pose inflationary pressures on the financial systems. Money supply growth is needed in order for governments to fund cleanups yielding monetary inflation. (0438-1 [Lamb, Charles])

Comment: The DGEIS does not indicate a funding mechanism for the ISFSI and DTS facility construction or replacement. The DGEIS not only assumes that ISFSI and DTS facilities will be constructed at every facility where they are needed, but also explicitly assumes ISFSI and DTS facilities will be replaced every 100 years, without identifying a funding source for either option or estimated costs. Little information is publicly available concerning costs of dry transfer systems, but a search of the NRC's Agencywide Documents Access and Management System (ADAMS) reveals a 1995 report prepared for Private Fuel Storage by Energy Resources International, Inc., which assumed dry transfer facility costs of \$8.1 million in 1995 dollars, based on an estimate by the Electric Power Research Institute. Energy Resources International, Inc., Utility At-Reactor Spent Fuel Storage Costs For The Private Fuel Storage Facility Cost-Benefit Analysis Revision 2 (Apr. 2000), ML003705093 at 6, citing Dry Transfer System for Spent Fuel: Project Report, A System Designed to Achieve the Dry Transfer of Bare Spent Fuel Between Two Casks, EPRI TR-105570 (Dec. 1995).²³ [footnote 23 text: Upon information and belief, this report is not publicly available.] This report includes dry transfer costs "for sites unable to handle large spent fuel storage and transport systems." Id. at 7 (implying that some sites are not able to handle large spent fuel storage and transport systems, rendering the DTS option a possibility only upon site-specific review in the Waste Confidence DGEIS as discussed above). Certainly, costs on that scale, multiplied by the number of sites at which the DTS systems as well as ISFSIs would be needed, is a substantial cost for the industry - and ultimately on the public - that has not been accounted for in the DGEIS. Without a reliable measure of costs, how the costs would be covered, and/or a cost-benefit analysis, the DTS option is more of the same NRC assumptions of future events that the courts have already rejected. In short: the DGEIS must analyze the potential impacts of long-term pool storage because the DTS and ISFSI options are not concrete enough at this point to form the basis for any facility's actual waste-storage planning. (0473-12-22 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: The numbers are simple, a dry cask can handle about 10 tons of material, and costs between \$1M to \$2M. There is roughly 60,000 tons of spent fuel in the USA that is not already Casked. USA generates around 2000 tons a year, and it takes 5 years to cool enough to be Casked, therefore $5 * 2000 = 10,000$ tons have to wait to be Dry Casked, leaving 50,000 tons that could be and SHOULD BE Casked now. At 10 tons per Cask, that is 5000 Casks. Material cost of \$1.5M each, that is \$7.5 B in Cask material cost. Let's allow 50% of the material cost as a labor cost related to making the slabs the Casks will sit on, and moving the fuel, documentation and testing, or \$3.75B. The security cost of monitoring and protecting the Dry Cask will be far less than securing the much more dangerous spent fuel pools, so there will out years savings on that cost item. So the total cost with labor and materials will be around \$11.25B to dry cask everything that can be Dry Casked now. This is about \$225,000 per ton. Let's say the process takes 7 years, an additional 14,000 tons will be created, that's another \$3.125B needed. Or a total of \$14.375B to dry cask ALL of the spent fuel in the USA up to 2020. But keep in mind \$4.8B of that will be going into the hands of US trade workers, who will immediately put that income back into the economy, and create a further economic boost when we need it the most. (0484-3 [Olsen, Steven])

Comment: Those who are responsible for creating the waste must pay for and facilitate its Safe storage. Not the people of this country, but the companies who profited from generating said waste. (0493-3 [Davis, Suzanne] [Davis, Tom])

Comment: The true costs of nuclear power should be assessed in detail in the EIS, including the substantial front end subsidies, and the long term costs of decommissioning and the management of nuclear waste. (0507-6 [Giese, Mark M.])

Comment: Who will pay for it down the road? How much will it cost to store for such a long period of time? It does not make economic sense and its not our right to decide what future generations must do. (0524-2 [Individual, Anonymous])

Comment: The numbers are simple, a dry cask can handle about 10 tons of material, and costs between \$1M to \$2M. There is roughly 60,000 tons of spent fuel in the USA that is not already Casked. USA generates around 2000 tons a year, and it takes 5 years to cool enough to be Casked, therefore $5 * 2000 = 10,000$ tons have to wait to be Dry Casked, leaving 50,000 tons that could be and SHOULD BE Casked now. At 10 tons per Cask, that is 5000 Casks. Material cost of \$1.5M each, that is \$7.5 B in Cask material cost. Let's allow 50% of the material cost as a labor cost related to making the slabs the Casks will sit on, and moving the fuel, documentation and testing, or \$3.75B. The security cost of monitoring and protecting the Dry Cask will be far less than securing the much more dangerous spent fuel pools, so there will out years savings on that cost item. But keep in mind \$4.8B of that will be going into the hands of US trade workers, who will immediately put that income back into the economy, and create a further economic boost when we need it the most. (0529-7 [Claybourne, Ana])

Comment: The GEIS is noticeably deficient in ascribing fiscal responsibility for the long term maintenance and safeguarding of the ISFSI. A "text" search of the entire GEIS document for the word "fiscal" brought up only the phrase "fiscal year." The word "responsibility" brought results only associated with the subject of "environmental responsibility." The words "fiduciary," and "ratepayer" brought no results. The GEIS provides multiple categories and scenarios for

potential costs, but no discussion of mechanisms for paying for these expenses. In fact, the GEIS assumes that somehow the utility that is in possession of an NRC license for the ISFSI remains financially liable[.] (0547-1 [Weisman, David])

Comment: During all this time, some entity must be responsible for paying the cost of labor and materiel needed for upkeep and security. Does the NRC assume that the federal government will cover this expense, and if so, can they point to the enabling legislation? Further, since this action could be taking place decades after the cessation of energy production-without revenue from the nuclear power plant-where does the NRC GEIS assume the money to pay for these ongoing activities will come from? How would a for-profit utility justify the outgoing expense to shareholders for a non-revenue producing obligation? How would a public utilities commission justify charging then-current (and future) ratepayers to store and maintain waste stockpiles decades after the last original ratepayers received any benefits? According to the GEIS, the licensee remains responsible for local property tax liabilities during long term storage. From what source would the utility pay this obligation given that the facility had long since abandoned any revenue generation? And if these local tax liabilities are not--or can not--be paid, what then happens to the infrastructure and institutions in the local host municipalities that were supported by that tax collection? (0547-6 [Weisman, David])

Comment: The purpose of my declaration is to evaluate whether the costs of nuclear waste management, including onsite spent nuclear reactor fuel storage and permanent disposal, are high enough to significantly affect the outcome of an analysis that compares the costs and benefits of nuclear reactors with other electricity sources. I understand that this type of analysis is generally conducted by the NRC in the course of its environmental review for new reactor license applications and applications for renewal of existing reactor licenses. In the discussion below, I analyze two of the most important costs of nuclear waste management -- the cost of "temporary" storage of spent fuel at reactors and the cost of building, filling, and operating a permanent repository for that fuel. The cost of decommissioning the reactors and closing the permanent repository are also costs of nuclear waste management, but I do not include them in this analysis. At present, the public is paying for the management of nuclear waste in three ways. Utilities pay a fee to the U.S. Department of Energy (DOE) for a Nuclear Waste Fund that is intended to pay for the repository. This fee is collected from ratepayers. The cost of temporary at-reactor storage is also being recovered by utilities from taxpayers in the form of penalties imposed on the federal government for the failure to execute its contractual commitment to take the spent fuel off reactor sites.¹⁰ [footnote 10 text: See, e.g., Ntl. Assoc. of Regulatory Util. Comm'rs v. United States DOE, 680 F.3d 819 (D.C. Cir. 2013).] This penalty is paid out of the U.S. Treasury and has not decreased the Nuclear Waste Fund. Finally, utilities collect funds from ratepayers for the decommissioning of reactors. Questions about the use of the funds and whether they are adequate are not the subject of my declaration, which focuses only on the question of the magnitude of the costs relative to the cost of power from nuclear reactors and the other potential resources that could be used to meet the need for electricity. Nevertheless, as discussed below, these advance payments have a bearing on the applicability of a discount rate to nuclear waste disposal cost estimates. My analysis shows that the costs of managing spent nuclear fuel are likely to be quite large in absolute value, running to hundreds of billions of dollars (in constant 2012 dollars). They are in the range of \$10 to \$20 per MWH (\$0.01 to \$0.02 per kWh), which is certainly large enough in relative value to affect the outcome of analyses that compare the cost of nuclear power to the alternatives available in the United States. Therefore, the cost of nuclear waste management is a significant cost that should be included in the NRC's economic comparisons of nuclear power with energy efficiency and other alternative energy sources. (0551-1 [Kysor, Jillian])

Comment: OUTPUT OF NUCLEAR REACTORS: The amount of power that the costs will be spread across is uncertain. The DOE's assumption is too high for several reasons. The DOE estimate shows a stream of output from nuclear reactors that start with a base in 2012 that is already 5% higher than the actual output.³⁴ [footnote 34 text: DOE, 2013.] The output is lower than expected because nuclear reactors were offline and have been retired early. That trend is likely to continue. The DOE assumption of a very high load factor is inconsistent with historical experience. It took a long time to build up to a high load factor; therefore, any new reactors that come online should not be assumed to immediately jump to a high load factor. Moreover, capacity factors for existing reactors have begun to decline as reactors age. In a recent paper, I showed that including early retirements in the calculation of load factors yields a load factor that is one-sixth lower than the very high assumptions being used in much comparative economic analyses.³⁵ [footnote 35 text: Mark Cooper, Renaissance in Reverse: Competition Pushes Aging U.S. Nuclear Reactors to the Brink of Economic Abandonment, July 2013 (hereafter, Aging Reactors).] The output of the nuclear fleet in 2013 will have declined from the peak in 2010 to the level achieved in 2004. DOE and many other analysts of waste management assume that reactor life will be 60 years.³⁶ [footnote 36 text: DOE, 2013.] While the license period might run that long, virtually all reactors that have been retired were retired before their licenses expired. The closure of Kewaunee and Vermont Yankee extend that pattern for reactors that were online when the retirement decision was made, while San Onofre and Crystal River extend the pattern of troubled reactors retiring early. DOE assumes an increase in capacity of almost 10 percent due to large scale uprates at existing facilities,³⁷ [footnote 37 text: DOE, 2013.] but virtually all large scale uprates pending have been cancelled due to a severe deterioration in the comparative economics of nuclear power.³⁸ [footnote 38 text: Cooper, Aging Reactors.] DOE assumes early online status for new reactors under construction and an "unplanned addition" of a new reactor which would add 2 percent to nuclear capacity.³⁹ [footnote 39 text: DOE, 2013.] Given the historical experience of new reactor cancellations and construction delays, the "unplanned addition" should certainly be dropped. Combining these observations, one can argue that the base case for NRC analysis should include actual 2013 output, which is 5% lower than the DOE analysis, an 80 percent load factor, without uprates and "unplanned additions." Under these assumptions, the output of the fleet would be at least 25% lower than assumed by DOE in its analysis of disposal system costs.⁴⁰ [footnote 40 text: This result is consistent with all remaining reactors plus five new ones -- Vogtle, Summer, Watts Bar -- running for a full 60 years at 90 percent capacity factor.] (0551-10 [Kysor, Jillian])

Comment: Lower output might lower the variable cost of at-reactor storage. Whether it lowers the cost of a permanent repository depends on whether one assumes that only one repository will be constructed. If adding nuclear capacity causes the construction of a second repository, fixed costs will increase substantially. The GAO analysis, adjusted for the discount rate and inflation, suggests that the cost of operating two repositories would be 32% higher than one, adding \$25 billion to the total cost.⁴¹ [footnote 41 text: GAO, 2009.] This would offset a substantial part of the variable cost savings. Put in another way, if denying licenses or license renewals allows a second repository to be avoided, the reduction in cost would be substantial including both fixed costs for the reactor and variable cost for spent waste storage. (0551-11 [Kysor, Jillian])

Comment: THE DISCOUNT RATE: There is a great deal of uncertainty and debate about the discount rate that should be used. In this case, as discussed below, it is my opinion that application of a discount rate is inappropriate. Therefore, the costs presented in Exhibit MNC-4 are not discounted. For purpose of long term analysis, analysts generally believe discount rates should be quite low.⁴² [footnote 42 text: Hamal, 2011.] The fact that costs of waste management are incurred a long time (i.e., hundreds or thousands of years) after the useful life of the facility

creates an intergenerational issue, since future generations will be incurring large costs without deriving any benefit. As GAO states: Although the concept of discounting is an accepted and standard methodology in economics, the concept of discounting values over a very distant future -- known as "intergenerational discounting" -- is still subject to considerable debate. Furthermore, no consensus exists among economists regarding the exact value of the discount rate that should be used to discount values that are spread over many hundreds or thousands of years.⁴³ [footnote 43 text: GAO, 2009, p. 28.]. Therefore the appropriate discount rate is a significant issue that should be addressed in the NRC analysis of the cost of waste management. (0551-12 [Kysor, Jillian])

Comment: In my opinion, there are two additional, important reasons why application of a zero discount rate is appropriate in these circumstances. First, the real increase in the cost of at-reactor storage and the permanent repository has been increasing substantially faster than the real, discount rate. Given the long time frames being considered, the real price increase can have a very large impact. An annual real rate of increase above the discount rate of one-half of one percent would more than double the cost of waste management. The second reason stems from the unique way that the financing of the repository is being handled. To the extent that the discount rate represents the time value of money (i.e., the value of the opportunity to use the money), the public is bearing the burden on the revenue side. The DOE analysis of fund adequacy takes credit for the earning of interest on the funds collected. Because those funds are being banked to make the fund whole, then the funds are not available to be used for other purposes. Much the same is true of the Treasury funds being paid to utilities because of the failure of the federal government to take the spent fuel. Because taxpayers are already being denied the opportunity to use their funds for other purposes, to discount the cost would be a double burden. Taxpayers and ratepayers would be bearing the full cost of the waste management, having been denied the opportunity to use the repository funds of penalties for storage costs for other purposes. Given these considerations, I believe it is reasonable to estimate the combined costs of at-reactor storage and a permanent repository in the range of \$10 - \$20/MWh (\$0.01 to \$0.02/kWh). I have rounded this estimate to one significant figure, to account for the uncertainties inherent in such estimations at the present time. In absolute value, given the EIA estimate of \$0.11/per kWh for the cost of nuclear power from new reactors, this is between 10% and 20% of the estimated cost.⁴⁴ [footnote 44 text: See EIA, 2013.] That is a substantial portion of new reactor costs and therefore strongly merits consideration by the NRC in its economic analysis of the relative costs and benefits of new nuclear reactors as compared to energy efficiency and other energy sources. For the above reasons, I believe that the bottom line in Exhibit MNC-5 provides cautiously low estimates of the cost of nuclear waste management. Therefore, in the remainder of this analysis I use the cost range of \$10/MWh to \$20/MWh to assess the importance of including nuclear waste management costs in the NRC's economic analysis. As discussed in more detail in Section IV, the cost of nuclear waste management is a much larger fraction of the cost of operating existing reactors than for new reactors. And it is large enough to affect the comparative cost of nuclear power from existing and new plants, relative to the available energy alternatives. Therefore, in the case of both new reactor licensing and license renewal for existing reactors, the costs of nuclear waste management could be high enough to affect decisions about which energy resources to develop. (0551-13 [Kysor, Jillian])

Comment: LEVELIZED COST ANALYSIS FOR NEW REACTOR LICENSES: The traditional approach to comparative resource selection for new reactors relies on the calculation of the levelized cost of electricity.⁴⁵ [footnote 45 text: Levelized cost is often cited as a convenient summary measure of the overall competitiveness of different generating technologies. It represents the per-kilowatt-hour cost (in real dollars) of building and operating a generating

plant over an assumed financial life and duty cycle. Key inputs to calculating levelized costs include overnight capital costs, fuel costs, fixed and variable operations and maintenance (O&M) costs, financing costs, and an assumed utilization rate for each plant type. http://www.eia.gov/forecasts/aeo/electricity_generation.cfm] For the purposes of this analysis, I start with the levelized cost of alternatives as estimated by EIA. I then add the cost of nuclear waste management to those costs and observe, qualitatively, whether it would alter the evaluation of the cost of nuclear power compared to the other options available. Exhibit MNC-5 shows the results using the range of estimates in the EIA analysis. Nuclear waste management costs of \$20/MWH would change the location of nuclear in the relation to other resources significantly. Nuclear moves: *• Out of the range of: > Conventional coal costs; > Gas Combined Cycle with CCS; > Advanced gas turbines; • Into the range of: > Advanced coal; > Advanced coal with CCS; • Much closer to and: > Slightly below gas turbines; > Slightly above Biomass. Waste disposal costs of \$10/MWH move nuclear costs in the same directions, but more modestly. Exhibit MNC-6 shows levelized cost estimates for a similar set of resources from the Pennsylvania, Jersey, Maryland Power Pool (PJM), a major Regional Transmission Organization (RTO) in an area of the country that is not especially well endowed with renewable resources (e.g. compared to the Midwest with a great deal of wind or the Southwest with a great deal of solar, or the Northwest with a great deal of hydro). Exhibit MNC-7 shows estimates from Lazard, which is a financial analysis firm. I include these two estimates because they not only represent different institutional points of view but also because both include efficiency as a resource. Both estimates demonstrate that efficiency is the least-cost resource by far. In fact, a significant amount of efficiency could be delivered at a cost that is close to the cost of nuclear waste management alone. Lazard also projects declining costs for solar, which I include in Exhibit MNC-7, which would make it cost competitive with even natural gas within a decade. As shown in Exhibit MNC-8, the cost trends for solar and offshore wind are expected to make them much more competitive over the next decade and would significantly affect all of the comparisons affecting nuclear power. Adding \$10 to \$20 per MWh to the cost of nuclear power generation would make a material difference in its attractiveness. Nuclear becomes even less attractive when one considers that other energy sources have little risk due to the short time from start of construction to finish. Looking at the cost of nuclear compared to the more costly alternatives in these analyses, the \$10 to \$20/MWH certainly can make a difference. Nuclear, which is almost the most expensive resource, could become the most costly. (0551-14 [Kysor, Jillian])

Comment: PORTFOLIO ANALYSIS: In the realm of electricity resource selection, I and many others have argued for an approach to analysis that deals more systematically with risk, uncertainty, vagueness, and ambiguity in the decision-making environment. I have developed a multi-criteria portfolio approach based on financial risk hedging and real option analysis, as well as a number of other efforts to deal with the challenge of ambiguity in the decision-making environment. For the purpose of incorporating the cost of nuclear waste management into the analysis, I will briefly describe the basic portfolio approach. The top graph in Exhibit MNC-9 presents the basic approach to financial portfolio analysis, as a publication from the National Regulatory Research Institute (NRRI) attempted to introduce it to regulators.⁴⁶ [footnote 46 text: Ken Costello, *Making the Most of Alternative Generation Technologies: A Perspective on Fuel Diversity*, NRRI, March 2005.] As shown in the upper graph, investors want to be on the efficient frontier, where risk and reward are balanced. They can improve their expected returns if they can increase their reward without increasing their risk or if they can lower their risk without reducing their reward. In the financial literature, risk is measured by the standard deviation of the value of the reward. In applying this framework to the evaluation of generation options, analysts frequently measure reward as kilowatts per dollar (a measure of economic efficiency). Reward is the inverse of cost (i.e., the lower the cost the greater the reward). Indeed, they use

efficiency and cost interchangeably.⁴⁷ [footnote 47 text: J.C. Jansen, L.W. M. Beurskens, and X. van Tilburg, Application of Portfolio Analysis to the Dutch Generating Mix, ECN, February 2006, p. 13 argue for a risk-cost frontier.] The lower graph in Exhibit MNC-9 shows the cost/risk relationship. Options that would move the portfolio toward the origin should be adopted since they embody lower cost and/or risk. Movement along the risk-cost frontier is neutral. Movement away from the origin raises either the cost or the risk. I use the array of resources to calculate a measure of the attractiveness of the reward. The distance of a resource from the origin measures the risk-cost characteristics of the resource (giving risk and cost equal weight). Resources that are farther from the origin (measured as the distance with each factor weighted equally) are less attractive. The distance from the origin can be expressed as the risk-adjusted cost or the expected cost. Exhibit MNC-10 shows the result of applying my approach to the EIA cost estimates, assuming that waste costs increase both the point estimate and the standard deviation of the cost estimates. Exhibit MNC-10 provides quantitative estimates that support the observations in the previous section. Waste disposal costs of the magnitude I have estimated make nuclear a much "closer" call in comparison to other alternatives, and they even reverse the direction of the conclusion in several comparisons. The top graph in MNC-10 focuses on the comparisons between resource costs that would be most affected by inclusion of waste management costs in the NRC's economic analysis. The bottom graph includes all of the resources. There are nine comparisons in which nuclear would be seen as a significantly less attractive asset to include in a resource portfolio. Including the trends for wind and solar cost and the cost of waste management, nuclear becomes almost the least attractive resource. (0551-15 [Kysor, Jillian])

Comment: ANALYSIS FOR LICENSE RENEWAL OF EXISTING REACTORS

I approach the analysis of the impact of waste management costs on the economics of aging reactors by examining these costs in relation to operating costs and margins. The economics of old reactors is already fraying and many are already on the economic "razor's edge."⁴⁸ [footnote 48 text: Cooper, Aging Reactors.] Uprates are already being abandoned because they are too costly. Old reactors are being shuttered because they are no longer economic. Proper consideration of waste disposal costs could play a part in pushing them over the edge. In my recent analysis of aging reactors I used a Credit Suisse analysis of operating costs and operating margins as the basic data to make the point that analysis of the economics of aging reactors that are still operating is challenging. Exhibit MNC-11 contains the estimated operating costs for almost all nuclear reactors online in 2012. Exhibit MNC-12 shows the "cash margins" that the reactors would yield, given the "round-the-clock prices" at different power hubs. It shows that in all but a few cases the cash margins -- revenues per MWh in excess of the offered hub price -- are less than \$20 per MWh. It also shows that the cash margins are less than \$10 per MWh in many cases. Exhibit MNC-12 also identifies reactors that have been retired recently or are scheduled to retire early, even though they were online and had significant periods before their licenses would expire. Major uprates that have recently been cancelled are also identified. The exhibit makes the point that cash margins of about \$9/MWH put reactors on the razor's edge because the cash margins are very thin.⁴⁹ [footnote 49 text: Credit Suisse, 2013, pp. 11-17, "Using current 2014 power price forwards and unit economics, we see modest cash margin expectations... Layering in typical parent overhead of \$5-7 / MWH, unit economics look even worse... We worry that rising operating and capital costs along with operational problems at some aging plants will force owners to continuously re-evaluate the useful lives of plants independent of license extensions especially as the time to absorb ongoing capex grows shorter."] Exhibit MNC-12 shows that 12 of the 18 license renewals pending or expected in the near future are on this razor's edge. The waste management costs identified above are clearly material in these circumstances. (0551-16 [Kysor, Jillian])

Comment: In conclusion, the calculations in this declaration indicate that spent fuel storage and disposal costs could be high enough to materially affect energy choices when the costs of new reactors or extension of the operating life of existing reactors are compared with energy efficiency and alternative energy sources. Therefore, in my opinion, the NRC should consider these costs in its licensing decisions for new reactors and renewal of existing reactor licenses. (0551-17 [Kysor, Jillian])

Comment: For the purposes of this analysis, I start with the most recent U.S. government estimates of costs of electricity generation and costs of spent fuel disposal: "Levelized Cost of New Generation Resources in the Annual Energy Outlook," prepared by the U.S. Energy Information Administration (EIA) in 2013¹¹ [footnote 11 text: Energy Information Administration, "Levelized Cost of New Generation Resources in the Annual Energy Outlook," Annual Energy Outlook, 2013 (hereinafter EIA 2013).] and the "Nuclear Waste Fund Fee Adequacy Assessment Report" prepared by the U.S. Department of Energy (DOE) in 2013.¹² [footnote 12 text: U.S. Department of Energy Nuclear Waste Fund Fee Adequacy Assessment Report, January 2013 (hereafter DOE, 2013)] Each of these studies has some limitations. I believe that the EIA has been wildly optimistic about the cost of nuclear power over the past decade, but I suspect that the NRC would be inclined to rely heavily on its estimates, and therefore I use it as my base case. I also show that the same conclusion would be reached if I were to rely on recent estimates from utility industry sources and Wall Street analysts. The DOE's recent analysis of the cost of a permanent nuclear waste repository is the most recent in a series of government analyses of those costs.¹³ [footnote 13 text: DOE, 2013.] Because it was prepared as part of DOE's legal obligation to assess whether current fees are adequate to fund a permanent repository, it takes a very narrow view of the costs considered. It does not consider at-reactor storage costs, and it assumes that the repository opens very quickly.¹⁴ [footnote 14 text: Id. p. 9, DOE 2013 assumes one pilot consolidated storage facility and one full-scale consolidated storage facility. It also assumes a time period of 34 years between the siting and opening of a repository.] Neither of these assumptions appears consistent with the current reality of nuclear waste management or sound economic analysis of waste management costs. As I show below, this view ignores at least half of the cost associated with nuclear waste management. Nevertheless, the DOE's analysis provides a useful starting point for estimating the cost of one component of nuclear waste management. (0551-2 [Kysor, Jillian])

Comment: The narrow costs of constructing and filling a permanent waste repository considered by the DOE can be a starting point for the analysis of the total cost of nuclear waste management. Exhibit MNC-1 shows a number of estimates, prepared by government agencies over the past thirty years, of the cost of this subset of waste management activities. I have endeavored to ensure that the comparisons involve only the specific set of costs associated with the repository. While at-reactor storage costs are included in some of the later estimates, I exclude these costs in order to maintain consistency with the DOE's analysis. I exclude historic costs that are sunk and not considered in each forward looking estimate. I convert all costs to real 2012 dollars using the Producer Price Index for intermediate goods (rather than the PPI for finished goods or the Consumer Price Index, which would include many types of distribution costs not included in an activity like the construction and operation of a repository).¹⁵ [footnote 15 text: GAO, "Nuclear Waste Management; Key Attributes, Challenges, and Costs for the Yucca Mountain Repository and Two Potential Alternatives," Government Accountability Office, GAO10-48, November 2010 (hereafter GAO 2009) presents analyses in discounted 2009 dollars where the discount rate reflects complex Monte Carlo simulations. Cliff W. Hamal, Julie M. Carey and Christopher L. Ring, Navigant, Spent Nuclear Fuel Management: How Centralized Interim Storage Can Expand Options and Reduce Costs, for the Blue Ribbon Commission on America's Nuclear Future, May 16, 2011. (Hereafter Hamal, 2011), have estimated the "best

estimate," which is 1.34 times the mean from GAO. Stating that in 2012 dollars yields an adjustment factor of 1.47. I use this to restate all GAO estimates in real, 2012, undiscounted dollars.] The cost per metric ton of uranium (used interchangeably with the term "heavy metal") is calculated based on the number of tons assumed in each of the individual studies.¹⁶ [footnote 16 text: This is the convention adopted by Hamal, 2011.] The most recent DOE estimate used just over 141,000 metric tons of heavy metal (MTHM) as the total amount of spent fuel that has been produced and will be produced given present reactor licenses and reactors under construction. Studies by the Government Accountability Office (GAO) and the Blue Ribbon Commission, in comparison, used just over 153,000 MTHM, but they counted civilian and defense material not associated with civilian nuclear reactors. (0551-3 [Kysor, Jillian])

Comment: The early estimates and the most recent estimate are for generic waste repositories. The others were for Yucca Mountain, which is generally assumed to be a bit more costly than a generic site. The DOE analysis of repository costs takes this into account.¹⁷ [footnote 17 text: DOE 2013, p. 12: "To derive a cost estimate for a generic repository, rather than one located at Yucca Mountain, the TSLCC [Total System Life Cycle Cost] cost estimate was reviewed and costs that were deemed specific to the Yucca Mountain site were removed from the estimate."] Exhibit MNC-1 shows the mid-point, or "best estimate" from each of the studies. Two things are clear from this history of cost estimation: First, the estimated cost of spent fuel disposal in a repository has been escalating dramatically, which is typical of cost estimates involving nuclear power. The trend is slightly stronger for the cost estimates since the 1990s. Second, the repository costs are very large in absolute value, reaching a hundred billion dollars. They are certainly large enough to be included in any economic analysis comparing the costs and benefits of nuclear reactor operation. As discussed below, the costs are also large enough to affect the economics of nuclear power compared to alternatives. While using the "best estimates" is useful to demonstrate a strong and consistent pattern of rising estimated costs, it hides a great deal of uncertainty about the cost. Exhibit MNC-2 shows the range of costs in the two most recent estimates. There is a great deal of uncertainty about cost in the most recent DOE study, which is typical of estimates involving nuclear power.¹⁸ [footnote 18 text: The standard deviation of the estimate of the repository costs is large compared to the "best estimate." The coefficient of variation (the standard deviation divided by the mean) is 0.75.] I will discuss my method for addressing this uncertainty below. (0551-4 [Kysor, Jillian])

Comment: The recent GAO analysis¹⁹ [footnote 19 text: GAO, 2009.] and the Blue Ribbon Commission study²⁰ [footnote 20 text: Hamal, 2011.] have recognized the increasing importance that onsite storage of nuclear waste plays in the overall cost of nuclear waste management. Onsite spent fuel storage is becoming the central cost driver of nuclear waste management because very long periods of onsite storage -- up to 300 years -- are being considered.²¹ [footnote 21 text: Dennis Vinson, Ron Kesterson, and Adrian Mendez-Torres, "Inventory and Description of Commercial Reactor Fuels within the United States," Prepared for U.S. Department of Energy Campaign Program Savannah River National Laboratory, March 31, 2011. Which is also noted in Eric M. Davied, Long-Term Interim Storage for Used Nuclear Fuel: Dry Cask Storage in Centralized Storage Facilities, Texas A& M University, 2011, identifying cask capacity at 10 to 15 MTU. (Hereafter, Davied 2011).] These costs are reflected in Exhibit MNC-3, which includes the GAO scenario in which waste remains on site for a long period of time (100 to 500 years). The GAO estimates in Exhibit MNC-3 suggest that the longer waste remains in storage on site, the higher the cost is likely to be. The Blue Ribbon Commission "best estimate" for 100 year at-reactor storage restated in 2012 dollars is just over \$100 billion.²² [footnote 22 text: Hamal, 2011, estimates just under \$72 billion for the large repository (including transportation) compared to the GAO estimate of \$53 billion. I use the difference $(71.46/53 = 1.348)$ to scale up to undiscounted dollars. Bringing the figure to 2012 dollars involves inflating

by a factor of 1.096. The adjustment factor is 1.477. Hamal's "best estimate" cost for the repository would \$78.3 billion in 2012 dollars compared to the DOE midpoint cost of \$88.9 billion.] (0551-5 [Kysor, Jillian])

Comment: Given that much longer periods of time for at-reactor storage are being contemplated, even this figure is too low for three reasons: First, when a nuclear reactor shuts down permanently, the waste at the reactor site becomes "stranded." That is, the site must be operated solely for the purpose of attending to the waste. This means that the costs of many activities that were once attributed to operating the reactor must now be allocated to managing the waste. The Blue Ribbon Commission study suggests that the cost of managing stranded waste is five times as high as the cost of managing waste at an operating site.²³ [footnote 23 text: This cost difference is derived from Hamal, 2011, p. 27. GAO, 2009 shows no difference between the average at-reactor storage costs for 100 years, which would include a substantial period in which spent fuel is not stranded, and the cost of 500-years of at-reactor storage. This suggests that stranding has not been taken into account, which was the central thrust of Hamal, 2011.] Second, over hundreds of years, storage casks will deteriorate and have to be replaced. I have assumed that cask replacement will be necessary every 100 years at a cost of \$1.6 million per cask, assuming no escalation in real costs.²⁴ [footnote 24 text: My assumption of cask replacement every 100 years is consistent with the NRC's Draft Waste Confidence Environmental Impacts Statement, p. xxviii, 2013. Davied, 2011, identifies cask capacity at 10 to 15 MTU.] Given this cost and the amount of material that will have to be stored, the GAO estimates of storage are low. Repackaging costs could be on the order to \$75 billion.²⁵ [footnote 25 text: GAO, 2009 uses the figure of \$1.6 million per cask. With 153,000 metric tons of waste and 10 tons per cask, the cost of repackaging all spent fuel is \$24.480 billion. Three repackaging operations would be just under \$75 billion.] Third, as with all nuclear costs, repackaging cost appear to be increasing dramatically.²⁶ [footnote 26 text: Michiel P.H. Brongers, Appendix CC, Nuclear Waste Storage, CC Technologies Solutions, Inc., N.D., p. cc-2, gives a figure of \$1.2 million; GAO, 2009, p. 56, puts the cost at \$1.6 million per cask, which is shown as a modification of the earlier assumption of \$1.2 million. GAO, 2009, reflects similar trends.] This analysis also excludes potentially significant costs associated with the repackaging and transportation of high burnup spent nuclear fuel over the next 30-50 years. For instance, in 2012 an expert with the National Academy of Engineering reported that "the technical basis for the spent fuel currently being discharged (high utilization, burnup fuels) is not well established" the NRC has not yet granted a license for the transport of the higher burnup fuels that are now commonly discharged from reactors. In addition, spent fuel that may have degraded after extended storage may present new obstacles to safe transport."²⁷ [footnote 27 text: National Academy of Engineering, "Managing Nuclear Waste", Summer 2012, pp 21, 31, <http://www.nae.edu/File.aspx?id=60739>.] Even the Nuclear Regulatory Commission (NRC) admits "there is limited data to show that the cladding of spent fuel with burnups greater than 45,000 MWd/MTU will remain undamaged during the licensing period" for dry spent fuel storage facilities.²⁸ [footnote 28 text: U.S. Nuclear Regulatory Commission, "Standard Review Plan for Spent Fuel Dry Storage Facilities, Final Report" NUREG-1567, March 2000. p. 6-15, <http://www.nrc.gov/readingrm/doc-collections/nuregs/staff/sr1567/sr1567.pdf>.] (0551-6 [Kysor, Jillian])

Comment: COMBINING AT-REACTOR STORAGE AND PERMANENT REPOSITORY COSTS Exhibit MNC-4 adds at-reactor storage costs to the most recent DOE estimates for the cost of the repository. The stranded waste costs are based on the difference in cost estimated in the Blue Ribbon Commission report between very rapid transfer of stranded waste to central storage and no transfer until 70 years later.²⁹ [footnote 29 text: Hamal, 2011 p. 41 shows stranded waste costs of \$477 million for a central storage facility taking 6000 MTU per year

starting 2020 and \$22.716 billion for a central storage facility taking 3000 MTU per year starting in 2090. The difference of \$22.239 billion in 2009 dollars equals \$24.4 billion in 2012 dollars.] That difference is slightly more than \$24 billion over the first 70 years. Extrapolating to 300 years, the difference in the stranded waste cost would be \$105 billion. Repackaging of waste is necessary as long as it is not deposited in a permanent repository.³⁰ [footnote 30 text: Hamal, 2011, p. 52.] Therefore, repackaging costs must be added. Assuming three rounds of repackaging in 300 years, repackaging adds another \$75 billion to the cost of managing spent fuel. Combining these cost estimates for storage and disposal of spent fuel yields a cost range of approximately \$210 to \$350 billion. (0551-7 [Kysor, Jillian])

Comment: OTHER POTENTIAL COSTS: The estimated cost range of \$210 to \$350 billion for spent fuel management leaves out significant costs. First, it does not include an escalation in the real cost of at-reactor storage and the escalation in the real cost of construction and operation of a permanent repository. Both of these have exhibited significant historical trends of increasing real cost. Second, the estimate in Exhibit MNC-4 does not include the cost or risk of accidents that may be significant with onsite storage of waste, especially during the very long period of onsite storage that is being contemplated. Large quantities of dangerous materials stored at sites close to population centers create a risk of accidents that can impose severe economic disruption and social dislocation. While much of the discussion of nuclear accidents focuses on public health issues, the economic and social impacts are substantial. The estimated economic costs of one accident run into the hundreds of billions, equaling or exceeding the entire cost of waste management and disposal.³¹ [footnote 31 text: Cooper, Nuclear Safety, discusses the general magnitude of these costs. Gordon R. Thompson, "Risk-Related Impacts from Continued Operation of the Indian Point Nuclear Power Plants", November, 28, 2007 examines the potential economic cost of a severe onsite storage accident, showing it is similar in magnitude to the general accident risk.] The fourth largest utility in the world was not thrown instantaneously into virtual bankruptcy by public health impacts, but it was destroyed by the economic cost of cleanup and compensation. While these are low probability events, keeping large quantities of nuclear waste onsite for long periods of time raises the probability of such an event. (0551-8 [Kysor, Jillian])

Comment: In addition, the above analysis does not include any escalation in the cost of decommissioning reactors. Decommissioning costs theoretically are included in calculations of levelized cost. But these costs have been rising dramatically in recent years.³² [footnote 32 text: David A. Krause, "Historical NDT Fund Balances, Annual Contributions and Decommissioning Cost Estimates", Nuclear Regulatory Commission Workshop, March 2011.] For the reactors that were retired in the past year, the total is approaching \$1 billion per site, significantly above the amount originally estimated.³³ [footnote 33 text: Decommissioning Cost Analysis for the Vermont Yankee Nuclear Power Station, February 2012; Kewaunee Power Station Post-Shutdown Decommissioning Activities Report, TLG Services, Inc., 2013; Decommissioning San Onofre Fact Sheet, 2013; Robert McCullough, et al., Economic Analysis of the Columbia Generating Station, December 2013, pp. 92-101, 110-130. Decommissioning Cost Escalation is a Global Phenomenon: Nuclear Decommissioning Authority, Managing Risk Reduction at Sellafield, Report by the Comptroller and Auditor General, November 7, 2012.] However, it is also important to recognize that the storage of spent fuel is included in the decommissioning cost estimates, and I have already included those costs in this discussion. In the case of Kewaunee, the spent fuel storage costs are one-third of the total decommissioning cost. At half a billion dollars per nuclear reactor, the total cost for decommissioning the entire fleet could be \$50 billion, which is quite significant, given the other costs that I have analyzed. It appears that utilities are going to ask for rate increases to cover decommissioning costs, which means they have not been collecting enough. Given the rising costs of decommissioning, it

remains to be seen if current cost estimates are adequate. For license renewals, there would be an additional question about whether extending the life of a reactor increases the decommissioning costs. In summary, I do not include decommissioning costs in this analysis, but these costs could well be another reason my estimate is low. (0551-9 [Kysor, Jillian])

Comment: NRC also has not provided the price tag for such future transfer and replacement operations. (0552-1-27 [Macks, Vic])

Comment: Over the past few decades American nuclear consumers have been forced to shoulder the increasing costs of nuclear waste management. Without a federal waste management system in place, utilities and consumers across the country have been shackled by the costs of maintaining its nuclear waste on existing reactor sites le continuing to pay \$750 million annually into the Nuclear Waste Fund. (0555-3 [Contreras, Raquel])

Comment: Reactors in regulated markets can pass costs on to ratepayers; consequently licensees are more likely to make investments in maintenance, both before and after operations cease, lowering the risk that mechanical malfunctioning and degradation will result in negative environmental impacts. Conversely, merchant reactors in deregulated markets increasingly cannot compete with cheaper sources of electricity and are losing money. Therefore, those licensees are not making the necessary investments in maintenance and personnel while operating and have a higher probability of failures after operations cease resulting in negative impacts on the environment from degradation and mechanical malfunctioning. Pilgrim provides an example. In 2013, using USB's analysis, Pilgrim is losing \$27 to \$30 million dollars a year. In 2013 alone Pilgrim had 18 event reports and 10 times more shutdowns than any other reactor. On November 6, the NRC announced that it had dropped Pilgrim's performance rating because of shutdowns with complications, placing it among 15 plants in the country requiring more oversight. Only a few days later, the NRC told Entergy that Pilgrim's rating is likely to drop again next month, placing it among the 8 worst performers. Therefore it is reasonable to bet that the overall condition of its pool and support structures will not be in adequate condition to face the many challenges over the 60 years after license expiration, 2092. After operations cease, it is unrealistic to expect licensees to spend monies on a site that is not generating income; and there is no assurance either the licensee will be around. Who pays? (0556-1-15 [Lampert, Mary])

Comment: The DGIS assumptions assume that the licensee will pay for the maintenance, personnel and new equipment purchases required such as the DTS. Nearly every licensee is a limited liability corporation. In deregulated markets, the merchant plants cannot compete with cheaper sources of electricity. Pilgrim, Vermont Yankee, and Fitzpatrick, for example, are in financial distress now, cutting personnel and maintenance. What basis is there to assume that licensees (or their parent corporations, which are shielded from liability) will invest monies that they do not have; and what basis is there to assume that these plants will not declare bankruptcy, leaving no party responsible? Actually there can be no basis. This summer, based on a 2.206 Enforcement Petition regarding the economic distress of Fitzpatrick, Pilgrim, and Vermont Yankee and its safety implications (G20130211), NRC Staff sent a request for information to Entergy to determine particulars regarding their economics. Entergy complained and NRC withdrew its request saying that it agreed with Entergy that economic inquiries were against previous practice¹⁷. [footnote 17 text: Senators Edward Markey & Bernie Sanders Letter to Chairman Allison Macfarlane, November 14, 2013] Moreover between closure and decommissioning there is a long time period. The decommissioning funds cannot be tapped for spent fuel management; the licensee has losses but no profits; so who does NRC believe is going to pay monies required for safe storage? (0556-2-10 [Lampert, Mary])

Comment: The unanswered questions are: who is going to pay for all of this replacement; will the NRC of 2192 (one hundred years after the end of Pilgrim's short-term time frame) require them; and even if required will NRC enforce the requirement, even if it can find some distant offspring of a current licensee? Judging from NRC's response to lessons learned from Fukushima, there is a consistent pattern that when industry finances clash with public safety, NRC sides with industry's economic interests. (0556-2-9 [Lampert, Mary])

Comment: I exhort you to employ the safest and most reliable storage method known, no matter the cost. (0570-3 [Boosinger, Marilyn])

Comment: Nuclear power plants are leaving behind an immense footprint of toxic and radioactive waste. No one wants to invest the huge amount of money it would require to secure such waste for hundreds if not thousands of years. (0596-1 [Shima, Tetsuo])

Comment: One unequivocal conclusion from my review of the NRC's Waste Confidence DGEIS is that the financial cost of indefinite "continued storage" of spent nuclear fuel is UNPREDICTABLE and UNKNOWABLE, a category and degree of "confidence" that is even worse than "uncertain and open-ended." In fact, the potentially ASTRONOMICAL cost over the long-run makes the business model of the nuclear industry entirely and absolutely absurd. The "elephant in the room" is the obvious fact that the "nuclear energy business plan" is not economically viable as an unsubsidized, independent commercial enterprise. (0603-25 [Schonberger, David])

Comment: Certainly, this proceeding can take administrative notice as to what these costs may reasonably be expected to be, and do with more efficiency and accuracy than can this commenter, considering the access to site specific knowledge and confidential costs enjoyed by NRC Staff. Regardless, there is support on the public record for certain of the numbers below in the testimony presented on December 4, 2013 by Mr. Phil Mahowald, Council for the Prairie Island Mdewakanton Dakota Community. In view of the apparent analytical challenges faced by NRC Staff, however, we provide below a rough estimate of one expenditure that is vital in terms of performing proposed Waste Confidence activities, the cost of casks, based on a reasonable framework for an initial calculation. The assumptions for this cost calculation are as follows: Cost per TN-40 dry storage cask .cel Energy testimony, 11.4.13, MPUC Rate Case \$5.96 M; Metric tons of irradiated fuel per reactor during 80 years of reactor operations Draft GEIS at 2-7 ---1,600 MTU; Estimated metric tons of irradiated fuel for 100 reactors during 80 years of reactor operations--- 160,000 MTU; Estimated number of fuel assemblies for a waste inventory of 160,000 MTU ---551,385 fuel assemblies; Estimated number of dry storage casks with capacity to each hold 40 fuel assemblies needed to contain 551,385 fuel assemblies--- 13,785 casks. The conclusion of this rough calculation is that the cost of new storage casks, per cask cycle, is about \$82.1 Billion in 2013 dollars. To this must be added several billion additional dollars per cask cycle to pay for a Dry Transfer System at each ISFSI facility and, of course, the cost of maintaining the necessary skilled work force. In addition, waste degradation (see discussion below) will require storage pools to be maintained throughout storage periods at each ISFSI facility in order to manage degraded waste that cannot be transferred from old casks to new in a DTS, and to contain degraded waste that may accumulate in the bottom of casks in patterns that result in criticality events. The cost of pool installation and maintenance throughout the storage period for each ISFSI must therefore also be included in the cost of maintaining institutional control. But just looking at the cost of casks, if \$82.1 Billion in 1913 dollars is equivalent to \$1,952 Billion in 2013 dollars, what do you think the equivalent of \$82.1 Billion in 2013 dollars will be in 2113 dollars? This staggering amount of money is absolutely required in order to pay for the functions the Draft GEIS presumes will be performed. Yet, seeing as how all

costs of performing these functions are totally ignored by the Draft GEIS, it is not surprising that there also is no discussion about where all this money might possibly come from. The question must be adequately addressed before Waste Confidence can be re-established, however, and it must be addressed in the context that for many prior years, decades, and centuries for any given dry cask replacement cycle, reactor operations will have been terminated and therefore there will be no incoming revenue stream to offset waste management costs. (0608-11 [Crocker, George])

Comment: This failure of the Draft GEIS profoundly illustrates the larger and generic failure of the commercial nuclear industry and its regulators, whereby present-day benefits, largely favoring industry cartel players and regulators, are harvested based on arbitrary, warped and stunted cost-benefit analysis, without reasonable or adequate accounting of societal costs and risks, and actual long-term operational costs. In this instance, the cost-benefit analysis (Chapter 7, Draft GEIS) is focused on an asserted cost differential of \$5-\$23 million among the presented administrative alternatives while failing to account for the many billions of dollars required to actually operate the waste management program. The justification for this behavior, evidently, is the following statement found on page 7-1 of the Draft GEIS: The costs and benefits do not include the environmental impacts of continued storage, an activity that will occur regardless of the alternative that the NRC selects to consider its impacts. This assertion can only be true, not that it necessarily will be, if actual waste management occurs in accordance with the timeframes and assumptions posited by the Draft GEIS, which presumes institutional control, which presumes the availability of many billions of unaccounted for dollars, repeatedly, into the dimmest distant future. Without the money, there is no foundation for the asserted environmental impacts. Where will the money come from? Until this question is answered with a high degree of confidence, any assertion that the present proceeding has re-established "Waste Confidence" is self-serving folly. (0608-12 [Crocker, George])

Comment: In addition funding for even short term storage, let alone long term storage cannot be assured, (0611-24 [Shapiro, Susan])

Comment: The GEIS glosses over and does not identify how funds will be made available in perpetuity to provide security for nuclear waste storage and for the replacement dry cask storage systems every 100 years. The brief discussion in Section 3.2.2 somehow magically assumes local taxes will cover the exploding, repeating costs of nuclear waste storage. This is unfounded and unsustainable for future generations who will not receive any benefits from the lethal nuclear legacy to continue funding replacement casks every 100 years. In a 100 years or more there the current tax based structure of government and society may not even exist. There is a real risk that financial commitments made by elected bodies may be subject to de-funding as we just witnesses during the recent Federal shutdown. (0611-45 [Shapiro, Susan])

Comment: Mark Cooper, senior fellow for economic analysis, Institute for Energy and the Environment, Vermont Law School, and author of "Renaissance in Reverse: Competition Pushes Aging U.S. Nuclear Reactors to the Brink of Economic Abandonment" (2013) and "Policy Challenges of Nuclear Reactor Construction, Cost Escalation and Crowding Out Alternatives" (2009), calculated the full price tag per megawatt hour of nuclear power in terms of the cost and risks of storing and disposing of the radioactive waste from reactors. Cooper found that the "hidden" cost of nuclear waste storage is rapidly rising, and is so massive that the NRC cannot ignore it when conducting its own economic analysis about the true cost of nuclear power. Yet the GEIS does ignore the cost impacts and realities of nuclear waste storage. Without question that cost considerations for High Burn Up fuel cannot not projected since there is no scientific basis for the methodology necessary for safe storage. It is arbitrary, capricious

and totally irresponsible for the NRC to leave funding of future replacement and repair of spent fuel storage to short term political whims. Failure to provide necessary funds for future safe storage will result in extremely dangerous situations for public health and safety and the future of the entire human race. (0611-47 [Shapiro, Susan])

Comment: Established a permanent revolving fund in perpetuity which can adequately address long term/permanent nuclear waste storage and security, including structural repairs and replacement, federal security teams, and research to reverse engineer man-made nuclear fission. (0611-56 [Shapiro, Susan])

Comment: Much of what the NRC depends upon for waste confidence is that a geological repository will be available when needed. This availability becomes a matter of timing. Timing does not stand alone. Our government, our money and all other issues that make up the nuclear fuel cycle must survive to an extent. I have raised the issue of money or financing earlier in response to Chairman MacFarlane's testimony before the House Energy and Commerce Subcommittee on 12/12/2013 wherein she stated that financing was the responsibility of the Congress and that the NRC responsibility was to present a budget (or words to that effect.) (0615-1 [Lewis, Marvin])

Comment: Furthermore, if the costs of waste disposal are so great as to make it impossible to operate nuclear power plants cost-effectively, that fact must be recognized. (0616-2 [Hoffman, Ace])

Comment: Timeframes Evaluated: For the PINGP ISFSI site, the short-term storage of no more than 60 years after the licensed life of a reactor could be to either 2094 or 2114, depending on whether the PINGP is relicensed for a second time; long-term storage of no-more than 160 years after the licensed life of the reactor would be until 2194 or 2214, depending upon a second renewal term; and indefinite on-site storage. The draft GEIS assumes that institutional controls will continue. We are concerned that the utility now operating the facility will even exist in 60 or 160 years, and we fail to see how the NRC can make this assumption. The NRC has failed to provide any factual basis to support this assumption with any confidence. With respect to the indefinite and the long-term scenarios, there is no certainty that current (and future) licensees will be responsible for the financial resources needed to support longterm and indefinite storage operations. What will happen if licensees cannot fulfill their legal financial obligations? Will the US Government provide sufficient resources and protection to ensure continued safe and secure storage? If so, will these sites become Federal storage sites? We have no basis for assuming that the current structure of financial assurances for spent fuel storage will continue to exist during the long-term and indefinite time periods. Furthermore, the final GEIS should discuss the impacts from the potential loss of institutional controls and oversight. How can we possibly know whether a utility (or any entity as we know them today) will be in business in 160 years or beyond? (0619-1-14 [Mahowald, Philip R.])

Comment: Chapter 7 discusses the costs and benefits associated with the Proposed Action, as well as the alternatives. There is no discussion regarding the significant costs (to the ratepayer or the taxpayers) to decommission ISFSIs, or to construct new ISFSIs and a DTS over the long-term and indefinite timer-periods. The draft GEIS assumes that there will be sufficient funding available for decommissioning the respective ISFSIs and constructing new ISFSIs, fabricating new dry casks, and constructing and operating the DTS (and eventually decommissioning it). Who will pay for this? What if State regulatory agencies (i.e., public utility commissions or public service commissions) simply refuse to allow the utilities (if they even exist) to pass along those costs to the ratepayers? If this draft GEIS is to support a revised

Waste Confidence Rule, shouldn't the cost of implementing the rule also be included? In a recent filing with the Minnesota Public Utilities Commission (MPUC) rate case, NSPM testified that its installed per cask cost at Prairie Island is \$5.96 million (which includes cask fabrication, loading and licensing costs).⁷ [footnote 7 text: See Direct Testimony and Schedules of Timothy J. O'Connor dated November 4, 2013 in Docket No. E002/GR-13-868 at pp. 49-52 and Appendix A] That's \$372 million in today's dollars for the 63 additional casks needed to store all of the waste generated during the PINGP 20-year license extension, and another \$584 million in today's dollars to re-load all 98 casks in a hundred years (if the plant is only licensed to operate another 20 years). The draft GEIS assumes a second reactor renewal term, which adds an estimated 33 additional dry casks for a total number of dry casks of 131. The 2013 cost to replace 131 dry casks is estimated to be \$781 million. This does not include costs to decommission the existing ISFSI, license and construct the DTS or any labor costs associated with the unloading of dry casks. We have no idea whether these costs have been factored into the PINGP's and ISFSI's respective decommissioning plans. Has the NRC performed this review? If not, then what is the factual basis for this assumption? This cost scenario will be repeated across the county and will be in the billions of dollars before the indefinite storage phase begins. According to a report issued by Oak Ridge National Laboratory, the current fleet of 104 commercial nuclear power plants annually discharge approximately 2,000 metric tons of heavy metals (MTHM) of spent nuclear fuel.⁸ [footnote 8 text: Available at <http://info.ornl.gov/sites/publications/Files/Pub40536.pdf> (February 2013).] As of the end of 2011 the inventory of commercial spent nuclear fuel was approximately 67,600 MTHM (the result 50 years of reactor operations). At the current rate of discharge, the current operating reactors will generate an additional 67,600 MTHM spent nuclear fuel over the next 30 years. That represents a total of approximately 135,200 MTHM of spent nuclear fuel that will be generated (or approximately 465,920 spent nuclear fuel assemblies).⁹ [footnote 9 text: See "Storage of Spent Nuclear Fuel," by Andrew C. Kadak, which was published in the National Academy of Engineers' Summer 2012 issue of The Bridge on Managing Nuclear Waste, available at <http://www.nae.edu/Publications/Bridge/59220/59226.aspx>: "by the end of 2011, the United States commercial nuclear waste inventory had reached approximately 65,000 metric tons of heavy metal (MTHM). This represents about 224,000 fuel assemblies." (at p. 25).] If we assume 40 assemblies per cask,¹⁰ [footnote 10 text: Based on the 40 fuel assembly capacity of the TN-40 and TN-40HT casks, but also recognizing that many casks are much smaller than the TN-40 and TN-40HT in use at the PI ISFSI.] that amounts to approximately 11,648 dry casks. Using the 2013 cost per cask at the PINGP, the conservative estimated cost for replacing these dry casts would be more than \$69 billion in today's dollars. This estimate doesn't include any costs related licensing, constructing and operating the DTS across the county, which one could assume would be in the billions of dollars as well. (0619-2-4 [Mahowald, Philip R.]

Comment: Whether the \$69 billion dollar figure is too high or low is irrelevant. The fact is, the NRC has not even considered the costs associated with its assumptions, and whether the cost to replace these casks will be borne by the ratepayer and/or the taxpayer. We have no assurance that the state regulators will allow the utilities to recover their costs. If the plants are no longer operating, will they have ratepayers from whom they can recover their costs? Will the utilities' shareholders be asked to cover these costs? A likely scenario is that utilities still operating or otherwise in control of the ISFSI sites will seek to recover their costs from the Federal government (due to partial breach of contract), like they have been doing for the last decade. As is stated in the draft GEIS, the Waste Confidence rule is not a licensing decision, but, the Waste Confidence Rule does, in fact, allow the Federal government to do nothing (i.e., develop and license a repository) because of its conclusions (i.e., that it is safe to store spent nuclear fuel on-site for the long-term or indefinitely). (0619-2-5 [Mahowald, Philip R.]

Comment: Not only is the individual owner/operator of the reactor unaccountable or liable for the care and final disposition of the results from which it has generated a profit, but the November 19, 2013 ruling by the U.S. District Court for the District of Columbia that the Department of Energy must discontinue the collection of fees from nuclear power reactor licensees for the purposes of funding the Federal repository program is further cause for concern about the long-term management of commercially-generated nuclear waste. (0620-10 [Rivera, Evelyn])

Comment: It is important to realise the crushing cost of generating or storing nuclear waste (spent fuel) in an unsafe manner. Here is a chilling real life example from the United Kingdom. When one of the Chernobyl NuclearPower Plant's reactors melted down more than 25 years ago the UK was seriously affected more than 1,300 miles away. Produce from 9,700 farms in the UK had to be quarantined and diverted as being unfit for human consumption. The UK is a continent away from Chernobyl. 25 years later, there were still more than 300 restricted farms in the UK, still too heavily contaminated with fall out to be allowed to sell their produce. (0634-5 [Cato, Michael])

Comment: I believe it is obvious that the long-term costs of waste disposal/storage are so great as to make it impossible to operate nuclear power plants cost-effectively. Nuclear waste management will become the most expensive component of using nuclear power. Not recognizing this fact is to side-step reality. (0640-3 [Geary, B.]

Comment: Over the past few decades American nuclear consumers have been forced to shoulder the increasing costs of nuclear waste management. Without a federal waste management system in place, utilities and consumers across the country have been shackled by the costs of maintaining its nuclear waste on existing reactor sites while continuing to pay \$750 million annually into the Nuclear Waste Fund. (0642-2 [Picking, Brian])

Comment: [T]he costs of waste disposal are so great as to make it impossible to operate nuclear power plants cost-effectively. Without state subsidies and taxpayer bail-outs, they never would have been built, especially since no insurance company will cover them. (0679-3 [Sorgen, Phoebe])

Comment: Currently, the NRC funding criteria for decommissioning does not account for short term, long term, or indefinite on-site storage of nuclear waste. The State of New York recommends that the NRC either include a financial plan for long-term spent fuel storage, or perform a revision to the NRC decommissioning certification of financial assurance to include the financial burden of on-site spent fuel storage. (0681-7 [Peterson, Alyse])

Comment: In addition, the total costs of providing electricity through nuclear power plants cannot be honestly calculated. It includes many unknowns that have been left out of the equation: such as the cost of unconceivable long term storage of spent fuel rods; the efficacy of even attempting to do that; the costs to future generations that our actions will impose upon them; the health risks imposed on the human race and the planet, the long term medical costs of caring for people negatively affected by the nuclear industry and its waste; the future costs on the environment for all inhabitants of the planet. When all is added together, it is clear that the real total cost of nuclear power is incalculable and therefore, morally unacceptable. (0686-9 [Malboeuf, Simone])

Comment: Nuclear power is too expensive and generating more nuclear waste too costly. (0690-6 [Eisman, Val])

Comment: No detailed cost analysis was done in this GEIS except comparing costs of a generic EIS to multiple site-specific ones. The cost analysis should have compared the costs and benefits of a geologic repository to long term or indefinite storage at reactors or away from reactors. It should have included total transportation costs and costs of the repeated replacement of casks and transfer facilities every 100 years or sooner. In addition, there are the growing liabilities associated with lawsuits by reactor owners over the failure to take the waste off their hands. Taxpayers have a right to fully understand the growing liabilities associated with continued production of high level radioactive spent nuclear fuel that will have to be successfully managed forever. (0693-1-13 [Warren, Barbara])

Comment: •No real analysis of the total costs of spent fuel nuclear waste management was in the GEIS including transportation, storage casks, transfer facilities, recontainerizing every 100 years, spills, accidents, cleanup costs, storage and disposal costs and the planned funding mechanism. The costs of severe accidents including permanent loss of property and businesses and who will bear the costs were also not evaluated. Taxpayers, ratepayers, and the general public have a right to understand the total costs and what costs they will be forced to bear, including whether major portion of the costs will be shifted or externalized from the nuclear industry onto the public sector. The absence of thorough analysis of future financial costs is a significant concern given what we are currently seeing related to the loss of institutional control over dangerous nuclear waste. The public can have no trust in promises about a future process when past promises are unfulfilled. (0693-4-3 [Warren, Barbara])

Comment: The handling of nuclear waste will over time be the most expensive piece of the puzzle -- possibly excepting disasters like Fukushima and Chernobyl. (0705-3 [Spring, Janet])

Comment: Furthermore, if the costs of waste disposal are so great as to make it impossible to operate nuclear power plants cost-effectively, that fact must be recognized. (0709-2 [Wythe Elnagar, Romi])

Comment: Despite this incredible confidence in the ability to manage waste in temporary storage facilities forever, NRC does not even bother to estimate the cost of doing so. Such costs are not trivial, even in the present-day United States of America, which is the wealthiest and most powerful nation-state in world history. Recent events demonstrate the folly of NRC assumptions, and the capriciousness of failing to analyze the costs of maintaining the presumed waste management regime. (0711-17 [Olson, Mary])

Comment: On November 19, 2013, the U.S. District Court for the District of Columbia ruled that the Department of Energy must discontinue the collection of fees from nuclear power reactor licensees for the purposes of funding the federal repository program. The court's ruling was based on the department's termination of the Yucca Mountain project and the lack of a credible cost assessment for the long-term management of commercial irradiated fuel without a viable repository project. This is, quite literally, the very situation envisioned in the Waste Confidence GEIS: the lack of a repository in which to permanently store irradiated fuel, forcing waste to be actively managed in temporary storage facilities indefinitely, forever. The government presently has no statutory basis on which to generate funds for such a program, which means that the existing High-Level Waste Fund would continue to be expended until it is exhausted. It is irresponsible for NRC to neglect to acknowledge that the "institutional controls" necessary to manage irradiated fuel in temporary storage facilities indefinitely would require statutory funding throughout that time, and to fail to offer an explanation of the amount of those funds and where they would come from. The GEIS does not, could not and must address the impacts of the D.C. Court's November 19th ruling, which included setting the Waste Fund Fee at

zero, creating a significantly changed circumstance that was not considered by the GEIS. (0711-19 [Olson, Mary])

Comment: This Generic Environmental Impact Statement is (as stated on page xxiii) on the "safety and environmental impact of storing spent nuclear fuel beyond the operating life for operations of a nuclear power plant." NRC's economic analysis is inadequate. The only economic analysis NRC carried out was a comparison of NRC's cost of doing ONE generic EIS versus the cost of doing numerous site specific EISs at each location that applies for a license or license extension. Those analyses did not consider the consequences of contamination at the sites. Even more egregious is the fact NRC did not even estimate how much the actual waste management would cost yet assumed that there will be institutional control and recontainerization every hundred years into the future. No assessment is made about the likelihood and costs of institutional controls existing, of basic costs of the new casks, presence of necessary facilities for carrying out recontainerization, or the remedial action needed based on the condition of the fuel as it deteriorates over time. No assessment is done of the consequences of NOT recontainerizing into the future. (0711-20 [Olson, Mary])

Comment: Full cost accounting is absolutely necessary. There has been no cost benefit analysis provided. Alternatives to the generation of more nuclear waste through re-licensing and issuance of new licenses for new build must be considered. According to National Environmental Policy Act project proponents must first take a "Hard Look" at alternatives. Regulators and Industry simply will not answer the question who will pay for repackaging of Dry Casks in perpetuity? Perpetual repackaging. What will be the cost of security for hundreds of years to come? (0713-4 [Keegan, Michael J.])

Comment: Will the NRC compare the risks and costs of isolating irradiated nuclear fuel for centuries with the costs of generating renewable energy (like solar and wind) and of increasing energy efficiency? (0715-5 [Drey, Kay])

Comment: To date, NRC's analysis has not included an acknowledgment and analysis of the cost to replace these drinking water resources that play a critical role in the daily life of New York City's residents. Replacing radionuclide-contaminated drinking water resources for millions of City residents would likely represent a substantial cost. (0718-1-4 [Sipos, John])

Comment: Even if society continues unhindered, who will pay to replace these facilities after the plant is shut down and the power company is bankrupt? Are these costs built in to the cost of the licensing of the facility? What guarantee is there that this maintenance will ever be done? (0724-4 [Gamble, Dan])

Comment: Additionally, NRC presumes the spent fuel can be safely stored in dry casks for a century, but will then need to be repackaged. This will involve complex remote handling and construction of repackaging devices. NRC assumes some institution will in fact take care of this task every hundred years, a difficult and expensive undertaking, given the hazard involved. These presumptions are predicated on the assumption that the utilities that own the reactor sites where the material will be stored will continue to exist and will have the resources and commitment to undertake these tasks over these very long periods. This is hard to countenance, given that no utility has been in existence that long, maintenance of funds for such a non-income-producing activity seems unlikely, and institutional memory at such utilities to carry out these functions difficult to maintain. (0738-11 [Hirsch, Daniel])

Comment: Since there is no viable economic value in re-purposing Nuclear waste, and certainly no recycling of the materials, the cost of operation including waste disposal is not viable. I can recall stating this in 1966 and it is now even more true today. (0755-1 [Calnan, Christopher])

Comment: The cost for creating these solutions for waste disposal is the sole responsibility of the producer. (0798-2 [deBruler, Gregory])

Comment: I have raised the issue of money or financing earlier in response to Chairman MacFarlane's testimony before the House Energy and Commerce Subcommittee on 12/12/2013 wherein she stated that financing was the responsibility of the Congress and that the NRC responsibility was to present a budget (or words to that effect.) (0818-2 [Lewis, Marvin])

Comment: NRC's preferred alternative is based upon the cost concerns of regulation to the agency and the utilities. This is an inappropriate priority. The cost concerns to be addressed in the GEIS, should be the costs of each of the storage timelines, including indefinite storage. And the costs of ongoing 100 year cask and facility replacement and funding for local, state, and federal collaboration - in enduring institutional controls, including monitoring, maintenance and management. (0820-13 [Eide-Tollefson, Kristen])

Comment: Certainly the NRC has not posed any evidence that a removal and re-storage in casks at a 100 year or any other long interval is practical. The NRC is not serious about the costs of decommissioning reactors. Your present formula for financial reserves for decommissioning are tragically short of what both experience and economic forecasting has shown to be the actual costs of decommissioning. If NRC cannot regulate funds for responsible decommissioning, how can the public believe the NRC will establish and enforce adequate financial responsibility so that future owners of surface cask storage sites will repackage cask stored waste? (0821-11 [Paddock, Brian])

Comment: It's not a question of IF, it's a question of WHEN we too realize the risks, costs and toxicity of spent nuclear fuel it too high when compared to alternatives. The NRC's Waste Confidence Generic Environmental Impact Statement delivers additional costs associated with short-term to mid-term (60 to 200 years) on-site storage of spent nuclear fuel and add yet another layer of real expense to the overly subsidized "too cheap to meter" vision of nuclear power. (0826-6 [Morgal, Rick])

Comment: There needs to be a national discussion on the subject of waste, that addresses the true costs of storing materials that remain highly radioactive, in the case of U-238 for 4.5 billion years, and in the case of Pu-239 for 24,000 years; but that's just the half-life. The true period of storage should be 10 times longer, in truth many times longer than the earth is likely to exist. (0834-6 [Thabit, Nick])

Comment: There is roughly 60,000 tons of spent fuel in the USA that are not stored in dry caskets, or "Casked". USA generates around 2000 tons a year, and it takes approximately five years to cool enough spent fuel to be Casked. Thus, approximately 10,000 tones are awaiting dry cask storage (i.e., 5 X 2,000 tons). This leaves approximately 50,000 tons that could be and SHOULD BE Casked immediately. The total cost with labor and materials will be around \$11.25 billion (US) B to dry cask all the spent fuel Dry Casked, or roughly about \$225,000 per ton. This approach is viable from a safety perspective, but also from an economical perspective. It will cost approximately \$14.375 billion (US) to dry cask ALL of the spent fuel in the USA up to 2020. However, this expense will be off-set by approximately \$4.8 billion (US) as an economic infusion

through job creation for US trade workers. Additional cost avoidance of approximately \$24 billion (US) from potential litigation can be gained with this Dry Cask Storage approach. Please note that other potential risks, such as risk of disaster or terrorist attacks, are not included in this calculation but could be significant and debilitating from an economic and/or social perspective. So, we can create US jobs and "fix" the spent fuel storage problem for the next 50 years (while we figure out a longer term solution) or we can risk litigation and the economic and environmental disaster that will surely accompany a natural, technological or/or human-made nuclear disaster. (0843-2 [Davis, Cherie])

Comment: Siting an interim repository is next to impossible because of the uncertainty that a permanent deep geologic repository will ever open in this country despite the assurances that the NRC is confident that one will. Without a deep geologic repository, the enormous costs of repackaging spent fuel every hundred years at various sites on into infinity is not taken into consideration in the NRC's EIS even though the draft EIS works hard to make the impression that it has taken into account all costs. (0851-10 [Thatcher, Tami])

Comment: While the NRC keeps pretending that the spent fuel is just not a problem, the Department of Energy has reported that "The current inventory of domestic [spent fuel] is massive, diverse, dispersed and increasing . . . [and] it represents a significant financial liability."⁵ [footnote 5 text: Wagner et al.] There are 137 variations of commercial spent fuel, each requiring specific research for storage design that the taxpayers will be paying for. (0851-7 [Thatcher, Tami])

Comment: Furthermore, if the costs of waste disposal are so great as to make it impossible to operate nuclear power plants cost-effectively, that fact must be recognized. (0856-2 [Fritz, John])

Comment: The DGEIS assumptions and the alternatives derived from them are examples of a normative forecast that describes a desirable future without sufficient reference to current conditions. For example, the DGEIS assumes funding will be sufficient without regard to the existing conditions of an industry in decline. An explorative forecast would have examined the current funding conditions and sought to create a more realistic description of the future from that basis. It would have possibly identified a forthcoming funding shortage as nuclear power declines and utilities decrease revenues from NPP operations. Such a funding shortfall would have impacts on institutional control, regulatory viability and environmental impacts. (0867-1-2 [Griffin, William])

Comment: Scenarios are typically extensive narratives that highlight likely possible alternatives. In this case, the NRC could have examined the problem of lost agency financing from the perspective of several different funding scenarios. Such analysis would have at a minimum addressed the possibility that the funding streams that underlie the very existence of the NRC may change. (0867-1-5 [Griffin, William])

Comment: Reactor operators are not obligated to retain funds for post-decommissioning activities, such as indefinite storage and maintenance of SNF. There is currently no program for the disposal of the SNF and such long term funding is essential to address. States and local governments, acting to protect their citizens ultimately may become responsible for some minimum level of activity at the site. This may include security, monitoring or supervision of maintenance. In any event, the time, attention, and funding to carefully observe the site will necessarily remain with the state. It will be necessary to pay for trained, knowledgeable staff, monitoring equipment, and a public safety program in the area. The DGEIS does not acknowledge this problem and does not address this unfunded mandates that could reasonably

be expected to infringe on the state. Nor does the DGEIS acknowledge that all these costs will ultimately be borne by the public in the form of increased taxes. (0867-3-10 [Griffin, William])

Comment: The NRC assumes that the funding will be available for the indefinite storage of the materials. This assumption may not be valid. (0867-3-2 [Griffin, William])

Comment: The assumption that funds will be available for the management and disposal of spent nuclear fuel is problematic. First, there is no requirement for nuclear power plant operators to maintain funds to manage spent nuclear fuel following decommissioning. Currently, reactor operators are required to maintain decommissioning accounts. NRC has developed a formula it uses to calculate the adequacy of the decommissioning funds. Based on this formula, those accounts are currently estimated to be sufficient (NREG 1577). Funding assurance for decommissioning nuclear power plants is governed by 10 CFR 50.33(k), 50.75, and 50.82. However, these cost estimates do not include the costs for long-term management of the fuel or the site. As the NUREG states: "In addition, the costs of managing and storing spent fuel on site until transfer to the Department of Energy for permanent disposal are not included in NRC cost formulas." (NUREG 1577 p. 16) The reason power plant operators were not responsible for long-term management of spent fuel was because of the assumption that long-term storage would be provided by DOE. In advance of this assumption, the power plant operators were being assessed fees to support the nuclear waste fund. However, the recent decision by the United States Circuit Court of Appeals has invalidated collection of those fees (*NARUC v. DOE*). Currently, there is no requirement for NPP operators to maintain a fund for the long-term management of SNF. Even today, the NRC's assumptions about funding are unfounded. It is easy to envision a future in which funding is not available. (0867-3-3 [Griffin, William])

Comment: Second, funding the long-term management of spent fuel requires a dramatic change in the way the United States manages the oversight of commercial nuclear waste. Currently, oversight is performed by the NRC. The NRC, however, receives 90% of its funding from fees assessed from operating NPP's (NRC Press Briefing). As reactors close, there will be fewer funds available for oversight of the stewardship and management of the materials. The NRC assumption of eternal funding for these activities will require Congressional action to change current policy, the funding of either the current organization, or the development of a new organization. (0867-3-4 [Griffin, William])

Comment: Third, the DGEIS makes the unrealistic assumption that funding is an either/or question. That is, either sufficient funding is available forever, or that it is not. A much more likely outcome is that funding from energy companies will dwindle and backfill funding from the Federal government will have to compete with other priorities and rather than be entirely eliminated, it will be gradually reduced. In this event, affected States may be compelled to supplement the maintenance or oversight of waste facilities with their own funds. If so, the sites will inevitably become unfunded mandates on the states. (0867-3-5 [Griffin, William])

Comment: Ultimately, funding is difficult to forecast. As the NRC said: "It is difficult to determine costs that could be incurred 50 to 100 years in the future. Changes in technology, regulation, or public policy could all have a profound effect on the actual cost. The purpose of including costs is to try to discern the benefit for the expedited transfer alternative. Of course, this analysis is based on best estimates of current spent fuel strategies and cost. If the U.S. government were to take possession of the spent fuel in order to provide storage at a non-operating plant site for extended periods, the costs could be heavily discounted, and the differences between storage alternatives in this analysis might be reduced" (COMSECY-13-0030 p.7). It is likely that if funding becomes unavailable for a short or an extended timeframe,

that states will be forced to provide essential services and protection to the facilities. This then is an example of how SNF could become an unfunded mandate on states. (0867-3-6 [Griffin, William])

Comment: There is no environmental impact statement where the NRC discusses the significant costs of a repository and spent fuel storage in a cost-benefit analysis for licensing of nuclear reactors. The only environmental document where costs related to spent fuel disposal are considered is Table S-3, but Table S-3 reports only that if there are no radiation releases from a repository there will be no costs. Table S-3 says nothing about the costs of a repository. And the DGEIS says nothing about the costs of spent fuel storage. As discussed in the declaration of Mark Cooper, costs of spent fuel storage and disposal could be high enough to tip the cost-benefit analysis in a reactor licensing or re-licensing decision away from a recommendation to license a reactor. But NRC provides no mechanism for integrating the high costs of spent fuel storage and disposal into the cost-benefit analysis and comparison of energy alternatives for reactor licensing cases. (0897-7-13 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: In addition, the costs of avoiding or mitigating those impacts are significant. For instance, the NRC's finding that it is feasible to have a geologic repository raises questions of cost. What will it cost to isolate spent fuel for many thousands of years? Is the cost affordable when compared with the profit that a nuclear reactor will yield? As discussed in the declaration of Mark Cooper, these costs are so large they must be considered. Conservatively estimating the costs of spent fuel storage and disposal, Mr. Cooper estimates total costs in the range of \$210 to \$350 billion, in real, undiscounted dollars. Cooper Declaration, p. 10. That is a figure that is certainly large enough to demand consideration by the Nuclear Regulatory Commission. Moreover, converting those costs to costs per unit of output, he concludes that the costs would be in the range of \$10 to \$20 per megawatt hour (\$0.01 to \$0.02/ kWh) of electricity generated by the reactors that produce the waste. Cooper Declaration, p. 4. This is equal to 10 to 20 percent of the cost of nuclear power from newly constructed reactors as calculated by the Energy Information Administration. Compared to the cost of the other resources included in the Energy Information Administration analysis, the cost of waste management would make nuclear power much less attractive as a resource. The Cooper Declaration also shows that the cost of nuclear waste management is often larger compared to the operating costs and margins of existing reactors. Several operating reactors have recently been abandoned because their operating margins can be as low as \$9/MWh, which is insufficient to cover their costs and meet the revenue requirements that their owners demand and others may face a similar fate. Cooper Declaration, pp. 20-21. Waste management costs of \$10 to \$20 per MWh must be considered very significant in evaluating the economics of aging reactors. The majority of the license renewals that are pending at the NRC, or expected to come before the NRC in the next few years, involve reactors whose operating costs and margins are no better than the margins for reactors that were recently retired before their licenses expired. (0897-7-5 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Costs of Spent Fuel Storage and Disposal Could Tip the Balance Of Reactor Licensing Decisions[.] As demonstrated by the Cooper Declaration, the costs of spent fuel storage and disposal could tip the balance of reactor licensing decisions away from licensing and in the direction of renewables and energy efficiency. As discussed above, spent fuel costs are equal to 10 to 20 percent of the cost of nuclear power from newly constructed reactors. These costs are also significant for existing reactors, which face increasing operating costs as a result of aging. Cooper cites estimates of the cost of electricity resources prepared by the mid-Atlantic grid operator PJM and Lazard, a Wall Street analysis firm, which show that a significant amount

of energy efficiency can be achieved at a cost that is lower than the cost of waste management alone. Cooper Declaration, p. 17. (0897-7-6 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Finally, even under the assumption of institutional controls for an indefinite period, the Draft GEIS fails to address the expense of those measures, the risk that they may fail, and how such costs and risks may impact reactor licensing and license extension decisions. (0898-1-6 [Curran, Diane] [Makhijani, Arjun])

Comment: In this context, it is important to note that this entire exercise is part of the process of licensing new reactors or extending the licenses of existing reactors. Cost is therefore a very material consideration. Long-term storage (or longer) followed by disposal in one repository could add up to between \$214 billion and \$351 billion. A second repository could add \$34 billion to \$171 billion.¹¹⁷ [footnote 117 text: Cooper 2013. Exhibit MNC-4, p. 25] These are huge sums of money. The NRC must take these into account when assessing the reasonableness of its assumptions regarding long-term storage followed by disposal - or indefinite storage, which would be even more expensive. (0898-4-14 [Curran, Diane] [Makhijani, Arjun])

Comment: Even under the assumption of institutional controls for an indefinite period, the Draft GEIS fails to address the expense of those measures, the risk that they may fail, and how such costs and risks may impact reactor licensing and license extension decisions. (0898-5-18 [Curran, Diane] [Makhijani, Arjun])

Comment: My analysis shows that the costs of managing spent nuclear fuel are likely to be quite large in absolute value, running to hundreds of billions of dollars (in constant 2012 dollars). They are in the range of \$10 to \$20 per MWH (\$0.01 to \$0.02 per kWh), which is certainly large enough in relative value to affect the outcome of analyses that compare the cost of nuclear power to the alternatives available in the United States. Therefore, the cost of nuclear waste management is a significant cost that should be included in the NRC's economic comparisons of nuclear power with energy efficiency and other alternative energy sources. (0900-1 [Cooper, Mark] [Curran, Diane])

Comment: There is a great deal of uncertainty and debate about the discount rate that should be used. In this case, as discussed below, it is my opinion that application of a discount rate is inappropriate. Therefore, the costs presented in Exhibit MNC-4 are not discounted. For purpose of long term analysis, analysts generally believe discount rates should be quite low.⁴² [footnote 42 text: Hamal, 2011.] The fact that costs of waste management are incurred a long time (i.e., hundreds or thousands of years) after the useful life of the facility creates an intergenerational issue, since future generations will be incurring large costs without deriving any benefit. As GAO states: Although the concept of discounting is an accepted and standard methodology in economics, the concept of discounting values over a very distant future--known as "intergenerational discounting" is still subject to considerable debate. Furthermore, no consensus exists among economists regarding the exact value of the discount rate that should be used to discount values that are spread over many hundreds or thousands of years.⁴³ [footnote 43 text: GAO, 2009, p. 28.] Therefore the appropriate discount rate is a significant issue that should be addressed in the NRC analysis of the cost of waste management. In my opinion, there are two additional, important reasons why application of a zero discount rate is appropriate in these circumstances. First, the real increase in the cost of at-reactor storage and the permanent repository has been increasing substantially faster than the real, discount rate. Given the long time frames being considered, the real price increase can have a very large impact. An annual real rate of increase above the discount rate of one-half of one percent would more than double the cost of waste management. The second reason stems from the unique

way that the financing of the repository is being handled. To the extent that the discount rate represents the time value of money (*i.e.*, the value of the opportunity to use the money), the public is bearing the burden on the revenue side. The DOE analysis of fund adequacy takes credit for the earning of interest on the funds collected. Because those funds are being banked to make the fund whole, then the funds are not available to be used for other purposes. Much the same is true of the Treasury funds being paid to utilities because of the failure of the federal government to take the spent fuel. Because taxpayers are already being denied the opportunity to use their funds for other purposes, to discount the cost would be a double burden. Taxpayers and ratepayers would be bearing the full cost of the waste management, having been denied the opportunity to use the repository funds of penalties for storage costs for other purposes. Given these considerations, I believe it is reasonable to estimate the combined costs of at-reactor storage and a permanent repository in the range of \$10 - \$20/MWh (\$0.01 to \$0.02/kWh). I have rounded this estimate to one significant figure, to account for the uncertainties inherent in such estimations at the present time. In absolute value, given the EIA estimate of \$0.11/per kWh for the cost of nuclear power from new reactors, this is between 10% and 20% of the estimated cost.⁴⁴ [footnote 44 text: See EIA, 2013.] That is a substantial portion of new reactor costs and therefore strongly merits consideration by the NRC in its economic analysis of the relative costs and benefits of new nuclear reactors as compared to energy efficiency and other energy sources. For the above reasons, I believe that the bottom line in Exhibit MNC-5 provides cautiously low estimates of the cost of nuclear waste management. Therefore, in the remainder of this analysis I use the cost range of \$10/MWh to \$20/MWh to assess the importance of including nuclear waste management costs in the NRC's economic analysis. (0900-10 [Cooper, Mark] [Curran, Diane])

Comment: As discussed in more detail in Section IV, the cost of nuclear waste management is a much larger fraction of the cost of operating existing reactors than for new reactors. And it is large enough to affect the comparative cost of nuclear power from existing and new plants, relative to the available energy alternatives. Therefore, in the case of both new reactor licensing and license renewal for existing reactors, the costs of nuclear waste management could be high enough to affect decisions about which energy resources to develop. (0900-11 [Cooper, Mark] [Curran, Diane])

Comment: In the previous section I showed that a very cautious estimate of waste management costs would be in the range of \$0.01 to \$0.02 per kWh. In this section I examine whether costs of that magnitude could affect the economic analysis of nuclear power compared to other resources. For the analysis of licenses for new reactors I examine the addition of waste management costs to the levelized cost of energy that are frequently used to evaluate new resources. For the analysis of the renewal of licenses for existing reactors I analyze the addition of waste management costs to the operating costs and margins of existing reactors. (0900-12 [Cooper, Mark] [Curran, Diane])

Comment: The traditional approach to comparative resource selection for new reactors relies on the calculation of the levelized cost of electricity.⁴⁵ [footnote 45 text: Levelized cost is often cited as a convenient summary measure of the overall competitiveness of different generating technologies. It represents the per-kilowatt-hour cost (in real dollars) of building and operating a generating plant over an assumed financial life and duty cycle. Key inputs to calculating levelized costs include overnight capital costs, fuel costs, fixed and variable operations and maintenance (O&M) costs, financing costs, and an assumed utilization rate for each plant type. http://www.eia.gov/forecasts/aeo/electricity_generation.cfm] For the purposes of this analysis, I start with the levelized cost of alternatives as estimated by EIA. I then add the cost of nuclear waste management to those costs and observe, qualitatively, whether it would alter the

evaluation of the cost of nuclear power compared to the other options available. Exhibit MNC-5 shows the results using the range of estimates in the EIA analysis. Nuclear waste management costs of \$20/MWH would change the location of nuclear in the relation to other resources significantly. Nuclear moves: • Out of the range of o Conventional coal costs o Gas Combined Cycle with CCS o Advanced gas turbines • Into the range of o Advanced coal o Advanced coal with CCS • Much closer to and o Slightly below gas turbines o Slightly above Biomass[.] Waste disposal costs of \$10/MWH move nuclear costs in the same directions, but more modestly. Exhibit MNC-6 shows levelized cost estimates for a similar set of resources from the Pennsylvania, Jersey, Maryland Power Pool (PJM), a major Regional Transmission Organization (RTO) in an area of the country that is not especially well endowed with renewable resources (e.g. compared to the Midwest with a great deal of wind or the Southwest with a great deal of solar, or the Northwest with a great deal of hydro). Exhibit MNC-7 shows estimates from Lazard, which is a financial analysis firm. I include these two estimates because they not only represent different institutional points of view but also because both include efficiency as a resource. Both estimates demonstrate that efficiency is the least-cost resource by far. In fact, a significant amount of efficiency could be delivered at a cost that is close to the cost of nuclear waste management alone. Lazard also projects declining costs for solar, which I include in Exhibit MNC-7, which would make it cost competitive with even natural gas within a decade. As shown in Exhibit MNC-8, the cost trends for solar and offshore wind are expected to make them much more competitive over the next decade and would significantly affect all of the comparisons affecting nuclear power. Adding \$10 to \$20 per MWh to the cost of nuclear power generation would make a material difference in its attractiveness. Nuclear becomes even less attractive when one considers that other energy sources have little risk due to the short time from start of construction to finish. Looking at the cost of nuclear compared to the more costly alternatives in these analyses, the \$10 to \$20/MWH certainly can make a difference. Nuclear, which is almost the most expensive resource, could become the most costly. (0900-13 [Cooper, Mark] [Curran, Diane])

Comment: In the realm of electricity resource selection, I and many others have argued for an approach to analysis that deals more systematically with risk, uncertainty, vagueness, and ambiguity in the decision-making environment. I have developed a multi-criteria portfolio approach based on financial risk hedging and real option analysis, as well as a number of other efforts to deal with the challenge of ambiguity in the decision-making environment. For the purpose of incorporating the cost of nuclear waste management into the analysis, I will briefly describe the basic portfolio approach. The top graph in Exhibit MNC-9 presents the basic approach to financial portfolio analysis, as a publication from the National Regulatory Research Institute (NRRI) attempted to introduce it to regulators.⁴⁶ [footnote 46 text: Ken Costello, *Making the Most of Alternative Generation Technologies: A Perspective on Fuel Diversity*, NRRI, March 2005.] As shown in the upper graph, investors want to be on the efficient frontier, where risk and reward are balanced. They can improve their expected returns if they can increase their reward without increasing their risk or if they can lower their risk without reducing their reward. In the financial literature, risk is measured by the standard deviation of the value of the reward. In applying this framework to the evaluation of generation options, analysts frequently measure reward as kilowatts per dollar (a measure of economic efficiency). Reward is the inverse of cost (i.e., the lower the cost the greater the reward). Indeed, they use efficiency and cost interchangeably.⁴⁷ [footnote 47 text: J.C. Jansen, L.W. M. Beurskens, and X. van Tilburg, *Application of Portfolio Analysis to the Dutch Generating Mix*, ECN, February 2006, p. 13 argue for a risk-cost frontier.] The lower graph in Exhibit MNC-9 shows the cost/risk relationship. Options that would move the portfolio toward the origin should be adopted since they embody lower cost and/or risk. Movement along the risk-cost frontier is neutral. Movement away from the origin raises either the cost or the risk. I use the array of resources to calculate a measure of

the attractiveness of the reward. The distance of a resource from the origin measures the risk-cost characteristics of the resource (giving risk and cost equal weight). Resources that are farther from the origin (measured as the distance with each factor weighted equally) are less attractive. The distance from the origin can be expressed as the risk-adjusted cost or the expected cost. Exhibit MNC-10 shows the result of applying my approach to the EIA cost estimates, assuming that waste costs increase both the point estimate and the standard deviation of the cost estimates. Exhibit MNC-10 provides quantitative estimates that support the observations in the previous section. Waste disposal costs of the magnitude I have estimated make nuclear a much "closer" call in comparison to other alternatives, and they even reverse the direction of the conclusion in several comparisons. The top graph in MNC-10 focuses on the comparisons between resource costs that would be most affected by inclusion of waste management costs in the NRC's economic analysis. The bottom graph includes all of the resources. There are nine comparisons in which nuclear would be seen as a significantly less attractive asset to include in a resource portfolio. Including the trends for wind and solar cost and the cost of waste management, nuclear becomes almost the least attractive resource. (0900-14 [Cooper, Mark] [Curran, Diane])

Comment: I approach the analysis of the impact of waste management costs on the economics of aging reactors by examining these costs in relation to operating costs and margins. The economics of old reactors is already fraying and many are already on the economic "razor's edge."⁴⁸ [footnote 48 text: Cooper, Aging Reactors.] Uprates are already being abandoned because they are too costly. Old reactors are being shuttered because they are no longer economic. Proper consideration of waste disposal costs could play a part in pushing them over the edge. In my recent analysis of aging reactors I used a Credit Suisse analysis of operating costs and operating margins as the basic data to make the point that analysis of the economics of aging reactors that are still operating is challenging. Exhibit MNC-11 contains the estimated operating costs for almost all nuclear reactors online in 2012. Exhibit MNC-12 shows the "cash margins" that the reactors would yield, given the "round-the-clock prices" at different power hubs. It shows that in all but a few cases the cash margins - revenues per MWh in excess of the offered hub price - are less than \$20 per MWh. It also shows that the cash margins are less than \$10 per MWh in many cases. Exhibit MNC-12 also identifies reactors that have been retired recently or are scheduled to retire early, even though they were online and had significant periods before their licenses would expire. Major uprates that have recently been cancelled are also identified. The exhibit makes the point that cash margins of about \$9/MWH put reactors on the razor's edge because the cash margins are very thin.⁴⁹ [footnote 49 text: Credit Suisse, 2013, pp. 11-17, "Using current 2014 power price forwards and unit economics, we see modest cash margin expectations... Layering in typical parent overhead of \$5-7 / MWH, unit economics look even worse... We worry that rising operating and capital costs along with operational problems at some aging plants will force owners to continuously re-evaluate the useful lives of plants independent of license extensions especially as the time to absorb ongoing capex grows shorter."] Exhibit MNC-12 shows that 12 of the 18 license renewals pending or expected in the near future are on this razor's edge. The waste management costs identified above are clearly material in these circumstances. (0900-15 [Cooper, Mark] [Curran, Diane])

Comment: In conclusion, the calculations in this declaration indicate that spent fuel storage and disposal costs could be high enough to materially affect energy choices when the costs of new reactors or extension of the operating life of existing reactors are compared with energy efficiency and alternative energy sources. Therefore, in my opinion, the NRC should consider these costs in its licensing decisions for new reactors and renewal of existing reactor licenses. (0900-16 [Cooper, Mark] [Curran, Diane])

Comment: I believe that the EIA has been wildly optimistic about the cost of nuclear power over the past decade, but I suspect that the NRC would be inclined to rely heavily on its estimates, and therefore I use it as my base case. I also show that the same conclusion would be reached if I were to rely on recent estimates from utility industry sources and Wall Street analysts. The DOE's recent analysis of the cost of a permanent nuclear waste repository is the most recent in a series of government analyses of those costs.¹³ [footnote 13 text: DOE, 2013.] Because it was prepared as part of DOE's legal obligation to assess whether current fees are adequate to fund a permanent repository, it takes a very narrow view of the costs considered. It does not consider at-reactor storage costs, and it assumes that the repository opens very quickly.¹⁴ [footnote 14 text: *Id.* p. 9, DOE 2013 assumes one pilot consolidated storage facility and one full-scale consolidated storage facility. It also assumes a time period of 34 years between the siting and opening of a repository.] Neither of these assumptions appears consistent with the current reality of nuclear waste management or sound economic analysis of waste management costs. As I show below, this view ignores at least half of the cost associated with nuclear waste management. Nevertheless, the DOE's analysis provides a useful starting point for estimating the cost of one component of nuclear waste management. (0900-2 [Cooper, Mark] [Curran, Diane])

Comment: First, the estimated cost of spent fuel disposal in a repository has been escalating dramatically, which is typical of cost estimates involving nuclear power. The trend is slightly stronger for the cost estimates since the 1990s. Second, the repository costs are very large in absolute value, reaching a hundred billion dollars. They are certainly large enough to be included in any economic analysis comparing the costs and benefits of nuclear reactor operation. As discussed below, the costs are also large enough to affect the economics of nuclear power compared to alternatives. (0900-3 [Cooper, Mark] [Curran, Diane])

Comment: The recent GAO analysis¹⁹ [footnote 19 text: GAO, 2009.] and the Blue Ribbon Commission study²⁰ [footnote 20 text: Hamal, 2011.] have recognized the increasing importance that onsite storage of nuclear waste plays in the overall cost of nuclear waste management. Onsite spent fuel storage is becoming the central cost driver of nuclear waste management because very long periods of onsite storage - up to 300 years - are being considered.²¹ [footnote 21 text: Dennis Vinson, Ron Kesterson, and Adrian Mendez-Torres, "Inventory and Description of Commercial Reactor Fuels within the United States," Prepared for U.S. Department of Energy Campaign Program Savannah River National Laboratory, March 31, 2011. Which is also noted in Eric M. Davied, *Long-Term Interim Storage for Used Nuclear Fuel: Dry Cask Storage in Centralized Storage Facilities*, Texas A& M University, 2011, identifying cask capacity at 10 to 15 MTU. (Hereafter, Davied 2011).] These costs are reflected in Exhibit MNC-3, which includes the GAO scenario in which waste remains on site for a long period of time (100 to 500 years). The GAO estimates in Exhibit MNC-3 suggest that the longer waste remains in storage on site, the higher the cost is likely to be. The Blue Ribbon Commission "best estimate" for 100 year at-reactor storage restated in 2012 dollars is just over \$100 billion.²² [footnote 22 text: Hamal, 2011, estimates just under \$72 billion for the large repository (including transportation) compared to the GAO estimate of \$53 billion. I use the difference ($71.46/53 = 1.348$) to scale up to undiscounted dollars. Bringing the figure to 2012 dollars involves inflating by a factor of 1.096. The adjustment factor is 1.477. Hamal's "best estimate" cost for the repository would \$78.3 billion in 2012 dollars compared to the DOE midpoint cost of \$88.9 billion.] Given that much longer periods of time for at-reactor storage are being contemplated, even this figure is too low for three reasons: First, when a nuclear reactor shuts down permanently, the waste at the reactor site becomes "stranded." That is, the site must be operated solely for the purpose of attending to the waste. This means that the costs of many activities that were once attributed to operating the reactor must now be allocated to managing the waste. The Blue Ribbon

Commission study suggests that the cost of managing stranded waste is five times as high as the cost of managing waste at an operating site.²³ [footnote 23 text This cost difference is derived from Hamal, 2011, p. 27. GAO, 2009 shows no difference between the average at-reactor storage costs for 100 years, which would include a substantial period in which spent fuel is not stranded, and the cost of 500-years of at-reactor storage. This suggests that stranding has not been taken into account, which was the central thrust of Hamal, 2011.] Second, over hundreds of years, storage casks will deteriorate and have to be replaced. I have assumed that cask replacement will be necessary every 100 years at a cost of \$1.6 million per cask, assuming no escalation in real costs.²⁴ [footnote 24 text My assumption of cask replacement every 100 years is consistent with the NRC's Draft Waste Confidence Environmental Impacts Statement, p. xxviii, 2013. Davied, 2011, identifies cask capacity at 10 to 15 MTU.] Given this cost and the amount of material that will have to be stored, the GAO estimates of storage are low. Repackaging costs could be on the order to \$75 billion.²⁵ [footnote 25 text: GAO, 2009 uses the figure of \$1.6 million per cask. With 153,000 metric tons of waste and 10

tons per cask, the cost of repackaging all spent fuel is \$24.480 billion. Three repackaging operations would be just under \$75 billion.] Third, as with all nuclear costs, repackaging cost appear to be increasing dramatically.²⁶ [footnote 26 text: Michiel P.H. Brongers, *Appendix CC, Nuclear Waste Storage*, CC Technologies Solutions, Inc., N.D., p. cc-2, gives a figure of \$1.2 million; GAO, 2009, p. 56, puts the cost at \$1.6 million per cask, which is shown as a modification of the earlier assumption of \$1.2 million. GAO, 2009, reflects similar trends.] This analysis also excludes potentially significant costs associated with the repackaging and transportation of high burnup spent nuclear fuel over the next 30-50 years. For instance, in 2012 an expert with the National Academy of Engineering reported that "the technical basis for the spent fuel currently being discharged (high utilization, burnup fuels) is not well established...the NRC has not yet granted a license for the transport of the higher burnup fuels that are now commonly discharged from reactors. In addition, spent fuel that may have degraded after extended storage may present new obstacles to safe transport."²⁷ [footnote 27 text: National Academy of Engineering, "Managing Nuclear Waste", Summer 2012, pp 21, 31, <http://www.nae.edu/File.aspx?id=60739>.] Even the Nuclear Regulatory Commission (NRC) admits "there is limited data to show that the cladding of spent fuel with burnups greater than 45,000 MWd/MTU will remain undamaged during the licensing period" for dry spent fuel storage facilities.²⁸ [footnote 28 text: U.S. Nuclear Regulatory Commission, "Standard Review Plan for Spent Fuel Dry Storage Facilities, Final Report" NUREG-1567, March 2000. p. 6-15, <http://www.nrc.gov/readingrm/doc-collections/nuregs/staff/sr1567/sr1567.pdf>.] (0900-4 [Cooper, Mark] [Curran, Diane])

Comment: Exhibit MNC-4 adds at-reactor storage costs to the most recent DOE estimates for the cost of the repository. The stranded waste costs are based on the difference in cost estimated in the Blue Ribbon Commission report between very rapid transfer of stranded waste to central storage and no transfer until 70 years later.²⁹ [footnote 29 text: Hamal, 2011 p. 41 shows stranded waste costs of \$477 million for a central storage facility taking 6000 MTU per year starting 2020 and \$22.716 billion for a central storage facility taking 3000 MTU per year starting in 2090. The difference of \$22.239 billion in 2009 dollars equals \$24.4 billion in 2012 dollars.] That difference is slightly more than \$24 billion over the first 70 years. Extrapolating to 300 years, the difference in the stranded waste cost would be \$105 billion. Repackaging of waste is necessary as long as it is not deposited in a permanent repository.³⁰ [footnote 30 text: Hamal, 2011, p. 52.] Therefore, repackaging costs must be added. Assuming three rounds of repackaging in 300 years, repackaging adds another \$75 billion to the cost of managing spent fuel. Combining these cost estimates for storage and disposal of spent fuel yields a cost range of approximately \$210 to \$350 billion. (0900-5 [Cooper, Mark] [Curran, Diane])

Comment: The estimated cost range of \$210 to \$350 billion for spent fuel management leaves out significant costs. First, it does not include an escalation in the real cost of at-reactor storage and the escalation in the real cost of construction and operation of a permanent repository. Both of these have exhibited significant historical trends of increasing real cost. Second, the estimate in Exhibit MNC-4 does not include the cost or risk of accidents that may be significant with onsite storage of waste, especially during the very long period of onsite storage that is being contemplated. Large quantities of dangerous materials stored at sites close to population centers create a risk of accidents that can impose severe economic disruption and social dislocation. While much of the discussion of nuclear accidents focuses on public health issues, the economic and social impacts are substantial. The estimated economic costs of one accident run into the hundreds of billions, equaling or exceeding the entire cost of waste management and disposal.³¹ [footnote 31 text: Cooper, Nuclear Safety, discusses the general magnitude of these costs. Gordon R. Thompson, "Risk-Related Impacts from Continued Operation of the Indian Point Nuclear Power Plants", November, 28, 2007 examines the potential economic cost of a severe onsite storage accident, showing it is similar in magnitude to the general accident risk.] The fourth largest utility in the world was not thrown instantaneously into virtual bankruptcy by public health impacts, but it was destroyed by the economic cost of cleanup and compensation. While these are low probability events, keeping large quantities of nuclear waste onsite for long periods of time raises the probability of such an event. In addition, the above analysis does not include any escalation in the cost of decommissioning reactors. Decommissioning costs theoretically are included in calculations of levelized cost. But these costs have been rising dramatically in recent years.³² [footnote 32 text: David A. Krause, "Historical NDT Fund Balances, Annual Contributions and Decommissioning Cost Estimates", Nuclear Regulatory Commission Workshop, March 2011.] For the reactors that were retired in the past year, the total is approaching \$1 billion per site, significantly above the amount originally estimated.³³ [footnote 33 text: *Decommissioning Cost Analysis for the Vermont Yankee Nuclear Power Station*, February 2012; *Kewaunee Power Station Post-Shutdown Decommissioning Activities Report*, TLG Services, Inc., 2013; *Decommissioning San Onofre Fact Sheet*, 2013; Robert McCullough, et al., *Economic Analysis of the Columbia Generating Station*, December 2013, pp. 92-101, 110-130. "Decommissioning Cost Escalation is a Global Phenomenon: Nuclear Decommissioning Authority, *Managing Risk Reduction at Sellafield*, Report by the Comptroller and Auditor General, November 7, 2012.] However, it is also important to recognize that the storage of spent fuel is included in the decommissioning cost estimates, and I have already included those costs in this discussion. In the case of Kewaunee, the spent fuel storage costs are one-third of the total decommissioning cost. At half a billion dollars per nuclear reactor, the total cost for decommissioning the entire fleet could be \$50 billion, which is quite significant, given the other costs that I have analyzed. (0900-6 [Cooper, Mark] [Curran, Diane])

Comment: In order to bring these waste management costs into the economic evaluation of nuclear power compared to other resources, I translate the aggregate estimates of costs into per kWh costs. This involves several challenges. The bottom row in Exhibit MNC-4 shows an effort to do so. There are two important issues that affect this calculation: output of nuclear reactors and a determination of the appropriate discount rate. (0900-8 [Cooper, Mark] [Curran, Diane])

Comment: The amount of power that the costs will be spread across is uncertain. The DOE's assumption is too high for several reasons. The DOE estimate shows a stream of output from nuclear reactors that start with a base in 2012 that is already 5% higher than the actual output.³⁴ [footnote 34 text: DOE, 2013.] The output is lower than expected because nuclear reactors were offline and have been retired early. That trend is likely to continue. The DOE assumption of a

very high load factor is inconsistent with historical experience. It took a long time to build up to a high load factor; therefore, any new reactors that come online should not be assumed to immediately jump to a high load factor. Moreover, capacity factors for existing reactors have begun to decline as reactors age. In a recent paper, I showed that including early retirements in the calculation of load factors yields a load factor that is one-sixth lower than the very high assumptions being used in much comparative economic analyses.³⁵ [footnote 35 text: Mark Cooper, Renaissance in Reverse: Competition Pushes Aging U.S. Nuclear Reactors to the Brink of Economic Abandonment, July 2013 (hereafter, Aging Reactors).] The output of the nuclear fleet in 2013 will have declined from the peak in 2010 to the level achieved in 2004. DOE and many other analysts of waste management assume that reactor life will be 60 years.³⁶ [footnote 36 text: DOE, 2013.] While the license period might run that long, virtually all reactors that have been retired were retired before their licenses expired. The closure of Kewaunee and Vermont Yankee extend that pattern for reactors that were online when the retirement decision was made, while San Onofre and Crystal River extend the pattern of troubled reactors retiring early. DOE assumes an increase in capacity of almost 10 percent due to large scale uprates at existing facilities,³⁷ [footnote 37 text: DOE, 2013.] but virtually all large scale uprates pending have been cancelled due to a severe deterioration in the comparative economics of nuclear power.³⁸ [footnote 38 text: Cooper, Aging Reactors.] DOE assumes early online status for new reactors under construction and an "unplanned addition" of a new reactor which would add 2 percent to nuclear capacity.³⁹ [footnote 39 text: DOE, 2013.] Given the historical experience of new reactor cancellations and construction delays, the "unplanned addition" should certainly be dropped. Combining these observations, one can argue that the base case for NRC analysis should include actual 2013 output, which is 5% lower than the DOE analysis, an 80 percent load factor, without uprates and "unplanned additions." Under these assumptions, the output of the fleet would be at least 25% lower than assumed by DOE in its analysis of disposal system costs.⁴⁰ [footnote 40 text: This result is consistent with all remaining reactors plus five new ones – Vogtle, Summer, Watts Bar – running for a full 60 years at 90 percent capacity factor.] Lower output might lower the variable cost of at-reactor storage. Whether it lowers the cost of a permanent repository depends on whether one assumes that only one repository will be constructed. If adding nuclear capacity causes the construction of a second repository, fixed costs will increase substantially. The GAO analysis, adjusted for the discount rate and inflation, suggests that the cost of operating two repositories would be 32% higher than one, adding \$25 billion to the total cost.⁴¹ [footnote 41 text: GAO, 2009.] This would offset a substantial part of the variable cost savings. Put in another way, if denying licenses or license renewals allows a second repository to be avoided, the reduction in cost would be substantial including both fixed costs for the reactor and variable cost for spent waste storage. (0900-9 [Cooper, Mark] [Curran, Diane])

Comment: Replacing dry casks, canisters, pads, and dry transfer systems once every hundred years is not "too cheap to meter," despite Lewis Strauss, Chair of the U.S. Atomic Energy Commission's, infamous words to the contrary in 1954. He was speaking about nuclear power, but irradiated nuclear fuel is the inevitable byproduct of commercial nuclear power. In fact, electricity is but the fleeting byproduct. The actual product is forever deadly high-level radioactive waste. (0919-2-2 [Kamps, Kevin])

Comment: In addition to the replacements described on Page 1-13, the "routine maintenance," for a million years or longer, would add to the on-site and/or away-from-reactor costs even more. Again, NRC has not described how much maintenance and replacement forevermore will cost, nor identified where those funds will come from. Given that the U.S. Circuit Court for the District of Columbia last month ruled that DOE should ask Congress to end the collection of the Nuclear Waste Fund fee from nuclear electricity consumers, there will be even less money to

work with in the future than there has been in decades past, concerning high-level radioactive waste management. (0919-2-20 [Kamps, Kevin])

Comment: In fact, Dr. Mark Cooper of Vermont Law School, expert witness on behalf of a coalition of dozens of environmental groups, including Beyond Nuclear, has provided NRC expert comments on the costs of such repeated replacements of dry cask storage infrastructure over time. Dr. Cooper's analysis foresees staggering costs that future generations - which derived no benefit from the nuclear generated electricity that led to the production of the forever deadly radioactive waste - will be forced to pay, in order to isolate the irradiated nuclear fuel from the environment forevermore. Remarkably, NRC has neither estimated the costs of such activities, nor ventured a guess as to who would actually pay those costs, where that funding would come from. (0919-2-4 [Kamps, Kevin])

Comment: If the EPA's acknowledgement, that commercial irradiated nuclear fuel will remain hazardous for a million years, is the figure we use, that represents 10,000 replacements of dry cask storage under NRC's "indefinite storage" (which also could be dubbed "infinite storage") timeframe: 1,000,000 years X 1 replacement/100 years = 10,000 replacements. Dr. Mark Cooper has provided expert estimates as to what those staggering costs would be just for the first few replacements - around \$100 billion per century! But multiplying such price tags by 10,000 replacements boggles the mind in terms of costs future generations will face. Of course, it'll be worse than that, due to inflation (even in the first century!), not to mention worsening problems of fuel degradation, which could be quite significant and boost the price tag astronomically! (0919-2-9 [Kamps, Kevin])

Comment: Given that DOE has estimated Yucca's price tag, had it been constructed, opened, and operated, would have approached \$100 billion (for just the first 63,000 MTHM of commercial irradiated nuclear fuel, per the limit set in the Nuclear Waste Policy Act of 1983, as Amended), how much does NRC calculate future commercial irradiated nuclear fuel disposal will cost, all told? Where will that money come from? Who will pay it? These questions are not answered in NRC's DGEIS. (0919-3-3 [Kamps, Kevin])

Comment: If the costs of waste disposal are so great as to make it impossible to operate nuclear power plants cost-effectively, that fact must be recognized. (0931-1 [Masullo, Ginny])

Comment: The true costs of nuclear power should be assessed in detail in the EIS, including the substantial front end subsidies, and the long term costs of decommissioning and the management of nuclear[.] Nuclear Reactor owners and operators are not fully financially responsible for disposal of their waste. Once the waste leaves the reactor site, the US taxpayer is on the line for any accidents and liability. These long term hidden costs must be made apparent, in full view and via "full cost accounting." (0938-10 [Sondheim, Steven])

Comment: The tax payer is on the hook for any accidents, why?? The NRC should not be receiving subsidies from the taxpayer. The NRC should provide your own insurance. (1003-1 [Cartmell, Cathy])

43. Comments Concerning Decommissioning

Comment: So, where does a generic environmental impact statement figure into the decommissioning process? The situation in Zion and Fukushima changes from moment to moment, not only on the physical level, which we can see, but even more critically at the

molecular and subatomic level. This is a quote from an authority from Canada, Dr. Gordon Evers: "The central fact about radioactivity is that no one knows how to turn it off. Radioactive materials continue to emit atomic radiation at a rate which cannot be influenced by any of the usual factors, heat, pressure, chemical reactions, absorption, dilution, nothing can be used to speed up, slow down, or stop the process of radioactive disintegration from occurring." This central fact means that 'radioactive cleanup' is a very misleading phrase. It suggests to ordinary people that we can somehow get rid of radioactive contamination. But we cannot do so, at least not in any actual sense. All we can do is move the contamination from one place to another. If you decontaminate one site, you must be contaminating another site. The contamination, whether repackaged, consolidated, or managed are made less available to the environment of living things but it cannot be eliminated. Governments and their electorates have been misled by the nuclear industry into believing false notions about nuclear waste. Lots of impact, millions of dollars spent, they do not know how to do this. There is no way to clean up or dispose of radioactive waste. (0245-10-2 [Lewison, Linda])

Comment: There's still spent fuel stored in pools at nuclear plant sites where the reactors have been decommissioned, and we need to take care of those spent fuel rods right away. (0250-29-8 [Rivard, Betsey])

Comment: As far as jobs, decommission these plants, every single one in the United States. You'll have more jobs than you could possibly think of. First off, decommission would probably take 10 years, maybe 20 years to get rid of the plants. On top of that is that then we'd have to move into robotics because it's not safe to deal with and bring in a whole other industry that the community colleges would force in the neighborhoods there and the universities would go into the research of robotics in order to decommission these facilities. (0327-44-3 [Chavez, Tim])

Comment: And the assumption that decommissioned reactors and reactors that may actually have been disassembled and removed and, yet, the cask storage will be subject to adequate monitoring, inspection, enforcement, and leak detection is contrary to the experience and to the existing regulation concerning what remains at a deactivated site. (0329-12-8 [Paddock, Brian])

Comment: The NRC has determined that it is no longer necessary to have permanent inspectors on site during the decommissioning process. The quantity of radioactive materials stored on site is nearly 90 times that released by the Chernobyl accident. (0433-2 [Stone, Gene])

Comment: A for profit energy company with its profit/risk tables cannot make the decommission plans. Unit 1 at SONGS is proof, 20 years buried still in progress for decommissioning. The world has changed in its dangers for nuclear spent fuel. We must act now. (0481-2 [Magda, Marni])

Comment: Something way beyond leaving spent fuel rods sitting in place at Oyster Creek and any other decommissioned nuclear plants has to be arranged quickly. We are all watching the horrors of what an uncontrolled nuclear mess looks like and the thought of leaving 50,000 casked but nevertheless still radiated rods right in between two of the most heavily traveled roads in New Jersey is beyond the pale. (0510-1 [Holmes, Helen])

Comment: Make decommissioning a priority at all costs, no matter what they are. (0526-2 [Arnott, Melissa])

Comment: Currently decommissioning funds are inadequate to safely decommission nuclear facilities throughout the country. In 2003 the GAO Report dated October 2003 found that the

NRC Needs More Effective Analysis to Ensure Accumulation of Funds to Decommission Nuclear Power Plant, yet since that time the NRC irresponsibly allow Entergy to gamble Indian Point decommissioning fund on the stock market, which resulted in a significant loss in the 2008 stock market crash. (0611-46 [Shapiro, Susan])

Comment: The NRC does not address ownership of the waste or responsibility post decommissioning in the DGEIS-other than the oft-repeated phrase that the federal government is expected to develop a deep geological permanent repository for radioactive waste 60 years after the end of the licensed life of each nuclear plant. The DGEIS presents no confidence that such storage will be available in any amount of time. In the case that such storage does not occur, the NRC should explain ownership of spent nuclear fuel post decommissioning in the DGEIS. (0622-1-9 [Vale, Karen])

Comment: The Decommissioning Plant Coalition was formed over a decade ago in response to the government's continuing failure to meet its obligation to remove the SNF/GTCC from reactor sites beginning in 1998 and to highlight the issues unique to permanently shutdown reactor sites undergoing decommissioning and operating on-site dry cask storage facilities. We have and will continue to safely store the SNF/GTCC stranded at our sites; however, as we highlighted in our prior comments and reiterate now, the federal government's continued default on its obligations under the standard contract and the resultant indefinite storage of this material at our shutdown reactor sites cannot be endorsed as acceptable public policy. (0637-3 [Norton, Wayne])

Comment: The DGEIS and rule also increase the risk that the obligations for SNF disposal may ultimately be transferred to the states and to their ratepayers, despite the long legal and regulatory history involving federal government promises and commitments that SNF disposal was to be a national and federal obligation. The Commission appears to ignore the reality that available legal and corporate strategies exist that can provide for the transfer of nuclear plants and ISFSI's, and the SNF itself, to unfunded separate limited liability companies that can easily abandon SNF at existing sites once the economic value of the generating plants are exhausted. (0704-8 [Callen, Ronald C.] [Keskey, Donald L.]

Comment: No spent fuel pools should be used to store a decommissioned plant's spent fuel rods once the fuel rods are cool enough to be transferred to a dry cask. (0826-13 [Morgal, Rick])

Comment: Additionally there is increased likelihood of an unintentional loss of cooling power to the spent fuel pool during the decommissioning process that could result in a spent fuel pool fire. It is suggested that that NRC motivate the shut down plant's owner/operator to quickly move the spent fuel into dry casks by tying the availability of decommissioning funds to the act of placing all the spent fuel into dry casks as soon as it is thermodynamically possible. This simple approach would not require the owner/operator to place the spent fuel into dry casks but with the uncertainty of sufficient decommissioning funds the owner/operator would be motivated to move the spent fuel quickly into casks to receive decommissioning funds more swiftly. Making sure the plant owner sees access to decommissioning funds tied to the movement of spent fuel from pools into casks will expedite the closure of the spent fuel pools. It is understood that the last spent fuel rods may take up to ten years to sufficiently cool before they can be installed into dry casks but given the 60 year timeline to decommission a plant ten years would not be that long of a wait before the plant begins to be dismantled using decommissioning funds. (0826-17 [Morgal, Rick])

Comment: It appears that utilities are going to ask for rate increases to cover decommissioning costs, which means they have not been collecting enough. Given the rising costs of decommissioning, it remains to be seen if current cost estimates are adequate. For license renewals, there would be an additional question about whether extending the life of a reactor increases the decommissioning costs. In summary, I do not include decommissioning costs in this analysis, but these costs could well be another reason my estimate is low. (0900-7 [Cooper, Mark] [Curran, Diane])

Comment: It is now generally accepted that those nuclear plants either decommissioned or closed are now the sites of a nuclear waste facility and will remain so for thousands of years. The plants themselves were licensed to run only when producing electrical energy and all designed to be safe and functional for forty years. (0933-3 [Anonymous, Janet])

Comment: The public oversight, accountability and transparency is totally inadequate relative to the enormous risks of the decommissioning project. Irradiated fuel transfers have never been attempted on this scale before. So, where does a generic environmental impact statement figure into the decommissioning process? The situation at Zion and Fukushima changes from moment to moment, not only at the physical level, which we can see, but, even more critical, at the molecular and subatomic level. This is a quote from Dr. Gordon Edward, a Canadian physicist and noted authority on radioactive waste: "The central fact about radioactivity is that no one knows how to turn it off. Radioactive materials continue to emit atomic radiation at a rate that cannot be influenced by any of the usual factors-heat, pressure, chemical reactions, absorption, dilution-nothing can be used to speed up, slow down, or stop the process of radioactive disintegration from occurring." This central fact means that 'radioactive cleanup' is a very misleading phrase. It suggests to ordinary people that we can somehow get rid of radioactive contamination. But we cannot do so, at least not in any actual sense. All we can do is move the contamination from one place to another. If you decontaminate one site, you must be contaminating another site. The contamination, whether repackaged, consolidated, or managed, is made less available to the environment of living thing, but it cannot be eliminated. Governments and their electorates have been misled by the nuclear industry into believing false notions about nuclear waste. Lots of impact, millions of dollars spent, they do not know how to do this. There is no way to clean up or dispose of radioactive waste. (0934-2 [Lewison, Linda])

44. Comments Concerning Emergency Planning

Comment: Additionally, currently power companies can end 10-mile radius emergency planning zones within 12 to 18 months post-reactor shutdown, whereas these contingency plans will be needed and should be carried out indefinitely. (0009-4 [Schwartzberg, Lora])

Comment: We have a problem in Philadelphia at bridges. Have a problem. We are trying our best and we're doing a very good job of bringing I-95 up to date, but it's a big, big highway that goes through here. Our emergency planning, how can I put it? Well, let's skip emergency planning. I don't like to say bad things about my city. Emergency equipment, we got emergency equipment, but let us say I hope the groups that are supposed to come out from the Federal Government for emergency problems do it fast. (0030-14-2 [Lewis, Marvin])

Comment: The chances of contamination of storage sites and all resources in large geographic areas necessitate better planning that we have seen thus far. If you must think only of the bottom line, make it the continuation of human existence. (0069-2 [Spangenberg, Samuel])

Comment: If New York State declares emergency evacuation due to nuclear explosion, Long Islanders have no where to go and New York streets are not meant for evacuation route. Remember during the Hurricane Sandy or Irene, or snowstorm, moment people heard the news, all New England colonies went to get gas before major storm hit and evacuated. Some people will not evacuate because they think they'll be safe. Long Islanders has no way to evacuate, unless ferry companies reach to help. Just like in movie, evacuation means heavy traffic jam. If this happens during the rush hour, it's impossible to evacuate because millions of peoples will be stuck in traffic. (0114-2 [Endo, Yuki])

Comment: I had to respond to fires and oil pollution and collisions. And I had patrol boats, harbor tugs and a helicopter to respond to these emergencies, but I later realized that if there was an incident at Indian Point, which is along the Hudson River, we did not have sufficient resources or training to respond to a radioactive emergency. And I wonder whether those resources and the training exists today. (0163-16-4 [Wolf, Peter])

Comment: Thirdly, I was group readiness officer and was involved in planning to respond to a major calamity in the port. The knowledge I gained made me dubious that a successful evacuation of significant proportions to be undertaken if there was a serious accident at Indian Point. When contemplating a nuclear mishap, I also ponder where the hundreds of thousands of evacuated people will go and how they will pay for their expenses if they suddenly have no job and their most important asset, their home, is suddenly worthless because it's in a nuclear contaminated zone. (0163-16-5 [Wolf, Peter])

Comment: In fact, a worker at Indian Point was exposed to radiation and the hospital emergency room took hours for a single one-person incident. What would a big disaster cause? (0163-20-8 [Gellert, Sally Jane])

Comment: Radiation covers entire New York State, portion of Connecticut, and New Jersey. If the state declares emergency evacuation due to nuclear explosion, Long Island -- Long Islanders have nowhere to go and New York streets are not meant for evacuation route. Remember during Hurricane Sandy, or Irene, or snowstorm, moment people heard the news, all New England colonies went to get gas before major storm hit and evacuated. Some people will not evacuate because they think they will be safe. Long Islanders has no way to evacuate unless ferry companies reach to help. Just like in the movie, evacuation means heavy traffic jam. If this happens during the rush hour, it will be impossible to evacuate because millions of people will be stuck in traffic. (0163-27-2 [Endo, Yuki])

Comment: Could people be evacuated safely if there's a fire at a waste fuel pool? Past experience with comparatively minor accidents like Windscale, Three Mile Island, Chernobyl and Fukushima suggests not. But in order to maximize the externalization of radioactive waste costs, within just a couple of years of final reactor shutdown the NRC will not require evacuation planning. This is reckless disregard for public safety and public health. (0230-3 [Garb, James])

Comment: FEMA has stated that they are not ready for any kind of -- stated to me they are not ready for the "big one." The big one meaning the New Madrid Fault. We have 23 reactors there. (0246-24-1 [McCune, Chuck])

Comment: The people in Japan fled into areas of high radiation. The NRC should be required to post nuclear events and status reports seven days a week, not this five days a week with holidays off. The USGS provides 24/7 reporting. So can the NRC. (0246-3-4 [Gray, Erica])

Comment: [E]xpand the emergency planning zones and include the people. Enlarge the planning zone to 50 miles, not ten miles. We're between those two zones, and we do not feel safe. (0250-11-4 [Kerr, Julius])

Comment: [S]o how far away is safe? Ten miles is the industry standard, but our own U.S. Government sets the distance for Americans in Japan at least 50 miles away. (0250-40-5 [Kerr, Beverly])

Comment: Just imagine trying to conduct an evacuation under real emergency conditions like those we've seen in other countries. Emergency planning has not been advanced over the years and must be expanded from 10 to 50 miles. State and local governments are responsible for all emergency response outside of nuclear plant gates. Outside the gates is where the industry's responsibility ends. (0250-40-6 [Kerr, Beverly])

Comment: It is very interesting that our comments tonight are being held in Charlotte, home of Duke Energy. I am a long-term resident of Charlotte. I grew up in the western part of the county. For about five years, I lived in the shadow of McGuire Nuclear Plant. There was a warning siren just down the street from me. If I lived there now, I would know how to evacuate if there was a nuclear emergency. I would be eligible for potassium iodide tablets. I now live in Charlotte, 14 and 17 miles from 4 nuclear reactors. I am not having that same level of protection if there is a nuclear accident at one of those 4 nuclear reactors. This needs to be addressed by the NRC. (0250-64-1 [Gupton, William])

Comment: It would be impossible to evacuate the millions of people living near California's Waste. Of the 34 million people in California, over 8.5 million reside within 50 miles of San Onofre!! (0284-7 [Borchmann, Patricia])

Comment: We need to get that fuel moved, it is deadly. And to say that it's a moderate risk is insane. People have talked about the kind of risk. I was in the Laguna fire in 1993. I watched the absolute -- you couldn't get six miles out of town with only 30,000 of us trying to get out, not 8.4 million. Thirty-thousand, we had one road going in to town, and every lane on Pacific Coast Highway going out and it took six hours to go four miles to get to Crown Valley Parkway. We have firestorms every year that are deadly. They've come up to the doorstep of San Onofre. We cannot be waiting for a solution. (0325-12-3 [Magda, Marni])

Comment: I'd like to take a little show of hands, how many people have had to move from their homeland because of power environmental destruction? Four? Can I get a hand? Okay. We got one person over there. I'm going to raise my hand too. My family lived along the river valley in El Salvador. We got, basically, flooded out due to the damming of Rio Lempa, which is the biggest river in El Salvador. And my family and generations forward have not recovered from this. Imagine if tomorrow you heard the sirens and you had to leave. That's what 160,000 near Fukushima, within 12 miles, were standing, probably around 9 miles from Diablo as the crow flies, as radiation clouds fly. I loved surfing, so I watch the weather; I watch wind patterns. The prevailing winds tend to be 8 to 10 miles an hour from Diablo. That means you have an hour to leave as soon as the sirens go. And that means -- so we're right here is Los Osos Valley Road. It's the only place in the county that probably has consistent traffic, and my children go to school between Los Osos Valley Road and Higuera. I would not be able to pick them up within an hour if the sirens went off. How many people have had family, or themselves, had cancer? Raise the hands. Okay. What would you have done to prevent that? Would you give up, you know, some financial gain, some benefit, maybe possibly, a job? My father died of stomach cancer. I don't

wish that on anybody. I would have done anything to prevent that. Within an hour, all of us would probably have some kind of cancer. (0326-47-1 [Monge, Roberto])

Comment: Dry cask storage at Daiichi survived the number nine earthquake much better than reactors there and the fuel pool. The NRC assumes that surrounding populations will be successfully evacuated in the event of a fuel pool fire. After the Daiichi explosions, the U.S. advised any Americans within 50 miles to leave. The head of the Japan Atomic Energy Commission warned that if cooling pool number four collapsed, and that risk continues today, an evacuation of 10 million people within 250 kilometers might be required. If that were undertaken in Japan or, similarly, at Indian Point in New York or at Fermi 2 or at Davis-Besse or anywhere in the U.S., it would be impossible to achieve in a necessary timely manner. (0327-27-4 [Macks, Vic])

Comment: Furthermore, we would need an evacuation plan with routes, destinations, immediate notification, long-term housing facilities, competent medical care for radiation exposures, funding for large displaced populations, and full disclosure of the realtime radioactive release measurements. None of that is or has ever been available in the U.S. The de facto plan of the nuclear industry and the NRC for the public is shelter in place and suck it up. (0327-27-5 [Macks, Vic])

Comment: The city as the host community is the first responder to any incidents at the facility. The city is obligated to maintain the necessary police, fire, and other emergency personnel, equipment, and facilities to respond in a timely and meaningful fashion. The city is obligated under the NRC and the State of Minnesota regulations to provide reasonable assurance that it can meet the emergency preparedness plan for the Prairie Island Plant, and accompanying independent spent fuel storage systems. The city as a host community is the recipient of certain tax payments from Xcel Energy that are used to pay for a portion of the necessary public safety services required to satisfy the emergency preparedness plan. While I'm not going to go into the detail tonight about those taxes, suffice it to say that those have declined greatly over the years. In fact, since 1995 there has been a dramatic shift in the tax base from the power plant to other tax payers in the Red Wing community. (0328-2-2 [Rauterkus, Ralph])

Comment: First, regarding emergency preparedness, the NRC has chosen to not include that within the scope of the GEIS. The city believes that this is a mistake. The key factor in any environmental impact statement is to examine the ability to mitigate any potential release or harm that may arise from the activity that is being examined. One of the primary ways mitigation occurs is through emergency preparedness and the response in the event of any incident. The purpose of a response is not to only mitigate, but also to contain and perhaps prohibit any further damage from any release, or a threatened release. It should be noted that for any operation of an ISFSI, that there is requirement that there be in place an emergency response plan; yet, this is found nowhere within the GEIS. Instead, the GEIS simply relies upon the robust characteristics of the containment vessels themselves, whether that be a pool or dry cask storage. Without emergency preparedness, an analysis of mitigation and containment in the event of a release or escape from a containment vessel, the GEIS fails. It must be part of the GEIS in order to be a fair and complete evaluation to be provided. (0328-2-5 [Rauterkus, Ralph])

Comment: Could people be evacuated safely if there's a fire at a waste fuel pool? Past experience with comparatively minor accidents like Windscale, Three Mile Island, Chernobyl and Fukushima says no. But in order to maximize the externalization of radwaste costs, within just a couple of years of final reactor shutdown the NRC will not require evacuation planning. This is altogether unacceptable. (0348-9 [Agnew, David] [Roscoe, Lee])

Comment: As things are now, hot radioactive waste is stored in tanks that, should they lose their cooling water, would not be able to contain the resulting emissions of radiation. This would be disastrous in an area for which no credible evacuation plan has been (or, realistically, can be) devised. (0351-2 [Stein, Robert])

Comment: Could people be evacuated safely if there's a fire at a waste fuel pool? Past experience with comparatively minor accidents like Windscale, Three Mile Island, Chernobyl and Fukushima says no. But in order to maximize the externalization of radwaste costs, within just a couple of years of final reactor shutdown the NRC will not require evacuation planning. This is altogether unacceptable. (0352-9 [Roscoe, Lee])

Comment: Could people be evacuated safely if there's a fire at a waste fuel pool? Past experience with comparatively minor accidents like Windscale, Three Mile Island, Chernobyl and Fukushima says no. But in order to maximize the externalization of radwaste costs, within just a couple of years of final reactor shutdown the NRC will not require evacuation planning. This is altogether unacceptable. (0373-9 [O'Malley, Brian])

Comment: Densely populated regions near nuclear plants like Limerick, clearly cannot be evacuated safely: - For example: NRC knew before Limerick construction was completed that within 30 miles Limerick had over double the population density than could be evacuated safely. Now there are four times as many people. In 2011, PA Safety Officials informed NRC that the Infrastructure could not support safe evacuation. Nuclear utilities are allowed to store HLRW in pools for many decades after reactors permanently shut down, in order to defer the costs of dry cask storage as far off into the future as possible, despite the inherent risks -At the same time, NRC allows utilities, via exemptions from regulations, to do away with 10-mile radius emergency planning zones (EPZs) within as soon as 12 to 18 months post-reactor shutdown. This, despite the lingering risk of storing HLRW in pools at such shutdown reactor sites. -How can populations be evacuated, if EPZs have been dismantled?! (0377-6-3 [Cuthbert, Lewis])

Comment: Unfortunately, history shows us that early post event evacuations are the exception rather than the rule. It seems to be human nature for nuclear managers to attempt first to cover-up the incident and only later reluctantly agree to evacuation. No mention is made in the report of how an emergency evacuation would be carried out to avoid the radioactive hot spots in the contamination plumes. In Fukushima, for example, some people were actually evacuated from an area of lower radiation level to an area of higher radiation because there was a failure to monitor the plumes and coordinate the evacuation based on the monitoring data. (0410-10 [Nelson, Dennis])

Comment: Could people be evacuated safely if there's a fire at a waste fuel pool? Past experience with comparatively minor accidents like Windscale, Three Mile Island, Chernobyl and Fukushima says no. But in order to maximize the externalization of radwaste costs, within just a couple of years of final reactor shutdown you will not require evacuation planning. So anyone with a shred of commonsense can see that 'safe' and 'NRC radwaste plans' fit in one sentence no better than 'containment' and 'vent' do. (0419-9 [Agnew, David])

Comment: If Dai-ichi fuel cooling pool number 4 collapsed---that risk continues today---and evacuation of 10 million people within 250 kilometers was undertaken in Japan, or a similar large population evacuation was necessary at Indian Point in New York, Fermi 2 in Michigan, or anywhere else in the U.S., it would be impossible to achieve in a necessary timely manner. Furthermore, we would need an evacuation plan with routes, destinations, immediate notification, long term housing facilities, competent medical care for radiation exposures,

funding for large displaced populations and full disclosure of real time radioactive release measurements. None of that is or has ever been available anywhere in the U.S. The de facto plan of the nuclear industry and the NRC for the public is shelter in place and suck it up. (0552-2-12 [Macks, Vic])

Comment: Moreover, a 10 mile evacuation is inadequate and misleading. It hides or obfuscates the seriousness of the risk---effectively a denial of the risk level. (0552-2-5 [Macks, Vic])

Comment: Dry cast storage at Dai-ichi survived the number 9 earth quake, tsunami, loss of the electrical grid, and loss of back up diesel generators much better than the reactors themselves and their fuel pools. The NRC assumes that surrounding populations will be successfully evacuated in the event of a fuel pool fire. After the Dai-ichi explosions, the U.S. advised any Americans within 50 miles to leave: Statement by U.S. Ambassador John V. Roos on March 16, 2011: "The United States Nuclear Regulatory Commission (NRC), the Department of Energy and other technical experts in the U.S. Government have reviewed the scientific and technical information they have collected from assets in country, as well as what the Government of Japan has disseminated, in response to the deteriorating situation at the Fukushima Nuclear Power Plant. Consistent with the NRC guidelines that apply to such a situation in the United States, we are recommending, as a precaution, that American citizens who live within 50 miles (80 kilometers) of the Fukushima Nuclear Power Plant evacuate the area or to take shelter indoors if safe evacuation is not practical." <http://www.whitehouse.gov/issues/foreign-policy/japan-earthquake-tsunami>. (0552-2-9 [Macks, Vic])

Comment: • Further, PW showed in its 2.206 Enforcement Petitions that NRC/FEMA's findings of adequacy of the KLD Estimates systems for notifying the public are insufficient.³⁶ [footnote 36 text: Pilgrim Watch's 2.206 Petition To Modify, Suspend, Or Take Any Other Action To The Operating License Of Pilgrim Station Until The NRC Can Assure Emergency Preparedness Plans Are In Place To Provide Reasonable Assurance Public Health & Safety Are Protected In The Event Of A Radiological Emergency (August 30 2013) and Amendment And Supplement To Pilgrim Watch's 2.206 Petition To Modify, Suspend, Or Take Any Other Action To The Operating License Of Pilgrim Station Until The NRC Can Assure Emergency Preparedness Plans Are In Place To Provide Reasonable Assurance Public Health & Safety Are Protected In The Event Of A Radiological Emergency (Nov 22, 2013)] So that even before emergency planning is officially ended, reasonable assurance is not provided. (0556-5-4 [Lampert, Mary])

Comment: There needs to be an open air policy warning the public if/when a nuke accident occurs, along with preventative measures and medications to be taken. (0623-2 [Individual, Anonymous])

Comment: Through further exemptions from regulations the NRC allows utilities to eliminate the 10-mile radius emergency planning zones (EPZs) required for each facility within as little as 12 to 18 months after a reactor is shutdown. As noted above, this clearly ignores the risk of storing HLRW in pools at such shutdown reactor sites. APV has spoken out publicly in the past about the need, not only to enforce the EPZs, but to expand them to a 50 mile radius. We are concerned for populations who may be largely ignorant of the risks or unaware that the EPZs have been dismantled. And of course such problems are only magnified as we move centuries and millennia into the future. (0648-12 [Price, Scott])

Comment: That the NRC doesn't have its own version of a SWAT team, which should be fully funded by the industry it serves, is really what is missing, imho, in the Nuclear Waste Confidence Arsenal. The containment of nuclear disaster is still a thing of guessing, hoping and praying. To still have this kind of questionable response to disasters that can alter the entire eco-system of the earth, well, you really see the point of those calling for a complete shutdown of this industry. I can say that as a mother, I do echo those conservative views. (We've got scores of natural disaster teams and several of them should be cross-trained and, oh, yeah, that's probably already being done we just haven't seen the reality tv show yet!) (0703-3 [Vandel, Nikohl] [Vandenberg Clermont, Elaine])

Comment: The incredibly ill-suited location of Indian Point makes emergency evacuation all but impossible. As stated by a director of the NRC over 30 years ago: "it is insane to have a three- unit reactor on the Hudson River in Westchester County, 40 miles from Times Square, 20 miles from the Bronx... [Indian Point is] one of the most inappropriate sites in existence."¹¹ [footnote 11 text: *Report of the Office of the Chief Counsel on Emergency Preparedness to the President's Commission on the Accident at Three Mile Island*, October 31, 1979, p. 5.] The high surrounding population around the facility results in significant traffic congestion that would prevent authorities from evacuating the residents living within the artificially small ten- mile Emergency Planning Zone ("EPZ") (let alone the residents beyond that zone) in the event of an emergency. Roads and bridges would not be able to handle the amount of traffic leaving the 10-mile radius and beyond in an emergency situation.¹² [footnote 12 text: See, e.g., Randi Weiner & Steve Lieberman, *Multiple Accidents Close Tappan Zee, Snarl Traffic for Hours*, The Journal News, July 28, 2007 (reporting two accidents—one on each side of the Tappan Zee Bridge, and a raft of fender-benders that blocked breakdown lanes and hindered commuters for hours).] According to an independent analysis of Indian Point's emergency plans commissioned by former New York Governor George Pataki in 2003 and authored by former FEMA director James Lee Witt, the radiological emergency plan for Indian Point is badly flawed, unworkable and key components are unfixable. Witt found that "the current radiological response system and capabilities are not adequate to ... protect the people from an unacceptable dose of radiation in the event of a release from Indian Point."¹³ [footnote 13 text: Review of Emergency Preparedness of Areas Adjacent to Indian Point and Millstone, p. viii, James Lee Witt Associates, 2003, *accessible at*, <http://www.riverkeeper.org/about-us/publications/reports/>, under the "Indian Point Reports" toggle (last accessed Dec. 20, 2013).] On October 8, 2013 a panel of nuclear experts, including the former chairman of the NRC, Gregory Jaczko, confirmed that alleged emergency plans at Indian Point are not designed to protect the public from unhealthy doses of radiation and that it would be best if the plant closes down.¹⁴ [footnote 14 text: See Jim Polson & Peter Ward, Indian Point Nuclear Plant Should be Shut, Jaczko Says, Bloomberg News (Oct. 8, 2013), *available at*, <http://www.bloomberg.com/news/2013-10-08/indian-point-nuclear-plant-should-be-shut-jaczkosays.html> (last visited Oct. 28, 2013).] Thus, the absence of a workable emergency evacuation plan puts the public around the plant at immense risk in the event of an emergency.] (0710-3 [Brancato, Deborah] [Musegaas, Philip])

Comment: As an adult I am only too aware of how inadequate our safety preparations for possible nuclear events, such as the ongoing one which continues from Fukushima Japan. (0733-1 [Vanderlan, Kelly])

Comment: •It would be impossible to evacuate the millions of people living near California's waste. Of the 34 million people in California, over 8.5 million are within 50 miles of San Onofre. (0764-5 [Gilmore, Donna])

Comment: On page 2-14, lines 25-28, the Draft GEIS should indicate, in some fashion, that there are certain minimum requirements associated with storage. This should include statements regarding emergency preparedness and a specific analysis of the same. (0783-2-16 [Harlan, Thomas])

Comment: Under section 4.18, starting on page 4-67 and carrying over to page 4-83, there is an analysis of the environmental impacts and postulated accidents. On page 4-68, lines 1-9, there are discussions of "additional measures ... designed to mitigate the consequences of failures in the first line of defense." The discussion goes on to reference emergency preparedness plans and protective action measures. And that is it. There is no further analysis. In order to meet NEPA requirements, the emergency preparedness plans and other proactive measures must be more fully discussed and explored. These are, as acknowledged in the Draft GEIS, the mitigating measures used in a failure of the containment vessel. (0783-3-8 [Harlan, Thomas])

Comment: I was a Councilman when the plant was licensed and have spoken publicly at many FEMA hearings about the impossibility of evacuating the population of San Clemente and the surrounding communities within the 10 mile radius and it is unbelievable to think of evacuating a 50 mile radius as was requested after the Fukushima disaster. (0785-1 [Korsen, Alan])

Comment: Since the evacuation plan for SONGS was erroneously approved by FEMA in the early 1980's until today no new evacuation routes have been made available, no plan to adequately evacuate the students has been formulated, a major railroad line and highway that links two major cities of Los Angeles and San Diego still run immediately adjacent to the plant. The plant is still in an earthquake zone and stands on a bluff that is susceptible to Tsunamis. (0785-3 [Korsen, Alan])

Comment: Referring to the NRC's website entitled "Spent Fuel Storage in Pools and Dry Casks Key Points and Questions & Answers" located at <http://www.nrc.gov/waste/spent-fuel-storage/faqs.html#26>, the last question regarding emergency planning of plants undergoing the decommissioning process states that: "Offsite emergency planning may be eliminated when the fuel has been removed from the reactor and placed in the spent fuel pool, and sufficient time has elapsed, such that there are no longer any *postulated accidents* that would result in offsite dose consequences large enough to require offsite emergency planning." Regarding the above NRC statement, the NRC needs to include the *postulated accident* of a successful terrorist aircraft attack on the spent fuel pool and its contents being exposed to air due to sufficient aircraft impact and the resulting explosive fireball being forceful enough to excavate sufficient cooling water out of the spent fuel pool to initiate a zirconium cladding fire of the pools contents. With this scenario in mind, the radioactive contents of the spent fuel pool do not significantly reduce over time to a level where offsite dose consequences would be so small that offsite emergency planning could be eliminated. Given the equality of a spent fuel pool fire to a severe nuclear reactor fire (as stated above and in NUREG-2157 section F.2.2) and the numerically indeterminable probability of a successful terrorist attack on a spent fuel pool (stated in Paragraph 4.19.1 of Draft NUREG-2157), it would seem unlikely that there would ever be a time that offsite emergency planning could be eliminated until the spent fuel pools were entirely emptied. There can be no sense of confidence in the NRC's waste storage plan when offsite emergency planning is eliminated before all the spent fuel is removed from the spent fuel pools. The NRC needs to level with the public and state that there are several postulated accidents that make dry cask storage systems more robust and safer than spent fuel pools. Tsunami, earthquake and a successful terrorist aircraft attack are three examples of such postulated accidents that could result in a spent fuel pool fire. Once the NRC accepts the above statement

and steps are taken to expedite the transfer of all the spent fuel from pools to casks before elimination of offsite emergency planning the beginning of a sense of confidence regarding spent fuel could emerge. (0826-22 [Morgal, Rick])

Comment: In a post Fukushima era, the "local community" is now considered to be a 50 mile radius which places over EIGHT MILLION PEOPLE within San Onofre's "local community". (0826-8 [Morgal, Rick])

Comment: Approximately 111- 120 million people, about 40 percent of all the Americans, live within 50 miles of a nuclear plant in the US. Policies which rely on temporarily storing waste in spent fuel pools anywhere near populated areas, are reckless. Population evacuation in response to a serious reactor or spent fuel pool accident is a wishful fantasy. (0840-11 [Taylor, Tom])

Comment: We do not have any evacuation plan from San Onofre site. 10 miles is not enough. We have to learn from Fukushima. Tokyo is 150 miles away from Fukushima Daiichi plant generator, but there are so many hot spots. If something is happen, we could lose much of California. (0850-1 [Bay, Miki])

Comment: On page 2-5, citing Decommissioning GEIS, the process of "storing spent fuel" is described as a delaying up to 60 years. This is an on-going threat to the sacrifice land as well as to the community of a standard 50 mile evacuation zone from Palisades-in which Grand Rapids [my family's homes] suburbs are included, but not the city itself. DOES THAT MEAN WE ARE SAFE IN AN EMERGENCY??? WHERE AND HOW DO WE ACQUIRE THAT INFORMATION??? [it used to be in the telephone book}. (0910-10 [Carey, Corinne])

Comment: NRC's statement, at line 21-22, that "A licensee will also maintain an emergency response plan for ISFSI-related events," is a significant admission that ISFSI emergencies are indeed possible. Whether or not the emergency response plan is adequate is a significant question. And Dominion Nuclear has requested an exemption from NRC, as of June 2013, that it not be required to have any Emergency Planning Zone requirements in place - even though its pool is still full. So any claims by NRC that emergency preparedness will remain in place for dry casks is suspect - as it appears poised to relieve Kewaunee of any such requirement re: its pool! (0919-4-1 [Kamps, Kevin])

45. Editorial Comments on the *Federal Register* Notice

Comment: Rule Package, FR 56779, first column towards bottom. In the discussion of the law suits that led to the 2010 waste confidence rule remand, discussion should be added that describes NRC's illegal actions terminating the Yucca Mountain licensing process. NRC is currently under a writ of mandamus to restart the licensing process and has announced it will complete the Yucca Mountain Safety Evaluation Report. (0544-15 [Enriquez, Elizabeth])

Comment: Rule Package, FR 56791, middle column towards bottom. The accurate, but incomplete, statement is made, "The NRC's review [Yucca Mountain license application] did not identify any issues that would challenge the feasibility of geological disposal." A statement should be added that the Yucca Mountain license application and NRC staff review of that application have shown a safe repository to be technically feasible. (0544-16 [Enriquez, Elizabeth])

Comment: GEIS, Section ES.19, p. Ixii. It's difficult to understand how the NRC unilateral action to terminate the Yucca Mountain licensing process, that led to the lawsuits resulting in the

remand of the 2010 waste confidence rule, would not be included as an area of controversy. At the time of the draft GEIS, it was the subject of ongoing litigation, and subsequently the court has issued a writ of mandamus to NRC that it must restart the Yucca Mountain licensing process. (0544-21 [Enriquez, Elizabeth])

Comment: In the interest of openness and transparency, the final rulemaking package and GEIS should recognize the fact that the Court of Appeals for the DC Circuit has now ruled that the unilateral actions directed by the former NRC chairman to suspend the Yucca Mountain licensing process were illegal. A writ of mandamus has been issued ordering NRC to restart the licensing process; and NRC has publicly stated it intends to complete and release the final Yucca Mountain Safety Evaluation Report. (0544-8 [Enriquez, Elizabeth])

Comment: In addition to the scenarios evaluated and analyzed, the final rulemaking package should recognize that completion and operation of a Yucca Mountain repository continues to be required by the NWPA. (0544-9 [Enriquez, Elizabeth])

Comment: Plain Writing: The actual proposed changes/amendments to the Rule text (10 CFR Part 51) -- as stated on 78 FR 56804 -56805, PART 51, Blocks 1 - 6 -- belong on 78 FR 56776 immediately preceding the SUPPLEMENTARY INFORMATION section of the document. The present organizing order is unclear, ineffective and confusing because, ordinarily, supplementary information is intentionally and appropriately placed BEHIND (after) essential information, not in front of (before) it. Furthermore, the lack of clarity and efficiency is exacerbated by the omission on 78 FR 56776 of any indication of page number for locating the actual proposed changes/amendments to the Rule text. Note that the Table of Contents (78 FR 56776 - 56777) is only applicable to the SUPPLEMENTARY INFORMATION section of the document. Draft Generic Environmental Impact Statement (DGEIS): Pertinent comments exist throughout this document. CITATIONS: 1) 78 FR 56783, SUPPLEMENTARY INFORMATION: Section III, Discussion, A21 -- What should I consider as I prepare to submit my comments to the NRC? 2) 78 FR 56799, SUPPLEMENTARY INFORMATION: Section IV -- Additional Issues for Public Comment, Issues 1 - 4. 3) 78 FR 56803, SUPPLEMENTARY INFORMATION: Section VIII -- Plain Writing. 4) 78 FR 56803, SUPPLEMENTARY INFORMATION: Section X -- Draft Environmental Impact Statement: Availability. (0603-20 [Schonberger, David])

Comment: As the NRC stated in the draft GEIS, the purpose of the document is to prepare a single document that reflects the NRC's current understanding of these environmental impacts. We suggest that the final GEIS include a discussion of the current status of the Yucca Mountain project (which remains the official geologic repository under the NWPA) and the political realities of licensing a national repository. As a host community for the PIN GP ISFSI, our Tribe has grown tired of relying on the NRC's wishful thinking. (0619-1-13 [Mahowald, Philip R.])

Comment: The draft FRN for the final rule currently states that, "(T)he analysis in the GEIS provides a regulatory basis for the final rule." ² [footnote 2 text: Fed. Reg. 56780, Sept 13, 2013, AI.] We believe that this statement should be clarified to convey that the NRC envisions that Transfer Systems and ISFSIs would require rebuilding at some point either at reactors or away from reactors and that 100 years is being used as a reasonable analytical surrogate while research continues. This will also improve the validity of the statement, "(T)he analyses in the GEIS are based on current technology and regulation."³ [footnote 3 text: Fed. Reg. 56788, Sept. 13, 2013, 89.] (0637-9 [Norton, Wayne])

Comment: The above definitions [of "confidence" and "spent"] are language standards, the opposite from NRC uses, deliberately misleading and therefore unacceptable and revealing of NRC policies and principles. (0910-3 [Carey, Corinne])

Comment: My Comment: In all NRC language, use standard language definitions, not twists. (0910-4 [Carey, Corinne])

46. Editorial Comments on the GEIS

Comment: GEIS Section 1.8.1, p. 1-15, lines 6-15 and footnote. Footnote 2 on pages 1-14 and 1-15 is a good addition to the review draft of the GEIS. The discussion regarding the no-action alternative in the Yucca Mountain Final EIS (about halfway down the second page of the footnote on p. 1-15), however, has some factual errors. First, the reference should be to the Final EIS (2002) versus the 2008 reference. The 2008 document is the Supplemental EIS and has no new no-action analysis except the update to dose conversion factors to estimate latent cancer fatalities. The FEIS (DOE 2002) is incorporated by reference in the Supplemental EIS. (0544-25 [Enriquez, Elizabeth])

Comment: TVA identified a few additional changes that should be made to the DGEIS to accurately reflect TVA's plants: •DGEIS Table G-1 ("Capacity of Spent Fuel Pools for Operating Nuclear Power Reactors") should be revised to list Sequoyah as a site with a shared SFP.¹⁴⁸ [footnote 148 text: DGEIS at G-6.] •DGEIS Table G-1 should be revised to list WBN as a site with a shared SFP.¹⁴⁹ [footnote 149 text: *Id.* at G-7.] •DGEIS Table G-4 ("ISFSIs with General Licenses under Part 72") should be revised to change the System Design for Sequoyah from "HI-STORM 10" to "HI-STORM 100S."¹⁵⁰ [footnote 150 text: *Id.* at G-10.] (0694-3-22 [Shea, Joseph])

Comment: There appears to be a typographical error on page F-2 of the DGEIS. The reference to "radioactive heat transfer" should be either "radiation" or "radiative" heat transfer. (0697-3-3 [Bessette, Paul] [Kuyler, Raphael])

Comment: Under section 3.3, page 3-10, lines 31-37, the Draft GEIS should be amended to reference that the PINGP is located within the City [Red Wing, MN] limits. (0783-2-22 [Harlan, Thomas])

Comment: [GEIS Section...4-3:] On GEIS 4-11, line 27, the 15-85 should be 20-85 to be consistent with Section 4.2.1. (0827-7-18 [Ginsberg, Ellen])

Comment: Page 1-22 Lines 1-3 "The storage of spent fuel during the initial licensed term for operation of a nuclear reactor is considered within the site-specific EIS for either a 10 CFR Part 50 or 10 CFR Part 52 licensing review." I think this is again a problem of wording. Probably you mean during the license term prior to ceasing power operations, because the license persists for up to 60 years, and as I mentioned, SCE believes it cannot terminate the license until the ISFSI is decommissioned as well. (0836-37 [Davis, Anonymous])

Comment: Additionally, I refer to the Draft Report length and page numeration which disguises repetitious materials, again at disadvantage to standard public uses. (0910-13 [Carey, Corinne])

Comment: Also on Page 10-1 Index, etc, there are no definitions in standard usage of terms. (0910-14 [Carey, Corinne])

Comment: Even NRC's citation on Page 1-15 creates confusion. NRC cites DOE's "Final EIS for Yucca Mountain (DOE 2008)." But DOE's FEIS for Yucca is dated February 2002. Perhaps NRC is referring to a Supplement to the Yucca FEIS, of which there were a number? (0919-2-18 [Kamps, Kevin])

Comment: This NRC rush job may explain the large number of typos, grammar errors, and other mistakes in the DGEIS text, such as this one: Line 10, "...construction of a new ISFSI pads adjacent to, or nearby, the initial pads" (0919-4-15 [Kamps, Kevin])

Comment: At line 27, NRC wrote "underground" where it meant to write "underwater." (0919-5-19 [Kamps, Kevin])

Comment: On Page 2-14, line 6, NRC makes another spelling error: pernitevery. (0919-7-16 [Kamps, Kevin])

Comment: Page 1-22 Lines 1-3 "The storage of spent fuel during the initial licensed term for operation of a nuclear reactor is considered within the site-specific EIS for either a 10 CFR Part 50 or 10 CFR Part 52 licensing review." I think this is again a problem of wording. Probably you mean during the license term prior to ceasing power operations, because the license persists for up to 60 years, and as I mentioned, SCE believes it cannot terminate the license until the ISFSI is decommissioned as well. (0930-2-11 [Lutz, Ray])

47. Comments Concerning Opposition to Rule or GEIS

Comment: I therefore oppose the Impact Statement. (0021-3 [Biddle, Lynn])

Comment: [O]ne of the NRC officials mentioned a statement of no significance. This particular statement should never be considered in this case. (0030-12-9 [March, Leslie])

Comment: NIRS has obviously a lot of input to provide on the Waste Confidence rule. NIRS has been one of the primary nuclear watchdog groups in the U.S. for the last 35 years. We've seen the evolution of this regulation throughout that time and we believe obviously that the Waste Confidence rule should be withdrawn and want to provide our thoughts on that. (0030-17-1 [Judson, Tim])

Comment: [NIRS] want to address, you know, really the proposed action, which is to essentially re-institute the Waste Confidence rule. And, you know, we believe that this regulation is completely out of date and out of touch with reality, and this is, you know, with no disrespect to the work of the NRC staff that have prepared these documents and the Federal Register notices of the proposed action. (0030-17-2 [Judson, Tim])

Comment: And in fact the very basis, the very underpinning for having a Waste Confidence rule has essentially been invalidated, you know, by reality at this point. I mean the very term "waste confidence" is based on a notion that the NRC is confident that nuclear waste has a solution. And there's really no policy basis or factual basis for that as a matter for streamlining the licensing process of nuclear reactors in this country at this point. (0030-17-4 [Judson, Tim])

Comment: It's amazing that a 20 yr contract is given for radioactive material removal, when there has been established NO QUALITY SPECIFIC PLAN OF PROTECTION ! How crazy, lazy and incompetent can this be? (0036-1 [Maier, Marie])

Comment: Fortunately the courts are now requiring the NRC to have a moratorium on licensing until they do an environmental impact statement on the radioactive waste. Now we have a chance to protect the river by demanding that the waste be stored safely. The Nuclear Regulatory Commission is now developing new rules for the long-term storage of highly radioactive waste from the nation's nuclear reactors. These rules will determine whether or not your state becomes a transportation route for thousands of shipments of highly radioactive waste on super-trucks, or a storage site for some or all of the 70,000 tons of radioactive waste. The federal government is now taking public comments on these rules: please tell the NRC to enact strong rules to protect our communities and environment. We have a very unique opportunity to have a say in how our country handles radioactive waste from nuclear reactors in the future. If we don't step up and comment, we will have lost our ability to protect our grandchildren, and many generations to come, from the deadly dangers of radiation. Let the NRC know that we are not confident with the current way they have regulated radioactive waste they need to do more. Thank you for everything you do for the environment. (0039-3 [Littlejohn, Nick])

Comment: The waste confidence, I shuddered when I heard that word, confidence, waste confidence, it sounds like a con game. It sounds like what you're trying to do is create some kind of techno legalese babble to get around the Court trying to enforce the protections that we put in place by law to protect us from nuclear dangers. (0045-12-2 [Kinsey, Bob])

Comment: It's feasible, yes, it's technically feasible just like, you know, you can, it's feasible to write a way around the ruling of the Court, but it won't happen. It's, what is this? A way to grease the so-called nuclear renaissance so that the nuclear industry can move ahead and build more nuclear plants and create the whole fuel cycle that endangers the planet. And as a clergy man I have to say it's immoral to do that, to take those kinds of risks. If I were a medical person I would say that the precautionary principle says why take the risk? Why reduce the cost? Why reduce the cost to license nuclear plants and not include the costs that it will take to in any way responsibly handle the waste? (0045-12-8 [Kinsey, Bob])

Comment: I don't have any confidence that that can be done politically or humanly in a capitalist system that will bend all kinds of corners to make a buck rather than be responsible if they can get away with it. There's no way that you can create waste confidence in my mind given the long-term dangers of nuclear waste. (0045-12-9 [Kinsey, Bob])

Comment: I appear today, to comment on the Draft GEIS on Waste Confidence. I reviewed the document, and will continue to do more in-depth analysis of it, and while I'm grateful that the courts mandated this process, I find that the NRC response to that mandate is not only insufficient in many technical areas, but lacks in honesty and integrity. (0045-6-2 [Andrews, Richard])

Comment: The Draft GEIS simply fails to address the realities of the dangers of spent nuclear fuel. In fact, throughout the document, it continually denies the dangers of inherent catastrophic consequences at any of the many causes of potential system failures. Failing to even legitimately describe those consequences. (0045-6-4 [Andrews, Richard])

Comment: But the nicer the waste confidence looks, the more the industry feels comfortable in creating more nuclear waste, which again, if I wasn't able to recycle plastic at my house, if it just turned up in a bin in the backyard for the animals to choke on and to fill up my yard over time, we would stop using the plastic and start looking for something else to use instead. (0045-8-5 [Bartlett, Bill])

Comment: I am very troubled by the NRC DWC GEIS statement's lack of agreement with, or even acknowledgement of, certain basic scientific facts and established theories, as well as other major mistakes. They include: (0052-1 [Tietjen, Jamie])

Comment: The breadth of these failures in this DWC GEIS suggest many questions about the NRC of its competency and corruption. (0052-4 [Tietjen, Jamie])

Comment: The Draft GEIS is nothing more than distraction, denial and deception. It should be withdrawn and totally redirected using reality as a guide toward a sane and safe future. (0059-16 [Andrews, Richard])

Comment: I appear today to comment on the draft GEIS on waste confidence. I have reviewed the document and while grateful that the courts have mandated this process, find that the NRC response to that mandate is not only insufficient in many technical areas but lacks in honesty and integrity. (0059-2 [Andrews, Richard])

Comment: The DGEIS simply fails to address reality of the dangers of SNF, in fact throughout the document continually denies the dangers of inherent catastrophic consequences from any of many potential causes for system failures, failing to even legitimately describe consequences. (0059-4 [Andrews, Richard])

Comment: When NRC ignores actual experience while relying on theoretical and wishful probabilities, we the people can have NO CONFIDENCE in their regulations. (0089-2 [Shaw, Sally])

Comment: Many of us already have no confidence in the NRC. (We don't know how many of their policies are colored by this kind of money.) Nor do we believe anyone can have "confidence" in so-called solutions that allow for waivers, or for the continued production, and storage, of nuclear substances in our midst. (0102-4 [Woodward, Julie])

Comment: I have no confidence. The State of Vermont has no confidence. The New England region doesn't have any confidence. And if you put it out there to the regular people all around this country, there's not a lot of confidence to be had with such a foolish plan. (0112-15-5 [Williams, Chris])

Comment: When the NRC ignores actual experience while relying on theoretical and wishful probabilities, we, the people, have no confidence in their regulations. (0112-18-3 [Shaw, Sally])

Comment: [W]e do not support the GEIS that is one of the two major supporting documents on which the NRC relies, frankly because it is not site-specific, and that the rationale for it is that they want to achieve efficiency. I would suggest that the proper rationale is let's achieve the public health and safety in a way that is reasonable and beyond inexpensive. (0112-2-5 [Lampert, Jim])

Comment: And I have no confidence in what you are doing with the GEIS and I would like to, but I do not. (0112-24-6 [Darling, Ann])

Comment: The Waste Confidence is a sham. Everybody knows it's a continuation of the sham that began with the Atomic Energy Commission back in the 50s which told us that they were going to care for the wastes from cradle to grave. And now here we are today, everybody's got their hands on their head saying what are we going to do with this waste? (0112-34-1 [Chichester, Ben])

Comment: And there is not one ounce of the waste that has been permanently disposed since it has been produced in secret outside of any democratic process by corporations in this country who are still designing and exporting this dangerous technology. And three of them are burning holes to China as we speak, out of control. And you're here today to ask us to have confidence, which was a ploy so that you continue the juggling act that you've been doing for all these years with the nuclear waste. It is a ploy and it has to stop because the people are onto it. (0112-34-2 [Chichester, Ben])

Comment: So you come up with the nifty phrases like interim storage and permanent disposal and below regulatory concern. All these clever phrases to mask what is really a crime against humanity to produce waste that will last for thousands of years to pass on to future generations. It's wrong. And it should be stopped. Stop the charade. Who profits? (0112-34-4 [Chichester, Ben])

Comment: There's no way to make sure it is permanently safe, okay. We need to take a lot of steps back and really think about the safest way to do this. (0112-35-4 [Boyes, Pam])

Comment: So, we do not have confidence in this process or in this GEIS and we think this is really what the NRC stands for, no confidence, no competence. (0112-5-11 [Bogen, Doug])

Comment: Oh, we want to approve the NRC's GEIS. We want to say it's fine. You guys, go ahead, you've got it all under control. We know that, we trust you because you're so open with us. (0112-8-4 [Sachs, Gary])

Comment: The claims made by the NRC in the new DGEIS are so flimsy and full of "wishful thinking" that they should be readily be rejected. It is beyond me how such an agency as the NRC could make such profoundly incomplete and potentially dangerous statements. (0130-1 [Cox, Bruce])

Comment: Yet the NRC plans to have a new rule in place inside of two years, by September 2014. To meet its tight deadline, the NRC plans to adopt a revised rule (10 CFR 51.23) based on a general study of the environmental impacts of continued high-level nuclear waste storage, a so-called generic environmental impact statement. Further, the new generic rule would state that environmental analyses for all future nuclear plants and nuclear fuel storage facilities would not need to consider the environmental impacts of continued storage at each specific site, this defies logic. Rather, the NRC should shut down all generators of nuclear waste until waste storage and environmental impacts are proven safe for as long as the waste remains a threat to our health and environment. The NRC's generic rule approach remains utterly inadequate to satisfy the requirements of the Atomic Energy Act and the National Environmental Policy Act. The Commission is abrogating its responsibility to allow the public to participate in decisions which affect them. A generic basis for nuclear power plant licensing, allowing the creation of more irradiated nuclear reactor fuel, should be accompanied by plant-specific safety and environmental impact studies at the nation's 65 reactor sites, not the one-size-fits-all generic approach now underway. For the above reasons, I respectfully request that the NRC reject the generic Environmental Impact Statement and the revised rule (10 CFR 51.23). (0144-3 [O'Nan, Margaret S.])

