PUBLIC MEETING

Nuclear Regulatory Commission  
One White Flint North  
Rockville, Maryland

Thursday, May 3, 1990

The Commission met in open session, pursuant to notice, at 10:00 a.m., Kenneth M. Carr, Chairman, presiding.

COMMISSIONERS PRESENT:

KENNETH M. CARR, Chairman of the Commission  
THOMAS M. ROBERTS, Commissioner  
KENNETH C. ROGERS, Commissioner  
JAMES R. CURTISS, Commissioner  
FORREST J. REMICK, Commissioner

NEAL R. GROSS  
COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

STAFF SEATED AT THE COMMISSION TABLE:

SAMUEL J. CHILK, Secretary

JOSEPH SCINTO, Office of General Counsel

JAMES TAYLOR, Executive Director for Operations

DR. THOMAS MURLEY, Director, Office of Nuclear Reactor  
Regulation

DR. THEMIS SPEIS, Office of Research

CHARLES MILLER, Director, Standardization and Life  
Extension Project, NRR

ASHOK THADANI, Director, Division of Systems Technology,  
NRR

WILLIAM TRAVERS, Assistant Director for Special  
Projects, NRR

JAMES RICHARDSON, Director, Division of Engineering  
Technology, NRR

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

P-R-O-C-E-E-D-I-N-G-S

10:00 a.m.

CHAIRMAN CARR: Good morning, ladies and gentlemen.

The purpose of today's meeting is for the NRC staff to brief the Commission on evolutionary light water reactor certification issues and their relationship to current regulatory requirements.

On April 27th, 1990, the staff briefed the Commission on the related topics of advanced reactor reviews and scheduling. At that meeting, the Commission requested this briefing to allow discussion of the specific certification issues currently before the Commission.

I understand that copies of the staff presentation slides are available at the entrance to the meeting room.

Do any of my fellow Commissioners have opening remarks?

If not, Mr. Taylor, please proceed.

MR. TAYLOR: Good morning, sir. With me at the table is Doctor Murley, Mr. Thadani, Mr. Richardson, to my left, Doctor Speis from Research and Bill Travers and Charlie Miller from NRR.

Doctor Murley will present the briefing.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 DOCTOR MURLEY: Thank you.

2 Mr. Chairman, Commissioners, last year the  
3 Commission asked the staff to identify where in our  
4 reviews of the EPRI Requirements Document or the  
5 evolutionary plants we were proposing to go beyond the  
6 regulations or to relax the regulations. That is the  
7 one common element among the 15 issues that we're going  
8 to discuss today, namely the fact that they either go  
9 beyond or relax current regulations.

10 But, in fact, there are four classes of issues  
11 and it's probably useful to talk about -- a little bit  
12 about each class.

13 The first class is a current or an emerging  
14 safety issue that has not been resolved completely, even  
15 for current plants, and intersystems LOCA would be an  
16 example of that class.

17 The second class are those requirements that  
18 were backfit on operating plants usually by a  
19 regulation, but where the staff believes there's a  
20 better solution for new plants that are still on the  
21 drawing board under design, and the station blackout  
22 issue is an example of that.

23 The third class is a design solution for  
24 dealing with the severe accident issue for which we do  
25 not have a regulation. An example of that would be the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 requirement to have depressurization capability, to  
2 prevent high pressure core melt ejection.

3 And the fourth class would be proposed  
4 relaxations from current requirements and the OBE/SSE  
5 separation would be an example of that.

6 The first issue to talk about then is safety  
7 goals. The staff is -- I'd say we were guided by the  
8 proposed safety goals, but they didn't control our  
9 thinking on these issues. That is we didn't necessarily  
10 decide to propose a new requirement simply to meet a  
11 numerical safety goal. I think a more basic guideline  
12 that we used in considering these issues was the  
13 Commission's policy statement on severe accidents, that  
14 future designs should be safer than current designs for  
15 severe accidents. Of course that raised the question  
16 should we give birth to the design of a new generation  
17 of reactors where the staff thinks there are safety  
18 issues that still have not been resolved. We thought  
19 not.

20 The Commission's severe accident policy  
21 statement also guided us to strike a balance between  
22 severe accident prevention and severe accident  
23 mitigation. These requirements or these proposed  
24 requirements do that and in particular it's covered in  
25 the containment performance guideline that we're going

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to talk about.

2 With regard to how we actually use the safety  
3 goals, the staff is proposing to accept EPRI's proposed  
4 core damage frequency goal and their large release  
5 safety goal. We're not proposing to push them for more  
6 conservative safety goals, but the staff does expect  
7 that the evolutionary light water reactor applicants to  
8 demonstrate that they've taken reasonable steps to  
9 achieve their stated goals. We would not hold them  
10 rigorously to bottom line demonstrations that they have  
11 met their safety goals, because we realize that there's  
12 a number of uncertainties in that kind of analysis at  
13 this stage, most importantly in the area of human error  
14 rates and that sort of thing. They are really not  
15 known. They can't be known at this stage. There are  
16 no tech specs available to review against and that sort  
17 of thing.

18 What one does is establish some average values  
19 for human error rates and then evaluates the design  
20 against the goals, against these targets. We think the  
21 EPRI goals are useful at this stage of design for  
22 setting safety system reliability design objectives, for  
23 example, and they would do -- just as I said, they  
24 assume some average value for human error rates and then  
25 from that they would evaluate various trade-offs for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 system configurations.

2 We think that's a very useful way to do it  
3 and that's how, in a nutshell, I guess, we have used  
4 the safety goal and that's how we're proposing that it  
5 be adopted by the Commission.

6 COMMISSIONER REMICK: Mr. Chairman, do you  
7 want to, as each one of these 15 issues come up, ask  
8 questions at the end of each?

9 CHAIRMAN CARR: Sure. Whatever you want.

10 COMMISSIONER REMICK: It might be more orderly  
11 to do that.

12 DOCTOR MURLEY: That would be more logical,  
13 I think.

14 COMMISSIONER REMICK: Tom, this is one area  
15 where I guess I continue to have some difference with  
16 the staff. You used the word "accept" the EPRI. I view  
17 it a little bit more strongly, "impose" the EPRI safety  
18 goal.

19 The problem I have, suppose they had suggested  
20  $10^{-6}$  for a core damage. Would the staff have accepted  
21 that? The problem I have is that by imposing at  $10^{-5}$ ,  
22 you're avoiding the Commission's safety goals. I think  
23 it makes it inconsistent with the health objectives  
24 which the Commission has set to say, "We think this is  
25 how safe is safe enough," and it makes it inconsistent

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 with proposed large release guidelines because the  $10^{-5}$   
2 you're talking about is for core damage and there's some  
3 probability beyond core damage that -- less than one,  
4 that there would be release from the primary system and  
5 you have hopefully such things as plate-out and scrub-  
6 out and then you have some kind of a containment  
7 performance also. So, you've gone far, far beyond the  
8  $10^{-6}$  release guideline and you've certainly gone far,  
9 far more than the health effects.

10 So, I think what the staff is proposing here  
11 is something which would void the safety goal. You're  
12 establishing a de facto new safety goal which ACRS --

13 DOCTOR MURLEY: I think it's clear that the  
14 EPRI guidelines are more stringent than the Commission's  
15 health effect safety goals, yes.

16 COMMISSIONER REMICK: And I applaud that. I  
17 think industry, for reasons, we encourage it and we  
18 expect. The Commission said that they expect that they  
19 will be safer. The question comes down whether you take  
20 their design objectives, which have many considerations  
21 beyond public health and safety, and impose those as a  
22 public health and safety requirement.

