Mr. R. A. Scarano, Chief
Uranium Recovery Branch
Division of Waste Management
Office of Nuclear Material Safety and Safeguards
U.S. Nuclear Regulatory Commission
Washington, D.C. 20555

Subject: Source Material License No. SUA-1331, Sundance Project,
Crook County, Wyoming, Docket No. 40-8663

Attention: J. Rothfleisch

Gentlemen:

For information only, and in accordance with Conditions 14 and 19 of the Source Material License, we are enclosing a copy of Nuclear Dynamics' 1980 Activity and Restoration Report on the In Situ Mining Test Site, Sundance Project, Crook County, Wyoming as prepared by Mr. Albert Stoick, Manager, Sundance Project. As you are aware, on October 31, 1979, Nuclear Dynamics received written approval from the Wyoming Department of Environmental Quality authorizing the September 19th shut down of the restoration phase of the research and development program. Activities were suspended for a period of six months to evaluate the stability and completeness of restoration achieved as of September 19th. The pilot plant and well field have been secured during that period with restoration check sampling commencing on April 23, 1980. A Restoration Summary Report covering activities to the September shut down was submitted to all concerned on October 19, 1979.

We are sending a copy of this report to the Department of Environmental Quality, Mr. Glenn Mooney, District IV Geologist, Sheridan office; Mr. Walt Ackerman, Administrator, Department of Environmental Quality office in Cheyenne, Wyoming; and the U.S. Nuclear Regulatory Commission office in Arlington, Texas.

Sincerely,

The plant modifications and related activities will be reported to the NRC and the Wyoming Department of Environmental Quality as major design change requests. He is also Albert F. Stoick, Manager, Nubeth Joint Venture support contractor.

...It appears from the latest pumping data, that a certain amount of oxidation is taking place and will continue to do so until the wells are plugged and sealed. That oxidizing condition apparently affects the amount of certain parameters, such as Uranium, Iron, Radium 226, Gross Alpha, Gross Beta, and to a lesser degree, Arsenic, Selenium and Molybdenum, mobilized in the water. The quantities of these parameters drop off substantially and rapidly once water is pumped out of the aquifer from a relatively short distance from the well.

Vanadium, at less than one part per million, appears to be mostly unaffected by this condition and remains about six tenths of a part per million above the established restoration limit.

As can be observed from the accompanying plots of restoration check sampling data, the great majority (27) of the thirty-three parameters assayed for are below the upper limit of restoration or according to the accuracy of chemical assaying are considered to be at or below that limit.

Albert F. Stoick, Manager

Introduction

For information purposes, this report covers the check on and evaluation of the stability of the established restoration of the solution mining test site well field at the Sundance Project in Crook County, Wyoming.

Early in September, 1979, the Nuclear Regulatory Commission (NRC) and the Wyoming Department of Environmental Quality (DEQ) were advised by telephone and by personal communication respectively, of the degree of restoration already attained for the majority of the parameters of the well field water. At that time, Nuclear Dynamics requested, and received on behalf of the Nubeth Joint Venture, permission to secure the well field for a period of six months.

The well field was shut down on September 19, 1979 and with the pilot plant remained secured until April 23, 1980. During this six month period the evaporation ponds continued to be monitored according to related permits and no fluid from inside the liners was found in the detection systems. Also, the "outside" or private wells have been sampled as required.

It is the opinion of Nuclear Dynamics that restoration is as complete as can be obtained within practical limitations and is stabilized with the possible exception of the immediate area of the wells themselves. In that area, it appears from the latest pumping data, that a certain amount of oxidation is taking place and will continue to do so until the wells are plugged and sealed. That oxidizing condition apparently affects the amount of certain parameters, such as Uranium, Iron, Radium 226, Gross Alpha, Gross Beta, and to a lesser degree, Arsenic, Selenium and Molybdenum, mobilized in the water. The quantities of these parameters drop off substantially and rapidly once water is pumped out of the aquifer from a relatively short distance from the well.

Vanadium, at less than one part per million, appears to be mostly unaffected by this condition and remains about six tenths of a part per million above the established restoration limit.

As can be observed from the accompanying plots of restoration check sampling data, the great majority (27) of the thirty-three parameters assayed for are below the upper limit of restoration or according to the accuracy of chemical assaying are considered to be at or below that limit.

All five well field monitor wells were sampled on April 24, 1980 and the chemical data indicates that no excursions, either horizontally or vertically have occurred. For your reference, data pertaining to these wells is attached to this report.