Comment: The purpose of NRC's Waste Confidence rule is to streamline nuclear plant licensing by ignoring the million-year, multi-billion dollar problem of what to do with radioactive waste. The only problem Waste Confidence solves is how to permit nuclear plants to continue making this waste when there is no solution for it. (0147-2 [Fallon, Gloria])

Comment: [T]he Draft EIS is significantly flawed. (0163-1-1 [Schneiderman, Eric])

Comment: As such, the Draft EIS fails to meet the requirements of the Circuit Court's ruling by making decisions based on an unsubstantiated hope that the waste will be gone by then. (0163-1-7 [Schneiderman, Eric])

Comment: Attorney General Schneiderman led the successful challenge to the temporary storage rule because he believes that communities that serve as De Facto long-term nuclear waste repositories deserve a full and detailed accounting of the environmental public health and safety risks. Unfortunately, he believes that the Waste Confidence Draft EIS, as presented, fails to provide such a full and detailed accounting, and therefore, fails our communities. Attorney General Schneiderman looks forward to the Commission addressing the Draft's deficiencies in this ongoing rulemaking process and expresses his appreciation to the NRC for the opportunity to comment on the Draft EIS and looks forward to submitting additional written comments during the comment period. (0163-1-8 [Schneiderman, Eric])

Comment: The report itself is really rather absurd honestly. 200 years -- what, 100 years in the short term, other than -- there's a little kid over there -- I don't mean to embarrass you, he'll still be alive, the rest of us won't be. (0163-12-1 [Lee, Michelle])

Comment: So Ms. Jaffee says that GEIS, DEIS, EIS, FEIS, this is the fourth environmental study I've been involved with this year, and I'm alarmed at how Environmental Impact Statements increasingly bend toward industry and away from the public good...And I appreciate and respect the work of the NRC. I do believe there is a level of arrogance and to put this in common parlance, we need more Leonard and a little less Sheldon....That's a Big Bang reference from the Assemblywoman's favorite program. (0163-13-1 [Jaffee, Ellen])

Comment: As I understand it, the NRC is charged with the oversight, not the defense of the nuclear industry, and with all due respect, the GEIS seems to be a huge attempt at legitimizing the continued production of irradiated waste for which we have no true solution. You can monitor, matrix, and massage the facts, but it's all a con, and we need to stop making the waste now. So perhaps a more suitable name for the report is the Waste Con or How to Waste the Confidence of the American People. So, I'm not an engineer and -- but I am a special ed teacher -- sometimes I have to put things in simplistic terms for myself, as well as my students, so here is an analogy. (0163-15-4 [Garner-Ritter, Maureen])

Comment: [W]e're [RiverKeeper] going to go into a lot of detail about why and how we think this generic EIS is both legally and factually completely deficient and why the NRC has to go back to the drawing board and do this over. (0163-2-1 [Musegaas, Philip])

Comment: So I have zero confidence in any kind of policy and rulemaking that doesn't think about women, mothers, young people, kids, you know, people of color. (0163-31-3 [Tonohira, Yuko])

Comment: And I'm speaking also as a New Yorker who is deeply concerned about the con job that seems to be going on here. I have absolutely no confidence in this Waste Confidence Rule nor in this Generic Environmental -- the GEIS Plan. (0163-33-1 [Geist, Sheila])

Comment: This reveals the true nature of the Waste Confidence Rule. It's not about confidence in an existing plan. It's about confidence that if reactors are allowed to continue to create dangerous waste, future humans will, out of necessity, take on the responsibility for

dealing with that waste to the best of our ability precisely because it's so dangerous. Basically, this is a policy of spew it, and they will have no choice but to deal with it. (0163-34-10 [Azulay, Jessica])

Comment: And now the NRC has crafted this superficial new document to justify the same old policy. This is a policy that deprives people like me from the ability to challenge the continued production of radioactive waste at reactors near where we live even when we can clearly see there is still no actual plan for storing it or removing it. (0163-34-3 [Azulay, Jessica])

Comment: I imagine they won't be amused by the rosy predictions in this Generic Environmental Impact Statement just as I am not amused by the prediction from 1979 that a centralized repository would be ready around 2009. (0163-34-7 [Azulay, Jessica])

Comment: The previous Waste Confidence was a house of cards built on a foundation of wishful thinking and it's clear that everybody here or majority of the people here are saying we don't want another wishful thinking document. That the only function that this Waste Confidence decision seems to be providing is aid and comfort to the industry to continue business as usual. (0163-36-1 [Brown, Jeffrey])

Comment: Many of us already have no confidence in the NRC. It's been said tonight. We don't know how many of their policies are colored by this kind of money, nor do we believe anyone can have confidence in any so-called solutions that allow for waivers or for the continued production and storage of nuclear substances. (0163-37-4 [Woodward, Julie])

Comment: The process by which the risks are being evaluated are unacceptable and I would ask the NRC most respectfully to reject -- answer the two questions in the negative. I don't think we have shown that the safely -- we can safely store spent nuclear fuel for the -- after the operational life of the reactor. And I don't think we're going to have an answer in 60 years. (0163-42-3 [Fry, Mark])

Comment: This GEIS, the flaws in this GEIS make this clear that there are conflict-of-interest issues. No matter how much detail goes into these designs, there will be unforeseeable circumstances in the future that future generations will have to bear. With all due respect, the engineers who have made these assumptions in the GEIS should be ashamed of themselves. These are real people lives that we're talking about. (0163-48-6 [Meyer, Bill])

Comment: So on top of that, the, as has been stated by other people, this GEIS is fatally flawed for a variety of reasons. (0163-7-2 [Shapiro, Susan])

Comment: First of all, there is no solution to the problem of nuclear waste. The Waste Confidence Rule amounts just to "Trust us." My third point is that it ignores the problems with waste, the leaks, the fires, the security issues and the other items that other people have testified about and will testify further this evening. The Waste Confidence Rule deals with waste, which is a major environmental issue, not a public relations issue. (0163-9-2 [Gerard, Daniele])

Comment: Nuclear Waste Confidence is bull. How can you really think this will work? Not only money, war, and environmental issues are affected but people! (0166-1 [Ryan, Kate])

Comment: "Nuclear Waste Confidence" is false. We cannot allow more radioactive releases into the environment. Please stop allowing more waste. Prevention is also a Solution! (0170-1 [Morgan, Leona])

Comment: I am against the "Nuclear Waste Confidence." I am deeply concerned with the creation of this waste and do not want any more nuclear waste on our planet! (0172-1 [Drotar, Laura])

Comment: We, members of Environmentalists Inc. (EI) and Women's International League for Peace and Freedom (WILPF), support the statements made by those who object to the Nuclear Regulatory Commission (NRC)'s conclusion that spent nuclear fuel can be stored safely above ground forever. (0174-1 [Thomas, Ellen] [Thomas, Ruth])

Comment: Attorneys and their consultants (some of whom brought the lawsuit against the NRC) call attention to what is wrong with the NRC Draft Waste Confidence Generic Environmental Impact Statement (DWCG EIS) and back up their criticism with numerous examples of failing to comply with federal laws, faulty decision-making practices, and poor operating histories. The Waste Confidence Decision approved by the NRC Commissioner leaves out repository disposal as a part of the waste confidence decision. Furthermore, this policy prevents intervenors from raising questions about the effects of continuing to produce spent nuclear fuel without a repository. (0174-5 [Thomas, Ellen] [Thomas, Ruth])

Comment: The NRC fails to abide by the intent, language, and provisions of the Atomic Energy Act (AEA) and the National Environmental Policy Act (NEPA). (0174-8 [Thomas, Ellen] [Thomas, Ruth])

Comment: I have zero confidence in the Nuclear Regulatory Commission to address the risks of nuclear waste disposal near my home here on the NC/SC border! (0175-1 [Arnason, Deb])

Comment: I am a biologist, a writer, and an activist for clean, safe, renewable energy. I was excited momentarily when I heard that the NRC had been ordered to set aside its "Waste Confidence" policy and assess the environmental impacts of nuclear waste. But after reading about the draft of your new policy, my excitement has waned. I'm a realist. I've spoken at a lot of energy hearings, and one thing I've learned is that government agencies and commissions that are supposed to be protecting the public are generally controlled by the corporations they're supposed to be regulating. Along those lines, the NRC has the reputation of looking out for the interests of the nuclear industry. Reading about your current proposal confirms to me that your goal is to ensure the future of nuclear energy, an industry that should have no future. I see no hint that you have any intention of trying to protect the public, now or in the future. What makes me think that? - Your claim that spent fuel can be managed at reactor sites or other above-ground storage facilities forever; - Your failure to address the vulnerability of these spent fuel pools to catastrophic fire caused by an attack; - Your declaration that the impacts of pool leaks will be insignificant; - Your plan to transfer radioactive spent fuel to new storage casks every 100 years - forever. These and many more absurdities are based on the assumption that government institutions will function safely for hundreds of years, an assertion that is inconsistent with human history and the NRC's own regulations. Your policy is also inconsistent with the mandate of the NWPA that above-ground storage is acceptable only on an interim basis. I'm asking you to behave as though you actually are acting on behalf of public safety, and stop protecting corporations that are profiting from nuclear energy. I'm asking you to behave as though we still have a government that serves people not corporations. You still have some power to make that a reality, in perhaps the most dangerous industry there is. (0185-1 [Kneidel, Sally])

Comment: Abandon the NRC Radioactive Waste Policy to assure safety. There is NO confidence in it. Abandon it, please! (0193-1 [Doyle, Rosemary])

Comment: I REJECT the U.S. Nuclear Regulatory Commission's (USNRC's) high-level radioactive waste confidence Draft Generic Environmental Impact Statement (DGEIS). In fact, the USNRC should WITHDRAW IT--AND DO A COMPLETE REVISION. In other words, I HAVE ABSOLUTELY NO CONFIDENCE IN THE USNRC'S "SO-CALLED 'WASTE CONFIDENCE!!'" (0196-1 [Nelson, Dennis R])

Comment: A generic address of spent nuclear fuel storage is not acceptable considering the history and potential hazards that cannot be seen in future events. Neither should impacts on the environment be considered generic. Sensitive subjects such as these require specific and detailed rulings. (0202-1 [Hill, Jack])

Comment: 30+ years later, we are discussing the future of nuclear waste again and the mounting spent fuel rods. Your 'waste confidence' has been challenged by the courts and now, these years later, the NRC has an environmental impact study. I am not sure why this was not a precedent after the first or second or even third nuclear accident in these past 30+ years. Now, we have Fukushima, and we are told again to not worry. I really cannot understand how so much money can go into this industry without considering the unknown accidents and violations perpetrated within the Energy Sector itself. Your arrogance defies logic. How can the consumer and taxpayer justify an industry that we simply can not trust? (0204-3 [Stein, Tami])

Comment: I respect the difficult decision that the NRC has to make but overall, I oppose the passing of this rule. My comment discusses the potential negative effects of on-site nuclear waste storage, including environmental contamination and psychological stress on the public, the dubious future of a long-term national repository, and possible alternative actions the NRC may be interested in considering. (0205-1 [Lyons, Laura])

Comment: This rule, proposed by the Nuclear Regulatory Commission concerning nuclear waste storage, is attempting to change the wording of 10 CFR 51.23. It would alter the way the code discusses a potential long-term national repository and the environmental impacts of storage at nuclear waste reactors by including a generic environmental impact statement. Although it is beneficial to have an EIS for all reactors, as it will ease the licensing process, there are several problems with passing this rule. (0205-15 [Lyons, Laura])

Comment: For these reasons, I do not support this rule and feel that it should be reconsidered. (0205-18 [Lyons, Laura])

Comment: I oppose this proposed rule because I feel that the negative impacts of its passing would surpass the benefits. I suggest that the NRC reevaluate its options and present a new proposal. (0205-5 [Lyons, Laura])

Comment: We deserve a credible plan for nuclear waste storage! (0209-1 [Hughes, Kevin])

Comment: For reasons stated by the public, and safety advocates, NRC should REJECT the proposed Draft Generic Environmental Impact Statement, and Proposed Rulemaking, and start over, with a more rigorous, full-disclosure analysis of potential impacts, with a Site Specific Environmental Impact Statement for San Onofre's Storage of Nuclear Waste. It is with greatest apprehension that citizens in southern California call upon all NRC Commissioners to fully perform your duty, and take action in the PUBLIC INTEREST, and for short and long term public health and safety, not necessarily in Licensee's interest to protect their profit margin. (0218-10 [Borchmann, Patricia])

Comment: In 2012 New York's Attorney General Eric T. Schneiderman successfully led the legal challenge to NRC's Temporary Storage Rule, because he believed that 'communities that serve as de facto long-term nuclear waste repositories deserve a full and detailed accounting of the environmental, public health, and safety risks. In 2012, a federal circuit court agreed with Attorney General Schneiderman that federal law requires NRC to complete a thorough analysis of public health, safety and environmental hazards such storage would pose before allowing long-term storage of nuclear waste in communities. In reaching its decision, the circuit court found the spent nuclear fuel stored on-site at nuclear power plants "poses a dangerous, long-term health and environmental risk". Another important finding which NRC must recognize is the similarity between San Onofre (SONGS) and the 2012 case led by New York Attorney General Eric Schneiderman, where he faulted NRC for assuming, with no factual basis, that all nuclear waste will be removed from nation's nuclear power plants by 60 years after plants are closed. Since there is no available off-site storage location to store high-level nuclear waste from these facilities, the DGEIS fails to meet requirements of circuit court's ruling, by making decisions based on -unsubstantiated hope' that sufficient, licensed off-site radioactive waste storage capacity will be available to accept nuclear plant waste within 60 years. The same conditions exist here in southern California, where use of high burn-up fuel is also ignored. (0218-2 [Borchmann, Patricia])

Comment: It is my argument that not only should the storage of spent fuels not be perpetually stored at the existing nuclear energy facilities but the facilities once no longer in operation should in a short term (arbitrary) be reclaimed to near natural lands, free of hazardous material and available for future civilizations or other species without ill effect. (0219-11 [Olmstead, Stan])

Comment: I ask that the Nuclear Regulatory Commission rewrite the Draft Generic Environmental Impact Statement for Waste Confidence[.] (0219-12 [Olmstead, Stan])

Comment: My review of the NRC's DGEIS concludes: No Confidence in Waste management by the Commission. (0219-4 [Olmstead, Stan])

Comment: Instead of acknowledging the potentially catastrophic impacts of leaving spent fuel on the surface of the earth indefinitely, the NRC claims that no serious impacts will happen. In place of the previous assumption that a safe repository will be licensed, the NRC has substituted a new and even more absurd assumption -- that spent fuel can and will be safely managed at reactor sites and in other above-ground storage facilities for the indefinite future. This assumption is inconsistent with the Nuclear Waste Policy Act (NWPA); it violates NRC's own regulations and runs counter to common sense and the experience of human history. (0221-1 [Ferguson, Tom])

Comment: By eliminating repository disposal as part of the Waste Confidence Decision, and by protecting licensing decisions from intervenors who raise questions about the environmental effects of continuing to generate spent fuel without a repository, the NRC effectively would institutionalize extended spent fuel storage as a de facto means of spent fuel disposal. This result is inconsistent with Congress' policy in the NWPA, and completely unacceptable from an environmental standpoint. The Draft GEIS should be sent back to the drawing board and the proposed rule should be scuttled. (0221-3 [Ferguson, Tom])

Comment: If we have indeed the confidence and the technology to say that we are okay to go ahead with these projects, you know, I would suggest that we have a trial site, maybe a storage of these fuels maybe going for a couple years, and if you guys are really confident in your technologies, maybe it could be at your offices and then that way we could see the effects of

these, you know, nuclear waste on you guys, you know, and then we could really assess if this is a small cost or not instead of the small communities and population or low-income people who might be easily deceived by progress. (0244-15-11 [Zuccarini, Ana])

Comment: You know, long-term storage, there's not really like a specific time line. You know, just have a little more science with it would be my recommendation. (0244-15-12 [Zuccarini, Ana])

Comment: The proposed action of the draft GIS is to issue a rule that, if adopted, would not require consideration of the environmental impacts of continued onsite surface storage at individual reactor sites. This is absurd and unacceptable and it fails to address the circumstances at individual reactor locations. (0244-3-4 [Hancock, Mandy])

Comment: I am opposed to this rulemaking. It is an enormous waste of time, money, and resources. It must stop. The NRC should take no action to generically address the environmental impacts of continued storage. (0244-6-2 [Steorts, Tim])

Comment: I would just ask that the NRC -- I know it's tough, it's a tough ask, but to really start over and make a really more concerted effort to prepare a EIS that really examines all these impacts. (0244-8-5 [Totou, Jason])

Comment: We oppose the Nuclear Regulatory Commission's waste confidence draft GEIS and ask NRC to withdraw it for a thorough revision. We have no confidence in the NRC's lack of a plan in place. (0245-10-4 [Lewison, Linda])

Comment: In addition, the waste problem is further convoluted by NRC's proposal to include in reactor licenses their idea that spent fuel can be stored safely aboveground forever which would end any public discussion about permanent storage and creation of more waste since there is no problem. (0245-14-5 [Kurz, Carol])

Comment: We ask that the NRC withdraw its proposed DGEIS until the NRC provides substantial proof and scientific evidence of the safety of their conclusions. (0245-14-9 [Kurz, Carol])

Comment: It's important that they get it right, which is why they should be withdrawing this current plan and going back to the drawing board. (0245-19-11 [Smith, Ed])

Comment: The draft GEIS reinstitutes 'kick the can down the road' approach that has failed to address the magnitude of our nuclear waste problem and legacy. (0245-19-6 [Smith, Ed])

Comment: Putting the GEIS into effect after the operating life of a nuclear reactor is a sham and in no way a proper approach to spent fuel management. (0245-19-8 [Smith, Ed])

Comment: As a conclusion, the updated decision is not even a reality, when necessary it's science fiction or fantasy. The Commission hasn't performed a thorough and comprehensive analysis of the future dangers and consequences on the site, onsite storage 60 years after cessation, and offers only a retrospective - Yet, we all know that past performance is not necessarily indicative of future results. (0245-24-5 [Conn, Corey])

Comment: In a nutshell, I'll finish up, the Waste Confidence Proposed Rule here tonight lacks any sufficiently thorough scientific analysis with many options, especially considering spent fuel pool and cask fires, leaks, and waste storage. (0245-29-8 [Shineflug, Marilyn])

Comment: The first point we want to make is that we submit that the GEIS, as written, is inadequate to both the task of satisfying the directives of the 2012 Court of Appeals and it's also inadequate in protecting the health and safety of the public and the environment. For these reasons, we would ask the NRC to withdraw the current DGEIS. (0245-3-2 [Kraft, David])

Comment: We find that NRC's finding of no significant impact regarding issues like spent fuel pool fires, spent fuel pool leaks, the vulnerability of the spent fuel pools and dried cask sites to natural disasters and terrorist assaults, and the NRC's belief in the adequacy of generic findings of reactors to be unfounded, inadequate to the protection of the public health and safety, and in contradiction to the NRC's own definition of what constitutes a nuclear safety culture. (0245-3-5 [Kraft, David])

Comment: I'm a resident of Illinois living in the southwest suburbs of Chicago. I'm circled by nuclear facilities in Illinois all the way to Michigan. The residents of Illinois do not agree to become the nation's nuclear waste dump. But slowly and ever so quietly over time, the residents of Illinois have come to live with the largest amount of high-level radioactive nuclear energy waste of any state in the country. If the NRC's draft Generic Environmental Impact Statement and Rule are adopted, all nuclear facilities will officially become permanent nuclear waste dumps. Discovering that no real individual environmental impact study has been done as to how 30 plus years of nuclear waste will impact an area makes the current situation even more unacceptable. Even more shocking is the government and nuclear industry's current plan to plan that the waste may end up staying onsite forever. I, of course, realize NRC's - and I would add DOE's - unrealistic handling of the nation's nuclear energy waste and are forcing them to face reality which unfortunately is not accomplished in the NRC's draft GEIS and Rule. (0245-30-1 [Snyder, Gail])

Comment: So, the League does not have confidence in the NRC's waste confidence and draft Generic Environmental Impact Statement, and the document should be thoroughly revised on the basis of objective or review of scientific data which includes NRC's own performance data. (0245-41-2 [Cella, Dr. Francine])

Comment: I guess I'm obviously demonstrating the fact that I have no confidence in the waste confidence, and that as a person who has lived in this kind of nuclear necklace of 11 nuclear power plant sites, I am feeling, I really feel trapped by the planned releases of nuclear gases, by the millions of gallons of tritium-contaminated water that was released to the Kankakee River and then to groundwater on Kankakee from the Braidwood Plant, and for all of the other kinds of oopsies that were not acknowledged by the plants, by Exelon, and by other companies that run nuclear power plants. And the NRC hasn't seemed to have done a real good job of protecting us from this. And so, as a mom and a potential grandma and a person who lives here and pays taxes and just retired working as a nurse for 40 years, you know, I object. (0245-45-3 [Aguilar, Margaret])

Comment: I do not support and have absolutely no confidence, and when there was a slight mishap here, I got involved because I called the governors, I called the senators. They didn't know what had happened. I called and they said talk to the DOE. DOE said you got to talk to Emergency Management. They have no clue. I did not like have people, like Tim and I were some stupid idiot. I am not and neither is the rest of this planet. (0245-47-2 [Grace, Karli])

Comment: And I'm coming here today to explain why I do not have the confidence in this Generic EIS and why you shouldn't either. I do not have confidence when I see reactor licenses being renewed without exception regardless of a plant's track record. (0245-6-1 [Headington, Maureen])

Comment: I have absolutely no confidence that the NRC has investigated every single possibility at every single power plant for fires, leaks, natural disasters, and terrorist attack. So, I for one and every single person that put their hand up has no confidence in the NRC's supposed Environmental Impact Statement. (0245-7-4 [Chamberlain, Lora])

Comment: However, rather than pressing forward, we really need to not continue with publishing a Rule that enables the creation of not only more and more of this waste, but also more dangerous waste. (0246-13-5 [O'Leary, David])

Comment: I guess we reject the NRC's Waste Confidence DGEIS and we ask for it to be withdrawn for thorough revision. We have no confidence in the NRC's Waste Confidence for the same reasons that the Court found. (0246-16-1 [Michetti, Susan])

Comment: The Waste Confidence Statement should be rejected. (0246-17-1 [Dugdale, Jane])

Comment: There is no way that we, in 2013, can say that we know in 3013 that the enormous amount of long-lasting radioactive waste that is being generated won't have an environmental impact. It simply defies logic, it defies morality and it is legally -- the document is legally inadequate to justify reinstating confidence. The NRC is supposed to show in this process that it will never have an impact for 60, 160, or virtually forever. Yet, you don't even know the impacts that it is having now. There is not adequate monitoring. (0246-2-4 [D'Arrigo, Diane])

Comment: So, our conclusion is that the NRC should not proceed with this rulemaking and should not be giving new licenses. (0246-2-8 [D'Arrigo, Diane])

Comment: [W]e believe that the environmental analysis represented by the draft GEIS and ordered by the Court of Appeals in New York last year is woefully inadequate. It is not in the spirit of what the Court intended. And it certainly is not fulfilling the purpose of the National Environmental Policy Act. And therefore, it doesn't provide a sufficient basis for eliminating consideration of nuclear waste disposal and storage impacts from reactor licensing proceedings. (0246-22-1 [Fisher, Allison])

Comment: This is the behavior of the Nuclear Regulatory Commission. This is who we are supposed to have confidence in to allow nuclear waste to be stored onsite indefinitely at nuclear facilities around the country. I do not have confidence in the Nuclear Regulatory Commission or their draft Generic Environmental Impact Statement and the accompanying Rule. (0246-25-4 [Snyder, Gail])

Comment: However, the current Draft Rule and Environmental Impact Statement failed to meet the standard established by the D.C. Circuit Court. (0246-7-2 [Zeller, Lou])

Comment: In closing I want to quote from the movie Pandora's Promise, or as many of us refer to it as Pandora's Broken Promises, which was mentioned in Oakbrook two nights ago when the people in Chicago came and gave testimony. A person was walking through the ruins at Fukushima and looked around and said, "This wasn't supposed to happen this way." That is

why we can't have any confidence in a Generic Environmental Impact Statement and why we do not support this document. (0246-9-7 [Lewison, Linda])

Comment: The waste confidence statement in the draft environmental impact study under consideration should be rejected. (0249-1 [Dugdale, Jane])

Comment: There is NO SAFE SOLUTION for deadly wastes that will remain dangerous and cause a huge financial burden on the public, virtually forever. How can a "waste confidence" statement be approved without answers to the above questions? The "confidence statement" must be rejected. (0249-14 [Dugdale, Jane])

Comment: Unless credible answers can be found to our many questions, the waste confidence statement is simply sweeping these risks under the carpet and the NRC is recklessly endangering our communities. Unless you give the draft statement a vote of NO CONFIDENCE, the risks described below should make the NRC liable for regulatory mismanagement. (0249-3 [Dugdale, Jane])

Comment: The Nuclear Regulatory Commission should abandon the generic approach. It should heed the advice and the direct order of the United States Circuit Court for the District of Columbia. (0250-1-7 [Zeller, Lou])

Comment: I was excited for a moment when I heard that the NRC had been ordered to set aside its Waste Confidence policy and assess the environmental impacts of nuclear waste. But after reading through the draft of the new policy, my excitement quickly evaporated. I'm a realist. I've spoken in a lot of energy hearings, and one thing I've learned is that government agencies and commissions that are supposed to be protecting the public are generally controlled by the corporations that they're supposed to be regulating. Along those lines, the NRC has the reputation of looking out for the interests of the nuclear industry. Reading about your current proposal confirms to me that your goal is to ensure the future of nuclear energy, an industry that should have no future. I see no hint that you had any intention of trying to protect the public, now or in the future. What makes me think that, that you're protecting the nuclear industry? Your claim that spent fuel can be managed at reactor sites or other above-ground storage facilities forever ; your failure to address the vulnerability of these spent fuel pools from catastrophic fire caused by an attack; your declaration that the impacts of pool leaks will be insignificant; your plan to transfer radioactive spent fuel to new storage casks every hundred years forever. These and many other absurdities are based on the assumption that government institutions will function safely for hundreds of years, an assertion that is inconsistent with human history, as others have said already tonight, and inconsistent with the NRC's own regulations. Your policy is also inconsistent with the mandate of the NWSA that aboveground storage is acceptable only on an interim basis. So I'm asking you, members of the NRC, to behave as though you actually are acting on behalf of public safety, and stop protecting corporations that are profiting from nuclear energy. I'm asking you to behave as though we still have a government that serves people, not corporations. You still have some power to make that a reality, in perhaps the most dangerous industry there is. (0250-16-1 [Kneidel, Sally])

Comment: Okay. I'll get back on to the waste issue. Okay. This white paper, or the general, Generic Environmental Impact Statement, I've got a feeling, you know, I've noticed that when somebody is speaking the truth and they really want to make things clear for you, they can say what they need to say in just a few sentences, maybe a few paragraphs. You know, when people have to go on and on for pages and pages, and use a bunch of big words, and do a bunch of verbal mumbly-jumbly; it's obfuscation, people. They're trying to fool you. They're

trying to make a joke out of what they're saying. They want you to -- they want your eyes to glaze over, and for you to throw it to the side and say hell, I can't understand this. (0250-23-2 [Ashe, Kenneth])

Comment: [T]he draft Generic EIS fails people and our planet by not adequately addressing the real risks of nuclear waste once again. (0250-28-4 [Embrey, Monica])

Comment: We do not have confidence in this ruling, or in the ability of companies like Duke to manage their nuclear plants; see Crystal River in Florida. (0250-28-6 [Embrey, Monica])

Comment: I think the EIS needs a great deal of reworking. I think certain basic tenets need to profuse and underlie everything in that study. (0250-31-2 [Clark, Terry])

Comment: We have had more than 50 years of wasted confidence and it's time for a real solution. This GEIS is the Generic Environmentally Ignorant Singsong that does, indeed, require a good spanking and ought to be filed where the sun don't shine, and never be heard of again. We deserve better than this. (0250-34-2 [Sorenson, Ole])

Comment: I have zero confidence in the Nuclear Regulatory Commission to address the risks of nuclear waste disposal near my home here on the North Carolina/South Carolina border. (0250-42-2 [Arnason, Deb])

Comment: And, with all due respect, I have no confidence in the NRC to regulate this dangerous industry. I have no faith in your so-called Generic EIS. Waste confidence for hundreds of thousands of years? (0250-48-2 [Hanrahan, Carol])

Comment: The draft GEIS is completely inadequate, all 585 pages of it. It needs to be started over. It's full of questionable assumptions that go from questionable to not even beginning to be credible. It does not satisfy the Nuclear Waste Policy Act or the federal court order. It took a federal court order to throw out this rule and start this process, because the NRC would not do it itself, and this document is more of the same stuff. (0250-5-3 [Safer, Don])

Comment: Just in conclusion -- I assume I'm out of time -- while it is true that paper will block alpha radiation, the reams of paper being used in this bureaucratic process will not enhance public safety. I'm sure the Japanese went through this whole process, something very similar. Look at how it's protecting the people and the biota in the Pacific Ocean. (0250-5-9 [Safer, Don])

Comment: Attorneys and their consultants, some of whom brought the lawsuit against the NRC which led to this hearing today, back up their criticism with numerous examples of the NRC's failure to comply with federal laws, faulty decision-making practices, and poor operating histories. The NRC fails to abide by the intent, language, and provisions of the Atomic Energy Act and the National Environmental Policy Act. (0250-51-4 [Thomas, Ellen])

Comment: I urge the Nuclear Regulatory Commission not to adopt the ruling. I oppose the EIS. (0250-59-1 [Krotz, Susan])

Comment: The American people have little basis to find confidence in both the Generic Environmental Impact Statement and the concept of nuclear waste storage outside the regulated community, as evidenced by the commenters and comments made at this evening's session. (0250-63-1 [Kasher, Brian])

Comment: The NRC can start by changing this one simple aspect of the nuclear energy framework by disavowing Waste Confidence in the shortcut generic approach to U.S. nuclear policy. (0250-63-5 [Kasher, Brian])

Comment: We thank the NRC for hearing our comments tonight, but we strongly oppose the draft comments of the EIS statement. (0250-64-6 [Gupton, William])

Comment: Redevelop what it is and what we know. You all are smart enough to come up with something better than this. Even our court system realized it, from Washington down, and let us go back and do what we need to do. Bring back something that the public can take hold to[.] (0250-8-3 [Utle, Charles])

Comment: In view of the above mentioned hazard at Fukushima, I reject any confidence in NRC's plan to relicense any nuclear power plants and NRC's confidence in storage of Diablo's waste in spent fuel storage ponds. Please consider the points made by the SLO [San Luis Obispo] Mothers For Peace and adopt their recommendations. (0251-4 [Baker, Sheila])

Comment: The U.S. Nuclear Regulatory Commission (NRC) has "confidence" that the high-level radioactive nuclear waste problem will be solved sometime in the future. So the "regulator" declared that it could continue to give 20-year license extensions to aging, brittle, accident-prone nuclear reactors without an objective, scientific study of safety, storage and disposal of thousands of tons of radioactive waste. (0256-2 [Harkins, Lynne])

Comment: We don't agree. Neither did the Court of Appeals in Washington, D.C., which overturned the NRC waste confidence ruling. In response, the NRC has written a new Waste Confidence Environmental Impact Statement, restating the same unsupported, unsafe, industry-friendly "confidence" in new packaging. (0256-3 [Harkins, Lynne])

Comment: Waste Confidence is a Radioactive ConGame. The purpose of NRC's Waste Confidence rule is to streamline nuclear plant licensing by ignoring the million-year, multi-billion dollar problem of what to do with radioactive waste. The only problem Waste Confidence solves is how to permit nuclear plants to continue making this waste when there is no solution for it. Obey the Court's Ban on Licensing Nuclear Reactors. There is no safe storage solution for nuclear waste, and NRC's new Waste Confidence policy is no more credible than the one the courts threw out. There is no safe dose of radiation, and to pursue licensing on the base of Waste Confidence is illegal and immoral. (0256-5 [Harkins, Lynne])

Comment: In summary, the "Waste Confidence" EIS must be revised to include and to consider all of the above issues. The public deserves and will accept nothing less! (0256-7 [Harkins, Lynne])

Comment: I have no confidence in the guidelines submitted by the NRC in the future of waste disposal. (0264-1 [Gutierrez, Ruth])

Comment: The NRC and DOE have not completed their research on extended storage and transportation, so there is no confidence in the draft GEIS conclusions. (0267-1 [Rodarte, Ron])

Comment: I understand you have complete confidence that nuclear waste will always be securely stored. In that case, to simplify the matter and for your agency to have an excellent vantage point, you should create a storage facility in the basement of your offices. (0268-1 [Rosenstein, Carl])

Comment: We submit that the DGEIS as written is inadequate to both the task of satisfying the directives of the 2012 Court of Appeals; and also inadequate to protecting the health and safety of the public and the environment; and for these reasons was ask NRC to withdraw the DGEIS. (0274-2 [Kraft, David])

Comment: These assertions will be elaborated upon in detail in our subsequent submittal. The first rule of holes is, when one finds oneself in the bottom of a hole, STOP DIGGING. NRC finds itself in a very deep hole, narrowly within the details of its inadequate DGEIS, and more broadly in its irrational defense of permitting the generation of more high-level radioactive waste absent an operational disposal facility. In 2012 the Court of Appeals abolished the NRC's magic linguistic detoxification wand known as the " waste confidence rule." NRC must now provide hard proof, based on real evidence, to back up its assertions. This DGEIS fails in this regard. We ask that NRC withdraw its proposed DGEIS. (0274-6 [Kraft, David])

Comment: We ask that NRC to withdraw it's proposed DGIS until the NRC provides substantial proof based on scientific evidence of the safety of their conclusions. (0276-10 [Kurz, Carol])

Comment: In addition, the waste problem is further convoluted by NRC's proposal to include in reactor licenses their idea that spent fuel can be stored safely above ground forever which would end any public discussion about permanent storage and creation of more waste since there is no problem. (0276-6 [Kurz, Carol])

Comment: Nuclear waste is toxic. "Clean" and "safe" are not terms that you can use to describe nuclear waste or its production. And yet members of the Nuclear Regulatory Commission (NRC) and their staff are repeatedly trying to sell to the public those falsehoods. Therefore, one wonders how the members of the NRC could determine an environmental assessment "finding of no significant impact" regarding nuclear waste and its storage resulting in the recommendation of a generic treatment with no further oversight for a 100 plus years. (0277-1 [Pierman, Bette])

Comment: This member of the public does not share your confidence! (0277-3 [Pierman, Bette])

Comment: Low Level Waste/Indefinite Storage = DOE/NRC; Where's the confidence? (0282-5 [Haber, Jim])

Comment: For reasons stated by the public, and safety advocates, NRC should REJECT the proposed Draft Generic Environmental Impact Statement, and Proposed Rulemaking, and start over, with a more rigorous, full-disclosure analysis of potential impacts, with a Site Specific Environmental Impact Statement for San Onofre's Storage of Nuclear Waste. It is with greatest apprehension that citizens in southern California call upon all NRC Commissioners to fully perform your duty, and take action in the PUBLIC INTEREST, and for short and long term public health and safety, not necessarily in Licensee's interest to protect their profit margin. (0284-12 [Borchmann, Patricia])

Comment: In 2012 New York's Attorney General Eric T. Scheiderman successfully led the legal challenge to NRC's Temporary Storage Rule, because he believed that communities that serve as de facto long-term nuclear waste repositories deserve a full and detailed accounting of the environmental, public health, and safety risks. In 2012, a federal circuit court agreed with Attorney General Schneiderman that federal law requires NRC to complete a thorough analysis of public health, safety and environmental hazards such storage would pose before allowing long-term storage of nuclear waste in communities. In reaching its decision, the circuit court found the spent nuclear fuel stored on-site at nuclear power plants "poses a dangerous, long-

term health and environmental risk". Another important finding which NRC must recognize is the similarity between San Onofre (SONGS) and the 2012 case led by New York Attorney General Eric Schneiderman, where he faulted NRC for assuming, with no factual basis, that all nuclear waste will be removed from nation's nuclear power plants by 60 years after plants are closed. Since there is no available off-site storage location to store high-level nuclear waste from these facilities, the DGEIS fails to meet requirements of circuit court's ruling, by making decisions based on "unsubstantiated hope" that sufficient, licensed off-site radioactive waste storage capacity will be available to accept nuclear plant waste within 60 years. The same conditions exist here in southern California, where use of high burn-up fuel is also ignored. (0284-2 [Borchmann, Patricia])

Comment: The draft Waste Confidence GEIS and rule being discussed at this meeting do not offer solutions. They only perpetuate the unjustified assumption that spent fuel can be stored for a quarter of a million years at reactor sites with no serious impact on the environment. The wording incorporates this assumption into the licenses for all reactors, thereby fencing out any further public discussion in individual reactor licensing actions. (0287-2 [Swanson, Jane])

Comment: Mothers for Peace asserts that these Waste Confidence drafts are not worth the paper they are written on. Scrap them. Start over to find the least dangerous ways to store the wastes already created. And shut down all operating nuclear plants in an orderly way so that NO MORE of this terrible radioactive poison is created. (0287-7 [Swanson, Jane])

Comment: [I urge that] a new, final Rule squarely place into its central focus all matters of public safety and health of our environment, not continued industry accommodation, convenience, and profit. (0303-17 [Lamberts, Frances])

Comment: As stated in the Background section in the Federal Register (September 13, 2013), the Commission's "reasonable confidence" decisions on safety spent nuclear fuel, its current management and eventual geologic disposal, goes back all the way to 1977, reinforced by various later laws and regulatory actions. But in the nearly half-century since then, and fully seven decades since the problem was first created, we are not anywhere near a proper solution. We have only made it to yet another law, still to be passed, under which a "mission Plan" is to be produced on how to deal with the accumulated (and still accumulating) high-level and spent-level-waste byproducts of the way we produce a portion of our electricity. In other words, nothing concrete toward a solution has been achieved in these many decades. (0303-2 [Lamberts, Frances])

Comment: The Commission acknowledges (p. 56778) that its "reasonable assurance" of completion of "one or more mined geological repositories ... by the years 2007-2209" was not materialized. Nevertheless, and despite this historic fact, the Rule repeatedly offers a new confidence conclusion – now of a "25-35 year timeline" – for the needed repository capacity to be built. This seems unjustified on the face of it. Even more unjustified is another stated assertion: that the SNF could be safely kept at the reactor sites "for a total of 160 years" after reactors' operational licensed lifetimes, or even indefinitely if a repository were never built. Propositions like these make the Rule as proposed quite unacceptable. They further undermine public trust in a safe solution for this intractable problem. They counteract, as well, the intent of Congress in the Nuclear Waste Policy law. (0303-6 [Lamberts, Frances])

Comment: There is no confidence in the NRC Radioactive Waste Policy to assure safety. (0304-3 [Young, Roberta])

Comment: There is no confidence in the NRC Radioactive Waste Policy to assure safety. (0305-1 [Norman, M. Jean])

Comment: The Waste Confidence Proposal is sorely lacking in reality-based reasoning. (0309-2 [Green, Jeanne])

Comment: This GEIS is the generic environmentally ignorant sing-song that does indeed require a good spanking and ought to be filed where the sun don't shine and never to be heard of again. We deserve better than this. (0314-2 [Sorensen, Ole])

Comment: NRC has refused to address the incredible risks these facilities pose. The NRC must abandon its so-called 'Waste Confidence' rule because it pretends the low likelihood of an accident makes the extreme consequences irrelevant. This is an evasion of the federal law requiring that the NRC demonstrate that all waste, regardless of quantity, generated by nuclear reactors will be managed safely. NRC's new Waste Confidence policy is no more credible than the one the courts declared illegal. (0319-11 [Nichols, John])

Comment: The NRC must obey the federal law requiring it to demonstrate that nuclear waste will be managed safely. The Waste Confidence rule was declared illegal by a federal court because the NRC has failed to demonstrate that, and NRC has not adequately considered the environmental impacts of the waste that new and relicensed reactors would generate. (0319-3 [Nichols, John])

Comment: [W]hat's frightening to me in this summary is to see small, small, small under environmental impacts at reactor's continued storage. Seeing in here that it's fine to stay 60 years. They will change the casks after 100 to 140 years. (0325-12-1 [Magda, Marni])

Comment: First of all, I want to tell you that there are three things that are really disappointing about human beings, lies, damn lies, and Generic Environmental Impact Statements. This is how -- (Applause.) This is how human beings have learned to lie to themselves. Somehow you put enough words in a document, you say that things are small, and now we're confident that we're okay. Let me tell you how this lying is done. (0325-19-1 [Lutz, Ray])

Comment: This is just a piece of crap that we're supposed to feel good about because it's already over there and we can't stop it. And this is supposed to make us feel confident for some reason. What does it do? Why does it make us feel -- doesn't at all. And we know, the word is out. NRC is lying, and we're not going to believe it any more. This has to go. We have to move the fuel out of this sensitive area. (0325-19-6 [Lutz, Ray])

Comment: The impacts in this Generic EIS are classified as mostly small impacts; that is, until an accident occurs. Is Fukushima small? This EIS does not solve the problem. I have no confidence in this approach or this EIS. (0325-29-8 [Feathers, Jösan])

Comment: [P]lease clean up this report. There's a lot of improvement that's needed. (0325-31-8 [Johnson, Roger])

Comment: The Proposed Waste Confidence Rule is severely flawed on many accounts. Many assumptions are based on outdated studies, wishful thinking, and declarations of confidence. I strongly agree with organizations, such as Union of Concerned Scientists, Nuclear Information Research Service, your own Nuclear San Luis Obispo Mothers for Peace, Alliance for Nuclear Responsibility, as well as with hundreds of citizens, groups, scientists, and individuals, locally and nationwide, which have correctly identified the many problems with this Rule. I make their

comments part of my own. Personally, I believe it is time to scrap the entire document and start all over. (0326-15-2 [Schumann, Klaus])

Comment: Let me just add that, in a tour of Diablo Canyon, I had the privilege of sitting next to a member of the Independent Safety Committee, with over 20 years of experience in the States and with the International Atomic Energy Agency, and he told me, off-the-cuff, we have to stop building these nuclear reactors until we know what to do with the waste. My level of confidence in his assessment is higher than that for any official comment from the NRC and industry spokespersons during the last decade. As for my level of confidence in the environmental and public safety of permitting long-term storage of nuclear waste at Diablo Canyon, it couldn't be lower. (0326-19-4 [Carrigan, Milton])

Comment: [T]he World Business Academy can only conclude that the Waste Confidence Rule is a confidence game and we have no confidence in it. (0326-4-6 [Brown, Jerry])

Comment: I want to mention I do not support the GEIS. I find it flawed. I've read EIS's and I don't think it's fully considered. Consider the slide that was so quickly breezed over where the man mentioned that we could use the NRC as the NRC's own check and balance if, maybe, we don't need to do another site analysis. That sounds to me like the wolf guarding the hen house. That's crazy. You can't just carte blanche they will check themselves. People have expressed concern about where's the licensing, the follow-through. Sure. Confidence? No, I don't have confidence. I'm concerned. (0326-55-2 [Krist, Mark])

Comment: I'm here because of love, love for my children, all children. It's too late to believe that you believe in your Waste Confidence. It's now time for the truth. As members of the NRC you must completely shelve the present Draft EIS and start anew with the truth and with us. We're not asking please, but with a strong and fair demand, to write a truly factual account of the liabilities and how spent fuel rods in open pools on a web of faults, grids of destruction on massive tectonic plates, will affect our land, our state, our country. (0326-58-1 [Davis, Adrienne])

Comment: I'm not happy to be here and I don't appreciate that the NRC has called this meeting. They have to call this meeting. I'm actually really disturbed that 34 years after the first NRC meeting I went to we're still discussing the exact same unmet safety needs. It's exactly the same. The same promises were made that, oh, by the time we run out of room we will have come up with a way to store it. Now we're being asked, once again, oh, in 60 years we'll have come up with a way to store it. I'm not buying it. I don't have any confidence. I have no confidence in that. I have no confidence in the availability of mine storage 60 years after plant closure. I have no confidence in dry cask storage because you're not doing it. You can make all the regulations you want. If you don't enforce them they're meaningless. My mom taught me that when I was a toddler. She counted to three and whacked me. She didn't abuse me, but I knew there was a consequence. (0326-61-1 [Henry, Anita])

Comment: A Generic Environmental Impact Statement. I've been going through these things for a lot of years but this is a new low. This is ridiculous. We've got to stop what we're doing. (0326-64-2 [Nelson, David])

Comment: The Draft Waste Confidence GEIS and Rule being discussed at this meeting do not offer solutions. They only perpetuate the unjustified assumption that spent fuel can be stored for a quarter of a million years at reactor sites with no serious impacts on the environment. The wording incorporates this assumption into the licenses for all reactors, thereby, fencing out any further public discussion of individual reactor licensing actions. (0326-8-2 [Swanson, Jane])

Comment: Mothers for Peace asserts that the Waste Confidence Drafts are not worth the paper they're written on. Scrap them. Start over to find the least dangerous ways to store the waste already created and shutdown all operating nuclear power plants in an orderly way so that no more of this terrible stuff is created. (0326-8-7 [Swanson, Jane])

Comment: I'm also here because I think you, NRC, need to be reminded of what your job really is. In this Draft GEIS, you hurriedly tried to address the issues that are so significant to us. (0326-9-1 [Seeley, Linda])

Comment: Well, they say a picture is worth a thousand words, so this pretty much sums up about Waste Confidence. The first picture says -- oh, the title of the cartoon is "The Three Biggest Whoppers." It's from 1989, so speaks to how long this has been going on. The first picture says, "The check is in the mail." The second says, "Of course, I'll respect you in the morning." It's two kids making out in a car. And the last one says, "I'm from the NRC, DOE and I just need to leave this here temporarily." (0327-11-1 [Kline, Connie])

Comment: If U.S. or foreign operatives contaminated 75 sites in 33 states with eternally lethal radioactive waste we would call them terrorists. Instead, we call them the nuclear industry, the NRC, and the DOE. Rarely have I perused, because I certainly couldn't read all 600 pages of the draft Environmental Impact Statement, but rarely have I perused something that spoke in more generalities and was less substantive -- I've rarely seen documents that were less substantive. The GEIS speaks in terms of 100, 150 years. The longevity and the hazard of this waste is measured in millions of years. There's a real disconnect there. (0327-11-3 [Kline, Connie])

Comment: I think the jig is up, NRC. The smoke and mirrors have cleared. Your solutions are delusions. (0327-11-6 [Kline, Connie])

Comment: My comments at today's public meeting, December 2nd, 2013 in Perrysburg, Ohio pertain specifically to the U.S. NRC's Waste Confidence DGEIS and Proposed Waste Confidence Rule, 10 CFR 51.23. So, I do not support the proposed NRC Rule that is the subject of this meeting, and I emphatically dispute both the premises and the conclusions of the Waste Confidence DGEIS which are codified in the Rule and form the regulatory basis for promulgating it. I also have serious doubts and concerns about the independence and integrity of the NRC's administrative rulemaking process. As Abe Lincoln famously said, "You cannot fool all of the people all of the time." (0327-17-2 [Schonberger, David])

Comment: Thirdly, regarding both supplemental additional issue number 1, and additional issue number 2, I believe that it is duplicative and more than a little duplicitous and deceptive to include inside an official CFR Rule, policy statements and language that are out of bounds of the force of law, as well as beyond the scope and authority of the Agency, NRC, to guarantee, implement, or enforce. I believe that such disingenuous language, policy statements in the Proposed Rule regardless of previous tradition, unintentionally invites the NRC's critics to correctly characterize the Proposed Rule as a con, and as a false assurance based on a foundation of [hubris], fantasy, and delusion. (0327-18-3 [Schonberger, David])

Comment: I've been tracking the nuclear power industry for 33 years, and I see this is the Waste Confidence meeting. This is a Waste Confidence game. This is a con game, and I suggest you shorten the name to Nuke Con Game. (0327-2-1 [Keegan, Michael])

Comment: There's no basis in science engineering, the behavior of the nuclear industry, and the NRC for confidence that high-level radioactive withdrawn fuel rods can or will be managed

with no risk to the biosphere for as long as the radioactivity lasts. For the NRC and the nuclear industry to assert probabilistic assessments of what will happen to radioactive material over 240,000 to a billion years is a fraud and a con game. (0327-27-1 [Macks, Vic])

Comment: I'm here to stand together with my comrades and deliver the message to the NRC that we have no confidence in your draft Generic Environmental Impact Statement. (0327-39-1 [Izant, Carol])

Comment: We cannot accept a newly revised Waste Confidence regulation that continues the fraud of this failed Federal policy, not for our generations, and certainly not for our next seven generations of our people, indeed, of all Americans who will be the first left to face the consequences of our nation's broken promises. (0328-1-7 [Johnson, Ron])

Comment: We're here tonight in a proceeding that, to me, is a little bit muddled because we're talking about a GEIS, we're also talking a Rule. It seems to me, I have here the Executive Summary and the GEIS, that with all due respect to the folks in the room who produced it, is an exceptionally weak, inadequate, and unconvincing document. I won't go on at great length about that, but I'd like to read to you at Executive Summary Section 20, the question is asked, "Are there any remaining issues to be resolved?" And the answer is, "The NRC believes there are numerous sources of the requisite technical data and information available. Therefore, there are no remaining issues that require resolution." That's a rather irrational statement, in my opinion. It's indefensible, and this and many, many other sections of this document need to be revised. (0328-11-1 [Muller, Alan])

Comment: I think this is a historic document. In so far as it -- it finally carries the claims of nuclear waste confidence to its ultimate conclusions, which are somewhat absurd. I think that's well recognized and documented. I mean, we're no longer playing a game of what short-term, long-term, and indeterminate storage means. That's laid out in the charts there, and I'm really grateful for that, because we've been sort of working with that bean game for a long time. So, I think what I really appreciate about this document is that it lays out the reality of the situation we're in. And what I'm deeply concerned about about the document is that with my focus on responsible nuclear waste management as a citizen and as a township planning commissioner, all of the necessary ingredients for responsible long-term storage are essentially scoped out of this document by the assumptions that it makes. Now, it's taken me many years to try to wrap my head around the way that NRC thinks about these things. And the -- my major -- and the assumption that we make that nothing will go wrong until it does is a really disabling assumption. And I think it disables not only NRC, but disables the utilities, and the communities, and everyone else who really cares. And I know that the utilities care, I know the NRC cares, and I know that the communities all care about responsible nuclear waste storage. But, unfortunately, the approach that is taken here undermines our ability to actually grapple with those very specific steps that would, in fact, come as close as we can as human beings in this time frame to ensure responsible nuclear waste management. (0328-12-1 [Eide-Tollefson, Kristen])

Comment: So, as much as I would like to say thank you to the NRC for having this public comment period, I think that creating this, what is it called, the Environmental Impact Statement, it's a sham. And I'm going to continue to fight and speak out against this. (0328-13-3 [Wagner, Sam])

Comment: So, I have no confidence, and we know what this is, we've called it what it is, and we hope you do go back and do it over, because it doesn't cut it. (0328-14-8 [Overland, Carol])

Comment: Our people around the world are human -- the whole human family, the NRC, Confidence Rule, denies them confidence -- denies the confidence in the people around the world, in the scientists around the world. It denies the confidence of the people to create something better, and I'm asking you please use your conscience and do the right thing at every turn. You can't have a generic code or whatever. (0328-16-8 [Bonniwell, Colleen])

Comment: We certainly don't envy the NRC staff. They've been given the impossible task of drafting the Waste Confidence regulations for our nation's failed nuclear waste policy. The District of Columbia Circuit Court of Appeals struck down the NRC's last revision because it was based on hope and not fact. Unfortunately, the Draft Environmental Impact Statement fails for the same reasons. (0328-3-7 [Mahowald, Philip])

Comment: Nothing in the NRC's draft NUREG-2157 changes these facts. Rather than managing a thoughtful reexamination of the NRC's radioactive waste policies and priorities which would have taken considerable time and effort, the NRC chose to hurriedly slap together a document whose only purpose is to provide a paper rationale for lifting the agency's moratorium on reactor licensing and renewal procedures. (0328-9-3 [LaForge, John])

Comment: I reject the NRC's Waste Confidence Draft Generic Environmental Impact Statement and ask the NRC to withdraw it for thorough revision. I don't have any confidence in the NRC waste confidence. There needs to be much more discussion. Just the whole idea of a generic format and discussing high-level nuclear waste is ridiculous. (0329-17-1 [Gray, Erica])

Comment: So I encourage you in the strongest possible terms to please go back to the drawing board and create a new environmental impact statement. (0329-28-5 [Wilansky, Laura])

Comment: I do not support the Proposed NRC Rule that is the subject of this teleconference, and I emphatically dispute both the premises and the conclusions of the Waste Confidence DGEIS, which are codified in the Rule and form the regulatory basis for promulgating it. (0329-7-2 [Schonberger, David])

Comment: I was in attendance at the meeting in San Luis Obispo on Weds. November 20, 2013 and I have to truthfully say that I have no confidence in the proposed rule's change or for the NRC to do what is right. (0330-1 [Beccia, John])

Comment: The NRC's draft document fails to do this [have a waste management system that is designed to handle myriad possible accidents]. I urge the NRC to create a document that ensures public health and safety regarding radioactive waste. (0331-2 [Miller, Kirk])

Comment: This proposed rule foregoes the imperatives of active public participation in agency decision-making, the role of the government in safeguarding national security and the precautionary principle of allowing an industry without adequate solutions to continue with hopes of future innovators to find one. It is not enough to equate all proposed actions and alternatives' impacts to the preferred rule by the agency to ensure agency efficiency. Holding agency efficiency above human health and safety does not parallel the agency's established mission in "regulat[ing] the Nation's civilian use of radioactive materials to protect public health and safety, promote the common defense and security and protect the environment." Please consider the concerns of the current public and future generations. (0339-4 [Wilmott, Emily])

Comment: In candor, we fear that your agency has lost perspective as to what is at stake. If the NRC goes forward with implementation of this GEIS, it will do something that no agency in

the history of America has ever done. It will enable the vast expansion of a threat that will be visited upon thousands of future generations. Make no mistake, this GEIS will be used to assure policy makers and the public that materials with the potential to unleash vast destruction can be allowed to continue to accumulate and remain controllable forever. (0341-1-1 [Mermelstein, Richard])

Comment: This is a point which must be stressed: In the area of nuclear safety, the nations of the world look to the NRC for leadership and guidance. You, as decision makers at the NRC, will set the standards for spent fuel safety. Your assessment will be used to make security determinations worldwide. You may not have sought it when you assumed the job, but an enormous historic responsibility has been leveled upon you. For these reasons we implore drastic revision of the GEIS. The current draft utterly fails to appreciate or honestly convey the level of risk. Worse, it sets a course that may be unalterable. Please be worthy of your public trust. (0341-1-6 [Mermelstein, Richard])

Comment: The Indian Point Safe Energy Coalition (IPSEC) asserts vigorous objection to the methodology, assumptions and core conclusions advanced by the Nuclear Regulatory Commission (NRC) in the Sep 2013 Waste Confidence Generic Environmental Impact Statement Draft Report (hereafter referred to as the "GEIS").[1] [Footnote 1 Text: IPSEC does not want to waste the time of NRC staff by redundantly proffering points previously or concurrently being advanced in filings by other citizen and public interest groups and watchdog organizations. Accordingly, please deem these IPSEC Comments to incorporate and heartily support the comments of the following groups: Alliance for Nuclear Accountability; Beyond Nuclear; Blue Ridge Environmental Defense League; Center for a Sustainable Coast; Citizens Allied for Safe Energy; Citizens Environmental Alliance; Don't Waste Michigan; Ecology Party of Florida; Friends of the Earth; Georgia Women's Action for New Directions; Hudson River Sloop Clearwater; Institute for Energy and Environmental Research; Missouri Coalition for the Environment; NC WARN; Nevada Nuclear Waste Task Force; New England Coalition; Nuclear Information and Resource Service; Nuclear Watch South; Physicians for Social Responsibility; Public Citizen; Riverkeeper, Inc; San Luis Obispo Mothers for Peace; SEED Coalition; Sierra Club Nuclear Free Campaign; Southern Alliance for Clean Energy; and Union of Concerned Scientists.] Simply put: Our vote is: NO CONFIDENCE. (0341-1-7 [Mermelstein, Richard])

Comment: The Draft GEIS is based on poor evaluation of inadequate criteria. It promulgates hypotheses as evidence, unrealistically bounds scenarios, disregards likely malfunctions, discounts human error, minimizes all risks, and shows profound indifference to the effects of radiation upon human health and the environment. The GEIS conclusions of "SMALL," "SMALL," "SMALL," for every time scale imaginable defy both experience and reason. That such a simplistic load of bunk would be presented by the nuclear regulator of the United States after 50 years of nuclear plant "near-misses" and leaks, following 9/11, and in the wake of the Fukushima disaster is unconscionable. This is willful denial. Please, we know there are people within the NRC who do care and work every day to protect the environment and the citizens of our great nation. We need you to speak up and act more forcefully within your agency. We need you to present an honest picture to the public. (0341-2-17 [Mermelstein, Richard])

Comment: Petitioners and intervenors have called attention to what is wrong with the NRC Draft Waste Confidence Generic Environmental Impact Statement (DWC GEIS) and backed up their criticism with numerous examples of failing to comply with federal laws, faulty decision-making practices, and poor operating histories. But many of these concerns and facts have been ignored. The NRC fails to abide by the intent, language, and provisions of the Atomic Energy Act (AEA) and the National Environmental Policy Act (NEPA). We endorse Principles for

Safeguarding Nuclear Waste at Reactors from the Institute for Energy and Environmental Research. (0348-12 [Agnew, David] [Roscoe, Lee])

Comment: Although it never agreed to do so, Massachusetts is forced to host a high-level nuclear waste dump for up to 380 years - if the industry's and regulator's promises are kept. But past promises (40 years of reactor operations and no waste dump) were not kept. Given this history, NRC confidence in a waste plan does not give us any confidence. (0348-5 [Agnew, David] [Roscoe, Lee])

Comment: The environmental impact statement the Nuclear Regulatory Commission prepared for its "Waste Confidence Rule" in response to New York v. NRC is woefully inadequate. (0351-1 [Stein, Robert])

Comment: Petitioners and intervenors have called attention to what is wrong with the NRC Draft Waste Confidence Generic Environmental Impact Statement (DWC GEIS) and backed up their criticism with numerous examples of failing to comply with federal laws, faulty decision-making practices, and poor operating histories. But many of these concerns and facts have been ignored. The NRC fails to abide by the intent, language, and provisions of the Atomic Energy Act (AEA) and the National Environmental Policy Act (NEPA). We endorse Principles for Safeguarding Nuclear Waste at Reactors from the Institute for Energy and Environmental Research. (0352-12 [Roscoe, Lee])

Comment: Although it never agreed to do so, Massachusetts is forced to host a high-level nuclear waste dump for up to 380 years - if the industry's and regulator's promises are kept. But past promises (40 years of reactor operations and no waste dump) were not kept. Given this history, NRC confidence in a waste plan does not give us any confidence. (0352-5 [Roscoe, Lee])

Comment: The draft of the proposed "Waste Confidence Rule" is severely flawed. Many assumptions are based on outdated studies, wishful thinking and declarations of "confidence". I strongly agree with Organizations, such as Union of Concerned Scientists, Nuclear Information and Resource Service, Beyond Nuclear, SLO Mothers for Peace, Alliance for Nuclear Responsibility, as well as with hundreds of citizen groups, scientists and individuals, locally and nationwide, which have correctly identified the many problems with this draft. I make their comments part of my own. (0358-1 [Schumann, Klaus])

Comment: Regarding the DGEIS, I believe it is time to scrap the entire document and start all over. (0358-10 [Schumann, Klaus])

Comment: At the very least, I beg you to keep the present moratorium on nuclear licensing in place & then, be ethical enough to give a deep & thorough review to the up-to-this-date-impossible-to-solve problem of disposing of nuclear waste. And when the true facts are in, we will mostly likely need to muster the courage to close down the existing nuclear plants across this country which have come into old age & have become more unsafe than ever. (0361-4 [Greenfield, Jan])

Comment: Perhaps you could store the waste in the sand with your heads? (0363-1 [Mull, Steven])

Comment: I believe that the proposed GEIS regarding nuclear waste is hopelessly optimistic and not scientifically valid. Please reject this document and direct staff to come up with a document that more accurately reflects the true dangers of nuclear waste. (0370-1 [Wolf, Robert S.])

Comment: Petitioners and intervenors have called attention to what is wrong with the NRC Draft Waste Confidence Generic Environmental Impact Statement (DWC GEIS) and backed up their criticism with numerous examples of failing to comply with federal laws, faulty decision-making practices, and poor operating histories. But many of these concerns and facts have been ignored. The NRC fails to abide by the intent, language, and provisions of the Atomic Energy Act (AEA) and the National Environmental Policy Act (NEPA). (0373-12 [O'Malley, Brian])

Comment: Although it never agreed to do so, Massachusetts is forced to host a high-level nuclear waste dump for up to 380 years - if the industry's and regulator's promises are kept. But past promises (40 years of reactor operations and no waste dump) were not kept. Given this history, NRC confidence in a waste plan does not give us any confidence. (0373-5 [O'Malley, Brian])

Comment: We have summarized our many significant concerns about the high-level radioactive wastes stored at Limerick Nuclear Plant in dangerous fuel pools and casks, and we outlined the many valid reasons we oppose NRC's plan for transport and interim storage. We believe NRC's transport and interim storage plan is really about NRC helping Exelon and other nuclear plant owners to avoid full and permanent financial responsibility and liability for their high-level radioactive wastes. (0377-1-1 [Cuthbert, Lewis])

Comment: ACE rejects NRC'S Generic Environmental Impact Study to make long-term conclusions for nuclear waste storage at Limerick Nuclear Plant or any other nuclear plants in our nation ACE rejects NRC's plan to exclude Limerick from new rules resulting from this NRC Nuclear Waste Study (0377-1-5 [Cuthbert, Lewis])

Comment: NRC is doing the bidding of the nuclear industry and compromised politicians by supporting transport and interim storage of nuclear wastes. NRC is making dangerous decisions that benefit the nuclear industry, but that can be devastating to taxpayers. (0377-2-14 [Cuthbert, Lewis])

Comment: Writing in the GEIS that the environmental impacts caused will be "small" or "small to moderate" is not a substitute for protection. It overlooks the many very possible and probable catastrophic events that can occur and have occurred. It takes no imagination. Just look at the present and the past. (0381-4 [Fasten, Susan])

Comment: I do not have confidence in NRC's Draft NUREG-2157. There are no realistic plans for long-term storage of high level radioactive waste, and I do not believe holding this waste in spent fuel pools and dry cask storage has been adequately studied as a safe indefinite alternative for waste disposal. (0404-1 [Smith, Roger])

Comment: The Draft Generic Environmental Impact Statement (DGEIS) allows the nuclear industry to continue to generate more radioactive waste even though there is no agreed to disposition site for this waste. This makes no sense. I ask the NRC to withdrawn this DGEIS until a safe depository actually exists. (0406-1 [Gerleman, Douglas])

Comment: First, I wish to state my observation that the draft report is massively redundant with much mind-numbing repetition. It seems to have been assembled on a word processor with a few "boiler plate" phrases and paragraphs repeated hundreds of times. I estimate that two-thirds to three-quarters of the report could safely be deleted without any loss of information content at all. A report loaded with so much excess verbiage is not more credible just because it is longer. Instead it buries the significant facts in a mountain of refuse. The report should rather focus on

presenting and developing the factual content in the analyses, by examining scenarios from all sides, and refrain from generalized statements of opinion. Second, the risk analyses in the document are very weak and cannot be supported by the facts. (0410-1 [Nelson, Dennis])

Comment: I urge that you revise the GEIS keeping these principles in mind. (0417-12 [Clark, Terrence])

Comment: The draft GEIS is not consistent with the NRC mission statement. The mission statement of the NRC starts with "protection of human health". (0417-2 [Clark, Terrence])

Comment: The proposed rule should not be adopted. (0422-1 [Dudley, Chris])

Comment: Realistic options must be explored and implemented before time runs out. I strongly object to the seemingly arbitrary change in the NRC policy stating that it will now be okay to leave the nuclear waste where it is, for however long it takes the federal government to create a permanent waste site. That is simply unacceptable. (0423-4 [Graves, Caryn])

Comment: I have no confidence in the Generic Environmental Impact Statement (GEIS) from the Nuclear Regulatory Commission. It is ridiculous to store this waste at this site. There are many potential dangerous events that may occur in this heavily populated and economically important area to allow storage of such hazardous substances at this location. I have no confidence in the NRC. What have they done to gain the public's confidence, nothing. (0426-1 [Morris, Wendy])

Comment: We commend and endorse the Blue Ribbon Commission position and we suggest that the GEIS, in concept and as drafted, is neither compatible with nor supportive of this wise and well-considered approach. (0431-16 [Pascall, Glenn] [Watland, George])

Comment: Residents Organized For a Safe Environment (ROSE) AND MANY CALIFORNIANS, OBJECTS TO THE GENERIC ENVIRONMENTAL IMPACT STATEMENT FROM THE NUCLEAR REGULATORY COMMISSION CONCLUDING THAT NUCLEAR WASTE CAN BE STORED AT SAN ONOFRE INDEFINITELY. OUR PEOPLE SEEK A MORE ACTIVE ROLE IN THE DECOMMISSIONING OF THE SAN ONOFRE NUCLEAR GENERATING STATION (SONGS). WITH SO MUCH EXPOSURE TO DANGER OVER THE FORESEEABLE FUTURE, IT IS ENCUMBERT ON US TO ACT RESPONSIBLY AND OPPOSE THIS GENERIC PLAN. (0433-1 [Stone, Gene])

Comment: We will strongly oppose becoming a permanent nuclear waste site by default, simply because other solutions have failed to materialize or have not been fully explored. With this Resolution, ROSE does formally object to the NRC's incomplete GEIS and seeks to become more actively involved in discussions leading to the best outcome possible concerning this very real and immeasurable threat to ourselves and neighboring communities. It is our fiduciary responsibility to do so on behalf of the citizens. (0433-5 [Stone, Gene])

Comment: I have NO Confidence in the NRC ability to protect citizens of the USA or the world from spent radioactive materials. Please withdraw the draft generic environmental impact statement and provide a thorough and scientifically based revision. (0435-2 [Coor, Kristen])

Comment: The NRC's Waste Confidence Generic Environmental Impact Statement is an exercise in speculation dressed up as science. Simply put, the document relies on the low probability of an accident to justify its position that reactor licensing and relicensing may

resume. I was very young when my mother taught me that by playing with fire, I was going to be burned. The NRC is playing with the "fire" of nuclear waste and putting us all at the risk of being burned. Everyone knows the risks of nuclear waste. Also, everyone knows that storage of high-level radioactive waste in fuel pools and dry casks is not a permanent solution. The whole Yucca Mountain permanent disposal site proposal, read: debacle, would never have been undertaken unless the NRC knew that pools and casks are not a "forever" solution. Yet, the NRC's draft document makes that assertion. (0443-1 [Sabo, Betty])

Comment: The NRC either cares more about its ability to license and re-license nuclear reactors or it cares more about protecting the public from the radioactive poisons that would be released from a radioactive waste accident. The current document proves the NRC cares more for the former and not at all about the later since it uses weak and even shameful arguments for its position. My mother also taught me to assess my life by daily asking myself as I put my head on the pillow at night, "Did I do the best I could today?" The NRC would do well to adopt my mother's test because if the "best" the NRC can do is push nuclear power by using faulty arguments about waste storage then the NRC is not only lying to us but to itself. (0443-11 [Sabo, Betty])

Comment: The NRC should dump this obfuscating, lengthy document and do its job. The NRC should be insisting on a robust waste management system intentionally designed to handle conceivable accidents whether through equipment failure, natural disasters, operator error or any other cause that could release radioactive materials to the environment. (0443-8 [Sabo, Betty])

Comment: It is not your job to "mollify the masses" by protecting the nuclear industry with claims that the environmental risks are "small to moderate" and that nuclear power is one solution to global warming. We are not stupid. We all understand that the damage and threat to humanity and the world by nuclear technology makes global warming look like child's play. (0445-2 [Fasten, Susan])

Comment: What follows are my written comments on the draft Waste Confidence Generic EIS. I have reviewed the document and while grateful that the courts have mandated this process, find that the NRC response to that mandate is not only insufficient in many technical areas but lacks in honesty and integrity. (0447-1-2 [Andrews, Richard])

Comment: Many other elements of the DGEIS are worthy of comment, but my statement will not cover all of the DGEIS deficiencies. (0447-1-9 [Andrews, Richard])

Comment: The companion proposed rulemaking is consequently also seriously flawed both legally and technically, and is inappropriate as public policy and directives to the government and nuclear power industry. (0447-2-10 [Andrews, Richard])

Comment: The Draft Waste Confidence GEIS is nothing more than distraction, denial and deception. It should be withdrawn and totally redirected using reality and honest commitment to prompt solutions for ultimate disposal as a guide toward a sane and safe future. (0447-2-18 [Andrews, Richard])

Comment: Due to the above noted severe inadequacies and inaccuracies of the draft Waste Confidence Generic EIS major revisions must be made or the document abandoned with a report back to the courts that truthfully states these failures of the government to perform its duties to the citizenry. (0447-2-6 [Andrews, Richard])

Comment: In your generic EIS, the impacts are classified as mostly small - that is, until an accident like Fukushima occurs. This EIS does not adequately address, much less, solve the problem. I have NO confidence in your approach or this EIS. (0453-7 [Feathers, Jösan])

Comment: The proposed new Rule on Waste Confidence is deficient in the following three fundamental respects: 3. It does not require the establishment of a permanent National Waste Storage Repository before new or extended licenses are granted. (0454-3 [Waldstein, Joe])

Comment: Realistic options must be explored and implemented before time runs out. I strongly object to the seemingly arbitrary change in the NRC policy stating that it will now be okay to leave the nuclear waste where it is, for however long it takes the federal government to create a permanent waste site. That is simply unacceptable. (0472-4 [Sheridan, Paul])

Comment: The DGEIS fails to fulfill the D.C. Circuit Court's mandate "to properly examine future dangers and key consequences" of spent fuel storage at reactor sites on lands held in trust by the United States for the benefit of federally-recognized Indian tribes. See *New York v. NRC*, 681 F.3d at 473. (0473-16-5 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: In conclusion, it is our opinion the Draft GEIS is inadequate to support a finding that continued storage is safe across sites, and that no further analysis of this issue should be required at the time of site-specific licensing decisions. (0473-4-3 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: I have no confidence in the NRC's waste confidence Draft Generic Environmental Impact Statement. It should be removed for thorough revision. (0475-1 [Graham, Candace])

Comment: The GEIS prepared by the NRC is wholly inadequate and without basis. The GEIS fails to take into consideration costs and environmental impacts of indefinite long term nuclear waste storage in violation of federal law. (0490-4 [Chin, Rebecca])

Comment: This statement also supports the comments of Mary Lampert, Director of Pilgrim Watch regarding the NRC proposed Waste Confidence rule. In total, I respectfully request the NRC to reject the GEIS. (0490-8 [Chin, Rebecca])

Comment: Nothing in the NRC's Draft NUREG-2157 changes these realities. It is apparent that rather than undertake a thoughtful re-examination of the NRC's radioactive waste policies and priorities--which admittedly might have taken considerable time and effort, the NRC chose to hurriedly slap together a document whose only purpose is to provide a thin veneer of a cover to overturn the agency's forced moratorium on reactor licensing and renewal procedures. (0491-3 [Commenters, Multiple])

Comment: Please rethink your proposed rule. (0492-4 [Maghakian, Carol])

Comment: [A]ny NRC policy on Reactor Waste management needs to better address the problems listed above - the present proposal is not acceptable. (0495-7 [Grigg, Richard])

Comment: Until this life-threatening situation is addressed, the World Business Academy can only conclude that the proposed Waste Confidence Rule and EIS is nothing more than a preposterous Con Game, and gives it a resounding vote of NO CONFIDENCE. (0501-5 [Brown, Jerry])

Comment: The purpose of the GEIS is to establish general presumptions regarding the environmental impacts of NRC's licensing decisions regarding "continued storage"¹ [footnote 1 text: The period after the end of the licensed life of operations for a nuclear reactor, and before final disposal in a permanent repository], which may not then be challenged in licensing decisions regarding particular reactors or reactor sites--thereby increasing the efficiency of site-specific licensing processes. (0505-2 [Williams, Jim])

Comment: I DO NOT CONCUR WITH THE PROPOSED RULE AS SAFETY GUIDELINES AND PROTECTIONS ARE NOT INCLUDED.. NRC is in error to say its safe to store spent fuel BEYOND the licensing period for the reactor. This just protects the company operating the spent fuel storage. This proposed rule is not in the best interests of our country, the USA. (0517-1 [Anonymous, JEC])

Comment: NRC is proposing it is feasible to safely store spent nuclear fuel beyond the licensed life for operation of a reactor and to have a mined geologic repository within 60 years following the licensed life for operation of a reactor. Because of the supposition, NRC should add the above comments to the Proposed Rule to insure safe implementation of NRC nuclear spent fuel waste storage. If ALL Items 1 - 7 above, are not feasible or not added to the ruling, then the proposed rule is flawed and should NOT be implemented. (0517-4 [Anonymous, JEC])

Comment: I strongly object to the seemingly arbitrary change in the NRC policy stating that it will now be okay to leave the nuclear waste where it is, for however long it takes the federal government to create a permanent waste site. That is simply unacceptable. Realistic options must be explored and implemented. (0528-1 [Brown, Susan])

Comment: We are opposed to all licensing activities that rely on the Waste Confidence rule and question the adequacy of the new Waste Confidence Generic Environmental Impact Statement. CWFNC also finds that the proposed rule (10 CFR. 51.23) is insufficient for realistically predicting potential environmental impacts of indefinite spent fuel storage. The Draft GEIS should be sent back to the drawing board, the proposed rule should be voided[.] (0531-1-1 [Morgan, Sally])

Comment: In creating the GEIS and new rule, the NRC is prioritizing agency efficiency and cost effectiveness, rather than prioritizing health and environmental safety[.] (0531-1-10 [Morgan, Sally])

Comment: The NRC has treated the Waste Confidence issue as a public relations issue, not as a serious concern for safety and environment. The US has no solution for nuclear waste, and the NRC refuses to admit to the immediate and future risks it poses. Waste Confidence is simply a policy of false promises, used to promote the industry by pretending its real problems don't exist. (0531-1-13 [Morgan, Sally])

Comment: There is no safe storage solution for nuclear waste, and NRC's new Waste Confidence policy is no more credible than the one the courts threw out. (0531-1-15 [Morgan, Sally])

Comment: The NRC's Waste Confidence rule, as well as the new GEIS and rule, serve to streamline nuclear plant licensing while still effectively ignoring the problem of what to do with the radioactive waste. (0531-1-9 [Morgan, Sally])

Comment: We are opposed to all licensing activities that rely on the Waste Confidence rule and question the adequacy of the new Waste Confidence Generic Environmental Impact

Statement. CWFNC also finds that the proposed rule (10 CFR. 51.23) is insufficient for realistically predicting potential environmental impacts of indefinite spent fuel storage. The Draft GEIS should be sent back to the drawing board, the proposed rule should be voided[.] (0531-2-1 [Morgan, Sally])

Comment: In creating the GEIS and new rule, the NRC is prioritizing agency efficiency and cost effectiveness, rather than prioritizing health and environmental safety[.] (0531-2-10 [Morgan, Sally])

Comment: The NRC has treated the Waste Confidence issue as a public relations issue, not as a serious concern for safety and environment. The US has no solution for nuclear waste, and the NRC refuses to admit to the immediate and future risks it poses. Waste Confidence is simply a policy of false promises, used to promote the industry by pretending its real problems don't exist. (0531-2-23 [Morgan, Sally])

Comment: There is no safe storage solution for nuclear waste, and NRC's new Waste Confidence policy is no more credible than the one the courts threw out. (0531-2-25 [Morgan, Sally])

Comment: The NRC's Waste Confidence rule, as well as the new GEIS and rule, serve to streamline nuclear plant licensing while still effectively ignoring the problem of what to do with the radioactive waste. (0531-2-9 [Morgan, Sally])

Comment: The GEIS fails to take into consideration costs and environmental impacts of indefinite nuclear waste storage in violation of federal law. (0537-4 [Commenters, Multiple])

Comment: I respectfully request the NRC reject the GEIS as inadequate, without basis in violation of NEPA. (0537-9 [Commenters, Multiple])

Comment: The Nuclear Regulatory Commission (NRC) should dismiss the findings of its Waste Confidence Generic Environmental Impact Statement. The study is flawed and should not become the excuse for leaving dangerous nuclear waste behind at closed nuclear plants. I oppose the GEIS findings that highly radioactive nuclear waste can be safely stored in current temporary facilities above ground for the long term on the grounds of the closed San Onofre plant and at similar temporary facilities near all other nuclear plants closed or still operating nationwide. (0540-1 [Watland, George])

Comment: The U.S. Nuclear Regulatory Commission seeks public input on NRC NUREG-2157, also known as the Waste Confidence Generic Environmental Impact Statement. The apparent intent of this Statement is to justify storing nuclear fuel waste on-site at closed nuclear power plants for decades or even longer, with no requirement to move the waste at any point to a less hazardous location. The NRC Statement rates the risks of on-site storage as almost insignificant. This is not credible at any site. (0540-3 [Watland, George])

Comment: The NRC should recognize that the attempt to use a GEIS to wish away this problem is fundamentally flawed, and should return to the sound policy proposed by its own Commission. (0540-9 [Watland, George])

Comment: The woefully inadequate draft GEIS is too generic -- it fails to address the complicated and long-lived dangers of managing and storing highly radioactive, spent nuclear fuel. (0542-1 [Paleias, Lewis] [Paleias, Linda])

Comment: First, I reject the NRC's waste confidence draft Environmental Impact Statement (DGEIS), and I ask the NRC to withdraw it for thorough revision. (0543-2 [Senkiw, Sheryl])

Comment: To summarize, the GEIS may be more adroit in analyzing and solving technical challenges, but in terms of analyzing and answering to the political and administrative challenges posed, is poised to create one of the greatest "unfunded mandates" in U.S. history-- a challenge will not be solved by simply ignoring its existence. (0547-5 [Weisman, David])

Comment: There is no basis in science, engineering, the behavior of the nuclear industry and the Nuclear Regulatory Commission (NRC) for confidence that high level radioactive withdrawn fuel rods ("spent fuel") can or will be managed with no risk to the biosphere for as long as the radioactivity last . For the NRC and the nuclear industry to assert probabilistic assessments of what will happen to radioactive material over 240,000 (plutonium) to a billion years is a fraud and a con game. There is insufficient data for such probabilistic assessments to have validity. Apart from that, even a small likelihood of the risk of a serious untoward event involving spent fuel could be catastrophic for all life forms, air, water and land. Nuclear accidents cannot be undone. (0552-1-1 [Macks, Vic])

Comment: NRC is treating nuclear waste not as a major human health and an environmental problem, but as a public relations issue. The U.S. has no solution for nuclear waste, and NRC refuses to address the immediate risks it poses. Waste Confidence is simply a policy of false promises, used to promote the industry by pretending its real problems don't exist. The NRC's new Waste Confidence policy is no more credible than the one the Appeals Court in DC vacated in 2012. (0552-1-15 [Macks, Vic])

Comment: What should be done? The draft study should be withdrawn and efforts to incorporate it into the NRCs regulatory framework should be halted. NRC should start with a clean slate and sponsor a proper investigation of the physics and chemistry of pool fires. Given that NRC lacks the in-house credibility to do this work, the agency should reach out to a broader pool of expertise and follow scientific principles. (0552-2-28 [Macks, Vic])

Comment: Pilgrim Watch (Herein after "PW") provides comment regarding the Proposed Waste Confidence Rule and its supporting documents that apply to storage of spent fuel after the end of operator's licensed life. PW disagrees with the rulemaking's and supporting document's methodology, assumptions and conclusions. (0556-1-1 [Lampert, Mary])

Comment: The proposed rule that accompanies the DGEIS incorporates the latter's baseless conclusions, and would continue to prohibit any public intervention of spent fuel issues in future licensing decisions. The Proposed Rule and Draft GEIS should be shredded. (0556-1-4 [Lampert, Mary])

Comment: Rather, the NRC should do what the Court of Appeals ordered. In *New York v. NRC*, 681 F.3d 471 (D.C. Cir. 2012), the Court ordered NRC to conduct a "full analysis" of "the potential environmental effects" of storing spent fuel onsite at nuclear plants "on a permanent basis." 681 F.3d at 479 NRC did not do the "full analysis." It simply assumed that permanent storage was safe. NRC must do a new EIS that complies with the Court's order, examines the probability that an environmentally justified offsite repository will be built and by what date. To do so, the NRC also must conduct a science-based analysis showing the public health and environmental consequences of spent fuel fire risks (including acts of malice) and spent fuel leaks that may occur if offsite storage is unavailable. (0556-1-5 [Lampert, Mary])

Comment: The proposed Waste Confidence Rule rests largely on supporting documents - the draft GEIS, seriously outdated referenced documents, and the NRC's Draft Consequence Study of a Beyond-Design- basis Earthquake Affecting the Spent Fuel Pool for a US Mark I Boiling Water Reactor. The document's methodology, assumptions and findings are faulty. (0556-1-8 [Lampert, Mary])

Comment: PW does not support the DGEIS's environmental assessment of "small impact." The DGEIS' findings are not "real," but were concocted to reach a desired, not a correct, result. (0556-1-9 [Lampert, Mary])

Comment: PW supports NRC going back to the drawing board to perform a sufficient scientifically defensible document. (0556-5-11 [Lampert, Mary])

Comment: In 1979, as an intervener for the Trojan Nuclear Power Plant Spent Fuel Pool Expansion (50-344), the NRC refused to allow me to raise the issue of the time period that wastes would or could remain in the Trojan spent fuel pool. I was told that within 5 years the federal government said that it would have an available repository. The NRC panel thus refused to allow me to ask the question. When I showed new information, obtained subsequent to licensing, that Trojan could not withstand an earthquake that was twice what the reactor was built to withstand, the NRC panel told me it was res judicata, and wouldn't allow the issue to be raised. Well, here we are today, more than 30 years later, with the NRC and its horde of lawyers still floundering about in a state of abysmal denial about the back end of the fuel cycle and with no long term plan to store or dispose of about 80,000 tons of nuclear waste. Spent fuel pools are bulging with re-racked waste subject to fires, terrorist attacks, airplane crashes and earthquakes. The NRC generic statement is just another shell game to keep building and operating nuclear power plants and deny the problem of continuing to generate the waste. In the face of Chernobyl and Fukushima, the NRC pretends nothing has happened or can happen to threaten life on the planet from meltdowns or a terrorist attack on a spent fuel pool. (0559-1 [McCoy, Dave])

Comment: 1. First, the opening statement in the Draft GEIS demonstrates a bias towards licensing a storage or disposal facility. NRC states: "Since the inception of nuclear power, the U.S. Nuclear Regulatory Commission (NRC) (including its predecessor, the Atomic Energy Commission) has worked to find a disposal solution for spent nuclear fuel ... generated by commercial nuclear power reactors"¹ [footnote 1 text: Draft GEIS at 1-1] Congress granted NRC "all the licensing and related regulatory functions of the AEC [Atomic Energy Commission]."² [footnote 2 text: P.L. 93-438 § 201(f)] Given its safety and regulatory obligations, it is essential that NRC not engage in the search for a site specific disposal or storage solution. If NRC is to perform its statutory duties to protect public health and safety, it is critical that NRC's licensing and regulatory evaluations be clearly independent, objective and not biased towards finding a disposal solution. The Blue Ribbon Commission on America's Nuclear Future ("BRC") similarly emphasized that "clearly independent, competent regulators [are] essential" in the evaluation of storage and disposal facilities.³ [footnote 3 text: The Blue Ribbon Commission on America's Nuclear Future, Report to the Secretary of Energy (BRC Report), January 2012, at x; see also at 62 (expressing that accountability is effective with independent regulatory oversight); 66 (independent radiological health and safety)] Utah appreciates and acknowledges Chairman Allison M. Macfarlane's recognition that "NRC is not the responsible Government authority in leading or making decisions on national policy in the back end of the nuclear fuel cycle" and the need for NRC to remain independent of site selection to protect public health, safety, and the environment.⁴ [footnote 4 text: NRC Notation Vote, SECY-13-0061-Proposed Rule: Waste Confidence-Continued Storage of Spent Nuclear Fuel (RIN 3150-AJ20), Chairman Allison M.

Macfarlane (July 12, 2013) at 2] The State of Utah urges Chairman Macfarlane to reflect her position in the final GEIS. (0579-1 [Smith, Amanda])

Comment: In conclusion, I hereby unequivocally cast a "No Confidence" vote on the current version of the proposed Waste Confidence Rule, and I strongly agree with the NRC's critics who correctly characterize the proposed Rule as a "con" and as a "false assurance" based on a foundation of "hubris, fantasy and delusion." (0603-19 [Schonberger, David])

Comment: I do NOT support the proposed NRC Rule that is the subject of these comments, and I emphatically dispute the premises, assumptions and conclusions of the Waste Confidence DGEIS. Therefore, I declare my opposition to using the DGEIS: (a) to support and form the regulatory basis for promulgating the proposed revised Rule, and (b) to codify the DGEIS determinations and conclusions into the text of the proposed revised Rule. (0603-2 [Schonberger, David])

Comment: Delete, vacate, remove and withdraw all of the proposed revisions and all of the proposed conforming amendments and language changes to 10 CFR Part 51. (0603-5 [Schonberger, David])

Comment: The DGEIS, which serves as the technical supporting basis and rationale for promulgating the proposed revised Rule, is fundamentally and fatally flawed, and its generic structure and presuppositions are inherently erroneous and absurd. Garbage in, garbage out. (0603-8 [Schonberger, David])

Comment: The "Waste Confidence Rule" GEIS prepared by the Nuclear Regulatory Commission (NRC) does not adequately address the future impacts of nuclear waste storage at U.S. nuclear reactors, especially for specific reactors such as Indian Point nuclear power plant in Buchanan, NY. (0604-1 [Pisha, Gayla])

Comment: We write to raise concerns about the Draft Generic Environmental Impact Statement on Waste Confidence (DGEIS). In particular, we urge the NRC to further consider plant-specific impact analysis, dry cask storage of nuclear waste, and the impacts of long term plant-based nuclear waste storage. (0607-1 [Messinger, Michael])

Comment: We appreciate the work that the NRC put into crafting the DEGIS. Our comments address what we see as deficiencies in the document, and hope that the NRC will consider our proposals as they move forward with the rulemaking process. (0607-7 [Messinger, Michael])

Comment: Nevertheless, the North American Water Office (NAWO) is at a loss in terms of understanding how otherwise seemingly rational and decent human beings could possibly have put such an insane, absurd pile of crap as this Draft Generic Environmental Impact Statement (GEIS) out for public comment. Yet there it is. (0608-3 [Crocker, George])

Comment: It is arbitrary and disingenuous for the NRC to base its GEIS on false assumptions and non-existent data. The circumstances and facts at Indian Point are contradictory to the main foundational assumptions of the GEIS. Any findings made based on this inaccurate and misleading GEIS will be invalid evaluating the environmental impacts of long term or permanent storage of radioactive waste at Indian Point. (0611-38 [Shapiro, Susan])

Comment: [T]he GEIS is incomplete and inadequate and cannot be used as a basis for any Decisions or Determinations regarding Waste Confidence. (0611-6 [Shapiro, Susan])

Comment: For all of the above reasons, the GEIS fails to satisfy the requirements of a NEPA environmental review and must be rejected as arbitrary, capricious, inaccurate, incomplete and invalid. (0611-61 [Shapiro, Susan])

Comment: I DO NOT HAVE CONFIDENCE IN THE WASTE CONFIDENCE RULE ISSUED BY THE NUCLEAR REGULATORY COMMISSION. (0612-7 [Takarabe, Tamae])

Comment: I absolutely reject NRC's waste confidence Draft Generic Environmental Impact Statement (DGEIS) and demand that you withdraw it for thorough revision. Based on the horrifying reality of nuclear waste and its toxic potential for thousands of years, I have NO confidence in NRC's waste confidence. (0617-1 [Zure, Lisa])

Comment: As a resident of San Clemente, CA, I would like to strongly oppose the GEIS report. (0618-1 [Johnson, Roger])

Comment: The plan should be based on science, not on PR considerations. The GEIS report reads like a PR document promoting the nuclear industry. It minimizes, ignores, dismisses and trivializes true dangers. It grossly overstates safety and expresses blind faith in the most optimistic possibilities. Its excessive reliance on probabilistic risk analysis is unwarranted and unprofessional. Everyone knows that risk analysis is heavily flawed and full of questionable assumptions. (0618-13 [Johnson, Roger])

Comment: Nuclear waste has been accumulating here since 1968. We have housed it long enough (about a half-century) and it is outrageous that you want to keep it here for another 60 years (or 160 or forever). The GEIS report is not a plan. Rather it is an avoidance of responsibility. The NRC logo says "protecting people and the environment" but this is a plan to do the opposite. The idea of labeling this time period as "short term" and "temporary" is irresponsible. Since the GEIS report is not a plan but rather a continuation of doing nothing, you need to completely revise it with a serious plan. (0618-5 [Johnson, Roger])

Comment: First, I find it inexcusable that the NRC, with its massive allocation of taxpayer funding, huge staff and powerful responsibility to oversee (or "regulate") the most dangerous, expensive, and problem-fraught industry in the history of the world has drafted and released a statement and proposed rule that make a mockery of the National Environmental Policy Act, the needs of the American people, and our legal system. Issuing a "generic impact" statement that ignores the main focus of the U. S. Court of Appeals, D. C. circuit ruling and its own purported mission that includes "to protect public health and safety...and protect the environment" the Commission has provided a the document that appears to be another smokescreen for not only the 56 years of accumulated high-level radioactive waste in this country but for allowing the creation of "waste" products from the mining, milling, enrichment and generation of power to continue unabated. (0620-1 [Rivera, Evelyn])

Comment: In my opinion, the Generic Environmental Impact Statement has not addressed the three deficiencies identified by the Court, is inconsistent with the requirements of the original Waste Confidence Rule, as updated, is grossly misleading in applying a "generic" rather than site-specific approach. In addition, it failed to admit that without site designation, design, and realistic time frame for completion of a permanent site for safe disposal of radioactive waste there can be no confidence in the proposal and the accompanying. (0620-11 [Rivera, Evelyn])

Comment: The NRC has, once again, illustrated that its concerns are with the "efficiency" of the industry rather than concerns for the safety of the American people. (0620-4 [Rivera, Evelyn])

Comment: I absolutely reject NRC's waste confidence Draft Generic Environmental Impact Statement (DGEIS) and demand that you withdraw it for thorough revision. Based on the horrifying reality of nuclear waste and its toxic potential for thousands of years, I have NO confidence in NRC's waste confidence. (0621-1 [Casebier, William])

Comment: We believe there are many issues not properly addressed by the DGEIS, specifically related to the storage of hazardous nuclear spent fuel at Entergy's Pilgrim Nuclear Power Station in Plymouth, Massachusetts (Pilgrim). (0622-1-1 [Vale, Karen])

Comment: These regional issues are challenging and require unique understanding, preparation, and mitigation strategies. The DGEIS attempts to legitimize destruction to the environment by complying with the letter of the law, but not with the spirit or true intent of the law, which is to preserve the environment as we develop industry to suit our needs. (0622-1-6 [Vale, Karen])

Comment: There are many technical shortcomings in the DGEIS; many issues that are not addressed properly in the report. (0622-4-13 [Vale, Karen])

Comment: There is no real way to manage nuclear waste, therefore no extension should be granted to find a solution to waste. If the Nuke industry cannot figure after 60 years what to do with their waste products, an extension will not make a difference. (0623-4 [Individual, Anonymous])

Comment: I am adamantly against any extension of the current time constraints with respect to spent nuclear fuel being 'stored in place' at any generating plant anywhere on the planet. (0629-1 [Individual, Anonymous])

Comment: The draft Environmental Impact Statement is inconsistent with the Nuclear Waste Policy Act and does not adequately protect human life or the environment. It should be withdrawn. The proposed Waste Confidence rule does not move national policy toward a sustainable solution to nuclear waste management. Instead it strives to find a waste policy that will allow the NRC to license new reactors without public input regarding spent fuel storage. The proposed rule should be withdrawn. (0646-23 [Hanson, Courtney])

Comment: APV [Alliance for Progressive Values] is deeply skeptical of recent NRC's proposed Waste Confidence Draft Generic Environmental Impact Statement (DGEIS), and we ask the NRC to withdraw it for thorough revision. Below is our critique and suggestions for revision. (0648-1 [Price, Scott])

Comment: APV opposes the NRC draft plan for Waste Confidence DGEIS. (0648-13 [Price, Scott])

Comment: I doubt you have the cajones to exercise the appropriate amends, but you ought to feel compelled to do everything you can, beginning NOW, by rejecting this absurd farce of a Propose Rule. (0651-3 [Wells, Jim])

Comment: The latest Waste Confidence document is simply more fraudulent language making promises and predictions that can not and will not be accomplished or attained. You are obviously kicking the can down the road, again. (0652-4 [Maurer, William])

Comment: This document is "generically" smoke and mirrors.....labeled as "confidence" in title only. Shame on you for passing this document off as science when it's little more than wishful and magical thinking designed to create the perception of confidence. (0652-6 [Maurer, William])

Comment: Are we as a nation capable of such an undertaking? Can we legitimately say it is in our people's interest to keep generating nuclear waste? Do we have an obligation to the other people and creatures of this planet to stop making nuclear waste? Re-write this law with sanity at it's core instead of madness. (0662-8 [McClintock, Francene])

Comment: The Generic Environmental Impact Statement is inappropriate and should be rejected across the nation[.] (0665-2 [van Thillo, Grace])

Comment: Finally, analysis in the draft GEIS should be strengthened to address unsupported assumptions, discrepancies and omissions as identified above. (0669-18 [Walter, Joan])

Comment: As such, the document fails to rigorously and objectively evaluate the no-action alternative, and other reasonable alternatives, and it undermines NEPA's purpose of promoting informed decision making and citizen involvement. (0669-2 [Walter, Joan])

Comment: Millions of people in this country living within close proximity to these radioactive wastes are depending on you to ensure that they are 100 percent safely and securely stored for the indefinite future. That is certainly a daunting task, but it is made all the more uncertain by the false and poorly defended assurances contained in your draft GEIS. (0680-3 [Bogen, Doug])

Comment: The people of San Luis Obispo, California, including myself, who are not employed by PG&E, have NO CONFIDENCE in the Waste Confidence Rule. I urge you to begin the of decommissioning Diablo Canyon Nuclear Power Plant immediately. (0686-21 [Malboeuf, Simone])

Comment: For these reasons and many others, the Draft GEIS is not scientifically valid and remains no more than a hope. I urge you to reject the Draft GEIS... (0686-6 [Malboeuf, Simone])

Comment: I encourage you in the strongest possible terms to go back to the drawing-board with a new EIS. (0687-6 [Wilansky, Laura])

Comment: I frankly have no confidence that the Draft Environmental Impact Statement and the current plans for disposal of nuclear waste are adequate, safe or sufficient. (0687-8 [Wilansky, Laura])

Comment: The GEIS as proposed by NRC and supported by the nuclear industry is a deliberate effort to close out all public due process rights on unresolved nuclear waste issues arising from new licensing and relicensing of nuclear facilities. (0691-1 [Gunter, Paul])

Comment: The Nuclear Regulatory Commission and the nuclear industry are now charting a similar attempt to unreasonably disassociate the expansion and extension of the nuclear waste hazard site-by-site from a reviewable environmental impact statement and a scientifically responsible and demonstrated waste management plan for that nuclear waste. This effort constitutes what amounts to "a confidence game" where the perpetrator seeks to defraud its victim by falsely winning their trust and confidence. (0691-12 [Gunter, Paul])

Comment: Beyond Nuclear therefore opposes the current reframing of the Waste Confidence Decision and the associated rulemaking. (0691-14 [Gunter, Paul])

Comment: The lack of both scientific and societal acceptance for the long-term management of nuclear waste gives rise to legal, civil and humanitarian violations of future generations. The public reasonably recognizes that the current Waste Confidence Decision seeks to disconnect irresponsible nuclear waste dumping from unlimited nuclear waste production. (0691-4 [Gunter, Paul])

Comment: The public recognizes that without a site-specific review and no limits on the production of nuclear waste, it is not reasonable to have confidence in responsibly managing nuclear waste once it is generated for the time frames imposed. (0691-6 [Gunter, Paul])

Comment: As discussed above, until the requested actions are completed, the rulemaking and DGEIS are patently defective. (0692-18 [Skov, Jeff])

Comment: We have NO Confidence in the NRC's ability to safely deal with the enormous problem of nuclear waste. The federal government continues to promote nuclear energy and weapons, and given this reality we have NO confidence that the government is capable of a comprehensive plan to deal with the mounting problem of nuclear waste in a manner that sufficiently protects the public and the environment for millions of years and future generations. (0693-1-1 [Warren, Barbara])

Comment: The regulatory analysis provides part of the reason for the con. "[T]his regulation does not establish any requirements that would place a burden on licensees." (Fed Reg, 10 CFR Part 51 Waste Confidence Proposed Rule, Sept, 13, 2013 p.56803.) NRC's approach to the GEIS has ensured that reactor owners (licensees) will not be burdened at all. While most of us have focused our concern on the terrible treatment of health and environmental impacts, the reality is that if this draft GEIS is allowed to stand, this nation will never need a geological repository because the NRC has determined that there are no significant environmental impacts associated with indefinite storage of spent fuel at reactors or at independent installations. This is despite the fact that long term storage at reactors was never part of the original licensing process, and therefore not thoroughly evaluated. (0693-1-14 [Warren, Barbara])

Comment: The Draft Generic EIS we were presented with starts with an enormous set of problems: •Scientific and technological failure for more than 60 years to solve the "simple" problem of nuclear waste. (0693-1-3 [Warren, Barbara])

Comment: Numerous members of the public have testified in public hearings to their lack of confidence in waste management by the nuclear industry and the NRC, including the con job they believe is being perpetrated on the public regarding this waste confidence activity. A "con" can be a verb or a noun. As a verb it means to trick or cheat somebody dishonestly, by first convincing the victim of something that is untrue; in other words, to lie. As a noun it is a dishonest trick or ploy that takes advantage of somebody's trust. It can also be an argument against doing something or saying it should not be done. (0693-1-8 [Warren, Barbara])

Comment: The NRC faced a fundamental challenge when it was ordered by the court to study the environmental impacts of the failure to obtain a geological repository. Since the nation had determined that only a geological repository represented safe disposal, in the absence of one, how could the Agency deal with long term and indefinite storage of spent fuel? We now know the answer-- by limiting the analysis to situations of low impact, by using inappropriate assumptions, by rigging the analysis and the outcome, by misrepresenting the truth or lying, and by providing no scientific or factual support for the results. (0693-1-9 [Warren, Barbara])

Comment: I. The Draft Generic EIS lacks the science and technical analysis usually found in environmental impact analyses. Instead the NRC continues to advance its own belief system-- its "confidence" in its ability to deal with nuclear waste, originally first expressed in 1984, but eventually struck down by the court in 2010 for the lack of analysis. Even the NRC belief system was undermined when 30 years after its original waste confidence decision, there is no geologic repository available and the agency is forced to revise its beliefs to include indefinite on-site storage of used nuclear fuel. Still nothing has really changed by the production of this GEIS. NRC is still operating with a belief system- "waste confidence"- that is divorced from reality and that has no scientific or technical support. (0693-2-1 [Warren, Barbara])

Comment: III. We Oppose the Proposed Action which is to adopt a rule incorporating the conclusions of the draft GEIS, ensuring that site-specific NEPA analyses of continued spent fuel storage and the associated environmental impacts are never adequately reviewed. (0693-2-11 [Warren, Barbara])

Comment: The GEIS is a completely unscientific document. It is based on faulty assumptions and it avoided looking at the most significant environmental impacts. Therefore, it has absolutely no future value. The GEIS should be discarded as unscientific, inadequate for the stated purpose and unresponsive to the Court order. See our detailed discussion of GEIS failings in Section VII. (0693-2-12 [Warren, Barbara])

Comment: The fundamental lack of science in the draft GEIS provides a substantive reason for it to be discarded and never used in the future by the NRC. (0693-2-5 [Warren, Barbara])

Comment: VII. The GEIS has a long list of significant problems and as a result it cannot be relied on as any kind of reference document for the environmental and public health impacts of spent nuclear fuel and its storage. (0693-3-10 [Warren, Barbara])

Comment: In general, the NRC has failed since its first Waste Confidence decision to establish a factual basis for its "confidence" instead it has regularly adjusted its timeline of when it believed waste would be handled by a permanent repository. In 1984, spent fuel would be handled on-site for a maximum of 70 years. Forty years of the reactor license and 30 years beyond that when a repository would be available. The Commission finding included reasonable assurance that one or more repositories "will be available by the years 2007-2009." (Fed. Reg, Proposed Rule, Sept. 13, 2013, p.56778) In 2008, the NRC assumed 40 years of the first license and 2 renewals-- 80 years and then 60 years of storage on site for a total of 140 years, double the estimate in 1984. Then NRC merely said a repository would be available when necessary. The GEIS defines short term storage as 140 years. Long term storage is for another 100 years, a total of 240 years. Indefinite storage continues indefinitely to the future. None of this storage has any potential significant environmental or health impacts according to the NRC, despite the nature of the hazard. The GEIS like the Waste Confidence decision reflects an opinion or point of view with no substantiation. (0693-3-2 [Warren, Barbara])

Comment: (Tune: "Little Drummer Boy") Not So Little Draft GEIS[.] The GEIS Report is Dumb dumb dumb dumb[.] With assurances that are Dumb dumb dumb dumb[.] Like old spent fuel pools will last A hundred more year Nothing to fear Dumb dumb dumb dumb[.] And corporations wrapped in LLC Won't cut out and flee Dumb dumb dumb dumb [.]And contractors won't make a mistake Cut me a break That's just Dumb dumb dumb dumb[.] (0699-1 [Lee, Michel])

Comment: And who can forget how Davis-Besse Was nearly a big Nuclear messy[.] GEIS is just so Dumb dumb dumb dumb Dumb dumb dumb dumb[.] (0699-3 [Lee, Michel])

Comment: The draft Environmental Impact Statement is inconsistent with the Nuclear Waste Policy Act and does not adequately protect human life or the environment. It should be withdrawn. The proposed Waste Confidence rule does not move national policy toward a sustainable solution to nuclear waste management. Instead it strives to find a waste policy that will allow the NRC to license new reactors without public input regarding spent fuel storage. The proposed rule should be withdrawn. (0700-7 [Women's Action for New Direction, Georgia])

Comment: I have No Confidence in the theory that an indefinite storage solution will ever be a reality. (0701-6 [Wilson, Greg])

Comment: I believe the DGEIS should be withdrawn and totally revised. I have NO confidence in it! (0702-1 [Scarff, Steve])

Comment: So, back to the FEDERAL REGISTER, not some Industry Pamphlet ... While they are wonderful ideas and THANK YOU for expanding the nuclear energy projects and, THANK YOU to whomever it was at the NRC to at least point out that it is all untested and we don't know what will happen disclaimers, of course, the question is -- How does this serve the mission of the NRC? When all the people are sick and dead, how does this kind of approach to rule making serve the mission of the NRC? It doesn't. Why is this in the Federal Register?! Thank you at least for putting my comments in the record. (0703-13 [Vandel, Nikohl] [Vandenberg Clermont, Elaine])

Comment: We thus recommend that the Commission go back to the drawing boards on this DGEIS and proposed rule, and provide for a process that ensures a more balanced and effective approach to promoting nuclear energy by ensuring the safe disposal of SNF at a federal responsibility in accordance with the NWPA, the Standard Contracts, and the long history of federal commitments for SNF disposal that gave rise to the attendant authorization for civilian development of nuclear energy in the first instance. (0704-11 [Callen, Ronald C.] [Keskey, Donald L.])

Comment: The DGEIS and proposed rule do not provide a credible path to ensure SNF disposal at any reasonable future time period. (0704-2 [Callen, Ronald C.] [Keskey, Donald L.])

Comment: The DGEIS and proposed rule appear aimed at promoting the further development of nuclear energy by detaching any concrete obligations for the safe disposal of the SNF generated from nuclear energy. (0704-7 [Callen, Ronald C.] [Keskey, Donald L.])

Comment: In September 2013 NRC issued its Draft GEIS, intending to comply with the Court's Waste Confidence Decision and the subject of today's comments. However, NRC's Draft GEIS fails to comply with the D.C. Circuit's plain direction, thus violating (again) the National Environmental Policy Act, 42 U.S.C. § 4321, et seq. The institutional, legal and regulatory history of managing and, perhaps one day, disposing of nuclear waste, is complicated. But the issue of the agency's failure in this instance and what it must do to rectify this failure is straightforward. (0706-1-1 [Fettus, Geoffrey])

Comment: As per the Court's direction, NRC must: 1) properly identify the major federal action necessitating an environmental impact statement; 2) evaluate the environmental effects of failing to secure permanent storage, with associated alternatives and mitigation strategies; and 3) properly examine future dangers and key consequences with respect to spent fuel pool fires and leaks. NRC has failed to perform each of these actions. (0706-1-2 [Fettus, Geoffrey])

Comment: In closing I want to quote from the movie Pandora's Promise, or, more accurately, Pandora's Broken Promises, which was mentioned in Oakbrook two nights ago, when the people in Chicago came and gave testimony. A person was walking through the ruins at Fukushima, looked around and said, "This wasn't supposed to happen this way." But it did. And reassurances that have no basis in fact continue to erode our trust in the NRC. That is why we can't have any confidence in a Generic Environmental Impact Statement. (0708-7 [Lewison, Linda])

Comment: Based on the foregoing, NRC's DGEIS is inadequate for failing to consider or account for numerous site-specific concerns implicated by the prospect of storing thousands of tons of nuclear waste at reactor sites for long-periods of time. As a result, the DGEIS does not justify or support the proposed rule, which would effectively preclude the consideration of the environmental impacts of waste storage in future reactor and waste storage licensing proceedings. (0710-24 [Brancato, Deborah] [Musegaas, Philip])

Comment: We groups, composed of and representing people impacted by NRC licensing, fundamentally oppose being treated as a "cost" to be systematically "reduced" for the nuclear industry "benefit". If there is a nuclear disaster or any environmental contamination (fast or slow, planned or accidental) we all lose, future generations too. (0711-1 [Olson, Mary])

Comment: As stated in the text of our comments, the Draft GEIS violates NEPA and NRC regulations as well as UN principles and higher moral laws, such as the precautionary principle, and basic logic. (0711-24 [Olson, Mary])

Comment: Statutes and Principles[:] We make these comments under the National Environmental Policy Act, the regulations of the NRC and the laws that empower the NRC to propose the "Waste Confidence" rule (78 Fed. Reg. 56,776 (Sept. 13, 2013)) and the Draft "Waste Confidence" Generic Environmental Impact Statement (Draft GEIS, NUREG 2157). Since these federal statutes and regulations as currently interpreted do not adequately protect our health and security, or that of future generations, we also make these comments under the authority of principles established by The Permanent People's Tribunal on Chernobylⁱⁱ [footnote ii text: Chernobyl: Environmental, Health And Human Rights Implications, Vienna, Austria, 12 - 15 April 1996 (Permanent People's Tribunal Session) January 1, 1999. Solange Fernex (Editor).], The Universal Declaration of Human Rights,ⁱⁱⁱ [footnote iii text: Articles 3 and 6 in particular. http://www.ohchr.org/EN/UDHR/Documents/UDHR_Translations/eng.pdf.] The United Nations Declaration on the Rights of Indigenous People^{iv} [footnote iv text: See: http://www.un.org/esa/socdev/unpfii/documents/DRIPS_en.pdf, particularly Articles 19 and 29 and 32.], and most importantly the Principle of Precaution.^v [footnote v text: See: <http://www.sehn.org/state.html#w> Most simply: Do No Harm; if there might be harm, then Protect First, Study Second; Act Third. If there is already (or could be) harm, those who advocate for the harmful practice are the ones who should pay the costs associated with preventing, reversing and redressing the harm while conforming to 1, 2, and 3.] Further we support the Principles invoked at the NRC GEIS comment meeting in Perrysburg OH, hard won in the 20th Century: it is not sufficient to say "it was my job description" or "I was following orders."^{vi} [footnote vi text: See oral comments by Michael Keegan, Don't Waste Michigan, and also: http://legal.un.org/ilc/texts/instruments/english/draft%20articles/7_1_1950.pdf.] A sustainable future does not include production (or authorization of production) of any more radioactive waste. The impacts NRC is dismissing as SMALL and "insignificant" from waste generation, management, storage, transport are financially and environmentally costly, and potentially deadly. (0711-5 [Olson, Mary])

Comment: The reliance on the "Human Exceptionalist Paradigm" which suggests that although we don't know what to do with it now, we'll figure it out later because we are so exceptional is snake oil. Societal costs have been exorbitant, loss of liberty, loss of health, loss of finances. This is a Confidence Game and it has always been such. (0713-2 [Keegan, Michael J.])

Comment: [T]he DGEIS is unacceptable as a basis for Rulemaking. (0714-1-9 [Edwards, Gordon])

Comment: In any event, the existing DGEIS is inadequate as a basis for NRC rulemaking. (0714-2-7 [Edwards, Gordon])

Comment: NEIS submits that the DGEIS as written is inadequate to both the task of satisfying the directives of the U.S. Court of Appeals in *New York v. NRC*, 681 F.3d 481 (D.C. Cir. 2012); and also inadequate to protecting the health and safety of the public and the environment; and for these reasons was ask NRC to withdraw the DGEIS. (0716-1 [Kraft, Dave])

Comment: *NRC's "finding of no significant impact" regarding: 1.) spent fuel pool fires; 2.) spent fuel pool leaks; 3.) vulnerability of spent fuel pools and dry cask sites to natural disasters and terrorist assaults; and 4.) NRC's belief in the adequacy of generic findings at reactors -- to be unfounded, inadequate to the protection of the public health and safety, and in contradiction to NRC's own definition of what constitutes a "nuclear safety culture".* NEIS concurs with the detailed statements provided by Attorney Diane Curran et al in comments provided on 20 December, 2013, titled, *Comments by Environmental Organizations on Draft Waste Confidence Generic Environmental Impact Statement and Proposed Waste Confidence Rule And Petition to Revise and Integrate All Safety and Environmental Regulations Related to Spent Fuel Storage and Disposal*; and those views presented in supporting Declarations Exhibits A through D to that document. Some examples should suffice to demonstrate how inadequately NRC has investigated these issues[.] (0716-11 [Kraft, Dave])

Comment: *The DGEIS as written is inadequate to both the task of satisfying the directives of the U.S. Court of Appeals in New York v. NRC, 681 F.3d 481 (D.C. Cir. 2012); and also inadequate to protecting the health and safety of the public and the environment[.]* NEIS concurs with the detailed statements provided by Attorney Diane Curran et al in comments provided on 20 December, 2013, titled, *Comments by Environmental Organizations on Draft Waste Confidence Generic Environmental Impact Statement and Proposed Waste Confidence Rule And Petition to Revise and Integrate All Safety and Environmental Regulations Related to Spent Fuel Storage and Disposal*; and those views presented in supporting Declarations Exhibits A through D to that document. (0716-23 [Kraft, Dave])

Comment: NEIS finds that NRC's "finding of no significant impact" regarding: 1.) spent fuel pool fires; 2.) spent fuel pool leaks; 3.) vulnerability of spent fuel pools and dry cask sites to natural disasters and terrorist assaults; and 4.) NRC's belief in the adequacy of generic findings at reactors -- to be unfounded, inadequate to the protection of the public health and safety, and in contradiction to NRC's own definition of what constitutes a "nuclear safety culture"[.] (0716-4 [Kraft, Dave])

Comment: The First Rule of Holes applies: if you find yourself in the bottom of a hole, stop digging. If you find yourself buried under a "Mountain of Waste, 70 Years High," stop making it, at least until you solve the disposal problem for what you've already created. NEIS therefore urges the NRC to maintain its present moratorium on new licenses and license extensions at U.S. nuclear reactors. The same voluminous amounts of unresolved issues pertaining to HLRW

storage, treatment, transportation will exist for any proposed CIS facilities. Until such time as NRC can provide a credible DGEIS on these matters, the nation should not create more contaminated waste sites with the same unresolved problems, just so the nuclear industry can continue to compound the waste problem with more waste from continued operation. (0716-8 [Kraft, Dave])

Comment: I am aware that the NRC responded to a Federal court order to justify its continued storage of nuclear waste in cooling pools and dry casks in an embarrassingly flimsy way -- despite the length of the document. (0719-1 [Hibbard, Angela])

Comment: Blue Ridge Environmental Defense League has referenced the Waste Confidence Rule in several of our legal interventions in nuclear power plant licenses during the last six years—Bellefonte, North Anna, William States Lee, Vogtle, Sequoyah—cases which raised safety and/or environmental concerns regarding management of irradiated nuclear reactor fuel, dubbed "spent" fuel by the industry. Specifically, we brought the following interventions: Blue Ridge Environmental Defense League Waste Confidence Contentions[:]

Date	Docket/s	Type	Applicant	Reactor/s	Site
December 11, 2006	52-011	ESP	Southern Nuclear Operating Company, Inc	Plant Vogtle Units 3 and 4	Waynesboro, Georgia
May 9, 2008	52-017	COL	Dominion Virginia Power	North Anna Unit 3	Mineral, Virginia
June 6, 2008	52-014 52-015	COL	Tennessee Valley Authority	Bellefonte Nuclear Power Plant, Units 3 and 4	Hollywood, Alabama
June 27, 2008	52-018 52-019	COL	Duke Energy Carolinas	William States Lee III Units 1 and 2	Gaffney, South Carolina
May 6, 2013	50-327 50-328	LR	Tennessee Valley Authority	Sequoyah	Soddy-Daisy, Tennessee

Attached in abbreviated form are the relevant actions and contentions which we have brought. At the five sites above, general and specific issues were raised. Until the DC Circuit ruled, four of them were deemed inadmissible by their respective Atomic Safety and Licensing Board three-judge panels. The fifth, filed after the vacatur, has been held in abeyance but not admitted. This represents a virtual stone wall of refusal regarding the long-term storage of high-level nuclear waste at these plants. The draft GEIS and rule now under review would return us to the *status quo ante*. This is unacceptable to us, and contravenes both the letter and the meaning of the *New York v. NRC*. (0720-2 [Zeller, Louis])

Comment: The Court's order was quite clear, stating that irradiated reactor fuel "will seemingly be stored on site at nuclear plants on a permanent basis" unless and until the federal government established a permanent repository.⁶ [footnote 6 text: *Id.*, *New York v. NRC* at 13] The Court rejected the NRC's arguments against the vacatur, stating, "Overall, we cannot defer to the Commission's conclusions regarding temporary storage because the Commission did not conduct a sufficient analysis of the environmental risks." The Court specified that "a generic analysis must be forward looking and have enough breadth to support the Commission's [licensing] conclusions. Furthermore, as NEPA requires, the Commission must conduct a true EA regarding the extension of temporary storage."⁷ [footnote 7 text: *Id.* *New York v. NRC* at 20] A solution to the long-term disposal of highly radioactive "spent" nuclear fuel may still lie decades in the future. There was a period of twenty years—from 1982 to 2002—from the passage of the Nuclear Waste Policy Act to the US Department of Energy's recommendation of

Yucca Mountain as a suitable site for repository development; this finding was itself overturned in 2010. The Gordian Knot presented by nuclear power plants which must be unraveled by the NRC involves the management of an intractable waste problem with long-term public health and environmental justice impacts. In light of the foregoing, the Commission must develop an environmental impact statement and a rule which truly encompasses on-site and beyond-60 year high-level radioactive waste storage at every reactor site in the nation. However, as detailed in our comments filed today and previously, we maintain that the NRC has not done what the Court ordered in its remand. (0720-3 [Zeller, Louis])

Comment: In your rush to promote nuclear energy, you have put the cart before the horse. Your generic proposals as in the G EIS are an insult and nothing more than a quickie means of bypassing the kinds of responsible studies that actually would require depth and breadth. There is simply no evidence of that here. Just politics as usual. (0722-4 [Headington, Maureen])

Comment: I praise the court for intervening. I have no confidence in a process that continues to produce waste without a safe way in which to dispose of it. (0722-6 [Headington, Maureen])

Comment: It is patently clear that NRC is only obtusely aware of, or minimally responsive to, the instructions of the Federal Court inasmuch as the Court effectively advised against warming over the assumptions of the past, but NRC Staff's first reaction to the Commission's assignment to produce a new, inclusive and technically defensible rule was to say, in effect, "no need to re-invent the wheel, we got plenty of good stuff in the work that we have already done." Besides ignoring the Court's attempt to throw the agency a credibility life ring, the Staff's knee-jerk approach of "Oh, we can answer that concern" doomed the new attempt to go back to the optimistic, definitely non-scientific, not technically defensible assumptions that bred and fed earlier illegitimate conclusions. (0723-1 [Shadis, Raymond])

Comment: I would ask the Commission in a sober moment of reflection to consider if an uninformed, evasive, cynical, and lacking in intellectual integrity, approach to regulation such as the waste confidence DEIS is not a disservice to the United States of America; driving a public that has already lost confidence in government even further afield in its allegiances. (0723-5 [Shadis, Raymond])

Comment: The Waste Confidence Draft Generic Environmental Impact Statement is categorically inappropriate. (0724-1 [Gamble, Dan])

Comment: "Licensed life for operation of a reactor"--There is a reason that licenses for operation are granted. To store spent nuclear fuel behind the "licensed life for operation of a reactor" is akin to sweeping dirt under the rug instead of cleaning one's house. This public opinion votes "NO" to storage beyond licensed life. (0728-2 [Anonymous, Anonymous])

Comment: The American citizens, their beloved children, and land we live on, were NOT created to be utilized as a nuclear waste dump site. To protect our health, and the health of our children, we will not accept the trafficking of radioactive waste "to or through" our homeland. I reject NRC's waste confidence Draft Generic Environmental Impact Statement (DGEIS), and ask NRC to withdraw it for thorough revision. I have NO confidence in NRC's "waste confidence". (0730-1 [Lawhorn, Larry])

Comment: The Nuclear Regulatory Commission is on the verge of adopting a grossly inadequate plan for storing nuclear waste. (0731-1 [Brotine, Howard])

Comment: I urge the NRC to find a better solution than THE GROSSLY INADEQUATE plan for storing nuclear waste. (0732-1 [Green, Jeane])

Comment: The GEIS is flawed. We are dealing with something that will stay lethal for tens of thousands of years but the study does not take any of that into consideration. (0734-1 [Hisasue, Carole])

Comment: I reject the nrc waste confidence proposal and u must reject it. (0735-1 [Velazquez, Lisette])

Comment: The history of waste practices to date has been one of irrational exuberance, misplaced confidence that things will just work out. But the historical evidence suggests the opposite. And despite that long history of failure, the NRC repeatedly asserts, "this time will be different." The latest iteration of the Waste Confidence Rule relies on a remarkable regulatory fiction: that just leaving large amounts of extraordinarily hazardous and long-lived material sitting on storage pads at numerous locations around the country will not result in unacceptable environmental impacts because institutions will continuously guard, regularly maintain, and periodically repackage the waste for hundreds of years, or even hundreds of thousands of years. This seems, to use a favorite phrase of the NRC, "non-credible." (0738-17 [Hirsch, Daniel])

Comment: The Draft Generic Environmental Impact Statement (DGEIS) is inadequate. (0739-1 [Quarterman, John S.])

Comment: I purpose that all get a start on a NEW EIS! that includes THE PEOPLE! and hold and keep through time. (0744-2 [Bonniwell, Colleen])

Comment: I reject NRC's waste confidence Draft (GEIS), and ask NRC to withdraw it for thorough revision. I believe it has no scientific validity. I have NO confidence in NRC's Waste Confidence. (0757-3 [Lynch, Laura])

Comment: These few examples I have given point out the need to reject this DGEIS. As a resident of New York City and a citizen of these United States, in all due respect, I recommend the NRC go "back to the drawing board" as these proposed generic regulations are completely unacceptable. (0762-6 [Skopic, Catherine])

Comment: I reject NRC's waste confidence Draft Generic Environmental Impact Statement (DGEIS), and ask NRC to withdraw it for thorough revision. I have NO confidence in NRC's "waste con-fidence"! (0763-1 [Freeman, Susan])

Comment: Stop the Waste Con: The NRC Draft Waste Confidence Generic Environmental Impact Statement Report is unacceptable. Much of it appears to be based on unsubstantiated hope. (0764-1 [Gilmore, Donna])

Comment: In the GEIS Executive Summary, the stated purpose of this ruling is for the efficiencies that would be gained, minimizing expenditures and avoiding delays in licensing reviews. This apparent bias towards the industry seems to contradict the sole purpose of the NRC in protecting the public and the environment. (0774-2 [Revilla, Oscar])

Comment: I absolutely reject NRC's waste confidence Draft Generic Environmental Impact Statement (DGEIS) and demand that you withdraw it for thorough revision. Based on the horrifying reality of nuclear waste and its toxic potential for thousands of years, I have NO confidence in NRC's waste confidence. (0775-1 [Zure, Lisa])

Comment: I reject NRC's waste confidence Draft Generic Environmental Impact Statement, and ask NRC to withdraw it for thorough revision. (0791-1 [Mierzwicki, Tony])

Comment: Your plan for storing nuclear waste is inadequate. We can't kick this can down the road any longer. Please listen to the many well informed advocates asking for a better, safer approach. (0803-1 [Bosold, Patrick])

Comment: We have lost all confidence that you have our best interest in mind. We have lost confidence that you will ever do the right thing. Prove us wrong. (0811-3 [Paulsen, Carol])

Comment: We are emphatically opposed to the NRC's proposed Waste Confidence Rule (10 CFR 51.23) as well as the premises, assumptions and conclusions of the NRC's Waste Confidence DGEIS. (0815-1 [Gunter, Keith] [Izant, Carol])

Comment: In summary, NRC risk calculations are demonstrably wrong, the assumptions made by the NRC are absurd and the NRC has not proposed a realistic plan for coping with spent nuclear reactor fuel. (0815-9 [Gunter, Keith] [Izant, Carol])

Comment: As in the NRC Perrysburg Waste Confidence hearing, where I offered oral testimony, I encourage "NO ACTION" on this propose rule. The rule change would make the relicensing of future operations of existing nuclear power plants and the storage of spent fuel rods and radioactive waste contingent on a Generic Environmental Impact Statement. The GEIS would not take into account any site-specific concerns that have arisen such as the lack of confidence in the NRC to develop a long term waste repository. (0816-1 [Stansberry, Mark])

Comment: I recommend the NRC to take "NO ACTION" on the NRC waste confidence rule change proposed in Docket ID No. NRC-2012-0246. (0816-4 [Stansberry, Mark])

Comment: I oppose the DGEIS and Proposed Rule, because both are based on scientifically and technologically unsubstantiated assurances and unproven assumptions. (0819-1 [Kline, Connie])

Comment: In my estimation, generic is suitable for breakfast cereal and soft drinks, not spent nuclear fuel. There may never be a permanent repository and the likelihood of creating centralized interim storage facilities is slim to none considering past attempts to do so and the failure, and/or closure of LLRW sites. The DC Circuit Court of Appeals in *New York v NRC* stated: ["] Both the Supreme Court and this court have endorsed the Commission 's ... practice of considering environmental issues through general rulemaking in appropriate circumstances ... (We) see no reason that a comprehensive general analysis would be insufficient to examine on-site risks that are essentially common to all plants ... Nonetheless, whether the analysis is generic or site-by-site, it must be thorough and comprehensive ... (We) conclude that the Commission has failed to conduct a through enough analysis here to merit our deference.["] The DGEIS is a perfect example that size doesn't matter. In 600 pages of baseless assumptions, the Commission has still failed to "conduct a thorough and comprehensive analysis of environmental issues." (0819-15 [Kline, Connie])

Comment: To add insult to injury, the Proposed Rule would incorporate into every reactor license this DGEIS conclusion that spent fuel can be safely stored above ground at reactor sites in perpetuity. This would prohibit challenging continued generation of spent fuel without means of safe, permanent disposal in individual reactor license actions. (0819-3 [Kline, Connie])

Comment: These documents don't even address the Court's mandate in *New York v NRC* which required the NRC to "examine the risks" associated with spent fuel storage not merely assume that storage would be safe . The NRC has still "failed to examine the environmental consequences of failing to establish a repository when one is needed." The NRC has arbitrarily, capriciously, and repeatedly changed the rules in midstream for the convenience and profit of the nuclear industry it purports to regulate. "The waste can be safely stored on-site for 30 years beyond reactor closure. No, make that 60 years beyond reactor closure. There may be no geological repository. No problem. We'll just leave the waste at reactors, and hope that a repository is available 'when necessary.' DOE withdraws its license application for Yucca Mt. Still no problem. We'll just leave the waste onsite forever and allow still more waste to be generated." (0819-4 [Kline, Connie])

Comment: At some point Congress will figure out that NRC's proposal is to make forever storage of high level waste a permanent public charge. A new "entitlement program" for the nuclear power industry seems unlikely. A panel of the Court of Appeals for the D.C. Circuit has already chastised the NRC for its disregard of the Nuclear Waste Policy Act requiring a geologic depository for high level waste and its inability to calculate an appropriate fee for the fund to implement such a repository. The proposed rule and the "blinders on" approach of the DGEIS show the NRC is ignoring the statute by proposing indefinite onsite storage. (0821-14 [Paddock, Brian])

Comment: NRC needs to admit waste disposal solution is unknown and move forward logically, transparently, and openly, to best solve "impossible" problems. We are all on this finite planet together and need to work together to move forward seeking progress[.] The causal acceptance, or complacency, of radioactive leakage into the environment violates scientific methods and practices; it also demonstrates that failure of scientific thinking is in operation at the level of NRC oversight, which represents its highest decision-making authority. The NRC's safety claims impossibly co-exist with practices of ignoring public complaints to stop radioactive leakage into the environment. The public complaints would not exist if safety existed. To ignore evidence that the safety assurances are flawed is unacceptable, but this has happened repeatedly and continues to happen. It is time to call for the brightest and best scientists to try to brainstorm a range of possibilities for intensive research toward the type of discoveries most likely to provide the safest solution for the lethal waste to best attempt to attain reliable isolation for thousands of years, if such a solution is even possible. It is time to move forward logically, instead of behaving as a group of lemmings going over a cliff to die en masse from craziness and faulty thinking. The sooner NRC admits its errors and stops being in denial that the waste solution appears impossible, the quicker we can move forward to deal with the remaining actual problem, which is the vast amount of lethal non-disposable waste that we have generated that we must somehow find a way to isolate and keep contained away from the environment and humanity. It is unacceptable for the NRC to continue to play the irrational denial role and interfere in this way with moving forward seeking progress. (0823-13 [Michetti, Susan])

Comment: Emerging and developing issues-- including those growing from errors in previous assessment, analysis, and practices-- require special timely treatment that enables safety issues to be prioritized and appropriately addressed within a reasonably timely timeframe. Scientific assessment and open-ended methods should be applied to permit submission of official concerns at any point in time, rather than being potentially inappropriately delayed for a specific scheduled review, while safety is compromised. (0823-17 [Michetti, Susan])

Comment: NRC's flawed irrational waste confidence rule of 9-13-2013 requires rejection. The Waste Confidence Draft Generic EIS unacceptably fails the tests of scientific thinking,

methodology, and practices at its most fundamental level. The NRC has developed a flawed tool, the Draft Generic EIS, that fails to adequately protect physical environment as well as people and other living organisms from unfortunate impacts. (0823-55 [Michetti, Susan])

Comment: Waste Confidence Generic Draft EIS does not lend itself to safely addressing an horrendous nuclear waste problem with unknown solution transparently; Unacceptably, the GDEIS evades reality of impossible safe solution. (0823-60 [Michetti, Susan])

Comment: The problem that precludes the Waste Confidence Decision from the Draft GEIS remains the lack of appropriate oversight and the lack of appropriate prioritization of full environmental safety at the top of the decision tree. It is irrational to make decisions to permit operations that generate such lethal waste, when any solution for storage and disposal with safety is impossible. The problem that allowed this irrationality to arise was insufficiency in the scientific assessment. A sufficient scientific assessment would have prioritized the storage and disposal with full environmental safety to be identified and solved, prior to permitting operations by granting license applications and license extensions to nuclear power plants to create the waste. (0823-62 [Michetti, Susan])

Comment: The present generic waste confidence rule critically fails to provide adequate rigorous scientific consideration regarding spent fuel disposal impacts as well as to spent fuel storage impacts and their major safety flaws. (0823-69 [Michetti, Susan])

Comment: We request that the US NRC stop its claims that any "confidence" can be found in any "generic" safe solution for permanent storage of high level nuclear waste. The safety prerequisite for the environment and all living organisms requires that the complete timeframe of potential impacts be considered. That timeframe exists for thousands of years, or perhaps millions, for some of the ionizing isotopes. The NRC waste "confidence" uses an unacceptable and inappropriate arbitrary timeframe that fails to cover even a major fraction of the impact timeframe. (0823-75 [Michetti, Susan])

Comment: In the past fifty years, the nuclear industry has not determined how to address the issue of storing spent nuclear fuel generated by commercial nuclear power plants. Now the public is being asked to comment on the NRC's Draft Waste Confidence Generic Environmental Impact Statement. As an engineer and concerned citizen, it is my duty to state that I have little, to no, confidence in the NRC's Waste Confidence Generic Environmental Impact Statement based upon a myriad of issues and the manner in which these issues have been historically addressed by the NRC. (0826-1 [Morgal, Rick])

Comment: The NRC's Waste Confidence Generic Environmental Impact Statement is another evolutionary step in the process of upping the public's exposure to a potential catastrophic nuclear accident. (0826-3 [Morgal, Rick])

Comment: Please do not approve this. Nuclear waste has a proven track record of mis management and envrionmental contamination. The worst imaginable thing you could do is put it near large bodies of fresh water. The potential impacts are everything from human well being to economic to envrionmental. By approving this you are signing off and our children's death certificates. (0832-1 [Smith, Adam])

Comment: The GEIS is not ready to be approved, and should not be approved. (0836-2 [Davis, Anonymous])

Comment: The NRC should not approve the Waste Confidence Generic Environmental Impact Statement, since they do not have sufficient data on extended storage of high burnup to have confidence this waste can be safely stored or transported. (0836-6 [Davis, Anonymous])

Comment: We find the Waste Confidence Generic Environmental Impact Statement to be fraught with errors, unfounded optimisms, omissions, and obvious obfuscations. (0836-64 [Davis, Anonymous])

Comment: Please review this document AND BE HONEST about the risks. Please do not sweep them under the "out of scope" carpet. (0836-69 [Davis, Anonymous])

Comment: The GEIS is not ready to be approved, and should not be approved. There are many unresolved issues, despite the statement in the introduction that "all issues have been resolved." (0836-8 [Davis, Anonymous])

Comment: I would have to say, based on the fact that I could not find in all of those words in the Federal Register anything that gave me confidence that THIS industry here in the United States of America would not do the same thing their peer did in Japan. In which case, this NRC Generic Rule MUST be way more detailed in the specifics than it currently is. (0838-6 [Clermont, Elaine])

Comment: The NRC should abandon its Waste Confidence policy, stop the creation of nuclear waste, and come up with a plan that actually mitigates the enormous risks associated with existing nuclear waste. The Waste Confidence policy is founded on overconfidence. I am confident that the waste can never be safely contained for as long as it poses a hazard. Creation of radioactive waste puts the public at grave risk and it transfers the financial and physical responsibility for waste management to future generations. (0840-1 [Taylor, Tom])

Comment: The U.S. has no solution for nuclear waste, and the NRC up to this point has done little to address the immediate risks it poses. It is not in the public interest to ignore underlying risks, technical deficiencies, and base a licensing policy on false confidence. (0840-7 [Taylor, Tom])

Comment: Waste Confidence ignores 1) the absence of a technological solution to safely store waste until it is not hazardous; 2) the absence of a nuclear waste facility in which waste can be permanently stored; 3) the ongoing high level risks associated with Spent Fuel Pool Storage, and the proximity of said fuels near millions of US citizens. There is no safe storage solution for nuclear waste. The NRC's new Waste Confidence policy is no more credible than the one the Court threw out. The NRC should throw out this overly optimistic policy, observe the Court's ban on licensing nuclear reactors, and come up with a realistic plan that safely and permanently stores waste until it is not hazardous and that does not attempt to pass the burden and costs of managing radioactive waste to future generations or to taxpayers. (0840-9 [Taylor, Tom])

Comment: I totally reject NRC's waste confidence Draft Generic Environmental Impact Statement (DGEIS) and demand that you withdraw it for thorough revision. Based on the toxic pollution that lasts for thousands of years, I have NO confidence in NRC's waste confidence. (0844-1 [Anonymous, Anonymous])

Comment: The Waste Confidence Generic EIS must not be approved because there is no acceptable solution for safely handling highly radioactive waste. (0846-1 [Wells, Gerald])

Comment: The "waste confidence" policy must be abandoned. There is no confidence in storing nuclear waste. The waste itself is extraordinarily toxic, deadly and extremely long-lasting. The government has failed to demonstrate that nuclear waste will be managed safely and the NRC has not adequately the environmental impacts of the waste that new and relicensed reactors would generate. (0849-2 [Nichols, Susan])

Comment: The fact is that a spent fuel nuclear catastrophe that may destroy many people's livelihoods, their health, and perhaps the nation is acceptable to the NRC. That the NRC ranks these accident consequences (and likelihood) as a SMALL impact says more about the mentality of the NRC than the impacts of indefinite spent fuel storage. Because the NRC places the health of the nuclear industry ahead of this nation's health and will state they have confidence that safely storing spent nuclear fuel and obtaining a repository is technically feasible while keeping a straight face, I suggest that citizens should not place any confidence in the NRC. (0851-12 [Thatcher, Tami])

Comment: Submitted because I believe it's time for people to understand that despite assurances from the nuclear industry, spent nuclear fuel poses serious health and economic risks to this country. The waste confidence decision is still an emperor with no clothes and it's time for people to understand the truth, despite the bland and distorted conclusions of NRC's generic waste confidence EIS. (0851-14 [Thatcher, Tami])

Comment: This draft EIS is reasonable only if the promotion of the nuclear industry is our country's highest priority, above national security and stability, health, and prosperity. The NRC knows that promotion of the nuclear industry requires the NRC to keep pretending that finding long term solutions for spent nuclear fuel will magically get easier as time goes on. It requires the NRC to keep pretending that the costs of repackaging spent fuel or building a repository that generated our electricity will not be a burden for future generations. And it requires the NRC to keep pretending that nuclear catastrophes are simple mundane affairs that may cause some unenlightened people to experience depression because they've had to vacate their homes permanently, their country and community may be bankrupt, and they and their land are being poisoned by widespread radionuclide contamination. (0851-2 [Thatcher, Tami])

Comment: What you are doing is so very wrong; no ifs ands or buts about it. (0862-1 [Thompson, Tammy])

Comment: I stand by my comments I made at both NRC meetings that were held in Maryland and the last meeting that was a telephone conference. STOP THE NUKE CON JOB!!!! (0865-1 [Gray, Erica])

Comment: The arguments above point out how the choices made by the agency impact the analytical viability of the analysis and thus how the DGEIS does not respond to the task of properly evaluating the environmental consequences of the major federal actions it is evaluating and alternative actions which can mitigate those consequences. (0867-3-18 [Griffin, William])

Comment: In short, the NRC has created a fictional world for its DGEIS that does not and cannot exist. It has created a weighty document with no real substance. It has failed in its obligation to take the mandated hard look, and failed to meet the obligations the agency had under NEPA. (0867-3-33 [Griffin, William])

Comment: The NRC public meeting had to take place to affirmatively respond, to a NUREG-2157 requirement. The meeting and the literature presented was an attempt to cajole the public

into agreeing that they felt confident in dry cask storage. Your report to NUREG should show that about 90%, of the attendees expressed "NO CONFIDENCE" in the NRC's draft. (0868-2 [Tilbury, Don])

Comment: I am even LESS confident about waste storage than before the meeting. (0872-1 [Wilvert, Calvin])

Comment: THE GENERIC ENVIRONMENTAL IMPACT STATEMENT IS ALSO A JOKE. (0887-4 [Chappellet, Carissa])

Comment: What was the purpose: confidence? I now have less (zero) confidence[.] (0888-1 [Wilvert, Rosemary])

Comment: In *Calvert Cliffs*, CLI-12-16, the NRC suspended all reactor licensing and re-licensing while it responded to the Court's order in *New York*. 76 NRC 63 (2012). As the Commission recognized, "[w]aste confidence undergirds certain agency licensing decisions, in particular new reactor licensing and license renewal." *Id.* at 66. The NRC has not satisfied the Court's order, NEPA, or the Atomic Energy Act. Therefore, licensing and re-licensing of reactors must remain suspended unless and until the NRC complies with the law. (0897-1-19 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: THE PROPOSED RULE FAILS TO SATISFY ATOMIC ENERGY ACT REQUIREMENTS FOR LICENSING AND RE-LICENSING REACTORS (0897-2-6 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The proposed rule marks a turning point for the NRC. After thirty years of making baselessly optimistic "reasonable assurance" findings about the future availability of a disposal solution for spent reactor fuel, and having allowed many thousands of tons to accumulate at reactor sites around the country based on those findings, the NRC has finally stopped issuing them. Instead of confidently assuring the public that human health and the environment will be protected from highly radioactive spent fuel as long as it remains dangerous, the NRC now claims only to have hope in a theoretical possibility. But hope cannot satisfy the Atomic Energy Act. The NRC has effectively conceded that it lacks a statutory basis for licensing the further generation of spent fuel. It must therefore continue to suspend all reactor licensing unless and until some basis for reasonable assurance findings are restored. The DGEIS cannot cure this fundamental failure to satisfy the Atomic Energy Act. And even if it could, the DGEIS is utterly inadequate to satisfy NEPA. (0897-7-22 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: The NRC Draft Generic Environmental Impact Statement's arguments in favor of DCR are fundamentally flawed; they are clearly drawn up to support PG&E's financial interests. (0907-2 [Bethlenfalvay, Marina])

Comment: For these reasons and many others, the Draft GEIS is not scientifically valid and remains no more than a hope. (0908-6 [Mikkelsen, Sara])

Comment: My Comment: Despite the obvious extensive work and organization of Draft participants, I FIND, FOR THE ABOVE REASONS [AND MORE] THE CURRENT WASTE DRAFT UNACCEPTABLE. (0910-15 [Carey, Corinne])

Comment: Clearly, this "Generic Environmental Impact"-Office of Nuclear Material Safety and Safeguards is misnamed and misleading to the public and all. I compare this misuse to the continuing use in this Draft and elsewhere of the term "spent", as in "spent fuel", which is so

highly irradiated that it cannot continue in use at nuclear power plants, and which contains so many highly radioactive elements as to be non-disposable and permanently hazardous. (0910-2 [Carey, Corinne])

Comment: We, the undersigned, call on the NRC to redo its draft environmental impact assessment and scuttle the proposed rule to remove nuclear waste issues from the reactor licensing process. The NRC has not conducted an adequate environmental impact analysis as ordered by the Court of Appeals in New York. Nor does the Draft GEIS provide an environmental analysis that is sufficient to justify eliminating consideration of spent fuel disposal impacts or storage impacts from every licensing proceeding. Finally, the NRC's proposed finding that spent fuel can be safely stored indefinitely, rather than temporarily, is inconsistent with the Nuclear Waste Policy Act and federal policy. The NRC must conduct a new environmental impact study and suspend the proposed rule to prohibit licensing challenges based on high-level radioactive waste management issues. (0912-1 [Fisher, Allison])

Comment: Comments on NRC's WC DGEIS ("Waste Confidence" Draft Generic Environmental Impact Statement In the Executive Summary and Introduction, NRC speaks about 80 years of reactor operations - that is, two 20-year license extensions. For example, on Page 1-12, in Figure 1-1, "Continued Storage Timeframes" (line 17), NRC speaks of "Reactor Licensed Life" as "40 years of reactor operation on original license" and "Up to 40 years of additional renewed license (up to 2 license renewals)." What is most significant about NRC's apparent plans - to someday grant rubberstamps for not just 20-years of extended operations, but an additional 20-years on top of that - is that this WC DGEIS would grease the skids for just such license extension approvals. This, despite NRC's claims to the contrary. (0919-1-1 [Kamps, Kevin])

Comment: In a New York Times article by Matthew L. Wald, entitled "3 States Challenge Federal Policy on Storing Nuclear Waste," dated February 15, 2011 (posted online at <http://www.nytimes.com/2011/02/16/nyregion/16nuke.html>, submitted here as Exhibit J), it was reported: "...David McIntyre, a spokesman for the Nuclear Regulatory Commission, said the lawsuit by the attorneys general had mischaracterized the nature of the December [2010 Nuclear Waste Confidence] decision. He described it as a commission "opinion" on how long waste could be safely stored rather than a rule permitting any plant to store spent fuel. But people who favor building new reactors said the adoption of the policy was important because it helped outline a legal basis for approving the construction of new reactors and long-range plans for handling their spent fuel...". Thus, the NRC's "nuke waste con game," and deceptive, misleading claims that NRC's Nuclear Waste Confidence Decision, Rule, and Policy have nothing to do with new reactor licensing or old reactor license extensions, have been played in one of the major media outlets in the nation. (0919-1-19 [Kamps, Kevin])

Comment: How then, can NRC grant *carte blanche* to the nuclear utilities to generate as much irradiated nuclear fuel as they want, as it proposes to do by finalizing this DGEIS and issuing a Record of Decision?! (0919-3-4 [Kamps, Kevin])

Comment: All the more ironic is the fact that NRC is essentially parroting itself here, claiming "Waste Confidence" vis a vis so-called "low-level" radioactive waste. For, in 2010, although it dared no longer give a "date certain" for the opening of a high-level radioactive waste repository, NRC nonetheless expressed its "confidence" that one would open "when needed." But, as reported by the New York Times, the D.C. Circuit Court of Appeals didn't buy NRC's "Waste Confidence" regarding such rosy prospects for the opening of a repository: "The commission apparently has no long-term plan other than hoping for a geologic repository," the

appeals court wrote.' ("Court Forces a Rethinking of Nuclear Fuel Storage," by Matthew L. Wald, New York Times, June 8, 2012, posted online at http://www.nytimes.com/2012/06/09/science/earth/court-says-nuclear-agency-must-rethink-fuel-storage.html?_r=2&). The article is submitted as Exhibit N. (0919-3-7 [Kamps, Kevin])

Comment: Those risks are potentially catastrophic, whether they unfold from pools or dry casks, whether due to accident, attack, or leakage. But so few people have been assigned to worry about such risks, it seems. And, as evidenced by this DGEIS itself, even those assigned to analyze the risks - under court order - have not done so. They have downplayed the risks, to the point of ignoring and even denying them, while here examining supposed benefits. This is very telling, not only about the nuclear utilities' attitude toward irradiated nuclear fuel risks, but even that of the NRC staff. (0919-5-7 [Kamps, Kevin])

Comment: With this new GEIS for the spent fuel, no new evaluations of the environmental impacts are being looked at. For example, as indicated earlier, the New Jersey plants continue to use the geologic and ground water information from the original reports from the building of the plants, not any new geologic mapping or interpretations. (0920-43 [Foster, Ruth])

Comment: According to the NRC, in this document the impact from the continued storage of the spent fuel at the plant sites will have only a small impact on the local environment. The major problem is that NRC makes many statements and assumptions but presents no data, studies or reviews from outside unbiased scientific groups or agencies. Specific comments listed below illustrate some of the areas where NRC is over simplifying the issues and problems or which contradict some of NRC's assumptions. (0920-9 [Foster, Ruth])

Comment: Citizens rejecting NRC's "waste confidence" ruling at public meetings by wide margin. At the recent NRC public meeting in Chicago, one of the commenters, a woman from Michigan, made a statement that, more and more, seems to be the defining answer to NRC's question about public sentiment towards its "waste confidence" rule: "This member of the public does not share your confidence!" (0921-2 [Kamps, Kevin])

Comment: I indicated during my oral comment submission that I would submit for the record a copy of the "Deja vu ...all over again!" Lucy (NRC) and Charlie Brown (the public) cartoon. It is attached. But while I am at it, I would like to attach three related placards. All four were generated by the Nuclear Energy Information Service of Chicago for use at the Oak Park, IL public comment meeting on Nov. 12th. When members of the public heard the words "Waste Confidence", "safe", "safely store". etc., uttered, they held up the placards. In this sense, this was a version of the game "Nuclear Bingo", as has been "played" by the public at various NRC meetings in the past. If the NRC insists on playing Nuclear Waste Con Games, then the can respond with games of their own! Just for sanity's sake, if nothing else. The three Nuke Waste Con Game additional nuclear bingo placards attached here are: "NRC: Putting the CON in was CON-fidence"; "What part of NO [in many languages] does NRC NOT understand?"; and "NO confidence in NRC's Waste Confidence." (0923-1 [Kamps, Kevin])

Comment: I do not share NRC's "confidence" that high-level radioactive waste storage pools across the U.S. are safe, sound, and secure, whether in the here and now, during up to 80 years of reactor operations, for 60 years beyond reactor shutdown, for a century beyond the end of decommissioning, or forevermore into the future (what NRC calls "indefinite storage," which could also be called "infinite storage"). (0926-2 [Kamps, Kevin])

Comment: The GEIS is not ready to be approved, and should not be approved. There are many unresolved issues, despite the statement in the introduction that "all issues have been resolved." (0930-1-1 [Lutz, Ray])

Comment: We find the Waste Confidence Generic Environmental Impact Statement to be fraught with errors, unfounded optimisms, omissions, and obvious obfuscations. (0930-3-16 [Lutz, Ray])

Comment: Please review this document AND BE HONEST about the risks. Please do not sweep them under the "out of scope" carpet. (0930-3-21 [Lutz, Ray])

Comment: Under the license terms for a given nuclear power plant, the entire plant must be decommissioned and restored to unlimited or partial use within 60 years of the end of operations. This is the underlying "contract" with the public when these plants were installed. Now, the NRC is suggesting in Section 4 that the ISFSIs can remain in operation for centuries. We believe this is WRONG for the NRC to suddenly change this contract with the public. (0930-3-5 [Lutz, Ray])

Comment: [W]e oppose the Nuclear Regulatory Commission's waste confidence draft GEIS and ask NRC to withdraw it for a thorough revision. We have no confidence in the NRC's lack of a plan in place. (0934-4 [Lewison, Linda])

Comment: Please do not allow this reckless and disputed policy to become law. (0935-8 [Uhls, Agnes])

Comment: The draft EIS should be rejected and revised to reflect the true and looming risks posed by nuclear waste. I have no confidence in NRC's "waste con-fidence." (0936-2 [Laney, Nan S.])

Comment: [Q]uit promoting the beleaguered greedy and highly toxic nuclear industry by acting like your so-called "Purpose" needs to be met. Thorough environmental review combined with useful alternatives with which to gauge comparative safety from different modes of radioactive waste storage are needed, and are sorely lacking in this aiming to be meaningless (except to accelerate rubber-stamping of licenses down the line) Waste Confidence Generic EIS document. (0937-28 [Campbell, Bruce])

Comment: All of the threat from the radwaste must be seriously analyzed, not treated as a bureaucratic joke intended as a steppingstone to get this inadequate and vague generic document adopted in order to help this leeching industry. If this WCGEIS can incorporate various documents by reference, you can incorporate by reference studies by Sandia and others which estimate risks from all of the nuclear power facilities in the USA. (0937-30 [Campbell, Bruce])

Comment: I reject NRC's waste confidence Draft Generic Environmental Impact Statement (DGEIS), and ask NRC to withdraw it for thorough revision. I have NO confidence in NRC's "waste con-fidence"! (0939-1 [Marschak, Cheryl])

Comment: I oppose the Draft Generic Environmental Impact Statement (DGEIS). (0941-1 [Scott, Sabra])

Comment: The Nuclear Regulatory Commission, in it's recent Draft Generic Environmental Impact Statement on Waste Confidence (DGEIS), has made changes to the long-term storage

of spent fuel rods that are concerning as it relates to the Pilgrim Nuclear Power Plant in Plymouth, Massachusetts. Spent fuel rods continue to pose a major risk to public health for many years after they are useful and it is important to properly store them. Pilgrim Nuclear Power Plant is a particular concern to me as it is within close proximity to my district. Should there be an accident or an attack at that plant, many of my constituents and the surrounding communities would be affected for years to come. The Commission must reconsider the changes that are being proposed to the long-term storage of spent fuel rods. The health and safety of the residents that live near Pilgrim rely upon the safe storage of spent fuel rods. (0943-1 [Hedlund, Robert L.])

Comment: The Nuclear Regulatory Commission (NRC) should dismiss the findings of its Waste Confidence Generic Environmental Impact Statement. The study is flawed and should not become the excuse for leaving dangerous nuclear waste behind at closed nuclear plants. (0944-1 [Pascall, Glenn] [Watland, George])

Comment: The NRC should recognize that the attempt to use a GEIS to wish away this problem is fundamentally flawed, and should return to the sound policy proposed by its own Commission. (0944-10 [Pascall, Glenn] [Watland, George])

Comment: I oppose the GEIS findings that highly radioactive nuclear waste can be safely stored in current temporary facilities above ground for the long term on the grounds of the closed San Onofre plant and at similar temporary facilities near all other nuclear plants closed or still operating nationwide. (0944-2 [Pascall, Glenn] [Watland, George])

Comment: The U.S. Nuclear Regulatory Commission seeks public input on NRC NUREG-2157, also known as the Waste Confidence Generic Environmental Impact Statement. The apparent intent of this Statement is to justify storing nuclear fuel waste on-site at closed nuclear power plants for decades or even longer, with no requirement to move the waste at any point to a less hazardous location. (0944-4 [Pascall, Glenn] [Watland, George])

Comment: For these reasons and many others, the Draft GEIS is not scientifically valid and remains no more than a hope. (0951-6 [Commenters, Multiple])

Comment: STOP LYING TO US. LOOKS TO ME THAT THE DRAFT NUREG-2157 WAS WRITTEN BY AN NRC CARTEL OF TERRORISTS WHO CARE NOTHING ABOUT THE CONSEQUENCES OF YOUR IRRESPONSIBLE FOLLY. FOR SHAME! (1004-4 [Dimondstein, Carla])

Comment: HOW CRAZY ARE YOU PEOPLE? WORLD-WIDE HUMANITY NEEDS FOR THE NRC TO NOT BE MAKING THESE VITAL DECISIONS! AS A 'REGULATORY' (haha) AGENCY, IT IS CLEARLY INCAPABLE OF WORKING IN THE PUBLIC TRUST, MUCH LESS IN THE PUBLIC INTEREST: THE NRC RELENTLESSLY SUBMITS SUBSTANDARD CRITERIA, DELUSIONAL THINKING SUCH AS 'LOW PROBABILITY OF INCIDENTS'! AS THE BASIS FOR GENERATION, MAINTENANCE, CLOSURE AND PERMANENT STORAGE CONCERNS. WASTE CONFIDENCE?! THAT'S YOUR BEST SHOT? WE HAVE NO CONFIDENCE IN ANY OF YOUR BOY'S CLUB DEADLY SHENANIGANS. (1004-7 [Dimondstein, Carla])

48. Comments Concerning Support for Rule or GEIS

Comment: This plan should go forward because the NRC's plan is going to meet its purpose and goals. this is the most major aspect of the whole proposal that it should meet its goals. The plan should also go forward because the environmental risks associated with this project are small to moderate at the worst. (0007-1 [Anonymous, Anonymous])

Comment: I have just a few comments on the development of the generic EIS. The NRC and its staff are widely recognized for their technical expertise. The GEIS appropriately draws upon that expertise and upon evaluations performed by the technical staff. (0030-7-5 [Matthews, Tim])

Comment: I Thank you for your efforts to minimize the danger from radioactive waste. I hope that we can do more to improve both on and off site storage of such waste and to include the overall costs of such actions in all consideration and licencing of nuclear plants. (0041-1 [Groff, Inga] [Groff, Joe])

Comment: In short, ConverDyn supports the NRCs fundamental Waste Confidence conclusion that used fuel can be safely stored at reactor sites or at off-site locations and the time interval between reactor shut down and the ultimate recycling or disposal of the fuel. This conclusion is supported by many decades of safe, secure, on-site storage of used fuel in spent fuel pools and in dry storage systems both in the United States and abroad. (0045-14-2 [Frankland, Chris])

Comment: We'd [Arizona Public Service Company] also like to compliment you and the Staff, on the quality of the document you prepared. I mentioned outside before the meeting started, that given the time constraints that you were facing, the documents were all very, very well done. (0045-2-1 [Green, Michael])

Comment: The draft Environmental Impact Statement that was prepared, could be done, and was done, on a generic basis, because first, continued storage will involve spent fuel storage activities, for which environmental impacts of operation are sufficiently well understood, as a result of lessons learned and knowledge gained from operating experience. Second, activities associated with continued storage are expected to be within this well-understood range of operating experience, thus the environmental impacts can be reasonably predicted. And third, changes in the environment around spent fuel storage facilities, are sufficiently gradual and predictable, to be addressed using this generic approach. (0045-2-4 [Green, Michael])

Comment: The 575-page Draft Generic Environmental Impact Statement contains abundant and comprehensive analyses of the issues remanded by the Court through the Commission, as well as all issues that should be considered in the Environmental Impact Statement process. Consequently, there is substantial evidence to support the conclusions regarding at reactor, and away from reactor storage, as well as the conclusions regarding commutative impacts of those scenarios, when combined with other federal and non-federal actions. (0045-2-5 [Green, Michael])

Comment: Notwithstanding the fact that some stakeholders may disagree with your technical conclusions and argue that you have not reached a correct decision, the record contains substantial evidence to support your conclusions. In closing, the analyses contained in the Waste Confidence Draft Generic Environmental Impact Statement support what the Commission and the Industry have long known. (0045-2-7 [Green, Michael])

Comment: In the meantime, the NRC can and should issue its revised Waste Confidence Decision. (0045-2-9 [Green, Michael])

Comment: The analysis contained in the Draft Waste Confidence Generic and Environmental Impact Statement supports what the industry has long known. If necessary, used nuclear fuel can continue to be stored in a safe, environmentally sound manner, for a long period, while we wait the political process to reach agreement on the disposal solution. In the meantime, the NRC can and should issue its Waste Confidence Rule. (0045-5-6 [Cannon, Tom])

Comment: For many reasons nuclear energy is a vital part of our nation's electricity system. It's essential for the Nuclear Regulatory Commission to complete the Waste Confidence rulemaking and move forward with issuing renewed operating licenses for existing nuclear plants and license to build and operate new plants. (0045-9-8 [Baker, Tammera])

Comment: Environmental Assessment vs. Environmental Impact: Several lawsuits in 2010 and 2012 have forced the NRC to change the original determination stated in the 1984 "Waste Confidence Decision". This decision declared that during the permitting process used in the granting of the thirty (30) year operations license of a nuclear generating station, an environmental assessment of the environment and sociological effects of short term storage of radiological waste would be sufficient when considering the issuance of this operations license. For the criteria used in the granting of the thirty (30) year renewal license an "Environmental Assessment" would be sufficient until permanent storage facilities are made available. With the decision of the U.S. Court of Appeals District of Columbia Circuit Court, it became clear that an "Environmental Assessment" could not be considered sufficient in determining environmental and/or sociological area impact regarding on site spent fuel storage when granting licenses to operate. This could only mean that an "Environmental Impact Statement" would be required in order to evaluate the various conditions involving onsite storage of radiological waste. -- Site Specific EIS vs. Generic EIS: The court decision of New York v. NRC determined that an Environmental Impact Statement of some kind would be required in order to issue, or reissue, the operations license. So the question beckons which type of EIS should be required, a Generic EIS or a Site Specific EIS? -- The "U.S. Energy Information Administration" lists sixty-five (65) operating nuclear power generating facilities in the United States. Should it be determined that a Site Specific EIS is required it would command sixty-five (65) individual Environmental Impact Statements that would need to be performed in order to issue a thirty (30) year operations renewal license. The use of a "Generic Environmental Impact Statement" would be tailored for all the generating stations thus requiring only site specific updates for each location. -- Local 51 Plumbers and Pipefitters Position: It is the position of the United Association of Plumbers and Pipefitters Local 51 that the use of a "Generic Environmental Impact Statement" (GEIS) would be preferred rather than the use of "Site Specific Environmental Impact Statements" (SSEIS). The crafting of a GEIS would be done utilizing the standardized guidelines promulgated by the NRC for the issuing of the renewal license. Guidelines for the completion of the EIS would obviously include the sampling of ground water for radioactive contamination as well as air quality sampling for any release of radioactivity, and any other required testing. The cost of an individual EIS would have to be borne by the station requesting the license renewal. This cost would ultimately be passed on to the consumer thus increasing the total cost of megawatt generation in an already expensive and competitive industry. The use of a GEIS promotes responsible cost management coupled with adherence to the environmental concerns of those living near these generating facilities. The town of Plymouth Massachusetts and the subsequent owners of the Pilgrim Nuclear Station have enjoyed productive relations through the years and there is nothing to suggest the use of a Generic Environmental Impact Statement over any Site Specific Impact statement would be any less lenient in protecting our very important and valued natural resources. (0096-1 [Byrne, Timothy])

Comment: I am here tonight in support of what currently exists in the proposed rule. (0112-1-1 [Giunta, Tony])

Comment: If we do not ensure a reliable electrical grid, we will reverse this trend that we are seeing of industry returning back to New England. And I look to the NRC to make sure that our grid is reliable for the future. So to end, I support the adoption of the Waste Confidence rule and the draft Environmental Statement. As adopted it will ensure the continued availability of sustainable, reliable, affordable nuclear power to the New Englander grid. (0112-1-4 [Giunta, Tony])

Comment: I appreciate the opportunity to support the Commission's work in this area and to highlight the public's awareness to the scientific and engineering basis that gives me confidence as an engineer working with the numbers. That although the rhetoric might sound uncertain, it's backed up by numbers that engineers devote their lives to getting and the people put their trust in for our ability to safely manage used nuclear fuel. But myths and scare tactics threaten this healthy discussion on the science and engineering of material safety systems. As engineers we welcome when people bring legitimate concerns that we can take a look at, that we can evaluate, and we can see if they're worth looking into and if they're worth the rhetoric. But when things escalate and we are unable to have a discussion on the merits, it's unhealthy for us to continue moving forward. (0112-12-3 [Garcia, Diego])

Comment: Tonight there have been many questions, as there have been in previous meetings, regarding whether the NRC can and should generically address the so-called Waste Confidence issues. I'm here to explain my view and to provide some input and information regarding how that question has been answered by the courts. The bottom line is the question has been answered in the affirmative both by the courts and by the Commission. As time is short, I will largely limit my comments to the legal basis for proceeding generically as reinforced by both the early decisions by the U.S. Court of Appeals for the District of Columbia in *Minnesota v. NRC*, which case was the first case to prompt the NRC to review the environmental impacts following license expiration, but before disposal -- pick up for disposal. (0112-19-1 [Ginsberg, Ellen])

Comment: But before I even mention my analysis of that decision [*Minnesota v. NRC*], I wanted to mention also that the Supreme Court, itself, has affirmed the Commission's longstanding practice of considering environmental issues through rulemaking in appropriate circumstances. Thirty years ago, in 1983, the Supreme Court in a case some of you may be familiar with, *Baltimore Gas and Electric*, concluded that the generic method chosen by the Agency is clearly an appropriate method for conducting the hard look required by NEPA. That's exactly what the NRC is doing with this rulemaking. (0112-19-2 [Ginsberg, Ellen])

Comment: So returning now to the initial decision that addressed Waste Confidence, which was the *Minnesota v. NRC* decision, I would highlight that the Court of Appeals said they're very -- in a very straightforward fashion where factual issues do not involve particularized situations, an agency may proceed by comprehensive resolution of the questions rather than re-litigating the question in each proceeding in which it is raised. Parsing the issue further, The Court in *Minnesota* said we agree with the Commission's position that it could properly consider the complex issue of nuclear waste disposal in a generic proceeding such as rulemaking and then apply its determinations in subsequent adjudicatory proceedings. Applying the legal principles set forth in *Minnesota*, which were also affirmed in the 2012 decision on the most recent revisions to the Waste Confidence rule, the Commission now has directed the NRC staff to prepare a GEIS and rule. This responds to the remand. (0112-19-3 [Ginsberg, Ellen])

Comment: NEI [Nuclear Energy Institute] supports the Commission's approach. We believe it's both legal and, as a practical matter, appropriate. The present rulemaking evaluates the environmental impacts from continued storage of spent fuel after the end of the reactor licensed life or operation but before it is placed in a repository. This rulemaking does not substitute for licensing actions that require site-specific NEPA analysis such as original licensing. The NRC's EIS on the instant issues does account for conditions at all reactor sites. (0112-19-4 [Ginsberg, Ellen])

Comment: We [Nuclear Energy Institute] also support this rulemaking because it's a reasonable use of NRC, licensee, and public resources. It avoids duplicative and inefficient site-specific reviews of continued spent fuel storage issues. We thoroughly concur, as well, that, for example, the no-repository scenario affects all sites similarly. Further, there's been no evidence presented that suggests that the issues of potential leaks or fires require site-specific consideration. The GEIS includes well-supported bounding analysis, which is to say these analysis encompass all reactor sites and operations. (0112-19-5 [Ginsberg, Ellen])

Comment: I support the updates that are proposed by the NRC. I believe that they are technically sound. That they represent an appropriate interpretation of the professional consensus of the nuclear engineering community. (0112-27-1 [Curtis, Daniel])

Comment: And I think the industry is doing a great job nowadays and we need to continue on that path. To the point I can state that the NRC has a good approach into the rulemaking and the technical basis is sound and reasonable. (0112-28-2 [Diaconeasa, Mihai])

Comment: Although the federal government has not completed its plans to develop a national repository so that used nuclear fuel can be removed from nuclear plants nationwide, we encourage you to continue efforts to clarify the issues, process, and findings regarding the safe and secure storage of used nuclear fuel storage. (0118-4 [Westchester, Business Council of])

Comment: Members of the NRC staff, and to the commissioners of the NRC, we ask you to hear our voices. Used nuclear fuel is being safely stored, can be safely stored and will be safely stored with confidence. Please pass the new waste confidence rule. (0138-11 [Cook, Dr. Andrew G.])

Comment: We believe that a Generic Environmental Impact Statement is the preferred tool to use to assess continued storage of spent fuel at the end of the reactors licensed life for operation, and prior to it being sent to a permanent repository. Environmental analysis that accompanies initial license and renewal will still be used to consider the potential environmental impact of fuel storage during operation. We see no need to require additional environmental studies to determine the potential impacts of continued storage when it has already been addressed in the initial licensing during operation. (0152-3 [Pelletier, David A.])