23 DOCTOR MURLEY: Well, I guess I'm  
24 uncomfortable with the notion that this is some staff  
25 conspiracy to go beyond Commission guidance. I don't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 think it's that case at all. These are industry  
2 proposed goals. They sound reasonable to us. They, in  
3 fact, meet the Commission's policy statement which is  
4 that future plants ought to be safer than current plants  
5 for severe accidents, and so --

6 CHAIRMAN CARR: Are you going to require them  
7 to be met, I guess is the question.

8 DOCTOR MURLEY: Not, as I said, in an absolute  
9 demonstration of a bottom line sense. But we are going  
10 to expect that they would make effort to meet them.  
11 Now, I don't mean to be cute, but we're not going to get  
12 into a big numbers analysis to demonstrate -- if it's  
13  $9.6 \times 10^{-6}$ , that's okay, or if it's  $1.1 \times 10^{-5}$ ,  
14 that's not okay. I think that would be a misuse of the  
15 goals.

16 COMMISSIONER REMICK: How about others in a  
17 hearing process? Knowing that the staff says that they  
18 should meet  $10^{-5}$  and the question logically arise, then  
19 do they? With what uncertainty? Can they demonstrate  
20 it?

21 DOCTOR MURLEY: My guess is we would be faced  
22 with those kinds of questions in a hearing, very likely.  
23 We haven't -- at the Indian Point hearing, if you'll  
24 recall, we've litigated PRA analysis before.

25 COMMISSIONER ROGERS: Could I just --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 COMMISSIONER REMICK: Oh, please.

2 COMMISSIONER ROGERS: -- step in there? My  
3 understanding is that what you're doing is setting a  
4 target that you expect them to aim for and that they  
5 are expected to demonstrate that they're aiming for that  
6 target. Then how it ultimately comes out in the end is  
7 going to be judged on some reasonable basis without  
8 trying to hold the designers to actually achieving 1.0  
9 times some factor of 10, that the objective of the  
10 design is to reach a certain target and if the design  
11 exceeds it a little bit, okay. If it falls below it,  
12 that that's the way it comes out. The staff is going  
13 to be somewhat relaxed on that --

14 DOCTOR MURLEY: Exactly,

15 COMMISSIONER ROGERS: -- on that  
16 interpretation of the meaning of that or the use of that  
17 target. That's my understanding of how you're proposing  
18 to do it.

19 DOCTOR MURLEY: That's the way I view it.

20 COMMISSIONER CURTISS: Let me expand on that.  
21 I gather, as I understand the argument that EPRI makes,  
22 they would like to know what the regulatory requirements  
23 are going to be and then beyond those regulatory  
24 requirements they would set, in this case, the two  
25 objectives that they'd lay out so that they can

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 demonstrate that they have met the licensing requirement  
2 with margin.

3           The argument or the concern, as I understand  
4 it's been expressed, is if we regulate or approach this  
5 with an objective of achieving the EPRI numbers, what  
6 we've done then is to erase the margin that is very  
7 important to them from the standpoint of demonstrating  
8 licenseability, which is one of the five objectives that  
9 they've set out in the Requirements Document. The  
10 concerns about the precise use of numbers and how you're  
11 going to approach that are the same concerns, I guess,  
12 in my mind, whether you're talking about the safety goal  
13 numbers or the EPRI numbers. The question that  
14 Commissioner Remick has raised, I think, and I share his  
15 concern, is that we've got safety goal numbers that  
16 we've established, first, and secondly, EPRI is seeking  
17 to go beyond that. I think that's a laudatory thing to  
18 do. As I understand it, they're proposing to do that  
19 so that they have that licensing margin.

20           But maybe you can expand on the question of  
21 the concern that's been expressed that as they set  
22 objectives to go beyond to achieve excellence, if you  
23 will, or go beyond what we require in the regulations,  
24 as our level of regulations rises up to whatever the  
25 objective is, you've just thereby eliminated the margin.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1           What is the response to that concern, if any?

2           DOCTOR MURLEY: I guess I don't understand  
3 it. I mean I've heard it before and I just don't  
4 understand it, that somehow they want to be able to use  
5 these numbers in a public relations kind of sense, but  
6 they don't want to be held to them. That's how I view  
7 it. I think we ought to at least not rigorously hold  
8 them to it, but expect them to demonstrate that they've  
9 made some effort to really meet the goals. If they're  
10 going to use them and they're going to use them in a  
11 public relations sense, as I sense they want to do it,  
12 then I think the staff has some responsibility to see  
13 that they've made a fair effort that way. And they are  
14 useful, I think.

15           Here's, I think, an example of how a designer  
16 might use the safety goals and it goes back. I mean I  
17 had some experience with this when I was working in AEC  
18 on the Clinch River project. We would take a goal and  
19 break it down to targets for subelements and one could,  
20 for example, for aux. feedwater system reliability, use  
21 this goal to set targets for the reliability of the  
22 goal, to show that they -- for that particular sequence,  
23 loss of all feedwater, that they've actually met it.

24           Now, what are we supposed to do if we don't  
25 uses those numbers as guidelines to evaluate the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 reliability of an auxiliary feedwater system?

2 COMMISSIONER CURTISS: Yes. I'm not sure I  
3 understand the distinction, but that question is going  
4 to come up whether you use as your goal the safety goal  
5 level or the higher EPRI level. The question that  
6 you're raising is should we have a goal like this that  
7 permits you to do the kinds of things that you've just  
8 described. If I understand at least what Commissioner  
9 Remick is saying, there's not an objection to using a  
10 goal, the question is whether it ought to be the higher  
11 EPRI goal which is set as a target or the lower goal  
12 that's proposed in the safety goal. It's not a question  
13 of not having a goal at all, it's a question of what  
14 that goal should be.

15 COMMISSIONER REMICK: That's correct.

16 I favor -- if the staff needs  
17 what I call subsidiary design objectives which are  
18 surrogates for the large release or something else, to  
19 have those, what we're differing on is what that number  
20 should be. I don't want to pursue it further because  
21 we owe you a vote sheet on 89-102 and 90-016 where I  
22 think the Commission will speak --

23 DR MURLEY: I think the real thing  
24 the Commission has to struggle with is what do the words  
25 in the severe accident policy statement mean with regard

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to future plants ought to be safer than current plants  
2 for severe accidents? And that's going to drive you to  
3 --

4 CHAIRMAN CARR: Well, but the advanced reactor  
5 policy statement says we expect at least the same degree  
6 of protection. While we expect that the future plants  
7 would be safer, the implication is we're going to  
8 require at least the same degree of protection as  
9 current plants. I'm not sure I see a dichotomy between  
10 those two. You've got a requirement and an expectation  
11 and as I read you, you would like to change the  
12 requirement.

13 DOCTOR MURLEY: We have been reading it, and  
14 perhaps wrongly. We have been reading it as -- that  
15 future plants ought to be required to be safer than  
16 current plants.

17 CHAIRMAN CARR: That's why I thought you said  
18 you were expecting a change of requirements.

19 DOCTOR MURLEY: Yes. We've been misreading  
20 it.

21 COMMISSIONER REMICK: But at the same time  
22 the Commission said this is how safe we think is safe  
23 enough at the same time.

24 DOCTOR MURLEY: Have they said that?

25 COMMISSIONER REMICK: The policy statement

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 is out from the standpoint of at least health objectives.  
2 That policy statement was issued.

3 CHAIRMAN CARR: Well, we owe you some  
4 guidance.

5 COMMISSIONER REMICK: Yes.

6 COMMISSIONER ROGERS: That's the point.

7 MR. TAYLOR: The health objectives, they are  
8 very loose standards.

9 CHAIRMAN CARR: We owe you a clarification of  
10 current guidance, one or the other.

11 Shall we proceed?

12 COMMISSIONER REMICK: Yes, please.

13 COMMISSIONER ROGERS: That's all I had.

14 DOCTOR MURLEY: The next topic then is ATWS.

15 COMMISSIONER CURTISS: Tom, could I --  
16 actually, I have a suggestion here at the outset, if it  
17 would fit well with what you're planning on doing. As  
18 I read through the individual overviews, it would be  
19 helpful as we go through here, because the question  
20 comes up with a number of issues, if you could, in the  
21 course of your discussion, highlight where we stand with  
22 EPRI on the individual issues, whether we're in  
23 agreement with EPRI, whether we're in disagreement but  
24 all the information is in, or whether we're waiting for  
25 information from EPRI on these individual issues. Would

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 it be possible to do that? Is that a --

2 DOCTOR MURLEY: Yes. Ashok Thadani and Jim  
3 Richardson are going to talk about most of these issues  
4 and I'll ask Charlie Miller to help us if he knows the  
5 status of EPRI views on things.