Nuclear Dynamics, as managers for the Nubeth Joint Venture, will be requesting permission from the Wyoming Department of Environmental Quality to plug and seal off all of the wells in the Phase I well field and then reclaim the well sites. The remainder of the well field has already been reclaimed and re-seeded. The pilot plant and evaporation ponds will remain intact, and in a standby condition, until final decisions on future pilot tests are made by the Nubeth Joint Venture Partners.

Sufficient and proper bonding is, and has been, kept in effect to cover our activities and obligations on the Sundance Project.

Very truly yours,

For

Nuclear Dynamics, Inc., Manager

Enclosure

Enclosure 1: A copy of the letterhead memorandum dated April 24, 1980, from the Wyoming Department of Environmental Quality, regarding the proposed plugging and sealing of the wells in the Phase I well field, and the reclamation of the well sites.

Enclosure 2: A copy of the letterhead memorandum dated April 24, 1980, from the Wyoming Department of Environmental Quality, regarding the proposed plugging and sealing of the wells in the Phase I well field, and the reclamation of the well sites. This memorandum also contains a copy of the letterhead memorandum dated April 24, 1980, from the Wyoming Department of Environmental Quality, regarding the proposed plugging and sealing of the wells in the Phase I well field, and the reclamation of the well sites.

Enclosure 3: A copy of the letterhead memorandum dated April 24, 1980, from the Wyoming Department of Environmental Quality, regarding the proposed plugging and sealing of the wells in the Phase I well field, and the reclamation of the well sites. This memorandum also contains a copy of the letterhead memorandum dated April 24, 1980, from the Wyoming Department of Environmental Quality, regarding the proposed plugging and sealing of the wells in the Phase I well field, and the reclamation of the well sites.

Enclosure 4: A copy of the letterhead memorandum dated April 24, 1980, from the Wyoming Department of Environmental Quality, regarding the proposed plugging and sealing of the wells in the Phase I well field, and the reclamation of the well sites. This memorandum also contains a copy of the letterhead memorandum dated April 24, 1980, from the Wyoming Department of Environmental Quality, regarding the proposed plugging and sealing of the wells in the Phase I well field, and the reclamation of the well sites.

In April, 1980. The analytical data from these wells, including data previously submitted and now updated, is attached as part of this report (Tables III, IV, V, VI and VII).

- 6) The monitor well (OSA-1) in the "A" aquifer (immediately above the mining zone) was also sampled in September, 1979 and again in April 1980. That analytical data, including data previously submitted and now updated, is attached as part of this report.

Summary of Activities - Sundance Project
September 19, 1979 to September 19, 1980

- 1) An updated Table IX, containing data on the water chemistry of Water Well 789V, is attached for reference and information only.
- 1) A final set of samples was taken on September 19, 1979 from the Recovery Well (R-1, 19XX Figure 1) and sent to CDM Labs for analyses. This "shut-down" data is plotted on the accompanying thirty-three graphs of the various parameters analyzed. Restoration stability can be checked by comparing this data with that obtained on check samples taken in April and June of 1980 and by comparing with the upper limit for restoration as shown on each graph.
- 2) Three sets of check samples were taken; one on April 23, 1980, after 2880 gallons had been removed from the Recovery Well (R-1), one on April 30, 1980, after 26,880 gallons were pumped, and a third sample, somewhat later, on June 5, 1980, after another 57,600 gallons had been pumped. It is estimated that the first sample removed water from as close as two to five feet around the well, that the second sample drew some water from ten to sixteen feet away, and that the third sample could contain some water coming from twenty to twenty-five feet away.
- 3) Table I is an updated Restoration Summary of the Water Chemistry of the recovery well and buffer water supply as some additional data has been received since the Restoration Summary Report was submitted on October 19, 1979. Table I-A illustrates the upper limit restoration data, the restoration data as of shut-down on September 19, 1979, and the check sampling data obtained during sampling activities on April 23, 1980, April 30, 1980 and June 5, 1980.
- 4) All of the water removed from the recovery well during the above sampling procedure was sent to the evaporation ponds. The attached Table II illustrates the Well Field Flow Volume as was required for restoration plus that pumped for sampling in April and June, 1980.
- 5) The five monitor wells (M-1, M-2, M-3, M-4, and M-5) in the "B" (mining zone) aquifer were also sampled in September, 1979 and again in April, 1980. The analytical data from these wells, including data previously submitted and now updated, is attached as part of this report (Tables III, IV, V, VI and VII).
- 6) The monitor well (OSA-1) in the "A" aquifer (immediately above the mining zone) was also sampled in September, 1979 and again in April, 1980. That analytical data, including data previously submitted and now updated, is attached as Table VIII.
- 7) An updated Table IX, containing data on the water chemistry of Water Well 789V, is attached for reference and information only.

search and development program, has been achieved while using a sodium bicarbonate-carbonate leachant system and a combination ground water sweep - fresh (buffer) water injection system for restoration.