Comment: I've read the revised Waste Confidence Rule and associated Environmental Impact Statement, and I commend the NRC staff on doing such a thorough and thoughtful job. (0163-11-1 [Gutherman, Brian])

Comment: The proposed rulemaking and Environmental Impact Statement are well done, accurate, and address the issues of the court's order. The Rule and EIS should be approved. (0163-11-6 [Gutherman, Brian])

Comment: While nuclear energy is a vital part of our state's electricity portfolio and economy, we [NAYGN] recognize the need to address the transportation, storage, and disposal of used

nuclear fuel. The National Conference of State Legislatures said recently that it supports Federal action to develop facilities for interim storage of high-level radioactive waste until a permanent repository is ready. We strongly urge the Nuclear Regulatory Commission to continue its strong independent oversight of the commercial nuclear energy facilities, operation of existing plants, licensing new reactors, renewing the operating licenses of existing reactors and the management, transportation, and disposal of used nuclear fuel. (0163-17-2 [Schepperly, David])

Comment: The first is that as was true in the several meetings prior to this one, there's been -- there have been questions asked about the NRC's evaluation generically of the period for storage from the time of license expiration until pick up for disposal. Much has been made of this point and the question then is can the NRC and should the NRC treat these issues generically? The answer has been long ago answered -- the question has been long ago answered by the courts, and again, in 2012 it was affirmed by the D.C. Circuit. The NRC may proceed by rulemaking on certain environmental issues and the courts have said particularly this is true on the issue subject of this rulemaking. In the context of the initial lawsuit in 1979 which challenged the NRC's failure to consider the environmental impacts associated with continued storage, the Court of Appeals for the District of Columbia stated succinctly where factual issues do not involve particularized situations, an agency may proceed by comprehensive resolution of the issues rather than re-litigating the question in each proceeding in which it is raised. Parsing the issue even further, the court said "We agree with the Commission's position that it could properly consider the complex issue of nuclear waste disposal in a generic proceeding such as Rulemaking and then apply its determinations in subsequent adjudicatory proceedings. A few years later in 1983 the Supreme Court endorsed the NRC's long-standing approach. Its commentary was as follows: "The generic method chosen by the agency is clearly an appropriate method of conducting the "hard look" required by NEPA." (0163-30-1 [Ginsberg, Ellen])

Comment: [O]ur [NEI] position is that as an independent health and safety regulator, the NRC has asked and answered the appropriate questions regarding repository availability in the Draft GEIS and Proposed Rule. (0163-38-3 [Bonanno, Jerry])

Comment: The NRC and its staff are to be congratulated for addressing these issues in a generic manner. Ever since our country began to deploy nuclear technologies in the late 1940's, the use of a generic approach -- such as has previously been applied on used fuel transportation issues-has served our country well. Further, the generic approach to addressing the Waste Confidence Decision is consistent with the NRC's responsibilities to carry out its mission thoroughly and efficiently. It is also consistent with the NRC Principles of Good Regulation which state: "Where several effective alternatives are available, the option which minimizes the use of resources should be adopted". Given that the issues associated with used fuel storage are subject to generic evaluations, rather than site specific considerations, the approach incorporated in this EIS makes complete sense. In closing, I would like to say three things: First, I believe the basis for the draft Waste Confidence Rule is as valid today as the time when I was a Commissioner and I also believe it is consistent with the draft environmental impact statement. (0180-6 [Merrifield, Jeffrey])

Comment: I work for a nuclear fuel cycle consulting firm, and my job is to follow spent fuel management issues for our clients. I have read parts of the revised waste confidence rule and associated environmental impact statement and I commend the NRC staff on doing such a thorough and thoughtful job. The assumptions the NRC used in the EIS are reasonable and conservative, and I believe the conclusions reached are correct. (0181-1 [Waters, Christine])

Comment: These facts are important because approval of this rulemaking and EIS is essential for the industry to continue with numerous licensing actions that will keep the reliable nuclear electricity we all take for granted flowing without interruption. The NRC will not issue final licenses or renewals until the rulemaking is finalized. Stopping this rulemaking will ultimately cost jobs, harm many local economies, reduce the tax base, and put the reliability of our nationwide electric power system at risk. All for no good reason. In summary, this proposed rulemaking and environmental impact statement are well done, accurate, and address the issues in the court's order. The rule and EIS should be approved. (0181-6 [Waters, Christine])

Comment: As a consultant who works in the nuclear industry, and who specializes in the back-end of the fuel cycle, I appreciate the opportunity to make comments on the proposed waste confidence rulemaking, and the associated generic environmental impact statement (EIS). I am concerned about the environment and about this country's ability to meet our electricity demand for the long-term future. Nuclear safety matters to me and my loved ones just like it does to everyone else in this room. As part of my job, I have read parts of the revised waste confidence rule and the Generic EIS and commend the NRC staff on doing such a thorough and thoughtful job. The assumptions the NRC used in the EIS are reasonable and conservative, and I believe the conclusions reached are correct. (0183-1 [Green, Carlyn])

Comment: These facts are important because approval of this rulemaking and EIS is essential for the industry to continue with numerous licensing actions that will keep the reliable nuclear electricity we all take for granted flowing without interruption. The NRC will not issue final licenses or renewals until the rulemaking is finalized. Stopping this rulemaking will ultimately cost jobs, harm many local economies, reduce the tax base, and put the reliability of our nationwide electric power system at risk. All for no good reason. In summary, this proposed rulemaking and environmental impact statement are well done, accurate, and address the issues in the court's order. The rule and EIS should be approved. (0183-6 [Green, Carlyn])

Comment: I am writing to say that I will be commenting on the topic about the update of the Waste Confidence Generic Environment Statement (Docket ID NRC-2012-0246-0362). I am fully in favor of writing this new EIS in order to make nuclear waste less of a problem. Throughout my comment, you will see I have provided different reasons on why I feel the updated EIS is needed very much. Potential benefits for the community and agencies, and some ethical environmental reasons effectively show my stance on this topic. Thank you for your time, and I hope this provides some useful insight! (0192-1 [Einhorn, Jeremy])

Comment: The NRC's proposal to update the Waste Confidence Generic Environmental Impact Statement is of utmost importance to be done as soon as possible. I say this because of benefits for the community and the agencies, the necessity of this, and how it's basically the NRC's job to do such action in order to do their jobs in the best way possible. In conclusion, I am all for the updating of this EIS, and I hope that everyone else sees just how important this is. (0192-15 [Einhorn, Jeremy])

Comment: It is without say that spent nuclear fuel is a very serious topic as it is incredibly dangerous and its damaging effects have the potential to be devastating. In 2010, the Nuclear Regulatory Commission (NRC) created a generic environmental impact statement (EIS), called the Waste Confidence Generic Environmental Impact Statement, which dealt with the environmental impact of spent nuclear fuel, or nuclear waste. It is now up for comment on the update and revision of this EIS. I am for the renewal of this EIS, as this is something that can come back to haunt American if not dealt with properly. (0192-2 [Einhorn, Jeremy])

Comment: I am very happy the NRC is providing this draft EIS on the proposed schedule. The original legislation to create government storage of spent fuel was passed in 1982 and the US has not picked up the first ounce of spent fuel. In the absence of government regulation, the utility companies would have found a faster, cheaper and more efficient method to store, move & handle spent fuel - but at least the government is moving forward again at this glacial pace. Since the NRC stated in 1977 that it "... would not continue to license reactors if it did not have reasonable confidence that the wastes can and will in due course be disposed of safely" (42 FR 34391). So the NRC vision of due course is greater than 36 years, probably over 80 years. Now a repository is predicted for 2048, so 71 years minimum. And the utilities are required to collect money in every power bill to continue to fund this non progress. Our lovely government is amazingly wasteful in spending the citizens money. (0199-1 [Dailey, Arthur])

Comment: I look forward to the completion of this rulemaking on the announced schedule, and resumption of licensing reactors and spent fuel storage installations. (0201-4 [Fregonese, Vic])

Comment: In closing, I fully support the NRCs analysis and conclusions related to Waste Confidence. (0201-6 [Fregonese, Vic])

Comment: I agree with the NRC's definition of proposed action of promulgating of a rule that generically addresses the environmental impact of used fuel storage, making such considerations largely unnecessary in individual licensing proceedings which then would focus strictly on the individual licensed properties. (0244-1-2 [Tulenko, James])

Comment: The Waste Confidence decision supports the licensing of nuclear plants that provide 63 percent of the nation's carbon-free electricity. And I think a comment was made earlier that, you know, why does the regulator need to be efficient. Well, NRC has been efficient and is continuing to be efficient in this process even while making sure that all comments are heard. Because all forms of energy are regulated. The nuclear regulatory process is one of the toughest ones out there. Coal is regulated; natural gas is regulated; oil, solar, and wind are regulated. If all those regulators don't pay attention to being efficient, the end result is that energy, electricity, becomes very very expensive. A world in which electricity is priced out of reach is perhaps the most dangerous world we could possibly live in. If you don't believe that, have you ever seen the pictures called The World At Night, where it's a composite photo of the globe looking down as if it was night all over the globe? You see where the bright spots are in the world? The developed countries, the countries that have a high standard of living, those bright spots also tend to be clustered around nuclear plants. We are a significant source of baseload electricity around the world, over 400 plants. (0244-11-2 [McCullum, Rod])

Comment: In the meantime the NRC can and should issue its Waste Confidence Rule. (0244-12-7 [Ratchford, James])

Comment: The bottom line is that I do believe that we do have the technical basis for concluding that there is confidence in our ability to store spent nuclear fuel onsite, short term, long term, and indefinitely. I believe that your conclusions in your existing EIS, pursuant to the Federal Register that you have posted out there, the number of which you cited earlier, that they are valid conclusions. Particularly those that, in its draft form, conclude small impact, especially as to the air quality and air impact of the EIS, and I hope that your record reflects that. (0244-9-9 [Paul, Jerry])

Comment: The coalition supports the Proposed Waste Confidence Rule because the facts show that spent fuel can be, and is, safely and securely stored in Illinois. We further urge the

NRC to move forward expeditiously with the construction of a central spent fuel repository which will help us further develop potential nuclear energy and nuclear science across the nation. (0245-16-4 [O'Brien, Doug])

Comment: It is important to continue progress on a permanent solution of the storage of spent fuel. Exelon supports the development of the GEIS as a stepping stone in this process and supports and agrees with the conclusions in this report. The draft report is a rigorous examination of the environmental impact based on 50 years of research and operating experience. The report draws on industry, government, and academic references to compile a complete view of the potential impacts of spent fuel storage. The report appropriately looks at bounding conditions over the time periods in question, and the conclusion forms a sound basis for continued nuclear fuel storage and disposal. (0245-20-2 [Dunlap, Jeff])

Comment: In the meantime, the NRC can and should issue its Waste Confidence Rule. (0245-20-7 [Dunlap, Jeff])

Comment: I fully support the Rule. (0245-23-3 [Korn, Susan])

Comment: I have confidence in the draft GEIS and I would urge the NRC to adopt the Rule. (0245-33-4 [Schussele, Samantha])

Comment: Now, in vacating the 2010 update to the Waste Confidence Rule, the Appellate Court, among other things, directed the Agency to more thoroughly examine the environmental impact of continued spent fuel storage. The Agency's findings of minimal impact are consistent with the excellent safety track record associated with dry storage systems and the broader performance of the U.S. Nuclear Energy industry. (0246-10-2 [Bennett, Nathan])

Comment: I would like to offer my support for the Proposed Rule and thank you for your time this afternoon. (0246-10-7 [Bennett, Nathan])

Comment: There is much more to be said about why it is appropriate for the NRC to have conducted a generic review to meet its NEPA obligation. There is also much more to be said about how the draft GEIS sufficiently responds to the Court's direction to consider spent fuel pool leaks and fires. (0246-14-4 [Ginsberg, Ellen])

Comment: [The United Association of Plumbers and Fitters in North America and Australia] support the NRC findings. (0246-18-7 [Karbowsky, Brad])

Comment: I work as a nuclear safety performance engineer and I work on the safety systems that are currently analyzing the spent fuel pool cooling for Fukushima-type conditions. And I take that responsibility to heart. I know the public and our country trusts engineers like me to provide them with the trust that they need in order to continue nuclear power and the safe storage of spent fuel. And I believe that the Proposed Rule is consistent with that. (0246-21-1 [Garcia, Diego])

Comment: I think the generalized approach is appropriate, as it takes into account bounding conditions, conditions for wet storage that are way beyond what storage is usually used for. It takes into account indefinite and long-term storage and dry casks. And those are applicable across the board. As an engineer, I feel confident in that. (0246-21-2 [Garcia, Diego])

Comment: I support the Rule and I think it does a very good and bounding job in addressing the issue at hand. (0246-21-5 [Garcia, Diego])

Comment: We [Decommissioning Plant Coalition] commend the Commission staff for its work to date and believe that the work firmly and fairly addresses the deficiencies found by the Court. Its analyses of short-term, long-term, and indefinite storage time frames are more than adequate to support the long-held tenant that the U.S. can and will successfully store and dispose of used fuel and reactor-generated greater-than-Class C waste safely and securely. And that would complete our comments on the Draft Final Rule and the Generic Environmental Impact Statement, itself. We do note that there is a need to address some of the written material ancillary to the Rule. We will offer comments that should illuminate the considerations and the publication of the Final Rule in the accompanying GEIS without disturbing the actual Rule and Statement. (0246-4-1 [Callahan, Mike])

Comment: I do, in closing, want to state that we do commend the staff and particularly this Directorate for its hard work and believe that you have firmly and fairly addressed the deficiencies of the Court. (0246-4-4 [Callahan, Mike])

Comment: [T]he draft Generic Environmental Impact Statement is a comprehensive assessment of the impact of the long-term storage of spent nuclear fuel. It's based on reasonable assumptions and it's based on current technology. Finally, the draft Generic Environmental Impact Statement provides a sound basis, both technically and on a regulatory framework, for the conclusion that it's technically feasible to store spent fuel on an indefinite long-term basis, safely and securely. (0250-15-4 [Rodack, Tom])

Comment: I support the conclusion that fuel can be stored without significant environmental impact, and laud the effort of the Commission to complete their analysis to eventually solve these issues, diverse energy solutions for storage and long-term energy planning for nuclear science and technology. (0250-19-3 [Howell, Adam])

Comment: I would like to thank the NRC for providing this time to provide public comments on the Waste Confidence ruling. I would like to state that I fully agree with and support the conclusions that are proposed in the Environmental Statement Impacts, and I fully believe, with all the technical understanding that I have of the nuclear industry, that the Environmental Impacts stated in that ruling are very clear, concise, and we have a very sound understanding of what is going to occur. (0250-24-1 [Rogers, Tim])

Comment: I'd like to extend my personal thanks to the NRC representatives for hosting this meeting. I would also like to compliment you and the staff on the quality of the documents that you have prepared. The documents are very well written, and laid out in very sound, logical fashion. (0250-25-1 [Wellwood, Jay])

Comment: Based off my experience, it is my professional opinion that there is substantial evidence to support the conclusions in the report regarding at and away from reactor storage, as well as the conclusions regarding cumulative impacts of those scenarios when combined with other federal and non-federal actions. (0250-25-3 [Wellwood, Jay])

Comment: I would like to express appreciation to the NRC for having this public meeting tonight. I do greatly support the NRC's efforts in the preparation of the GEIS which will help advance Waste Confidence for our industry[.] (0250-27-1 [Pennington, Charlie])

Comment: The proposed Waste Confidence Rule and Generic Environmental Impact Statement support the efforts of our company to deliver safe, reliable, and emission-free power to our customers, long into the future. It will also support efforts by other utilities that are working

to license new reactors to support their strategic objectives. We support the NRC's efforts this evening, and we support the agency moving forward with the proposed Waste Confidence Rule and Generic Impact Statement. (0250-3-5 [Archie, Jeff])

Comment: We can all be confident that used nuclear fuel is being safely stored, can be safely stored, and will be safely stored. I ask the NRC Commissioners to pass the new Safe Storage rule. (0250-35-7 [Cook, Andrew])

Comment: The court was very specific, the findings were very narrow; NRC has addressed these. A lot of talk about the generic nature and whether that's appropriate. NRC has done it appropriately because they've been bounding a lot of enveloping assumptions in here. Impacts are shown to be small, but in reality they're even smaller. We won't be repackaging every 100 years; we won't be building dry transfer facilities at every site; we won't be waiting 60 years to move fuel out of pools at shutdown plants. The average since dry cask storage was invented is 11 years. So, in closing, there's a lot to be confident. There will be more innovation. (0250-36-3 [McCullum, Rod])

Comment: Developing a final storage rule allowing the outside storage of spent fuel has a negligible environmental impact. (0250-37-4 [Barilla, Frank])

Comment: I'd like to thank the professionals at the NRC for their hard work developing this rule, and I urge the Commission to approve it. (0250-37-6 [Barilla, Frank])

Comment: The NRC and its staff should be congratulated for addressing these issues in a generic manner, rather than using a site-specific methodology. This approach to addressing the Waste Confidence decision is consistent with the NRC's responsibility to carry out its mission thoroughly and efficiently. It is also consistent with the NRC's principles of good regulation, which state "Where several effective alternatives are available, the option which minimizes the use of resources should be adopted." In closing, I'd say three things. First, I believe the basis for the draft Waste Confidence Rule is as valid today as the time when I was a Commissioner, and I also believe is consistent with the draft Environmental Impact Statement of which we discussed tonight. (0250-4-4 [Merrifield, Jeffrey])

Comment: And I implore the NRC to pass the GEIS as proposed. (0250-41-5 [Abendano, Juan])

Comment: I will briefly say that I do endorse the NRC's Environmental Impact Statement, and I worked at a number of nuclear plants now. I've been in the business for five years, and I have complete confidence in the NRC to continue to provide robust, safe, and reliable regulatory oversight and rules for our industry that includes the storage of nuclear fuel waste. (0250-43-1 [Causey, Lee])

Comment: The Nuclear Regulatory Commission's draft Generic Environmental Impact Statement adequately addresses the items identified in the remanding of the 2010 Waste Confidence rulemaking by the United States Court of Appeals for the D.C. Circuit Court. The draft Generic Environmental Impact Statement thoroughly examines across multiple time frames the environmental and societal impacts of storing spent fuel at licensed facilities. The draft Generic EIS considers not only the effects of time but the possibility for such adverse conditions as seismic events, extreme weather, and hostile human action. These studies have been conducted in a conservative and bounding manner to ensure that the generic study is applicable to facilities nationwide. For those of you who actually read it and, well, a side comment, I am wondering how many of you actually did -- it actually lists all the facilities in the country that

have stored spent nuclear fuel and it covers that list. The specific dependencies on spent nuclear fuel leaks and fires mandated by the Court of Appeals ruling enforces the communities' understanding that, even under the worst of conditions, the likelihood of spent fuel stored at commercial facilities contributing adversely to a severe event is extremely small. (0250-56-1 [Murphy, William])

Comment: The conclusions of the draft Environmental Impact Statement most of all, to me, serve to confirm what I have personally observed and contributed to that storage of spent nuclear fuel has been and will be conducted with public health and safety as an overriding objective. (0250-56-3 [Murphy, William])

Comment: I support the NRC's conclusion that used fuel can be stored safely and without significant environmental effects and ask the NRC to complete this rulemaking in a timely fashion. (0250-57-6 [Jones, Lauren])

Comment: Despite our industry's frustrations, we are committed to keeping the lights on. And I am confident in the NRC's ability to objectively evaluate options with respect to used nuclear fuel storage and safety. I look forward to the issuance of the Waste Confidence Rule. (0250-58-7 [Cagnetta, Matt])

Comment: [W]e [Duke Energy] endorse the proposed Waste Confidence Rule. The NRC properly concludes that reactor operators can safely store used fuel after shutting down, until the federal government carries out its responsibility to dispose of the material. (0250-6-2 [Nesbit, Steve])

Comment: I think there are three important things with respect to the rulemaking and the Generic EIS that are very important here. I do endorse the Generic EIS and the treatment of that. I found the EIS to be very thoroughly written in the proposed rulemaking, but I would say three things are really important for the NRC. First is to make sure that we are removing uncertainty that the analysis is thorough, it's well-done, and the analyses and the EIS and the incorporation of comments from members of the public and industry are incorporated into that comment process, which is one of the events that we're doing tonight. (0250-61-3 [Little, Jim])

Comment: First of all, I do support the conclusions from the Nuclear Regulatory Commission as it relates to the Generic EIS. It's a very important issue for our industry to address and for our country to address. It provides needed certainty in an industry that provides a lot of reliable, safe, clean generation. It provides a lot of jobs for our citizens. And it is a vital part of our energy mix in the United States. So I applaud the NRC process. (0250-62-2 [Fregonese, Vic])

Comment: I support the conclusions of the EIS. And I look forward to the NRC bringing this to closure. (0250-62-6 [Fregonese, Vic])

Comment: Our safety record for protecting the public and our proven ability to safely harness nuclear power is why I support the Waste Confidence Rule and have the utmost confidence in this industry's ability to safely store used nuclear fuel in both spent nuclear fuel and dry storage. (0250-67-3 [DeVoe, Joe])

Comment: I support the NRC's decision to generically revise 10 CFR 51.23. It's the most efficient use of government resources, and it does compromise its mission of ensuring safety. The staff is also to be commended for their work on this draft GEIS. It's comprehensive, both in its effects and its three large time frames considered, particularly the inclusion of the indefinite storage period, which is conservative, although obviously not politically desirable. I think that the

assumptions of the GEIS are reasonable. The range of resource areas, in effect, considered, are logically and technically sound. (0250-70-1 [James, Andrew])

Comment: And we support the draft Environmental Impact Statement. (0250-70-6 [James, Andrew])

Comment: The South Carolina Governor's Nuclear Advisory Council (GNAC) was formed by statute to advise the Governor on issues relating to nuclear materials and activities in South Carolina. South Carolina hosts seven power reactors, with used fuel in pools and dry casks, and the Savannah River Site, which stores vitrified defense waste waiting permanent disposal. We provide the following comments on the subject rule and its supporting EIS for your consideration. The GNAC agrees with the conclusions in the Waste Confidence Draft GEIS and with the proposed revisions to the Waste Confidence - Continued Storage of Spent Nuclear Fuel rule. The draft GEIS is a National Environmental Policy Act (NEPA) document and its conclusions support the proposed rulemaking (0262-1 [Patterson, Karen])

Comment: The proposed rule simply clarifies the issues and processes surrounding the safe and secure storage of spent nuclear fuel. It does not authorize individual licenses, as this is only one step in the commission's National Environmental Policy Act (NEPA) review. Enhancing the clarity of this policy will lead to a more efficient licensing process, which will benefit consumers throughout our region. (0273-2 [Kinzinger, Adam])

Comment: I therefore support the pending rulemaking. (0313-3 [Waage, Edward])

Comment: We have reviewed the Waste Confidence Draft Generic Environmental Impact Statement and conclude that the NRC is interpreting well the professional consensus in preparing a more thorough Environmental Impact Statement as requested by the U.S. Court of Appeals for the District of Columbia in order to satisfy the NRC's NEPA obligations. (0325-17-1 [Pearson, Jeremy])

Comment: But I think that we've had confidence, and we have confidence in their Draft EIS for future storage. (0325-18-4 [Lemmon, Tom])

Comment: I think what they've done in terms of putting together a generic program is a good idea. It takes away 80 percent of the issues. So, when we get to San Onofre and what to do with that fuel, then a lot of the other issues have already been solved. And we can look at the specifics of this. We don't have to reinvent the wheel all the time. (0325-32-4 [Lord, Stephen])

Comment: I'm here to support the NRC Waste Confidence Ruling. (0326-18-1 [Schrader, Ken])

Comment: So that being said, I definitely support a spent fuel storage policy, and specifically, long-term storage solutions, and encourage that to move forward. A rulemaking that generically addresses Waste Confidence issues is absolutely a step in the right direction. (0326-41-3 [Zaitz, Kristin])

Comment: The United States Nuclear Regulatory Commission, NRC, has asked for public comment on the Proposed Waste Confidence Rule. The State Building Trades believes it is important that the NRC more efficiently conduct its licensing process by adopting a Waste Confidence Rule which provides a generic analysis of the environmental impact of the continued storage of spent nuclear fuel beyond the licensed life of the operation of the nuclear reactor. The adoption of the Waste Confidence rule, which states that used nuclear fuel can be stored at nuclear power plant sites safely and without significant environmental impact, provides the

nuclear industry with a certainty regarding the management of the spent fuel. Providing this clarity is critical towards ensuring operations and capital investment at these nuclear facilities continue which means jobs for our State Building Trades. (0327-12-1 [Knisley, Mike])

Comment: In summation, the State Building Trades supports adoption of the Waste Confidence Rule which provides the nuclear industry with long-term stability on this issue, and which will likely continue for significant work opportunities for our members. (0327-12-4 [Knisley, Mike])

Comment: I live close to both Fermi and Davis-Besse, and I am in favor of, and have confidence in, these fuel storage options. (0327-17-1 [Padot, Paul])

Comment: I support the adoption of this Proposed Waste Confidence Rule. We need a safe, secure, and commonsense way to store this waste until a permanent facility is available. Many of my members [Plumbers and Steamfitters Local 50] help maintain and service the Davis-Besse powerhouse in Oak Harbor, and I will say it is one of the safest and most secure job sites there is for them to have an opportunity to work at. (0327-19-1 [Szabo, Lou])

Comment: I've reviewed the GEIS and the proposed rulemaking, and I want to voice my support. (0327-28-1 [Greenwood, John])

Comment: In further support of this rulemaking, I believe firmly in the nuclear industry because I see life within infrastructure. And it's key to our infrastructure to maintain integrity of our electrical grid. I've traveled abroad and have seen places without that infrastructure that have desolation and the poor living standards that are there. Our country is rich. We want to maintain this tradition. If we want to support our education, if we want to support the growth of our future, we need to maintain critical infrastructure, which is the electric grid. (0327-28-5 [Greenwood, John])

Comment: The NRC has asked for public comment on the Proposed Waste Confidence Rule. ACT Ohio is in full support of a Waste Confidence Rule which provides a generic analysis of environmental impacts of the continued storage of spent nuclear fuel beyond the life of the license of the operation of the nuclear reactor. The adoption of such a Rule would provide the nuclear industry with a long-term stability and allow it to make capital improvements to its facilities, which helps leads to increased work opportunities for the skilled construction trade industry and the safety of our local communities. (0327-31-1 [Dorans, Rob])

Comment: In summation, ACT Ohio [Affiliated Construction Trades Foundation of Ohio] supports the adoption of the Waste Confidence Rule, which provides the nuclear industry with long-term stability on this issue and will help lead to work opportunities for the skilled construction trades industry. (0327-31-6 [Dorans, Rob])

Comment: I would like to applaud the NRC on completing a Draft Generic Environmental Impact Statement and convey our support for the proposed action of issuing a revised Waste Confidence ruling. As a member of the nuclear industry, I realize the significance and impact that both the Draft GEIS and the revision of the Waste Confidence ruling will have on the growth and sustainability of this industry. As our current nuclear fleet ages and the continued need for carbon-free energy increases, it has never been more imperative that these issues are addressed. (0328-10-2 [Biersdorf, John])

Comment: I support the NRC's findings in both the GEIS and the Nuclear Confidence ruling. These findings will allow the industry the flexibility to deal with its own spent nuclear fuel until a finalized solution can be agreed upon, while also allowing the industry to grow and meet the demand for carbon-free electricity using proven methods for spent fuel storage in the interim. (0328-10-5 [Biersdorf, John])

Comment: The analysis contained in the Draft Waste Confidence Generic Environmental Impact Statement supports what nuclear experts have long contended, used nuclear fuel is, and can continue to be, stored on site at commercial nuclear power plants in a safe, environmentally sound manner for a long time. However, just because it can be done does not mean that it should be done. (0328-5-11 [Pickens, Terry])

Comment: In the meantime, the NRC can, and should, issue its Waste Confidence Rule. (0328-5-14 [Pickens, Terry])

Comment: I am in complete support of what the NRC has promulgated in its Waste Confidence Draft Rule. (0329-2-1 [Mirsky, Steven])

Comment: I am my family are in support of NRC's spent fuel rule- (0374-1 [Landers, Don])

Comment: I and my husband and son support the NRC Spent Fuel Storage Rule. (0383-1 [Mordaunt, Brandon] [Mordaunt, Laura] [Mordaunt, Philip])

Comment: As a 33-year resident of the Central Coast of California, I am writing this letter to convey my support for the NRC's Spent Fuel Storage Rule. (0388-1 [Cox, David])

Comment: It is essential for the Nuclear Regulatory Commission to complete the waste confidence rulemaking and move forward with issuing renewed operating licenses for existing nuclear plants and licenses to build and operate new plants. The proposed rulemaking will enhance efficiency in individual licensing reviews by utilizing the Waste Confidence Generic Environmental Impact Statement to satisfy the requirements of the National Environmental Policy Act with regards to continued storage of spent nuclear fuel, which are the same or largely similar at each nuclear site. Additionally there is strong international scientific consensus that geologic disposal is the best solution to permanently isolate spent nuclear fuel from the public and the environment. Studies by the National Academy of Sciences and the International Atomic Energy Agency have confirmed this conclusion. (0398-1 [Helsel, Adam])

Comment: It is essential for the Nuclear Regulatory Commission to complete the waste confidence rulemaking and move forward with issuing renewed operating licenses for existing nuclear plants and licenses to build and operate new plants. The proposed rulemaking will enhance efficiency in individual licensing reviews by utilizing the Waste Confidence Generic Environmental Impact Statement to satisfy the requirements of the National Environmental Policy Act with regards to continued storage of spent nuclear fuel, which are the same or largely similar at each nuclear site. Additionally there is strong international scientific consensus that geologic disposal is the best solution to permanently isolate spent nuclear fuel from the public and the environment. Studies by the National Academy of Sciences and the International Atomic Energy Agency have confirmed this conclusion. (0399-1 [Sylvester, Richard])

Comment: It is essential for the Nuclear Regulatory Commission to complete the waste confidence rulemaking and move forward with issuing renewed operating licenses for existing nuclear plants ? and licenses to build and operate new plants. The proposed rulemaking will enhance efficiency in individual licensing reviews by utilizing the Waste Confidence Generic Environmental Impact Statement to satisfy the requirements of the National Environmental

Policy Act with regards to continued storage of spent nuclear fuel, which are the same or largely similar at each nuclear site. Additionally there is strong international scientific consensus that geologic disposal is the best solution to permanently isolate spent nuclear fuel from the public and the environment. Studies by the National Academy of Sciences and the International Atomic Energy Agency have confirmed this conclusion. (0400-1 [Blankenmyer, Eric])

Comment: For many reasons, nuclear energy is a vital part of our nation's electricity system. It is essential for the Nuclear Regulatory Commission to complete the waste confidence rulemaking and move forward with issuing renewed operating licenses for existing nuclear plants and licenses to build and operate new plants. (0456-1 [Hoisington, Paula])

Comment: It is essential for the Nuclear Regulatory Commission to complete the waste confidence rulemaking and move forward with issuing renewed operating licenses for existing nuclear plants...and licenses to build and operate new plants. The proposed rulemaking will enhance efficiency in individual licensing reviews by utilizing the Waste Confidence Generic Environmental Impact Statement to satisfy the requirements of the National Environmental Policy Act with regards to continued storage of spent nuclear fuel, which are the same or largely similar at each nuclear site. (0461-1 [Pan, Arthur])

Comment: The proposed rule on storage of spent nuclear fuel seems reasonable (0466-1 [Tanner, John])

Comment: The HPS supports the analysis and conclusions of the Waste Confidence Generic Environmental Impact Statement (GEIS) and Proposed Rule. We are particularly pleased that the staff report supports the conclusion that environmental impacts from all three timeframes are adequately small to support proceeding with the rulemaking. This conclusion is consistent with our HPS Position Statement PS022-1, "Managing Spent Nuclear Fuel," revised June, 2007. (0534-1 [Vetter, Richard])

Comment: We were satisfied that the GEIS addressed the use of high burnup fuel, mixed oxide fuel, stainless steel cladding, small modular reactors and other peripheral issues being raised in objection to the proposed rulemaking. The second issue of concern to members of the public is the potential for fire in a spent fuel pool caused by reduced water inventory. The GEIS has also adequately addressed this very low potential environmental impact. (0534-2 [Vetter, Richard])

Comment: NAYGN supports NRC's on rulemaking. NRC appropriately addresses the spent fuel storage issues in a Generic Environmental Impact Statement and rulemaking. The draft Generic Environmental Impact Statement makes conservative assumptions and reasonably shows that if necessary, used nuclear fuel can continue to be stored in a safe, environmentally sound manner for a long period. (0535-4 [Damratoski, Katie] [Thornton, Adam])

Comment: I strongly support the NRC's efforts to keep our nuclear facilities safe and reliable. As the NRC continues its Waste Confidence rule making, I urge the NRC to proceed efficiently. (0555-1 [Contreras, Raquel])

Comment: We [The Decommissioning Plant Coalition] commend the Commission for its work to date and believe that it firmly and fairly addresses the deficiencies found by the Court and that its analyses of short, intermediate, and long-term storage timeframes are more than adequate to support the long held tenet that the U.S. can and will successfully store and dispose of used fuel and reactor-generated high-level wastes safely and securely. (0637-1 [Norton, Wayne])

Comment: Xcel Energy appreciates the opportunity to address this very important rulemaking action by the Nuclear Regulatory Commission and applaud the Commission's efforts to act in an efficient, transparent and expeditious manner. We support the NRC staffs proposed determinations that it is feasible to safely store spent nuclear fuel beyond the licensed life for operation of a reactor and to have a mined geologic repository within 60 years following the licensed life for operation of a reactor. We believe that the Commission's proposed rule and draft generic environmental impact statement comprehensively addresses the issues raised by the U.S. Court of Appeals for the District of Columbia Circuit in *New York v. NRC*. (0638-1 [Glass, Peter])

Comment: The draft EIS provides a thorough evaluation of the environmental consequences of used fuel storage at reactor sites or at consolidated storage facilities following termination of reactor operations. (0672-3 [Jamil, Dhiaa])

Comment: I am writing to you today to show support for PG&E's successful spent fuel management program and the NRC's Spent Fuel Storage Rule. (0682-1 [Adam, Peter])

Comment: I am writing to you today to show support for PG&E's successful spent fuel management program and the NRC's Spent Fuel Storage Rule. (0683-1 [Nelson, Bob])

Comment: The draft EIS provides a thorough evaluation of the environmental consequences of used fuel storage at reactor sites or at consolidated storage facilities following termination of reactor operations. (0685-4 [Davis, Ed])

Comment: TVA agrees with the Proposed Rule and the conclusions in the DGEIS that it is eminently feasible to safely store spent nuclear fuel beyond the licensed life for operation of a reactor and to have a mined geologic repository within 60 years following the licensed life for operation of a reactor. TVA further agrees with the conclusions in the DGEIS that the environmental impacts of continued at-reactor storage of spent fuel are generally small, including the impacts from spent fuel pool leaks and fires. (0694-1-1 [Shea, Joseph])

Comment: TVA fully agrees with the NRC's and NEI's conclusions that a generic approach is appropriate. TVA's conclusions are supported by the following: •As the NRC correctly notes, the impacts of continued storage of spent fuel can be assessed generically because: (1) continued storage will involve SNF storage facilities for which the environmental impacts of operation are sufficiently understood as a result of lessons learned and knowledge gained from decades of operating experience (including the use of common storage technologies); (2) activities associated with continued storage are expected to be within this well-understood range of operating experience and, thus, environmental impacts can be reasonably predicted; and (3) changes in the environment around SNF storage facilities, including those existing or planned for WBN, are sufficiently gradual and predictable to be addressed generically. •The advantage of a generic rulemaking in these circumstances is clear and well-established, and expressly stated in the Proposed Rule: to enhance efficiency in individual licensing reviews by comprehensively analyzing environmental impacts that are the same or largely similar for each nuclear power reactor or storage site, thereby avoiding the need to "repeat the identical or substantially similar analysis in individual licensing actions." This is consistent with the Commission's longstanding practice to address long-term waste storage issues generically by rulemaking rather than on a case-by-case adjudicatory basis. •Use of a generic rulemaking also has been sanctioned by the federal courts, including the D.C. Circuit in *New York v. NRC*,²⁰ [footnote 20 text: See *New York*, 681 F.3d at 480; see also *Baltimore Gas & Elec. Co. v. Natural Res. Def. Council, Inc.*, 462 U.S. 87, 101 (1983) ("The generic method chosen by the agency is

clearly an appropriate method of conducting the hard look required by NEPA."); *Minnesota v. NRC*, 602 F.2d 412, 416-17 (D.C. Cir. 1979).] and avoids the obvious inefficiencies attendant to case-by-case adjudication of fundamentally generic environmental issues. (0694-1-10 [Shea, Joseph])

Comment: TVA has confirmed that the conclusions in the DGEIS regarding the small environmental impacts of continued storage of SNF apply to TVA's plants, including WBN. Thus, there is no need for or benefit of a site-specific analysis for issuance of an operating license for WBN-2 or other pending or future TVA licensing actions. In summary, the use of a generic rulemaking and a generic EIS is entirely appropriate for the waste confidence issues under consideration in the Proposed Rule and DGEIS, and has been justified by the NRC. (0694-1-11 [Shea, Joseph])

Comment: TVA supports the comments submitted by the Nuclear Energy Institute on behalf of the nuclear power industry. In particular, TVA agrees that the NRC's use of a generic rulemaking to address the waste confidence issues is appropriate and consistent with applicable law, and the NRC has fully addressed the issues identified by the U.S. Court of Appeals for the District of Columbia Circuit in *New York v. NRC*. (0694-1-2 [Shea, Joseph])

Comment: TVA provides comments that confirm that the NRC's general analysis of spent fuel storage impacts is fully applicable to TVA's nuclear plants, including Watts Bar Unit 2. In addition to support for NEI's comments and discussion of the applicability of the DGEIS analysis to TVA's plants, TVA provides comments for changes to the DGEIS, including recommendations for additional detail or topics in places to support the NRC's conclusions that environmental impacts are small and appropriately apply to all U.S. nuclear plants. TVA's comments demonstrate that there is no need for a site-specific Environmental Impact Statement for any TVA plant with a pending license application. (0694-1-3 [Shea, Joseph])

Comment: In summary, the Proposed Rule states that the Commission has determined that it is feasible to safely store SNF following the licensed life for operation of a reactor, either in spent fuel pools ("SFPs") or dry casks, and to have a mined geologic repository within 60 years following the licensed life for operation of a reactor. The Proposed Rule is supported by the conclusions in the DGEIS that most of the environmental impacts of continued at-reactor storage of spent fuel in a SFP or Independent Spent Fuel Storage Installation ("ISFSI") are small. TVA agrees with and fully supports these conclusions and the NRC's supporting explanation. (0694-1-5 [Shea, Joseph])

Comment: NRC's generic analysis of spent fuel storage impacts is fully applicable to TVA's nuclear plants, including WBN-2. This includes consideration of the DGEIS assumptions, such as the reference facility described in Chapter 2; the affected environment in Chapter 3; consideration of the environmental impacts in Chapter 4; consideration of continued safe storage of spent fuel in Appendix B; consideration of SFP leaks in Appendix E; and consideration of SFP fires in Appendix F. (0694-1-9 [Shea, Joseph])

Comment: The Proposed Rule and the supporting DGEIS directly address the three deficiencies identified by the D.C. Circuit in its remand order, ³⁶ [footnote 36 text: *New York*, 681 F.3d at 478-79.] and do so in a manner that thoroughly and reasonably address the environmental impacts of continued storage of SNF for all reactors-including those at TVA's plants. ³⁷ [footnote 37 text: See Proposed Rule, 78 Fed. Reg. at 56,780 ("[T]he Commission instructed NRC staff to proceed with a generic EIS to analyze the environmental impacts of continued storage and address the issues raised in the Court's decision and to update the

Waste Confidence rule in accordance with the analysis in the EIS. The DGEIS and the proposed rule implement the Commission's direction."); *id.* at 56,784 ("The analysis in the GEIS constitutes a regulatory basis for the proposed rule at 10 CFR 51.23, which codifies the NRC's conclusions in the GEIS on the environmental impacts of continued storage, including the Commission's expectations on the availability of a geologic repository.".)] (0694-2-1 [Shea, Joseph])

Comment: TVA agrees with the NRC and NEI that the indefinite storage scenario is not likely to occur. (0694-2-10 [Shea, Joseph])

Comment: Nonetheless, the D.C. Circuit specifically directed the agency to assess the environmental impacts of failing to establish a permanent repository, and TVA agrees with NEI that the NRC's consideration of an indefinite storage timeframe completely addresses the remand on this issue. Furthermore, inclusion of the indefinite storage scenario in the analysis helps the DGEIS to fully cover any possible environmental impacts associated with continued storage of spent fuel. (0694-2-12 [Shea, Joseph])

Comment: NRC's analysis of possible impacts from each storage scenario is applicable to TVA's nuclear plants, including WBN and any incremental impacts associated with issuance of an operating license for WBN-2. (0694-2-14 [Shea, Joseph])

Comment: [T]he NRC's generic analysis of spent fuel storage impacts in the Proposed Rule and DGEIS is fully applicable to TVA's nuclear plants, including WBN-2; any site-specific differences are not expected to have any new or significant environmental impacts. Therefore, the NRC has completed a reasonable and thorough generic evaluation that fully satisfies NEPA and no site-specific evaluation of spent fuel storage impacts is necessary or warranted for any of TVA's plants, including WBN-2. (0694-2-15 [Shea, Joseph])

Comment: This scope encompasses spent fuel storage issues applicable to TVA's nuclear plants. (0694-2-16 [Shea, Joseph])

Comment: DGEIS Chapter 2 discusses "typical facility characteristics and activities" that the NRC used to assess environmental impacts that may occur from continued storage of SNF.⁶⁰ [footnote 60 text: See DGEIS at 2-1.] These characteristics and activities are generally comparable to those for the WBN site. (0694-2-17 [Shea, Joseph])

Comment: Characteristics of WBN-1 and WBN-2, including facility description, reactor core size, fuel design, enrichment, and burnup, are generally comparable to the reactor description assumptions in Section 2.1 of the DGEIS. For example, as discussed below, some of TVA's reactors have or may participate in tritium production for the Department of Energy ("DOE"), but that activity does not significantly alter their characteristics that are relevant to waste confidence considerations and any minor differences do not impact the DGEIS conclusions. (0694-2-18 [Shea, Joseph])

Comment: As stated in the DGEIS, "[f]or most of the resource areas, the impact determinations for all three timeframes are SMALL."⁴² [footnote 42 text: DGEIS at 4-90.] There is nothing unique or different at TVA's plants that calls into question the applicability of these impact determinations. (0694-2-2 [Shea, Joseph])

Comment: Therefore, this SFP design is consistent with, and in fact appears to exceed, the SFP designs considered in the DGEIS. (0694-2-21 [Shea, Joseph])

Comment: Assuming a maximum uranium loading for each fuel assembly, TVA estimates that the WBN's SFP storage capacity is less than the 700 MTU storage capacity discussed in the DGEIS for the "reference spent fuel pool."⁷⁶ [footnote 76 text: DGEIS at 2-11.] (0694-2-22 [Shea, Joseph])

Comment: TVA has not identified any activities that it plans to conduct that would be inconsistent with those discussed in DGEIS Section 2.2. For example, the DGEIS assumes timely decommissioning of reactors in accordance with 10 CFR 50.82 and 52.110(c), and that all spent fuel would be moved from SFPs to dry storage by the end of the short-term timeframe (i.e., within 60 years beyond the licensed life for reactor operations).⁸⁹ [footnote 89 text: Id. at 2-26.] Such assumptions are reasonable and applicable to TVA's nuclear plants, including WBN. (0694-2-27 [Shea, Joseph])

Comment: TVA concludes that DGEIS Chapter 3 provides a reasonable description of the affected environment for consideration of the issues in the DGEIS, and that this description is comparable to TVA's plants for the purposes of the DGEIS. (0694-2-29 [Shea, Joseph])

Comment: Consistent with decades of operating experience and environmental monitoring, including TVA's own operating experience, that analysis concludes that the impacts are SMALL.⁴⁴ [footnote 44 text: See Proposed Rule, 78 Fed. Reg. at 56,797; DGEIS at E-19.] As discussed below, the SMALL finding regarding the potential offsite impacts of SFP leaks applies to potential impacts at TVA's plants. (0694-2-3 [Shea, Joseph])

Comment: [T]he SMALL finding regarding the risk of SFP fires applies to potential impacts at TVA's plants. (0694-2-4 [Shea, Joseph])

Comment: In summary, the NRC has taken reasonable and appropriate actions, in the form of the DGEIS and a proposed generically-applicable rule, to address the deficiencies in 10 CFR 51.23 identified by the D.C. Circuit. (0694-2-5 [Shea, Joseph])

Comment: The Proposed Rule and DGEIS Consider Appropriate Timeframes for Continued SNF Storage[.] (0694-2-6 [Shea, Joseph])

Comment: The assumptions within the short-term timeframe are reasonable for TVA's nuclear plants, including WBN. (0694-2-7 [Shea, Joseph])

Comment: The assumptions within the long-term timeframe are also reasonable or conservative for TVA's nuclear plants, including WBN. (0694-2-8 [Shea, Joseph])

Comment: These assumptions [indefinite timeframe] also are reasonable or conservative for TVA's nuclear plants, including WBN. (0694-2-9 [Shea, Joseph])

Comment: TVA is not aware of any aspects of its plants that would place them outside the generic evaluation of the environmental impacts of continued at-reactor storage of spent fuel that is provided in the DGEIS. (0694-3-10 [Shea, Joseph])

Comment: DGEIS Appendix B addresses the technical feasibility of continued safe storage of spent fuel, including the technical feasibility of wet storage (Section 8.3.1) and the technical feasibility of dry cask storage (Section 8.3.2). TVA has not identified anything in these sections of the DGEIS that is inconsistent with its own substantial spent fuel storage experiences and plans. (0694-3-11 [Shea, Joseph])

Comment: DGEIS Appendix E describes the environmental impacts of SFP leaks that may occur during the short-term storage timeframe, and concludes that the environmental impacts from leaks would be SMALL to groundwater, surface water, soils, and public health.¹¹⁸ [footnote 118 text: *Id.* at E-19.] TVA has confirmed that these conclusions regarding the impacts of SFP leaks apply to its nuclear plants, including WBN. (0694-3-14 [Shea, Joseph])

Comment: It is entirely reasonable for the NRC, like other government agencies in other waste-related contexts, to assume that institutional controls will remain for all reactor sites. There is nothing unique about TVA's plants in this regard. (0694-3-21 [Shea, Joseph])

Comment: Some of the reasons for a SMALL impact for TVA include: TVA already has a large area of previously disturbed land at its sites that would be used for the construction of storage facilities, TVA would mitigate any adverse effects on historic properties, TVA has appropriate management plans and procedures that are protective of historic and cultural resources, and these activities would be subject to further consideration of historic and cultural impacts during future regulatory activities. (0694-3-6 [Shea, Joseph])

Comment: •As described in DGEIS Sections 4.18.1 and 4.18.2, the environmental risks of continued storage of spent fuel associated with postulated accident conditions, such as design basis events for SFPs and dry cask storage systems, including hazards from natural phenomenon, such as earthquakes, floods, and tornadoes, and severe accidents, are SMALL.¹⁰¹ [footnote 101 text: *Id.* at 4-69 to 4-83.] These conclusions apply to TVA's plants, including WBN-2. (0694-3-8 [Shea, Joseph])

Comment: We respectfully submit the attached comments on the Proposed Rule and the DGEIS on behalf of Entergy Nuclear Operations, Inc. ("Entergy"). In summary, Entergy agrees with the Proposed Rule and the conclusions in the DGEIS that it is eminently feasible to safely store spent nuclear fuel beyond the licensed life for operation of a reactor and to have a mined geologic repository within 60 years following the licensed life for operation of a reactor. Entergy further agrees with the conclusions in the DGEIS that the environmental impacts of continued at-reactor storage of spent fuel are generally small, including the impacts from spent fuel pool leaks and fires. (0697-1-1 [Bessette, Paul] [Kuyler, Raphael])

Comment: Therefore, the DGEIS evaluations and conclusions apply fully to Entergy's plants. (0697-1-10 [Bessette, Paul] [Kuyler, Raphael])

Comment: Entergy demonstrates that the DGEIS generic conclusions are applicable to IPEC, such that no additional site-specific analysis is necessary to evaluate the environmental impacts of long-term storage of SNF at IPEC. (0697-1-11 [Bessette, Paul] [Kuyler, Raphael])

Comment: Entergy fully agrees with the NRC's and NEI's conclusions that a generic approach is appropriate and would result in increased efficiency. Entergy's conclusions are supported by the following: •As the NRC correctly notes, the impacts of continued storage can be assessed generically because: (1) continued storage will involve SNF storage facilities for which the environmental impacts of operation are sufficiently understood as a result of lessons learned and knowledge gained from decades of operating experience (including use of common storage technologies); (2) activities associated with continued storage are expected to be within this well-understood range of operating experience and, thus, environmental impacts can be reasonably predicted; and (3) changes in the environment around SNF storage facilities, including those existing or planned for IPEC, are sufficiently gradual and predictable to be addressed generically.¹⁴ [footnote 14 text: Proposed Rule, 78 Fed. Reg. at 56,781.] (0697-1-12 [Bessette, Paul] [Kuyler, Raphael])

Comment: •The advantage of a generic rulemaking in these circumstances is clear and well-established, and expressly stated in the Proposed Rule: to enhance efficiency in individual licensing reviews by comprehensively analyzing environmental impacts that are the same or largely similar for each nuclear power reactor or storage site, thereby avoiding the need to "repeat the identical or substantially similar analysis in individual licensing actions."¹⁵ [footnote 15 text: *Id.* at 56,784.] •This is consistent with the Commission's longstanding practice to address long-term waste storage issues generically by rulemaking rather than on a case-by-case adjudicatory basis.¹⁶ [footnote 16 text: See *Entergy Nuclear Operations, Inc. (Indian Point Nuclear Generating Units 2 & 3)*, CLI-10-19, 72 NRC 98, 99-100 (2010) (citing *Duke Energy Corp. (Oconee Nuclear Station, Units 1, 2, & 3)*, CLI-99-11, 49 NRC 328, 343 (1999); *Kelley v. Selin*, 42 F.3d 1501, 1512-13 (6th Cir. 1995)) (directing denial of the admission of waste confidence contentions that were the subject of general rulemaking).] (0697-1-13 [Bessette, Paul] [Kuyler, Raphael])

Comment: •Use of a generic rulemaking also has been sanctioned by the federal courts, including the D.C. Circuit in *New York v. NRC*,¹⁷ [footnote 17 text: See *New York*, 681 F.3d at 480; see also *Baltimore Gas & Elec. Co. v. Natural Res. Def. Council, Inc.*, 462 U.S. 87, 101 (1983) ("The generic method chosen by the agency is clearly an appropriate method of conducting the hard look required by NEPA."); *Minnesota v. NRC*, 602 F.2d 412, 416-17 (D.C. Cir. 1979).] and avoids the obvious inefficiencies attendant to case-by-case adjudication of fundamentally generic environmental issues. (0697-1-14 [Bessette, Paul] [Kuyler, Raphael])

Comment: [T]he conclusions in the DGEIS regarding the SMALL environmental impacts of continued storage of SNF apply to Entergy's plants, including IPEC. Thus, there is no need for or benefit of a site-specific analysis for issuance of renewed licenses for IP2 and IP3 or other pending or future Entergy licensing actions. In summary, the use of a generic rulemaking and a generic EIS is entirely appropriate for the waste confidence issues under consideration in the Proposed Rule and DGEIS, and has been justified by the NRC. (0697-1-15 [Bessette, Paul] [Kuyler, Raphael])

Comment: The Proposed Rule and the supporting DGEIS directly address the three deficiencies identified by the D.C. Circuit in its remand order,³⁴ [footnote 34 text: *New York*, 681 F.3d at 478-79.] and do so in a manner that thoroughly and reasonably addresses the environmental impacts of continued storage of SNF for all reactors—including those at Entergy's plants.³⁵ [footnote 35 text: See Proposed Rule, 78 Fed. Reg. at 56,780 ("[T]he Commission instructed NRC staff to proceed with a generic EIS to analyze the environmental impacts of continued storage and address the issues raised in the Court's decision and to update the Waste Confidence rule in accordance with the analysis in the EIS. The DGEIS and the proposed rule implement the Commission's direction."); *id.* at 56,784 ("The analysis in the GEIS constitutes a regulatory basis for the proposed rule at 10 CFR 51.23, which codifies the NRC's conclusions in the GEIS on the environmental impacts of continued storage, including the Commission's expectations on the availability of a geologic repository.").] (0697-1-18 [Bessette, Paul] [Kuyler, Raphael])

Comment: As stated in the DGEIS, "[f]or most of the resource areas, the impact determinations for all three timeframes are SMALL."⁴⁰ [footnote 40 text: DGEIS at 4-90.] There is nothing unique or different at Entergy's plants that calls into question the applicability of these impact determinations. (0697-1-19 [Bessette, Paul] [Kuyler, Raphael])

Comment: Entergy fully supports the comments submitted by the Nuclear Energy Institute on behalf of the nuclear power industry. In particular, Entergy agrees that the NRC's use of a

generic rulemaking to address the waste confidence issues is logical and appropriate and consistent with applicable law, and the NRC has fully addressed the issues identified by the U.S. Court of Appeals for the District of Columbia Circuit in *New York v. NRC*. (0697-1-2 [Besette, Paul] [Kuyler, Raphael])

Comment: Consistent with decades of operating experience and environmental monitoring, including Entergy's own operating experience, that analysis concludes that the impacts are SMALL.⁴² [footnote 42 text: See Proposed Rule, 78 Fed. Reg. at 56,797; DGEIS, App. E at E-19.] As discussed below, the SMALL finding regarding the potential offsite impacts of SFP leaks is sound and applies to potential impacts at Entergy's plants. (0697-1-20 [Besette, Paul] [Kuyler, Raphael])

Comment: [T]he SMALL finding regarding the risk of SFP fires applies to potential impacts at Entergy's plants. (0697-1-21 [Besette, Paul] [Kuyler, Raphael])

Comment: In summary, the NRC has taken reasonable and appropriate actions, in the form of the DGEIS and a proposed generically-applicable rule, to address the deficiencies in 10 C.F.R. § 51.23 identified by the D.C. Circuit. (0697-1-22 [Besette, Paul] [Kuyler, Raphael])

Comment: The Proposed Rule and DGEIS Consider Appropriate Timeframes for Continued SNF Storage[.] (0697-1-23 [Besette, Paul] [Kuyler, Raphael])

Comment: The assumptions within the short-term timeframe are reasonable and appropriate for Entergy's nuclear plants, including IPEC.⁴⁶ [footnote 46 text: See Entergy Letter NL-08-144, "Unit 1 & 2 Program for Maintenance of Irradiated Fuel and Preliminary Decommissioning Cost Analysis in accordance with 10 CFR 50.54 (bb) and 10 CFR 50.75(f)(3)," Attach. 1 at 2 (Oct. 23, 2008) ("IP2 IFMP"), *available at* ADAMS Accession No. ML083040378; Entergy Letter NL-10-123, "Unit 3 Program for Maintenance of Irradiated Fuel and Preliminary Decommissioning Cost Analysis in accordance with 10 CFR 50.54 (bb) and 10 CFR 50.75(f)(3)," Attach. 2 at 2 (Dec. 10, 2010) ("IP3 IFMP"), *available at* ADAMS Accession No. ML103540233.] (0697-1-24 [Besette, Paul] [Kuyler, Raphael])

Comment: The assumptions within the long-term timeframe are also reasonable or conservative for Entergy's nuclear plants, including IPEC. (0697-1-25 [Besette, Paul] [Kuyler, Raphael])

Comment: These assumptions [indefinite timeframe] also are reasonable or conservative for Entergy's nuclear plants, including IPEC. (0697-1-26 [Besette, Paul] [Kuyler, Raphael])

Comment: Nonetheless, the D.C. Circuit specifically directed the agency to assess the environmental impacts of failing to establish a permanent repository, and Entergy agrees with NEI that the NRC's consideration of an indefinite storage timeframe appropriately addresses the remand on this issue. Furthermore, inclusion of the indefinite storage scenario in the analysis helps the DGEIS to fully cover any possible environmental impacts associated with continued storage of spent fuel. (0697-1-29 [Besette, Paul] [Kuyler, Raphael])

Comment: NRC's analysis of spent fuel storage impacts is fully applicable to Entergy's nuclear plants, including the Indian Point Energy Center. (0697-1-3 [Besette, Paul] [Kuyler, Raphael])

Comment: As discussed further below, the NRC's analysis of possible impacts from each storage scenario is applicable to Entergy's nuclear plants, including IPEC and any incremental

impacts associated with issuance of renewed operating licenses for IP2 and IP3. (0697-1-31 [Bessette, Paul] [Kuyler, Raphael])

Comment: Entergy's comments demonstrate that there is no need for a site-specific Environmental Impact Statement for Indian Point Energy Center, or any Entergy plant with a pending license application. (0697-1-4 [Bessette, Paul] [Kuyler, Raphael])

Comment: In summary, the Proposed Rule states that the Commission has determined that it is feasible to safely store SNF following the licensed life for operation of a reactor, either in spent fuel pools ("SFPs") or dry casks, and to have a mined geologic repository within 60 years following the licensed life for operation of a reactor. The Proposed Rule is supported by the DGEIS conclusions that the environmental impacts of continued at-reactor storage of spent fuel in a SFP or ISFSI are SMALL.⁶ [footnote 6 text: See DGEIS at 4-90.] Entergy agrees with and fully supports these conclusions and the NRC's supporting explanation. (0697-1-6 [Bessette, Paul] [Kuyler, Raphael])

Comment: [T]he NRC's generic analysis of spent fuel storage impacts is fully applicable to Entergy's plants, including IPEC. This includes consideration of the DGEIS assumptions, such as the reference facility described in Chapter 2, the affected environment in Chapter 3, the environmental impacts in Chapter 4, consideration of continued safe storage of spent fuel in Appendix B, consideration of SFP leaks in Appendix E, and consideration of SFP fires in Appendix F. (0697-1-9 [Bessette, Paul] [Kuyler, Raphael])

Comment: [T]he NRC's generic analysis of spent fuel storage impacts in the Proposed Rule and DGEIS is fully applicable to Entergy's nuclear plants, including IPEC. Any site-specific differences are not expected to have any new or significant environmental impacts. Therefore, the NRC has completed a reasonable and thorough generic evaluation that fully satisfies NEPA and no site-specific evaluation of spent fuel storage impacts is necessary or warranted for any of Entergy's plants, including IPEC. (0697-2-1 [Bessette, Paul] [Kuyler, Raphael])

Comment: •As described in DGEIS Sections 4.18.1 and 4.18.2, the environmental risks of continued storage of spent fuel associated with postulated accident conditions, including design basis events for SFPs and dry cask storage systems, hazards from natural phenomenon such as earthquakes, floods, and tornadoes, and severe accidents, are SMALL. These conclusions apply to Entergy's plants, including IPEC. (0697-2-17 [Bessette, Paul] [Kuyler, Raphael])

Comment: Entergy is not aware of any aspects of its plants that would place them outside the generic evaluation of the environmental impacts of continued at-reactor continued storage of spent fuel that is provided in the DGEIS. (0697-2-19 [Bessette, Paul] [Kuyler, Raphael])

Comment: DGEIS Appendix B addresses the technical feasibility of continued safe storage of spent fuel, including the technical feasibility of wet storage (Section B.3.1) and the technical feasibility of dry cask storage (Section B.3.2). As described further below, Entergy has not identified anything in these sections of the DGEIS that is inconsistent with its own substantial spent fuel storage experiences and plans. (0697-2-20 [Bessette, Paul] [Kuyler, Raphael])

Comment: DGEIS Chapter 2 discusses "typical facility characteristics and activities" that the NRC used to assess environmental impacts that may occur from continued storage of SNF.⁵⁷ [footnote 57 text: See DGEIS at 2-1.] These characteristics and activities are generally comparable to those for the IPEC site. (0697-2-3 [Bessette, Paul] [Kuyler, Raphael])

Comment: The characteristics of IP2 and IP3, including facility description, reactor core size, fuel design, enrichment, and burn-up are generally comparable to the reactor description assumptions in Section 2.1 of the GEIS. (0697-2-4 [Bessette, Paul] [Kuyler, Raphael])

Comment: [T]he IP2 and IP3 SFPs are consistent with the SFP designs discussed in the DGEIS[.] (0697-2-5 [Bessette, Paul] [Kuyler, Raphael])

Comment: Entergy has not identified any activities that it plans to conduct that would be inconsistent with those discussed in DGEIS Section 2.2. For example, the DGEIS assumes timely decommissioning of reactors in accordance with 10 C.F.R. §§ 50.82 and 52.110(c), and that all spent fuel would be moved from SFPs to dry storage by the end of the short-term timeframe (i.e., within 60 years beyond the licensed life for reactor operations).⁷¹ [footnote 71 text: *Id.* at 2-26. An ISFSI facility is relatively simple to construct and would be relatively simple to deconstruct. Replacement of the ISFSI would be a short-term project with little radioactive material requiring disposal. Once all loaded casks are transferred to replacement storage overpacks on a new ISFSI pad, the original ISFSI would be decommissioned in a short time frame. The decommissioning plan would be prepared and approved prior to any decommissioning, and the site of the decommissioned ISFSI would be available for future use as a replacement ISFSI.] (0697-2-7 [Bessette, Paul] [Kuyler, Raphael])

Comment: Entergy concludes that this DGEIS Chapter 3 provides a reasonable description of the affected environment for consideration of the issues in the DGEIS, and that this description is comparable to Entergy's plants, including IPEC, for the purposes of the DGEIS. (0697-2-9 [Bessette, Paul] [Kuyler, Raphael])

Comment: The DGEIS concludes that the impacts on groundwater, surface water, soils, and public health would be SMALL for all plants.⁹⁹ [footnote 99 text: *Id.* at E-19.] Entergy has confirmed that these conclusions regarding the impacts of SFP leaks apply to its nuclear plants, including IPEC. (0697-3-2 [Bessette, Paul] [Kuyler, Raphael])

Comment: [T]he assumption in the DGEIS that all spent fuel has been transferred from the SFP to an ISFSI by the end of the short-term timeframe (i.e., by 60 years after the end of licensed reactor operating life) is reasonable and applies to IPEC. (0697-3-6 [Bessette, Paul] [Kuyler, Raphael])

Comment: [T]he 2013 Proposed Rule and DGEIS fully address New York's previously-stated concerns about the lack of environmental impact findings beyond 60 years after plant shutdown. The DGEIS analyzes, in a bounding fashion, the impacts of three timeframes that represent various scenarios for the length of continued SNF storage that may be required. (0697-3-7 [Bessette, Paul] [Kuyler, Raphael])

Comment: In summary, there is extensive, uncontroverted evidence in the public record to show that the DGEIS's generic conclusions of SMALL environmental impacts from SFP leaks fully apply to the IPEC site. (0697-3-8 [Bessette, Paul] [Kuyler, Raphael])

Comment: In summary, the generic analysis of the environmental impacts of SFP fires in the DGEIS is well-supported, is conservative, satisfies NEPA, and is fully applicable to IPEC. (0697-4-1 [Bessette, Paul] [Kuyler, Raphael])

Comment: With respect to ISFSIs, the DGEIS explains that ISFSIs are inherently robust and highly resistant to damage, and that NRC and licensee experience with ISFSIs and cask certification indicates that spent fuel can be safely and effectively stored using passive dry cask

storage technology.²²⁶ [footnote 226 text: See DGEIS at B-13.] This evaluation applies to Entergy's plants, including IPEC. This issue is further addressed in Section III.D, above. In summary, no site-specific seismic hazards exist at IPEC that would call into question the DGEIS's generic evaluation of seismic hazards for wet and dry storage. (0697-4-2 [Bessette, Paul] [Kuyler, Raphael])

Comment: Nuclear energy is a vital part of our clean energy portfolio in the United States. According to a current public survey conducted by Quest Global Research, a majority of the public favor nuclear power, making the Waste Confidence rulemaking an imperative issue for the nation to address. In addition, the proposed rule and draft GEIS are significant to AREVA and the entire nuclear industry because the NRC's final rule on Waste Confidence supports both the licensing of new builds and renewed licensing of the existing fleet. (0745-2 [Kelley, Devin])

Comment: As a 35-year resident of the city of San Luis Obispo, I support the NRC's Spent Fuel Storage Rule. (0753-1 [Devitt, Andrea])

Comment: I support the Commission's proposed Rule-making on Continued Storage of Spent Nuclear Fuel (Docket ID NRC-2012-0246). As a registered professional engineer (nuclear) in California, it is abundantly clear to me that this is a necessary step in the continued use of nuclear power as a reliable baseload component of the US energy grid. It is further clear to me that safety issues have been and can continue to be addressed so that there are NO public safety dangers. (0802-1 [Moore, Richard])

Comment: Second, NextEra supports the NRC's decision to continue following its historical approach to this industry-wide issue by considering it generically, both through the GEIS and through the proposed rule. The decision to address this generic issue on a generic basis instead of in individual licensing proceedings continues to be the right choice. (0808-2 [Petro, James])

Comment: NextEra concludes that the NRC adequately addressed the areas of concern identified by the Court in *New York v. NRC*. NextEra concurs with NEI that, though the need for indefinite storage is unlikely, the NRC's consideration of the indefinite storage scenario makes for a robust analysis that satisfies the Court's requirements. Similarly, the NRC's discussion of spent fuel pool leaks and fires is adequate to address the Court's stated concerns. (0808-3 [Petro, James])

Comment: The USHCC is a member of the Clean and Safe Energy Coalition's Business, Labor and Minority Steering Committee and strongly believes that nuclear energy is an important part of our national energy portfolio. Not only do we agree with the Nuclear Regulatory Commission's efforts on the Waste Confidence rulemaking, but we also agree that nuclear energy is critical to our nation's energy production and economic output. (0825-1 [Palomarez, Javier])

Comment: In sum, the NRC's responsibility is to identify any insurmountable technical barriers to safe storage of spent nuclear fuel until a repository is developed; and to robustly analyze and consider the environmental impacts of continued storage. To date, the NRC has identified no such barriers; and has found the environmental impacts of continued storage to be small. As explained by the Second Circuit in the *NRDC* decision, the NRC is not, however, responsible for the national energy policy decision to pursue development of commercial nuclear power in parallel with development of a repository. To the contrary, responsibility for that decision lies squarely with Congress and is not the subject of the draft GEIS or proposed rule. (0827-1-12 [Ginsberg, Ellen])

Comment: Ultimately, an EIS must contain "high quality" information and "[a]ccurate scientific analysis."²⁸ [footnote 28 text: *Seattle Audubon Soc. v. Espy*, 998 F.2d 699, 704-05 (9th Cir. 1993).] After all, an EIS's purpose is to avoid speculation and ensure data is gathered and analyzed prior to decision-making.²⁹ [footnote 29 text: *Found. for N. Am. Wild Sheep v. U.S. Dep't of Agric.*, 681 F.2d 1172, 1179 (9th Cir. 1982).] The NRC has done just that with the draft GEIS. (0827-1-6 [Ginsberg, Ellen])

Comment: NEI agrees with the conclusions in the draft GEIS that almost all environmental impacts resulting from the continued storage of spent nuclear fuel at, or away from, reactor sites would be small. In general, the NRC's assessment of environmental impacts from interim spent fuel storage is thorough and well-reasoned. (0827-2-9 [Ginsberg, Ellen])

Comment: The proposed rule appropriately points to the GEIS for an assessment of the environmental impacts of continued spent fuel storage beyond the licensed life of a reactor. However, in lieu of the five prior WCD Findings, the SOC for the proposed rule, Section C ("Decision"), contains "Conclusions" based on the draft GEIS and the assessment of spent fuel storage and disposal practices nationally and internationally. The Conclusions generally address the same issues as the five prior WCD Findings. The Conclusions relate to technical feasibility and availability of a geologic repository (see section III.C.2 of the SOC), and safety and environmental impacts of spent fuel storage during the three timeframes discussed above (see section III.C.3 of the SOC). While the use of "Conclusions" instead of "Findings" represents a departure from the prior WCD, the Conclusions are valid and well-supported based on the record in the GEIS. (0827-5-4 [Ginsberg, Ellen])

Comment: NEI agrees with NRC's determination¹⁰⁴ [footnote 104 text: Proposed 10 C.F.R. § 51.23(2)(i).] that it is "feasible to safely store spent nuclear fuel following the licensed life for operation of a reactor" and to not limit the time to which this determination applies. The NRC has described the role that aging management programs and confirmatory studies play in supporting safe, long-term storage. NRC has commendably built the draft GEIS on the extensive work already done. More than 40 years of experience have produced a mountain of research and data on previous events that supports the conclusions in the draft GEIS. This research and data were produced by a variety of sources, including industry, government, academia, and international organizations. The conclusions that are reached in the draft GEIS are firmly based on the experience of decades of spent fuel storage already behind us. In fact, the probability of future events decreases for future storage systems because of actions and programs created and performed to prevent re-occurrence of the past events, as well as technological advances. (0827-5-5 [Ginsberg, Ellen])

Comment: As a member of the public, I wish to support the NRC's proposed rule revising Part 51 provisions dealing with waste confidence and the supporting generic EIS. (0841-1 [Corrino, G])

Comment: Considering the political polarization connected with the disposition of spent nuclear fuel, it is essential to employ "Planning-in-Depth". The goal of Planning-in-Depth is to guarantee the safety and security of the United States inventory of spent nuclear fuel regardless of any possible political developments, or the lack of political developments. Both the former and updated versions of the Waste Confidence rule successfully employ the principle of Planning-in-Depth. (0863-5 [Brinton, Samuel] [Curtis, Daniel])

Comment: We support the proposed rule update and implementation of the associated Generic Environmental Impact Statement. The proposed NRC updates accurately reflect the current technical consensus. (0863-7 [Brinton, Samuel] [Curtis, Daniel])

Comment: Exelon believes that the NRC has met the requirements specified for development of this generic environmental impact statement, in that: > --The GEIS addresses the environmental impacts of storage of spent nuclear fuel beyond the licensed operating life of a reactor; and > --It is shown to be "feasible" to safely store spent nuclear fuel following the licensed life for operations of a reactor and to have a mined geologic repository within 60 years following the licensed life for operation of a reactor. (0942-10 [Helker, David P.])

Comment: Exelon supports the NRC's generic determination that used fuel can be stored at nuclear power plant sites, safely and without significant environmental impact, between the end of the license term and the time it is shipped offsite. (0942-2 [Helker, David P.])

Comment: NAYGN supports the NRC's efforts on this rulemaking. The NRC appropriately addresses the spent fuel storage issues in a Generic Environmental Impact Statement and rulemaking. The draft Generic Environmental Impact Statement makes conservative assumptions and reasonably shows that if necessary, used nuclear fuel can continue to be stored in a safe, environmentally sound manner for a long period. (0948-4 [Commenters, Multiple])

49. Out-of-Scope Comments – General

Comment: The nuclear industry's over confidence is proving a dangerous and costly risk to the public. (0011-3 [Follett, Carol])

Comment: The horrid mess at Fukushima is good evidence that nuclear power can become very dangerous when something goes wrong. I have NO CONFIDENCE in the ability of corporate nuclear power plant owners to safely store spent nuclear fuel rods even in dry casks. I suggest asking US Navy to choose one of the four commercial nuclear power plants designated for decommissioning as being the safest of the four for them to use as a location where they can use spent fuel rods as high grade ore to make new fuel rods out of. Whether they use the new fuel rods made of material salvaged from old fuel rods in the navy or sell them to remaining commercial nuclear power operators, they will be disposing of those spent fuel rods and avoiding the need to dig up as much more virgin uranium ore as otherwise. They will end up with three products: new fuel rods ready to use, long half-life radio-active material mostly depleted uranium which is toxic but can be used as the counterweight in fork life trucks, and short half-life radio-active material which will need to be stored safely out of harm's way for 300 years after which the remaining hazard will be chemical toxicity rather than radioactivity. That should be less of a problem than storing spent fuel rods safely out of harm's way for 3,000 years waiting for them to decay back down to the same amount of radioactivity as was in all the ore that had to be mined and processed to make the fuel rods. It will mean making whichever nuclear power plant campus the Navy chooses the de facto location for storing spent fuel rods use the have cooled down enough to put in dry casks and ship. I suggest making sure that rail lines between other commercial nuclear power plant campuses and the decommissioned campus chosen by the Navy are as safe as possible. (0013-1 [Adams, Grace])

Comment: Face it, you don't have a real clue what you are doing, besides accomodating the desires of the industry and especially the individuals at the top of that particular industrial food chain and the government "officials" that are in their pay. I haven't the inclination to be more polite to those who are allowing our beautiful planet and the future of life to be collateral damage to sociopathic greed. End this madness now and let us just have to deal with the damage already done. (0014-3 [Bolognini, Franceseca])

Comment: Spent fuel must be RECYCLED as we did in the 1960s. In the 1960s, we recycled spent nuclear fuel. We don't recycle nuclear fuel now for two reasons: 1. It is valuable and people steal it. The place it went that it wasn't supposed to go to was Israel. This happened in a small town near Pittsburgh, PA circa 1970. A company called Numec was in the business of reprocessing nuclear fuel. [I almost took a job there in 1968, designing a nuclear battery for a heart pacemaker.]; 2. Virgin uranium is so cheap that it is cheaper than recycling. This will change eventually, which is why we keep the spent fuel where we can reach it. The US possesses a lot of MOX fuel made from the plutonium removed from bombs. MOX is essentially free fuel since it was paid for by the process of un-making bombs.; Please read this Book: "Plentiful Energy, The Story of the Integral Fast Reactor" by Charles E. Till and Yoon Il Chang, 2011[.] Per Till & Chang: The Integral Fast Reactor [IFR] uses "nuclear waste" as fuel and gets 100 times as much energy out of a pound of uranium as the Generation 2 reactors we are using now. The IFR is safer than the Generation 2 reactors, which are safer by far than coal. The IFR is meltdown-proof. The IFR can be turned up and down quickly and repeatably. The IFR uses metal fuel that is recycled in a system that makes it difficult to get plutonium239 out of the fuel. To make a good plutonium bomb, you must have almost pure plutonium239. 7% plutonium240 and higher isotopes or other actinides will spoil the bomb. IFR Pyro process recycled fuel is useless for bomb making. Elements with more protons than uranium are called trans-uranics alias actinides. Actinides are the part of so-called nuclear "waste" that makes it stay radioactive for a long time. The IFR uses up the actinides as fuel. Actinides include plutonium, neptunium, americium, curium, berkelium, californium, einsteinium, fermium, mendelevium, nobelium and all of the other "synthetic" elements. The IFR is the ideal source of electricity since it does not make CO2. The resultant "waste" is very small, will decay in only 300 years and is useful in medicine. The following countries either already recycle spent fuel or are experimenting with a recycling process or both: France, Japan Russia, China, India, South Korea. The US recycled spent fuel in the 1960s. Purex process: The old one. Separates out plutonium, but does not separate the isotopes of plutonium. Any bomb made with this plutonium from a powerplant reactor would fizzle. You can't make a plutonium bomb with more than 7% Pu240. Pyro process: Leaves plutonium mixed with uranium and trans-uranic elements. [All fissionable elements are kept together with uranium][.] Other processes [wet] are also under development. By recycling nuclear fuel, we have a 30,000 [thirty thousand] year supply. (0016-1 [Greisch, Edward])

Comment: The attached may have something to do with why we stopped recycling spent fuel. My solution would be to reprocess the fuel at a Government Owned Government Operated [GOGO] facility. At a GOGO plant, bureaucracy and the multiplicity of ethnicity and religion would disable the transportation of uranium to Israel or to any unauthorized place. Nothing heavier than a secret would get out. (0017-1 [Greisch, Edward])

Comment: The problem is political: The Republicans think GOGO plants are socialist/communist, which is nonsense. If a COCO [Contractor Owned Contractor Operated] plant is the low bidder, it is inevitably a front for Israel or some other country. We could send our spent fuel to France, Japan or Russia to be recycled. (0017-2 [Greisch, Edward])

Comment: I would like to comment on the proposed NRC Nuclear Waste Confidence draft Generic Environmental Impact Statement. To me it sounds as though the nuclear industry has some improper influence with the NRC. As Senator Markey pointed out, Allison McFarlane, NRC's Chairwoman, co-authored a 2003 study "that strongly warned of the needless risks of fire in densely-packed HLRW storage pools". Why has she changed her mind about the risk? Does she give unqualified support to the Impact Statement? (0021-1 [Biddle, Lynn])

Comment: I find it very difficult to find most of the information when I'm looking for it. So after the earthquake and Fukushima I became very aware. I'm getting ready to turn 50 years old. I have obviously lived through Three Mile Island, Chernobyl, and now Fukushima. And really the media hasn't really covered a lot except for here recently with some leaking tanks. And we're talking about a global issue. (0030-15-4 [Gray, Erica])

Comment: Transparency though on the issue needs to begin at the beginning, and that's with the monies that are given to our elected officials by these very industries that are present here today and many more, the monies given them in order to stack the deck in their favor. And it always the public that's on the short end of it. When they keep talking about cheap, what they're saying is their end of it is cheap. You are asking us, the citizens, the taxpayers, to pay the loan guarantees and the subsidies that even allow these things to be built. And I don't know at this point if we can ever turn around Congress, because if you bother to look up and see what all of our elected officials are on the receiving end of, it's no wonder than when the votes come down, they do as they do. I would want transparency in the BRC, because I didn't see an Arjun Makhijani being named to the BRC. I saw John Rowe, the chair of Exelon, being named to the BRC, which was very self-serving. So in terms of the public, I think the only way we can get a fair shake, if there is one, has to do with the licensing. (0030-22-2 [Headington, Maureen])

Comment: I might remind some of our friends here that actually the industry pays \$0.90 of every dollar in reimbursements to the NRC. Actually only 10 percent of the NRC budget is covered by the taxpayers. And to that end it's always perplexing when the NRC is affected by things like sequestration and Government funding shortfalls. But we've encouraged reform in that area and that simply hasn't happened today. (0030-23-2 [Blee, David])

Comment: And no one has even addressed, at least not addressed adequately, as far as I'm concerned, who bears the risk? What's the insurance? Who pays when this happens? And it inevitably will happen, because we've seen it happen. Who pays? Now, the Government doesn't pay. The Government passed a pathetic anemic compensation bill for the downwind victims of the bomb testing. It was \$50,000 for each person. No medical payments. Who pays for the loss of property when the property disappears or is no longer useable? If it's contaminated like it was in Chernobyl, like it is in Fukushima, who pays? Do I have shoulder that burden? This has to be in your environmental impact statement. All risk. The damages have to be in there. And the Government has no good real record of paying. The token payments that were made for the bomb testing are pathetic. They're minuscule. (0030-24-2 [Nelson, Dennis])

Comment: As I have followed this process, I have been amazed by the Nuclear Regulatory Commission's bias toward continuing to regulate -- to allow radioactive waste to be manufactured by these power plants. And it just points out the fact that the very beginning of -- the Nuclear Regulatory Commission was created because the Atomic Energy Commission was perceived as being unduly favorable to the industry. And I think the NRC is that -- in that same situation now. It is interesting to note that, according to records I have found, NRC has over 4,000 employees, and you do not need people doing this type of thing for solar power, for wind power. We just need to quit making this radioactive waste. (0030-5-4 [Safer, Don])

Comment: I think we should pursue a closed fuel cycle, reuse of the wasted energy, maybe provided as a 10-year program, same as that was used for landing on the moon. What did we get out of space exploration? Everyone in this room is tied at their hip to their cell phone through satellite communication. (0030-9-3 [Guido, Jeffry])

Comment: I am writing you because I am concerned about how we store and transport our most hazardous waste, the radioactive fuel rods from nuclear reactors. What compensation do citizens living near storage sites or near transportation routes receive for becoming victims of accidental radioactive discharges? I have read case histories of people who were living near Three Mile Island at the time of the disaster there. I am well-aware of the scientific weakness of such information. But when number of major medical problems vastly exceeds the occurrence of similar medical problems in areas with no increase in radio- activity, one needs to draw the obvious conclusion. (0042-1 [Hellwig, Louis])

Comment: It's feasible perhaps to handle nuclear waste, but the fact of the matter is that a lot of nuclear waste has been made into depleted uranium shells that have been used by the United States military and have poisoned the land and the air in Southern Iraq and in Serbia battles and has caused all kinds of birth defects and deaths in the process. So it wasn't in fact safely handled, the nuclear waste, that the so-called depleted uranium was allowed to get out. (0045-12-4 [Kinsey, Bob])

Comment: Fortunately, American nuclear providers have successfully demonstrated that they can safely store nuclear waste while we wait for the Federal Government to enact a long-term solution. Federal policymakers must act now to develop consolidated facilities for interim storage, as recommended by the President's Blue Ribbon Commission on America's Nuclear Future, and supported by a bi-partisan group of congressmen. Our nation must also pursue an agreed-upon site for permanent disposal. (0045-4-3 [Martini, Shawn])

Comment: There must be tighter design criteria for "nuke" power plants, constant inspection, and the means to shut them down as soon as they need to be retired. (0057-4 [Lamont, Dana])

Comment: We cannot wait for a Federal solution for all of the 104 US reactors' spent fuel storage. California must come up with its own solution. We must create a place away from populations, away from aquifers, away from earthquake zones to store California nuclear spent fuel from SONGS and DIABLO. The law that would create this solution must include prohibition of any other spent fuel to be stored there and a law against any new reactors ever being built in this earthquake fault state so obviously vulnerable to nuclear accident. We have Fukushima from which to learn. A desert military base away from population centers and earthquake faults in California could be a solution. What must be done to create that solution? Meanwhile we are playing Russian roulette with the future of California by storing our spent fuel with a company that has a dismal safety record and will continue to profit from leaving the spent fuel in the pools where it now is. We need an immediate MRS solution - Monitored Retrievable Storage. Is there any interim step that could get the spent fuel pools moved from the ocean and at least 50 miles away from 8.4 million people, monitored and protected by our US military? Who on the NRC is willing to help create this complex but necessary solution before the third largest economy in the world, the state of California, gets compromised forever? (0063-13 [Magda, Marni])

Comment: I am also aware of substantial upgrades in plant safety and reliability, reactant toxicity, fuel divertability, with remarkable reductions in both overall waste and the waste's half-life, substantially reducing long-term waste safe storage requirements. I refer to designs like G.E.'s PRISM thorium molten-salt reactor. Why are designs that have demonstrated severe catastrophic capability being proposed for new construction? Why aren't safer and less toxic designs considered? (0068-1 [Chrisler, Gary])

Comment: Finally, I am dismayed that significant upgrades to reactor safety and waste reduction have been made, but are not being applied to designs proffered for approval in the

attempted resurgence of conventional nuclear technology. Why are designs such as the thorium molten salt reactor, which runs on a less-toxic, nonexplosive reactant, has "walk-away safe shutdown" operation, that produces 99% less waste, and the waste with a half-life of 300 years vs 168,000, why hasn't there been a serious effort to license and promote such improvements? The single fact of 300-year half-life versus 168,000 is a complete game changer, because a structure or containment lasting the better part of a million years is simply not feasible. It is impossible to ensure reliability over timespans like that. But waste repositories safeguarding waste for 1200 or 1500 years CAN be constructed. We know how to do that, we've built structures that have lasted that long. To want to build more units designed in the era of the Fukushima reactors is demonstrably unwise. Why risk contaminating an entire region for a million years when you don't have to? Pursue better alternatives. (0068-2 [Chrisler, Gary])

Comment: I am writing you because I am concerned about how we store our most hazardous waste, the radioactive fuel rods from nuclear reactors. As a retired scientist (medicine), I would like to know what happened to the then seemingly sound method of storage of at least low level reactor waste via glassification and subsequent burial in salt domes? I discussed with an engineer friend in the early eighties. Is the technology inadequate, or has the political process been typical of the current dysfunction in Washington, namely, stalemate until the situation worsens beyond consideration, in addition to the "Not (thousands of feet under) my back yard? I would love to have a response, even if from one of your lowest aides, who would know much more than me about the subject matter. (0070-1 [Peters, Mark])

Comment: We need much more environmental oversight in the SE TN, N GA areas, in all areas possible. (0074-1 [Rowlett, Kimberly])

Comment: New rules, yes! Take care of and protect our (your, my, our) human habitat/home/ecological niche. (0075-6 [Hill, Barbara])

Comment: This is the future black market for weapons of different kind - there are too few possibilities to secure the waste. Don't let it become a market for criminal terrorist trade. Future generations have a right to safety. (0084-1 [Hennig, Anna Christina])

Comment: The hazard can be at least partially mitigated. US Navy has done some re-manufacturing of nuclear fuel rods from spent fuel rods. So they know how and can do it. Half of the U235 in a new fuel rod is still in a spent fuel rod. So the U235 from two spent fuel rods and enough of the U238 to make up the same total weight as one original fuel rod will go into a re-manufactured fuel rod. Somewhat over 40% of the rest of the material is U238 aka depleted uranium the remaining 5% to 10% is fission products--mostly short half life, average half life about 30 years. By displacing new fuel rods made from virgin uranium ore, the re-manufactured fuel rods will at least partially mitigate the hazard. Spent fuel rods fresh out of the reactor are a million times as radioactive as brand new fuel rods, And 5% is one twentieth as much as 100%. So the short half-life isotopes as concentrated should be 20 million times as radioactive as a spent fuel rod fresh out of the reactor. A million is a thousand times a thousand. So it should take two times ten half lives or two times 300 years or 600 years for the short half life isotopes to decay down to 20 times the radioactivity of a new fuel rod, and one more thirty year half life to decay down to 10 times the radioactivity, or thirty more years total 60 more years to get down to 5 times as radioactive as new fuel rod, total 90 years past the 600 years mark; maybe a total of 180 plus 600 equals 780 years to get to or below the radioactivity of a new fuel rod. I believe another three hundred years for a total of less than 1100 years should get it down to about as hazardous as uranium ore. Still a very long time but still less than half the time it would take an intact spent fuel rod to get there. If the United States lasts as long as Rome through Byzantine

Empire did, the United States would actually still be here to guard the hazardous wastes that long. OSHA permits depleted uranium to be used as a counterweight in a fork lift truck with proper lead shielding. So that part of the problem is minor. You do not have to share nuclear power plants that still have unexpired licenses with US Navy--only turn over to US Navy the nuclear power plants with expired licenses, for US Navy to salvage what it can of spent fuel and decommission the power plants with expired licenses, and allow US Navy to sell re-manufactured fuel rods to still operating nuclear power plants. I feel that hazardous waste is at least as worthy a foe for US Navy to defend us from as any group of humans that might attack us thus declaring themselves our enemies. I would also be glad for US Navy to defend us from toxic chemical wastes and from biologically hazardous wastes. (0097-2 [Adams, Grace])

Comment: Providing "spot energy" for small individual users, as these core units could be thought of as very large water heaters, or heat exchangers.... Another twist to the concept of reusing spent fuel, is that believe it or not, you do not have to use the radioactive material in the old cores to generate electricity, as a reactor does. You can simply place them in a given area to generate heat. (0100-10 [Behling, Steve])

Comment: A nuclear power plant, once you remove all the bells and whistles, is simply a giant water heater. The reason why a reactor has to be refueled, is not because it will no longer boil water, its because it will no longer boil water at the design rate of the reactor. Putting it another way... A reactor may have a 100 megawatt design rating. Over time, the power output will fall below this rating as the fuel decays. At some point after this it must be refueled to stay at the 100 megawatt power level. At this point the spent fuel is removed, and placed in a cooling pond separate from the main reactor. This is why most reactors are located next to a river, large lake, or ocean. There is so much waste heat generated, just from these old cores, that to cool the reactor in an emergency, any municipal water source would be inadequate and overwhelmed. In the old days, the spent rods cooled for a time, in these ponds, and then were shipped to a reprocessing plant. As stated earlier, this proved to be a disaster. As a result, spent cores are now gathering dust, so to speak, at nuclear power plants all over the United States, as there is no longer a place to put them. The same river water that helps cool the reactor, cools these rad waste core ponds. The result of this whole mishmash, is that much useable energy is being wasted heating bodies of water instead of large buildings. This whole situation could be resolved if the spent fuel was containerized and used at factories or large buildings to provide heat. (0100-11 [Behling, Steve])

Comment: As everyone knows, ethanol and bio-fuel plants are springing up all over the United States. These companies use energy to separate alcohol from water to generate motor fuel. The boiling point of alcohol is about 175 degrees Fahrenheit. This is all the heat you need to complete the processing of ethanol. There are over one hundred ethanol plants in the U.S. alone. Currently, most of these ethanol plants use natural gas to provide the heat input. This not only uses valuable natural gas, it also adds to the overall cost of the ethanol. Using the heat from rad-waste however, changes the situation 180 degrees. In other words, motor fuel can be manufactured at a lower cost, using the dry casks of spent fuel that nobody else wants. (0100-12 [Behling, Steve])

Comment: Using the spent fuel dry casks to manufacture fresh water from salt water, in Death Valley. According to all the unsubstantiated gossip I have been hearing over the years, the state of California, as well as most of the southwest, is a drop or two short of fresh water, among other things. Seeing as how Death Valley is 198 feet below sea level, it would be a matter of simple physics to run a pipeline from the Pacific ocean to Death Valley and at least partially fill it with sea water. No pump would be needed, as gravity would provide the siphon action that

would be needed. A solar powered desalinating plant, or many plants, could be built at the site to provide distilled water to the rest of the state, and neighboring states. Also, a turbo generator, or more than one, could be placed in the pipeline to generate electricity as a by-product. It would be a simple matter to use conical mirrors to generate all of the heat that you would want, to boil all of the water that you would want, to obtain all of the distilled water that you would want.... And at night, the spent fuel dry casks would take over in place of the sun. (0100-13 [Behling, Steve])

Comment: The reason why the desalinating plant should be built in Death Valley, as opposed to a plant on the west coast of California, is because it is located in a much safer area than on the coast. You see, there are no hurricanes in this area, as sometimes occur on the coasts. You may remember the oil rigs that were destroyed off the American coast by destructive tidal waves and hurricanes. The Fukushima damage was also caused by a giant tidal wave. I don't think you would have this problem in the valley. Also, the tree-huggers who live on the coast, would have just one more reason to complain about the scenery. Since relatively few people live near, or visit Death Valley anyway, and it is already on government land, and has an Army base close to it, I would say it would be in a safe location to recycle spent nuclear fuel, and build small structures to do so. (0100-14 [Behling, Steve])

Comment: The electrical power system that exists in the United States, is the worlds largest invention. The current costs and payments run into billions of dollars per year. What I am proposing, amounts to cutting costs with no layoffs to power company employees. No new equipment has to be designed, or no different type of metal has to be forged. The nuclear power companies are already encasing the old cores in concrete shells, with no place to store them. Also, the turbo-generators that could be used in the Death Valley pipeline, would be little different then the units that are used in Hoover dam. Another rather large advantage would be small size of such heat generators. Each steam or hot water generator unit would be self contained. It, or they could be placed in remote locations, with little maintenance. Each unit or cluster of units could be used to create live steam or electricity. (0100-15 [Behling, Steve])

Comment: Billions of dollars in savings. First off, let's stop the thirty years of worthless talk of burying the rad waste in the Yucca mountain area. At a cost of ten billion to date. This idea has went nowhere, and probably never will. According to Wall Street Journal articles on the subject, the amount of rad?waste sitting around nuclear plants, already exceed the amount of burial space created in the tunnels. The fact is, that this material generates heat, and it can be used for lower level heat sources. So why not use it! (0100-16 [Behling, Steve])

Comment: Big deal, these casks are still visible from the air. A much more robust solution to the problem of storing the spent nuclear material can be achieved by storing the casks under water. For proof of my claim, simply rent a movie on the war in the pacific during world war two. Every time a Japanese plane was shot down, it either bounced off the water, or went down about five feet before slowly sinking. In other words, water is better than armor from a cost standpoint! Also much less expensive to create and manipulate! (0100-17 [Behling, Steve])

Comment: Another area of cost savings is the elimination of lawsuits, or the near elimination. So far close to one hundred lawsuits have been filed, generally speaking, for breach of contract. To start the budding nuclear industry off, the government promised to dispose of the waste. Well.... this never happened. So the nuclear industry adopted an interim measure of on site storage, and this is why we now have the cask storage problem. As far as I am concerned, this is not a problem, this is the end result. All that needs be done now is to bunch the casks together, and mine the heat. (0100-19 [Behling, Steve])

Comment: As safe or safer than a pebble bed reactor. For those of you people that may have come to the conclusion that this article does not make any sense, what I am proposing is exactly the same thing as the new generation of nuclear reactors, called the pebble bed reactors. In the pebble bed reactor, softball sized uranium pellets are installed in a empty reactor vessel until the proper heat output is obtained. To explain further, in a "standard reactor," uranium fuel rods are installed in the vessel, and the heat output is regulated, by raising or lowering the control rods. When the heat output drops below a certain level, the reactor has to be taken out of service until new fuel rods can be installed. In a pebble bed reactor, the softball sized spheres can be added until the heat output is at the design level of the reactor. As time passes, and the heat level of the spheres decrease, the old spheres can be removed, and new fresh spheres can be added, while the reactor is in operation. The big advantage of a pebble bed reactor, over a "standard" reactor is that the loss of coolant problem is eliminated. In a "standard reactor," a loss of coolant leads to a meltdown, in a pebble bed reactor, a loss of coolant causes no problem, as the spheres do not cause reactor floor melting. (0100-20 [Behling, Steve])

Comment: Employing Death Valley, or any other similar suitable areas, to generate electricity at a profit, as well as rock salt, seafood, distilled water, and an ongoing tax base, as well as creating permanent jobs in the state of California. On a second level, which does not have to be incorporated into the overall concept, a possible solution to the problem of the disposal of spent nuclear fuel. (0100-3 [Behling, Steve])

Comment: Note: Observe the picture below. It would seem that the Atomic Energy Commission, the Nuclear Regulatory Commission, as well as all the nuke haters, and their lawyers, seem to think that the way the casks are constructed, as well as their storage on a concrete slab, are safe enough. Or at least, they cannot drum up enough scientific evidence to prevent the construction of more of them. So lets say that the casks are placed in an uninhabited area, enclosed in a steel container, six casks to a container, and they be allowed to generate steam. This steam after condensing will be distilled water. No energy input is needed. Two problems are solved at once. The casks have a safe storage area, and the entire area has a unlimited supply of fresh water. (0100-30 [Behling, Steve])

Comment: In summation, what I am proposing, is a alternative to the idea of running a pipeline from the great lakes to the southwest. At a lower cost, a pipeline could be run from the Pacific ocean to Death Valley. An area that is currently being mostly unused. A badly needed tax base could be created, by creating a inland lake. Electrical energy could be created, as well as hydrogen gas, rock salt, and a fishing industry. And if anybody is concerned about it, old rad-waste cores could be stored there, at a profit. (0100-31 [Behling, Steve])

Comment: I don't know if you are aware of the so called "Rad-waste-problem" or not. I submit to you that there is no serious problem. A while back I found out that these spent fuel containers or "dry casks," constructed around old reactor cores, have a skin temperature of up to 350 degrees. This is more than enough to boil water. Because of the politics involved, which I will not go into in this paper, the reactor owners are not allowed to ship the old cores to the Yucca flats burial area. Currently, the result is that the plant operators are encasing the old cores in concrete shells, and storing them out of sight behind the plants, so to speak. It seems plausible to me that boilers, or steam generators could be constructed using these old cores, and put them to good use, generating cash rather than trying to dispose of them. (0100-5 [Behling, Steve])

Comment: These dry casks that are piling up all over the United States, and the rest of the world for that matter, which at the moment, nobody wants, could be configured into a low cost giant electrical power plant, or used to heat large buildings directly. (0100-6 [Behling, Steve])

Comment: At any rate, if the cores are allowed to "cool off" for ten years or so, most of the hard radiation will be greatly reduced. I submit that by creating a "middle step" of harvesting heat from these cores, instead of burying them, will drastically reduce the cost of reprocessing spent cores. (0100-7 [Behling, Steve])

Comment: Another item that is not widely known, is that between ninety five to ninety seven percent of the energy of the original core is retained in the spent cores. This is what produces the latent heat output. With the price of nuclear fuel rising, it would make a substantial cost savings to reuse old cores. Dr. Terry Michalske is the head of the Savannah River Site's research body. He claims that Helium-3 and Americium 241 among the recoverable assets that are mixed with the spent fuel. (0100-8 [Behling, Steve])

Comment: Solving the spent fuel burial problems. As far as I know, not one single cask of spent nuclear fuel has been safely "buried" anywhere in the United States, or anywhere else in the world for that matter. Over a billion dollars has been spent on the Yucca mountains burial project, and has went nowhere. Also, the amount of spent fuel that has been created up to this point would more than exceed the tunnel space that has been excavated so far. By the way, have fun trying to convince all the people in the area, that it's a good idea to live down the street from a high level spent fuel dump. Reusing high level spent fuel would go a long way to solve this problem. The Yucca mountains people, might not have an objection to having "low level" waste being put into tunnels. Low level waste being, boots, gloves, clothing, respirator masks, and small quantities of short lived rad-waste products, such as hospital rad-waste discards. (0100-9 [Behling, Steve])

Comment: Why not use the storage facility at Carlsbad that was originally intended for weapons waste? (0101-1 [Streeter, Richard])

Comment: I know this evening is focussing on waste confidence, but we can't do that without talking about confidence in the NRC - and in most of our elected officials. On-site waste storage at nuclear plants is literally a very "hot" topic for the people who live and work in the vicinity, but you would never know it from the inexcusable silence on the part of most of our elected officials. And by "local" I mean from Congresspersons on down. We keep putting these people back in office because we think the other candidates would speak even less to our interests, but people like Senators Schumer and Gillibrand aren't doing us any favors on this issue. I'm too old to learn how to Tweet, but I do know how to Google, and this afternoon I Googled both of these senators and a number of other electeds that should be out there fighting for the safety of their constituents in the region. Schumer seemed to have gingerly stepped up to the plate 13 years ago, just after Con Ed re-opened IP 2 in 2001. The Times reported that he faulted Con Ed and the NRC for not providing a "full, timely accounting of the new leaks" and said that "until the N.R.C. verifies that Indian Point is in good working condition and will not leak, the doors of this nuclear power plant cannot in good conscience be reopened." He also said that "the utility must confront a perception that it cannot be trusted in light of past accidents at the plant" <http://www.nytimes.com/2001/01/05/nyregion/public-officials-urge-regulators-to-close-indian-point-2-again.html>. This part was not read aloud for time constraints. The Google search also produced a statement from Schumer six years later, in March of 2007, when he called for an Independent Safety Assessment after the same reactor was shut down because the water level being used to cool the core got too low. He said at that time that "When it comes to nuclear

safety and security, we expect the highest standards. Safety must be the number one priority. There must be an independent vigorous investigation so that we can get to the bottom of what is going on at Indian Point - and fix it."

http://www.schumer.senate.gov/Newsroom/record_print.cfm?id=270480 Seven years ago, and nothing since --at least according to Google. (0102-1 [Woodward, Julie])

Comment: Sen. Gillibrand seemed even less concerned: LoHud reported almost two years ago that she actually supported building new reactors in communities that want them: QUOTE: "There's lots of places in the state that would certainly welcome a nuclear facility."

<http://www.lohud.com/article/20110320/OPINION/103200341/>. Really? I guess so, if Entergy and their lobbyists keep persuading people that it's completely safe to live next to more than 2,000 tons of spent fuel, in fact, all the rods the reactors have ever used since the first one went online in 1962. What can you expect from an elected who received a lot of cash from Entergy. Everyone knows about the Common Cause report on lobbying and campaign spending, which said that -At the state and local level: \$4.8 million between 2005 and 2012 went to electeds in NY. On top of that \$4.8 million, is the QUOTE: "massive advertising and public relations campaigns they have mounted to sway public opinion. ... 28% was spent by ... groups masquerading as independent organizations but actually under the control of Entergy."; -And at the federal level: \$31.1 million using 18 firms to lobby the federal government, and \$4 million to candidates, PACs and committees. - Included in these recipients are our silent, ostensibly position-less electeds: Senators Schumer, Gillibrand, and Clinton before them. Common Cause adds that "Spending has intensified in recent years."; <http://www.riverkeeper.org/news-events/news/stop-polluters/power-plant-cases/indian-point/report-documents-how-entergy-spends-millionsto?influence-indian-point-relicensing/>; (0102-2 [Woodward, Julie])

Comment: These people need to break the ties they have with Big Money and start thinking reality: Nuclear waste does not go away. Right here in Buchanan this stuff is not on our doorstep, but inside our house. We need whomever we put into office to start feeling very uncomfortable about the money they accept from a corporation like Entergy - a whole industry, in fact - that puts profit over limited, half-baked solutions and potential long-term devastation. (0102-3 [Woodward, Julie])

Comment: Too many Americans live surrounded by toxic pollution from factories like coal plants, refineries, cement kilns, chemical plants, and incinerators, plus highways, truck routes, and hazardous waste sites. When children go out to play, they wheeze, cough, gasp for air, and face asthma attacks, burning eyes, and long-term health harm. Our most vulnerable communities often have less access to quality, affordable health care, which only exacerbates the impacts of environmental hazards. All of our communities need strong, scientific protection now from air, water, pesticides, and radioactive waste to ensure a happy and healthy future for the people who live there, especially children. (0105-1 [Armerding, Christopher])

Comment: I am writing you because I am convinced that nuclear energy is NOT CLEAN energy and about how and where nuclear is stored. Americans have been told our nuclear waste must go somewhere & spent reactor fuel needs to be stored inside a mountain in the desert, where it will sit as a threat and menace to the world for millions of years. We're told there's nothing we can do about it. What if that "spent fuel" was not spent at all? What if a technology existed which allowed the same fuel to be used over and over, twenty times in fact, and safe enough to handle directly out of the reactor? Think any "spent fuel pools" would be full? What if foreign nations, (France was one) offered to buy this fuel from America for billions of dollars only to have the American Government refuse the offer for no reason at all? Certainly allowing France to have it would solve the problem of getting rid of it right? One final question,

WHY would the American Government want so much nuclear material sitting around the country - enough to make countless atomic bombs - only to have it become a threat to America's national security that the govt adamantly states they must protect? Perhaps after reading this report, you will have a change of heart. <http://www.jimstonefreelance.com/busted.html> (0108-1 [G, Ambriel])

Comment: I am always disappointed when the long term public health, environmental and public clean up costs are discounted or not considered when governmental agencies make critical decisions. I understand that we need successful businesses to have a successful economy. But, these things must not be mutually exclusive and business success/profits should not be the guiding principal. (0111-1 [Fox, Patsy])

Comment: Lest you think I have nothing good to say about your regulatory agency, you may be glad to hear that I give the NRC very high marks, but only for hubris and audacity. I wish to make it very clear how much contempt I have for your hubris and audacity. But I recognize that although you are insensitive to the cancers and birth defects of many thousand generations to come, your staff are sensitive beings. (0112-11-3 [Agnew, David])

Comment: There's another aspect to this about oversight. And, you know, the whole thing about, you know, Federal oversight versus municipal oversight. Everybody's afraid of the NRC. They're big dogs. And not too many people went against you. And these little host towns know that they can't afford a fight with you. And so in talking to William Dean I learned that Entergy and any of these host communities do not have to file plans with the NRC prior to building a nuclear waste dump site at an existing reactor. What happens is the NRC goes out, takes a look at the construction after it's built, and issues a certificate of compliance. So there's no preliminary review. Nobody reviewed the siting of the pad, you know. This is incredible. This is not oversight. (0112-23-2 [Maurer, Bill])

Comment: I've been to NRC hearings before, I've read all kinds of things and I've studied the issues. I've never heard anything from the NRC that has made me feel safe. And, in fact, I am more afraid listening to the NRC because I can see that you are colluding with the industry that you are supposed to regulate. You may know more about nuclear engineering than I do, but I knew -- know that you are not keeping me safe. (0112-24-3 [Darling, Ann])

Comment: And in parting, as a veterinarian, 46 percent of dogs are getting cancer. 39 percent of cats are getting cancer. They are canaries in our coal mine. Let's look at that picture, guys, and look at what's happening with these animals. They are telling us what's wrong with us. (0112-29-4 [Roman, Margo])

Comment: And when I was reading one of those endless reports I came across a statement that said the owners of the nuclear power plants are suing the government, that means us, our money, for \$21 billion because the government hasn't made good yet on how to -- what to do with this nuclear power waste, the spent fuel. \$21 billion! (0112-30-3 [Parks, Sheila])

Comment: So my solution is because nobody wants these spent fuel rods or this nuclear power waste any place, but I want it at the White House buried there. I want it buried in the homes of every Congress person who doesn't stand up and say no more nuclear power plants. I want it in the backyards of every single person on the Nuclear Regulatory Commission. And I want every one of the people that I've just named to face a Nuremberg-like trial because that's what you are doing. You are murdering many more people than the Nazis ever did. (0112-30-6 [Parks, Sheila])

Comment: And let me address the legal counsel and the Supreme Court. The Supreme Court of the United States also said that slavery was legal lest you forget and every single solitary thing that the Nazi's did in Germany was legal. And that's what this United States government is doing now, killing all of us with these legal weapons of mass destruction. (0112-30-7 [Parks, Sheila])

Comment: So I hope that all of you on the Nuclear Regulatory Commission take what I'm saying very personally because I mean it personally. Because you can resign. You can get a better job. You can be a whistleblower. You can be on the side of the angels and you can look in the mirror again. What do you tell your children and what do you tell your grandchildren? You know, this planet isn't going to be safe for hundreds of thousands of years. (0112-30-8 [Parks, Sheila])

Comment: Some of the terms that I've come across in what I was reading tonight because I didn't have time to go over the 575 pages, although I fully intended to and will. These ideas of generic and efficiency are their [the NRC's] ways to find words to describe a process that has basically become unmanageable. You are in charge of regulating a fleet of aging reactors that is crumbling as we speak and it's exposed to a multitude of threats from weather and accidents, power outages, terrorism, and just old age, decay, bad design. So, the process is unmanageable. And I think the NRC's job has become unmanageable. So it's not -- I don't, you know, so much have criticisms of individual there unless they're so on the side of industry that they can't make a rational decision on behalf of public safety, but you are as much trapped in the bureaucracy as anyone else. This started mostly before you were born. (0112-31-4 [Johanson, Birgit])

Comment: But in my experience on the board [Groton Board of Health], for example, a neighbor down the street from me had an unfortunate accident. He had -- he was running his truck on vegetable oil and he had a fire and a lot of the vegetable oil spilled. And we made him clean it up. Not just clean up the vegetable oil, but remove the soil. Vegetable oil. In other words, we considered the protection of clean water so important that vegetable oil was considered a threat, because it is if it gets into the aquifer. I don't see that same level of concern about the essentials of life in our nuclear regulation. And I think regulation is very important. And I don't see regulation, for example, as antithetical or the enemy of market forces. And, in fact, you need good regulations. Regulations that state what you insist must happen for market forces to then work. In other words, if you simply regulate to the level of safety that the industry is willing to offer you, then market forces aren't working in that area. They're not working to find a safe solution. You're simply going to get what they offer. Now, if you really rely on market forces after -- and you really regulate for real safety, the safety you want, the protection of the environment that you want, you might find that the market forces do more than you expect. They might push you to a new technology. They might tell you one industry goes down. One thing I don't understand is why this entire industry which was predicated on finding permanent storage, safe, permanent storage wasn't shut down when that didn't happen. And I see that as a fundamental failure of regulation. And a failure that allowed market forces to just produce poison and it really worries me. (0112-32-1 [Fleischer, Robert])

Comment: This nuclear mafia that has been running the nuclear bomb industry around the country, around the world operates outside of the democratic process and the people want that to stop. This nuclear waste has been called a resource by people in my hometown who build nuclear submarines where the nuclear waste is being stored and building up at the military installations across this country as well. And they want to call it a -- it's a resource that can be somebody wants to buy that stuff. Well, good luck. But everybody knows that if you have a

fancy coat and you shake enough hands, you can sell anything, even nuclear waste. (0112-34-3 [Chichester, Ben])

Comment: We're tired of the systematic arrogance of the nuclear industry and the regulatory system. We're glad the judicial process is finally calling you out on this charade. (0112-5-9 [Bogen, Doug])

Comment: Oh, the NRC, it's my belief that if the NRC is not able to stop what occurs right now in Fukushima or if they're not able to stop the degradation of San Onofre's reactor of their steam generators, that it shouldn't be in the business of regulating nuclear power. If you can't stop criticality, how can you regulate it? If you can't find the cause at Fukushima, how can you call yourselves a regulator? (0112-8-1 [Sachs, Gary])

Comment: I did hear the NRC say this year they don't think they should be under the control of the Federal justice system. Who do you want to be under the control of, Congress? Markey's now a senator. He might be able to do something to have better effect with you. (0112-8-5 [Sachs, Gary])

Comment: 14. The Uranium that was in the reactors at Fukushima Daiichi originated from Aboriginal Lands in Australia, where the traditional people opposed the uranium ever being removed from the ground. It is time for the decision structure of our United Nations to honor and include the wisdom of those who truly, if heard, could have prevented this disaster. (0113-10 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: 15. The Memorandum of Understanding between the World Health Organization and International Atomic Energy Agency should be dissolved permanently. The charge of the IAEA is to spread "peaceful" uses of nuclear technology. This official mandate prevents IAEA from being independent assessors of health impacts of the same technology. (0113-11 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: In addition to the action plan outlined above, we have broader concerns about radiological accounting and regulation that United Nations agencies such as the World Health Organization (WHO), International Atomic Energy Agency (IAEA) and United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) have already engaged in. With regard to the Fukushima nuclear disaster other UN Agencies, like the High Commission on Human Rights, have recognized how this accounting is not serving humanity. (0113-2 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: 8. A new formulation of the radiological risk coefficient assigned to radiation exposure is needed, as well as a rigorous discussion of the option for more than one such coefficient. Unfortunately, outdated assumptions are still being applied to what is happening to the people of Japan, and others being exposed to radioactivity from Fukushima (and elsewhere). More accurate understanding of the impact of ionizing radiation from both

internalized radionuclides, and also across the life-cycle, has not yet been incorporated into risk estimates. "Old" (inaccurate) assumptions do not account for disproportionate harm to females in general, and young children in particular (National Academy of Sciences, BEIR VII page 311, Tables 120-1 and 120-2 Lifetime Attributable Risk of Cancer Incidence and Mortality). Official estimates are beginning to acknowledge this reality [World Health Organization, 2013, Health risk assessment from the nuclear accident after the Great East Japan Earthquake ... see page 54 section 5.2.2 Results of lifetime risk calculations. http://www.who.int/ionizing_radiation/pub_meet/fukushima_risk_assessment_2013/en/index.html ; UNSCEAR press release (http://www.unis.unvienna.org/unis/en/pressrels/2013/unisinf4_75.html) and video (<http://www.youtube.com/watch?v=gyLDNg3VBMU&feature=youtu.be>)] however, this impact is not yet incorporated in the regulation of radiation exposure worldwide. In addition, it is no longer valid to omit the impact of internal exposure; risk estimates can no longer assume different types of radiation outside the body have equivalent health impact once inside the body. (See: Yablokov, 2013, "A Review and Critical Analysis of the "Effective Dose of Radiation" Concept" Journal of Health & Pollution Vol. 3, No. 5-pg 13--28.) Finally, it is not clear that exposures in utero, during the initial phases, or over time will be included in the estimate of health risk or consequences from Fukushima. (0113-4 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: 9. The global organizations charged with radiological analysis and regulation should be generating a real base of monitoring data from Fukushima. Contamination levels in both humans and the environment need to be woven into any health assessments. Reliance on dose reconstruction alone is insufficient and collection of biological data will help researchers observe, not just predict, health outcomes. It is incumbent upon these global organizations, given the amount of information now known about disproportionate impacts from internal exposure; and the disproportionate harm across the lifecycle (human and otherwise) to collect data and calculate exposures directly; not from extrapolations mired in outdated and incorrect assumptions. The UN Special Rapporteur supports collection of biological data to assess internal exposure: "Refrain from restricting examination for internal exposure to whole-body counters and provide it to all affected population [sic], including residents, evacuees, and to persons outside Fukushima prefecture;" (Grover 2013, p 23) (0113-5 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: 10. In general, public health concerns need to drive public spending and health assessments; principles of biology need to drive health research not scientific investigation for science's sake. People need proper medical treatment, not data-mining. Japanese People, especially parents, should be told the truth about the medical effects of radiation exposure and have full and open access to the tests that are being performed on them to detect health abnormalities, such as thyroid cancer. All investigations into health abnormalities should include all cancers and other diseases related to radiation exposure. The world must not re-commit the post-war crimes of Hiroshima and Nagasaki, where the radiation victims known as Hibakusha, were only studied by the West rather than helped to heal. (0113-6 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: 11. Where biological mechanisms or results are unclear, precaution should be used and not be superseded by principles of physics alone because physics is only one of the forces acting to impact health. Research finding negative health impacts of low doses should be accounted for, not disregarded. The UN Special Rapporteur, after reviewing such research, recognizes this: "...disregarding these findings diminishes the understanding of and increases vulnerability to health effects of long-term exposure to low-dose radiation." (Grover 2013, p 6) Unfortunately these concerns extend far beyond Japan today, and per new projections (shown graphically here), impacts are still expanding: <http://liopscience.iop.org/1748-326/7/3/034004/article?vshowaffiliations=yes> (0113-7 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: 12. Those who are displaced from their homes due to radioactivity need to have good options regarding how and where to live that are respectful of their culture and traditions. Consequently, the Special Rapporteur's report says any relief package should "(i)include cost of reconstruction and restoration of lives" (Grover 2013 p 24) This starts by providing them information about radiation in the context of other determinants to health, and this information should not be in the control of parties with financial interests in the nuclear industry. (0113-8 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: I am waiting for the individuals on the Commission to behave as individuals who must be accountable to your families and communities. Because now families and communities are not only watching, they are measuring. They are measuring the radiation in the atmosphere. The Gamma radiation from Cesium 137. The data will do the talking. The presence of Cesium 137 will not be a secret and silenced. (0120-7 [Seeman, Laurie])

Comment: It seems to me that the threat "Your money or your life!" has never been more accurate. I feel that the NRC has a moral obligation to put all other concerns aside & show global responsibility & leadership, based on what I hope their mission is: to regulate the use of nuclear power in order to require that the safest methods are used in all aspects of the technology - period. I hope their mission is not to do this by the cheapest means possible. (0126-3 [Houston, Ann E.]

Comment: With all due respect, the policies perpetrated by this agency put the interests of the nuclear power operators far above the welfare of populations in reactor communities. (0136-12 [Shaw, Gary])

Comment: One might ask what type of oversight the NRC provides if it could not see that the operator was incapable of maintaining safe operations? Over the last 13 years of observing this agency, my conclusion is that the agency is not so good at preemption, but works hard to find root causes after damage has been done. (0136-2 [Shaw, Gary])

Comment: I am saddened and dismayed that there is so much controversy surrounding nuclear plants, nuclear waste storage and leakage of contamination into the groundwater. The NRC must adopt very strict standards and regulations for existing and future nuclear plants. The damage and ensuing threat of a nuclear meltdown at Fukushima should be example enough that our nuclear plants must adhere to the strictest of standards. (0158-1 [Payne, Joanne])

Comment: There was a project at UNLV to recycle nuclear waste. I'm not sure of the outcome of this particular project, but I'm sure scientists would be happy to work on this project with some support from the government. (0162-1 [Ramsey, Betty])

Comment: Before closing I would like to note that 20 months ago the Disposal Subcommittee of the Blue Ribbon Commission of America's Nuclear Future presented its upgraded report and there's a roadmap there and certainly the NRC should follow that. However, in the interim, it's incumbent upon you to promulgate rules and enforce them so that we will have the maximum protection to the public and the surrounding from the potential ill effects of an adverse incident which causes the release of nuclear waste. (0163-16-8 [Wolf, Peter])

Comment: One last point. Indian Point has become a defacto toxic waste dump on the banks of the Hudson River 34 miles from mid-town Manhattan. That's the reality. It wasn't -- didn't start out that way, but that's the situation we're dealing with now. And we deserve better than -- what we deserve from the NRC is a thorough and honest assessment of the risks and the impacts and a plan to deal with this waste safely instead of what we got, which was business as usual from the NRC on Indian Point. (0163-2-7 [Musegaas, Philip])

Comment: I live five-and-a-half miles from Indian Point. I was going to start off talking about what a poor job I have observed the NRC doing in terms of preemption of problems. They didn't prevent Con Ed from having a steam pipe eruption that released radioactive steam into the atmosphere and irradiated water right into the Hudson. They weren't -- they couldn't prevent more ruptures and leaks in underground piping. They had no idea that their spent fuel pools were leaking until, as somebody else mentioned, a contractor started doing excavation and said "Oh, it's wet outside the spent fuel pool." So the NRC is not very good at preemption, but they're pretty good at going "Uh-oh, what do I do now that there's a problem?" So the idea that they now have a plan to take care of nuclear waste into millennia, it would be hilarious if it wasn't so scary. (0163-22-1 [Shaw, Gary])

Comment: With all due respect, the policies perpetrated by this agency put the interests of the nuclear power operators far above the welfare of populations in reactor communities. (0163-22-10 [Shaw, Gary])

Comment: The idea that, you know, when we had public meetings with the NRC and asked how many exemptions has Indian Point received and they didn't -- they had no idea how many exemptions they've given or how they interacted. So I have very little, very little, confidence in this so-called regulator whose primary objective by law is supposed to be protection of public health and safety. They're obviously much more interested in the financials of the operator. That came out in an Inspector General's report when they almost let Davis Bessie reactor in -- outside of Toledo, Ohio, have a breach of containment because they were concerned about the financial impact of shutting the plant down to find out what the problem was. (0163-22-2 [Shaw, Gary])

Comment: I can't think. And it just occurs to me that there is so much arrogance going on at the NRC and has been for decades, because I've been coming to these meetings for over 30 years, ever since I moved to my home which is 14 miles from Indian Point. And I'm furious, and I know that there are a lot of other people who are being more polite than I am who are equally furious that you think that you can con us into thinking that there is any solution for this. (0163-24-3 [Allen, Judy])

Comment: I want you to know that there is a disconnect between what the NRC says and what the public perceives. There is lip service. Only lip service paid to the public health and safety. We all know that you are beholden to the nuclear industry. We all know that organizations like SHARE and New York AREA have been created by Entergy with Entergy's money. (0163-24-4 [Allen, Judy])

Comment: First of all, on behalf of people who are not here, I want to say, like a lot of people, just everyday people like myself, they're already catching up with all the deceptions of nuclear energy and it's amazing to see NRC people whose doing amazing job in keeping status quo even after the post-Fukushima wall. We are in an incredible situation, an extreme situation, and people in suits today from the industry and from Regulatory Commission might be just doing their job to keep their, you know, career and all that. And it's just obvious that people like us and people from Japan need to be heard. (0163-31-1 [Tonohira, Yuko])

Comment: Onsite waste storage at nuclear plants is literally a very hot topic for the people who live and work in the vicinity, but you would never know it from the inexcusable silence on the part of most of our elected officials. And by local, I mean from congress-people down. We keep putting these people back in office because we think the alternative candidates would speak even less to our interests. But people like Schumer, Gillibrand, aren't doing us any favors on this issue. I'm too old to learn how to tweet, but I do know how to Google, and this afternoon I Googled both of these senators and a number of other elected that should be out there fighting for our safety or the -- and their constituents in this region. Schumer seemed to have gingerly stepped up to the plate 13 years ago after Con Ed reopened Indian Point Number 2 in 2001. The Times reported that he faulted Con Ed and the NRC for not providing a full, timely accounting of the new leaks and said that until NRC verifies that Indian Point is in good working condition and will not leak, the doors of this nuclear power plant cannot in good conscious be reopened. I'll shorten my remarks, but the next time he spoke on the issue of Indian Point was in 2007. That's six years later. The most recent comments he made were about barbeque grills at a time when we expected him to be talking about Indian Point. (0163-37-1 [Woodward, Julie])

Comment: These people need to break the ties they have with big money and start to think reality. Nuclear waste does not go away. Right here in Buchanan this stuff is not on our doorstep but inside our house. We need whomever we put into office to start feeling very uncomfortable about the money they accept from a corporation like Entergy, the whole industry in fact -- that puts profit over limited half-baked solutions and potential long-term devastation. (0163-37-3 [Woodward, Julie])

Comment: I have confidence that the sun will rise in the east and basically, death and taxes. But I don't have confidence that any agency could actually take responsibility and carry out a responsibility to deal with this huge, huge issue. When I hear news or information presented as fact, I ask myself what's the source of the information and what does that source have to gain by their so-called facts? Follow the money is my motto, and I respect everyone here who has spoken and who has spoken on both sides of -- on whatever side of this issue. However, it cannot be said that somebody who works for the nuclear industry is disinterested, is a disinterested party. (0163-39-2 [Sack, Emily])

Comment: The other thing I would like to point out and emphasize again, is of course, how shall I put this? Well, I will put it this way. In a functional society the decision-making on any issue would not be open to anyone who has a vested interest in the outcome of that decision, right. Meaning -- meaning of course that the honorable thing is that if you're making money off of, say, Indian Point, you recuse yourself from decision-making about waste storage and

whether it should be open because even if you try to be devoid of the conflict of interest, it's going to be there and present, you know, your livelihood depends on it. And for those people who are making a living by, you know being engineers or management people or secretaries at Indian Point, yes, I have sympathy for your predicament, but it's kind of like, you know, you're making money off something that's very dangerous. The witch burnings in Europe went on for 300 years because the interrogators of witches and the people who made instruments of torture for the interrogation, it was a big money-maker in Europe, you know. We got to put money behind good stuff that we need and take it away from poisoning the water, poisoning the air, poisoning the earth, poisoning ourselves, et cetera. (0163-41-4 [Kidney, Barbara A.])

Comment: I really respect everyone that has spoken tonight. But all I can think of, and I know this is going to be very crude and rude, all I can think of is my father, who really would have just been aghast at what is going on. And all I can think of is the expression he told me once. All you can do is put your head between your knees and kiss your ass goodbye. That's all. (0163-50-1 [DeCrescenzo, Jackie])

Comment: It occurs to me, everyone who has spoken in favor of nuclear energy, its safe storage and generic rules for waste has a JOB that depends on nuclear energy! (0175-4 [Arnason, Deb])

Comment: Given the complexity and seriousness of this issue and given that we are currently witnessing movement of spent fuel rods at Fukushima and some of us are holding our breath in anticipation of more serious consequences I ask that all interested parties enter into a serious and respectful discussion. Individual citizens, policy advocates from ngos, volunteers from various groups have no vested interest in this other than their concern for human survival and the health and well-being of all and our planet. They are not a lobbying group, they stand to gain nothing on the material level. start listening to them and engaging them in real conversation. Stop being a front for the industry and do your duty to humanity. (0177-6 [Craig, Anne])

Comment: GmP's mission is the deployment of small modular reactors. We believe that SMRs provide a near-term option to address multiple needs: diversity of fuel supply, replacement of aging fossil fleets with a carbon-free option, the ability to stabilize small and segmented grids, addressing post-Fukushima safety requirements with significant improvements in safety margins, and providing access to safe, carbon-free generation options at sites never before envisioned, all with reasonable investment and project risks. We also provide electric generation and process heat options not available previously in emerging markets, and are working to provide options worldwide for near-term, low-risk, carbon-free power. This mission is in support of a strategic need, both here in the US and abroad, to transition electricity generation to cleaner, long-term power. Approval of our design by the NRC is considered by many to be a prerequisite to deployment in other countries. And a very important aspect of moving forward in any area of nuclear licensing is regulatory stability; the deployment of SMRs in the US is no exception. (0182-2 [Vytlačil, Gordon])

Comment: The philosopher, Georges Santayana, said that those who ignore the failures of the past are doomed to repeat them. Within his first 100 days, Jimmy Carter issued an Executive Order on April 7, 1977 to defer indefinitely the reprocessing of used nuclear reactor fuel. He said it was necessary to prevent proliferation, and that nuclear power could go ahead just fine. He was wrong on both counts. His order was a Major Federal Action. Did he prepare an EIS (Environmental Impact Statement)? No! He made his decision in secret, listening only to those who he knew would agree with him. Kept tightly classified, there were no White House leaks. Carter ignored four decades of planning, study and Congressional funding on waste disposal,

and never reviewed the lengthy hearings in the Senate or the House on the economics, proliferation or the Waste Confidence Rule. The Vietnam War had brought changes to American policymaking. Activists challenged governments from Federal down to county levels. "Public participation in decision making" was Ralph Nader's banner and was demanded by activist groups. In 1975, activists won a court decision that forced an EIS on the entire planning for reprocessing and recycling of used nuclear fuel. The GESMO (Generic Environmental Statement on Mixed Oxide Fuels) meant months of preparation, and a series of public meetings had already been announced when Carter was elected. Carter's new nuclear policy stopped the GESMO. It achieved victories for NRDC, UCS, EDF and Common Cause. GESMO's demise showed that a small group of dedicated organizations could use NEPA (National Environmental Policy Act) and the EIS to try to stop a big program of a major industry. While not offering viable alternatives or even documented facts, and maybe not being able to totally stop it, they were able to delay it while raising costs, feeding public doubts and fears, and fueling more distrust of government. Carter read voraciously, but skipped or ignored experts who knew enough to point out weaknesses and fundamental errors in his scheme, including its impact on the national program for nuclear waste management. Even after his election, President Carter never consulted the directors of our weapons laboratories about plutonium. He feared that if his policy were leaked, the nuclear industry would use its vast financial resources to undermine his plans. Carter just believed that if the US took the lead by stopping our reprocessing, separating and recycling plutonium and the breeder reactor, the other nations would follow our lead and that would prevent proliferation. They did not, and the U.S. lost its leadership in the nuclear power world. Our friends and partners were appalled and furious. They realized that the U.S. had just given activist groups a powerful political gimmick they could use to stop nuclear power. And they tried! (0191-1 [Rossin, A. David])

Comment: Alongside these harmful effects comes the retaliation of the victims; in other words, lawsuits can easily arise when it comes to nuclear waste and its harmful effects. Although a possible lawsuit usually is between a community of people, whether it be a lot of people or a small amount, and a company that deals with nuclear waste directly, the whole ordeal can come full circle and end up putting a negative pressure on the NRC. (0192-6 [Einhorn, Jeremy])

Comment: The reactor licensing must be made permanent and inspectors on the current active power plants are needed to assure our safety. Many are old and need repair. (0193-2 [Doyle, Rosemary])

Comment: Continuing on, I OPPOSE "CENTRALIZED INTERIM STORAGE" (CIS), which has been proposed by the nuclear industry. Illinois should NOT be considered to be a DE FACTO HIGH-LEVEL RADIOACTIVE WASTE DUMPSITE! (0196-4 [Nelson, Dennis R])

Comment: We need to deal with nuclear waste once and for all! (0197-1 [Webb, David])

Comment: I know nuclear energy is a strong player in the energy bussiness and helps meet our needs on the home front. But just like oil and natural gas it depends on a resource that will run out. I think that if the way of the future is renewables, technologies that depend on wind, sun, things that we will never run out of, why are we investing in things that we know for certain we will run out of. If we start investing in renewable energy then we skip a step, building up a technology that will eventually be useless, and have a head start on what were going to have to do anyway. (0200-4 [Individual, Anonymous])

Comment: Companies that use nuclear fuel to produce electricity for profit should maintain strict chain of custody for the duration of its possession until permanent storage is established and carry liability for environmental and/or human issues that may evolve from future events. (0202-2 [Hill, Jack])

Comment: Another option would be alternative designs for nuclear plants. A South African company called PBMR Ltd. began developing a new type of reactor called the pebble bed modular reactor in the 1990s. This design would improve the efficiency of the process, reduce overall quantities of waste, and reduce dangerous conditions (Adams, 2001). Improving the design of the plants would help with the long-term waste storage problem because it would allow plants to generate less waste. Not only will pebble bed modular reactor plants generate less waste, but they will also be designed with a system to make the waste they do generate safer. PBMR proposes to coat the waste with a layer of fuel that will keep it separate from the environment and allow it to safely degrade into a stable substance (Adams, 2001). Furthermore, this design will include specifically engineered areas within the facilities themselves large enough to store the by-products that the plants generate (Adams, 2001). This would make the plants almost self-sufficient and greatly reduce, if not eliminate, the need for substantial off-site storage. Now other countries, like China, have also begun developing the pebble bed reactors. It may prove beneficial for the United States to look into this technology as well. (0205-14 [Lyons, Laura])

Comment: To put things on a more positive note, I think there is a good chance we will eventually learn how to safely recycle high-level nuclear waste. For example, there is this proposal: ACCELERATOR DRIVEN SYSTEMS; D. Vandeplassche and L. Medeiros Romao, SCKCEN, Mol, Belgium; <http://accelconf.web.cern.ch/accelconf/IPAC2012/papers/moyap01.pdf>; From the Proceedings of IPAC2012, New Orleans, Louisiana, USA. I have seen other proposals in the popular media that use fusion as the neutron source to accomplish this. These ideas do look promising, but they currently aren't viable solutions. Also, the time frame for recycling is still going to be on the order of a thousand years, because any real recycling process has to release the remaining energy stored in the high-level waste and it will take that long to use the energy! So, the best advice I could give at this time would be to plan for 1000 years of interim storage. (0208-8 [Robinson, Herb])

Comment: The NRC licenses and regulates the nation's civilian use of radioactive materials to protect public health and defense and security and protect the environment. I state that most important in the NRC's mission is the protection of public health and the protection of the environment. (0219-14 [Olmstead, Stan])

Comment: Further, the NRC's lack of basis for a finding of confidence in the technical feasibility of a repository fatally undermines Table S-3 of the NRC's Uranium Fuel Cycle Rule, which depends on the assumption that radioactive releases from a repository will be zero. (0222-12 [Zeller, Lou])

Comment: Prohibit reprocessing: The reprocessing of irradiated fuel has not solved the nuclear waste problem in any country, and actually exacerbates it by creating numerous additional waste streams that must be managed. In addition to being expensive and polluting, reprocessing also increases nuclear weapons proliferation threats. (0222-20 [Zeller, Lou])

Comment: DISPOSE OF THE WASTE IN THE NEW MEXICO SALT FLATS ALREADY -- THE SOLUTION IS OBVIOUS! (0225-1 [Ludwig, Andy])

Comment: Now you, the NRC, want comments on our plan to store radioactive waste on our seismically active coastline for 300 years. What do I think? I hope a negative answer is as obvious to you as to everyone else. My question to you is, "Who owns you?" It certainly is not the public you are supposed to serve, the 99%. Big money owns our country today. Reason has been discarded. Example: San Onofre closed because repair was too costly -- not because of safety. Must we find a money answer for you and PG & E? Or are you providing it? (a) store spent waste; (b) continue Seismic Studies; (c) wait for an earthquake (0234-1 [McNeil, Dorothy F.])

Comment: The forum was very informative. Both sides presented their arguments on how they feel about coal. I listened to both sides of the equation and I really do not have a stance either way. I did learn some information that I did not previously know so I was happy to be able to attend. I believe nuclear energy is a good alternative to coal but is not the total answer to the question that really needs to be asked. I believe renewable energy is the way to go and I also understand that is not the total answer as well. We have to use all technologies that we have at our disposal as well as what is to come in the future but we should rely on renewable energy as much as possible. In the end nobody on either side of the coin wins on the issue of nuclear. (0235-1 [Ford, Jay])

Comment: In December of 2011, I attended the PowerGen conference in Las Vegas Nevada and delivered hard copy evidence to Clayton Smith, Technical Services Director of Fluor Corporation that a test was done under NRC supervision at Rocky Flats Colorado in the mid 90's that showed conclusively that Plutonium 239 could be safely neutralized. Since hand delivering that information to Mr. Smith, he will not return letters, email or telephone calls. It became apparent to me that NRC officials came down on him with a lead hammer to suppress that information. NRC appears to have one prime directive: that of providing weapon grade materials to the Defense industry, regardless of which administrative shell they hide under. This is not acceptable to a civilized country. I demand this information not only be released, but immediate implementation of the process be used to begin neutralizing ALL of America's radioactive waste AT THE FACILITY. The equipment to accomplish this is small, portable and can be used at each facility. This negates the need for dangerous transportation of any waste. The crisis in Fukushima should make this the top priority in the nuclear power industry. No exceptions. For anyone who honestly is not aware of this process, I can easily provide contact information of the physicist who accomplished the feat at Rocky Flats Colorado in 1994. No nuclear facility should be approved for further operation until this process, or anything proven better, is implemented. (0239-3 [Rasmussen, Kenneth])

Comment: If America wants to be seen as exceptional, we should be setting an example of reason and responsibility. We can set an example by reprocessing spent fuel to reuse it as France has done. That effort cannot possibly cost more than our frantic cleanup efforts cost us. Our 'exceptional' reputation is based too much on keeping our investors happy rather than keeping our environment safe. (0242-1 [Labiosa, Eleanor])

Comment: I trust you to keep the welfare of your own country as your first concern. As a trusted representative of our great Country you cannot possibly not know the dangers inherent in storing nuclear waste. Thank you for putting our health ahead of company wealth. (0242-2 [Labiosa, Eleanor])

Comment: Another thing that I've seen in this EIS is the -- or I've seen in these meetings is people think that NRC might be, what they call a "captured regulator," where NRC is on our side. And if you've been to a lot of the meetings I've been to where we're discussing the details of this process, nothing could be further from the truth. It's a very adversarial process. If you

don't believe that look at the record of public meetings recently between industry and NRC. You know, we both agree that we should be focusing our resources on the things most important to safety, and as we see regulatory costs increasing across our industry we don't always agree about what those things are. Look at the correspondence that's gone back and forth between NRC in industry. If you look at the facts, there's a very strong record to suggest that -- not just to suggest but to prove that this is a very tough adversarial regulator. Those of you concerned about nuclear safety probably say, "Darned good thing." And, you know, we do too. And we don't say, "Oh, phew, we met the regulations let's go home." Our safety culture, where regulatory compliance is a minimum standard of performance. We don't just meet regulations, we exceed them. (0244-11-9 [McCullum, Rod])

Comment: A philosopher, George Santayana, said that those who ignore the failures of the past are doomed to repeat them. Within his first 100 days in office, Jimmy Carter issued an Executive Order on April 7th, 1977 to defer indefinitely the reprocessing of used nuclear reactor fuel. He said it was necessary to prevent proliferation and that nuclear power could go ahead just fine. He was wrong on both counts. His Order was a major Federal action. Executive Orders by the President have the force of law. Did he prepare an Environmental Impact Statement? No. He made his decision in secret, listening only to those who he knew would agree with him. Kept tightly classified, there were no White House leaks and his statement caught the American nuclear industry off-guard, they didn't know it was coming. Carter ignored four decades of planning, study, Congressional funding on waste disposal, and never reviewed the lengthy hearings in the Senate or the House on the economics, proliferation, or the Waste Confidence Rule. The Vietnam War had brought changes to American policymaking, and these changes were very evident by the mid-70s before Carter was elected President. Activists challenged government from Federal level on down to county levels. "Public participation in decision-making" was Ralph Nader's banner, and it was demanded by activist groups one after the other on one issue or another. In 1975 a group of activists won a court decision that forced the Environmental Impact Statement -- forced an environmental statement on the entire planning for reprocessing and recycling of used nuclear fuel. It had the funny acronym, GESMO, G-E-S-M-O, the Generic Environmental Impact Statement on Mixed-Oxide Fuels. And this meant months and months of preparation and a series of public meetings had already been announced and the locations had already been set when Jimmy Carter was elected. (0244-4-1 [Rossin, A. David])

Comment: Anyway, back to Jimmy Carter's new policy. It stopped the GESMO. It achieved victories for NRDC, Union Concerned Scientists, Environmental Defense Fund, and Common cause. GESMO's demise showed that a small group of dedicated organizations could use the National Environmental Policy Act and the Environmental Impact Statement to try to stop a big program of a major industry while not offering viable alternatives or even documented facts, and maybe not even being able to totally stop it, they were able to delay a project while raising costs, feeding public doubts and fears, and fueling more distrust of government. And these were impacts. Jimmy Carter read voraciously, but he skipped or ignored experts who knew enough to point out the weaknesses and fundamental errors in his scheme, including its impact on the National Program for Nuclear Waste Management. Even after his election President Carter never consulted the directors of our weapons laboratories about plutonium. He feared that if his policy were leaked, the nuclear industry would use its vast financial resources to undermine the plan. Carter just believed that if the United States took the lead by stopping our reprocessing, separating, and recycling of plutonium and the breeder reactor, other nations would follow our lead and that would prevent proliferation. They did not follow our lead and the United States lost its leadership in the nuclear power world. You can look at the difference between 1976 and 1978, the United States was no longer a big player. Our friends and partners were appalled and furious at this policy. They realized that the United States had just given activist groups a

powerful political gimmick that they could use to stop nuclear power, and they tried. I want to take a few seconds just to tell one story. I said the U.S. nuclear industry didn't know about Jimmy Carter's policy, neither did anybody else. A day before his press conference he made personal phone calls to the Prime Ministers of the United Kingdom, Germany, and France. The United Kingdom told the President of the United States politely to mind his own business. Carter had asked them to shut down the reprocessing plant that the UK was building. Helmut Schmidt in Germany hung up on Jimmy Carter; he said, "You're crazy." The Prime Minister of France, whose name was Couve de Murville, took Jimmy Carter's call, thanked him for calling, picked up his other phone and called the project manager at the reprocessing plant that the French were building. He said, "Monsieur, I have just received a call from Jimmy Carter. The United States is going to stop its reprocessing program and they want us to do the same." "Thank you Mr. President," said the chief engineer, and he picked up the other phone and called his construction design manager and in effect said, "Stop the presses, triple the size of our reprocessing facility," and they did. (0244-4-3 [Rossin, A. David])

Comment: I just had a conversation with a friend of mine and he said, "Well, you know what I think, these people they just really aren't worried. They think Jesus is coming. It's the apocalypse, they don't have to worry, it's all going to be over." So like when I was up there at that PSC hearing just recently, they're jacking the rates because of their fiasco. You know, and I say, do you feel lucky, do you feel lucky? Oh yeah baby, roll those dice (indicating). That's what you're doing. You don't know what's coming. This is just a big big guess. You don't have any proof. You're all a bunch of jokers. You're rolling the dice. That's all it is, it's a big craps game here. And all these people are saying, "Oh, we know what this is, we know the science, we can tell you with confidence." And, you can't even get a line right. I was supposed to be speaking number four. Clown. (0244-5-6 [Klutho, Mark])

Comment: There have been proposals to incorporate their radioactive effluent in consumer products. That may not be the exact point of this hearing, but that may be the most insane proposal of all. What a great idea, let's expose everyone, including babies and children, to products known to cause horrible illnesses and death. (0244-6-6 [Steorts, Tim])

Comment: My purpose for pointing that out is only this: I've been involved with energy policy, energy planning, and nuclear energy in the state of Florida for over two decades. And I will tell you that the issue that you're dealing with right now is probably the most important one for Florida's clean energy plan in the future. Certainly Florida has made some modest attempts to develop more solar energy, some of which have been successful, some of which have not. (0244-9-5 [Paul, Jerry])

Comment: So, I hope one day we can actually get one better and reprocess the fuel and minimize the amount of waste actually produced. (0245-12-6 [de Graaf, Brandon])

Comment: It's important to get this right because the nuclear industry wants thousands of small modular reactors around the world, which means at least hundreds if they get their way around the country. And this will be the guidance for hundreds of small modular reactors. (0245-19-10 [Smith, Ed])

Comment: It's clear that for our overall quality of life as well as our overall economic well-being that we need a reliable, cost-competitive, diverse, and stable supply of energy. In the past few months, I've been to public hearings on license extensions for nuclear power plants, USEPA regulation on emissions for coal plants, regulations on fracking in Illinois, and permitting for efficient lines that would bring more green energy in Illinois. Every single energy project that I

was at had its detractors at these meetings. Yet no one has come to any of the hearings with the perfect solution, just reasons why the current system isn't perfect. Well, of course it's not perfect. Everyone in this room knows that there is no perfect form of energy. If there was one, believe me, we'd be using it. So, we're stuck with an abundance of imperfect choices. (0245-2-1 [Wolf, Tom])

Comment: I think you should think twice about whether the food you put on your table because of the industry you work for is worth the future that you threaten without the industry. I mean no disrespect for people who work for nuclear industry. It's not a personal issue. It's a systemic issue and the fact that this country has been overwhelmed by corporations and businesses whose first concern is profit over safety. (0245-25-4 [Lehman, Dale])

Comment: In the movie Pandora's Promise, what I believe to be the most important statement in the movie is made by pro-nuclear Mark Lynas, while turning to the nuclear disaster in the area of Fukushima, Japan, he says, "this was not supposed to happen to a reactor." All the things that are not supposed to happen are exactly the problems with storing nuclear waste. In fact, this is something that nuclear industry operators, investors, governments, and their agencies that facilitate nuclear energy as well as companies that build nuclear reactors are concerned about. They know things that aren't supposed to happen do happen. They also know this risk creates a great liability. So, just like stockpiling the nuclear energy waste so quietly, stockpiling risk and liability has happened equally as quietly, and has put upon the public unbeknownst to them a burden. The public is carrying a portion of the liability and risk for the nuclear industry. This is happening on a global scale. Last week, the U.S. Department of Energy Secretary Munoz went to Japan to offer to Fukushima - - as long as Japan signs on to the convention of supplementary compensation for nuclear energy - - removing the liability for nuclear construction companies and other nuclear vendors from nuclear accidents. If you think the same will not apply here in the U.S., think again. (0245-30-2 [Snyder, Gail])

Comment: We know that you represent the industry and not the consumer or the people of the Earth. We feel -- don't need or want to be at great risk due to the ways of the Nuclear Regulatory Commission. Please change your ways. (0245-35-1 [Seastrom, Tina])

Comment: I'm realizing that really the issue here is that what we're looking at is confidence in the NRC. And regardless of that, I am so happy to hear about the culture of safety that is in place in the existing plants, but regardless of what efforts are being made within the plants by all you people who are working there and doing such a fine job, and I trust that you are all very capable, if the structural integrity of the plant is not sound and the only ones that can solve that are NRC. They are the agency that is responsible for addressing safety problems. So, global and safety -- identify problems, but the NRC is basically designated by the Federal government as the responsible agent for correcting the problems or seeing the problems are corrected. And there has been some history that they have always done that. Several decades ago, the government determined that nuclear plants in seismic zones presented specific increased risks. So, in 1996, the NRC required that new reactors built in seismic areas be designed with protections against earthquakes. It took almost nine years, however, for the NRC to begin assessing the potential risk and existing reactors that were already operating in seismic areas. In 2005, NRC identified its 27 most vulnerable reactors, two of these are in Illinois, the two Dresden units, and eight years later there still has not been any corrective action on those. You know, in this world where, you know what, and I don't think anybody in the world disagrees that there is a high risk of nuclear fission. It's like every conceivable effort has to be made to ensure that absolutely nothing goes wrong. The Feds have designated the authority for the safety of our nation's nuclear plants exclusively to the NRC. There are some questions about their track

record with that. So, regardless of how hard you're working in these plants, there's questions, there are serious questions. (0245-41-1 [Cella, Dr. Francine])

Comment: Can the NRC morally defend its position of bequeathing the problem of radioactive waste for thousands of years? The hubris we have as humans, to leave this legacy of waste for 6,000 human generations for a single generation's comfort, it is immoral and arrogant. And I have no confidence that the NRC represents the interests of the future and life on this planet. (0245-43-5 [Michaud, Debra])

Comment: And I want to quote, although there is a lot that could be said, a lot of it has already been said, what it needs to be is taken to heart. And I urge those members of the NRC to remind themselves that they also are people and that their mission is to serve the people of this country and beyond that of the planet and not the business. Let's repeat that, they are there to serve the people. Let us remind them of that. And if they do not serve the people, they are betraying their job, they are betraying their country, and they are betraying their planet. (0245-48-2 [Walter, Beverly])

Comment: The APY recently, I discovered the State of Illinois reactors racked up 1,120 safety violations. In fact, that was from the period 2000 to 2012, and yet the NRC has never met a license renewal it has not liked and licenses routinely are renewed. (0245-6-2 [Headington, Maureen])

Comment: I also have no confidence when the President's Blue Ribbon Commission is made up of industry promoters like John Rowe, former Chairman of Exelon, and others for whom there is a clear conflict of interest in any decision-making capacity. The BRC's recommendation for CIS, centralized interim storage, is no solution, it just puts lethal materials onto our streets and expressways and opens it to traffic accidents and terrorist attacks. Just because, to the statement I heard, just because we haven't had an accident yet means that it's safe is shortsighted and unrealistic. (0245-6-4 [Headington, Maureen])

Comment: Be mindful when you listen to the accolades of industry or politicians who have been the recipients of campaign dollars in terms of listening to them. These reactors are unsafe and unreliable, they are not clean, they are not green. I have no confidence in the -- Anderson Act because it's being reauthorized in 2017. It limits the nuclear power industry's liability and it's a pittance compared to what the people in Japan are facing in trillions of dollars. Our accidents will be paid for by our own tax dollars just like the loan guarantees and subsidies that are building these atrocities in the first place. (0245-6-7 [Headington, Maureen])

Comment: We need the NRC to shepherd us out of this nuclear waste mess as responsibly and quickly as possible. (0246-11-5 [Dubois, Gwen L])

Comment: We should be looking at -- more at allowing the industry to reuse and recycle the fuel rods[.] (0246-18-5 [Karbowsky, Brad])

Comment: I think we are in a situation right now that actually reflects reality. Since I have been tracking the nuclear waste issue in the last '70s, this is the first time that we have had an acknowledgment that there really is no real confidence, that there is no real justification for the creation of high-level radioactive waste. Irradiated fuel is one of the most dangerous, potentially the most dangerous, material that humans have created. And to completely rubber stamp and ignore impacts, which is what the NRC has done in the past and is doing, is unacceptable and it is allowing continued poisoning of our planet. (0246-2-2 [D'Arrigo, Diane])

Comment: But the purpose of my call today is that we have three major, separate regulatory processes going on, Waste Confidence, the Senate Bill S.1240, and foreign ownership of reactors, each with an overarching implicit angle of infusing money into the private treasuries of energy companies, deliberately isolating our comments and questions and objections within each, so as not to apply what would be taken in total for the overall issue of whether we should be even considering continuing with this technology. I have brought up in prior hearings that this industry seems to be out of money. If you approve Waste Confidence, then potentially S.1240 will open up the quasi-government corporate use of the waste funds, giving it back to the companies to handle the waste and decommissioning. And then that won't be enough so we will need foreign investment in these reactors. (0246-24-2 [McCune, Chuck])

Comment: If San Onofre, and now Vermont Yankee, doesn't tell us that this industry is short on money, they are ten percent or more short on the decommissioning of SONGS, then I am asking formally now in this hearing that the NRC, as provided in Section 10 CFR 50.33(f)(4) that the NRC seek additional information on licensees' financial qualifications if the Agency considers such information appropriate. We think at the present time that this information is appropriate. If I were going to go to my bank as a business man and say to them "loan me some money, give me some money, invest in me, and by the way, here is my 20-year-old or 30-year-old financials for you to analyze," I wouldn't get a cent. This industry doesn't need to get a cent either because they can't prove they are even financially viable. (0246-24-3 [McCune, Chuck])

Comment: I am also formally entering my objection to these three separate regulatory processes going on, Waste Confidence, S.1240 with the Nuclear Waste Administration being created, and foreign ownership of reactors. (0246-24-5 [McCune, Chuck])

Comment: For decades, the NRC has licensed and relicensed reactors, not knowing what to do with the highly radioactive spent fuel. You all have kicked the can around for decades. NRC has been complacent, submissive, and accommodating to the nuclear energy industry. The NRC needs to put people and the environment first. We need real-time monitoring. (0246-3-3 [Gray, Erica])

Comment: So, if we can't trust the Nuclear Regulatory Commission to act on its own staff recommendations, how can we have confidence in the NRC acting responsibly in the future? (0246-9-4 [Lewison, Linda])

Comment: But what about Thorium? It is a much safer nuclear fuel, its waste has a much, much shorter half-life, and it cannot be weaponized. As a physicist and engineer, I don't see why a commercial prototype thorium reactor can't be built and tested before 2020. Also, I can't see why existing nuclear power plant designs can't be easily simplified and adapted for thorium fuel. Thorium is a no brainer. Build uranium plants now, but build thorium plants with them. The US could lead the world in thorium power plants in a short period of time. Let's do it. (0248-1 [Snyder, Mark])

Comment: Stop putting the industry's profit and convenience over the safety of the people and the environment. I'm angry about this, but I still pray for you, and I pray that you will do the right thing. (0250-11-6 [Kerr, Julius])

Comment: Again, I would support or would encourage the NRC to move towards reprocessing, and in the interim, a long-term storage facility is certainly an advantage to the nation for today and for the future. (0250-14-8 [Brookhart, Ryan])

Comment: We can use our spent fuel to generate more energy, and in the process reduce the amount of waste as in the volume, and also the longevity of that waste. (0250-18-3 [Lang, Amanda])

Comment: We were once leaders of nuclear science. I would like my generation to reclaim that title, risk-informed, performance-based rulemaking, not rulemaking based on irrationality, misunderstanding, and political grandstanding. (0250-19-4 [Howell, Adam])

Comment: I personally feel that the media and NRC and energy plants are keeping the public in the dark. We hardly hear anything about it. You have to do all the research on your own. The ocean is being contaminated with radiation, and the air is coming through here and also into the currents so the fish you eat from California and Oregon and all over from Japan is going to be contaminated, too. So no matter what you think, what you eat might make a difference in your life. (0250-22-4 [Hands, Tara])

Comment: Many of us in the room know that the NRC is a captured agency, and its inability to adequately regulate the nuclear industry and protect the public has never been more evident than it is today, but yet we are still hopeful this can change, and we will continue to fight. As was mentioned in the presentation today, the NRC is charged with protecting the public's health and safety[.] (0250-28-3 [Embrey, Monica])

Comment: Today hundreds of unpaid concerned citizens are here tonight to ask you to stop protecting the corporations like Duke Energy, headquartered here in Charlotte, and instead defend the people of the United States. Recently, Duke Energy CEO Lynn Good had expressed her intention to continue Duke's nuclear fleet. (0250-28-5 [Embrey, Monica])

Comment: Now we're [Physicians for Social Responsibility] much more -- we've come to recognize the close tie between nuclear weapons and nuclear -- commercial nuclear power. As was mentioned a number of times, it can be reprocessed but one of the products of reprocessing can be plutonium; thus, that's why we're so concerned about Iran and other countries having commercial power capabilities. (0250-31-1 [Clark, Terry])

Comment: I want to get at one of the most important issues, and that is the structural problems with the Nuclear Regulatory Commission, the revolving door. I went to the section on Ethics in the NRC website, and it looked thorough, and I was pleased to see they gave some examples of how someone, if they're a professor, could go give a lecture and not get extra money. What I didn't find was the example of how someone can make a favorable ruling regarding a corporation and then have a job with them in three months. That's not addressed in the Ethics. I don't know that -- (0250-31-4 [Clark, Terry])

Comment: The Japan parliament commissioned an independent study, and what they got back was the number one concern was the structural problems in Japan of the close tie to industry and the regulators, and they place major blame on that. Thus, that is a recommendation that affects the environment, affects all of this. We've heard this stuff, you know, lasts for thousands and thousands and thousands of years, and we don't have plans. (0250-31-5 [Clark, Terry])

Comment: I'm concerned about the environmental impact of the many other energy sources that you and I are breathing the waste of, the gasoline you used to drive here today. (0250-35-6 [Cook, Andrew])

Comment: I'm one of the common people in that area. I was born and raised in that area. And with our politicians and our government, to me it seems though they are accepting bribes instead of looking out for the common people, for the people that God put here on this earth for us to protect each other, but through that circumstance, to me it seems it's all about greed. What can I get for myself? When you stand up there and make those decisions, are you making decisions for yourself, for your personal gain, or are you making decision for the people? You should be for the people because that's what this country was built on. We are the people of the United States of America. When you harm me, you harm the whole nation because are individual, but yet we are collective, and we're all God's children. And when you start making decisions for your personal gain and your greed within your heart, may God have mercy on your soul. (0250-38-2 [Howard, Claude])

Comment: [I]t occurs to me that everyone in favor of nuclear energy and these Generic Waste rules has a job in the industry. (0250-42-1 [Arnason, Deb])

Comment: This is a room full of high-paid, career, corporate true believers in an industry subsidized by corporate welfare. And to you workers there all in your red t-shirts and other uniforms, you know the EPA has drastically reduced standards for radiation protection. So beware. What they tell you is safe is not necessarily safe. (0250-48-3 [Hanrahan, Carol])

Comment: And so one of the things I find fascinating is when I people rationalizing and minimalizing. And that is exactly what I heard when I heard the comment that waste management is only a small part of what you guys deal with. It is a pretty big part of it. There are many voices talking about reasons for concern about nuclear waste. They are good reasons. (0250-52-1 [Amos, T.J.])

Comment: I am standing here today to remind the NRC commissioners of their role to be independent regulators of the nuclear power industry. There is a concern that the NRC commissioners come to the NRC with close ties to the industry. And I would like to ask the commissioners to keep in mind the problem of a confirmation bias. We all tend to value, perhaps overvalue, data that confirms our particular point of view and to give less weight to other positions that would oppose our point of view. That's understandable. I do it, too. We all do. But the NRC commissioners have a grave responsibility to have an evenhanded approach and to take that very seriously. They must have the courage to fulfill that role. They have been entrusted by the nation to regulate the nuclear power industry in an independent and fair-minded manner. They must take confirmation bias into consideration. I know this is very hard, but I implore the commissioners to look anew at the challenging issue of nuclear waste. There are no good solutions. But please try to look at the issue with clear eyes. (0250-53-1 [Larsen Clark, Brita])

Comment: And every dollar spent is again a dollar not spent on renewable energy that will save our planet and ourselves. There is a great big ball of fire out there. Why don't we try to harness it? Why don't we put that effort and that brilliance and that education and that training into saving this world because nuclear and natural gas, these are not a bridge to the future? They are a gangplank. And I will close by saying this. I remember growing up the story of Br'er Rabbit. And when I hear an industry saying, "Please regulate us. This will take care of it," I get a little suspicious. So I say, in closing, look out for us, not the corporations. We know you work hard. We know folks care. But look out for us because this is our future. This is our children's future. This is our inheritance. And we need not spoil it for future generations. (0250-55-2 [Wood, Nick])

Comment: A poem, "Nuclear waste, acid rain, chemical waste, it's in our brains. It's in our cities. It's in our streams. It's in our futures. It's in our dreams. Three Mile Island, Chernobyl, and Fukushima held well-attended safety meetings the day each of them blew. Doctors, engineers, physicists, the whole crew. So what does this mean to the safety of me and you? Carbon impacts all industries, and nuke is not exempt. Kind of makes me wonder if this rule might have been written in a state with legalized hemp. Nuclear waste, acid rain, chemical waste. It's in our brains. Only you and you and you, only we, the people, can effect change. Ecclesiastes 3:1 tells us to everything, there is a season." (0250-63-6 [Kasher, Brian])

Comment: GmP's mission is the deployment of small modular reactors. We believe that SMRs provide a near-term option to address multiple needs, diversity of fuel supply, replacement of aging fossil fleets with a carbon-free option, and the ability to stabilize small and segmented grids addressing post-Fukushima safety requirements with significant improvements in safety margins and providing access to safe, carbon-free generation options at sites never before envisioned, all with reasonable investment and project risks. We also provide electric generation and process heat options not available previously in emerging markets and are working to provide options worldwide for near-term, low-risk carbon-free power. This mission is in support of a strategic need, both here in the U.S. and abroad, to transition electricity generation to cleaner, long-term power. Approval of our design by the NRC is considered by many to be prerequisite to deployment in other countries. And a very important aspect of moving forward in any area of nuclear licensing is regulatory stability. The deployment of SMRs in the U.S. is no exception. (0250-65-2 [Vytlačil, Gordon])

Comment: But what it [science] has succeeded in doing is finding a way to meet all of our energy needs, carbon-free and nuclear-free, without anyone living in a cave or giving up their iPhone, without polluting our communities, and without leaving future generations a huge burden of nuclear waste. (0250-66-6 [Hanson, Courtney])

Comment: If the NRC were running the TSA, I am afraid that we would not have machines. We would not have X-ray machines because the risk of any single person being a terrorist is very small. Therefore, let's not check them. Let's not test them. So I am afraid that the NRC is really not stepping up to its responsibilities with respect to these issues. (0250-68-2 [Robinson, David])

Comment: I urge the Nuclear Regulatory Commission to continue its strong, independent oversight of commercial nuclear energy facilities. (0253-6 [Avilla, Karen])

Comment: My list of radioactive waste neutralization methods includes the electrino fusion power reactor, Hawkings' generator of cold electricity, collective ion accelerator, dematerialization using highest powered positive ions ever, photo-deactivation using gamma rays, implosion machine which duplicates ball lightning, Radha Roy's transmutation process, Barker's method, Gillembarado's method, Keller catalytic process, transmutation of low-level nuclear waste into glassy substance with super high voltage, Brown's gas, combining Brown's gas with bucking magnetic fields inside a plasma ball, Bearden's method, Russian process using liquid lead bismuth to trigger transforming in the form of neutrons, accelerator-driven transmutation of waste, Brown's gas-metal matrix process, photoremediation, ZIPP fusion process, RIPPLE fission process, low-energy nuclear transmutation electrolytic cells, plasma induced/injected transmutation, Kervran reactions, Monti process, higher group symmetry electrodynamics, plasma gasification melting, low-energy nuclear remediation with ultra-low momentum neutron generator, flame-free incineration in a catalyzer, John Hutchison's raygun, and fusion-fission hybrid reactor. More information on many of these methods is available at www.padrak.com/vesperman. (0260-1 [Williams, David])

Comment: The Department Of Energy refuses to neutralize radioactive waste because of its insane policy of preserving its supply of bomb-grade uranium and plutonium for manufacturing nuclear weapons. The Nuclear Regulatory Commission would better serve the nuclear power industry by vigorously developing methods of neutralizing radioactive waste. Free Energy by popular demand helps address Fukushima issues to US Department of Energy with "Three Rhetorical Questions" So Please Like DCW Facebook Comment on Tesla Energy Technologies For Public Meeting 21Nov13 DoE Google Hangout "free energy by popular demand" (0260-2 [Williams, David])

Comment: The nuclear waste already on hand is both a ticking time bomb & a wasted resource. Find ways to reuse/recycle it, instead of just letting it sit there for millennia. (0266-2 [Kutcher, Celia])

Comment: It's clear that for our overall quality of life-as well as our overall economic well-being-that we need a reliable, cost-competitive, diverse and SAFE supply of energy. In the past few months, I've been to public hearings on license extensions for nuclear power plants, USEPA regulations on emissions from coal plants, regulations on hydraulic fracturing in Illinois and permitting for new transmission lines that would bring more wind energy to Illinois. Every single energy project had its detractors at these meetings. Yet no one has come to any of the hearings with the perfect solution. Just reasons why the current system isn't perfect. Of course it's not perfect! Adults in this room know that there is no perfect form of energy. If there was one, we'd be using it! So we're stuck with an abundance of imperfect choices. But we've done pretty well with these[.] (0275-1 [Wolf, Tom])

Comment: If you do not begin to make responsible decisions regarding the protection of this planet and its humanity, then you need to remove your NRC motto "Protecting People and the Environment" because your "adequate" effort will have failed and all will be harmed as a result. (0277-11 [Pierman, Bette])

Comment: Require that any new nuclear reactor designs be able to endure impacts from a large aircraft. Current designs of Westinghouse's AP1000 have the spent fuel pool on an exterior wall of an ancillary building that is 3 stories above the ground. Are you kidding me, this design makes it even easier for a novice pilot to strike the spent fuel pool. I'd like to leave you with one light-hearted antidote to the current situation ...Its all fun and games until someone gets hurt. (0279-3 [Morgal, Richard])

Comment: We cannot wait for a Federal solution for all of the 104 US reactors' spent fuel storage. California must come up with its own solution. We must create a place away from populations, away from aquifers, away from earthquake zones to store California nuclear spent fuel from SONGS and DIABLO. The law that would create this solution must include prohibition of any other spent fuel to be stored there and a law against any new reactors ever being built in this earthquake fault state so obviously vulnerable to nuclear accident. We have Fukushima from which to learn. A desert military base away from population centers and earthquake faults in California could be a solution. What must be done to create that solution? Meanwhile we are playing Russian roulette with the future of California by storing our spent fuel with a company that has a dismal safety record and will continue to profit from leaving the spent fuel in the pools where it now is. We need an immediate MRS solution-Monitored Retrievable Storage. Is there any interim step that could get the spent fuel pools moved from the ocean and at least 50 miles away from 8.4 million people, monitored and protected by our US military? Who on the NRC is willing to help create this complex but necessary solution before the third largest economy in the world, the state of California, gets compromised forever? (0280-13 [Magda, Marni])

Comment: Regarding the disposition of waste and the classification of waste streams: More emphasis must be placed on how actively radioactive material is and less on where it came from. (The DOE is worse than the NRC on this Score.) (0282-2 [Haber, Jim])

Comment: The NRC is responsible for the health and safety of future generations. It is not responsible for the corporate profits of the nuclear industry. (0287-8 [Swanson, Jane])

Comment: The Hudson River is a gift beyond our comprehension. All of us understand the necessities of daily living and the difficulty we have in managing them properly at times. Perhaps Nuclear power usage in limited capacity is necessary for a time. But we must do everything in our power to make sure that this does not jeopardize the greatest natural resource in our community. Toxic waste and its proper disposal must be a priority of our government, for it has been more than evident over the centuries that the business community is unable to do this properly without strict oversight. Thank you for all you do to keep our community & the United States a pristine setting of wondrous bounty. We must never take this for granted. (0294-1 [Goley, Timothy])

Comment: [I]nspections on the current active power plants are needed to assure safety of human kind. (0304-2 [Young, Roberta])

Comment: [I]nspectors on the current active power plants are needed to assure safety of human kind. (0305-3 [Norman, M. Jean])

Comment: Russia and China are building new nuclear. Russia is build 2 fast reactors. In the EU, France has the lowest power cost. NRDC was completely wrong to be against nuclear. Using fast reactors we can use our existing nuclear waste (except fission products) for fuel. (0306-1 [Kirsch, Steve])

Comment: The NRC must move faster even at the expense of political correctness. Let engineers make the decisions instead of polititions and activists. (0312-4 [Meyer, Charles])

Comment: The fears about nuclear energy are based on irrational associations of physics applied to the benefit of mankind with armaments applied to its destruction. There is NOTHING on the table right now that can approach the energy needs of mankind other than fossil fuels, which will surely destroy us, and nuclear energy which we need to learn to use better. The NRC needs to show some courage, and to promote the deployment of safe and sane nuclear energy. That includes fast neutron breeder reactors of the IFR type, that de facto increase the available energy resources by almost two orders of magnitude. The time for dilly-dallying is over. It is time to pursue the one solution we know of, as aggressively as we can. (0317-1 [Minster, Bernard])

Comment: I am a proponent of destroying the nuclear waste by heating it to a high temperature, which at the same time can produce electricity for the grid. I am asking the NRC to team up with the DOE, and Congress to pass legislation that would require all nuclear electric utilities in the Country to start destroying their waste within 5 years, and to have the fuel pools empty of all waste within 10 years. How do you destroy the waste? One proposal calls for moving the fuel rod bundles into onsite Storage Casks (SC) after five years of cooling in the pool. Then, the SC would be moved to a processing room where the Uranium fuel pellets are removed from the zirconium storage tubes. The pellets are fed through a grinder and turned to a powder. The powder is mixed with a Lithium fluoride salt mixture (LF) The LF is then pumped into a Thorium Molten Salt Power Cell, known in the industry as a Liquid Fluoride Thorium Reactor (LFTR) (0321-2 [Bagwell, Charles])

Comment: I propose that Fermi 1, located in Monroe, Michigan, be used as a test site to destroy all the waste stored at the Fermi 2 Power Plant, right next door. I've had a brief discussion with DTE Energy representatives concerning this proposal. They thought it was feasible but they could not act because NRC regulations was a road block to even studying the matter. I am asking the NRC to reform regulations and to become a proponent to recycling our nuclear waste from long term to short term half-life's. (<800 years) (0321-3 [Bagwell, Charles])

Comment: They're very concerned about food safety, and they've been asking -- three people separately have asked me-- if I know where they could find a calibrated Geiger counter that they could take to a supermarket or grain purchase or fish to the center. Some of them with a Geiger counter, and they've got some idea of how hot their tuna or salmon is. So, that is one thing that I would like to add. If you're talking about how confident you can be, maybe we should include something about just making the local public feel safer in the future when more and more of these nuclear plants are shut down. (0325-10-1 [Chambers, Fred])

Comment: According to the Blue Ribbon report of the President in 2012, the U.S. Navy has final geologic disposal casks that it is using right now, 50 of them have already been used because -- and they're transportable because they have to have all of the nuclear waste out of Idaho by 2035. It will have 350 more by that date. We need those casks. I don't know what they cost. I don't care what they cost. They have to be final deposit. (0325-12-4 [Magda, Marni])

Comment: I urge the Nuclear Regulatory Commission to continue their strong independent oversight of commercial nuclear energy facilities, the operation of existing plants, licensing of new reactors, renewing the licensing of existing reactors, and the management, transportation, and disposal of our used nuclear fuel. (0325-13-6 [Wicks, Tonja])

Comment: I believe the best solution to the problems posed by the 1,600 metric tons of spent fuel in San Onofre resides in the MSR, Molten Salt Reactor technology. This technology is safe, it's proven, and cost-effective means of reducing the volume in radioactive waste by 99 percent, and a half-life from 10,000 years to a manageable 100 years while generating affordable electricity. Moreover, this non-pressurized Molten Salt Reactor has the capability to mitigate the San Onofre pressurized water reactor-style risks of high-pressure radioactive release and core meltdown. The MSR can be fueled by spent uranium or by thorium. Thorium is an element that has 500 times the abundance of uranium-235. A gram of thorium has as much energy potential as 7,500 barrels of oil with no fracking or CO2 emissions. Energy from thorium in the MSR at 3 cents a kilowatt is cheaper than coal, at 5 cents a kilowatt. This Molten Salt Reactor technology was recommended by the superstars responsible for the birth of the nuclear age. These were Glen Seaborg, the President of the Atomic Energy Commission and Nobel Prize winner who discovered ten of the elements and held over 50 honorary degrees. Alvin Weinberg, Manhattan Project. He actually owns the patent on the pressurized water reactor up here at San Onofre. And he ran Oak Ridge National Labs where he developed the Molten Salt Reactor technology. And Eugene Wigner, who was the founder of the Atomic Theory and also a Nobel Prize winner. The Civilian Nuclear Power Report was submitted to President John F. Kennedy in 1962. This report contained the vision of these superstars of safety, inexpensive, nearly limitless civilian power by transitioning to Molten Salt Reactors with energy from thorium. Unfortunately, John F. Kennedy was killed 50 years ago on the 22nd of this month. His vision was never brought to -- was never implemented. So, I think following the advice of the most inspired and brilliant nuclear experts, the Nuclear Regulatory Commission should immediately begin to advocate and lobby for MSR development. The response will probably be that R&D of new reactors is not their job, but their charter in the NRC was charged with overseeing the reactor safety and spent fuel management. The Union of Concerned Scientists has accused the NRC of doing an inadequate

job. This is, obviously, a demanding and funding -- there is obviously a demand for funding for spent fuel abatement as evidenced by the \$18 billion spent preparing Yucca Mountain to be a waste repository before the program was cancelled. (0325-15-1 [Robinson, Eric])

Comment: The NRC needs to be re-tasked with a mission that's worthy of its charter. They have an annual budget over \$1 billion and a staff of 3,800. They need to initiate a creative entrepreneurial research incubator that incentivizes the rapid prototyping and development of Molten Salt Reactors to solve the domestic and global energy crisis for the next 1,000 years. In the semiconductor industry there is something called Moore's Law. Every 18 months a new generation of faster, smaller, less expensive processors are developed. If the NRC can establish a new Moore's Law paradigm for the development of continuous dense power production systems we can get down to realistically solving the global problems of pollution, poverty, and population. What really ended slavery was not the Civil War, but the invention of the internal combustion engine. It made human labor obsolete. This technology allows the increased freedom and the largest growth of the standard of living in history. Engines run by petroleum products have run their course. Molten Salt Reactors are a source of clean, green, continuous dense power that can take us to a new level of humanity by producing a millionth the pollution of energy powered by fossil fuels. Instead of endless resource wars, the U.S. can finally solve the global problems of poverty, pollution, and population. And if you want to join me, I've got a lot of information here that shows how this reactor works, and we also have a bill going through Congress that needs attention right now, so if you can swing by I'll give you a sheet who to call. There's important legislation going on right now (0325-15-3 [Robinson, Eric])

Comment: I would like to say I don't think we have an energy policy. If we had a true energy policy, we would be looking at local solar, we be looking at where our money is going and where we might do best with it. We certainly have heard about retrofit, which helps in every way to save energy, so that probably won't get in this EIR, but I think it's important. Have you read any James Thurber? You remember he had an aunt that said she would go around and put tape over the electric plugs because energy leaks, and she was afraid it would get her. Well, it does leak. You lose about 40 percent of your energy on transmission lines depending how far they go. So, if you have a huge plant here that sends electricity to San Francisco, and LA, and who knows where else, it just leaks. We really need a good energy policy that takes some of these things into consideration. Thank you for listening. (0325-25-2 [Welty, Delores])

Comment: I would like to propose an out-of-the-box solution for dealing with the waste that we have to deal with. And I firmly believe we really do need to get rid of the stuff. Off the California coast and other places around the world there is a subduction zone where the Pacific plate is moving under the continent. I'm proposing that we sink wells into that trench, put the stuff in there, cover it up. What will happen over thousands and tens of thousands of years is the stuff will be carried back into the earth where it came from in the first place. So, I would urge that we take a serious look at this approach because, again, we really need to get rid of this stuff. (0325-30-1 [Cleveland, Charles])

Comment: One thing we've learned from Fukushima, Chernobyl, and the other disasters is that the people in the nuclear industry and the NRC are professional risk takers. The fact that they switched to high-burnup fuel, that was a big risky venture. We're hearing risk taking all the time. It's run by bankers. Bankers are risk takers. (0325-31-7 [Johnson, Roger])

Comment: It all started with the Manhattan Project. We had a lot of money to develop this kind of technology, and the Japanese got an experience of what it was like. And then we started developing hydrogen bombs and we had all this radiation floating around because we did it all

above ground, and we showed off all these mushrooms. And all the radiation went around, and people started having cancer. And we started to learn that from Hiroshima, and we learned from the radioactive fallout that it's not a healthy thing, radioactive materials. (0325-33-1 [Zigler, Randy])

Comment: When we were doing the aboveground testing we knew it was bad, and they found it necessary to put it under the ground and not have it spread around. (0325-33-3 [Zigler, Randy])

Comment: My question for the Nuclear Regulatory Commission is when will it be necessary for the Nuclear Regulatory Commission to act with authority and provide adequate force towards a serious decommissioning of San Onofre? That's my first question. When will it be necessary for them to act seriously and not just come up with words and paper, on paper that's highly questionable? (0325-33-4 [Zigler, Randy])

Comment: My second question is, is there any possibility whatsoever of making harmless the radioactive waste that we have produced in such massive quantity? Is there any possibility at all for making this waste harmless? Is it possible? (0325-33-5 [Zigler, Randy])

Comment: We heard from a number of pro-nuclear people here today. I didn't hear them discussing solutions to the waste problem. I heard them trying to discuss, for example, solutions to the climate change problem which, of course, is wind, and wave, and solar, and things like that; offshore, space-based solar power with large mirrors. These things exist. They can be built. There's no problem with it, thin film technology, et cetera, et cetera; lots of fancy words that will describe things that are effective now. (0325-7-2 [Hoffman, Ace])

Comment: Why aren't we recycling and reusing fuel as they are doing in France, Russia, and the United Kingdom? So far, almost 90,000 tons of used fuel from commercial power reactors has been reprocessed. Why aren't we doing that in the U.S.? This isn't anything new. In fact, according to the World Nuclear Association, over the last 50 years the principle reason for reprocessing used fuel has been to recover unused uranium and plutonium, gaining up to 30 percent more energy, but the secondary reason is because it reduces the volume of material to be disposed of to about 1/5, and the level of radioactivity in the waste from reprocessing is much smaller, and falls much more rapidly than in used fuel itself. (0326-11-2 [Bean, Judith])

Comment: I want to be sure and get in, there's new nuclear technologies that are much safer, and I know you're skeptical, but keep an open mind and do some reading. Thorium, look up thorium nuclear power, it's a new kind of reactor, and there's a lot of excitement about it. It's unpressurized; the vessel is unpressurized. The operators have to work to keep it going as opposed to our current nuclear technology, where they have to be there to make sure it doesn't go out of control. With thorium, they're there to keep it going, so look up thorium nuclear power. (0326-24-3 [Gloge, William])

Comment: I love solar cells. I've lived on them on my sailboat for the last 18 years. They're just not enough to power our world today. So keep an open mind, read all you can, read the other side, what they have to say, and make sure you read stuff that is peer-reviewed good scientific stuff. (0326-24-4 [Gloge, William])

Comment: So I'm in the cost tradeoff analysis, and what that really means is, okay, how much does it cost to do this versus that? What I'm interested in is, what would it take to decommission Diablo and offset that power in another way? If we did 50 percent reduction, I'm a PG&E authorized energy upgrade contractor, I'm a general contractor, so I'm all for some of the things that PG&E does, if they focused the \$2 billion of upgrades that this plant actually needs on

offering expanded energy upgrade grants to retrofit, increase the energy efficiency of existing homes, 2.2 million homes would eliminate the power that's, you know, consumed by this power plant. So why aren't we spending the money on an alternative that makes sense? We don't have to put up windmills, we don't have to put solar panels, this is the cheapest way for us to move into the future without energy, and it happens to also create 200,000 jobs in the State of California. If you retrofit these homes, the return on investment to the consumer is seven to ten years. So after seven to ten years, the energy savings alone have paid for the retrofits, and they continue to pay for themselves for the next 100 years, at a time when energy rates are continuing to climb. There's nothing that makes more sense than this. It makes more sense than even solar power. I greatly am a proponent of taking the Diablo facility, only if the Native Americans present agree, and taking that land, and making it a symbol of what wind power, wave generation, and solar power could do in this country. (0326-26-2 [Severance, Bruce])

Comment: It's good to be here tonight. I date back on this particular issue a long time and I think it would be worthwhile to revisit history, probably more than anybody in the room here. In '75 to '79, I was, first, with the Senate, and then the State Department, and it was right after the Indian bomb of 1974, and at that point there were about six nations that were going to be building reprocessing plants, et cetera, and we were heading to build the breeder, and do reprocessing, and have a plutonium economy. And the end result is, the six reprocessing plants did get shutdown[.] (0326-30-1 [Hafemeister, David])

Comment: Lastly, I want to end with a little lecture for the group, and I won't be popular for this, but I don't care. I have more of an international focus. I worked for the Senate Foreign Relations Committee, the State Department, the Arms Control Agency, et cetera, and I've been to a lot of embassies and so forth. And I see California is the state we import about a quarter or so of our electricity. The County of San Luis said no to natural gas at Morro Bay, even the Sierra Club opposed topaz, coal is out of there, everybody knows that, it's going to be replaced by fracking. So in other words, somebody has to have some kind of big think going on, and it's very easy to be against something, but then finally, what are you really for other than just saying solar? And I have a Leaf car. I have PBs on my roof. I love it. I love it. But, you know, the American Physical Society says, until you get energy storage cracking, you know, it's not going to go beyond 20 percent. So I think you have to have some broader view than just saving my life. You have to look at, well, what about the other people? (0326-30-3 [Hafemeister, David])

Comment: [A]nd why haven't our entrepreneurs, who want to go out into space, put some money where their mouths are and turn that PG&E rocket fuel from our nuclear poop? (0326-36-3 [Vandel, Nikohl])

Comment: Somebody had mentioned nuclear regeneration. I did read, at one point, that President Putin from Russia, had made an offer to this country to purchase any kind of nuclear waste for regeneration, that they would take any that we would give them, so that does exist. Also, for nuclear waste, there is the, what some call, isotope economy that these nuclear wastes can be used for medical purposes, et cetera. There is a technology that exists for nuclear remediation. It's called Brown's gas. It was developed by a Dr. Yule Brown, who was on the, what was it?-- Tesla Board, and also was a speaker for the Tesla Convention until he died in the late-1990s, but he does have a technology called Brown's gas for remediation of nuclear waste, that I understand is totally effective. The other thing that I have been pushing recently that is kind of -- oh, and also, I wrote down a website. That one's called -- that's associated with Dr. Brown's work. It's called zapnuclearwaste.com. So if anybody's interested in Dr. Brown's work, or the possibility there. I also see that, in this country right now, we're in kind of a production collapse, and really, to restore the high-productive forces in our country, we are going to need

energy that is high-flux density per capita and per square area. And there is a technology called ICF fusion. It actually can use the nuclear wastes that are available now to produce fusion energy. It can actually use those to eliminate them as a transition into full nuclear fusion and no nuclear waste. (0326-42-1 [Hollingsworth, Timothy])

Comment: I stand here today as an act of resistance. I will not allow other young people who work for Clean and Safe Energy Coalition and are funded by the nuclear industry to speak for my generation. I especially won't let them speak for me because these people were so shameless that they failed to disclose that they are funded by the nuclear industry and live nowhere near a nuclear power plant or disposal site. (0326-51-1 [Gutierrez, Ingrid])

Comment: I lived in Nevada a lot and I'm not an authority on storing this material there. But when the man spoke of removing it and dealing with it later, after storing it in Nevada, perhaps that's best. (0326-52-2 [Fosmo, Vaughn])

Comment: While this is in operation it would be of great benefit to PG&E and its customers to design benign and sustainable energy alternatives suited for its surrounding campus for a steady replacement of new energy. Yours and PG&E's reputation will change. You can become a graceful good neighbor. Thank you. I'm a parent and proponent of conservation. If we put conservation to work we could save 45 percent of our energy. Solar, wind, and tidal energy is within grasp. (0326-58-5 [Davis, Adrienne])

Comment: I do support San Luis Obispo City upgrading their street lights to LED. I urge everyone here to switch out their light bulbs to LED light bulbs, conserve as much power as you can. And we should be transitioning to renewable energy. (0326-59-1 [Cordes, Reo])

Comment: I suggest the NRC create a rule to require nuclear power plants in coastal zones such as Diablo Canyon power plant to provide a secondary, beyond what it is already doing, a secondary backup power source, provided by a renewable energy onsite, such as solar power at the surrounding hills of Diablo Canyon. We have some beautiful south-facing hills there which could be providing electricity from the sun. (0326-59-4 [Cordes, Reo])

Comment: And I'm going to wrap this up here but I wanted to, I need to dispel the big lie. We do have choices. We do have options. But the idea that our choice is between climate change, global warming, or nuclear power, that's the big lie. We have had no Federal program for alternative energy and for renewables. And our own renewable energy lab states that, this is our government, our research This is my last thing here. Renewable electricity generation from technologies that are commercially available today, in combination with more flexible electric system, is more than adequate to supply 80 percent of total U.S. electricity generation by 2050. While meeting electricity demand on an hourly basis in every region in the country. That's 34 years from now. (0326-61-5 [Henry, Anita])

Comment: This is insane, that's all it is. It's money-driven insanity and the Indians used to say that if you take more or you destroy your environment that you're insane. And they used to deal with people. We don't deal with them. We're making them heroes. We're giving them big paychecks. They get paychecks of \$100,000 and over because, let's see, oh, I know, because our government gives PG&E a bonus to manage all of this for us. They're doing us a big favor. Well, the favor, the rule that I'd also like to see is that they have to carry an insurance policy so that everything I've worked for over in Morro Bay, when you screw up this place, somebody compensates me for it, because they're not going to. We know that. I mean, look at Fukushima. They're giving people \$20,000 for the land that they've been on for nine and ten generations.