6 So, ATWS is one of those areas where we do  
7 have a rule, but the staff believes that there are  
8 better ways to -- better solutions for plants that are  
9 under design.

10 MR. THADANI: Okay. (Slide) May I have  
11 viewgraph number 3, please?

12 As Doctor Murley indicated, our approach to  
13 these reviews was to see how one could get better design  
14 in terms of its ability to deal with severe accident  
15 issues. We started out by looking at background  
16 information. This is operating experience, insights  
17 from various probabilistic risk assessments that have  
18 been conducted to date, the severe accident research  
19 program, the containments performance improvement  
20 program, to see what we could learn in terms of  
21 challenges, severe accident challenges, as well as  
22 challenges to the containment. So, we're focusing  
23 attention on both prevention issues as well as  
24 mitigation issues.

25 I'll briefly discuss one of the prevention

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 issues.

2 (Slide) Viewgraph number 4, please.

3 The first issue is anticipated transients  
4 without scram. This issue has long been recognized as  
5 an important safety matter. And, in fact, in 1984, a  
6 rule was promulgated, 50.62, the purpose of which was  
7 to reduce the likelihood of a severe ATWS event. The  
8 rule is prescriptive in nature, specifies hardware  
9 improvements that were believed to be appropriate and  
10 it's our judgment that for these advanced light water  
11 reactor designs, one can do more, be more effective in  
12 dealing with an ATWS event.

13 For the pressurized water reactor designs,  
14 one area where we think more can be done is to provide  
15 improved diversity in the electrical portion of the  
16 protection system, unless the consequences can be shown  
17 to be acceptable for an ATWS event, in which case the  
18 requirement for diversity would not exist. That's the  
19 key difference as far as the 50.62 requirement and what  
20 we're doing here.

21 For the boiling water reactors, the proposed  
22 design by General Electric actually goes beyond the  
23 requirements of 50.62 in one area and that is the  
24 diversity of the scram system. They have a good diverse  
25 system. However, they have proposed that one

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 requirement in 50.62 that says the standby liquid  
2 control system be automatically actuated, be changed,  
3 they would prefer that that be a manual system. We are  
4 currently evaluating their proposal on this issue. Our  
5 decision will be based in terms of the relative impact  
6 on risk from this change.

7 COMMISSIONER ROGERS: Before you go onto the  
8 next slide --

9 MR. THADANI: Certainly.

10 COMMISSIONER ROGERS: -- I wonder if you could  
11 just say something with respect to the ACRS comments on  
12 the diverse -- on the appropriateness of analyzing --  
13 or the difficulties of analyzing the logic of a diverse  
14 scram system. What is your view on that?

15 MR. THADANI: I think our approach would be  
16 similar to that proposed by the ACRS. As a matter of  
17 fact, the choice would be to design out ATWS. That  
18 would be our choice too. It seems that that might be  
19 doable in a pressurized water reactor, but will be very  
20 tough to do in a boiling water reactor system.

21 As for difficulties in terms of the value of  
22 diversity, there is merit to what the ACRS says. But  
23 we do believe after some of the studies that have been  
24 done in the past few years that implementation of  
25 diversity does improve overall reliability of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 system. But it's tough to quantify as to how much  
2 improvement one really achieves that way. But the  
3 thrust of ACRS comment, I think, was try to write out  
4 an ATWS, which is a fair --

5 COMMISSIONER ROGERS: Well, it seems to me  
6 there is a little never-never land here in between those  
7 two as to how much, to what extent you can really design  
8 out the possibility of an ATWS and to what extent  
9 additional protection is given by diversity so that, you  
10 know, you've brought the two together. It seems to me  
11 that that's something of a question, of how does one  
12 know when you're there that you have sufficient  
13 confidence that diversity will do something, that it  
14 would be adequate to meet a less than totally  
15 comfortable design that can ride out an ATWS.

16 MR. THADANI: It's a tough area. We've made  
17 some estimates and there are often arguments as to how  
18 much benefit one really gets. But the judgment has been  
19 that if you go for diversity and if it's done fairly  
20 well, that one can perhaps get an order of magnitude  
21 improvement. Again, it's -- there are disagreements  
22 even on that.

23 COMMISSIONER REMICK: I had some questions.

24 MR. THADANI: Yes?

25 COMMISSIONER REMICK: It's mostly for just

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 one of understanding. I'm not sure. When you're  
2 talking about diversity, what I read ACRS has written  
3 about diversity and what was in the SECY document, when  
4 I read the SECY document the staff mentions diverse  
5 scram systems. In my mind, I pictured the proposed ABWR  
6 design with the electric and hydraulic scram. I said,  
7 "Okay, that's diverse." Throughout, you talk about  
8 diverse systems and I thought that's what you were  
9 talking about, but the ACRS letter talks about logic and  
10 now you just mentioned the electrical systems and the  
11 advantages or possible disadvantages of diverse.

12 So, are we talking about diverse electrical  
13 components or are we talking about diverse scram things  
14 similar to perhaps the ABWR, although they're using one  
15 rod system, but two different means of scrambling? I'm  
16 not quite sure what we're talking about here and what  
17 the staff's position is on PWRs.

18 MR. THADANI: Okay. If I may back up now, to  
19 go into the background. The ATWS rule for boiling water  
20 reactors requires that diversity be provided in the  
21 electrical components. The scram system is hydraulic.  
22 The diversity was not required in the hydraulic control  
23 units.

24 The ABWR goes beyond in that they also provide  
25 not only the hydraulic insertion system, but they also

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 provide the electric insertion system, which clearly  
2 seems to us as diverse and would improve reliability.

3 For the pressurized water reactors, the rule  
4 required for Babcock & Wilcox and Combustion Engineering  
5 plants that diversity be provided in the electrical  
6 components of the protection system, not the rods  
7 themselves. It was all the electrical components,  
8 downstream of sensors, as a matter of fact.

9 For the Westinghouse design, because it was  
10 more tolerant of an ATWS event, the requirement was only  
11 to provide diversity in actuation of auxiliary feedwater  
12 system and turbine trip. But there was no requirement  
13 in place that the electrical components in the  
14 protection system be diverse to meet the ATWS rule.

15 COMMISSIONER REMICK: And the staff here --  
16 diverse here is other than redundant? You're talking  
17 about definitely diverse.

18 MR. THADANI: That's right.

19 COMMISSIONER REMICK: Okay.

20 MR. THADANI: Now we're talking about for the  
21 advanced light water reactor designs, PWRs, to in fact  
22 have one of two approaches they could utilize. One is  
23 to provide diversity in the electrical components, or  
24 to be able to ride through an ATWS.

25 CHAIRMAN CARR: And diversity you don't mean

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 dual systems, you mean different components?

2 MR. THADANI: Diversity can be achieved in a  
3 number of different ways. One could be through  
4 manufacturing diversity. One could be buying components  
5 that operate on different principles. There's some  
6 other forms, energized versus deenergized and so on.

7 COMMISSIONER ROGERS: That's not really part  
8 of the logic though. That's an actuation system.

9 MR. THADANI: It's actually -- the distinction  
10 comes then as downstream of the signal conditioning  
11 equipment in the protection system on up to the actuated  
12 devices. So, that's the portion. I admit we have used  
13 different terms to characterize it.