- 7) No excursions occurred during the test or during restoration.
- 8) It is recommended that the Phase I well field be secured by plugging and sealing all wells as soon as possible. The procedure for sealing wells that have no further value has been established with the Wyoming Department of Environmental Quality.
- 9) The pilot plant and well field remained secured all winter and now stand in that condition.
- 10) Well 1-2 (north injection) was repaired on October 31, 1979 with 235 feet of 4" liner and three very tight fitting packers. This well has not been used for any activity since prior to the well field shut down.
- 11) Reclamation of all drill sites on the Sundance Project is 99% completed with only a few small recently built drill hole sites to be re-seeded this fall. Also, the entire well field, except for the wells themselves, has been reclaimed and re-seeded.
- 12) Baseline vegetation studies for the Sundance Project have been completed by International Environmental Consultants. These studies are intended to suffice both for a possible Phase II research test as well as for anticipated commercial mining activities.
- 13) Five wells, located about four thousand feet northwest of the present well field, have been completed and are intended to be used to obtain baseline information for a proposed Phase II test.
- 14) The "outside" or private wells have been sampled as required by the permits granted to Nuclear Dynamics. Table 2, 3, 4, 5, and 6 illustrate the data obtained from these wells since July, 1979.
- 15) Proper and sufficient bonding for all drilling and research activities conducted on the Sundance Project have been kept in effect and are properly filed with the Wyoming Department of Environmental Quality.

Conclusions

- 1) Satisfactory restoration, under the intent and limitations of a research and development program, has been achieved while using a sodium bicarbonate-carbonate leachant system and a combination ground water sweep - fresh (buffer) water injection system for restoration.
- 2) No excursions occurred during the test or during restoration.
- 3) It is recommended that the Phase I well field be secured by plugging and sealing all wells as soon as possible. The procedure for sealing wells that have no further value has been established with the Wyoming Department of Environmental Quality.

Monitor Well Program

Wells sampled in September, 1979 and again in April, 1980 are as follows:

Quarterly Report No. 1, August 31, 1978. Source Material License No. SUA-1331, Docket No. Monitor Wells, 40-8663, pages 59-61.

Well	"In House" Designation	
12X	M-1	Northeast Monitor Well - "B" Zone Aquifer
5X	M-2	Northwest Monitor Well - "B" Zone Aquifer
121X	M-3	West Monitor Well - "B" Zone Aquifer
6X	M-4	Southwest Monitor Well - "B" Zone Aquifer
11X	M-5	Southeast Monitor Well - "B" Zone Aquifer
789V	789V	Buffer Injection Water Source
7X	OSA-1	Monitor Well - "A" Zone Aquifer

Sample methods and preservation of collected samples were identical to those employed in the premining baseline program.⁽¹⁾ Samples were field filtered through 0.45 u membranes and all analytical values represent dissolved concentrations only.

Although the excursion control parameters for monitor wells are pH, uranium, bicarbonate, carbonate, sodium, chloride, conductivity, and total dissolved solids; each monitor well sample was assayed for thirty-three (including the above) parameters both in September, 1979 and April, 1980. This analytical data is illustrated in Tables III, IV, V, VI, VII, and VIII.

No excursion condition was detected for any control parameter in either the "A" or "B" zone aquifer.

(1) Quarterly Report No. 1, August 31, 1978. Source Material License No. SUA-1331, Docket No. 40-8663; pages 59-61.

PRIVATE WELL ANALYSIS

The program to sample surface waters and private well sources within a three mile radius of the test site was continued during the reporting period.

Wells in this program are shown in Table 1.

TABLE 1

Private Wells

<u>Well</u>	<u>Description</u>
101	Oshoto Reservoir - Dip Sample
102	Harry Berger Pasture - Windmill (Hand Pump)
104	Grace Reynolds House Well - Windmill
109	Harry Berger Pasture - Electric Pump
110	Oshoto Reservoir - Dip Sample
119	Burch Ranch Pasture - Electric Pump
125	Allan's Pasture - Windmill
3V	Well 700 feet west of test site - "A" Aquifer
788V	Well 800 feet west of test site - "B" Aquifer

Analytical data is presented in Table 2, 3, 4, 5, and 6 on samples collected from the above wells in July, August, and September, 1979 and January and April, 1980.

No problems or concerns are present with this program except that Well 109 was not available (due to pump problems) during January and April, 1980.