This is a sick thing that we're doing here. And I believe in Karma, and we'll leave Karma to Karma. And we will all pay for your indiscretions. You can push me, but I've been here six hours and I wait longer anyway. (0326-64-5 [Nelson, David])

Comment: Lessons, the NRC is responsible for the health and safety of future generations; it is not responsible for the profit margin of Pacific Gas & Electric Company. Do the right thing. (0326-8-8 [Swanson, Jane])

Comment: And he said, "You're an electrical engineer. What do you know about power?" And I said, "Well, I'm digital but I've been involved with power." He said, "Well, can you tell me where we're going to get power over the next 10 to 20 years?" And I said, "What do you mean?" He says, "We're running out of power here." I said, "Well, I recommend nuclear." And he laughed. He said, "We tried that and we built one plant, had some problems with it, just shut it down, turned off the lights, and locked the door." He said, "What do you think of wind power?" Well, I live in Bowling Green and I can tell you that wind turbines have their own set of problems. One of them is very simple, once you get over about 20 percent of your power coming from wind turbines, the days that the wind doesn't blow is a real problem. You're killing birds, there's all sorts of problems with wind turbines. Then he said, "How about solar cells?" I said, "Yes, maybe in 50 years there'll be affordable." I said, "How about coal, they say with scrubbers." And he just laughed, he said, "No, they won't do that." He says, "They want to tear down Grand Coulee Dam and Bonneville Dam." Where are we going to get power? (0327-16-1 [Border, Gary])

Comment: This is not just a matter of trust, or lack of public trust, lack of confidence. This is a criminal enterprise being perpetrated on the public by the nuclear power industry and the captured regulator. This meeting is a fraud, this process is a fraud. I believe this to be criminality. There are five Nuremberg principles. I don't have them with me today, but I will be submitting them in writing because it does not get one off the hook just because they're following directions of the government, following orders. I was just following orders. Everyone in this room has been pleasant on the phone setting up the meeting, so on and so forth. I thank you for that. I have nothing against any one of you, but you are engaged in a criminal enterprise and you need to recognize that, and cease and desist. (0327-2-6 [Keegan, Michael])

Comment: What about depleted uranium? Does anybody know about depleted uranium? Our soldiers are being irradiated, just getting blasted with this stuff, and we're spreading it all over the planet. All over. And in Iraq, babies are being born with two heads and eyes in the center of their forehead. It's a nightmare. (0327-22-5 [Muser, Mary Jo])

Comment: I find it really ironic that you've changed your name to the Waste Confidence Directorate. It rings a little too true to the Clean Air Initiative. With a dwindling EPA, corporate greed seems to always win. You guys, your industry, can't win this one. We have to. (0327-23-1 [Tolls, Leatrice])

Comment: I find it ironic that now to save the water I have to get arrested. I find it ironic and disgusting that the NRC can, in the face of what I've lived through, Three Mile Island -- my father worked for General Electric. The year we moved to Ohio, the Perry spent rods were a problem. My dad and mine's relationship ended when I was 13 and I was protesting at the Perry plant against General Electric. I find it ironic and disgusting that we have an entire ocean right now in trouble. We have children on the West Coast of California that are at major risk for thyroid issues, and they're testing positive in the milk for nuclear radiation. And the tuna that we all like and the sushi we all like really shouldn't be eaten ever again. I find it really ironic and disgusting that we have to, as citizens, come before you again and again and again and again. Our water

is our lives, okay? Water is life. Your bodies are made out of it. The planet depends upon it and, yet, we are having these conversations over, and over, and over. (0327-23-2 [Tolls, Leatrice])

Comment: I don't know how we can continue to leave in the hands of people, who do not have humanity's best interests always at heart, the future of our species. (0327-24-3 [Rivers, Alicia])

Comment: I've heard some people talking about the need for more power, but I have yet to hear one person talk about conservation. (0327-25-2 [Crow, Valerie])

Comment: The only thing we can do at this point is to re-purpose the NRC. I heard at the beginning Keith said that this is only a small part of the relicensing and the regulatory proceedings at the NRC. This should be the main purpose of the NRC: protecting us from this radioactive waste and protecting our future generations. And, please, re-purpose yourselves. It would be a boon to mankind if that became the main mission of the NRC. (0327-29-5 [DeMare, Joseph])

Comment: This organization who I represent [Radioactive Waste Alert] is now in an effort to stop what is considered to be low level of radioactive waste to be ignored through recent regulation in Ohio that has deregulated shale waste streams from t-norm to norm, invisible basically, and is all going to be dumped in open landfills in the state of Ohio. This issue is dwarfed by the issue we're here for tonight. (0327-32-3 [Pace, Greg])

Comment: Radioactivity, fracking, water. It's in gasoline. Anything from below 2,000 feet is radioactive. Has anybody checked the Philippine flood to see what the radioactivity that those people are facing as a result of Fukushima? (0327-33-2 [Carey, Corinne])

Comment: I remember pulling out an encyclopedia and finding a statement on atomic power, "Wow, this is pretty cool. I've heard of atomic bombs." Okay. Reactors, a statement in, I think it was the World Book said nuclear power will be so cheap that we will not use the fuels, like coal and oil, to generate electricity anymore. This was a kids' encyclopedia. I don't know what it was. And I'm thinking, well, that didn't work out. The nuclear fuel cycle we are stuck with flat out is aimed at weapons. That's all it's aimed at. We are using it because it was convenient to develop it for that use, in addition to getting weapon-grade materials out of it. Depleted uranium is not a big deal unless you are an airman loading the rounds into the 30 millimeter canon that fires it. Think about that. I wonder what the outcome has been for those soldiers. Oh, well. I'm sure they're doing as good as they can do. The bad choices have resulted in waste products that are just too devilish to discuss any further. What are other advanced countries doing? The most advanced country, other than the United States, Germany, has quit. Good for them. The weapons-grade fuel cycle is still going to get distributed. We've heard that in the news. Iraq is still going to be able to develop nuclear power. (0327-34-1 [McCrane, Richard])

Comment: Higher tech fuel cycles are out there. The waste products are the problem. What are we going to do? We can go back to day one, quit doing anything else, start the new fuel cycle, and maybe also lobby our government for representation of citizens in the government. (0327-34-2 [McCrane, Richard])

Comment: Another thing that makes me lose confidence in the NRC is the lack of performance or reaction at Davis-Besse and the significant corrosion of that reactor. Some lazy NRC guy dry labbed the results of his inspection. He didn't want to go out in the contaminated area. He didn't want to go out in the high radiation area and see for himself. And he took the words, the report of a person who had a vested interest, namely the operator, and said all is well. He should have

had his head chopped off for that, but he didn't. And his supervisor should have had the same thing. So there's my problem with confidence. (0327-36-3 [Lamberger, Paul])

Comment: I just want to address the elephant in the room, and the issue is that everyone should be asking, and I don't have an answer to this question, but it's a question we should all be asking: is this agency really an independent agency? Is there anything that citizens could say here that will be taken seriously if it contradicts or runs against the interests of the industry that it is supposedly regulating? That is the question that we need to be talking about and not trying to convince people who cannot institutionally be convinced of things, no matter how much scientific, historical, sociological, etcetera, evidence we marshal. Now, this agency is not unusual because almost all of our agencies in Washington, D.C. are now essentially captive agencies. This is the question we should all be putting our efforts to, and then all these disparate issues that are consuming us, we don't know what to work on first. Should it be the food stamps, the fact that people are hungry? Should it be global warming? Should it be the nuclear -- what do we work on first? (0327-37-1 [Leontis, Neocles])

Comment: Well, you know, it might be that if we could get at the root issue, if we could elect people that address the root issue and get at this, we might be able to start solving all of these problems because, fundamentally, we no longer have control of our government. It is governed by corporations, corporatocracies, by special interests. And guess what? The people in those special interests, they may be able to control their little agency, but they're just as at the mercy of what other agencies are doing. They have to eat the same food that we all have to eat. You know, they may be getting special interest from, special treatment from, their little agency, but they're subject to the same problems the rest of us are. So, in fact, this could be good for everybody. And I want to leave you all with this idea. All this energy in this room, can we get together in the next six months in Michigan, in Ohio, and start thinking about a constitutional amendment to turn back Citizens United? (0327-37-2 [Leontis, Neocles])

Comment: We are making a plea to the NRC to step back from their political positions today and look to the future. We are in the midst of a major geological extinction. The world's major fisheries have collapsed, honeybees that pollinate one-third of the world's food crops are declining even more rapidly this year. Rising sea levels are killing the world's corals and threatening low-lying coasts. The intensity of storms and floods, droughts and fires is increasing. Ash trees are gone, and oak and pine are succumbing to imported diseases. The very fabric of our society is threatened from communities, to government, to banking systems, to civilization itself. (0327-4-1 [Marida, Patricia])

Comment: We [The Energy From Thorium Foundation] are an education and advocacy group. We're basically advocating for the development and licensure of advanced nuclear reactor designs, generation four designs, specifically molten salt reactor designs that have enormous promise to deal with our energy issues in this country and to deal with even the spent fuel that we have today. Variations on the class of reactor designs referred to as molten salt reactors can consume, as fuel, the spent fuel of today's reactors, thus eliminating the 300,000-year lifetime into something far, far shorter. These reactors produce a tiny fraction of the waste that we have today, and it is radiotoxic for far less time. One percent of the waste, 0.1 percent of the duration. These reactors are far safer. They cannot melt down. They are, in fact, already molten so they cannot undergo that phase change. And they are very promising. A great deal of work was done on these reactor designs back in the 1960s at Oak Ridge National Labs. These reactor designs, for political reasons, the research and development into that line of design stopped. It has not been picked up since. We'd like to see that happen. We are advocating for the advanced research and development of molten salt reactors. We see them as a way to use not uranium

but thorium as a fuel source that can last literally billions of years as an energy source for the country and the world and raise up all seven billion people on planet Earth to a Western-style standard of living and increase that standard of living. That is the positive side that nuclear energy has to offer that I think needs to be considered, and we also have to weigh it against the negative. Let's address the negative. The ability to address our problems is part of the American tradition. If we looked at the electronics industry over 40 years ago, it would be unrecognizable relative to today. If you look at the nuclear industry, it is stagnated relative to today. There's technology out there that can be developed that can address all these problems. Let's look at this as a scientific project, let's undertake it, and let's change the world for the better. I ask you to inform yourself. You can learn more at energyfromthorium.com. (0327-41-1 [Thesling, William])

Comment: And regarding to alternatives, which is another major area that needs to be developed, as everyone here knows, the major corporations have squelched alternatives and there are alternatives besides wind. Solar. Germany is really powerful in solar and, hopefully, that really will grow. That's a wonderful, passive, peaceful way to generate electricity, but it depends on sunlight. Tesla drove across the U.S. about 70 miles an hour, only had to stop every 500 miles to change - - well, it was like a piece of zinc to put in a battery generation unit, in the electric motor sitting up in front. Now, it appears to be a reliable report. But between Tesla and Schauburger, Victor Schauburger, I believe it's S-C-H-O-E-B-E-R-G-E-R, but there's somebody in northern Michigan who developed a turbine, it's a turbine system, and it is wonderful. Once you get it moving, it self-propels itself. And that's usable in transportation, but that's not his interest. He designed a unit to replace a coal-generated electricity plant. And those plants, I tried to find it in the internet. This was ten years ago when I was really into this stuff, and then I kind of got whacked to radionics. I'm starting to come out of it. Okay. There is advanced technology on more than one level. But, in any case, the Schauburger turbines with Tesla does replace the coal power plants. (0327-45-1 [Guindon, Ernest])

Comment: I think over here there's a small group of young indoctrinated nuclear -- future nuclear industry practitioners. I see you, how are you doing? I can spot you every time. You all look similar and dress similar, and have the same smiley little faces, and nodding your heads nervously when we address the issues that you seem so gullibly in tune, paid for by the Nuclear Energy Institute to indoctrinate a future generation of automatons to march forward. Nuclear power is the solution to global warming, and all this other BS put forward, so we have this ménage à trois, I like to call it, between the nuclear industry, the Nuclear Regulatory community, and our sad and pathetic politicians. (0327-6-3 [Leonardi, Michael])

Comment: Our tribal council chamber overlooks the nuclear plant. One afternoon, someone in a meeting would look at me and say, "Ron, why do you always sit on the opposite side looking out the windows here?" And, you know, I had to think about it for a minute, and it kind of occurred to me I always watch the plant. And I'm not looking for scenery or anything, but I do, I keep an eye on the plant, and that's what I do. And that's part of my position that I do, you know. And it's not the, you know -- to make sure that things are okay and everything for the safety of the community. But then out of concern for the family and the community here, that's why I encourage the people of Minnesota and beyond that that I'm compelled to be here. So, you know, it's part of what we do. (0328-1-2 [Johnson, Ron])

Comment: Or something even simpler, when Monticello's rotor was going down the railroad, going back to somewhere in Illinois, probably where it was made, they low bridged it in downtown Minneapolis. Did you even hear about it? This is about 1997. I mean, something that simple. I'm sorry, you know, I don't have confidence in this industry. (0328-14-6 [Overland, Carol])

Comment: I have to consider the effects of nuclear power and fossil fuels on our governance, the governance where the people get to choose. Here I see the NRC, I'm not just addressing you, NRC. I'm addressing the President, I'm addressing the Senate, and I'm addressing the whole Congress. I'd like to support the move to amend that gives the right of corporations the rights of individuals. That's why we're here today. 1876, that's when the government of the people, by the people, for the people was destroyed. There is no conscience in these industries. These industries are going to have to be forfeited by the greedy ones who have encouraged this and allowed this to occur to all life, allowed this to occur to our water. That's the greatest thing they've done. The greatest thing they've done is they forget where everything they ever had, have, or will have comes from, and they're destroying it. The pipelines, the fracking. Right now there's two leaks, oil leaks that they can't -- scientists can't turn off. (0328-16-1 [Bonniwell, Colleen])

Comment: And my suggestion would be to focus on an economy that is sustainable, with sustainable agriculture, with sustainable health care, and that would work. That would work. All this time we could have had vegetable cellulose. We didn't need petrol, but they cut it off. They cut it off. Ford tried in the automobile, they cut him off. The fossil fuel industry, the nuclear power industry, those industries move to amend, take their right to do this to the people away from them and give the people the confidence they need to deal with their future in a compassionate, kind, responsible way. (0328-16-10 [Bonniwell, Colleen])

Comment: Karen Silkwood. Karen Silkwood knew just exactly how evil, and corrupt, and gangster-like is the nuclear power industry. The environmental movement knows exactly how evil, and corrupt, and gangster-like is the nuclear power industry. And we now have the United States Nuclear Regulation Commission working with the nuclear power industry. Somebody killed Karen Silkwood. A lot of us environmentalists in this room know exactly who that was. We know which power brokers and which power industries killed Karen Silkwood. (0328-17-1 [Cavlan, Michael])

Comment: I have been watching, and watching with dismay, the actions of the Nuclear Regulatory Commission for a number of years, and I'm just going to keep it, keep it very simple. This is about confidence, and I have no confidence in the Nuclear Regulatory Commission, especially when it comes to simple facts, simple facts such as, you know, this radioactive and dangerous material is seeping into our water supply. That's a fact. That's a fact that's proven by the tritium leak at the North Anna Nuclear Power Plant that hasn't really been addressed by the NRC, who seems to be covering this up. (0329-1-1 [Dorsey, Chris])

Comment: A couple of concerned citizens on this call have spoken about reprocessing as a possible alternative. I think one of them called it recycling. And I would urge them and every one on this call to look more deeply into this issue. Reprocessing is probably the worst single thing you can do with high-level radioactive waste that already exists. It's a nuclear weapons proliferation risk. It's astronomically expensive. It causes an environmental disaster wherever it's carried out. Mahogan Tramps is one example. (0329-11-4 [Kamps, Kevin])

Comment: I think the work that needs to be done is to figure out what can be done with our current level of waste and to begin to transition out of nuclear into replacement energy, which is beginning to happen. (0329-14-5 [Sondheim, Steven])

Comment: Yellow caution strips remind us that as pedestrians on this planet, we are guests. And each choice we make, each step we take brings us one step closer, together or apart, based on the choices we make. And the leadership and the lack thereof at making just simple

decisions , like how did we come up with this NUREG, where we have half-*priced human being value? (0329-19-2 [Vandel, Niki])

Comment: I was mortified to learn that while I was on mother leave and focusing on that, that nobody paid attention to that well enough to bring it to at least the Bill Moyers' level. And the lack of the voice of the intelligencia on this issue [what to do with the waste] in the mainstream is really disturbing. (0329-19-3 [Vandel, Niki])

Comment: So I and many others relate the situation in Japan to be very, very similar to the situation in the United States. Having industry capture regulation of the nuclear power industry is very dangerous. And I'm confident that we have that. (0329-31-3 [Carberry, Mike])

Comment: There seems to be just an unbelievable amount of collusion between the agency that is supposed to be regulating nuclear power and protecting the public and those people who are producing nuclear power for profit[.] (0329-32-4 [Seeley, Linda])

Comment: And PG&E, at the San Luis Obispo hearing, who couldn't get excited when she was talking about the recycling of our nuclear waste. As powerful as it is, of course it's going to create more energy in a different form. Let's get on it. We can't transport it. Let's do it where it is, but we've got to do it right. We have to have citizen oversight for the area. We have to have the original people involved. They're the only ones that understand Mother Earth at the innate level, and that's who we need to be listening to. We can't mine anymore. (0329-6-5 [Vandel, Niki])

Comment: But you guys are doing a great job. Do I have confidence in the NRC? Yes, I do if you guys make some serious hardcore decisions, put into place something that we can be confident in, that we've got a team that can go in in the situation like Fukushima and they're just handling it. We don't have that, not in the industry, which I don't understand just on that level. (0329-6-6 [Vandel, Niki])

Comment: I am a resident of Ann Arbor, Michigan, home of the University of Michigan Department of Nuclear Energy, which desperately needs a fundamental shift in consciousness and an existential redefinition of purpose and mission, as does the NRC. (0329-7-1 [Schonberger, David])

Comment: Listening to the comments of people, I've not heard of any studies of making the waste inert, or making it inert. That should be looked into. (0329-9-1 [Martin, David])

Comment: I testified multiple times in the early 1980's to your body, and have found that even though the waste was a huge problem then, and still remain's an unresolved problem today that the NRC's actions in the end always supports the Nuclear industry's existence. I guess job security warrants that to be so. (0330-2 [Beccia, John])

Comment: Shame on you. This community deserves better. (0330-4 [Beccia, John])

Comment: Recent experience shows that the organizations that manage energy are not competent to handle high-risk systems; they are too focused on maintaining profits, rather than on protecting their customers and the general public. I fear that this focus will lead to reducing estimates of the probability of systemic failure and of the costs of such failure. (0333-2 [Balke, Karl])

Comment: The taxpayers of this nation have been forced to assume costs and liability for this waste that runs in the hundreds of billions. The safety, security, health and environmental

dangers involved in nuclear power are of such potential magnitude, that neither the commercial nuclear industry, nor the insurance industry, will accept more than a fraction of the potential liability. And thus through laws like the Price-Anderson Act of 1957 and the Nuclear Waste Policy Act of 1982, most of the risk burden has been placed on the American public. The NRC itself has taken the position that it cannot be held responsible for cleanup in the event of a major accident. The NRC has allowed nuclear power plants to be owned and run by LLCs, limited liability corporations and other legal constructs which would allow the multi-billion parent corporations to walk away from a major liability, not just in the future, but today. (0341-1-9 [Mermelstein, Richard])

Comment: Water is essential to life. In the Midwest portion of the United States we are gifted with a surplus of potable water. Without a doubt other parts of the United States and world will not be able to sustain current consumption rates based on their current supply of potable water. Please consider the comparative advantage potable water offers regarding health and economic growth. By not requiring commerce to disclose the waste it is moving through public waterways it endangers the local supply of water along the entire Ohio river. There is no way for first responders to effectively respond to a spill or disaster. Also, by allowing another source of waste to be transported along our rivers it increases the risk of a spill. The ramifications of not requiring commerce to disclose the contents and ingredients of their waste could be enormous. Please consider how precious potable water is and our need to protect it effectively as possible. (0346-1 [Boyda, Jonathan])

Comment: I believe there is so much dis-information circulating that the public cannot possibly make a good decision and Nuclear Energy and nuclear waste and Nuclear Waste storage decisions should be made through the unbiased and apolitical eye of science, that is an open process for all to see, and is subject to independent audit of watchdog groups. While I have great confidence the NRC is doing a great job in keeping the public safe. I would have even more confidence in the NRC if they would accelerated licensing private research and development of technologies (such as MSRs Molten Salt Reactors) that would radically reduce our nuclear waste stockpiles with affordable small modular reactors that could be shipped to onsite storage sites, hooked to the electrical power grid, and consume 99% of our radioactive waste, and make the small amount of resulting waste radioactive for only hundreds of years in stead of hundreds of thousands of years. By privatizing nuclear waste not only could we save \$billions in taxpayer and ratepayer dollars, we could help spark an economic recovery, and not pass nuclear waste hundreds of thousands of years into the future[.] Currently, the US Government by law, owns all nuclear waste. The federal government has wrestled with this problem (of nuclear waste storage) for decades and has not presented a viable solution for reducing our nuclear waste instead of just storing it. If industry had a profit motive through ownership of the waste, then more than likely self serving profit driven companies (under the watchful eye of the NRC) would come up with a solution such as a MSR actinide burner that would allow for the safe and very economical onsite destruction of nuclear waste (conversion into energy cheaper than coal). This would greatly lessen the cost of nuclear power, benefit the environment, minimize the potential for accidents, and create many jobs. Jobs that America needs! (0347-12 [Morrow, Jon Paul])

Comment: There are many that will say the NRC is owned by the corporations that are behind nuclear energy and anyone that believes otherwise is just a dupe! There are many that will say that the NRC is in bed with the corporations that run Nuclear Power Plants and we (the public) are playing with a ticking time bomb that will kill us all because these corporations would throw caution into the wind and sacrifice safety to the expense of all of us. Logical conclusion number 1: Nuclear power companies like to build nuclear power plants because it helps them to make a

profit. It does not make any logical sense that if they (nuclear power companies) own the NRC under some illogical conspiratorial grand design that they have not built any new nuclear power plants within the last 30 years. On the contrary, that would point to Wind and Solar lobbies running the government and paying off NRC officials to eliminate the competition (another far flung conspiracy). Logic would dictate these claims are without merit and that the NRC, if anything is overprotective of the public's safety. (0347-5 [Morrow, Jon Paul])

Comment: Thus, in accord with *In re: Aiken County*, a portion of the federal government's delay in curing the breach of the NWPA-prescribed "standard contracts," and therefore a portion of the damages, is attributable to the NRC. Based on the \$1.6 billion figure in GAO-12-797 and the time duration between January 31, 1998 (breach start date), and August 15, 2012 (GAO report date), which is about 174 months (i.e., 11 mos. for 1998; 12 mos. each for 1999 through and including 2011, or $12 \times 13 = 156$ mos.; and 7 mos. for 2012), the breach has been costing the Judgment Fund, on average, about \$9.2 million per month ($\$1.6b / 174\text{mos.} = \9.195m per month). NRC's NUREG-1100, Vol. 26, documented NRC's decision to commence "an orderly closure of the agency's Yucca Mountain licensing support activities." *In re: Aiken County* ruled that closure decision was not lawful. Therefore, the NRC's share of the government's delay in curing the breach can reasonably be measured from February 2010, when NUREG-1100, Vol. 26, was issued, to August 13, 2013, when *In re: Aiken County* was issued. That's about 41 months (i.e., 10 mos. in 2010, 12 mos. each in 2011 and 2012, and 7 mos. in 2013). Thus, at \$9.195m per month for 41 months, the NRC's share of the federal government's delay in implementing the Nuclear Waste Policy Act of 1982, as amended (NWPA), has cost the Judgment Fund at least \$377 million. Significantly, that money comes from the U.S. taxpayers and not from the utility-supplied Nuclear Waste Fund. Based on the \$2.6 billion figure in the House Energy and Commerce (E&C) Committee memorandum, NRC's share works out to be larger: at least \$570 million ($\$2.6b / 187 \text{ mos.} = \$13.9037\text{m per month}$; which, over 41 months, comes to \$570m). (0355-2 [Skov, Jeff])

Comment: In sum, NRC needs to conduct a thorough root cause analysis, to include an "extent of condition" evaluation, and implement sound corrective actions to prevent recurrence. To do so would be consistent with commonsensical management principles; the expectation expressed in the concurring opinion in *In re: Aiken County* that "[t]oday's judgment should ensure that the Commission's next chapter begins with adherence to the law"; the approach embodied in the agency's regulations at 10 CFR 50, Appendix B, Criterion XVI, "Corrective Action," which the agency applies to its licensees; and the traits of a healthy safety culture (see the NRC's "Final Safety Culture Policy Statement," 76 FR 34773, 34777-34778, dated June 14, 2011), including, in particular:

- Leadership Safety Values and Actions-Leaders demonstrate a commitment to safety in their decisions and behaviors.
- Problem Identification and Resolution-Issues potentially impacting safety are promptly identified, fully evaluated, and promptly addressed and corrected commensurate with their significance.
- Continuous Learning-Opportunities to learn about ways to ensure safety are sought out and implemented.
- Questioning Attitude-Individuals avoid complacency and continuously challenge existing conditions and activities in order to identify discrepancies that might result in error or inappropriate action.

On a brighter note, I did receive the Statements of Consideration supporting the 10 CFR 50.9 rule. (0355-9 [Skov, Jeff])

Comment: The human race may not explode itself with a man-made bomb (as we worried about when I was a kid in the 50's) but instead, we are likely setting ourselves up for a slow & steady death by escaped radiation. We, the people of the entire planet, are COUNTING ON YOU TO KEEP US SAFE; there is no one else who has as much authority to do so as you do. Thanking you in the hopes that you will heed my plea for CAUTION & SAFETY! (0361-5 [Greenfield, Jan])

Comment: We endorse Principles for Safeguarding Nuclear Waste at Reactors from the Institute for Energy and Environmental Research. (0373-13 [O'Malley, Brian])

Comment: While I am talking to the issue of reports that will be delayed, I point out the issue of NTTF Recommendation 1, Enhanced Regulatory Framework. My take on the NRC's enhancement is a means to accept that which the licensees and their engineers provide with minimum friction and delay. The NRC approach to 'enhancement' does not provide more safety to the public, but minimizes safety to the public to provide benefits to the nuclear industry. The staff and Commissioners state that the safety of the public is paramount, but are clear they really mean that following the rules is paramount. I quote from an email sent to me from a staffer, 'Having worked here for 19 years I have never met anyone that is not dedicated to safety... we don't care if the plant runs or not, but it is permitted to run, if it meets our regulations... that is not our choice, it is the law of the land. We make the regulations which we believe to provide safety...' This quote shows that the regulations are believed to provide safety, and that the plants are allowed to run when they meet regulation (0376-2 [Lewis, Marvin])

Comment: Recommend legislation to hold nuclear owners accountable in perpetuity for all costs associated with radioactive wastes left on site after closure. (0377-1-10 [Cuthbert, Lewis])

Comment: Reprocessing is not a solution. It has been an abysmal costly failure, creating larger radioactive waste streams and pollution. -Reprocessing is extremely polluting, risky, and costly to taxpayers; -Increases Volume of Radioactive Waste; -Expensive for Taxpayers/Ratepayers (0377-6-6 [Cuthbert, Lewis])

Comment: Unfortunately, the NRC has a lousy record of enforcement, and can be counted on to continue its practice of granting relief from its requirements. So, we can expect it will allow Pilgrim's owners (and all other nuclear plant owners) extensions of time and "mitigation" measures without license suspensions or even fines for noncompliance. The agency will always protect the interests of the nuclear industry over the safety of the public. (0380-3 [Holt, Joan])

Comment: After attending this meeting and reading the GEIS I am horrified by the lack of conscience of those who represented and defended the NRC, the GEIS, and the nuclear power industry. (0381-1 [Fasten, Susan])

Comment: We rely on the NRC to regulate this most dangerous, toxic, contaminating, uncontrollable, uncontainable substance ever created. We rely on the NRC to protect our air, water, earth, all living things from any more radioactive mishaps and contamination - now and thousands of years into the future. We rely on the NRC to prevent any more 3 Mile Islands, careless handling and storage, leaks, careless dismantlings and disposals, and careless transportings and incinerations. We rely on the NRC to make sure that we do not ever experience a Fukushima or a Chernobyl or a Chelyabinsk. The stakes are too high. If you must err, err on the side of the precautionary principle. It is your job to protect my children and grandchildren. I hold you to it! (0381-10 [Fasten, Susan])

Comment: Recycling radioactive contaminated material into the commercial metal stream is also an incredibly unreasonable option. Do you really want radioactive waste in your kid's braces, toys, high chairs, romper snaps; in your pants zippers, eyeglass frames, eating utensils, heating ducts, water pipes, appliances, and virtually everything you live with? Do you really want to subject virtually every person on earth to yet more radioactive contamination in their daily life? Is there not enough cancer already? Where is the conscience and consciousness in this proposed action? (0381-9 [Fasten, Susan])

Comment: The issue at hand is storage of nuclear waste. Two possible solutions exist. Breeder reactors use up and make harmless most of the current nuclear waste that nuclear power plants now have to store. Congress and the Carter administration banned breeder reactors. France allows breeder reactors which are currently operating safely and efficiently there. Please encourage Congress to repeal the ban on breeder reactors. (0390-2 [Kirkland, Gary L.])

Comment: The NRC's continuing lax approach to regulation endangers American citizens and the myriad commercial, industrial and agricultural activities that they engage in as they live and work near Diablo and other nuclear plants. This casualness, for the sake of the single industry that benefits from such lax regulation, is, in our opinion, indefensible. We are merely two citizens. But we believe you work for the citizens of this country, not for the nuclear industry. Are we wrong? Please demonstrate the courage to look at nuclear storage and safety issues in the way that you must---namely, as if everyone's lives depended on it. (0409-2 [Hanson, Lauren] [Jones, Mary])

Comment: In the USA, per capita expenditures for medical "care" are more than twice as high as the next highest developed country. Total radiation exposure due to medical procedures is also much higher in the USA than in other countries. Unfortunately this excess expenditure for health care and the excess radiation exposure from medical treatment does not translate into better health. The USA ranks low compared to other countries in such objective measures of health as life expectancy. Prior to the nuclear age an estimated one person in ten died of cancer, now it is about one in four. Clearly environmental contamination with radionuclides and chemical toxins has effectively quadrupled the overall cancer rate between 1940 and 1980. The NRC "permissible" dose from man-made radiation (500 mR/yr) is about four to five times higher than the true level of external NBR. This would suggest that the cancer rate in people subjected to the NRC allowed exposure level to man-made radiation might be four to five times higher than the natural rate. Although the average exposure to man-made radiation during those same years probably did not reach the maximum level, it is still possible that the roughly four-fold increase in cancer rate during this period might be explained by the significant radioactive contamination of the environment due to nuclear bomb testing and radioactive emissions from power plants and the rest of the nuclear complex. The overall cancer rate post 1980 appeared to be leveling or decreasing slightly as the radioactive contamination of the environment, (after the cessation of atmospheric nuclear bomb tests) was slowly cleared and the latency period for radiogenic cancers had run its course. Unfortunately, the reactor accidents at Chernobyl and Fukushima, once again added a considerable new radioactive burden to the planet so I expect that cancer rates will hold steady or increase again in the near future. One event which happened in 1953 is illustrative of the danger posed by radioactive contamination of the environment. Earlier in that year several above-ground nuclear bomb tests had been conducted at the Nevada Test Site, which dropped significant fallout on the downwind areas. Later in the year Hollywood filmed a movie called "The Conqueror," starring John Wayne, in Snow Canyon, Utah, about 120 miles downrange from the test site. The particulate radioactive fallout from the earlier tests had mixed in with the soil in the canyon and the horses and wind machines stirred

up large amounts of dust, together with fallout, during the filming of the movie. Years later it was observed that of the approximately 220 cast and crew members on the movie set more than 90 including John Wayne himself had contracted cancer. This is a cancer rate of nearly one person in two, a rate so far above the national average that it is statistically impossible to explain by chance. (0410-17 [Nelson, Dennis])

Comment: As a whole, the analyses appear to show a strong NRC bias in favor of the nuclear power industry. That bias is not surprising given that 90% of the NRC operating budget is provided by the same industry it purports to regulate. Although the NRC is supposed to be an agency of government (which is assumed by most to have as its principal role the protection of the public health), this does not, in fact, seem to be the case. Rather, the NRC seems to be a promoter of nuclear power and a cheerleader for the nuclear industry. The clear preference of the NRC for the "rule making" option in the GEIS, even though it will have the effect of excluding the public from many future licensing decisions, shows that it does not have the genuine interests of the public at heart. This position is in direct contravention of the intent of Congress when it divided the AEC into two parts: the DoE with a mission to promote all things nuclear, including nuclear weapons and reactors; and the NRC whose mission was to act as a brake on the uncontrolled exuberance of the nuclear physicists and to ensure that the public health was not threatened by excesses in that industry, as it had been in the past. (0410-2 [Nelson, Dennis])

Comment: Although the nuclear enterprise is only about 70 years old and the commercial nuclear power industry is only about 60 years old, there is quite an abundant history from which to draw observations and conclusions as to the risk and safety of the enterprise. We are informed by catastrophic nuclear "accidents/events," both intended and unintended, with widespread radiological contamination of the environment, which have impacted the health, homes, property, livestock, livelihoods, and the pursuit of happiness of millions of people in scores of countries. Most of those losses were incurred by ordinary people, who happened to be in the way, and occurred almost entirely without compensation. These past actions have not shown responsibility on the part of either the nuclear industry or their governments in the conduct of this enterprise. Instead, they demonstrate a reckless disregard for ordinary citizens. To be fair, some government "compensation" programs have been created many years after the events; but they were generally too little, too late. Some examples are: Radiation Exposure Compensation Act (RECA) administered by the Department of Justice which provides limited "compensation" payments to Downwinders, uranium miners and millers, and on-site participants at the nation's nuclear tests; Energy Employees Occupational Illness Compensation Program (EEOICP) administered by the Department of Labor which provides payments to ill workers in the nation's nuclear complex; and the Department of Veterans Affairs which provides some payments to atomic veterans. The US Government has also negotiated a Compact of Free Association with the government of the Marshall Islands which includes some limited payments to residents of certain islands who were displaced or injured when the US Pacific nuclear tests were conducted. All these payments total in the billions of dollars but still represent only a small fraction of the total damages incurred by the victims. Private insurance policies also exclude damages from radiological and nuclear events, so there does not appear to be any compensation program in place in this country to reimburse the victims of a potential nuclear accident at a nuclear power plant or fuel storage facility for their losses. This has certainly been the case for the more than one hundred thousand people in Japan displaced by the Fukushima disaster. In the USA there is not even a true national health care system to take care of people injured by radioactive contamination. This amounts to a transfer of costs in the event of an accident from the nuclear operators to the victims, since they must pay for their own medical care. (0410-3 [Nelson, Dennis])

Comment: Downwinders, against the Federal Government and after more than forty years of Government denials and stalling; that the Congress finally passed a compensation act which gave a modicum of relief to the victims of US nuclear bomb testing. Acts such as increasing the allowable radiation dose limits in the aftermath of Fukushima, not based on health science but rather on politics and the level of contamination on the ground, only add to this distrust. This was done by the Japanese government in the regions around Fukushima, with the advice of the US Department of Energy, and makes one begin to question whether the same thing might happen here in this country in the event of a serious radiological accident. Even now people in Japan are being told to return to their homes in the still contaminated zones, against their better judgment and at peril to their health, because they are given nowhere else to go. (0410-31 [Nelson, Dennis])

Comment: Structural/system issues can have an adverse effect on sound management of nuclear waste. This includes for example, officials securing employment in nuclear related industries following their work with The NRC. This risks placing personal gain over the mission of The NRC. Such structural/system must be addressed as potentially harmful to health and the environment. (0417-5 [Clark, Terrence])

Comment: It is my desire to see nuclear plants built that can burn the SNF ridding ourselves of a burden AND producing electricity at the same time. It is time for a reassessment of the prohibition on reprocessing; I do not share the fear of proliferation that President Carter had. (0418-1 [Davison, David])

Comment: Lest you think I have nothing good to say about your "regulatory" agency, you may be glad to hear that I give the NRC very high marks? but only for hubris and audacity. I wish to make it very clear how much contempt I have for your hubris and audacity, but I recognize that although you are insensitive to the cancers and birth defects of many thousand generations to come, your staff are sensitive beings. (0419-3 [Agnew, David])

Comment: In response to the court's decision, the NRC must look to other methods of waste disposal. With sufficient energy input, waste can be transmuted to isotopes that will quickly stabilize. Using particle accelerators where the waste is presently stored would avoid the inevitable accidents related to transporting waste to a centralized facility. This should be the technology upon which confidence statements are based rather than geological storage. License renewals should be contingent on paying in advance for adequate clean energy resources and local accelerator capacity to transmute the waste within 60 years of its being produced. (0422-3 [Dudley, Chris])

Comment: US Navy has re-manufactured spent fuel rods to make new fuel rods meeting same specs as original equipment fuel rods, spent uranium which has cooled enough that it can be used as the counter weight in a fork life truck with suitable lead shielding to protect the operator and is probably about as radioactive as some of the more radio-active types of granite, and short-lived radio-active isotopes (average half-life about 30 years) that will take about 1100 to 1200 years to cool down to the same amount of radioactivity as virgin uranium ore, compared to the 3,000 years it would take for not reprocessed spent fuel rods to reach that state. I know you are ferociously jealous of US Navy. However, it would suit the owners of the reactors with expired licenses, the public, and US Navy just fine if you could turn over those expired license reactors and the spent fuel rods to US Navy and buy back the fuel rods meeting original equipment specs made from the material in spent fuel rods from US Navy to avoid the need to buy fuel rods made from virgin uranium ore. I have a LOT MORE CONFIDENCE in US Navy with its great track record on nuclear power plant safety than I do in either any for profit

corporation or any civilian regulatory agency that has been regulating its same industry for more than ten years. So, please turn over reactors with expired licenses and spent fuel rods to US Navy to deal with as it sees fit. (0439-2 [Adams, Grace])

Comment: Letting US Navy reprocess spent fuel rods to make new rods from material in old rods will help some. (0439-3 [Adams, Grace])

Comment: Why don't you make all LWRs obsolete and go with LFTRs-Liquid Fluoride Thorium Reactors? They can burn up these leftovers and are cheaper than coal. (0440-2 [Pieart, Richard])

Comment: Furthermore, it has been demonstrated that Brown's gas can neutralize some to most of the radio-activity in these dangerous substances. Qualified observers and government agencies have witnessed the demonstrations. It is not enough to store rad-waste and I certainly do not want it in my fertilizer or food. (0441-2 [Baker, Helen])

Comment: WE NEED SCIENTISTS AS A PART OF ANY AGREEMENT THAT HITS A TABLE WHERE IT COMES TO THE NATION'S HEALTH. NO JUNK SCIENTISTS PAID FOR BY THE KOCH BROTHERS OR SOME REPUBLICAN FLUNKY LIKE DARYL ISSA. THE PUBLIC HAS A RIGHT TO THE BEST INFORMATION IT CAN GET AND IT'S OBVIOUS THAT FEW IF ANY MEDIA OUTLETS ARE CAPABLE OF FOLLOWING ANYTHING THIS IMPORTANT. SO IT IS UP TO OUR GOVERNMENT TO SEE TO IT THAT ALL INCIDENTS ARE LOOKED AT WITH A LEVEL HEAD AND A SCIENTIFIC EYE. THAT THERE BE TOUGH REGULATIONS ON ANY TYPE OF ENERGY AND THAT A YEARLY FOLLOW UP ON SUCH ENERGY PROJECTS AND ALL NEW ONES BE DONE AND THEN HIGHLY PUBLICIZED. THAT IS SIMPLY NOT TOO MUCH TO ASK. (0442-2 [Butler, Dee])

Comment: While I support nuclear energy in general, I believe a nuclear technology exists that is superior in many ways to the solid-fuel, high-pressure, light water-cooled reactor (LWR) technology in current use. I refer to the molten salt reactor (MSR) operating in the thorium fuel cycle, designed and successfully prototyped at Oak Ridge National Laboratory in the 1960s. A problem with the LWR is that fuel rods have to be removed from the reactor core after only about 3% of the fissile material is fissioned, leaving 97% of the valuable fissile material in the spent fuel rod, which is regarded to be radioactive "waste" to be disposed of. Not only is that a terrible waste of valuable fissile material, the amount of waste that has to be disposed of is far greater than it needs to be. The MSR does not create that problem, as it fissions 100% of its fuel, leaving only fission products whose total mass is always less than that of the fuel consumed, and a small fraction of the mass of spent fuel rods from a LWR. Besides creating dramatically less waste, the MSR has many advantages over the LWR that make it a logical choice for nuclear energy production. The core consists of molten fluoride salt in which the fuel is dissolved and which serves as the coolant and heat transfer medium for power generation. It is not pressurized but operates at atmospheric pressure, so there is no danger of explosion, as there is with a LWR in the event of the loss of active cooling, as happened at Fukushima. In that scenario, the total loss of active cooling, the core of a MSR simply melts a freeze plug and flows into a drain tank whose geometry prevents criticality and dissipates decay heat. It shuts itself down into a safe configuration without human intervention. There are many other compelling reasons to replace conventional LWR with MSR technology, which the Nuclear Regulatory Commission needs to consider, so as to allow that technology to be implemented on a scale what will provide low-cost energy to enable domestic manufacturing to be globally competitive, creating millions of jobs in the domestic economy. Energy from the MSR fueled by thorium can also be used to synthesize fuels for transportation, ending our reliance of imported oil. So as we consider how best to deal with nuclear waste, it behooves us to consider an alternative nuclear

technology that minimizes the amount of radioactive waste, enables far more efficient utilization of valuable fuel, and ensures dramatically safer operation. More information about MSR technology is available at energyfromthorium.org, and thoriumenergyalliance.org. (0444-1 [Brown, Steve])

Comment: Finally, with full integrity NRC must inform Congress of the untenable hazards of the nuclear industry and advise Congress to authorize prompt cancelling all current nuclear power plant licenses and to accelerate the political and regulatory processes to as quickly as technically possible place all spent fuel and high level radioactive wastes in deep geologic repositories. (0447-2-16 [Andrews, Richard])

Comment: I personally call upon the Nuclear Regulatory Commission and NRC staff to restore the agency to its proper role as regulator of the nuclear industry, not promoter and protector; and to restore its proper role of protecting public health and safety. The AEC was intentionally split up decades ago, to avoid the conflict of being both protector-promoter and regulator of atomic energy and weapons. NRC's solitary role is serving the public interest, ensuring its security, health and safety. NRC is not the steward of nuclear power. (0447-2-19 [Andrews, Richard])

Comment: This posture of the Blue Ribbon Commission, and then repeated by NRC, instills no waste confidence, nor confidence in the NRC as a protector of the public interests, health and safety. The NRC needs to confront this absurdity of the Blue Ribbon Commission and provide valuable and much needed advice to the administration and to Congress to chart a more aggressive path to properly handling and disposing of spent nuclear fuel and other radioactive wastes. To do anything else is putting at extreme risk millions of people of the USA, as well as our lands and economic systems. A single catastrophic SNF fire or major release event would be devastating. (0447-2-21 [Andrews, Richard])

Comment: The interests of the NRC and the operators of Nuclear Reactors are not the same as the Public's interest. Protecting the Public from the health consequences of radiological releases should be the abiding and primary function of the NRC. Sadly, it seems that protecting the Nuclear Operators from the necessity of spending the necessary funds to insure public safety is instead the primary function of the NRC. (0454-13 [Waldstein, Joe])

Comment: An immediate example is EPA's highest paid employee admits to a decade of deceit. How can the public have any confidence in government employees where the highest paid employee in an agency gets away with deceit for a decade without repercussions? (0455-1 [Lewis, Marvin])

Comment: We need to delineate between what's reusable (for other reactors or medicine) and what's truly waste. The sophomoric language of mainstream media reinforces apathy when faced with a demand for greater education on nuclear processes and materials. (0458-1 [Solinsky, Joseph])

Comment: I have no doubt that the Nuclear Regulatory Commission will continue its strong, independent oversight of commercial nuclear energy facilities-the operation of existing plants, licensing new reactors, renewing the operating licenses of existing reactors, and the management, transportation and disposal of used nuclear fuel. I believe it is important for the NRC to continue its transparent and efficient efforts to issue the current waste confidence proceedings so that progress on both plant licensing and used fuel management can continue. (0461-3 [Pan, Arthur])

Comment: The Consequence Study was not conducted pursuant to the requirements of NEPA and thus did not include a hard look at alternatives to continued storage of spent fuel in spent fuel pools nor did it apply NEPA standards to determining whether alternatives to pool storage would be environmentally preferable. Most importantly, it did not apply NRC's requirement that NRC "has taken all practicable measures within its jurisdiction to avoid or minimize environmental harm from the alternative selected, and if not, to explain why those measures were not adopted." 10 C.F.R. § 51.103(a)(4). (0473-8-1 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: Like the Consequence Study upon which it was primarily based, COMSECY- 13-0300 did not address the requirements of NEPA. Rather, it conducted an evaluation of the costs and benefits of expedited spent fuel transfer to dry cask storage using only the restrictive standards imposed under the backfit provision of 10 C.F.R. § 50.109. Using those restrictive standards, COMSECY-13-0300 found *that the expedited transfer of spent fuel to dry cask storage would provide only a minor or limited safety benefit (i.e., less than safety goal screening criteria), and that its expected implementation costs would not be warranted." Id. at 1-2. That conclusion is reached although Staff also found that at least in some evaluations using reasonable conservative assumptions the cost advantage of expedited transfer of spent fuel to dry cask storage could be hundreds of millions of dollars per reactor.¹⁵ [footnote 15 text: Notably, COMSECY-13-0300 includes a detailed non-concurrence of its analysis and conclusions that expedited spent fuel transfer is not warranted, a critique which is not fully rebutted. The DGEIS ignores all of the critiques contained in that rebuttal. COMSECY-13-0300 at Enclosure 2.] (0473-8-2 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: [B]ut let's face the facts Southern California Edison fired Gregory Jaczko for telling the truth. He stated that to build a 25 billion dollar nuclear power station, does protect a 300 billion accident. It's obvious the nuclear industry protects the nuclear industry and can give a shit about human safety. (0478-4 [Higgins, Kevin])

Comment: Invest in Thorium reactors and eliminate the current process and materials used in nuclear power generation. (0480-3 [Arnold, James])

Comment: Protect Our lands, waters, wildlife, health & future! You work for citizens, Not industry! (0483-3 [Garvey, Lydia])

Comment: I am concerned that environmental groups and the public are fixated on SOLAR as the power of the future. This is unrealistic, it should be a priority to educate the public on baseload and peak power. Calif. and Ontario both publish on-line their 24 hour electric power graph/curve. It is very useful to demonstrate that renewables have an insignificant effect on baseload. I would encourage NC to do the same. (0489-2 [Padden, Jim])

Comment: The NRC Commission, and its past and present Division of License Renewal (DLR) management have perpetuated an indefensible scientific fraud upon the American public, in particular, the stakeholders who will have to pay the burden for a future nuclear calamity. (0496-1 [Batobato, Alicia])

Comment: From the beginning of the atomic age in 1945, EVERYONE eats, drinks and breathes invisible, deadly radioactive fallout. Most disease rates then increased. All we can do now is minimize exposure to radiation. Conduct a proper test to find the most cost effective method. It was clear to me that the late Dr. Radha Roy, professor of physics emeritus, invented

the best method that will eliminate....(not reprocess or bury nuclear waste which does not eliminate the radiation health threat). THE ROY PROCESS FOR THE TRANSMUTATION AND NEUTRALIZATION OF RADIO ACTIVE WASTE Please join this campaign:

http://www.change.org/petitions/united-states-senator-harryreid-amend-the-nuclear-waste-policyact?hare_id=OQwAwNKSwf&utm_campaign=mailto_link&utm_medium=email&utm_source=share_petition; There is a viable, cost effective alternative to the federal policy of burying nuclear waste. First, there must be a Congressional Bill passed to allow transmutation, or backwards engineering nuclear waste to a non-radioactive element. In addition to eliminating nuclear waste, the decay heat can turn the steam electric generators at each nuclear power plant to produce electricity. (0497-1 [Nester, Dennis F.]

Comment: If you take the time to read and understand what is REALLY going on as opposed to the spin (or the complete silence) put out by mass media owning companies like GE, which also manufactures and sells nuclear power plants, then you will also understand why even survivalists and preppers will not make it through 20 years of staying underground, much less 25,000 years of staying underground, once the Carrington Effect hits Earth. They are all living in a fantasy land. 11 What are they going to eat down there; dirt? Where will they get radiation free water, and more uncontaminated food, when what they stocked up, runs out? You can only store so much food and pure water, and then you have to come up on the surface and grow more. But those people will be coming up into a world that is very high radioactively contaminated environment. Or, it may be possible that survivors could start eating their comrades, but cannibalism has its own consequences. (0498-16 [AGreen Road Project, Anonymous])

Comment: Please keep Fukushima in mind because it is from the same design batch as Oyster Creek. We cannot risk the Atlantic Ocean and I am begging you to stop worrying so much about the companies involved and address instead Life - all forms of it. (0510-3 [Holmes, Helen])

Comment: Whenever there is a profit to be made, experience shows that operators will place profits over safety. The Navy developed nuclear - powered ships for defense. The Navy could spend money on safety. Private companies have a duty to shareholders to make profits. (0512-2 [Bibb, William])

Comment: Nuclear energy is unsafe because an absolute degree of care is required. No regulator can force middle management types to follow rules. In the Navy you have courts martial. Who has ever been sued or gone to jail in the nuclear industry. I have NO confidence in your system of regulation for the above reasons. Trial lawyers are looking for the first big win as we did with tobacco and asbestos. The laws must be changed. No industry has ever been effectively regulated without unlimited legal liability. (0512-6 [Bibb, William])

Comment: My utility was fined last year for not having the proper neutron absorbing chemicals on site. This should have resulted in a loss of license, not a slap on the hand fine. The NRC mission is incompatible with protecting public safety and this is dangerous for all humanity. (0514-4 [Fahey, John])

Comment: Nuclear power only made economic sense because you allowed incompetence and endangerment of humanity. You are criminally responsible for public endangerment. What the rest of you did to G. Jasko is professional bullying and should be subject to public scorn. I am thankful that your criminality has not turned our country into the nuclear wasteland that Japan is

now (only parts of it). I pray that you will learn the lessons of Fukushima and discontinue such dangerous practices. (0514-7 [Fahey, John])

Comment: 4. Stop allowing shipment of spent fuel to the U.S. from other nations for reprocessing or disposal; 5. Do not allow the disposal of fracking waste and radioactive waste in salt caverns, as this destabilizes the ground in surrounding areas (think Bayou Corne). (0515-10 [Stennes, Nancy])

Comment: Do not allow reactors to operate beyond their design lifespans; (0515-7 [Stennes, Nancy])

Comment: Do not allow fuel reprocessing. There is more than enough nuclear material already in existence to destroy all life on earth; (0515-9 [Stennes, Nancy])

Comment: There's is no mercy to be held for any one in the nuke industry, you're all a bunch of the most foulest criminals that ever walked the Earth. I look forward to the downfall of the industry and the selfish fruitcakes within it. (0523-2 [Hamilton, Richard])

Comment: The Dept. of Justice needs to examine illegal nuclear waste handling over the decades and prosecute regulators who were negligent. The US needs to really ban burning nuclear waste instead of just pretending to. (0527-2 [Titus, Mary])

Comment: Stop, immediately, manufacturing toxic D.U. Label all consumer and industrial products containing D.U. and do a recall on all of them. (0527-3 [Titus, Mary])

Comment: The NRC needs to stop telling the public runaway nuclear plant melt-down pollution is harmless. It is a bold faced lie. (0527-4 [Titus, Mary])

Comment: Wind and solar power, not to mention fuel cells, are sufficient for all our present and future needs. (0530-2 [Proeller, John])

Comment: The Commission Should Acknowledge an Absence of Waste Confidence and Propose that the NWPA be Amended or Replaced (0532-17 [Kotra, Janet])

Comment: Views expressed by the extreme end members of this irresponsible continuum distract the Commission from its foremost responsibility - namely protector of the public health and safety and provider of the common defense and security. No, it is not NRC's job to advocate for or against nuclear power or the generation of increasing amounts of spent nuclear fuel. That was made abundantly clear when NRC was formed. The Commission's authority does include, however, the responsible advocacy of nuclear safety and security for the Nation, for both the short- and long-term. (0532-4 [Kotra, Janet])

Comment: Beyond that, the NRC should focus on finding ways for the US to be powered by solar energy, perhaps changing its name to the Nuclear Regulatory and Solar Energy Expansion Agency. (0543-7 [Senkiw, Sheryl])

Comment: Unfortunately, reprocessing proponents have used this opportunity to promote reprocessing as the solution for managing our nuclear waste. Contrary to their claims, however, reprocessing is extremely expensive, highly polluting, and a proliferation threat, and will actually complicate the management of irradiated fuel. Nor will reprocessing obviate the need for, or "save space" in, a geologic repository. The United States has a unique opportunity to re-evaluate our nuclear waste management plan. We can make wise decisions about safeguarding

radioactive waste or go down the risky, costly, and proliferation prone path towards reprocessing. (0545-2 [Patrie, MD, MPH, Lewis E.]

Comment: Prohibit reprocessing: The reprocessing of irradiated fuel has not solved the nuclear waste problem in any country, and actually exacerbates it by creating numerous additional waste streams that must be managed. In addition to being expensive and polluting, reprocessing also increases nuclear weapons proliferation threats. (0545-5 [Patrie, MD, MPH, Lewis E.]

Comment: My list of radioactive waste neutralization methods includes the electrino fusion power reactor, Hawkings' generator of cold electricity, collective ion accelerator, dematerialization using highest powered positive ions ever, photo-deactivation using gamma rays, implosion machine which duplicates ball lightning, Radha Roy's transmutation process, Barker's method, Gillembarado's method, Keller catalytic process, transmutation of low-level nuclear waste into glassy substance with super high voltage, Brown's gas, combining Brown's gas with bucking magnetic fields inside a plasma ball, Bearden's method, Russian process using liquid lead bismuth to trigger transforming in the form of neutrons, accelerator-driven transmutation of waste, Brown's gas-metal matrix process, photoremediation, ZIPP fusion process, RIPPLE fission process, low-energy nuclear transmutation electrolytic cells, plasma induced/injected transmutation, Kervran reactions, Monti process, higher group symmetry electrodynamics, plasma gasification melting, low-energy nuclear remediation with ultra-low momentum neutron generator, flame-free incineration in a catalyzer, John Hutchison's raygun, and fusion-fission hybrid reactor. More information on many of these methods is available at www.padrak.com/vesperman. (0550-1 [Vesperman, Gary])

Comment: The Department Of Energy refuses to neutralize radioactive waste because of its insane policy of preserving its supply of bomb-grade uranium and plutonium for manufacturing nuclear weapons. The Nuclear Regulatory Commission would better serve the nuclear power industry by vigorously developing methods of neutralizing radioactive waste. (0550-2 [Vesperman, Gary])

Comment: In 2012, a Catholic nun and two other non-violent peace activists went through 4 layers of security to the heart of the Y-12 National Security Complex in Oak Ridge, TN to draw attention to the U.S. violations of International Law and the Nuclear Non-Proliferation Treaty and the threat to life on the planet. Four weeks later, the hole in the fence had not been repaired and 2 other persons had inadvertently traveled into prohibited areas. U.S. nuclear facilities should be secure. They are not. (0552-1-16 [Macks, Vic])

Comment: Reactor owners and the NRC are not credible sources for protection of the public safety and health with respect to management and oversight of nuclear waste and reactor vulnerabilities that impact the safety of onsite withdrawn spent fuel. Risks are not/can not be eliminated as demonstrated over the years. (0552-2-29 [Macks, Vic])

Comment: Hallmarks of the nation's nuclear weapons program have been and still are extraordinarily sloppy record-keeping, careless handling of deadly materials, and blind faith in nature's ability to absorb anything. The Atomic Energy Commission (AEC) originally served as a watchdog and industry booster. The dual roles conflicted, so the Department of Energy (DOE) and the Nuclear Regulatory Commission (NRC) were created to separate them. Both maintain cozy, mutually-supportive relations with the industry and neither is known for trying to protect public health or, least of all, the well being of other living entities. (0553-4 [Wilshire, Howard])

Comment: The number of safety violations at U.S. reactors varies dramatically from region to region. A congressional study awaiting release points to inconsistent enforcement. The authors of the report wrote, "NRC cannot ensure that oversight efforts are objective and consistent. (Uneven enforcement suspected at nuclear plants." (AP, Oct 16, 2013) (0556-1-28 [Lampert, Mary])

Comment: The number of safety violations at U.S. reactors varies dramatically from region to region, pointing to inconsistent enforcement, according to a congressional study awaiting release. The authors of the report wrote, "NRC cannot ensure that oversight efforts are objective and consistent." (Uneven enforcement suspected at nuclear plants. AP, Oct. 16, 2013.) (0556-1-35 [Lampert, Mary])

Comment: NRC needs to pause for a mental enema. NRC needs to take its risk assessment experts and store them in a spent fuel facility. Insulting? It's only the mild truth compared what should be said to NRC as one of the most politically- and industry-compromised agencies between earth and Betelgeuse. You nuclear morons allow Diablo Canyon to continue operating near major earthquake faults. Now that kind of decision making requires an IQ level somewhere below that of an aphid. The problem with addressing the NRC in any meaningful or scientific fashion about nuclear power or nuclear waste is that NRC suffers from the "three-monkey" syndrome. Now, the NRC partner in crime, the Department of Energy, came up with the bright solution for how to manage mixed nuclear waste in New Mexico at Sandia National Laboratories Mixed Waste Landfill. The waste is left in unlined pits and trenches leaking into Albuquerque's drinking water aquifer. DOE/Sandia installed a dirt cover ABOVE the wastes. So now I've given NRC something to be proud of-you're not quite as imbecilic as the DOE/Sandia criminals. (0559-2 [McCoy, Dave])

Comment: Spent fuel should NOT be reprocessed. Reprocessing takes an enormous amount of energy and creates additional radioactive and chemical waste streams (no matter how many nuclear proponents claim otherwise). (0562-13 [Hoffman, Ace])

Comment: ...and all of the best thinkers in the world to team up to find solutions to get rid of the nuclear waste in a NOT harmful way and implement alternative energy supply solutions asap. There are enough out there, suppressed by the military/energy industrial complexes. (0564-3 [Meincke, Doro])

Comment: Do not allow fuel reprocessing. There is more than enough nuclear material already in existence to destroy all life on earth; 4. Stop allowing shipment of spent fuel to the U.S. from other nations for reprocessing or disposal; 5. Do not allow the disposal of fracking waste and radioactive waste in salt caverns, as this destabilizes the ground in surrounding areas (think Bayou Corne); (0566-10 [Tocornal, John])

Comment: Do not allow reactors to operate beyond their design lifespans (0566-9 [Tocornal, John])

Comment: Here's an idea: Let's stop bombing and occupying other countries and funnel the money into nuclear safety and alternative energy development! (0570-4 [Boosinger, Marilyn])

Comment: Utah further notes, in an apparent contradiction to NRC staff engaging in a clearly independent manner, staff, apparently on its own initiative, aided Private Fuel Storage, LLC ("PFS") in retaining its storage license, notwithstanding PFS had earlier requested to terminate its license due to a lack of funds.⁵ [footnote 5 text: In 2006, the NRC issued the only away-from-reactor, dry storage license to PFS for a facility to be located in the State of Utah on the Skull

Valley Indian Reservation . Staff document that "[s]ince it had taken a considerable amount of effort and resources to license the PFS [],the NRC thought it prudent to notify PFS of [the potential to be classified as a small entity] in light of the decision by the Department of Energy to site an Interim Storage Facility." NRC Conversation Record between Terry Pikens and Chris Allen, dated February 6, 2013.] Subsequently, staff reversed an earlier decision and waived all PFS annual licensing fees.⁶ [footnote 6 text: Notwithstanding almost a year prior NRC staff determined that waiving PFS licensing fees was not in the public interest, on September 27, 2013, Mr. James Dyer reversed his prior decision and granted PFS a full exemption from all annual fees, retroactive to January 1, 2013. In direct contradiction to his earlier reasoning, Mr. Dyer determined that it is "unfair" that the Department of Interior has not issued necessary approvals given the district court overturned Interior's decisions to deny the PFS lease agreement and the requested rights-of-way. In making his decision, Mr. Dyer failed to recognize or acknowledge that the district court held that Interior could in fact disapprove the lease agreement and deny the right-of-way requests but such denials must be made in a manner consistent with the ruling . See Skull Valley Band of Goshute Indians v. Davis, 728 F. Supp. 2d 1287 (D . Utah 2010).] (0579-2 [Smith, Amanda])

Comment: Please increase the wind and solar technology, for real, not just by giving some money to companies that donated to elections. It's time to move beyond democrat and republican goals. The parties and lobbyists do not have our best interests at heart. The people are finally waking up to this. (0581-2 [Rohl, T.]

Comment: I urge the Nuclear Regulatory Commission to continue its strong, independent oversight of commercial nuclear energy facilities -- the operation of existing plants, licensing new reactors, renewing the operating licenses of existing reactors, and the management, transportation and disposal of used nuclear fuel. (0598-6 [Wicks, Tonja])

Comment: So, with that specific concern in mind, my attention turns to Chapter 9.0 "List of Preparers" (Pages 9-1 to 9-5) of the DGEIS. "Tables 9-1 and 9-2 provide a listing of the NRC [staff] and CNWRA [Center for Nuclear Waste Regulatory Analyses] staff involved, their experience, and their role in preparing this draft GEIS." (Page 9-1, lines 6 - 7). There are three individuals listed as expert contributors whose function was to prepare the Waste Confidence DGEIS Sections pertaining specifically to "spent fuel pool fires." Presumably, Appendix F "Spent Fuel Pool Fires" was the result primarily of their work. I contend that, of these three individuals, NOT EVEN ONE of them is genuinely qualified to competently and adequately address the complexities of the issue. Dr. Todd Mintz has a Ph.D. in Materials Science and Engineering, but, ominously, he has only ONE year of relevant experience, and he is not a trained Nuclear Engineer. Mr. Donald Helton only has a Master's degree in Nuclear Engineering, and he is not a trained expert in Chemical or Materials Science or Civil or Environmental Engineering. Finally, Mr. Michael Wentzel only has a Bachelor's degree, and his degree is in Microbiology -- which begs the question: How can he possibly be qualified to prepare an EIS analysis of spent fuel pool fires? Many DGEIS Preparers have twenty or more (20 +) years of relevant experience, but, unfortunately, all of the listed experts who prepared the analysis of spent fuel pool fires dramatically fail this seniority test. Thus, it seems to me that a travesty is occurring in plain sight, and I am taking this opportunity to clearly express my grave concern. I suppose the NRC could argue that if the three individuals put their heads together, they would equal 1 (one) qualified individual. However, I would respectfully rebut that. (0603-13 [Schonberger, David])

Comment: Re: "externalities;" The U.S. Supreme Court recently heard oral arguments in a case pertaining to regulations under the Clean Air Act -- the Cross-State Air Pollution Rule of 2011, also known as the "good neighbor rule," generally applied to emissions from coal-fired

power plants. (www.marketplace.org, Dan Weissmann, 12/9/13; David Weinberg, 12/9/13.). It is possible that the Court's pending decision could have implications for the nuclear power industry, given that releases of dangerous emissions into the environment are "routine." (Beyond Nuclear). Perhaps the NRC could consider taking proactive steps to reduce the toxic footprint of the industry which it is supposed to regulate. (0603-23 [Schonberger, David])

Comment: South Carolina Electric & Gas Company (SCE&G), V. C. Summer Nuclear Stations (VCSNS) Units 1, 2 and 3 has reviewed the proposed changes under NRC-2012-0246 dated September 13, 2013. Docket ID NRC-2012-0246 was issued by the Nuclear Regulatory Commission (NRC) through 78 Federal Register 56,776 "Waste Confidence--Continued Storage of Spent Nuclear Fuel" and 78 Federal Register 56,621 "Draft Waste Confidence Generic Environmental Impact Statement." VCSNS representatives attended the meeting held in Charlotte, North Carolina on November 4, 2013 as documented within ML13323B474. VCSNS has actively worked with NEI on this matter and fully concurs with the position taken by NEI for Docket ID NRC-2012-0246. (0606-1 [Garza, John])

Comment: There is, however, reason to expect that commercial nuclear power will not compete economically with energy efficiency and modern dispersed and distributed electrical generation technologies that get cheaper as more of them get mass-produced and deployed. The wide-spread deployment of these technologies renders obsolete the "base-load" central-station paradigm niche occupied by nuclear power. Already, the cost of installed nuclear capacity is 4 and 5 times or more the cost of renewable technologies that have zero fuel costs. (0608-8 [Crocker, George])

Comment: The Commission needs to avoid the influence, that the nuclear industry's trade association - The Nuclear Energy Institute (NEI), has over the NRC which is supposed to regulate the nuclear industry's actions. (0610-3 [Brechin, Vernon])

Comment: Although the NRC was spawned from the U.S. Atomic Energy Commission it was left out of controlling the radioactive waste generated by the nuclear weapons test program which resulted in about 830 underground nuclear explosive tests. Each of those tests resulted in the release of radioactive debris whose composition is quite similar to the spent nuclear fuel discharged from commercial nuclear power plants. In April 1997, a report was issued by the U.S. Department of Energy's Nevada Operations Office's Environmental Restoration Division, Nevada Environmental Restoration Project. That report title is Focused Evaluation of Selected Remedial Alternatives for the Underground Test Area (DOE/NV--465, UC-700). On page 8-3 of the report is Table 8-1 - Comparison of Conceptual Costs of Various Alternatives. In the Open-Pit Mine option, which would involve the most extensive clean-up but still a partial one, the estimated cost was \$7.29 trillion. All, but the least expensive option were rejected, leaving primarily long-term monitoring. All other options were considered impractical for various reasons, including costs. The end result is that the problem of potential future contamination is being passed on to future generations so that today's people can continue to live in their customary ways. It's time we pull our heads out of the sand and realize the scope of dealing with radioactive hazards that last for hundreds of thousands of years. (0610-7 [Brechin, Vernon])

Comment: In addition there is no safe way to reverse engineer the nuclear fission reaction once it is started in nuclear reaction. Dr. Rhada R. Roy, nuclear physicist, proposed the Roy Process to reverse engineer nuclear waste, yet to date the Roy Process has never been considered. Since even if reverse engineering was possible, under the current regulations it could never be realized, since the only permissible method for dealing with spent fuel is limited to burial. (0611-29 [Shapiro, Susan])

Comment: The Department of Homeland Security, FEMA, Department of the Interior Department of Agriculture, Department of Energy and Department of Defense need to be actively engaged in any and all decisions regarding long term nuclear waste storage. (0611-51 [Shapiro, Susan])

Comment: Establish a independent Nuclear Waste Administration, whose participants must include the Reactor community. The Blue Ribbon Commission's most valuable finding was that waste storage issue need to be consent-based and include buy in by the local communities/Reactor communities must have equal representation in any waste storage decisions. Non binding consultation with reactor communities does no provide adequate consent. It is necessary to establish a permanent Nuclear Waste Administration Board which will include equal number of Reactor community stakeholders and industry stakeholder. (0611-57 [Shapiro, Susan])

Comment: In November, I attended the NRC Waste Confidence hearing in Oak Brook, Illinois. I wanted to hear what everyone had to say. Attending there, were a majority of antinuclear citizens and a minority of attendees who were clearly paid by Exelon to testify. Over and over, those young nuclear engineers who were so hubristic to state that they have total confidence in their nuclear plants, and have no questions as to its safety clearly do not know the history of nuclear plants in the state of Illinois nor the history or narratives of those communities surrounding nuclear plants in the state of Illinois. No comments by those bought by Exelon reflected any nuanced opinion with an iota of a doubt of the complexity of the energy situation that we are presented with here. (0612-2 [Takarabe, Tamae])

Comment: There was an Exelon employee who claimed that the government had enough funds to mop up a nuclear disaster. With our government in its precarious financial situation and with the state of Illinois in such financial dire straights, I wonder if those funds are actually there, and if such a disaster were to happen, is it enough? This may seem like an aside, but when Kurt Vonnegut was an anthropology graduate student at the University of Chicago, in the late 1940's, the physics department at the university claimed that it had achieved total knowledge in the realm of physics. Today, and yesterday, all of us know that, science had just started to scratch the surface of what will be discovered in the following 70 years in physics. (0612-4 [Takarabe, Tamae])

Comment: Every other one of NEI's claims is similarly twisted logic and should not be considered. NEI has a vested interest in the outcome of this WCD and has exhibited bias in favor of the nuclear industry which funds them, instead of in favor of public safety, at every juncture in these proceedings. (0616-9 [Hoffman, Ace])

Comment: In addition to a real plan like that outlined above [a plan for consolidated interim storage on Federally-owned lands], here are some more suggestions: (1) The plan should specify close cooperation with local cities and towns. (0618-10 [Johnson, Roger])

Comment: [I respectfully urge the Commission to] Conduct site-specific assessment of existing storage systems and require tighter controls on fuel in pools[.] (0620-13 [Rivera, Evelyn])

Comment: [I respectfully urge the Commission to] Modify its proposal to state that there no longer exists a basis for waste confidence, and propose the U.S. Congress amend the Nuclear Waste Policy Act to require specific, achievable plans for permanent disposition of nuclear waste before any new permits are granted to create it. (0620-15 [Rivera, Evelyn])

Comment: This is similar to the ongoing unwillingness of our nation's legislative and executive representatives to recognize the threats from this waste issue over multiple decades and address the situation before the interests of the industry. The human and civil rights of all people have been declared to be "without standing" in the context of these proceedings. The laws that created the NRC and endowed it with its "independent" status, legalized the production of massive quantities of radioactivity by an industry which has no concern about, responsibility or legal liability for deadly consequences of its actions by virtue of being "regulated" by an agency of the government and has assured its deployment across the country via a licensing process which routinely downplays those impacts. (0620-8 [Rivera, Evelyn])

Comment: Any operation that generates spent nuclear fuel should be located far from any productive farm land and far from any populated area to mitigate the damage done in event of loss of cooling to spent Nuclear fuel. (0634-10 [Cato, Michael])

Comment: The private sector should have to provide unsubsidised private insurance to cover the costs of any disaster involving storage of spent nuclear fuel. This is vital if safety is to be taken as seriously as it should be. There should be no legislative limits on liability in event of an accident. (0634-12 [Cato, Michael])

Comment: In fact it should be generated away from population centres and farm land in the first place, as it is very difficult to move when hot, which is when it is difficult to manage and potentially very dangerous. (0634-3 [Cato, Michael])

Comment: In order to ensure private nuclear power suppliers and private handlers of spent nuclear fuel take safety seriously in their businesses, the government should not provide free insurance for accidents, or limit liability for private entities running waste producing nuclear facilities such as power plants, or to private entities storing nuclear waste. The increased costs of gaining private insurance, and the monitoring that comes with that will undoubtedly be greater motivation to take safety much more seriously than has been the case in the past. Three mile Island, Chernobyl and now Fukushima being the most public examples of how important every motivation to keep storage of waste , and facilities that generate that waste as safe as possible. (0634-4 [Cato, Michael])

Comment: Nuclear contamination of food is very serious, and storage of nuclear waste has to be as safe as possible. The consequences are so costly for a mistake with for example recently used nuclear fuel, that it is reasonable to spend vast sums of money to make it as safe as possible. If the private sector is unwilling to take the risk to store fuel safely without legislative insurance subsidies limiting their liability, then the government should take control of the rad waste problem. There should be no legal limits placed on liability with regard to storage accidents. To limit liability is to shield the private sector from a powerful motivating factor to get their storage up to a safe standard. The public deserve better than that. (0634-8 [Cato, Michael])

Comment: Xcel Energy has participated in the preparation of and has carefully reviewed the comments filed by the Nuclear Energy Institute by letter dated December 20, 2013. We fully subscribe to and adopt those comments. (0638-3 [Glass, Peter])

Comment: It needs to be pointed out that claims made by the Nuclear Energy Institute are nothing but self-serving business PR. Their claims consist of twisted logic and should not be considered. Of course the NEI has a vested interest in the outcome of this Waste Confidence Decision. Of course the NEI. shows bias at every juncture in favor of the nuclear industry (which funds them). (0640-8 [Geary, B.])

Comment: The majority of Americans, both Liberal and Conservative, do not care about Party Politics when it comes to something as important as our countries energy future and safety thereof. We must use the findings of our trusted "scientists" who have done the work already and the rest of the world who has recycled fuels for 30+ years and move forward with the U.S. solution. We started making terrible political decisions in the 1970s, which has now spiraled in to a political game for some politicians, which must stop. Much of the rest of the world recycles spent nuclear fuel safely and without proliferation incident, the science and facts are not different here in the U.S. than the rest of the world, so quit squandering our U.S. tax Utilities funds and get back to work on the obvious solutions, Please!!!. (0644-3 [Chunglo, Steve])

Comment: ANA supports independent state and federal regulation of SNF storage and disposal facilities. Independent regulation is essential for technically sound nuclear waste facilities, confidence in the competence and oversight of their management, and to ensure effective public participation and accountability. Fifty years of little or no regulation of nuclear weapons facilities resulted in contamination of those sites that will take decades and hundreds of billions of dollars to address. Additional legislation is required to establish a robust regulatory regime, which must include elimination of the pre-emption of state and federal regulation of radionuclides. (0646-10 [Hanson, Courtney])

Comment: ANA opposes reprocessing. Reprocessing for nuclear weapons accounts for much of the contamination at DOE sites, and the HLW from reprocessing remains an immediate and long-term health and environmental threat. Commercial reprocessing at West Valley, New York, also was an environmental and economic disaster that remains a burden. It is clear that fissile materials should not be separated from spent fuel. ANA is aware that consolidated SNF storage is seen by some as a way to promote reprocessing. For example, the SRS Community Reuse Organization report of March 2013 endorsed a linkage between spent fuel storage and reprocessing. (0646-12 [Hanson, Courtney])

Comment: ANA opposes expanding the mission of the Waste Isolation Pilot Plant (WIPP) to include disposal of commercial waste or high-level waste. Since 1979, federal law has limited WIPP to handling defense transuranic waste. It would do great damage to the credibility of laws and agreements covering any future nuclear waste storage or disposal site if the WIPP mission were changed. Moreover, WIPP is technically precluded from accepting such waste because of various deficiencies, including that it is surrounded by many oil and gas wells and that bedded salt is rapidly deformed by thermally hot waste. (0646-13 [Hanson, Courtney])

Comment: ANA supports a sustainable energy policy that focuses on increased energy efficiency and clean renewable energy technologies. (0646-15 [Hanson, Courtney])

Comment: The Department of Energy (DOE) has approximately 90 million gallons of HLW; most is stored in more than 230 tanks at Hanford, Washington; Savannah River Site, South Carolina; and Idaho National Lab, Idaho. DOE also manages about 2,500 metric tons of SNF. About 70,000 metric tons of commercial SNF is primarily stored at the reactor sites; about 2,000 metric tons more commercial SNF is created each year. ANA supports improved storage for HLW liquids and sludges immediately and solidification of those wastes as soon as possible. ANA recognizes that HLW and SNF will continue to be stored at DOE sites for decades. (0646-24 [Hanson, Courtney])

Comment: ANA supports scientifically sound, publicly accepted environmental protection standards before any SNF disposal site selection activities begin. The Environmental Protection Agency (EPA) should engage in a rulemaking process to establish new disposal standards.

That process requires adequate funding from Congress. EPA standards should be in place before any siting work commences so that generic standards guide the site selection process. (0646-7 [Hanson, Courtney])

Comment: Dear NRC: your proposed decision with regard to storage of nuclear waste at San Onofre shows that you are not being professional or competent in your duties! Your sworn duty is to protect the public, not to rubber-stamp the industry agenda. If you're only going to rubber-stamp, then why are you in this job? (0649-1 [Imhoof, Christina])

Comment: The US policy concerning radioactive "waste" (terminology somewhat akin to the term "side-effects" of medications, as if they are inconsequential -- when they are actually just not the effects being marketed to consumers) has always been woefully negligent from a standpoint of public safety, is apparently being considered by the NRC to be doubled-down on. Polite discourse has not the means to express my derision of you as individuals for being lap-dogs for a nuclear industry that is headed by military-state maniacs. It makes me wish there truly was a God, so that there would be a Hell for you and they to spend eternity in for what you have done to endanger life on this planet. (0651-1 [Wells, Jim])

Comment: I once studied nuclear chemistry, and performed some laboratory work in the field. It seemed (and seems) to me that enormous amounts of research money went in to discovering commercial applications, and almost zero into how to deal with its consequences responsibly, Being true alchemy and having the unlimited funding behind it of the Pentagon, the only true barrier to having concurrently figured out how to completely de-toxify any and all nuclear material was will -- which to say was sorely lacking is an understatement, because it was purposefully ignored. The shame on you all for that only scratches the surface of the personal consequences you deserve. (0651-2 [Wells, Jim])

Comment: Do the right thing!! (0661-1 [Individual, Anonymous])

Comment: The Price Anderson Act should be repealed. The nuclear facilities should have their own insurance of at least \$1 trillion to \$9 trillion per reactor based on their location. Stop nuclear bailouts and welfare to the nuclear industry. Enact curie limitation. Enough curies have already been produced. (0662-11 [McClintock, Francene])

Comment: Defense should phase out/decommission nuclear weapons ASAP. (0662-13 [McClintock, Francene])

Comment: The new organization [as recommended by the Blue Ribbon Commission] should be enacted through the legislative branch, not the executive. More public hearings and public access to reports/meetings is needed. The public has a right to comment on appointees. The agency should be in charge of all waste including low level waste buried in trenches, which needs to be exhumed. (0662-14 [McClintock, Francene])

Comment: Knowing that radionuclides such as Iodine-129 with a 1/2 life of 15.9 million years and Technetium-99 with a 1/2 life of 213,000 years will be contained in this repository and that nuclear waste must be isolated from the environment for at least 10 - 20 times the 1/2 life of the radionuclide, also known as it's hazardous life, the law should be changed. Current law only states that high-level waste should be isolated from the biosphere for 10,000 years. Since we know this is impossible, we should at least admit that to ourselves and stop the deceit and cover-up. (0662-7 [McClintock, Francene])

Comment: Nuclear industry comments on the proposed Waste Confidence rule are being provided under the auspices of the Nuclear Energy Institute (NEI), and Duke Energy endorses those industry comments. (0672-1 [Jamil, Dhiaa])

Comment: We can use our spent fuel to generate more energy and, in the process, reduce the amount of waste and the longevity of the waste (right now we have to store waste for a set period of time, but we could substantially reduce that time period by using up the long-lived waste and turning it into energy). Recycling is currently utilized in France and has been done for decades. Recycling nuclear waste is an option available for us (in the U.S.) in the future[.] (0674-3 [Lang, Amanda])

Comment: The other important policy needed to support renewable energy is expansion of the transmission grid. We have heard the comment that since adequate transmission is not available right now we need to continue to expand the use of nuclear energy. That comment is incorrect for two reasons. First, expanded transmission is occurring right now. The Federal Energy Regulatory Commission (FERC) has over the past few years adopted policies to promote expansion of transmission lines. The most recent FERC action is Order 1000 adopted on July 21, 2011. And every area of the country has a regional transmission organization (RTO) that promotes and coordinates expanded transmission in each respective region. In the Midwest, for example, the Midwest RTO (MISO) has approved a number of transmission expansion projects designed to accommodate increased renewable energy production and they are ready for regulatory approval. Second, it takes at least 10 years for a new nuclear plant to be licensed and put on line. New transmission will begin to be constructed within the next year or two, long before we would gain any alleged benefit from additional nuclear power. Furthermore, a new nuclear plant, which would not be needed when renewable energy becomes dominant, would be licensed for probably 40 years and undoubtedly relicensed for another 20 years. We would be stuck with 60 more years of radioactive waste that could be avoided with the right policies supporting renewable energy. (0688-21 [Taylor, Wallace])

Comment: Finally, we have reviewed the comments being submitted by Diane Curran and colleagues, along with expert declarations, on behalf of various environmental groups and organizations. The Sierra Club Nuclear Free Campaign agrees with and adopts those comments and declarations. (0688-22 [Taylor, Wallace])

Comment: •My comment of February 17, 2012²⁵ [footnote 25 text: Available in ADAMS (<http://adams.nrc.gov/wba/>) at Accession Number ML12052A045.]("Rather than expend limited resources on efforts to extend the time that increasing quantities of spent nuclear fuel may be stored at the nation's reactor plant sites . . . the NRC should simply proceed to comply with Section 114(d) of the Nuclear Waste Policy Act of 1982, as amended (NWPA)" (footnote omitted)); and •The D.C. Circuit Court's Order, dated August 3, 2012, holding the mandamus proceeding in abeyance (as described in *In re: Aiken County*: "[W]e followed a cautious approach in our decision more than a year ago when we declined to issue mandamus against the Commission at that time. But the Court's majority clearly warned that mandamus would eventually have to be granted if the Commission did not act or if Congress did not change the law. Since then, despite the clear warning, the Commission has still not complied with the statutory mandate. On the contrary, the Commission has reaffirmed that it has no plans to comply with the statutory mandate. In the face of such deliberate and continued agency disregard of a statutory mandate, our precedents strongly support a writ of mandamus."). Given all these clear and conspicuous indicators, and NRC's actions and inactions in response thereto, over the course of 41 months,²⁶ [footnote 26 text: That is, from NUREG-1100, Vol. 26, dated February 2010 to *In re: Aiken County*, dated August 13, 2013.] it is reasonable to question

whether NRC has sufficiently robust management and oversight systems to identify what compliance looks like. (0692-12 [Skov, Jeff])

Comment: We would like to emphasize that reprocessing generates more nuclear waste than you start with, that the experimental reprocessing at West Valley, NY was a failure that left a completely contaminated site that we are having enormous difficulty getting properly cleaned up, partly due to inadequate funding. (0693-4-9 [Warren, Barbara])

Comment: There is no way to safely store the waste! Please fully inspect all existing plants & their processes. (0696-2 [Becker, Joanna])

Comment: Entergy agrees with the NRC Staff⁴⁹ [footnote 49 text: *Id.*] and NEI⁵⁰ [footnote 50 text: NEI Comments.] that the indefinite storage scenario is not likely to occur. (0697-1-27 [Bessette, Paul] [Kuyler, Raphael])

Comment: A central Long Term Storage site must be found north of Lake Okeechobee in a location that is 1,000 feet high and inland from I-95. The spent fuel should be transported up The Florida Turnpike to somewhere around Sebring or north up Hwy 27. I-95 goes through downtown Miami and has increased traffic and more accidents which makes the Turnpike the preferred route. North Florida or south Georgia would be less populated but the long distance would rule that area out. Both South Florida Nuclear Power Plants have been lucky to not have had a hurricane storm surge hit them yet. (0701-14 [Wilson, Greg])

Comment: A solution for the Nuclear Spent Fuel problem must include a method to render spent fuel back into a harmless material in the near future. (0701-5 [Wilson, Greg])

Comment: Also, consolidated storage is a bad idea. We don't need a bunch "temporary" storage sites around the country, with their associated transportation risks. These risks would be even greater for "centralized interim storage". (0702-4 [Scarff, Steve])

Comment: The continuation of the nuclear program must require industry to rise to a level it has never been called to do before, and it is up to the NRC to raise the calling of the industry players to more fully be responsible for their participation in that industry. If the NRC cannot do that, then likely Fukushima will be our last opportunity to learn a lesson about nuclear power here on earth. Maintaining or diminishing current regulatory levels that created the present on-going nuclear waste confidence issue will produce more of the same. (0703-4 [Vandel, Nikohl] [Vandenberg Clermont, Elaine])

Comment: The problem with reading something like the Federal Register is that there are so many voices involved in the writing, there is no "bottom line" its like a "middle ground" at best.* Unfortunately for the #GlobalNuclearIndustry, they are irresponsible stakeholders and their input to the voice of the Federal Register is too loud for the #commondefense of our nation, and in truth, our planet. But, I'm just sayin'.... (0703-5 [Vandel, Nikohl] [Vandenberg Clermont, Elaine])

Comment: I believe that if the US NRC wants to be a major player in the global scene, it is time for it to empower itself to that level and take a bold role of leadership amongst its peers, and support in common those with whom humanity's "common defense" is held, the Original Nations, the United Nations and other globally recognized governments -- as opposed to those global economic clubs we seem to mostly be beholden to because ??!!! (tangent, I know.) (0703-8 [Vandel, Nikohl] [Vandenberg Clermont, Elaine])

Comment: I am writing to express my disagreement with the NEI's recommendations and encourage the NRC to proceed with utmost caution, placing public safety above all other concerns. (0705-1 [Spring, Janet])

Comment: NEI is clearly prejudiced in favor of the nuclear industry. Its biases should not be allowed to influence public policy. The NRC should investigate all sources of information and make a cautious decision that prioritizes public safety. (0705-6 [Spring, Janet])

Comment: NRC should immediately commence a draft rulemaking process to rectify its deficiencies. (0706-3-16 [Fettus, Geoffrey])

Comment: Policy Statement, Licensing and Regulatory Policy and Procedures for Environmental Protection; Uranium Fuel Cycle Impacts, 47 Fed. Reg. 50,591, 50,593 (Nov. 11, 1982). In the 1990 update to the Waste Confidence Rule, the Commission also acknowledged that if it were to change its waste confidence decision, it would have to revisit the adequacy of Table S-3. 55 Fed. Reg. at 38,490. The NRC has not meaningfully updated Table S-3 or WASH-1248 for decades. As the Commission explained, a planned update: [w]as delayed because, by the mid-1980's, there were no new applications for construction of nuclear power plants, nor, at that time, were any future ones predicted. Consequently, there was no regulatory need to update Table S-3 and competing priorities for rulemaking resources eventually resulted in the cessation of activities on the table. Since the mid-1980's, the NRC has revisited the issue of revising the value for radon-222 in Table S-3 on more than one occasion, but in each case higher priority rulemakings led to a halt in these efforts. *New England Coalition on Nuclear Pollution; Denial of Petition for Rulemaking*, 73 Fed. Reg. 14,946, 14,947 (March 20, 2008). (0706-5-1 [Fettus, Geoffrey])

Comment: 2. The Baltimore Gas & Electric Decision[.] As described above, in 1979, NRC published its final Table S-3 rule. 44 Fed. Reg. 45362 et seq. (1979). Table S-3 is, in brief, a numerical compilation of the NRC's estimates of resources used and effluents released by fuel cycle activities supporting a year's operation of a typical light water reactor. From this, the NRC decided that NRC Licensing Boards should assume, for the purposes of NEPA review, that permanent storage of nuclear waste would have no significant environmental impact (the so-called "zero release assumption"), reactor operations would have no significant impact on the environment, and thus none of these issues should affect the decision whether to license nuclear power plants. NRDC and the State of New York challenged Table S-3 as a violation of NEPA and the Administrative Procedures Act (APA), the proceedings were combined, and ultimately, the Supreme Court ruled on the issue. At the "heart of the dispute" was the viability of Table S-3, 44 Fed. Reg. 45362 et seq. (1979). *Baltimore Gas & Electric v. NRDC*, 462 U.S. 87 (1983). The Supreme Court reversed a Court of Appeals ruling for NRDC and New York, finding that the NRC, in its final S-3 Table, "summarized the major uncertainties of long-term storage of nuclear wastes, noted that the probability of intrusion was small, and found the evidence 'tentative but favorable' that an appropriate storage site could be found." *Id.* at 87. The central holding of BG&E is straightforward – the NRC complied with NEPA's requirements of consideration and disclosure of the environmental impacts of its licensing decisions. *Id.* at 88. But as discussed in comments below, the fundamental bases upon which the Supreme Court relied to find the NRC's actions lawful are no longer valid or applicable, and such a situation has a significant impact on the NRC's NEPA obligations for the relicensing of existing facilities and licensing of new facilities. (0706-5-2 [Fettus, Geoffrey])

Comment: a. The rationale for the BG&E decision no longer spares NRC from having to perform a GEIS/NEPA review for addressing the environmental impacts of the storage of

nuclear waste[.] In 1983, the Supreme Court found that the NRC, in its final S-3 Table, "summarized the major uncertainties of long-term storage of nuclear wastes, noted that the probability of intrusion was small, and found the evidence 'tentative but favorable' that an appropriate storage site could be found." *BG&E v. NRDC*, 462 U.S. at 87. The central holding of *BG&E* is straightforward -- the NRC complied with NEPA's requirements of consideration and disclosure of the environmental impacts of its licensing decisions." *Id.* at 88. But in dicta, the Supreme Court explained that the zero-release assumption and, indeed, the entirety of Table S-3 rule was made for a limited purpose, and that it would be supplemented with an explanatory narrative. *Id.* at 101. Also, a separate and comprehensive set of programs has been undertaken to serve the broader purposes of long-term waste disposal technology and site selection. *Id.* See note 1, *supra*. Second, the Court emphasized that the zero-release assumption is but a single figure in an entire Table, which the Commission expressly designed as a risk-averse estimate of the environmental impact of the fuel cycle. *Id.* at 102 and 103. And third, the Court was careful not to tread into the area of the NRC's special expertise. *Id.* The crucial bases for the Supreme Court's decision to uphold the NRC's defense of the validity of Table S-3 are no longer valid, and the NRC must revisit this decades-old Table S-3 and all associated decisions regarding the environmental impacts of the uranium fuel cycle with new, "hard look" NEPA review. As the Court itself noted, "no one suggests that the uncertainties are trivial or the potential effects insignificant if time proves the zero-release assumption to have been seriously wrong. After confronting the issue, though, the Commission has determined that the uncertainties concerning the development of nuclear waste storage facilities are not sufficient to affect the outcome of any individual licensing decision." *Id.* at 98 (emphasis added). (0706-5-4 [Fettus, Geoffrey])

Comment: b. The bases for Table S-3, including the zero release assumption, are no longer technically supportable, accurate or consistent with policy[.] At the time of *BG&E* decision, the NRC considered bedded salt as suitable for disposal either of reprocessed high-level waste or un-reprocessed spent fuel. Yet, the Proposed Waste Confidence rule of 2008 states that salt formations are not being considered for spent fuel disposal for technical reasons. Hence, the technical underpinning of Table S-3 is inconsistent with current law and the NRC's own understanding of salt repositories. Indeed, disposal in salt, which was the original basis for the S-3 Table in estimating the environmental impact of high-level waste or spent fuel disposal, is only considered suitable for high-level waste resulting from reprocessing, but reprocessing is not the current policy, and nor should it be.⁴⁸ [footnote 48 text: Spent-fuel reprocessing and plutonium-fueled fast reactors are well-proven commercial disasters. The United States, Europe, and Japan spent tens of billions of dollars in the 1970s and 1980s trying to develop plutonium fast-breeder reactors (like the proposed Global Nuclear Energy Partnership "advanced burner reactors," but with uranium "blankets" added to "breed" more plutonium than is consumed in the reactor). These fast reactors proved to be uneconomical, highly unreliable, and prone to fires due to leaking liquid sodium coolant, which burns spontaneously when it comes in contact with air or water. For a full discussion, see <http://www.nrdc.org/nuclear/gnep/agnep.asp>.] Rather, direct disposal of spent fuel, for which the NRC would not consider salt formation, is now the current policy. (0706-5-5 [Fettus, Geoffrey])

Comment: More pointedly, presuming "zero release" of radioactivity when disposing of spent fuel runs directly counter to all established scientific understanding of the expected performance of any geologic setting. One glance at Appendix A to this filing demonstrates this fact. Radioactivity will be released from a repository – the dose and timing of such release is a matter for standards and licensing, but the point remains. Radioactive dose is the result of positive releases of radionuclides into the human environment. As far back as 1983, the report on geologic isolation prepared for the DOE by the National Research Council shows positive doses

attributable to both fission products as well as actinides in un-reprocessed spent fuel as well as from fission products in reprocessed high-level waste in all settings other than salt that were evaluated – tuff, granite, and basalt. The Supreme Court's concerns – that the problems would be neither trivial nor insignificant if the zero-release assumption turned out to be wrong – were well taken. Where, for example, is the Commission's analysis of the estimated range in the collective dose from the proposed Yucca Mountain repository, and what is the basis for concluding that the Table S-3 is still valid in light of this collective dose range? Moreover, the original scope of Table S-3 (and the underlying document in WASH-1248) is inadequate and outdated. Along with failing to address the environmental impacts of spent fuel disposal, the table looks only at the health impacts of an individual plant licensing decision. The Table fails to account for the cumulative impacts of licensing many plants, the economic costs of disposing of all waste generated by the uranium fuel cycle, or even adding those costs to the other costs of a nuclear power plant. Nor does the Table compare the total costs of building and operating a new nuclear facility (and ultimately disposing of associated waste and funding the decommissioning costs) with the costs of the no action alternative or with other alternative sources of energy. (0706-5-6 [Fettus, Geoffrey])

Comment: Oppose any proposal to transport and stockpile nuclear waste at interim sites throughout the country. This proposal is risky and unnecessary and it therefore should not be seriously considered. (0707-6 [Werner, Shahla M.]

Comment: Every (other) one of NEI's claims is (similarly) twisted logic and should not be considered. NEI has a vested interest in the outcome of this WCD and has exhibited bias in favor of the nuclear industry which funds them, instead of in favor of public safety, at every juncture in these proceedings. (0709-9 [Wythe Elnagar, Romi])

Comment: NRC expressly excludes reprocessing of commercial nuclear waste and the reprocessing waste that results from this GEIS ^{xviii} [footnote xviii text: NUREG 2157 page xxv “ES.6 What is Not Covered in the Draft GEIS? The NRC is evaluating the continued storage of commercial spent fuel in this draft GEIS. Thus, certain topics are not addressed because they are not within the scope of this review. These topics include: •noncommercial spent fuel (e.g., defense waste) •commercial high-level waste generated from reprocessing • Greater-than-Class-C waste •foreign spent fuel stored in the United States • need for nuclear power •reprocessing of commercial spent fuel.] Nonetheless, NRC has engaged in meetings considering new regulations specifically for licensing of reprocessing factories. NRC should not foster plutonium separation as a waste "management" option. NRC says it does not set policy, so NRC should stay out of the geopolitics of plutonium. We reject any promotion of the idea (by any party) that increasing the volume and destabilizing its form further in order to separate plutonium improves the confidence that this waste will not pose a threat to public health and safety. Plutonium separation is a direct threat to global stability and liquid, caustic forms of this waste are worse than fragile fuel rods. We reject the idea that corporations should be allowed to use fission, or generate new or extract plutonium at all. (0711-22 [Olson, Mary])

Comment: Where has US NRC considered incorporation of the Principles of Precaution in its regulatory role? (0711-27 [Olson, Mary])

Comment: Nuclear proponents feel the need to reassure decision-makers and the public that nuclear waste is not an insuperable problem, because otherwise their industry has no future. This creates a conflict of interest that has clouded the judgment of nuclear proponents and led them to make a number of exaggerated and unsupportable claims that are not scientifically verifiable. Law-makers have been misled into enacting legislation obligating the federal

government to "dispose" of the industry's irradiated nuclear fuel, based on false assurances from the industry that the disposal problem had been solved, when in fact it had not been solved and is still not solved. Decision makers have placed their trust in nuclear proponents who have been more concerned with meeting the public relations needs of the industry than the long-term safety concerns associated with the ever-growing inventories of highly radiotoxic and indestructible waste byproducts. The NRC should not allow itself to be a party to this deception. (0714-1-18 [Edwards, Gordon])

Comment: The NRC's job is to protect the public health and safety and to protect the environment over the long term. To carry out its responsibilities NRC must rely on sound science and develop prudent policies for the future, undeterred by the industry's perceived public relations needs. (0714-1-20 [Edwards, Gordon])

Comment: *NRC lacks a demonstrated safety culture by its own definition. It therefore is in no position to be responsible for the institutional management of spent-fuel into the indefinite future.* At a meeting between NRC and Entergy Corporation at the Palisades NPP in Sept., 2012, NRC attempted to define for Entergy what it meant by having a "nuclear safety culture": *"Nuclear Safety Culture is the core values and behaviors resulting from a collective commitment by leaders and individuals to emphasize safety over competing goals to ensure protection of people and the environment."* [NRC side show, Palisades reactor presentation, 9/12/12] In further dialog and exposition on the topic, then-Region III Director Chuck Casto offered that it meant, "Going beyond what's required." NEIS pointed out to NRC and those present that, by this very definition, NRC itself possesses no "nuclear safety culture," since it repeatedly allowed innumerable "competing goals" – utility profits, production and operation timelines, strict adherence to unreasonable comment periods, numerous license waivers and variances, unwillingness to adopt the precautionary principle, even after Fukushima, etc., as examples --to govern its behavior and decision making, none of which were for the public good. d.) *"Betrayal is a solid rational basis for distrust."* – *journalist and author William Boardman*[.] Subsequent actions or lack of actions (and certainly many previously documented ones) on the part of NRC have borne out the accuracy of the above criticism. (0716-18 [Kraft, Dave])

Comment: •By a 4 to 1 vote, the Commission voted against quicker implementation of Fukushima lessons learned, delaying them at U.S. Fukushima-designed reactors for up to 6 years. Those four Commissioners later forced out the Commission Chair Gregory Jaczko – the only one in favor of more rapid implementation of safety measures. According to authors John Byrne and Steven Hoffman, since the 1980s the NRC has generally favored the interests of nuclear industry and has been unduly responsive to industry concerns. The NRC has often failed to pursue tough regulation. At the same time, it has sought to hamper or deny public access to the regulatory process and created new barriers to public participation. (Source: *Governing the Atom: The Politics of Risk*, 1996)[.] •The number of safety violations at U.S. nuclear power plants varies dramatically from region to region, pointing to inconsistent enforcement in an industry now operating mostly beyond its original 40-year licenses, according to a congressional study awaiting release...the reasons aren't fully understood because the NRC has never fully studied them, the report says. Right now, its authors wrote, the "NRC cannot ensure that oversight efforts are objective and consistent." (Source: "Uneven enforcement suspected at nuclear plants," AP, Oct. 16, 2013)[.] (0716-20 [Kraft, Dave])

Comment: •"In a letter submitted Friday afternoon to internal investigators at the Nuclear Regulatory Commission, a whistleblower engineer within the agency accused regulators of deliberately covering up information relating to the vulnerability of U.S. nuclear power facilities that sit downstream from large dams and reservoirs. The letter also accuses the agency of

failing to act to correct these vulnerabilities despite being aware of the risks for years." (Source: Flood Threat To Nuclear Plants Covered Up By Regulators, NRC Whistleblower Claims, Huffington Post, Sept. 14, 2012)[.] •"A separate former senior Democratic aide who has worked with Jaczko, Magwood and Flint said that Yucca is the impetus for the industry's opposition to the outgoing chairman. "Magwood "and the industry hate Greg because they think he was put on the commission by Reid, who's anti-Yucca, and he's gonna be a Reid stooge. And you know what? They're f*cking right," the former aide said. "That's exactly why he was put on there. But that commission and that agency were complete and total captives of the nuclear industry. One and the same." (Source: "Nuclear Regulatory Commission Chairman Steps Down," Ryan Grim, Huffington Post, May 21, 2012)[.] While NRC may be legally charged with regulating the nuclear industry, and in completing the DGEIS and mandates emanating from the New York Court decision of 2012, the responsible thing for NRC to do would be to inform Congress of its incapacity to carry out such responsibilities absent a safety culture; recuse itself from future efforts on the DGEIA; and appoint, assign, or recruit an independent public research body to conduct such efforts. We would be happy to provide references for such a public body. (0716-22 [Kraft, Dave])

Comment: Our health is being compromised. Witness the leukemia studies conducted not only in England and France, but the one here in Illinois focused on the Clinton reactor. (0722-3 [Headington, Maureen])

Comment: You make nuclear regulation look ridiculous. For shame, NRC. (0723-6 [Shadis, Raymond])

Comment: Its way past the time to begin putting PUBLIC SAFETY FIRST! For years people of the state of California and beyond have shouted against the insanity that is the NRC! Building plants on/near earthquake faults, having substandard safety regulations, and inept people in very important positions regarding PUBLIC HEALTH & SAFETY!! It's time to rethink the entire industry and its use of nuclear materials and how where why it is properly disposed of (if there is even such a thing).. We are watching and your actions and decisions will weigh heavily on us and the future generations you impact! (0731-2 [Brotine, Howard])

Comment: I testified at the Minnetonka, Minnesota meeting Dec 4, 2013. And a date I quoted was wrong! I said 1876 and meant to say 1871!, in reference to the law that gives corporations the rights of "persons." Persons are human beings. This business and other fossil fuel industries are guilty of laws against humanity and nature. Their politics are extremely TOXIC and defies the BILL of Rights, and they abuse the English language in the courts! Mr. President, Senators, Congressmen and women, NRC....Admit a mistake has been made. "Move to Amend" the 1871 Law that gives anyone the right to foreclose on the FUTURE! ON HUMANITY, ON ALL LIFE! (0744-14 [Bonniwell, Colleen])

Comment: Consider EMOTO's science. Base economic markets on cooperatives, renewable energies and sustainable agriculture. ECO SAFE! With access to pure water for all life. (0744-4 [Bonniwell, Colleen])

Comment: No interim storage. Do not force the waste on any state domestic or International. More time is needed for these determinations to get it RIGHT! From now forward - remove the corruption in this industry allow the people to secure the future that these Industries had and have threatened. The people know! (0744-7 [Bonniwell, Colleen])

Comment: AREVA is in agreement with and endorses the comments submitted by the Nuclear Energy Institute (NEI). (0745-1 [Kelley, Devin])

Comment: The agency of the Nuclear Regulatory Commission under the U.S. Constitutional dictates of its administrative law responsibilities have failed in their responsibilities to protect the Inalienable Rights of Citizens of these United States. (0750-2 [August, Bernard])

Comment: The NRC and this "Waste Confidence Hearing Process" is a sham publicity stunt ". Their are hundreds, if not thousand of studies done on the issues of nuclear waste from the nuclear fuel cycle processes. And billions of dollars already spent on the nuclear waste problem and no remediation in sight for this (at a minimum) 200,000 year problem. The Nuclear Regulatory Commission must be replace with a truly transparent body and not a "revolving door of inside lobbyist from the" Nuclear Energy Institute" and their "associated industries". This is a world wide issue... Only a world wide collaboration through a fair and just political economy will re-mediate the nuclear waste problem . The Nuclear Regulatory Commission and Its" "current mindset" must be decommissioned. (0750-3 [August, Bernard])

Comment: In addition, inspections on the current active power plants are needed to assure safety for all of us. (0752-2 [Abdro, Ann])

Comment: We do not have safe and secure heavy lift technology to remove these materials away from the biosphere (towards the sun) and storage has been the orphan of the industry since its inception. (0755-2 [Calnan, Christopher])

Comment: Decades of accidents and cover-ups in the " nuclear industry" sanctioned by military predominance must end today. Leaks in waterways like the Columbia River and Three Mile Island incident , are a legacy that is marred at best and still not studied as thoroughly as other more visible accidents in other countries such as Chernobyl ,then USSR. Thank our Founding Fathers for the insight to build such a thoughtful constitution for this country ,which allows for mistakes and the power to learn from them. This allows for true knowledge to pervade the American Experience and thankfully does not overtly sanction the Emperor/King Hidden new clothes syndrome. (0755-5 [Calnan, Christopher])

Comment: Dear NRC: your proposed decision with regard to storage of nuclear waste at San Onofre shows that you are not being professional or competent in your duties! Your sworn duty is to protect the public, not to rubber-stamp the industry agenda. If you're only going to rubber-stamp, then why are you in this job? (0776-1 [Kuttler, Eugenij])

Comment: What a sham the nuclear industry is. We cannot trust them. (0790-2 [Richardson, Carlos])

Comment: I am writing in strong support of the San Clemente City Council Resolution 13-53, and I strongly urge the NRC to make public safety its very highest priority, true to the mission with which it has been entrusted. (0796-1 [Hanna, Helen])

Comment: Our state government documents even indicate that California has plenty of power without nuclear. These facts must be taken into consideration. (0796-3 [Hanna, Helen])

Comment: For more than 60 years the nuclear industry has been producing nuclear waste. During the last 60 years this same industry has not come up with long-term solutions that are protective of human health and the environment for as long as the waste remains hazardous.

The primary reason industry has not created permanent protective solutions for radioactive waste is because the US Government has not forced the industry to create solutions to deal with this deadly waste. The NRC has an opportunity to end the 60 years of procrastination by demanding that industry store this waste, treat this waste so that is it protective to human health and the environment for as long as the waste remains hazardous. (0798-1 [deBruler, Gregory])

Comment: An Important Factor That Does Not Lend Itself to Generic Assessments[;] History of Neglect[.] Comment: Hallmarks of the nation's nuclear weapons program have been and still are extraordinarily sloppy record-keeping, careless handling of deadly materials, and blind faith in nature's ability to absorb anything. The Atomic Energy Commission (AEC) originally served as a watchdog and industry booster. The dual roles conflicted, so the Department of Energy (DOE) and the Nuclear Regulatory Commission (NRC) were created to separate them. Both maintain cozy, mutually-supportive relations with the industry and neither is known for trying to protect public health or, least of all, the well being of other living entities. (0805-4 [Wilshire, Howard])

Comment: I am not only for us, but for my children and future generations. I am so sick of saying this over and over. I don't want fracking in my country, I don't want my water and soil contaminated, I don't want GMOs in my food, and I want everyone to wake up to reality. (0806-1 [Jones, Angela])

Comment: We strongly support the written and verbal comments of the Prairie Island Indian Community and City of Red Wing. We urge a careful reading of the critique submitted by NAWO and Nukewatch, who have been 'on duty' for the public interest in nuclear safety and health issues, collectively, for over 60 years. (0820-5 [Eide-Tollefson, Kristen])

Comment: Tritium leakage happened at both Point Beach and Kewanee in Wisconsin. Worse yet, concerns about this tritium leakage were dismissed during license extension approval with the NRC claiming that license extension approval process was the inappropriate time to address concerns involving off-site contamination of drinking water with tritium. If the license extension approval process is the inappropriate time and the GEIS is the inappropriate time to address non-generic complaints, when is the appropriate time? How did the NRC get so bureaucratic that it has lost sight of what should be its primary duty to protect the public and environment safely? Sufficient oversight assessment requires the safety of environment and living organisms have highest placement as the highest priority on the decision tree. When safety of environment and living organisms including humanity sits at the top of the decision tree by its highest priority ranking, then it becomes the gatekeeper. When safety is the gatekeeper, it pre-empts insufficient safety and does not approve or extend licenses when a safe endpoint for storage and disposal of nuclear waste industry-wide remains unknown. (0823-11 [Michetti, Susan])

Comment: To the extent that NRC, along with other federal regulatory and consumer protection agencies, is not actively sufficiently collecting and sharing raw data about ionizing leaks in time, date, and location variables required for further scientific research and analysis (which can be used to expand our ability to protect the full environment and living organisms), that is the extent to which the NRC is standing in the way of the discovery of deeper and wider scientific knowledge about ionizing radiation and possibly the potential solutions to solve the horrendous problem of all of this lethal waste without any safety assurance case to be able to isolate and contain this waste for the full duration of its ionizing lives. (0823-20 [Michetti, Susan])

Comment: The failure to sufficiently collect and openly and transparently share the full sets of raw data required for moving forward constitutes a failure to approach a most highly scientific

and technological job in the most scientific and safest way. This inadequacy of raw data stands in the way of scientific progress and slows down improvements to safety. (0823-21 [Michetti, Susan])

Comment: The environmental assessment stage of rigorous rational scientific thinking requires developing an accurately valued decision tree as oversight priorities that serves as an appropriate gatekeeper. When we are dealing with safety from some of the most lethal and toxic substances on earth, safety assurances are very critical to survival and well-being of humanity and the environment. Safety assurances for the environment and humanity on this limited finite planet where all people breathe the same air and drink the water, logically, are assigned the highest value and the highest placement on the decision tree. The safety of whole interconnected environment on this finite earth planet, which is the only place we have to live, requires being assigned the highest value. Our whole interconnected environment consists of that which sustains all living organisms in survival, particularly including the high quality clean air in the atmosphere and the high drinking water quality in the water cycle. Without safety assurances, the survival of living organisms within the fragile environment may be critically threatened quickly from extremely lethal and toxic nuclear radio-nuclides; thereby, decisions determined by rational thinking assign the highest value to the critically important survival of humanity and other living organisms, which, in turn, requires safety of the complete environment of this physical world planet earth. The highest value is represented by the highest placement on the decision tree, which, in turn, provides appropriate oversight as the gatekeeper. (0823-3 [Michetti, Susan])

Comment: Appropriate decision-tree placement of environmental safety assurances in the highest position provides appropriate oversight as the gatekeeper of the path. The top of the decision tree begins with required logical pre-emption of dangerous unsolved problems with unknown solutions that get sent back, so to speak, to the "drawing board." Appropriate decision-tree placement and rational scientific thinking does not permit generation of lethal substances that cannot be safely contained throughout their full sets of life-times of thousands and millions of years because they are too dangerous for survival of well-being, health, and reproduction. When safety assurances are given their rightful weight and importance as the primary gatekeeper that drives possibilities in a properly designed scientific decision tree, logic recognizes that sufficient safety assurances would have preempted the most lethal substances on earth from being created in the first place. By logical corollary, only insufficient safety assurances allowed creation of lethal substances for which safe storage or disposal was unknown in the actual physical world. (0823-4 [Michetti, Susan])

Comment: Owners of nuclear power plants are too often not reporting problems accurately, timely, and completely with reliability and trustworthiness of integrity. Leaks require full identification of ionizing isotopes and their concentrations. The requirements of the NRC to protect the environment and public health necessitate that the NRC step up its enforcement actions to the point that complacency is eliminated. If owners of nuclear power plants do not take their responsibilities to the full environment and humanity with the honor of extreme seriousness and full honesty and transparency, then those plants require shut down. Other energy alternatives exist: solar and wind energy are readily available at reasonable costs without lethal risks to humanity and the environment. (0823-48 [Michetti, Susan])

Comment: If safety is an impossibility, we are left in a double-bind quandary. An irrational decision was made when the first nuclear power plants were licensed. That irrational decision arose from lack of rigorous and thorough assessment of the full set of potential impacts from start to ending of ionizing radiation. This involves the complete timeline into the distant future of

each set of each ionizing isotope's complete life span which goes thousands of years. This impossible problem originated with insufficient oversight. (0823-61 [Michetti, Susan])

Comment: Every licensing proceeding should review any safety considerations that are presented for scientific discovery surrounding unexamined assumptions that may introduce unreliability into the evidence and into the decisions, but this does not happen. (0823-70 [Michetti, Susan])

Comment: The extreme lethality of these most toxic substances on earth that, in turn, pose a most serious threat to the continuation of humanity deserves nothing less than complete, thorough, and rigorous scientific view of every detail. Anything less is negligent given the logical potential to wipe out humanity genetically; Malformed humans are already visible in the wake of Chernobyl. Scientific principles and analysis require constant hard work exploring attributes and characteristics with assorted measurements and their insights. Man-made failures with surprises, unpredictable events, and accidents emerge from inadequacies and lack of rigor in the scientific principles and thinking used for assessment, including insufficient testing and faulty application and maintenance; such errors arise from irrationality and the lack of wisdom in oversight. These man-made errors usually involve unexamined assumptions that were overlooked which resulted in accidents. Man-made accidents, even when extremes of climate change provide the final trigger, also likely point the path to lessons to learn to adapt increased safety, but this does not happen sufficiently. These safety issues, created by man's generation of unacceptable lethal toxics, can shed light on the possible discovery of new physical principles and deeper understanding of the information emerging from the data; but this doesn't happen sufficiently without complete transparency, honesty, and open-mindedness in search of environmental safety. Unanticipated weaknesses and structural flaws emerge from inadequate and incomplete scientific assessments where rigor and thoroughness was lacking or from inadequacies in product development and testing. The unknown requires identification and articulation to be accurately precise in scientific assessments. Anything less than complete openness and transparency in the application of the scientific method toward all details and analyses undermine, subvert, and distort scientific thinking and render it distorted and inferior to its full capacity to move us forward. Moving forward with reliable scientific progress requires openness with further testing, observation, and thinking, where the transparent attempts to identify the unknown are articulated as precisely as possible. (0823-71 [Michetti, Susan])

Comment: Moving forward involves the very dealing with the ugly problems transparently and openly that will generate the best responses that will lead to the best solutions. Lack of safety reliability usually emerges from human errors that distorted the accuracy, measurability, and repetitiveness of the Physical World and its physical laws of matter. Lack of reliability may emerge from physical changes that arose from that which was erroneously assumed to be constant, when what they required was additional scientific observation and verification of their constancy. Observations of the Physical World contains very wide and deep reliability in the behavior and reactions of its physical attributes, if considered sufficiently, from the atomic level up, excepting some deeper quantum phenomena and perhaps excepting black hole phenomena. (0823-73 [Michetti, Susan])

Comment: In order to more scientifically discover the facts of how solids, liquids, gases, chemicals, light, and other factors impact function, we request published and peer-reviewed high level scientific replicable research on toxicology, particularly that which involves all forms of various elements and any ionizing isotopes, manmade or found in nature, that are involved in the waste that requires a storage solution. (0823-80 [Michetti, Susan])

Comment: We call for research into the detailed significance of each residual adverse effect on the biophysical environment from any and all elements and ionizing isotopes as well as any other matter that require a long term storage solution. This includes geology, hydrogeology, surface water, terrestrial environment, aquatic environment, radiological conditions, air quality, noise, and vibrations. This includes impacts on human populations, wildlife, fish, insects, birds, plants and trees, including reproduction or gestation of bringing forth new beings. This includes impacts upon the function of warm-blooded humans and animals to generate heat in their blood; upon cold-blooded creatures to circulate blood; and upon plants to circulate sap, deposit green chlorophyll, and color flowers. Impacts on American Indian tribes should be thoroughly identified and studied. This includes impacts upon the function of living organisms to remain organized and to not experience disharmony of vibrations, disintegrating effects, atrophy and excessive early aging, malformations, changes in attraction and repulsion principles, changes in growth patterns. These are not all inclusive lists. Such studies should measure variables involving the full range of elements and their ionizing isotopes that require permanent long term storage in isolation under the actual wide variety of variables found in reality in terms of assimilation, attraction, and selection as well as by expulsion, excretion, and toxicity. Assessment of social context is required as well as ecological context of adverse effect with references to peer-reviewed scientific literature and "grey" literature. (0823-81 [Michetti, Susan])

Comment: To summarize my comments it is obvious that the NRC minimizes the calculated risk and incurred cost of nuclear power, exposing an unknowing public to risks far greater than revealed by NRC reports and documents. (0826-2 [Morgal, Rick])

Comment: Once a more realistic prediction of potential impacts of a spent fuel pool fire is presented it is equally necessary to ensure that until all the spent fuel is placed in dry cask storage there needs to be an education program to alert the entire US population to the health impacts associated with a spent fuel pool fire. The entire US population should then be educated on steps that should be taken in case of a spent fuel pool fire emergency before a spent fuel pool fire is experienced by the general public on TV. The NRC and the federal government should take pro-active steps to ensure immediate availability of potassium iodide tablets to all inhabitants within a 50-mile radius of each nuclear power plant and/or operational spent fuel pool. Current availability of potassium iodide tablets at local drug stores is non-existent. This fact needlessly exposes the surrounding community to significantly increased chances of thyroid cancer a few years after a successful spent fuel fire has occurred. Mainly through radical survivalist Internet-mail-order stores can potassium iodide tablets be purchased, making it virtually impossible for an ignorant general public to attain protection from radioactive iodide becoming concentrated in person's thyroids within the fallout region of a spent fuel pool fire. These tablets need to be available immediately following a spent fuel pool fire to all people within a 50-mile radius of the spent fuel pool. Stockpiles in a few strategic locations across the nation will not provide sufficiently rapid access to protect to the public. It is suggested that a local convenience store like 7-11 be the local repositories of potassium iodide tablets within the 50 mile radius of each of the nation's spent fuel pools with the public being told where to go to obtain the tablets. Additionally these tablets should be distributed to residents within the 50 mile radius of the spent fuel pool. Since Potassium Iodide tablets last 10 plus years this level of protection to the general public would not be that costly compared to the increased number of thyroid cancers that would result from allowing the general public to go unprotected. In the past the NRC has justified not providing these tablets except to residents in a very small radius around a nuclear power plant based upon cost. Fukushima should be a wake up call to the possibilities of a spent fuel pool fire. Due to prevailing winds, had Fukushima been on the West Coast of Japan the human and economic impacts would have been magnitudes greater. (0826-25 [Morgal, Rick])

Comment: Until the NRC incorporates a proactive education program that informs the public of potential impacts to the surrounding community and its inhabitants from a spent fuel pool fire it will be hard to have any sense of confidence in the NRC's approach to the storage of spent nuclear fuel. Additionally this education program must also be coupled with publically known repositories of potassium iodide tablets to provide the surrounding public a sense that the NRC is prepared to protect the public's safety from the dangers of nuclear materials. Seeing that "protection" is the NRC's number one *stated* priority, until that directive is filled with respect to a spent fuel pool fire, there can not be any sense of confidence in any other aspect of how nuclear waste material is stored for tens if not hundreds of years on the past sites of nuclear power plants. (0826-26 [Morgal, Rick])

Comment: Countries like Germany are shutting down their power plants due to the problems associated with accidents and spent fuel storage. (0826-5 [Morgal, Rick])

Comment: GEIS section 1.8.6: NRC has eliminated reprocessing, advanced reactors, and non-power reactors from consideration. While we understand that full consideration of these impacts might be beyond the scope of this GEIS, it would be useful if NRC would add an explanation of how it would separately address these impacts, particularly with respect to any generic consideration that might be conducted. (0827-7-4 [Ginsberg, Ellen])

Comment: Spent fuel storage is our nation's big problem and have to put all the wisdom together to find the best solution possible. NRC has to work hard for its duty of protecting people, but not prioritize big corporation's gain. So, I'll ask each of NRC staff people to work its noble mission hard and put priority first on public safety. (0831-3 [Collins, Yoko])

Comment: In the case of San Onofre, and in fact for all older reactors and reactors in known danger zones, decommission the old reactors, and startup Molten Salt Reactors(thorium) to burn the stored waste as fuel and reduce the danger we face long term (while producing power). In most case we can process in place, without the dangers of moving the waste, AND over time we eliminate an extreme danger zone for terrorist acts. This is not a replacement for sustainable/renewable sources of energy, but a supplement to them that also helps eliminate one of our biggest national security and health headaches. (0833-1 [Lieberman, Bruce])

Comment: The NRC should stop approving high burnup fuel. (0836-5 [Davis, Anonymous])

Comment: Most Americans have not been privy to the facts about Nuclear power plants and the horrific permanent waste they create. My family and I are disgusted with the lax way the NRC operates and how it is basically run by the Nuclear industry. The threat of disaster is real and it is plain stupidity to continue the way we have for decades leaving so much to chance. It's time some changes were made. The public safety should be the utmost concern of the NRC. It is not. Most Americans have no clue what is happening with nuclear and nuclear storage. If they did they'd be very upset. Business as usual, they are not informed of the truth about nuclear intentionally. This is unfair and devious. Too many things are forced on the public without their knowing for the sake of the all mighty dollar and we're paying for it! (0848-1 [Whiting-Broeder, Pamela])

Comment: Is spent nuclear fuel waste? The Department of Energy has determined that the vast majority of the nation's spent fuel inventory should be disposed of without the need for retrieval. Only a small portion is needed for research and possible feedstock for potential closed cycle operation,² [footnote 2 text: *ibid.*] should the significant hurdles of cost and safety of fast reactors be overcome in a few decades. It is often suggested that the US should reprocess

spent fuel despite the high cost and the fact that this multiplies the volume of waste that requires storage in a geologic repository by 6 times, not to mention the extensive pollution of air and water that accompanies reprocessing. Are partitioning and transmutation going to solve the spent fuel problem? Not any time soon nor without significant financial investment, according to the DOE.³ [footnote 3 text: SRS Citizens Advisory Board May 21, 2013 recommendation and DOE's response regarding partitioning and transmutation to reduce the burden of spent nuclear fuel, July 10, 2013, from David C. Moody, Manager, Department of Energy. http://cab.srs.gov/recommendations_2013.html.] While some of the nation's spent fuel is stored in dry cask storage, most is stored in vulnerable, overcrowded spent fuel pools. (0851-4 [Thatcher, Tamij])

Comment: Needed NRC Actions: 1. The NRC should promptly request supplemental appropriations to achieve a full restart of the Yucca Mountain proceeding. 2. The Commission should Order DOE as a party to the proceeding to request supplemental appropriations from Congress and to provide the NRC, under oath and affirmation, with a plan to restart all need DOE activities related to Yucca Mountain. 3. NRC should submit proposed legislation to the Congress that would amend the NWPA to transfer the DOE responsibilities to a new federal-private corporation. The draft legislation should transfer all Nuclear Waste Fund (NWF) fees and prior collections to the new federal-private corporation. This draft legislation should further specify that NWF monies be directly collected by the corporation and not be subject to Congressional appropriations. The NRC Commissioners and staff should vigorously press the Congress for passage of this legislation. In summary, NRC should make appropriate Waste Confidence technical findings and advocate a legislative arrangement where the dictatorial views of a powerful Senator can no longer undermine the Nation's nuclear safety program. Consign the politicians and their acolytes to a smoke-filled room. (0859-4 [Haughney, Charles])

Comment: UPS & Fed X tracks better than you do for radioactive materials be it medical or otherwise. (0862-4 [Thompson, Tammy])

Comment: You are an insult to what you are supposed to stand for & insulting the intelligence of everyone this will harm. I offend you (?) You offend everyone all of us/US & everything environmental without regret. For every child & person suffering or worse in nuclear/radioactive neighborhoods etc. their blood is on your hands. Stop wasting lives; our time & all our futures if my tax dollars are your salary & industry welfare we the people demand a refund. (0862-8 [Thompson, Tammy])

Comment: We must proceed to develop wind energy, solar and find other ways to live. We must be guardians and protect this beautiful earth that we are to care for. This is a monumental job, but it is what we need to do (0870-2 [Anonymous, Anonymous])

Comment: Instead of ignoring the problem, I believe we should let the new generation of scientists attempt to reduce, recycle and reuse the spent nuclear fuel and waste produced during our exploration. (0881-4 [Szymanowski, Jennifer])

Comment: [Will Congress please give the NRC some teeth and make law to] (2) reprocess and reuse nuclear energy[?] (0881-6 [Szymanowski, Jennifer])

Comment: I DON'T THINK NRC CAN IMPROVE THIS SITUATION...(OVER) UNTIL OUR NATION SUFFERS AN EVENT SIMILAR TO CHERNOBYL OR FUKUSHIMA, I SUPPOSE WE'LL HAVE TO TOLERATE THE "SMARTER-THAN-YOU" ATTITUDE I WITNESSED IN THE HEARING. (0895-2 [Stein, Ed])

Comment: • Table S-3 is clearly related to the NRC's findings regarding feasibility of spent fuel disposal, because the NRC has stated that it will not revisit the conclusions in Table S-3 unless it has reason to doubt its waste confidence conclusion regarding the feasibility of spent fuel disposal. 55 Fed. Reg. at 38,491. • As discussed in the Makhijani Declaration, Table S-3 assumes that spent fuel will be disposed of in a bedded salt repository. Based on that assumption, Table S-3 states that the environmental impacts of a spent fuel repository are zero. But Table S-3 is no longer technically valid, because the NRC has ruled out the assumption underlying Table S-3 that spent fuel can be safely disposed of in a bedded-salt repository. Makhijani Declaration, par. 8.20. However, NRC has refused to re-evaluate Table S-3, because – as discussed above – only a change in the waste confidence determination would cause NRC to revisit Table S-3. (0897-7-10 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: In its license renewal rule (Table B-1 of Appendix A to 10 C.F.R. Part 51), the NRC treats the environmental impacts of spent fuel disposal as insignificant for purposes of making license renewal decisions, based on the existence of EPA repository standards, but does not relate this decision to Table S-3, which concludes that spent fuel impacts are insignificant on completely different grounds. The NRC does not explain the inconsistency between Table B-1 and Table S-3. (0897-7-11 [Curran, Diane] [Goldstein, Mindy] [Kysor, Jillian])

Comment: Table S-3 is inadequate, incorrect, or obsolete in a number of respects. First, it assumes disposal in bedded salt; this assumption is obsolete. The NRC itself has ruled out disposal of spent fuel in salt formations on grounds of possible instability during repository operation: Although there are relative strengths to the capabilities of each of these potential host media [i.e., crystalline rock, clay, and salt], no geologic media previously identified as a candidate host, with the exception of salt formations for SNF, has been ruled out based on technical or scientific information. Salt formations are being considered as hosts only for reprocessed nuclear materials because heat generating waste, like SNF, exacerbates a process by which salt can rapidly deform. This process could cause problems with keeping drifts stable and open during the operating period of a repository.¹³⁰ [footnote 130 text: NRC 2010a, p. 81059, emphasis added] (0898-5-1 [Curran, Diane] [Makhijani, Arjun])

Comment: Second, Table S-3's assumption that disposal of spent fuel or high-level waste in bedded salt will result in zero releases (and hence zero radiation doses to the public after repository closure) has been shown to be incorrect as a generic conclusion. The most comprehensive review of radiation releases and radiation doses to the public from deep geologic disposal in a variety of geologic settings was done following the passage of the Nuclear Waste Policy Act (NWPA) in a 1983 study by the National Research Council of the National Academies.¹³¹ [footnote 131 text: NAS-NRC 1983, Chapter 9. Bedded salt radiation dose estimates are shown in Figure 9-5 (p. 262).] This study was commissioned by the Department of Energy. It shows that there is a risk of significant radiation doses¹³² [footnote 132 text: define "significant" doses in this context as being comparable to or greater than those defined in 40 CFR 190.10(a), which limits doses to the public from uranium nuclear fuel cycle operations] in all geologic media that were quantitatively examined, *including bedded salt*.¹³³ [footnote 133 text: See Chapter 9 of NAS-NRC 1983. Bedded salt radiation dose estimates are shown in Figure 9-5 (p. 262).] More recent assessments have confirmed that there is a risk of significant radiation releases and doses from a variety of geologic media. The NRC's assumption of zero releases and radiation doses from deep geologic disposal is therefore incorrect for both high-level waste and spent fuel even for bedded salt repositories. (0898-5-2 [Curran, Diane] [Makhijani, Arjun])

Comment: The other regulation that covers high-level waste disposal impacts is Table S-3 at 10 CFR 51.51. But this table is invalid for estimating high-level waste disposal impacts. Among other things, its underlying assumption of disposal in a bedded salt repository was repudiated by the NRC itself. Therefore, the NRC must prepare a new analysis in the context of its waste confidence decision. (0898-5-22 [Curran, Diane] [Makhijani, Arjun])

Comment: The NRC itself has conceded for well over a decade that the assumption of zero releases and zero doses for geologic disposal in Table S-3 is incorrect. It has not done so in so many words, but it has admitted in other regulatory contexts that radiation doses to the public would not be zero. In 1996, in the first license renewal GEIS (NUREG-1437), the NRC abandoned the zero-release, zero-dose assumption of Table S-3: For the high-level-waste and spent-fuel disposal component of the fuel cycle, there are no current regulatory limits for off-site releases of radionuclides for the candidate repository site at Yucca Mountain. If we assume that limits are developed along the lines of the 1995 National Academy of Sciences (NAS) report, *Technical Bases for Yucca Mountain Standards*, and that, in accordance with the Commission's Waste Confidence Decision, 10 CFR 51.23, a repository can and likely will be developed at some site that will comply with such limits, peak doses to virtually all individuals will be 100 mrem/year or less. While the Commission has reasonable confidence that these assumptions will prove correct, there is considerable uncertainty because the limits are yet to be developed, no repository application has been completed or reviewed, and uncertainty is inherent in the models used to evaluate possible pathways to the human environment. The National Academy report indicates that 100 mrem/year should be considered as a starting point for limits for individual doses, but notes that some measure of consensus exists among national and international bodies that the limits should be a fraction of the 100 mrem/year. The lifetime individual risk from 100-mrem/year dose limit is about 3×10^{-3} . Estimating cumulative doses to populations over thousands of years is more problematic.¹³⁴; [footnote 134 text: NUREG-1437 (1996), p.6-19] 8.23. As the above quote in paragraph 8.22 shows, the NRC cannot even assure that doses will remain limited to 100 millirem per year, the current annual limit in 10 CFR 20, much less any more stringent limit that is recommended by "national and international bodies." (0898-5-3 [Curran, Diane] [Makhijani, Arjun])

Comment: Renewables = common sense (0901-4 [Anderson, Janet M.])

Comment: Bloom Box is the choice of alternative energy for Google, FedEx, Walmart. Fuel cells from beach sand, corporate choice, now solar and fuel cell the rest, so we can trust the process that sustains us. Incredible renewables are waiting to be known and are discovered and realized by all who have the means to know and control what the hell they are doing. (0901-6 [Anderson, Janet M.])

Comment: Do your job. Regulate. Earn the "confidence" label. (0902-10 [Fasten, Susan])

Comment: It helped me to understand that there is no serious interest in properly regulating the deadly technology--only in protecting the nuclear industry. (0902-2 [Fasten, Susan])

Comment: Acknowledge that there are no real solutions to the problems posed by the nuclear industry. Show some humility. (0902-7 [Fasten, Susan])

Comment: Acknowledge that there are no real solutions to the problems posed by the nuclear industry. Show some humility! (0903-4 [Fasten, Susan])

Comment: Do your job. Regulate. Earn the "confidence" label. (0903-7 [Fasten, Susan])

Comment: Quit trying to push their agenda on the public. (0904-1 [Collins, Jessie])

Comment: Start figuring out what other lines of work you would like to go into. (0904-3 [Collins, Jessie])

Comment: I realize it is your job to protect and promote this deadly industry. However, I believe you understand the insanity of it all. (0904-4 [Collins, Jessie])

Comment: Table S-3, Summary of environmental considerations for uranium fuel cycle, contains errors and omissions that may rise to violations of NEPA and several other United States laws. I call your attention to the criticism of Walter H. Jordan, Ph. D., Administrative Law Judge in the TMI#1 Restart Hearings. "Deaths in future generations due to cancer and genetic effects resulting from the radon from the uranium required to fuel a single reactor for one year can run into the hundreds. (See Pohl, Search, Vol.7 No. 8, Aug. 1976). It is very difficult to argue that deaths in future generations are unimportant." Memo for James Yore from W. H. Jordan, dated Sep. 29, 1977, Errors in 10 CFR 51.20, Table S-3. I consider that this admission by an NRC staffer is very impactful as this is an admission of deaths not allowed into the cost benefit analysis and comes from a skilled member of the NRC staff. I request that the entire Table S-3 be re-evaluated to determine if the remaining data points are as deficient. (0906-1 [Lewis, Marvin])

Comment: The STP Nuclear Operating Company (STPNOC) endorses the NEI comments and agrees with NEI's responses to the four specific questions the NRC posed in the Federal Register Notice. Furthermore, STPNOC endorses the industry position that dry storage of spent fuel is a safe means for long term storage. (0914-1 [Koehl, Dennis L.])

Comment: The United States can solve all its problems of waste by going to "Thorium is a natural occurring element found on earth, the moon, mars... essentially everywhere. It is a slightly radioactive metal and is about four times more abundant on Earth than uranium. Because of its fertility, it can be used as fuel in a nuclear power plant. Why is thorium important if we already have uranium-fueled nuclear power plants? A thorium-fueled nuclear reactor generates hundreds of times the power of a uranium or coal power plant but produces essentially no waste. A thorium power plant would produce much less than 1% of the waste that a uranium plant of equal magnitude produces and, of course, would produce no carbon dioxide. More importantly, while the waste of a uranium power plant is toxic for over 10,000 years, the little waste that is produced in a thorium plant is benign in under 200 years. Even more impressive, the thorium power plant can be used to burn our current stockpile of nuclear waste. And yet, the benefits continue. The thorium power plant cannot "melt down", thorium cannot practically be used to make nuclear weapons, there is enough thorium in the United States alone to power the country at its current energy level for over 10,000 years, and the thorium power plant can be designed to be a plug and play module that could tap right in at the source of a current coal or uranium plant so there would be no need for laying a new grid. (0917-2 [Priano, Guy])

Comment: Now, although it sounds like science fiction, the potential of thorium power has already been witnessed. Studies and experiments were conducted from the 1950's until the 70's. Almost 20,000 hours of operation and the true value of thorium was proven as a superlative energy source in the molten-salt reactor experiment (MSRE) between 1964-1975. With all that said, we hear the same question from everyone who hears about thorium for the first time. "It almost sounds too good to be true, why isn't it already in use today?" Surf on if you

are one of these people. You'll find that there isn't a good reason."
<http://www.thoriumenergyalliance.com/> (0917-3 [Priano, Guy])

Comment: Re: footnote 3 at the bottom of Page 1-17, it should be pointed out that 80 years of operations should just be assumed, as a given, if NRC's granting of rubberstamps for 60 years of operations is any indication. Of 73 license extensions for 20 additional years of operations sought, all 73 have been approved by the Nuclear Rubberstamp Agency. Not one has been denied, no matter how age-degraded or problem-plagued the reactor, no matter how rogue the nuclear utility applying for the extension, nor how non-existent the safety culture amongst the reactor's management and workforce. The most painful such example, perhaps, was Vermont Yankee - NRC staff rubberstamped its 20-year license extension, despite deep, widespread opposition throughout Vermont and neighboring states, within days of the Fukushima triple-meltdown, at reactors of identical design and vintage to Vermont Yankee - GE Mark Is BWRs. If any applicant approaches NRC for approval for 80 years of operations, a rubberstamp is all but assured. NRC is itself a rogue, captured agency, captured by the industry it is supposed to regulate. This is very frightening, and dangerous. The Japanese Parliament concluded that the root cause of the Fukushima nuclear catastrophe was collusion between industry, regulator, and elected officials. We have that in spades here! (0919-3-9 [Kamps, Kevin])

Comment: At lines 23-24, NRC states "In accordance with 10 CFR 72.42, the initial license term for an ISFSI must not exceed 40 years and licenses may be renewed upon NRC approval for a period not to exceed 40 years." This reflects a decrease in NRC safety oversight, over time. In the early 1990s, casks were certified for 20 years of operations, with the option for 20 year renewals. But last decade, by a split vote (Chairman Diaz dissented), the NRC Commission allowed for 40 year extensions at one fell swoop. That first one went to Surry, which happens to have the oldest ISFSI in the U.S. Prima facie, it is fair to say that NRC doubling ISFSI license extensions from 20 to 40 years (both for initial licensing, and for license extension) marks a significant decrease in regulatory oversight. (0919-4-2 [Kamps, Kevin])

Comment: As mentioned above, 437 environmental and environmental justice groups protested NRC's licensing of PFS (see their letter, posted online at <http://www.nirs.org/radwaste/scullvalley/skullvalleygoshutesgroup1tr772005.pdf>). But NRC's oversight has been weakened even more since then, now allowing 40 year initial licensing for ISFSIs, followed by 40 year license extensions. (0919-4-5 [Kamps, Kevin])

Comment: As the old saying goes, "follow the money." Why are such potentially catastrophic societal risks taken by industry, and allowed by NRC? Well, vast fortunes are being made. The nuclear power industry, with lots of help from friends in government, have largely succeeded in externalizing their costs, risks, and liabilities onto the public, whether the rate-paying public, or the taxpaying public (actually, most people I know are both ratepayers and taxpayers!). Meanwhile, the industry pockets the profits made from large-scale electricity generation, not to mention the large-scale subsidies enjoyed, again, at the expense of the public. Why does industry and NRC work so hard to convince themselves and others that nothing could possibly go wrong with irradiated nuclear fuel? Why don't they do the health studies re: what "routine" radioactivity releases alone are doing to health in the area of atomic reactors and irradiated nuclear fuel storage sites, let alone the health and safety risks from potential disasters? To do so would risk the lucrative business they profit from, of course. So risks are downplayed in the public arena, while their armies of lawyers make sure, behind the scenes, that the companies will not be held liable if the worst happens. The public will be left holding the bag, yet again. Upton Sinclair's famous quote is apt: "It is difficult to get a man to understand something, when his salary depends on his not understanding it." (0919-5-8 [Kamps, Kevin])

Comment: Since trust is largely a function of how one is treated by another, it is a fair and realistic question to ask: how can the public have ANY confidence in an Agency with a track record like this?: (0921-3 [Kamps, Kevin])

Comment: By a 4 to 1 vote, the Commission voted against quicker implementation of Fukushima lessons learned, delaying them at U.S. Fukushima-type reactors for up to 6 years. Those four Commissioners later forced out the Commission Chair Gregory Jaczko-the only one in favor of more rapid implementation of safety measures. - According to authors John Byrne and Steven Hoffman, since the 1980s the NRC has generally favored the interests of nuclear industry and has been unduly responsive to industry concerns. The NRC has often failed to pursue tough regulation. At the same time, it has sought to hamper or deny public access to the regulatory process and created new barriers to public participation. (Source: Governing the Atom: The Politics of Risk, 1996) (0921-5 [Kamps, Kevin])

Comment: At the December 9, 2013 NRC Waste Confidence Draft Generic Environmental Impact Statement (WC DGEIS) call-in public comment meeting, I mentioned in my oral comments that day, in response to a previous commenter, that reprocessing of high-level radioactive waste -to extract still-fissile plutonium and uranium isotopes - is the single worst thing one can do with irradiated nuclear fuel that already exists, other than dumping it directly into the environment, that is. Making irradiated nuclear fuel in the first place was the first major mistake; reprocessing it would compound the mistake. The reasons for this include nuclear weapons proliferation risks, unleashing large-scale radioactive contamination that harms human health over wide regions, and an astronomically expensive price tag, which would be foisted onto the public's back, yet again. All that, and *we'd STILL need a dumpsite!* Please accept the attached pamphlet, "NUCLEAR FUEL REPROCESSING = WEAPONS PROLIFERATION: An inseparable link between nuclear power & nuclear weapons," as additional public comment in the Nuclear Waste Confidence DGEIS proceeding, as rebuttal against reprocessing being any sort of solution, given its very high costs and risks, given that it's dirty, dangerous, and expensive in its own right, as is nuclear power and radioactive waste in the first place (please also find attached the Beyond Nuclear pamphlet entitled "Dirty, Dangerous, and Expensive: The Verdict Is In On Nuclear Power" (created by Beyond Nuclear board member Kay Drey of St. Louis, MO). (0922-1 [Kamps, Kevin])

Comment: Prohibit reprocessing: The reprocessing of irradiated fuel has not solved the nuclear waste problem in any country, and actually exacerbates it by creating numerous additional waste streams that must be managed. In addition to being expensive and polluting, reprocessing also increases nuclear weapons proliferation threats. (0927-10 [Kamps, Kevin])

Comment: Dr. Arjun Makhijani, President of IEER, and one of the expert witnesses on behalf of an environmental coalition representing dozens of groups, including Beyond Nuclear, in this proceeding, coined the phrase "Hardened On-Site Storage (HOSS)" at a national environmental gathering in April 2002 held in Middletown, CT at Wesleyan University. The event was organized by Citizens Awareness Network of the Northeast. The Statement of Principles for Safeguarding Nuclear Waste at Reactors, an explication of HOSS, was first unveiled on Capitol Hill at a U.S. House hearing in September 2006 by Michele Boyd, on staff at Physicians for Social Responsibility. Already at that time, the Statement had been endorsed by well over 100 groups, representing all 50 states. The Statement of Principles was updated in August 2009 to include concerns about reprocessing. By March 2010, well over 170 organizations had signed on-including a number of coalitions, such as Alliance for Nuclear Accountability (a network of some three dozen groups), Michigan Environmental Council (a state-wide coalition of more

than 70 groups), etc. Thus, the Statement is endorsed by hundreds of groups, representing all 50 states. (0927-2 [Kamps, Kevin])

Comment: Unfortunately, reprocessing proponents have used this opportunity to promote reprocessing as the solution for managing our nuclear waste. Contrary to their claims, however, reprocessing is extremely expensive, highly polluting, and a proliferation threat, and will actually complicate the management of irradiated fuel. Nor will reprocessing obviate the need for, or "save space" in, a geologic repository. The United States has a unique opportunity to re-evaluate our nuclear waste management plan. We can make wise decisions about safeguarding radioactive waste or go down the risky, costly, and proliferation prone path towards reprocessing. (0927-5 [Kamps, Kevin])

Comment: More and more thorough inspections on current facilities are desperately needed. (0932-2 [Bridgeman, Janis])

Comment: MANY have already been relicensed, deemed safe with attempts to have them relicensed well before their first license any where neared those forty years. At a meeting in April of 2013, when questioned about the factoring of climate change and whether or not it was taken into consideration before relicensing, the answer was no. (0933-4 [Anonymous, Janet])

Comment: The NRC has been recklessly pursuing very long license extensions for nuclear power facilities which will be very fortunate to chug along to the end of its operating license -- let alone be able to safely operate for many additional decades. This point is related to my concern (under my Point B) about the distinctions between the radwaste sitting at commercial nuclear power facilities whose licenses have terminated (such as at San Onofre) and the radwaste sitting at commercial nuclear reactor sites where an operating license is still in effect (or to which a long license extension was granted sometimes even a decade before the current license is set to expire.) (0937-17 [Campbell, Bruce])

Comment: I realize that the alleged definition of "waste confidence" is necessarily referring only to the radioactive waste being stored after the operating license at a commercial nuclear power facility expires, and before this waste may eventually be taken to a geologic repository or to an interim storage site. Are there other documents and rulemaking procedures which deal with the radioactive waste which is stored at nuclear power facilities during electricity generation, refueling, and other phases preceding the expiration of the operating license? How does one find such documents? (0937-3 [Campbell, Bruce])

Comment: Adding to its ridiculous nature is the fact that the NRC takes the nonsensical steps of seeking to (and sometimes succeeding in) extend operating licenses at nuclear power facilities many decades beyond when regulators believe that the facilities will cease generating electricity. Most reactors need luck in operating through the end of their operating license -- let alone be able to successfully operate for additional decades. (0937-4 [Campbell, Bruce])

Comment: The NRC is too closely involved with the nuclear industry to make an objective decision regarding waste generation. (0938-2 [Sondheim, Steven])

Comment: Exelon supports the comments submitted by the Nuclear Energy Institute (NEI) on behalf of the industry related to this subject. (0942-1 [Helker, David P.])

Comment: Why doesn't the US start developing thorium reactors more? These would not only be cheaper and safer to run than the current nuclear reactors, but they would also use the radioactive waste as fuel, getting rid of it. (0966-1 [Hunt, Le])

Comment: Finally and most importantly, how about funding development of Liquid Fluoride Thorium Reactors? (0969-1 [Falis, Edward])

Comment: Until our Government DEMANDS that the CEO's and their worker's take ownership of the residue toxins they leave behind, and demand they live in these Communities, nothing will change. But they have outrageous incomes, whereby they can live (CEO'S) anywhere on the planet they please, far, far way, from the health hazards, they create. (0973-2 [Johnson, Bobie])

Comment: Also, we need to put more resources into nuclear fusion. This technology would solve all our energy problems not to mention our economic, geopolitical and environmental ones. (0976-1 [Sears, Peggy])

Comment: Switch immediately to proven demonstrated redundantly safe Thorium Reactors that can even reuse these wastes as fuel enough for generations of generating species wide! (0979-1 [Paul, Stephen])

Comment: We have a most hateful, unconcerned, spiteful Congress interested ONLY in a pay check and keeping the NRA dollars flowing. Congress doesn't give a damn about climate, nuclear waste or any dangers pollutants in the water we drink. (0980-1 [Brave, Jacqueline])

Comment: And what about recycling spent fuel rods like some other countries due??? (0981-1 [Levine, Jeff])

Comment: I would like to see the U.S. like France turn their spent rods back into reusable rods instead of letting them sit around and be dangerous. (0983-1 [Webb, Hubert])

Comment: Unfortunately, our elected officials have been driven by greed and the power of the wealthy instead of concentrating on the dangers caused by dangerous hazardous chemicals...as they have with the petroleum companies. (0989-1 [Wells, Harmony])

Comment: But for you to continue to perpetrate this blatantly obvious fraud that nuclear waste can be disposed of safely is criminal ,hasn't our federal Government and it's many agency's already proved to be corrupted as well as totally and completely disgraced this nation and the ideal's it boast's of daily . We think it's time just one of you treasonous failure's stepped up to finally earn the pay checks you steal each pay cycle you should be jailed and forced to return the pay you defrauded the American tax payer out of . OR DO YOUR JOB before we do it for you . now you don't have to take my word for it you can certainly continue to do the job you pretend doing and defraud the public until retirement or you can retire free of disgrace by just doing your bullshit job .. (0991-1 [Lavery, Michael])

Comment: Nuclear Regulatory Commission, where are you and why aren't you doing your job? We had this conversation after Fukushima. Why are we still having it and why hasn't anything been done? My recommendation: Send all used nuclear rods to Texas. I'm sure the Texas governor, their brilliant leader Rick Perry will certainly know what to do with them. And he can always get up to date advice from George W. Bush, our former fearless leader. (0992-2 [Thaw, Karen])

Comment: Also, please consider the health effects on the people who live and work near uranium mines. Take time to research the health effects on the Navajo Nation regarding uranium mining. (0993-1 [Henning, Marcia])

Comment: Finally, the EIS should consider the option of using THORIUM IN CURRENT nuclear plants and not making any nuclear waste at all in the future by comparing the environmental footprint of nuclear from mining to long term waste disposal to that of renewables and energy efficiency. (0994-1 [Severance, Beth])

Comment: THIS IS EMBARRASSING - AND SCARY! UNLESS NRC CAN TAKE ITS RESPONSIBILITIES SERIOUSLY, IT WILL BE TIME FOR CONGRESS AND/OR THE PRESIDENT, NOT JUST A COURT, TO INTERVENE, FOR OUR SAFETY. IF CURRENT PERSONNEL CAN'T FACE UP TO NUCLEAR INDUSTRY INTERESTS, MAYBE NEW FACES ARE CALLED FOR. (0997-1 [Goodwin, Liberty])

Comment: It is clear that the Nuclear Regulatory Agency sees it's purpose as providing the least possible regulation. The reason for that is clear and two-fold: agency commissioners and employees are devotees of nuclear power, and agency commissioners and employees look forward to working for the nuclear industry at high salaries when they leave "public" service. (0998-5 [Rosanelli, Donald])

Comment: It would be responsible to research the possibility of small triple-safe reactors that CONSUME as fuel, rather than generate, radioactive waste. (1002-1 [McNair, Robert])

Comment: IT IS AN OUTRAGE THAT THE NRC PURSUES IT'S IMPERIAL INTEREST IN PROFIT AS FAR MORE IMPORTANT THAN THE CONSEQUENCES OF SICKENING AND DESTROYING HUMANITY AND THE EARTH. THE NRC MAY KNOW A FEW THINGS, BUT THE REALITY AND THE TRUTH CONSISTENTLY REVEAL THAT YOUR DECISIONS ARE NOT BASED ON ADEQUATE KNOWLEDGE AND PUBLIC SAFETY BUT A PATHOLOGIC, GREEDY POLITICAL PURSUIT OF POWER...(NO BLOODY, CANCEROUS PUN INTENDED)WE ARE OPPOSED TO THE WAY YOU DO BUSINESS, WHICH KEEPS US ALL IN DANGER. WE ARE OPPOSED TO YOUR CARELESS MANIPULATIONS. (1004-1 [Dimondstein, Carla])

Comment: THE NRC IS A CORPORATE LOBBYING ENDEAVOR, AND NEEDS TO BE RETIRED, ALONG WITH ALL NUCLEAR PLANTS. THE LONGER THE NRC MAKES THESE DECISIONS, THE BIGGER THE MESS, MORE PROFOUND THE DISASTERS. (1004-3 [Dimondstein, Carla])

Comment: SCARY BEYOND COMPREHENSION! THE NRC IS A HOMICIDAL, CRIMINAL CARTEL, AND STUPID, IF YOU THINK WE'RE NOT PAYING ATTENTION! (1004-5 [Dimondstein, Carla])

Comment: Sixty years ago, while an undergrad at UCB, I waited table at the Claremont Hotel, where the AEC members had their conferences. As the Quakers were sending asparagus to Eisenhower and the AEC was issuing press release statements that everything was safe to eat, I was the waitress for the head table where I watched Glenn Seaborg, Ed Teller, and other dignitaries push all dairy and veggies away. In my early twenties, this was my first lesson in authoritarian duplicity. By congressional legislation, the AEC changed it's name to the NRC in 1974, in hopes of moving away from a poor reputation due to its lies and obscurations. I have hoped all my life that things would change, but Fukushima has demonstrated that there is still no honesty on the part of the overseers. Please prove me wrong. Please reverse this

dishonesty, and be honest about the hazards of the god-like power of nuclear fission. Having taken these awesome powers into our hands, it is mandated that we must evolve a higher, more god-like consciousness. As Einstein referred, "We must change our mode of thinking." You can do that now! (1005-1 [Vilen, Sydney])

Comment: How much could nuclear energy lobbyists be lining the pockets of the commission? Please do the right thing. (1008-1 [McMillian, C.C.])

Comment: I am all for eco-nuclear power (recycle waist) and eco-fracking (eco-liquids in ground) with transparent regulations to keep this industry honest. If these regulations are not enforced, big business will do everything they can to increase their profits with total disregard for the health and wellbeing of society and our environment. (1009-1 [Levine, JR])

50. Out-of-Scope Comments – HOSS and Expedited Transfer

Comment: Petition for rulemaking (PRM-72-6), item number 11, requests that the NRC ... "require Hardened On-site Storage (HOSS) at all nuclear power plants as well as away-from-reactor dry cask storage; that all nuclear industry interim on-site or off-site dry cask storage installations or ISFSIs be fortified against attack." Consequently, item 11's technical content appears to be relevant to the scope of the proposed rulemaking and it is mentioned in the draft technical basis. Therefore, the NRC may consider this petition in the course of developing the proposed rule. However, the NRC has not yet reached a decision on acceptance of this petition and this notice does not prejudice the agency's final action on whether to accept the requests in PRM-72-6. (0001-21 [Griffin, William] [Sipos, John] [Snook, Robert] [Springer, Darren])

Comment: For the HLRWs that already exist, require Hardened On-Site Storage (HOSS). Hundreds of environmental and public interest groups, representing all 50 states, have endorsed the Statement of Principles for Safeguarding Nuclear Waste at Reactors, which describes HOSS. Where possible, densely-packed, vulnerable HLRW storage pools, at risk of catastrophic fires and radioactivity releases, should be emptied into on-site dry cask storage that is "hardened": designed and built well, safeguarded against accidents, fortified against attacks, and protected against leakage into the environment. This should be expedited as a national security top priority. Locations where HOSS is not safe (places vulnerable to flooding, for example), hardened dry cask storage should be done as close to the wastes' point of generation as possible, as safely as possible. HOSS must be monitored and retrievable, and is but an interim measure. HOSS cannot be a permanent measure on the sea coasts and fresh water sources (rivers, lakes, reservoirs) of our country, due to rising sea levels and risk of leakage into our vital drinking water supplies. (0002-2 [Commenters, Multiple])

Comment: Hardened-on-site storage at relatively safe sites (not prone to earthquakes or flooding, etc.) should be the minimum standard for the existing waste. (0009-2 [Schwartzberg, Lora])

Comment: Nuclear waste should not be stored in pools for longer than 5-10 years. The improved HOSS (Harden On-Site Storage) method must be implemented for safe dry cask storage at reactor sites. (0023-10 [Bridges, Martha])

Comment: [E]liminating some of the spent fuel; and I'm not talking about some of the hotter fuel, and taking them out of the casks and taking them out of the pools and putting them in the dry storage sounds like probably the best that we can do to lessen the consequences of a drain

down, or of a fire, or of an earthquake. But, you know, I'm not sure if it was even addressed in this environmental impact. (0030-15-8 [Gray, Erica])

Comment: For the 70,000 metric tons of commercial high-level radioactive waste that already exists in the United States, for well over a decade a coalition of hundreds of environmental groups representing all 50 states have called upon the Nuclear Regulatory Commission to implement hardened onsite storage as a regulatory mandate to empty the vulnerable pools which are at risk of leaks and fires due to accident or attack or simple age degradation into hardened dry cask storage that is designed and built well, designed to last for not decades but centuries without leaking into the environment, designed to withstand terrorist attacks, and designed with safeguards against accidents, such basic safeguards as radiation monitors, heat monitors, and pressure monitors, which are not currently required. (0030-2-5 [Kamps, Kevin])

Comment: For that which already exists ---- some 70,000 metric tons worth in the U.S. ---- hundreds of environmental groups representing all 50 states have called on NRC for over a decade to require hardened on-site storage (HOSS). HOSS would empty the densely packed storage pools, vulnerable to leaks and catastrophic fires, into quality dry cask storage, that is designed and built to last not decades, but centuries, without leaking its deadly contents into the environment. HOSS would also be designed and built with fortifications against attacks, and safeguards against accidents, including such basic measures as monitors to track heat, pressure, and radioactivity, none of which are currently required. Although HOSS is but an interim measure, it should be mandated as a national security priority of the highest order. (0034-4 [Wagner, Jim and Virginia])

Comment: Secondly, high-level waste should be stored in hardened on-site storage or dry cast storage. (0035-2 [Fulton, Doris])

Comment: In addition, the transfer of waste from the pools to dry storage becomes more dangerous if we wait to do this transfer in the future so we should not delay. (0035-4 [Fulton, Doris])

Comment: While we are working on the solution, I am also concerned that many of our nuclear reactors have overcrowded fuel pools on site. These present safety threats to the communities and industries that surround the plants. The NRC should take immediate action to reduce the number of fuel assemblies in the water-filled pools. (0039-5 [Littlejohn, Nick])

Comment: Before transferring the fuel rods to cask storage, the cask storage needs to be examined and reinforced to be able to safely store the fuel rods particularly those that qualify as high burn up fuel. Hardened on-site storage of the casks should become the choice for storage. (0039-6 [Littlejohn, Nick])

Comment: We need to make sure that all waste is done as hardened on site storage. And that the NRC does not begin to issue licenses again until that is a state of the art nationwide. (0045-1-2 [English, Becky])

Comment: First, require all reactors to immediately harden the structures housing spent fuel pools, since at a minimum, spent nuclear fuel will have to stay in them for about five years for primary cooling. They are dangerous and vulnerable. We only need to look at Fukushima to see the very much imperiled spent fuel at the top of those reactors. (0045-6-5 [Andrews, Richard])

Comment: Second, move as quickly as possible to remove the spent fuel from fuel from cooling pools and into hardened dry casts that are small enough for transport. Not 125 to 150 tons, those are just too large for transport. (0045-6-6 [Andrews, Richard])

Comment: Third, the key difference from many other commenters, particularly from the environmental community and what I'm saying is, I want all of those casks removed to off-site facilities remote from heavily populated areas. And placed and dispersed arrays of burial bunkers to make them less vulnerable to terrorist attacks, and reduce the consequences if attacked. (0045-6-7 [Andrews, Richard])

Comment: Please insist that all above ground pools be emptied of rods that are 5years old and older and placed in dry cask storage. This is absolutely essential for all reactors that are shut down and waiting for decommissioning to begin because there will be fewer staff available to deal with any emergency. STORING SPENT FUEL IN DRY CASKS IS SIGNIFICANTLY SAFER THAN IN SPENT FUEL POOLS. PLEASE PROTECT THE PUBLIC! (0048-2 [Davidson, Judith])

Comment: It should also become obvious to observers that where high-level radioactive wastes already exist, Hardened On-Site Storage is the only immediately acceptable interim measure. This should be expedited as a top priority for our national security. (0052-3 [Tietjen, Jamie])

Comment: Please stop making nuclear waste. It is not safe and never will be. At least, use hardened storage. That makes waste somewhat safer. Indefinite storage is never safe. (0056-1 [Poulson, Judi])

Comment: Before transferring the fuel rods to cask storage, the cask storage needs to be examined and reinforced to be able to safely store the fuel rods particularly those that qualify as high burn up fuel. Hardened on-site storage of the casks could become the choice for storage. (0057-3 [Lamont, Dana])

Comment: Require all reactors to harden structures housing spent fuel pools since at a minimum SNF will have to stay in them for about five years for primary cooling. (0059-12 [Andrews, Richard])

Comment: Move quickly to remove all possible spent fuel from cooling pools and into hardened dry casks of small enough size for transport (0059-13 [Andrews, Richard])

Comment: The NRC claims that security measures have improved since 9/11 but no real actions have been required to secure the structures housing SNF, to make them hardened and not penetrable... and that quite frankly is not possible to accomplish under a determined attack. Scores of spent fuel pools remain in nothing more than a fragile shell of a building, yet contain far higher levels of radioactive materials than the reactor cores themselves. Even partially loss of cooling water or pool level could create a disastrous radioactive steam cloud, and potentially a zirconium oxidation fire releasing far more radioactivity than in the core. (0059-6 [Andrews, Richard])

Comment: In the meantime, for short- or interim-term storage, we urge the NRC to require immediate implementation of dry cask storage for adequately cooled spent fuel. (0064-2 [Skud, Bruce])

Comment: The NRC should require all nuclear power plants to move spent fuel into dry cask storage to minimize the risk to the public immediately after the spent fuel has cooled. Dry cask storage is inherently safer than wet storage of spent because it is air cooled. Wet storage depends on electrical generators to keep spent fuel cooled. Should generators fail and the ability to circulate cooling water be lost, the public would be put at serious risk. Geologic or weather-related events could disable the electrical generation used for wet storage, possibly setting off fires and radioactive release. (0064-9 [Skud, Bruce])

Comment: 70,000 metric tons of commercial high level nuclear waste have been created so far, with no long-term storage solution in sight. Overcrowding in irradiated/spent fuel pools is an unacceptable risk to the public. The NRC should take immediate action to reduce the number of fuel assemblies in the water filled pools, as well as analyzing the deficiencies of the current dry cask storage. (0065-1 [Payne, Gail])

Comment: Please require that radioactive waste be removed from spent fuel pools and stored on-site in protected casks, until long-term storage can be completed. In the absence of a long term repository for the nation's high level nuclear waste, the waste will continue to be stored onsite at the nation's operating and shut down reactor sites. A federal judge has ruled that the NRC's existing waste confidence decision is invalid in large part because of legitimate concerns about the potential environmental consequences in the event of a radiological release. For this reason, numerous independent experts have recommended the accelerated transfer of spent radioactive fuel from densely packed pools at reactor sites to much safer, more secure dry cask storage. Because these casks don't require electricity to cool the waste, they are far less vulnerable -- from severe weather, seismic events or terrorist attacks -- and therefore much less likely to result in a major release of radioactivity which would have potentially devastating human AND environmental consequences. (0071-1 [Borie, Edith])

Comment: The tens of millions of Americans who live near these de facto nuclear waste sites deserve to know that everything that can be done to minimize the risks to them is being done. The NRC's claims that there is no real safety difference between wet or dry storage -- only because they make the mistake of assuming that an unlikely event will never happen. Everyday, we are reminded that the improbable is becoming more probable -- severe storms like Hurricane Sandy, deadly hurricanes, tsunamis -- as a result of global warming. Assuming a bad event won't happen is the height of irresponsibility and runs counter to the NRC's primary mission of protecting public safety. The NRC is currently revising its waste confidence rule as required and in so doing it should stress that it will enact policies that will require reactor owners to thinning out spent fuel pools as quickly as possible after the fuel is cool enough to do so. (0071-3 [Borie, Edith])

Comment: New rules, yes! Rules that require that fuel assemblies in overcrowded onsite fuel pools be removed and placed in hardened, on-site cask storage within a reasonable time and before reactors are relicensed. (0075-4 [Hill, Barbara])

Comment: Next, move toward hardened on-site cask storage of spent fuel rods. (0078-3 [Mock, Neal])

Comment: As Fukushima continues to demonstrate, fuel stored in spent fuel pools is not safe from environmental hazards such as earthquakes and floods. The pools at Fukushima continue releasing irradiated water that crosses the Pacific to our shores, more than 1 year after the Fukushima disaster, and a "permanent" solution is not yet in sight. Clearly, storing spent fuel

rods in pools does not insure long term safety, yet some storage pools in the US already hold as much as 9 times the amount of spent fuel they were designed to hold. (0086-2 [Lewis, Carol])

Comment: NRC should also require use of hardened onsite storage to mitigate these risks, and should investigate the environmental impacts of failure of a single or multiple dry casks. (0089-7 [Shaw, Sally])

Comment: Irradiated fuel casks can withstand environmental disasters that spent fuel pools cannot, as evidenced by the continued function of the dry casks at Fukushima. The casks survived the 9.0 quake and continue to protect the irradiated fuel, even though the tsunami flooded them. These containers have not exploded; are not on fire; are not catastrophically leaking and do not require ongoing addition of liquid to cool. They are out-performing the pools on the site. (0089-8 [Shaw, Sally])

Comment: In the meantime, for short-term storage at plants we [No More Fukushimas] urge the NRC to require immediate transfer from wet storage to dry cask storage. (0112-10-2 [Skud, Bruce])

Comment: We need the NRC to get a grip on reality and to help us. We cannot have the fuel in the pool for 60 years or 40 years or 20 years. We need it expeditiously moved out of the pool and into dry casks. And that's going to cost hundreds of millions of dollars that we don't have. I hope the staff is writing this down because this is going to be a big problem at other merchant facilities. A big mistake was made when we moved into the merchant mode with these plants. And now we're seeing the reality unfolding in Vermont. So I would ask that you, you know, take a moment as you're working on your Confidence ruling here or Confidence rule here and get a grip on reality with regard to leaving that much waste in a pool at a single reactor site for 60 years. (0112-15-4 [Williams, Chris])

Comment: We support expedited transfer of a spent fuel and hardened dispersed dry cask storage. (0112-3-7 [Lampert, Mary])

Comment: [M]oving all spent fuel to hardened storage that can withstand climate change, power outages, accidents, and terrorism. (0112-31-8 [Johanson, Birgit])

Comment: Along with hundreds of other groups and many others here, we [Seacoast Anti-Pollution League] strongly support hardened on-site storage of this waste and removal of the fuel that's in the spent fuel pool as soon as possible. After Fukushima it's really getting absurd for the NRC and the industry to argue that dry cask and wet pools are equally safe. We've had a live action, full-scale experiment with extended power outages and water pump loss and the casks remain safe at Fukushima while the pools boiled, caught fire, exploded, you name it. I think that should make the point pretty clearly that these two approaches are not the same and they do not make us equally safe. (0112-5-4 [Bogen, Doug])

Comment: We can't afford to continue to maximize acceptable risk by filling or overfilling these pools while avoiding the cost of dry cask storage. We can pay some now to deal with this problem or pay much more later. And we'd rather not pay for it with our health and those of our children or grandchildren. (0112-5-6 [Bogen, Doug])

Comment: To protect against possible flooding in plants located on the coast, hardened dry cask storage as close to the source of generation as possible is recommended as an interim measure. (0112-6-4 [Wrenn, Nancy])

Comment: All of the fuel pools [at the Vermont Yankee Nuclear Power Station] should be immediately transferred into dry cask storage. Now, are we happy to have -- you know, I think we're going to end up with something like 60 dry casks on the banks of the Connecticut River. No. But I live five miles from those spent fuel -- that spent fuel pool and the risks are undeniable. And the improvement, the reduction of those risks is equally undeniable when you move to dry cask storage. (0112-7-6 [Sachs, Leslie Sullivan])

Comment: In regard to this Environmental Impact Statement, I do not believe that leaving the waste for 50 years in the pool at Vermont Yankee will be anywhere near as adequate as putting the waste into dry casks. That pool, again, as my wife said, is 50-feet, 60-feet off the ground. It's the Boiling Water Mark 1 Reactor. (0112-8-2 [Sachs, Gary])

Comment: To protect against possible flooding in plants located on the coast hardened dry cask storage as close to the source of generation as possible is recommended as an interim measure. (0116-4 [Wrenn, Nancy])

Comment: I support your REQUIRING ALL nuclear contractors to store all existing high level radioactive waste in Hardened On-Site Storage (HOSS). HOSS, dry cask storage that is "hardened" means: -designed and built well (not "cheaply"), -safeguarded against accidents and routine wear-and-tear (continuously monitored by trained personnel), -fortified against attack (treated as a national security top priority), -and protected against leakage into the environment (0 bq). HOSS cannot be permanently located on seacoasts and fresh water sources (rivers, lakes, reservoirs, underground aquifers) because of risk of poisonous leakage into our vital drinking and agricultural water supplies. Densely-packed, currently vulnerable HLRW storage pools, at risk of catastrophic fires and radioactivity releases, should be emptied immediately into on-site HOSS. For some inexplicable reason (if not the convenience of industry financiers), you have permitted nuclear power plant generators to be built next to rivers and oceans, free sources of water for cooling pools. These locations are not safe; they are vulnerable to flooding. Therefore, hardened dry cask storage should be done as close to the wastes' point of generation as possible, but on-site only as an interim measure. (0127-1 [Lee, Catherine])

Comment: The very real risks of nuclear waste continue at reactor sites which should have at the very least hardened on-site storage systems. (0139-2 [Hodik, Barbara J.])

Comment: We must beware! Get this stuff in dry casks as soon as possible and please require strict limits on how much spent fuel is allowed in the pools and how long they can remain there...should not be more than 5 years. Our waters will not keep up with more demand. (0145-2 [Sorensen, Laura])

Comment: Hardened on-site storage of the casks should be the choice for storage. (0149-2 [Powell, Michael])

Comment: Concrete and steel dry casks, on the other hand, do not require electricity because they are passively cooled by natural air flow. The dry casks at the Fukushima plant in Japan, for example, went relatively unscathed after the March 2011 disaster there. Independent experts at the Union of Concerned Scientists and elsewhere agree that radioactive waste that has cooled sufficiently should be transferred to dry casks. As the waste must eventually be transferred to dry casks in order to be shipped offsite, why not demand that this happen sooner rather than later and improve safety right now???) I would like to add my voice to those asking the question - Why have we not made our nuclear waste more secure??? - Do we want a terrorist attack on

our nuclear plants? Please do the sensible thing and begin the transfer of this nuclear waste into dry casks. Lets not wait until we have a disaster (0151-1 [Gale, Robert and Beverly])

Comment: Our [RiverKeeper] main concern with Indian Point and with the nuclear waste stored at Indian Point, we have currently over 200 metric tons of highly toxic, highly radioactive waste at the site. Our main concern is that the waste stored in the pools is vulnerable to terrorism, is vulnerable to accidents, it's leaked into the Hudson River, and so the overarching need, both immediately and in the long term, is to move the waste out of the spent fuel pools and into dry casks. (0163-2-2 [Musegaas, Philip])

Comment: At present hardened on-site storage (HOSS) seems to be the only solution, even though it obviously cannot be the final answer for safe storage that must last for thousands of years. (0174-3 [Thomas, Ellen] [Thomas, Ruth])

Comment: In achieving SCFE and satisfying our necessary corollary of making zero toxic nuclear waste we also can greatly reduce, and in effect, cap the magnitude of safe storage space needed. This will save money, helping alleviate our national debt burden as well as requiring less off-limits, posted land. I encourage you to make Hardened On Site Storage (HOSS) a significant component of your recommendations. Not only does HOSS eliminate the costs of transit and the dangers to public health from inevitable accidents, spills, leaks, fires on our highways, but it keeps the toxic waste where it already is-on already posted, off-limits, secured sites. These sites will be with us as such for a long time, even after nuclear power generation is phased out. 4. I urge you at NRC to bear in mind, to emphasize the merit of satisfying our necessary corollary and HOSS in forming your proposals for nuclear waste containment and storage. Our long term health and sustainability depend on it! (0188-2 [Howarth, Robert])

Comment: Instead of a so-called temporary proposal of transporting large quantities of these materials, our experts should adopt the safer plan of storing them in dry hardened, secure on-site facilities until a permanent, scientifically defensible and publicly acceptable waste solution is developed. This would allow the waste to be moved only once, to a permanent site. (0189-6 [Patrie, MD, MPH, Lewis E.]

Comment: I am also concerned that many of our nuclear reactors have over-crowded fuel pools on site. These present safety threats to the communities and industries that surround the plants. The NRC should take immediate action to reduce the number of fuel assemblies in the water-filled pools. (0198-2 [Cerrito, Robert])

Comment: Hardened on-site storage of the casks should become the choice for storage. (0198-4 [Cerrito, Robert])

Comment: I am extremely concerned about spent fuel rods in overcrowded fuel pools. I want to see spent fuel transferred to DRY CASKS as soon as possible. (0207-1 [Denton, Jill])

Comment: Establish hardened on-site storage (HOSS): Irradiated fuel must be stored as safely as possible as close to the site of generation as possible. Waste moved from fuel pools must be safeguarded in hardened, on-site storage (HOSS) facilities. Transporting waste to interim away-from-reactor storage should not be done unless the reactor site is unsuitable for a ROSS facility and the move increases the safety and security of the waste. HOSS facilities must not be regarded as a permanent waste solution, and thus should not be constructed deep underground. The waste must be retrievable, and real-time radiation and heat monitoring at the

HOSS facility must be implemented for early detection of radiation releases and overheating. The overall objective of HOSS should be that the amount of releases projected in even severe attacks should be low enough that the storage system would be unattractive as a terrorist target. Design criteria that would correspond to the overall objective must include: a) Resistance to severe attacks, such as a direct hit by high-explosive or deeply penetrating weapons and munitions or a direct hit by a large aircraft loaded with fuel or a small aircraft loaded with fuel and/or explosives, without major releases. b) Placement of individual canisters that makes detection difficult from outside the site boundary. (0222-16 [Zeller, Lou])

Comment: Require periodic review of HOSS facilities and fuel pools: An annual report consisting of the review of each HOSS facility and fuel pool should be prepared with meaningful participation from public stakeholders, regulators, and utility managers at each site. The report must be made publicly available and may include recommendations for actions to be taken. (0222-18 [Zeller, Lou])

Comment: I also endorse the Principles for Safeguarding Nuclear Waste at Reactors from the Institute for Energy and Environmental Research. (0230-13 [Garb, James])

Comment: Hardened On Site Storage, with earthen berms to isolate casks, should be required for all High Level Reactor Waste (HLRW) cool enough to store dry. For a greater margin of safety, low density configuration of the SFP should be required for all HLRW not placed in casks. (0230-9 [Garb, James])

Comment: I have no confidence that this is a safe solution for the people and environment of this county. It is a vital matter of public safety that spent fuel rods be moved from the overcrowded spent fuel pools into dry casks immediately. But this is only a short-term solution. (0232-4 [Hall, Caroline])

Comment: The NRC needs to require that spent fuel be moved out of vulnerable pools and into hardened on-site storage casks (HOSS). This should be required as soon as the fuel is cool enough to move relatively safely, rather than waiting until the pools are too full to take any new spent fuel otherwise. Require hardened onsite storage. (0233-5 [Dubois, Gwen L])

Comment: Empty spent fuel pools as soon as possible. (0233-6 [Dubois, Gwen L])

Comment: There are two things I am asking you to do. First, require that all spent fuel rods held in pools be put into dry cask storage as soon as is safely possible, As we learned from Fukushima, pool storage, especially the overcrowded pool storage we have a DCNPP (5x over the design), is one of the most unsafe situations we can have. I am asking you to make it as safe as possible. (0236-2 [Reinheimer, Alice])

Comment: The NRC should expedite reduction in the number of fuel assemblies in water-filled pools, securely transferring them to dry cask storage. (0244-14-11 [Prescott, Lisa Marie])

Comment: I had been to some information sessions by NEIS and I learned about hardened onsite storage and I expected that would be included in the document, but again, I didn't find any of that. (0245-31-3 [Fox, Tracy])

Comment: Just as it is around the country, the spent fuel pools in our region, I am from Baltimore, at Calvert Cliffs and Peach Bottom have several times the amount of radioactivity as the Daiichi 4 spent fuel pool. Peach Bottom shares the Mark 1 design like the Fukushima

reactors with the elevated spent fuel pool. Moreover, more and more of today's fuel is the radioactively hotter high burn-up fuel. The consequences of a loss of electricity would be catastrophic. We can't say just because a tsunami is unlikely that a Fukushima-like disaster can't happen here. Peach Bottom, within 50 miles of my city, is at risk from a sudden dam failure, as are 33 other reactors in our suite. Calvert Cliffs is three miles from the largest liquid natural gas terminal on the east coast, where a large fire explosion could occur. Climate change may bring more super storms up the coast like Sandy. The NRC needs to require that spent fuel be moved out of the vulnerable spent fuel pools and into not just safer dry casks, which of course are safer because of the double advantage of passive cooling and smaller amounts of radioactivity per cask, but into hardened onsite storage, safe from airplane attacks, terrorists, and explosions. This should be required as soon as the fuel is cool enough to move relatively safely, rather than waiting, as it is done now, until the pools are too full to take any new spent fuel otherwise. (0246-11-1 [Dubois, Gwen L])

Comment: Spent fuel into hardened onsite casks. (0246-11-6 [Dubois, Gwen L])

Comment: I also agree that we shouldn't avoid addressing our existing waste storage problems. And as suggested before, hardened onsite storage seems to be really the best answer. (0246-13-4 [O'Leary, David])

Comment: And we do prefer hardened onsite storage systems. (0246-16-9 [Michetti, Susan])

Comment: I also want to take opportunity remind the Agency, the NRC, that a large coalition of national, state, and local groups and organizations have been calling on this Agency for years to mandate the expedient transfer of spent fuel from overcrowded pools to hardened onsite storage, where this country's stockpile of lethal waste can be monitored until a permanent disposal solution is determined. I will just call on you again to consider taking action on this reasonable safeguard. (0246-22-6 [Fisher, Allison])

Comment: In achieving self-containment for eternity and satisfying the necessary corollary of making zero toxic nuclear waste, we also can greatly reduce and in effect, cap the magnitude of safe storage space needed. This will save money, helping alleviate our national debt burden, as well as requiring less off limits-posted land. I encourage you at NRC to make hardened onsite storage a significant component of your recommendations. Not only does HOSS eliminate the costs of transit and the dangers to public health from inevitable accidents, spills, leaks, fires on our highways, but it keeps the toxic waste where it already is, already posted in off limits secured sites. These sites will be with us as long -- for a long time, even after nuclear power generation is phased out. I urge you at NRC to bear in mind and to emphasize the merit of satisfying our necessary corollary and HOSS, informing your proposals for nuclear waste containment and storage. Our long-term health and sustainability depends on it. (0250-12-2 [Howarth, Robert])

Comment: We need to move the spent or irradiated fuel rods from pools at reactor sites to hardened onsite storage. I am a supporter of hardened onsite storage. (0250-29-1 [Rivard, Betsey])

Comment: If there ever is to be one site where the fuel would be, it would have to go to dry casks, anyway, to be transported, so I say move it to dry casks as soon as possible. (0250-29-2 [Rivard, Betsey])

Comment: Instead of a so-called temporary proposal of transporting high quantities of these materials, our experts should adopt a plan of stopping them and storing them in high dry hardened secure onsite facilities until a permanent scientifically defensible and publicly acceptable waste solution is developed. (0250-30-5 [Patrie, Lewis E.]