14 COMMISSIONER ROGERS: I wouldn't really call  
15 that logic. Yes.

16 COMMISSIONER REMICK: It's more than logic.

17 MR. THADANI: It's really more than logic,  
18 yes. Logic is just a set of cards, yes.

19 CHAIRMAN CARR: All right.

20 COMMISSIONER ROGERS: We ought to clarify that  
21 though, I think --

22 MR. THADANI: Okay. We'll do that. Yes.

23 COMMISSIONER ROGERS: -- that we don't really  
24 mean just logic.

25 COMMISSIONER CURTISS: Where do we stand with

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 that?

2 MR. MILLER: Well, EPRI's approach is  
3 compliance with the ATWS rule. We haven't proposed  
4 requirements beyond that.

5 MR. THADANI: That's correct, yes.

6 DOCTOR MURLEY: Okay. The next item is mid-  
7 loop operation and this is one of those emerging safety  
8 issues that we have not resolved completely yet, even  
9 for operating plants.

10 MR. THADANI: Okay. As a result of the  
11 operating experience and particularly the Diablo Canyon  
12 event of 1987, staff has required the industry to take  
13 certain actions to minimize the significance of this  
14 issue. Some of the requirements have been to provide  
15 better level instrumentation, tighter technical  
16 specifications in terms of the available equipment to  
17 provide make-up and better procedures for being prepared  
18 to take specific actions if they become necessary.

19 That's generally been the thrust for the  
20 operating reactors. And for the advanced light water  
21 reactors, we believe that they should also provide  
22 features that would significantly reduce the challenge  
23 to the operators, the likelihood of getting in trouble  
24 during mid-loop operation. The type of features that  
25 Westinghouse has discussed with us would, in fact,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 provide much greater margin in terms of available level  
2 before one can get in trouble, better devices to  
3 minimize vortex effects and so on for air ingestion  
4 concerns.

5 It seems to us that that's a good design, a  
6 good way to go, and we have required that all  
7 evolutionary designs incorporate such features for  
8 pressurized water reactors only.

9 Again in terms of EPRI, they have only  
10 addressed the requirements. They indicate they'll meet  
11 the requirements as they were imposed on the operating  
12 reactors. They have asked for a design that they have  
13 not proposed to go beyond in terms of specific design  
14 features.

15 COMMISSIONER CURTISS: So they come up short  
16 here on what you're proposing essentially?

17 MR. THADANI: Yes. Yes.

18 MR. MILLER: They've offered to meet the  
19 requirements in generic letter 88-17, which is primarily  
20 procedural. It doesn't get to just --

21 MR. THADANI: I'm sorry, no. Let me correct  
22 that. It's not procedural. It does go into  
23 enhancements. These are called program enhancements.  
24 As I indicated, they improve instrumentation,  
25 particularly level instrumentation because that's a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 critical item. So, there's some hardware involved.

2 MR. MILLER: Some of the things that Ashok  
3 said concerning design modifications that might get to  
4 the root cause of the problem have not been identified.

5 COMMISSIONER ROGERS: Have not been?

6 MR. MILLER: Have not been identified.

7 COMMISSIONER ROGERS: Do you intend to pursue  
8 that with them?

9 MR. MILLER: Yes, we do.

10 MR. THADANI: Yes.

11 COMMISSIONER ROGERS: Because it did seem to  
12 me that the ACRS recommendations there, the four points  
13 of recommendation seem to be very important to try to  
14 press for.

15 MR. THADANI: In fact, I think they are very  
16 important, yes, sir.

17 COMMISSIONER CURTISS: What is the precise  
18 posture there? Is the ball in our court analyzing their  
19 information or are we waiting for more information from  
20 EPRI? Just where are we?

21 MR. THADANI: We have indicated to EPRI  
22 specifically that what they propose is insufficient and  
23 here are the areas we expect them to address and tell  
24 us why not.

25 COMMISSIONER CURTISS: I guess one of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 generic questions that I have as we look at these issues  
2 and when we get to hydrogen I'll pursue it in more  
3 detail, but if you could expand upon where we disagree  
4 with EPRI on an issue, I'd be interested in knowing  
5 whether we've got all the information that EPRI intends  
6 to submit, they've got all the views that we intend to  
7 provide them, and if so how we reach the point of  
8 saying, "This is our bottom line. This is the position  
9 that we intend to take on hydrogen," as distinguished  
10 from they've got Qs and As from us, we're waiting for  
11 information from them, they're waiting for analysis from  
12 us. I'd just like to know how it is we get -- on those  
13 unresolved issues or what we call still unresolved  
14 issues, how we get to a resolution.

15 DOCTOR MURLEY: Many of these issues are  
16 unresolved between us and EPRI. We've sent out Chapter  
17 5 of the Requirements Document just within a few months.  
18 But at the Commission's direction, we've put in there  
19 a very big disclaimer that this is not the Agency  
20 position, it's the staff views. So, we can't, by  
21 ourselves, come to a resolution until you tell us what  
22 the resolution is. That's what we're here for.

23 COMMISSIONER CURTISS: Yes, but I guess I'm  
24 trying to distinguish -- and you've come to us with  
25 recommended approaches on a number of these. For a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 couple of them, it wasn't clear to me whether we've  
2 reached the end of the rope with EPRI. They've got all  
3 their information and we've got all our information or  
4 whether we're waiting for additional information.

5 I guess what I'm looking for is some kind of  
6 mechanism where you all think you've done everything  
7 you can do in the context of discussing the issue back  
8 and forth with EPRI and where you're prepared to come  
9 to us and say, "This is the final position that we  
10 intend to take. We've got all the information in and  
11 we propose to resolve it this way." And as we go  
12 through this, we can talk about that on matters like  
13 hydrogen and others.

14 DOCTOR MURLEY: I think that was the purpose  
15 here. We may not have all those adjectives, but where  
16 we say EPRI's position is as follows, they haven't  
17 changed -- if they have changed them, it will bring it  
18 up to this briefing.

19 COMMISSIONER CURTISS: All right. But what  
20 you have here on the 15 issues represents your view that  
21 you've undertaken all the discussion with EPRI that you  
22 think is fruitful, everything is in from them and this  
23 is your final call?

24 DOCTOR MURLEY: Yes.

25 COMMISSIONER CURTISS: Okay.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. MILLER: I guess I'd add to that, Commissioner,  
2 that these issues were addressed primarily in our draft  
3 safety evaluation, with caveats. In fairness to EPRI,  
4 they haven't said that they wouldn't continue the  
5 dialogue on them and we're anxious to continue some  
6 dialogue. But at this point in time, we haven't seen  
7 that they've offered --

8 COMMISSIONER CURTISS: Okay. Fair enough.  
9 I understand.

10 MR. MILLER: -- to come towards what the staff  
11 position is. The staff position is on the table.

12 COMMISSIONER CURTISS: Okay. Let's proceed.

13 CHAIRMAN CARR: Well, let me ask you one more.  
14 You say these are not yet -- this particular mid-loop  
15 problem is not yet resolved for operating plants. Will  
16 the fix you're putting in for the EPRI Requirements  
17 Document going to apply to operating plants, to fix  
18 that?

19 DOCTOR MURLEY: Yes. Now, I said that. What  
20 I meant is that we're still -- we think that the generic  
21 letter 88-17 is adequate.

22 CHAIRMAN CARR: So, if we just incorporate  
23 that into the EPRI Requirements --

24 DOCTOR MURLEY: This goes beyond that a little  
25 bit even. We are still looking. What I meant is it's

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 not totally resolved for operating plants as we're still  
2 looking to see whether there are some other  
3 vulnerabilities that we've missed. But we think --  
4 we're quite confident that the generic letter 88-17 is  
5 adequate to resolve the issues with mid-loop operation  
6 that we know about.

7 CHAIRMAN CARR: I guess my question is then,  
8 as I understand it, EPRI said, "Hey, we'll comply with  
9 the generic letter."