Comment: At present, hardened onsite storage seems to be the only solution, even though it obviously cannot be the final answer, for safe storage that must last for thousands of years. (0250-51-2 [Thomas, Ellen])

Comment: I am opposed to the Yucca Mountain solution. I believe that the waste should be as soon as possible transferred from the waste pools to hardened structures onsite. (0250-64-3 [Gupton, William])

Comment: And in the meantime, we have got to get our nuclear waste arsenal stored as safely as possible. And the best way to do that is to get it out of the spent fuel pools and into hardened onsite storage. (0250-66-4 [Hanson, Courtney])

Comment: And what I would really encourage is moving, you know, spent fuel out of the pools as soon as possible after the five years to dry cask or dry container storage, just because it is inherently safer. (0250-69-5 [Rundle, Steve])

Comment: The SLO [San Luis Obispo] Mothers For Peace have asked for expediency in moving Diablo Canyon's spent fuel rods from storage pools into onsite dry casks. (0251-2 [Baker, Sheila])

Comment: The Fukushima nuclear plant disaster shows us that radio-active pools of spent fuel cells are much more vulnerable to damage than those stored in dry casks. The inexorable conclusion is that reliance on long term storage in pools must end as soon as possible. The NRC should mandate an urgent, accelerated rate of transfer of spent fuels cells from pools to dry casks. (0252-3 [Golden, Leon] [Goldin, Martha])

Comment: Accelerate the schedule for transferring spent fuel rods from overcrowded spent fuel pools into dry casks. Some irradiated fuel pools in the U.S. currently hold up to 9 times the amount of spent fuel for which they were designed. The pools are not protected by redundant emergency makeup and cooling systems or housed within robust containment structures having reinforced concrete walls several feet thick. Irradiated fuel casks can withstand environmental disasters that spent fuel pools cannot, as evidenced by the continued function of the dry casks at Fukushima. The casks survived the 9.0 quake and continue to protect the irradiated fuel, even though the tsunami flooded them. These containers have not exploded; are not on fire; are not catastrophically leaking and do not require ongoing addition of liquid to cool. On the face of it, they are outperforming the pools on the site. Dry casks have the advantage of passive cooling via airflow, making them less vulnerable to natural disaster and sabotage. Spent fuel pools are attractive targets for terrorists and that has not been adequately considered! (0256-6 [Harkins, Lynne])

Comment: If anything, accelerate the schedule for transferring spent fuel rods from overcrowded spent fuel pools into dry casks, and complete a thorough review of storage issues. (0257-3 [Abbott, Dana])

Comment: The shift to dry cask storage should be accelerated. (0288-2 [Wickham, Wendelyn])

Comment: Your job and the responsibilities that come with it are awesome. You make decisions that not only affect us today but generations to follow. Not only human health and life but virtually every living organism will be affected if there is an accident or terrorist attack on any of the 104 reactors in this country. According to your NRC mission statement, your focus is on regulatory actions that protect health and safety of the public and the environment. Please, prove to us you mean it. Dry Cask Storage Immediately. (0290-5 [Brown, Marty])

Comment: [I urge that] spent-fuel transfer to hardened dry casks, not transport to “interim” storage sites, be incorporated in the final Rule. (0303-16 [Lamberts, Frances])

Comment: For many reasons – and because we know of their far superior safety from the Fukushima and North Anna reactors – the Rule, as a minimal measure, should mandate a speedy transfer to all sufficiently cooled SNF waste to hardened casks. (0303-4 [Lamberts, Frances])

Comment: Catastrophic nuclear accidents constitute an enormous, if not existential, menace for people in large areas around such facilities. The US has luckily – but barely several times – so far escaped these. Chernobyl and Fukushima demonstrate their horrific danger. In any possible such disaster, the SNF crowding in cooling pools creates large additional risks, which could be avoided through hardened dry-casking. (0303-9 [Lamberts, Frances])

Comment: I support safe expedited transfer of cooled spent fuel[.] (0309-3 [Green, Jeanne])

Comment: [I support]...hardened dispersed dry cask storage (concrete & steel). (0309-4 [Green, Jeanne])

Comment: Until then or if this does not happen, safe dry cask storage on site must be hardened for possible terrorist attack or other accidents. (0309-6 [Green, Jeanne])

Comment: The spent fuel must be put into dry cask storage for the immediate future. This is essential for the public safety. (0318-2 [Saltzman, Dale])

Comment: Therefore NRC must stop licensing new nuclear power plants and extending existing licenses unless and until a proven-safe permanent waste storage site is established, and in the interim require and implement HOSS as fast as possible. (0319-12 [Nichols, John])

Comment: Moreover NRC needs to require and implement Hardened On-Site Storage (HOSS) of wastes, as quickly as possible. (0319-2 [Nichols, John])

Comment: The NRC needs to mandate HOSS to store spent fuel more safely and securely at or near nuclear plants. HOSS solves the immediate dangers nuclear waste poses, without creating unnecessary risks. (0319-9 [Nichols, John])

Comment: For the HLRWs that already exist, require Hardened On-Site Storage (HOSS). Hundreds of environmental and public interest groups, representing all 50 states, have endorsed the Statement of Principles for Safeguarding Nuclear Waste at Reactors, which describes HOSS. Where possible, densely-packed, vulnerable HLRW storage pools, at risk of catastrophic fires and radioactivity releases, should be emptied into on-site dry cask storage that is “hardened”: designed and built well, safeguarded against accidents, fortified against attacks, and protected against leakage into the environment. This should be expedited as a national security top priority. Locations where HOSS is not safe (places vulnerable to flooding,

for example), hardened dry cask storage should be done as close to the wastes' point of generation as possible, as safely as possible. HOSS must be monitored and retrievable, and is but an interim measure. HOSS cannot be a permanent measure on the sea coasts and fresh water sources (rivers, lakes, reservoirs) of our country, due to rising sea levels and risk of leakage into our vital drinking water supplies. (0320-1 [Kennedy, David])

Comment: My second suggestion to you, therefore, is that sufficiently cooled fuel rods be transferred to dry, hardened canisters. In these, I understand, this highly radioactive waste material can be passively cooled, through air flow, instead of being dependent on continuous, deep-water cooling and uninterrupted electricity for the water pumping and circulation. At the Japanese nuclear plant in Fukushima, the dry-canister stored spent fuel was not affected by the earth quake and tsunami there. We, too, should better secure this material by placing it into safer, hardened, dry storage as soon as possible. In the Commission's regulation on these, nuclear-waste matters, the industry should be ordered to promptly perform this transfer. (0322-5 [Baker, Hannelore])

Comment: After you've had the fuel in the reactor you need about seven years in the spent fuel before you can safely put it into a cask and keep it sealed with all the thermal analysis and that kind of thing. So, we can't do it just immediately. And I think San Onofre has a plan for roughly 20 years to have that taken care of, so we have to -- the physics of it tell us we're stuck in the -- a minimum seven years before we can even move it out of the spent fuel pool. (0325-26-4 [Hannaman, Bill])

Comment: Last week, the Alliance for Nuclear Responsibility met with the NRC Chairman and the Office of Inspector General, and we asked will the NRC stand in California's way if we choose to invest in expedited transfer of spent fuel into a dry cask system? Yes, even the NRC admits it's marginally safer. SCE [Southern California Edison] stands ready to expedite, and as PG&E begins to realize that license renewal will be unprofitable, we expect they will follow suit. We ask the NRC, work on the process for safe transfer and storage and get out of California's way. (0325-3-5 [Becker, Rochelle])

Comment: Nearly all of this waste is currently being stored in overcrowded and unprotected pools when a safer alternative exists. So my third message is this, help protect us and future generations by, one, requiring the accelerated transfer of the waste from the pools into the more secure concrete and steel dry casks[.] (0326-10-3 [ZamEk, Jill])

Comment: "Your job and the responsibilities that come with it are awesome. You make decisions that not only affect us today, but generations to follow. Not only human health and life, but virtually every living organism will be affected if there is an accident or a terrorist attack on any of the 104 reactors in this country. According to your NRC mission statement, your focus is on regulatory actions that protect health and safety of the public and the environment. Please prove to us that you mean it; dry cask storage immediately." (0326-14-5 [Brown, Marti])

Comment: [E]mploy hardened onsite storage for the independent spent fuel storage insulation[.] (0326-15-10 [Schumann, Klaus])

Comment: I was especially appalled to learn that the conclusion in the draft against accelerated transfer of spent fuel assemblies from the pools to the dry casks is primarily based on a cost/benefit analysis. Given the catastrophic consequences of a mishap in the pools, this conclusion seems to be questionable at best. (0326-15-3 [Schumann, Klaus])

Comment: At a subsequent Senate Subcommittee Meeting, chaired by Senator Feinstein, she was having a hard time understanding why the NRC had not mandated, not encouraged, but mandated more rapid transfer of spent fuel to dry casks, as there were no problems with dry cask storage at Daiichi. Senator Feinstein is not alone in urging a speedier move to dry cask storage. The Union of Concerned Scientists has described the pools as a weak link in plant safety. It's of the opinion, that's their opinion, that the worst dry cask storage is immeasurably safer than vulnerable spent fuel pools. Astonishingly, the NRC, in its post-Fukushima recommendation, did not call for an acceleration of transfer of waste out of the pools. (0326-19-3 [Carrigan, Milton])

Comment: Currently, the NRC is allowing Diablo Canyon to exceed -- or to continue to store, the spent fuel assemblies in open storage. This must stop. The stark lessons of Fukushima should prompt you, the Nuclear Regulatory Commission, to require PG&E to move its spent fuel into dry cask storage in a meaningfully accelerated rate. (0326-43-4 [Rippner, Sharon])

Comment: I certainly have agreed with very much that has been shared. Primarily I'm going to speak of getting it into the dry casks as soon as possible. Spend the money. Money spent now, it may seem like a bunch. Later on it will seem to you, I believe it will seem to us to have been money well spent. (0326-52-1 [Fosmo, Vaughn])

Comment: Primarily I want to speak to putting the material in the dry casks. I'm not an authority on it but it seems to me that's valid. (0326-52-3 [Fosmo, Vaughn])

Comment: [I'd like to say]...accelerate the schedule for transferring spent fuel rods from over-crowded spent fuel pools into dry casks. (0326-53-6 [McGibney, Patrick])

Comment: I heartily suggest that the NRC use its leadership to hasten PG&E's mitigation of its spent fuel rods by transferring the remaining two-thirds of all those cool enough to dry casks, safer storage, not in years' but in months' time. (0326-58-3 [Davis, Adrienne])

Comment: I urge the NRC to fast track the transfer of spent fuel from spent fuel pools to dry cask storage as quickly as possible. (0326-59-2 [Cordes, Reo])

Comment: Let me first say that I'd like to see a rule immediately putting all the spent fuel, at least, in the concrete cylinders. (0326-64-1 [Nelson, David])

Comment: It's impossible to have confidence in any aspect of this Federal program. Tonight, I would like to speak to the very narrow issue of the pace at which waste is moved from the liquid pools into dry cask. And I'd like to direct my remarks to the NRC staff. For five years, the California Energy Commission has directed California's two nuclear utilities, PG&E and Southern California Edison, to accelerate the transfer of waste from the pools to dry casks with the very important caveat, consistent with all NRC rules. For five years, that direction has been stonewalled by both utilities. Now, I recognize that, for many at the NRC, this was regarded as unwelcome interference and second-guessing by the State of California in decisions that are considered to be, exclusively, the realm of the Federal government. That is not the case. These are rate-payer-driven decisions and they are entitled to considerable deference for that very reason. The origin of the policy was based upon reports from the National Academy of Science, expert testimony from a variety of distinguished professionals in the field, and in particular, a very highly-esteemed geologist who used to be known as Dr. Alison McFarland. (0326-7-1 [Geesman, John])

Comment: The Southern California Edison Company, last month, told the Public Utilities Commission that now that its plant is in decommissioning, it was going to attempt to move waste from the pools to dry casks, consistent with all NRC rules, as soon as practicable. The very words in the State of California's policy. If you live here in Central California, or Northern California, you're familiar with PG&E's latest advertising campaign. Every day we're working to do the right thing. I have a suggestion, starting tomorrow, why don't you step-up the pace of moving this waste from the pools to dry casks? (0326-7-3 [Geesman, John])

Comment: Hardened onsite storage has been endorsed by hundreds of environmental groups, and densely packed, vulnerable, high-level radioactive waste-storage pools that are at risk for fire and radioactive releases should be emptied onto onsite dry cask storage that is hardened, that is designed and built well, safeguarded against accidents, and fortified against attacks, and protected against leakage into the environment. (0327-20-6 [Clemons, Victoria])

Comment: Seventy-five percent of spent fuel is in fuel pools and allowed to remain there for as much as 60 years, often in overcrowded pools. The GEIS underestimates the risk of fuel pool fires and ignores safer alternatives of hardened onsite storage at the plant sites. (0327-27-3 [Macks, Vic])

Comment: That said, with what's already sitting precariously onsite in spent fuel pools -- and I'd like to say to the legal counsel I think you had it right the first time. It was the spent nuclear fools. Let's get it moved at least into a hardened onsite storage as soon as possible. (0327-39-6 [Izant, Carol])

Comment: Hardened with concrete, the casks could be safe against hopefully most disasters and terrorism. For instance, the casks at Fukushima were undamaged during that event. (0327-9-3 [McArdle, Ed])

Comment: In the interim, NRC must mandate the immediate movement of high-level waste that has been sufficiently cooled out of the fuel pools to dry storage containers, and those should be hardened onsite to improve safety and security (0328-9-7 [LaForge, John])

Comment: And the final thought I'd like to share has to do with hardened onsite storage, which is an environmental coalition consensus opinion, environmental groups numbering in the hundreds representing every single state in the U.S. has called for hardened onsite storage for over a decade. This would be a good step in the right direction in terms of keeping high-level radioactive waste out of the environment and getting it out of the vulnerable pools and putting it into a dry cask storage system that will last not decades but centuries into the future and itself will need to be replaced. (0329-11-5 [Kamps, Kevin])

Comment: In April of 2011, one of the strongest tornados known to man twisted a row of power towers about 500 meters from the Browns Ferry fuel pools. Both Browns Ferry and Sequoyah are in tornado corridors and have seen multiple invasions of severe weather. One thing Fukushima showed us is that hardened onsite storage can withstand extreme weather since the storage casks were not damaged by the tsunami, whereas the cooling pools were severely damaged and are still a major hazard. We want to once again request that the Nuclear Regulatory Commission require a specific accountable schedule for moving fuel rods from the cooling pools into safe hardened onsite storage at Browns Ferry Nuclear Power Plant and other Mark I and Mark II reactors. (0329-13-2 [Johnston, Gretel])

Comment: I think the only thing that I can agree with is the idea of starting to unload these overfull filled-to-the-brim spent fuel pools into hardened onsite storage, HOSS units, even though I know we have a big problem with this high burn-up fuel. And it seems that the industry, that the regulators have allowed the industry to produce this stuff without really knowing what to do with it. (0329-17-3 [Gray, Erica])

Comment: We need to get all of the spent fuel out of the pools as soon as we can into dry hardened onsite storage, or HOSS. (0329-18-5 [Carberry, Mike])

Comment: If you would like to have more information about the hardened onsite storage principles that these 135 organizations have signed onto, it's readily available on Sierra Club's website and from other websites of some of our partnering organizations, such as Beyond Nuclear and the Nuclear Information and Research Service. (0329-33-3 [Feldman, Jane])

Comment: In the interim, NRC must mandate the immediate movement of waste that has been sufficiently cooled out of the pools to dry storage containers, and those should be hardened on-site to improve safety and security. (0336-16 [Lish, Christopher])

Comment: While we are working on the solution, I am also concerned that many of our nuclear reactors have over-crowded fuel pools on site. These present safety threats to the communities and industries that surround the plants. The Nuclear Regulatory Commission (NRC) should take immediate action to reduce the number of fuel assemblies in the water-filled pools. Before transferring the fuel rods to cask storage, the cask storage needs to be examined and reinforced to be able to safely store the fuel rods, particularly those that qualify as high burn up fuel. Hardened on-site storage (HOSS) of the casks should become the choice for storage for the high-level radioactive waste (HLRW) that already exists. (0336-5 [Lish, Christopher])

Comment: Hundreds of environmental and public interest groups-representing all 50 states-have endorsed the Statement of Principles for Safeguarding Nuclear Waste at Reactors, which describes HOSS. Where possible, densely-packed, vulnerable HLRW storage pools, at risk of catastrophic fires and radioactivity releases, should be emptied into on-site dry cask storage that is "hardened": designed and built well, safeguarded against accidents, fortified against attacks, and protected against leakage into the environment. This should be expedited as a national security top priority. Locations where HOSS is not safe (e.g., places vulnerable to flooding), hardened dry cask storage should be done as close to the waste's point of generation as possible, as safely as possible. HOSS must be monitored and retrievable, and is but an interim measure. HOSS cannot be a permanent measure on the sea coasts and near fresh water sources (rivers, lakes, reservoirs) of our country due to rising sea levels and risk of leakage into our vital drinking water supplies. (0336-6 [Lish, Christopher])

Comment: Keeping the nuclear waste on the sites where it was produced is very probably the optimal choice at this point, especially if the plan were to include expeditious transfer of spent fuel into casks protected by berms or other hardened supra-structural systems. However, this represents the least bad option, not a desirable outcome. (0341-1-4 [Mermelstein, Richard])

Comment: Cracks have been found in the current tanks, and even though those cracks have not yet resulted in a disastrous leak, it is clear that the radioactive waste, wherever it is to be stored eventually, must be sufficiently diluted and stored in hardened containers. To allow this issue to continue to fester is both foolish and irresponsible. (0351-3 [Stein, Robert])

Comment: The EIS must consider safer options like Hardened On-Site Storage (HOSS) for storing the more than 70,000 tons of spent fuel that will be created and housed at nuclear plants by 2050 to reduce risk of leakage or terrorist attack. (0357-3 [Daily, G. Allen])

Comment: The NRC should take immediate action to reduce the fuel assemblies in spent fuel pools, as well as analyzing the deficiencies of current dry cask storage. (0357-4 [Daily, G. Allen])

Comment: Employ "Hardened On-Site Storage" for the ISFSI's. (0358-14 [Schumann, Klaus])

Comment: In addition, the draft is flawed because the conclusion against "accelerated transfer" is mainly based on its "cost-benefit analysis". Given the catastrophic consequences of a mishap in the pools, this analysis seems questionable at best. (0358-7 [Schumann, Klaus])

Comment: The NRC must mandate the immediate movement of waste that has been sufficiently cooled out of the pools to dry storage containers, and those should be hardened on-site (HOSS) to improve safety and security (0362-4 [Schietinger, Helen])

Comment: i think the sooner you get the waste into dry casks the better...please, for the sake of our children. (0364-1 [Yelda, Peter])

Comment: The nuclear industry is against permanent on-site hardened storage of nuclear waste to avoid what should be their financial responsibility to pay for unending storage and security, as well as liability. (0377-1-16 [Cuthbert, Lewis])

Comment: 2. Provide an accountable schedule for speedy removal of Limerick's high-level radioactive wastes from fuel pools into hardened on-site cask storage. (0377-1-7 [Cuthbert, Lewis])

Comment: WHY FUEL POOLS MUST BE UNLOADED AS SOON AS POSSIBLE INTO ONSITE STORAGE EVIDENCE BELOW SHOWS WHY NRC MUST REQUIRE NUCLEAR PLANT OWNERS TO REMOVE HIGH-LEVEL RADIOACTIVE WASTES FROM FUEL POOLS AS SOON AS POSSIBLE AND MOVE IT TO ON-SITE DRY STORAGE; Spent Fuel Pools: Are A Catastrophe Waiting To Happen; Are Vulnerable to Meltdown From Loss of Water and/or Loss of Power Through Accidents, Natural Disasters, or Terrorist Attacks by Plane or Missile; Are Packed And Can Be Turned Into Weapons of Mass Destruction; Spent Fuel In Pools Contains More Radioactivity Than Reactors Spent Fuel Rods Give Off Enough Radiation To Kill People In Seconds; Pools Are At High Risk From Loss of Water Accidents; Loss of Water Can Be Caused By Penetration by Aircraft or Missiles, Or By Extended Loss of Power Due To Natural Disasters. (0377-3-5 [Cuthbert, Lewis])

Comment: For nuclear wastes that already exist, NRC must require Hardened On-Site Storage (HOSS). ACE joined many other groups across the nation, endorsing the Statement of Principles for Safeguarding Nuclear Waste at Reactors. Densely-packed, vulnerable HLRW storage pools, at risk of catastrophic fires and radioactivity releases, should be emptied into on-site dry cask storage that is "hardened": designed and built well, safeguarded against accidents, fortified against attacks, and protected against leakage into the environment. This should be expedited as a national security top priority. In locations where hardened safe storage (HOSS) is not safe (places vulnerable to flooding, for example), hardened dry cask storage should be done as close to the wastes' point of generation as possible, as safely as possible. HOSS must be monitored and retrievable. HOSS cannot be a permanent measure on the sea coasts and fresh water sources (rivers, lakes, reservoirs) of our country, due to rising sea levels and risk of leakage into our vital drinking water supplies (0377-5-16 [Cuthbert, Lewis])

Comment: 3. Leaving the spent fuel in overcrowded, multilevel, unprotected cooling pools for long periods is irresponsible and dangerous and inviting disaster. Secure it in solid hardened well protected storage on site ASAP until a way can be found to neutralize it or a place can be found to permanently store this dangerous substance. This will eliminate the risk of transport accidents or incidents, contaminating surrounding areas during transport, and inviting vandalism and attack. (0381-7 [Fasten, Susan])

Comment: Please arrange to have used fuel pools at Diablo transferred as soon as possible to hard storage. Many years ago, before there were tight restrictions, I have flown over Diablo; open storage pools would be fairly easy for a suicide bomber to destroy. I am convinced a severe earthquake could create leakage. Even the hard casks should be transferred as soon as possible because of the possibility a very severe quake would tumble several down toward the plant and toward the ocean. I am writing out of concern for the many, many students I taught in the school district downwind from Diablo. (0389-1 [Atlee, Susan])

Comment: To lessen the danger now the NRC should require the immediate movement of sufficiently cooled waste out of the pools to dry storage containers, hardened on-site (HOSS). (0402-5 [Gross, Cheryl])

Comment: Additionally, we should learn from Fukushima and get waste out of spent fuel pools as soon as possible. (0404-3 [Smith, Roger])

Comment: In the interim, NRC must mandate the immediate movement of waste that has been sufficiently cooled out of the pools to dry storage containers, and those should be hardened on-site (HOSS) to improve safety and security. (0405-6 [Dugan, Pat])

Comment: In addition to not relicensing the Indian Point nuclear power plants in order to avoid the production of any additional dangerous waste, please require the expedited removal of spent fuel from pools into dry casks to reduce the safety risks of pool storage. (0407-3 [Kerr, Mary Ellen])

Comment: This requirement is best achieved with Hardened On-Site Storage. Hardened Onsite Storage has been endorsed by hundreds of environmental and public interest groups, representing all 50 states. Densely-packed, vulnerable HLRW storage pools, at risk of fire and radioactivity releases, should be emptied into on-site dry cask storage that is "hardened": that is, designed and built well, safeguarded against accidents, fortified against attacks, and protected against leakage into the environment. (0421-7 [Clemons, Victoria])

Comment: Although no viable long term solutions are currently available, the highly radioactive fuel rods which have sufficiently cooled must be immediately transferred into more secure, hardened on site, dry cask storage. This process should be accelerated in anticipation of California's next big earthquake. (0423-1 [Graves, Caryn])

Comment: The dangers to our community posed by storing nuclear waste here indefinitely requires us to become more involved in the decommissioning process. There are steps that could and should be taken to reduce the risk to our community by taking highly radioactive waste from vulnerable pools and move into fortified dry cask storage containers as soon as fuel rods are cool enough to be transferred; and/or by expediting storage and transport solutions for high burn up fuel. (0433-4 [Stone, Gene])

Comment: I don't agree with hardened on site, but the rest is right on. (0440-1 [Pieart, Richard])

Comment: In the interim, NRC must mandate the immediate movement of waste that has been sufficiently cooled out of the pools to dry storage containers, and those should be hardened on-site (HOSS) to improve safety and security. (0443-10 [Sabo, Betty])

Comment: The NRC claims in the DGEIS that security measures have improved since 9/11. But no remedial actions have been required to harden or fortify the structures housing SNF, to make them hardened and less penetrable...and that, quite frankly, is not possible to accomplish under a determined attack from terrorists or by sabotage from insiders. Scores of spent fuel pools exist in nothing more than a fragile shell of a building with little more than a thin metal roof, yet contain far higher levels and quantities of radioactive materials than the reactor cores themselves that are shrouded by containment buildings. Scenarios put forth by NRC and national lab publications regarding releases from spent fuel pools have not studied all of these potential modes of attack, and related failure modes of the spent fuel systems. Furthermore, I contest the statements by NRC that airspaces are or can be protected or defended. Hence, waste confidence security certainly does not exist. (0447-1-14 [Andrews, Richard])

Comment: I call on the NRC staff and commissioners to act immediately, taking the following steps with respect to spent nuclear fuel management, transport, disposal, and its regulation: - Require all reactors to immediately harden all structures housing spent fuel pools since at a minimum SNF will have to stay in the pools for about five years for primary cooling, even after reactor cessation of power operations (0447-2-11 [Andrews, Richard])

Comment: Move quickly to remove all possible spent fuel from cooling pools and place SNF into hardened dry casks of small enough size and designs to avoid secondary or subsequent repackaging and transfer for safe transport to remotely sited interim or final repositories (0447-2-12 [Andrews, Richard])

Comment: Since dry cask storage of spent fuel at nuclear power stations is a proven technology, and because it prepares spent fuel for eventual transport to a regional or national long term storage sites, I support the rapid deployment of dry cask storage. (0448-3 [Moncy, Charles])

Comment: Independent experts at the Union of Concerned Scientists and elsewhere agree that the dangerous, radioactive waste from spent fuel pools, that has cooled sufficiently, should be required to be transferred to safer, on-site dry cask storage. (0453-4 [Feathers, Jösan])

Comment: It is irrational for the NRC not to mandate immediate removal of as much spent fuel as possible from the overcrowded pools at our nation's Nuclear Reactors. As previously stated this is largely a matter of money. Safety is a secondary consideration. (0454-12 [Waldstein, Joe])

Comment: The proposed new Rule on Waste Confidence is deficient in the following three fundamental respects: 2. It does not require the transfer of Spent Fuel from storage pools into hardened on site dry cask storage as soon as the fuel becomes cool enough to make the transition. (0454-2 [Waldstein, Joe])

Comment: Nuclear fuel rods and assemblies must be removed from fuel pools as soon as they are ready to be and placed into dry cask storage. This applies to operating plants as well as plants being decommissioned. (0467-2 [Hynes, H Patricia])

Comment: Although no viable long term solutions are currently available, I insist on the immediate transfer of highly radioactive fuel rods which have sufficiently cooled in the

vulnerable pools into more secure, hardened on site, dry cask storage. This process should be accelerated in anticipation of California's next big earthquake. (0472-1 [Sheridan, Paul])

Comment: The DGEIS does not indicate that the NRC is currently taking any action to expedite removal of spent fuel rods from pools into casks. In fact, as discussed above, the recent COMSECY-13-0030 states that expediting fuel transfer will not be considered any further--it is essentially off the table. Moreover, this restricted analysis of one alternative was done outside the procedural protections and substantive requirements of NEPA. (0473-12-13 [Dean, Janice] [Griffin, William] [Mahowald, Philip R.] [Snook, Robert] [Springer, Darren])

Comment: My husband and I believe that there must be an immediate transfer from San Onofre of the highly radioactive fuel rods which have sufficiently cooled in the vulnerable pools, into more secure, hardened on site, dry cask storage. This process should be accelerated in anticipation of California's next big earthquake. (0477-1 [Tache, Jan])

Comment: The GEIS fails to consider the need to: Require ongoing hardened, bermed, on-site storage of spent fuel including during Safestor and decommissioning[.] (0490-6 [Chin, Rebecca])

Comment: In the interim, NRC must mandate the immediate movement of waste that has been sufficiently cooled out of the pools to dry storage containers, and those should be hardened on-site (HOSS) to improve safety and security. (0491-7 [Commenters, Multiple])

Comment: With this in mind the most rational approach is a concentrated effort to move any and all spent fuel that has aged enough to be stored in dry casks into dry storage immediately - this would greatly lessen the problems that would need to be managed if a large Earthquake were to occur. (0495-3 [Grigg, Richard])

Comment: [T]hat first immediate step should be to move any spent fuel that has aged enough to Dry Cask Storage as quickly as possible. (0495-5 [Grigg, Richard])

Comment: Sufficient NRC funding should be used to expedite the transfer of the millions of nuclear fuel rods currently stored in pools at power plants to dry, hardened onsite storage. (0499-1 [Ramsay, Rebecca])

Comment: The EIS must consider safer options like Hardened On-Site Storage (HOSS) for storing the more than 70,000 tons of spent fuel that will be created and housed at nuclear plants by 2050 to reduce risk of leakage or terrorist attack. (0507-2 [Giese, Mark M.])

Comment: The NRC should take immediate action to reduce the fuel assemblies in spent fuel pools, as well as analyzing the deficiencies of current dry cask storage. (0507-3 [Giese, Mark M.])

Comment: Please dry cask all spent nuclear fuel now. (0511-1 [O'Brien, Patricia])

Comment: Move all spent nuclear fuel into dry cask storage post-haste, and get it out of the spent fuel pools. (0515-6 [Stennes, Nancy])

Comment: The NRC must insist all domestic nuclear waste gets put into dry cask storage immediately. For-profit utilities must bear this cost and not fob it off on customers as they bought into unsafe nuclear power knowing there was no practical way of handling the waste. (0527-1 [Titus, Mary])

Comment: [I]t [short term solution] immediately creates good productive jobs while making the spent fuel much safer than it is sitting in spent fuel pools. Dry Cask everything that can be done now. Until the fuels are put into Dry Cask, there is a risk of a regional economy killing event due to power loss/natural disaster, or terrorist action. There have been far too many close calls in the last few years. Our good judgment in risk control has been decimated by lack of good choices and the hope of a Yucca mountain, always right around the corner. (0529-2 [Claybourne, Ana])

Comment: I insist on the immediate transfer of spent fuel rods which have sufficiently cooled for 5 years in the vulnerable pools into more secure, hardened on site, dry cask storage. (0529-4 [Claybourne, Ana])

Comment: Dry Casks stored in Hardened On-Site Storage is a safer alternative to open pools, and is endorsed by over 170 public interest groups in the US as an interim storage solution. Still, spent fuel must be re-casked every 100 years in this system. (0531-2-22 [Morgan, Sally])

Comment: The GEIS fails to consider the need to [r]equire ongoing hardened, on-site storage of irradiated/spent fuel including during reactor operation, after cessation of reactor operation, Safestor and decommissioning[.] (0537-6 [Commenters, Multiple])

Comment: --Require a low-density, open-frame layout for fuel pools: Fuel pools were originally designed for temporary storage of a limited number of irradiated fuel assemblies in a low density, open frame configuration. As the amount of waste generated has increased beyond the designed capacity, the pools have been reorganized so that the concentration of fuel in the pools is nearly the same as that in operating reactor cores. If water is lost from a densely packed pool as the result of an attack or an accident, cooling by ambient air would likely be insufficient to prevent a fire, resulting in the release of large quantities of radioactivity to the environment. A low density, open-frame arrangement within fuel pools could allow enough air circulation to keep the fuel from catching fire. In order to achieve and maintain this arrangement within the pools, irradiated fuel must be transferred from the pools to dry storage within five years of being discharged from the reactor. (0545-3 [Patrie, MD, MPH, Lewis E.])

Comment: --Establish hardened on-site storage (HOSS): Irradiated fuel must be stored as safely as possible as close to the site of generation as possible. Waste moved from fuel pools must be safeguarded in hardened, on-site storage (HOSS) facilities. Transporting waste to interim away-from-reactor storage should not be done unless the reactor site is unsuitable for a HOSS facility and the move increases the safety and security of the waste. HOSS facilities must not be regarded as a permanent waste solution, and thus should not be constructed deep underground. The waste must be retrievable, and real-time radiation and heat monitoring at the HOSS facility must be implemented for early detection of radiation releases and overheating. The overall objective of HOSS should be that the amount of releases projected in even severe attacks should be low enough that the storage system would be unattractive as a terrorist target. Design criteria that would correspond to the overall objective must include: --Resistance to severe attacks, such as a direct hit by high-explosive or deeply penetrating weapons and munitions or a direct hit by a large aircraft loaded with fuel or a small aircraft loaded with fuel and/or explosives, without major releases. --Placement of individual canisters that makes detection difficult from outside the site boundary. --Protect fuel pools: Irradiated fuel must be kept in pools for several years before it can be stored in a dry facility. The pools must be protected to withstand an attack by air, land, or water from a force at least equal in size and coordination to the 9/11 attacks. The security improvements must be approved by a panel of experts independent of the nuclear industry and the Nuclear Regulatory Commission. --Require

periodic review of HOSS facilities and fuel pools: An annual report consisting of the review of each HOSS facility and fuel pool should be prepared with meaningful participation from public stakeholders, regulators, and utility managers at each site. The report must be made publicly available and may include recommendations for actions to be taken. --Dedicate funding to local and state governments to independently monitor the sites: Funding for monitoring the HOSS facilities at each site must be provided to affected local and state governments. The affected public must have the right to fully participate. (0545-4 [Patrie, MD, MPH, Lewis E.]

Comment: The NRC should require that spent fuel be transferred from wet (pool) storage to dry cask storage on the most accelerated time schedule possible. (0548-3 [Gibson, Bruce])

Comment: DCPD also has a facility for dry cask storage of spent fuel, which is generally agreed to be the preferred means of spent fuel storage. Testimony before our Board has suggested that the loading of dry casks at DCPD is not occurring as fast as it could. Given the extra density of spent fuel in the pools and the risks specific to DCPD, we would request that the NRC require the transfer of fuel from the pools to dry casks to be conducted in the most timely manner possible. (0548-8 [Gibson, Bruce])

Comment: Irradiated fuel casks can withstand environmental disasters that spent fuel pools cannot, as evidenced by the continued function of the dry casks at Fukushima. The casks survived the 9.0 quake and continue to protect the irradiated fuel, even though the tsunami flooded them. These containers have not exploded; are not on fire; are not catastrophically leaking and do not require ongoing addition of liquid to cool. On the face of it, they are outperforming the pools on the site. Dry casks have the advantage of passive cooling via airflow, making them less vulnerable to natural disaster and sabotage. Spent fuel pools are attractive targets for terrorists. (Physicians for Social Responsibility, National Academy of Sciences, 9-11 Commission Report, Alvarez) Dry casks are less promising targets for terrorists because one would have to trigger failure in several casks to accomplish the same amount of radiation release as an attack on a spent fuel pool. Casking spent fuel should be expedited as a national security top priority. Transfer of irradiated fuel to casks should be done sooner rather than later. Since irradiated fuel will have to be put into dry containers to remove it from the reactor site when a repository is available, this process is not an "if" it is a "when." Public health will be protected better if the fuel is transferred now from cooling pools to casks. Robert Alvarez, Jan Beyea, Klaus Janberg, Jungmin Kang, Ed Lyman, Allison Macfarlane, Gordon Thompson, and Frank N. von Hippel, Reducing the Hazards from Stored Spent Power-Reactor Fuel in the United States, Science and Global Security, 11:1-51, 2003.
<http://mothersforpeace.org/data/20030122ReducingTheHazards?searchterm=spent+fuel+pools>.
"Safer Storage of Spent Nuclear Fuel", Union of Concerned Scientists, 2012.
http://www.ucsusa.org/nuclear_power/nuclear_power_risk/safety/safer-storage-of-spent-fuel.html. (0552-1-23 [Macks, Vic])

Comment: On-site storage of irradiated fuel rods in dry casks should be made safer and more secure by adoption by NRC of regulations to mandate HOSS (Hardened On-Site Storage). HOSS is a system whereby more space between the containers increases security, and earth mounds or berms form a barrier between the containers and any public-access points such as roads, delivery areas and water-front. HOSS also mandates real-time heat and radiation monitoring and would also provide for local community over-sight of the waste installation such as a citizen advisory board. (0552-1-24 [Macks, Vic])

Comment: Casking the spent fuel would prevent much of the hazard associated with transportation of high-level nuclear waste. However, locations where HOSS (Hardened On-Site

Storage) is not safe (places vulnerable to flooding, for example), hardened dry cask storage should be done as close to the point of generation as possible. HOSS cannot be a permanent measure on the seacoasts and fresh water sources (rivers, lakes, reservoirs) of our country, due to rising sea levels and risk of leakage into our vital drinking water supplies. Another major appeal of HOSS is that it is currently an interim storage choice that is safer and endorsed by the bulk of public interest groups concerned with nuclear issues. Over 170 groups in all 50 states have endorsed the concept of HOSS, including most groups near reactor sites. (NIRS) (0552-1-28 [Macks, Vic])

Comment: Hardened On-Site Storage systems (HOSS) should be used to store spent fuel more safely and securely at or near nuclear plants. HOSS reduces the immediate dangers spent fuel poses, without creating unnecessary risks.

http://ieer.org/wp/wpcontent/uploads/2010/03/HOSS_PRINCIPLES_3-23-10x.pdf (0552-2-7 [Macks, Vic])

Comment: Is expedited transfer more expensive? The short answer is that it shouldn't be. All spent fuel generated in the past and for the foreseeable future will eventually be transferred to dry casks located at reactor sites or centralized facilities. The only question is when. The total number of casks and size of the related facilities will be the same, whether or not transfer to dry casks is expedited or dragged out. Again, the only unanswered question is when the casks and pads will be built. There is no reason to think they will be cheaper 50-60 years after license termination. EPRI, 2012 Technical Report, *Impacts Associated with Transfer of Spent Nuclear Fuel from Spent Fuel Storage Pools to Dry Storage After Five Years of Cooling* estimated the cost to U.S. industry as a whole at \$3.5 billion to \$3.9 billion. The costs for all such transfers pale in comparison to the estimated cost of a spent fuel pool fire at Pilgrim: one reactor, \$488 billion. EPRI's estimates include purchasing casks; cask loading operations; dry storage facilities; annual operations and maintenance; construction, or expansion. (0556-5-6 [Lampert, Mary])

Comment: Concerned citizens hope to be able to get additional requests from other local communities, to force the federal government to remove nuclear waste from the now-closed San Onofre Nuclear (Waste) Generating Station, or at least, to give us hardened on-site storage, which neither the current dry casks nor the spent fuel pools provide. "Hardened" might mean underground, behind earthen berms, separated from each other, moved away from rail, ship, aerial and truck bomb access points, fewer assemblies in each cask, etc. etc.. These are standard anti-terrorism procedures which are NOT being done at our ISFSIs (Independent Spent Fuel Storage Installations, the current acronym for "semi-permanent nuclear waste dump and blight on the land.") Yesterday Donna Gilmore and I were suddenly interviewed by Fox 5 San Diego about Southern California Edison's shipment of Unit II's original reactor pressure vessel head to Clive, Utah. It's a dome-shaped object approximately 14 feet across. Edison says it weighs 77 tons, and says that standing six feet away from it for an hour will give you about as much radiation as watching television for about a year. Do they mean modern OLED screens or old tube TVs? Do they mean the most modern types of dental x-ray equipment when they say it's equal to a dental x-ray, or do they mean older machines that give out nearly an order of magnitude more radiation? Or even older ones that were even worse? Here's a link to the report based on the on-site interview with Donna Gilmore:

<http://fox5sandiego.com/2013/12/16/san-onofre-transport-nuclear-waste-out-of-state/#ixzz2nh3ycGur>. This report by 760KFMB gives additional information:

<http://www.760kfmb.com/story/24237142/77-ton-nuclear-component-on-the-road-from-san-onofre-to-utah>. Here's a link to my own animation of San Onofre's reactors, which shows the exact part they are moving (screen two (the two triangles at the top advance the screens)). Notice that the RPVH is a pretty small piece of the entire system:

<http://www.acehoffman.blogspot.com/2013/02/new-animation-shows-what-could-happen.html>. The RPVH is highly radioactive, although presumably it will be shipped facing down, so that most of the gamma emissions will be shielded by 8 inches of steel (with a lot of holes, which aim straight up, but presumably have been plugged with something). Underneath perhaps they will have a heavy metal plate several inches thick bolted to the bottom, and any gamma emissions that get through it will, presumably, mainly go into the ground beneath the vehicle as it travels down the road. Few will get through the eight inches of steel, few will get through the bottom plate and then bounce off the ground into where other vehicles with people might be, and so it is called "low level waste." The inner liner of the RPVH is made of the finest stainless steel available -- and millions of kid's braces could have been made with that steel, if it were not irradiated. Some of it might find its way into kid's braces some day by accident anyway. Edison sent out a press release about moving the RPHV and assured the public it was safe. Certainly, it won't catch fire and spread radiation, thus contaminating the local population and the air, water and land. (0562-2 [Hoffman, Ace])

Comment: Please dry cask the spent fuel that can be dry casked. (0563-1 [Songchild, Stephanie])

Comment: Move all spent nuclear fuel into dry cask storage post-haste, and get it out of the spent fuel pools. (0566-7 [Tocornal, John])

Comment: We send rockets to Mars, but do not have the ability to remove the waste? Garbage I say! We the people are at the end of our patience. Why must it be like pulling teeth to get the officials to do what they should have done a long time ago? Follow the money I say, and you'll find who's behind it all, and in my opinion, it's Edison! Game over. Get it out of here, and do it NOW! We closed SONGS, and we will win this battle as well. You're just making us work a little bit harder than necessary. (0567-2 [Taylor, Jeff])

Comment: I am not a scientist, so I am not qualified to suggest the best method for handling the staggering amount of nuclear waste produced in this country, but I know what the effects of radiation poisoning are, as well as the nearly insurmountable problem of safely sequestering spent fuel rods. As the spent fuel pools are intended for preliminary cool-down maintenance until they can be stored by other means, it is imperative to move ahead with implementation of secure interim storage methods, such as "dry casking," while pouring every effort into research and development of a reliable extreme long-term storage modality. Any method that relies upon uninterrupted electric supply is bound to fail eventually. (0570-2 [Boosinger, Marilynn])

Comment: Oh and please make the utilities put the commercial spent nuclear fuel in Dry Hard Casks...for safety. (0571-4 [Young, Jane])

Comment: Dry Cask storage is the most viable long term solution, held in a storage system local to the mother reactor mitigating the inevitable spillage of rail or road transport. (0573-2 [Gerhart, Dan])

Comment: This dangerous material at the now closed San Onofre nuclear power plant in California needs to be transferred to a federally designated safe depository, ASAP. (0583-1 [Connoy, Gina])

Comment: We demand that NRC desist from collaborating and favoring the energy producing companies that are responsible for this situation and actually protect and defend the public by removing the radioactive material stored a San Onofre immediately. (0587-2 [Ciferri, Flavio])

Comment: As Japans' Fukushima nuclear plant crisis has shown, the spent fuel pools are just as dangerous if not more so than the main nuclear reactor. So NO I do not want to see 60 plus years of 'legal' safe time for nuclear fuel to sit in the spent fuel pool. It should only be allowed to stay until the cooling period renders it safe to be put in dry casks. I believe the cool down period is on average around 5 years for fuel coming out of a core into the spent fuel pool. After the cool down period, the plant operator should not be allowed to put more nuke fuel rods into the spent fuel pool, until all the cooled down nuke fuel rods are dry casked. Any fuel rod that is 90 days past it's cool down date should start running up fines against the plant operator, say about 5000.00 USD a day per fuel rod. Bet the cheap plant operators would move the fuel out then. (0590-1 [Anonymous, Scott])

Comment: All spent fuel that can be dry casked should be. We can't have another Fukushima event! The FSPs located in the reactor buildings were never intended for long-term storage and it is completely inappropriate to continue this reckless behavior. (0595-1 [Farbish, Peter])

Comment: At the very least, please see fit to delay relicensing until such time as the dangerous quantity of highly radioactive spent fuel rods is transferred into dry casks. At present, that is the only safer option for this diabolical material. (0609-4 [Leon, Vicki])

Comment: Require all spent fuel once adequately cooled to be placed in Hardened Dry Cask Storage in robust casks with leak detection, like German Castor V cask which have low visual and low infrared signatures. Removal of excess spent fuel being stored in spent fuel pools beyond the original approved spent fuel pool design capacity, as soon as adequate cooled. Require all dry casks to be bolted down and bermed or placed in other robust structures. At Indian Point the dry cask are not even attached to the pad, and in the event of an earthquake seismic scientists from Lamont Doherty have identified the risk of tipping and rolling into the Hudson River. (0611-53 [Shapiro, Susan])

Comment: [I respectively urge the Commission] that hardened on-site storage casks be maintained[.] (0620-14 [Rivera, Evelyn])

Comment: Spent Nuclear fuel should be moved to dry cask storage as quickly as possible, spent fuel should not be stored where a fuel pool fire could affect people, farm land or even worse, a nuclear reactor anywhere near farm land or people. (0634-11 [Cato, Michael])

Comment: Fuel should be moved to dry cask storage as soon as possible, and needs to be moved away from population centres and farm land. (0634-2 [Cato, Michael])

Comment: The best plan I have heard suggests leaving waste in place using hardened on - site storage placed in earth berms. (0636-3 [Bluestein, Bonnie])

Comment: ANA supports Hardened On-Site Storage (HOSS) for commercial SNF to reduce the amount and density of spent fuel in storage pools, increase the amount of SNF in dry storage, and improve the safeguards to reduce the impacts of natural or human events. (0646-3 [Hanson, Courtney])

Comment: The Nuclear Regulatory Commission (NRC) should be required to establish HOSS standards by rulemaking for licensed reactors. (0646-8 [Hanson, Courtney])

Comment: APV suggests transferring HLRW to cask storage as soon as possible after removal from the reactors. (0648-11 [Price, Scott])

Comment: In the case of the HLRW that already exists, we suggest requiring Hardened On-Site Storage (HOSS) as opposed to removing the material. APV joins hundreds of environmental and public interest groups, representing all 50 states, in endorsing the Statement of Principles for Safeguarding Nuclear Waste at Reactors(*italics*), which describes HOSS. Quoting Beyond Nuclear's statement: "Where possible, densely-packed, vulnerable HLRW storage pools, at risk of catastrophic fires and radioactivity releases, should be emptied into on-site dry cask storage that is "hardened": designed and built well, safeguarded against accidents, fortified against attacks, and protected against leakage into the environment. This should be expedited as a national security top priority. Locations where HOSS is not safe (places vulnerable to flooding, for example), hardened dry cask storage should be done as close to the wastes' point of generation as possible, as safely as possible. HOSS must be monitored and retrievable, and is but an interim measure. HOSS cannot be a permanent measure on the sea coasts and fresh water sources (rivers, lakes, reservoirs) of our country, due to rising sea levels and risk of leakage into our vital drinking water supplies." (0648-4 [Price, Scott])

Comment: Accelerate ongoing hardened, on-site storage of spent fuel at all reactor sites. (0660-9 [Headrick, Gary])

Comment: Use HOSS until a repository is available. No interim storage facility should be allowed. All spent fuel in pools over five years old should be immediately removed and placed in HOSS. (0662-2 [McClintock, Francene])

Comment: If there will be no long-term, dedicated storage facility built (a la Yucca Mountain), all spent fuels ought be dry-casked ASAP. (0666-1 [Sams, David])

Comment: THE NUCLEAR WASTE STORED IN CASKS AT SAN ONOFRE CAN NOW BE SAFELY MOVED AND MUST BE RELOCATED IMMEDIATELY TO A LESS POPULATED AREA IN CALIFORNIA. THE REMAINING WASTE CURRENTLY IN POOLS MUST BE PLACED IN CASKS AS SOON AS POSSIBLE. (0673-1 [Massey, Jennifer])

Comment: Our lives and livelihoods depend on the safe regulation of this nuclear power plant [Diablo Canyon] and Nuclear Waste Storage Site, responsibilities of the NRC. We urge the NRC to order PG&E to transfer the radioactive wastes into dry casks storage on an accelerated schedule, rather than leaving the rods in densely packed spent fuel pools. (0678-1 [Georgi, Carol])

Comment: For the high level wastes that already exist, NRC should require Hardened On-Site Storage (HOSS). Hundreds of environmental and public interest groups, representing all 50 states, have endorsed the Statement of Principles for Safeguarding Nuclear Waste at Reactors, which describes HOSS. High level wastes currently in risky and vulnerable storage pools should be transferred as soon as possible into on-site dry cask storage that is "hardened": designed and built well, safeguarded against accidents, fortified against attacks, and protected against leakage into the environment. This should be a top national security top priority. Obviously locations vulnerable to flooding would not be suitable for HOSS, but nearby suitable nearby sites should be identified so transportation of such wastes can be minimized and accomplished as safely as possible. Also, HOSS must be monitored and not allowed to leak, especially into fresh water sources, including ground water. (0702-3 [Scarff, Steve])

Comment: Employ the safest possible onsite alternatives for existing nuclear waste, such as Hardened On-Site Storage (HOSS) to reduce risk of leakage or terrorist attack. (0707-4 [Werner, Shahla M.])

Comment: Will the NRC require its nuclear power plant licensees to implement hardened on-site storage for their irradiated nuclear fuel --- that is, require that the irradiated fuel be removed from vulnerable, high-density reactor waste pools for storage in hardened dry-storage casks fortified against attacks and natural disasters? (0715-4 [Drey, Kay])

Comment: The next two recently released documents are a speech and slideshow presented by Michael Weber, NRC's Deputy Executive Director for Operations, at the U.S. Nuclear Infrastructure Council Meeting on January 31, 2012.¹²⁰ [footnote 120 text: Michael Weber, Responding to Fukushima-Daiichi (Speech), ML12037A072 ("*Weber Speech*") (Jan. 31, 2012); Michael Weber, Responding to Fukushima-Daiichi (Slideshow), ML120310267 ("*Weber Slideshow*") (Jan. 31, 2012).] These documents discuss NRC's response to the Fukushima accident, focusing in particular on spent fuel pools. Director Weber acknowledged that the pools were not designed for the long-term storage of spent nuclear fuel, that zirconium fires can occur in pools, and that the consequences of a zirconium fire could be very large.¹²¹ [footnote 121 text: *Weber Speech* at 4-5.] Furthermore, he stated that since the fuel pools are located outside of the primary containment that houses the reactor, a release of radionuclides from the pool can reach the environment much more easily than a release from the reactor core.¹²² [footnote 122 text: *Id.* at 4.] Director Weber further acknowledged that thinning the spent fuel pools would reduce the potential land contamination and economic impacts if a large release occurred.¹²³ [footnote 123 text: *Weber Slideshow* at slide 20.] He stated that due to the threat of zirconium fires, NRC is studying the benefits of removing spent fuel to achieve lower fuel density in the pools. Additionally, Mr. Weber disclosed that NRC Staff is currently conducting a Spent Fuel Pool Scoping Study to assess the impacts of thinning the pools.¹²⁴ [footnote 124 text: *Weber Speech* at 5.] This development reflects NRC's new understanding of the risks posed by spent fuel pools, due in large part to the events at Fukushima. The State believes this new understanding must be reflected in a revised EIS and rule. (0718-2-11 [Sipos, John])

Comment: Accelerate ongoing hardened, on-site storage of spent fuel at all reactor sites. (0728-7 [Anonymous, Anonymous])

Comment: I am horrified with the conclusion of the draft study against accelerated transfer of radioactive waste from the pools to dry casks being based on a cost/benefit analysis. Cost/benefit?! Isn't our safety supposed to be top priority? Who do you work for? If you are not working for the tax payers who support you, should you not instead be getting paid by the nuclear industry? (0734-6 [Hisasue, Carole])

Comment: As a concerned resident of San Clemente our city is dangerous. We have an enormous amount of high spent fuel rods in our "backyard"..this highly radioactive waste needs to be removed as soon as safely possible.it is my understanding that 2/3 'a of it can be removed NOW. This MUST be moved immediately. Our city is densely populated with NO evacuation plan. Please do the right thing NOW. (0736-1 [Johnston, Christined])

Comment: As you decide on a "Plan", please make it fully responsible with removal swiftly, not over many years putting all the nearby residents in danger of leakage as they have discovered in Japan. Please do it right, swiftly and completely. Our children and grandchildren will thank you. (0737-1 [Meyer, Frederick])

Comment: Accelerate ongoing hardened, on-site storage of spent fuel at all reactor sites. (0741-4 [Giese, Mark M.])

Comment: [K]eep the waste at the plant sites in a hardened fashion. (0748-2 [DeLano, Harry])

Comment: [I believe the NRC must:] Accelerate ongoing hardened, on-site storage of spent fuel at all reactor sites[.] (0757-15 [Lynch, Laura])

Comment: Accelerate ongoing hardened, on-site storage of spent fuel at all reactor sites. (0774-9 [Revilla, Oscar])

Comment: It is in everyone's interest to Dry Cask as soon as possible. (0778-1 [Sorgen, Phoebe])

Comment: Fukushima showed the danger in relying on long-term storage of nuclear waste rods in spent fuel pools which require constant circulation of cooled water. Nuclear waste rods need be transferred to hardened dry cask storage as soon as possible, even if it is more expensive for electrical utilities. (0788-1 [Sattler, Alfred])

Comment: Accelerate ongoing hardened, on-site storage of spent fuel at all reactor sites. (0789-4 [Salto, Don])

Comment: Begin an emergency program to put spent fuel into dry cask storage. (0801-4 [Magyar, Michael])

Comment: While we wait and watch the global disaster at Fukushima, follow the currents of the great Pacific Ocean carrying radioactive waste to distant shores, destroying everything in its path, you act as if its is "business as usual." Why would you do anything less than humanly possible to secure the spent fuel rods into dry cask storage as soon as possible at Diablo Canyon nuclear power plant? It is your job, your responsibility. (0811-2 [Paulsen, Carol])

Comment: Get the spent fuel rods out of the pools and into dry casks. (0811-6 [Paulsen, Carol])

Comment: Second, the facility where the waste is stored should be Hardened On-Site Storage (HOSS) systems to resist anti-tank missiles, crashed commercial jets and similar means of attack. At ground level, this would mean layers of concrete, steel, gravel and other substances around and above the spent fuel. Neither spent fuel pools -especially the "attic pools" of the GE Mark 1 design -nor dry casks by themselves meet this criterion. (0815-5 [Gunter, Keith] [Izant, Carol])

Comment: The NRC has not proposed any sort of hardened storage which is the safest option. (0815-7 [Gunter, Keith] [Izant, Carol])

Comment: In Michigan and around the Great Lakes basin, citizens, corporations, and governments alike are responsible for the largest amount of surface freshwater in the world. Including Canadian reactors, there are 33 reactors on the Great Lakes basin which is even more reason to implement HOSS at all of these facilities. (0815-8 [Gunter, Keith] [Izant, Carol])

Comment: This leads to the consideration of fuel handling and storage at Browns Ferrys G.E. Mark I (Fukushima) reactors which was ignored and legally foreclosed as these reactor licenses were renewed. I believe that a risk and environmental safety analysis will show that reducing the high density wet fuel storage pools located overhead in buildings with little storm resistance (and subject to a recent station blackout caused by tornadoes) is a much more urgent problem than indefinitely long onsite storage. (0821-6 [Paddock, Brian])

Comment: Adoption of Hardened Onsite Secure Storage regulations (HOSS) would provide at least some sense of improved security from various causes of release to the environment or

terrorist exploitation, but NRC has never even proposed such rules and now wants to leap to forever storage in unhardened surface locations. (0821-9 [Paddock, Brian])

Comment: Additionally it is hard to imagine a single terror event inflicted upon a dry cask storage system that would equal the radiological fallout from a single successful terrorist aircraft attack on a full spent fuel pool where a zirconium cladding fire occurred. Removing the active cooling requirements and lowering the concentration of the spent fuel storage density as quickly as possible will enhance the surrounding community's confidence in short-term nuclear waste storage. (0826-21 [Morgal, Rick])

Comment: The NRC needs to stop allowing the nuclear power plant owners from utilizing dry cask systems that are not capable of protecting their contained fuel from an impact from a large aircraft. The Draft GEIS talks about storing fuel in casks for up to several hundred years. The casks used need to be able to endure whatever mechanical impacts we can foresee in our current society before we pass the site on to the next seven generations. Massive movable concrete ramps positioned in front of the cask lid could be used to deflect an aircraft from directly hitting the metal cover of the NUHOMS dry casks. The ramps could be segmented, allowing them to be moved to facilitate inspection and re-arrangement dry cask contents. Since the concrete pad is very thick where the dry cask transportation truck operates, the weight of the concrete ramps would not be a problem to the storage site. By orienting the ramps in front of the NUHOMS metal cover it would be possible to protect the dry cask sealed lid from direct impact from a large aircraft. Protecting the surrounding community from a possible dry cask dirty bomb fallout scenario less catastrophic than a spent fuel pool fire but still potentially very devastating to the surrounding community. (0826-27 [Morgal, Rick])

Comment: [S]ecure the existing reactor waste in hardened on-site storage. (0829-2 [Anonymous, Debra])

Comment: Page 4-81, external events on fuel pools... the pools are not in hardened containment buildings but instead have only a thin roof over them, only for decoration. Those in Mark I containments are elevated above the ground, like those at Fukushima. THESE STRUCTURES ARE UNSAFE! Your rules for Fuel Pools are wholly insufficient but you will not admit this because it will mean you will have to tell existing licensees that they will have to spend money for safety, or shut down. And even when they shut down, they are still left with the problem.. STANDARDS FOR FUEL POOL SAFETY, INCLUDING HARDENED CONTAINMENT MUST BE IMPROVED! (0836-57 [Davis, Anonymous])

Comment: The risks associated with spent fuel pools are real, and extreme consequences of mishaps, accidents, and space weather are relevant. Hardened On-Site Storage systems (HOSS) should be used immediately to store spent fuel more safely and securely at all near nuclear plants until a permanent storage solution is developed. HOSS solves many of the immediate dangers nuclear waste poses, without creating unnecessary risks associated with water cooled spent fuel pools. (0840-6 [Taylor, Tom])

Comment: The NRC emphasizes that the consequences to focus on are the radiological doses to humans which the report states are low in both cases because of the modeled successful evacuation and sheltering that limit the radiological doses. The nuclear plants have to transition to dry storage anyway to retain space in the pool. The NRC focuses on accident rem dose to the public as the health indicator of accident severity rather than miles of land uninhabitable, acres of farm land unusable, and dollar cost of the catastrophe. The NRC concludes that there is no significant safety benefit from reducing high density spent fuel pool storage to low density

storage. Thus, NRC rationalizes that transitioning to low density spent fuel pool storage is unnecessary. Likewise, the NRC also rationalizes that expediting the transition to dry cask storage which is significantly safer than pool storage is unnecessary. The NRC is serving the nuclear industry well. You and me? Not so much. (0851-6 [Thatcher, Tami])

Comment: Accelerate ongoing hardened, on-site storage of spent fuel at all reactor sites. (0860-9 [Headrick, Gary])

Comment: In addition, I would request that all irradiated fuel rods be put into hardened on-site storage, with berms, as soon as possible, rather than waiting until the fuel pools are filled. The longer we have to keep cooling those pools, the greater the risk of a failure and consequent disaster. (0864-9 [Gellert, Sally Jane])

Comment: Hardened with concrete the casks could be safe against most disasters and terrorism. For instance, the casks at Fukushima were undamaged. (0883-3 [McArdle, Ed])

Comment: Go to dry cask storage as rapidly as possible! (0888-9 [Wilvert, Rosemary])

Comment: [F]ind better ways to harden existing wastes in place[.] (0890-4 [Arnason, Deb])

Comment: [S]tore [nuclear radioactive waste] in hardened storage existing waste where it is! (0890-8 [Arnason, Deb])

Comment: HOSS = common sense (0901-3 [Anderson, Janet M.])

Comment: (XI-7) Table XI-1 shows how the United States could benefit from policies that ensured that critical infrastructure is designed to be robust and inherently safer. The benefits could include, for example, a reduction in the federal government's perceived need to conduct surveillance of the domestic population. That matter is a subject of current debate. Designing critical infrastructure to be robust and inherently safer would be part of a national strategy of protective deterrence. (XI-8) Nuclear facilities – including reactors, pools, and ISFSIs using dry casks – are components of critical infrastructure. In the context of storing spent fuel, a dry cask is more robust and inherently safer than is a pool equipped with high-density racks. A dry cask in an ISFSI with enhanced protection would be even more robust and inherently safer. Thus, the aspects of radiological risk that I discuss in this declaration are significant for national security, and could be productively addressed within the context of protective deterrence. The draft GEIS is oblivious to this matter, and does not respond to my recommendation as quoted in paragraph XI-6, above. More generally, NRC appears oblivious to its potential ability to benefit the nation by implementing principles of protective deterrence. (0916-3-10 [Curran, Diane] [Thompson, Gordon R.])

Comment: (XI-18) The third conclusion is as follows. The cumulative frequency of successful attacks on ISFSIs, now and in the future, could be decreased by providing ISFSIs with enhanced protection against attack. (0916-3-14 [Curran, Diane] [Thompson, Gordon R.])

Comment: First Dry Cast all available waste[.] (0917-1 [Priano, Guy])

Comment: Enclosed please find the signatures of many in our community who are asking that you take additional measures for our health and safety. That is, after all supposed, to be the guiding mission of your organization. Please adhere to your guidelines of public safety and require the industry to move waste into dry cask storage. (0918-2 [Church of New York, The Riverside])

Comment: As you are well aware, many hundreds of environmental organizations, representing all 50 states, have long called for Hardened On-Site Storage (HOSS) as the least-worst interim measure for safeguarding and securing irradiated nuclear fuel that already exists in the U.S. (0927-1 [Kamps, Kevin])

Comment: HOSS represents the national environmental consensus position for addressing the dire risks of pool storage, as well as current dry cask storage; not decades or centuries into the future, but right now. (0927-3 [Kamps, Kevin])

Comment: Establish hardened on-site storage (HOSS): Irradiated fuel must be stored as safely as possible as close to the site of generation as possible. Waste moved from fuel pools must be safeguarded in hardened, on-site storage (HOSS) facilities. Transporting waste to interim away-from-reactor storage should not be done unless the reactor site is unsuitable for a HOSS facility and the move increases the safety and security of the waste. HOSS facilities must not be regarded as a permanent waste solution, and thus should not be constructed deep underground. The waste must be retrievable, and real-time radiation and heat monitoring at the HOSS facility must be implemented for early detection of radiation releases and overheating. The overall objective of HOSS should be that the amount of releases projected in even severe attacks should be low enough that the storage system would be unattractive as a terrorist target. Design criteria that would correspond to the overall objective must include: --Resistance to severe attacks, such as a direct hit by high-explosive or deeply penetrating weapons and munitions or a direct hit by a large aircraft loaded with fuel or a small aircraft loaded with fuel and/or explosives, without major releases. --Placement of individual canisters that makes detection difficult from outside the site boundary. (0927-7 [Kamps, Kevin])

Comment: Require periodic review of HOSS facilities and fuel pools: An annual report consisting of the review of each HOSS facility and fuel pool should be prepared with meaningful participation from public stakeholders, regulators, and utility managers at each site. The report must be made publicly available and may include recommendations for actions to be taken. >-- Dedicate funding to local and state governments to independently monitor the sites: Funding for monitoring the HOSS facilities at each site must be provided to affected local and state governments. The affected public must have the right to fully participate. (0927-9 [Kamps, Kevin])

Comment: The terrorist threat to nuclear power reactors--brought home so clearly by the attacks of Sept. 11, 2001 as well as the U.S. federal government's admission that nuclear reactors are high on al-Qaida's list of potentially catastrophic terrorist targets--also raises concern about waste stored on-site at reactors. Pool fires caused by terrorist attacks could release massive amounts of radioactivity into the environment for hundreds of miles downwind, risking death and injury to hundreds of thousands of people. But dry casks, stored in concentrated rows (not unlike bowling pins) in clearly visible outdoor locations, are also very vulnerable to terrorist attack. Some concerned citizens groups have advocated "hardening" at-reactor waste storage, fortifying it against terrorist attack, such as by emptying vulnerable pools and dispersing and bunkering dry storage casks behind thick concrete, steel, and earthen shields to defend against attacks by high explosives or missiles (see www.nukbusters.org/issues/hoss). (0929-16 [Kamps, Kevin])

Comment: Page 4-81, external events on fuel pools... the pools are not in hardened containment buildings but instead have only a thin roof over them, only for decoration. Those in Mark I containments are elevated above the ground, like those at Fukushima. THESE STRUCTURES ARE UNSAFE. Your rules for Fuel Pools are wholly insufficient but you will not admit this because it will mean you will have to tell existing licensees that they will have to

spend money for safety, or shut down. And even when they shut down, they are still left with the problem.. STANDARDS FOR FUEL POOL SAFETY, INCLUDING HARDENED CONTAINMENT MUST BE IMPROVED. (0930-3-9 [Lutz, Ray])

Comment: Overcrowding in irradiated/spent fuel pools is an unacceptable risk to the public. The NRC should take immediate action to reduce the number of fuel assemblies in the water filled pools, as well as analyzing the deficiencies of the current dry cask storage. (0938-4 [Sondheim, Steven])

Comment: Spent nuclear fuel older than five years should be stored in dry, hardened storage casks. (0946-2 [Commenters, Multiple])

Comment: In the interim, NRC must mandate the immediate movement of waste that has been sufficiently cooled out of the pools to dry storage containers. (1007-4 [Diamond, Jim])

51. Out-of-Scope Comments – Reactor Accidents

Comment: It's my opinion that safety is compromised when the plant continues to operate in any capacity after it's expected operational life span. (0026-2 [Campbell, Mary])

Comment: In Russia the Chernobyl reactor was precisely the same design as Hanford's. Shouldn't that mean something to us? As for the Japan disasters, it does not take the proverbial rocket scientist to tell us that it is a very dumb idea to build three reactors close together on a major fault line. (0057-5 [Lamont, Dana])

Comment: Although Walter and his followers were unable to stop the first breeder project in the U.S., another group called the Joint Committee on Atomic Energy, talked the Atomic Energy Commission into making a study on what would happen if a reactor melted down. The following study was named the WASH-740 report, or the Brookhaven Report. In a nutshell, the report stated that: In the event of a nuclear meltdown, there would probably be 3,400 deaths, 43,000 injuries, and 7 billion dollars of property damage, PER EVENT!.... Keep in mind as far as property values went, as this was figured in 1950's dollars. (0100-23 [Behling, Steve])

Comment: [Y]ou have estimated the risk of a core melt with containment breach at a G.E. Mark 1 BWR at 1 in 1 million reactor years. Actual reality has revealed the risk to be 1 in 352 reactor years. That's 200 -- 2,841 times more likely than the NRC prediction. (0112-11-4 [Agnew, David])

Comment: The NRC concludes in Section 4.1.3 that the impact of indefinite storage on land use will be small. How does that jive with real world engineering experience? We don't have many examples in this area, but we do have one rather significant one, Fukushima Daiichi. That's the best real world data we have now. That says that every 50 years we will have a major leak of high-level nuclear waste that will render about 250 square kilometers unusable for a million years. That works out to be 5 million square kilometers or about one-thirtieth of the land area of the entire world. I claim that's catastrophic, not wrong. But my estimate is based on real world experience and EPA requirements. (0112-20-4 [Robinson, Herb])

Comment: And he [Gregory Jaczko] came back and he wasn't -- it wasn't a unanimous votes anymore to license new plants in South Carolina and Georgia or relicense Pilgrim, for example. It was 4 to 1, 4 to 1. He voted against and against and against and he started speaking the truth. And he really suffered the consequences like all whistleblowers do. The NRC doesn't want

to know the truth. And what he said was I really want to give him this credit, "All 104 nuclear power reactors now in operation in the United States have a safety problem that cannot be fixed. And they should be replaced with newer technology. Continuing to put Band-Aid on Band-Aid is not going to fix the problem." He continues to speak and he was in Boston a week or two ago and he spoke about Fukushima won't happen again. (0112-22-2 [Nestel, Hattie])

Comment: I focused my attention on the PRA, like the probabilistic risk assessment, and more exactly on the human reliability assessment part. Because if you look back on the history and you look at all the accidental incidents at the nuclear power plants, most of them came from the human errors. And humans are made to fail. We cannot avoid that. So it's better to design fail-safe reactors. (0112-28-1 [Diaconeasa, Mihai])

Comment: So I want to just make one other comment about the Santa Fe Institute. Does anyone here know the Santa Fe Institute? It's a think tank in Santa Fe, New Mexico. A group of scientists come together and discuss topics. And all of these students here that are studying at MIT, I've been at Harvard, I've been at Tufts, I've been at all these universities, okay, and I want to tell you how smart I am, okay. So the Santa Fe Institute brought together scientists from all over, all specialties around the nuclear physicists, the electrical, you know, engineers, the botanists, the M.D.s, they took all the medical specialties, you know, physical specialties, brought them all together, sat them in one room and said, "Listen, guys, we want you to think of -- I want you to figure out what percentage of information you know, you know, you know, you know, you know, you know, you know, you know, you know. That you are so certain that you can tell somebody 100 percent that there is nothing else that could ever happen." And you know what this group knew? 4 percent. So if I studied for 38 years as a doctor, have gone to seminars and learned everything that I want to try, I'm constantly in continuing education, taught at Tufts for eight years, how much information do I know? Maybe .10001 percent. And I know this much. So for those brilliant students at MIT, you know this much. And the confidence that we have to say that nothing could happen like Fukushima or Chernobyl or Three-Mile Island is so -- it's so arrogant on the part of this group to think that we have to be so -- we know everything. We know the engineering, we know -- they know this much, guys. This much. (0112-29-3 [Roman, Margo])

Comment: Furthermore, it's premature because the probabilistic risk assessment, which is a foundation of assessing the impact of the various areas you looked at, are currently based on pre-Fukushima assumptions and probabilities; and, therefore, it's inappropriate to use a PRA of yesterday to make any judgment in this area until it has been updated. I would direct you in this to Chairman Macfarlane's notation note on the SECY dealing with filtration where she goes into the problems with PRA that she's identified. (0112-3-2 [Lampert, Mary])

Comment: Thirdly the infrastructure of nuclear plants is aging and more subject to deterioration. (0125-4 [Kidney, Barbara A.])

Comment: Although I know that the risk of a serious problem under a nuclear reactor is small, the consequences can be so severe that they must be considered anyway. (0163-20-1 [Gellert, Sally Jane])

Comment: The last time I checked the Sunday New York Times real estate section, Three Mile Island, Chernobyl, and Fukushima were not places with many listings. Nor were there any articles indicating that there were customers looking to move to either of these three places. While I'm certainly not qualified to make any decisions for other concerning either our economic well-being or how to become a successful real estate entrepreneur, I know that an ecological catastrophe forcing millions to flee permanently from their homes and others not so fortunate

who could not escape in time and are left to die of various cancers due to radiation poisoning is bad for business..... And since millions of dead people are no longer able to be customers, it might be more cost-effective in the long run for those who are responsible for the storage of the lethal material which can kill us all to deal with the problem in a sane and sensible way that will assure the safety of the millions of people who have no desire to become casualties of a nuclear disaster. No amount of lawsuits or gracious letters of sympathy could ever undue the tragedies of Three Mile Island, Chernobyl, and Fukushima. (0163-26-2 [Amram, David])

Comment: I'm almost sure that no one working for the NRC wants to have an emergency phone call telling them that they and their families have to pack up and flee immediately from where they live even if it means becoming homeless. And if they survive, seeing aerial photographs of where they used to live now reduced to ghost towns. And this is not a plot for a grade-B movie. This is the reality of what's already happened. (0163-26-4 [Amram, David])

Comment: Let's spot-check the document. The document concludes in section 4.1.3 that the impact of indefinite storage on land use will be SMALL. How does that jive with real world engineering experience? We don't have many examples in this area, but we do have one rather significant one: Fukushima Daiichi. This is the best real world data we have, now. That says every 50 years we will have a major leak of high-level nuclear waste that will render a 250 km² area unusable for a million years. That works out to be 5 million km². About 1/30th of the land area of the entire world! I claim that is "CATASTROPHIC," not "SMALL." My estimate is based on straightforward, real world, experience and EPA requirements. (0208-5 [Robinson, Herb])

Comment: I am also EXTREMELY concerned about the vulnerability of US reactors to an extended loss of power event. It seems to me that this is a "single" mode failure that every US reactor is subject to. (0224-1 [Simon, Daniel])

Comment: So, as some of the previous speakers have mentioned, there are four reactors in Illinois which are Fukushima Daiichi twin designs. These are General Electric Mark I boiling water reactors located at Dresden and Quad Cities. And we've seen on live television what these reactors are capable of in terms of risks if you lose the electric grid and the emergency diesel generators for a long enough period of time. (0245-13-1 [Kamps, Kevin])

Comment: The, and just moving -- this whole probabilistic risk mitigation and assessment, it's just mumbo-jumbo, mangling of logic to make it seem that the risk on paper is small, and it just does not do that. (0250-5-8 [Safer, Don])

Comment: I am concerned about the safety of nuclear energy. It does not have a reliable safety history. There have been 26 accidents in the US since 1961, some with fatalities--that's 1 every 2 years, the most notable being Three Mile Island in 1979. (0276-2 [Kurz, Carol])

Comment: Three Category 9 accidents have all occurred since 1979. Risk-quantification models which hold major-accident chances as so remote that they can be discounted are no longer defensible. Given the horrific damage to people and the environment such accidents can unleash, neither is the Commission's apparent safety-analysis focus on minimizing cost to the nuclear industry -- see failure so far to mandate hardened dry storage -- instead of assuring health- and environmental protection for the citizenry. (0303-12 [Lamberts, Frances])

Comment: And I want to start by acknowledging some of the people who have spoken for all the great people that work at PG&E and their ethic of safety and everything. I'm sure they're very, very dedicated and intelligent people, and they're doing their very best to make that a safe

plant. And I just don't want to discourage any of them, but unfortunately, there's just so many different things that can go wrong in a complex system. And Charles Perrow, in his award-winning book, *"The Normal Accidents: Living with High-Risk Technologies,"* talks about this phenomenon. And he describes what happened at Three-Mile Island. I'd like to read you this story. I think it's revealing. "The incident began when leaking moisture from a blocked filter inadvertently tripped valves controlling the flow of cold water into the plant's cooling system. Redundant backup valves should have intervened, but were inexplicably closed, which would have been clear from an indicator light, but the light was obscured by a tag hanging from a switch above." "A tertiary line of technological defense, the relief valve, should have opened, but did not, while a malfunctioning indicator light erroneously indicated that it had. This led to a partial meltdown at Three-Mile Island." Now, if anybody had been smart enough and creative enough to think of this particular sequence of events, they would have calculated it to be one in a million, I don't know, one in a billion, but there are a million or a billion of these things out there that we don't even know about, that we can't calculate, so in the end, it becomes inevitable. (0326-34-1 [Phillips, Mark])

Comment: We were also officially told, for decades we've been told, that a meltdown is impossible and, yet, we all saw them happen. We were also told that a nuclear power plant can't blow up like an atomic bomb, but the whole world saw the mushroom cloud over Fukushima. (0327-29-3 [DeMare, Joseph])

Comment: This past summer, I also participated in a radiation exposure conference in Japan that included an onsite tour of the Fukushima Daiichi facility. I've seen firsthand what happens when design basis isn't enough, when multiple supposedly redundant backups, safety systems, fail. I've seen the devastation and driven to the abandoned villages. (0328-1-3 [Johnson, Ron])

Comment: We've already seen that nuclear accidents happen. Fukushima, Chernobyl, Hanford, Three Mile Island. (0329-16-5 [Hoffman, Ace])

Comment: All nuclear power plants release radiation and other pollutants into the environment as a matter of course throughout operation. Accidental releases of radiation into environment have already occurred at the majority of nuclear plant sites. Two nuclear power installations have had severe accidents involving explosions, fires, meltdowns and massive releases of radiation. The Chernobyl disaster, in 1986, resulted in the permanent relocation of 300,000 people, the severe contamination of over 1000 square miles of land, and a sizable geographical region being deemed uninhabitable for centuries. The Fukushima accident, in 2011, resulted in the evacuation of over 150,000, with ultimate numbers of displaced uncertain. But both Chernobyl and Fukushima accidents occurred in relatively unpopulated areas. (0341-1-10 [Mermelstein, Richard])

Comment: Entropy isn't addressed by the NRC waste document. The NRC concludes in Section 4.1.3 that the impact of indefinite storage on land use will be small. How does that jive with real world engineering experience? Real world data says that every 25 years we will have a major leak of high-level nuclear waste that will render about 250 square kilometers unusable for millennia. That works out to be 5 million square kilometers or about one-thirtieth of the land area of the entire world. (0348-11 [Agnew, David] [Roscoe, Lee])

Comment: The NRC has estimated the risk of a core melt with containment breach at a GE Mark 1 Boiling Water Reactor such as Pilgrim at 1 in 1 million reactor-years. Actual reality has proven the risk to be 1 in 352 reactor-years, 2,841 times more likely than NRC prediction. (0348-7 [Agnew, David] [Roscoe, Lee])

Comment: Entropy isn't addressed by the NRC waste document. The NRC concludes in Section 4.1.3 that the impact of indefinite storage on land use will be small. How does that jive with real world engineering experience? Real world data says that every 25 years we will have a major leak of high-level nuclear waste that will render about 250 square kilometers unusable for millennia. That works out to be 5 million square kilometers or about one-thirtieth of the land area of the entire world. (0352-11 [Roscoe, Lee])

Comment: The NRC has estimated the risk of a core melt with containment breach at a GE Mark 1 Boiling Water Reactor such as Pilgrim at 1 in 1 million reactor-years. Actual reality has proven the risk to be 1 in 352 reactor-years, 2,841 times more likely than NRC prediction. (0352-6 [Roscoe, Lee])

Comment: In particular, the use of probabilistic risk assessments (PRA's) suffers fundamentally from the fact that their results don't reflect in the remotest real life occurrences. The reason appears to be that classical PRA's cannot sufficiently predict nuclear catastrophe because of the low base rate for such events AND that such events usually have a multitude of causes and/or causes based on human error or other contributors which are not calculable in mathematical equations. Examples: Three Mile Island occurred after 500 reactor years while the PRA prediction was once in three million years. Chernobyl after 300 reactor years, the prediction was once in ten million. And the prediction for Fukushima would have been off the scale altogether: for three reactor meltdowns and pool problems all at once? A series of unpredicted events combined with unforeseen human errors: a beyond design basis quake, a drop in the coastline, insufficient seawalls, emergency generators in the basement and battery back-up power for just eight hours. Remarkably, at Fukushima, dry casks remained unscathed while the pools still present enormous problems 2 1/2 years later. (0358-8 [Schumann, Klaus])

Comment: Entropy isn't addressed by the NRC waste document. The NRC concludes in Section 4.1.3 that the impact of indefinite storage on land use will be small. How does that jive with real world engineering experience? Real world data says that every 25 years we will have a major leak of high-level nuclear waste that will render about 250 square kilometers unusable for millennia. That works out to be 5 million square kilometers or about one-thirtieth of the land area of the entire world. (0373-11 [O'Malley, Brian])

Comment: The NRC has estimated the risk of a core melt with containment breach at a GE Mark 1 Boiling Water Reactor such as Pilgrim at 1 in 1 million reactor-years. Actual reality has proven the risk to be 1 in 352 reactor-years, 2,841 times more likely than NRC prediction. (0373-7 [O'Malley, Brian])

Comment: The licensee and the NRC have performed many tests which have not been placed upon the ADAMS search site because the data has not been purged, and the report has not been issued. This leaves the NUREG 2157 existing without adequate basis, and untimely and prematurely issued. To provide an example, I point to the NUREG 2121: Fuel Fabrication, Relocation and Dispersal During a LOCA. This was discussed in an ACRS subcommittee meeting on 11/7/2013. Apparently problems with the fuel in a LOCA were not fully answered, such as cladding failure, micron size fuel chips, and other LOCA concerns. Will there be an effort to allow comment to the NUREG 2157 from these tests that have not gotten into the record as yet before the NUREG 2157 issues in final form? The discussion specified that the final decision on these LOCA/fuel issues will take several months to answer. May I have a time line when reports and solutions will be issued for comment? (0376-1 [Lewis, Marvin])

Comment: The NRC consistently draws overly optimistic conclusions in the draft report as to the safety of the nuclear enterprise while ignoring the disasters. It cites the Fukushima catastrophe as proof that spent fuel pools can maintain their integrity even under great environmental stress and it talks about lessons learned; but it seems to ignore all the human consequences and misery attendant in this tragedy. It also ignores the vulnerabilities in the GE boiling water reactors such as those affected in Fukushima, which need to be remedied. (0410-27 [Nelson, Dennis])

Comment: Nuclear reactions are so dangerous because they are fundamentally uncontrollable. There is no off switch! Once enough purified, fissionable material is collected into a small enough space it achieves a life of its own. After a chain reaction has been initiated and the fuel has burned up to a certain degree it also becomes so radioactively and thermally hot that it is very difficult to handle. The reactor operator attempts to limit run-away chain-reactions using cadmium, boron and other neutron scavengers in control rods. Sometimes control fails because it depends on the physical integrity of the reactor. If the process gets outside of its design parameters, fuel assemblies and control rod channels can bulge, warp or distort in such a way as to prevent the proper insertion and operation of the control rods. This can lead to a rapid increase in the chain-reaction, a temperature excursion, further disruption of the reactor components and an eventual meltdown of the core. Even if the chain-reaction can be stopped the fuel components continue their radioactive decay and this keeps the fuel elements incredibly hot. If the cooling system fails to remove the decay heat from the rods and provide replacement water for that which evaporates, the rods can become exposed to air and can self-ignite burning the zirconium metal cladding. Zirconium is pyrophoric, i.e., will self-ignite and burn in air if the temperature becomes high enough. Uranium and plutonium metals are also pyrophoric and so will ignite and burn in air at high temperatures. Small modular reactors which can use metallic fuels are therefore fundamentally much more dangerous than the metal oxide fuels in common use today in large commercial reactors. (0410-7 [Nelson, Dennis])

Comment: You have estimated the risk of a core melt with containment breach at a GE Mark 1 BWR at 1 in 1 million reactor-years. Actual reality has revealed the risk to be 1 in 352 reactor-years, 2,841 times more likely than NRC prediction. (0419-4 [Agnew, David])

Comment: NRC regulations—10 C.F.R. § 50.68, Criticality Accident Requirements—require that safety analyses be conducted for scenarios in which fresh fuel assemblies, when housed in fresh fuel storage racks, *in a dry environment*, would be exposed to flooding, foam, or water mist, which fire fighting operations could cause. According to the NRC, “[f]oam or mist affects the neutron moderation in the [dry storage] array and can result in a peak in reactivity at low moderator density (called “optimum” moderation¹⁶¹ [footnote 161 text: J. M. Cano et al., “Supercriticality through Optimum Moderation in Nuclear Fuel Storage,” Nuclear Technology, Vol. 48, p. 251 (1980).])”¹⁶² [footnote 162 text: NRC, “Guidance on the Regulatory Requirements for Criticality Analysis of Fuel Storage at Light-Water Reactor Power Plants,” August 19, 1993, (ADAMS Accession No: ML072710248), Attachment 1, p. 4.] 10 C.F.R. § 50.68, Criticality Accident Requirements, states: Each licensee shall comply with the following requirements in lieu of maintaining a monitoring system capable of detecting a criticality as described in 10 CFR 70.24: If optimum moderation of fresh fuel in the fresh fuel storage racks occurs when the racks are assumed to be loaded with fuel of the maximum fuel assembly reactivity and filled with low-density hydrogenous fluid [water is hydrogenous], the k-effective [the estimated ratio of neutron production to neutron absorption and leakage] corresponding to this optimum moderation must not exceed 0.98 [below 1.0 is subcritical], at a 95 percent probability, 95 percent confidence level. This evaluation need not be performed if administrative

controls and/or design features prevent such moderation or if fresh fuel storage racks are not used. (0463-2-4 [Leyse, Mark])

Comment: Failure to Address Defects of Mark 1 Containment Vessel: NRC's own nuclear experts have known for years that the Mark 1 design, including its containment vessel are flawed and particularly susceptible to a major nuclear accident. Yet, NRC utterly failed to even mention this new information in their LR EISs -- the very document where such problems are to be investigated and publicly vetted. The WCGEIS needs to be revised to address this safety concern and how it could affect spent-fuel storage, including potential accidents. The WCGEIS needs to consider the option of closing down and not reissuing licenses to reactors, including those based on the Mark 1 design. (0496-6 [Batobato, Alicia])

Comment: The lessons of Fukushima are that loss of reactor control is not an acceptable risk given the systems and designs in use. The reactors can and will melt down in less than 5 hours if loss of external power occurs. The designs are flawed, the operators in both the TMI and Fukushima cases failed to prevent damage when they had the opportunity. The public was lied to in both cases and there was a coverup of information critical to public safety. These are crimes against humanity. (0514-2 [Fahey, John])

Comment: The vulnerability of the population of United States to sources of radioactive contamination from outside our borders must be studied and disclosed, including ongoing risks associated with the nuclear accident at Fukushima Dai'ichi. What would be our strategy for dealing with nuclear waste and contamination that would arise from an event of similar magnitude in the United States? (0522-4 [Rogers, William])

Comment: The probability of an accident relied upon is outdated and ignores qualitative factors. NRC Chair Macfarlane explained in her Notation Vote to SECY-12-107, pp. 3-4 that: ¹⁸ [footnote 18 text: <http://www.nrc.gov/reading-rm/doc-collections/commission/cvr/2012/2012-0157vtr.pdf>] Postulated frequencies of accidents at nuclear power facilities in the U.S. are often expressed anywhere from one in 1,000 years to one in 1,000,000 years (but) it's important to recognize that the world has seen three severe accidents at nuclear facilities in the past 33 years, or essentially one every 10 years, on average... The existing record for severe accidents at nuclear facilities worldwide over the past three decades versus the theoretical performance of nuclear power facilities in the U.S., highlights our struggle to assign uncertainties to these types of quantitative measurements. (If) current agency guidance while performing cost-benefit analysis...include(d) the potential costs of offsite releases similar to those experienced in Japan after the Fukushima accident, for instance...Any postulated changes to the way the agency addresses the evaluation of economic consequences of accidents would clearly increase the costs averted side of the equation and move the results in the direction of being more cost-beneficial. (0556-2-12 [Lampert, Mary])

Comment: The Nuclear Regulatory Commission cannot simply hide behind the proposition that the possibility of a nuclear explosion here is remote and therefore unlikely to happen. I am sure that the same was said in Japan and see what has happened. (0587-1 [Ciferri, Flavio])

Comment: On the other hand, one only has to look at Fukushima to know what will happen if we keep on running our nuclear reactors until they break. Loss of lives. Loss of land. Loss of income. (0616-4 [Hoffman, Ace])

Comment: On the other hand, one only has to look at Fukushima to know what will happen if we keep on running our nuclear reactors until they break. Loss of lives. Loss of land. Loss of income. (0709-4 [Wythe Elnagar, Romi])

Comment: A disastrous fire in March 1975 [at the Brown's Ferry Reactor in Alabama] nearly caused two of its reactors to melt down. The NRC adopted fire protection regulations in 1980 seeking to prevent another serious nuclear plant fire. But the three reactors at Browns Ferry, along with nearly four dozen other reactors in the U.S., still do not comply with fire protection regulations more than three decades later...It's not the cumulative effects of regulation that the NRC should be evaluating. The NRC should be concerned about the cumulative effects of non-regulation. (Paper by David Lochbaum, UCS, "Cumulative Effects of Non-Regulation," August 23, 2012)[.] (0716-21 [Kraft, Dave])

Comment: Significant New Information Regarding Spent Fuel Pools[.] The past three years have seen several developments involving the storage of spent nuclear fuel that NRC should take into consideration in the Proposed Rule and the DGEIS. CEQ regulations, to which NRC gives deference, and NEPA caselaw recognize that over time new information may become available that should be factored into the decision-making process or used to update a previous EIS. Agencies must supplement a previously issued EIS when "[t]here are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts."⁶⁹ [footnote 69 text: 40 C.F.R. § 1502.9(c). See also *Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 374 (1989) ("If there remains major Federal action to occur, and if the new information is sufficient to show that the remaining action will affect the quality of the human environment in a significant manner or to a significant extent not already considered, a supplemental EIS must be prepared" (internal citations omitted)).] Similarly, when new information comes to light over the course of a rulemaking, the federal agency should ensure that such information is taken into account in the rulemaking process and that any resulting NEPA-APA-AEA rulemaking does not impede consideration of such information in site-specific regulatory proceedings. As the colloquy during the January 11, 2012 Commissioners' meeting made clear, with respect to severe accidents, Staff's position is not that real world consequences and environmental impacts of such accidents would be insignificant, but rather that there is a low probability that precursor accidents will occur. Based on this supposed low probability, the Staff categorizes the environmental impacts from severe reactor accidents as "small."⁷¹ [footnote 71 text: Id. at 80-81.] But NRC's characterization of severe accidents as "small" ignores the significant consequences that would ensue if a severe accident were to occur. The reports and photographs of the consequences of Fukushima's multi-reactor accidents depict impacts that were anything but "small." NRC's logic is simply no longer tenable in a NEPA review of the site-specific environmental impacts associated with issuing an operating license. The destruction of four GE-designed reactors at Fukushima-Daiichi in March 2011 shows that severe accidents are neither improbable nor are the environmental impacts of severe accidents at power reactors or spent fuel pools "small." The consequences of those severe accidents, including the radiological contamination of portions of Fukushima Prefecture, show that the real world consequences of severe accidents are not "small." In light of the Fukushima accidents, recent regulatory actions and statements, and newly released documents, the State believes that NRC should consider the information contained herein to be significant and should pursue a site specific and site wide severe accident mitigation alternatives analysis for Indian Point. (0718-2-1 [Sipos, John])

Comment: Various other organizations and individuals have pointed out the lessons to be learned from the Fukushima accident. Former NRC Commissioner Victor Gilinsky wrote in the *New York Times*: "[F]ederal regulators have yet to absorb the lessons from this crisis" and

pointed out the dangers of a Fukushima-like accident at Indian Point.¹⁰⁵ [footnote 105 text: Victor Gilinsky, Indian Point: The Next Fukushima?, New York Times (Dec. 16, 2011).] Additionally, the Natural Resources Defense Council ("NRDC") released a document warning, "An accident at one of Indian Point's reactors on the scale of the recent catastrophe in Japan could cause a swath of land down to the George Washington Bridge to be uninhabitable for generations due to radiation contamination."¹⁰⁶ [footnote 106 text: Natural Resources Defense Council, Nuclear Accident at Indian Point: Costs and Consequences, (Oct. 2011), *available at*: <http://www.nirs.org/reactorwatch/aging/nrdccaccidentip1011.pdf>.] (0718-2-8 [Sipos, John])

Comment: On the other hand, one only has to look at Fukushima to know what will happen if we keep on running our nuclear reactors until they break. Loss of lives. Loss of land. Loss of income. (0856-4 [Fritz, John])

Comment: (XII-4) Over a period of decades, pursuit of short-term cost minimization has increased the radiological risk of nuclear power production in various respects. This pursuit influenced the design of the nuclear power plants that participated in the Fukushima accident of 2011. Other manifestations of this pursuit include reactor power uprates, use of higher-burnup fuel, shorter refueling periods, and use of high-density racks in spent- fuel pools. (0916-3-16 [Curran, Diane] [Thompson, Gordon R.])

Comment: On the other hand, one only has to look at Fukushima to know what will happen if we keep on running our nuclear reactors until they break. Loss of lives. Loss of land. Loss of income. (0931-3 [Masullo, Ginny])

52. Out-of-Scope Comments – Fukushima

Comment: The operation and attempted clean up of these hundreds of plants that have been built all over the world will be a legacy of death and destruction the likes of which have never been seen before upon the earth. We already have ample proof of that with Fukushima. Please do not try to tell me that I am exaggerating. The waste that was dumped and piped into the seas around Europe is concentrating in the sealife and distorting them permanently. It is washing up on the beaches and poisoning the children and giving people cancer all over the place. This effect will go on in perpetuity, due to the half life and toxicity of the substances sumarily dumped out into our life giving ocean to "dillute". When regulators routinely use weak measuring devices to obtain deceptively low readings, government publishes seismic maps that show no activity in a proposed area by simply not measuring it and we are constantly told there are no dangers from Fukushima because radation will be dilluted while Russian and Chinese sources say they are finding that it is concentrating, there is NO CONFIDENCE to be had. (0014-2 [Bolognini, Franceseca])

Comment: You know the risks and you know the alternatives. Let's recall Fukoshima which is not over yet! Make the shift now, Stop trying to enrich corporations who, if they were human, would be psychopathic personalities. We, the real people, deserve real protection from the unreasonable risks of nuclear energy and nuclear wastes! (0018-2 [Arnason, Deb])

Comment: We have seen the consequences of poor risk-management at Fukushima. We have not excuse for not planning for the unexpected, not when the stakes are so high. (0021-2 [Biddle, Lynn])

Comment: Fukushima is teaching us daily about the unimaginable dangers of a catastrophic event. (0023-8 [Bridges, Martha])

Comment: Fukushima. How can you begin to put out something generic and not take into account what is happening as we speak? Fukushima sadly is being kept out of our media. You get a little bit on it here and there, or you really have to look for it on the Internet, but it's a real problem. It's happening now. And I would wage the electronic minds of Japan where most of electronics even come from. If they can't figure out how to stop it, then certainly how can we? (0030-22-4 [Headington, Maureen])

Comment: There were a lot of rumors at Fukushima 4, but those rumors turned out to be false. The fuel in seven pools, including three that were in buildings that completely blew up, is still safe. It's still under water. Very robust structures, a lot of nuclear cultures. (0030-6-6 [McCullum, Rod])

Comment: There is an artificial distinction really made in the EIS over just the waste and not looking at the waste in the fuel pools. The material in the pools is essentially waste itself. And so if you look at what happened at Fukushima, maybe the fuel pools didn't themselves blow up or disperse at this point, but it is irradiated fuel that did that and that did get dispersed. So we do have living proof that this material can cause unacceptable risks, and then we get down to whether one considers what has happened in Japan as acceptable, and of course common sense says that it's not. (0030-8-7 [D'Arrigo, Diane])

Comment: Regarding the risk of pool fires, we need only look at Fukushima Daiichi Unit 4 in Japan. That reactor building was badly damaged by the hydrogen explosion that took place there. The HLRW storage pool is now open-air. Another bad quake could topple the entire building, including the storage pool. If the cooling water is lost, some hundreds of tons of HLRW could then catch on fire in a short period of time. The catastrophic release of hazardous radioactivity directly into the environment would dwarf what has occurred up to this point since March 11, 2011. (0034-7 [Wagner, Jim and Virginia])

Comment: And now, of course, we've got the nuclear pollution that is infesting the entire Northern Pacific Ocean fish and has been found already from Fukushima. (0045-12-7 [Kinsey, Bob])

Comment: At the Japan, Fukushima Dai-ichi site, used fuel was stored in seven pools and nine dry storage containers when the earthquake and tsunami and subsequent explosions occurred in March 2011. All of this fuel was protected and remains in safe storage today. (0045-13-3 [Allen, Rick])

Comment: We try to prepare for all the eventualities that we can and we hope that the operators that are putting together these facilities are preparing for these eventualities and that they're listened to. In Fukushima, for instance, the people who created those plants, there were people involved in the creation of that plant who have problems with the placement of the plants and the way they were putting it together. They weren't listened to and they left that project and it was still created and this is what we have today. So there are people involved who can affect the process and bring up ideas in case we have disasters like an earthquake, like a tsunami, like a flood. (0045-8-4 [Bartlett, Bill])

Comment: The NRC reminded us that Fukushima dry storage casks survived the tsunami in 2011. What kind of dry storage casks were these? How far away from the reactors that were damaged and are still out of control today were these casks stored? (0063-9 [Magda, Marni])

Comment: Business as usual isn't going to get the job done, just ask the people of Fukushima prefecture. (0067-2 [Parrish, Dave])

Comment: In Fukushima, tens of thousands of Japanese have been displaced from their homes and businesses -- and their lives and livelihoods severely impacted, because radioactive fuel waste was stored in pools and could not be cooled when the electricity went off. (0071-2 [Borie, Edith])

Comment: The explosion of the spent fuel pool in reactor number 4 at Fukushima resulted in bits of fuel assemblies blown up to a mile from the reactor. These are more than hot particles, they are lethal chunks of highly irradiated fuel assemblies that TEPCO and Japans NRA had full confidence would be safely stored in that fuel pool indefinitely. Their probabilistic assumption was wrong. Therefore NRC has no basis for making a similar assumption generically about all nuclear waste sites in the US. (0089-12 [Shaw, Sally])

Comment: The casks, the dry casks at Fukushima continued to function as they were designed after the disaster there. (0112-7-4 [Sachs, Leslie Sullivan])

Comment: I -- you know, in a few days, on November 8th, all of you in this room probably, because you follow the issue, will be holding your breath watching to see what happens in Fukushima when they attempt to move - those fuel assemblies out of the fuel pool. We don't need anymore lessons-learned from Fukushima. (0112-7-7 [Sachs, Leslie Sullivan])

Comment: We've all seen the, Fukushima 1, Fukushima 2, and Fukushima 3. Except Fukushima 3 held plutonium in it. How much plutonium is damaging to the human body? Is it a one-hundredth of a gram? How many pounds were in Fukushima 3? 500? But let's turn a blind eye to that. (0112-8-3 [Sachs, Gary])

Comment: We write to you in urgency. The situation around the world at radioactively contaminated sites is not good, and it is clear that the situation at the Fukushima Daiichi reactor site is progressively deteriorating, not stabilizing. We write because of your personal interest in a sustainable future, but also because you are the Executive for global organizations charged with protection of the public's health, public safety and the common good when it comes to radioactivity, radiation and nuclear technology. Together we call upon you to act immediately to:

1. Prevail upon international organizations and Japan to replace TEPCO with a worldwide engineering group to take charge of the Fukushima nuclear disaster.
2. Appoint a group of experts independent from either TEPCO or IAEA to advise the new engineering group to establish a risk informed stabilization, containment and remediation plan for Fukushima.
3. Create a well-funded oversight panel of local citizens and local elected officials to ensure transparency and accountability of both of the above groups, as well as to facilitate well-informed self-determination and further recovery of the impacted populations.
4. Call upon the Japanese government to admit financial costs in excess of \$500B USD.

<http://mobile.reuters.com/article/idUSBRE92417Y20130308?irpc=932>; And Gundersen, Arnold, http://www.amazon.co.jp/japanesecharacters/dp/4087206289/ref=sr_1_1?ie=UTF8&gid=I378938739&sr=8-1&keywords=gundersen

5. Call upon the Japanese government to assure adequate funding for decontamination of the prefecture and site.;
6. Call upon the Japanese government to cease the massive incineration program underway in Japan which carts and bums rubble from the earthquake and tsunami, much of it toxic and some of it radioactive, in municipal incinerators.

(0113-1 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: 7. Any projection of total cancers or deaths from the Fukushima disaster is premature; and any previous publications need to be viewed as "speculative" at best. It is clear now that the Fukushima Daiichi nuclear disaster is far from over, and that there can be no credible estimate of total environmental or human health impacts because the radiological release has not ceased and the outcomes from exposing large populations to low doses over long time frames is unclear. A final estimation of the radiological release from the Fukushima Daiichi site, of necessity lies in the future; perhaps the distant future. Therefore, it remains of utmost importance to monitor radioactivity and provide and increase protective measures to individuals and communities. *When* future updates to such studies are done, it must be incumbent upon the researchers to revise previous findings, not merely extend them, since it is known that key data from the past were not included--such as the World Health Organization omitting the radiation exposures to members of the public prior to being evacuated (the first 4 days of the disaster; Becker, Oda 2012: <http://www.greenpeace.org/international/Global/internationalbriefings/nuclear/2013/2012/OdaBecker.pdf>). In addition Japanese physicians and scientists in Japan must be allowed and supported to treat and report Fukushima related health consequences. Nuclear calamities to date result in institutional pressure to under report and even distort patient health data and other evidence (see, for example: The Advisory Committee on Human Radiation Experiments, Final Report <http://archive.org/details/advisorycommitteeOOunit> and Steven Winget al. (1997). "A reevaluation of cancer incidence near the Three Mile Island nuclear plant: the collision of evidence and assumptions". Environmental Health Perspectives (Brogan & Partners) 105 (1): 52-57.) Such institutional pressure is now contributing to a downplaying of the true impact of the Fukushima accident. Further, slavish reliance on past exposure assumptions is not advisable, not only because these assumptions could have been subject to this type of pressure, but also because every nuclear catastrophe/exposure is different; according to the UN Special Rapporteur on Health, who references applicable research in his report: "Though experiences from the Three Mile Island and Chernobyl accidents provide invaluable guidance, a narrow appreciation of the accidents would not provide proper guidance." [Report of the Special Rapporteur on the right of everyone to the enjoyment of the highest attainable standard of physical and mental health, Anand Grover, Mission to Japan (15-26 November 2012) p 9] (0113-3 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: 13. The Fukushima disaster has inflicted suffering from family, social and economic disruption and loss of cultural traditions including food sources and family shrines. These losses are causing visible impacts on the mental and physical health of children, parents, grandparents, and whole communities. While it is radioactivity that will prevent their return to that life, there are many dimensions in which harm has been done. Those responsible for constructing and operating the reactors, and accumulating irradiated fuel, should be accountable to the people impacted. The Special Rapporteur's report says legal structures should "(e)nsure that TEPCO and other third parties are held accountable for the nuclear accident and that their liability to pay compensation or reconstruction efforts is not shifted to taxpayers." (0113-9 [Caldicott, Helen] [Ehrle, Lynn Howard] [Freeman, S. David] [Grodzinsky, D.M.] [Gunderson, Arnie] [Koehnlein, Wolfgang] [Koerblein, Alfred] [Meyer, Alfred C.] [Mironova, Dr. Natalia] [Patterson, Jeffrey J.] [Pflugbeil, Sebastian] [Preobrazhenskaya, Natalia] [Scherbak, Yuri] [Sovacool, Benjamin K.] [Starr, Steven] [Wing, Steve] [Yablokov, Alexey])

Comment: When the women farmers from Fukushima came here a year ago, that is one thing they said that stuck with me hard. That in Fukushima they had no place to rest safely at the end of each exhausting day is traumatic. Imagine you go to lie down and you know your pillow is

contaminated with radiation. Then also imagine that your family is divided, maybe forever. The elders did not want to leave their homes. Men stayed behind to work while women left with children. Imagine, imagine... But don't just imagine. (0120-3 [Seeman, Laurie])

Comment: Now the issue has been forced, I guess in part by the looming potential of global catastrophe from reactor 4 at Fukushima. How much of this extraordinary threat could have been prevented if Japan (TEPCO) had been required to spend the extra money for what I understand to be much safer but more expensive dry cask storage - not to mention all the other places around the globe put at equal risk because of the same short-sighted "frugality"? (0126-2 [Houston, Ann E.])

Comment: We're currently on the edge of our chairs, to see what happens with the latest Fukushima caper ... taking out the hot rods. AT LEAST wait to see what happens there!! It may not be good, from the inherent danger, to the hiring policies, to the quirks of fate and nature involved! (0133-1 [Sunflower, Susan])

Comment: The agency must resolve many technical issues including long-term waste integrity, vulnerability, deterioration and accidents, in particular, the nuclear waste stored at Fukushima. (0144-2 [O'Nan, Margaret S.])

Comment: The lessons of Chernobyl and more recently the tragic disaster of Fukushima speak for themselves. Two and a half years later and STILL leaking nuclear radioactive waste unchecked into the Pacific Ocean and our Earth's atmosphere is unconscionable and inexcusable. This alone is a potentially life ending time bomb for planet earth and all its life forms as the corium continues to melt down with no remedy in sight. Already the costs in damage to human life, contamination of species of marine and plant life, and biosphere disruption are difficult if not impossible to quantify- and it has not yet been contained. (0156-2 [Heinle, Helen])

Comment: Please examine the dire situation in Japan, which is already contaminating the ocean and our food chain, as the prime example of what we don't want! (0158-5 [Payne, Joanne])

Comment: Even in Fukushima where the nuclear reactor accident was initially ascribed to a tsunami following an earthquake, recently both the operator Topco and the Japanese government have admitted that the disaster was preventable. (0163-16-3 [Wolf, Peter])

Comment: An image I have in my mind right after Fukushima is a young mom in a shelter with her five-year-old and she said "Before the accident I didn't think about it. Now my husband is still working at the plant after the accident, and I don't know what our future holds." Another person trained as a nuclear physicist, her sister asked her "What is the impact on human health?" She said "We didn't learn that in our studies." And I was with Laurie Seeman the day we met with the organic farmers, the moms from Fukushima a year ago, who said they had to send their soil to France to be tested, and that instead of protecting their children at the schools, the government raised the allowable levels. Last week at an event on nuclear energy, Naoto Kan, the prime minister of Japan when Fukushima occurred, said that he had been a supporter of nuclear power, but after the Fukushima accident I changed my thinking 180 degrees. He said that the first days of the accident it looked like an area that included Tokyo. He said "We do have accidents such as an airplane crash and so on, but no other accident or disaster can affect 50 million people." And Jaczko, the former NRC Chair, said Fukushima exploded the myth that severe accidents wouldn't happen. Severe accidents can and will. Just yesterday I got word that

more marine life is dying in the Pacific Ocean. Food in California is contaminated. (0163-49-2 [Evans, Laurie])

Comment: Consider Fukushima. (0174-12 [Thomas, Ellen] [Thomas, Ruth])

Comment: However, the experience of the Japanese disaster at Fukushima Daiichi makes it clear that on-site storage of large accumulations of nuclear waste greatly worsens the dangers of natural disaster, attack, or accident that can fracture containment, destroy backup systems, or hinder repairs. (0190-3 [Phelan, Steven] [Phelan, Walter])

Comment: The Fukushima nuclear plant disaster is still recent enough to cause concern[.] (0205-9 [Lyons, Laura])

Comment: The Fukushima disaster has shown that we must be far more vigilant about the storage of nuclear waste as well as the siting of nuclear plants. The Diablo plant is right on the edge of the Pacific, close to volcanic faults and shares many of the vulnerabilities of Fukushima. (0232-1 [Hall, Caroline])

Comment: The spent fuel pools at Fukushima are collapsing yet we continue to store fuel in pools. (0232-3 [Hall, Caroline])

Comment: I think that there is a white elephant in the room here that we're not looking at, and that is what is going on with Fukushima. For people to just blithely think that we can continue on using nuclear power as though it's a panacea or is the best thing, I think is crazy. (0244-10-2 [Betancourt, Nelson])

Comment: I've heard about Fukushima being a reason why you should not be confident in the safety of storage. What Fukushima's -- and a tragic and unacceptable event that it was -- is an example of why you shouldn't build a reactor at sea level in an area where there's a historical record of very tall tsunamis without sufficient protection, with safety systems vulnerable. (0244-11-10 [McCullum, Rod])

Comment: From what I've been hearing, everybody knows about Fukushima. There is a reporter on Fukushima that lives in Fukushima that keeps reporting live, reports every day. It's not on national news or anything. From what I get, it takes about six months to a year for this information to come out. He is reporting at TEPCO. Tokyo Energy has been lying quite a bit, and three of the cores have melted down into the ground. (0244-13-1 [Wilson, Greg])

Comment: Lessons learned from management of Japan's Fukushima nuclear reactors since March 11th, 2011, and those currently being experienced due to continuous leakage of radiation into groundwater, should nullify this viewpoint of environmental stasis. We face, in the coming days and in the coming year, the challenging and potentially dangerous transfer of 1300 spent rods from Fukushima reactor 4. Was the damage in Fukushima the result of stasis? Was it predictable? (0244-14-7 [Prescott, Lisa Marie])

Comment: In fact, in Fukushima, there were casks at that facility, they were knocked over, they were wetted, but they were safe and won't leak any radiation. And the spent fuel pool, as much as some of the media might have said that there was accidents because a spent fuel pool had lost water, none of the fuel became actually uncovered if you actually read the reports from the analysis after the accident. (0245-12-3 [de Graaf, Brandon])

Comment: And the pool risks are also highlighted by what's happened after Fukushima Daiichi. As Linda Lewison mentioned earlier, the extraction of the high-level radioactive waste from a unit fuel pool is about to begin at Fukushima Daiichi Unit Number 4. It's a very dicey operation. The cooling water at one point was saltwater, so the fuel is likely corroded. The fuel may be bent, it may be damaged, it could fail during this unloading procedure. (0245-13-2 [Kamps, Kevin])

Comment: Fukushima in 2011 is important because we have four Mark I's here in Illinois. Radiation is still pouring into the Pacific Ocean as workers frantically try to keep rods covered with water. Now there's talk of robots to remove rods from the reactor without causing a catastrophic fire. This accident wasn't supposed to happen but it did. And it should be a wake-up call for all of us. In the U.S., spent fuel pools are even more crowded than Japan's. (0245-14-2 [Kurz, Carol])

Comment: The fact is that this kind of meeting and conversations pro and con took place in Japan not so long ago where the technicians and the proponents of nuclear power assured the public that they were informed, that things operated carefully, well-designed, highest technology, security, no previous accidents. All that is gone now. Japan itself almost became a failed state. It remains to be seen whether they can sustain themselves. Tokyo was heavily irradiated in the accident. The Japanese government lied about that because of business interests. Japanese government elevated the standards of radiation allowable for children to address the severity of the contamination rather than evacuate them because the main concern was money. (0245-25-2 [Lehman, Dale])

Comment: Fukushima, the world's worst nuclear accident that will continue for centuries, just as the other nuclear accidents have, only this one being a triple meltdown, poses new challenges that none of the great engineers thought of and some they should have. (0246-15-1 [Minniss, Regina])

Comment: Yesterday, Reuters put out from Tokyo, Wednesday, November 13, 2013, Fukushima: now for the tough part. The operator of Japan's crippled Fukushima nuclear power plant will this week begin removing 400 tons of highly irradiated spent fuel in a hugely delicate and unprecedented operation fraught with risk. Carefully plucking out more than 1,500 brittle and potentially damaged fuel assemblies from the plant's unstable Reactor No. 4 is supposed to take about a year, and will be seen as a test of Tokyo Electric Power Company's ability to move ahead in decommissioning the whole facility and would likely take decades and cost tens of billions of dollars. The world is watching as we hold our breath. What about the human cost? The NRC uses the acronym ALARA, A-L-A-R-A, in nuclear dealings, as low as is reasonably achievable, which means making every reasonable effort in maintaining exposures on ionizing radiation as far as below the dose limits as practical. I remind you there is nothing practical that is going on in Fukushima. We don't even have the technology that is needed in this ongoing crisis. And what we have seen in Japan is they simply raise the dose level that is accepted. And do we actually think things would be different here? Essentially the people in Japan have been turned into test subjects. Shame, shame. This is criminal. And what about the children that are most susceptible to radiation? (0246-3-2 [Gray, Erica])

Comment: After Fukushima, the Nuclear Regulatory Commission ordered staff to review the 24 Fukushima twin reactors here, of which Illinois has four, two at Dresden and two at Quad Cities, and come up with a series of safety recommendations to be implemented to make sure that U.S. reactors were adequately safeguarded and protected. A number of safety upgrades were recommended. The Nuclear Regulatory staff presented these recommendations to the commissioners, as you all now. To date, the Nuclear Regulatory Commission has not acted on

these safety recommendations. Many groups supported the closing of these 24 reactors until these safety inspections took place. This also has not happened. (0246-9-1 [Lewison, Linda])

Comment: The reason I tell you what you already know is to make the point -- how can we have confidence in the Nuclear Regulatory Commission if you don't even listen to the most serious findings of your own staff? (0246-9-2 [Lewison, Linda])

Comment: Another thing I'm wondering if you know, that the butterfly genes have been mutated in Fukushima by radiation. How many know that the butterflies are now deformed? Have you heard that? Okay. Another thing to raise your hand on: September 12th of last year the Reactor 4 in Fukushima has sunk 31 inches in the ground. (0250-22-3 [Hands, Tara])

Comment: We know it from Fukushima. We know -- I mean, great grannies in Fukushima are giving up their life in Japan, are giving up their life to clean up the mess there. I don't want to do it here. And I don't want my grandchildren to do it, either. (0250-26-3 [Maphet, Sheila])

Comment: I was at the site, actually, with my best friend who lives in Japan, Fukuoka, and her name is Aki. And in the middle of our conversation, all of a sudden the computer screen started to shake, and she jumped and screamed "Earthquake." She then had to hide in the small door frame of her one-bedroom apartment. That was the day that the tides rose and the triple meltdown happened at Fukushima. Since then I have heard heartbreaking stories of what the communities in Japan are going through; the sacrifices of the elders knowing that they face certain death, but still go out to help with the cleanup efforts; the mothers who are begging for the lives of their children, and crying out to the world, "Nidoto nai yoni," which means let it never happen again. (0250-28-1 [Embrey, Monica])

Comment: Remember Fukushima. (0250-51-8 [Thomas, Ellen])

Comment: Fukushima is a cautionary tale. But yet, we have failed to heed its warnings. The investigation of the Fukushima disaster found that the regulatory bodies NISA and NSC and the government body promoting the nuclear power industry METI failed, failed to correctly develop the most basic safety requirements, failed to assess the probability of damage, failed to adequately prepare for containing collateral damage, failed to develop a realistic evacuation plan. The official investigation determined those failures. (0250-52-3 [Amos, T.J.])

Comment: Fukushima is expected to cost \$14 billion to clean up, to whatever extent that might be possible, and to take 40 years. (0250-59-3 [Krotz, Susan])

Comment: In light of the difficulties experienced at the Fukushima Nuclear Plant, I request that the points and arguments made by the San Luis Obispo Mothers For Peace be considered as those of my own. A new and dangerous earthquake has occurred in the Fukushima area as TEPCO is transferring thousands of spent fuel rods out of dangerously stored pools. The world holds its breath with each minute of this operation in remembrance of that fateful moment in March 2011 when we became aware of the dangers we face with radioactive waste. (0251-1 [Baker, Sheila])

Comment: My comment is that Fukushima, Japan be the standard by which we proceed in the future. What better lesson is there that we can learn from? (0264-2 [Gutierrez, Ruth])

Comment: Fukushima, in 2011, is important because we have 4 Mark 1's here in Illinois. Radiation is still pouring into the Pacific Ocean as workers frantically try to keep rods covered

with water. Now there's talk of using robots to remove rods from the reactor without causing a catastrophic fire. This accident wasn't supposed to happen--but it did. And, it should be a wake-up call for us. In the U.S., spent fuel pools are even more crowded than Japan's. (0276-3 [Kurz, Carol])

Comment: The NRC reminded us that Fukushima dry storage casks survived the tsunami in 2011. What kind of dry storage casks were these? How far away from the reactors that were damaged and are still out of control today were these casks stored? (0280-9 [Magda, Marni])

Comment: I mean, people talk about Fukushima, and the truth of the matter is that after Fukushima, the emperor went on TV in Japan and he asked everybody in Japan to conserve energy because they were going to shut down these dangerous nuclear plants. And lot of people in Japan are very -- particularly the elderly people who are very trusting in the emperor, did what he asked. They turned off the heat, they conserved electricity, and they died. Who dies in these sort of energy conservation situations? Elderly. So, more people in Japan that actually died from energy conservation than from the radiation. (0325-32-2 [Lord, Stephen])

Comment: The cruel irony of the timing of this public hearing is that, as we speak, we and the world are witnessing the ongoing international environmental impact of the stricken nuclear plant at Fukushima, which is in such dangerous condition that a future earthquake, of which there is a high probability, "Could trigger a disaster that could decimate Japan and affect the entire West Coast of North America," according to prominent Japanese-Canadian scientist David Suzuki. (0326-4-3 [Brown, Jerry])

Comment: Most people agree that the outcome of possible future events is best predicted by the outcome of similar past events. I'm sure that on March 10, 2011, TEPCO, Japan's nuclear power company, would have assured their public that its power plants and waste storage systems were safe and able to withstand natural disasters. We all know what happened the next day on March 11th. Fukushima, Japan is still very much in the news. Two days ago, however, PG&E's senior vice president and chief nuclear officer, Mr. Halpin, attempted to convince readers of the Santa Maria Times that there has been no damage to Fukushima's open storage pools. We all know that recent pictures and articles appearing in numerous respected U.S. and foreign news outlets provide a very different description. (0326-43-3 [Rippner, Sharon])

Comment: And here is my explanation for that [mushroom cloud over Fukushima], and I'm sorry I have to go quickly because I only have three minutes, but plutonium and uranium are often soluble in water that has oxygen. However, if you remove the oxygen, the plutonium and the uranium precipitate out. This forms a layer of reactive substance on the bottom of your container. This is what I believe happened in the reactor that had the mushroom cloud over it, as opposed to the hydrogen explosions. So this plutonium and uranium built up on the bottom and they were held in pressure by the containment dome, and they started reacting nuclearly and there was an atomic explosion. This is also supported by the water tanks in Fukushima right now. They had water tanks where they put water in. They knew it was contaminated. They were monitoring the radiation and, suddenly, one of the tanks or many of the tanks, there were radiation spikes. Well, how is this possible? They didn't put more radioactive water in. How did it get more radioactive? Well, again, if you set a container and set it for a long time in water, the oxygen bubbles out. It becomes anoxic. At that point, the plutonium and the uranium precipitate, can precipitate out and cause a nuclear reaction on the bottom of the container, which can melt the container and cause radiation spikes, which is maybe what's happening at Fukushima. Is it what's happening at Fukushima? Is that what caused the mushroom cloud? You don't know. You don't know if I'm wrong. You don't know what you're doing. (0327-29-4 [DeMare, Joseph])

Comment: There are a number of transcripts included showing dialogue between individuals making decisions on behalf of the NRC and corresponding with TEPCO, the Tokyo Electric Power Company in Japan immediately following the earthquake and subsequent tsunami that struck the Fukushima Daiichi power plant on the coast of Japan in March 2011. Up until now, TEPCO, the NRC, and a number of notable news outlets have been reporting that the unit fuel pool at Reactor 4 escaped the brunt of the storm relatively intact, and that fuel rod removal was to begin in the third week of November of 2013. Inside the transcripts contain statements, "I know we're under a belief that Unit 4, the wall had been blown out, but regardless of that, someone would have to tell us of Units 1, 2, and 3." That quote was by a man named John Monninger. It's on page 390 of the FOIA documents that were released. Later on, a man named Chuck Casto, on page 403 said, "We need to probably let Bill and the Chairman of the NRC know that on yesterday we're going by what we thought, that with the explosion there was structural damage to the Unit 4 fuel pool. We don't really know if there's any integrity in that pool or not." And then one of the more damning documents enclosed shows that as of March 18th, 2011, a document titled, "Fukushima Reactor and Water Pool Release Considerations," shows that "adding to the uncertain situation cooling has been lost in the fuel storage pools in Units 1-4. The NRC believes that water from the Unit 4 storage pool completely drained and a violent zirconium and water reaction occurred resulting in the significant release of radioactivity to the atmosphere." Now, I'm going to pose a question that I know probably won't be answered, but it's one that I think that the employees of the NRC should consider. Using deductive reasoning, one could assume that the knowledge the NRC had since March 18th, 2011 has and was spun for public consumption. I want to know, and I know that others would like to know why have the actions of the individuals with -- inside the NRC and TEPCO been contradictory to the information known in March of 2011? The majority of the planet still thinks that there's a fuel rod removal going on, and it's not. It's a complete sham. I'm pissed off about this. I don't know about you guys. I think that these documents released by the NRC completely -- this Commission right here is completely illegitimate. (0328-13-1 [Wagner, Sam])

Comment: I'd like to just direct people for reference that if they want to know more about these documents that I'm referring to, to Google the word "Plume-Gate." It's arguably the largest active coverup taking place on this planet. (0328-13-4 [Wagner, Sam])

Comment: Let's go to Fukushima, for instance. What I have faith in and confidence is that we get to the bottom of what the true causes of the disaster in Fukushima were. The Japanese Diet, which is their legislative body, similar to our Congress, a few months after the Fukushima disaster of 3/11/11 took a look at the causes of Fukushima. And they determined that it was not the earthquake that caused the disaster, it was not the tsunami, but that it was a manmade disaster and that it was created by the collusion of industry, the nuclear industry; nuclear regulators; and government and that was the problem. And, obviously, we know that the main issue, ongoing issue, at Fukushima is the spent fuel pools. (0329-31-2 [Carberry, Mike])

Comment: What I don't understand in this whole Fukushima lessons learned thing is why we don't have a global emergency response team. Why has Fukushima gotten this far? What's going to happen when those nuclearized waters meet the nuclearized waters of the North Sea and what is that chemical reaction going to be are questions that come to my mind. (0329-6-2 [Vandel, Niki])

Comment: My comments today center on the problem of lack of transparency in the Japanese information about the Fukushima accident. Japan has recently passed a new secrecy law. Mere statements in the press or referral to secrecy law can garner a 10 year prison term and fines. The Manichi Shimbun, (shimbun means news in Japanese although my Japanese is very

limited), was sent a copy of the draft law with contents entirely blacked out. Although the NRC has faced problems in the Near term task force Recommendation 1 before the ACRS, I ask, "How can the NRC deal with the details of the Fukushima accident cannot be discussed without violating Japanese law"? (0378-2 [Lewis, Marvin])

Comment: Your sister agency in Japan also reassured the public that the nuclear facilities under its jurisdiction were safe. Then came Fukushima Daichi. (0380-4 [Holt, Joan])

Comment: The NRC states that the Fukushima disaster proves the design strength of spent fuel pools, in that all pools survived the tsunami and reactor explosions virtually intact. They do not mention the fact that these pools are now perched precariously six stories above the destroyed reactors and are almost impossible to access. Removing the spent fuel to a safer location would expose workers to high ambient, perhaps lethal, radiation levels. Photos of the pools in news reports from the site appear to show debris lying in the pools although the water level seems to be maintained. Two and a half years after the accident TEPCO has only just now begun to deal with this spent fuel and the outcome is still far from certain. (0410-12 [Nelson, Dennis])

Comment: Lessons from Fukushima are too readily dismissed and minimized in the EIS. This adversely impacts the formulation of the EIS. Fukushima has caused massive environmental degradation, evacuation of a large area, and there is a high probability that it will increase the incidence of malignancies in humans. These lessons must influence the gravity and precautions we need to take in managing nuclear waste. One example of this is that by defining the timeframe of waste management starting once a reactor is decommissioned avoids addressing a Fukushima type incident. The EIS must address situations wherein a functioning reactor is in proximity to stored nuclear waste. Note that the Fukushima Nuclear Accident Independent Investigation Commission determined that an overly close relationship between regulators and industry representatives contributed substantially to the poor management of the Fukushima outcome. (0417-6 [Clark, Terrence])

Comment: Finding truth in disclosures from TEPCO and the Japanese Government will challenge the world as a result of the waste failure in Japan. (0438-2 [Lamb, Charles])

Comment: How many radioactive elements and isotopes are released from something like Fukushima, some of which eventually end up inside all of us? According to Asahi: about 1,000 kinds of radioactive materials have been released from Fukushima reactors. <http://enenews.com/asahi-sources-reveal-about-1000-kinds-of-radioactive-materials-released-from-fukushima/comment-page-1#comment-195658> Let's focus on just 93 out of the 1,000 total, shall we? There are 93 different long lived radioactive elements that hang around and pollute both the environment and us for at least 17,000 years and up to BILLIONS of years in total decay life. Want to see the list of all 93? 93 Long life Radiation Contaminants, A Problem For Billions Of Years; via A Green Road Blog <http://agreenroad.blogspot.com/2012/03/93-long-lived-nuclear-elements.html> Fissioning reactor corium blobs at Fukushima are STILL releasing this long lived radiation TODAY, with no known turn off date. The media and regulatory bodies keep saying this plant is in cold shutdown. But is it really? (0498-15 [AGreen Road Project, Anonymous])

Comment: Fukushima Reactor 3 released 500 - 6000 pounds of plutonium into the air, and possibly 20 tons of uranium when it exploded. No, it was NOT a hydrogen explosion. WHERE IS FUKUSHIMA REACTOR 3? - IT SEEMS TO BE MISSING? (0498-7 [AGreen Road Project, Anonymous])

Comment: To elaborate, the GEIS Abstract states that "The objective of this draft Waste Confidence Generic Environmental Impact Statement is to examine the potential environmental impacts that could occur as a result of the continued storage of spent nuclear fuel (spent fuel) at at-reactor and away-from-reactor sites until a repository is available." The cruel irony of the timing of this Public Hearing is that -- as we speak - we and the world are witnessing the ongoing international environmental impacts of the stricken nuclear plant at Fukushima, which is in such dangerous condition that a future earthquake -- of which there is a high probability -- "could trigger a disaster that could decimate Japan and effect the entire West Coast of North America," according to the prominent Japanese-Canadian scientist David Suzuki. (0501-2 [Brown, Jerry])

Comment: Without full legal liability of operators, they are encouraged to cut corners on safety. The nuclear industry is now facing the largest potential legal liability from Fukushima contamination entering people's lungs in Seattle and Oregon. There is only a metal she'd covering on spent fuel pools. (0512-4 [Bibb, William])

Comment: NRC FOIA documents, and numerous reports by international experts such as those at Woods Hole have shown the Fukushima accident had dire consequences. NRC documents released under FOIA dated March through May of 2011 clearly indicate the severity of the Fukushima Daichi disaster. This event was supposedly was mathematically impossible; it nonetheless occurred. It could occur in the U.S. The events taking place at Fukushima are horrifying; perhaps thousands of people are already dying from radiation-related illnesses. The incidence of cancers and diabetes have risen dramatically. These facts are well documented. (0515-2 [Stennes, Nancy])

Comment: Hundreds of U.S. Navy personnel from the U.S.S. Ronald Reagan are now sick and dying from radiation poisoning they got when exposed to the Fukushima reactor melt-down plumes during "Operation Tomadachi." Three nuclear reactor cores escaped containment, and are "MIA." They are contaminating the aquifer and an underground river running under the plant. Water flows directly into the Pacific Ocean. Tepco has had to release highly radioactive water during typhoon events, and due to failure of its water storage tanks. Tepco and the IAEA recently asked for public "permission" to dump all the contaminated water into the Pacific. It is unthinkable; unconscionable. "Dilution" is irrelevant; isotopes harm and kill when ingested or inhaled. The Pacific Ocean food chain could collapse, or entire species and fisheries be wiped out due to Pacific Ocean radiation contamination. The plume of radioactive water emanating from the Kurushio current in Japan travels directly across the Pacific. Destination: the U.S. West Coast, and in particular, California. The plume is supposed to arrive in March, 2014. It will impact our coastline for at least 10-20 years. Fishery collapses (sardines, herring, salmon) in the Pacific, and massive die-offs of marine mammals from Alaska to Southern California, indicate something is terribly wrong in the Pacific biosphere. The immune systems of marine animals and plankton are likely being damaged by all the radiation coming from Fukushima; disease ensues. There is also a massive amount of tsunami debris drifting toward the U.S. West Coast from Japan. A lot of chemical toxins are contained in the water, in those debris flows. Imagine all the chemical plants and manufacturing facilities on the Japanese coastline, destroyed when the tsunami struck in March, 2011. The Pacific is being hammered by multiple sources of intense contamination. The radioactive isotopes coming from the Fukushima Daichi plant are highly suspect in the die-offs of marine mammals, fishes, and crustaceans. The scope of problems in the Pacific biosphere are truly staggering, when one considers them in their entirety. We can ill afford to have such a disaster occur in the U.S., even if it were to occur inland, and away from our coastlines, or the Gulf area. (0515-3 [Stennes, Nancy])

Comment: The risk to humanity is too great and Fukushima is proving that as it destroys the Pacific Ocean and Japan and will kill many more across the globe from its fallout. Why is there no advice or even mention of this ongoing nuclear catastrophe?? (0518-2 [Individual, Anonymous])

Comment: The on going crisis at Fukushima Daiichi is a global issue. It will not go away. Tepco is a energy company for profit. They cannot solve this problem. The global community must be involved in order to have a chance of containment. The problems of storage are not limited to Fukushima. The same issues prevail at every single nuclear plant in the world. Something must be done and it must be done right now. We, as a planet, have no more time to waste. (0520-1 [Perez, Robert])

Comment: Dear NRC--please release information about the Fukushima meltdowns and public health consequences immediately. We are not fooled by the lack of information and doublespeak. We know the truth and it is your duty and obligation to disseminate this truth to the public at large. Should you refuse your duty, you will be held accountable in the court of public opinion and I would assume eventually be named in the myriad of lawsuits which are certainly pending. (0521-1 [Temple, Scott])

Comment: I want to know the truth on Fukushima with data regarding radiation levels everywhere in the world including cancer statistics. (0533-1 [Individual, Anonymous])

Comment: The radiation from Fukushima has reached Florida and California shores and has been found in fish there. (0539-4 [Luttinger, Lionel])

Comment: The NRC should also be focusing its attention on the ongoing emergency of radioactive contamination coming from Fukushima Japan, and protecting US citizens from that disaster. (0543-6 [Senkiw, Sheryl])

Comment: Bob Alvarez of Institute for Policy Studies has calculated that Fukushima Daiichi Unit 4's pool contains ten times the amount of hazardous radioactive Cesium-137 than was released by the Chernobyl catastrophe. Dai-ichi fuel pool number 4 is an ongoing catastrophic risk in an ongoing tragedy in which many are exposed to continuing radiation, loss of their homes, safe food and water, etc. (0552-2-10 [Macks, Vic])

Comment: In fact, Japan weighed evacuating Tokyo's 35 million people even as they downplayed the risks in public. "...The report quotes the chief cabinet secretary at the time, Yukio Edano, as having warned that such a "demonic chain reaction" of plant meltdowns could result in the evacuation of Tokyo, 150 miles to the south. "We would lose Fukushima Daiichi, then we would lose Tokai," Mr. Edano is quoted as saying, naming two other nuclear plants. "If that happened, it was only logical to conclude that we would also lose Tokyo itself." The report also describes the panic within the Kan administration at the prospect of large radiation releases from the more than 10,000 spent fuel rods that were stored in relatively unprotected pools near the damaged reactors." http://www.nytimes.com/2012/02/28/world/asia/japan-considered-tokyo-evacuation-during-the-nuclear-crisisreport-says.html?_r=2&hp. (0552-2-11 [Macks, Vic])

Comment: NRC FOIA documents, and numerous reports by international experts such as those at Woods Hole have shown the Fukushima accident had dire consequences. NRC documents released under FOIA dated March through May of 2011 clearly indicate the severity of the Fukushima Daiichi disaster. This event was supposedly was mathematically impossible; it nonetheless occurred. It could occur in the U.S. The events taking place at Fukushima are horrifying; perhaps thousands of people are already dying from radiation-related illnesses. The

incidence of cancers and diabetes have risen dramatically. These facts are well documented. Hundreds of U.S. Navy personnel from the U.S.S. Ronald Reagan are now sick and dying from radiation poisoning they got when exposed to the Fukushima reactor melt-down plumes during "Operation Tomadachi." Three nuclear reactor cores escaped containment, and are "MIA." They are contaminating the aquifer and an underground river running under the plant. Water flows directly into the Pacific Ocean. Tepco has had to release highly radioactive water during typhoon events, and due to failure of its water storage tanks. Tepco and the IAEA recently asked for public "permission" to dump all the contaminated water into the Pacific. It is unthinkable; unconscionable. "Dilution" is irrelevant; isotopes harm and kill when ingested or inhaled. The Pacific Ocean food chain could collapse, or entire species and fisheries be wiped out due to Pacific Ocean radiation contamination. The plume of radioactive water emanating from the Kurushio current in Japan travels directly across the Pacific. Destination: the U.S. West Coast, and in particular, California. The plume is supposed to arrive in March, 2014. It will impact our coastline for at least 10-20 years. Fishery collapses (sardines, herring, salmon) in the Pacific, and massive die-offs of marine mammals from Alaska to Southern California, indicate something is terribly wrong in the Pacific biosphere. The immune systems of marine animals and plankton are likely being damaged by all the radiation coming from Fukushima; disease ensues. There is also a massive amount of tsunami debris drifting toward the U.S. West Coast from Japan. A lot of chemical toxins are contained in the water, in those debris flows. Imagine all the chemical plants and manufacturing facilities on the Japanese coastline, destroyed when the tsunami struck in March, 2011. The Pacific is being hammered by multiple sources of intense contamination. The radioactive isotopes coming from the Fukushima Daiichi plant are highly suspect in the die-offs of marine mammals, fishes, and crustaceans. The scope of problems in the Pacific biosphere are truly staggering, when one considers them in their entirety. We can ill afford to have such a disaster occur in the U.S., even if it were to occur inland, and away from our coastlines, or the Gulf area. Robert Alvarez, formerly of the DOE, has said the spent fuel from Reactor 4 at Fukushima alone, if its building were to fail and it fell to the ground, could "end civilization" as we know it. (0566-2 [Tocornal, John])

Comment: We truly should learn more, and apply the lessons from Fukushima Daiichi. An international response to the crisis is desperately needed. (0566-5 [Tocornal, John])

Comment: Why hasn't the NRC rounded up all the brilliant minds in this world to address the problem of Fukushima right now? TEPCO and the gov of Japan are not dealing well with this.. and it affects us all. (0580-2 [Shinker, Carol])

Comment: NO MORE FUKUSHIMAS!!!! (0588-1 [Johnson, Joe])

Comment: Fukushima has given all of us a play-by-play of the multiple ways in which things can go terribly wrong with nuclear facilities in a natural disaster--and even more in the aftermath of unforeseen circumstances. It has vividly shown us, in real time, how beautiful communities and fertile soils surrounding a nuke facility can turn into toxic never-never lands after an accident or a partial meltdown. Two years in, and Fukushima's problems continue to mount. Now they are our problems, too, as radioactive materials and contaminated water continued to flow into the Pacific and circulate through the air that arrives on our California shores. (0609-2 [Leon, Vicki])

Comment: The ongoing problems, with the Fukushima Daiichi nuclear power plant, need further analysis that should be applied to this EIS study. The level of confidence that was behind the design of that plant and its storage pools reflects the level of confidence that many in this country have for the production of nuclear energy and the storage of the spent nuclear fuel

assemblies. The ongoing attempts to deal with that situation serves as a fine example of how deeply denial can play in the ways we cope with failures of our confidence. (0610-6 [Brechin, Vernon])

Comment: In light of the ongoing and uncontrolled horrors of the Fukushima Nuclear Crisis, which continues to spew hundreds of thousands of tons of highly radioactive water into the Pacific Ocean for nearly three years, with "sanctioned" plans to dump ALL the water into the Pacific, and continuing to burn unfiltered radioactive waste into the air, and the US-influenced IAEA and former NRC advisers to Japan recommending we "dump it all" into the ocean or store it in the deep sea; and no acceptable means of containment in sight, I cannot logically find any reason to continue to produce more nuclear waste. (0617-6 [Zure, Lisa])

Comment: The government needs to come clean about the impact of Fukushima on the West coast of North America. The FOIA documents from Fukushima PROVE the government willfully covered up that dairy products tested positive iodine-131, and the NRC and EPA chose NOT to tell the public. (0623-3 [Individual, Anonymous])

Comment: Right now the only answer for the cooling water at Fukushima is dumping it in the ocean. We may not see it, but it's going to affect all marine life in the pacific as water is to marine life as the air is to man. Horrible, horrible, horrible. (0625-5 [Mandrell, Rebecca])

Comment: Why won't the gov't admit Fukushima is destroying the Pacific and negatively affecting humans? Honesty and truth is it gone? St Louis Waste - I don't even know where to begin. So much under the ground, close to a smoldering fire, in the middle of large metro area. Dig it up and turn it into Glass? risk releasing more shit into the atmosphere? It snowed in STL on the 14th of Dec and my kids played in it. Found out that the snow is contaminated with FUKU crap about 70cpm. No one cares, especially not the NRC. Promotion no Protection!!!! I have seen no one comment, no news stories about Fukushima here in the US. The only thing is ENENEWS. FOIA docs prove the lies the NRC and govt are complicit. (0631-1 [Reimer, Matt])

Comment: I propose that every member of the NRC, the DOE, and the EPA; every drafter of environmental impact statements related to nuclear power; every person who supports the existence and expansion of nuclear power be required to personally visit Fukushima today ---- -> to speak with the victims about their tragic experiences; their losses of family members and friends and homes and communities ; and the cancers and other health issues that have already developed and will continue to develop into the future. -> to observe first hand the ongoing contamination of air, land, and sea they are experiencing with no end in sight. -> to observe the millions of tons of radioactive water that is being poured daily into the Pacific Ocean and understand that it is now contaminating all of our oceans as well as our own west coast. Only then can there be an intelligent, responsible, sensible discussion about nuclear power. Only then can there be responsible suggestions, proposals, and decisions about the problems and future of nuclear power here in the US. (0641-2 [Fasten, Susan])

Comment: I have been closely following the Fukushima meltdowns in Japan as I live in Portland OR and see and feel the effects of this extremely powerful waste product that is in our ocean fronts and air streams. We, as American citizens deserve more truthfulness and protections from the harmful effects of radioactive waste products. Also the birds, fish, sea mammals, starfish and all other species deserve protection from this disaster which is ravaging wild populations and virtually killing the Pacific Ocean. (0656-1 [Bonney, Mary])

Comment: How do we contain Fukushima? "THE WALL: The Thin Ice; Even with walls very tall, The water continues to fall: How high will suffice? Plus, cracks in the ice, Will require more cubes in the wall. There's no ice which they can install; To completely encircle it all; Plus, flows over the top Make the need never stop; For another cube in the wall. No education at all, No thought control to recall: Leave them kids alone, There's no time to postpone Another cube in the wall. I've seen the wall-written scrawl-- Nothing will help now at all; You can pile on more ice, But here's doomer advice: It's all just cubes in the wall." BenjaminTheDonkey (0663-1 [McClintock, Francene])

Comment: The three core meltdowns in Japan are quite literally out of our control. There doesn't seem to be anything we can do about it at this point. We are actually suggesting ideas like building a wall of ice to contain the situation. In my experience, when I pull an ice cube out of the freezer, it instantly starts to melt. And to the best of my knowledge, the corium (melted fuel rods), is, by most peoples standards, quite warm. It's been nearly three years since the earthquake and tsunami that destroyed the Fukushima Dai-ichi nuclear power plant, and there is hardly a peep about it on the corporate news. This can be described as a media blackout. Obviously the nuclear power industry is very powerful, with teams of lobbyists, lawyers, apologists, "scientists" who claim it's safe, etc. It's no wonder to me that the news isn't reporting on it. But the honest truth is that this situation is bigger than anything else the news could possibly be reporting on. Budget deficits, immigration reform laws, congressional gridlock is all going to take a back seat when a critical mass of people start to realize that everything in the Northern hemisphere is poisoned, and demand to know more about it. All food is radioactive, and the water might now give you cancer. It took TEPCO over two years to admit that the reactor core in reactor unit 1 (I believe) melted down in a matter of hours, not days. I'm not an authority on the subject, but I am an electrical engineer who is fascinated with radioactive physics. I have a couple of geiger counters, and am part of a network actively collecting and sharing data on the situation, and I'm now actively seeking work in the Southern hemisphere. Small bits of uranium pellets have been found hundreds of miles away from the Fukushima Dai-ichi plant, suggesting to me that it's now saturated the Northern hemisphere, and the only way to escape it is to move South. I don't mean to be an alarmist, but I am a realist. The situation is very bad, and what's worse is that all of my friends and family, except for a few exceptions, have no idea what I'm talking about when I mention the irradiation of the Northern hemisphere. I have to start explaining the situation in very basic terms, and finally lead up to the current situation. It can take hours, or days, to explain what's going on. (0670-2 [Anonymous, Brian])

Comment: Duke Energy concurs with NEI that NRC should add a discussion of the lessons learned from the March 2011 accident at Fukushima Daiichi. It is now clear that used fuel in both wet and dry storage at Fukushima Daiichi withstood the various challenges of the event without significant damage. However, because of confusion during the initial days of the Fukushima Daiichi accident, there is considerable misunderstanding on this point. Unfortunately, many people continue to believe erroneously that damage to fuel in storage at Fukushima Daiichi contributed to the offsite consequences from the accident. It would be very beneficial from a public understanding perspective if NRC would clarify this point in the supporting information associated with the Waste Confidence final rule. (0672-6 [Jamil, Dhiaa])

Comment: NIC believes that NRC should add a discussion of the lessons learned from the March 2011 accident at Fukushima Daiichi. It is now clear that used fuel in both wet and dry storage at Fukushima Daiichi withstood the various challenges of the event without significant damage. It would be very beneficial from a public understanding perspective if NRC would

clarify this point in the supporting information associated with the Waste Confidence final rule. (0685-8 [Davis, Ed])

Comment: •The Fukushima Dai-Ichi 2011 ongoing nuclear disaster presents especially significant issues regarding the dangers of spent nuclear fuel (not acknowledged in the GEIS). (0693-1-6 [Warren, Barbara])

Comment: Fukushima: Lessons Learned, is I hope the wake-up call for the NRC to realize that the industry is not self-empowered enough to manage emergency situations. Perhaps the fear factor of being the corporation at the helm of a nuclear plant melting down was too much for the corporate executives to come out and say, "OH MY, We ARE absolutely SCREWED!" immediately. The instinctive need of corporations to protect secrecy and maintain autonomy has no place in the world of nuclear meltdowns. I think this is the fundamental level that the NRC must incorporate in its Rules of authority with the nuclear industry. (0703-2 [Vandel, Nikohl] [Vandenberg Clermont, Elaine])

Comment: The industry could and should do better at being a responsible part of the nuclear waste water reclamation for the benefit of New Industry. Clearly, as we witness the ONGOING disaster of #Fukushima, we are reminded that if such a disaster would strike here in America, the same response MUST be expected by the current #GlobalNuclearIndustry. Without an adequate #NuclearFirstResponseTeam, the thought of what a disaster at #DiabloCanyonNuclearFacility under the "control" of PG&E is simply, beyond depressing. It brings so much fear of death and destruction to that region, of course its depressing and scary and why do we do this to ourselves?! (0703-6 [Vandel, Nikohl] [Vandenberg Clermont, Elaine])

Comment: After Fukushima, the Nuclear Regulatory Commission ordered its staff to review the 24 Fukushima twin reactors here in the US, of which Illinois has four, two at Dresden and two at Quad Cities. NRC staff was asked to come up with a series of safety recommendations, to make sure that U.S. reactors were adequately safeguarded and protected. A number of safety upgrades were recommended. The Nuclear Regulatory staff presented these recommendations to the NRC commissioners, as you well know. To date, the Nuclear Regulatory Commission has not acted on these safety recommendations. Many groups around the country supported the closing of the 24 Fukushima twin reactors until these safety inspections took place. To date, this recommendation also has not been acted on. (0708-1 [Lewison, Linda])

Comment: The reason I tell you what you already know is to make the point: How can we have confidence in the Nuclear Regulatory Commission if you don't even listen to the most serious findings of your own staff? (0708-2 [Lewison, Linda])

Comment: So, if we can't trust the Nuclear Regulatory Commission to act on its own staff recommendations [regarding the Fukushima Task Force recommendations], how can we have confidence in the NRC acting responsibly in the future? (0708-4 [Lewison, Linda])

Comment: Several reports have discussed the significant new information generated by the Fukushima accident. On April 19, 2011, Dr. Arjun Makhijani of the Institute for Energy and Environmental Research submitted to NRC a declaration in support of an emergency petition to suspend all pending reactor licensing decisions pending investigation of the lessons learned from the Fukushima disaster.⁹⁵ [footnote 95 text: Declaration of Dr. Arjun Makhijani in Support of Emergency Petition to Suspend all Pending Reactor Licensing Decisions and Related Rulemaking Decisions Pending Investigation of Lessons Learned from Fukushima Daiichi, ML111091181 (Apr. 19, 2011).] Dr. Makhijani outlined the significant new information that has

come out of the Fukushima accident including: the unanticipated compounding effects of simultaneous accidents at multiple co-located reactor units, including spent fuel pools; the unanticipated risks of spent fuel pool accidents, including explosions; the frequency of severe accidents and explosions; the inadequacy of safety systems to respond to long-duration accidents; and the health effects and costs of severe accidents.⁹⁶ [footnote 96 text: *Id.* at 5.] Makhijani highlighted the unprecedented nature of the accident, noting, "In the entire history of nuclear power, there has not been another major accident (level 5 or above) that has involved multiple major sources of radioactivity—including multiple reactors and multiple spent fuel pools."⁹⁷ [footnote 97 text: *Id.* at 6. The Near-Term Task Force acknowledged that before the Fukushima accident, NRC had not anticipated an accident involving multiple units and spent fuel pools. In a May briefing one member stated, "Also, if you look at the way that we've analyzed accidents in the United States and the way that we deal with them, it really focused on a single unit being affected. Fukushima is a situation where multiple units were affected at the same time. So our EP [emergency preparedness] requirements focus on a single unit event . . . And if you're dealing with a multiple unit event at the same time, you have considerations with regard to adequate staffing, how to triage, who makes the decisions on how to triage, and how you go about proceeding with what you need to do first." Nuclear Regulatory Commission, Briefing on the Task Force Review of NRC Processes and Regulations Following the Events in Japan, Transcript of Proceedings, at 19-20, ML111360513 (May 12, 2011).] He asserted that the information from the simultaneous system failures at Fukushima should be used by NRC to evaluate the safety and environmental implications of co-locating multiple reactors and spent fuel pools. (0718-2-5 [Sipos, John])

Comment: In October 2011, the NRC Advisory Committee on Reactor Safeguards ("ACRS") acknowledged that the Fukushima accident has provided new information regarding the hazards posed to spent fuel pools by falling debris.¹⁰⁰ [footnote 100 text: Advisory Committee on Reactor Safeguards, Initial Review of: (1) the Near-Term Task Force Report on Fukushima and (2) Staff's Recommended Actions to be Taken Without Delay, at 7 ML11284A136 ("ACRS Review") (Oct. 13, 2011).] It noted, "The Fukushima accident clearly demonstrates that hydrogen combustion events can cause significant structural damage. Such damage can also cause debris to fall into the spent fuel pools with subsequent potential ramifications not heretofore considered."¹⁰¹ [footnote 101 text: *Id.*] The ACRS found that the leaching of the debris may change the pool water chemistry, causing the aluminum racks to corrode and eventually degrading their integrity.¹⁰² [footnote 102 text: *Id.* at 9.] It also noted, "These events at Fukushima have reminded us that spent fuel pools at nuclear power plants can be contributors to the overall risk posed by the plants."¹⁰³ [footnote 103 text: *Id.* at 10.] (0718-2-7 [Sipos, John])

Comment: Furthermore, the findings of the Near-Term Task Force support the argument that the Fukushima accident provides significant new information. "The Task Force concluded that the Fukushima Dai-ichi accident . . . provides new insights regarding low-likelihood, high-consequence events that warrant enhancements to defense-in-depth on the basis of redefining the level of protection that is regarded as adequate."¹⁰⁷ [footnote 107 text: *Near-Term Task Force Report* at viii.] In short, based on the information from the Fukushima accident, the Task Force found that NRC should create new regulations to protect against occurrences that it previously characterized as having "small impacts" due to their low probability. Fukushima has shown that low probability, high consequence events do occur and therefore, they must be considered and measures must be taken to mitigate their potential consequences. In acknowledging this fact and suggesting measures to mitigate such dangers, the Task Force Report constitutes significant new information that must be considered in this proceeding. The Fukushima accident and the recommendations of the Task Force also show that site-specific factors must be taken into consideration with regard to accidents involving spent fuel pools. The

different characteristics of each pool affect the chances of a radionuclide release and the appropriate response to prevent a release. At Fukushima's boiling water reactors, the spent fuel pools are located high up in the reactor buildings, making it difficult for water to be added in an emergency, "[h]owever, TEPCO's approaches to adding water to pools revealed a lack of preparation for this contingency."¹⁰⁸ [footnote 108 text: *Thompson 2011 Report* at 19. The boiling water reactor design was developed by the federal government's Idaho National Laboratories and the General Electric Company in the 1950's.] Responding to the site-specific problems at Fukushima, "many of the actions recommended in the Task Force report have plant-specific features, and therefore require plant-specific regulatory attention."¹⁰⁹ [footnote 109 text: Gordon R. Thompson, Declaration of Gordon R. Thompson Addressing New and Significant Information Provided by the NRC's Near-Term Task Force Report on the Fukushima Accident, at 2, ML11223A283 (Aug. 11, 2011).] For example, the Task Force recommends that plants install "seismically qualified means to spray water into the spent fuel pools."¹¹⁰ [footnote 110 text: *Near-Term Task Force Report* at 46. This proposal is similar to a recommendation made by the National Academy of Sciences back in 2006. *NAS Report* at 55.] Such means will vary due to site-specific factors such as the location of the spent fuel pool. Additionally, the ACRS noted: "[T]he vulnerabilities of spent fuel pools under accident conditions and the need for measures to assure adequate coolant levels are design specific. . . . Staff should initiate a request for information for licensees to document details such as their current plant-specific spent fuel pool instrumentation, sources of spent fuel pool makeup and cooling, power supplies, contingencies and procedures for alternate makeup sources, etc. This information would better inform subsequent staff efforts and would help focus industry communications with respect to these issues." [footnote 111 text: *ACRS Review* at 10.] The Fukushima disaster also highlighted the importance of safety-related systems for spent fuel pools. According to a Near-Term Task Force member, "[T]ypically the spent fuel pool makeup and cooling systems in the United States are not safety-related systems. Loss of cooling in the spent fuel pool was expected to be a very slow-evolving, non-design basis accident situation. So the requirements for those systems are less stringent than they are for other systems addressing design basis accidents." [footnote 112 text: Comments of Jack Grobe Deputy Director of the Office of Nuclear Reactor Regulation, before Advisory Committee on Reactor Safe Guards, Fukushima Subcommittee, at 87, ML11229A243 (Aug. 16, 2011).] For this reason, the Task Force recommendations include measures such as providing safety-related AC electrical power for pools and installing safety-related instrumentation to monitor the pools from the control room that can withstand design-basis natural phenomena. While the Commission ordered the installation of instruments to measure the level of pool water and relay that information to the control room, other measures to mitigate or minimize the impacts of severe pool accidents also exist. NRC should also acknowledge that NRC's Appendix R fire safety regulations (promulgated in the wake of the Brown Ferry fire) do not extend to spent fuel pool facilities. (0718-2-9 [Sipos, John])

Comment: Spent nuclear fuel, one of the most dangerous and long-lasting substances known to humans, was never meant to be stored long-term and densely packed in pools at nuclear plants. When many of these facilities were built, AEC and NRC told the public that the spent fuel would be stored temporarily in pools only for a brief time before being promptly removed from the host communities. Contrary to those assurances, spent nuclear fuel has remained in densely packed spent fuel pools for decades. The events at the Fukushima nuclear facilities should serve as a lesson to reinforce what is already known—long-term storage of spent fuel in pools poses significant environmental risks and impacts. (0718-3-6 [Sipos, John])

Comment: I have a niece, nephew and brother. The children are Japanese-American, and since March 11, 2011 I have been trying to get them out ! of ! Japan! They will not leave. I mourn the loss of life in the oceans. (0744-9 [Bonniwell, Colleen])

Comment: I'm not a nuclear decommission expert by far, and even I can see what's right in front of me. The disastrous handling of decommissioning the Fukushima nuclear plant, the discharge of contaminated water into the waters surrounding the plant and into the Pacific, as well as the extraction of spent nuclear fuel has gone long enough. There are other solutions that need to be urgently looked at and implemented without hesitation or interference on behalf of interested third parties and bureaucratic bodies[.] As I've said before, I am not an expert, however there is a man who quite clearly is a certifiable expert in the field of nuclear plant decommission. Arnie Gundersen of Fairewinds Energy Education, a non-profit organization aimed at educating people like me and the thousands of people like me who know little about the process of dealing with disasters such as the one at Fukushima, has demonstrated his wealth of knowledge on the subject, has shared this knowledge with the world, and has offered constructive, effective solutions time and time again. I implore you to listen to this man, his colleagues, and others like them, before it becomes too late to do anything at the site of the Fukushima meltdowns. Mr. Gundersen's website can be viewed at the following address: <http://fairewinds.org/>[.] Thank you for taking the time to read my thoughts and I wish for everyone involved in the clean-up and decommissioning of the Fukushima Nuclear Plant a quick and healthy success. (0759-1 [Resnyanky, Dmitry])

Comment: Look What's happening in Japan and to the Pacific Ocean and will be all of them ! Those were 2 Spent Fuel pools that burned and exploded ! The only thing that's going to fix the Fukushima's disaster is a Time Machine ! 3 cores in full meltdown. 300 tons or more of highly radioactive water running into the sea. These spent rods have to be looked after for thousands of years !!!!! Putting more and more on the heads of the unborn to deal with !!! (0784-2 [Earl, David])

Comment: With hindsight it is clear that the public was not informed of critical developments during the first few days and weeks of the Fukushima disaster. The public was harmed as a result. We should learn from this historical fact. Not only was Tepco silent about what FOIA documents now reveal as 3 meltdowns in the early days of the Fukushima accident, but FOIA documents also reveal that a contingent of US nuclear engineers and scientists were active participants in the technical response to the 3 meltdowns, as they occurred. For me it is clear that the development of the 3 meltdowns was well known to the US nuclear industry as the meltdowns occurred. And yet this situation was kept secret. Regardless of why--whether it was considered a national security issue, or whether it was merely to prevent panic--the dire situation at Fukushima, and the likely creation of radioactive fallout, was kept secret. As a result of the meltdowns, airborne radioactive Iodine-131 was beginning to circle the globe. But the public was not informed. Pregnant women in the northern hemisphere should have taken steps to minimize their exposure. But they were not informed. Sailors on the USS Reagan were exposed to high doses of radiation from the radioactive plumes. But they were not informed. (0801-1 [Magyar, Michael])

Comment: Fukushima: Lessons Learned, is I hope the wake-up call for the NRC to realize that the industry is not self-empowered enough to manage emergency situations. Perhaps the fear factor of being the corporation at the helm of a nuclear plant melting down was too much for the corporate executives to come out and say, "OH MY, We ARE absolutely F*CK*D!" immediately. The instinctive need of corporations to protect secrecy and maintain autonomy has no place in the world of nuclear meltdowns. I think this is the fundamental level that the NRC must incorporate in its Rules of authority with the nuclear industry. (0838-3 [Clermont, Elaine])

Comment: The industry could and should do better at being a responsible part of the nuclear waste water reclamation for the benefit of New Industry. Clearly, as we witness the ONGOING

disaster of #Fukushima, we are reminded that if such a disaster would strike here in America, the same response MUST be expected by the current #GlobalNuclearIndustry. Without an adequate #NuclearFirstResponseTeam, the thought of what a disaster at #DiabloCanyonNuclearFacility under the "control" of PG&E is simply, beyond depressing. It brings so much fear of death and destruction to that region, of course its depressing and scary and why do we do this to ourselves?! (0838-7 [Clermont, Elaine])

Comment: In light of the ongoing and uncontrolled horrors of the Fukushima Nuclear Crisis, which continues to spew hundreds of thousands of tons of highly radioactive water into the Pacific Ocean for nearly three years, with "sanctioned" plans to dump ALL the water into the Pacific, and continuing to burn unfiltered radioactive waste into the air, and the US-influenced IAEA and former NRC advisers to Japan recommending we "dump it all" into the ocean or store it in the deep sea; and no acceptable means of containment in sight, I cannot logically find any reason to continue to produce more nuclear waste. (0844-6 [Anonymous, Anonymous])

Comment: Re: lines 19 and following, "Spent fuel pools are housed in shield buildings at nuclear power plants with boiling water reactors or in fuel buildings at plants with pressurized water reactors..."--The shield buildings, so called, did not survive the earthquake, tsunami, meltdowns and explosions in March 2011 at Fukushima Daiichi nuclear power plant in Japan. Now, those high-level radioactive waste storage pools, at Fukushima Daiichi Units 1, 2, 3, and 4, are exposed to the open air. The U.S. has 23 identically designed GE BWR Mark I reactors still operating. The U.S. has an additional 8 similarly designed GE BWR Mark II reactors still operating. Attached to these comments is a fact sheet I wrote in the aftermath of the Fukushima Daiichi nuclear catastrophe re: Mark I and II HLRW storage pool risks in the U.S. The NRC should address those risks in this DGEIS, but has not done so. (0919-4-20 [Kamps, Kevin])

Comment: This is especially true regarding General Electric Mark I and Mark II Boiling Water Reactor high-level radioactive waste storage pools. The U.S. has 23 Mark I reactors, and another 8 Mark II reactors, that are identical (Mark I) or very similar (Mark II) in design and even vintage to the four reactors at Fukushima Daiichi destroyed by the nuclear catastrophe there which began on March 11, 2011. (0926-3 [Kamps, Kevin])

Comment: The ongoing catastrophe at Fukushima stands as a warning for what can happen. If we are fortunate, this crisis may eventually be resolved. Our entire northern hemisphere could be at risk if the damaged tank of spent fuel rods explodes. The potential of this nightmare is already with us. Do everything you can to minimize the danger here in the United States. (0963-1 [Jacopetti, Anna])

Comment: Please protect us from future Fukushimas. And pray that Fukushima may eventually be an object lesson, not the end of life as we know it. (0963-3 [Jacopetti, Anna])

Comment: Although I am a US citizen, I have been living in Japan and have seen first hand the disaster of Fukushima. If such a disaster can happen in an advanced, safety-conscious society like Japan, it can happen in the US. We need to make sure there are no more Fukushimas. (0972-1 [Brunelli, Crystal])

Comment: The idea of siting a plant at Fukushima when both scientific and environmental groups opposed it shows how short sighted corporations are. After the tsunami in 2003, Tepco did no reevaluation of the possibility of earthquake and furthermore after the meltdowns refused to deal with the water leakage or the urgent need to blanket the plant in cement as was done at Chernobyl. Furthermore shutting down nuclear power plants will be an extraordinarily difficult,

dangerous and costly process which must be undertaken now. And of course, our corporate dominated government here instead of pushing the Japanese government hard to act decisively allowed it to leave the decision making to Tepco and the government, get this absurdity, is only now doing something because it wants the 2016 Olympics in Tokyo. (0974-2 [Conley, Patrick])

53. Out-of-Scope Comments – Yucca Mountain

Comment: Yucca Mountain has already failed, and our current 70,000 tons of nuclear waste surpasses capacity. (0023-6 [Bridges, Martha])

Comment: And the United States was on a similar towards used fuel disposition at Yucca Mountain when some non-germane politics really intervened in that process. Fortunately, as a result of the court order from the U.S. Appeals Court, the NRC is back on the job to begin re-prosecuting that license application. And the Council urges the Department of Energy and the NRC to proceed expeditiously with the safety review of the Yucca Mountain construction authorization application. In particular, completion and issuance of the SERs and, if necessary, or as necessary, a request for additional appropriations. (0030-23-9 [Blee, David])

Comment: [C]onsistent with federal law and in light of recent decisions by the U.S. Court of Appeals, it is our hope that the Department of Energy and the NRC will proceed expeditiously with the safety review of the pending Yucca Mountain construction authorization application and consummation of the nearly completed safety evaluation reports. Since 1982 the Government has accumulated a nuclear waste fund of \$30 billion from money collected from customers of nuclear electricity. It is time to use that money for its purposes, progress towards a national repository. The Nation has already spent upwards of \$10 billion on Yucca Mountain and the American people deserve to see the results of an independent, objective safety review performed by the NRC. As President Obama himself pointed out at the beginning of his first term in office, regulatory decisions should be based on sound science not politics. (0045-15-2 [Sandos, Theann])

Comment: The United States made significant progress towards geological disposal, up to the point where the Yucca Mountain licensing process was abruptly ended in 2010. The Energy Department had documented its safety case in a license application and a final Environmental Impact Statement. The Nuclear Regulatory Commission concluded an exhaustive review of these documents and sent DOE more than 600 detailed scientific and technical questions. The Department of Energy answered all the questions to the NRC's satisfaction. The NRC was preparing the Safety Evaluation Report when the process was abruptly halted. The President appointed a commission to examine nuclear waste management issues, and they issued a report that suggested finding two or three alternate sites using a concept-based process. Legislation is pending in the Senate to begin the process of selecting alternate sites. Recently, the U.S. Court of Appeals ordered the NRC to resume the Yucca Mountain licensing process, which will further inform our efforts towards geological disposal. Even if development of the Yucca Mountain repository is not resumed, both the industry and some members of Congress, are calling for the NRC to complete and issue the safety evaluation report. (0045-5-3 [Cannon, Tom])

Comment: Is there any way that the Yucca Flats Nuclear waste storage facility can be salvaged and opened? After spending so much money on this strong looking facility in the middle of a desolate area, I was disappointed to hear it's been abandoned due to a previously

unknown fault line. I'm wondering if a study can be done to see if it can't be retrofitted and made strong enough to withstand a 9.0 magnitude earthquake. (0073-1 [Jackson, Bruce])

Comment: I would like to voice concern, irritation, and displeasure at our government, including the NRC, on what happened with Yucca Mountain. We spent over \$9 billion of evaluations and designs to a facility and then turn around and for political reasons without a fair hearing basically have suspended work on it. That's a crime. And it's us as taxpayers in the time when we're talking about budget deficits and what's going to happen, to have that money wasted is unconscionable. There have been multiple reports dating back as far as 1945. And all of them concluded that out of, you know, they looked at options but that Yucca Mountain was a good site for repository and it was better than the other options that were being looked at. (0112-17-2 [Stamm, Steve])

Comment: [T]he truth is there is no real plan to isolate high-level radioactive waste materials effectively for the amount of time really necessary to protect public health and safety, their primary objective. (0163-22-8 [Shaw, Gary])

Comment: Seismic reality tells us that Yucca Mountain couldn't work. Sure, there was politics against it, but ultimately, those politics will come and go with the decades. Ten years from now the politics that affected that will have no meaning whatsoever, but the reality in science will still be the same if not worse. (0163-35-4 [Shaw, Jeanne])

Comment: I also had the opportunity to visit Yucca Mountain in Nevada as well as the highly successful Waste Isolation Pilot Project (otherwise known as WIPP)-which is a Department of Energy facility 2,500 feet underground in a New Mexico salt dome - currently being used to permanently store high activity transuranic nuclear waste. All of the information I received regarding Yucca Mountain as a Commissioner led me to the conclusion that it is an appropriate and safe facility to permanently dispose of our used fuel. While the political process in Washington has delayed the NRC staff from filing its final safety report, I am highly confident that the NRC will eventually validate the safety of Yucca Mountain-and allow DOE to meet its statutory responsibility to provide a permanent used fuel storage facility. Further, the demonstrated success at the WIPP facility strongly underscores the ability of our nation to identify, permit and operate a high level waste facility to address the long term management of used fuel-irrespective of Yucca Mt. (0180-2 [Merrifield, Jeffrey])

Comment: Second, our nation should meet its legal obligation to take permanent responsibility for used fuel by completing the licensing and construction of the Yucca Mountain site. (0180-7 [Merrifield, Jeffrey])

Comment: For years we have been counting on a depository in Yucca Mountain, Nevada, to solve this problem, but public protest and political infighting prevailed over scientific consensus. This rule is a sleeping pill to help us forget Yucca Mountain. (0190-2 [Phelan, Steven] [Phelan, Walter])

Comment: I also advocate the restart of the NRC and DOE review of the Yucca Mountain license application. (0201-5 [Fregonese, Vic])

Comment: The United States made significant progress towards disposal, up to the point where the Yucca Mountain licensing process was abruptly halted in 2010. The Energy Department has documented its safety case in a license application in a Final Environmental Impact Statement. The Nuclear Regulatory Commission conducted an exhaustive review of

these documents and sent DOE more than 600 detailed scientific and technical questions. DOE answered all these questions to the NRC's satisfaction. The NRC was preparing the Safety Evaluation Report when the process was abruptly stopped. The President appointed a commission to examine nuclear waste management issues, and they issued a report that suggested finding two or three alternate -- alternative sites using a consent-based process. Legislation is currently pending in the Senate to begin the process of selecting alternative sites. Recently the U.S. Court of Appeals ordered the NRC to resume Yucca Mountain licensing process, which will inform -- further inform our efforts towards geologic disposal, even if development of the Yucca Mountain repository is not resumed. Both the industry and some members of Congress are calling for the NRC to complete and issue the safety evaluation report. (0244-12-4 [Ratchford, James])

Comment: Now, I could get up here and tell you how Chernobyl or even Fukushima could happen in this country, but I won't do that because safety culture, my safety culture won't let it. For all we have achieved, for all the record of safety, I believe it's going to get better. I believe young people are going to be better. \$26 billion on the nuclear waste fund, the courts have asked NRC to do this. I would also ask the NRC to restart the Yucca Mountain licensing process. And they're also looking at what the Department of Energy is doing with that money. (0245-34-5 [McCullum, Rod])

Comment: People have put in pieces and bits and kind of thrown away things like Yucca Mountain. I suspect many people here realize that Yucca Mountain was chosen for political rather than scientific reasons. The site has been subject to two earthquakes in the last 15 years, one of which partially destroyed the building that was built on there. So, it's really not a seismically stable area to be a real resource to store or be a real storage thing. (0245-45-2 [Aguilar, Margaret])

Comment: Finally, we encourage the NRC to facilitate waste removal and permanent disposal by complying with the nuclear waste policy act and moving, expeditiously, with the completion of the Yucca Mountain license application. Such actions will go a long way toward giving our members, other stakeholders, and the public the assurance that the Federal government will make good on its promises. (0246-12-3 [McMurrian, Katrina])

Comment: I also believe that the NRC should complete their review of the Yucca Mountain repository. (0250-10-3 [Tampas, Courtney])

Comment: However, I also firmly believe that the NRC should complete the review of the Yucca Mountain license application submitted by the Department of Energy. Pending a positive review of the application, construction and operation of the Yucca Mountain facility should proceed as a national priority, in accordance with the Waste Policy Act. There is a safe and effective solution to used fuel management. We just need to implement it. (0250-13-3 [Herwig, Bill])

Comment: I had the opportunity to visit Yucca Mountain in Nevada twice, as well as the highly successful Waste Isolation Pilot Project, otherwise known as WIPP, which is a Department of Energy facility 2,500 feet underground in New Mexico, in a salt dome currently being used to store high-activity transuranic nuclear waste. All the information I received regarding Yucca Mountain as a commissioner led me to the conclusion that it is an appropriate and safe facility to permanently dispose of used fuel. While the political process in Washington has delayed the NRC staff from filing its final safety report, I am highly confident that the NRC will eventually validate the safety of Yucca Mountain, and allow DOE to meet its statutory responsibility to

provide a permanent used fuel storage facility. Further, the demonstrated success of the WIPP facility strongly underscores the ability of our nation to identify, permit and operate a high-level waste facility to address the long-term management of used fuel, irrespective of Yucca Mountain. (0250-4-2 [Merrifield, Jeffrey])

Comment: Second, our nation should meet its legal obligation to take permanent responsibility for used fuel by completing the licensing and construction of Yucca Mountain. (0250-4-5 [Merrifield, Jeffrey])

Comment: And that includes not only addressing Waste Confidence but arriving at a final decision to allow the licensing and review of the licensing for the federal repositories authorized by Congress that we all know is Yucca Mountain. So I think that is first and foremost. (0250-61-6 [Little, Jim])

Comment: I also am very interested in the NRC bringing the Yucca Mountain license application back into play with the Department of Energy. I think that is another area where we need to get some traction to get some motion, so would like to go on record to say that we really need to do that. (0250-62-4 [Fregonese, Vic])

Comment: I am pleased to note that the NRC Commissioners directed the NRC staff to finish the safety evaluation report for the Department of Energy's Yucca Mountain construction authorization application. This process will allow the NRC to proceed carefully and thoughtfully through the evaluation of this site for safe storage for spent nuclear fuel. We need the NRC to get the storage done safely and securely. Based on years of study the use of Yucca mountain as a monitored retrievable storage appears to be a much better alternative than leaving the spent fuel rods in the casks located at the shutdown nuclear plant facilities. The retrievable storage allows for future use of the valuable isotopes in the spent fuel. (0286-3 [Hannaman, Bill])

Comment: Well, I'm pleased to note, and I think some other speakers mentioned this, that the NRC Commissioners have directed the NRC staff to finish the Safety Evaluation Report for Yucca Mountain's construction authorization process. If that came in before we had the interim facilities ready, well, that would be good news because then there would be a place to put things. So, I think there's a timing here as to whether we actually launch into these interim facilities because now we're on a path to look at and possibly have Yucca Mountain as the place to send the fuel. So, we need to get the NRC to -- this strategy, whatever it is, should be done safely and securely. Based on the years of study at Yucca Mountain as a monitored retrievable storage facility, it appears to be a much better alternative to me than leaving the spent fuel rods in the casks located near the plant facility. And the retrievable storage allows for recovery of the valuable isotopes that are in those fuel rods. (0325-26-5 [Hannaman, Bill])

Comment: I'm very pleased to hear today that the Federal government charged the NRC with proceeding with review of licensing for Yucca Mountain. That's an important step forward. That licensing process will come up with the engineer's review of what is needed for the licensing process. The rest of the licensing will need to go through Congress. One of the companies I work with worked on the Blue Ribbon Commission, and I'm real pleased with the results of the Blue Ribbon Commission. (0325-4-3 [Quinn, Ted])

Comment: Last August, there was ruling by the U.S. Court of Appeals for the District of Columbia, the NRC acted illegally when it suspended its work in 2011 on the Yucca Mountain Nuclear Waste Repository, and the Court ordered the NRC to continue its evaluation of the nuclear waste site. The NRC then ordered staff to finish and release safety evaluations that

were shelved two years ago when the current administration in Washington withdrew support for the project. This was done without regard to the consequences of storing nuclear waste above ground in dry caskets or in water pools. The NRC claimed that there was limited funding to continue work on the project. Although dry cask storage is relatively safe, removing the waste to the Yucca Mountain Repository would be far better than storing it above ground as it is now. At Yucca Mountain, the used nuclear fuel will be isolated 1000 feet below dry rock and 1000 below the water table, and within 1000 years, I've read, 99 percent of the radioactivity in the used fuel would be eliminated through the natural process of radioactive decay. A good solution? No, but we do have the waste fuel now that needs to be taken care of, and we have a perfectly safe solution at Yucca Mountain, which including taking the risk of transporting the fuel to the repository. Speeding up the removal of the waste from the water pools into dry casks, as recommended, does not solve the problem. Ironically, a problem that was created in the first place by opposition of environmental groups, such as the Mothers for Peace, and others, to the Yucca Mountain Project. (0326-46-1 [Byrne, Peter])

Comment: After 60 public hearings and completed studies recommended by the National Academy of Science, the Department of Energy, and the U.S. Geological Survey, among others, the Department of Energy, in 2002, certified that Yucca Mountain meets site selection requirements. I'm asking that local and state leaders put aside politics and provide political support for fully-funding and reopening the Yucca Mountain Repository. (0326-46-2 [Byrne, Peter])

Comment: The nuclear industry paid for, ahead of time, the Waste Repository and the U.S. Department of Energy never came through, and that's a shame. I stood on Yucca Mountain. I went out and toured it. It's a perfect spot. I say let's put it there for now. Let's go get it, when we can use it, later. (0326-48-2 [Zawalick, Steven])

Comment: Waste disposal. Yucca Mountain is a solution to that problem. There's nothing wrong with that. And I hate to see NRC blowing the future of nuclear power. (0327-36-5 [Lamberger, Paul])

Comment: And now this gets us to the problem. It appears that the \$30 billion invested by the nuclear power industry to set up Yucca Mountain in Nevada is off the table. But I guess the nuclear power industry didn't really pay for it because the public paid for it with increased electric rates. (0327-42-5 [Faris, Kelly])

Comment: But, on a lighter note in my closing, I went when I was campaigning a little bit with a couple of folks to try to prevent the Yucca Mountain thing. I don't think the Yucca Mountain deal is a good thing, because water leaks in there, and you don't want to have water around leaking in when you have radioactive waste. (0328-15-4 [Davis, Leslie])

Comment: From 2008 to 2010, the NRC conducted an exhaustive review of these documents and sent the Department of Energy more than 600 detailed scientific and technical questions. DOE answered all these questions to the NRC's satisfaction, and the NRC was preparing its safety evaluation report when the process was stopped in 2010. (0328-5-6 [Pickens, Terry])

Comment: Recently, the U.S. Court of Appeals ordered the NRC to resume the Yucca Mountain licensing process which will further inform our efforts towards geologic disposal. Even if development of the Yucca Mountain repository is not resumed, the NRC has directed its staff to complete the work on the safety evaluation report on the Department of Energy's construction authorization application for the proposed Yucca Mountain Repository. (0328-5-8 [Pickens, Terry])

Comment: I think the NRC is ignoring the most recent D.C. Circuit decision which told the NRC to go to Congress and ask permission to stop collecting the radioactive waste fee because there seems to be no plan at hand for ever finding permanent geologic storage, which is what the rationale for that fee and statute was. (0329-12-9 [Paddock, Brian])

Comment: The lack of industry people that really need to know how to bring the waste that we have -- we have to do something with it. And putting it in the middle of Yucca Mountain, which is going to go -- they ruled. We go Yucca. Go put it in Yucca. (0329-19-4 [Vandel, Niki])

Comment: I see the dangers. I've studied in an academic way. I've become familiar with projects, the failed project of Yucca Mountain. (0329-4-2 [Messer, Diane])

Comment: [W]e also have the super volcano in Yellowstone Park, which, from what I've seen on the science movies, would basically cover the Yucca Mountain repository with volcanic ash and rock probably around 2,000 degrees. So that storage place would not be suitable if Yellowstone was to blow up, and that's 60,000 years past due from blowing up. (0329-8-8 [Wilson, Greg])

Comment: The NWPA is the "definite Federal policy" that establishes waste confidence-its very purpose is to "provide a reasonable assurance that the public and the environment will be adequately protected from the hazards posed by high-level radioactive waste and . . . spent nuclear fuel." Its status as law was thrown into question by the U.S. Department of Energy's (DOE's) 2010 motion before NRC's assigned Atomic Safety and Licensing Board ("Licensing Board") to withdraw the DOE's construction authorization application for Yucca Mountain, and NRC's actions in response to that motion. However, the August 13, 2013, *In re: Aiken County* ruling by the U.S. Court of Appeals for the District of Columbia Circuit ("D.C. Circuit Court") reaffirmed that the NWPA is indeed the law of the United States. The Court held that the NRC had been "flouting" and "defying" it. (0355-1 [Skov, Jeff])

Comment: The NRC's errant decisions and delay were less protective of the public health and welfare than compliance with the NWPA would have been. NRC's decisions and actions served to prolong storage of spent nuclear fuel (SNF) at the plant sites, which are usually near both important bodies of fresh water and significant population centers, and summarily foreclosed its placement deep underground in a dry, desert environment, far removed from population centers, on an expansive, guarded federal government reservation. Although the ultimate licensing and opening of Yucca Mountain cannot be presupposed, NRC's compliance with the NWPA would at least have let the NWPA-prescribed process continue, and certainly (as described above) at least 41 months of continued onsite storage would have been saved. (0355-3 [Skov, Jeff])

Comment: Economic security - The delay and resulting uncertainty stemming from the NRC's "flouting" and "defying" the NWPA -uncertainty associated both with resolving the waste confidence issue and with trust in the regulator to implement federal statutes enacted to provide waste confidence-cause investors to doubt the future availability of inexpensive, plentiful, reliable, non-price-volatile baseload electricity for industrial-scale enterprises in the U.S. Therefore they invest instead overseas where such doubt is less. (0355-5 [Skov, Jeff])

Comment: And these are still not the worst of it, which gets to the second point. I must respectfully disagree that "[t]he August writ of mandamus against the NRC related to NRC's review of DOE's Yucca Mountain construction authorization application, not waste confidence." In fact, there is a widely held view that *In re: Aiken County* fundamentally impacts the waste

confidence rulemaking. First, it highlights the NRC's incongruous position that it can both (1) resolve the vacatur and remand handed to it in *New York v. NRC*, 681 F.3d 471 (D.C. Cir. 2012), provide the "reasonable assurance" the D.C. Circuit Court required of it in *Minn. v. NRC*, 602 F.2d 412 (D.C. Cir. 1979), and provide the "reasonable confidence" it promised when it denied the Natural Resources Defense Council's (NRDC's) petition for rulemaking in 1977 (42 FR 34391, 34393) AND (2) simultaneously "flout" and "defy" (paraphrasing *In re: Aiken County*) the NWPA. However, the *In re: Aiken County* decision saddles the rulemaking with a more substantial, fundamental, and obvious infirmity. The argument goes like this. The NRC seeks to issue a new rule, which the agency will aver has been produced in accordance with the Atomic Energy Act (AEA), the Administrative Procedures Act (APA), the National Environmental Policy Act (NEPA), and maybe others. These are all federal laws, like the NWPA. Until the NRC studies and understands why it failed to implement the NWPA over the course of 41+ months (despite several clear indicators, described below, of the wrongfulness of the agency's actions), can substantiate that NRC's compliance with the AEA, APA, NEPA, etc., are not similarly affected, and can point to sound corrective actions it has taken to prevent recurrence of the failure in the future, then few would be willing to ascribe any legitimacy to the rule, or, to the extent that the rule establishes law, to credit NRC with intent to abide by it. The NRC's situation is similar to that of one of its licensees when NRC finds a fundamental breakdown of the licensee's Quality Assurance Program. Until that fundamental breakdown is addressed, the NRC has little confidence in any pronouncements from the licensee. Everything becomes suspect. Similarly, until the NRC convincingly addresses its fundamental failure to abide by the law, as documented in *In re: Aiken County*, few will have any confidence in any pronouncements by the NRC that are purported to be based in law. (0355-7 [Skov, Jeff])

Comment: As mentioned above, there were several clear indicators that should have made apparent that NRC was failing to implement the NWPA, including: -The plain language of the NWPA ("The Commission shall consider an application for a construction authorization" and "shall issue a final decision approving or disapproving the issuance of a construction authorization" within three years, with provision for a one-year extension); -The ruling of the Yucca Mountain Licensing Board in LBP-10-11, dated June 29, 2010 ("[W]e deny DOE's motion to withdraw the Application. We do so because the Nuclear Waste Policy Act of 1982, as amended (NWPA), does not permit the Secretary to withdraw the Application that the NWPA mandates the Secretary file [and] at this point, mandates progress toward a merits decision by the Nuclear Regulatory Commission on the construction permit."); - The Order of the Commission itself that sustained the ruling of its Licensing Board, CLI-11-07, dated September 9, 2011 ("[T]he Commission finds itself evenly divided"); - The ruling in (the previous) *In re: Aiken County*, 645 F.3d 428, 436 (D.C. Cir. 2011), which contested the DOE's attempted withdrawal of the application and apparent decision to abandon development of the repository ("[W]e note that the NWPA requires the Commission to review the application . . . and therefore we must assume that the Commission will comply with its statutory mandate"); - The NRC's own pleadings in *In re: Aiken County*, filed with the D.C. Circuit Court on February 13, 2012 ("The NWPA directs NRC to issue a decision approving or disapproving an application within 3 years from the date the application is submitted, but allows the agency a one-year extension. 42 U.S.C. § 10134 d)."); and - The D.C. Circuit Court's Order, dated August 3, 2012, holding the mandamus proceeding in abeyance (as described in *In re: Aiken County*: "[W]e followed a cautious approach in our decision more than a year ago when we declined to issue mandamus against the Commission at that time. But the Court's majority clearly warned that mandamus would eventually have to be granted if the Commission did not act or if Congress did not change the law. Since then, despite the clear warning, the Commission has still not complied with the statutory mandate. On the contrary, the Commission has reaffirmed that it has no plans to comply with the statutory mandate. In the face of such deliberate and continued agency

disregard of a statutory mandate, our precedents strongly support a writ of mandamus."); All of this leads to the conclusion that it is crucial for the NRC effectively to address-to "own"-the writ of mandamus. That was the driver behind my question of whether NRC had ever been confronted with one. I have been told that it has not, i.e., before *In re: Aiken County*. If that is true, then NRC might misapprehend the significance of the writ. The D.C. Circuit Court Rules call it an "extraordinary" writ. The U.S. Supreme Court terms it a "drastic" remedy (see, e.g., *Cheney v. United States Dist. Court for D. C.*, 542 U. S. ____ (2004)). (0355-8 [Skov, Jeff])

Comment: Purpose of this letter is to bring your attention to the responsibility of the Department of Energy's commitment to provide safe storage of spent nuclear fuel currently being safely stored by PG&E at the Diablo Power Plant. Please resume review of the Yucca Mountain license application and proceed with whatever process is necessary to establish storage sites. (0387-1 [Emmons, Roger])

Comment: The second option concerns waste storage. The U.S. Government created a waste storage site at Yucca Mountain, Nevada, just for this waste. However, Democrats in Congress have prevented the site from operating. Commission members please put pressure on these Congressional members to allow the Yucca Mountain waste site to operate. (0390-3 [Kirkland, Gary L.])