10 DOCTOR MURLEY: This goes beyond that even.

11 CHAIRMAN CARR: You're requiring them to go  
12 beyond the generic letter?

13 MR. THADANI: That's correct.

14 CHAIRMAN CARR: In what?

15 MR. THADANI: It's the one area and that is  
16 to provide -- now that they have this opportunity for  
17 a proper layout and so on that the operating reactors  
18 can't deal with, it seems to us there are some simple  
19 things that can be done today to significantly reduce  
20 the likelihood of getting in a situation of losing decay  
21 heat to move a system completely.

22 CHAIRMAN CARR: Okay. So you want them to  
23 design the pipes so you don't have --

24 MR. THADANI: That's exactly what it is.

25 CHAIRMAN CARR: Yes, I understand.

1 DOCTOR MURLEY: Loop seal configurations.

2 CHAIRMAN CARR: It's a design fix. It's not -  
3 -

4 DOCTOR MURLEY: Exactly.

5 MR. TAYLOR: Now it's more cost effective if  
6 you get it in in the design stage. You'll see others  
7 like --

8 CHAIRMAN CARR: Just don't have air traps.

9 MR. THADANI: Almost not global.

10 COMMISSIONER REMICK: I'd like to mention  
11 something along this line in case there are designers  
12 out there somewhere who might be listening. But Glen  
13 Reed, some years ago when this came up, claimed that  
14 there was a fix in some of the earlier reactors for this  
15 that was very simple. He claimed that the people are  
16 having to reduce the level for mid-loop operation lower  
17 than if they had this fix. He claims that apparently  
18 to get down to the mid-loop operation level, they have  
19 to reduce the level to drain the water out of the steam  
20 generator tubes. If I understand, he indicated that  
21 some of the early plants, that they had some sort of  
22 event. So it was not necessary to lower water as low  
23 as they currently do. I take it as fact. I don't know  
24 that it's true, but I just throw it out in case  
25 anybody's interested, but he proposed it was a very

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 simple fix and it was apparently in Point Beach perhaps  
2 or other -- enough said.

3 CHAIRMAN CARR: Okay. Let's proceed.

4 DOCTOR MURLEY: Okay. The next issue is  
5 station blackout.

6 MR. THADANI: (Slide) Next viewgraph, please.

7 Again, station blackout is another important  
8 safety issue and it was only in 1988, June of '88 I  
9 believe, that 10 CFR 50.63 was issued. And that rule  
10 required the operating reactors to do one of two things.  
11 One was to determine the duration for which the plant  
12 would have to be able to cope with station blackout and  
13 show that the plant could, in fact, cope with station  
14 blackout. Or the other option offered was that  
15 alternate AC power source be provided to deal with  
16 station blackout. In fact, the rule indicated  
17 preference for the choice of alternate AC power source.

18 What we're proposing to do here is to say  
19 really since that's the preferred option, let's stay  
20 with that for these advanced light water reactors. And  
21 so, our recommendation is that an alternate AC source,  
22 diverse from the existing source, be provided. As for  
23 EPRI, in fact, they do meet this requirement.

24 COMMISSIONER REMICK: Your wording of --  
25 excuse me -- of diverse design, I could interpret that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to mean it could be two diesel generators and two  
2 different manufacturers. I assume you mean here  
3 something like a gas turbine is diverse rather than  
4 diverse design.

5 MR. THADANI: That's what we meant, yes, gas  
6 turbine. In fact, the next viewgraph --

7 CHAIRMAN CARR: You mean if I want to buy  
8 another FM and I've already got an FM diesel, I've got  
9 to buy a GM or something?

10 MR. THADANI: That's what we --

11 CHAIRMAN CARR: You'd like to have airplanes  
12 fly around with four different kinds of engines? I mean  
13 that doesn't make sense to me.

14 MR. THADANI: The intent here simply is to do  
15 whatever we can in a reasonable manner to minimize  
16 common cause failures. That's the goal. If we're  
17 worried about multiple systems failing, it's very likely  
18 they'll fail from one common cause. Then how should one  
19 go about achieving that? One way to achieve that would  
20 certainly be to have a combustion turbine versus an  
21 emergency diesel generator.

22 CHAIRMAN CARR: But the idea that you couldn't  
23 have two separate diesels with separate systems, you  
24 would try to convince me that's not as reliable as  
25 having two different kinds of diesels with separate

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 systems?

2 MR. THADANI: Two different kinds of diesels  
3 with separate systems as long as each one is very  
4 reliable. I think that's a clearly important factor.  
5 It's tough to know up front, for example --

6 CHAIRMAN CARR: We're creating a maintenance  
7 and spare parts problem that, in my opinion, is not  
8 worth it.

9 MR. THADANI: That would add to that problem,  
10 yes.

11 CHAIRMAN CARR: I mean that's an opinion.  
12 You can take that diverse design so far that it becomes  
13 ridiculous.

14 MR. THADANI: In general, the focus on  
15 diversity has been in a limited number of areas, limited  
16 number of systems, protection systems, diesels and I  
17 think the auxiliary feedwater system.

18 MR. TAYLOR: I agree it could become  
19 ridiculous. I think this is just an example.

20 CHAIRMAN CARR: Yes. We've got to be very  
21 careful there, I think, my personal view.

22 All right. Let's --

23 COMMISSIONER ROGERS: Well, I just question  
24 whether EPRI really was buying that interpretation of  
25 diverse, that if they had two diesels they had to be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 different manufacturers. Is that -- are they in  
2 agreement with that?

3 MR. THADANI: Well, I can't say whether they  
4 agree with that interpretation. What they have proposed  
5 is, I believe, gas turbine as the alternate source. So,  
6 --

7 MR. TAYLOR: That answers -- that satisfies  
8 the issue.

9 CHAIRMAN CARR: Well, but there are other  
10 advantages to that machine over a diesel.

11 MR. TAYLOR: Certainly.

12 DOCTOR MURLEY: Why don't you mention what,  
13 in fact, the ABWR design is in this area?

14 MR. THADANI: Okay.

15 DOCTOR MURLEY: Do you recall that?

16 MR. THADANI: Yes, I have it in front of me.  
17 They have actually three independent trains of AC power,  
18 any one of which can provide shutdown capability. They  
19 are also proposing to have an alternate gas turbine.

20 COMMISSIONER REMICK: And each one of those  
21 systems has 100 percent diesel?

22 MR. THADANI: That's my understanding.

23 CHAIRMAN CARR: And they're three identical  
24 diesels?

25 MR. THADANI: Yes, identical diesels. And it

1 seems to us it's an outstanding way to deal with this  
2 important issue. I think they've just done a tremendous  
3 amount.

4 DOCTOR MURLEY: Now, this is an area where  
5 EPRI really pushed the designers further than they  
6 wanted to go initially. In this case, this is an  
7 example where the EPRI Requirements Document and that  
8 effort improved in our judgment.

9 COMMISSIONER REMICK: This is a true N plus  
10 2.

11 MR. THADANI: That's how I interpret this,  
12 yes. I might note they have another feature that's very  
13 important and one we discussed with you from our plants  
14 and that is the tie-in with the fire water system as  
15 well, to be able to depressurize and provide water to  
16 the core as well as to the sprays capability.

17 CHAIRMAN CARR: All right.

18 MR. THADANI: It's a good system.

19 DOCTOR MURLEY: Okay. The next issue is fire  
20 prevention.

21 MR. THADANI: Fire -- in some of the past risk  
22 assessments, fire has been identified as a relatively  
23 important contributor to core damage frequency. And two  
24 areas that appear to us to be most significant in terms  
25 of where we could do better now are to make sure that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 there is total separation, that the fact that fire were  
2 occur in a specific room or area, that we have a  
3 redundant trend totally separate that can safely shut  
4 the plant down. That goes beyond Appendix R  
5 requirements which would permit a 20 foot separation.

6 The other area -- next viewgraph, please.

7 COMMISSIONER ROGERS: Well, just on that, how  
8 do we stand currently on being able to satisfy that kind  
9 of requirement, that we could get safe shutdown assuming  
10 total loss of all equipment in any fire area? How many  
11 plants can we do that with now?

12 MR. THADANI: I think there are two exceptions  
13 in terms of areas. One is the control room, the other  
14 is the containment.

15 COMMISSIONER ROGERS: Well, the control room,  
16 yes.

17 MR. THADANI: The control room we have  
18 alternative shutdown.

19 COMMISSIONER ROGERS: Right.

20 MR. THADANI: For containment we said to the  
21 extent practical, you're still within the containment  
22 provided as much separation as can reasonably be  
23 provided. Outside of those two areas, most of the  
24 designers say that they don't see any real problem, as  
25 I understand EPRI, I don't believe, has indicated that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to us.

2 Charlie, do you recall?

3 MR. MILLER: EPRI's approach was the Appendix  
4 R approach.

5 MR. THADANI: That's what I thought.

6 MR. MILLER: You know, three hour fire  
7 barriers and 20 foot separation approach. We've stated  
8 our concerns with that in the Chapter 5 draft SER.

9 CHAIRMAN CARR: What do you -- let's discuss  
10 that environmental control system comment by the ACRS  
11 a minute. I assume, like you did, that that meant air  
12 conditioning.

13 MR. THADANI: That's how we interpreted it,  
14 yes.

15 CHAIRMAN CARR: But I didn't quite understand  
16 just how far they were going to go with it. I mean do  
17 you want to have separate air conditioning for the  
18 emergency shutdown panel too?

19 MR. THADANI: I don't think so. I don't think  
20 so.

21 CHAIRMAN CARR: Or at least have them rigged  
22 so that if you lose the control room, you lost that air  
23 conditioning and if you lose the emergency shutdown, you  
24 lose that air -- you could at least separate them that  
25 way.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. THADANI: There may be other ways of  
2 dealing with this without having to --

3 CHAIRMAN CARR: Well, that raised my curiosity  
4 when you said, "However, other options may be available  
5 to the designer," and I was trying to think of one and  
6 I couldn't come up with some system.

7 MR. THADANI: Ventilation. They may be able  
8 to do things with dampers and so on. It's not clear to  
9 me all the things they could do, but we thought there  
10 might be other options available.

11 CHAIRMAN CARR: Well, is it your intent to  
12 include that air conditioning requirement?

13 MR. THADANI: Is that -- I'm sorry?

14 CHAIRMAN CARR: Is that your intent then to  
15 include some kind of redundancy in the air conditioning  
16 systems?

17 MR. THADANI: Not in terms of air conditioning  
18 systems, no. But let me confirm that.

19 Conrad, can you address that?

20 MR. McCracken: Conrad McCracken, Plant  
21 Systems, NRR.

22 The reason we did include the requirement,  
23 and it was as you had expressed, Mr. Chairman, that the  
24 ACRS said they should have a redundant system.  
25 Basically a train A should have a train A ventilation

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 system, train B, a train B ventilation system and the  
2 control room would be, in fact, separate from the  
3 alternate shutdown panel.

4 The reason we, in our position we took with  
5 EPRI, didn't do it that way is because we didn't have  
6 any evidence of there being a problem significant enough  
7 to cause us to change at this time. It's a good idea.  
8 It makes sense. We would like to see them do it, but  
9 we didn't have any evidence on a PRA basis or anything  
10 else that showed it to be a big problem. We would like  
11 to see them go in the direction ACRS recommended. But  
12 in the other things we did in the area of fire  
13 protection, these were based on a known problem in  
14 plants and the design could change it and make it  
15 better.

16 Without having that, we felt that we were  
17 going beyond the regulations without a basis in going  
18 beyond the regulations, other engineering judgment and  
19 intuition and therefore we didn't include it. If you  
20 ask me if I'd like to include it, yes.

21 CHAIRMAN CARR: Okay. Thank you.

22 DOCTOR MURLEY: Let's see. Did you want any  
23 more discussion on the EPRI --

24 COMMISSIONER CURTISS: Just to make sure I  
25 understand what Charlie said. The different between

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 EPRI and us on this issue, does it boil down to a  
2 treatment of in containment systems? Is that the --  
3 when you say they've agreed to -- they take the Appendix  
4 R approach, is that --

5 MR. THADANI: No, I think the difference might  
6 be greater in terms of -- I believe EPRI would stick  
7 with the three R barrier concept rather than separation.

8 COMMISSIONER CURTISS: Okay. I understand.

9 DOCTOR MURLEY: The next issue then is  
10 intersystem LOCA, which is an emerging issue. It may  
11 or may not be a problem for current plants. We're  
12 looking into it, but it's one of those things that we  
13 believe is easy to fix with a fresh design.

14 MR. THADANI: (Slide) Okay. Can we go to  
15 viewgraph number 10, please?

16 Okay. As you have heard us say this before,  
17 the intersystem LOCA sequence is one where the barrier  
18 between the reactor coolant system and the low pressure  
19 system extending outside the containment  
20 is -- such sequences can lead to core damage as well as  
21 bypassing the containment, and hence the concern.

22 We believe that at this stage for these  
23 evolutionary designs, measures can be taken to  
24 essentially eliminate this problem. That's if the low  
25 pressure systems were designed such that they would not

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 fail if exposed to reactor coolant system operating  
2 pressure, then the concern for this issue would  
3 essentially go away.

4 The ACRS also told us that in so doing we  
5 should not ignore certain other pieces such as pump  
6 seals and things like that and they're quite correct.  
7 We do intend to discuss this matter with EPRI and  
8 vendors.

9 CHAIRMAN CARR: What's your estimate of the  
10 added cost of the plan of that design?

11 MR. THADANI: Added cost of --

12 CHAIRMAN CARR: You're making high pressure  
13 piping, a lot of high pressure piping that's not now  
14 required to be high pressure piping.

15 MR. THADANI: Yes.

16 CHAIRMAN CARR: And so it will be welded and  
17 x-rayed and all that. So, it's going to cost --

18 MR. THADANI: Yes, indeed. It would cost  
19 more. Currently, for example, this issue is more of a  
20 concern for PWRs. The RHR system is designed to about  
21 450 pounds and they have indicated that if they designed  
22 a system to 900 pounds, that actually it would be okay  
23 even under the operating conditions, pressure of 22,  
24 2300 pounds. And that would indeed add to costs. How  
25 much, I don't know.

1 CHAIRMAN CARR: Do you have any feel for how  
2 many welds and how many feet of piping and that kind of  
3 thing we're talking about?

4 MR. THADANI: We are talking about quite a  
5 bit of piping.

6 CHAIRMAN CARR: Now, my experience is it would  
7 -- I wouldn't say it would probably add half the cost  
8 of the primary system, but it's going to add a lot of  
9 money. There's a lot of manhours to fabricate those  
10 small pipes and that kind of stuff. I don't know -- you  
11 think 900 pounds would take care of a 2300 pound system?

12 MR. THADANI: We have not seen the capacity  
13 factors in the final calculations.

14 But Tad, do you want to --

15 CHAIRMAN CARR: Would you identify yourself,  
16 please?

17 MR. MARSH: Yes, sir. Tad Marsh, Chief of  
18 Mechanical Engineering Branch. Let me try. I too don't  
19 have an estimate of cost, but my perspective is that it  
20 would not be, in fact, an increase in pipe size, it  
21 would only require an increase in pipe schedule.

22 CHAIRMAN CARR: Yes. I understand that.

23 MR. MARSH: In other words, an increase in  
24 pipe thickness. Other welds that, of course, would have  
25 to be qualified for the extra thickness. But my

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 judgment is it wouldn't be an extra significant increase  
2 in cost.