Comment: In the mean time, I support opening Yucca Mt. if only to relieve currently operating nuclear plants of their need for more space for their SNF. (0418-2 [Davison, David])

Comment: The Nye County, Nevada Nuclear Waste Repository Project Office (NWRPO) appreciates the opportunity to provide comments on the NRC draft rule and Generic Environmental Impact Statement on Waste Confidence (GEIS) and continued storage of spent nuclear fuel as requested by the Nuclear Regulatory Commission (NRC) in a September 13, 2013 Federal Register Notice(FR 56776). Our comments, in large part, reiterate points made to NRC staff in previous comments made by the NWRPO to the NRC staff on previous related matters. In particular, these include comments made by the NWRPO in our December 28, 2012 letter to NRC regarding Waste Confidence GEIS scoping; comments made in our November 25, 2008 letter to the NRC regarding the "Update and Proposed Revision to the Waste Confidence Decision;" and comments made by the NWRPO in our February 16, 2012 submittal to the NRC staff regarding the NRC Draft Report for Comment, Background and Preliminary Assumptions for an Environmental Impact Statement -Long-Term Waste Confidence Update, December 2011," which echo and complement our comments contained in this letter. It is requested that NRC reconsider the comments in those documents in light of recent court rulings regarding the legality of NRC's unilateral action to suspend the Yucca Mountain licensing process and NRC's recent agreement to restart that process and abide by the recent writ of mandamus issued to NRC. (0544-1 [Enriquez, Elizabeth])

Comment: Without following Federal law requiring that a repository be constructed and operated at Yucca Mountain, there is no assurance of repository availability at any time in the United States. Recent illegal actions by NRC and DOE to halt the Yucca Mountain Project led to the DC Circuit court remand of the 2010 Waste Confidence Rule. (0544-2 [Enriquez, Elizabeth])

Comment: The United States does not currently have a national policy for the permanent storage of high-level nuclear waste. The Obama administration has determined that the Yucca Mountain site, which has been mired in bad science and mismanagement, is not an option for geologic storage of nuclear waste. (0545-1 [Patrie, MD, MPH, Lewis E.])

Comment: I have attended nearly every Nuclear Regulatory Commission hearing on San Onofre for nearly 20 years. For more than a decade we were told by Southern California Edison (with no objection from the NRC) that the waste problem was essentially solved because the waste would go to Yucca Mountain. But Yucca Mountain is an imperfect solution: Before the federal government stopped the project (or at least slowed it to a crawl), one of the last problems they could not be sure they had any good science about was "drip shields" which were to protect the fuel rods -- that were to be permanently entombed at the site -- from water dripping from above. The shape, material, thickness, and expected durability of the shields were all undecided, but my recollection is that the last design was an upside-down flattened out V shape made out of 4-inch thick titanium. And no one knew how long it would last, but 300 years was an outside estimate, or at least the hope. After that, good luck. What the transport vehicles would look like, and whether they would use rail or roads or both, was all undecided when the project was stopped, despite 10s of billions of dollars having been spent. (0562-4 [Hoffman, Ace])

Comment: Yucca Mountain was cancelled not for political reasons, but for reasons of public health, due to the uncontainable and uncontrollable radioactively released and the release of ?heat waste? from nuclear fission for thousand of years. (0611-27 [Shapiro, Susan])

Comment: ANA opposes Yucca Mountain, which is a technically flawed, politically chosen site. As the State of Nevada, tribal, and non-governmental organizations have shown, Yucca Mountain has many technical flaws, including seismic and volcanic issues and rapid groundwater flow, which preclude the site from meeting adequate disposal standards. In 1987, Congress inappropriately selected Yucca Mountain as the sole repository site, a clearly political, not technical, decision. (0646-9 [Hanson, Courtney])

Comment: In response to the U.S. Court of Appeals Mandamus decision, the NRC's recent order to the NRC staff to restart the Yucca license proceeding beginning with a focused effort to update and publish the Safety Analysis Reports is an important first step in demonstrating confidence that a repository can be licensed in a safe and regulatory compliant manner. (0685-10 [Davis, Ed])

Comment: We encourage the NRC to request the necessary funds from Congress to facilitate timely completion of the Yucca Mountain license review. (0689-5 [Boyd, David])

Comment: Prior to finalizing the rule and associated DGEIS, the NRC should •Complete an analysis to determine the root and contributing causes of the failures of the NRC's management and oversight systems relative to compliance with the Nuclear Waste Policy Act of 1982, as amended ("NWPA"),¹ [footnote 1 text: Codified at Title 42, The Public Health and Welfare, of the U.S. Code, Section 10101, et seq.] that led to the ruling in *In re: Aiken County*, dated August 13, 2013,² [footnote 2 text: 725 F.3d 255 (D.C. Cir. 2013).] by the U.S. Court of Appeals for the District of Columbia Circuit ("D.C. Circuit Court"); •Complete an "extent of condition" evaluation to determine whether NRC's implementation of other statutes and regulations has been or is similarly affected; •Implement immediate corrective actions to address any failures identified by the extent of condition evaluation; •Formulate and implement robust corrective actions to prevent recurrence based on the root cause analysis and extent of condition evaluation; and •Issue a report documenting the above. The report should directly answer the questions listed in the "Discussion" section below. The activities of the NRC's Office of the Inspector General (OIG) should be included within the scope of the root cause analysis and extent of condition evaluation. Consideration should be given to tasking an independent outside entity to complete the requested actions. The requested actions are consistent with commonsensical management principles; the expectation expressed in the concurring opinion in *In re: Aiken County* that

"[t]oday's judgment should ensure that the Commission's next chapter begins with adherence to the law"; the principles embodied in the agency's regulations at 10 CFR 50, Appendix B, Criterion XVI, "Corrective Action," which the agency applies to its licensees; and the traits of a positive safety culture (see the NRC's "Final Safety Culture Policy Statement," 76 FR 34773, 34777-34778, dated June 14, 2011). The requested actions are warranted because of (1) the significance of the failures of NRC's management and oversight systems that led to the *In re: Aiken County* ruling; (2) the need to assure that those systems are repaired sufficiently to provide confidence that this rulemaking is well supported by rigorous, across-the-board statutory compliance; and (3) the need to assure that the DGEIS assumption of ongoing "institutional controls" is valid. As discussed below, until the requested actions are completed, the rulemaking and DGEIS are patently defective. More importantly perhaps, the requested actions will also help assure that the NRC's quest for waste confidence, and, more broadly, the nation's quest for safe, secure, ultimate³ [footnote 3 text: The enormous residual energy content of the nation's spent nuclear fuel (SNF) (see FN 32, *infra*), the proposition that the world's fossil fuel supplies are finite and decreasing, the growing deterioration of the world's air quality resulting from fossil fuel combustion (see FN 19, *infra*), and the emerging burgeoning of robotics all suggest that SNF energy recovery may be a prosperous and beneficial future enterprise. For purposes of this comment, however, that is a decision for a younger generation.] disposal of its spent nuclear fuel (SNF) do not (further) devolve into a Sisyphean ordeal-with nuclear power proponents, nuclear weapon nonproliferationists, and rule-of-law advocates forever pushing the "waste" boulder up the mythological hill, only to have political operatives roll it back down again. (0692-1 [Skov, Jeff])

Comment: Commonsensical management principles dictate that significant failures by an organization warrant (1) study to understand both the extent and the causes (root and contributing) of the failures and (2) subsequent formulation and implementation of suitable corrective actions to prevent recurrence. These principles are embodied in the agency's regulations at 10 CFR 50, Appendix B, Criterion XVI, "Corrective Action,"²² [footnote 22 text: In relevant part, this criterion states: "Measures shall be established to assure that conditions adverse to quality, such as failures, malfunctions, deficiencies, deviations, defective material and equipment, and nonconformances are promptly identified and corrected. *In the case of significant conditions adverse to quality, the measures shall assure that the cause of the condition is determined and corrective action taken to preclude repetition*" (emphasis added).] which it applies to its licensees, and are consistent with the traits of a positive safety culture (see the NRC's "Final Safety Culture Policy Statement," 76 FR 34773, 34777-34778, dated June 14, 2011), including, in particular: •Leadership Safety Values and Actions-Leaders demonstrate a commitment to safety in their decisions and behaviors. •Problem Identification and Resolution-Issues potentially impacting safety are promptly identified, fully evaluated, and promptly addressed and corrected commensurate with their significance. •Continuous Learning-Opportunities to learn about ways to ensure safety are sought out and implemented. •Questioning Attitude-Individuals avoid complacency and continuously challenge existing conditions and activities in order to identify discrepancies that might result in error or inappropriate action. (0692-10 [Skov, Jeff])

Comment: The extent of condition evaluation is important to determine whether there are other statutes and regulations that the NRC is "flouting" and/or "defying." This is not a splenetic concern. That is, there were several clear indicators that should have made apparent that NRC was failing to implement the NWPA, including: •The plain language of the NWPA ("The Commission shall consider an application for a construction authorization" and "shall issue a final decision approving or disapproving the issuance of a construction authorization" within three years, with provision for a one-year extension); •The ruling of the Yucca Mountain

Licensing Board in LBP-10-11,²³ [footnote 23 text: 71 NRC 609 (2010); see at , beginning at p. 609. Also available in ADAMS (<http://adams.nrc.gov/wba/>) at Accession Number ML101800299.] dated June 29, 2010 ("[W]e deny DOE's motion to withdraw the Application. We do so because the Nuclear Waste Policy Act of 1982, as amended (NWPAA), does not permit the Secretary to withdraw the Application that the NWPAA mandates the Secretary file [and] at this point, mandates progress toward a merits decision by the Nuclear Regulatory Commission on the construction permit."); •The ruling in (the previous) *In re: Aiken County*, 645 F.3d 428, 436 (D.C. Cir. 2011), on July 1, 2011, which contested the DOE's attempted withdrawal of the application and apparent decision to abandon development of the repository ("[W]e note that the NWPAA requires the Commission to review the application . . . and therefore we must assume that the Commission will comply with its statutory mandate");²⁴ [footnote 24 text: The concurring opinion by Judge Kavanaugh in that case culminated-after 19 pages of well-reasoned, tightly woven legal analysis-with the clear conclusion that "*the ball in this case rests . . . with the Nuclear Regulatory Commission*" (emphasis added).] •The Order of the Commission itself that sustained the ruling of its Licensing Board, CLI-11-07, dated September 9, 2011 ("[T]he Commission finds itself evenly divided"); •The NRC's own pleadings in *In re: Aiken County*, filed with the D.C. Circuit Court on February 13, 2012 ("The NWPAA directs NRC to issue a decision approving or disapproving an application within 3 years from the date the application is submitted, but allows the agency a one-year extension. 42 U.S.C. § 10134(d).") [.] (0692-11 [Skov, Jeff])

Comment: The thoroughness of the cause analysis is also important. For example, it has been posited that NRC did not complete its review of the Yucca Mountain application because the Congress failed to appropriate sufficient funding. Fair enough. However, a probing analysis would inquire further: Why did the Congress fail to appropriate sufficient funds for NRC to continue its review? The answer to that may be that NRC *failed to request* sufficient funds. For example, see NUREG-1100, Vol. 26, dated February 2010, Executive Summary, pp. 9-10: "The FY 2011 budget *request* for High-Level Waste Repository is \$10.0 million ... Major activities the requested resources will support include the following: ... Work related to an orderly closure of the agency's Yucca Mountain licensing support activities ..." (emphasis added). A thorough cause analysis would then seek to understand why the NRC failed to make the request for sufficient funding. The "why" question is then repeated until a root cause is determined. This methodology has been termed the "why staircase" by root cause analysis practitioners. (0692-13 [Skov, Jeff])

Comment: The questioning attitude is also crucial. The public, the nuclear industry, and doubtless the NRC Staff would appreciate answers to a variety of questions: •Why did over a year go by between receipt of all briefs (on *July 19, 2010*²⁷ [footnote 27 text: See "2010 Annual Report on Commission Adjudication," SECY-11-0008 ("OCAA Report"), at Attachment: "Commission Adjudicatory Decisions, January-December 2010," p. 9 (January 13, 2011).]) requested by the NRC Secretary's Order of June 30, 2010²⁸ [footnote 28 text: Available in ADAMS (<http://adams.nrc.gov/wba/>) at Accession Number ML101810432.](which established an expedited briefing schedule relative to Commission consideration of Licensing Board Order LBP-10-11²⁹ [footnote 29 text: 71 NRC 609 (2010); see at <http://pbadupws.nrc.gov/docs/ML1305/ML13056A621.pdf>, beginning at p. 609. Also available in ADAMS (<http://adams.nrc.gov/wba/>) at Accession Number ML101800299].), and the Commission's subsequent Order sustaining the Licensing Board's ruling, CLI-11-07, on *September 9, 2011*, even though the Commission was on record (CLI-10-13, dated April 23, 2010), on this very matter, with this guiding leadership touchstone: "[W]e think the prudent course of action is to resolve the matters pending before our agency as expeditiously and responsibly as possible"? •Relatedly, are the words "expeditiously" and "responsibly" terms of

art within the agency, and, if so, should they be properly defined in the U.S. Code of Federal Regulations (CFR) so that no one is potentially misled? Note that a year's delay is all the more conspicuous given that the statutory scheme only allows three years total (with the possibility for an additional fourth year if warranted) for the NRC to render a final decision on the merits on the DOE's Yucca Mountain construction authorization application. (0692-14 [Skov, Jeff])

Comment: •Since considerable benefits from the NRC's errant decisions run to the nuclear utilities—e.g., their SNF management costs are being paid by the taxpayer through the Treasury Department's Judgment Fund, the considerable corpus³⁰ [footnote 30 text: See "Department of Energy's Nuclear Waste Fund's Fiscal Year 2013 Financial Statement Audit," OAS-FS-14-02, December 2013 ("As of September 30, 2013, the U.S. Treasury securities held by the Department related to the NWF had a market value of \$36.6 billion").] of their investment into the NWF is being preserved, and they retain title and ready access to a quantity of SNF that, as of almost a decade ago, had the energy equivalent of *over six billion barrels of oil* (see here;³¹ [footnote 31 text: Testimony of Mr. Kyle E. McSillarow, Deputy Secretary, U.S. Department of Energy, before the U.S. Senate Committee on Energy and Natural Resources, S. Hrg. 108-658, July 13, 2004, p. 10.] search for "6 billion barrels of oil")³² [footnote 32 text: For comparison purposes, consider that, as of December 17, 2013, the price of oil (light crude) was \$97.51 per barrel and the price of gold was \$1,244.40 per ounce (troy). There are 147.3 million ounces (troy) of gold in the United States Bullion Depository at Fort Knox, Kentucky (see here). That gold is worth \$183.3 billion (i.e., 147.3 million oz. troy times \$1244.40 per oz. troy). Six billion barrels of oil are worth \$585 billion (i.e., 6 billion barrels times \$97.51 per barrel). Thus, the nation's spent nuclear fuel constitutes an asset worth over three times more than all the gold in Fort Knox.])—was consideration given to the potential appearance of collusion between the NRC and the nuclear utility industry, especially when not a single utility joined in the petition for mandamus that resulted in the D.C. Circuit Court's August 13, 2013, ruling? Does NRC refute this implication? •Was consideration given to pursuing obstruction of justice charges in accordance with 18 U.S.C. 1505 or conspiracy charges in accordance with 18 U.S.C. 371, since (1) "a systematic campaign of noncompliance" was *evidently* being "orchestrated" within NRC, as stated in the concurring opinion in *In re: Aiken County*, and (2) outside "advice" in that regard (i.e., to unlawfully "close out" the Yucca Mountain licensing proceeding) had been provided, as stated by counsel for NRC at oral argument³³ [footnote 33 text: See on p. 39 of the transcript, lines 5-6.] for *In re: Aiken County* on May 2, 2012? (0692-15 [Skov, Jeff])

Comment: •Why does this comment need to be made? That is, when faced with the D.C. Circuit Court's August 13, 2013, ruling, and possessed of common sense, and familiar both with the traits of a positive safety culture and the content and intent of 10 CFR 50, Appendix B, Criterion XVI, and mindful that the significance of the NRC's failures is likely per se, since it was pronounced by the second highest court in the United States, but also circumstantially apparent (in accordance with the Statement of Considerations supporting the 10 CFR 50.9 rule³⁴ [footnote 34 text: 52 FR 49362, 49364, dated December 31, 1987 (As applied to licensees: "The fact that a licensee considers information to be significant can be established, for example, by the actions taken by the licensee to evaluate that information. Thus . . . there are objective indicia of recognition that can be used by the NRC in determining whether a licensee in fact recognizes the significance of the information in question.")]).] from the lengths NRC has gone to evaluate and/or address the ramifications of the condition—e.g., NRC's recent effort to evaluate the need for expedited transfer of SNF from pools to dry casks,³⁵ [footnote 35 text: See "Consequence Study of a Beyond-Design-Basis Earthquake Affecting the Spent Fuel Pool for a U.S. Mark I Boiling Water Reactor," Draft Report, June 2013; available in ADAMS (<http://adams.nrc.gov/wba/>) at Accession Number ML13133A132.] this rulemaking initiative, etc.—why has no root cause analysis been initiated already? Should efforts be initiated to

bolster a questioning attitude within NRC? *In re: Aiken County* identified serious failures of the NRC's management and oversight systems relative to the NWPA, and the clear potential for a virtual colander of compliance relative to other statutes and regulations. Without significant efforts to understand the extent and causes of the failures, and to establish sound, thoughtful corrective actions to prevent their recurrence, the NRC cannot in good faith attest that the instant rulemaking complies with any governing statute. The rulemaking is consequently defective. The final reason that NRC must take the requested actions relates to the assumption in the DGEIS of ongoing "institutional controls."³⁶ [footnote 36 text: Per Section 1.8.3 of the DGEIS: "To evaluate the potential environmental impacts of continued storage, this draft GEIS makes several assumptions. . . . Institutional controls, i.e., the continued regulation of spent nuclear fuel, will continue. This assumption avoids unreasonable speculation regarding what might happen in the future regarding Federal actions to provide for the safe storage of spent fuel.] Implicit in this assumption, and made clear by the words themselves, is a requirement that the governing institutions have control. In the wake of *In re: Aiken County* that cannot be said of the NRC; at least, that is, until the actions requested herein are completed. As a result, the DGEIS is defective. (0692-16 [Skov, Jeff])

Comment: Prior to finalizing the waste confidence rule and associated DGEIS, the NRC should determine the extent and causes (root and contributing) of the failures of the agency's management and oversight systems that led to the adverse ruling in *In re: Aiken County*. Any failures identified by the extent of condition evaluation should be addressed immediately. Robust corrective actions to prevent recurrence should then be formulated and implemented, based on the results of the root cause analysis and extent of condition evaluation. Finally, NRC should issue a report documenting the above. The report should directly answer the questions listed in the "Discussion" section above. The activities of the NRC's Office of the Inspector General (OIG) should be included within the scope of the root cause analysis and extent of condition evaluation. Consideration should be given to tasking an independent outside entity to complete the requested actions. These actions are warranted because of: (1) the significance of the failures, including the considerable financial impact to the taxpayer attributable to the NRC's unjustified delay—over \$805 million,³⁷ [footnote 37 text: As a final point of comparison, had this \$805 million been afforded to the United Nations Children's Fund, UNICEF (formerly the United Nations International Children's Emergency Fund), some 1,290,000 infants and children could have been nourished, vaccinated, and provided emergency medical care over the course of those 41 months when the NRC had "the ball" (see FN 24, *supra*) but unlawfully failed to advance it. That is, based on the 50¢ per day per child value quoted by Ms. Alyssa Milano in UNICEF's recent television advertisement (see here), \$805 million divided by \$0.50 per child per day, divided by 30.4375 days per month (on average), divided by 41 months equals 1,290,000 children.] as detailed above—the added risk to the public health and safety from the additional months of proximity of the majority of nation's spent nuclear fuel to sizeable fresh water sources and significant population centers, the risks associated with additional SNF handling evolutions at the plant sites, the numerous adverse health impacts from protracted national reliance on fossil-fueled power plants, and creditable indirect economic and national security impacts; (2) the need to assure that NRC's management and oversight systems are repaired sufficiently to provide confidence that this rulemaking is well supported by rigorous, across-the-board statutory compliance; and (3) the need to assure that the DGEIS assumption of ongoing "institutional controls" is valid. (0692-17 [Skov, Jeff])

Comment: •Also difficult to quantify is the burden that NRC's errant decisions have placed on the nation's economy. The delay and resulting uncertainty stemming from the NRC's decisions—uncertainty associated both with resolving the waste confidence issue and with trust in the regulator to implement federal statutes enacted to provide waste confidence—cause

investors to doubt the future availability of inexpensive, plentiful, constant, reliable, non-price-volatile baseload electricity for industrial-scale enterprises in the U.S. Therefore they invest instead overseas where such doubt is minimized. (0692-19 [Skov, Jeff])

Comment: The NWPA is the "definite Federal policy"⁴ [footnote 4 text: NWPA, Sec. 111(b)(2); codified at 42 U.S.C. 10131(b)(2).] that establishes waste confidence. Its very purpose is to "establish a schedule for the siting, construction, and operation of repositories *that will provide a reasonable assurance that the public and the environment will be adequately protected* from the hazards posed by high-level radioactive waste and such spent nuclear fuel as may be disposed of in a repository"⁵ [footnote 5 text: Id. at Sec. 111(b)(1); codified at 42 U.S.C. 10131(b)(1).] (emphasis added). Its status as law was thrown into question by the U.S. Department of Energy's (DOE's) March 3, 2010,⁶ [footnote 6 text: Available in ADAMS (<http://adams.nrc.gov/wba/>) at Accession Number ML100621397.] motion before NRC's assigned Atomic Safety and Licensing Board ("Licensing Board") to withdraw the Department's construction authorization application for the Yucca Mountain repository, and NRC's decisions, actions, and inactions in response to that motion. However, the August 13, 2013, *In re: Aiken County* ruling by the D.C. Circuit Court reaffirmed that the NWPA is indeed the law of the United States. The Court held that the NRC had been "flouting" and "defying" it. NRC did not request a rehearing following this ruling. (0692-2 [Skov, Jeff])

Comment: •Importantly, the NRC's decisions, actions, and inactions that led to the *In re: Aiken County* ruling and, indeed, the text of the ruling itself substantially undermine the agency's reputation as an independent and transparent regulator. Such a tarnish is hard to remove, even once the decision is made to do so. The NRC Chairman's prepared remarks for presentation on November 11, 2013, at the American Nuclear Society's Winter Meeting²⁰ [footnote 20 text: NRC document S-13-011, released November 14, 2013.] are illuminating in this regard. In six pages, the words *independent* and *independence* appear 13 times, and the words *transparent* and *transparency* appear 3 times. However, the word "Yucca" does not appear, even though the current NRC has been reduced to veritable impotence—disempowered of its fundamental authority to issue or renew power reactor licenses—because of its decisions relative to Yucca Mountain, and despite the fact that the agency is under a writ of mandamus—a "drastic" remedy—from the second highest court in the United States, to "promptly continue with the legally mandated licensing process" for Yucca Mountain. Those prepared remarks thus suggest that the NRC is still in denial regarding the import and effect of the writ of mandamus, that it still considers Yucca Mountain to be a dead proposition, that it still views the NWPA to be some sort of "okay-to-violate" ("OTV") statute,²¹ [footnote 21 text: The proposition that there are "okay-to-violate" ("OTV") statutes is a very slippery slope that opens the door for multiple difficult questions; for example: Can the NRC give the public some criteria for determining which statutes are OTV statutes? Are those criteria inviolable or are some of them OTV also? Which ones? Are there OTV regulations also? If NRC designates its OTV statutes based on input from, say, Senator Reid's office, could those communiques be posted on NRC's website, so that NRC's current list of OTV statutes is readily discernable? Should NRC rulemaking documentation include certification that the rule was prepared, reviewed, and adopted only in accordance with statutes that were not and are not on the current NRC OTV List (and that the rule itself has been designated to not be OTV)?] and that it regards "independent" as a word like "um" or "uh"—to be used liberally without much thought or concern that some meaning will be conveyed. (0692-20 [Skov, Jeff])

Comment: It is well-documented that the Yucca Mountain repository is of intense political interest.⁷ [footnote 7 text: See, e.g., "In Deal, Aide to Reid To Be Named to NRC," Washington Post, November 23, 2004 ("In a deal to let 175 of President Bush's nominees take office, an

adviser to new Democratic leader Harry M. Reid, the Senate's staunchest opponent of a nuclear waste dump in his home state of Nevada, will be named to the Nuclear Regulatory Commission."); "Reid to National Republicans on Their Desire to Ship Nuclear Waste to Yucca Mountain: 'Hell No,'" Sen. Harry Reid Press Release, September 17, 2010 ("Nevada is not the nation's dumping ground and it never will be as long as I have something to say about it").] However, we should not accept that NRC's violation of the NWSA is just "politics as usual." NRC's management and oversight systems need to be sufficiently robust to overcome political intrusions, whether overt or covert, before they lead to unlawful actions. That NRC cannot be insulated from politics does not excuse its "flouting" and "defying" the law, in the words of the D.C. Circuit Court. The use of that word "flouting" by the Court is particularly troubling since it conveys the Court's conclusion that there was an element of contempt in NRC's actions.⁸ [footnote 8 text: To "flout" means "to show contempt (for)" (Collins), "to treat with contemptuous disregard" (Merriam-Webster), "[t]o show contempt for; scorn" (American Heritage). The word thus goes beyond insouciant and even willful violation of the law; it connotes-it means-*contemptuous* disregard for the law.] The concurring opinion went so far as to declare that "a systematic campaign of noncompliance" was being "orchestrated." That word "orchestrated" is often associated with conspiracy indictments. (0692-3 [Skov, Jeff])

Comment: The D.C. Circuit Court is generally held to be the second highest court in the United States.⁹ [footnote 9 text: See, e.g., "President Obama Announces Three Nominees for the D.C. Circuit Court," White House Blog, dated June 4, 2013, quoting President Obama: "The D.C. Circuit is known as the second highest court in the country, and there's a good reason for that."] Its August 13, 2013, ruling was effectuated by issuing a "writ of mandamus" to the NRC. A writ of mandamus is a court order used, *inter alia*, to compel a government agency to do its duty. The Court's rules¹⁰ [footnote 10 text: CIRCUIT RULES of the UNITED STATES COURT OF APPEALS for the DISTRICT OF COLUMBIA CIRCUIT (Together with the corresponding Federal Rules of Appellate Procedure), Circuit Rules Effective January 1, 1994, As Amended Through December 1, 2013, Federal Rules Effective July 1, 1968, As Amended Through December 1, 2013 (see here).] identify it as an "extraordinary" writ.¹¹ [footnote 11 text: See Rule 21, "Writs of Mandamus and Prohibition, and Other *Extraordinary* Writs" (emphasis added).] The U.S. Supreme Court calls it a "drastic" remedy.¹² [footnote 12 text: See, e.g., *Cheney v. United States Dist. Court for D.C.*, 542 U.S. 367 (2004) ("In light of the *drastic* nature of mandamus" (emphasis added); "This is a '*drastic* and extraordinary' remedy 'reserved for really extraordinary causes'" (quoting *Ex parte Fahey*, 332 U.S. 258, 259-260 (1947)) (emphasis added)).] Seasoned government attorneys allow that a writ of mandamus issued by the D.C. Circuit Court is a serious legal order, reflective of egregious agency behavior. (0692-4 [Skov, Jeff])

Comment: I have been told that the NRC has never received one. The failures of NRC's management and oversight systems in this instance were significant: •The NRC's errant efforts to close out the Yucca Mountain licensing proceeding have cost U.S. taxpayers upwards of \$805 million,¹³ [footnote 13 text: Through September 30, 2013, the Judgment Fund has paid out \$3.691 billion, comprising \$2.7 billion in settlements and \$991 million in court-awarded damages, to nuclear utilities as a result of the federal government's breach of the NWSA-prescribed "standard contracts" see DOE's Fiscal Year 2013 audit report for the Nuclear Waste Fund (NWF), Report OAS-FS-14-02, dated December 2013, p. 18. Based on the time duration between February 1, 1998 (*i.e.*, the breach start date), and September 30, 2013 (the "as of" date indicated in the DOE audit report), which is about 188 months (*i.e.*, 11 mos. for 1998; 12 mos. each for 1999 through and including 2012, or 12 x 14 = 168 mos.; and 9 mos. for 2013), the breach has been costing the Judgment Fund, on average, about \$19.633 million per month (*i.e.*, \$3.691b / 188 mos. = \$19.633m per month). NRC's NUREG-1100, Vol. 26, documented

NRC's decision to commence "an orderly closure of the agency's Yucca Mountain licensing support activities." *In re: Aiken County* ruled that closure decision was not lawful. Therefore, the NRC's share of the government's delay in curing the breach can reasonably be measured from February 2010, when NUREG-1100, Vol. 26, was issued, to August 13, 2013, when *In re: Aiken County* was issued. That's about 41 months (*i.e.*, 10 mos. in 2010, 12 mos. each in 2011 and 2012, and 7 mos. in 2013). Thus, at \$19.633 million per month for 41 months, the NRC's share of the federal government's delay in implementing the NWPA has cost the Judgment Fund at least \$805 million. Significantly, that money comes from the U.S. taxpayers and not from the utility-supplied Nuclear Waste Fund.] based on the consequent 41 months (at least) of additional, unjustified expenditures from the Treasury Department's taxpayer-supplied Judgment Fund to nuclear utilities in settlements and court-awarded damages resulting from the U.S. government's breach of the NWPA-prescribed "standard contracts." (0692-5 [Skov, Jeff])

Comment: •The NRC's errant decisions were less protective of the public health and welfare because they served to prolong storage of SNF at the plant sites, which are usually near both important sources of fresh water and significant population centers, and summarily to foreclose its placement deep underground in a dry, desert environment, far removed from population centers, on an expansive, guarded federal government reservation.¹⁴ [footnote 14 text: Although the ultimate licensing and opening of Yucca Mountain cannot be presupposed, NRC's compliance with the NWPA would at least have let the NWPA-prescribed process continue, and certainly (as described above) at least 41 months of continued onsite storage would have been avoided.] The delay attributable to NRC's errant actions has required utilities to transfer a corresponding additional amount of SNF from their spent fuel pools to dry casks; each of these manipulations presents a non-zero risk of mishap. Protracted dry cask storage at the plant sites provides the additional concerns that the casks are situated (1) in the weather and are therefore susceptible to weather-related degradation (see, *e.g.*, NRC's Information Notices 2012-20, "Potential Chloride-Induced Stress Corrosion Cracking of Austenitic Stainless Steel and Maintenance of Dry Cask Storage System Canisters," and 2013-07, "Premature Degradation of Spent Fuel Storage Cask Structures and Components from Environmental Moisture") and (2) in conspicuous view to terrorist planners.¹⁵ [footnote 15 text: The June 2, 2006, ruling of the U.S. Court of Appeals for the Ninth Circuit in *San Luis Obispo Mothers v. NRC*, 449 F.3d 1016 (9th Cir. 2006), lends substantial credence to the proposition that onsite dry cask storage might lead to or increase the risk of a terrorist attack because (1) the presence of the casks would increase the probability of a terrorist attack on the plant, and (2) the casks themselves would be a primary target for a terrorist attack.] That latter concern reflects that NRC's errant decisions have a national security aspect. (0692-6 [Skov, Jeff])

Comment: •The errant decisions have forced NRC to essentially disempower itself—the agency declared that it will not issue any new power reactor or Independent Spent Fuel Storage Installation (ISFSI) licenses or license renewals until "waste confidence" can be restored (see NRC's Order No. CLI-12-16, dated August 7, 2012, and associated SECY-12-0132, dated October 3, 2012). (0692-8 [Skov, Jeff])

Comment: The Commission's DGEIS and proposed rule demonstrate an unreasonable view of SNF disposal actions, virtually ignoring the delays in DOE's SNF disposal program, the breaches in the Standard Contract, the violations of the NWPA, and the suppression by Congress of appropriations to ensure good faith compliance with the NWPA and the Standard Contract. The federal courts declared in 1996 and 1997 that the obligation of utilities to pay the contract fees was a "reciprocal obligation" to the federal government's commencement of disposal of SNF by January 31, 1998,⁴ [footnote 4 text: *Indiana Michigan Power Co et al. v. DOE*, 88 F.3d 1272 (D.C. Cir. 1996); *Northern States Power Co v. DOE*, 178 F.3d 754 (D.C.

Cir., 1997).] an obligation that has now been breached for nearly 16 years with no end in sight. The United States Court of Claims is now regularly issuing decisions in litigated cases awarding utilities substantial damages for the federal government's contract breach, which on a combined basis equates to billions of dollars. Meanwhile, ratepayers have continued to pay duplicative costs for the contract fees under the breached Standard Contract as well as otherwise avoidable increased costs for expansion of SNF storage, new ISFSI facilities, higher decommissioning obligations, among other costs. At the same time, states and their taxpayers and ratepayers where SNF is stored face contingent liabilities involving unknown billions of dollars of future costs in the event that both the nation's nuclear utilities and the federal government permanently default in their obligations to dispose SNF. (0704-4 [Callen, Ronald C.] [Keskey, Donald L.]

Comment: The DGEIS and proposed rule do not promote or enforce the provisions, objectives, and goals of the NWPA and the Standard Contract or a timely decision on the Yucca Mountain License Application. A proposed decision that would in effect accept the extremely long-term or permanent storage ("non-disposal") of SNF at or near the nation's nuclear plants simply is not consistent with the NWPA or the Standard Contract. (0704-5 [Callen, Ronald C.] [Keskey, Donald L.]

Comment: The apparent escapist purpose or result facilitated by the DGEIS and proposed rule are reinforced by the federal government's inability or refusal to properly perform SNF disposal or to abide by federal court decisions clarifying and mandating said SNF disposal duties and obligations, as illustrated by *Indiana Michigan Power Co, et al v Dept of Energy*, 88 F3d 1272 (DC Cir 1996); *Northern States Power Co v DOE*, 128 F3d 754 (DC Cir 1997); *In re Aiken County*, U.S. Court of Appeals Docket No. 11-1271 (August 13, 2013); and *National Association of Regulatory Utility Commissioners v United States Department of Energy*, U.S. Court of Appeals Docket No. 11-1066 (November 19, 2013), and in numerous U.S. Court of Claims decisions awarding damages to utilities and appellate decisions arising therefrom. (0704-9 [Callen, Ronald C.] [Keskey, Donald L.]

Comment: Yucca Mountain Repository Project Formally Abandoned[.] In 2009, the federal government announced that the long awaited nuclear repository at Yucca Mountain, Nevada, was no longer a viable option.⁷³ [footnote 73 text: Nuclear Regulatory Commission, Draft Report for Comment, *Background and Preliminary Assumptions For an Environmental Impact Statement—Long-Term Waste Confidence Update*, at 2, ML11340A141 (Dec. 2011).] Subsequently, in March 2010, the Department of Energy ("DOE") submitted to NRC a request to withdraw its license application for the Yucca repository.⁷⁴ [footnote 74 text: Dep't of Energy Motion to Withdraw, *In re U.S. Dep't of Energy (High-Level Waste Repository)*, Docket No. 63-001, ASLBP No. 09-892-HLW-CAB04 (United States Nuclear Regulatory Commission), ML100621397 (Mar. 3, 2010).] Although the NRC's Atomic Safety and Licensing Board ("Board") denied DOE's request,⁷⁵ [footnote 75 text: HLW License Application Docket No. 63-001, Board Memorandum and Order (LBP-10-11), ML101800299, (June 29, 2010).] the decision was appealed and, after an evenly divided vote, the Commission ordered the Board to suspend its review by the end of fiscal year 2011, due to lack of funding for the upcoming fiscal year.⁷⁶ [footnote 76 text: HLW License Application Docket No. 63-001, Commission Memorandum and Order (CLI-11-07), ML11252A532 (Sept. 9, 2011). See also Memorandum from Catherine Haney, Director, Office of Material Safety and Safeguards, to Commission, *Update on the Yucca Mountain Program*, ML11180A265 (Sept. 1, 2011) (stating that the Yucca Mountain Program is on track to complete the closure of the Yucca Mountain licensing review by the end of Fiscal Year 2011).] In its final report, the federal Blue Ribbon Commission noted: The Obama Administration's decision to halt work on a repository at Yucca Mountain in

Nevada is but the latest indicator of a policy that has been troubled for decades and has now all but completely broken down. The approach laid out under the 1987 Amendments to the Nuclear Waste Policy Act (NWPA)—which tied the entire U.S. highlevel waste management program to the fate of the Yucca Mountain site—has not worked to produce a timely solution for dealing with the nation's most hazardous radioactive materials. The United States has traveled nearly 25 years down the current path only to come to a point where continuing to rely on the same approach seems destined to bring further controversy, litigation, and protracted delay. . . . Put simply, this nation's failure to come to grips with the nuclear waste issue has already proved damaging and costly and it will be more damaging and more costly the longer it continues . . . ⁷⁷ [footnote 77 text: *Blue Ribbon Commission on America's Nuclear Future*, Report to the Secretary of Energy, at vi ("*Blue Ribbon Commission Report*") (Jan. 2012).] The State recognizes that the U.S. Court of Appeals for the D.C. Circuit recently directed NRC to resume its review of the application for a license to store nuclear waste at the Yucca Mountain site. In re Aiken County, 725 F.3d 255 (D.C.Cir 2013). According to NRC, approximately \$11 million of Congressionally-approved funds remains. *Id.*, at 267. (0718-2-2 [Sipos, John])

Comment: When I visited the site on an ANS engineering tour in 2001, Stone and Webster contractors were plowing desert tracks leaving the site. No plan had been established for handling multi-purpose fuel canisters when they arrived via rail to the desert floor. It had not been decided if the peak temperature of storage casks would be above or below the boiling point of water. A super seal n' shield alloy had yet to be selected. A promising copper-21 that enduring years of beachfront exposure without blemish, fell apart in weeks when subjected to a theoretical storage vault environment. Engineers had just designed a bat (and guano) exclusive (loose-rubble-filled) cavern chimney, but it was untested; nor were engineers quite certain what other critters might set-up housekeeping in the storage vaults over time or whether they would piss alkali or acid. This is not a facetious remark when one is considering the response of materials to environment to which they are subjected over hundreds, thousands, or tens-of-thousands of years. Further the nuclear plume from two generations of nuclear weapons testing was known to pass beneath Yucca Mountain on its way to Death Valley, but it was as yet uncharacterized. So what comparisons, even theoretical, could be supported for the eventual plume from Yucca Mountain? I have seen no indication that these simple issues have been examined and resolved to this day. Has NRC looked at any of this? It is not evident in the GEIS and it ignores NRC's long-standing advice to its licensees, "Always consult operating experience." NRC must understand that barber chair confidence and affirmation are different than scientifically and technically defensible determinations. Further, how is it ethical or legal for the Commission to pronounce on the outcome of a licensing proceeding (Yucca Mountain) even before it has heard any evidence? (0723-3 [Shadis, Raymond])

Comment: The duping of the citizenry of the State of Nevada as a site to bury for "long term storage" the waste in salt mines has NOT been thoroughly modeled or studied and is basically flawed as a solution. (0755-3 [Calnan, Christopher])

Comment: I believe Yucca mountain to be the optimal place for storage. Storage should be on site for no more than 2 years, with waste then being shipped to Yucca mountain. The world can ill afford another Fukushima catastrophe. (0772-2 [Bogdan, Andrew])

Comment: Yucca Mountain has been determined to lack safety as a ionizing waste repository. The US government put major resources into developing Yucca Mountain to be as safe as possible and finally pulled out of that storage solution when safety was proven impossible. (0823-14 [Michetti, Susan])

Comment: Scientific thinking and analysis requires this decision to be at the top of the scientific decision tree for the safety case. By necessity of survival, safety of life forms and environment are required to be the highest and top value and priority for the decision tree which should open, transparent, and available to the public. Scientific thinking requires the NRC to seriously study the full ramifications of dozens of scientific studies pertaining to Yucca Mountain, including the National Research Council Report noting the "scientific impossibility" of making a container last 10,000 years. Specifically, DOE's own studies show that once containers begin to leak, Yucca Mountain rock is practically useless in holding back radioactive materials. President Obama, a pro-nuclear advocate, ended Yucca Mountain and cut off its funding, based on sufficient scientific evidence that it did not meet the safety criteria as a radioactive storage location. (0823-9 [Michetti, Susan])

Comment: As well, the proposed site of Yucca Mtn. is inadequate, as the mountain is 10% salt water and would erode any metallic housing for waste modules, among many other reasons. (0834-3 [Thabit, Nick])

Comment: The political actions of the past few years have halted NRC and DOE actions on Yucca Mountain. These actions occurred as a clear violation of the Nuclear Waste Policy Act (NWPA), a violation that has compelled the DC Circuit to issue a Writ of Mandamus to the NRC for its illegal halt to the Yucca Mountain licensing review and proceeding. This shutdown has been led by Harry Reid, the Senate Majority Leader and has been quietly condoned by the Obama Administration. The instruments of this halt were principally two Reid and Obama political appointees, the former Secretary of Energy, Stephen Chu and the former NRC Chairman, Greg Jaczko. All these individuals ignored the NWPA and other laws. There is no reason that this sort of mischief might not happen again, if a powerful politician chooses to sabotage a new high level waste program. This sort of political ruination could affect both another repository and a central interim storage facility for spent nuclear fuel. (0859-3 [Haughney, Charles])

Comment: The NRC and DOE fixation on Yucca Mountain is understandable; the nation has invested billions into the facility and the policy choices therein. This is a reality despite the fact that DOE, coupled with oversight by the NRC, has yet to produce a viable plan. Given the variety of alternatives - including such non-Yucca specific ideas as Monitored Retrievable Storage (MRS) and multi-purpose canisters (MPC's) - the Yucca project has been tried and failed multiple times as a solution to the nation's SNF storage problems. (0867-1-20 [Griffin, William])

Comment: In fact, the waste generated at Palisades from 1971 to 2010 may also be excess to Yucca, in that the proposed dump may never open. The State of Nevada maintains that NRC's "Nuclear Waste Confidence Decision" is erroneous, in that it biases NRC to favor the Yucca Mountain dump license lest it be proven wrong in its assurance to the public that a high-level radioactive waste geologic repository will open in the U.S. by 2025. (0919-1-10 [Kamps, Kevin])

Comment: Any waste generated at Palisades after 2010 would be excess to the capacity of the proposed national dump at Yucca Mountain, Nevada according to U.S. Department of Energy projections in its Yucca Mountain Final Environmental Impact Statement (Feb. 2002), as revealed in Tables A-7 and A-8 on pages A-15 and A-16 of Appendix A. (0919-1-9 [Kamps, Kevin])

Comment: DOE stated its preferred alternative was the Yucca dump, and examined the on-site releases of radioactivity no further. Dr. Makhiyani covers this issue in his expert commentary in

this proceeding. (DOE downplayed to the point of ignoring the catastrophic releases of radioactivity that would result if high-level radioactive wastes were actually buried at the Yucca site, the geologic unsuitability of which eventually caught up to itself, resulting in the proposal's cancellation.) (0919-2-12 [Kamps, Kevin])

Comment: Yucca's Final EIS wasn't final, after all, as the resistance to the dangerous plan mounted over time, and as the site's hydrological, geological, seismological, volcanological, etc., risks could no longer be suppressed. (0919-2-19 [Kamps, Kevin])

Comment: The United States does not currently have a national policy for the permanent storage of high-level nuclear waste. The Obama administration has determined that the Yucca Mountain site, which has been mired in bad science and mismanagement, is not an option for geologic storage of nuclear waste. (0927-4 [Kamps, Kevin])

Comment: If irradiated fuel rods are dangerous in pools and dry casks, then why not ship them to the proposed Yucca Mountain site in Nevada for burial? For one thing, Yucca Mountain is not a scientifically suitable site. Yucca Mountain is an active earthquake zone, prone to volcanic activity. Yucca leaks water like a sieve into the aquifer below, the sole source of drinking water for nearby farming communities. If waste were buried there, it would eventually leak into that drinking water, harming people downstream. In addition, shipping many tens of thousands of irradiated fuel casks cross country through 45 states plus Washington, D.C. (according to the U.S. Energy Dept.'s 2002 Final EIS for Yucca Mountain), through major metropolitan areas and America's breadbasket, past the homes of 50 million Americans carries unprecedented risks. The transport containers have been inadequately safety tested, most emergency responders are poorly trained and equipped for dealing with a radiation accident, and the health and economic impacts of a radiation release would be immense. Going forward with Yucca Mountain and such cross country transportation is ill-conceived and would make the nuclear waste dilemma worse, not better. (0929-17 [Kamps, Kevin])

Comment: Why was the storage facility build in Nevada at the cost of billions of tax payers monies that does not contain a single nuclear waste storage container or cask? What are you thinking? Sorry, I did not know that you know how to think!!!! (0985-1 [Von Duvillard, Serge])

54. Out-of-Scope Comments – Opposition to Nuclear Power

Comment: Stop making it. The only solution to the high-level radioactive waste (HLRW) problem is to not generate irradiated nuclear fuel in the first place. Our society's "preferred alternative" to nuclear power and the forever deadly radioactive waste it inevitably generates is efficiency and renewables, such as wind and solar power. As Dr. Arjun Makhijani, President of the Institute for Energy and Environmental Research, showed in his 2007 book Carbon-Free, Nuclear-Free: A Roadmap to U.S. Energy Policy, both fossil fuels and nuclear power can be completely phased out of the U.S. economy by 2040, and replaced by efficiency and renewables, without any further technological breakthroughs required, and for the same percentage of our Gross Domestic Product (GDP) as we currently spend on dirty, dangerous, and expensive fossil fuels and nuclear power. (0002-1 [Commenters, Multiple])

Comment: I am writing you because I am concerned about how we store our most hazardous waste, the radioactive fuel rods from nuclear reactors. We should not license or re-license any reactor until it has been proven that we can successfully isolate this waste. (0003-1 [Commenters, Multiple])

Comment: It's very important to have safety at our nuclear power plants. The Mobile Chernobyl idea is a very poor one and endangers a lot of people. How can you safely store the waste? Fukushima is an example of why nuclear power is a bad idea. (0005-1 [Poulson, Judi])

Comment: I protest most vigorously the idea of the passage of time being any guarantee that safe storage and containment will come along...I respectfully request a moratorium on any new licensure of nuclear power plants until the time when such storage and containment are an actuality, not a figment of a greedy industry's imagination. (0008-2 [Daly, John])

Comment: The only sane choice is to stop making additional nuclear waste. Our society's preferred alternative is efficiency and renewables, such as wind and solar power. (0009-1 [Schwartzberg, Lora])

Comment: [I]t is quite obvious that there is NO SAFE WAY to store or dispose of nuclear materials and wastes. ALL USE OF NUCLEAR POWER AND WEAPONS MUST BE BANNED. there is already more waste than we can ever properly store[.] (0010-1 [Zuckerman, Naomi])

Comment: As a citizen living in the state of Washington which is still contending with the clean up and contamination from the Hanford Nuclear site, I currently have zero confidence in the nuclear industry and how waste is managed. Although the last reactor was shut down in 1987, we are still dealing with clean up and containment of the continuous contamination and various harmful effects from this nuclear waste source. The tax payers have spent about \$2 million a year and counting. The deadline for cleanup/containment has been repeatedly extended and is now set for 2040, so, if the cost remains the same, taxpayers will pay about 27 million for clean up. At every stage of this site's development the public and government were assured of safety and ability to control the waste. They were incorrect. I have very little confidence that we may ever safely store nuclear waste and hope we cease to create this waste in the future. (0011-1 [Follett, Carol])

Comment: No nuclear waste should ever be considered safe. Decommission and shutdown all nuclear reactors immediately. (0012-1 [Swanson, Mark])

Comment: I have no confidence in any means of storage of nuclear waste that are purported to be capable of securely containing plutonium. The toxicity and half life of this substance make it literally and entirely impossible to handle in any convincing manner. Therefore, we should, on grounds of global morality and common sanity, not be producing it. (0014-1 [Bolognini, Franceseca])

Comment: As you reconsider our stance toward nuclear waste, please remember that my husband and I have no confidence in the ability of commercial or governmental entities to handle the waste appropriately over a long period of time. We have not seen any new reason why creating nuclear waste would be safer now. We know that generating energy with nuclear reactors offers an alternative to fossil fuels that harm the planet, but we would rather seek a better way that doesn't create a problem like nuclear waste. (0015-1 [Kemp, James] [Metcalfe-Kemp, Joni])

Comment: Stop making nuclear waste! Solar, wind, efficiency and geothermal are far more reasonable sources of energy than the forever deadly radioactive substances produced by nuclear power. You KNOW carbon and nuclear sources can be completely phased out by 2040, yet continue this crazy pursuit of expensive and dangerous nukes and fossil fuels! See CarbonFreeNuclearFree.org for just one simple solution. Also refer to Jeremy Rifkin's The Third Industrial Revolution and Renewable Energy World trade organization for many other viable

alternatives. Follow cloudy Germany's stellar example for distributed rooftop solar. Refer to Jon Wellinghoff of FERC who said we could easily switch our baseload to renewables in a few years! Check out what Eric Schmidt of Google laid out as an alternative plan. You will still have thousands of years of job security just from the nuclear wastes already present in our country! (0018-1 [Arnason, Deb])

Comment: Nuclear power is inherently unsafe and must be phased out. Its waste, including spent fuel rods, must be stored under the strictest conditions. (0019-1 [Handelsman, Robert])

Comment: From the beginning, until this day, there never has, nor will there ever be, a way to dissolve the waste; therefore, the entire nuclear program is both dangerous and deceitful and I recommend you dispense with your ridiculous "theories" of ways to safely retain and store waste and begin now to tell truth in the production of your conclusions and documents. Unless, and until, there is a way to dispose of it. I recommend you use your knowledge (to include scientific evidence of Chernobyl, TMI, Japan, the unsafe storage) in your documents to assist in ending furtherance of our dilemma of the waste (to include the furtherance of the production of waste via expansion of nuclear plants as in Georgia Plant Vogtle). (0020-2 [Carter, Pat])

Comment: North Carolina is one of the most beautiful states in the US. We moved here to get away from some of the idiocy of Alabama and the fact that business/power interests there were running rampant over the best interests of life and safety. Nuclear power now threatens to overrun common sense in North Carolina as well. PLEASE do not let this happen here. I urge you to consider holding firm on these extremely important points: (1) Stop the making of nuclear waste! Permit NO new nuclear power plants. (0023-1 [Bridges, Martha])

Comment: There is currently NO SAFE STORAGE option for nuclear waste, and there is no safe dose of leaking radiation. KEEP THE COURT'S BAN ON NUCLEAR LICENSING. (0023-11 [Bridges, Martha])

Comment: Spent fuel rods can no longer be routinely stored at nuclear reactor sites. No new nuclear plants should be permitted until a solution to nuclear waste storage is developed. Further, existing nuclear plants now reaching the end of their permitted lives should be decommissioned. (0024-1 [Thomas, Bill])

Comment: Finally, stop creating the waste! Decommission nuclear power plants, weapons facilities, etc. What we are already leaving future generations is enough a crime. (0028-2 [Craig, Anne])

Comment: I am a stakeholder. I don't represent anybody but myself as a mother of my daughter and hoping that she's going to have grandbabies one day that it may or may not be affected by the nuclear-ized water we already have. And now we're creating a situation where we do not have waste confidence because we do not have containment of the waste we already have. And if we ignore that -- and I don't know why the lawyers haven't already gone to the court and said we need more time because the president of Japan has said Fukushima is not contained. (0030-11-2 [Vandel, Niki])

Comment: I am not crazy about nukes. And I'm not confident in the Nuclear Regulatory Commission to site a permanent repository, particularly in this 25 to 30-year time frame. (0030-12-10 [March, Leslie])

Comment: The nuclear cycle is not carbon-free at all. Considering the entire cycle, like Leslie just said, it makes a significant contribution. And we've analyzed that if some of the money

going into the nuclear program were to go into a fast-paced efficiency and renewable program, we could reach a carbon-free scenario much, much quicker. (0030-13-1 [Sondheim, Steven])

Comment: Essentially it's time to stop the nuke con game. Stop producing this waste that we have nowhere to put it. Never guaranteed safety. The plan -- and the public like myself, the average person wants to see a plan where we start decommissioning them, taking the ones off fault lines. Look at Indian Point. Twenty million people in a 50-mile radius that there's no way you can evacuate. (0030-15-11 [Gray, Erica])

Comment: The question that must be answered in a reactor licensing decision is, if you look all the way to the end of the reactor's life, including decommissioning, spent nuclear fuel, or irradiated nuclear fuel storage and disposal, is having that source of electricity -- nuclear power - - worth all of the environmental costs, risks, and impacts that will then inevitably ensue? As soon as NRC licenses a reactor, the generation or creation of spent nuclear fuel, irradiated nuclear fuel, and all of its related costs, risks, and impacts will then follow. (0030-2-1 [Kamps, Kevin])

Comment: The mountain of commercial radioactive waste in the United States is now 56 years high, and we don't even know what to do with the first cupful. Obviously, the only real answer to the high-level radioactive waste problem is to stop making it. (0030-2-4 [Kamps, Kevin])

Comment: Our last three speakers who were from the nuclear industry are telling us that the nuclear power is clean, safe, and cheap, and they forgot to say that it was too cheap to meter. We all know that in reality nuclear power is dirty, dangerous, and expensive. And they're also claiming that nuclear power was a climate change solution, when in fact it's the most dangerous and expensive way we've ever thought of to boil water. They conveniently ignore the front-end energy use of nuclear power and the fuel cycle and the energy needed to babysit the nuclear waste for 200,000 years. So what we really need is a carbon-free and nuclear-free future or we won't have one. (0030-21-1 [Carberry, Mike])

Comment: We don't handle disasters well. Witness Katrina. We did not handle Sandy well. It is always the individual home owner and taxpayer. And in the case of nuclear, your home owner's insurance will not cover you on nuclear disaster. So in terms of what you are doing on behalf of the public and what is safe for them, what is good for them, you must take these things into account. Generic isn't good enough. You need to be spending the bulk of your time on the unimaginable. And as smart as we are; because I heard earlier on the pat on the back for we're smarter now than we were 50 or 60 years ago, we're not as smart as we will be 100 years from now, if we still exist. Actually, I think I'd prefer to be done by global warming, because a nuclear disaster will be so catastrophic and I don't think any of the folks from the nuclear power industry are going to be out there helping us dig out of the rubble for those who survive it. It is just inconceivable, inconceivable that you don't plan on the riskiest. I don't care if it's a -- as long as there's any risk whatsoever, consider that that might be what happens and the fact that you won't be able to control it. (0030-22-5 [Headington, Maureen])

Comment: So if you really want to have confidence, if you want people to have confidence in your rulemaking, in the ability of the NRC to contain, safely contain this radioactive debris -- well, not debris, but could potentially be debris through all of the transport, the storage, whatever -- I don't have that confidence. And I'm sorry, but this is why I can't really believe that nuclear power has a future, because there's too grave a danger. And the monetary consequences of a major disaster are too incredible to even contemplate. (0030-24-3 [Nelson, Dennis])

Comment: We don't need to make it [nuclear waste] anymore to generate electricity. Solar energy, wind power, energy efficiency, they all relegate nuclear power to a dead end and a historical mistake that future generations will already pay for until the basically end of time. We need to stop making any more radioactive waste. I realize that may be beyond the scope of this particular Waste Confidence rule, but I think it needs to be stated. (0030-5-2 [Safer, Don])

Comment: I'm just going to close by saying we just need to stop making more radioactive waste, and the Nuclear Regulatory Commission should start decommissioning every one of these reactors. There is not enough money to decommission them anyway at this point, and we need to stop making more radioactive waste. (0030-5-6 [Safer, Don])

Comment: The NRC has an opportunity right now to do the right thing, which is to admit the real long-term dangers and the immediate potential dangers from irradiated nuclear fuel, to stop making things worse by maintaining the moratorium on new licensing and license extensions, and to require protection of current and future generations. (0030-8-5 [D'Arrigo, Diane])

Comment: Given that there is no way to safely store radioactive waste, it is essential to avoid creating it in the first place. For that reason I urge you to permanently cease licensing new nuclear reactors and to permanently shut down the reactors currently operating in the United States. (0031-1 [Greene, Linda])

Comment: Nuclear power is under-regulated and dangerous and the risks to public health too high. It's too expensive for the US tax payer with hidden and implicit subsidies for uranium mining, radiation leak clean-up, insurance, subsidized financing, and decommissioning. There is no safe disposal method or even safe dump. Nuclear energy should be discouraged and more closely regulated. (0032-1 [Hatfield, Barry])

Comment: The only way to ensure that nuclear waste won't escape and cause mass environmental destruction is to not make it in the first place. Using existing clean technology, America can produce ALL the energy we need without generating nuclear waste. And, clean energy is cost effective. We must use the best technology available to safely enclose current nuclear waste. Don't generate more of a problem that we already have. No one knows what the weather, including seismic activity and violent storms, will be in the future. Nor can we control future generations. Remember the half life of plutonium. Nuclear energy isn't a risk worth taking. America deserves better. (0033-1 [Cobb, Sandra])

Comment: First of all, high-level waste would not be produced if we switched to renewable sources of power such as wind or solar which would cost no more than what we pay of our GDP for fossil fuels and nuclear. Nuclear power is the most expensive source of power, and insurance companies will not even insure nuclear power plants because of the likely catastrophic consequences. (0035-1 [Fulton, Doris])

Comment: I don't mind dying in my lifetime. But, the lifetime of nuclear plants? Questionable. So, tear 'em down! (0037-1 [Zidbeck, George])

Comment: No more nukes! Hanford's pollution did enough to us. (0038-1 [Scheller, April])

Comment: I am writing you because I am concerned about how we store our most hazardous waste, the radioactive fuel rods from nuclear reactors. We should not license or re-license any reactor until it has been proven that we can successfully isolate this waste. (0039-4 [Littlejohn, Nick])

Comment: I, my children, and my grandchildren need to tell you what you should know in the wake of Fukushima. Let's have NO MORE DEVELOPMENT OF NUCLEAR ENERGY in our future. We as humans should know better at this point. (0040-1 [Raynier, Kathleen])

Comment: I and my wife have long been steadfast opponents of nuclear power due to its long-term dangers to environment and humanity. To locate nuclear waste near the great lakes is to court disaster. (0044-1 [Talbot, J])

Comment: We don't believe that the NRC should be issuing any new licenses in view of the confidence issue, and a number of other issues as well, which I understand it's really not appropriate for me to go into this evening. (0045-1-3 [English, Becky])

Comment: Sierra Club, in case some of you may not be aware, is opposed to nuclear power in general, as we are also opposed to other non-sustainable forms of energy, such as fossil fuels. So my particular expertise in our chapter is working on that transition to clean renewable energies, and energy efficiencies in order to meet our needs. (0045-1-4 [English, Becky])

Comment: Nuclear energy is extremely expensive, prohibitively so. Without significant public subsidies it is too expensive to continue. Taxpayers shouldn't be expected to pick up the tab for dirty and dangerous energy production when clean renewable energy resources are far cheaper, safer, reliable, and available. (0045-10-1 [Navrkal, Alisa])

Comment: If a cloudy country like Germany can shut down its nuclear power stations and be powered by 50 percent renewable energy at times during this past year, the United States can, too. For the sake of our children and our future generations, it's time to transition beyond dirty and dangerous energy sources to a clean renewable energy future. (0045-10-2 [Navrkal, Alisa])

Comment: [T]he nuclear industry in Colorado [has] messed this up and cost us a lot of money, money that is not included in the cost per kilowatt hour for nuclear power when it said that nuclear power can provide power cheaper than renewable sources like wind and solar. (0045-12-1 [Kinsey, Bob])

Comment: [T]he [nuclear] industry is fully and irretrievably flawed, undeniably linked to weapons proliferation, and not capable of being operated safely, or even sanely, given the extreme catastrophic consequences to human health and the environment that could occur. And in many cases, already have occurred. I was born when President Truman was handed the keys to the nuclear bomb, within the days of that incident. For my entire life, ever since, the Government has been promising the benefits of nuclear technology, but all we really have to show is a legacy of broken and false promises. Plus, the reality of the dangers while laying all the problems of waste from this nuclear age on our children. When I grew up in Kansas in the 1950s, the AEC was planning a nuclear waste disposal repository in the Kansas salt mines. That never happened, nor has anything happened since, to solve the waste issue. (0045-6-1 [Andrews, Richard])

Comment: Finally, to discontinue any new licensing, or license renewals of any nuclear generating plant or facility, including all states of the fuel cycle. In other words, stop permitting waste generation. Better yet, withdraw all the current licenses, and totally focus on repository disposal. (0045-6-8 [Andrews, Richard])

Comment: [T]he Green Party, as a stance, we do not agree with nuclear power, but we disavow all nonrenewable energies in favor of renewable energies and we do understand that in

the interim there is a place for nonrenewable energies to maintain a steady energy grid, but long term we need to be thinking about phasing out these dangerous technologies in favor of more green technologies that can supply effective fuel sources. (0045-8-1 [Bartlett, Bill])

Comment: So the goal, more renewable energies, less nonrenewable poisonous energies. Let's not have a plastic island that's radioactive in the ocean, let's have more renewables. (0045-8-7 [Bartlett, Bill])

Comment: The projections here say they're trying to prepare for the 20 percent of energy that we use as nuclear energy now, into the future. But as a Green, I'd like to see us projecting less than 20 percent into the future while we prepare for that 20 percent. I won't take up anymore of your time. I appreciate everybody's hard work on this issue, because we are all relying on you to keep us safe on this. (0045-8-8 [Bartlett, Bill])

Comment: As an American who has lived comfortably and affordably in an entirely solar-electricity-powered and passively solar-heated home (in South Dakota!) for more than 5 years, I find it difficult to understand the reasoning of those who insist that nuclear power is a necessary part of our country's energy mix. Renewable energy technologies have now reached a level of maturity and reliability where we can move beyond the enormous problems associated with both fossil-fuel and nuclear power generation. Removal of the subsidies for these older technologies, thus leveling the playing field, will lead to a rapid transition to a much more sustainable future. A variety of careful scientific studies have shown that such a future is possible, given an appropriate level of political will and leadership. (0046-1 [Kelley, Don])

Comment: We must stop using nuclear plants because they are dangerous, leak, and are enormously expensive. We must increase SOLAR. IKEA is even selling solar now! Wind and the electricity generated from cattle manure is also good. But SOLAR is the very best. Stop doing all nuclear now. (0049-1 [Dolph, Ivar] [Dolph, Phyllis])

Comment: I AGREE TO THE SIERRA CLUB'S VISION ON THIS SUBJECT BUT LET US ALL REMEMBER!!! NUCLEAR WASTE GETS EVERYONE AND EVERYTHING SICK, A BAD SICK THAT BURNS INTERNALLY THAT NO ONE DESERVES. A TIME OF CHANGE IS HERE NOW! IGNORANCE IS WHAT WE ALL CAN'T AFFORD ANYMORE! TO LET NUCLEAR WASTE LEACH INTO AMERICA'S BLOOD STREAMS IS SICK IN ITSELF! DON'T BE WRITTEN THAT YOU DROPPED THE BALL. THERE IS ALOT OF GENIUS MINDS ALL AROUND THE WORLD AND THE ANSWERS DO EXIST. JUST PUT THE CALL OUT. WE ARE HERE TO HELP OURSELVES. SO LEAD ON. (0051-1 [Freund, Tim])

Comment: Measuring the risk of catastrophic failure of radioactive storage in cannot be done meaningfully in financial units. This type of measurement of this kind of outcome misses many of the detrimental and binding long term interrelated environmental problems that will continue to imperil our species and our planet for many millennia. When meaningful, the equivalent monetary value of of a single species' benefit to our ecosystem is often surprisingly large, such as that of the honeybee (for pollination) or the common brown bat (insect control). It should become obvious to observers of the overall "big picture" that the inherent risks and rising costs of nuclear-generated power are more than reason enough to stop making nuclear waste, and immediately put our resources into enhancing efficiency and rapid development of renewable sources of energy. (0052-2 [Tietjen, Jamie])

Comment: Production of nuclear power, it's use and it's waste are all unsafe. (0054-1 [Kurland, Miriam])

Comment: Instead of making the world safer for the next 7 generations, we are leaving radioactive toxicity for the next 7000 generations! To paraphrase Another Mother for Peace, "Nuclear power is not healthy for children and other living things." The only reason we have nuclear power is government subsidy, because it is more costly (and dangerous) than other power, both green and polluting. (0055-1 [Fast, Wendy])

Comment: I am writing you because I am concerned about nuclear plants and nuclear waste. Unfortunately, I have had personal experience with this particular issue. I lived near Hanford Nuclear plant when I was young. It wasn't safe. I don't think these plants can be safe. My family is left with health problems resulting from having lived in the area. We are basically viewed as collateral damage or something. Nothing is done. Years go by. We pay the price and those who created and released the material that harmed us are allowed to just ignore what they have done, now leaving cleanup to be paid for mostly by taxpayers. We don't really have a good, safe way to dispose of radioactive material. Transporting it is dangerous. Storing it is dangerous. Frankly, we need to stop refining and using these materials. More than enough damage and waste has already been created. (0058-1 [Turnbow, Lisa M.])

Comment: the entire nuclear technology and industry was fatally and irretrievably flawed, inseparably linked to weapons proliferation, and not capable of being operated safely or even sanely given the extreme catastrophic consequences to human health and the environment. (0059-1 [Andrews, Richard])

Comment: I call on the NRC to act immediately: Require all reactors to harden structures housing spent fuel pools since at a minimum SNF will have to stay in them for about five years for primary cooling. Move quickly to remove all possible spent fuel from cooling pools and into hardened dry casks of small enough size for transport and Remove all dry casks to ISFSI facilities away from populated areas of our country in dispersed arrays to make them less vulnerable to terrorists attacks, and reducing the consequences if attacked, and to discontinue any new licenses or license renewals of any nuclear waste generating plant or facility, including all stages of the fuel cycle. In other words stop permitting nuclear waste generation. Better yet, withdraw all current licenses. (0059-11 [Andrews, Richard])

Comment: Please do what is healthiest and best for all the people of America & the world. Looking at previous of history Rocky Flats, Chernobyl, Fukushima, etc., I don't have any faith that this can become a viable, clean energy source. Please focus on renewable, safe, healthy energy options. We are smart people. We could do this easily,.... IF the money & regulation flowed that way instead of into big business pockets. Your agency has the power to begin this change from focus on profit to what's truly best for ALL of us. BUT,will you? Please. (0062-1 [Clendening, Tommie])

Comment: No More Fukushimas urges the Nuclear Regulatory Commission (NRC) to continue the moratorium on licensing and relicensing commercial nuclear power plants until safe and permanent high-level nuclear waste disposal is available (assuming a safe solution is attainable). (0064-1 [Skud, Bruce])

Comment: At this juncture, the most logical and immediate way to begin to effectively address the spent fuel problem is to limit the generation of new spent fuel by stopping the licensing and relicensing of nuclear plants. A moratorium would ultimately end production of spent fuel at all nuclear reactors as plant operating licenses lapse. Obviously, the US would still need to address spent fuel that has already accumulated as well as spent fuel that will be generated from licensed plants. (0064-7 [Skud, Bruce])

Comment: Do you still claim nuclear power is safe? Ask the (mostly Native) Americans that are suffering from disease where uranium is mined. You thought serious accidents would never happen at nuclear power plants. Turns out they happen every 7-10 years. What power source requires such a large supply of water, which is getting in short supply as the earth continues to warm. What power source depends on electricity to keep massive disaster at bay? Only nuclear power. Let's end the use of this deadly 20th Century technology, and embrace the far cheaper (consider the cost of safeguarding the waste for 1,000,000 years) and safer wind, geothermal and solar energy sources. (0065-3 [Payne, Gail])

Comment: Each year, more long-lasting nuclear waste is created which directly impacts future generations of humans and living creatures on our planet. It is imperative that a plan be put into place and adhered to immediately to regulate and dispose of ALL nuclear waste to ensure life continues. (0067-1 [Parrish, Dave])

Comment: There is more than a bit of hubris in thinking that we can safely create and store nuclear waste that has a dangerous half-life that is twice as long as man's recorded history! Experience alone should encourage a changed approach to the pursuit of all technologies that generate dangerous waste and require such security and prolonged maintenance. (0069-1 [Spangenberg, Samuel])

Comment: We need less nuclear energy and more solar energy, energy made from our waste from landfills, sewers, farming operations, oil products from restaurants, and more. Biodiesel made from materials derived from research done at UTK, Oak Ridge, TN, and perhaps other areas, could really be key to the national energy future! However, before we can go forward, we need many more nonelitist, strongly-adversarial-to-rightwingers, pro-farming, rural areas and environment NewDEAL democrats to help in these and other areas of need. But we need much more investments in clean energy, biodiesel, etc, to help expand our clean energy horizons! We need companies, etc, to take some steps forward, and not allow clean energy or the energy economy to stagnate, and decline, when it could be prospering and accelerating to a better tomorrow! (0074-2 [Rowlett, Kimberly])

Comment: New rules, yes! Rules that require proven waste isolation methods before the licensing or relicensing of any reactor. (0075-3 [Hill, Barbara])

Comment: I am writing you because I am concerned that there is NO WAY to safely store, the radioactive fuel rods from nuclear reactors. We should not license or re-license any reactor ever again. We should decommission all nuclear reactors. Never ever have one operating in this world. They are not safe and there is no place to put the unsafe waste. One earth one people. (0077-1 [LeCour, Melinda])

Comment: My 6th grade science book sang the praises of nuclear energy, stating that in the nuclear powered future, we would have free, non-metered energy. In college, I witnessed 3 Mile Island and learned that there is no safe low level of nuclear radiation exposure due to potential recessive genetic damage. Since then, Chernobyl and Fukushima and the discovery that Yucca Mountain is not geologically stable have driven home the point that the environmental costs of fission far outweigh the benefits. The waste storage problem has always been ignored by dishonest economists and industry insiders who suffer from the hubris of deeming nuclear waste as an externality. One can not put out a fire by giving it more fuel. First do no more harm. (0078-1 [Mock, Neal])

Comment: First, do no more harm by initiating a moratorium on nuclear licenses and extensions. (0078-2 [Mock, Neal])

Comment: Once nuclear contamination extends beyond the containers designed to hold it there is no way of getting that contaminated waste back, and away from areas of environmental concern. Nuclear power should not be given the green light anymore. It is perhaps even more detrimental to the environment than are the CO2 emissions from power plants. Nuclear contamination does not eventually lose its toxicity until many years, and several generations or more, and by that time it has exacted enormous physiological, and biological damage to both humans, and the life forms that come in contact with it. There is not safe "forever" design for nuclear waste, and the best alternative is to eliminate it from the arsenal of potential energy systems. (0081-1 [Balgemann, Dennis])

Comment: There should be NO relicensing of nuclear facilities until there is a solution to nuclear waste storage, and that does not mean foisting it on Native American tribes or rural communities. PERIOD. (0082-1 [Long, Marcie])

Comment: What can I say about nuclear waste leaking at a site that is next to one of the biggest river systems on our continent? Are you insane? We have alternatives NOW that can replace coal and nuclear energy, so what is the holdup? Could it be giant piles of money to match the giant piles of coal and nuclear waste that are destroying this planet? (0082-2 [Long, Marcie])

Comment: There is no safe way to store nuclear waste, no containers, pools or indefinite storage sites that will prevent leaks for the hundreds of thousands of years it remains dangerous and deadly. The extreme danger lasts too far into the future to be certain of how to responsibly and safely deal with it then. The only solution to the problem of storing high-level radioactive waste is to not generate irradiated nuclear fuel in the first place. Historically it has proven to be too dangerous and uncontrollable, and the consequences of human error and natural disasters jeopardize life all over the Earth via buried waste leaking into ground water, dumping it in the ocean or releasing it into the air which circulates all around the globe. The NRC must address what to do with existing nuclear waste before licensing or relicensing any new or currently operating reactors, and you have no viable safe solutions, so stop licensing reactors and generating more hazardous radioactive waste. (0083-1 [Davis, Shelle])

Comment: I strongly urge you realize that high level nuclear waste cannot now be stored safely and not to approve new or renewal storage license requests. (0086-1 [Lewis, Carol])

Comment: I live within a 50 mile radius of the Vermont Yankee nuclear plant. I am very happy that it is going to cease operations soon, but knowing that the spent fuel from that reactor is planned to remain there means to me that the threat of nuclear disaster remains fully present. We don't need any additional nuclear waste while we can't deal with what we already have in a manner that is truly safe, safe not just for a decade, but for a century. (0086-6 [Lewis, Carol])

Comment: We have mortgaged future generations (as in my grandchildren and yours, and we can add an uncountable number of greats the the grandchildren and the rods are still killers). This makes no sense. To make matters even worse, the financial cost of nuclear power is so high that it is not viable without huge government subsidy. Stop the government funding, stop the expense, and stop the unconscionable danger. (0088-2 [Fast, Wendy])

Comment: Yet NRC arrogantly claims it is "confident" that what has happened at 3 reactors in Japan due to loss of power, loss of cooling capability and hydrogen explosions could NEVER happen here in reactors of nearly identical age and design. And because they think it could never happen, they do not consider the consequences of which Alvarez warns. This is faith-based science. We should not be creating any more highly irradiated nuclear waste until REAL science comes up with a solution. If they are so confident that a solution is at hand, NRC should put its money where its mouth is, shut down all reactors, stop making more waste, take care of the waste already manufactured by putting it in transportable dry casks, and suspend all new and recently renewed operating licenses until the final waste solution is built and in place, and the existing waste safely stored there. (0089-1 [Shaw, Sally])

Comment: This issue should have been addressed decades ago. Just dumping radioactive material at sea or into a hole in the ground is not a solution to the growing problem. The rocket ship into the sun suggestion for getting rid of nuclear waste isn't viable either. Get serious and take care of this problem now. Begin by decommissioning old and risky reactors at once and do not build new reactors. Do not create even more waste while we are trying to figure out what to do with what already exists. The "swords into plowshares" program was not well thought out. It was always assumed that some day somebody would figure out something to solve the problem and now sixty plus years later, we must. (0090-1 [Stonecipher, Carolyn])

Comment: Clearly the accident at Fukushima and 3 mile Island and other risky plants have proven that Nuclear energy is TOO risky and NOT worth the extremely deadly waste it produces! It is preposterous to me that we still consider this means of energy when we are facing such dire threats from carbon emissions! Retiring Nuclear and Coal powered plants must be done to ensure the very health and future of this country and the world. Millions die every year due to pollution by these fossil fuels and the effects of radiation span generations! (0092-2 [Scharin, Lisa])

Comment: This is a major problem...long-term storage of nuclear waste. Is that even a phrase that can go together and truly make sense? No! There is no long-term storage solution for radioactive waste because at one point and time or another, the "container" will no longer do its job and leak or break down. Therefore, I call for a move against nuclear waste and support for sustainable, unarmful energy production. Otherwise, we are only making more of a problem for future generations. Nuclear energy is not any sort of plausible solution for our nation's energy needs. (0099-1 [Dupiche, Sharon])

Comment: [T]he [radioactive fuel rods] remain toxic for hundreds of years. This is an on-going issue and the solution will require serious consideration and, perhaps, bold action. Moving away from nuclear energy seems the best solution. America must move toward environmentally friendlier, sustainable forms of energy. With your leadership, may we help direct the rest of the world toward that goal. (0103-1 [Thornlow, Ann])

Comment: Now is the time to put 'new energies' in place. Nikola Tesla's "free energy" technology has resulted in a simple, small machine: non-polluting and continuously renewing--drawing unlimited electrum from the atmosphere. One machine can provide a whole community with all the free energy needed. This means NO more utility bills, NO more pollutants, NO more cancer-causing by-products. Natural disasters are unleashing the toxic by-products of our archaic energy systems! This technology has been available for decades. If not now, when? (0104-1 [Rousseau, Barbara])

Comment: For an efficient economy, please recommend and use safe and sustainable energy. (0107-1 [Popa, Jeni])

Comment: There is no one who can tell you what to do with any nuclear waste. This is not just something I say, this is what experts in nuclear energy say. The closest we've come is to telling someone that putting it underneath the Nevada desert is safe. And I ask: For how many years? Please reconsider every assumption. Don't look at it from the standpoint of the folks wanting to promote nuclear waste (and the money involved). Look at it from the standpoint of your son or daughter's baby being exposed to a toxic dose of nuclear energy (during a meltdown). We have a moral duty to reject nuclear energy and the risks associated with it. (0109-1 [Sovereign, David])

Comment: On behalf of public safety, we [No More Fukushimas] urge the NRC to continue the moratorium on licensing and relicensing of nuclear plants until a safe, national disposal site is up and running. (0112-10-1 [Skud, Bruce])

Comment: At this juncture the only logical way to begin to effectively address the spent fuel problem is to limit the generation of new spent fuel by stopping the licensing and relicensing of nuclear plants. A moratorium would ultimately end production of spent fuel as operating licenses lapse. Obviously, the U.S. should still need to address -- would still need to address spent fuel that has already been accumulated. (0112-10-5 [Skud, Bruce])

Comment: The nuclear industry promised cheap, safe electricity from reactors which would operate for 40 years during which time its hellishly, God-awful waste would be safely removed. The industry has delivered on none of that. Instead leaving its, bleep, waste scattered across the country. A gift to accompany increased cancer rates for yet unborn generations. (0112-11-6 [Agnew, David])

Comment: You have allowed the owners to operate with insufficient funds to properly decommission their, bleep, cancer factories until such time as the financial climate may allow it. The NRC colludes with the industry to enable all of this and for what? For industry profits and little else. We don't need nuclear power. It is completely unnecessary in Massachusetts. And the nation can convert to renewable energy for the same money now spent on nuclear and fossil fuels. (0112-11-7 [Agnew, David])

Comment: We are seven decades into too cheap to meter and no one knows what to do with the industry's toxic waste. Whether the problem is NIMBY or scientific, the result is the same. No one knows what to do with the industry's bleep toxic waste. (0112-11-9 [Agnew, David])

Comment: We should not be creating any more highly irradiated nuclear waste until real science comes up with a solution. If they are so confident, the NRC should put its money where its mouth is and require all new and recently renewed operating licenses to be put on hold and shut the reactors down until the nuke waste solution that they have been saying is just around the corner for the past 30, 40 years is built and in place. (0112-18-2 [Shaw, Sally])

Comment: But believe me, a nuclear accident will occur somewhere and this is wrong. Unless we can guarantee that there will never be an accident again, we have to shut all these reactors down and for renewables. (0112-22-3 [Nestel, Hattie])

Comment: Confidence, give me a break. For the good of humanity we have got to stop this somehow. (0112-22-5 [Nestel, Hattie])

Comment: I just get so tired of hearing people say that nuclear power is clean. And I just want to say that we learned with the environmental movement that good science means when you're talking about fuel of energy production you have to look at the whole life cycle. You have to look at mining, you have to look at when you make the energy, and you have to look at how you deal with waste. So, I mean, look at coal. We're all up in arms about coal because of all the strip mining and what do we do to clean the air after it makes the energy? The same thing has to go for nuclear. There is just nothing clean or green about it. We all should have learned something about this lesson as children, though, I want to say. And I'm a mother and I'm going to sound like one. If you play, you have to clean up after yourself. And if you do not, you get your toys taken away. That's the way it goes. (0112-24-1 [Darling, Ann])

Comment: My name is Karen Silkwood and so is the name of everybody else in this room who spoke against nuclear power tonight. And just remember what they did to her. They being the NRC, our U.S.A. government, and everybody who owns the nuclear power plants. (0112-30-1 [Parks, Sheila])

Comment: So for me who -- I spent a lot of years working against nuclear weapons and now I'm back here on nuclear power, all nuclear power plants are crimes against humanity. Crimes against the flowers, the birds, the trees, the animals. Crimes against our planet Earth. (0112-30-4 [Parks, Sheila])

Comment: I support redesigning the entire legal basis for the NRC's regulatory enforcement: [including] closing aging reactors.... (0112-31-7 [Johanson, Birgit])

Comment: No nuclear plant is safe. We had a major problem at mile -- Three-Mile Island. Russia had a major disaster at Chernobyl. Now Japan with G.E. Technology has a two and a half year old lethal nuclear problem. They do not have -- which they do not have technical or financial resources to deal with. We have no time to waste if we want human, animal, and plant life to survive. Please decommission all nuclear plants. Finance the best scientists and engineers to explore safe ways to do this. Finance the best people to research and develop renewable energy, solar and wind. I believe the U.S. should follow Germany's example in how to move forward in this direction. (0112-33-1 [Sullivan, Cornelia])

Comment: Passing this problem off to the next generation once again is clearly not acceptable and it's the reason that we're all here. We must have a viable solution to -- before relicensing is done and/or we start any new plants. (0112-5-10 [Bogen, Doug])

Comment: Both of these organizations [Women's International League for Peace and Freedom, Mass Peace Action] have long opposed nuclear power plants. We are pleased that the Vermont Yankee Plant owners have decided to phase out this plant and we hope that a similar action will take place at the Plymouth, Massachusetts plant in the near future. (0112-6-1 [Wrenn, Nancy])

Comment: We [Women's International League for Peace and Freedom, Mass Peace Action] concur that the nation has a very serious challenge in protecting the environment surrounding these plants and the many other aging plants in the country from hazards associated with storage of nuclear waste. We are aware of the continuing pollution from the Fukushima plant in Japan and the apparent impossibility of containing it. We urge that as soon as possible all U.S. nuclear power plants be phased out in favor of renewable wind and solar sources of energy. (0112-6-2 [Wrenn, Nancy])

Comment: The NRC and the Nuclear Power Industry have us caught between a rock and hard place. We urge that these plants be phased out. (0112-6-6 [Wrenn, Nancy])

Comment: We have a problem. We have a problem in terms of climate change and we have a problem in terms of nuclear power. Nuclear power is unnecessary. I don't consider it a clean energy source because -- oh, that was a nice - clean-air electricity. That was great. I'd never heard that before. Thank you. I'll get to look that up when I go home tonight. That's a new acronym, clean-air electricity. (0112-8-6 [Sachs, Gary])

Comment: I am not happy with Nuclear Regulation Commissinor, Fracking gas land industry and Coal Industry, which causes major problems for health and global warning. I am urging all NRC, LNG, Whitehouse and US Government to shut down all nuclear power plants, nuclear factories, tracking gasland stations and Coal Industries because they all have same issue. People living or working in nuclear, tracking or coal zone sare containmated and dangerously exposes by chemical and radiation. Radiation covers entire New York State, portions of Connecticut and New Jersey. (0114-1 [Endo, Yuki])

Comment: Please SHUT DOWN NUCLEAR/COAL/FRACKING INDUSTRY. All these industries destroy beautiful view of NY and all other States. (0114-3 [Endo, Yuki])

Comment: Both of these organizations [Women's International League for Peace and Freedom, Mass Peace Action] have long opposed nuclear power plants. We are pleased that the Vermont Yankee plant owners have decided to phase out this plant and we hope that a similar action will take place at the Plymouth, Mass. plant in the near future. (0116-1 [Wrenn, Nancy])

Comment: We concur that the nation has a very serious challenge in protecting the environment surrounding these plants and the many other aging plants in the country from hazards associated with storage of nuclear waste. We are aware of the continuing pollution from the Fukushima plant in Japan and the apparent impossibility of containing it. We urge that as soon as possible, all U.S nuclear power plants be phased out in favor of renewable, wind and solar sources of energy. (0116-2 [Wrenn, Nancy])

Comment: NRC and the nuclear power industry are thus caught between "a rock and a hard place" for which there is no good solution but to stop any future production of nuclear waste. (0116-6 [Wrenn, Nancy])

Comment: I am also sure that no one working for NRC wants to have an emergency phone call telling them that they and their families have to pack up and flee immediately from where they live, even if it means becoming homeless, and if they survive, seeing arial photographs of where they used to live, now reduced to a series of ghost towns. This is not an outline for a plot of a grade B horror movie. This is the reality of what has already happened, and if we don't have the courage to act now, it will happen again. (0117-2 [Amram, David])

Comment: I know that an ecological catastrophe forcing millions to flee permanently from their homes and others not so fortunate who cannot escape in time and are left to die of various cancers due to radiation poisoning is BAD FOR BUSINESS!!! Since millions of dead people are no longer able to be customers, it might be more cost effective in the long run for those who are responsible for the storage of the lethal material which can kill us all [to] deal with the problem in a sane and sensible way, that will assure the safety of the millions of people who have no desire to become casualties of a nuclear disaster. No amount of lawsuits or gracious letters of

sympathy can ever undo the tragedies of Three Mile Island, Chernobyl and Fukushima. The NRC has the chance today to avoid another one in our back yard. (0117-3 [Amram, David])

Comment: I oppose any expansion of Nuclear waste facilities. I oppose Nuclear power and ask for Indian Point and all other Nuclear plants to be closed. They are too much of a National security risk and pose to much of a safety threat. (0124-1 [Wieder, Dr. Robin])

Comment: Obviously, nuclear energy is always unsafe and life threatening, to all species, including food crops. It involves use of radioactive materials that even in the best case scenario remain radioactive and dangerous for hundreds of thousands of years. (0125-2 [Kidney, Barbara A.])

Comment: Additionally, nuclear plants are always subject to accident, earthquakes and terrorist attacks. Obviously they are extremely dangerous and extremely foolish. Only the sad fact that a few people are allowed to make large sums of money from them keeps them operating. If our society weren't allowing this, there would be no motivation for any sane person to choose to perpetuate nuclear energy. (0125-5 [Kidney, Barbara A.])

Comment: Fukushima's reactor 4 has me very, very much on edge, where I will stay until the problem is resolved, one way or the other. I simply do not understand how any one industry is allowed to gamble with the health of the entire planet; it seems inconceivable. How do we explain that to our children? (0126-4 [Houston, Ann E.])

Comment: I expect you to regulate, not cater to the financial needs of this industry that is literally killing life on the planet through cancer. Other sources of energy that do not pollute for billions of years exist and should be substituted. As Dr. Arjun Makhijani, President of the Institute for Energy and Environmental Research, showed in his 2007 book *Carbon-Free, Nuclear-Free: A Roadmap to U.S. Energy Policy*, both fossil fuels and nuclear power can be completely phased out of the U.S. economy by 2040, and replaced by efficiency and renewables, without any further technological breakthroughs required, and for the same percentage of our Gross Domestic Product (GDP) as we currently spend on dirty, dangerous, and expensive fossil fuels and nuclear power. (0127-5 [Lee, Catherine])

Comment: As a voting citizen in NC, and near an existing nuclear plant, I am urging you to stop making nuclear wastes. We have more and are slowly creating more CLEAN renewable sources of electricity. We need to stop taking chances in creating storage facilities that will leak and have even more accidents. NRC is ignoring the real risks of spent fuel. Other countries are increasing the use of solar and wind. Please do the same. (0128-1 [Wood, Keely])

Comment: Fukushima is so frightening that it's a wonder people are still pro nuclear! With no solution in sight, the world watches to see if their worst fears will be realized! Where are we going to store our spent fuel rods? Not in my backyard! (0129-1 [Cunningham, William and Barbara])

Comment: As long as Fukushima is grappling with their already worst case scenario, we should not build or renew leases at our own facilities. Nuclear supporters claim we are safe and nothing will happen here in the US. We need to decide how to deal with all the rods now stored in the facilities. How many is too many? We're walking a fine line here. Hopefully you will not cave in to pressure from pro nuclear activists and will enforce laws already in place and make stricter ones to keep us all safe. Global warming is already threatening our planet. We have a lot

of work ahead of us. Please help make our earth sustainable for future generations. (0129-3 [Cunningham, William and Barbara])

Comment: I'm writing because I'm really worried about nuclear waste, and I don't think we should be encouraging nuclear energy till after this problem has been solved. If it ever is solved. It seems to me that touted solutions are untried, and that no-one wants to accommodate the waste and we should stop pretending that that will be a solution at some stage. This is terribly dangerous stuff, and we shouldn't be keeping it in temporary storage either. (0132-1 [Karson, Ann])

Comment: Let's find alternative ways to meet our energy needs that are neither fossil-fuel based or nuclear. And while we wait for alternative ways to be more adequately developed, let's at least not aggravate the nuclear situation. Please let's stop making nuclear waste. (0132-2 [Karson, Ann])

Comment: The Draft Generic Environmental Impact Statement is ERRONEOUS in stating a storage solution can be found in the next 60 years, give or take a few decades! ACTS of GOD and other Fukushima's will occur. But don't invite them into OUR planet! Let's act like global leaders and quit the nukes! (0133-3 [Sunflower, Susan])

Comment: The impossibility of getting rid of nuclear waste makes it unethical to continue creating it, as we are burdening future generations with it, many thousands of generations into the future. As long as it continues to be created, and thus has need of being stored, the communities in which it is stored will suffer negative consequences. Sending such waste to poor, rural communities is akin to social injustice in more recognized forms. Please, for the sake of our communities, our environment, and our progeny, do not allow it to be stored here anymore. (0134-1 [Johnston, Josiah])

Comment: The knowledge about the dangers of nuclear waste was available in the nineteen-forties. Back then the science teacher in Highland NY High School, John Gaffney, described how cancer was caused by nuclear radiation. Energy companies wanted to build a nuclear power plant on Black Creek near Highland NY, but the high school science teacher convinced the local population that it was too dangerous for the area, because of the radiation. So the energy companies went down the Hudson to Peekskill whose science teacher was not quite so astute (or perhaps he wasn't listened to). Those board members and officials in Peekskill were more influenced by money and promises, so today we can see what the nuclear waste problem truly is. Other people with dollar signs in their eyes discovered that you could turn nuclear waste into depleted uranium and make it into weapons and use it in Iraq. The children in Iraq suffer from the lack of vision of those who would push nuclear energy as safe environmentally. How could any humane and ethical person make weapons to destroy children (or anybody else)? SUGGESTION: Some have suggested that USA could put the waste back where they took the uranium out. I don't think we should, but the US government could do a health study on how local populations and miners are affected by the mining of uranium. Perhaps such a study would be exploiting the Native Americans again, with the profit going to the corporations. But such a study might emphasize the problems with nuclear waste. (0135-1 [Cypser, Betty])

Comment: If there is no real plan and no real solution, then we should not make any more. Anything less would seem self-destructive and a shameful legacy for our grandchildren and their grandchildren. (0136-11 [Shaw, Gary])

Comment: The US should stop generating nuclear waste since no scientifically proven solution. (0139-3 [Hodik, Barbara J.]

Comment: Nuclear fuel should not be produced on this continent, let alone stored. It's NOT safe, it never was safe, and it's never going to be safe. I don't understand how any nuclear plant anywhere on Earth could be allowed to operate in the 2 1/2 years since Fukushima. What is the plan to safely deal with that? You have all these regulations and guidelines, how are they working out for Japan and the rest of the world right now? When is that accident being 'safely' dealt with? You already have a free, safe, nuclear reactor to use. It's called the sun. (0140-1 [Nickerson, Samantha])

Comment: Right now. My suggestion to NRC is to please revoke the license to operate all reactors as soon as possible, that is the best and only solution to waste management, if any. (0141-2 [Tonohira, Yuko])

Comment: There should be no more licensing or re-licensing of nuclear reactors until the permanent disposal of radioactive waste has been determined, proven and funded. (0143-3 [Arauz, Jorge])

Comment: Please NRC: Let's stop kicking the can down the road pull up our moral muster and quit making more nuclear waste. As a grandma, I am pleading for the 6,000 generations that will be stuck with this horrible man made substance. Do you ever cry for the children who have thyroid cancer in Fukushima? I do. You should try it some time. It might send some blood from your heart to your brain and change your mind. (0145-4 [Sorensen, Laura])

Comment: Without a scientifically proven solution for safely disposing of nuclear waste, we must stop making it. Clean, renewable sources of electricity are readily available and affordable, so there is no excuse for continuing to rely on nuclear power. No technology has yet been proven capable of containing radioactive waste for the hundreds of thousands of years necessary to protect the environment. Debates continue over whether it is even possible to do so, but unfortunately the U.S. has failed even to identify a viable site for a nuclear waste repository despite two decades, billions of dollars, and a federal mandate to do so. (0147-1 [Fallon, Gloria])

Comment: I am a retired pathologist with boards in Nuclear Medicine with no illusions about nuclear power, nuclear weapons and radiation. Nuclear energy is an energy source whose time never came, a spinoff of the Manhattan Project to make doomsday weapons which to this day have done nothing except vaporize Japanese children. Opportunists like Edward Teller were determined not to abandon the technology they had created and found willing supporters in government and the military, people desperate to wield power over others for their own personal indulgences, while reasonable and ethical citizens saw nothing but death and destruction in its future. (0154-1 [Richardson, Don])

Comment: The human race stands today on the verge of social, environmental and moral collapse. Our present course is now very probably irreversible and the odds of a human presence on Earth 100 years from now is low. Greedy and ignorant people with power have brought us to this path to extinction. They populate business, banking, corporations, government and the military with no regard for the future of Mankind, including their own children. The fuel pool #4 at Fukushima is poised to collapse and render the Northern Hemisphere uninhabitable. Meanwhile Mr. Abe has traveled to Turkey to boost for Japanese nuclear technology. This is a perfect example of the insanity that pervades that industry. Profits

before survival is madness. We have gotten used to living so far above our means that we cannot face the obvious: we must greatly reduce our population, our consumption of non-renewable resources, and use only cleaner and cheaper energies if we are to leave anything for our progeny. This means an END to nuclear technologies and stopping the production of yet more isotopes which will be with the planet forever. Human survival is incompatible with nukes. What are you telling your own children? (0154-2 [Richardson, Don])

Comment: It is time to accept this and shut down the industry as quickly as is practical. (0155-3 [Preschle, Gus])

Comment: I am writing to express my desire for no more nuclear energy to be used- either weapons or power plants. (0156-1 [Heinle, Helen])

Comment: There IS NO ARGUMENT left for continuing to build Nuclear Power plants. NO MORE. In fact we should be shutting down and dismantling the ones that are currently in operation. We know there are technologies available for free clean energy sources,(i.e. Tesla technologies) It is high time to put the safety and well being of ALL LIFE ON EARTH ahead of the profits of elitists and the power structures that be and allow these clean technologies to be brought forth. NO MORE NUKES. (0156-3 [Heinle, Helen])

Comment: I "get" that we must find energy sources to replace fossil fuels, and I strongly agree. What I don't understand is why, with so many possibilities for increasing renewable energy, we would spend money on nuclear energy that produces toxic waste that no one has figured out what to do with. No informed person wants it near them or their children. No informed person wants it transported near them or their children. Accidents might be rare, but they are sure to happen, and are always devastating. That is not true for renewables. I do not want more nuclear power stations. I do want more renewable energy. (0157-1 [MacKenzie, Therese])

Comment: We should not license or re-license any reactor until it has been proven that we can successfully isolate and properly store radioactive waste. (0159-2 [Evjion, Virginia])

Comment: Due to storage problems of nuclear waste, nuclear power is not a safe mode of energy. We should shut down our nuclear reactors and invest in safe, green energy that will also create good jobs. (0159-3 [Evjion, Virginia])

Comment: The use of nuclear power, on the whole, needs to be re-thought as we are now more aware of the hidden costs of nuclear power. Germany is at the beginning of a bold step into the construction and exclusive use of renewable, non-nuclear energy production. We need and must also head that direction, boldly rather than timidly. (0161-2 [Rose, Melene])

Comment: I think we should start working on the solution and stop making more of the waste right now. (0163-10-2 [Kimmich, Erl])

Comment: [T]here's a level of absurdity that almost cannot be responded to and so this is simply a plea, and I speak on behalf of the Public Health and Sustainable Energy, PHASE, and the Council on Intelligent Energy and Conservation Policy, but also, of citizens and a mother and for somebody whose great grandchildren, I guess, will be around when the waste is still sitting there, please, please take this serious. (0163-12-3 [Lee, Michelle])

Comment: I'm wearing this green headband on my head to represent something because I'm a very metaphorical person. It's my constant unrelenting awareness that Indian Point with its tons

of new and old fuel rods poses an ever-present danger to myself, the people I care about, my students, my colleagues. It never goes away, and it might look funny and it might look like "Oh, there they are those crazy activists doing their thing again." We have to lighten it up a little bit, okay. You have to have some fun with it because it's serious and it doesn't go away and most people don't think about it. I do, and my cohorts do, but it's there and it's nasty and it's in my brain like background man-made radiation all the time. I'm not a math teacher. I'm an English teacher. But I know this. I know that it's unconscionable that this stuff is going to be around as a legacy, you know, a poisonous legacy for -- I wrote this down -- not only our great-great-great-great-great-great grandchildren, but also their great-great-great-great-great grandchildren. I can't even say it. And their great-great-great grandchildren. Basically, 12,000 generations. And it's just wrong. It's wrong. (0163-14-2 [Schepart, Margot])

Comment: A mother who is adamantly opposed to leaving lethal legacy of high-level radioactive waste for my children and the generations to come. (0163-15-3 [Garner-Ritter, Maureen])

Comment: As a homeowner with an old and troubled toilet, I would cease to use it if it became so filled with waste that I could no longer flush it. I would not consider -- I would not continue to sit there and eliminate any more waste into it. And the thought of leaving little empty boxes that may degrade around my house is absurd and you might say "That's crap." (0163-15-5 [Garner-Ritter, Maureen])

Comment: Imagine now that you have this apocalyptic event with the waste at Indian Point and we're not going to be measuring it in dollars. We will be measuring it in lives and futures. If we could have prevented Hurricane Sandy, we would have. It is counterintuitive, uneconomical, irresponsible, and I dare say immoral not to close down the waste factory now. (0163-15-6 [Garner-Ritter, Maureen])

Comment: There's no real plan and no real solution, so we shouldn't be making any more. To do anything less than that seems absolutely self-destructive. (0163-22-9 [Shaw, Gary])

Comment: I really feel that people have said a lot of things that need to be said, but the thing that keeps coming back to me is the issue of what are we doing to the future? What are we doing to the future? I started out in college in engineering physics, which would have led me on the path to a career perhaps in nuclear physics, and I found it wasn't what I needed. I ended up finishing with a degree in philosophy. There are logical and ethical issues here. One of the logical issues has to do with denial. There is a problem that we can't wish away, but we keep trying to. (0163-23-1 [Fullerton, Dan])

Comment: And that the CASE organization Clean and Safe Energy is created by the nuclear -- the nuclear energy industry. So we want you to know about the disconnect. We want you to know that we don't believe you anymore, if we ever did. And the people who do, I just want to say one word, which is Kool-Aid. I believe that a new study has come up that shows that there -- it's going to take the best minds of the century for the next hundred years to figure out what to do at Fukushima; is that correct? Right? Right. Okay. So I will stop now. (0163-24-5 [Allen, Judy])

Comment: I am not happy with the Nuclear Regulatory Commission fracking gas land industry and coal industry, which cause major problem for health and global warming. I am urging all NRC, liquified natural gas, White House and United States government to shut down all nuclear power plants factories, fracking gas land station, and coal industry because they all have same

issue. People living or working in nuclear, fracking, or coal zone are contaminated and dangerously exposed by chemical and radiation. (0163-27-1 [Endo, Yuki])

Comment: Please shut down nuclear, coal, fracking industry. All this in -- all these industries destroy a beautiful view of the New York and all other states. (0163-27-3 [Endo, Yuki])

Comment: What will our grandchildren think of our actions today relating to making more nuclear waste. Their lives, their friends, family, and community's lives depend on what we do today in this era. The injustice is that the choice is ours not theirs. They have no choice, no voice. It takes everyone working together to make a better world for our grandchildren. We have two short songs, and we ask if you can to join in. At least hum along. You need to drown us out. The first song is Killer Radioactive Waste to the tune of "Home on the Range." Just hum it. Hum "Home on the range." This is for the grandchildren. (0163-28-3 [Cypser, Betty])

Comment: Oh, give us a home where the grandkids grow strong, where they live long, live strontium free. Where we don't have to fear, waste vision is near, where rain fall is iodine free. We've made tons of that waste. It's a waste we don't know how to store. It can't be made safe. It costs billions to make. Where's the sense in us making some more. The waste is not safe. Oh, we're told that it's safe. Now we know that's not true. Exposure to low levels kills. No safe lower limit means we've had more than our fill. Un-contained the waste circles the globe. We've made tons of that waste. It's a waste we don't know how to store. It can't be made safe. (0163-28-4 [Cypser, Betty])

Comment: Tons, tons of that waste. It's a waste that's a hazard to store. It can't be made safe. It costs billions to make. It's insane to be making some more. (0163-28-7 [Cypser, Betty])

Comment: It can't be made safe. It costs billions to make. It's insane to be making some more. (0163-28-8 [Cypser, Betty])

Comment: Don't put your waste in my backyard, your backyard, our backyard. Don't put your waste in our backyard (0163-28-9 [Cypser, Betty])

Comment: So here I am to say just very simply that we've hackled about this for 30 years. We've done nothing and we still have nuclear waste deposit all over the nation and doing nothing is the same as letting the bully have their way. We really need to get our act together and do something. (0163-3-1 [Peck, Joe])

Comment: So I just want to say we are the generation to stop producing this mess, okay. I'm determined and a lot of people, who you don't see here, are also determined. (0163-31-4 [Tonohira, Yuko])

Comment: I have confidence that they will wonder in bewilderment what people in our day were thinking when the choice was made to continue with nuclear power and continue generating this waste instead of switching to renewables. (0163-34-6 [Azulay, Jessica])

Comment: What's real is nature and science, and what's real is that nuclear waste is forever. There's no time span that's conceivable to human beings that can deal with nuclear waste and its time span. (0163-35-2 [Shaw, Jeanne])

Comment: It's beyond not being worth the risk. It's not worth anything. It's got to stop being made. (0163-35-6 [Shaw, Jeanne])

Comment: Frequently within the document, as I skimmed it, I noticed a phrase "the reasonable approach," the reasonable approach which basically eliminated what most of the people here tonight have asked for, but it seems to me the only reasonable approach is Germany's. Stop making it. Phase it out in a decade. Figure out how to operate an advanced industrial economy with safe alternatives. (0163-36-2 [Brown, Jeffrey])

Comment: I'm old enough to remember a whole lot of lies starting for me with the Vietnam war, with what got us into the Vietnam war, the Iraq war, asbestos poisoning, the tobacco industry, the risks of smoking and enough of the lies except the lie about clean nuclear power. When -- it's true that nuclear energy doesn't produce carbon in the actual production of energy of electricity. However, from the start of mining and building and all the other things that go into making a plant startup, there's plenty of damage done and it's not economical. It's definitely not economical. Amory Lovins, a brilliant scientist who works on practical solutions and is a co-founder of the Rocky Mountain Institute, has said nuclear power is not -- is not viable and that efficiency and the development of more sustainable methods of getting energy are the way to go but -- I just urge everybody to look up on Google Joanna Macy and her idea for the storage onsite of this poison fire and the creation of communities around each site that will keep the story -- that will tell the story of the poison fire for generations and generations and pass it along so that as people come up, they know that this is something that they have to respect and that as science and storage improves, the most up-to-date storage will be taken[.] (0163-39-3 [Sack, Emily])

Comment: In Breezy Point my neighbors, for whom these were their primary homes that they lost, where there's nothing left now but sand, but we can -- somehow or other people will go back to Breezy Point. Now you look at the maps there's nothing there. In two years, three year it will be back, but you look at those same maps of Fukushima, people aren't going back. Tens of thousands of people are never going back, so just make -- put this waste, which is now overflowing these spent fuel pools, into dry cask storage immediately and stop creating more of the stuff. (0163-40-3 [Dengler, Allegra])

Comment: So anybody who has any kind of intelligence or is past the age of five knows for sure that nuclear energy is very unsafe. But -- thank you. But a process that human beings, we all engage in this at times, is rationalization, right. If a truth is too inconvenient, we generate pseudo reasons why what we're doing that's really dangerous is really okay. So that's something that's going on. (0163-41-3 [Kidney, Barbara A.])

Comment: I was in Germany recently. They have a fabulous sustainable energy program. It's incredible the progress we've made. Let's make that our model going forward. (0163-42-4 [Fry, Mark])

Comment: I think it's time for a major shift in thinking towards evaluating risks and, you know, et cetera. And I'm going to call upon somebody whose name may ring a bell, Dick Cheney. Remember him? He used to be vice president. He said the following about a completely different matter, the war on terror. Sometime after 9/11 he is supposed to have said this, "You may convince me that the risk of another 9/11 attack on our country is low. Low probability we'll call it, but if it does happen, the consequences will be huge. So we will call it low-probability, high-consequence equation." Bringing the top around to this one, I could believe perhaps, I don't really, but I could believe everything I've heard from, you know, the union gentleman from Indian Point, the engineer about the safety of the casks, the young people talking about clean energy and how we need it. I could believe all of that and yet I'm still stuck with this low-probability, high-risk equation. Low probability is not the same thing as saying no -- no

possibility, right. I keep hearing this phrase "small risk" in the GEIS, but small risk is not no risk, and unless we had -- we really have no risk in all of this, the consequences are so huge. We spent millions and billions of dollars in pursuit of Cheney's idea about low risk but high probability, so we have the war on terror. If we use the same kind of thinking towards solving our energy problems, getting rid of the low-risk nuclear and, you know, some of the other things that are also low risk, I'm sure like fracking, and really put that same attention, you know, into solving our energy and environment problems that we're putting into the war on terror, I think we could do it. I mean frankly, if Germany, the high-energy use country that it is, can do away with nuclear power plants, why can't the states? (0163-43-1 [Dalton, Andrew])

Comment: It's so fundamentally and fearsomely apparent that a mistake has been made. Starting to generate nuclear energy before a plan was formulated regarding the used rods was the mistake and is now a huge problem. We can stop compounding this mistake by closing operations until such time as we have a solution to that problem. There is a time for every purpose, to make mistakes and a time to recognize that a mistake has been made and to stop making that mistake. It is so absurd. It reminds me of "How do we make pigs fly?" Well, we don't know, but let's just forward -- go forward as if we did know and drop them out of planes and hope a plan will be developed before they land. It's double speak. Waste Confidence. I mean the ministry of truth has been at work folks. (0163-44-1 [Marcley-Hayes, Janet])

Comment: We have to close the nuclear reactors, put that money, the millions and billions of dollars into developing renewable energy. It's not that hard. (0163-44-2 [Marcley-Hayes, Janet])

Comment: [T]o me it is, yes, incredible that we continue to generate profoundly, profoundly toxic material whose toxicity lasts, as many people have said, beyond our imaginations and which I do not have any confidence that we can store safely. (0163-47-1 [Segal, Elizabeth])

Comment: First, I would like to dispel the myth that nuclear power is carbon-free energy. It is the seventh most carbon-intensive energy source we have. Uranium mining is one of the most fossil-fuel intensive industries out there. Converting yellowcake into uranium is very fossil-fuel intensive and transporting the fuel is very expensive as well and takes a lot of truck trips. Nuclear energy in general is the most expensive way we have in the world to generate power. I don't know why we're still generating power using nuclear energy. The fact is that cheaper wind is closing down nuclear power plants. Yankee -- Vermont Yankee closed because it was losing money. The only nuclear power plants being built in this country are in South Carolina, and they have to pre-charge their rate payers in order to afford to build these plants, and these rate payers are also paying for the cost overruns of these plants. These plants are unsustainable economically. They're also unsustainable environmentally. We need to take away government-subsidized insurance policies for these plants. (0163-48-2 [Meyer, Bill])

Comment: Once we stop the farce and take away the nuclear-subsidized policy, there will be no nuclear industry in this country or anywhere else. (0163-48-4 [Meyer, Bill])

Comment: I would ask the nuclear -- NRC to -- the only solution we could have is to immediately stop generating all nuclear power. Move to wind, solar, and efficiency. (0163-48-8 [Meyer, Bill])

Comment: And finally, finally, to pursue licensing on the basis of a Waste Confidence Rule that is not inspiring of confidence is both illegal and immoral, so now that I have the opportunity finally to voice my opinion, and I hope that some of you will join me in a show of hands. (0163-9-3 [Gerard, Daniele])

Comment: This is not "Hate Mail." Every job has its challenges and I'm sure you are doing your best in the way you know how. But did you know that a conversion of just 15% of US parking lot acreage to photovoltaic rooftops would produce more electricity than the entire US generates today? Please STOP THE WASTE. We have other alternatives now. (0165-1 [Osta, Hanna])

Comment: I have no confidence in nuclear power. We need to follow Germany and phase out all nuclear power. (0167-1 [Barton, Jim])

Comment: NO MORE NUCLEAR WASTE! We don't want nuclear power. We need to deal with the current waste!! (0168-1 [Jacobs, Kamri])

Comment: Until we find a way to safely store radioactive waste indefinitely, we must stop creating it. (0169-1 [Ober, Jack])

Comment: NO NUKES! NO THANKS! Keep us all healthy and well! (0171-1 [Kinnicle, Kat])

Comment: As an individual living on the coast of Cali in earthquake country, nuclear power is endangering my community and my livelihood. STOP THIS INJUSTICE! (0173-1 [G., Brittany])

Comment: We encourage the NRC decision-makers to, this time, give FULL consideration to ALL the inherent negative aspects of adding more radiation to an environment already forever polluted by the dropping and testing of nuclear weapons, routine or accidental releases from nuclear power plants and weapons complexes, enrichment facilities and supporting operations, and the release of radiation during and after hurricanes, tsunamis, earthquakes, and other natural disasters. (0174-11 [Thomas, Ellen] [Thomas, Ruth])

Comment: We agree with those who ask the NRC to stop building new nuclear facilities, stop extending the licenses of existing nuclear power plants, don't expose the nuclear workers and the public by transporting nuclear waste until and unless there is a final resting place. (0174-2 [Thomas, Ellen] [Thomas, Ruth])

Comment: This seems to indicate that the only sane approach would be to stop producing nuclear waste. In seventy years of producing nuclear weapons and nuclear energy we have found no way to dispose of the radioactive waste created that will not continue to threaten life on earth. (0174-4 [Thomas, Ellen] [Thomas, Ruth])

Comment: I have been studying the nuclear waste situation for the past 20 years, having lived in the shadow of nuclear energy plants both here in NC and previously in Florida. I have attended conferences to deal with the issue and have heard former government employees say that this area of the Southern US (at least a 5-State radius) has been referred to as a "Nuclear Sacrifice Zone." After Fukushima and in the light of Yucca Mountain not being licensed (a good thing), I am unwilling to add (nuclear) fuel to the (radioactive) fires by permitting either (1.) more costly nuclear power plants generating more nuclear waste or (2.) any vague rules being applied to the centuries-long storage of hazardous nuclear wastes. Personally, I believe the current wastes must be safely stored in place and that no new waste be generated until and unless there is a reliable way to deal with the existing waste. (0175-2 [Arnason, Deb])

Comment: Solar, wind and geothermal energy are quite feasible to become our primary energy sources per the Federal Energy Regulatory Commissioner, Jon Wellinghoff. We must be following Germany's lead to convert to renewable sources by 2020! All NRC licensing, planning

and permitting should be directed towards the phase out of nuclear energy and existing nuclear waste storage safety. Then you can change your name to the Renewables Regulatory Commission, the RRC, and keep your jobs. (0175-3 [Arnason, Deb])

Comment: What I am clear on is that enough is enough. There is no truly safe or eternally secure storage solution for nuclear waste. Folks who are much more knowledgeable than I will speak to this. There is no safe dose of radiation, and to pursue licensing nuclear power plants on the basis of Waste Confidence is illegal and immoral. We need to stop producing this stuff, first off. Are we mad to even consider continued nuclear power generation knowing full well we really don't know what to do with the waste. We've opened a Pandora's box. Let's try to close the lid a bit. No new nuclear plant licenses and no license renewals. DECOMMISSION NOW! (0177-2 [Craig, Anne])

Comment: Today I am here to speak up for what I believe to be an underrepresented population. I'm here to represent all the anomalous creatures out there that support and thrive off of nuclear waste. If our nation was ever to abandon the nuclear power that has so faithfully supplied us with the precious energy that nourishes our comforts and warms our microwavable dinners, we might be allowing the one eyed, one horned, flying purple people eaters to slip into extinction forever. There has also been claims amongst world renowned cryptozoologists that the endangered and extremely rare chupacabra may also perish without nuclear waste, along with our heroic population of mutant vigilante superheroes. Oh, the tragedy. Of course, these creatures will most likely be able to survive at a dwindling rate for the next millennia off our current radioactive waste, but we have to think ahead for the future generations of mutants and vigilante superheroes. Increasing our demand for nuclear energy is perhaps the only viable solution to their dwindling population, and the rapidly increasing humanoid population. Now, I understand there is some concern for the health of non-mutant normies out there. I believe repetitive exposure of radiation in smaller doses has extremely protective benefits. Remember, visit your dentist, radiologist, and local airport scanner as much as possible. And for the nuclear family with lower income who would not be able to afford frequent visits to a professional administrator of small scale radiation, a trip to the ocean would be an apt substitute. Thank you for time and consideration. (0184-1 [Diem, Larkin])

Comment: Precautionary principle; From Wikipedia, the free encyclopedia The precautionary principle or precautionary approach states that if an action or policy has a suspected risk of causing harm to the public or to the environment, in the absence of scientific consensus that the action or policy is harmful, the burden of proof that it is not harmful falls on those taking an action. The principle is used by policy makers to justify discretionary decisions in situations where there is the possibility of harm from taking a particular course or making a certain decision when extensive scientific knowledge on the matter is lacking. The principle implies that there is a social responsibility to protect the public from exposure to harm, when scientific investigation has found a plausible risk. These protections can be relaxed only if further scientific findings emerge that provide sound evidence that no harm will result. In some legal systems, as in the law of the European Union, the application of the precautionary principle has been made a statutory requirement in some areas of law. Regarding international conduct, the first endorsement of the principle was in 1982 when the World Charter for Nature was adopted by the United Nations General Assembly, while its first international implementation was in 1987 through the Montreal Protocol. Soon after, the principle integrated with many other legally binding international treaties such as the Rio Declaration and Kyoto Protocol. (0186-1 [Robinson, David])

Comment: Well for the record, I care. I care about my children, my grandchildren and the welfare of all future generations and I consider it my responsibility not to willingly do them harm through my actions today, especially, through a totally unnecessary activity such as boiling water through the use of a nuclear chain reaction to create steam that runs a nineteenth century technology turbine in an inefficient, dirty and environmentally irresponsible and obsolete method of generating electricity. We don't have to do this because we can dramatically reduce energy consumption through public policies that drive conservation and energy efficiency, as well as the deployment of clean, safe and renewable technologies that harvest the sunlight, the wind, geothermal heat, the ocean waves and tides. At best, the current schemes for storing our existing nuclear waste amount to kicking the can down the road and leaving this legacy as an unsolvable problem for future generations. And, if that doesn't seem irresponsible enough the irrationality is vastly compounded by the fact that the intention is to continue producing more nuclear waste, build more nuclear plants, waste more energy, divert more investment away from the development of truly safe and clean renewable technologies, even though we have no solutions, practical or political to the safe long-term storage of high-level nuclear waste. (0187-3 [Friedman, Avram])

Comment: For more than twenty-five years I was a plumbing contractor. On occasion I would be called by a frantic person who had a flooded basement because a water main had broken. Water was everywhere, knee deep or higher, damaging the structure of the building, ruining the contents, under-mining the foundation. When that happens I can tell you with expert certainty that the first thing you do to address this problem is to shut off the water supply. Then you begin to deal with the water that has already accumulated. If you don't shut off the water first, all subsequent efforts at solving the problem are more or less futile. Any sane, thoughtful and intelligent person understands this. There is no difference in the logic of dealing with our current conundrum on high-level nuclear waste. The first thing we have to do is to stop making more nuclear waste. (0187-4 [Friedman, Avram])

Comment: Safe Containment For Eternity (SCFE) must be the objective, the mission of your containment work. With half lives for radioactive nuclear wastes ranging from 30 years for strontium and cesium to some 24,000 years for plutonium-239, and time till permissible human exposure ten times half life, it follows as a necessary corollary that that "the making of toxic nuclear waste must be reduced to zero". In our physical world we sometimes cannot achieve the ideal, but often we can and do approach it very closely. There are some good uses for nuclear energy, e.g. in medicine and in astronautics. But, we know that bombs and weapons are not included in the short list -neither are nuclear power plants. There are better means than these to provide the needs for life on our shared Earth. (0188-1 [Howarth, Robert])

Comment: Do not precautionary principles call for rapidly phasing out nuclear power. Our nation should be accelerating maximum development of ending wasteful energy practices, improving energy efficiency and putting resources planned for the very excessive and escalating costs of nuclear power into truly renewable energy resources, especially solar, wind and geothermal? Ending the generation of radioactive waste would be the most effective single step toward addressing our radioactive waste dilemma. (0189-5 [Patrie, MD, MPH, Lewis E.]

Comment: We are all downwinders - with unknown, man-made radionuclides in our bodies. Human intellect has not devised a way to determine how much radioactive material we as individuals or as a population has absorbed. Neither has human intellect the capacity to discern if there is a human burden which will ultimately threaten human existence. Precautionary principle directs us to stop making radioactive waste. (0189-8 [Patrie, MD, MPH, Lewis E.]

Comment: You simply CANNOT "dispose of" high-level radwaste like a dirty, snotty Kleenex (after a bad cold)! NO industry should be allowed to continue generating toxic waste (either radioactive or chemical) which it has no ability to manage properly. Both the nuclear industry and the U.S. Department of Energy (USDOE) do NOT have a licensed, operating irradiated nuclear fuel (i.e., high-level radioactive waste) management facility. Therefore, the nuclear industry should NOT be allowed to create anymore of this long-lived, extremely radio-toxic waste! (0196-2 [Nelson, Dennis R])

Comment: The USNRC should NOT be allowed to grant any new commercial nuclear reactor operating licenses or give any more 20-year license extensions to older operating commercial nuclear reactors until a permanent, deep-geological high-level radioactive waste management repository is built, licensed, and fully operating. (0196-3 [Nelson, Dennis R])

Comment: In conclusion, rather than a "so-called 'nuclear renaissance,'" America's nuclear enterprise is in the midst of a "NUCLEAR RETREAT." [Any new commercial nuclear reactor construction MUST be totally covered by federally-subsidized taxpayer loan guarantees and/or state-based utility customer-funded "Construction Work-In-Progress" (CWIP).] If there are no new nuclear reactor licenses or current nuclear reactor licensing extensions, then so be it! (To paraphrase an older expression: "That's the way the '[radioactive] cookie' crumbles!") (0196-6 [Nelson, Dennis R])

Comment: With our nuclear enterprise "financially imploding," and the competitive energy marketplace economics favoring a total nuclear phase-out: QUITE FRANKLY, HAVING ABSOLUTELY NO CONFIDENCE IN THE USNRC'S "SO-CALLED 'RADIOACTIVE WASTE CONFIDENCE'" IS ACTUALLY ONE OF THE BEST THINGS WHICH CAN HAPPEN TO OUR NATIONAL ENERGY POLICY!! [We already have a "Mountain of Radio-toxic Waste Nearly 71 Years High," and it is high time to go "Beyond (and End) the Nuclear Age."] At the same time, the energy economics are favoring the rapid implementation of a non-nuclear, non-fossil-fuel energy strategy, which is based upon these five things: [1] The immediate removal of all federal nuclear (and fossil fuel) subsidies wasting taxpayers' money, and the immediate termination of all state-based "Construction-Work-In-Progress" (CWIP) wasting ratepayers' money. [2] The full practical use of the best technologies and techniques for greatly increasing our energy efficiency (or, in other words, improving our energy productivity). [3] More utilization of combined heat-and-power (otherwise referred to as commercial/industrial co-generation). [4] Well-designed/properly sited and installed dispersed and distributed appropriate renewable energy technologies using solar, wind, solid biomass, liquid biofuels, methane biogas, wave and tidal, hydro, and geothermal. [5] A "'smart' electricity grid" with advanced energy storage. (0196-7 [Nelson, Dennis R])

Comment: I am concerned about how we store our most hazardous waste, the radioactive fuel rods from nuclear reactors. We should not license or re-license any reactor until it has been proven that we can successfully isolate this waste. (0198-1 [Cerrito, Robert])

Comment: Just because nuclear energy doesn't contribute to CO2 and is considered clean doesn't mean that there isn't waist involved, when there is waist involved it's not a clean source of energy. (0200-1 [Individual, Anonymous])

Comment: Enough already. Let's move forward, leave the hazardous waste of old fuels behind. If we spent 1/2 the energy on new development that is spent foolishly haggling over who has the right to poison who (for handsome profits, of course) then we'd be light-years

ahead in our energy and conservation efforts evolution by now! It's a no-brainer, close that old nuclear plant NOW and move on to clean, safe renewables. (0216-1 [Bird, Melissa])

Comment: [I ask that the Nuclear Regulatory Commission] not consider the renewal of nuclear plant licensing nor the continue accumulation of spent nuclear waste until an "End Game" is proven and in place. (0219-13 [Olmstead, Stan])

Comment: We should never subsidize nuclear power at any point. Better to shut all the reactors down and work on safer storage. (0226-3 [Garden, Claire])

Comment: It is obvious to me that nuclear power is not sustainable. It's the stupidest way anyone ever invented to boil water! And then have to cool the rods with whole rivers of water. (0226-4 [Garden, Claire])

Comment: Please stop the use of nuclear materials forever! We must be insane to think that this is a useful alternative for generating energy. Think of the consequences of what you are doing now and to future generations. (0229-1 [Eckert, Rose])

Comment: All relicenses issued to date should be rescinded pending compliance with realistic new standards. No new licenses to generate additional radioactive waste should be allowed. And no additional radioactive waste should be generated. It is immoral to create deadly toxins that will remain a threat for so long when we have no real plan for safekeeping them over their hazardous 'lifespan'. (0230-7 [Garb, James])

Comment: The only way to solve this problem for future generations is to stop making nuclear waste. (0232-5 [Hall, Caroline])

Comment: Then phase out nuclear power because we have no foolproof plan how to safely dispose of the waste. . In 300 years our land will be littered with high level waste that is no longer theft proof as the shorter lived isotopes disappear leaving purer and purer plutonium waste(3) This is a nightmare for those of us who are concerned with the growing nuclear weapons proliferation risk we leave a world that we don't even know who will be left to govern. We imperil the future of our planet and our descendents, my god, in order to boil water. We need you NRC to sheppard us out of the nuclear waste mess as responsibly as possible. Spent fuel into hardened on site casks. Stop making new waste as soon as possible. Transition out of nuclear and coal and into efficiency, solar and wind. (0233-7 [Dubois, Gwen LJ])

Comment: My first point is the most important: There is simply no safe storage of nuclear waste. The latest technology that was being used in 1991 was in France, a huge and ugly blight on the countryside. We in Connecticut were told at that time that this new nuclear waste dump technology would be entirely safe in our water-rich and population-intense state. The nuclear storage facility in France was leaking within six months of being built and used. I repeat: There is no safe storage of nuclear waste. (0237-1 [Cullen, Noreen])

Comment: Thirdly, radionuclides are unstable by definition. It would not take much of an explosive to set off a chain reaction within a nuclear dump site, or indeed, at a nuclear plant. The question we should grapple with first is: how we do we go about permanently shutting down our surviving nuclear plants? Then we must find places we will destroy as close to forever as the human brain can imagine, as nuclear dump sites. There will be no restoring them, since the half-life of "low-level" nuclear waste was changed in the 1980s to include nuclear waste with a toxic, deadly half-life of a million years. Any intelligent person has to ask, "What are we thinking

to be producing this nuclear waste in the first place?" Our careless and prolific use of human-made toxins such as Plutonium 244 shows how unconcerned we are about human health and the health of our home, Planet Earth. We have shown ourselves to be undeserving of our place here and have compromised every natural resource at will. Let us first make the obvious admission that we do not know how to safely store the nuclear waste we continue to manufacture. Then let us get serious about solving the problems that we ourselves have thrust upon all life on our planet. (0237-3 [Cullen, Noreen])

Comment: I think no new nuclear power plant should be approved as long as storage is not solved. We cannot assume that long-term geologic storage will be secured, we cannot assume that indefinite storage onsite will be safe. (0238-1 [Greene, David])

Comment: Living between two nuclear energy plants is a constant reminder of the hazards of nuclear energy and the inevitable radioactive waste produced. This is no joke. (0240-1 [Remein, Warren])

Comment: As a member of a local zero waste effort the concept of zero waste is critically important to long term sustainability on this planet and for personal safety in my town. (0240-3 [Remein, Warren])

Comment: Nuclear is not the power source of the future. It is a source of potential catastrophe, depending on: human error, lack of proper safeguards, maintenance, and oversight, natural disasters such as earthquakes, floods and typhoons, and terrorism plots. Any and all of these are possibilities that should absolutely not be overlooked or dismissed. For the good of our country, our citizens, and future generations, we must decommission and safely shutdown aging nuclear plants that pose the highest risks in all of the afore mentioned scenarios, and work to clean up and stop any leaks or environmental damages caused by the plants and their use. (0241-2 [Nixon, Kerry])

Comment: Nuclear power is an extreme example of when private risk-taking is publicly funded, and any ensuing damages or disasters would likewise fall on the shoulders of the communities immediately affected and the larger public coffers funding any damage control. This is absolutely unacceptable. (0241-3 [Nixon, Kerry])

Comment: The first thing to do to protect our communities from radioactive waste is to STOP MAKING MORE OF IT. All nuclear power plants should have their licenses suspended until it has been proven that we can successfully isolate the waste. (0243-2 [Hoch, Susan])

Comment: I'd like to talk about -- first of all today's a really, really important day, which is the reason -- one of the reasons why I'm here. Today is Amchitka Day. Forty-two years ago today the United States had the largest underground nuclear test in the island of Amchitka in Alaska. It was 380 times -- 85 times the yield of the bomb that was dropped on Hiroshima. My father was one of the people that dug a cavity a mile deep in the earth's crust to put that bomb. He was also one of the people that went back and cleaned up the place afterwards. He was also one of the people that died as result of nuclear contamination. I've been active in this field for a long time because I feel that I think it's time to change the conversation about other sources that we can use besides nuclear power. I think there is a -- first of all let me just get to the point here. I think -- I'm not an expert, I'm not educated in the field of nuclear radiation, but I feel it from the standpoint that what happened to my father. As a result of that I run a nonprofit organization that is involved with the abolition of nuclear weapons. We have gotten the city of Orlando to sign onto the Mayors for Peace, there are almost 7,000 cities throughout the world that have signed

to be members of Mayors for Peace, calling for the abolition of nuclear weapons by the year 2020. (0244-10-1 [Betancourt, Nelson])

Comment: For people to continue to insist that we're going to have as an alternative that the other alternative that we have is nuclear power, is no longer a question of ignorance or a question of incompetence, it's insanity. The potential for what is going on right now, what could happen if we don't deal safely with spent rods, fuel rods, in generator No. 4 at Fukushima could have a devastating effect to this country. Yet my whole point here is that I think we need to change the conversation about this. I realize that a lot of people make a lot of money from nuclear -- nuclear power. But it's also true that banks will not finance it, Wall Street will not finance it, and I'm sick and tired of our government having to finance it and the citizens having to pay the price when these events happened. So to the gentleman that just spoke, I happen to be from Columbia, South America. I don't know who wrote that article about why nuclear power would be so fine for Latinos. That's baloney. Personally, that has not been the case in my family. (0244-10-3 [Betancourt, Nelson])

Comment: I would like to leave you with a couple of things. We run a film festival in this town for the past nine years, and one of the people that we invited to our festival was Dr. Rosalie Bertell. Some of you know who she is. She passed away recently. One of the world's most well-known nuclear scientists. She was also a Catholic nun, by the way. And she wrote this. And this is where I feel in my heart that's really going on if we continue to push the idea of nuclear power much longer. She says, she wrote, "The probable fate of our species is extermination by poisoning." So we've got all kinds of environmental poisoning and now we're poisoning the seas with nuclear -- with the toxic waste from Fukushima, and God knows what else some of the other folks have talked about here. But I wanted to leave you with one last quote by the poet Anne Sexton. And she says, "Live and die, but don't poison everything." (0244-10-4 [Betancourt, Nelson])

Comment: Currently, 2000 metric tons of commercial high-level nuclear waste is being produced each year by nuclear power reactors. Nuclear industry is not currently able to safely dispose of these 70,000 metric tons of commercial high-level nuclear waste already generated. Unless and until permanent isolation of the existing radioactive waste from the biosphere has been demonstrated, there should be no confidence in licensing waste production regarding nuclear. (0244-14-10 [Prescott, Lisa Marie])

Comment: Then another thing that I wanted to say was that -- a gentleman before was saying that he was very concerned with having this project go through because of public interest and bringing power to the poor. However, you know, as Mr. Rossin said, there are other types of energies. There was not a section on here addressing alternatives or the effects of not having this thing go through. And also, you know, if the poor really need power, sunlight's always free. I, myself, come from a Third World country, I come from Peru. I lived there for 12 years and I did not have an iPad or a cell phone or computers. So I really just, you know, had enough power for a TV and a radio and I was happy. So there's really not a lot of high demand for nuclear for the poor. I'm pretty sure they're more concerned about food and clothing and housing. (0244-15-3 [Zuccarini, Ana])

Comment: You know what I can't get over, and I didn't hear it from any of the cheerleaders, that statement back from when I was a young tyke that nuclear power was going to be too cheap to meter. Didn't turn out to be true. And right now that plant over in Finland they can't finish, and the cost is way beyond what is supposed to be, and the same thing for the one in Georgia. And what it was supposed to be was; we have it all figured out now, it's not going to be

like it was in the past, there aren't going to be cost overruns, and we're going to finish them on time. (0244-5-2 [Klutho, Mark])

Comment: Here's Popular Science from this past summer, "American Energy Independence, Five Clean Technologies That Will Set Us Free," they don't mention nuclear. And Non-Nuclear Futures: The Case for an Ethical Energy Strategy from Amory Lovins, copyright 1975. I brought out the old old shirt, it's about ready to disintegrate, but, you know, these are what I had back when I was on that energy -- that nuclear weapons assembly team down in Fort Hood, Texas in 1970. And here's the newsletter from the Rocky Mountain Institute and Amory Lovins says, "New nuclear reactors, same old story." And this word, "confidence," it's not to be used by the NRC. It's like when I'm up at the hearing just recently that the PSC had, and over and over and over again I hear the word, "prudent." No. No. Not hardly. Not hardly. (0244-5-4 [Klutho, Mark])

Comment: Yet after the NRC makes that statement on the same page you contradict -- you contradict yourself. Now, you're going to use the word "confidence"? It can't come from you. That's impossible. It's a fraud and a farce. A joke. Too cheap to meter. And, we have a handle on it now. The plants will be on time, there won't be cost overruns. Is that plant in Finland working? And have you seen what's happening in Georgia? No. (0244-5-5 [Klutho, Mark])

Comment: I just want to say thank goodness the Court threw out the Waste Confidence Rule, because the radioactive waste produced by nuclear power is dangerous, toxic, and deadly. That is indisputable. The industry, governments, and the NRC have already imposed the dangers and costs on hundreds of future generations. Hundreds of generations. There is no solution, period. There is no solution on the horizon. The lie of a possible future solution has been told so long and so many times that you have fooled many people into believing it. I was told -- it was told 50 years ago, 40 years ago, and every year and every day for decades. It is still a pipe dream and a lie. (0244-6-1 [Steorts, Tim])

Comment: Nuclear power is so extremely dangerous there are no words to even come close to expressing the dangers. You know, I don't know if you people ever hear what we try to tell you sometimes. The NRC should focus on trying to keep the existing plants from completely destroying our planet and continually searching long-term storage solutions. (0244-6-4 [Steorts, Tim])

Comment: As you know, if it weren't for the enormous taxpayer subsidies in numerous ways; Federally imposed limits on owner/operator liability; exemption of nuclear accidents from virtually all home and business insurance coverages; a decades-long conspiracy by governments, industry, academia, the scientific community, and the press to lie about the cost and problems and to brainwash the public into believing there were benefits; none of these abominations would ever have been built. There is no need for nuclear power and it's extremely expensive -- enormously expensive. You know, extremely, enormous, there's no words. The cost is virtually infinite as even in the best-case scenarios we're using power now that will be paid for for thousands of years. It's my opinion that nuclear power is insane, if you hadn't noticed or already guessed that, and must be phased out even if sacrifices must be made. The people in this industry have no right to continue creating additional risks to humanity to profit their stockholders. And I would just like my power company, based in North Carolina to know, that there are no words to express how much I resent them continuing to charge me to fund something that I pray to God will never be built. And if anyone here directly addresses my comments, I reserve the right to respond. (0244-6-7 [Steorts, Tim])

Comment: As my colleague Shirley Bain from California put it years ago, why would we ever support an energy source that had no plans and knew that there was no way to safely dispose of its deadly radioactive waste when it began, hidden this from the public, and we are now left with the creation of endless waste, endless economic and environmental cost, and endless risk to ourselves and to the plant? Why would we ever pick such an energy source in the first place? (0245-10-5 [Lewison, Linda])

Comment: I come before you today because I had serious concerns. Nuclear waste is toxic. Clean and safe are not terms that you can use to describe nuclear waste or its production. And yet members of the Nuclear Regulatory Commission and their staff are repeatedly trying to sell to the public those falsehoods. Therefore, one wonders how the members of the NRC could determine an environmental assessment finding of no significant impact regarding nuclear waste and its storage resulting in the recommendation of a generic treatment with no further oversight for a hundred years. While reviewing the documents for comment, the term 'adequate' repeatedly appears regarding the steps currently used to store toxic nuclear waste. Whenever I hear the term used by NRC staff to describe any of the nuclear plants across the country, excuse me, whenever I hear the term used by NRC staff to describe any of the nuclear plants across the country, but in particular Entergy's Palisades Nuclear Plant, I cringe. I am not sure how the use of this term is supposed to be reassuring to the public since it means 'good enough.' The connotation connected with 'good enough' is mediocre. So, I ask you, how safe would you feel with an 'adequate' pilot on a turbulent transcontinental flight? Or how quickly would you employ an 'adequate' heart surgeon if you required surgery? Yet you throw the word 'adequate' around to the public like that is supposed to reassure us about the safety of these aging, decrepit, nuclear power plants in this country and what you propose as the generic treatment of high-level radioactive waste storage for a number of years far into the future (0245-11-1 [Pierman, Bette])

Comment: Supposedly you studied what happened at Fukushima Daiichi, and yet I see no evidence that you have learned anything from your study. If you had, you would be shutting down all of the nuclear plants in this country to halt future production of toxic nuclear waste, and would be devoting your full attention to resolving the problem of current toxic nuclear waste accumulation. Okay. I have a lot more to say and I'll submit my written comments, but I'm going to finish with this paragraph. As stewards of this planet, it is time for the members of the Nuclear Regulatory Commission to begin to act responsibly and stop all further toxic nuclear waste production. Your job is not to represent the greedy, reckless, and irresponsible nuclear industry. (0245-11-3 [Pierman, Bette])

Comment: I'm concerned about the safety of nuclear energy. It does not have a reliable safety history. There have been 26 accidents in the U.S. since 1961, some with fatalities. That's one every two years, the most notable being with the Three Mile Island. (0245-14-1 [Kurz, Carol])

Comment: Aging nuclear power plant licenses should not be extended nor new ones built until a permanent repository is built. (0245-14-8 [Kurz, Carol])

Comment: I guarantee you that if the public knew exactly what was going on at all these facilities, they would say no to this. How many people do you know have died from radiation, or excuse me, exposure to solar panels? How about wind? Think if they had solar and wind backup rather than diesel and that was only a limited amount of time, what would have happened in Japan? I do have friends and family in Japan, and what they're living through is a living hell. What these communities are living in in Braidwood and Dresden, which by the way do, you know, on occasion shut their emergency alarm systems off but it doesn't get reported,

it's just wrong for you to even consider this and call it something that is safe. It's not safe. It was designed to be a bomb. It was designed to kill, and kill it does. I don't want it in my state, I don't want it in my country. And there's better alternatives than that. We are smarter than this. We are Americans and we can do better. (0245-17-3 [Thompson, Tammy])

Comment: I have a question. Why can't insurance companies insure these sites? If the nuclear power plants are so safe, then there should be a way for insurance companies to insure them. But that doesn't happen because the consequences of accidents at nuclear power plants run into millions. I thought it very interesting that the last speaker said, well, we've got \$26 billion to take care of nuclear waste. I believe that the cost of Chernobyl has exceeded a trillion at this point. And nobody ever mentions the first responders there at Chernobyl that are now all dead and the effects of the whole nuclear power project is having in the world. We're very, very much against having Iran developing nuclear power of their own because we know that the byproduct of a nuclear reactor is plutonium that is used in atomic bombs. And this is the most dangerous element or it's the most dangerous isotope in the world. And it had to be gone from the earth before the biosphere could develop. Now that the biosphere has developed, and we're bringing the plutonium back to our enormous risk. (0245-21-2 [Boudart, Jan])

Comment: And can you believe it? Can you really believe it? Sometimes listening to the comments here tonight of the proponents of nuclear power, I think they're from another planet. (0245-22-1 [Headington, Vince])

Comment: I refuse to bear that kind of a risk. What needs to happen, we need to stop producing the waste. We need to stop licensing nuclear power plants and their relicensing. We need to stop this insanity. (0245-22-4 [Headington, Vince])

Comment: Years ago, I read a phrase that startled me, and I mentioned it to a friend who was also actively concerned about nuclear waste and the reactors which made it. I was equally startled by my friend's reaction which was don't even say that. That phrase was "nuclear waste tends to remain where it's first placed." Now a dozen years later, I'm getting the exact words from NRC. As my friend may have then foreseen that it is being offered as a foundation for licensing decisions - - so don't say that at this time. (0245-24-2 [Conn, Corey])

Comment: I'm a resident of Zion, Illinois and it was mentioned earlier that Zion Nuclear Plant is permitting the decommission and actually fuel transfer should be starting at any time. So, Zion is going to have 65 casks of high-level waste sitting there for a total amount of at least a minimum 35 years. That's if they can open a storage facility now, it would be 35 years from now for that fuel to be moved out of Zion. So, that's the best-case scenario. It just to me makes no sense to continue producing more waste when we don't have storage facilities. So, I don't think there should be any licenses or license renewals until a permanent repository is established. (0245-27-1 [Ower, Douglas])

Comment: Nuclear power needs to be phased out. (0245-29-7 [Shineflug, Marilyn])

Comment: We believe that the moratorium on licensing of new and the licensing of the currently operating reactors should remain in place until such time as a permanent geological, high-level radioactive waste disposal facility is designed, licensed, built and in operation, not just a theory. We ask the NRC to maintain its moratorium until this condition is reached and ask that the moratorium be extended to include the siting and licensing of any temporary away-from-reactor storage facilities such as those referred to as centralized interim storage facilities. It's

irresponsible to continue the production of such waste without a demonstrated and operational means of disposal. (0245-3-3 [Kraft, David])

Comment: I believe that we are making a lot of choices here that are not only endangering us but also putting off better choices that we could be making. For every dollar that a taxpayer has to sink into nuclear power in dealing with its waste and dealing with its risks is a dollar that we can be spending on renewables and things that will really move us forward. (0245-31-7 [Fox, Tracy])

Comment: I believe it's because when we look at the truth, the real truth of what we've created, we are terrified. Terrified of the magnitude of dumping radioactive waste that we have created and are continuing to create. We are terrified of the certainty of contamination that's already happening and the destruction of life. The USGS is already finding polar bears and seals with skin rashes and diseases and open sores. Our fish are contaminated with nuclear radiation from Fukushima. And so, we need to face the scary and embrace it, because then you can take off the blinders that are keeping us in denial of the truth. We need to pay attention to the boy in the stable. He speaks the truth we are afraid to see. The emperor has no clothes. We do not know how to protect ourselves from radioactive waste. We need to stop making it now. Germany has already done this two years ago. They are now supporting energy generated from solar power and other sources. So, we need to stop pretending that this is safe and that we know what we are doing. Knowing when we embrace this difficult truth we can really start to have an honest discussion that will find some solutions. The emperor has no clothes. (0245-32-2 [Rude, Kathleen])

Comment: Nuclear is not the way to go while we have geothermal, solar, and wind, and who knows what else? (0245-35-2 [Seastrom, Tina])

Comment: I'm going to tell you for a second about my breast cancer book. Two elements - nuclear and treating breast cancer. I won't go into the first, the second is nuclear radiation. I can only quickly tell you that after ten years, the women in Nagasaki developed a mass of breast cancer. It's a long-term effect. It doesn't immediately pop up. You will see it eventually if you have been exposed over a period of time. Therefore, I'm going to start out by telling you this is an issue of madness dealing with a dangerous technology, dangerous, notwithstanding the word safe, it isn't. It's a dangerous technology that costs way too much; that threatens the lives of thousands of people; that generates poisons even in low-level emissions; that generates lies and false statements to lull the public into their sense of safety, as a clean technology and nuclear power is not; that we lull ourselves into denial to justify our cool homes, while corporate executives take home their salaries, and while millions and millions of dollars are invested in this technology, while PR firms promote this technology and frankly it's become a mad world. Any time we think it's okay to allow some exposure to radiation through accidents, which are many, or any releases, and any time someone is harmed, that's evil. Let's deal with facts. After Chernobyl, I heard the Russian equivalent of the EPA come to America to warn us about the dangers of nuclear radiation. He talked about the thousands of people who were harmed and died, thousands. He finally actually admitted that there were millions, and he also admitted the Russian government lied. They didn't want to admit this, they were avoiding it, and he died two years later. He was involved with the cleanup. No human life is expendable or collateral damage. No one. Accidents will happen. No one must deny this. How can anyone justify harming just one human being when less toxic and more sustainable technology is available? This whole mindset is morally indefensible. If I take a gun and randomly shoot bullets into a crowd, I'd be called insane, criminal, and evil. This technology is no less. Let's just stop making the waste. (0245-36-1 [Casten, Liane])

Comment: For my children's future, no more nuclear power. These are my grandchildren. (0245-37-6 [Bilenko, Stephanie])

Comment: I'd like to say 60 years from now we're going to have a repository? That is totally irresponsible. A repository should be now. And the other part that should be now, to reiterate what my good friends have said, is to stop producing this highly dangerous waste. We are people, we want to live, give us a chance! (0245-38-3 [Good, Joyce])

Comment: I'm here as a mother and a grandmother, and someone who is really very concerned about the actions that are taken by our government. We want to believe that you all represent us and represent our interests, but the history of the nuclear age is not like that. It started off with a bomb, and that was more than 60 years ago. And then it was sold as a peaceful way of getting, you know, nuclear energy, that it was a peaceful thing. Well, it's still a horrible, toxic, dangerous process. And if we haven't found a solution to the waste out of 60 years, what confidence do you have that we would have the notion to solve it now. No, we don't. It's just like the government, once it starts on one direction, it's so difficult to change it. And all the subsidies that you're getting for it, why can't we put those subsidies into good, renewable energy? All that money, we could be free and we could be healthy and we could be safe, and so would our children. And for you young people there working, I would implore you to read this book, "Full Body Burden" by Kristen Iversen who worked in the 60s and 70s in Rocky Mountain Flats or whatever you call that dump. And the number of commissions and the secrecy and the illnesses and the coverup, and all of the hearings that were heard and that went nowhere, and her life is a testimony. And all the people who are sick and who got ill, you've got to wake up and read those. And let us be courageous and do what we need to do, and it's move away from nuclear forever. It's dead. (0245-39-1 [Tobin, Clare])

Comment: Enough! Stop making nuclear waste! There are better, safer, cheaper ways to supply our energy needs. (0245-42-3 [Rorem, Bridget])

Comment: I often remark it's interesting that every major world religion has some form of the golden rule. Every single major world group has some form of "don't do unto others that you wouldn't want done unto you." There is something about that that just resonates with our humanity. That we're called to care for others. That we're called to care beyond short-term economics. That we're called to care for our future. So, I'm here to speak for our future. And I'm here to tell you it's unethical to require future generations to handle the waste that we're generating. It's unethical to put this burden on the future generations. We wouldn't have wanted it done to us. Where do we get off thinking that we have the right to do it to others? So, the short-term approach to handling nuclear waste is unethical. If we're going to have nuclear power, then we need to be honest and face it and handle it within our generation. The answer is we haven't found a way to do that here. So, until we do, we need to stop. It's unethical to put our generation to the future generation. It's in our humanity. We're addicted to cheap fossil fuel and cheap power. We need to look beyond short-term economics. We need to think about what is truly human and what we would want future generations to have to bear because we wanted the lights on. There's other ways. (0245-44-2 [Gallagher, Dr. Terry])

Comment: I remember adults telling me in 4th Grade that I should hide under my desk and to protect myself from nuclear fallout. In 8th Grade, I didn't understand yet and I built a model of a nuclear reactor as a science fair project. It wasn't until I started to build a working model that the dangers of nuclear energy became clear to me. While earning my engineering degree, I worked at no accelerated test without data from a non-accelerated test. I'm concerned that life test data for existing plants in Illinois is not available, and that this data is only now being generated as

the licenses for these plants are extended. Without it, we're guessing. In the late 80s, I worked for a company that designed control valves. The valves designed by my older colleagues for the nuclear industry were already antiquated. And the redundancy in the designs struck me as Rube Goldberg embarrassments to satisfy bureaucratic requirements to make a fundamentally dangerous process appear safe. Perhaps the most alarming evidence I have seen convincing me to oppose this GEIS is the excessive confidence demonstrated by the comments of some of the enthusiastic employees here tonight. 'None have broken yet' is an unsafe approach to terrestrial nuclear power and it ignores basic engineering discipline. I'd be less concerned if more had a healthy fear. (0245-46-1 [Craig, Evan])

Comment: I'm a citizen of this planet. And there has been a lot said and the longer I listen the more absurd all of it sounds. I can't believe that we even have this discussion. Why are we even having this discussion? I invite everyone that works at Exelon and any other nuclear regulation commission to go off, plop themselves down right now in Fukushima. I want you to be first responders there right now. I want your bill to be paid off so that you can live there. I want your wives who are pregnant to be brought back there so that they can have a free house. I want you all to have a Geiger counter and have all your processed. I want you to start eating the tuna off the West Coast that is now highly radioactive. I want you to be involved because what you do, you do with great care. You take safety to the fact that you've got like plagues into your buildings because what you have, I don't care what the cask looks like, how well it's built, within it is death! Chicago originated this and in 70 years they haven't been able to figure out how to neutralize or put this back into the bottle. I don't need this about facts. I don't need to hear either side's facts. It's true that it's death. And I don't care if someone said, well, people are going to have to do without their TVs. You're darn right we may have to do without some stuff. It's either that or the planet. I don't know about you, I don't have kids. You have kids, you have grandchildren. I have me and I've lived a good life and I'm grateful for that. But we are depriving the future. When the Pacific is already trashed, it's not a bathtub. Who is going to be drinking that water? Who is going to surf in it? Who is going to fish in it? I want the safety to go right to the heart of it. Go back and live in Chernobyl. Go back in Three Mile Island and see that damage. There is moral integrity that is missing and there shouldn't even be a conversation because this shouldn't even have to be on the forum for a discussion. The water resources that are going to be so very terribly at risk that it takes to keep anything cool, all right, is it going to be let's cool the plant or let's have some water to drink? All you have to do is, look at what happens in the Philippines when you have people without water. And you can be smug and laugh, then I want you to sign up right now and go to Fukushima. Those of you who have been sitting here laughing and just chortling at this need to be doing some soul-searching while you still have a soul left, while there is a planet for us to inhabit. There isn't a plan B, and you can only go underground for so many years if you think you've got that kind of self-repository built with food. You come up and there won't be anything. (0245-47-1 [Grace, Karli])

Comment: And let us remind ourselves that this technology, which is being so touted by some of the members and so say as demonstrably and too that some say, and in addition to that it's old technology, isn't it? Isn't it time we really look and say, hey, let's move into the 21st century. Let's decrease our consumption. Let's not be pigs about how much energy we use or waste. Let's turn to renewables because we can. And all of the engineers and all of the safety people, you can have a marvelous career, a green career in solar and geothermal and all the kinds of cold fusion, all these kind of incredible discoveries that have been suppressed. We have a future to look for. Let's turn our back on technology that is dangerous and is poisoning people and the planet. And let's move to the future. And nuclear industry has got millions, billions of dollars from the U.S. taxpayers. Let's put that into renewables. Let's look to the future. (0245-48-3 [Walter, Beverly])

Comment: You know, I'd rather be home doing other things, enjoying my family. I feel for the last year I have been in places where I didn't want to be. I'm involved with -- Green I'd rather not be dealing with energy issues. I guess it would be a fairy tale to me if we would proceed with clean green energy, I'm talking about wind, solar, geothermal. For my children, I would be out there every day working for free. These are the words I've heard tonight, stepping stone, that was from Jeff Dunlap, a stepping stone is fair. We wouldn't have a plan or proposal except for college. Well, that's the same thing with fracking. It's a stepping stone and it's -- politics, we would have better regulations. Let's talk about regulation. Jerry Peck said, he's from the Illinois Manufacturers Association, and considered the impact of regulations on the economy. Well, I don't know that much about this except it's poison. That's what I know and that's why I'm here tonight. We have very weak regulations for fracking, that I do know. And we call them the best in the country. Well, this is the same. We might have the best in the world but it's still poison. We're dealing with a toxic waste that has to be carefully dealt with. And Mr. Gallagher is right, we're giving it to children. (0245-49-1 [Paulus, Jill])

Comment: Tom Wolf said nuclear gives us a quality of life and economic well-being. I would like to think that the quality of my life was not hurting other people, not causing climate change, and that my economic well-being was just part of a world where I live in and we're nice people and we're not at each other's, you know, throats. I mean we're -- we don't need to do this. We just don't. And it's all the same, the same things that we talk about, our food, our water, this is all the same thing, and I'm very sorry for it. (0245-49-2 [Paulus, Jill])

Comment: I've been reading about energy and nuclear for a while but I'm certainly no authority on it. But I can't give any confidence on this idea NRC has, mainly for the reason that even though people work really hard and do a good job, human beings aren't infallible. And it doesn't seem like it's all up to us, we don't have everything under control what we think we have under control. And it's getting less likely to be able to do that in the future. So, I think the only thing this would do is perpetuate something that we can't live with anymore, never could live with it, but I don't want the effects -- have on people who are relying on it but I think there's no other choice. So, that's pretty much all. I think we have to stop doing it and I don't know of a solution to all that. The only non-detrimental source of energy that we have, I think, is photosynthesis and we seem to have moved beyond that for some reason. (0245-50-1 [Costanza, Frank])

Comment: I hope I never get a call to respond to a nuclear accident, a radiological incident. I hope that I will never have to go, I hope that I will never be woken or called at any time to go to talk to people who have been through a disaster. I can only imagine how horrible it is to the people that lived through that experience in Fukushima. My heart goes out to them. I wish there was more I could do for the people living that suffered. And I hope that there is never another incident like this. But I know there is one if we continue to develop this technology, it's going to be a possibility. We have to take responsibility for the mess we already have. I'm sure there are many, many jobs for all you bright young people who are working in the industry to take care of what's already been created. And I ask that we all put our heads together to search for better solutions for the rest of us, for all of us, and for all time. And I hope that God helps us to solve the problems that we've already created and I hope we find better solutions while working together. (0245-51-1 [Bluestein, Bonnie])

Comment: I'd like to say that I think it's a bad idea. We can't put this burden on other generations. We can't put a burden for people 250,000 years down the line. That's just totally irresponsible, immoral, unethical, you know, for people to sort of really believe that. You know, for one generation's worth of energy consumption, we're creating a life-long problem for hundreds of thousands of years. Human civilization is not that long. I believe Debra mentioned

it, what if the Egyptians were using nuclear waste? Would you want to be responsible for maintaining that waste disposal in modern times and for generations and generations to come? I think if you do the math, you'll realize that it's not economically efficient, it's not safe, it's not wise. We need to take that money and we need to reinvest it into renewable energy, renewable resources. That's the way to go for the future. (0245-52-3 [Kalas, Mike])

Comment: I thank the Federal District Court for throwing us a lifeline. The nuclear power industry puts us at risk, our families at risk, our communities at risk. Their claims of infinitesimal risk do not reconcile with the major nuclear accident happening every ten years. Go back and do the math. You need not be scientist for that. I taught Chicago Center City schools for 20 years and my third graders could do that now. (0245-6-5 [Headington, Maureen])

Comment: The NRC has stated they have a mandate to ensure the protection of the people and the environment. And I want to state here in argument to some of the statements earlier by some of the industry folks, that nuclear power is neither safe, clean, affordable, or cost effective. On the safety issue, I merely have to mention Three Mile Island, Chernobyl, and Fukushima. And that's all that needs to be said about the safety issue of nuclear power. The clean tag on nuclear power is absolutely ridiculous when you factor in the carbon-intensive and toxicity of uranium in our, for stations, areas across the country. And affordable and cost competitive is a joke. As Ms. Headington just said, the loan guarantees and the taxpayer subsidies of nuclear power should certainly be factored in to every kilowatt hour that we think we're getting from the nuclear power plant. And I assure you that all economists agree that nuclear power without Federal subsidies is neither cost competitive nor affordable. (0245-7-1 [Chamberlain, Lora])

Comment: I want to just ask the audience right now, who here right this moment feels terrorized, terrorized of what's happening in Fukushima with the spent fuel -- exactly! There we go. So, nuclear power is really a terrorist organization. We all feel terrorized by this. Any accident, a disaster can occur at every nuclear power plant. (0245-7-3 [Chamberlain, Lora])

Comment: Our group has, as long as we've existed for the last two years, focused on finding things to address global warming on a local basis. We come out and strongly oppose the nuclear power in general because we feel, despite some of the carbon arguments, that this is not the argument to justify the issue really we're here to talk about tonight, which is our confidence in how you deal with the spent fuel and the hazards that we face with the nuclear energy. (0245-8-1 [Fox, Rick])

Comment: [W]e need to phase out nuclear power because we have no fool-proof plan to safely dispose of the waste. (0246-11-2 [Dubois, Gwen L])

Comment: We imperil the future of our planet and our descendants and we do this, my God, in order to boil water. (0246-11-4 [Dubois, Gwen L])

Comment: Stop making new waste as soon as possible. Transition out of nuclear and out of coal and into efficiency, efficiency, efficiency: solar and wind. (0246-11-7 [Dubois, Gwen L])

Comment: As the earth is being re-shifted, humans have not adjusted to the new extremes upon us. With climate change inside our front door, the problems of nuclear energy will be augmented. It is great news that no new license or no new renewal of existing license will receive final approval until the waste issue is addressed. (0246-15-2 [Minniss, Regina])

Comment: As a first step towards dealing with this waste, this decision showed real leadership. But at least 12,000 tons of nuclear waste per year keeps accumulating from existing operating plants. The second step to dealing with the waste is to make the amount of nuclear waste finite. This is a time to show more leadership. The reality is if a solution is found, we will still have it, and generation after generation will have to deal with the continued problem. (0246-15-3 [Minniss, Regina])

Comment: If we continue business as usual, we are truly on the path to total destruction. This highly toxic energy destroys our air, water, food, soil, and gene pool of all living plants and animals. You will see children with tumors -- sorry. A look on the internet of the children of Belarus will verify the long-term effects of nuclear energy. This is a site where parents cannot deal with their children from the Chernobyl accident. You will see children with tumors beyond imagination, tumors that are bigger than beach balls showing up anywhere on their small bodies, deformities so grotesque that you think you are looking at a horror film but these are innocent children. Let's at least make the nuclear waste finite and begin aggressively pursuing truly green energy sources. (0246-15-5 [Minniss, Regina])

Comment: Therefore, we shouldn't be creating it. Therefore, we shouldn't be relicensing and we should make licensing a permanent moratorium on all licensing because we do not have anything, any safe place to put this waste. No industry should be allowed to make and manufacture and create waste that is unsafe and that there is no place to put it. The NRC should not be allowed to issue any new licenses from this point forward or to grant any license extension because there is no safe way to deal with the waste. (0246-16-3 [Michetti, Susan])

Comment: There are technical shortcomings everywhere we look throughout the entire nuclear process. Those technical shortcomings need to be addressed and closed up, too. (0246-16-7 [Michetti, Susan])

Comment: We stop making this deadly radioactive waste for which there is no safe solution. The NRC should move to repurpose plants such as Limerick and encourage electricity generation by improving efficiency and investing in renewable sources of energy such as solar and wind. (0246-17-7 [Dugdale, Jane])

Comment: So how anyone in their right mind could continue to promote nuclear power as safe and could promote building more nuclear plants is just beyond my comprehension. I mean denial can be a wonderful thing but I just think this is total insanity. Nuclear power has caused continued massive destruction in the past and it is still continuing today. And by the looks of it, it always will. There is no safe solution for radioactive fuel rods. They can remain radioactive for a million years the EPA states. So, I just believe nuclear power is dirty and deadly from cradle to the grave. (0246-23-2 [Ruppe, Lorraine])

Comment: Now, Fukushima has been spewing tons of radioactive water into the ocean continually for the past two years. Future generations of every form of life is in jeopardy now. So please, no more relicensing or no new nukes. (0246-23-3 [Ruppe, Lorraine])

Comment: And I just think we need to change to renewables. The other countries are doing it, China, India, Germany, Japan, they are now generating more power from renewables than nuclear, according to the nuclearreport.org. So this is what we need as soon as possible. (0246-23-5 [Ruppe, Lorraine])

Comment: I am calling because I do live in a nuclear-surrounded city. So, I am very concerned about that. It is nice to have confidence that we don't have any problems, but I don't share that confidence. (0246-27-1 [Gerleman, Doug])

Comment: It seems rather absurd to me because I am hearing forecasts that we could go into wind and into water and solar and replace not only nuclear but fossil fuel, too. If we just put in like ten percent of the investment that we have put in already in the nuclear power, we might have something that is really sustainable. (0246-27-2 [Gerleman, Doug])

Comment: Let's try to make something that will be sustainable for our kids and grandkids. So, those are my concerns. It just makes no sense to continue throwing so much taxpayer money into the nuclear industry when it is not the wave of the future. (0246-27-4 [Gerleman, Doug])

Comment: [W]hat we need is a permanent solution to permanently close nuclear power plants. And we can't come up with any other solutions anywhere, so close them all. (0246-29-12 [Hoffman, Ace])

Comment: And that is where we are right now. We have got 100 reactors producing waste and we are down four this year with nowhere to put it. Four isn't good enough; 25 years it would take to close all the other 100, if we are going to close them at the rate of four a year. So, I think we are going to have to do better than that. I think just corrosion and old age is going to cause us -- these things to be closed down at a more rapid pace in the future. (0246-29-6 [Hoffman, Ace])

Comment: And we don't need nuclear power as an interim for climate change[.] (0246-29-9 [Hoffman, Ace])

Comment: [Y]ou all need to focus on securing the waste, not producing more of it. There is no confidence in making more of it. (0246-3-5 [Gray, Erica])

Comment: I am also very surprised that nobody has apparently studied the book by Dr. Arjun Makhijani who laid out for us a path to nuclear free, carbon-free future. I recommend you all read it. Then we don't need to worry about more expansion of nuclear power. We go to wind and other energies that are truly sustainable and do not endanger life. This is the real goal. (0246-30-2 [Fabihrn, Dagmar])

Comment: What we want are new policies to eventually close all those nuclear power plants down, start with decommissioning. It is very costly, as we all know. And then think of life beyond nuclear power, as has been laid out many times and calculated to be feasible. And there are plenty of states that are existing without nuclear power. This will be our goal and preserving life is the upper most goal. (0246-30-4 [Fabihrn, Dagmar])

Comment: I am wanting to focus on the big picture. The point of having this GEIS approved is to continue with the NRC licensing process. And when we think about what has been happening with nuclear power since its inception, I think we can only look at all the close calls we have had in this country and look at the accident in Chernobyl and Fukushima and see how those accidents have not only affected the nation when the accident occurred, but how any nuclear accident is really a worldwide problem. I think we need to look at that and apply the common sense that we all have inside and say enough is enough. It is only by God's grace, God helping the NRC to do its job to protect the U.S. public from accidents. And we haven't had a major disaster in this country. And if we keep testing this, we will. (0246-31-1 [Sunderland, Mary Brooke])

Comment: We have to take a step back and just look at this. It is not okay. It is not okay to keep continuing with nuclear energy. We don't have a safe place to store it. What kind of home or nation or anything runs efficiently when we don't have a place to clean up the waste? No city runs like that. How can we expect a type of energy to run like that? We can't. It is not okay. (0246-31-3 [Sunderland, Mary Brooke])

Comment: We need to stop any possible new licenses and we need to phase out nuclear energy with all the plants when they become 40-years-old, they need to be shut down. (0246-31-4 [Sunderland, Mary Brooke])

Comment: Hyman Rickover put it very clearly, "Why then, you might ask why do I have nuclear powered ships? That is a necessary evil. I would sink them all. Have I given you an answer to your question?" That is Admiral Hyman Rickover. He would have sunk every nuclear sub if he had a chance. (0246-6-5 [Lewis, Marvin])

Comment: Finally, we must stop making this deadly radioactive waste for which there is no safe solution. The NRC should move to re-purpose plants such as Limerick and encourage electricity generation by improving efficiency and investing in renewable sources of energy such as solar and wind. For more information, contact Dr. Lewis Cuthbert, ACE President, aceactivists@comcast.net. Documentation for all issues except high-burn fuel are on NRC's public record from ACE in testimony for Limerick's Environmental Impact Statement. (0249-15 [Dugdale, Jane])

Comment: I have planned for weeks to be here to do this. It's hard for me to drive here and to stand up here and speak out against nuclear hazards. But I do it. I must do it. I'm protecting my home, my state, and my country. That's what veterans do. (0250-11-1 [Kerr, Julius])

Comment: Safe containment for eternity must be the objective of a mission of your containment work. With half-lives for radioactive nuclear waste ranging from 30 years for strontium and cesium, to some 24,000 years for plutonium-239, and time 'til permissible view and exposure, which is ten times half-life, it follows with those kinds of times that a necessary corollary is the making of toxic nuclear waste must be reduced to zero. In our physical world, we sometimes cannot achieve the ideal, but often we can and do approach it very closely. There are some good uses for nuclear energy; for example, in medicine and in astronautics. But we know that bombs and weapons are not included on the short list. Neither are nuclear power plants. There are better means than these to provide the needs for life on our shared earth. (0250-12-1 [Howarth, Robert])

Comment: I beg you to put aside the profit that can be made from building more nuclear facilities and think more carefully of the real risk involved in the legacy that we'll leave behind. (0250-17-3 [Kneidel, Ken])

Comment: This plan definitely makes sense when I read that Duke Energy, for example, is guaranteed a profit greater than 10 percent on all its construction projects. We should be directing our money, resources, and research towards developing sun, wind, and geothermal technology. They're clean, they'll never run out, and they won't leave a shameful legacy for our descendants. (0250-17-4 [Kneidel, Ken])

Comment: In my childhood, I heard about nuclear madness. Maybe it was mutually assured destruction madness, or maybe it was Helen Caldicott having the courage to stand up ahead of many of us and say making this waste on a daily basis that we don't know what to do with is madness. But here I am in the fifth decade of my life, and I'm here to celebrate some sanity. I

can't call it nuclear sanity, because that's an oxymoron for me. But I'm going to name a few names and then I'll be done. But we have a federal judge, a panel of three guys, who said "I don't buy this scam." That's why we're here tonight. He said I don't buy this scam, and then Fukushima happened and he said now I really don't know that we have a solution, so I'm vacating the Rule, thank you very much.; Sanity, wow. We have a President who said that dump's no good, and had the courage, unlike previous presidents, to say Yucca Mountain's off the table. Amazing. A geological level event from the White House. You have a Senate Majority Leader who's sticking up for democracy. The people of Nevada don't want that waste. We have a Prime Minister who was in charge when the tsunami and earthquake and tsunami hit, and he's now brave enough to stand up as Prime Minister can and say "nuclear is not the answer. We have to phase it out." We have Prime Minister Merkel, who said the same thing. By 2022, Germany will be nuclear free. Finally, we have former NRC Chair Greg Jaczko, someone I've worked with in various capacities for many years, who now has the courage and the sanity to stand up and agree with me, and many of us in this room, that the only solution for radioactive waste is to stop making any more of it, and that darn little vacation that your rule has should become a nice, permanent little chalet, and no more nuclear licenses. (0250-2-3 [Olson, Mary])

Comment: Are nuclear power plants safe? No, that's a big no. (0250-20-2 [Cooper, Elaine])

Comment: [H]owever long nuclear radioactive waste might be around for us, for the next 20,000 years, 200,000 years. I don't know. It's a problem, isn't it? Oh, there's so many things I'd like to say. One thing I want to get out right now is that I think the big push for why we -- the nuclear power industry keeps gripping, keeps pushing on and on, it's a centralized way of producing electricity. It is easily controlled, dominated by a small group of people. To decentralize the electric grid through solar and wind power would be to give power to the common man, to democratize our electrical system, and that's the last thing that the rule oligarchy wants is to democratize the system. (0250-23-1 [Ashe, Kenneth])

Comment: And it concerns me a great deal that we are creating waste that lasts for, I don't know, thousands of years. I'm not technical, but it is very -- I mean, you know, suppose we could store it safely for 160 years. Well, you know, I won't be around but my grandchildren will be, and my great-grandchildren will be, and I'm concerned about them. (0250-26-1 [Maphet, Sheila])

Comment: Cleaner and cheaper energy is the future. This includes solar and wind. I'm glad to hear that Duke Energy is also investing in them, but would love to see more than 3 percent in the Carolinas in the next 30 years. (0250-28-9 [Embrey, Monica])

Comment: We need to stop making the waste, and stop licensing and relicensing nuclear plants to make more waste. (0250-29-5 [Rivard, Betsey])

Comment: Do not precautionary principles call for rapidly phasing out of nuclear power? Our nation should be accelerating maximum development of ending wasteful energy practices, improving energy efficiency, and putting resources planned for the very excessive and escalating costs of nuclear power into truly renewable energy resources, especially solar, wind, and geothermal. Ending the generation of radioactive waste would be the most effective single step toward addressing our radioactive waste dilemma. (0250-30-4 [Patrie, Lewis E.])