3 CHAIRMAN CARR: Okay.

4 DOCTOR MURLEY: That was the impression I  
5 received also. We talked about this both with General  
6 Electric and with Westinghouse and they seemed to think  
7 it would really only be a modest increase in cost.

8 CHAIRMAN CARR: My experience with small gauge  
9 lines is it's a lot of work. You're talking material  
10 costs. I'm talking manpower to install and all that  
11 kind of stuff as well, but that's all right. So be it.

12 MR. THADANI: (Slide) Next viewgraph, please.

13 DOCTOR MURLEY: The next -- oh, you're still  
14 on intersystem?

15 MR. THADANI: Yes.

16 The other aspect of this requirement is that  
17 where system pressure, design pressure is not increased  
18 to be able to deal with intersystem LOCA, specific  
19 features should be provided that would, A, indicate to  
20 the operator quickly if the barrier is lost. There  
21 would be alarms, indication and ability to be able to  
22 close these valves and so on.

23 CHAIRMAN CARR: Is the intent here to do away  
24 with check valves as a protection?

25 MR. THADANI: Not necessarily. I think the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 check valves may still be there in the design, but I  
2 can't tell you for sure if they have got rid of all the  
3 check valves.

4 CHAIRMAN CARR: So, the leak testing  
5 capability is not going to be required for a check  
6 valve?

7 MR. THADANI: It would still be required. If  
8 there are two check valves in between, they would have  
9 to have some capability to be able to determine if  
10 there's leakage.

11 CHAIRMAN CARR: Okay.

12 DOCTOR MURLEY: Is that all?

13 MR. THADANI: Yes.

14 DOCTOR MURLEY: The next issue then is  
15 hydrogen generation and control, which is a severe  
16 accident issue.

17 MR. THADANI: Okay. Those were largely the  
18 prevention type issues and our focus in terms of  
19 mitigation issues was on those types of challenges to  
20 containment that could lead to early containment  
21 failure. One such challenge is, of course -- potential  
22 challenge is from hydrogen.

23 The TMI accident generated between 30 and 50  
24 percent hydrogen and even though we have been studying  
25 this issue since then, questions and uncertainties still

1 remain regarding hydrogen generation, detonation,  
2 impacts on continuing and survivability of containment.  
3 A large number of questions still remain on this issue.

4 In presence of this uncertainty and questions,  
5 the staff believes that it is appropriate to go forward  
6 with the 50.34(f) requirement which says in terms of  
7 generation that one should consider 100 percent of the  
8 active clad reacting and generating hydrogen and that  
9 in terms of containment, that it be able to deal with  
10 hydrogen concentration not in excess of ten percent.  
11 First the issue of the -- using 100 percent active clad,  
12 we believe that's a reasonable level as a surrogate for  
13 both in-vessel hydrogen generation as well as ex-vessel<sup>o</sup>  
14 hydrogen generation. We think 75 percent for in-vessel  
15 is reasonable based on a number of analyses and work  
16 that we've done and that 25 percent ex-vessel is a  
17 reasonable value to use for hydrogen generation.

18 There are experiments planned and underway  
19 now at Argonne. Our expectation is that those  
20 experiments would confirm what we're doing is  
21 appropriate.

22 In terms of the global hydrogen concentration,  
23 some experiments have been done at varying conditions  
24 in terms of temperature, presence of steam, different  
25 geometries, scaling factors are involved. The results

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 seem to indicate that one can get detonation in the  
2 range of nine to 15 percent hydrogen. A lower  
3 percentage of nine, ten percent is driven if, in fact,  
4 you have hydrogen air mixtures largely. If you have  
5 more steam, then you shouldn't get detonations at those  
6 levels unless the temperatures are pretty elevated.

7 All of these -- the work that's been done so  
8 far, there's still a lot of questions remain. National  
9 Academy of Sciences on combustion, hydrogen combustion,  
10 indicated that the use of ten percent to minimize  
11 likelihood of detonation was a reasonable kind of thing  
12 to do. And our judgment at this stage is -- in the  
13 presence of some of these uncertainties, that that is,  
14 in fact, a prudent thing to do. EPRI has, of course,  
15 disagreed with us. They have given us a document.  
16 About two months ago they sent in a report which we are  
17 reviewing and we expect to stay with this position  
18 unless there is some substantial evidence provided to  
19 the contrary.

20 DOCTOR MURLEY: Let me as Themis Speis, do  
21 you want to comment on this then?

22 DOCTOR SPEIS: We have been also doing quite  
23 a bit of research in this area, mostly with small scale  
24 bundles. We try to see if there are mechanisms that  
25 would slow down or limit the production of hydrogen.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 Earlier on, people thought that maybe the blockage is  
2 in the core itself, but we found out that the blockages  
3 are formed in an incoherent way and somehow the steam  
4 always is able to get to the zirc. So, as long as there  
5 is steam or water, which is turned into steam, you keep  
6 producing hydrogen basically. Okay?

7 Earlier on, also, there were discussions that  
8 maybe the initial hydrogen production will blanket the  
9 fuel and maybe that will retard additional production  
10 of hydrogen, but that was put to bed also. So, the key  
11 thing is that as long as the core has been heated up and  
12 there's some water. Of course, if you're able to cool  
13 the debris with lots of water and bring the degraded  
14 core to a stable configuration, then you stop producing  
15 hydrogen.

16 So, basically, as we said, the EPRI position  
17 is one that they say that we shouldn't be considering  
18 ex-vessel challenges. Okay? The core is a retaining  
19 vessel. That is their thing and that is their design  
20 basis condition. We feel that based on what we know  
21 from Research and PRA, that we should be more prudent  
22 and consider scenarios that involve additional hydrogen  
23 production from ex-vessel scenarios.

24 Also, I might point out that this 100 percent  
25 of active fuel, actually there's much more zirc and also

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 other materials in the core that could lead to the  
2 production of hydrogen. For example, in the ABWR, I  
3 think has an equivalent amount of zirc in boxes which  
4 are made up of zirconium and also has something like  
5 40,000 pounds of iron. So, this 100 percent really  
6 represents of less than 50 percent of the potential  
7 material that could lead to a production of hydrogen.

8 CHAIRMAN CARR: Is that mostly where the EPRI  
9 disagreement occurs in how much hydrogen can be  
10 generated or are they also disagreeing with the  
11 exposure number of ten percent?

12 DOCTOR SPEIS: I think it's how much hydrogen  
13 can be generated.

14 DOCTOR MURLEY: I think there are two.

15 MR. THADANI: Themis, let me say -- two parts.  
16 I don't believe they disagree with us in terms of the  
17 use of 75 percent in-vessel hydrogen generation. As  
18 Themis correctly noted, they are talking about  
19 recoverable degraded accidents. That is the damaged  
20 core is kept within the vessel. Whereas what we're  
21 talking about is a core melt going through the vessel  
22 and that 25 percent hydrogen generation from ex-vessel.  
23 So, that's one disagreement.

24 The second disagreement, and I think a bigger  
25 one, really is to do with the global concentration of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 hydrogen where they believe one would be concerned about  
2 detonations and potential impact on containment  
3 integrity. They would propose that 13 percent is a  
4 reasonable value for global concentration of hydrogen,  
5 whereas we're recommending a ten percent global  
6 concentration. I think that's a bigger issue simply  
7 because it has -- if you stay with 13 percent, you  
8 probably don't have to have an ignitor system. But if  
9 you go with ten percent, you probably have to have an  
10 ignitor system. So, my sense is that's the bigger  
11 issue.

12 CHAIRMAN CARR: Okay.

13 COMMISSIONER CURTISS: Has the Department of  
14 Energy done any work on this issue and, if so, where  
15 are they going to go?

16 MR. THADANI: Department of Energy, in fact,  
17 has been working with EPRI on this issue and the work  
18 done by, I think, Fauske Associates is supported by EPRI  
19 in conjunction with Department of Energy. That is the  
20 report I referred to earlier. I believe it was done by  
21 Fauske Associates.