Comment: Are we not all downwinders with achieved -- with unknown manmade radionuclides in our bodies? Are we C-- do we have the human intellect to find a way to determine how much of these nuclides are in our bodies at the present time? (0250-30-7 [Patrie, Lewis E.])

Comment: Has the human intellect the capacity to discern if there is a human burden which will ultimately threaten human existence? I think not. Precautionary principles direct us to stop making radioactive waste. (0250-30-8 [Patrie, Lewis E.]

Comment: We have to stop making this poison. (0250-31-6 [Clark, Terry])

Comment: Well, for the record, I care. I care about my children, my grandchildren, and the welfare of all future generations, and I consider it my responsibility not to willingly do them harm through my actions today, especially through a totally unnecessary activity such as boiling water through the use of nuclear chain reaction to create steam that runs a 19th century technology turbine in an inefficient, dirty, and environmentally irresponsible and obsolete method of generating electricity. We don't have to do this because we can dramatically reduce energy consumption through public policies that drive conservation and energy efficiency, as well as the deployment of clean, safe, and renewable technologies that harvest the sunlight, the wind, geothermal heat, the ocean waves and tides. (0250-33-3 [Friedman, Avram])

Comment: For more than 25 years, I was a plumbing contractor. On occasion, I'd be called by a frantic person who had a flooded basement because a water main had broken. Water was everywhere, knee deep or higher, damaging the structure of the building, ruining the contents, undermining foundation. When that happens, I could tell you with expert certainty that the first thing you do to address the problem is to shut off the water supply. Then you begin to deal with the water that is already accumulated. If you don't shut off the water first, all subsequent efforts solving the problem are more or less futile. Any sane, thoughtful, and intelligent person understands this. There's no difference in the logic of dealing with our current conundrum on high-level nuclear waste. The first thing we have to do is stop making more nuclear waste. (0250-33-4 [Friedman, Avram])

Comment: It was a dark and stormy night of the nuclear powers when the people fought the radiation showers, and in spite of its friendly atom, it had made absolutely no peace on the planet, and hardly anyone could muster flower powers. But then the NRC came finally and had a great vision, and gathered their courage with much greater mission. They swallowed their pride, they took it in great stride, and declared that now is the end of nuclear fission. Now, I'm back here today to raise my voice to be heard and to speak against mankind's greatest folly. I'm again showing up like a bad penny, but with all the sense this penny can muster. Making sense of nuclear power is something that I have never been able to do. No matter what I read, how I turn it, I always end up shaking my head and wonder how did we come up with such a pea-brained idea. (0250-34-1 [Sorenson, Ole])

Comment: I promise you, the NRC, that the time has come when you will begin to feel the ire of us who has commonsense, and who realize how stupid this whole nuclear circus always has been. I have absolutely no confidence in any solution dealing with any more nuclear waste than to stop making the darned stuff. And don't even consider some desperate idea that the waste can be used as fuel in a new generation. Give me a break. At this point, you still have a small chance to redeem yourself and maybe get a decent review in the future history books. Otherwise, I can promise you that the next 6,000 generations will look back at your misguided activities with much disdain, anger, and disbelief. So, to close, stop being an embarrassment to the human race and show us the courage that will make us all smile and let out a big sigh of relief. It's time to get out of the diapers and grow into responsible human beings. Putting a stop to the nuclear power generation will definitely show real leadership and true concern for the quality of life in the generations to come. (0250-34-4 [Sorenson, Ole])

Comment: I'm in education because children are the hope of the future. I'm here because radioactive nuclear waste opposes that hope. (0250-39-1 [Richards, Kitty Katherine])

Comment: [N]or make any more waste either. Let's remember the children. What we do will be their reality for generations to come. (0250-39-6 [Richards, Kitty Katherine])

Comment: After Fukushima and in the light of Yucca Mountain not being licensed, which I think is a good thing, I am unwilling to add nuclear fuel to the radioactive fires by permitting either; one, more costly nuclear power plants generating more nuclear waste; or, two, any vague rules being applied to the centuries long storage of hazardous nuclear waste. Personally, I believe the current waste must be safely stored in place and hardened, and that no new waste be generated until and unless there is a reliable way to deal with the existing waste. (0250-42-4 [Arnason, Deb])

Comment: Solar, wind, and geothermal energy are quite feasible to become our primary energy sources according to the Federal Energy Regulatory Commissioner, John Wellinghoff. We should be following Germany's lead to convert to renewable sources by 2020. Okay. All NRC licensing, planning, and permitting should be directed towards the phase out of nuclear energy, and existing nuclear waste storage safety. Then you can change your name to the Renewables Regulatory Commission, the RRC, and you can all keep your jobs. Okay. I was going to stop with that, but I have to add a joke. I can't leave it on such a heavy, depressing spot. So, what do you call a solar energy spill? A sunrise. And what do you call a solar energy waste? A sunset, gone in half a day, not half a millennium. (0250-42-5 [Arnason, Deb])

Comment: I live in Sandy Mush, North Carolina. It's a mountain farming community with rich soil, woods; pristine beauty. We live by the seasons; we plant, we harvest, we return nutrients to the earth to insure an ongoing abundance. We know the fields, the woods; we know the wild animals that live there and where they live. Some families have been living in this and farming in Sandy Mush continuously from the time that their ancestors got a land grant from the king in the 1700s. We know our neighbors. We watch out for each other. We help each other in the fields during storms, when someone is sick. We share when we have an abundance of fruit or vegetables. We are a community; a generous and a happy community. Imagine our surprise, or bewilderment to learn in the 1980s of a proposal to turn this pristine community into a nuclear waste depository. Not surprisingly, people who passionately love their home and know how to work hard together were able to save Sandy Mush, but I have some questions for you today on deciding what to do with the accumulated nuclear waste. Who is your neighbor? Do you know your neighbors? We do not dump on our neighbors in Sandy Mush. Why is more nuclear waste being created when we do not know what to do with what we already have? We do not make a mess for our neighbors in Sandy Mush. We do not use toxic materials that can run off into other's fields. It is not neighborly. How are you protecting your neighbors? Are you prepared to handle a situation like the one now in Fukushima? If you are not, who is? Who is protecting our neighbors, your neighbors, all neighbors? (0250-44-1 [Larson, Jean])

Comment: We want you to have the same logic as the court and say we're not going to license this plant. We don't want any more nuclear power. So, for the sake of timing, my point is our waters; they're not going to keep up with this. (0250-45-2 [Sorenson, Laura])

Comment: The faithful adherence of nuclear power and weaponry in myopic and self-serving fashion expect us to embrace this deadly and unforgiving technology with the same cultish enthusiasm that they have lavished on it at taxpayers' expense for four generations now. We're expected to ignore its history of destruction, deceit, and death and accept a legacy of future

horrors that nearly defy comprehension. Stuck with a waste product that is practically infinite in its toxicity to all living things, the industry continues to dodge accountability for its internal storage and has manipulated legislation to avoid liability. (0250-46-2 [Stein, Ed])

Comment: Negligence and hubris are components of the human condition. These are red flags to rational people and indicate a level of cult-like faith and perverted altruism, perhaps not seen since national socialism and eugenics marched across Europe, an offense comparison to some, but adherence of both faiths are firm in the conviction that they are on a near sacred mission, ultimately benefitting humanity. We defeated the first, and we can defeat the second. We can't undo the Pandora's box of nuclear fusion, but we have the right to not subsidize keeping its lid propped open. (0250-46-3 [Stein, Ed])

Comment: No confidence. No more permits. No more faith-based science. Let the high priest of the nuclear temples go live in the steel and concrete vaults with the existing waste so as to commune with their god. Every dollar they seek to extract from us to propagate their faith is a dollar taken from non-lethal energy development. Every step they force our societies to take on their march to a nuclear future is a step to the obliteration of a living world. They don't have the right. (0250-46-4 [Stein, Ed])

Comment: I am here to represent all the anomalous creatures out there that support and thrive off of nuclear waste. If our nation was ever to abandon the nuclear power that has so faithfully supplied us with the precious energy that nourishes our comforts and warms our microwaveable dinners, we might be allowing the one-eyed, one-horned, flying purple people eaters to slip into extinction forever. There have also been claims amongst world renowned cryptozoologists that the endangered and extremely rare chupacabra may also perish without nuclear waste, along with our heroic population of mutant vigilante superheroes. Oh, the tragedy. Of course, these creatures will most likely be able to survive at a dwindling rate for the next millennium off our current radioactive waste, but we have to think ahead for future generations of mutants and vigilante superheroes. Increasing our demand for nuclear energy is perhaps the only viable solution to their dwindling population and the rapidly increasing humanoid population. Now, I understand there is some concern for the health of non-mutant normies out there. I believe the repetitive exposure of radiation in smaller doses has extremely protective benefits. So, remember, visit your dentist, radiologist, and local airport scanner as much as possible. And for the nuclear family with lower income, who would not be able to afford such frequent visits to a professional administrator of small-scale radiation, a trip to the ocean would be an apt substitute. (0250-47-1 [Diem, Larkin])

Comment: I live in Asheville, North Carolina at the nuclear crossroads, in the western mountains, in atomic Appalachia, where the deadly twins of nuclear weapons and nuclear power collide. I was raised in Tennessee, a nuclear waste sacrifice zone, where it is buried in landfills, burned in incinerators. The South is a sacrifice zone. I am here to raise my voice as an elder, a grandmother, and a conscious person, a part of this sacred Earth. (0250-48-1 [Hanrahan, Carol])

Comment: There is no safe level of radiation. We know this. It's more waste and less protection. So stop producing this waste, hardened onsite storage for those 70,000 tons. An industry, this industry, is itself one that continues to produce poisons. You perhaps are the real terrorists. (0250-48-4 [Hanrahan, Carol])

Comment: I am deeply concerned that our community is continuing to create more toxic high-level nuclear waste every day. When we have no means to dispose of it in a safe and functional way, it is so toxic that exposure for a short period of time can kill. (0250-49-1 [Gantt, Carol])

Comment: I cannot see the reason we are continuing to create this waste when we have viable, renewable alternatives. Nuclear energy cannot be called clean energy with its waste issues. Consider the dangers of Fukushima with no solution in sight and for over two and a half years, radioactive elements have been polluting the air and the ocean and affecting many people, animals, plants, and this Earth. There are so many problems with nuclear waste I cannot address all of them in the time I have to speak. (0250-49-2 [Gantt, Carol])

Comment: With all the talent and expertise in our country, we could be looking for ways to protect the people and the environment by focusing on renewable energy sources, rather than continuing with an energy source that creates toxic waste that kills and destroys. (0250-49-5 [Gantt, Carol])

Comment: I want to start by dedicating my words to the victims of this energy, this nuclear power and nuclear weapons, that of the past, the present, and the future. This is a technology that kills, maims, and creates birth defects. Those are the facts. (0250-5-1 [Safer, Don])

Comment: We need to stop making this waste. We need to deal with the 70,000 metric tons already made. (0250-5-5 [Safer, Don])

Comment: And there's no safe way to store this. Obviously, there is radioactive material that gets out in any way that they store it. So it needs to stop being made. (0250-50-2 [Blevins, Eric])

Comment: And, according to the NRC, the EPA, and the National Academy of Sciences, there is no safe dose of radiation. So we need to stop making it since we don't know how to store it without getting it in the environment. (0250-50-4 [Blevins, Eric])

Comment: And I don't think the Environmental Impact Statement -- I haven't read the whole thing, obviously, but I am sure it addresses uranium mining and how that is related to this. And a lot of that has gone on indigenous land in this country, and they want to do more of that. And folks have been talking about what a good record the industry has, but I don't know if folks remember Three Mile Island or the largest release of radioactive material in the country's history, which also was in '79 in the Puerco River on indigenous territory. (0250-50-7 [Blevins, Eric])

Comment: Whether you are pretending to be confident that you know how to safely deal with this stuff or you really feel confident, you just need to stop it. (0250-50-8 [Blevins, Eric])

Comment: We agree with those who ask the Nuclear Regulatory Commission to stop building new nuclear facilities, stop extending the licenses of existing nuclear power plants, don't expose the nuclear workers and the public by transporting nuclear waste until and unless there is a final resting place. (0250-51-1 [Thomas, Ellen])

Comment: This seems to indicate that the only sane approach would be to stop producing nuclear waste. In 70 years of producing nuclear weapons and nuclear energy, we have found no way to dispose of the radioactive waste created that will not continue to threaten life on Earth. (0250-51-3 [Thomas, Ellen])

Comment: Yes, we need energy, but at what cost? We are asking future generations to store the unstorable for thousands of years. We are asking for our children's children to bear this burden. What will they think of us? I am asking that our hubris not put our children at risk. (0250-52-5 [Amos, T.J.])

Comment: The nuclear industry both created my hometown, inspired my high school. We were the Bombers with a mushroom cloud coming up. But, fortunately for me, the cleanup, the continuous cleanup, the billions of dollars coming in to clean up that mess, is what put food on my table growing up. And I have to say I am concerned about our collective future, and I am concerned about people being blinded by dollar signs because there is a lot of money in ignorance and waste and toxics. I stand here in opposition along with many from around the country, though I will say we are a bit less coordinated than the industry folks, who seek to profit from the continuation of this. I also stand here in Charlotte, the home of Duke Energy, the world's largest utility and a big purveyor of nuclear power that costs billions and billions of dollars of ratepayer money, of which every dollar of which is not invested in renewables that are the way to the future. The nuclear industry is a dinosaur. (0250-55-1 [Wood, Nick])

Comment: I call this into question for a variety of reasons. Granted, a highly marketed belief is what we have heard tonight from the nuclear industry. I have not heard a single citizen say, "I want nuclear power. I think nuclear power is safe." This is all industry speak. And it's disturbing. I would like the record to note that there were no citizens here supporting nuclear power other than those who are inuring to a financial benefit from nuclear power. We have known since the '80s that the cost to decommission nuclear power plants is astronomical. However, the industry compartmentalizes safety. They are looking at the technical process as safety when, in reality, the toxic waste is not safe. It can never be safe. (0250-59-2 [Krotz, Susan])

Comment: I would like the Nuclear Regulatory Commission to listen to the physicians and scientists who spoke here tonight and take their views into consideration. They are not inuring to a financial benefit. They don't have a stake in this other than for humanity. Other costs that are not considered. For example, Rev. Utley, who spoke here tonight, helped a community relocate from Savannah with federal HUD dollars. The people got new homes because they couldn't live there anymore. These costs are not being calculated into nuclear power. (0250-59-4 [Krotz, Susan])

Comment: I think that there is sufficient controversy to stop producing nuclear waste and rule against this proposal. (0250-59-5 [Krotz, Susan])

Comment: I can't believe after the accident at Fukushima that we are even considering this. Shame on you. This is awful. Shame on anybody that believes that making future generations have to pay for our stupidity ** that's a shame. We should all be ashamed. You know, homeland security needs to add another terrorist to their list. It is called the nuclear regulatory industry. They are terrorists. They are forcing us to accept something that is going to destroy our environment, our home, and our generations. The only answer for energy is safe, renewable energy sources and conservation. Everything that is being done for this industry is because of greed. That is what is running this. It is greed. Shame on you. It's oxymoron to even put "nuclear" and the word "safe" in the same sentence. It's ridiculous. (0250-60-1 [Lee, Denise])

Comment: We should not license any more nuclear power plants. We need to stop any relicensing. And if we don't, it is your fault. It is your fault. Our children are going to pay for this. We should be ashamed if this goes through. (0250-60-2 [Lee, Denise])

Comment: I will at least say that I tried. And many other good people did, too. You know, I can't wait until the next commercial from the coal industry. Tonight all you kept hearing was "Oh, we're carbon-free." The new commercial for the coal industry is going to be "We're nuclear-free." It's the same dirty industrial gimmick. Go to something that's safe, reliable, and nonpolluting. (0250-60-3 [Lee, Denise])

Comment: What does it take? Another Fukushima? If this industry continues on the road that they're on, we will have an accident. We will have an accident. Please stop this process. (0250-60-4 [Lee, Denise])

Comment: The abundance of alternative energy sources available today, including but not limited to wind, solar, and hydrogen, enhance the United States' ability to compete globally while not imposing nuclear waste burdens on our progeny. The United States should be a global leader shifting resources away from the existing nuclear infrastructure and moving forward together, leading industry to cleaner, safer energy potentials, creating jobs for those brilliant people in the industry along the way. (0250-63-2 [Kasher, Brian])

Comment: I also would like to say that we are very supportive of the cessation of licensing of new nuclear power plants until this waste issue is resolved in an acceptable manner. We are opposed to the relicensing or the licensing of Lee Nuclear Power Plant proposed in Gaffney, South Carolina. We are opposed to the Construction Work in Progress regulations which would give Duke Energy an interest-free loan to build their nuclear power plants. (0250-64-5 [Gupton, William])

Comment: We [Georgia WAND] know that the only thing we can really have confidence in, unfortunately, is that nuclear waste is a threat to public health. And it will remain a threat to public health for thousands of years. We know that there is no safe dose of radiation for human beings. (0250-66-2 [Hanson, Courtney])

Comment: So the best thing we can do now is to stop producing nuclear waste by halting new reactor licenses and construction of nuclear reactors. (0250-66-3 [Hanson, Courtney])

Comment: So we advocate that the NRC obey the court's order to not license any new reactors, not just now but indefinitely. (0250-66-7 [Hanson, Courtney])

Comment: And, you know, ultimately what I would like to see is a move to a cleaner, safer technology in the long run because, you know, if a terrorist shoots out the solar panels on my neighbor's house, you know, it is only affecting my neighbor, but, you know, if they undermine a major high-technology, you know, pool, you know, we're all in trouble. (0250-69-6 [Rundle, Steve])

Comment: You know, South Carolina is heavily involved in nuclear, from all ends of the spectrum. From fuel enrichment, to manufacturing, to waste disposal. However, we have found that it's not very clean, it's not very safe, and it certainly is not very affordable. South Carolina now has the highest utility rates from Washington, D.C. to Texas. I want to say a little bit about the National Sierra Club Nuclear-Free Campaign. The Sierra Club has been on record for many decades questioning the need for nuclear power. Tomorrow morning on CNN, National Sierra Club Director Michael Brune will be debating the director of Pandora's Promise, to expose the propaganda, the mistruths, half-truths, and lies about the future and the need for the future of nuclear power in our country. (0250-7-1 [Corbett, Susan])

Comment: My brothers and sisters, it just won't work. Let us deal with the facts and as they are, and what they stand for. You and I both know that our future cannot afford 60 or 160 in one container. I don't think so, and you know it doesn't. So let us be real with ourselves and go back and do what we've been asked to do. Take it away from the table. (0250-8-2 [Utley, Charles])

Comment: [B]ecause three major things, and I want you to listen to them. One is they leak constantly. They shut down when they have the will or want to, and the cost is astronomical. (0250-8-4 [Utley, Charles])

Comment: What I'm saying to you tonight, I don't want my 18 month old or that eight month old grandchild of mine to pick up this waste. So let's end it now. I know I've used my time, but I want to make sure you hear me loud and clear. Take it back from where it came from. (0250-8-6 [Utley, Charles])

Comment: As we all we know, of the 104 reactors there are in the country, 60 of those are from the south. Many of them have been there since the 50's, and they are under strain, for the simple reason as you all recognize, that those of us --, that you don't exist long on the planet before change comes. The same thing is true with everything that God has created. Change does come. So therefore, with these aged reactors, we need to come up with a better way, or totally delete the method that we're using to produce electricity. (0250-9-1 [Tomlin, Willie])

Comment: I'm one of those who believe that in this age in which we live, that our technology most definitely can exceed something that we came up with two centuries ago. I am one of those who believe that if we would put our minds to it, give some dedication to it, that we will not only change our method of producing electricity for the citizens of this country, give some consideration to the health and hazard that, as Reverend Utley has mentioned, our grandchildren and our great-grandchildren are potentially going to have to deal with. Whatever method we come up with is a threat to the future generation, particularly if it pertains to -- particularly if it pertains to nuclear. I will simply -- my last statement is this, and that is I wish we would sincerely give some consideration to the generations to come, and not so much based on what the technology is now. Because when the next generation comes, they will most definitely have other ideas and other methods, just as we have come from the kerosene lanterns to where we are now. We have no idea what method the next generation will do. (0250-9-2 [Tomlin, Willie])

Comment: Equally important is the SLO MFP [San Luis Obispo Mothers for Peace] call to cease relicensing of existing nuclear power plants including the licensing of Diablo Canyon. Making more waste is senseless and dangerous for existing generations and those yet to be born. (0251-3 [Baker, Sheila])

Comment: Thus, it is imperative that the production of more and more of these potentially disastrous spent fuel cells must stop. First and foremost, the NRC should not re-license existing nuclear plants, primarily the Diablo Canyon nuclear plant; nor should the NRC license any new nuclear power plants. (0252-6 [Golden, Leon] [Goldin, Martha])

Comment: Nuclear power facilities must be shut down as soon as possible, to assure the safety and health of the American people. (0252-7 [Golden, Leon] [Goldin, Martha])

Comment: The nuclear power plant at Diablo was originally proposed for the dunes near Oso Flaco Lake. As a responsible Biologist in 1977 I felt radioactive nuclear waste should NOT be produced as it modifies DNA. (0254-1 [Denneen, Bill])

Comment: Stop making nuclear wastes. Without a scientifically proven solution for safely disposing of nuclear waste, we must stop making it. Clean, renewable sources of electricity are readily available and affordable, so there is no excuse for continuing to rely on nuclear power. (0256-4 [Harkins, Lynne])

Comment: Additionally we need to stop making nuclear waste, as we really don't have a solution to its permanent and safe storage (0257-2 [Abbott, Dana])

Comment: In addition, we should migrate our country's future energy generation investments towards non-nuclear options and not extend any future licenses of nuclear power plants. There should be a permanent moratorium on licensing any future reactors. (0259-3 [Katz, Shari])

Comment: Nuclear power has a dirty supply chain in uranium mining that leaves a toxic waste trail as soon as it is mined from the ground until eternity while eons of generations have to safeguard it from threatening human existence. Nuclear power is not "green", and its ongoing operational "normal releases" of radiation are an unacceptable pollutant that is toxic. Humans are imperfect beings, and even when they do their upmost best to mitigate risks, errors happen. Tritium leaks occur. Unexpected "releases" of radioactive steam are emitted from plants. Radiation bio-accumulates, and there is no safe dose. Attempts to downplay the risks of this type of radiation and compare it to airplane flights miss the point that man made radiation stays with us for our lifetimes. Studies have proven this. (Dr. Jay Gould's 1996 book, The Enemy Within, subtitled "The High Cost of Living Near Nuclear Reactors,") Gould and his associates in the New York City based Radiation and Public Health Project showed that US counties within 100 miles of a nuclear reactor had statistically significant higher rates of age-adjusted white female breast cancer deaths than counties located more than 100 miles from a nuclear reactor. The book breaks down this information into specific counties, in relation to specific reactors, as well. No wonder breast cancer rates aren't decreasing after all of the fund raising and treatment and detection programs! Dr. Gould also found that in the time that it took overall breast cancer rates to double in the US, in the 14 US counties in which nuclear power plants had been in operation the longest, the breast cancer rate quintupled (a 500% increase, compared to the national average of a 100% increase)! Your job as the regulator of this industry is to protect the American public, not the utilities. Stand up for the health and safety of Americans. (0259-4 [Katz, Shari])

Comment: In the wake of Fukushima, it is clearly the time to end the nuclear madness that could destroy the earth. It is time to stop creating nuclear waste. Shut them down! (0261-1 [Sweeney, Jay])

Comment: STOP MAKING NUCLEAR WASTE IMMEDIATELY. THE TIME HAS COME!!! (0263-1 [Pavlik, Rayena])

Comment: The best solution is stop making nuclear waste and spend this money on alternative safe solutions. This would be the best gift that we can give to our future generation. I am already contemplating leaving my accumulations as a burden for my kids to deal with just as what I dealt with my parents possessions. We can make this easier. (0264-3 [Gutierrez, Ruth])

Comment: I don't want to have my grandchildren have to clean up my generations screw ups. (0265-1 [Gall, Gary])

Comment: Immediately stop making more nuclear waste. (0266-1 [Kutcher, Celia])

Comment: We appreciate your efforts to rid our world of the the ridiculous (if it weren't so insane) production of heat to boil water using nuclear fission. It's quite apparent to any reasonable person that human beings have no business playing with such a potentially harmful technology on such a large scale with our current inability to foresee our errors and even behave civilly towards one another. On behalf of our 7 year old daughter who has no real idea what horrors humans have and continue to unleash on one another we thank you. (0270-1 [Jouet, Lisa] [Jouet, Tim])

Comment: I urge the Nuclear Regulatory Commission to stop the making nuclear waste immediately. There is no way to ensure the safety of a nuclear reactor or it's waste. Fukushima and it's ongoing safety concerns should give us more than pause. (0271-1 [Affonso, Jane])

Comment: I must say that I have no confidence in the NRC Waste plans. No industry should be allowed to create deadly wastes that it cannot possibly dispose of. Neither the nuclear industry nor the Federal Government has a functioning radioactive waste disposal facility, so no more of these deadly wastes should be produced. (0272-1 [Leighton, Taigen])

Comment: The deadly peril from these radioactive wastes and the difficulty of managing them is evident now at Fukushima, Japan. (0272-2 [Leighton, Taigen])

Comment: The NRC should not be allowed to issue new reactor licenses nor grant license extensions to old reactors until we have the technology to create permanent high-level waste disposal facilities, and then have them in operation. (0272-3 [Leighton, Taigen])

Comment: We believe that the moratorium on licensing of new and re-licensing of currently operating reactors should remain in place until such time as a permanent, deep-geological high-level radioactive disposal facility is designed, licensed, built and in operation. We ask NRC to maintain this moratorium until this condition is reached; and ask that the moratorium be extended to include the siting and licensing of any temporary, away-from-reactor "storage" facilities, such as those referred to as "centralized interim storage" facilities. It is irresponsible to continue the production of such wastes without a demonstrated and operational means of disposal. (0274-3 [Kraft, David])

Comment: Aging nuclear power plant licenses should not be extended nor new ones built until a permanent repository is built. (0276-9 [Kurz, Carol])

Comment: Supposedly, you studied what happened at Fukushima-Daiichi, and yet, I have seen no evidence that you have learned anything from your study. If you had, you would be shutting down all of the nuclear power plants in this country to halt future production of toxic nuclear waste and be devoting your full attention to resolving the problem of the current toxic nuclear waste accumulation. (0277-5 [Pierman, Bette])

Comment: It is time that you face the reality that it is insane to continue the charade of re-licensing these aging nuclear plants and that the continued production of toxic nuclear waste is not positive for the health of our planet, our habitats, our ecosystems, and the health and welfare of future generations. As stewards of this planet, it is time for the members of the Nuclear Regulatory Commission to begin to act responsibly and stop all further toxic nuclear waste production. Your job is not to represent the greedy, reckless and irresponsible nuclear industry. (0277-9 [Pierman, Bette])

Comment: It is irresponsible to continue nuclear energy and weapons production because of the intractable, even insoluble, problem of long-term hazard of the waste. (0282-1 [Haber, Jim])

Comment: The moratorium on new reactors should be continued indefinitely. (0288-4 [Wickham, Wendelyn])

Comment: I am able and do produce all the energy I use for my home and that is needed for my transportation by solar panels on my roof. Why risk the future of my beloved world. (0289-3 [Curren, Elizabeth])

Comment: Better yet, shut the plant down-stop producing nuclear waste and let PG&E stand behind what they claim is their mission to use sustainable, clean energy, of which, nukes are not. Diablo is the last nuclear energy, radioactive waste producing plant in California. It's an old plant that will be over 60 at the end of licensing period. We don't miss Humboldt (1976) or Rancho Seco (1989) or San Onofre (2013). The lights are still on. The nuclear waste left behind is a grim reminder they were there. (0290-4 [Brown, Marty])

Comment: Waste must not be produced if the safety of storage is in question. (0291-5 [Mauter, Nancy])

Comment: Why discuss how to make it safe for a catastrophic event? What about those who have already paid the price for this unnecessary energy. It is not safe NOW. (0292-3 [Comer, Gail])

Comment: Some of it, like Cesium and Strontium, take three hundred years to become safe. And that's the short end. Other elements, and there are many kinds created in the fission process, (not just the three I mentioned) take hundreds of thousands of years to decay into safety, and some even a million years. So we create these new elements now, in the nuclear fission of uranium, in order to use the extra release of energy to heat up the water to power the generators with steam. And the result of all this is centuries and millennia of dangerous, toxic elements that must be kept out of the environment. When you take all of that into account, it doesn't sound very cost effective to me. (0293-5 [Lewis, Sherry])

Comment: I live a few miles from Indian point. And this is a constant concern for us. If we must use nuclear power instead of safer methods such as wind and solar in the short term it's imperative we come up with a safe plan, made public to all, that will illuminate the risks of environmental damage including our physical health. (0295-1 [Collier, Grant])

Comment: Gais' Plea to the NRC 2014; I am your one, beautiful green earth; A spinning ball of soil and sea; And you are my voice; Appointed by man; To pass sentence over me.; Over all beings, creatures; animals, babies who cannot speak for themselves.; Do not turn away from us now; Don't condemn us to danger and destruction And my eventual demise; Do I not give you all that I have?; The beauty and bounty of the sea; The thrill of the mountain top; The fragrance of the Redwood; Why would you now turn your back on me?; We need your protection now more than ever.; Keep California safe; Keep the world safe; Get all nuclear power and storage of nuclear materials Off of my soil and out of my ocean; Do the wise thing, The hard thing, The right thing; For all of us Now -- and for the future of this planet; I beg you. (0296-1 [Silberstein, Mary])

Comment: I think it's time to move on from a failed approach to generating energy for today that leaves waste forever. (0297-2 [Fishman, Zelma])

Comment: Please put a stop to nuclear waste being made TODAY. It is time. (0299-1 [Smith, Diane])

Comment: Please do not allow any more nuclear reactors. No one has figured out a safe way to store the radioactive waste, which is bound to occur. Fukushima is an illustration of what is likely to occur. (0300-1 [Reichardt, Dorothy])

Comment: Furthermore the security and ability of our society to continue functioning is not dependent on nuclear energy. We are perfectly capable of creating energy from renewable and clean sources, namely wind, water, and sun. The only reason we don't get on with it is the influence, power, and wealth of the nuclear and fossil fuel interests. (0301-2 [Hayati, Sally])

Comment: In light of the Fukushima dangers, please shut down the Diablo Canyon Nuclear Plant. Think of the horrors that will occur if there is an earthquake In the area! (0302-1 [Light, Lillian])

Comment: [I urge that] the Court's moratorium on licensing or re-licensing of reactors be kept in place...[and] the eminent wisdom of not continuing a problem for which no solution exists be followed, i.e. that the generation of toxic and infinitely radioactive waste, through nuclear-power generation, be terminated as soon as possible. (0303-15 [Lamberts, Frances])

Comment: The Rule reviews various efforts, internationally, in the quest for final repositories that are hoped to quarantine the deadly waste, without fail, for tens or hundreds of thousands of years into the future. It acknowledges the nearly five decade-long experience in Germany – so far still unsuccessful except for having gotten to a new public-hearings phase – toward a final repository there. I suggest that the German government has drawn conclusion, largely as a democracy-honoring response to safety concerns, and demands by the citizenry, for a transition to non-polluting and non-risky, renewable energy sources. It is shutting down the electricity generating plants that leave dangerous SNF waste behind. It is a model for energy policy I would like to see followed in the US, for many sensible reasons. As a start, therefore, keep the current, court-ordered moratorium in place. I urge the Commission to move from licensing or re-licensing nuclear-power generation to promotion of truly safe electricity from renewable sources. (0303-5 [Lamberts, Frances])

Comment: Reactor licensing moratorium must be made permanent. (0304-1 [Young, Roberta])

Comment: Reactor license moratorium must be made permanent. (0305-2 [Norman, M. Jean])

Comment: NRC should continue the moratorium on licensing and re-licensing of nuclear plants until a safe national disposal site is up and running. (0309-5 [Green, Jeanne])

Comment: These vulnerabilities have been ongoing for too long. We must not wait until it's too late. The public must be protected from the grave dangers of possible nuclear waste dispersion, an untenable situation brought on by for-profit nuclear corporations. (0309-7 [Green, Jeanne])

Comment: We must stop generating nuclear waste by closing all existing nuclear power plants in the country. We are creating the most deadly environmental hazard, waste which will be harmful to living matter for tens of thousands of years. (0310-1 [Oster, Phyllis])

Comment: I would like to start with a little poem: It was a dark and stormy night of the nuclear powers; When the people fought the radiation showers; And in spite of its friendly atom; It had made no peace on the planet; And hardly anyone could muster flower powers.; But then the

NRC finally had a great vision; And gathered their courage for a much greater mission; They swallowed their pride,; They took it in great stride; And declared that NOW is the end of nuclear fission. I'm here today raising my voice to be heard and to speak against mankind's greatest folly. I'm here AGAIN-showing up like a bad penny, but with all the cents that this little penny can muster. Making sense of nuclear power is something that I NEVER have been able to do. No matter how I turn it around, I always end up with shaking my head and wondering how we came up with such a pea-brained idea. We have had 50 years of wasted confidence and it is time for a real solution. (0314-1 [Sorensen, Ole])

Comment: I promise you, the NRC, that the time has come when you will begin to feel the ire of us who has common sense and who realize how stupid this whole nuclear circus always has been. I have absolutely NO CONFIDENCE in any solution to dealing with any more nuclear waste than to STOP making the darn stuff. And don't even consider some desperate ideas that the waste can be used as fuel in a new generation reactor. Give me a Break!!! At this point you still have a small chance to redeem yourselves and MAYBE get a decent review in the future history books. Otherwise I can promise you that the next 6,000 generations will look back at your misguided activities with much disdain, anger and disbelief. So stop being an embarrassment to the human race and show us the courage that will make us all smile and let out a big sigh of relief. It is time to get out of the diapers and grow into responsible human beings. Putting a stop to the nuclear power generation will definitely show real leadership and true concern for the quality of life in the generations to come. (0314-4 [Sorensen, Ole])

Comment: In general, I have great concerns about both our high level of electric-energy consumption and the manner of its production. Our policy should be focused on greatly reducing consumption, as my household has done, and on moving to electricity from renewable sources like solar and wind, rather than from coal and nuclear energy. (0322-1 [Baker, Hannelore])

Comment: I was glad to learn, therefore, regarding nuclear power, of the Court decision placing a moratorium on your agency's permitting authority for the building of new (nuclear) plants or extending the operations of existing plants. My first recommendation is that this moratorium be kept in place. (0322-2 [Baker, Hannelore])

Comment: The extraordinary and long lasting damage to people and land which nuclear accidents can cause and have caused makes it far better that this method to produce electricity be wound down, in favor of safe methods like solar energy. (0322-3 [Baker, Hannelore])

Comment: Since the waste from nuclear power production is and remains extremely dangerous, four thousands of years hence, we shouldn't be burdening future generations by continuing to produce it. My third recommendation (related to and extending the first): Stop making more of this waste while we have no safe place to "sequester" it, in fail safe manner, from our environment and our children's. Help our country, as quickly as can be, to move on to safe, renewable energy. (0322-6 [Baker, Hannelore])

Comment: The current nuclear regulatory structure must stop stifling innovation and not license any new type of reactor for commercial use since they inherited the pressurized water reactor. (0325-15-2 [Robinson, Eric])

Comment: Nuclear energy is not clean even though you hear that here from people. Fuels that come in from the industry. It is not reliable, the thing has been shut down. They go out all the time. We had a blackout in San Diego partly because of San Onofre. It is not needed in

California. We have 156 percent of the energy that we need, and 20 percent is nuclear. You can just get rid of it, and we're fine. (0325-19-3 [Lutz, Ray])

Comment: I just have to say, you know, climate change is a very big concern, but I think using nuclear as a way to solve that is the most expensive, and the most reckless path we could go and follow. (0325-27-3 [Davis, Patti])

Comment: I challenge nuclear industry, the NRC, clean it up. Don't spend any more money on promotion, on new nuclear stuff that is not proven. Clean up what we have now, the stuff that is threatening and putting risk at our community and to my children. (0325-27-4 [Davis, Patti])

Comment: I just want to say that yes, we do need a diversified energy portfolio, and highly recommend wind, hydro, and a very wonderful nuclear reactor that we can all depend upon that's safely located 93 million miles away. It's called our sun. (0325-27-5 [Davis, Patti])

Comment: We have a surplus of energy supply here in California without our nuclear reactors putting us even more at risk. (0325-28-4 [Branigan, Mary Beth])

Comment: The nuclear industry has destroyed our DNA, of not only the humans but the whole planet, all the creatures. I am so upset with the nuclear industry and the NRC for its cooperation with them. (0325-28-7 [Branigan, Mary Beth])

Comment: In the meanwhile, the NRC should learn from their mistakes and shut down the remainder of operating nuclear power plants in this country until you can find a reasonable and safe way to deal with deadly radioactive waste. (0325-29-7 [Feathers, Jösan])

Comment: The system is not working. It's not either/or, we're going to have global warming or we're going to have nuclear energy. That's a false question. I'm for jobs, but we should have jobs doing the right thing, making energy that is safe and that doesn't cause harm to the next seven generations. Global warming is serious. There's no denying. Nobody that's against radioactive waste is for global warming. It's a very serious thing, but so is nuclear radioactive poisoning. It's very serious. We cannot just live by hope and faith. (0325-33-6 [Zigler, Randy])

Comment: Years ago, the eminent scientist, John Gofman, led 40 health physicists under him at Lawrence Livermore Labs and they were asked to disprove the work of Dr. Ernest Sternglass, who said that there was no safe level of radiation, that even the lowest dose was harmful to human health. But what Gofman came up with when he worked on this problem was he found that, in fact, there is no safe dose, and that Sternglass was right. So, Gofman famously said that licensing a nuclear power plant is de facto licensing premeditated murder, because we know that the doses that are regularly released from nuclear power plants do, in fact, kill people, especially the most vulnerable members of our society, the children and pregnant women are the most vulnerable. And even if they don't develop cancer and die, they suffer serious health consequences. (0325-9-3 [Reson, Myla])

Comment: So, we've got to stop making this nuclear waste, and we have to stop allowing this high-burnup practice to continue because it's nothing short of the reckless endangerment of the American people. So, let's stop the nuclear waste con job and let's stop the high-burnup waste experiment. (0325-9-4 [Reson, Myla])

Comment: One, nuclear power is obsolete. It's expensive, it's dirty, it's dangerous, and it's not sustainable, so we must abandon this technology. Two, safe storage of high-level radioactive waste is a myth, and Fukushima is our proof. (0326-10-1 [ZamEk, Jill])

Comment: [S]top being the generation of more of this dangerous material by closing all nuclear facilities. (0326-10-4 [ZamEk, Jill])

Comment: We are here to direct the Nuclear Regulatory Commission to change their name to the Nuclear Removal Commission, and we just want to say that it's our feeling that no one has the right, or ever had the right, to light matches that they couldn't put out for 250,000 years. Unfortunately, one of those little boys now sits on the Supreme Court of the United States. I would say, with Fukushima, no one can explain that, so instead of buying your kid an iPod, now you have to buy him a Geiger counter. (0326-12-1 [Racano, Joey])

Comment: "Better yet, shut the plant down. Stop producing nuclear waste and let PG&E stand behind what they claim is their mission; to use sustainable, clean energy, which nukes are not. Diablo is the last nuclear energy active waste-producing plant in California. It's an old plant that will be over 60 at the end of licensing period. We don't miss Humboldt, which shutdown in '76, or Rancho Seco, which shutdown in '89, or San Onofre, which shutdown earlier this year. The lights are still on. The nuclear waste left behind is a grim reminder that they were there." (0326-14-4 [Brown, Marti])

Comment: Remarkably, at Fukushima, dry cask remained intact, while the pools still present enormous problems two and a half years later. Clearly, cessation of further production of spent fuel is the safest way for the future. The less highly-radioactive waste is produced, the less future generations will be burdened. Common sense dictates, if you're in a hole, stop digging. (0326-15-5 [Schumann, Klaus])

Comment: [T]he production of more spent fuel must cease[.] (0326-15-8 [Schumann, Klaus])

Comment: I'd like to also, just off-the-cuff, say to claim that nuclear power does not contribute to global warming and is carbon free is preposterous. If you look at mining uranium and following the whole process, there's tremendous energy that's used and contributes to global warming. (0326-19-1 [Carrigan, Milton])

Comment: I have no confidence in the NRC's radioactive waste policy. Make the current licensing moratorium permanent. (0326-20-1 [Caulfield, Lee])

Comment: It's painful to study the nuclear industry. You know, I'm standing here. I'm going, what can I say to the NRC, or to PG&E, or to my friends and neighbors that can make your heart or your mind, kind of really, honestly grapple with this, because, you know, we're supposed to clean up our mess, and I know this is kind of a sore subject in this areas, but we don't even know how to keep the poop out of our groundwater and our ocean, much less deal with radioactive waste. We don't know what we're doing and we're leaving a horrible legacy. Hanford's one example of how we don't know what to do with nuclear waste. Humboldt-- took them 20 years for PG&E to put the radioactive waste into dry casks and now they're supposedly decommissioning it, but some would say it's just sinking into the wetlands, which it'll continue to contaminate the area. The NRC made us a promise that if we allow the nuclear industry to move forward, they would protect us and our interests, and our safety, and you're not doing it. If you were, and if the nuclear industry had to adhere to the rules like I do every day as an individual, there would be no operating power plants. None. (0326-21-2 [Conn, Diane])

Comment: Waste needs to not be produced unless there's a place for it to go, and there is not a safe place for nuclear waste to be permanently stored. That doesn't add up to me. And there's an interesting echo on my voice, but you get the point. Let's stop producing it and what we have, let's get into permanently safe storage that is not water-based. (0326-22-2 [Davies, Phyllis])

Comment: When we mine uranium, we deplete a non-renewable resource that eventually will be unavailable for future generations. Spent fuel rods create extremely toxic waste that cannot be safely disposed of. From an inter-generational justice point of view, nuclear power plants are inherently unethical. The total cost of electricity from nuclear power plants cannot honestly be calculated. It includes many unknowns left out of the equations, including, but not limited to, the cost of storing spent fuel rods for at least 1000 years, lifelong medical care for people harmed by the nuclear industry, irrevocable damage to the environment. When all this is added together it is clear that the real total cost of nuclear power is incalculable and morally unacceptable. This is not inter-generational justice. Instead, we need to explore other technologies that can provide needed power and allow us to meet our obligations to future generations. Nuclear energy has been imposed on the human race as an ongoing social experiment for long enough. The jury is no longer out. If Fukushima has not taught us that, then what will? (0326-23-1 [Malboeuf, Simone])

Comment: I believe it's time for the experiments with nuclear power on the inhabitants of the Earth to cease. We already know the answers. The costs are too high; the risks are too great. There are now proven ways to create electrical power that are different than this and don't leave the risk. Let's now step up to the plate. Let's become the world leader in developing safe electrical power. If not now, then when? (0326-23-4 [Malboeuf, Simone])

Comment: To object to the ongoing use of nuclear energy in our community under the illusion that it is somehow safe for us, our children, and all future generations, under the illusion that, somehow, it is less expensive than clean alternative energies, which actually do mitigate climate change. What they've neglected to mention, what CASE has neglected to mention, is that nuclear energy does not have a zero-carbon footprint. It has a very significant carbon footprint. According to some of the NRC spokespeople and physicists out here, there's quite a bit of energy that goes into the embodied energy of the materials, that go into the plant, the construction of the plant, the management of the plant, it is not a zero-carbon footprint energy by any means. (0326-26-1 [Severance, Bruce])

Comment: [T]here is no waste confidence, there is only waste incontinence. As exemplified by the currents, which are projected to increase the radioactivity of our waters off the California coast tenfold over what they are off the coast of Japan right now. (0326-26-3 [Severance, Bruce])

Comment: I want to give you a quote from John Adams. Remember him? The second President of the United States. One of our founders. He liked to say, "In everything, one must consider the end." In everything, one must consider the end. Now, that has not been done in the whole nuclear industry; that is not being done by the NRC. I think we ought to shuttle that, as Klaus suggested, and maybe fire all of you guys (0326-29-2 [Groot, Henriette])

Comment: I'm a retired teacher from Lucia Mar District. And I wanted to speak to the staff of the NRC about perspective. There's a world of difference between theory and reality. We who live in the evacuation zone, we live with the reality of the risk of an accident. We're reminded day in and day out when we drive on the highway, drive in our communities, the speaker boxes on the tall poles, if that siren goes off, we run. And when we saw the Japanese people running, we saw ourselves. That is us. And so it's a real issue for us. The NRC perspective is one of theory. They don't live here. They don't have to worry about what the heck they would do if the

siren goes off. So it's not a real perspective. And my message to the NRC Commissioners would be, you have a lot of power, you have the authority to make decisions that affect our lives. And when you make those decisions, make it from your higher consciousness. These are real people that live here. We already receive more contamination, as everyone does, who lives within 50 miles of a nuclear power plant. That's fact-checked online. So we're already more at risk. And as far as the supposition that we have -- we need nuclear power to put a stop to global warming, I recently came home from Germany on a rainy day, I was riding through the country, I was blown away by all the solar collectors on the roofs, far more than I see in California. And then I remembered, after Fukushima, the Germans were marching in mass and they got Merkel to take a stand. All their nukes will be shut down by 2024. Twenty-four percent of their energy comes from nukes, so thank you. (0326-31-1 [Highfill, Debbie])

Comment: I agree that I believe most of the employees at PG&E are good, responsible employees, and they love their jobs, and that's all fine and dandy, but they are dealing with the most toxic item on the planet. And we could have an environmental disaster, we could have a terrorist event, or we could have human error, and all three of those are very possible in this world. I just wonder if everybody remembers that great old phrase: safe, clean, and too cheap to meter. I don't think that. I think it's proven incorrect. We were also told that we could put the waste someplace safe. That's also incorrect. So there really isn't a whole lot to look forward to with nuclear energy production, except for potentials like the Fukushima even. I believe that we're all wishing for something safer and I agree that it's a difficult task to figure out how we will produce enough energy to take nuclear energy out of our lives and store that stuff for eternity someplace. But I've spent 16 years of my life in third-world countries, and they have the challenge of having energy production that is not as well-funded as ours is, and it's a lifestyle that I think I would be more than willing to go back to if I could feel that I wasn't going to be in the midst of a radiation event that could possibly happen just ten miles from my home. (0326-35-2 [Owen, Linde])

Comment: I'm baffled by the fact that we're still coming to these meetings. I don't know how many I've attended and all the wise, articulate people that have spoken about the harmful effects of nuclear power, and the waste that goes with it. This is why I'm here. And I hope that a picture is as strong as a thousand, a million, words. These are my grandchildren. They live with their parents in Morro Bay. (0326-38-1 [Waddell, Duane])

Comment: PG&E, and the CEOs, and the stockholders, they get -- I mean, they get the profits and we get the power, even though the rates have gone up; continue. And they get to deal with the waste and everything that goes with it for who knows how long. How many generations? How can we morally justify passing this on to them because of power that we're using in such a short period of time? Doesn't make sense. (0326-38-2 [Waddell, Duane])

Comment: I live near Santa Barbara, down the coast, and since before the inception of Diablo Canyon, I've paid a lot of attention to nuclear energy issues and risks. I've read many, many reports, so my comments, probably, they'll reflect what a lot of people have said, but I'm thinking not only about Diablo Canyon, but about all the other sites across the United States, places like Vermont Yankee and Brown's Ferry come to mind, as well as reports about all the near misses that are reported, and the problems that happen, despite everybody's efforts not to have them happen over and over again. You can read those in the Union of Concerned Scientists reports. (0326-39-2 [Weissglass, Theresa])

Comment: My granddaughter helped me make this poster. It says, "The safest distance from a nuclear reactor is 93,000,000 miles." And that's because the spent fuel that comes out is a

million times more radioactive than when it went into Chernobyl, Fukushima, Diablo. (0326-40-1 [Wilvert, Rosemary])

Comment: Now, instead of government subsidizing the nuclear industry or the fossil fuel industry, if they subsidized clean energy like solar, and wind, and wave, plus the job training, our whole economy would be a lot healthier, as we would be as individuals. (0326-40-3 [Wilvert, Rosemary])

Comment: Some of it, like cesium and strontium, take 300 years to become safe, and that's the short end. Other elements, and there are many kinds created in the fission process, not just the three I mentioned, take hundreds of thousands of years to decay into safety, and some, even a million years. So we create these new elements now in the nuclear fission of uranium in order to use the extra release of energy to heat up the water to power the generators with steam. And the result of all this is centuries and millennia of dangerous toxic elements that must be kept out of the environment. When you take all of that into account, it doesn't sound very cost effective to me. (0326-44-4 [Lewis, Sherry])

Comment: I am one of the indigenous peoples that meet down in San Diego and we come together. It's indigenous peoples of Canada and the United States. We had a very long discussion on nuclear waste, so I'm coming to you as a messenger of them. Today we are speaking on behalf of all life. We recommend that Diablo Canyon Nuclear Power Plant be decommissioned immediately and halt any further production of spent fuel. (0326-45-1 [Baker, Crystal])

Comment: We are in a hole. We've been in a hole for quite some time. Americans are very pragmatic dreamers. We keep thinking nuclear power is clean. It's cheap. It's safe. It won't leave a fossil imprint, not like coal, not like oil, nuclear is safe. So here we are tonight, hundreds of us, thinking about this very issue. What has really brought it to our attention is Fukushima, and Jerry just referred to the possibility of earthquake in case -- during the time that they're removing the rods off the ceiling of Reactor 4. Well, just Monday night, about 11 o'clock, I'm looking at my computer and there's the announcement that there's been a 5.8 earthquake off the coast of Fukushima on the very day that they've started removing. Now, the scientist David Suzuki, says that if the earthquake reaches 7 point, that's when we head for the hills, because that will result in an evacuation of the West Coast and the destruction of Japan. So this is not something to fool around. I know that the people in the NRC are making a wonderful income, most of us here tonight are retired, and we're not making that income. We're here because we care. We want out of this hole. (0326-5-1 [Brousse, Elizabeth])

Comment: I'd like to say that when this room was full I would have said that many of you, 35 years ago, went to jail protesting the building and the licensing of this plant with the very fear that we are addressing tonight. Didn't we all say back then, what are you going to do with the waste? We were told that something would be figured out. Thirty-five years, energy too cheap to meter. What, do we have the most expensive electricity in the nation now? (0326-50-1 [Evans, Pete])

Comment: This is why I stand here today, to demand that there is no new nuclear power licenses granted, that all existing power plants are decommissioned and that the spent fuel is transferred from the pools to the dry casks. (0326-51-3 [Gutierrez, Ingrid])

Comment: People talk about what are we going to do without nuclear power. Well I think most of us here remember the oil embargo in the early 70s. Jimmy Carter had a national conservation

plan going. We saved 15 percent of our energy needs at that time. That was more than nuclear power was putting out. We don't talk about conservation. We can do this. Nuclear power is only putting out 19 percent right now. If we had a national conservation plan we could save more than that. We do not need nuclear power. We do not need Diablo Canyon. I have lived 7 miles, for the last four years, from the Diablo site. And you ask about confidence. How much confidence do we have in the NRC judgment? We were lied to when we were told that nuclear power would be so cheap that it would cost a penny per kilowatt. We were lied to when we were told plutonium was safe enough to sprinkle on your breakfast cereal, you know, how like putting Brewer's yeast or a handful of almonds over your Cream of Wheat or something. (0326-53-2 [McGibney, Patrick])

Comment: Two things I'd like to say is stop making nuclear waste... (0326-53-5 [McGibney, Patrick])

Comment: I just heard that radioactive water entering the Pacific Ocean at the Fukushima site in Japan is expected to reach the West Coast of the United States sometime around March of next year, 2014. Nuclear power and the waste that it creates is deadly to most living things. I also feel it's the most deadliest form of pollution man has ever created. I feel we must phase out all nuclear power plants as soon as possible. (0326-54-2 [Crimmel, Steve])

Comment: As a graduate of the Natural Resources Management Department I look at the nuclear industry with a "is this sustainable" aspect. And it's pretty clear that there is no solution to nuclear waste. And I'd implore you all to consider that when you make these decisions for the future. Transporting nuclear waste, nobody wants this in their backyard. Nobody's comfortable with it. I hear corporate shills say that it's carbon-free and safe. Safe? You know what's happening in Fukushima, right? Or Three Mile Island or Chernobyl? Imagine, say, feeling if you hear those alarms. I'm not 30. I have concerns for my little brother who has to deal with this waste and that potential of danger. (0326-55-1 [Krist, Mark])

Comment: We can't blame the Federal government for not yet making a repository. We're still creating the nuclear waste. That's not --let's just throw the blame to the Federal government because they haven't given us a solution. We have not stopped making the waste. (0326-55-3 [Krist, Mark])

Comment: Please look in the mirror. Ask yourself, are you comfortable with nuclear energy and what the potential for future generations having to deal with this mess is. And if you are, look into a child's eyes and tell them that you are supportive of nuclear energy. (0326-55-4 [Krist, Mark])

Comment: Sustainable energy sources, photovoltaics, wind turbines, wave action turbines, et cetera, are no longer simply experimental sources of energy, as you would like to make us think. You know that and so do we. The site at Diablo Canyon offers a perfect opportunity for a conversion to safe, renewable energy sources, sources that could provide economic possibilities that are staggering. By the way, terms like generic and feasible do not inspire confidence. Political will and greed are holding us hostage. You are holding us hostage. The utilities are holding us hostage. Nuclear energy makes C-E-N-T-S to you and no S-E-N-S-E to the safe perpetuation of life on earth. The nuclear energy has turned our beloved planet Earth into a ticking time bomb. Don't let NRC be translated as Not Really Caring, Not Really Concerned, Not Really Conscious. (0326-57-2 [Livingston, Rosanne])

Comment: This plant must be shut down and buried, all those plants around us must be. (0326-58-4 [Davis, Adrienne])

Comment: I feel like Rachel Carson when she tried to tell people that when you have pesticides and you have reactor emissions, then you have really high rates of cancer, and the press, the corporate press, castigated her and called her conspiracy theorist. And she talked about the enemy within. I don't know how many of you have read this book, but I wish you would. It's an old book, but it tells about what happens around nuclear power plants and how many cancers occur all the time. And I want to -- my father is sitting here on my shoulder. My father, the War Department, after the war, sent him to Fukushima -- or no, to Nagasaki, sent the soldiers to clean up. They called it mopping up. They gave them no protective gear. He came back and he had a 16-year post traumatic stress syndrome, they called it shell shock, and he lived 16 miserable years, and he died of lymphosarcoma at age 51. I had a real early awakening of the diabolical effects of ionizing radiation. And I want to leave you with this statement: you can't play a song of freedom on an instrument of oppression, and that's what I see as ionizing radiation. It remained an instrument of oppression. (0326-6-2 [Walking Turtle, Willow])

Comment: And, oh, I also recommend that Diablo nuclear power plant not be allowed to apply for re-licensing unless they have a permanent offsite storage solution. And I actually, thank you, I don't think they should re-license Diablo, period, but that's just my opinion. I think that it makes the most sense that they should have a plan for that. (0326-60-4 [Spooner, Rena])

Comment: And I had one more comment because I live in Los Osos. They've had a moratorium on building more toilets, in other words, having more poop, because they don't have a sewer. And I think there should be a moratorium on nuclear, which is way worse than poop. (0326-60-7 [Spooner, Rena])

Comment: I also agree that there should be no-- they shouldn't be able to apply for re-licensing without the storage issue being addressed. We all know it can't be addressed. That's why they're allowed to reapply. And the burden in our community isn't the lack of a Federal repository. The burden on our community is the continued creation of nuclear waste. We keep doing it and we don't have to. (0326-61-3 [Henry, Anita])

Comment: When I was arrested 34 years ago for protesting, I'm almost 60 now, I was 25 years old when I was arrested. They asked me why I did it. Three reasons. We don't need nuclear power, it's not cost-effective, there's nowhere to put the waste. I repeat, we don't need nuclear power, it's not cost-effective, not without the nuclear welfare program that we have going in our country. The taxpayers pay for most of it and will continue thanks to the Price Anderson Act that limits corporate liability to \$12.5 billion. Fukushima's already up to hundreds of billions of dollars. That's not going to change. (0326-61-4 [Henry, Anita])

Comment: I moved here in 1979. And I was honored to go to some protests over at Diablo Canyon, voicing my disapproval of what was going on back then. Yet, and you've heard it before, other people have stood here saying the same thing. We asked backed then, and I was here. I talked to the NRC back then and I said well, what are you going to do with the waste. Oh, we're going to take care of the waste. We're talking about, I mean, this is half my lifetime ago and we still have nothing for the waste. We keep making the waste. (0326-64-3 [Nelson, David])

Comment: The NRC must finally act responsibly and phase out nuclear power as quickly as possible, and manage the mess you've enabled as diligently, as possible. (0327-11-9 [Kline, Connie])

Comment: Nuclearism is corrosive to democratic forms of human governance and, in fact, the mere existence of high-level radioactive waste provides the only rational justification for the

permanent imposition of martial law that exists. If there's any doubt about this, it was only the falsified mention of yellowcake that allowed the government to go into Iraq and be in this interminable war that is still affecting the people of Iraq, the Middle East, and the rest of the world. The Patriot Act was a result of this, the NSA spying is a result of this. This is nuclearism, and it's the denial of democratic forms of human governance. (0327-14-3 [Ellison, David])

Comment: But as a mother, I just want to say that I'm scared. I'm scared for my children. I'm scared for my potential grandchildren. I'm going to be dead, and I'm looking at all of you and so are you, 160 years. What are you thinking? Let's stop while we're ahead. Let's not put this on our grandchildren and our great-grandchildren any more than we already have. I want you to stop now. I don't want to have my great-grandchildren, or my grandchild, or my son say well, there went the Great Lakes. People, human beings, operate these plants, and you all make the rules. And humans, I've got to tell you, we are not infallible. We make mistakes. This is dangerous stuff to be making mistakes with. I just want to have future generations. Please, stop making the waste and turn attention to safely isolating it, because that's the problem that we've already created. (0327-15-1 [Miller, Susan])

Comment: Stop making it period. (0327-2-7 [Keegan, Michael])

Comment: This requirement [rolling stewardship] is best stopped by stopping production of nuclear waste, and the second would be hardened onsite storage. (0327-20-5 [Clemons, Victoria])

Comment: For the many generations to come, I am angry that I get to inherit along with my future children, grandchildren, great-grandchildren, and so on, and so on, and so on, and so on the problem of deadly permanent nuclear waste. Nuclear waste, as we all know, comes from reactors. This is an unnatural type of energy. The further we move away from natural types of energy, like wind, solar, geothermal, hydro the more consequences that we are going to have. The enormous consequence of the most deadly manmade material on the planet is what we are faced with when we have nuclear energy. (0327-21-1 [Miskena, Jessice])

Comment: We cannot relicense or license any more reactors. We don't know what to do with the 76,000 plus tons in this country alone. We have nowhere to put this. (0327-21-2 [Miskena, Jessice])

Comment: If you hold up to your mission statement then you would see that nuclear energy is immoral. We are killing people with this type of energy. We are causing DNA mutations, we are causing horrific birth defects. Please research them. We are causing infertility, heart problems, immune deficiencies, and cancer especially among the youngest of our population. That is immoral. Nuclear energy is an incalculable danger to the whole of creation for historic and geological ages. It is a transgression against life itself. It is infinitely more serious than any crime perpetrated by man. Nuclear energy is an ethical, spiritual, and metaphysical monstrosity. It means conducting economic affairs as if people didn't matter, and you will be seeing me again, I'm sure. (0327-21-5 [Miskena, Jessice])

Comment: I'm just going to touch on the subject of nuclear power plants are huge plutonium factories. Electricity is a byproduct. It's not the other way around. (0327-22-3 [Muser, Mary Jo])

Comment: So this is also a product of this industry. And it goes into the war machine. No more war. Let's stop this crap. We don't want it. (0327-22-6 [Muser, Mary Jo])

Comment: It's got to stop. We are at a period in world history where we are ruining the water, between the fracking industry going into our water tables all over this country and all over the world and now this, on the largest body of fresh water, you are talking about more? Really? Really? We're done if it continues, and you all will be to blame, not me. But I'll be equally as dead, as will my son and my children and my grandchildren and everyone else's, because this stuff, it needs to be contained and you need to stop producing it. (0327-23-3 [Tolls, Leatrice])

Comment: We need to come up with better sustainable energy solutions that will provide jobs, that will ensure our children's future into seven generations, that will stop this stupid mental masturbation of these hearings in perpetuity, to bring about a change of good news because when there is a solar spill, we just have a nice day. And I want you all to have nice days ahead of you. (0327-23-5 [Tolls, Leatrice])

Comment: This is the Pandora who was fashioned by Greek gods who wanted to punish humans for having discovered fire and made good use of it. And what Pandora made the mistake of doing was opening the bottle of the gifts that the gods had given her, which were really to be punishments for humankind. We seem to have found one of those gifts in nuclear energy, and we seem to be reaping the consequences as punishment. But not all of us realize that it is punishment yet. It's happening slowly to our species, as our genes are damaged, as we find ourselves afflicted with diseases that, you know, they can't quite put their fingers on the causes of. Those are the kinds of consequences, I would use that word, today for what we are undergoing as a result of these gifts of nuclear energy. (0327-24-1 [Rivers, Alicia])

Comment: In our American Indian ways, we were taught that any important decision affecting community must take into consideration how it will impact the next seven generations coming behind us. It's our responsibility to protect the earth, and we take that responsibility very seriously. Obviously, that consideration was not taken, or we wouldn't be here tonight, because we would never have started nuclear energy projects in the first place until the subject, until the subject of waste and safety were satisfied. Consequently, nuclear waste is now going to be impacting many more than those seven generations, given that some components of nuclear waste will remain dangerously radioactive for tens of thousands of years into the future. (0327-25-1 [Crow, Valerie])

Comment: My objection is the same now as it was back in the early 70s: what are you going to do with the nuclear waste? How ironic that 71 years ago today Enrico Fermi split the atom, creating the first nuclear waste. No waste has moved anywhere for those 71 years, yet you want us to believe that something is now magically changing and we should keep going along the same path we've been on for 71 years? Ridiculous. I give the NRC a no real confidence vote and demand that no new or extended licensing be granted, which seems to be the very same finding that the courts had. The NRC has an obligation to citizens first and not the nuclear industry. When you don't know what to do with the waste, stop making more. (0327-25-5 [Crow, Valerie])

Comment: And more owners of aging plants just may decide that these stations aren't worth continuing to operate. The 2005 Energy Policy Act provided a whopping \$18.5 billion in loan guarantees to the nuclear industry. But perhaps we should consider Germany, an economic powerhouse. Haven't they decided that the prudent way to get energy is to stop using nuclear and instead support the use of solar and wind? (0327-26-2 [Myers, Dan])

Comment: There's a consensus between the U.S. government and the nuclear industry for about 70 years now that withdrawn fuel rods are lethal unless shielded. To continue to produce

them and intent to abandon them into the biosphere is profoundly immoral and a burden and a curse on future generations into eternity. It is premeditated murder. (0327-27-2 [Macks, Vic])

Comment: I went to the Rochester Institute of Technology where there was a symposium on nuclear energy. There was a pro-nuke person and an environmentalist, an anti-nuke person. They were having a debate. At one point, the environmentalist brought up the problem of nuclear waste. The pro-nuke position, the man up there, got up there on the stage and he said, "We have a solution now for the nuclear waste." And the environmentalist said, "Well, what is it?" and he said, "I can't tell you right now, but we have one." And at 18, I felt compelled to stand up and say it's obvious he's lying. The whole industry is built on a lie, and the fundamental lie is that you know what you're doing. (0327-29-1 [DeMare, Joseph])

Comment: Instead, we will address the morality of passing on our responsibilities to future generations. The NRC is overseeing the production of deadly poisons that will affect so large a number of generations in the future that the human mind has not evolved to comprehend the magnitude of the figures. All of this to boil water in the last half of the 20th century. How outdated will the technology appear in a couple of generations, let alone hundreds of generations, and who will want to pay to get rid of the waste? We offer a plea to the members of the NRC to take a step back from the life of the everyday, and look at the bigger picture that humanity is now facing. You are all interested in having a nice home, putting your children through college, having social dignity. If the jobs that you and many of the most of the rest of us are taking are increasingly controlled by a small percentage of individuals and corporations which has been referred to as the 1 percent. The jobs they offer us are rarely about fairness to the 99 percent. The 1 percent are stealing the natural resources that should belong to all of humanity. They are selling our own resources back to us, exploiting them, and depleting them for short-lived personal gain. Extractive processes, including uranium mining and milling are occurring at the expense of clean air, clean water, and healthy food. Decisions about resources of energy, about sources of energy and wars to control them are being made outside the democratic process. (0327-3-2 [Todd, Doug])

Comment: A major portion of the U.S. economy goes into making weapons of war, including nuclear technology whose destructive power the human mind can scarcely comprehend. Technology and whether or not it serves humanity is out of the control of our democratic process. If World War II were reenacted today, all of Europe would be uninhabitable due to the presence of nuclear reactors and their waste pools. And what happened to the democratic process when it was decided that the public would take responsibility for the waste and take it off the hands of the industry? (0327-3-3 [Todd, Doug])

Comment: There are alternative methods to produce non-greenhouse-emitting energy that are already being developed now. Remember, first do no harm. Do not continue to produce more nuclear waste, hoping for a solution. The Nuclear Regulatory Commission should not assume that proper nuclear waste facilities will be developed. Instead, you should stop the construction of new nuclear plants unless and until we have a failsafe containment system. (0327-30-4 [Parker, Bob])

Comment: We're [Radioactive Waste Alert] a grassroots organization who does not believe that any amount of radioactive contamination is safe for anybody. And our society, our society is moving in a dark direction. But rather than using our resources to make our mechanized industrial complex of energy and manufacturing safer for all of us, we are all following a path to the bottom. Profit and mediocrity take the place of commonsense and safety for all of our lives. The easiest road seems to be to maintain the status quo, even when common sense tells us

that it will not lead to the best results in the long term. This road is supported and fed by those who are most vested in the shorter-term outcomes without concern for the long-term outcomes. The more difficult road is that which takes the most short-term resources to form because it looks at the long-term outcome and forms its basis therein. The easy road is the road to oblivion over time. We are now seeing the consequences of taking the easy road for generations, and skyrocketing cancer and disease rates in our country, super storms that are just beginning to reveal the onset of symptoms of climate change. The scientific consensus is overwhelming that it is manmade. And investing our collective focus on economic profit motives over protection and safety considerations that result in all of the aforementioned consequences. (0327-32-1 [Pace, Greg])

Comment: It is time that our mode of corporate, legislative, regulatory, and social behavior and priorities put priorities where we all know that they must preside: safety of human life, safety of human social interaction next, safety of human economics next. In other words, all the money in the world will not accommodate a wish for millions of unhealthy lives into healthy lives. The direction the NRC is taking with lowballing regulatory considerations for dealing with high level of radioactive waste is shamefully remiss in terms of priority number one. Nuclear energy is not a viable option to continue to supply our vast energy needs in today's civilization because we cannot do it safely. (0327-32-2 [Pace, Greg])

Comment: The issue of high-level radioactive waste, so dangerous that we cannot even figure out how to dispose of what place it has in our society. We can't even dispose of it. We can't figure it out. If we reach into our hearts, transcended to the place where we have created vested interests in maintaining status quo on this issue, we all can see that really there is no place for more radioactive waste in our society where human safety is the number-one priority. Therefore, we must focus our energy and efforts on shutting down the nuclear power industry and putting resources we have been using to support this industry into fully renewable energy methodologies now. Germany is doing it, Denmark is doing it, as are other countries. The dinosaurs were killed off by an outside force. We do not want to become the dinosaurs who killed themselves off. (0327-32-4 [Pace, Greg])

Comment: I am concerned, though, with the nuclear industry custom of twisting the words. They use the term spent fuel. Spent is not spent. Most of us think of the word spent in a common fashion, meaning it is no longer any useful, any good. And, yet, that's not exactly what this means at all. It means just the opposite. Spent fuel is so highly irradiated that it cannot be used any further in a nuclear fashion. So what happens to it? It sits around for quite a while. For instance, we've had a lot of talk about the long time and that tritium is rather, in fact we know that tritium is being released by every nuclear plant in this country, and we're always being told, oh, but it hasn't gone offsite. And what kind of a half-life does it have? Twelve-and-a-quarter years. That's the half-life. In order to figure a full life from a half-life, you have to multiply it by at least 10, which would be 120 years, okay? But we've got other ones, too. For instance, radium has a half-life of 1600 years, but you have to multiply, put another zero on that one, and you've got 16,000 years. And that's radium. But the one that's the real topper that I know of that -- oh, this list was made out from some, the technology, safety, and cost of decommissioning a referenced low-level nuclear plant. But it does say uranium, which is, oh, let's see, uranium-235 is 710 million years and uranium-238 is 4.5 billion years. Now, I know even my sweet little granddaughter isn't going to be around that long. So it's something that we all have to be considering all the time. How the supposed greatest minds of our nation and the world ever got into this kind of a mess, you know, I have trouble believing it. So do most of the people I know. (0327-33-1 [Carey, Corinne])

Comment: Remember that great American story, the Wizard of Oz? Remember when we said that big scary fiery talking head scared me? Pay no attention to that man behind the curtain. The Great Oz has spoken. Think yourself lucky I'm giving you audience tomorrow instead of 20 years from now. The Great Oz has spoken. To that, Dorothy says, "If you were really great and powerful, you'd keep your promises in the end, Oz." In the end, Oz finds alternative solutions to his promises and admits his scary energy. I mean, scary tactics were wrong. Be great and powerful. Come out from behind the curtain and reveal the scary reality of what to do with nuclear waste. (0327-35-1 [Poprafsky, Nancy])

Comment: And, again, famous words from the Wizard of Oz to the NRC: use your brain, find a heart, love your home, and use your courage to abolish nuclear power forever. (0327-35-3 [Poprafsky, Nancy])

Comment: In fact, what we are gathered here together today is to sort of hold up yet another ruse that's been designed to deflect the real issue at hand, and the real issue is, of course, why are we continuing to make this stuff? The ultimate answer to the dilemma of radioactive waste is not to make any more of it. This has been repeated many times this evening. So let's stop digging ourselves in deeper and deeper into a hole that we can't possibly dig ourselves out of. (0327-39-2 [Izant, Carol])

Comment: And if it hasn't become perfectly clear from the recent, still-unfolding disaster at Fukushima that nuclear power is simply too deadly, too dangerous, not to mention unneeded, uncompetitive, and obsolete, to be considered as a likely component of the 21st century energy policy. (0327-39-4 [Izant, Carol])

Comment: They say truth is stranger than fiction. And when it comes to the matter of radioactive waste, I couldn't agree more. Let's face it: we built the mansion. We forgot to put in the toilet. You know what? If I was a builder and it got out there that I was building McMansions without a toilet, my reputation would go down the toilet. (0327-39-7 [Izant, Carol])

Comment: Now is not the time for business as usual. We are all in this together. Whether or not we realize it, we are all on the same side here. There is no such thing as something that is bad for one person and good for another. If something is harmful for even one person, we are all connected and, ultimately, it harms humanity. So, I make a plea that the NRC stop for a minute and take responsibility along with the rest of us for standing up to the 1 percent that controls our paychecks. We have a responsibility to protect, not endanger, future generations. We have confidence that the first solution to nuclear waste is to stop generating it. Continuing to generate poisons that must be isolated from the biosphere forever is not in the interest of our progeny. We cannot pretend that future generations will somehow invent alchemy to turn lead into gold. As the song goes, "Plutonium is forever," but I won't sing it here. (0327-4-3 [Marida, Patricia])

Comment: I don't think that most people realize they [nuclear power plants] are nuclear waste dumps. I mean, they think they're a power plant. They don't even take into account where all that waste is going and how it's building up. The attitudes towards people as far as health issues, you know, it won't happen to me or, if it does, it's just an unfortunate thing that happens. You need to connect the dots. And maybe if you were 38 years old and diagnosed with cancer from an environment that is killing people, you would realize you have to do something beyond just as you've been doing, as you've been doing, and dealing with it at some future point. Our generations cannot do this. I'm an oncology nurse, and I see the people that are affected by these environments and I deal with them year after year, day after day. I've been out in Oregon

for 22 years as an oncology nurse. I see the people that come from Oak Harbor, that come from Davis-Besse. It's heartbreaking to see a mother, 35 years old, with three small children dying. (0327-40-1 [Berlincourt, Kerry])

Comment: And people have to do something not only about the waste but stop producing it. While you're worrying about what you're going to do with the waste, you're continuing to produce more and more and more. You need to realize that this is not a problem that you're just going to try to solve now, and the NRC needs to think not as a government agency, really you're for the people. You're supposed to be helping, just like the EPA is supposed to be helping and there for us instead of being there for big business. (0327-40-2 [Berlincourt, Kerry])

Comment: I attended a number of meetings prior to the construction of the Davis-Besse Nuclear Power Plant. During these meetings, two things were stressed: nuclear power is safe and electricity from nuclear power will be cheap, so cheap, in fact, one expert said that electric meters will become a thing of the past and residents will be just charged a flat rate. They were wrong on both points. Nuclear power is not cheap, and nuclear power is not safe. (0327-42-2 [Faris, Kelly])

Comment: A former prime minister of Japan has called for the end of all nuclear power generation in Japan. There's nothing more costly than nuclear power, he said. In Germany, all nuclear power plants will be shut down by 2022. (0327-42-4 [Faris, Kelly])

Comment: So here's my solution. You want our input? Close down all nuclear power plants, place all radioactive waste in the reactor building, and cover it with tons and tons of concrete, as was done in Chernobyl, and hope for the best for the next 20,000 years. (0327-42-7 [Faris, Kelly])

Comment: I can think about 50 years ago how happy a room like this would have been when they were announcing they were going to build Davis-Besse. Electricity was going to be free, jobs were going to be abound everywhere on all different levels of the community. And, you know, I can see there was probably a lot of rejoicing on that end. A lot of people got hired, the plant got made, electricity was sold. And then we started having our problems on it. So as far as what everybody spoke out here tonight is -- I pretty much agree with almost every single speaker that was here. There is some benefit in nuclear energy, like as far as, like, in the medical field. And then there's the, and then, on top of that, it is probably the most dangerous type of energy we could ever, ever take on. I mean, when you get down to it, there really is no safe way to mine it. I know that from New Mexico because that's where I'm from. The Navajos got sick. There's no way to mill it. I know that from my wife because she worked at the uranium mines in Grants, New Mexico and she ended up with thyroid disease. There's no way to enrich it because people over there in Piketon, they're all sick. No way to be able to use it for energy because of all the people that, just the safety and the incidents that have happened which we're talking about: Fukushima, Three Mile Island, and all the other places people have been affected. And that's not just with nuclear plants, it's with the way they enrich it and the mines -- everything that they're doing -- which turns out, like in Grants, New Mexico and Piketon. The biggest industry there right now is the healthcare industry. And to have an industry that compensates people that work in the industry is, like, insane. I mean, they're getting sick and they're compensating, and they're saying it's safe. So how could it be that way? (0327-44-2 [Chavez, Tim])

Comment: So, really, the happy face on nuclear industry, on the nuclear industry, the happy face is, the happy face is energy. Really, you know, this fuel goes into weapons, and that's what's fueling the whole industry. If I had \$500 million in order to be able to, or a billion dollars

like it is, it's not \$500 billion. When you take the health aspects on it, it's trillions of dollars. We could throw that into something that's safe. And you know what? You're right, we are Americans. And, yes, we can come up with better ideas. But there's a lot of other alternatives we could take as far as producing energy. (0327-44-4 [Chavez, Tim])

Comment: Fermi 2 is the largest Mark I reactor in the world, and it has accumulated a lot of deadly waste in its years of operation. And without any plan for the waste, removing the waste, Detroit Edison seeks a license for another reactor, Fermi 3. We already have too many reactors and radioactive dumps at every operating reactor in the country. More than that, if a truck driver told me the truth when he said he had hauled radioactive waste and dumped it in the former Cold War missile silos and dumped it. (0327-5-1 [Collins, Jessie Pauline])

Comment: Each reactor continues to endanger an entire bio region. In our modern world, nuclear produced electricity is totally unnecessary other than to extract the plutonium for powering nuclear triggers which I'm told need to be pepped up each year. (0327-5-4 [Collins, Jessie Pauline])

Comment: I urge the officials here to uphold the law, not to renew an existing license, and not to license any new reactors, and shut down all operating reactors for the sake of humanity. We have passed through the deadly nuclear age, and found it wanting. (0327-5-5 [Collins, Jessie Pauline])

Comment: It's quite clear that we're at this point again because there is no solution to disposing or maintaining nuclear waste safely for an eternity, and it's absurd to think so. So, we can say over and over again as the public does, that we need to stop producing it, we need to stop relicensing nuclear power plants, and we need to shut down the existing ones now. And that's what people say over, and over, and over again like a broken record to the NRC. (0327-6-2 [Leonardi, Michael])

Comment: I would like to take note that \$500 billion or more of U.S. tax payer subsidy has helped to create a nuclear industry, a fantasy world where nuclear power is too cheap to meter, where nuclear accidents are literally impossible, and where nuclear waste is not only not a problem, but is considered a resource and an inexhaustible source for future power. (0327-7-1 [Gunter, Keith])

Comment: I say to you tonight that after over a half century we, the public, have seen too much to be fooled any longer. Fukushima Daiichi epitomizes the hazards of GE Mark I irradiated fuel storage, and any loss of onsite and offsite power could lead to a very bad day. You don't need a earthquake or a tsunami. In closing, I will say this. We are long past due in banishing somehow, some way, the nuclear power fantasy to the dust bin of history in favor of truly clean, renewable, and affordable forms of power, and that finally placing human health and public safety above the interests and profits of gigantic corporations. The time has come. (0327-7-4 [Gunter, Keith])

Comment: I think the best answer is to keep working on solutions, but stop making it. (0327-8-4 [Barnes, Kathryn])

Comment: The most obvious and moral solution is not to make more waste in the first place since, especially now, it is unnecessary. Nuclear electrical generation comprises only 20 percent of our power supply, and there are now less expensive and safer alternatives. We should not as a civilization endanger generations far into the future because nuclear waste is forever. (0327-9-5 [McArdle, Ed])

Comment: It's responding or submitting comments to the President that aren't factual in many cases. The lying needs to stop. These nuclear power plants need to be decommissioned. I don't see any safe nuclear alternative from my perspective, which admittedly is very limited. (0328-13-2 [Wagner, Sam])

Comment: I've always been afraid of radiation and nuclear power. I remember as a child during the second World War, I was in elementary school, and one of the things that I was allowed to do was help paint the lines in the halls that we would run to in the event of an air raid and sit between the wall on those particular lines. And I carried that concern with me all my life. So, lo and behold, they bombed the Japanese in 1945 when I was still in elementary school, and we read the horror stories about the radiation and all that. And then it became part of my makeup. (0328-15-1 [Davis, Leslie])

Comment: So, I formed together with Dr. Charles Hoover and Steve Chapman, and Patrick Reagan, and Steve Gadler, and I'm the only survivor. We formed together in 1979 and 1980 to fight certain environmental issues, and expose this whole nuclear power thing, and then you'd think people would rise up if they knew what was going on about it. So, I survived them and go on today, and I say well, let's see what we can do about this radioactive waste problem, this nuclear problem, because they talk about we want to be carbon-free, but they don't talk about conservation and efficiency that can automatically reduce your carbon footprint by 30 or 40 percent cost-effectively. That's probably a better way to reduce the carbon footprint than mining, milling, transporting, enriching, processing uranium and winding up with this problem today. (0328-15-2 [Davis, Leslie])

Comment: So, I don't think there's really any hope for us as we immerse more and more as the wave of problems from Fukushima, Japan comes over. It wasn't enough of a lesson for Chernobyl, or Three Mile Island, and now Fukushima is not enough because you're talking about licensing more nuclear plants. (0328-15-3 [Davis, Leslie])

Comment: So, I'd go with my sign to a small college in Minneapolis, and one kid comes over to me and he says what are nukies? I said well, I said nukies are something we all probably need a little more of. But these are not nukies, these are nukes, and nobody needs any of them. And if you continue licensing them, and permitting them, and giving them a chance to get out of it, you're dooming the society. (0328-15-5 [Davis, Leslie])

Comment: All of industry can't turn it off. Fukushima, these are human beings. You are defying human rights. You are in default against all of nature. You've heard it before. Tesla told you ones who want to want to fix it, you ones who think you can do something about this, I would encourage you, I would encourage you at this late hour. All directions, all the elements, sacred elements, plutonium is the first manmade element, and it's changed the whole course of humanity through time forever. And all life waits, waits for the human beings to come forward in the best of their nature to fulfill their purpose here, to protect all life, to participate with all life. I don't know how to recover it for the human beings, for the people. I've heard you. I heard you say that society is sick, granted the society is sick, we're all human beings here. What are we going to do with the best of our nature? How are we going to turn this around? What are we going to do? Why aren't we helping Fukushima? Why aren't we helping? Russia went. They offered it. There's nothing they can do. And we can sit here and act like the profits are going to continue? There is no profit. True cost has never been considered because true cost means all life, all the future. (0328-16-2 [Bonniwell, Colleen])

Comment: I would also propose that the NRC begin to adjust to the concept of an international uranium mining moratorium, and an international nuclear waste moratorium. (0328-16-5 [Bonniwell, Colleen])

Comment: Colonial oppression, colonial domination by corporation Fukushima, the today people with the mining, the mining that's gone on in Northern Saskatchewan, and the nuclear waste dumping threat in Minnesota, Wisconsin, Michigan, Ontario, and Manitoba. As we speak, they're planning to put a nuke dump right on Lake Huron. The Pacific Ocean, is it going to support life, questionable, very questionable. And then the two oil spills, the Gulf is dead. I came here tonight to make a plea for Lake Superior, to make a plea for the children, to make a plea for the future. That's why I kept going through the whole way down here through the blizzard because the blizzard is nothing compared to what threatens. And I would come here to you today and say kill me now because your politics behind this industry is so corrupted, and so vile. And I would say kill me now and spare the future. But guess what, where's our future? Where are we going? The water is sacred. NRC focus on the water, the children, and the future. (0328-16-6 [Bonniwell, Colleen])

Comment: You know, I was going to come up here and say I'm going to have a three-minute meditation and have everybody just meditate on the children, the children that are here, the children that are coming, just meditate on them. What do you want to do about this situation for them? Brainstorm, pray, whatever you can do to come up with a solution to the hopelessness that they're going to feel when people wake up and realize what has happened. No more nukes, no more nukes in Siberia, no more nukes anywhere. (0328-16-7 [Bonniwell, Colleen])

Comment: And I want to thank our children for their forgiveness because all they have to hope for is us, all they have. And this, this is what we have, a nuclear police state. That's what we get, that's what they inherit unless we get real, every one of us. There is no profit in nuclear power. There is absolutely no profit, but if you can come up with a way to deal with it in a compassionate -- with a compassionate understanding toward life, do it. I challenge you to do that. I will pray for that myself. I haven't seen a way to shut down Fukushima. It's like little bitty suns burning themselves through the earth, and you might live in some kind of bubble, but people out there know, they know what they're facing. (0328-16-9 [Bonniwell, Colleen])

Comment: To even be talking about this issue of nuclear power given what's going on in Fukushima right now as we speak, is beyond insanity. It's beyond insanity. (0328-17-2 [Cavlan, Michael])

Comment: The Sierra Club opposes nuclear power because its fuel cycle from uranium mining to spent radioactive fuel poses grave dangers to the environment. In addition, reliance on nuclear power unjustifiably delays the beneficial transition to clean and renewable energy. (0328-4-1 [Taylor, Wallace])

Comment: In discussing the alternative of discontinuing production of spent fuel, the EIS should consider how renewable energy can replace whatever current or future energy needs would have been supplied by nuclear power if nuclear power is discontinued as an energy source. Numerous studies have shown that renewable energy sources combined with a comprehensive transmission and distribution grid will provide all the power that we need in this country if we just put our minds to it. The electric utilities and energy companies assert that in order to provide baseload power, they have to use coal, natural gas, or nuclear power. But baseload as viewed by the utilities and power companies is an outdated concept. They are stuck with a narrow view of the electric power coming from power plants, but rather than

referring to the term baseload we're really talking about energy and capacity. Energy is the total amount of electricity that is being supplied to consumers. Capacity is the highest level of electricity that can be supplied at any one time to meet peak demand. Renewable energy can meet the energy and capacity demands of this country if we supply a transmission grid that will allow the energy to be transferred and consumed when and where it is needed. Those steps are being taken already. Many companies and utilities are installing wind and solar, they're installing transmission lines, and that's ongoing right now sooner than any new nuclear plant could be online and at a much lower cost. (0328-4-9 [Taylor, Wallace])

Comment: We're always worried about the money, but do we ever really think about the children; the animals; the plants; the birds; the water, sacred water without which we cannot live. If we poison the water at the head of the Mississippi River with our nuclear insanity we will, in fact, poison this continent. We will poison the continent. And I have no confidence whatsoever that the Nuclear Regulatory Commission or Xcel Energy, or any of the other multiple nuclear industries in the corporate reich have any concern for the sacred water because they dump their poison in it on a routine basis every single day, every single day. And we know what to do with the waste, we do it all the time. We kill people with it, our adversaries, our enemies. We put it in their bodies and we watch them die. And then we track them all over the world after we've killed them with it, so we know what to do with nuclear waste. We do it very nicely. (0328-6-2 [Foushee, Lea])

Comment: Ending the generation of radioactive waste is the essential first step that we can take to reduce the risks of its storage. The Nuclear Regulatory Commission should revise its Waste Confidence document to insure the speediest possible end to waste production, a phase-out of nuclear reactor operations. (0328-9-6 [LaForge, John])

Comment: Another thing I would like to say is that we are creating this waste or, actually, the NRC, and the NRC, in my mind, is nothing but a PR arm for the corporations that run the nuclear energy industry, and we don't have proper storage for what has already been created, which will not be resolved in any of our lifetimes, and we're continually, you are continually or the corporations, the energy corporations are continually creating more waste. We don't even have any proper way to store the waste that has already been created, and we're creating more. (0329-1-2 [Dorsey, Chris])

Comment: Now, I always ask why is this continual reckless endangerment of the entire population of the United States continuing when it's very clear that this is a danger to all of humanity. I would love to hear somebody disagree and explain how this is not reckless endangerment and this is not a high crime against the American people. I oppose everything you do. I oppose every aspect of nuclear energy. I think it's too dangerous to exist, and I have never heard anyone tell me how it's not too dangerous to exist. I would love to hear you tell me how this is not reckless endangerment and how nuclear energy is not too dangerous to exist. (0329-1-3 [Dorsey, Chris])

Comment: And I don't believe that we should allow the industry to continue making more of this highly toxic-forever nuclear waste that obviously, at this point, we have nowhere to store and no idea what to do with it. (0329-17-2 [Gray, Erica])

Comment: I would like to focus on in these three minutes is the important service done to our country by nuclear whistleblowers, in both industry and the NRC, that have brought problems to light that show that that false confidence, that technological arrogance is just that. (0329-20-2 [Kamps, Kevin])

Comment: Many nuclear reactors have closed down their operations or have made the decision to close down in the near future, Vermont Yankee, Zion, Kewaunee, San Onofre to name a few. Several more are in the pipeline to close also: Clinton and Palisades. Given the high-risk levels there, it can't happen fast enough, as Kevin [Kamps] mentioned some of the problems just now. (0329-23-2 [Lewison, Linda])

Comment: I have been living with the threat of nuclear energy for my whole life, as long as I can remember. Although the dropping of the atomic bombs on Hiroshima and Nagasaki were unspeakable, I personally believe the ongoing nuclear catastrophe at Fukushima poses the greatest threat to the future of life on Earth that we have ever seen. After Fukushima, it is clear that nuclear energy is just way too dangerous. And it's impossible to prevent or to clean up nuclear accidents. The very future of life on Earth is threatened by use of this form of energy. And accident and equipment malfunction, operator error, or terrorist attack at a nuclear plant literally could mean the end of life on Earth. And if you're not convinced by Fukushima and you still think that that can't happen, think about the O-ring on the Challenger. You know, I live in Florida. And these things loom very big here, as they do with everyone. There is no way to guarantee 100 percent safety using this technology. (0329-28-1 [Wilansky, Laura])

Comment: This technology is so dangerous that even Wall Street won't invest in it, and Wall Street will invest in anything. So all of this leads me to the conclusion that the halt on licensing new plants should be made permanent. (0329-28-3 [Wilansky, Laura])

Comment: There are so many truly clean, safe, renewable, and sustainable technologies that are available and in development. We don't need more nuclear plants. They'll just drain resources from the full development of other technologies, like solar, wind, geothermal, and maybe something that is in development that we don't know about yet that needs funding. (0329-28-4 [Wilansky, Laura])

Comment: And we should not be making more nuclear waste. I urge you to end the licensing and relicensing of all nuclear plants, end it now, and shut down all currently licensed nuclear plants. I believe that the future of life on Earth depends on this. You know, as I said, I live in Florida. And people have already addressed Turkey Point, the dangers of Turkey Point. That's my local nuclear plant. And those plants and the new plants that are proposed and the nuclear waste are going to be underwater in the time that we can foresee. We should not be making new nuclear waste. And we need to do everything we can to assure the safety as best we can as fallible humans of the nuclear waste that we already have. (0329-28-7 [Wilansky, Laura])

Comment: I also want to make a point, stress that we are wasting valuable time and resources in fiddling around with how are we going to make safe something that isn't safe and cannot be safe when we should be putting our best minds and efforts into getting us off of nuclear energy? There is no future for it. (0329-29-1 [Messer, Diane])

Comment: We can't keep doing this. We have to get smart. We have to work for long-term future. We have to get ourselves onto clean energy and reduce demand. That's the hugest issue. We are gluttons for energy. It's affluenza. Bigger and more is not better. We can do with less. We have to be much more efficient. There are superb building methods, are new inventions coming down all the time that allow us for transportation, for industry. All of this should have the best minds working on accomplishing this transformation and not wasting our, pardon me the pun with waste that we're dealing with now, but not wasting our valuable assets and time in trying to deal with something that is undoable. (0329-29-5 [Messer, Diane])

Comment: I will say that we think that nuclear energy is now constituted. It is a dead end. And it is a very dangerous dead end. And we think we would be much better served as a nation and as a community and throughout the world to turn away from nuclear energy as a power source and, instead, invest our time and our effort into clean and renewable energy. I am occasionally told by people in the industry that nuclear energy is clean, is safe, is renewable. And I have to say it is none of those things. So we think that this is a boondoggle and deeply troubling. (0329-30-2 [Price, Scott])

Comment: I would like to address a few comments, really, about confidence and what confidence means. I'm looking at a dictionary definition. And one of them says, "trust or faith in a person or thing." And then a second definition is "a trusting relationship." Well, I have faith in that nuclear power is dirty, dangerous, and expensive and that the waste is a serious, serious issue that is not being adequately dealt with. (0329-31-1 [Carberry, Mike])

Comment: And I feel that this is pretty much an exercise in futility. However, because I am persistent and dogged, like many of my allies in this work, to shut down nuclear energy, I will keep at it. (0329-32-2 [Seeley, Linda])

Comment: Is there a good solution? No. But I think steering away from any kind of nuclear power, nuclear waste would be advantageous for us. (0329-34-4 [Myers, Susan])

Comment: But investigating solar energy options, everywhere from passive gain to actually photovoltaics, which was merely a dream in the late '70s. There's a lot of other options that we can do before we go further with the nukes and start permitting more and more. I just wanted to give you guys a little bit of feedback that I am still here, I am still fighting the fight, and I know there are solutions out there that don't involve nuclear power and nuclear waste. (0329-34-5 [Myers, Susan])

Comment: I really would like to see this industry focus on waste, securing the waste, and stop making more of it. (0329-35-2 [Gray, Susan])

Comment: We had the dream in the late 50s into the 60s of building this very inexpensive infrastructure, nuclear power, the choice of the future. But it has cost us a tremendous amount both in money and lives and safety and security[.] (0329-4-4 [Messer, Diane])

Comment: I am very much against going further with any nuclear plants that are either planned or on the drawing board and in the beginning of construction now. (0329-4-5 [Messer, Diane])

Comment: Therefore, I personally give the NRC a no-confidence vote, and I propose instead, in order to avoid further costly legal action in Federal court, the NRC should make the current licensing moratorium permanent or at least indefinitely extended until such time as a mined geologic repository becomes available. Anything less would be appallingly irresponsible. (0329-7-6 [Schonberger, David])

Comment: I just hope it helps. I'm not for nuclear energy. I hope that they all get shut down until we figure out what to do with them. There are hopes of being able to reprocess that fuel at some point. And it should be stored where it could be opened up and reprocessed at some point. (0329-8-9 [Wilson, Greg])

Comment: Please, no more licensing nuclear reactors. Fukushima has taught us that nothing is "safe." (0332-1 [Parks, Eric])

Comment: Make the licensing moratorium permanent. (0332-3 [Parks, Eric])

Comment: It is only by making licensing of new plants contingent on actually solving this problem that it will be addressed. (0333-4 [Balke, Karl])

Comment: Please move beyond this idea of "confidence" and make the moratorium on new leasing and renewal of previous leases of nuclear power facilities in the U.S. permanent. We quite literally have no place for the creation of more nuclear waste, even if it is only from power plants and not from weapons production. (0334-2 [Nuccio, Theresa])

Comment: Please do not allow this moratorium to be a temporary stop gap measure when other types of energy development are needed and wanted by the public. Nuclear energy is not carbon neutral given the amount of concrete and other resources needed to build, repair, or maintain these facilities. Their cost in dollars and to the environment and to future generations is too high; without adequate benefit to justify continuing their use. (0334-4 [Nuccio, Theresa])

Comment: The only solution to the HLRW problem is to not generate irradiated nuclear fuel in the first place. Our society's "preferred alternative" to nuclear power and the long-term deadly radioactive waste it inevitably generates is efficiency and renewables, such as wind and solar power. As Dr. Arjun Makhijani, President of the Institute for Energy and Environmental Research, showed in his 2007 book Carbon-Free, Nuclear-Free: A Roadmap to U.S. Energy Policy, both fossil fuels and nuclear power can be completely phased out of the U.S. economy by 2040, and replaced by efficiency and renewables, without any further technological breakthroughs required, and for the same percentage of our Gross Domestic Product as we currently spend on dirty, dangerous, and expensive fossil fuels and nuclear power. (0336-14 [Lish, Christopher])

Comment: We should not license or re-license any reactor until it has been proven that we can successfully isolate this waste. (0336-4 [Lish, Christopher])

Comment: Nuclear waste is among the most hazardous materials on the planet. A man exposed to a spent fuel rod which has come out of a reactor will be delivered a fatal dose of radiation within a matter of seconds. Nuclear waste remains highly toxic for hundreds of thousands of years.² [footnote 2 text Certain radioactive isotopes like Iodine 129 (I-129) have half-lives of millions of years. Both Cesium 137 (Cs-137) and Strontium 90 (Sr-90) remain radioactive for hundreds of years, with half-lives of approximately 30 years. After a few half-lives of Cs-137 and Sr-90, the heat load in spent nuclear fuel is dominated for over 50 years by Americium 241 (Am-241), with a half-life of approximately 432 years. Am-241 is a precursor to Neptunium 237 (Np-237) which has a half-life of over 2 million years and is highly mobile in water.] Since the very inception of the nuclear age - our democracy has struggled, unsuccessfully, to reach consensus on how to dispose of nuclear waste. (0341-1-8 [Mermelstein, Richard])

Comment: Corporations Always Clean Up their Messes. Really? Gee, if that's the case how come the industry is so intent on wrapping itself up in multiple protection layers of LLCs? (Schlissel) And why do we have so many statutes like the Price-Anderson Act of 1957 and the Nuclear Waste Policy Act of 1982, which shift the financial risk burden from the nuclear industry onto the shoulders of the public (i.e., taxpayers)? And how come corporate giants like Entergy seem to forever be seeking to "optimize" the value for shareholders? (King; Hakim) Prioritization of profit and shareholder value is, of course, what corporations seek. Corporations are not biological beings with heart and soul, they are legal constructs devised to promote profit and

reduce liability. That is actually what corporate law and corporate tax law allows. What the NRC has allowed, is for the behemoth nuclear corporations to wrap themselves in additional layers of "protection" that enable the parent corporations to cut loose at risk subsidiaries, should they pose a substantial threat to profitability. The primary responsibility is to corporate bond holders and stock holders, not to the citizens of a community where a reactor is shut, and waste is seeping from spent fuel pools into the groundwater. (Cooper; Schlissel; Tidmore) (0341-2-10 [Mermelstein, Richard])

Comment: We agree with those who ask the NRC to stop building new nuclear facilities, stop extending the licenses of existing nuclear power plants, to not expose the nuclear workers and the public by transporting nuclear waste. (0348-13 [Agnew, David] [Roscoe, Lee])

Comment: Rather than generating more waste, we believe that the prudent approach is to stop producing nuclear waste. (0348-15 [Agnew, David] [Roscoe, Lee])

Comment: Fermi 2, being the largest Mark 1 reactor in the world, has accumulated a lot of deadly waste in its years of operation. And without any real plan of removing the waste, the Detroit Edison Company seeks a license for another reactor, Fermi 3. We already have too many radioactive dumps, at every operating reactor in the country. More than that if a truck driver told me the truth when he said that he had hauled nuclear waste to former Cold-War missile silos and dumped it. (0349-1 [Collins, Jessie Pauline])

Comment: I defer to my esteemed colleagues' impeccable research, while I rely on common sense. Each reactor continues to endanger an entire bio-region. In our modern world, nuclear produced electricity is totally unnecessary, other than to extract the plutonium for powering nuclear triggers, which I am told need pepping up yearly. (0349-4 [Collins, Jessie Pauline])

Comment: I urge the officials here to uphold the law; not to renew any existing licenses: not license any new reactors, and shut down all operating reactors - for the sake of humanity. We have passed through the deadly nuclear-age, and found it wanting. Moving the world to renewable energy sources is the right thing to do. Tonight, you have the opportunity to choose between right and wrong. Choose right - even if you risk losing your well-paying jobs. (0349-5 [Collins, Jessie Pauline])

Comment: We agree with those who ask the NRC to stop building new nuclear facilities, stop extending the licenses of existing nuclear power plants, to not expose the nuclear workers and the public by transporting nuclear waste. (0352-13 [Roscoe, Lee])

Comment: Rather than generating more waste, we believe that the prudent approach is to stop producing nuclear waste. (0352-15 [Roscoe, Lee])

Comment: Having watched and listened to that meeting on nuclear energy. I thought the environmental impact regarding the safety of its waste would outweigh the benefits. At the same time, I agree the fact that nuclear energy is one of the cheapest source of energy available to mankind today. Having said that, it seems to me that we could be much better off on investing in more natural sources, like wind power or solar. These are natural resources that occur around us daily and we should take advantage of them and properly give them a chance to help make a difference. (0353-1 [Yusuf, Hassan])

Comment: The production of more "spent fuel" must cease. (0358-12 [Schumann, Klaus])

Comment: Clearly, cessation of further production of "spent fuel" is the safest way for the future. Common sense dictates: if you are in a hole, stop digging. For the already existing "spent fuel", dry casks are far safer than the crowded pools. (0358-9 [Schumann, Klaus])

Comment: Production of such waste by nuclear power plants must be discontinued, and the plants closed down. Then the best of an array of bad alternatives must be identified for the storage of the waste already produced. (0359-2 [Kushigian, Elizabeth])

Comment: I am a 71-year-old Minnesotan who is becoming more appalled every day that our upcoming children & grandchildren are being asked to pay the price for nuclear waste gone crazy. (0361-1 [Greenfield, Jan])

Comment: YOU -- NRC -- are charged with protecting the public. Please be HONEST & FORTHRIGHT & admit there is no safe way to continue to operate nuclear power plants. Fukushima has given us "the writing on the wall"; nuclear mishaps are POISONING our delicate globe & all of the living creatures on it! (0361-3 [Greenfield, Jan])

Comment: I don't buy your assertion that nuclear waste can EVER be "scientifically-defensible, environmentally-responsible and publicly-acceptable." All processes that generate radioactive waste should be terminated immediately, in the interest of public safety, if nothing else. (0362-1 [Schietinger, Helen])

Comment: I am amazed that the NRC, with all its expertise, has not learned from Fukushima, Chernobyl, Bhopal and Love Canal that ending radioactive waste generation is the single most important step we can take to minimize the risks surrounding its storage. (0362-3 [Schietinger, Helen])

Comment: As you can see, it is important to stop generating this waste because a worst case disaster is in the trillions of dollars and would ruin large areas for generations. No known economic model exists that can put a value on the loss of say, the State of California after worst case nuclear meltdown and fuel pool fire. (0366-2 [Frey, Paul])

Comment: Please discontinue the use of these dangerous and dirty energy generators - we can no longer afford the high costs (in health, environment and dollars) of these antiquated power plants. Let's put our efforts and resources into renewable solutions! (0367-1 [Bird, Melissa])

Comment: I strongly ask that the moratorium on new nuclear power plant licenses continue. (0368-1 [Mattox, Judy])

Comment: Renewable energy options are increasingly affordable; therefore, don't use nuclear power. (0368-5 [Mattox, Judy])

Comment: We agree with those who ask the NRC to stop building new nuclear facilities, stop extending the licenses of existing nuclear power plants, to not expose the nuclear workers and the public by transporting nuclear waste. (0373-14 [O'Malley, Brian])

Comment: In concluding, one elephant in the room stands: the NRC's failure to understand the very real, and well documented science, of radioactive substances in this waste. A fingernail of plutonium could kill off, conservatively a large city. Cesium, strontium, and other radionuclides contained in waste, are some of the most toxic substances on earth, creating cancer and genetic injuries. The NRC has a duty to protect children and grandchildren for generations to come from substances which contaminate human beings, the biosphere and the environment

and which can create lasting, adverse, multi-generational changes in the genome. We believe the DWG GEIS shows that the NRC does not take that duty seriously. Rather than generating more waste, we believe that the prudent approach- when there is no solution to the storage problem-is to stop producing nuclear waste. (0373-15 [O'Malley, Brian])

Comment: ACE calls on NRC to protect the public's long-term health and financial interests by acknowledging reality - There Is NO SAFE SOLUTION. 1. Stop allowing lethal radioactive wastes for which there is no safe solution to be produced (0377-1-11 [Cuthbert, Lewis])

Comment: 4. Stop the production of deadly nuclear waste for which there is no actual safe solution, based on astronomical endless costs to the public for transport, storage, and security. (0377-1-9 [Cuthbert, Lewis])

Comment: The only real solution to the problem of lethally radioactive waste that remains a hazard for more than a million years is to stop generating more. NRC must stop allowing nuclear plants to produce deadly radioactive wastes for which there is no safe solution. The only solution to the high-level radioactive waste (HLRW) problem is to not generate irradiated nuclear fuel in the first place (0377-5-14 [Cuthbert, Lewis])

Comment: Nuclear power can be completely phased out of the U.S. economy by 2040, and replaced by efficiency and renewables, without any further technological breakthroughs required, and for the same percentage of our Gross Domestic Product (GDP) as we currently spend on dirty, dangerous, and expensive fossil fuels and nuclear power (0377-5-15 [Cuthbert, Lewis])

Comment: A BODY OF EVIDENCE SHOWS THAT THERE IS NO SAFE SOLUTION. THE ONLY LOGICAL THING TO DO IS STOP MAKING RADIOACTIVE WASTE AT LIMERICK AND OTHER NUCLEAR PLANTS. (0377-6-7 [Cuthbert, Lewis])

Comment: The only really safety guarantee would have been to not produce this waste in the first place. Since that measure wasn't taken seriously, the next most effective measure would be to stop producing any more high-level radioactive waste. Nuclear waste is far more dangerous than, say, DDT which, once recognized as dangerous, was banned. There is no conceivable method for safeguarding spent nuclear fuel virtually forever, as it must be, so our priority should be to end its production. (0380-1 [Holt, Joan])

Comment: The only really safety guarantee would have been to not produce this waste in the first place. Since that measure wasn't taken seriously, the next most effective measure would be to stop producing any more high-level radioactive waste. Nuclear waste is far more dangerous than, say, DDT which, once recognized as dangerous, was banned. There is no conceivable method for safeguarding spent nuclear fuel virtually forever, as it must be, so our priority should be to end its production. Until we do that, we have not solved the problem. We're stuck with the waste we've already produced, and dry cask storage is better than overcrowded spent fuel pools so obviously that must be pushed. (0380-2 [Holt, Joan])

Comment: 2.The only reasonable first step to deal with the unsolvable problem of nuclear waste is to stop producing any more ASAP! (0381-6 [Fasten, Susan])

Comment: Please do not renew the license for Diablo because of the inherent dangers, and please help make arrangements to close Diablo as soon as possible. (0389-2 [Atlee, Susan])

Comment: Your "Nuclear Waste Confidence" is false! we have a mountain of c....[word is illegible] of radioactive waste that we don't know what to do with. Stop making it! (0392-1 [Owl, Griffin])

Comment: Your "Nuclear Waste Confidence" is false and a con game. We already have more commercial radioactive waste than we know what to do with! STOP MAKING IT!! (0393-1 [Schmidt, Peg])

Comment: Your "Nuclear Waste Confidence" is false and a con game. We already have a mountain of commercial radiological waste 56 years high and we don't even know what to do with the capful. Stop making it. (0394-1 [Mullens, Mark])

Comment: The programs now in place are inadequate for public safety, and the generation of radioactive waste should not and never should have been allowed. (0403-2 [Brown, Deborah])

Comment: Reactors must be phased out - quickly. No one has the right - they are glorified nuclear weapons..... (0403-3 [Brown, Deborah])

Comment: There are better cleaner healthier, more efficient ways to produce power... Why are you so resistant?? Have you not learned from Fukushima to Chernobyl to Bhopal and Love Canal..... It is past time to improve safety, security, and respect. (0403-4 [Brown, Deborah])

Comment: No no reactors should be permitted while we have growing stores of waste to deal with. (0404-2 [Smith, Roger])

Comment: Three reactors at Fukushima have not been capped and reactor four has damaged fuel rods which have to be removed from the spent waste pool above the reactor. Chernobyl is being recapped and three of Fukushima's cores have not even been located. The fuel rods from Fukushima's reactor pool no. 4 can explode giving the northern hemisphere many Chernobyl sized doses of radiation. Does this sound like nuclear plants and nuclear waste is safe? The Pacific is being dosed with Fukushima plutonium found in tuna off of the California coast. The food chain is being polluted. Greater risks of cancer and genetic damage, and immune system degradation will be faced by future generations of humans and animal life. Plant life will be effected. Nuclear waste is leaking from water used to cool the reactors in Fukushima. WHY SHOULD ANYONE IN THE WORLD ALLOW MORE NUCLEAR POLLUTION? (0405-1 [Dugan, Pat])

Comment: The nuclear plant licensing moratorium needs to remain in place. Please do humanity the great gracious favor of pausing to learn more about and to consider the incredibly long term effects of nuclear power and armaments. Please keep the nuclear plant licensing moratorium in place. (0405-2 [Dugan, Pat])

Comment: Do not forward a vote of confidence for what is happening to the planet. The more one learns about nuclear pollution the less confidence one has about containment. (0405-3 [Dugan, Pat])

Comment: Finally, Mark Jacobson, Director, Atmosphere/Energy Program at Stanford University and many others calculate that all America's energy can be generated by sustainable and cheap wind, water and solar energy. It makes no sense to continue spending so much tax payer money on nuclear energy with its never ending deadly radioactive contamination. (0406-6 [Gerleman, Douglas])

Comment: Because nuclear storage is a 250,000 year issue, we should not produce any more nuclear fuel, which means shutting down current reactors and replacing the power that is currently produced with nuclear through conservation and renewable energy, which should be given preferred tax status, especially for conservation and distributed energy production. (0411-1 [Krumm, Paul])

Comment: I fail to see how the NRC can continue to license plants when there is no central place to store nuclear waste other than onsite. Many of the fuel pools are already filled to overcapacity, yet we continue to produce more fuel rods. It makes no sense. (0413-1 [Palaia, Joyce])

Comment: We should consider closing Diablo as well all nuclear plants. (0413-3 [Palaia, Joyce])

Comment: The time is upon us now to realize that life is more important than economics. Please do not allow more life threatening nuclear waste to be generated or stored. It is not safe and it threatens all of life (as the nuclear fallout from Fukushima is currently a testament to.) It is time for us to realize our true values. And the truth is that life is more important than economics. (0415-1 [Laing, Josephine])

Comment: All nuclear reactors should be shut down so no more nuclear waste is created. Nuclear waste should not be transported, barged, recycled, buried, or placed in untested, unlicensed casks. Nuclear waste has no where to go. It should not be stored near bodies of water or areas of population density. It is a problem that will have to be continually dealt with. Currently there is no solution. However, there is a start to a better plan. Stop making it. That should be your rule. Stop making it. (0416-5 [Barnes, Kathryn])

Comment: We do not have a scientifically proven solution for safely disposing of nuclear waste. There is no good reason to continue to rely on nuclear power. Clean, renewable sources of electricity are readily available and affordable. (0417-13 [Clark, Terrence])

Comment: The soundest solution to management of nuclear waste is: STOP Making Nuclear Waste. (0417-14 [Clark, Terrence])

Comment: All relicenses issued to date should be rescinded pending compliance with realistic new standards. No new licenses to generate additional EXPLETIVE radwaste should be allowed. And no additional radwaste should be generated - it is immoral to create deadly toxins that will remain a threat for so long when we have no real plan for safekeeping them over their hazardous 'lifespan'. (0419-12 [Agnew, David])

Comment: You have allowed the owners to operate with insufficient funds to properly decommission their EXPLETIVE cancer-factories until such time as the financial climate MAY allow it. The NRC colludes with the industry to enable all of this, and for what? For industry profits and little else. We don't need nuclear power - it is completely unnecessary in Massachusetts, and the nation can convert to renewable energy for the same money now spent on nuclear and fossil fuels. (0419-14 [Agnew, David])

Comment: The nuclear industry promised safe, cheap, electricity from reactors which would operate for 40 years during which time its hellishly godawful wastes would be safely removed. The industry has delivered on none of that, instead leaving its EXPLETIVE waste scattered across the country, a gift to accompany increased cancer rates for yet-unborn generations. (0419-6 [Agnew, David])

Comment: We are seven decades into 'too cheap to meter' and no one knows what to do with the industry's toxic waste. Whether the problem is NIMBY or scientific, the result is the same: no one knows what to do with the industry's EXPLETIVE toxic waste. (0419-8 [Agnew, David])

Comment: This message betrays the inadequacy of the NRC to cope responsibly with the measured rises in background radiation due to our irresponsible handling of nuclear waste. It says to me that the NRC is another bureaucracy more concerned with covering its ass than addressing the real issue. We continue to produce more nuclear waste with every act of fissioning. (0428-1 [Seitz, Tim])

Comment: This is another reason me to call for the ABOLITION OF ALL NUCLEAR FISSIONING APPLICATIONS ASAP! (0428-2 [Seitz, Tim])

Comment: Waste Confidence is an outrageous euphemism for the disposal of our nation's most toxic and long-lived materials! In my view, there can be no confidence in the treatment of such waste unless the production of more waste has already stopped. But nuclear power plants continue to produce radioactive waste. In the event of an accident such as occurred at Fukushima, there will be tons and tons MORE waste and no feasible place to put it. In view of such danger, generating more waste merely in order to power our shopping malls and electronic devices seems to me to be madness. Re-licensing old power plants is also questionable and should not be approved. It's time we stopped taking gigantic risks with the future safety of the planet and began to make the health of the environment and the well being of our human populations our highest priority. (0429-1 [Hiller, Stephanie])

Comment: We continue to create waste that is not manageable or safe instead of working from the bottom up by providing alternative energy and changing the paradigm of consumption. (0435-3 [Coor, Kristen])

Comment: I would like to express my concern with the amount and critical radioactivity of reactor waste and how and where it is stored. In my perfect world, it wouldn't exist at all. Since it is too late for that, I urge you to consider stop issuing and extending permits to create more waste. To think of the amount sitting about around reactors in my state and neighboring states is frosting. (0436-1 [Patrick, Kay])

Comment: Stop rubber stamping permits to keep this nuclear folly limping along. Shut these reactors down and find a permanent secure repository for this eternal waste. (0436-5 [Patrick, Kay])

Comment: I write to urge the commission to reject the licensing of any more nuclear power plants in the United States. (0437-1 [Kinnaird, Eleanor])

Comment: It is currently being stored on-site at each facility. This is not a safe solution since accidents could jeopardize the storage casks, terrorists could gain access to the casks, and especially since the radioactive material will last in some cases, thousands of years. At some point in time, the waste will have to be dealt with. Solar power is becoming more feasible as to cost and siting, especially distributive solar installations on roof-tops throughout the country. Please continue the moratorium on the approval of any new nuclear power plants. The price of natural gas also makes nuclear power no longer competitive as a source for electricity. (0437-3 [Kinnaird, Eleanor])

Comment: It is way past the time when the world should have been made clean of these disgusting abominations and those who have profited from their creation and use should now pay for their neutralization. Anything less is hopelessly immoral and tantamount to mass murder. The days of "too cheap to meter" have never come. It is time to stop suppressing the myriad of ways to make free clean electricity any time any place any quantity and to decommission EACH and EVERY nuclear reactor. The People are aware. You shall be judged accordingly. It would be better for you to "straighten up and fly right" before you are "brought down in flames". (0441-3 [Baker, Helen])

Comment: Look, all reasonable people recognize that meeting the energy needs of this country is of vital importance. The place that nuclear power has in any United States energy policy, however, must be based on truth and science not on hope and luck. All energy proposals must be scientifically-defensible, environmentally-responsible and publicly-acceptable. Nuclear energy, however, is in a class by itself since no other energy source leaves such a toxic waste that lasts so long and whose potential for destruction is so extreme. (0443-5 [Sabo, Betty])

Comment: Acknowledge that there are no real solutions to the problems posed by the nuclear industry. After the half century that nuclear power has been around there is still no solution for nuclear waste or for everything from the supposedly minor mishaps to the major tragic devastating catastrophes we have been subjected to. SHOW SOME HUMILITY! The "Trust us. We're the experts" attitude doesn't work. (0445-3 [Fasten, Susan])

Comment: Do your job. Regulate the nuclear industry because it is the most dangerous, enduring, destructive threat to all of humanity and to the earth. (0445-5 [Fasten, Susan])

Comment: Americans DEMAND MORE than hope for the future. We DEMAND solutions that are technologically sound & healthy for humans & our planet. Until the NRC may PROVE they have a viable, healthy solution for storing nuclear reactor waste, we STRONGLY SUGGEST that the nuclear reactor across America be shut down soonest. (0446-2 [Krause, Laurel])

Comment: Hope is not enough to offer Americans. We want proven solutions or turn the nuclear reactors off now! (0446-4 [Krause, Laurel])

Comment: the entire nuclear technology and industry was fatally and irretrievably flawed, inseparably linked to weapons proliferation, and not capable of being operated safely or even sanely given the extreme catastrophic consequences to human health and the environment. In subsequent years, my only involvement with nuclear technology has been to engage in efforts to discontinue it, and on occasion to technically support means to safely dispose of the wastes and to accelerate closure of facilities. (0447-1-1 [Andrews, Richard])

Comment: Discontinue any new licensing or license renewals of any nuclear waste generating plant or facility, including all stages of the fuel cycle. In other words stop permitting additional nuclear waste generation. (0447-2-15 [Andrews, Richard])

Comment: This all points to the necessity and urgency for much more prompt solutions to the disposal of these wastes and the cessation of generation of additional nuclear wastes. The NRC should simply declare NO SNF WASTE CONFIDENCE and speak the truth about the extreme hazards from nuclear power and nuclear wastes. It should curtail any and all existing and new licensing, except licenses for prompt closure and final disposal of nuclear materials. (0447-2-5 [Andrews, Richard])

Comment: The ONLY rational solution is to STOP PRODUCING DEADLY WASTE (0450-7 [Bast, Nancy])

Comment: I just want to express my viewpoint that nuclear energy is the most dangerous option we have. So much so that it needs to be eliminated as soon as possible and no further development should occur. It is far, far too dangerous. (0452-1 [Frances, Esther])

Comment: [T]he remainder of operating U.S. nuclear power plants should be shut down until a reasonable and safe procedure to deal with the deadly radioactive waste is developed. (0453-6 [Feathers, Jösan])

Comment: In any event, without the establishment of a permanent National Storage site, the NRC will be pursuing an irrational and dangerous policy if it persists in granting new licenses or extending old ones in an environment where an increase in the total quantity of Nuclear Waste Fuel only compounds an already intractable problem. (0454-10 [Waldstein, Joe])

Comment: Your "Nuclear Waste Confidence" is false, and a con game. We already have a mountain of commercial radioactive waste 56 years high, and we don't even know what to do with the 1st cupful! Stop making it! (0460-1 [Qian, Dorothy] [Scott, Emily Elizabeth])

Comment: PLEASE bring nuclear power to a halt! PLEASE stop poisoning our planet and our people and threatening our health and very existence! WAKE UP!! (0462-1 [Windsong, Debra])

Comment: This is TOO dangerous- we must use alternative sources of energy!! (0468-1 [Gill, Susan])

Comment: We need to use safe renewable energy like wind and solar. (0469-2 [Joslyn, Celia])

Comment: Nuclear power plants and their waste are not safe. There can be far better solar and wind power options than are now available, to produce better quality and lower cost electric power than existing equipment. Please see <http://rpm2.8k.com/> and its links, for detailed descriptions and analysis of building-integral solar and wind power installations, and electric vehicles with onboard solar power. (0471-1 [Fradella, Richard])

Comment: The future is that we need to stop supporting and generating these deadly earth killing wastes, has chernobyl and fukashima taught us anything? (0474-2 [Bucklin, Christine])

Comment: Since we have no disposal facilities in operation, we need to stop creating spent-fuel/high-level radioactive waste! (0475-2 [Graham, Candace])

Comment: No new reactor licenses should be issued until there is an operating facility to permanently house deep-geological high-level radioactive waste. (0475-3 [Graham, Candace])

Comment: The NRC has been playing "kick the can down the road" regarding nuclear waste for years and years. It must not be stored in California with the earthquake threats. It must not be stored anywhere near where I live. It is pure poison. My husband was raised in Richmond near the Hanford plant, and he is all too familiar with radioactive waste storage. There used to be two-headed jackrabbits around there and all manner of malformations from all the leaks. And there were several on-purpose releases of radioactivity over the years. Most of his school friends are dead from cancer. Human beings are too fallible to handle the excessive danger of nuclear radiation. Witness all the human errors over the years---those that we found out about the hard way. (0477-3 [Tache, Jan])

Comment: If the NRC and the nuclear industry insist on giving us dangerous, high priced, government subsidized nuclear energy, I believe those in favor of it should be required to live near the power plants and near the storage facilities. This country doesn't want nuclear power. The risks are too high for our planet---as we have amply seen in Japan, in the Ukraine, at three Mile Island, and other problem facilities that haven't been publicized. (0477-5 [Tache, Jan])

Comment: Why is it that we as citizens are told by fastfood restaurants that certain fats are not healthy for us? Because they are bad for us. If there are guidelines for fastfood restaurants then why is there no regulations for Nuclear Power stations? They release radiation into the air each month "Batch releases" yet the general public has no idea on how much radiations is being released. Why? We should know how radiation affects us as citizens. We should have monthly reports on the radiations levels being released each month this is especially true for individuals such as myself who live directly down wind from a nuclear facility. (0478-1 [Higgins, Kevin])

Comment: The planet has been contaminated enough already and future generations have already been subjected to poisoning, we need to stop. (0480-2 [Arnold, James])

Comment: Shut down San Onofre (CA) & All (toxic) nuke plants! (0483-1 [Garvey, Lydia])

Comment: Go Totally sustainable, renewable energy! Your attention to this most urgent matter would be much appreciated by all present & future generations of all species! (0483-4 [Garvey, Lydia])

Comment: The GEIS fails to consider the need to: Cease production of new nuclear waste until safe and secure storage exists. (0490-7 [Chin, Rebecca])

Comment: Anything to do with nuclear waste scares me. (0492-1 [Maghakian, Carol])

Comment: Rule # 1 must be: Make it illegal to produce any more waste. (0493-2 [Davis, Suzanne] [Davis, Tom])

Comment: Now we have proven that the nuclear industry is a huge risk and liability to humanity's survival, instead of the opposite, which is what they claim to be. Where is the nuclear industry solution for nuclear waste? They have none. Where is their solution for preventing a nuclear war? They have none. Where is their solution for preventing meltdowns from whatever reason and then paying to clean up the 25,000 square miles of resulting radioactive wasteland that results? They have nothing. What is your politician doing to protect your family from a major nuclear disaster? Ask them. Send them a link to this article. (Send them a copy of this article, with title and link information included, please.) What is your local emergency planning and disaster preparation official doing to prevent this? Ask them. Send them the article. What is your environmental or animal loving group doing to prevent this from happening? Ask them. Send them the article. What is your legislator doing to prevent this from happening? Ask them. Send them the article. These people all have children and families. They are not safe either, no matter what bomb shelter that they think will save them. Some of these government officials may believe that this disaster will not affect them, as they have a nuclear bomb shelter ready for them. (0498-12 [AGreen Road Project, Anonymous])

Comment: Now we have proven that the nuclear industry is a huge risk and liability to humanity's survival, instead of the opposite, which is what they claim to be. Where is the nuclear industry solution for nuclear waste? They have none. Where is their solution for preventing a nuclear war? They have none. Where is their solution for preventing meltdowns from whatever

reason and then paying to clean up the 25,000 square miles of resulting radioactive wasteland that results? They have nothing. What is your politician doing to protect your family from a major nuclear disaster? Ask them. Send them a link to this article. (Send them a copy of this article, with title and link information included, please.) What is your local emergency planning and disaster preparation official doing to prevent this? Ask them. Send them the article. What is your environmental or animal loving group doing to prevent this from happening? Ask them. Send them the article. What is your legislator doing to prevent this from happening? Ask them. Send them the article. These people all have children and families. They are not safe either, no matter what bomb shelter that they think will save them. Some of these government officials may believe that this disaster will not affect them, as they have a nuclear bomb shelter ready for them. There is only one small problem. This super mega nuclear disaster of 800 nuclear plants and spent fuel pools melting down will go on for tens of thousands of years, with no end. Unless they are willing to live underground PERMANENTLY and forever, they better make some changes happen above ground. No life can survive above ground if all of these plants and spent fuel pools melt down. Very little has changed since Chernobyl blew up and radiated everyone, except that many more nuclear accidents, meltdowns, melt throughs and accidental radiation releases happened, plus way more radioactive substances are now in the air, on the ground and in the ocean as well as inside all of us. (0498-14 [AGreen Road Project, Anonymous])

Comment: We can get ready. Nuclear energy only supplies around 8-9% of the total power required in the U.S. If the nuclear plants can be shut down and the fuel cooled off so that it does not take any power, this 'loss' can be made up by other fuel sources that will keep on working and not blow up or melt down if the power goes out for awhile. Let's fill that small nuclear hole with conservation, clean carbon renewables, grid efficiency, or gas fired plants, which are currently the cleanest of the fossil fuel energy generating plants. https://en.wikipedia.org/wiki/Energy_in_the_United_States; <http://needtoknow.nas.edu/energy/energy-sources/nuclear.php> (0498-4 [AGreen Road Project, Anonymous])

Comment: Today we rely on electricity and technology for everything. We also rely on nuclear power plants, which need to have electricity going to them 24 hours a day, or they melt down. Bottom line, we need to have all nuclear plants turned off and all nuclear material cooled down to the point where there is no power needed to keep the nuclear fuel material cool, or we are all toast. Why is this? (0498-6 [AGreen Road Project, Anonymous])

Comment: They are lying about the risks of nuclear radiation, and making humanity less and less safe, while multiplying risks exponentially through the use of MOX fuel, and lack of preparation for a Carrington Event. (0498-9 [AGreen Road Project, Anonymous])

Comment: I am one of many who strongly believe that drastic measures need to be taken NOW to shut down and end all things nuclear. (0503-1 [Fitch-Johnson, Janet])

Comment: [W]hy are we using this very dirty material to make electricity? It is the most expensive way to generate electricity! It is the most dangerous way to make electricity! We don't have a clue what to do with the Nuclear Waste (Spent Rods) except to pour water on it for the next 100,000 years? Would you want a Nuclear Power Plant in your back yard? You can put Solar Cells and Wind Turbines in my back yard and on my roof! (0504-1 [Howard, Gordon])

Comment: Nuclear materials, radioactive elements kill and cause great suffering Please end extraction and manipulation of radioactive materials, and get rid of all and the wastes safely. There are horrendous deformities, cancers, illnesses, deaths, contamination that has occurred

already and the future looks to be promising more of the same. We can not project into the future how long we can run energy plants, store weapons, etc and contain this radioactivity, some types of which have an alarmingly long half life. Why are we still developing this evil killer? Get rid of all waste and make certain that all of Indian Country soils and waters are cleaned up immediately and all who are suffering from cancers and other radiation effects are compensated and treated. Creating dark karma while in a human body on Earth is in opposition to our true purpose here, which is to walk the harm-free path of the Spirit and meditate upon the light within us. We are always to help, never to create suffering and damage, go against Nature. (0506-1 [Tapp, Yvette])

Comment: Do not build any more nuclear power plants. (0508-2 [Marsh, Kathryn])

Comment: Start closing down all the old nuclear plants (they are all old). (0511-2 [O'Brien, Patricia])

Comment: The damages can be minimized by shutting down all reactors until such time as there is a safe way to dispose of nuclear waste. (0512-7 [Bibb, William])

Comment: Dry casking. Dumping it into the ocean, storing it in nuclear weapons, or just waiting for more Fukus to just let the biosphere suck it up hasn't worked out so well so far has it? Don't all you people have children that you love? Of course you do. Do the right thing, for them. Tell the truth. (0516-1 [Shelton, Matt])

Comment: I am horrified and terrified by the lack of oversight and omissions of the Nuclear industry of contamination of our air, land and waters of nuclear releases and 'leaks'-'controlled' and otherwise. Furthermore, I am extremely concerned about the nuclear waste produced with no viable storage solution. Earth is no place for any nuclear product. Our world has been pillaged and plundered enough! Nuclear is not clean when its byproducts last for many thousands of years and truly never disappears. (0518-1 [Individual, Anonymous])

Comment: All nuclear must end for the sake of our children and theirs and so on who will inherit this disgusting legacy! This includes yours! Nuclear is not cost effective and regardless, be damn the cost. it is time to embrace renewable energy and decommission every nuke reactor in the WORLD. (0518-3 [Individual, Anonymous])

Comment: Until such time that there is a bona fide solution to this difficult problem, it is IMPERATIVE that we do whatever is necessary to eliminate further production of these catastrophically toxic substances. All existing sources of commercial nuclear power must be shut down[.] (0522-2 [Rogers, William])

Comment: The entire nuke industry is terrorism against the world. You are nothing but organised crime. It all needs to stop, immediately. (0523-1 [Hamilton, Richard])

Comment: Consider that any continued leaks of nuke products in the environment is an act of war against all life forms on Earth. There will be no mercy (except for those that help with decommissioning all of the poisonous monsters your industry has created). You and your industry are the most despicable and evil creatures to have ever walked the Earth, by far. Your evil actions will cause the poisoning of planet Earth, nothing in history has ever been so foul and corrupt. The nuke industry is considered the enemy (0523-3 [Hamilton, Richard])

Comment: I feel we have no right to decide that future generations of people will have to take care of our nuclear waste. How is it fair to leave casks of poison for our children's children and their children's children etc to pay for and make sure this poison stays safely contained? (0524-1 [Individual, Anonymous])

Comment: I don't know how anyone in the pro-nuke community can sleep at night knowing how many thousands/millions of suffering children and women you're responsible for. Nukes need to be done with, all together. You've proven you have no clue what you're doing with the energy, no clue how to keep it remotely "clean." You can't manufacture, use, and then store it safely. Get the F out of here. Anything nuke has got to go. Including pro nukers. (0525-1 [Jacobson, Janet])

Comment: Nuclear must be abolished! Think of your own children and grandchildren. All the money in the world cannot save them from this. (0526-1 [Arnott, Melissa])

Comment: Please, enough is enough. Humans have so much potential, this can't be what we were put here to do. Please think of all the innocent people who are suffering tremendously who do not deserve the agony you inflict on them. Please end your insanity. Put something before power, greed and money for a change. Please, we all beg you to do the right thing. Think of the children. (0526-3 [Arnott, Melissa])

Comment: Please do not authorize any new nuclear plants or extend any who's license time is up until you have a safe solution to the storage of nuclear waste! (0528-3 [Brown, Susan])

Comment: Clean Water for North Carolina opposes the licensing of any new reactors based on the Waste Confidence policy[.] (0531-1-17 [Morgan, Sally])

Comment: [Clean Water for North Carolina] calls for a rapid reduction in all nuclear waste being produced, as well as replacement by safe, non-hazardous, non-water intensive, non-carbon sources. (0531-1-18 [Morgan, Sally])

Comment: [W]e urge the NRC to consider a permanent cessation of licensing activities, which would halt the future generation of spent fuel. (0531-1-2 [Morgan, Sally])

Comment: The continued production of nuclear waste, with no safe way to contain or dispose of it, is not an environmentally, economically, or socially acceptable practice. We must stop more from produced. (0531-2-13 [Morgan, Sally])

Comment: [W]e urge the NRC to consider a permanent cessation of licensing activities, which would halt the future generation of spent fuel. (0531-2-2 [Morgan, Sally])

Comment: Clean Water for North Carolina opposes the licensing of any new reactors based on the Waste Confidence policy[.] (0531-2-27 [Morgan, Sally])

Comment: [Clean Water for North Carolina] calls for a rapid reduction in all nuclear waste being produced, as well as replacement by safe, non-hazardous, non-water intensive, non-carbon sources. (0531-2-28 [Morgan, Sally])

Comment: Please discontinue all nuclear power plants and developments. (0536-1 [Jackson, Carol])

Comment: There has been NO PROGRESS IN STORING NUCLEAR WASTES SAFELY in the over 60 years I have been concerned. You have not managed a single safe storage site or disposal program throughout your existence. Cease deceiving yourselves and the public. Since the Fukushima meltdown began, the most serious threat comes from the nuclear storage rods kept at the site because there is no place else. What a stupid program! You must finalize nuclear power production in this country, wind it down successfully at the 100 remaining plants, and continue trying to resolve the waste storage problem. That will keep you in your jobs the rest of your life--if the human species and Earth survive the idiocy you created with your nuclear power delusion. (0536-2 [Jackson, Carol])

Comment: The GEIS fails to consider the need to [c]ease production of new nuclear waste , unless safe, secure & affordable storage exists[.] (0537-7 [Commenters, Multiple])

Comment: The GEIS fails to consider the need to [I]mmediately stop production of HIGH BURN UP waste[.] (0537-8 [Commenters, Multiple])

Comment: Nuclear facilities should be shut down, and stop creating waste for which there is NO SAFE DISPOSAL POSSIBLE. (0539-2 [Luttinger, Lionel])

Comment: Nuclear energy is entirely counterproductive, because the multibillion dollar disassembling of this most dangerous and filthy form of energy, is never figured into the cost, and disposal is a huge problem and an expensive one. NUCLEAR ENERGY CANNOT BE MADE SAFE IN THE AGE OF EXTREME WEATHER AND SUPER STORMS. The shoreline plants are in grave danger of releasing their very extremely lethal poisons and toxins. We need clean renewable energy now to survive on our planet. There is NO SUCH THING AS SAFE NUCLEAR ENERGY, except in very small nuclear generators that if they fail or drown will not send out huge lethal amounts of radioactive materials. The large plants are obsolete and insane ideas and the NRC is too full of people in the industry to be truly objective. The NRC is full of special interest minded regulators, and we the people all know it. It has been all over the press, as well. (0539-5 [Luttinger, Lionel])

Comment: Second, no industry should be allowed to continue creating waste that it has no ability to dispose of. The waste generated by nuclear power are the most toxic known to humankind, and remain that way forever. The NRC therefore must insist that all nuclear reactors stop operations, and deal with the waste that has already been created. Third, the NRC should not issue new reactor licenses, nor grant license extensions to old operating reactors. (0543-3 [Senkiw, Sheryl])

Comment: Furthermore, the NRC should be empowered and expanded to protect the citizens of the USA from the radioactive nuclear waste that already exists, and to do everything possible to keep more from being created. (0543-5 [Senkiw, Sheryl])

Comment: The direction the NRC is taking with low-balling regulatory considerations for "dealing with" high-level radioactive waste is shamefully remiss in terms of priority number one. Nuclear energy is NOT a viable option to continue to supply our vast energy needs in today's civilization because it cannot be done safely. The organization who I represent is now in an effort to stop what is considered to be low-level radioactive waste to be ignored (through recent regulation that has deregulated shale waste stream TENORM materials to NORM) and dumped in open landfills in the state of Ohio. This issue is dwarfed by the issue we are here for tonight...the issue of high-level radioactive waste, so dangerous that we cannot even figure out how to dispose of it, and what place it has in our society. (0546-2 [Pace, Gregory])

Comment: If we reach into our hearts, transcendent to the place where our everyday dealings have created vested interests in maintaining status quo on this issue, we all can see that there really is no place for more radioactive waste in our society where human safety is the number one priority. Therefore, we must focus our energy and efforts on shutting down the nuclear power industry and putting the resources we have been using to support this industry into fully renewable energy methodologies now. Germany is doing it, Denmark is doing it, as are other countries. The dinosaurs were killed off by an outside force...we do not want to become the dinosaurs who killed themselves off. (0546-3 [Pace, Gregory])

Comment: There is a consensus among the U.S. government and the nuclear industry for more than 60 years that withdrawn spent fuel rods are lethal unless shielded. To continue to produce them and intend to abandon them into the biosphere (deep underground dump) is profoundly immoral and a burden and a curse on future generations into eternity. It is premeditated murder. (0552-1-2 [Macks, Vic])

Comment: There is a consensus nationally and internationally among government agencies, the nuclear industry, and those who opposes it that spent reactor fuel rods are lethal if not adequately shielded and that that risk continues up to millions of years. The opposition is to the government/industry continuing to produce spent fuel; not adequately and safely managing it; deferring to the financial interest of the nuclear industry, not the safety of the public; and intending to abandon spent fuel into the biosphere instead of shielding it and monitoring it forever. The struggle is also over who pays for this debacle: the public not the industry. Humans are the only species that would fatally soil its own nest and seems determined to do so for the right short term profit. (0552-3-6 [Macks, Vic])

Comment: Get a clue from Germany. Shut down nuclear power reactors and stop building more. (0559-3 [McCoy, Dave])

Comment: And then stop making it! (0563-2 [Songchild, Stephanie])

Comment: How could anyone support nest pooping ? Using nuclear power with all its consequences is nest pooping. The fact that I have to take this action is obscene in itself. How dare that men are playing their retarded, life hostile greed and dominance game even with an energy form that is lethal and uncontrollable, once released ?! How dare and insane ! And now - like the wizards student - they don't know what to do with the deadly demons they have created. If I would have been asked in the first place, never would I have agreed to create and use nuclear power !!! (0564-1 [Meincke, Doro])

Comment: No, I don't want its waste in my backyard. I want all reactors being shut down, all nuclear systems being dismantled... (0564-2 [Meincke, Doro])

Comment: This is a global issue. We only have this wonderful planet to sustain us. Nuclear energy and its handling is an issue of Life or Death for the whole planet, for all life. My heart is broken into a mangled mass to witness the catastrophe happening in Fukushima, especially the coma when it comes to applying solutions. How dare I have to write this letter ! How dare you let it come to this point ! (0564-4 [Meincke, Doro])

Comment: Please put me in the camp of favoring immediate shut down of all nuclear facilities, other than waste handling and warhead decommissioning. Yes, even if this causes brownouts or workplace changes, or shared housing during cold snaps. It is too perilous, and always has

been. What a scary mess that is sure to catch up to us, that all of the profiteers and sparkly eyed physicists have created. (0565-1 [Saxon, Craig])

Comment: In the U.S. reactors have been granted extensions to operate far beyond their useful lives, and beyond design capacity. Our air and aquifers are being contaminated; billions of gallons of water containing dangerous tritium are allowed to enter waterways and our coastal areas. (0566-3 [Tocornal, John])

Comment: Nuclear generated energy as it is currently implemented is dangerous, to say the least. In the best of times neglect and malfeasance have led to many radioactive releases. In a disaster---e.g., Three Mile Island, Hanford, Chernobyl, Fukushima---the effects are deadly and long-term, industry and government coverups notwithstanding. In a worst case scenario---a repeat of the major solar storm that produced the Carrington Event of 1859, which is inevitable in our dynamic universe---it will be an ELE (extinction level event), because there will be NO way to maintain hundreds of nuclear power plants worldwide in cold shutdown with continued cooling of the fuel rods. To continue with nuclear fission folly is genocidal and suicidal. There are alternatives to energy production and we must go ahead with research and development while sparing no expense to secure the byproducts of our dangerous flirtation with atom splitting. (0570-1 [Boosinger, Marilyn])

Comment: We need the actual location for the deep repository NOW as we have actual waste NOW.. and until we find the actual location...then we need to STOP creating more waste and using nuclear fuel. (0571-3 [Young, Jane])

Comment: The risks associated with nuclear power are too great to continue. Here in the Downwinder state of Utah we have first-hand experience of fallout on human health. It would be in the best interest of the health and safety of all people of the United States and the world to follow the leadership of Germany's Angela Merkel and begin the process of decommissioning all U.S. nuclear reactors. Obviously the Fukushima disaster sets a new high for the devastating consequences of nuclear power and the need to responsibly dismantle the nuclear industry. (0573-3 [Gerhart, Dan])

Comment: Please, Think you can't clean it up!! Just Stop Now ! I am a victim I had Thyroid Surgery Please Think This stuff will end the world if you keep going Oh and how old are they would you drive a 40 year old car ? We are to take care of the Earth not Kill Her ! What did 3/11/2011 show us we may be all done anyway Think ? Yes many KNOW.... Thank You..... Great Job So Far.....NOT !!! What is that 104 Dirty Bombs man made or other wise ? Just saying we could have a9.0 or other something or other same as Japan get Smart Be For Its Too LATE Dam IT (0575-1 [Duke, George])

Comment: I prefer a full life for the future children of the world, and all that is offered are agendas of disease and death. PTB, why is this? The only sane course for people that prefer life over the status quo is to shut all npp's down and begin an Apollo Project into alternative means of energy production and remediation. Doesn't anybody love their children anymore? (0577-1 [Beane, Gary])

Comment: NRC documents released under FOIA dated March through May of 2011 clearly indicate the severity of the Fukushima Daichi disaster. This event was supposedly was mathematically impossible; it nonetheless occurred. It could occur in the U.S. Please stop creating nuclear waste. We cannot store waste without signing our death warrant, if it is not already too late due to Fukushima. (0581-1 [Rohl, T.])

Comment: NO NUKES. (0581-3 [Rohl, T.])

Comment: I think we, as a nation, should reconsider nuclear power. There are many lessons to be learned from Fukushima and I'm very concerned that it appears that the NRC is a captive of the nuclear power industry. The NRC should be working for the people who depend on their overseeing of the corrupt power companies, who are in business to make money and for no other reason than that. The whole concept of nuclear power is flawed as it will lead to the extinction of most complex living animals including humans. What a legacy to leave your Grand Children, if they survive. In ten (10) years every family will be fighting cancer in multiple family members, and that is just from the nuclear disaster in Japan that has spread radiation all over the world. (0582-1 [Sugas, Zick])

Comment: Please, shut down this whole nuclear industry that is poisoning our planet. An "I told you so" moment in the future will be too late. Please. Please, do the right thing now on this issue. (0582-2 [Sugas, Zick])

Comment: Nuclear power is touted as a clean, efficient alternative to fossil fuels and other alternatives (wind, solar). The problem with nuclear power is that the issue of accidents, the regular releases of radioactive isotopes during a plants operation, and nuclear waste is handled as if the public and taxpayers are elementary children. Accidents are regularly covered up: eg. Santa Susana http://en.wikipedia.org/wiki/Sodium_Reactor_Experiment. Investors won't touch nuclear plant construction and insurance because the liabilities are so massive Cleanup is either socialized, or in the case of Fukushima, doesn't happen at all because TEPCO-the operator-is too concerned with profits. So instead of looking for the nuclear fuel melting through the reactor right after the accident on March 11, 2011, instead the core is permitted to melt down and poison the entire world. <http://enenews.com/iaea-expert-molten-core-is-suspected-to-have-penetrated-containment-no-water-was-injected-for-28-hours> The press doesn't cover the largest industrial accident in mankind's history because they are told not to. That is the only explanation for the sparse coverage. Radiation testing stations are shut down after the Fukushima accident because the governments don't want to protect their people. Yet, prospective recycling technologies by scientists like RM Santelli is swept under the rug using heavy handed tactics: <http://nuclearwasterecycling.com/> (0586-1 [Taylor, David])

Comment: Why? So it is as if our 'leaders' have been given a choice of nuclear power or life on earth, and have chosen nuclear power without consent of the people. Cancer rates are skyrocketing, background radiation has increased significantly the last 30 years. Tritium is regularly released by plants and is linked to diabetes. Downwinders have higher cancer incidences. If nuclear power was truly cheap then the profits from cheap power would easily pay for cleanups. Instead Somalia has radioactive tides, Hanford is contaminating aquifers and the DOE wants to put nuclear waste in silverware. Only an insane person could reasonably continue to pursue this strategy. A small number of people are triggering genocide. The end of the human race is possible with the bioaccumulation of all the nuclear waste that is already released into the environment. (0586-2 [Taylor, David])

Comment: The lessons still to be learned from the ongoing Fukushima catastrophe should shockingly awaken us all to the fact that there is no such thing as "safe nuclear power". We have no control over the heaving of the tectonic plates, not to mention our vulnerability to unpredictable "terrorist" attacks. I have heard that the super hot fuel rod waste is too hot to handle and does not have a known responsible safe method of long term storage. What are we going to do with this exaggerated outcome of that which was marketed to us so long ago as "cheap" and "safe" power generation? Local building officials require that we anticipate the 100

year flood zones before we can build a barn. What is the 1/2 life of this radioactive waste? How long will it be before we are assuredly safe in our own neighborhood? (0589-2 [Broska, Robert])

Comment: Just remember, this was all sold to the American taxpayers as 'TOO CHEAP TO METER'. Not to mention how safe Nuclear would be. Just go ask the people of Japan how safe they feel! (0590-2 [Anonymous, Scott])

Comment: Eventually, such waste is disposed of in unconventional ways for lack of better words and common people suffer the consequences unknowingly. We are destroying the planet, and mutations are forever. Every single nuclear plant is a sitting duck, an easy target for terrorists and prone to too many failures that are quietly reported. We are not ready to harness such power and even less capable of managing the waste it generates. If you love life, your family, your children, your brother, your neighbor, your land, you would consider a less dangerous and more costly efficient source of energy. (0596-2 [Shima, Tetsuo])

Comment: I have been a committed anti-nuclear weapons activist for over 31 years and only recently have included anti-nuclear power activities. I understand many connections between nuclear weapons and nuclear power plants and none of them are good or healthy. (0597-1 [Bergier, Kim])

Comment: No nuclear power plant should be operating another day until the highly toxic waste can be dealt with truly safely for the rest of time. (0597-3 [Bergier, Kim])

Comment: I have been a committed anti-nuclear weapons activists for over 31 years and only recently have included anti-nuclear power activities. I understand many connections between nuclear weapons and nuclear power plans and none of them are good or healthy. (0599-1 [Bergier, Kim])

Comment: No nuclear power plant should be operating another day until the highly toxic waste can be dealt with truly safely for the rest of time. (0599-3 [Bergier, Kim])

Comment: In lieu of the recent nuclear disasters locally and globally suggestions regarding the concerns of the storage of past, current and future waste bi-product from these facilities can no longer be tolerated in "Except-able" measure and exit strategy from nuclear energy must be designed and an alternative in to action. This is life. With out life, you have no current life or a future. (0600-1 [Riddle, William])

Comment: All nuclear power plants are crimes against humanity and planet Earth and so is all the waste from these plants. Here are my recommendations for where nuclear waste should be buried with confidence: - On the lawns of the White House. - In the yards of all the Congresspeople, past and present, who voted for nuclear power plants. - In the yards of all the owners, past and present, of nuclear power plants. - In the yards of all the lobbyists past and present, for nuclear power plants. - In the yards of the entire NRC, past and present. I hope some day we will have Nuremberg Trials for all the people who are responsible, past and present, for nuclear power plants, nuclear waste from these plants, and those talking about the waste of nuclear power plants as if it were something you could safely deal with and dispose of with confidence - instead of noting that it is a crime against humanity and planet earth. Nuclear power plants and their waste are murdering generations of our children. Their blood is on your hands. (0602-2 [Parks, Sheila])

Comment: I endorse the overall official positions and sentiments of ATHF3, NIRS (Nuclear Information and Resource Service), and Beyond Nuclear. (0603-1 [Schonberger, David])

Comment: Re: "shift in consciousness;" I currently live in Ann Arbor, Michigan -- home of the University of Michigan Department of Nuclear Engineering, which, much like the NRC, desperately needs a fundamental shift in consciousness and an existential redefinition of mission and purpose. It is abundantly clear to me that our whole society needs a new perspective as we proceed with determining how to meet our electricity needs. With a renewed ecological connection and sense of humility, gratitude and reverence for the web of life on Earth, we would certainly see nuclear energy in a different way. We would notice and care that there are much safer, cleaner, more efficient and more economical ways to meet our energy needs than the egregiously irresponsible and highly unethical, so-called "nuclear option." In fact, energy production is a clear example of the disproportionality and unsustainability of resorting to the "nuclear option." (0603-24 [Schonberger, David])

Comment: Furthermore, significant advances in energy efficiency technologies (accomplished with relatively limited investment resources), renewable energy systems, and innovations in energy transmission, storage and distribution make it completely unnecessary and strategically-flawed to continue to pursue nuclear fission as a part of our energy portfolio. It is a travesty that anyone would perceive nuclear power as a solution to global climate change, and even the so-called "baseload" argument for pursuing nuclear power is now outdated. Therefore, the so-called "all of the above" strategy for energy sourcing represents a grave and historic mistake and an undeserved gift to the nuclear industry -- a gift that is grossly inconsistent with the most recent and best available science as well as best-practices rules of accounting and long-term planning. Ominously, on a national level, the best thinking seems to have been disregarded for the sake of political expediency. Thus, my "active hope" (read Joanna Macy) is that a People's Movement will emerge from a grassroots process of listening to each other, and, together, we will act responsibly and forthrightly for the sake of the future of all life on this planet. (0603-26 [Schonberger, David])

Comment: Given the recent overwhelming rebuke of the NRC by the Federal Court of Appeals of the DC Circuit (New York v. NRC, June 2012), I believe that a thorough reexamination is warranted of the viability and sensibility of perpetuating a lawful existential role for nuclear fission in this society. (0603-4 [Schonberger, David])

Comment: In the meantime, the NRC should indefinitely extend the current moratorium on all major licensing actions and relicensing decisions. In good faith, the NRC should defer to the anticipated and pending legal challenges initiated through the Federal Court system by multiple states and organizations representing millions of U.S. persons, American citizens and residents. Anything less than all of the above would be appallingly irresponsible. (0603-7 [Schonberger, David])

Comment: Your fixation on commercial nuclear power apparently prevents you from learning the most important lessons. Since the dawn of the Nuclear Age the long list of nuclear accidents and events that either released, or came very close to releasing massive amounts of radiological contamination into the biosphere has continued growing. Without being encompassing, among the events on this list that should be teaching people to reduce and phase out nuclear power instead of embracing it are: Chalk River in Canada in 1952; Kyshtym in the Soviet Union in 1957; Windscale in the UK in 1957; Enrico Fermi near Detroit in 1966; Lucens in Switzerland in 1969; Surry Unit 2 in Virginia in 1972 and in 1986; Browns Ferry in Alabama in 1975 and in 1983; Three-Mile Island in Pennsylvania in 1979; Saint Laurent des

Eaux in France in 1980; Chernobyl near Kiev in 1986; Sosnovy Bor near St. Petersburg in 1992; Tokaimura in Japan in 1997 and in 1999; Davis-Besse in Ohio in 2002; Mihama in Japan in 2004; Fleurus in Belgium in 2006; Fukushima Daiichi in Japan in 2011. (0608-1 [Crocker, George])

Comment: Now, almost three years after the catastrophe at Fukushima began and still continues unabated, destroying ever widening ecosystems throughout the Pacific and spewing ever increasing amounts of radiation into global ecosystems, disrupting food-chains and eroding in multiple dimensions the very institutional controls that NRC staff blithely assume will be in place into the dimmest distant future, you have still learned nothing. Instead, with unmitigated gall you present this Draft Report, as though the malignant belief-system that possesses the commercial nuclear industry is absolutely true, lofty, and unassailable. Your madness has unleashed Hell on Earth, and your firm intent is to license and permit more activities that visit radiological damnation upon every ecosystem on the planet. (0608-4 [Crocker, George])

Comment: Immediately stop production of High Burn Up Waste. (0611-52 [Shapiro, Susan])

Comment: The answer from the nuclear industry and the NRC is always the same, it will be different next time. But the only reliability the nuclear industry has to offer is continually break promises and bust budgets. It is time for the NRC and the nation to acknowledge nuclear power is a science experiment that has gone very wrong. (0611-59 [Shapiro, Susan])

Comment: Since there is not solution for the nuclear waste already produce we must stop making more unmanageable high level radioactive waste. Only a fool keeps repeating a mistake over and over again. (0611-60 [Shapiro, Susan])

Comment: Even with more humane character, disasters happen, even with great minds. The Challenger and Columbia spacecrafts come to mind. These are huge undertakings that were engineered by the best minds of the world. The best scientists failed. The young engineers of Exelon, I assure you, are NOT the best minds of the world, since the best minds are working at Apple or at Caltech or some other interesting place. Were they the best minds around, they would not be running nuclear power plants, because truly, who the hell wants to do that. And given that they are NOT the best minds in the world, I fear what judgments they will make with regard to nuclear safety. (0612-6 [Takarabe, Tamae])

Comment: I wholeheartedly support the stand taken by Mother's for Peace members at the recent meeting in San Luis Obispo. I also, believe the person who recommended using the land for safer forms of sustainable energy, such as: wind machines, using the ocean for hydro power, etc. was on the right track. We need to be moving away from dangerous nuclear power plants and their volatile waste material and using all of our creativity to provide clean, sustainable energy. Our country's focus needs to be on providing a safe, pollution free environment -helping to halt global warming as quickly as possible for the welfare of the peoples of our planet. (0613-2 [Blake, Elisabeth])

Comment: Once the economic and environmental realities are acknowledged, it becomes possible to assess whether the "intractable" problem of storing ever-increasing quantities of spent nuclear fuel is best solved by not making any more in the first place. (0616-3 [Hoffman, Ace])

Comment: The reality is, there is no reason on earth to continue with a "technology" that threatens life itself; the definition of "technology" should be "tools, created by humans to make their lives more livable." In reality, the nuclear "industry" and nuclear "technology" is destroying

life. This is not a helpful industry, this is destructive industry based on false science. (0617-2 [Zure, Lisa])

Comment: I firmly believe that no industry should be allowed to continue creating wastes it has no ability to dispose of. In fact, I do not believe in any industry that creates more toxic waste. As stated before, this is destructive industry based on false (or incomplete) science. The truth is, neither the nuclear industry nor the Federal Government has an operating spent-fuel/high-level radioactive waste disposal facility in operation. Further, there is no "safe" method for disposing of nuclear waste. Therefore, it should not be allowed to manufacture any more of these wastes. NRC should not be allowed to issue new reactor licenses, nor grant license extensions to old operating reactors ever. (0617-3 [Zure, Lisa])

Comment: Some have suggested that a permanent, deep-geological high-level radioactive waste disposal facility be built and fully operational to deal with existing waste. But in any case, there is no justification to continue to create more nuclear waste. Ever. (0617-5 [Zure, Lisa])

Comment: The nuclear "industry" and US government and other governments clearly do not know how to deal with the fallout of disasters, much less the ongoing waste product of an overpriced and inefficient energy industry that has proven itself, time and time again, to be ill-conceived. (0617-7 [Zure, Lisa])

Comment: As a U.S. citizen, mother and professional, I am appalled that my government is involved in such a dangerous, unmanageable and out-of-control industry. Nuclear was a bad idea from the start, and now the waste problem will haunt us for generations. We can do better. (0617-9 [Zure, Lisa])

Comment: The reality is, there is no reason on earth to continue with a "technology" that threatens life itself; the definition of "technology" should be "tools, created by humans to make their lives more livable." In reality, the nuclear "industry" and nuclear "technology" is destroying life. This is not a helpful industry, this is destructive industry based on false science. Nuclear technology is not compatible earthly biology. Nuclear waste can be made safe, It can not be stored safely. (0621-2 [Casebier, William])

Comment: All nuke activity must cease, and full disclosure of all the health dangers that REALLY occur need to be disclosed. (0623-1 [Individual, Anonymous])

Comment: Then Three Mile Island happened in 1979, I believe. I began reading and writing letters about the insanity of nuclear power. I read many of Dr.Caldicott's articles. She became one of my heroes. Along with Louis Leakey and Jane Goodall. I heard Dr. Leakey speak at the University of Colorado in 1972. He said he was only speaking to college audiences any more because the way he saw it was that the future of mankind was solely in our hands. What we did with protecting and caring for our earth would mean either man and other life forms lived or we very likely would see the end of the human species. (0625-2 [Mandrell, Rebecca])

Comment: I believe every single nuclear power plant needs to be immediately shut down. (0625-6 [Mandrell, Rebecca])

Comment: Dry cask all spent fuel and close all nuclear plants, as they are old. (0626-1 [Individual, Anonymous])

Comment: Consequently, the only solution that one can contemplate is the closing of all nuclear power plants in the U.S.A. and an absolute prohibition on building any new ones. (0628-6 [Perkins, V.E.])

Comment: If Fukushima-Daiichi does not clearly show that nuclear energy is too dangerous for human beings to manage (and the utterly inept behavior of Tepco after the tsunami illustrates this), then it is entirely likely that we should give the human race the Darwin Award. (0628-7 [Perkins, V.E.])

Comment: We are too arrogant and stupid to survive on a fragile planet that is already under considerable stress from the depredations of globalized capitalism. Last, what gives the present generation of humans the right to poison this planet hundreds of thousands of years into the future for all future generations of human beings and creatures to come. Unethical is far too weak a word for our current selfishness, arrogance, and stupidity. (0628-8 [Perkins, V.E.])

Comment: Preferably you would shut down all reactors in the United States, most are very old and the risk of melt becomes higher each year. If real data on Fukushima were made available to Americans, these reactors would be shuttered immediately. Do you people have a soul? (0630-2 [Anonymous, Jeff])

Comment: Nuclear energy is a 20th century product. We need 21st century ideas. Warren Buffet just spent 1 billion on wind in Iowa. It made economic sense. Wind is a safe, clean energy that does not leave harmful waste for 10's of 1000's of years. Is there a message here?? (0633-7 [Kurz, Carol])

Comment: Albert Einstein observed that nuclear fission is a hell of a way to boil water. Even he could not have imagined the hell about to wreak havoc on the northern hemisphere from Fukushima (actually, it already is). (0635-1 [Bernhoff, Eric])

Comment: Let it be recognized that if there is no informed confidence as to handling of nuclear waste it is insane and immoral to continue making nuclear waste. The intractable problem of storing ever-increasing quantities of spent nuclear fuel is best approached by not making any more of it. (0640-2 [Geary, B.])

Comment: If the costs associated with disposal of nuclear waste are so great as to make nuclear power inefficient, we must find another source of power. I favor renewables. To these inefficiencies we must add physical health consequences in the (unavoidable, because they will happen!) accidents. (0643-1 [Schulte, Karen])

Comment: You see we have reached a critical point....it IS in your back yard too now! It IS going to be your children dying! Just like the rest of the world, if you continue to allow production it IS going to effect you and all of the world. IT ALREADY HAS AND YOU HAVE SEEN THIS! Now are you going to be part of the problem that continues or are you going to be part of the solution that says no more! We can no longer afford to utilize this Nuclear Waste and we certainly can not afford to store it because there is no man made container that can isolate and keep any isotope from doing harm. Since the containers will eventually leak there WILL BE MORE HARM and instead of continuing in such way I use my vote to find another better way! Each one of you have this option. How do you think your children would want you to vote? (0645-2 [Britz, Joan])

Comment: ANA supports limiting future nuclear waste generation, including a phased closure of commercial nuclear power plants. As long as the amount of commercial SNF continues to

increase, storage capacity must continue to expand in tandem, and the final amount of waste requiring disposal is unknown. Without knowing the scope of the problem, effective solutions cannot be fully implemented. (0646-14 [Hanson, Courtney])

Comment: Frankly, as high as the stakes are in regard to nuclear waste storage, we do not feel we can trust the industry, nor do we feel we can trust the regulators. And at its heart, we do not trust the technology itself. We are making a deadly mess that will last so far into the future that it can scarcely be imagined and leaving it for generations whose technological skills and societal framework, we cannot hope to predict. We have already gone too far. (0648-14 [Price, Scott])

Comment: We must stop now and begin to seriously come to grips with the damage we have already done. (0648-15 [Price, Scott])

Comment: APV [Alliance for Progressive Values] believes that as currently established the nuclear industry in America and elsewhere constitutes a technological dead-end and a very dangerous one at that. Our first and best option as a society should be to transition as quickly as possible away from nuclear fission based energy production and towards clean and renewable sources like wind, tidal and solar. We believe that these resources coupled with gains in efficiency and conservation can eventually solve our dependence on fossil fuels and dangerous nuclear power. Fission reactors generate high-level, deadly waste as a necessary part of their operation, the sooner we begin the process of decommissioning old reactors and replacing them with clean renewable energy sources, the better. The technology to replace nuclear and fossil fuels exists today; it is merely a matter of defying the culture of entropy and greed that currently guides our energy policy. (0648-2 [Price, Scott])

Comment: We already have an enormous radioactive waste storage problem; we do not need to make it worse by adding more. (0648-3 [Price, Scott])

Comment: The only thing we can do to reduce the harm caused by so much production and storage of nuclear waste is to stop producing it. (0653-1 [Kraskian, Jessica])

Comment: Despite how much profit is involved for your self-regulating business, nuclear power is obsolete and the risks greatly outweigh the benefits. Better technology for clean energy is improving every day. We could easily power the world with wind and solar if industries like yours would stop suppressing their development and deployment. Stop creating a toxic wasteland out of the only planet we have, the only planet your children and their children will be growing up on. (0653-2 [Kraskian, Jessica])

Comment: The problem with nuclear energy is the disposal of waste. That has not and will not change. We need to stop producing nuclear energy and focus on clean energy with waste products that can be safely disposed of. (0656-2 [Bonney, Mary])

Comment: Kathy C posted on the internet important ideas to consider: [The commenter posted remarks found on articles at <http://guymcpherson.com/2013/01/climate-change-summary-and-update/> and <http://guymcpherson.com/2013/06/savanna-louise-rose-omalley-mcpherson/#comment-79334>] (0657-1 [McClintock, Francene])

Comment: I don't care if the industry goes bankrupt. Though this would be an economic crisis it pales in comparison to the humanitarian crisis that would rest on your shoulders! Have some guts! (0658-2 [Jennings, Stephanie])

Comment: Cease production of all nuclear waste. (0660-10 [Headrick, Gary])

Comment: Close down all nuclear power plants starting with Mark I and Mark II's and all plants using salt-water. (0662-1 [McClintock, Francene])

Comment: Close down the nuclear industry. (0662-12 [McClintock, Francene])

Comment: Plants should be closed to allow for fuel to start cooling. (0662-3 [McClintock, Francene])

Comment: Nuke plants during normal operation release radionuclides into the air, water and land and we, as a race, are dying because of it. Nuke plants are not "green energy". Sorry Senator Alexander but you are wrong. Please read Dr. Helen Caldicott's book, Nuclear Power Is Not The Answer and educate yourself. To power our 21st century we need renewables. (0662-6 [McClintock, Francene])

Comment: There is no solution to containing nuclear waste. Stop making it now. (0663-2 [McClintock, Francene])

Comment: A nuclear power plant, on the other hand, is a very different type of "bridge." When they fail, as we have seen in Chernobyl and Fukushima, they cause massive devastation for decades, possibly centuries, with an ever-increasing number of dead and suffering. From my understanding, we build nuclear power plants for only two reasons: to generate electricity, or to build nuclear weapons. Proponents of nuclear power will argue that they are less harmful to the environment than coal plants. This argument is ridiculous, and anyone suggesting this simply needs to look at the mining operations where uranium is gathered, or the island of Japan, to see what can happen when things go terribly wrong. (0670-1 [Anonymous, Brian])

Comment: The bottom line is that if we want to contain the situation as best we can, it is imperative that we shut down and dismantle the remaining nuclear power stations immediately. What's worse than one nuclear power plant spewing radiation into the environment? Two nuclear power plants spewing radiation into the environment! (0670-3 [Anonymous, Brian])

Comment: And who's idea was it to build a nuclear power plant on fault lines along the ring of fire, anyway? One day I may have to explain to my grandchildren why greedy politicians and power companies built toxic power plants that have the capacity to destroy all life on earth, and I'm not looking forward to that day. (0670-4 [Anonymous, Brian])

Comment: Shut them down! Shut them all down! End this ridiculous idea that we can somehow control what cannot be controlled. Yes, all nuclear power plants are "safe," until they fail and rapidly become "unsafe." (0670-5 [Anonymous, Brian])

Comment: Nuclear plants should be immediately shut down & decommissioned since we lack the knowledge, honesty, & resources to handle them safely. The on going disaster at Fukushima & our own problems with Hanford plus the TMI accident should be enough evidence to move us in this direction (decommissioning). (0671-3 [Conley, Pam])

Comment: No more additional waste should be created until existing on-site stored waste is all safely transported to a permanent storage location. The threat of a spent fuel pool losing coolant and/or power for pumping is just too great to allow the current practice to continue. No additional operating licenses should be issued or renewed until this problem is solved. If we need to pay higher electrical rates because of this so be it. (0676-1 [Individual, Anonymous])

Comment: Nuclear fuel, spent and otherwise is antithetical to life. The human race and the companies responsible must stop producing this toxic poison. There is no way to store it safely, though all in our power must be done to do so, while we research ways to "deactivate" it. Stop all production NOW this is the only sane and reasonable answer for the future. (0677-1 [Individual, Anonymous])

Comment: In the meantime, know that geologic, atmospheric and many geopolitical conditions are changing rapidly and there is no way to responsibly think that projections based on past relatively stable conditions can apply to the future... just notice big earth quakes, intensifying storms, geopolitical unrest, economic collapses, all around the world. The time is now or never. STOP NUCLEAR. It is not the answer, it is the lid on the coffin. (0677-2 [Individual, Anonymous])

Comment: Taking a cold, hard look at the economic and environmental realities, it becomes quite clear that the "intractable" problem of storing ever-increasing quantities of spent nuclear fuel is best solved by refraining from producing any more of these toxins. (0679-4 [Sorgen, Phoebe])

Comment: Fukushima proves what will happen if we continue running nuclear reactors until they break. Loss of lives, land, income. If there are more Fukushima-scale calamities, which is quite likely, perhaps our entire habitat will be lost. I recall learning in 6th grade biology class that survival of the species is the most basic of instincts. The human species' most basic instinct and common sense have been usurped by blind greed. The NEI's bias in favor of the nuclear industry which funds it is egregious. Public safety must come first! If you do not yet understand this, Nuclear Regulatory Commissioners, I beg you to come to your senses. (0679-5 [Sorgen, Phoebe])

Comment: Instead, we need to explore which scientifically feasible future technologies have the potential to provide needed power and that help us comply with our obligations to protect our home, the earth, and to future generations better than nuclear power. Traditional approaches to cost analysis and risk assessment should include the moral non-acceptability of nuclear technology and the risks it poses. Intergenerational justice should be included in this analysis. The fact is that nuclear energy has been imposed on the human race as an ongoing social experiment. Moral issues such as the long term risks and feelings of responsibility for future generations need to be taken seriously and not dismissed from the debate in denial. (0686-10 [Malboeuf, Simone])

Comment: High-level nuclear waste is the inevitable end result of nuclear energy production. The waste will remain radioactive and/or radiotoxic for at least 100,000 years. It is estimated that the total amount of high-level nuclear waste in the world today is between 250,000 and 300,000 tons. The amount of waste increases daily. This needs to stop. This is not intergenerational justice. (0686-11 [Malboeuf, Simone])

Comment: Radioactive waste is hazardous to all living organisms and exposure to radiation may result in death, incurable disease, as well as mutation of the genetic code. The security standards are based on theoretical assumptions, as humanity has no previous experience to build on with regards to radioactive waste. In Europe there is a security standard of 100,000 years for the min. period that the waste must remain isolated from all living organisms. In the US it is 1,000,000 years. Is it moral for our generation to leave this legacy for our children, their children and all future generations? I THINK NOT! (0686-13 [Malboeuf, Simone])

Comment: I believe it's time for the experiments with nuclear power on the human race and inhabitants of earth to cease. We already know the answer - it costs too much, the risks are too great. How much should be sacrificed for the profits of the share holders of the corporation? (0686-15 [Malboeuf, Simone])

Comment: At the November 20 NRC meeting in San Luis Obispo, the NRC representative openly expressed the idea that the radioactive waste generated at Diablo would need to stay there until the Federal government established a repository in the US. This is a big lie. At this time, there is no such place and no concrete plans to build one. The standard of the nuclear power industry is to keep the waste on site. There are no completed repositories for radioactive waste in China, Japan, the United States, France, Germany, Canada or anywhere else in the world. How much waste does PG&E expect to store there over the lifetime of this plant? I am greatly concerned that the NRC representative at this meeting was blatantly perpetuating this lie. As a representative of NRC, he appeared to have no scruples. How can the public trust the NRC with representatives like this? The NRC knows this and is perpetuating the LIE that there will someday, in the near future, be a place for radioactive waste to be shipped to and "safely stored" for eternity. This is done to placate the audience into not objecting more strongly than they already are, so the NRC representative can get through the meeting and pretend the audience is in agreement with the plans to continue operating Diablo Canyon Nuclear Power Plant as usual. Even if there was such a place, or many of them in the world, the concept of storing unlimited amounts of radioactive waste for unconceivable lengths of time is absurd and irresponsible. It is morally wrong for the nuclear power corporations to create this highly toxic and destructive waste and plan to "dispose" of it in the earth. It is also wrong for the corporations to reap the financial profits and give them to stock shareholders who keep them for their own families while subjecting the families of 99.9% of the population on the earth to the negative affects of the waste of their business. It is wrong to leave the problem of what to do with the radioactive waste to future unborn generations. They will not have use of the electricity (it has already been used). They will not share in the profits made from its generation. They should not be forced to bear the burden of dealing with the waste products produced and the effects they have on the environment of their homes. (0686-16 [Malboeuf, Simone])

Comment: When we produce nuclear power, we are depleting a non-renewable resource (uranium) taken from the earth, that will eventually not be available for future generations. When we turn it into fuel rods that are spent, we create non-disposable waste that needs to be dealt with as it is highly radioactive and dangerous. Therefore, from an intergenerational justice point of view, the process of building and operating nuclear power plants is inherently unethical. (0686-8 [Malboeuf, Simone])

Comment: In addition to these comments, I would like to add to the record the following resources: My Nuclear Free Zone: <http://www.SilverNightingale.com/nuclear.html>: Nuclear Free Music: My "No Nukes Swing", "Sakura", "Salute to the Sun" and more: <http://www.cdbaby.com/Artist/LauraSuetheSilverNightingale>. I have free download cards and song sheets available for "No Nukes Swing", for those who would like to share or perform this song. I hope you will take the time to listen to "No Nukes Swing", as it is a thoughtful and sincere statement in song of my views on the use of nuclear technology, whether in the form of nuclear plants or weapons. (0687-1 [Wilansky, Laura])

Comment: I was born in 1952, so have been living with the threat of nuclear energy for my whole life, for as long as I can remember. Although the dropping of atomic bombs on Hiroshima and Nagasaki was unspeakable, I believe the ongoing nuclear catastrophe at Fukushima poses the greatest threat to the future of life on Earth that we have ever seen. After Fukushima, it is

clear that nuclear energy is just way too dangerous, and it's impossible to either prevent, or clean up nuclear accidents. The very future of life on Earth is threatened by use of this form of energy! One accident, equipment malfunction, operator error, or terrorist attack at a nuclear plant could literally mean the end of life on Earth. If Fukushima did not convince you, and you still think it can't happen, just think about that little O-Ring on the Challenger. I live in Florida and these things are very present with us here, as they are with us all. (0687-2 [Wilansky, Laura])

Comment: Nuclear plants are so dangerous even Wall Street won't invest in them, and they'll invest in almost anything, no matter how risky! The halt on licensing new plants should be made permanent. (0687-4 [Wilansky, Laura])

Comment: With so many truly clean, safe, renewable and sustainable technologies now available and in development, there is no reason to build new nuclear plants, which will only drain much-needed resources from full development of better, safer technologies. We will get much better value and results from investing in solar, wind, geothermal, and other truly safe and renewable technologies. (0687-5 [Wilansky, Laura])

Comment: And we should not be making more nuclear waste. I urge you to end licensing and relicensing of all nuclear plants, and shut down all currently-licensed nuclear plants. As I mentioned, I live in Florida. Others have spoken about Turkey Point - that's my local nuclear plant - and the current and proposed plants, and nuclear waste at Turkey Point WILL be underwater in the foreseeable future. It's time to end the use of all nuclear power, and as discouraging as it may seem at times, we must keep working to find better ways to keep nuclear waste safe. (0687-9 [Wilansky, Laura])

Comment: The Sierra Club supports sustainable energy alternatives that do not harm the environment. The Sierra Club opposes nuclear power because its fuel cycle from uranium mining to spent radioactive fuel poses grave dangers to the environment. In addition, reliance on nuclear power unjustifiably delays the beneficial transition to clean and renewable energy sources. (0688-1 [Taylor, Wallace])

Comment: Furthermore, our old nuclear plants have outlived their lives and parts and also endanger our nation and should be shut down. The problem is there is no safe depository. We don't even run fuel efficient plants in this country. (0690-4 [Eisman, Val])

Comment: France is now grappling with nuclear waste removal and the ocean has become a dump site and repository which is destroying it and endangering a needed source of food. (0690-5 [Eisman, Val])

Comment: More than a half century ago, our government sold the public on the promise of "atoms for peace" and electricity that would be "too cheap to meter." At the time, there was fascination with our technological capability and as a result the government assured the public that nuclear waste would be a very simple problem to solve. Today we have created approximately 70,000 tons of highly radioactive used nuclear fuel, and there is nowhere to dispose of it. By 2050 we will have twice that amount if we continue to operate our existing nuclear reactors, even if we build no new nuclear reactors. This quantity does not even include all the high level nuclear waste that is being handled by government agencies, especially the Dept. of Energy, at hundreds of sites across the country. Nuclear Waste is the "Achilles Heel" of the Nuclear Industry. Each plant produces tons of extremely radioactive fuel. After 40 years of operation, a reactor can have 1,200 tons or more of this relatively useless, but lethal fuel stored on site. The long term management of nuclear waste is costly. It must be isolated from humans,

their water and food supply, animals and the natural environment. A few decades of power creates waste that is hazardous for more than a million years. This situation is clearly unsustainable over the long term. There is no safe dose of radiation. Radiation causes cancer and mutations in DNA, thus having the potential to impact the viability of future generations. (0693-1-2 [Warren, Barbara])

Comment: The truth is that Nuclear Energy is unconscionably dangerous. Remember the fairy tale about the Emperor's Fabulous New Clothes--and the fact that he was really nude. We'll that the story of nuclear power--except that usually nudity does not kill. (0695-2 [Fast, Wendy])

Comment: Please do not give licenses to anymore Nuclear Reactor Power Plants. (0696-1 [Becker, Joanna])

Comment: The only solution to the problem of nuclear waste is to stop making more. The Waste Confidence rule doesn't move national policy toward that solution, quite the opposite, it strives to find a waste policy that will allow the NRC to license new reactors and create more of the same problem. Putting communities at risk. (0700-2 [Women's Action for New Direction, Georgia])

Comment: The radioactive material must be rendered into a low radioactive safe material. Every effort must be made to advance making Radioactive Material a low level radioactive material and safe for all life on the planet. I do not have any confidence in the ability of any nuclear scientist to be able to make nuclear material safe. The NRC and the Nuclear Industry must stop making any more enriched uranium material for nuclear power on the planet. That includes weapon grade nuclear material. (0701-19 [Wilson, Greg])

Comment: The NRC has many years of work to do mothballing the nuclear power industry. (0701-20 [Wilson, Greg])

Comment: It is unethical and immoral for our government to allow the continued creation of deadly wastes, some of which will be dangerous for nearly a million years. We have no technology for making these wastes safe; indeed, such a technology may well prove impossible. If so, these wastes must be isolated from the biosphere virtually in perpetuity. This is an impossible task for fallible humans, so we can only expect more and more radioactive poisoning of the earth. "Hope" is not a strategy! We already have more radioactive waste than we can deal with, and our nuclear reactors keep creating more. Therefore, NRC must shut down all reactors soon as possible, and not license or build any more. The electricity we currently generate by nuclear power can be replaced by the existing technology of efficiency and renewables, without the risks of relying on dirty, dangerous, and expensive nuclear power. (0702-2 [Scarff, Steve])

Comment: The safe storage and perpetual vigilance of high level nuclear waste is a grave matter that must be addressed seriously with a care for the distant future, and not by people with the attitude of "You'll be gone and I'll be gone." (0702-5 [Scarff, Steve])

Comment: AND THEN, further answering, I read that the NRC is involved in developing yet untested nuclear material and ... oh, boy, where will this expansion take, except, once again, we have the problem with the present reality, Fukushima is STILL at an emergency state with no solution in sight, and all of our existing projects have serious ecological issues that this Waste Confidence Rule taps dances around by saying all the wonderful things developing in the nuclear industry. AND YES, wonderful ideas and projects, absolutely fascinating!!! BUT, NO! This Industry is GROUNDED! Until someone cleans their room, they are not able to work on that new science project. Common defense, common sense, common goals. "SAFETY FIRST"

with any and all science projects, and most definitely with the nuclear facilities within the regulation of the government. The Court's have said that, right?! That's what I thought was the Court's reason in this whole rethinking idea we are doing, right?! But, maybe I'm wrong. I've been wrong before! (0703-12 [Vandel, Nikohl] [Vandenberg Clermont, Elaine])

Comment: Stop all the nuclear power plants, which is what it seems like we are doing; Stop the mining, looks like that is also being restored (at least in our nation), Just STOP! Now breathe. Again. Breathe. Again. Breathe. We do not know how to contain nuclear waste. We do not know how to store it so it does not harm our natural environment because every environment we put it into it irreparably alters and changes that environment. We have plenty of #spentnuclearwaste to practice on, to reclaim, to recycle, to use up, to facilitate the rest of our learning curve. A moratorium on the #GlobalNuclearIndustry should be called for UNTIL full #fukushimacontainment.**#commondefense#Fukushima#NuclearFirstResponseTeam#DiabloC anyonNuclearFacility#spentnuclearwaste#GlobalNuclearIndustry#fukushimacontainment *in working on this problem, and being so new in this nuReg game and now jumping back into dialogue having left it for a while, I found that there was no common ground except the one that I saw. (0703-7 [Vandel, Nikohl] [Vandenberg Clermont, Elaine])

Comment: If there is no "waste confidence" it is inappropriate to continue running nuclear power plants and creating nuclear waste. (0705-2 [Spring, Janet])

Comment: Once the economic environmental realities are acknowledged, it becomes possible to assess whether the "intractable" problem of storing ever-increasing quantities of spent nuclear fuel is best solved by not making any more in the first place. (0709-3 [Wythe Elnagar, Romij])

Comment: Does NRC as an institution, and the NRC staff as an individual recognize the very real situation that it has created: material that would not be on this planet but for the licenses to engage in atomic fission that will persist as a hazard for hundreds of thousands of years, capable of causing cancers, deformities and other genetically--regulated malfunctions? (0711-25 [Olson, Mary])

Comment: They need to focus on securing the waste, NOT making more of it! (0712-2 [Schimmelpfennig, Pamela Y.])

Comment: We must evaluate phasing out nuclear reactors in the near future[.] (0712-3 [Schimmelpfennig, Pamela Y.])

Comment: 70,000 metric tons of commercial high level nuclear waste have been created thus far, with no long-term storage solution in sight. This is an unacceptable failure in safety for the public and environment. It's high time to stop adding to this waste. (0712-5 [Schimmelpfennig, Pamela Y.])

Comment: Albert Einstein also informs us "To the village square we must carry the facts of atomic energy. From there must come America's voice." The people have spoken. Stop making it! Cease and desist. Stop making it period. Do not relicense, do not license new ones. You don't know what to do with what you have. (0713-11 [Keegan, Michael J.])

Comment: To continue to generate high level nuclear waste among the most toxic and lethal poisons known to mankind are crimes against humanity and crimes against the future. (0713-6 [Keegan, Michael J.])

Comment: Please enter into the record this testimony by Dr. John Gofman which further articulates how the generation of nuclear power and waste constitute violations of the Nuremberg Principles. Dr. John Gofman (Ph.D. in nuclear-physical chemistry and M.D.) Nuclear Power: A Simple Question[.] Many people think nuclear power is so complicated it requires discussion at a high level of technicality. That's pure nonsense. Because the issue is simple and straightforward. There are only two things about nuclear power that you need to know. One, why do you want nuclear power? So you can boil water. That's all it does. It boils water. And any way of boiling water will give you steam to turn turbines. That's the useful part. The other thing to know is, it creates a mountain of radioactivity, and I mean a mountain: astronomical quantities of strontium-90 and cesium-137 and plutonium—toxic substances that will last—strontium-90 and cesium for 300 to 600 years, plutonium for 250,000 to 500,000 years—and still be deadly toxic. And the whole thing about nuclear power is this simple: can you or can't you keep it all contained? If you can't, then you're creating a human disaster. You not only need to control it from the public, you also need to control it from the workers. Because the dose that federal regulations allow workers to get is sufficient to create a genetic hazard to the whole human species. You see, those workers are allowed to procreate, and if you damage their genes by radiation, and they intermarry with the rest of the population, for genetic purposes it's just the same as if you irradiate the population directly.[27] So I find nuclear power this simple: do you believe they're going to do the miracle of containment that they predict? The answer is they're not going to accomplish it. It's outside the realm of human prospects. You don't need to discuss each valve and each transportation cask and each burial site. The point is, if you lose a little bit of it—a terribly little bit of it—you're going to contaminate the earth, and people are going to suffer for thousands of generations. You have two choices: either you believe that engineers are going to achieve a perfection that's never been achieved, and you go ahead; or you believe with common sense that such a containment is never going to be achieved, and you give it up. If people really understood how simple a problem it is—that they've got to accomplish a miracle—no puffs like Three Mile Island—can't afford those puffs of radioactivity, or the squirts and the spills that they always tell you won't harm the public—if people understood that, they'd say, "This is ridiculous. You don't create this astronomical quantity of garbage and pray that somehow a miracle will happen to contain it. You just don't do such stupid things!" (0713-7 [Keegan, Michael J.]

Comment: Licensing a nuclear power plant is in my view, licensing random premeditated murder. First of all, when you license a plant, you know what you're doing—so it's premeditated. You can't say, "I didn't know." Second, the evidence on radiation-producing cancer is beyond doubt. I've worked fifteen years on it, and so have many others. It is not a question any more: radiation produces cancer, and the evidence is good all the way down to the lowest doses. The only way you could license nuclear power plants and not have murder is if you could guarantee perfect containment. But they admit that they're not going to contain it perfectly. They allow workers to get irradiated, and they have an allowable dose for the population.[28] So in essence I can figure out from their allowable amounts how many they are willing to kill per year. I view this as a disgrace, as a public health disgrace. The idea of anyone saying that it's all right to murder so many in exchange for profits from electricity—or what they call "benefits" from electricity—the idea that it's all right to do that is a new advance in depravity, particularly since it will affect future generations. You must decide what your views are on this: is it all right to murder people knowingly? If so, why do you worry about homicide? But if you say, "The number won't be too large. We might only kill fifty thousand—and that's like automobiles"—is that all right? . . . (0713-8 [Keegan, Michael J.]

Comment: People like myself and a lot of the atomic energy scientists in the late fifties deserve Nuremberg trials. At Nuremberg we said those who participate in human experimentation are

committing a crime. Scientists like myself who said in 1957, "Maybe Linus Pauling is right about radiation causing cancer, but we don't really know, and therefore we shouldn't stop progress," were saying in essence that it's all right to experiment. Since we don't know, let's go ahead. So we were experimenting on humans, weren't we? But once you know that your nuclear power plants are going to release radioactivity and kill a certain number of people, you are no longer committing the crime of experimentation—you are committing a higher crime. Scientists who support these nuclear plants—knowing the effects of radiation—don't deserve trials for experimentation; they deserve trials for murder.....The only solution is, you must stop all efforts to develop first-strike force solutions everywhere—whether they be nuclear or other—and move toward a more just society. Even if you made an agreement to abolish all nuclear weapons, but you left established power structure in the U.S. and the USSR, they'd go on to research mind control or some chemical or biological thing. My view is, there exists a group of people in the world that have a disease. I call it the "power disease." They want to rule and control other people. They are a more important plague than cancer, pneumonia, bubonic plague, tuberculosis, and heart disease put together. They can only think how to obliterate, control, and use each other. They use people as nothing more than instruments to cast aside when they don't need them any more. There are fifty million people a year being consumed in a nutritional holocaust around the world; nobody gives a damn about starvation. If fifty million white Westerners were dying, affluent Western society would worry, but as long as it's fifty million Third World people dying every year, it doesn't matter. In my opinion, what we need is to move toward being nauseated by people who want to be at the top, in power. Can you think of anything more ridiculous than that the Chinese, Russian, and American people let their governments play with superlethal toys and subject all of us to these hazards? The solution is not to replace one leader with another or to have more government. Society has to reorganize itself. The structure we have now is, the sicker you are socially, the more likely it is that you'll come out at the top of the heap. (0713-9 [Keegan, Michael J.]

Comment: I, for one, do not have confidence that currently existing nuclear waste poses no threat to public health and safety. (0719-4 [Hibbard, Angela])

Comment: I insist that ending radioactive waste generation is the single most important step we can take to minimize the risks surrounding its storage, and the NRC should revise its Waste "Confidence" document to ensure the speediest possible end to that generation. (0719-6 [Hibbard, Angela])

Comment: Stop this insanity of licensing nuclear power plants when there is no safe way to dispose of radioactive nuclear waste! (0721-1 [Headington, Vince])

Comment: I live in Illinois, which is home to more nuclear reactors than in any other state. The more I learn about reactors, their operation, their impact on communities, the more I realize the sacrifice that my family and community are being asked to make for the enrichment of an industry that is dishonest, and sadly by government officials that are pawns of a hugely powerful lobby. This is an industry that is propped up by loan guarantees and taxpayer subsidies, not by Wall Street. Any decisions being made by DOE, the NRC, Congress, and even the President are compromised by limitless dollars infused by the nuclear power industry. This is about politics, not science. If science were paramount, there is no way on earth that nuclear power would prevail over truly clean energy development like wind and solar. (Apparently, not enough campaign contributions being made by those folks.) The public has been lied to since the get-go on the most basic question of safety. It is as though Fukushima never happened. But it did. And 4 of the same model reactors are the reality for my state. Mishaps at Illinois' reactors are

commonplace occurrences. We are repeatedly told that tritium leaks are benign. They are not. (0722-1 [Headington, Maureen])

Comment: The fact is that there is no safe level of radiation. Stop making it. Stop licensing it. Stop relicensing it. STOP! (0722-7 [Headington, Maureen])

Comment: More modern technologies and methods such as solar, wind and energy conservation all offer utility scale environmentally preferable alternatives. The price of solar power plants continues to fall. Already solar power plants on a utility scale have fallen to just above \$1 per watt, making them cheaper to build and operate than nuclear facilities – so much cheaper, in fact, that the cost savings covers the grid scale storage infrastructure necessary to accommodate such improvements. Advances in battery efficiency, reliability and life cycle, most notably sodium-sulfur and zinc-air batteries, can make a solar power plant into a 24/7 base load solution. The same applies to wind energy sources. Reliable grid-scale storage solutions are now offered by reputable companies using proven technologies. These companies include GE, NGK and Fluidic Energy. Even more accessible than new sources of generation is the single most affordable source of untapped energy in the nation: conservation. If every building in the country were improved with even the simplest of efficiency measures, then the whole fleet of existing nuclear power plants could be taken offline. Why are we even considering building new nuclear power plants? Let us spend our money, time, and intellect more constructively. (0724-6 [Gamble, Dan])

Comment: Cease production of all nuclear waste. (0728-8 [Anonymous, Anonymous])

Comment: At least please shut down the producers of this waste so we will not create any more. (0729-2 [Wolpoff, Deborah])

Comment: No industry should be allowed to continue creating wastes it has no ability to dispose of. If you have no place to dispose of radioactive spent fuel, STOP MAKING IT! The NRC should not be allowed to issue new reactor licenses, nor grant license extensions to old operating reactors. (0730-2 [Lawhorn, Larry])

Comment: The cost to the American taxpayers for solar energy is one fifth that of nuclear energy. No American state is a waste dump! (0730-3 [Lawhorn, Larry])

Comment: Waste needs to be dealt with and if you can't, you have to stop making it. Perhaps in the future there will be a scientific rather than geologic solution in which man can neutralize the deadly by-products of nuclear fission. Until that time, you need to suspend all nuclear power plant operations and stop creating more waste. Nobody really has a clue as to what to do with it other than hope, pray, believe that nothing will happen to start a radiological release. (0734-3 [Hisasue, Carole])

Comment: You've asked everyone to have "confidence" that you'll find a permanent solution to the nuclear waste problem when the first power plant went into operation in the mid-50's. Decades later, you are asking us again to believe that you will find one in 60 years. What faith do we have? None. Yet without a solution in place, you continue to allow power plants to remain in operation, creating more waste. The TEMPORARY answer to this problem is to stop making more waste! And then, we need to find a permanent solution to the radioactive waste that has already been created. (0734-4 [Hisasue, Carole])

Comment: Beyond the waste issue, the nuclear industry is fraught with too many hazards that have the potential of an enormous catastrophic disaster. We need to phase out not only nuclear power but the entire industry and I realize this goes against what the NRC is here to do, but it seems like you are coming up with inadequate solutions to keep the industry (including yourselves) going. You keep talking about the "lessons from Fukushima" but are you paying attention? The real lesson is that we cannot afford nuclear power -- it will be our undoing. The only reason why the entire world is not in a panic over the continuing catastrophe in Fukushima is that we cannot "see" radiation. There are no photos or videos like those of an oil spill so it's easy for some to ignore. What we have is a whole lot worse and if one could see it, the nuclear power industry would be dead by now -- nearly 3 years of the ongoing situation at Fukushima. It's just not worth it. Invest in renewable, clean energy. Conserve. Be smart. And, most importantly, keep the planet viable for humanity. (0734-7 [Hisasue, Carole])

Comment: If there is to be a hope for our children and by the power of all that is loving and good help now to free the planet and our children from a nuclear death sentence. Reject all permits unless they are for shutting down nukes permanently. No state or country or sea or outerspace is a dump for toxic waste. Lets all end the waste. (0735-2 [Velazquez, Lisette])

Comment: "Eternal vigilance" seems quite outside of any reasonable expectation for human institutions and the hazardous lives of high level radioactive wastes. Perhaps the more important question is whether it is morally appropriate to produce more of such wastes, dangerous for hundreds of millennia, if one cannot reasonably expect such eternal vigilance. At the end of the day, that is what is at issue in NRC's proposed Waste Confidence Rule and associated environmental review. (0738-20 [Hirsch, Daniel])

Comment: Our society reaps the benefits of these atomic power plants: roughly fifty years of electricity. But thousands of generations to come may pay the price if even a small fraction of the radioactive waste contaminates water, soil, or air over the time period for which it is dangerous. We get fifty years of power; they get 500,000 years of radioactive waste. Yet those who may bear the burden of our mistakes neither will have benefited from the power nor had any say in the decisions that may so severely impact their environment. Those who will be adversely affected have not yet been born. They cannot submit comments on draft environmental impact statements or proposed rulemakings; they cannot vote for elected officials who set policy and appoint or confirm key decision-makers; they cannot file suit in an effort to defend their interests. The choices we make today can harm in grievous ways many, many generations to come who will have had no voice in those hugely impactful decisions. (0738-3 [Hirsch, Daniel])

Comment: No nuclear waste stored in California - the earthquake state. No Fukushima. Please think about the future of our children and our planet. Don't you have grandchildren? (0740-1 [Gordon, Michelle])

Comment: Cease production of all nuclear waste. (0741-5 [Giese, Mark M.])

Comment: We ! Demand the shut down of all 104 nuclear plants and facilities and all 1000 globally. Begin with a plan with this focus for the sake of ALL Life on Earth. (0744-11 [Bonniwell, Colleen])

Comment: Keep minds and Hearts open to all life. These truths are age-prepared. Give direction to the future! Make good use of CONSCIENCE. (Emoto's Science on Water is a good study for pre science nuclear physics-for HOPE!) Protect the Water! (The Great Lakes)!!!! and

all water sheds - Recover the waters from all poisons! Protect the Air and Lands! Protect All Life! I am an anti nuclear activist who, on the front line - suffered a Hit! and will not be detered as Life Precious Life of Earth is Extremely Challenged! Consider the True Cost of Nuclear Power! (0744-12 [Bonniwell, Colleen])

Comment: No new nukes, no uranium process or mining, no interim waste sited, no transport of nuclear waste, secure nuclear waste, no nuclear waste from other countries. No more nukes. Shut all down. Plan NOW! NO NUKES! (0744-13 [Bonniwell, Colleen])

Comment: Protect the Children and their future, our future! Do not let us become Slaves to this POISON! Protect the land, water and the future - our safety and future! And Freedoms. There is your example. I admitted and corrected my mistake in this testimony. (humbly). Please know LOVE is the mindbomb! Nuclear waste - the only "enclosure" we can secure! Remember what got us all here and gave us everything we all have ever had - have- or will have, and that takes us back....."Our Common Mother Earth! is Sacred." "In art work, native people sometimes make 1 mistake and it is that mistake, a proff of authentisity, and where the spirit comes through the work!" ! NO FREE PASSAGE ! of WASTE! STOP MAKING MORE WASTE! NO STATE IS A NUCLEAR WASTE DUMP. (0744-15 [Bonniwell, Colleen])

Comment: STOP making nuclear waste. Set a NEW CLEAR example to the International Community. Approach an International Uranium Mining Moritorium. No new licenses for nuclear plants (?). SECURE the waste. Protect the land and water, all life and the Future. (0744-5 [Bonniwell, Colleen])

Comment: My mother told me not to eat the snow when I was 3 1/2. I loved to eat the snow. So I asked why can't I eat the snow? She said "because its radioactive." I asked whats radioactive. She said "it comes from the big boom!" This was my first memory. Now at 62, I remember 3MI (79) and PI (79) and Chernobyl (86) and have researched Hanford. (And the MOVIES...."The China Syndrome," "Godzilla," "Chernobyl Hearts", and "Into Eternity," AND TRIVE the Movie! (And I am Mohican!) (0744-8 [Bonniwell, Colleen])

Comment: Immediate Total Conversion Now ! Ca IOUs are bankrupt just like 10 years ago with Enron. This is because of the full costs of nuclear waste. To hell with them Solar Cal now Immediate Total Solar Conversion by 2020 of California..... (0746-1 [Eder, Harvey])

Comment: Our children's safety must be a priority over industry profit. There is no place for grossly inadequate storage of lethal nuclear waste in our children's future. Do not put our children, our families, our future at risk! It is time for truly clean energy. Cut your losses and change your tack. (0747-1 [Olson, K.])

Comment: Shut down nuclear reactors[.] (0748-1 [DeLano, Harry])

Comment: The existence of nuclear power generation plants and their nuclear weapons and all of their deadly associated waste must be pulled out of production. All nuclear power plants in these United States according to former NRC Chairman, Gregory Jaczko should be closed and DE-commissioned. (0750-1 [August, Bernard])

Comment: As a Japanese origin, I know the lie of propaganda: "Nuclear energy is safe and clean." From uranium mining to nuclear waste, all the process will spread radioactive nucleus into environment and to all the creatures. (0751-1 [Temlock, Ayumi])

Comment: Immediately decommission all the nuclear power sites and fund for sustainable energy. (0751-3 [Temlock, Ayumi])

Comment: People do not believe that the NRC Radioactive Waste Policy is sufficient to assure safety; therefore, the reactor licensing moratorium must be made permanent. (0752-1 [Abdro, Ann])

Comment: 70 years into the Atomic Age, and 55 years into commercial nuclear power, and still no deep geologic repository; no permanent, safe location or technology has yet been found to isolate this radioactive waste from the biosphere; it's high time you stop making it! (0757-1 [Lynch, Laura])

Comment: [I believe the NRC must:] Cease production of all nuclear waste! (0757-16 [Lynch, Laura])

Comment: I believe no industry should be allowed to continue creating high level radioactive waste (HLRW) that it has no ability to dispose of. Since neither the nuclear industry nor the Federal Government has an operating spent-fuel/high-level radioactive waste disposal facility in operation, it should not be allowed to manufacture any more of these wastes. Since you have no place to dispose of radioactive spent fuel why are you still allowing 100 atomic reactors across the U.S. to continue churning out 2,000-3,000 metric tons (2,200 to 3,300 tons) of HLRW yearly? This is in direct contradiction to your obligation of safety first for the wellbeing of people and the environment. (0757-17 [Lynch, Laura])

Comment: There is no safe nuclear power! Please stop this madness! Government intervention is very much needed to contain what we can and shut down all the rest of the nuclear industry! (0760-1 [Brefeld, James])

Comment: I believe that no industry should be allowed to continue creating wastes it has no ability to dispose of. Since neither the nuclear industry nor the Federal Government has an operating spent-fuel/high-level radioactive waste disposal facility in operation, it should not be allowed to manufacture any more of these wastes. The first Rule of Holes is: when you find yourself in the bottom of a hole, STOP DIGGING! If you have no place to dispose of radioactive spent fuel, STOP MAKING IT! (0763-2 [Freeman, Susan])

Comment: In California we need bomb-proof, earthquake-proof, environmentally sound nuclear waste disposal sites in remote locations far from populous cities. Otherwise, we need to decommission nuclear power plants until we have the technology to create such storage facilities. (0767-2 [Harris, Kate])

Comment: Fukushima is poisoning the world as we speak, so I wish you would dismantle all of your nuclear plants today and make the world a safer place. We can live with blackouts while solar comes online, but we will die from cancer if we continue to use nuclear. It's just not worth the risk. Didn't your mother ever teach you not to take unnecessary risks? Come on and do the right thing for a change!!! You owe it to yourself and to your children. It's the ultimate no-brainer. (0768-1 [Mazzocco, Kevin])

Comment: If there is no such facility existing, the waste should never have been created in the first place. The benefit of electricity generation was small, considering that there is no shortage now without the plant running. The risk should something go wrong is devastating. (0770-3 [Maher, Ed])

Comment: And why are you still approving new nuclear plants when you have not been able to find permanent safe storage for spent fuels from over 100 nuclear plants. (0771-2 [Carlton, Paul])

Comment: I feel bad when I think about all the risks for our health and all life on earth because of the nuke plants and their long lived and toxic waste. (0773-1 [Dupont, Alice])

Comment: I think it's better to stop all the nukes on earth as soon as possible and store the waste in several places, in small amounts and not too far deep in the ground. Mox should be forbidden immediately ! (0773-3 [Dupont, Alice])

Comment: Cease production of all nuclear waste. (0774-10 [Revilla, Oscar])

Comment: The reality is, there is no reason on earth to continue with a "technology" that threatens life itself; the definition of "technology" should be "tools, created by humans to make their lives more livable." In reality, the nuclear "industry" and nuclear "technology" is destroying life. This is not a helpful industry, this is destructive industry based on false science. (0775-2 [Zure, Lisa])

Comment: I firmly believe that no industry should be allowed to continue creating wastes it has no ability to dispose of. In fact, I do not believe in any industry that creates more toxic waste. As stated before, this is destructive industry based on false (or incomplete) science. The truth is, neither the nuclear industry nor the Federal Government has an operating spent-fuel/high-level radioactive waste disposal facility in operation. Further, there is no "safe" method for disposing of nuclear waste. Therefore, it should not be allowed to manufacture any more of these wastes. NRC should not be allowed to issue new reactor licenses, nor grant license extensions to old operating reactors ever. (0775-3 [Zure, Lisa])

Comment: As a U.S. citizen, mother and professional, I am appalled that my government is involved in such a dangerous, unmanageable and out-of-control industry. Nuclear was a bad idea from the start, and now the waste problem will haunt us for generations. We can do better. (0775-5 [Zure, Lisa])

Comment: We'd all do best to put away every nuke facility. We found out it isn't worth the risk. Please act and vote accordingly, in the public interest. This is why you have your job. (0777-1 [Individual, Anonymous])

Comment: The conflicted NRC has become a lackey of the industry it is supposed to regulate. Nuclear power only exists as a spinoff from the bomb makers, bombs being a product the world is trying to get rid of and cannot live with. So, the NRC is putting short term profits and long term extinction before the health of 7.2 billion people including their own families! What does that say about priorities? Nearly 40% of new energy now comes from clean, cheaper, more quickly deployed and safe, decentralized renewables. Nukes are soon to be history as that cannot compete even if they were non-lethal, which they aren't. The market, common sense and morality all rage against the monster that is the split atom. (0779-1 [Richardson, Don])

Comment: Do your job: stop nukes now, no more wastes which have contaminated the world forever, no more terrorist threats of instant death by bullies like the US who want the world NOW, against all reason and sanity. (0779-2 [Richardson, Don])

Comment: When I was a child I heard on TV that the nuclear waste would be shot out to space or to a dead planet, no problem. Being a child I believed it. Now to my horror I find out just how many nuclear plants there are and that the fuel is just stored nearby and piling up over the

years, just waiting for some natural disaster or human trip up to bring us all deadly radionuclides to our back doors, in our kids sandboxes and to breathe in construction areas, when lawn mowing and a plethora of other activities that might stir up dust. Not to mention getting in our food and water. Let us not go down in history, providing someone is left alive to read it, as the civilization that destroyed themselves for greed. These are death machines and their excreta, their waste, will contaminate the earth for thousands of years. (0780-1 [De Lacey, Carol])

Comment: Please build no more of these and get the greatest scientific minds to come up with a solution to make this waste safely stored away until such time as we know how to safely dispose of it. It is unconscionable to continue running the plants creating more waste, increasing the probability of mass annihilation. (0780-2 [De Lacey, Carol])

Comment: Enough Already ! Shut them down !! (0784-1 [Earl, David])

Comment: Cease production of all nuclear waste. Make it so! (0789-5 [Salto, Don])

Comment: I believe that no industry should be allowed to continue creating wastes it has no ability to dispose of. Since neither the nuclear industry nor the Federal Government has an operating spent-fuel/high-level radioactive waste disposal facility in operation, it should not be allowed to manufacture any more of these wastes. (0791-2 [Mierzwicki, Tony])

Comment: It is time for the world to move toward renewal sources of energy and to stop using the most dangerous source-nuclear power. The ongoing, uncontrolled disaster in Fukushima is convincing evidence of this. (0792-1 [Soto, Carol])

Comment: It is time for the Nuclear Regulatory Commission to shut-down and decommission all operating nuclear plants in the United States. (0792-2 [Soto, Carol])

Comment: If we are looking for confidence in our nuclear waste management, then we should consider the above historical lesson as we plan our escape from the nuclear waste quagmire. We should do the right thing. We cannot allow a repeat of Fukushima on our own soil. (0801-2 [Magyar, Michael])

Comment: I support the Washington DC court of Appeals for speaking the truth, I support the moratorium on licensing and re-licensing of all nuclear power plants in the United States. You have no right to create this burden for our future generations. You have no right to threaten our health and safety and the health and safety of the Pacific Ocean. Stop producing waste immediately. (0811-5 [Paulsen, Carol])

Comment: It is shocking that this has been going on for 60 or more years and that nuclear energy project continue to be designed, and built and new designs are being developed, new experiments worked on. Millions, billions and more being spent sometimes the facility never being operated, never producing any electricity with citizens, tax payers, paying for them. (0813-2 [Thomas, Ruth])

Comment: Rather than go on with more of the same type of examples of faulty decision-making, I'll close with the reminder of the Generic fact about nuclear materials of the nuclear industry. These sources of man-made radiation are and have been exposing human beings, animals, and plants for more than 60 years, and the released radioactivity remains here and its damaging effects are cumulative. (0813-4 [Thomas, Ruth])

Comment: Close Diablo Canyon and stop making any more toxic waste for future generations to have to deal with. (0814-2 [Foley, Nancy])

Comment: The logical conclusion is to stop making more spent fuel, remove as much as possible as soon as possible from storage in pools, and recognize that dry casks, while better than pool storage, are not an adequate plan. (0815-10 [Gunter, Keith] [Izant, Carol])

Comment: Continuing to create a waste stream which must be isolated for thousands of years, long after current institutions have disappeared, is irresponsible and should be stopped as quickly as feasible. (0821-13 [Paddock, Brian])

Comment: I am a citizen of the US, I come asking you to hear my words today and think upon your own families. How would you feel to see your child drink water contaminated with nuclear waste? How would you feel to know you set a plate of food before your child and it was contaminated with nuclear waste but you had nothing else to feed them even though you know they will surely get sick and possibly die. I want each one of you to think about this because you are educated people. You have been informed of how "we can safely store nuclear waste" yet each one of you read the news or watch it then turn your head. You know of the thousands of animals dead from this waste, the high rise of cancers in the areas of storage wherein your "safe nuclear waste storage facility" leaked or the nuclear plant that failed caused so much death and destruction to all people and animals, and the land is no longer safe to even walk upon. You see we have reached a critical point....it IS in your back yard too now! It IS going to be your children dying! Just like the rest of the world, if you continue to allow production it IS going to effect you and all of the world. IT ALREADY HAS AND YOU HAVE SEEN THIS! (0822-1 [Soldier, Wolf])

Comment: In retrospect, continuation of the creation of grave and lethal radioactive wastes without a specifically identified and known end-point where it would safely end was clearly irrational. It is time to stop this irrational behavior. It is time to stop sabotaging the survival of humanity itself. It is time to admit transparently the errors caused by lack of facts and faulty thinking in the past. It is time to admit the solution does not exist. It is time to stop wishful thinking. It is time to get out of irrational denial mode that is sabotaging the very survival potential of humanity itself. We must immediately implement the Precautionary Principle. (0823-12 [Michetti, Susan])

Comment: Using tools that continue to permit societal denial of reality is irrational. These adverse impacts to safety of humanity and environment are not only man-made, but unnecessary and extremely financially expensive when safe, economic alternatives for energy exist-solar and wind. It is not rationally feasible to continue generating the most lethal substances on earth without any way to permanently isolate and contain them for their full cumulative lifetimes. These dangerous radioactive isotopes must be kept away from exposure to the full environment and humanity. (0823-24 [Michetti, Susan])

Comment: By extension of this corollary, it is unacceptable to allow creation of nuclear waste's ionizing isotopes that can't be safely stored, disposed, discarded, or abandoned without unacceptably interfering with the environment we need to survive as well as our ability to reproduce with well-being and health. (0823-5 [Michetti, Susan])

Comment: No industry should be allowed to continue creating wastes when that industry has no ability and solution for which to dispose it. When we have no safe place to dispose of radioactive spent fuel, it is irrational and crazy to continue making it. A safe permanent, deep-

geological high-level radioactive waste disposal repository, or a safe solution to dispose safely of all the waste, should be required rationally before any new reactor licenses are issued or any license extensions are approved to old operating reactors. However, overwhelming evidence exists against the possibility for a safe place to contain the ionizing isotopes. No known solution has been found. (0823-59 [Michetti, Susan])

Comment: The irrationality occurred approving the first nuclear power plant license. This irrationality was continued through decades of unacceptable accumulation of extremely dangerous waste from 103 nuclear plants without any safe disposal. As the nuclear plants atrophy and operations close, we are now faced with dangerous piles of this lethal waste all over the USA without a safe solution anywhere. We must get out of denial, formally admit that we have a serious problem, and put that problem in its appropriate place at the top of the decision tree where it will become the top priority in terms of scientific investigation and study. (0823-63 [Michetti, Susan])

Comment: It is irrational, or insanity, to produce more and more waste without a physical solution that can safely isolate and contain that very lethal waste permanently to keep it away from humanity and the environment for thousands of years and more. Humanity has been put harms' way from irrational oversight and very flawed thinking, lacking is sufficient assessment of rational scientific principles. Without any safe storage method and location for the most lethal substances made on earth, rational thinking requires a rapid phase-out that systematically shuts down all nuclear power reactors. (0823-7 [Michetti, Susan])

Comment: The human inability to visibly see the presence of ionizing radiation allows our human awareness to forget and ignore its presence. This does not change the fact that ionizing radiation can be observed to have reliable and repetitive physical impacts on other physical matter and living organisms. The smallest exposure of ionizing radiation alters the membranes of the blood cells and alters the CBC fractions in animal and human medical tests. It alters the membranes of sap in plants. Ionizing radiation has a linear dose response pattern that is very repetitive. Ionizing radiation is not safe for humans, excepting perhaps in medical diagnoses where the advantages are gambled against the disadvantages in individualized and unique circumstances. Ionizing radiation is not safe for living organisms. (0823-74 [Michetti, Susan])

Comment: From this perspective, we ask that an immediate ban be imposed on the man-made manufacture of lethal nuclear fission products. It is irrational to continue to accumulate the most lethal substances on earth when they cannot be safely contained for their entire impact period. We can not control the variable of extremely long timeline with the variable of non-containable lethal waste with the variable of humanity's genetic reproduction with the variable of full environmental safety within our living space on earth required for our continued survival. (0823-78 [Michetti, Susan])

Comment: It seems logical to start with those that have the worst safety records and largest leakages, and those with past experience of electric brownout/blackout or flooding. It is not rationally feasible to continue generating the most lethal substances on earth without any way to permanently isolate and contain them for their full cumulative lifetimes from exposure to the full environment including all life forms. (0823-8 [Michetti, Susan])

Comment: Stop government subsidies to new and operational plants and repeal the Price Anderson Act[.] The downplay of financial and safety concerns associated with building nuclear reactors is unacceptable. In 1985, Forbes magazine called the US promotion of nuclear power "the largest managerial disaster in history." With renewable energy now safer, cheaper, faster,

more secure, lest wasteful, nuclear power does not meet the public trust and does not deserve scarce capital. The public cannot afford to subsidize the nuclear industry's predictable financial failure. The private insurance companies are the best experts in the world with financial risk analysis calculations. The private insurance industry refused to insure the nuclear power plants decades ago because the entire industry was too risky for environmental and human safety. It is totally irrational that the costs of an out-of-control nuclear catastrophe, perhaps like Fukushima, would have to be paid by US taxpayers who would also be the unfortunate victims of it. The Price Anderson Act irrationally makes the taxpayers pay for financial risks of a private for-profit industry inadequately regulated by the NRC with rampant unsafe situations, including radioactive leaks at nearly every nuclear plant location. (0823-83 [Michetti, Susan])

Comment: My only comment is to please stop making nuclear waste. (0824-2 [Ingram, Gwen])

Comment: This is all being done while the NRC does as little as possible to draw attention to itself or the nasty truth that nobody in the entire world has proven how to safely store spent nuclear fuel for the eons of time required to protect the biosphere from high concentrations of its radio nucleotides. (0826-4 [Morgal, Rick])

Comment: We need to stop nuclear NOW! The ongoing disaster at Fukushima has awakened me the fact that nuclear energy can never be safe. For the future of my children please end all support for this outdated farce of a technology. Instead, please put your energy into green energy like solar and wind. (0828-1 [Johnson, Troy])

Comment: No safe, permanent solution has yet been found anywhere in the world - and may never be found - for the nuclear waste problem. Let's end the production of nuclear waste[.] (0829-1 [Anonymous, Debra])

Comment: Hidden costs of reactor waste storage & disposal make nuclear power less attractive than wind and solar energy. Wind and solar energy are inherently safer than nuclear energy--let's support the earth now and in the future for our children. (0829-3 [Anonymous, Debra])

Comment: We simply don't have any real plan for storage and we have to admit that. We have to admit that the best possible plan, which would still fall far short of what is needed for public safety, would be exorbitantly expensive, possibly enough to damage our economy for the long term. And yet anything less than our utmost effort and expense will turn out to be a disaster, slowly unfolding. We can't leave it to future generations, for the rest of the lifespan of the earth, to pay for our power generation for a paltry 40 years. We need to face the truth and determine what is necessary to protect future generations no matter what the cost. And we need to stop making more waste, now. (0834-7 [Thabit, Nick])

Comment: It is unconscionable to continue operation nuclear reactors, producers of such highly-lethal material, when there are other alternatives for creating energy. Localizing energy production will eliminate 40% of the need (lost in transmission) at one stroke. We can't continue to protect an industry that does nothing to protect us. (0834-8 [Thabit, Nick])

Comment: It's time to stop making high level nuclear waste period! (0835-1 [Bettega, Gayle])

Comment: Alternative forms of energy DO exist. In California, we have 156% of the power requirements of the state, and according to a presentation at the California Energy Commission, SONGS would have been cost effective for only 16 16-hour periods in the entirety of 2012, when the plant was already shut down. The dirty secret is that these plants are NOT COST

EFFECTIVE and DO NOT COMPETE WITH OTHER FORMS OF ENERGY, and HAVE A SEVERE DEFECT IN THAT THEY PRODUCE VAST QUANTITIES OF WASTE THAT IS EXTREMELY DANGEROUS FOR LONGER THAN RECORDED HISTORY. (0836-31 [Davis, Anonymous])

Comment: The continuation of the nuclear program must require industry to rise to a level it has never been called to do before, and it is up to the NRC to raise the calling of the industry players to more fully be responsible for their participation in that industry. If the NRC cannot do that, then likely Fukushima will be our last opportunity to learn a lesson about nuclear power here on earth. Maintaining or diminishing current regulatory levels that created the present on-going nuclear waste confidence issue will produce more of the same. (0838-4 [Clermont, Elaine])

Comment: Stop all the nuclear power plants, which is what it seems like we are doing; Stop the mining, looks like that is also being restored (at least in our nation), Just STOP! We have plenty of Spent Nuclear Waste to expand the industry for years bringing together a safe industry the achieves our highest potential, saving humankind in the process. (0838-8 [Clermont, Elaine])

Comment: For the duration of the nuclear energy promotin as a clean energy, the one prohibitive factor in the true safety of the process is that there does not exist, nor has there ever existed the capacity to safely eliminate or even store nuclear waste. Nuclear waste is continuously toxic and there is NO safe way to dispose of th spent rods nor radioactive water. FOr many generations now, the proponents of this technology have assumed that through technology they will find a way to destroy the waste that they also artificially created. However, it has proven an impossible task and I am NOT Confident that htere is any way now or at any point in the future. For that sake, and the sake of future generations, clean, safe water for drining, bathing, farming, wildlife, etc... I support the complete elimination of all nuclear activities, both production and waste. (0839-1 [Kemp, Karla])

Comment: Any product that creates such a negative externality throughout its lifecycle and particular in the waste disposal /grave phase, should not be allowed to produce. Such actions are irresponsible and foolish. There is no way to "pay" for any damages sustained in the nuclear industry, and the public shold not be the ones to foot the bill for either production, nor any form of cleanup. The precautionary principle is the correct and appropriate way to go. Solar alone in a very small footprint can supply us with adequate power. We need to focus on truly sustainable green energy, like solar or wind, as opposed to creating more poison for the world in which there is no antidote! (0839-2 [Kemp, Karla])

Comment: By virtue of waste toxicity and longevity, a management and financial burden which cannot be ignored is being passed to future generations. No level of confidence will result in the financial or management risks, or exposure consequences, diminishing. Radioactive waste is not safe, clean or green. It lasts for more than 240,000 years and it irradiates cells and damages DNA, causing cancer, birth defects, heart problems, kidney problems, infertility, immune deficiencies, and more. There is no safe dose of radiation. (0840-2 [Taylor, Tom])

Comment: There are clean, reliable, renewable, and lower cost energy alternatives to nuclear power. (0840-8 [Taylor, Tom])

Comment: It's quite simple, really. As you have been warned by many government & scientific agencies, the grid is vulnerable to outages from three possible threats; a solar event, an electromagnetic pulse from a nuke exploding at altitude or a cascading power outage. Any of these would be very, very bad. Look at Fukushima (wear shades). Risk "managers" always plan

for the disaster, "lessons learned" and all that nonsense. Would you recognize a Black Swan if it flew into your face? HARDEN THE GRID! SHUT DOWN THE GLOW TOMBS! (0842-1 [Thunder, Warren Storm])

Comment: To summarize: dry cask store the spent nuclear fuel now; create jobs; invest in alternative, safe energy; and shut-down all US nuclear power plants NOW. (0843-3 [Davis, Cherie])

Comment: The reality is, there is no reason on earth to continue with a "technology" that threatens life itself; the definition of "technology" should be "tools, created by humans to make their lives more livable." In reality, the nuclear "industry" and nuclear "technology" is destroying life. This is not an industry that instills confidence-quite the contrary. (0844-2 [Anonymous, Anonymous])

Comment: I will not support an industry that is allowed to create wastes that it has no ability to or sound place for storage. In fact, I do not believe in any industry that creates more toxic waste. There is no spent-fuel/high-level radioactive waste disposal facility in operation and storing on site has been demonstrated to be a frightening option-as seen in Japan. Further, there is no "safe" method for disposing of nuclear waste. Therefore, it should not be allowed to manufacture any more of these wastes. Already, we have an enormous problem with what to do about the existing reactor waste. NRC should not be allowed to issue new reactor licenses, nor grant license extensions to old operating reactors ever. (0844-3 [Anonymous, Anonymous])

Comment: The nuclear "industry" and US government and other governments clearly do not know how to deal with the fallout of disasters, much less the ongoing waste product of an overpriced and inefficient energy industry that has proven itself, time and time again, to be ill-conceived. (0844-7 [Anonymous, Anonymous])

Comment: As a U.S. citizen, mother and professional, I am appalled that my government is involved in such a dangerous, unmanageable and out-of-control industry. Nuclear was a bad idea from the start, and now the waste problem will haunt us for generations. We can do better. (0844-9 [Anonymous, Anonymous])

Comment: As a resident of San Luis Obispo County living near the Diablo Canyon Nuclear Power Plant, I am opposed to continuing to generate more spent nuclear fuel for which there is no known safe storage. Spent nuclear fuel will be hazardous for thousands of years to come, and I feel it is morally and ethically wrong to continue generating this waste with which our current and future generations will be burdened, both environmentally and financially, long after the energy is used. It is morally and ethically wrong for the utility company to continue making profits now which our future generations will be paying for, for years to come. Please do not renew the license for Diablo Canyon, or any other nuclear power plant. You have the moral responsibility now to shut down these plants and take care of our children who will inherit, and have to deal with, this mess. (0845-1 [Gibson, Julie])

Comment: The nuclear industry was ill conceived from the beginning. Stop producing more poison. Funnel resources to the most safe repositories possible, and promote transition to truly clean and renewable energy sources. (0846-3 [Wells, Gerald])

Comment: My personal attitude about Nuclear is that it is the most evil thing ever! It is not safe and it never will be safe! Millions will die and soon because of Fukushima. Hundreds of thousands of children will develop thyroid cancers. Enough already. It's time America woke up and set some examples. We are so behind in so many things. There's nuclear waste all over the

planet. It's a mess! Years of irresponsible regulation that is worthless! Shameful! Stop procrastinating and start protecting public safety! No more excuses! (0848-3 [Whiting-Broeder, Pamela])

Comment: Stop the making nuclear waste. Stop licensing new nuclear plants and renewing licenses for current nuclear plants until a valid, realistic assessment of the environmental impacts of nuclear waste is done by you . The licensing moratorium should be permanent. (0849-1 [Nichols, Susan])

Comment: Until this changes, we cannot responsibly license the production of any new nuclear waste. And we cannot responsibly move what we have created. Any other policy is irresponsible, criminally dishonest and savagely cruel. (0852-2 [Ein, Mark])

Comment: The Pacific ocean is dying from Fukushima, and you think we should add to this madness? There are alternatives. PLEASE, NO MORE NUKES.
<http://www.silverdoctors.com/fukushima-98-of-the-pacific-ocean-floor-covered-by-dead-sea-creatures/> (0853-1 [Milcarek, Thomas])

Comment: The problem of safely storing nuclear waste for hundreds if not thousands of years may never be solved. Yet until that day comes, no more nuclear plants should be built in this country. The economic, social, and environmental costs are far too high, especially now that safer technologies for generating power are available. (0855-4 [Holloway, Patricia])

Comment: Once the economic and environmental realities are acknowledged, it becomes possible to assess whether the "intractable" problem of storing ever-increasing quantities of spent nuclear fuel is best solved by not making any more in the first place. (0856-3 [Fritz, John])

Comment: As I recall, 104 of "our" nuclear power plants are inherently unsafe and, aside from shutting them down, the problems which afflict them, and by extension us, cannot be remedied. (0857-1 [Anonymous, Anonymous])

Comment: Cease production of all nuclear waste. (0860-10 [Headrick, Gary])

Comment: Here is my opinion of "waste confidence": It is clear that the creation of such language indicates a lack of confidence in how you, the Nuclear Regulatory Commission, will handle nuclear waste. All informed citizens know that it is dangerous. There is no safe level of nuclear radiation for humans, other animals, or the entire biosphere. The biosphere could not have developed until a highly radioactive planet became less radioactive with the decay of plutonium and the fissionable isotopes of uranium. Biota's original development could not have occurred until this danger was contained. But humans have restored the danger. (0861-1 [Boudart, Jan])

Comment: But cleaning up the explosions of the past is another thing. Our physicists should be working on this problem; but, instead, they are proudly (proudly! proudly??) at work developing another generation of nuclear waste creators, namely more nuclear power plants. Our tax dollars go to pay them high salaries at Argonne National Labs while they pursue activities that can only further harm us. (0861-3 [Boudart, Jan])

Comment: So, not only is there no confidence that the NRC can handle the waste already created, but also we must stop creating nuclear waste, whether from deliberate explosions, as in the past, or from the continued use of nuclear generated power today and in the future. (0861-4 [Boudart, Jan])

Comment: My emotional response to the nuclear problem as a mother, sister, aunt, cousin and grandmother is such that expressing myself on the issue is difficult. It beggars the imagination that anyone could seriously continue creating nuclear waste that will continue to cause harm on the earth for several hundred thousand years. Why would anyone do it? (0861-5 [Boudart, Jan])

Comment: You are proverbial serial killers giving out more licenses to spill & kill. (0862-6 [Thompson, Tammy])

Comment: To continue to create more is to ignore the very real dangers and to fall back on public relations as a panacea for the generally trusting public, which remains unaware of the potential for disaster lurking nearby. (0864-15 [Gellert, Sally Jane])

Comment: I heard some statements at the hearing that I feel obliged to refute. There were repeated references to nuclear power as "clean air" electricity. This might be true at the site (if one wants to simply ignore the ongoing leaks of radiation); it is clearly not at all accurate when considering the entire cycle, from mining of yellowcake, through enrichment, transportation, and processing. When the full cycle is considered, nuclear energy is highly intensive in its use of fossil fuels-and has perhaps the greatest impact on native Americans near uranium mines and other people living in environmental justice communities. (0864-16 [Gellert, Sally Jane])

Comment: Therefore, I request that we look toward minimizing the scope of local danger by shutting the reactors and generating no more radioactive waste. Until they are shut down, there are "routine" low-level releases of unknown impact on public health. (0864-8 [Gellert, Sally Jane])

Comment: Most comments during the Chelmsford meeting were not focused on just the subject of storage confidence. They feel, as I do, that shutting the plants down is the only option. No plant, no additional lethal waste to have to deal with. (0868-4 [Tilbury, Don])

Comment: Enough is enough! Nuclear for electricity has been tried but it is now evident that it is a "dead end street." To continue shows shameful lack of consideration to future generations. It's bad enough as things are today without making it worse by continuing. Do pro nuclear individuals fail to see that if we have so many problems that have to be resolved presently, it can only get worse by continuing? Stop now. Be an example to the world. Haven't they read about Fukushima? (0868-5 [Tilbury, Don])

Comment: The question to be discussed should be, how do we stop making nuclear waste? The answer is don't make it- we know that forty or fifty years ago-Why were we not listened to then? That is the question and in all this time NRC has learned how to run a meeting - Now that we are in this mess- (0870-1 [Anonymous, Anonymous])

Comment: Clean up this terrible mess we have created, conserve and enjoy-Don't relicense- this monstrosity- Help us! (0870-3 [Anonymous, Anonymous])

Comment: Nuclear power should NOT be promoted- solar power, wind energy, intertidal energy should be promoted. (0871-2 [Denneen, Bill])

Comment: STOP MAKING NUCLEAR WASTES! There can be no "confidence" about this unsolvable catastrophic hazard! You/we cannot create more sacrifice land! (0874-1 [Anonymous, Anonymous])

Comment: In that endeavor a lot of waste material was created and many lessons were learned. We will never be able to undiscover nuclear but we as a civilization cannot ignore our current charge of dealing with what we made. (0881-3 [Szymanowski, Jennifer])

Comment: The most obvious and moral solution is to not make more waste in the first place especially since it is now not necessary. Nuclear electrical generation comprises only 20% of our power supply and there are now less expensive and safer alternatives. We should not as a civilization endanger generations far into the future. Nuclear waste is forever. (0883-6 [McArdle, Ed])

Comment: They never acknowledged the burden we're creating for our children and future generations and that we should stop creating more spent fuel now! (0888-7 [Wilvert, Rosemary])

Comment: We should never have taken uranium out of the ground. But since we have, the only responsible thing is to stop doing in and invest in solar and wind and other clean energy sources. New Jobs and retraining will boost the economy. Our children will thank rather than curse us. (0888-8 [Wilvert, Rosemary])

Comment: Go Renewables by 2020! Become the RRC. Keep your jobs and end nuclear waste piling up! (0890-1 [Arnason, Deb])

Comment: Something wrong with this picture! End nuclear energy[.] (0890-3 [Arnason, Deb])

Comment: Do Not create more wastes we do not know what to do with! (0890-5 [Arnason, Deb])

Comment: Stop digging! End making more nuclear radioactive waste[.] (0890-7 [Arnason, Deb])

Comment: Renewables by 2020 and this relicensing will be unnecessary - follow Germany (not AREVA-France does not know what to do with wastes themselves!) Stop taking money from nuclear industry - prevent Fukushima America esp here in the 5-State "sacrifice zone" where we live! Thanks, Become RRC! (Renewables Regulatory Commission) (0890-9 [Arnason, Deb])

Comment: Best onward move - Stop all nuclear production and HOSS (hardened on site storage) for a million years. (0901-1 [Anderson, Janet M.])

Comment: Nuclear = insanity (0901-5 [Anderson, Janet M.])

Comment: It is not your job to "mollify the masses" by protecting the nuclear industry with claims that the environmental risks are "small to moderate" and that nuclear power is one solution to global warming. We are not stupid. We all understand that the damage and threat to humanity and the world by nuclear technology makes global warming look like child's play. (0902-6 [Fasten, Susan])

Comment: It is not your job to "mollify the masses" by protecting the nuclear industry with claims that the environmental risks are "SMALL to MODERATE" and that nuclear power is one solution to global warming. We are not stupid. We all understand that the damage and threat to the world and humanity by nuclear technology makes global warming look like child's play! (0903-3 [Fasten, Susan])

Comment: Don't relicense any more nuclear reactors. Don't renew any expiring licenses. (0904-2 [Collins, Jessie])

Comment: The NRC and PG&E claim that DCR provides clean (CO₂-free) power for 3 million homes. That's a big plus. It also produces dirty (radioactive) residues for millennia. That's a big minus. Which one is bigger? (0907-1 [Bethlenfalvay, Marina])

Comment: My Comment: STOP MAKING IT ! CLEAN UP [ALSO IMPOSSIBLE!] THE EXISTING AND DAILY PRODUCING NUCLEAR WASTE ! (0910-6 [Carey, Corinne])

Comment: My Comment: STOP MAKING IT! CLEAN UP [ALSO IMPOSSIBLE] THE EXISTING AND DAILY PRODUCING NUCLEAR WASTE! (0910-8 [Carey, Corinne])

Comment: The good news from all this, of course, is that those five reactors will no longer generate irradiated nuclear fuel - the only real solution to the problem is to not generate it in the first place. (0919-3-11 [Kamps, Kevin])

Comment: The overall radiological impact on people and environment, over time , should be included in the NEPA decision making on whether, or not, the use of nuclear power to generate electricity is a wise societal decision. (0919-4-13 [Kamps, Kevin])

Comment: On Dec. 2, 2012, a major event was held at the University of Chicago, sponsored by Beyond Nuclear, Friends of the Earth, and Nuclear Energy Information Service,. It marked the 70th year, to the day (Dec. 2, 1942), since Enrico Fermi created the first self-sustaining nuclear chain reaction, in the world's first prototype atomic reactor ,under the bleachers of the U. of Chicago football stadium. It came during the Manhattan Project race for the atomic bomb, eventually dropped on Hiroshima and Nagasaki, Japan. Thus was generated the world's first reactor-generated high-level radioactive waste. The mountain of commercial radioactive waste would begin to be generated some 15 years later, in 1957 at Shippingport, PA, site of the country's first "civilian" atomic reactor. But the same lessons apply ... The take home lesson, in a nutshell, from the conference? As reflected in the logo for the conference, and the pamphlet created for the occasion: The lethal legacy of the Atomic Age is a "Mountain of Radioactive Waste 70 Years High," and we don't even know what to do with the first cupful. It's time to stop making it. (0924-1 [Kamps, Kevin])

Comment: Given the costs, risks, and liabilities of irradiated nuclear fuel-as well as the ready alternatives to nuclear power of energy efficiency, energy conservation, and renewable sources such as wind power and solar power-NRC's current moratorium on approving new reactor combined construction and operating licenses and old reactor license extensions should be made permanent. (0924-2 [Kamps, Kevin])

Comment: A carbon-free, nuclear-free energy future is indeed doable. In fact, it is the only sane way out of the climate crisis. (0924-3 [Kamps, Kevin])

Comment: Alternative forms of energy DO exist. In California, we have 156% of the power requirements of the state, and according to a presentation at the California Energy Commission, SONGS would have been cost effective for only 16 16-hour periods in the entirety of 2012, when the plant was already shut down. The dirty secret is that these plants are NOT COST EFFECTIVE and DO NOT COMPETE WITH OTHER FORMS OF ENERGY, and HAVE A SEVERE DEFECT IN THAT THEY PRODUCE VAST QUANTITIES OF WASTE THAT IS EXTREMELY DANGEROUS FOR LONGER THAN RECORDED HISTORY. (0930-2-5 [Lutz, Ray])

Comment: Once the economic and environmental realities are acknowledged, it becomes possible to assess whether the "intractable" problem of storing ever-increasing quantities of spent nuclear fuel is best solved by not making any more in the first place. (0931-2 [Masullo, Ginny])

Comment: The moratorium on reactor licensing must be made permanent. (0932-1 [Bridgeman, Janis])

Comment: As my colleague Shirley Vaine from California put it years ago, why would we ever support an energy source that had no plans, knew that there was no way to safely dispose of its deadly radioactive waste when it began, hid this from the public, and now leaves us with the creation of endless waste, endless economic and environmental cost, and endless risk to ourselves and to the plant? Why would we ever pick such an energy source in the first place? (0934-5 [Lewison, Linda])

Comment: Without a waste and fuel storage solution, there should be absolutely NO PUBLIC FUNDING for this form of energy. (0935-5 [Uhls, Agnes])

Comment: We need to focus on cleaning up the sites already contaminating Americans every day, before we allow more of the same 70 years after the Manhattan Project. Robert Oppenheimer recriminated himself for Pandora's box, and the U.S. court system remembers and demands accountability before even more widespread contamination become part of the innumerable and many unaccounted for "Legacy" sites on both U.S. and Native American soil. (0935-7 [Uhls, Agnes])

Comment: Nuclear technologies are the most harmful, toxic and long-lasting practices that humans have ever engaged in. Nuclear activities should have been halted generations ago - there is nothing safe about nuclear at any stage of the nuclear fuel cycle. Now we are faced with the nuclear waste issue - one of the many monsters in the closet - that will last for millions of years, killing much of life on our Earth in it's wake. (0936-1 [Laney, Nan S.])

Comment: The nuclear industry in it's entirety - from mining to processing to "power" to reprocessing to weapons should be shut down completely due to the extreme risks it poses to life itself on our planet Earth. Why are we making extremely toxic waste that we have no capacity to safely transport, store and contain for the next few million years? (0936-3 [Laney, Nan S.])

Comment: No new reactor licenses should be issued due to the extreme risks to public and environmental health. (0936-4 [Laney, Nan S.])

Comment: Nuclear technologies never should have been. I demand that you stop the insanity now. No more nuclear anything - halt the entire cycle before you put an end to life on Earth. (0936-7 [Laney, Nan S.])

Comment: I believe that no industry should be allowed to continue creating wastes it has no ability to dispose of. Since neither the nuclear industry nor the Federal Government has an operating spent-fuel/high-level radioactive waste disposal facility in operation, it should not be allowed to manufacture any more of these wastes. (0939-2 [Marschak, Cheryl])

Comment: I have no confidence in the use of nuclear power. Period. (0941-2 [Scott, Sabra])

Comment: Albert Einstein also informs us "To the village square we must carry the facts of atomic energy. From there must come America's voice." The people have spoken. Stop making it! Cease and desist. Stop making it period. Do not relicense, do not license new ones. (0945-9 [Keegan, Michael J.]

Comment: The largest concentration of radioactivity on the planet, nuclear waste, is stored at nuclear power plants near populated towns and cities across America. After more than 50 years, the quest for safe, permanent nuclear waste disposal remains incomplete; therefore it is irresponsible to keep producing more spent nuclear fuel. (0946-1 [Commenters, Multiple])

Comment: We must stop making nuclear waste, Keep the ban on licensing new nuclear plants! Our future generations are depending on us. (0946-5 [Commenters, Multiple])

Comment: Just look at Fukushima. Are you willing to risk that ? You are dealing with some of the most dangerous materials know to mankind. A mistake or accident will be far worst than a terrorist attack not to mention the possibility of a terrorist attack using our own spent fuel as a weapon against us. Nuclear energy is not worth the risk. (0962-1 [Schneider, Howard])

Comment: Nuclear waste can cause tremendous harm to thousands, even millions of people if it is not disposed of safely. And we need th think of safety not in terms of decades, but in terms of millenia. This silent, invisible killer can contaminate our water, kill our wildlife, and even get into our oceans. There is no cure for sustained radiation poisoning, and even if we develop one, our diagnosis and treatment are likely to be too late. (0964-1 [Glime, Janice])

Comment: If you look at how Fukushima has been handled by Tepco two things become obvious: one, corporations are too irresponsible to run something as risky as nuclear power plants and two, the human species has no business using nuclear power. (0974-1 [Conley, Patrick])

Comment: As a consequence of perhaps the worst decision our primate species has ever made we have 400 delayed fuse nuclear catastrophes waiting to happen (not to speak of the fool hardiness that has been going on with nuclear weapons). So here we are, an absurd and delusional species that is about to go extinct either through nuclear poisoning or global warming. Good decision making in political leadership is virtually nil on things that really matter. (0974-3 [Conley, Patrick])

Comment: [S]outh Africa stopped its nuclear program because the true cost to health made it unacceptable. (0987-1 [Kansas, Sharon])

Comment: There is *NO* proven means to render a significant amount of this waste "inert" on a large scale and the vast majority of it will remain at dangerous levels for thousands of years. Nuclear power is an infected bandage on a problem requiring major surgery. Its proponents care more about their own economic convenience than future generations and the current health of this planet. (0990-2 [Schilling, Francis])

Comment: I am a concerned citizen and a lifelong voter. I have closely followed the nuclear power issue since 1970, and have witnessed the Three Mile Island, Chernobyl and Fukushima "accidents." Nuclear power has been a boondoggle from it's inception, when the public was told that electricity would be generated so cheaply it would not be metered. That was just the first of many lies about the cost and safety of nuclear power. (0998-1 [Rosanelli, Donald])

Comment: THE NRC's Draft NUREG-2157 MAKES CLEAR, IN NO UNCERTAIN TERMS, THAT THE TIME IS OVERDUE FOR YOU LAZY, UNCARING, DELUSIONAL, SELF AGGRANDIZING PSYCOPATHS TO STEP DOWN AND LET QUALIFIED AND ENVIRONMENTAL AND HUMANITY LOVING SCIENTISTS TO DECOMMISSION ALL YOUR NAZI NUCLEAR EXPERIMENTING. (1004-8 [Dimondstein, Carla])

Comment: We as a society should also think of the bigger picture. Alternative to nuclear energy are cheaper and safer. Thank you for attention to my views, which I hope can nudge policy toward safer alternatives. (1007-6 [Diamond, Jim])

55. Out-of-Scope Comments – Support for Nuclear Power

Comment: It's important that we make sure that nuclear energy facilities across the country are allowed to do what they've been doing, and that is producing much needed clean, safe, and efficient electricity. I am here to express my personal support and confidence in the storage of spent nuclear fuel onsite at nuclear facilities. (0030-18-2 [Curtin, Kenneth])

Comment: Nuclear energy provides 19 percent of our electricity, but more than two-thirds of our emissions-free technology. This means that nuclear energy provides more clean air energy than every other source of emissions-free technology we have right now. At a time when we're looking at how we can address the threat of climate change, nuclear energy is already our best ally in this fight. Not only is it the largest source of clean-air energy, it's an extremely reliable form of baseload, always-on power. As the NRC continues these series of public hearings I would just like to reiterate my support for an industry that has shown it can safely and securely store spent fuel onsite and has shown this for decades. While other sources of energy pump harmful greenhouse gases, sulfur oxide, nitrogen oxide, and mercury into the air, nuclear energy doesn't emit any of these. Rather, the nuclear energy industry has shown that it can safely, securely, and cleanly store spent fuel onsite. As the NRC considers this and future issues, I would encourage them to think about what it can do to strengthen our nation's commitment to clean-air technology. (0030-18-5 [Curtin, Kenneth])

Comment: As has been mentioned, the reality is that two-thirds of all the clean electricity produced in the United States comes from nuclear energy. Combined nuclear and hydroelectricity provide 87 percent of non-greenhouse-emitting electricity in the United States, and yet of the past 30 years neither of these sources has seen any real meaningful new construction. And a lot of that is due to the fact that hydroelectricity has been hindered by a lack of viable new capacity and the fact that nuclear has been hindered by obstinate opposition. What has been so completely obscured is the simple truth that nuclear energy is the greatest energy technology for environmental stewardship. There's no source of energy with less impact on human health or less impact on the environment, and that's borne out in this Waste Confidence GEIS. And I would encourage anybody to compare the supply chains and the mining techniques required for the construction of wind turbines and solar panels and the amount of materials consumed to those used in a nuclear power plant. (0030-19-2 [Cohn, Jeremy])

Comment: The reality is that we are making choices every single day and all personally that I see are political leaders and activists taking the path of convenience, taking out loans against our planet to be paid in the health and welfare of my family and families around the world. I see people taking the feel-good path admiring their own handiwork while ignoring the livelihoods that they destroy and the burdens that impose on the poorest Americans in the form of higher

electricity prices and unreliable sources of electricity. Somewhere along the way it seems that we've decided that self-righteousness is more important than meaningful policy and we've lost all context behind this important discussion. Every one of us wants what's best for humanity and we all wish for health and prosperity for ourselves, our country and our species. As a student of science and history, I know that we all be best served if we can beyond the technology tribalism of the past that has plagued our energy industry for the past decades. The path to preventing and mitigating global climate change will be through a balance of economic competitiveness and environmental concerns. A costly energy policy might be successful in a single country, but it will not gain influence in other countries, especially among the emerging nations of the world. The American energy market will need to be a balanced and diversified portfolio of the most responsible, affordable and reliable generating technologies. If we can achieve it here and demonstrate to the world the effectiveness of a policy of environmental responsibility and robust economic health, then the United States will be the leader in supplying the human expertise, advanced technologies and materials to the hungry energy markets around the world. We are the ones who are going to have to pay for the shortsighted decisions of today. Global climate change is extremely dangerous and the decisions that we make today as a country will have global implications. I believe in nuclear energy because it is safe. I believe in nuclear energy because it can protect our planet from catastrophic climate change. I believe in nuclear energy because it can lift us to new levels of prosperity. (0030-19-4 [Cohn, Jeremy])

Comment: Nuclear energy has shown it is a responsible source of electricity and a valuable community partner. Nuclear energy safely and cleanly produces nearly 20 percent of the electric power and supports more than 100,000 high-paying jobs in this country. Because of nuclear energy's commitment to producing affordable clean power and its commitment to safely, cleanly, and securely storing spent fuel, it is no wonder our communities near nuclear energy facilities support nuclear energy and their local facility. (0030-20-3 [Lapiska, Evan])

Comment: As the Commission continues these public hearings, I would just like to reiterate that nuclear energy has shown the utmost commitment to safety and securely storing spent fuel. (0030-20-5 [Lapiska, Evan])

Comment: Thank you for your time today and I would like to reiterate my support for nuclear energy. (0030-20-6 [Lapiska, Evan])

Comment: Nuclear power is an important part of your country's energy infrastructure past, present, and future. Nuclear energy of course provides the majority of the country's emissions-free electricity 24 hours a day, even when the sun isn't shining and the wind isn't blowing. (0030-23-4 [Blee, David])

Comment: Nuclear power plays an important role in this nation's energy mix. Given that 63 percent of the nation's carbon-free electricity comes from nuclear generation, continuing to license safe, secure, reliable, and environmentally sound nuclear facilities is simply sound public policy. And, more particularly, the resumption of licensing activities is essential for long-term power-planning decisions. (0030-3-3 [Ginsberg, Ellen])

Comment: Some of the information gave out, that 63 percent of carbon-free energy in the country is provided by nuclear energy, we [Maryland State Pipe Trades Association] think it should be 90 percent. (0030-9-1 [Guido, Jeffry])

Comment: The economic growth, education for operating these systems, world population is expected to be seven billion by 2050 I believe. I don't think wind turbines and solar energy are

going to do it. I don't know of one wind farm that provides enough energy to manufacture a wind turbine. And that's pretty much the points I have to make. We [Maryland State Pipe Trades Association] support nuclear energy, and I hope the process continues. (0030-9-4 [Guido, Jeffry])

Comment: So I'd like to get on to a little bit of the economic impacts of this. Nuclear energy generates 63 percent of the carbon free electricity produced in the United States according to the U.S. Energy Information Administration. The operation of a nuclear plant requires hundreds of people to perform numerous and various responsibilities. The closing of San Onofre Nuclear Power Plant means 1100 workers will lose their jobs. The closing of the Vermont Yankee Nuclear plant will cost more than 600 workers their jobs. These numbers include only direct full-time jobs at these plants. Also lost will be hundreds of jobs involving maintenance completed during outages and hundreds of more for suppliers and vendor companies who rely on these plants for their survival. The Boston Globe newspaper reported on September 18 that 17 years since the Maine Yankee Nuclear Power Plant closed and 600 workers lost their jobs, property taxes have spiked more than ten times for the town of 3700 residents. The number living in poverty has more than doubled as many professionals left and the town's services and jobs have been cut. The town of Wiscasset lacks money to repair leaky windows and roofs in school buildings and the high school has fewer than half the students it had two decades ago and about 50 percent of them rely on subsidized lunches. On average a nuclear energy facility generates \$470 million dollars in sales of goods and services the local community and nearly \$40 million in total labor income annually. Each year it pays out about \$67 million in federal taxes and almost \$16 million in state and local taxes. (0045-13-4 [Allen, Rick])

Comment: CA [Consumer Energy Alliance] has long believed that nuclear energy must remain a part of a balanced and sensible national energy policy. And furthermore, the United States must find ways to thoughtfully expand the source of carbon-free electricity, in order to meet rising consumer demand, in an increasingly carbon-constrained world. Nuclear energy is historically provided one of the most consistently affordable sources of electricity. Since fuel cost typically account for less than one-third of a nuclear plant's production cost, nuclear energy consumers are less susceptible to fluctuations in price. (0045-4-1 [Martini, Shawn])

Comment: The United States was the first country to develop commercial nuclear power plant, and we have the largest nuclear program in the world, 100 reactors, and five more under construction. Having once being a leader in this technology, we're at risk of losing our competitive edge and our nation's credibility towards other nuclear powers. (0045-5-4 [Cannon, Tom])

Comment: Nuclear energy plays a vital role in meeting our nation's electricity needs, protecting the environment and preserving the fuel and technology diversity that is the strength of the U.S. electricity supply system. (0045-9-1 [Baker, Tammera])

Comment: The Energy Department projects that U.S. electricity demand will raise 28 percent by 2040, and that's even with very modest economic growth. That means the United States will need hundreds of new power plants of all types to meet the increased demand and replace older facilities that are being retired. Some of these new plants are going to have to be nuclear, like the five that are currently under construction in Georgia, South Carolina and Tennessee. Nuclear energy is the only emission-free source of electricity that can be widely expanded. (0045-9-2 [Baker, Tammera])

Comment: The president has set very ambitious goals for reducing carbon dioxide emissions, and the United States simply cannot get there without nuclear energy. (0045-9-3 [Baker, Tammera])

Comment: In addition to generating clean energy, nuclear plants strengthen state and local economies through jobs, taxes and secondary spending. (0045-9-4 [Baker, Tammera])

Comment: The presence of nuclear power, or nuclear plants and its employees filters throughout the local economy. Analysis shows that every dollar spent by the average nuclear plant results in the creation of \$1.04 in local economy, \$1.18 in the state economy, and \$1.87 in the U.S. economy. (0045-9-6 [Baker, Tammera])

Comment: I see the French model and believe there may be hope for nuclear power properly researched and well managed. It is safer and cheaper than fracking or pipelines, and has more potential for widespread use while wind and geothermal are being refined. (0057-6 [Lamont, Dana])

Comment: Our members [Clean and Safe Energy Coalition, or CASEnergy] support the increased use of nuclear energy to ensure an environmentally clean, safe, affordable and reliable supply of electricity. (0060-1 [Lapiska, Evan])

Comment: Nuclear energy has shown that it is a responsible source of electricity and a valuable community partner. Nuclear energy safely and cleanly provides nearly 20% of our electric power and supports more than 100,000 high-paying jobs. Because of nuclear energy's commitment to producing affordable, clean power, and its commitment to safely, cleanly and securely storing spent fuel, it is no wonder why communities near nuclear facilities strongly support nuclear energy. (0060-3 [Lapiska, Evan])

Comment: I would just like to reiterate that nuclear energy has shown the utmost commitment to safely and securely storing spent fuel. (0060-5 [Lapiska, Evan])

Comment: It is important that we make sure that nuclear energy facilities across the country are allowed to keep doing what they're doing -producing much-needed power, cleanly, safely, and efficiently. I am here to express my support and confidence in the storage of spent nuclear fuel on-site at nuclear facilities. (0061-2 [Kirton, Kenneth])

Comment: Nuclear energy provides 19% of our electricity but nearly two-thirds of our emissions free electricity. That means nuclear energy provides more clean-air energy than every other source of emissions free electricity combined . At a time when we are looking at how we can address the threat of climate change, nuclear energy is already our best ally in the fight. Not only is it the largest source of clean-air energy, it is an extremely reliable form of baseload, "always on", power. As the Commission continues this series of public hearings, I Would just like to reiterate my support for an industry that has shown it can safely and securely store spent fuel on-site for decades and is at the forefront of clean-air energy. Nuclear energy is not only a reliable and responsible source of power; it is our largest source of emissions free electricity. While other sources of energy pump harmful greenhouse gas emissions, sulfur dioxide, nitrogen oxide and mercury into the air, nuclear energy emits none of these. Rather, the nuclear energy has shown it can safely, securely, and cleanly store spent fuel on-site. As the Commission considers this and future issues, I would encourage them to think about what we can do to strengthen our nation's commitment to clean-air technology, like nuclear energy. (0061-5 [Kirton, Kenneth])

Comment: The Energy Department projects U.S. electricity demand will rise 28 percent by 2040, even with very modest growth. Put simply, as we take some of our older, fossil fuel plants off-line, the US will need many new plants of all varieties to meet the demand of clean and reliable energy. Nuclear should be part of the mix; it has proven itself as a viable option. An Associated Press story in October reports that Seabrook Station had the fewest maintenance problems of any nuclear plant in the country in a recent review. That performance must be recognized and allowed to continue. And do not overlook the basic dollars and cents of nuclear plants like Seabrook. Economic impacts of plants are significant and on-going. A typical nuclear plant generates \$470 million a year in economic output, including more than \$35 million in total labor income. Nuclear plant jobs are good-paying, community-sustaining jobs that cannot be replaced. In addition, the average nuclear plant pays millions in state and local taxes annually. These tax dollars benefit schools, roads and other state and local infrastructure. Nuclear energy must be a continued part of our region's energy grid. It is efficient, economically viable, and environmentally cleaner than any other option that can produce power that matches New England's energy demands. (0087-2 [Hinch, Richard])

Comment: Please note that all power derived on earth is nuclear. The sun operates on hydrogen fusion, which creates heat and light, which is responsible for all fossil fuels on earth. (0100-2 [Behling, Steve])

Comment: First of all the anti nuclear panic-mongers should get one thing straight from the beginning. The reason there is life on the planet Earth in the first place is because of nuclear energy. In other words, the Sun. The Sun is powered by hydrogen fusion. The waste products of this action, i.e. heat and other different spectrums of light, is what has created all of the fossil fuels on this planet, to say nothing of all the life. For whatever nutty reason, the eco-panic-mongers fail to see this issue. (0100-21 [Behling, Steve])

Comment: It occurs to me that legal action should be brought against anyone who knowingly manufactures false evidence, or makes false statements against any legal product. Including nuclear reactors. The constant calling of more studies on reactor safety is redundant to the extreme, and is costing the rest of us more capitol for no reason. What the legal system should do is have the eco-nuts prove that a certain aspect of reactor design is unsafe. As far as I know any corporation has the same rights as an individual human being, and is entitled to the same legal protections. Would it be incorrect to state that the eco-panic-mongers are costing the world untold trillions of dollars based on - Lost Wages - Phoney claims - Worthless lawsuits - and New ideas that are not pursued because of the fear of lawsuits by the eco-panic-mongers. Example: The panic over childhood vaccinations that were stopped by frightened parents because of A SINGLE QUACK PSUDO DOCTOR, that stated that the same vaccinations caused autism. It was discovered later that all the claims made by the fake doctor were false. Also, along the same lines a female panic monger clamed that DDT was killing human off life on this planet. Again the opposite turns out to be true. DDT is not harmful to humans or higher animals, just insects. The environmental movement is responsible for much of the mess that the world finds itself in today. (0100-22 [Behling, Steve])

Comment: Now here is an observation for you. Since the construction of the first nuclear reactor, millions of people have died of disease, war, auto accidents, and drug overdoses, and speaking of drug overdoses, this would be a big concern in the San Francisco bay area. Especially aids ridden homosexual drug dealing. As opposed to this Godless perversion, almost no one has died of radiation poisoning. There is one other thing. These same people who complain about nuclear power, use this same power to grow drugs! According to Lars Larson,

1% of all energy used in the United States, or five billion dollars a year, are used to grow and process illegal drugs. (0100-24 [Behling, Steve])

Comment: According to my accounting, we have now had our fourth meltdown. Chernobyl, Three Mile Island, and at least two reactors in Japan. According to the eco-panic-mongers, many thousands of us should be dead by now, and large sections of our planet should be a barren wasteland. Hey guess what? We're still here! (0100-25 [Behling, Steve])

Comment: According to the eco-panic-mongers, during a reactor melt down, internal parts of a reactor can be turned into missiles that can slam into other parts of the reactor, thus causing a greater runaway. As of our fourth melt down...Not one part in any reactor has turned into a missile, since the beginning of nuclear power plants. (0100-26 [Behling, Steve])

Comment: Keep in mind that the United States power grid is the worlds largest invention, employs over a million people, and is kept on line with billions of dollars in revenue on a yearly basis. This is also true of the natural gas supply system. Because of the new fracking technology, the supply of natural gas has increased to the point of bulk prices being driven down. This development has a negative price impact on the generation of nuclear energy. Low cost natural gas creates energy at a lower price than nuclear power. The concept that is missed however, is that all the new found natural gas, or any other form of nuclear created energy, can be used up in a century. After that, then what. The what is, nuclear energy. (0100-4 [Behling, Steve])

Comment: I'm here tonight to tell you as a city councilor that the reliability of the New England electrical grid must be maintained. And it is up to NRC to oversee that one of the major factors in maintaining a reliable electric grid is nuclear power. (0112-1-2 [Giunta, Tony])

Comment: Like it or not, part of the mix of a reliable system of electricity in New England is nuclear power. (0112-1-3 [Giunta, Tony])

Comment: And while it's not perfect, new generation of nuclear engineers like me are clearing regulatory hurdles to bring even safer and more reliable nuclear energy that is leaps and bounds from what we know today. And it keeps improving just like all the other technologies are improving. (0112-12-5 [Garcia, Diego])

Comment: Nuclear energy safely and cleanly provides nearly 20 percent of our electric power with absolutely zero GHG omissions and supports more than 100,000 high paying jobs. Nuclear energy has a crucial impact on America's energy portfolio[.] (0112-21-3 [Morris, Kelsi])

Comment: There is a lot of technical information already in the license applications. That's why NRC went from 20 years to 40 years on license renewals. Those licensing processes will work faster than global warming. (0112-25-5 [McCullum, Rod])

Comment: Now, I want to go back and close with something that Councilman Giunta said at the very beginning of this meeting and that is the importance of safe, reliable, clean electricity, affordable electricity to his community. Business is coming back into his community because they have confidence in our infrastructure. And what gives us that is a good mix of energy, including nuclear along with all the renewables. And it's great that natural gas is cheap. But what causes us to lose that, what causes us to fall behind France and maybe even some countries that are further behind is if we start devoting resources to things that aren't significant to reducing risk. So I'm glad we're having this discussion. (0112-25-8 [McCullum, Rod])

Comment: Now, we heard a lot about various frustrations and concerns about the length of time here. I can tell you people of my generation are also frustrated. This is a problem that is not yet solved. But it is one we're eager to solve. We're eager to make sure that these dry storage systems are reliable for as long as they're needed and we are eager to solve the geological waste disposal problem. (0112-27-3 [Curtis, Daniel])

Comment: Nuclear energy facilities play an important role across America by producing clean, reliable power for many communities - and it's necessary that they be allowed to continue their safe and efficient operations. (0122-1 [Bailey, Savannah])

Comment: Today there are many concerned and knowledgeable people here: young engineers, young couples, mothers, fathers, grandparents - people who like me are concerned about the future - and people who, like me, know nuclear energy can be a key contributor to that safe, environmentally successful future. (0138-10 [Cook, Dr. Andrew G.])

Comment: Maybe more importantly I know the used fuel can be safely stored since it was, by the earth 1.7B years ago. At one of our AREVA uranium mines in Oklo, Gabon Africa we discovered that 1.7B years ago 16 nuclear chain reactions, actual real natural nuclear reactors, ran on their own, underground, in the presence of water, long before humans even existed. The reason we know is that we found the "used fuel" by products of those reactors right there, less than one foot from the location of the reactors themselves. What happened? The reactors naturally shut down, some of the used fuel became entrained in the water, and then like all minerals do, it precipitated out of solution. And indeed the byproducts of the reactions were found, precipitated out and in crystalline form, less than one foot from their point origin. So the earth has shown us, in marvelous natural detail, that even in the direct presence of water, the used fuel can be safely stored for more than a billion years in underground geological formations. (0138-6 [Cook, Dr. Andrew G.])

Comment: But all of this has little bearing if there is no need for nuclear energy. So is it needed? I can assure you as a concerned parent and concerned environmentalists it is most assuredly needed. First let's consider that most one of us got here tonight by consuming at least a gallon of gasoline or diesel fuel. Where did the waste from that transportation go? Unlike the solid, safely stored nuclear fuel, all of the waste from our trips here went straight into the air, the air you and I are breathing right now. And this situation persists worldwide. 85% of all the energy consumed by humans today and into the future comes from carbon based fuels - fire wood, biomass, coal, oil, and natural gas. Accessibility to energy improves lives and increases standards of living. As the world population continues to grow this situation will persist, despite the fact that renewables - like nuclear energy - are desirable. It will occur because the worlds peoples' world hunger for energy is so huge and the population growth is so significant, that carbon based fuels will be the inexpensive, accessible energy source of choice for those in greatest need. We see this occurring in China where air pollution from carbon-based fuels is reaching near toxic levels. We are breathing the waste from those carbon based fuels, every minute, every breath. (0138-8 [Cook, Dr. Andrew G.])

Comment: In fact today, it is highly unlikely that the US, a leader in managing CO2, can achieve its climate goals without the CO2 free energy of nuclear energy. Nuclear energy will be a key component in providing a healthy, CO2 free relief valve. Nuclear energy is the CO2 free source that can serve as a stable and reliable back up for wind and solar energy. It is the CO2 free, environmentally friendly, renewable energy source that is here for us 24/7 365 days a year rain, or shine, wind or no wind, day and night regardless of the weather. And we see it doing this job for the US as it accommodates that electric energy fluctuations associated with other

renewables. Nuclear energy is the low cost, safe reliable soldier that has stood beside us through oil embargos, gas pipe line pressure drops, coal pile freezes and even system wide black outs. Our nuclear energy plants have been there as worthy and durable soldiers helping us with a diversified and secure CO2 free energy mix. It is for this reason that leading environmentalists like Patrick Moore, Steve Brand, James Lovelock and Greg Warren all strongly support nuclear energy. (0138-9 [Cook, Dr. Andrew G.]

Comment: The Nuclear Power Industry provides a clean, safe and reliable source of power for a large portion of the American consumer's electricity needs. This type of energy generation (nuclear) is carbon free power and economically beneficial to the American consumer as well. Stringent management programs of spent nuclear fuel, in dry storage containers and in pools, insure public safety and answer the environment concerns that the public might have. (0148-1 [Ryan, Paul])

Comment: The large amount of energy provided by nuclear power generation in the United States is a vital component of the entire American energy program. American energy requirements will only increase in the future and nuclear power generation is needed to keep America free from dependence on other sources of carbon based fuel for our energy needs. (0148-3 [Ryan, Paul])

Comment: Nuclear energy is an integral part of a national energy plan. It generates 98% of the carbon-free electricity produced in our state, according to the Energy Information Administration. Nuclear energy facilities also provide substantial economic benefits to the state and local community, including high-paying jobs and tax revenue that helps keep town services funded and property taxes are much lower than they otherwise would be. In fact, nuclear industry jobs pay substantially higher salaries than other jobs in the communities where nuclear power plants are located. On average, a nuclear energy facility generates \$470 million in economic output. (0150-1 [Rivera, Wendy])

Comment: The United States was the first country to develop commercial nuclear power plants, and we have the largest nuclear program in the world—100 reactors, with five more under construction. Having once been a leader in this technology, the United States is at risk of losing our competitive edge—and our nation's credibility among other nuclear powers. Nuclear energy plays a vital role in meeting our nation's electricity needs, protecting the environment, and preserving the fuel and technology diversity that is the strength of the U.S. electricity supply system. On behalf of the MEA [Multicultural Education Alliance], we implore you to take the steps necessary to ensure the United States does not lose its competitive edge. (0150-3 [Rivera, Wendy])

Comment: The Nuclear Power Generation Industry provides the American consumer with a reliable, clean(carbon free footprint) and safe source of power. (0153-1 [Capurso, Thomas])

Comment: In closing, I feel that as the American energy demands increase, and as concerns of global warming grow, the Nuclear Power Industry will be an important part of the American Energy Program, helping to providing Americans independence from carbon based fuel for their long term energy demands. (0153-4 [Capurso, Thomas])

Comment: Now a word about nuclear power. It's an undisputed truth that nuclear power plants produce about two-thirds of the emission-free electricity in this country. New York State's six reactors produce 30 percent of its electricity with Indian Point providing a large chunk for New York City. New Jersey's four reactors produce fully half of its electricity. These power plants do

not require the sun to shine or the wind to blow to keep the electricity flowing. They are there 24/7. They provide essential, reliable electricity to our homes, businesses, factories, and hospitals all over the country. But they also do something else. They provide jobs with good pay and benefits for our families, friends and neighbors. And that's not just the people who work at the facilities but the regulators, supplier, and local businesses that exist solely to cater to the people who work at the plants. Let's not forget all the taxes that are paid. (0163-11-5 [Gutherman, Brian])

Comment: NAYGN strongly believes that nuclear energy is an integral part of a national energy plan and must continue to generate an essential share of the nation's clean non-emitting zero-carbon baseload energy. Nuclear energy generates 59 percent of the carbon-free electricity produced in New York. This factor is according to the Energy Information Administration. Our nuclear energy facilities also provide substantial economic benefits to the state and local community including high-paying jobs and tax revenue that helps keep town services funded and property taxes much lower than they otherwise would be. (0163-17-1 [Schepperly, David])

Comment: Our members [CASEnergy] support the increased use of nuclear energy (interference) -- excuse me -- to ensure an environmentally clean, safe, affordable, and reliable supply of electricity. (0163-18-1 [Lapiska, Evan])

Comment: Nuclear energy has shown that it is a responsible source of electricity and a valuable community partner. Nuclear energy safely and cleanly provides nearly 20 percent of our electric power nationwide and nearly two-thirds of our carbon-free electricity, and supports more than 100,000 high-paying jobs. Because of nuclear energy's commitment to producing affordable clean power and its commitment to safely, cleanly, and securely storing spent fuel, it is no wonder why communities near nuclear facilities strongly support nuclear energy. (0163-18-4 [Lapiska, Evan])

Comment: I hope to hear a discussion of the facts and that is that nuclear energy has shown the utmost commitment to safely and securely storing spent fuel and that will never change. (0163-18-6 [Lapiska, Evan])

Comment: First of all, it's important I think that we all recognize that nuclear energy is safe. In the 50-year history of commercial operation there has not been a single death from nuclear energy. (0163-19-1 [Steidler, Paul])

Comment: The second thing -- the second thing I'd like to add, you know, there's been a lot of discussion today about Hurricane Sandy and the one year anniversary having been yesterday and that is a tragedy that we should not forget and it's something that we should look at and look to rigorously examine so we can prevent events like that from happening again. We believe that nuclear energy is essential to that. (0163-19-2 [Steidler, Paul])

Comment: President Obama and his Energy Secretary Ernest Moniz believe that nuclear energy is essential for addressing global warming and giving our kids a better world and with that as background, there is some good news. New York City today has the cleanest air it's had in 50 years and New York State has the lowest per capita carbon emissions rate of any state in the country in large part because of the fact that 30 percent of the state's electricity comes from nuclear power. (0163-19-3 [Steidler, Paul])

Comment: With that said, I would like to read the statement from our Chairman Mr. Kremer. "We have every confidence that the used fuel stored at New York's six nuclear power plants is

safe and secure in good part because it is already rigorously inspected by the U.S. Nuclear Regulatory Commission. We urge the NRC and other policy makers to find permanent solutions for this used fuel including the establishment of designated repositories to where it can be shipped and recycling options." (0163-19-4 [Kremer, Jerry])

Comment: Our members [CASEnergy] support the expanded use of clean-air nuclear energy to ensure an affordable and reliable supply of electricity for America. (0163-29-1 [Bailey, Savannah])

Comment: Nuclear energy facilities play an important role across America by producing clean reliable power for many and it's necessary that they be allowed to continue their safe and efficient operations. (0163-29-3 [Bailey, Savannah])

Comment: To end I would like to restate my support for an industry that continues to provide clean-air energy while storing spent fuel safely and securely on site for decades. Beyond being reliable and affordable, nuclear energy does not put harmful greenhouse gas emissions, sulphur dioxide, nitrogen oxide and mercury into our air making it our largest source of emissions free electricity. (0163-29-8 [Bailey, Savannah])

Comment: I would like to finish with what I would describe as the value proposition of nuclear energy. First, it provides large quantities of electricity around the clock, safely and reliably when needed, but the value proposition doesn't end there. Nuclear plants provide clean-air energy. They also provide voltage support to the grid, helping to maintain its stability. Nuclear plants provide forward price stability and are not subject to the price volatility that many in the northeast experienced with gas-fired generation being dominant. Finally, nuclear energy plants contribute to the fuel diversity and technology diversity that is one of the bedrock characteristics of a reliable and resilient electric sector. (0163-30-2 [Ginsberg, Ellen])

Comment: I have been in the nuclear industry for the past 2.5 years and have come to view it as one of the most safety conscious work environments that I have ever worked in. For example, in this industry the operator is recognized as part of the system and every task he performs is evaluated for its impact on the safety of the plant. This means that if a job is deemed to be "too risky," then the job itself will be redesigned. As a result, the nuclear industry has had a long history of proportionally safe human performance. (0176-1 [Stringfellow, Paris])

Comment: Third, nuclear power is a safe, carbon free and reliable form of energy that provides the foundation for our nation's electric grid. As expected in the Atomic Energy Act, the NRC should efficiently provide for the continued licensing of this safe and proven technology. (0180-8 [Merrifield, Jeffrey])

Comment: Nuclear power plants supply about 20% of the nation's electricity, and provide two thirds of the emission-free electricity in this country. These power plants do not require the sun to shine or the wind to blow to keep electricity flowing. They are available around the clock. They provide essential, reliable electricity to our homes, businesses, factories, and hospitals all over the country. They provide jobs with good pay and benefits for our families, friends and neighbors. (0181-4 [Waters, Christine])

Comment: Nuclear power plants supply about 20% of the nation's electricity, and provide two thirds of the emission-free electricity in this country. These power plants do not require the sun to shine or the wind to blow to keep electricity flowing. They are available around the clock. They provide essential, reliable electricity to our homes, businesses, factories, and hospitals all

over the country. They provide jobs with good pay and benefits for our families, friends and neighbors. (0183-4 [Green, Carlyn])

Comment: As stated before, nuclear waste is just spent nuclear fuel. What does this nuclear fuel do for us exactly? The amount of energy put out by even the smallest amount of nuclear fuel is incredible, and energy is beyond crucial to everyday life. Energy is what enables us to do everyday activities, such as sit in a room with light, do laundry, drive a car; energy is involved in about 99% of what we do everyday. Nuclear energy is a huge breakthrough in human technology, because we can get so much energy from so little fuel. The efficiency and relative ease of this process is truly amazing. Author Alvin Weinberg talks about how society today must correctly choose what is essential to human survival and what is not. "I would put nuclear energy and pesticides in the first category, supersonic transports in the second" (Weinberg, 1970). Weinberg means that category one is the one that holds the things that are essential to human survival. What I'm trying to say with all of this is that nuclear energy is so precious to us that to give it anything less than our full attention is not necessarily an illegal or evil act, but rather a very questionable move on our part. (0192-10 [Einhorn, Jeremy])

Comment: As I just explained, the power of nuclear energy is astonishing. Its ability to provide such massive amounts of energy with such little amount of fuel is truly a milestone for human existence. This amazing technology, however, as well as many other pieces of technology always has the potential to become "better." This means that we constantly are researching and testing new ways that the technology can be more productive and be more efficient. With this movement forward in technology, that means that new standards must be in place so that it is up to date with the updated technology. Nuclear waste disposal technology has most definitely moved forward in the past decade or so. (0192-12 [Einhorn, Jeremy])

Comment: Throughout this comment, I have shown how critical it is that we have nuclear energy as an option. Energy is beyond critical is all of our daily life activities; every last person in this country uses so much energy per day, that to have none would mean human existence ceases to exist. If we are going to readily use nuclear energy as a way to provide so much of said energy to us, then we also have a responsibility to uphold. We cannot assume that we can have such great power and get away with not having to upkeep anything dealing with it. I'm talking mostly about the waste it produces; it is highly toxic. Since it is the NRC's job to be the fixed point for any nuclear energy related activities, it is also their job to be in charge of the nuclear waste. (0192-14 [Einhorn, Jeremy])

Comment: I have worked in the US Nuclear Power Industry for over 30 years. I have worked in both the Utility and supplier sectors of this business. During that time I have witnessed our industry continue to be a safe, secure, and environmentally sound source of electricity supply to our nation. Nuclear energy provides an emissions free, domestic source of base load electricity generation, and creates thousands of jobs for our citizens. Nuclear Energy is a vital part of our energy portfolio in the US. (0201-2 [Fregonese, Vic])

Comment: Our members support the increased use of nuclear energy to ensure an environmentally clean, safe, affordable and reliable supply of electricity. (0212-1 [Lapiska, Evan])

Comment: Stepping back from spent fuel storage, the larger debate I have seen taking place at these meetings is on the future of nuclear energy in general. Plain and simple, if we are serious about addressing climate change and reducing carbon emissions, nuclear energy is a vital part of any viable plan. Nuclear energy currently provides electricity to one out of every five homes and businesses, yet it accounts for nearly two thirds of our clean air electricity. In

addition to being clean, it is reliable as a 24/7 baseload source of electricity, or put another way, a perfect complement to intermittent renewables like wind and solar. (0212-4 [Lapiska, Evan])

Comment: I hope to hear a discussion of the facts, and that is that nuclear energy has shown the utmost commitment to safely and securely storing spent fuel and that will never change, while providing us with clean, safe and reliable electricity around the clock. (0212-6 [Lapiska, Evan])

Comment: The CASEnergy Coalition is a national grassroots organization that supports the increased use of nuclear energy to ensure an environmentally clean, safe, affordable and reliable supply of electricity. (0213-1 [Coalition, Clean and Safe Energy])

Comment: The nuclear energy industry has built a comprehensive system using state-of-the-art technology to safely and securely contain the spent fuel it creates that keeps both the public and the environment safe. (0213-2 [Coalition, Clean and Safe Energy])

Comment: Nuclear energy is a safe, reliable source of electricity and a valuable community partner--it provides nearly 20% of our electric power and supports more than 100,000 high-paying jobs. Because of nuclear energy's commitment to producing affordable, clean power, and its commitment to safely and securely storing spent fuel, it is no wonder why communities near nuclear facilities strongly support nuclear energy. (0213-4 [Coalition, Clean and Safe Energy])

Comment: Nuclear energy is a vital component of the U.S. electrical generation family. (0244-1-4 [Tulenko, James])

Comment: But industry doesn't rest on that. Once again, we go beyond. You know, we are very confident at our plants we didn't overlook something as a high probability as the tsunami in Japan. But we're not going to say, "Okay, we're fine, we're stopping there." No. Not even close. We're saying, "Okay, in spite of all the work we've done over all the years to look at what can happen, what if something we didn't think could happen, happens?" We're putting in place flexible strategies that can be deployed from offsite and from areas where if everything is wiped out we could bring in the right stuff, and it's called flex, and it will be yet another innovation in nuclear safety. We always continue to get better and to get stronger. Yet, in this EIS the NRC has assumed we stay the way we are, and based on the facts they have concluded, and there are a lot of facts in there, that the impacts are small. We believe the impacts will be even smaller. (0244-11-12 [McCullum, Rod])

Comment: We're a national grassroots organization that supports the increased use of nuclear energy to ensure an affordable environment -- environmentally clean, reliable, and safe supply of electricity. As everyone knows, safety is the most important element of our focus in nuclear. Our priorities in Waste Confidence should be no different and protecting the public must be the top priority in what we do. (0244-12-1 [Ratchford, James])

Comment: The U.S. was the first country to develop commercial nuclear power plants, and we've the largest nuclear program in the world; 100 reactors with 5 more under construction. Having once been a leader in this technology, we are risking -- we are at risk of losing our competitive edge and our nation's credibility among other nuclear powers. (0244-12-5 [Ratchford, James])

Comment: I think this is important work you're doing because there is really no need that waste handling -- nuclear waste handling should be a barrier to future continued development of

nuclear power generation. AABE Florida strongly believes that nuclear energy is an integral part of our national energy plan and must continue to generate an essential share of the nation's clean, non-emitting, zero-carbon baseload electricity. According to the Department of Energy's Energy Information Administration, in Florida, nuclear generates 98 percent of zero carbon electricity. The state's nuclear facilities also provide substantial economic benefit to state and local economies, including high-paying jobs, tax revenue, which helps keep local taxes down, and also funds local services. Property taxes, for example, are much lower than they would otherwise be. On average a typical nuclear facility provides nearly \$500 million in annual economic output including more than \$35 million of employment income. Each year it pays about \$67 million in federal income taxes and nearly \$16 million in state and local taxes. (0244-2-1 [Knowles, Berdell])

Comment: As students in the state of Florida, we believe that current and continued use of zero-emission nuclear energy is vital to the state both economically and environmentally. (0244-7-2 [Kuntawala, Jitesh])

Comment: To finalize: the continued storage of spent nuclear fuel onsite is not a limiting factor of the operation of Florida zero-emission nuclear plants, nor is it an environmental or public safety issue. We, as nuclear engineering students, are studying every day so that we can be a part of our nation's clean, zero-emission future. (0244-7-5 [Kuntawala, Jitesh])

Comment: [T]he only source of zero-emission energy that we have is those nuclear power plants. It's been that way for five decades, it is going to be that way for a long, long time in the future. As to witness who spoke earlier ostensibly on behalf of an alliance for clean energy, a witness whose title I think was a high-risk energy advisor. I would just suggest that the high risk, the high risk is that we further delay licensing decisions for more clean energy, more zero-emission nuclear power. That's the real risk here. And although I know it's -- it's no fault of y'all's but the Waste Confidence Rule and the politics of it, some of which Dr. Rossin spoke about, really has only served to delay, delay the ability to provide cleaner air for more people. (0244-9-6 [Paul, Jerry])

Comment: So I know that some of that is slightly off-topic, but it is to say to you that this issue that you're wrestling with, the question of approving a generic EIS and moving forward so that Florida can get back on track with planning more clean energy. It's very important to the state, not just to the nuclear industry and people who work in the industry, but for the people who need the clean air that come from it. So, I hope you keep that in mind[.] (0244-9-8 [Paul, Jerry])

Comment: [T]hank you for allowing my office the opportunity to address this public meeting regarding Nuclear Regulatory Commission Rulemaking to address waste confidence. As many Illinois residents rely on nuclear clean and portable energy, this rulemaking will have an important impact to consumers across the state. In the 16th District alone, there are four nuclear power plants providing great price stability to consumers throughout our nation. Nuclear power provides half of our state's energy and generates almost 93 percent of the carbon-free electricity produced in Illinois. Without the availability of this baseload power, there is no doubt that prices would skyrocket and energy stability would plummet. In addition, the nuclear energy industry support thousands of high-paying jobs, which in turn supports the tax base of our local communities. (0245-1-1 [Wilson, Reed])

Comment: I want to talk to the fact that the Nuclear Regulatory Commission has suspended all final licensing decisions while this rulemaking process moves forward. I believe it's time to provide this industry that provides a clean source of energy to billions of consumers the ability to

move forward with a greater level of certainty for the long-term operations. (0245-1-3 [Wilson, Reed])

Comment: So, it comes down to this. I mean as nuclear engineers, the last thing we want to do is cause any harm to the environment. I mean I have a son, and a family, and a home, and I care about the environment as much as you. You know, many of us became nuclear engineers because we know it's a great technology and it's a workable technology today. (0245-12-5 [de Graaf, Brandon])

Comment: When it comes to the rhetoric of a lot of the activists who oppose nuclear energy, the story always remains the same. There is some hypothetical scenario or red herring issue concocted to represent the immediate peril supposedly created by nuclear power. But as always, upon closer examination, the story unravels. (0245-16-1 [O'Brien, Doug])

Comment: Now, of course the past is no guarantee of what's to come in the future. These are facts, plain and simple. To try and counter these facts in the overall safety record of nuclear energy with scenarios worthy of the most inventive Hollywood screenwriter is to irresponsibly distract from what should be a serious discussion of the important role of nuclear power in creating a diverse and independent energy supply for our country. These tactics also divert attention from the growing forest of support for nuclear energy from the environmental movement itself. Among those who realize that if we are going to reduce our carbon footprint in a meaningful way, we must rely on the single great source of carbon-free emission, nuclear. There are many examples in the recent media about the environmental leaders, about how the global warming and the leaders in the environmental community wisely embrace nuclear power, and the Energy Secretary who states that nuclear power will play a key role in the fight against climate change. Now, we can juxtapose the hypothetical scenarios that try to paint spent fuel storage as some impending doom with some very tangible data. According to NASA Climate Sciences James Hansen who is a leading voice in the battle against global warming, the use of nuclear power generation has globally prevented the emission of over 60 billion tons of greenhouse gases and has prevented as many as one million premature gas globally. This is quantifiable. It's not based on what ifs, maybes, theoreticals, or scenarios. The Illinois Clean Energy Coalition promotes the use of clean energy sources in a competitive and sustainable marketplace that will fuel our economy while benefitting our environment. (0245-16-3 [O'Brien, Doug])

Comment: I've worked in radiation protection for three years and to a lot of people it may not seem like a very long time to really gain a grasp on how serious it is to work in the nuclear industry. I've talked to a lot of you before the meeting and I appreciate all of those that did come up and talk to me about their opinions on the nuclear industry. I want to talk to you about my opinion on the nuclear industry and what I've worked with in the three and a half years. I have confidence in my plant. I have confidence in our safety. There are a lot of different examples I can give you, but one of them -- we were mentioning terrorist attacks. Every three years, the government comes up with a team of military individuals to break into our power plant called -- and every year since I've been, or for the last ten years, Braidwood has been successful in passing that. They, like, really try to break in, they break down wires, they shoot fake weapons at each other, kind of like really high-tech laser tag. But that's really safe. I mean we've come up with scenarios, we try to put it on ourselves against terrorist attacks. (0245-18-1 [Stenson, Amanda])

Comment: I also wanted to bring up operating experiences. We learn from our mistakes. TMI happened in 1979, and out of that INPO was created. And I don't know any other industry that is

open to other businesses talking to each other about their problems as the nuclear industry. We have forums set out across the country to discuss with each other whatever problems they might be having to kind of gain insight to all those. And that's unheard of in any other industry. That's why I have confidence. We're not afraid to say that we made a mistake and we fix it. (0245-18-2 [Stenson, Amanda])

Comment: First and foremost, I just want to say that I am extremely proud to be an Exelon Nuclear employee. I have a degree in nuclear engineering. I've worked in the industry for 25 years. And a side note, I have had three children, I had been pregnant. Through working at the plant, I have three healthy young adult women, so on the testimony that working in the plant and being pregnant has no impact on bearing healthy children. What I would like to tell you is I have worked for a long time in the industry and I can tell you that the folks that I work with throughout the organization from top to bottom have an appreciation that nuclear power is special. We get that. We understand it's special. And it's our priority every day in what we do to ensure that we operate these plants in a manner that protects the health and safety of the public. We do live in the vicinity of plants. We have family, we have friends, we have our colleagues we care about deeply. We would not put any of those people in harm's way. As an employee, we are committed to ensure that our plants run safely. Our plants operate 93 percent of the time, regardless of the weather or the time of day, providing a reliable baseload output greater than any other generation source. We understand that the decisions we make on a daily basis have a potential to impact the lives of our coworkers, our families, and the surrounding communities. Because of this, we hold each other accountable. We challenge, we train, and we continuously improve. You spend a day with us in our facilities, it would be apparent to you, we take nothing for granted. We get independent expert opinions on technical issues. You would see that our employees are encouraged to and are comfortable with challenging each other. You would hear every morning across our organization industry experience being shared and actions taken to ensure that we mitigate potential issues. (0245-23-1 [Korn, Susan])

Comment: I have been an Illinois resident my entire life. Everyone I know and love, including all of my family and my friends, live here in the Chicagoland area. My husband and I live near these plants and this is where we plan to raise our family. If this technology was not safe, I would not be here. (0245-26-2 [Kovacs, Ashley])

Comment: I'm a construction engineer out of Iowa State and I work at the Braidwood Station Nuclear Power Plant down southwest of Illinois. The comments that I want to bring forth here are just based on my experience with the safety culture at nuclear power. I know a lot of the criticism we've had has been based on some, to put it pointedly, lack of morality of some of the people in the nuclear industry. And I just really don't think that's true. Again, a lot of the folks sitting here can call us young and naive but I do represent part of the young generation in nuclear and actually NAYGN is exactly what it means, the North American Young Generation in Nuclear. And really, my perspective is just a shocking safety culture, especially considering what industry I was planning on going into, which was in construction industry. I understand that all the talk here is, in part, borne from the events in the past, but again I'd like to talk about the recent performance based on my experience of the nuclear industry. And I believe that it's safe to say that thinking that workers would value their own personal safety is really indicative of workers who also value safety culture and their perspective of the effect that it normally has on themselves while they're working, but the public when they meet that work environment. So, something I haven't heard a lot of is to throw out some actual facts and statistics. So, I'll try to give a little bit of that right now. So, earlier this year, I gave a speech to some high school kids who are looking at going into trades. And one of the things I tried to advertise to them when they were looking at what trades they wanted to pursue is to look into the nuclear industry because

really what they want to do is contribute to longevity and in order to do that you want to work in a safe environment. So, just pulling straight from the Bureau of Labor Statistics, looking at injuries per 100 full-time workers, the nuclear industry is, it's actually pretty shocking how much better we are as far as just personnel safety. Per 100 full-time workers, we get 0.3 injuries. To compare that to other generation really don't, the only next closest generation activity you can compare that to is fossil fuel and that's 2.1 injuries per 100 full-time workers. So, several times higher. The industry that I thought I was going to into, construction, 3.7, so even higher. And stepping up to another industry which is the industrial sector, manufacturing, at 4.3 injuries per 100 full-time workers. So, I really think anybody that, I really think that people who would value their own personal safety, it's just a cultural norm that they're going to also value the safety of the public. (0245-28-1 [Rosso, Chris])

Comment: And as a fairly new face to the nuclear power industry, I would just like to take a moment to speak the issue of culture shock that I had when I arrived. A shock at, you know, the seriousness that we take with every decision that we make, and at the attention that we continuously give to safety. The safety culture that's established at our plant and all the Exelon plants and all of the nuclear plants, at least in the U.S. and across the world, it's held to the highest standard. So, it is always on top of our mind in every decision we make and I never ever question my personal safety when I'm at work. (0245-33-1 [Schussele, Samantha])

Comment: I currently live within 50 miles of three nuclear power plants as I'm sure many of you do. I plan on remaining there. I plan to get married there. I plan to raise my family there. And I have the utmost confidence that my future family and I will live in a safe and happy community even with these nuclear power plants, enhanced by these nuclear power plants. (0245-33-3 [Schussele, Samantha])

Comment: Illinois leads the nation and has a chance to lead the world in reaping the benefits of this experience. 50 percent of your electricity, 5,000 jobs, \$400 million in annual payroll, and \$170 million in taxes. Most importantly though, the nitrogen oxide pollutions that are avoided by using all this nuclear energy is the equivalent of 4.3 million cars. A lot has been said here tonight, a lot of speculation, a lot of them are flat out untrue. But 4.3 million tons of nitrogen oxide in the air, we know what that does. A very real health situation about air pollution. (0245-34-2 [McCullum, Rod])

Comment: A lot of young people today are looking into facts about climate change. They are asking the hard questions. They're deciding to become nuclear engineers. If we were to turn our backs on nuclear energy, it is the best weapon we have against climate change. Yes, solar should play a role. Yes -- should play a role -- based on large-scale electricity generation. If we were to turn our backs on our biggest weapon against climate change, I would question the safety culture of our nation. But I know we won't do that. I'm heartened to see, when I come to Illinois, so many young people getting into this business and letting their safety culture drive our nation in the right direction. (0245-34-4 [McCullum, Rod])

Comment: The Will County Center for Economic Development is committed to creating a healthy business environment to attract businesses and jobs to Illinois. We know that having a competitive, safe energy infrastructure is a key part of the economic growth equation. We are fortunate to be home to one of Illinois' nuclear power generating stations at Braidwood. This facility employs nearly a thousand people and supports many thousands of additional jobs in the region. Braidwood Station pumps tens of thousands of millions of dollars directly into the area and economy and invests in many worthwhile community causes. (0245-4-1 [Fleming, Scott])

Comment: Manufacturers in Illinois employ more than 600,000 workers and contribute the single largest portion of the gross state product. Illinois manufacturers were responsible for over \$92 billion in economic output last year alone. Illinois residents benefit greatly from a quality energy policy. Our state's energy portfolio of coal, nuclear, natural gas, and renewable sources ensure that we have a strong, stable energy supply at relatively low cost. Reliable and affordable energy is a key factor that helps ensure that Illinois manufacturers can remain competitive in the world economy. Nuclear plants account for 48 percent of electric power generated in Illinois. (0245-9-1 [Peck, Jerry])

Comment: Illinois residents and manufacturers greatly benefit from reliable and affordable energy produced by nuclear power plants. Any efforts to cripple the industry through vexatious regulation is dangerous, not only for our state's economy, but to the long-term health and safety of Illinois residents. (0245-9-4 [Peck, Jerry])

Comment: NCSL [National Conference of State Legislators] believes that nuclear energy is an integral part of our national energy plan and must continue to generate an essential share of the nation's clean energy, zero carbon baseload electricity. (0246-1-1 [Husch, Ben])

Comment: I am very grateful, not only for the opportunity to speak here today but also for the work that the NRC does in ensuring that American reactors operate safely. The American public and the industry benefit tremendously from the work that you do. (0246-10-1 [Bennett, Nathan])

Comment: When I relocated to Maryland 15 years ago, I had no reservations about buying a house in that county that close to a nuclear power house. That is because of my first-hand knowledge from working on existing plants and new construction of nuclear power, both of which I have participated in. I know what stringent standard these plants are held to in construction, maintenance, and safety and security. (0246-18-1 [Karbowsky, Brad])

Comment: Couple this with the growing effects of greenhouse gas, we should be finding ways to help the nuclear industry, not hamper it. (0246-18-3 [Karbowsky, Brad])

Comment: Our members [of the Clean and Safe Energy Coalition] support the increased use of nuclear energy to ensure an environmentally clean, safe, affordable, and reliable source of electricity. (0246-20-1 [Lapiska, Evan])

Comment: Stepping back from spent fuel storage, the larger debate I have seen taking place at these meetings is on the future of nuclear energy in general. Plain and simple, if we are serious about addressing climate change and reducing carbon emissions, nuclear energy is a vital part of any viable plan. Nuclear energy currently provides electricity to one out of every five homes and businesses. Yet, it accounts for nearly two-thirds of our clean-air electricity. In addition to being clean, it is reliable as a 24/7 baseload source of electricity. Or put another way, a perfect complement to intermittent renewables like wind and solar. (0246-20-4 [Lapiska, Evan])

Comment: As the Commission continues these public hearings, I hope to hear a discussion of the facts. And that is that nuclear energy has shown the utmost commitment to safely and securely storing spent fuel and that will never change, while providing us with clean, safe, and reliable electricity around the clock. (0246-20-6 [Lapiska, Evan])

Comment: As a young engineer I am, however, sometimes frustrated with the safety issues in early generation reactors and I work hard to make sure that these reactors generating electricity for us are running like new, that their components are replaced, and that we can trust them. We

have learned over time that humans aren't infallible and I am part of a new generation of engineers that is working hard to make sure that reactors rely on the laws of gravity and natural laws that can fail and moving nuclear to a purely safety age. But these reactors, generation 1 and 2 and 3 were built in technologies from the '50s, '60s, and '70s. And computers of that age look ancient now. The technology for nuclear has not stayed the same either. We have new technology we are working hard to implement and getting it through the regulatory hurdles. And I do think that it is going to present a baseload and reliable form of cleaner energy for a future that we really need. (0246-21-3 [Garcia, Diego])

Comment: Nuclear energy is a safe, reliable source of electricity and a valuable community partner. It provides nearly 20 percent of our electric power and supports more than 100,000 high-paying jobs. Because of nuclear energy's commitment to producing affordable, clean power, and its commitment to safely and securely storing spent fuel, it is no wonder why communities near nuclear facilities strongly support nuclear energy. (0246-8-2 [Vince, Jenny])

Comment: The focus of nuclear power is always on protecting the health and safety of the public, and the safety of our employees. Our safety culture is like our personality, and thinking safety first is just how we are wired to respond. Every nuclear plant has subject matter experts in every area, to ensure that the choices and changes we make always reflect our commitment to safety. My group has over 100 years of combined expertise in nuclear technology. Nuclear is also a thriving industry. New graduates are entering the nuclear industry every year, and V.C. Summer Unit 1, 35 percent of our staff has been in the industry for less than five years. We have all committed to making nuclear energy a safe and abundant source of energy for the public, because in energy, diversity is the key. Nuclear is important to the energy security of the United States. I am personally passionate about my commitment to the nuclear industry. My goal is to educate. I want you to know my views, know all of the facts and make informed decisions regarding nuclear power. I have a great sense of pride for my projects at V.C. Summer Units 2 and 3, and for this reawakening of nuclear power. I encourage everyone in the audience to educate themselves on the benefits and challenges of nuclear power, along with other green technologies, and make the decision for themselves. (0250-10-1 [Tampas, Courtney])

Comment: Both of these are solutions that can be used to ensure the used fuel management security of the nuclear industry. (0250-10-4 [Tampas, Courtney])

Comment: But without an environmentally clean economical method to produce electricity, nuclear power, I fear that they will be living in caves, with nothing to do. So that's kind of my position on nuclear power. I think it's a clean method for the production of energy for the future. (0250-14-3 [Brookhart, Ryan])

Comment: I have worked my entire career in the nuclear industry on the design, the licensing and the manufacturing of nuclear fuel. I can personally attest to the high standards, the technical rigor, and the overriding commitment to safety in the U.S. nuclear industry. (0250-15-1 [Rodack, Tom])

Comment: As someone who is concerned about the environment, I am a strong supporter of nuclear energy. In fact, this is the reason I became a nuclear engineer. Nuclear energy is safe, it's reliable, and it does not emit greenhouse gases during operation. An advantage of nuclear energy over other sources of electricity generation is the concentrated manner of its waste. (0250-18-1 [Lang, Amanda])

Comment: Nuclear waste is a solid, and it's very compact, unlike gases, ash, particulate matter, or toxic chemicals from solar panel production. This waste or used fuel accumulated over 50 years of nuclear operation in the U.S. can fit in the area of one football field filled to a height of 20 feet. I feel much more confident handling this waste than I would other types. In addition to being compact, another advantage of nuclear waste is the fact that it's not really waste. (0250-18-2 [Lang, Amanda])

Comment: In the nuclear industry, the safety and health of the public and the environment are first and foremost in the minds of employees like myself, and I take that very seriously. (0250-18-6 [Lang, Amanda])

Comment: I support a diverse national energy portfolio, but believe we should use the resources where it makes sense. With respect to energy density, land usage, and air emissions, nuclear power is the best option for baseload power generation. I'm currently working with industry and wouldn't have continued down my career path in the past five years if I thought this was contributing to something that was inherently unsafe and dangerous. I've worked at several plants that were run very well. I've seen plant maintenance outages as well as the day-to-day operations. I've even talked to NRC inspectors who are very thorough operators; worked on several projects throughout my career and have shown that industry has continued to progress. (0250-19-1 [Howell, Adam])

Comment: Nuclear energy plays a vital role in meeting our nation's electricity needs. Protecting the environment, preserving the fuel, and technology diversity is a strength of the U.S. electricity system. One hundred nuclear power plants generate nearly 20 percent of our electricity, and in seven states nuclear plants generate more electricity than any other source. The Energy Department projects that the U.S. electricity demand will rise 28 percent by the year 2040 even with very modest economic growth. That means the United States will need hundreds of new power plants of all types to meet increased demand and replace older facilities that are retired. To help close that gap, we're in the process of constructing two new units right now and have them scheduled to go on line in 2017 and 2018. Some of these new power plants will have to be nuclear, like the two new units under construction now in Georgia at Vogtle, or the other three that are also under construction in South Carolina and Tennessee. Nuclear energy is the only emission-free source of electricity that can be widely expanded. The President has set ambitious goals for reducing carbon dioxide emissions, and the United States simply cannot get there without nuclear energy in the mix. In addition to generating clean air electricity, nuclear plants strengthen state and local economies through jobs, taxes, and direct and secondary spending. A typical nuclear reactor generates \$470 million a year in economic output, including more than \$35 million in total labor income. These figures include both direct output and secondary effects. The secondary effects at the local level include subsequent spending attributable to the presence of the plant and its employees, and plant expenditures filter through the local economy. The spending amounts to approximately \$17 million a year. That just shows that every dollar spent on the average nuclear plant results in the creation of \$1.04 in the local community, \$1.18 in the state economy, and \$1.87 in the U.S. economy. The average nuclear plant pays about \$16 million in state and local taxes annually. These tax dollars benefit schools, roads, and other state and local infrastructure. As a lifelong resident, I was born and raised in the area of the Plant Vogtle, and for many reasons nuclear energy has to be a vital part of our nation's energy plan. (0250-21-1 [Gunn, George])

Comment: Nuclear energy plays a crucial role in our nation's diversified energy portfolio, serves as a safe, reliable, clean air baseload energy source. Solar power and wind power are different parts of that diversified portfolio, and we fully believe in using those energy sources at

Duke Energy, but nuclear has to be a part of that portfolio as well. Nuclear energy makes up nearly 32 percent of the energy in North Carolina, and helps bring stable power prices and availability to all of the residents here. The Energy Department projects that U.S. electricity demand will rise roughly 28 percent by 2040, and the U.S. will need hundreds of new power plants to meet that increased demand over that time frame. Energy demand has grown roughly 2.4 percent per year over the past five years in North Carolina, and in order to meet this energy demand and reduce carbon dioxide emissions at the same time, nuclear energy will need to continue to be a major part of the electricity portfolio. The United States was the first country to develop nuclear power, and we have the largest nuclear program in the world. U.S. reactors have demonstrated over a long period of time their ability to maintain safe operation over their long life times. Stringent federal regulations from the Nuclear Regulatory Commission and an industry culture that has been built on principles for strong safety culture and the NRC's robust, independent oversight ensure that the nuclear industry reflects a safety first position in every decision that we make, including the safe management of used nuclear fuel. In addition, the NRC holds nuclear power plants to the highest security standards of any American industry to date. (0250-24-2 [Rogers, Tim])

Comment: Industry currently located in our state, as well as industry considering locating in our state, need to have confidence that not only we can satisfy their energy needs today, but we are also committed to having economical baseload energy generation to meet their long-term needs in the future. (0250-3-4 [Archie, Jeff])

Comment: Southern Nuclear strongly believes that nuclear energy is an integral part of the national energy plan and must continue to generate an essential share of the nation's clean, non-emitting, zero carbon baseload electricity. Nuclear energy generates 17 percent of the carbon-free electricity produced by Southern Company and that will increase with the completion of the construction of the two new units at Vogtle, currently underway. (0250-32-1 [Wesley, Ashleigh])

Comment: Southern Nuclear's top priority is the safety and health of the public and our employees. We are committed to the safe operation of our nuclear generating facilities with equipment and systems that meet strict NRC safety and design regulations. To that end, we urge the Nuclear Regulatory Commission to continue its strong independent oversight of commercial nuclear energy facilities, the operation of existing plants, licensing new reactors, renewing the operating licenses of existing reactors, and the management, transportation, and disposal of used nuclear fuel. (0250-32-2 [Wesley, Ashleigh])

Comment: I say it can be safely stored because my company, AREVA, will today take any nuclear fuel from any nuclear power plant in the United States, put it with the thousands of fuel assemblies we have at our La Hague reprocessing facility, and even recycle it today, extract the plutonium, and just like we burned plutonium for Russian nuclear weapons in U.S. nuclear reactors to take that plutonium off the street as a weapon and instead peacefully produce electricity, we can do the same today with U.S. nuclear fuel at our recycling facility and take the small amount of extra material and melt into glass logs this size to keep it protected from the environment. But I say again, it can be safely stored because for those who ask about the long timelines, in one of our mines in the Oklo Mine in Gabon we discovered there were no less than 60 nuclear reactors, nuclear fission reactors which ran 1.7 billion years ago, long before human beings existed. I encourage you to look it up. And how we know that they were there? Because by the grace of God that nuclear fuel was safely stored. And what happened, when the water got on it? It precipitated into the water and then moved as much as a foot, and then precipitated

out of solution as crystals. And we found those crystals so we know the fuel can be stored for 1.7 billion years. It, in fact, has actually happened. (0250-35-4 [Cook, Andrew])

Comment: One of the things that's kept me going in this sometimes frustrating end of the business for the last 15 years, is that it is a business where people don't get into the business unless they really believe in what they're doing, and they don't stay in the business unless they're really good at what they're doing. Charlotte, you are so very lucky to be a hub of this industry, to have so many of these companies located here, all of the jobs. They are doing good work for America. I'm proud to say that for my entire life millions of people have been getting the benefits of safe, clean, and reliable electricity from nuclear energy. The people I'm speaking out for today, the people who I work for, they don't just enrich America with the efforts they do, they have enriched your communities. They are an important part of the fabric of this part of the country. I'm jealous. I live in the Washington, D.C. area. I'm surrounded by a bunch of politicians. I think we have a lot of differing opinions but a lot of common grounds about what the politicians have done with this issue. Waste confidence is just one small piece of the regulatory puzzle that nuclear professionals must deal with every day, and these are professionals that don't just meet regulations, they exceed regulations. (0250-36-2 [McCullum, Rod])

Comment: I'm surprised that as a society we voiced all these concerns about nuclear energy, but we're very comfortable with commercial airlines. Both of these industries provide benefits to society by implementing complex and intricate technologies. Both of these industries are filled with dedicated professionals who have spent their life's work trying to understand how to harness the technology, and make it safe for the public. Let me say that again. Both of these industries are filled with dedicated professionals who have spent their life's work understanding how to harness the technology, and make it safe for the public. Both of these industries have independent regulatory structures to insure the public safety. Tonight's meeting is an example of the Nuclear Regulatory process in action. In addition to the NRC, the nuclear industry also has established the Institute for Nuclear Power Operations, which is an organization that the industry uses to help itself improve, in addition to the oversight provided by the NRC. Both the nuclear and airline industries have proven safety records. (0250-37-1 [Barilla, Frank])

Comment: I would also argue that the nuclear technology with a negligible environmental impact is actually a positive impact when compared with fossil fuels, because nuclear does not provide -- not generate carbon dioxide emissions. Even renewable technologies like solar and wind can increase carbon emissions, since they're often coupled with natural gas turbines to generate electricity when the sun isn't shining and the wind isn't blowing. (0250-37-5 [Barilla, Frank])

Comment: Third and finally, nuclear power is a safe, carbon-free and reliable form of energy that provides the foundation for our nation's electric grid. As expected in the Atomic Energy Act, the NRC should efficiently provide for the continuing licensing of a safe and proven technology. (0250-4-6 [Merrifield, Jeffrey])

Comment: My sophomore summer in college I was presented with the opportunity to intern at a nuclear power plant in Texas. I took that opportunity, and day in and day out I saw how people work at the nuclear power plant. They are so safety conscious, it's ingrained in their mind. You see, they have daughters, sons, mothers and fathers, grandfathers; they have grandchildren and great-grandchildren, and each day when I asked them what makes you work here? They said, you know, I'm concerned about the future of my kids and their kids. And by me working here, I can guarantee that things are done right, safely, efficiently, and that's why I'm here. And that is why I'm in the nuclear industry. I'm looking for my kids in the future. I want them to be

safe, and that's why I work in the industry. You know that 104 nuclear power plants have been running safely for the past 40 years? (0250-41-1 [Abendano, Juan])

Comment: You can take all that spent fuel or used fuel, if you will, and stack it end to end on a football field. From end to end about 20 feet high, that's all the waste we have. Now, we also have the technology to recycle. We can take that and diminish it down several times over, so we have that technology. So, do you think we can safely store now, in the past, now and in the future? You're darned right we can. And this is why I'm also in the industry. I'm looking to keep that new technology coming. As an electrical engineer, I want to contribute to that technology, to that safeness of our industry. (0250-41-3 [Abendano, Juan])

Comment: I implore you guys to go out and look at the facts, look at the facts of what is actually going on in the nuclear industry. I implore you to look for yourselves, look to other people who are in the industry, and you'll find out the real truth. We're a safe industry. We've safely stored our fuel in the past, today, and in the future. (0250-41-4 [Abendano, Juan])

Comment: As I mentioned earlier, I have complete confidence in the NRC. I have worked under the regulations for five years now, and really, it's a marvel in the same way that you -- I think that we should focus our energy on solving this large problem we have before us. I recommend to the NRC that they continue to review and take the insight of the Blue Ribbon Commission report, and I hope that you will continue to review and look into new nuclear technology as it develops new facilities, and pursue active licensing and active regulations to make sure we continue to operate things safely. I think both sides can agree that we need to solve this problem, and I think we need to look for solutions from industry, and I wish you the best of luck. I will continue to stay in this industry as long as I can under your guidance. (0250-43-3 [Causey, Lee])

Comment: Just one month after earning my mechanical engineering degree from Clemson University, I moved to Charlotte and began my career at Westinghouse Electric Company analyzing piping systems in our AP1000 pressurized water reactor. It was a significant shift from school. You see, previously, excelling in my senior design project when finding an ideal solution to a problem, guided by quantitative criteria based on things like material properties, process requirements, and economics; professionally, the first thing I had to learn was that in the nuclear industry safety takes ultimate importance over everything. This meant that quality was not a variable to be balanced against cost or schedule but, rather, an absolute that must always be maintained. Very quickly, this fundamental requirement of the overall nuclear safety culture became engrained in every decision I made, technical or not. This evolution is not unique to engineers beginning their careers in the nuclear industry. From accountants to human resource professionals to technical and craft labor, everyone is personally responsible for nuclear safety. And accepting direct accountability for such a monumental responsibility is the entry fee to work in the industry. Every generation of workers, from the men and women near the end of their careers to the millennials just starting hours, upholding the nuclear safety culture cultivates a tremendous sense of purpose, upon which we can all work together. After all, there is no other industry that depends so heavily on the success of everybody, direct competitors included. As a result, our professional and technical organizations enjoy remarkable participation from a diverse and intelligent labor pool. One such organization is the North American Young Generation Nuclear, a group of over 10,000 young professionals who are passionate about ensuring the myriad benefits of safe, responsible application of nuclear science and technology are enjoyed by generations to come. (0250-54-1 [Hennen, Jimmy])

Comment: Finally, I understand that there may still be lingering doubts about the viability of my industry's plans for long-term storage of spent nuclear fuel. So I want to close by reminding the Commission and members of the public that the future leaders of the nuclear industry have taken personal responsibility to guarantee that our society continues to enjoy incredible benefits of safe, responsible application of nuclear science and technology. And we will do whatever it takes to achieve this humanitarian goal. (0250-54-2 [Hennen, Jimmy])

Comment: I also recently moved from Lynchburg, Virginia to the Charlotte area and chose to live within the plant exclusion zone for McGuire Nuclear Power Plant. You may wonder why I did that. I grew up about 20 minutes away from Fermi Nuclear Power Plant and survived my entire life with no issue. And I really do love nuclear power and understand the science behind it. (0250-57-1 [Jones, Lauren])

Comment: Throughout my eight-year career in the nuclear industry, I have continued to gain respect for commercial nuclear power as a safe, clean, and reliable option for baseload electricity generation. The nation's operating nuclear power plants provide the majority of our nation's free electricity 24 hours a day, 7 days a week. You can't say that about solar, and you can't say that about wind. Overall, approximately 20 percent of the electricity produced in the United States comes from nuclear power, and about 32 percent of electricity produced in North Carolina comes from nuclear power. (0250-57-2 [Jones, Lauren])

Comment: Nuclear power is necessary for sustaining clean, affordable production of electricity in the United States. And I ask you today to support the continued licensing and relicensing of nuclear power plants and independent spent fuel storage and solutions. (0250-57-7 [Jones, Lauren])

Comment: And I have spent the last five years of my career as a technical professional in the nuclear industry as an advocate for nuclear power. I am an AREVA employee and a NAYGN chapter officer and chemical engineer. As you noticed already, I am here with several of my colleagues. Before me, my grandfather dedicated 50 years of his career as an engineer in the nuclear industry, a university dean, and a proponent of nuclear. We are just a few of the thousands of skilled employees of the industry that make sure that the lights in your homes go on and stay on every day. The fact remains that nuclear energy accounts for a fifth of the United States generating capability. And it is the most appropriate route to clean, safe, reliable, and carbon emission-free baseload energy with a proven track record of performance, despite the many misconceptions which abound, many of which I heard this evening. I assert that this country cannot sustain its energy needs, reduce its greenhouse gas emissions by any significant factor, and continue to secure the low cost of electricity that consumers and industries enjoy without drawing from nuclear power. The many available facts in my personal experience in regards to nuclear design, licensing, maintenance, research and development, and advocacy bolster my conclusions. (0250-58-2 [Cagnetta, Matt])

Comment: In sum, nuclear power is a viable, safe, clean, and reliable method for supplying America's renewable baseload energy needs for the foreseeable future and cannot be discounted from the nation's energy mix. (0250-58-5 [Cagnetta, Matt])

Comment: Nuclear power is an important source of safe, economical carbon emissions-free electricity, now and in the future. Our country needs the 24-7 baseload source of electricity. (0250-6-7 [Nesbit, Steve])

Comment: One of the things that we do in the nuclear business is we always focus on safety. And that's, first and foremost, the most important thing that we do. We have a tremendous responsibility. A lot of speakers have spoken about the responsibility that we have. We recognize that the nuclear energy industry is a socioeconomic organization. It provides benefit to people, safe, reliable energy supply that drives our economy, makes our lives safe, makes our economic well-being possible. (0250-61-1 [Little, Jim])

Comment: In my 40 years, I have worked in over 50 nuclear plants in 12 different countries around the world. I have been involved in not only design of reactors. I have lived near them. I have operated nuclear installations, treated high-level nuclear waste in a glass safely at the West Valley demonstration project, where I was the CEO of the company that did that very successfully with the Department of Energy. And I have lived near nuclear facilities. I lived less than 8 miles away from the Catawba nuclear plant, where I was the reactor designer for that facility over 40 years ago. So I have a lot of confidence in that technology and the ability to run safely. (0250-61-7 [Little, Jim])

Comment: And as part of getting the EIS approved, we also need to get the license application process for nuclear plants and spent fuel storage facilities moving again as well. In terms of I think the nuclear power industry and safety, it has been mentioned before, but I would just like to mention that over the past 30 years, I have lived in and around nuclear power plants. I, like some previous speakers, was involved in the design and construction startup operation and now on the service side, maintenance of nuclear plants. And there has been one thing I have noticed about all of the people I have worked with over the years. And that is a commitment to safety. It has been unwavering, and it has been a consistent theme with the nuclear professionals I have worked with. And if you look at the industry record with storing and transporting of spent fuel or used fuel, we have a demonstrated record of doing that not only here in the United States but also around the world. (0250-62-5 [Fregonese, Vic])

Comment: There are thousands of Americans that work in the nuclear industry. Each and every one of them work diligently to ensure that nuclear power and the mechanisms to transport and store spent nuclear fuel are designed to the highest quality to ensure the safety of the public. Of those thousands of people, many of which work at nuclear facilities, work at engineering firms like I do, even those that are regulating the industry, all of us have families. I am married with a three-month-old baby girl with the world ahead of her. And I have a very large extended family, probably larger than most. I can assure you that every action taken, every decision that is made is done so not only with the safety of our employees and the public at large in mind, but also the safety of our loved ones for generations to come. I guarantee that sincerely. Outside of the decisions that we carefully make, there are extensive quality requirements that we must meet. These requirements are heavily regulated to ensure a safe and accurate design. There is also a major emphasis on human performance, tools that we practice daily to prevent human error. Safety and human performance are how we at AREVA start every meeting. It is an essential part of how we do business. It is always a forethought. It is never an afterthought. From the regulators, to those who design and build, to those who operate the facilities, the safety culture of the nuclear industry is a fabric that is woven into each entity involved. Using operational experience from commercial reactors worldwide, our safety culture has been refined to provide safeguards that result in the safe and reliable use of the most efficient and CO2-free form of energy available: nuclear power. (0250-67-2 [DeVoe, Joe])

Comment: New U.S. plants and storage installations will rely on this Waste Confidence ruling. Right now worldwide there are about the equivalent of 35 plants the size of McGuire Station on

Lake Norman under construction. About five percent of that is going on domestically. We should lead the world in this technology. (0250-70-2 [James, Andrew])

Comment: Diversity of fuel supply is a very good thing. Regions have mixes of nuclear power, gas, coal, and appropriate levels of renewables are among the lowest cost in the country. That's a trend that has continued for years. Growth in renewable generation also is a good thing when it is done in a controlled fashion, but it is not a panacea. The error intermittency and the lack of reliability has been a Achilles' heel in places like Germany, Spain, and Ontario, where the dash to renewables has increased the power prices and also had really negligible impacts on CO2 there because of the backup fossil you need because of the non-dispatchability. In summary, my wife and I and our two children live about two miles from McGuire Nuclear Station on Lake Norman. And, as informed and educated citizens, we have no qualms about that. Nuclear power is essential to our power sector. (0250-70-5 [James, Andrew])

Comment: As an elected official, I believe that nuclear energy is an integral part of a balanced, national energy plan. Nuclear is a clean and reliable energy source that is producing electricity for millions across the nation and in my home state of California. According to the U.S. Energy Information Administration, nuclear energy generates 26.5% of the carbon-free electricity produced in California. And with this energy production comes employment opportunities for CA residents and economic growth for our local communities. The operation of a nuclear plant requires hundreds of people to perform numerous and varied responsibilities. (0253-1 [Avilla, Karen])

Comment: Nuclear energy facilities provide substantial economic benefits to the state and local community, including high-paying jobs and tax revenue that helps keep town services funded and property taxes much lower than they otherwise would be. (0253-3 [Avilla, Karen])

Comment: In the 16th district alone, there are four nuclear power plants providing grid and price stability to consumers throughout our region. Nuclear power provides half of our state's energy, and generates almost 93% of the carbon-free electricity produced in Illinois. Without the availability of this base load power, there is no doubt that prices would skyrocket and energy stability would plummet. In addition, the nuclear energy industry supports thousands of high-paying jobs, which in turn supports the tax base of our local communities. (0273-1 [Kinzinger, Adam])

Comment: Lastly, I want to touch on the fact that the Nuclear Regulatory Commission has suspended all final licensing decisions while this rulemaking process moves forward. I believe it is time to provide this industry, which provides a clean source of energy to millions of consumers, the ability to move forward with a greater level of certainty for their long-term operations. (0273-5 [Kinzinger, Adam])

Comment: The Will County Center for Economic Development is committed to creating a healthy business climate to attract businesses and jobs to Illinois. We know that having a competitive and safe energy infrastructure is a key part of the economic growth equation. We are fortunate to be home to one of Illinois' nuclear power generating stations at Braidwood. This facility employs nearly a thousand people and supports many thousands of additional jobs in the region. Braidwood station pumps tens of millions of dollars directly into the area economy and invests in many worthwhile community causes. (0278-1 [Fleming, Scott])

Comment: The FSHCC is a member of the Clean and Safe Energy Coalition and believes that nuclear energy is an important part of our national energy portfolio. And ensuring the continued

production of nuclear energy is critical to our nation's energy production and economic output. In Florida, nuclear energy generates 98 percent of the carbon-free electricity produced in the state, according to the U.S. Energy Information Administration. On average, a nuclear energy facility can generate nearly \$500 million in annual economic output, including more than \$35 million in labor income. Each year, it pays about \$67 million in federal taxes and nearly \$16 million in state and local taxes. It is clear that nuclear energy already plays a vital part of our electricity portfolio and economy. (0307-1 [Fuentes, Julio])

Comment: As a country that single-handedly commercialized the nuclear energy industry through the development of the world's first commercial nuclear power plants, the United States must ensure that it maintains a competitive edge and continues to build upon what is now the largest nuclear program in the world with 100 reactors. With nuclear energy being the most eco-efficient of all energy sources producing the most electricity in relation to its minimal environmental impact we must work to protect this. (0307-3 [Fuentes, Julio])

Comment: As an elected official, I believe that nuclear energy is an integral part of a balanced, national energy plan. Nuclear is a clean and reliable energy source that is producing electricity for millions across the nation. Ensuring its continued production is not only critical to our nation's economic outlook but to the well-being of our nation as a whole. The U.S. Department of Energy projects that U.S. electricity demands will rise 28% by the year 2040, even with just very modest economic growth. That means the United States will need hundreds of new power plants of all types to meet increased demand and replace older facilities that are retired. And some of these new power plants will have to be nuclear like the five reactors already under construction in Georgia, South Carolina and Tennessee. According to the U.S. Energy Information Administration, nuclear energy generates 98% of the carbon-free electricity produced in the state of Florida. And with this energy production come employment opportunities for Florida residents and economic growth for so many of our communities. One nuclear energy facility creates 1,400 to 1,800 high-paying jobs during construction, with peak employment estimated as high as 3,500 jobs during that period, yielding 400 to 700 jobs during the operation of the facility. Each year, a nuclear energy facility pays about \$67 million in federal taxes and nearly \$16 million in state and local taxes. (0308-1 [Weinberg, Luz])

Comment: This country needs Nuclear Power especially the the "New Technology" kind. The Green energy concepts that flourish and require tax subsidy will not produce the power we need. The tax subsidies must end. The US will need increasingly more power especially if the electric cars catch on. Electric cars with out Nuclear power bad for the enviroment. (0312-2 [Meyer, Charles])

Comment: I strongly believe that nuclear energy is an integral part of the national energy plan, and must continue to generate an essential share of our nation's clean, non-emitting, zero carbon baseload electricity. Nuclear energy generates approximately 26.5 percent of the carbon-free electricity reduced in our state according to the Energy Information Administration, and nearly 21 percent of our nation's electric output. (0325-13-2 [Wicks, Tonja])

Comment: [T]he one conclusion I have come to, our country, our state, our cities, they need a diverse portfolio of energy resources to meet our current and future energy needs, and to insure our energy security. It is imperative that we do not repeat the issues of the past and over-rely on a single source of generation resources which could lead to over-reliance, reliability issues, and price volatility. As a result, nuclear energy must, it must remain a vital part of a diverse energy resource mix. I believe we need to continue to find ways to utilize these resources and meet our

energy needs, and also keep our local communities viable and our residents employed. (0325-13-3 [Wicks, Tonja])

Comment: Our nuclear energy facilities provide substantial economic benefits to the state and local communities, including high-paying jobs, and tax revenues that help keep our town services funded and our property taxes lower than they otherwise would be. On average, a nuclear facility generates nearly \$500 million in annual economic output including more than \$35 million in labor income. Each year it pays approximately \$67 million in Federal taxes, and over \$16 million in local and state taxes alone. (0325-13-4 [Wicks, Tonja])

Comment: Our members support the expanded use of clean air nuclear energy to insure an affordable and reliable supply of electricity for America that also plays an active role in our fight against climate change, which stands as one of the most important issues of my generation. As a supplier of nearly two-thirds of our country's emission-free electricity, the use of clean nuclear energy has and must continue to play a role in reducing emission levels across the country. (0325-16-1 [Bailey, Savannah])

Comment: [T]he NRC is committed to insuring American nuclear facilities adhere to its strict regulations and operate in the best interest of the public. As such, operating facilities are subject to onsite inspections by NRC staff 24 hours a day, seven days a week, 365 days a year. Nuclear energy has shown that it is a responsible source of electricity and a valuable community partner. Safe, clean, and reliable nuclear energy provides nearly 20 percent of our country's electric power and supports more than 100,000 high-paying jobs that contribute to our growing economy. Because of nuclear energy's position as a producer of affordable clean power, its commitment to safely and securely storing spent fuel, and its role as an economic powerhouse at the local, state, and national level, it is no wonder why communities near nuclear facilities strongly support nuclear energy. (0325-16-3 [Bailey, Savannah])

Comment: My view is that nuclear energy is an important part of the national energy strategy in California, as well as in the East Coast. I was with the Secretary of Energy last week in a meeting and his speech was that all forms of energy are required to solve our energy security issues in the United States, and nuclear is certainly one of them. It provides 20 percent of the energy for the U.S. now. (0325-4-1 [Quinn, Ted])

Comment: We think it's important to make sure that nuclear energy facilities across the country are allowed to keep doing what they have been doing best, which is producing clean, reliable electricity. Now, I'm here to express my support and confidence in the storage of spent fuel onsite at nuclear facilities. (0325-5-2 [Kirton, Stratton])

Comment: Nuclear energy provides 19 percent of our electricity, but it provides 64 percent of our clean air carbon-free electricity. That's more than every other source of electricity in the United States combined right now. And, yes, that's measured over lifetime cycle analysis, as well. We should continue to invest in renewables like wind and solar, but if we're serious about climate change we shouldn't be so eager to attack our country's largest source of clean air electricity. We shouldn't cut off our nose to spite our face. As the NRC continues these public meetings, I would just like to reiterate my support for an industry that has shown it can and has safely stored spent fuel onsite. (0325-5-5 [Kirton, Stratton])

Comment: And during its rulemaking process I would encourage the NRC to support a process that continues to strengthen our nation's commitment to clean air technologies and improving nuclear energy. (0325-5-6 [Kirton, Stratton])

Comment: We are a pro-nuclear group that supports the use of nuclear power as a climate-friendly zero carbon emission source of electricity. We represent members all across the country in many of the states, if not all 50 states, and from all walks of life. So I'm here today on behalf of the Coalition, and I'd like to start by thanking the NRC for holding this meeting, and thank everybody for coming out here tonight for a spirited discussion. So we believe that it's important that the NRC make sure that nuclear energy facilities keep doing what they have done best, which is producing zero-carbon emission clean-air energy. (0326-16-1 [Kirton, Stratton])

Comment: Now, nuclear energy represents 19 percent of our country's electricity, but 64 percent of our carbon-free electricity; that means it's the number one source, by far, of carbon-free electricity in our country. Now, I understand concerns --- So we should continue to invest in renewables like wind and solar, but if we're serious about climate change, we shouldn't be so eager to attack our country's number one source of clean-air electricity. We shouldn't cutoff our nose just to spite our face. So as the NRC continues these series of public hearings, I would like to reiterate my support for an industry that's shown it can and has safely secured spent fuel onsite, and an industry that's at the forefront of clean-air electricity technology. During the NRC's rulemaking process, I would simply encourage it to support a process that strengthens our nation's commitment to clean-air technologies, including nuclear energy. (0326-16-4 [Kirton, Stratton])

Comment: I believe in nuclear energy as a means for providing our nation with clean, reliable-based load power, and in Diablo Canyon specifically, as a safe source of that power. (0326-17-1 [See, Daniel])

Comment: Nuclear energy is an important contributor to our nation's grid, providing 24/7 power. Also, nuclear energy, as was previously stated, our largest zero-carbon contributor to electricity right now, and it's key to reducing our greenhouse gas emissions in support of our U.S. clean energy goals. Also, I think we have a really good example of the impact of nuclear plants with the shutdown of San Onofre. California's CO2 emissions this year will go up above 35 percent. I'm personally not very happy about that. Also, the bills have went up about double for the people in that community, and happy that I'm not living there. (0326-18-4 [Schrader, Ken])

Comment: I am here on behalf of the Clean and Safe Energy Coalition, or CASEnergy Coalition, representing over 3300 individual and organization members in the business, environmental, academic, consumer, and labor communities across America. Our members support the expanded use of clean-air nuclear energy to ensure an affordable and reliable supply of electricity for America that also plays an active role in our fight against climate change, which stands as one of the most important issues faced by my generation. As a supplier of nearly 2/3 of our country's carbon-free electricity, the use of nuclear energy has and must continue to play a role in reducing potentially dangerous emission levels across the U.S. (0326-25-1 [Bailey, Savannah])

Comment: Nuclear energy has shown that it is a responsible source of electricity and a valuable community partner. Safe, clean, and reliable nuclear energy provides nearly 20 percent of our country's electric power and supports more than 100,000 high-paying jobs that contribute to our growing economy. (0326-25-3 [Bailey, Savannah])

Comment: Lastly, we are very proud of the safety record that we have accumulated over the years of operation and the clean energy that we provide to the State of California. (0326-3-4 [Strickland, Gerald])

Comment: On a personal note, I grew up with an acceptance of nuclear power. My father was an electronic engineer with a small manufacturing company, Time-Trol, Inc., located in Van Nuys, California, where he developed some of the first temperature control devices utilized in reactors early on as we were harnessing the force of nuclear energy. So for me, my trust in my dad and his understanding of the sciences nourished my level of comfort with the source of energy that brings us here this evening. Continuing on my journey through life, I ended up having a couple of not-so-comfortable experiences with nuclear reactors. In a previous career, I was part of a touring entourage where we were scheduled to appear on March 29, 1979 in Harrisburg, Pennsylvania, the day after the Three-Mile Island accident, and then I made several business trips to the Soviet Union shortly after the Chernobyl disaster. Those stories are for another time. (0326-33-2 [London, Rick])

Comment: The first is that, you know, as citizens we are all reliant upon energy, and I certainly believe that nuclear energy and its benefit should continue to be part of those different sources of energy that we utilize on a daily basis. (0326-37-2 [Rethmeier, Blain])

Comment: I'm a PG&E employee. I'm not here on behalf of the company. I'm not a company spokesperson. I'm definitely speaking for myself. I've been a resident of this area for many years. I was born here in San Luis Obispo and I also attended Cal Poly. I'm the past president of an organization in the United States, Canada, and Mexico called the North American Young Generation in Nuclear. We're 10,000 members who believe in nuclear science and technology and the benefits that it brings to all of our lives. I firmly believe in the benefits of nuclear science and technology, and specifically, in nuclear energy. I believe that nuclear energy in the United States is safe. (0326-41-1 [Zaitz, Kristin])

Comment: I live in Pismo Beach. I have two daughters that I've raised here. And I'm an environmentalist. I grew up in Wisconsin actually. I've been here since 1995. But as a child I spent almost all my time, almost all of it, sailing. I had a sticker on my car that said, "Split wood, not atoms" and in the end I became a nuclear engineer. And I work at the plant. I'm not a spokesperson. I guess I'm supposed to say that. But I do work there and I wanted to share some things. In college I studied all methods of creating power. I thought that getting into the energy industry would be a good, safe career. I studied everything. And really there are no perfect answers. We all have to live with the fact that nothing's perfect. You burn coal you're going to be dumping tons of radioactive crap in the air. You're going to be dumping tons of radioactive ash into the soil. You damn up rivers you're going to make people move, as the previous speaker said. You have wind turbines that are incredibly expensive. Solar, you're killing birds, you're wasting the land. There's nothing that's perfect, okay? All I can say is that I do trust the people I work with and I trust the company I work for. I think they're good people. I think they mean to do the right thing. I think we're all in a very, very difficult situation because of the government that we are all in. (0326-48-1 [Zawalick, Steven])

Comment: I just encourage everybody here to think about that, think about global warming. We've talked about all this radiation. Okay? But global warming could kill everybody on this planet in 100, 200, 300 years. And if we keep putting greenhouse gases into the atmosphere, and I'm not convinced that will happen, but it could, so you've got to look for clean power. Right now, I don't see any choice. And I want to commend the NRC for working with a very difficult problem, and I encourage the NRC in whatever is produced to produce something that allows for the responsible licensing, construction, and operation of nuclear power plants. (0327-16-2 [Border, Gary])

Comment: I am a pro-nuclear power person. It does not release CO₂. It does not result in radioactivity being emitted into the atmosphere like coal burning. It does not result in mountaintop removal, and I think it is a very good idea and it can be done safely, has been done safely. (0327-36-4 [Lamberger, Paul])

Comment: Let's just shut down all the nuclear power plants. What's going to happen then? What's happening in Germany? Germany, now they have to buy a lot of their electricity that's made by coal-fired power plants. What's in coal? It's got radioactive isotopes. It's being put all in the air all across the world. That's a problem. That's what causes cancer, causes diseases. It causes all kinds of problems when you do things like that. You have people that get cancer because of what the air is contaminated with. When you look at how many people nuclear power plants save? Has anybody ever considered that? How many medical diagnostic tests are run every year that help save people's lives, that tell us what's on the inside of you? That comes from isotopes created from a nuclear power plant. China has the world's worst coal pollution. Look at their longevity after birth. They're living longer because they have power, because they're prosperous and they can afford better healthcare. That's what nuclear energy brings to us. I myself have been affected very horrendously because of nuclear energy, not in very negative terms but not because of nuclear energy, because there was not a certain type of reactor that would produce a certain type of isotope that would have kept my fiancé from dying of brain cancer. Sentence her to death. That's what you happens when you go against nuclear energy. Does it have problems? Yes. Can they be overcome? Yes, they can be overcome. There are new technologies. We are not the old world. We are not the flat earth society. Americans can overcome. Americans do have ingenuity. We can do it if we're allowed to do it. There should not be something that's very negative. I've heard no, I've heard no, I've heard no tonight. Americans are, yes, we can, and we can solve this problem. And I think that we should be able to apply ourselves and we should be allowed to fix the problem. That's all. (0327-43-1 [Morrow, Jon])

Comment: I have been a passionate supporter of nuclear power since I began researching possible career paths in high school. That passion has drove my acquisition of a nuclear engineering degree, a career in the nuclear industry, and allowed me the opportunity to speak to you today as a member of the North American Young Generation in Nuclear, or NAYGN. NAYGN is a group of over 10,000 young professionals who are passionate about assuring that the myriad benefits of safe, responsible application of nuclear science and technology are enjoyed by generations to come. (0328-10-1 [Biersdorf, John])

Comment: Allowing for the NRC to complete this study will open the doors for the industry to grow and provide new, safer, and more efficient plants to be built that would help sustain this country's need for carbon-free electricity. Nuclear is just one answer to solving humanity's need to offset our carbon emissions, albeit an important one. And any delays in the implementation of well-rounded carbon-free portfolio could hinder this country's ability to adapt to our own energy needs, or even possibly cause irreparable damage to the environment in which we live. (0328-10-4 [Biersdorf, John])

Comment: It is important because nuclear energy plays a vital role in meeting the nation's and Minnesota's energy needs, electricity needs. With the diversity of supply providing balance, flexibility, and protection from price volatility, Xcel Energy is among the nation's leaders in delivering affordable, reliable, and clean energy to residents and businesses in Minnesota. Our Prairie Island and Monticello Nuclear Plants provide a steady baseload of carbon-free energy and play an important role in our ability to meet our customer's needs. In Xcel Energy's Upper Midwest Service Territory which includes customers in Minnesota, Wisconsin, North Dakota,

South Dakota, and Michigan, our nuclear generating plants have safely and reliably produced clean energy for our customers for more than 40 years. In 2012, they generated nearly 30 percent of the total electric energy used by our customers and produced 60 percent of the carbon-free energy that we provide our customers. (0328-5-1 [Pickens, Terry])

Comment: The United States was the first country to develop commercial nuclear power plants. We have the largest nuclear program in the world, 100 reactors with five more under construction. Having once been a leader in this technology, we're at risk of losing our competitive edge and our nation's credibility on commercial nuclear power issues. (0328-5-9 [Pickens, Terry])

Comment: I hear from the previous commenter, basically, a lot of lack of knowledge and unappreciation of where we would be in this world today if we did not have nuclear energy. So I would actually ask people like him to try to find the actual facts and not read conjecture, which is widely available on the internet to anyone who wants to. I have worked at nuclear power plants. I've worked with nuclear material, and the nuclear industry is much safer than many other activities that we have in our daily life. The risk that the previous caller accepts by getting in his car, flying in an airplane, taking medications, climbing a ladder, and doing many other activities are much worse. I also believe that people do accept risks of radiation everyday by living, by subjecting themselves to radiation on flying, and by medical procedures. (0329-2-2 [Mirsky, Steven])

Comment: So I applaud the NRC for proceeding forward on this, and I believe that, with sane, logical voices and people that understand the entire area of nuclear energy, that this is a positive step and an important asset in our energy mix that will improve our standard of living and the future of the world. (0329-2-3 [Mirsky, Steven])

Comment: The presence of abundant and affordable energy nearly always outweighs its negative effects it may cause. This can best be demonstrated by the coal-fired powered plants in China that are saving lives, not hundreds of lives, not thousands of lives, but millions of lives, every day in the most polluted cities in the world. Coal and nuclear energy has afforded a standard of living that decreases many of the societal factors that would shorten lifespans. Many Chinese in very polluted cities are now living as long or longer than Americans. (0347-10 [Morrow, Jon Paul])

Comment: Thousands of people are saved every year through non-invasive medical diagnostic testing with the use of medical isotopes that are derived from nuclear energy. Better yet, one of the best promises for a cure for cancer and AIDS lies in differing types of nuclear isotope therapies and treatments. There is a tremendous potential to save millions more lives every year with expanded research and development into new nuclear technology[.] I believe that the public cannot make good choices (decisions as a society) on nuclear energy, as they (the public) are primarily driven and motivated by fear and anger upon this topic and any topic of crises. (0347-11 [Morrow, Jon Paul])

Comment: Truth is not perception, truth is immutable, provable, auditable, and it is arrived at without the encumbrances of biases and preconceived notions. Using scientific principle and logic we can arrive at the truth of any issue. I am above all, a seeker of truth, and I think we should all be a seekers of truth...it is how we best interact with reality which is based upon a set of facts and truths that are immutable...as for passions, no matter how well intentioned, are still just passions, which are personal perceptions jaded by heart-felt emotion and they do not necessarily have to have any basis in reality. This is true no matter upon which side of the aisle

you stand. When I listen to the death count on Nuclear accidents like Chernobyl I hear one study that says 28 people died, another that says 100,000 and another that says 1,000,000. Clearly, someone is not being truthful and has an agenda. All three death toll claims are supposedly from reputable sources, but again, I am going to accept the one that makes their information public and it is auditable by the general public using scientific principles. Thank you NRC! (0347-4 [Morrow, Jon Paul])

Comment: I am glad nuclear power companies have a profit motive. Killing their customers is bad for business and accidents and leaks cost a ton of money. There is a financial incentive for nuclear utilities to be run well and waste stored well. I shudder to think how our nuclear industry would operate without a profit motive. (0347-6 [Morrow, Jon Paul])

Comment: Passionate speeches are made of how nuclear waste is killing and will kill thousands and millions of people, today, and in the future. Yet thousands and millions of people are killed everyday. You take a chance just crossing the road and getting hit by a car...should we ban cars? Every year thousands of people die in tragic car accidents, and using the same logic as the logic I have heard in these testimonies at the waste confidence hearings, I would surmise there would be those that advocate banning the automobile. That is illogical, as the automobile has provided us with prosperity which has allowed us to lengthen our lifespans, and therefore, save many more lives than what they have taken. (0347-7 [Morrow, Jon Paul])

Comment: The same is true of nuclear energy. While there is no doubt that the nuclear industry and the NRC has had its share of problems, the problems are fewer and becoming more and more insignificant everyday. (0347-8 [Morrow, Jon Paul])

Comment: Claims have been made that Germany has it right by eliminating Nuclear yet, this has caused increases in the burning of coal, more nuclear material (which is found in coal) is entering the atmosphere more than ever in Germany (and many purported environmentalist are happy about this....and using the very same logic presented by anti-nuclear activist...that would mean many more deaths than all the nuclear catastrophes combined will happen because of Germany's anti nuclear policy. At least Nuclear power plants contain the nuclear waste rather than letting it be spread into the atmosphere for all to breathe! (0347-9 [Morrow, Jon Paul])

Comment: Every year thousands of people die prematurely as a result of burning coal to provide our required electrical power. In the entire history of nuclear power in the USA no member of the public has ever been physically harmed by this energy source. Consider the saving of life and accrued medical costs if only nuclear power plants had been built over the past several decades. A more comprehensive review of the energy situation is provide at: www.energyfactoepriim.blogspot.com (0360-1 [Fray, Joseph])

Comment: Our atomic energy plant has an excellent record and is essential to the central coast power supply--Unless you can assure us that those hapless wind-mills can keep our homes lited and warm, please keep Diablo working--If you want to cool the run off water- that would be OK- (0374-2 [Landers, Don])

Comment: There is of course a lot of noise from those that oppose but most do not live here nor do they see a requirement for businesses and residences to have the power necessary to exist. I for one would hate to see any change, shut down or brown out coming from Diablo. (0382-2 [Tognazzini, Randall])

Comment: Nuclear power is a vital part of the energy sources society needs to maintain civilization. Without enough energy people could not produce, process, and transport enough food to keep most of the people on earth alive today. Starvation is not pleasant. (0390-1 [Kirkland, Gary L.])

Comment: Both Congressional actions described above occurred because of the fear of nuclear power. Cowards make decisions based on fear, an emotion. Our forefathers founded this country based on reason after defeating the most powerful military on earth. We must be brave. (0390-4 [Kirkland, Gary L.])

Comment: I urge you *not close the Diablo Nuclear Power Plant!* The power plant's energy is essential to a large population in California. It is a clean and efficient form of electrical power. (0408-4 [Watson, Jeannette])

Comment: I am quite sick of the anti-nuke, tin-foil hat club interfering with policy, frightening the public in their disinformation campaigns, and providing no rational alternative to the decisions made by the industry nor the NRC. They worked to prevent Yucca Mt. from opening and now at SONGs, these air heads are demanding we get rid of the SNF ASAP. The fools don't seem to recognize any inconsistency in these activities. I do hope the NRC will pay them the attention their ideas merit, i.e., none, and round file any correspondence from these knuckleheads. (0418-3 [Davison, David])

Comment: Nuclear power continues to be important in New England, because the alternative for baseload power is mostly coal. Several coal power stations are now scheduled for closure in Mass., so the continued operation of New England power stations is even more important than a few years ago. (0448-2 [Moncy, Charles])

Comment: Nuclear energy is a clear necessity as we move forward in developing a green world. The transition away from our dirty power, like coal and oil, cannot be as sudden as the flip of a switch and nuclear energy is key in this gradual transition. It is safe, for each facility takes great care to maintain a top safety protocol, and the clean nature of the power provides an excellent means to reduce the world's carbon footprint. In summary, nuclear power is essential for our world's future. (0449-1 [Zimmern, Matt])

Comment: I believe nuclear energy plays a vital role in meeting our nation's electricity needs. One hundred nuclear power plants generate nearly 20 percent of our electricity and in seven states; nuclear plants generate more electricity than any other source. The Energy Department projects that U.S. electricity demands will rise 28 percent by 2040, even with very modest economic growth. That means, the United States will need hundreds of new power plants of all types to meet increased demand and replace older facilities that are retired. I strongly believe some of these new power plants will have to be nuclear like the five reactors under construction in Georgia, South Carolina and Tennessee. Nuclear energy is the only emission-free source of electricity that can be widely expanded. The President has set ambitious goals for reducing carbon dioxide emissions, and the United States simply cannot get there without nuclear energy. In addition to generating clean-air electricity, nuclear plants strengthen state and local economies through jobs, taxes, and direct and \$35 million in total labor income secondary spending. A typical nuclear plant generates \$470 million a year in economic output, including more than These figures include both direct output and secondary effects. The direct output reflects the plant's annual electricity sales--approximately \$453 million. The secondary effects at the local level include subsequent spending attributable to the presence of the plant and its employees as plant expenditures filter through the local economy. That spending amounts to

approximately \$17 million a year. Analysis shows that every dollar spent by the average nuclear plant results in the creation of \$1.04 in the local community, \$1.18 in the state economy and \$1.87 in the U.S. economy. The average nuclear plant pays about \$16 million in state and local taxes annually. These tax dollars benefit schools, roads and other state and local infrastructure. A September 18 story in The Boston Globe highlighted the economic impact of a nuclear plant from the standpoint of a community whose plant closed. The article states, and I quote: "In the 17 years since Maine Yankee began dismantling its reactors and shedding its 600 workers, the town of Wiscasset have experienced drastic changes: property taxes have spiked by more than 10 times the number living in poverty has more than doubled and town services and jobs have been cut." The article quotes the town manager, Laurie Smith: "All these years later," she said, "we're still feeling the loss of jobs, the economic downturn and the huge tax increases." (0456-2 [Hoisington, Paula])

Comment: I am in total agreement that nuclear will power the future. Its' the only way to reduce dumping CO2 in the atmosphere. (0489-1 [Padden, Jim])

Comment: NAYGN strongly believes that nuclear energy is an integral part of a national energy plan and must continue to generate an essential share of the nation's clean, non-emitting, zero-carbon baseload electricity. Nuclear energy plays a vital role in meeting our nation's electricity needs, protecting the environment, and preserving the fuel and technology diversity that is the U.S. electricity supply system's strength. In addition to generating clean-air electricity, nuclear plants strengthen state and local economies through jobs, taxes, and spending. As a member of the River Bend NAYGN chapter, I know first hand the impact nuclear power has in the state of Louisiana. The two nuclear reactors in Louisiana provide approximately 15.8% of the state's electricity, provide more than 1,350 high paying jobs and contribute \$470 million to the local economy. (0535-1 [Damratoski, Katie] [Thornton, Adam])

Comment: I, and many others I know, would support construction of new nuclear power plants here in California, especially reactors that do not generate waste in their fuel cycle. I do hope that the opposition and political climate regarding the issue of waste storage and the use of nuclear power plants will subside in time, especially with future implementation of newer, cleaner reactors. (0538-3 [Kaul, Michelle])

Comment: I don't believe that renewable energy alone would be sufficient to address the US and World's energy needs and consider that Nuclear Energy has to be an integral part of the electricity generation options. (0568-2 [Michael, Edward])

Comment: I strongly believe that nuclear energy is an integral part of a national energy plan and must continue to generate an essential share of the nation's clean, non-emitting, zero-carbon baseload electricity. Nuclear energy generates 26.5% of the carbon-free electricity produced in our state, according to the Energy Information Administration and nearly 20% of our nation's electricity output. (0598-2 [Wicks, Tonja])

Comment: [T]he one conclusion I have come to is that our country, our state, and our cities need a diverse portfolio of energy resources to meet our current and future energy needs. It's imperative that we do not repeat the past and move to an over-reliance on any single generation source, which could lead to potential reliability issues and extreme price volatility. As a result, nuclear energy must remain a vital part of that diverse energy resource mix. I believe we need to continue to find ways to utilize these resources to meet our energy needs and also keep our local and state economies viable and our residents employed. (0598-3 [Wicks, Tonja])

Comment: Our nuclear energy facilities provide substantial economic benefits to the state and local community, including high-paying jobs and tax revenue that helps keep town services funded and property taxes much lower than they otherwise would be. On average, a nuclear energy facility generates nearly \$500 million in annual economic output, including more than \$35 million in labor income. Each year, it pays about \$67 million in federal taxes and nearly \$16 million in state and local taxes alone. (0598-4 [Wicks, Tonja])

Comment: Thank you for the opportunity to express my support for nuclear power. (0642-6 [Picking, Brian])

Comment: As someone who is concerned about the environment, I am a strong supporter of nuclear energy. In fact, it is the reason I became a nuclear engineer. Nuclear energy is safe, reliable, and does not emit greenhouse gases during operation. Why is it safe? Nuclear power has the lowest number of deaths per kilowatt hour when compared to fossil fuels, biofuel, rooftop solar, and wind power. [James Conca, "How Deadly Is Your Kilowatt?" Forbes, June 10, 2012] Why is it reliable? The United States nuclear fleet has a capacity factor of 90%. Finally, nuclear power does not emit carbon dioxide, methane, or nitrous oxide during operation. An advantage of nuclear energy, over other sources of electricity generation, is the concentrated manner of the waste. (0674-1 [Lang, Amanda])

Comment: Nuclear waste is a solid, and very compact, unlike gases, ash, particulate matter, toxic chemicals from solar panel production, etc. from other types of electricity generation. This waste, or "used fuel," accumulated over 50 years of nuclear operation in the US, can fit in the area of one football field filled to a height of about 20 feet. [Max Carbon, "Nuclear Power: Villain or Victim?"] I feel much more confident handling this waste, than I would other types of waste. In addition to being compact, another advantage of nuclear waste is the fact that it's not really waste. (0674-2 [Lang, Amanda])

Comment: Actually, nuclear waste from a fission reactor has been stored on earth for approximately 2 billion years without any storage casks. The Oklo reactors are natural reactors active approximately 2 billion years ago [Alex P. Meshik, The Workings of an Ancient Nuclear Reactor, Scientific American, January 26, 2009]. The "waste" from these reactors was never contained by human actions and yet it remained stable for billions of years within the geological formation where it formed. (0674-6 [Lang, Amanda])

Comment: Many of the environmental concerns the public has with nuclear waste storage stem from a fear of radiation. I would like to address the perception of radiation that exists with the public. Radiation is "mysterious" (really, it's just quantum mechanics!) and some people think it is scary because you can't see it/touch it/smell it and you don't know when you are being irradiated. In fact, you are being irradiated all the time. Radiation is naturally occurring and it's found all around us! Life would not be possible without radiation. (0674-7 [Lang, Amanda])

Comment: In the nuclear industry, safety and health of the public and environment are first and foremost in the minds of employees (like myself). (0674-9 [Lang, Amanda])

Comment: As you know, nuclear energy provides safe, clean, economical and reliable electricity--approximately 20 percent of the Nation's needs. In addition to the vital importance of the existing U.S. nuclear energy fleet and the jobs, competitiveness and clean energy they provide, additional reactors are currently under construction and more will be needed to meet growing demand. (0685-1 [Davis, Ed])

Comment: I urge the Commission to not be swayed by activists who cannot or will not do the math to see that nuclear power is by far the least carbon-generating power source available to humans on the scale necessary to mitigate global warming. The Commission's foresight in this matter should prevail. (0802-2 [Moore, Richard])

Comment: On average, a nuclear energy facility can generate nearly \$500 million in annual economic output, including more than \$35 million in labor income. Each year, it pays about \$67 million in federal taxes and nearly \$16 million in state and local taxes. In addition, one nuclear energy facility creates 1,400 to 1,800 high-paying jobs during construction, with peak employment estimated as high as 3,500 jobs during that period, yielding 400 to 700 jobs during the operation of the facility. These are jobs that cannot be shipped overseas. (0825-2 [Palomarez, Javier])

Comment: The United States was the first country to develop commercial nuclear power plants, and we now have the largest nuclear program in the world with 100 reactors. But we are at risk of losing our competitive edge. Of all energy sources, nuclear energy is the most eco-efficient of all, as it produces the most electricity in relation to its minimal environmental impact. Nuclear power plants produce no controlled air pollutants or greenhouse gases and produces nearly two-thirds of all carbon-free electricity in the U.S. We urge the Nuclear Regulatory Commission to continue its thoughtful and robust oversight of commercial nuclear energy facilities - the operation of existing plants, licensing new reactors, renewing the operating licenses of existing reactors, and the management, transportation and disposal of used nuclear fuel. (0825-6 [Palomarez, Javier])

Comment: My quest is scientific in nature, but it seems that NRC is being treated as a pawn. Nuclear energy in my opinion is the ultimate green energy and recycling model. Our past leaders discovered a new power and without haste exploited the power. (0881-2 [Szymanowski, Jennifer])

Comment: [Will Congress please give the NRC some teeth and make law to] 3) sell the American public on nuclear energy as effectively as private interest groups have defiled it. (0881-7 [Szymanowski, Jennifer])

Comment: I appreciate the fear invoked by mechanisms we don't understand but that fear will not make problems disappear. Education not public service announcements is the most effective way to dismiss these fears. Education is the most effective way to allow our generation to be great. (0881-8 [Szymanowski, Jennifer])

Comment: NAYGN strongly believes that nuclear energy is an integral part of a national energy plan and must continue to generate an essential share of the nation's clean, non-emitting, zero-carbon baseload electricity. Nuclear energy plays a vital role in meeting our nation's electricity needs, protecting the environment, and preserving the fuel and technology diversity that is the U.S. electricity supply system's strength. In addition to generating clean-air electricity, nuclear plants strengthen state and local economies through jobs, taxes, and spending. As a member of the River Bend NAYGN chapter, I know first hand the impact nuclear power has in the state of Louisiana. The two nuclear reactors in Louisiana provide approximately 15.8% of the state's electricity, provide more than 1,350 high paying jobs and contribute \$470 million to the local economy. (0948-1 [Commenters, Multiple])

Comment: Until renewables are fully developed, we may need to keep nuclear as an option, particularly when compared with coal and oil, but so long as we are going to use it, we need to make every effort to preserve the safety of people and the environment. (0971-2 [Schneider, Linda])