22 DOCTOR SPEIS: It's mostly analytical.

23 MR. THADANI: That's right. That's right.

24 COMMISSIONER CURTISS: Two additional  
25 questions on this subject. This is one where from what

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 you've described it sounds to me like the staff review  
2 of the Fauske report is still underway, that there may  
3 be additional staff views that emerge as a result of  
4 that, although I gather from what you're recommending  
5 here that your opinion is firming up, if not set at this  
6 stage.

7           The first question focused on the evolutionary  
8 reactors. Number one, what are those folks doing? I  
9 know GE, I guess, is inerting the containment to address  
10 the issue. Secondly, as we move forward with this issue  
11 and as it becomes more important for the passive reactor  
12 designs, what's going to transpire between here and  
13 there? Is the work going to continue on this or have  
14 you pretty much brought this issue to a technical  
15 conclusion subject to completing review of the Fauske  
16 report?

17           DOCTOR MURLEY: Let me answer that. I think  
18 for the passive plants this is a very important issue  
19 for some fundamental aspects of the design, mainly the  
20 size of the containment and some elevations and so  
21 forth. So, my judgment, it needs to be resolved fairly  
22 quickly in order to set some ground rules for  
23 continuation of the design. Otherwise, they may go down  
24 a path thinking that they're going to prevail in their  
25 arguments and, I don't know, three, four, five years

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 from now, if the staff's view prevails, they may have  
2 to scrap major aspects of their design.

3 So, we can continue discussion or a dialogue,  
4 but I sense from the staff, from the research staff and  
5 my technical staff is we have not seen any really new  
6 information in the last few months that's going to  
7 change our position. So, we would recommend technically  
8 that our position is still sound. But also from a  
9 programmatic point of view, we think it's important to  
10 make a decision so we can move on.

11 COMMISSIONER CURTISS: And this approach, I  
12 gather from what you say, would be incorporated in both  
13 the evolutionary and the passive requirements document,  
14 that it is the approach to be taken?

15 DOCTOR MURLEY: Yes.

16 COMMISSIONER CURTISS: Any feel for when we  
17 reach that point where continued discussion of this  
18 issue might, in fact, if EPRI expects to prevail on it,  
19 might adversely effect their design? How far out can  
20 we go before we reach that point?

21 DOCTOR MURLEY: I don't know.

22 Charlie, do you have any thoughts on that?

23 MR. MILLER: Concerning the evolutionary  
24 plants?

25 COMMISSIONER CURTISS: Passive.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. THADANI: Passive.

2 MR. MILLER: EPRI is in the final stages of  
3 trying to prepare their passive requirements document.  
4 We anticipate the receipt of it in the next few months.  
5 So, I think the issue is going to be on the table then.  
6 If our decisions are not changed because of no new  
7 information over the next few months and we're trying  
8 to do the EPRI Requirements Document before proceeding  
9 with the actual reviews of the passive plant reviews,  
10 I would certainly say less than a year.

11 COMMISSIONER CURTISS: Okay.

12 CHAIRMAN CARR: Did I understand you to say  
13 it would effect the size of the containment decision  
14 and would it also effect core design, do you think?

15 DOCTOR MURLEY: I don't think it would effect  
16 the core design, no.

17 CHAIRMAN CARR: So we're only discussing the  
18 size of the containment or whether it's going to be  
19 inerted or not.

20 DOCTOR MURLEY: Also major aspects of the  
21 containment too. Not just the volume, but I think  
22 probably some features of the containment. I don't know  
23 all the details of where it might -- certainly ignitors  
24 or no ignitors and the electrical system that would be  
25 needed to supply the power for those ignitors would be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 an impact.

2 MR. THADANI: If I may just add, the issue is  
3 certainly the volume of the containment. There still  
4 would be some issues in terms of local concentrations,  
5 stratification and so on, and that EPRI, as I  
6 understand, would address those issues because you can  
7 get substantial amount of hydrogen in some pockets, some  
8 areas, so that one could handle this with volume. As  
9 I understand, there have been developments in terms of  
10 passive ignitor systems and so on too.

11 CHAIRMAN CARR: Okay.

12 COMMISSIONER CURTISS: One last question on  
13 the ACRS views. They recommend on this issue that the  
14 staff seek further technical information on the effects  
15 of, among other things, stratification before setting  
16 an average hydrogen concentration. Could you comment  
17 on that?

18 MR. THADANI: As far as I know, we have looked  
19 at all the relevant information on this subject. We  
20 have had discussions with a number of eminent people in  
21 this area and I think what's needed is better  
22 information. There's just a set of experimental data  
23 that's available, that all of us have looked at.  
24 Research currently is talking to MITI, for example, for  
25 further work in the hydrogen area.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 But unless this big set of information that  
2 exists out there that we just don't know about, I don't  
3 know what else we can really do.

4 COMMISSIONER CURTISS: Let me just read what  
5 they say. "We are not aware of any experimental or  
6 analytical work that demonstrates the detonation of  
7 hydrogen 10, 13, or some other level could damage the  
8 integrity of the containment and essential components."  
9 Is it just they're not aware of what you've looked at?

10 MR. THADANI: No, I think it's not just  
11 detonation. People worry about multiplication of shock  
12 waves and so on that can be generated. It's a complex,  
13 complex phenomenon. A single detonation may, in fact,  
14 not do anything to the containment structure. But these  
15 things can develop and become worse.

16 DOCTOR SPEIS: Also, we're looking at -- these  
17 type of calculations have to have in front of it the  
18 final decision, all the surfaces, all the constraints,  
19 all the geometries to make sure that there are no  
20 reinforcing waves. But if you have a simple geometry,  
21 these calculations are not very difficult. All of us  
22 have learned that maybe the pressure of detonation is  
23 approximately twice the conflagration, but then in the  
24 process of getting different surfaces and constraints  
25 and other things, then you can get -- so, it's difficult

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to calculate that.

2 So, the more prudent thing is to avoid. But  
3 if we have then do a multi-dimensional calculation and  
4 wait until the end and then if things don't work out,  
5 then they have to put something. At that time, that  
6 doesn't make sense.

7 DOCTOR MURLEY: And we did have one explosion  
8 in a reactor containment and it did damage equipment and  
9 containment. You can't say that it affected the  
10 integrity, but it sure affected a lot of the equipment  
11 because I've seen it.

12 CHAIRMAN CARR: No doubt in my mind that a  
13 hydrogen explosion will affect --

14 DOCTOR MURLEY: Yes.

15 CHAIRMAN CARR: I've seen it in a submarine.

16 COMMISSIONER REMICK: The staff for a long  
17 time --

18 CHAIRMAN CARR: It didn't affect the hull of  
19 the submarine, but it affected a hell of a lot of  
20 equipment.

21 COMMISSIONER REMICK: The staff for a long  
22 time had a consultant, I think from the University of  
23 Virginia, in this area, hydrogen. Are his views  
24 consistent with the staff views on detonation and so  
25 forth?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. THADANI: I will have to check on that.

2 COMMISSIONER REMICK: Okay.

3 DOCTOR MURLEY: We'll get back on that.

4 The next issue then is core-concrete  
5 interaction and that is a severe accident litigation  
6 issue.

7 MR. THADANI: Well, this issue -- I don't  
8 think there's any significant disagreement between  
9 either the vendors, EPRI or us. The goal here is  
10 clearly to minimize core-concrete interactions. What's  
11 been proposed is that adequate surface would be provided  
12 for spreadability of core debris and that capability  
13 will be provided to be able to flood this debris to  
14 hopefully terminate rapidly core-concrete interactions.  
15 But this clearly goes beyond our current requirements.

16 Again, as I indicated earlier, experiments  
17 are underway at Argonne and they may have some bearing  
18 on this.

19 CHAIRMAN CARR: Yes. Are they going to be  
20 out in time to have an effect?

21 MR. THADANI: The results will be available  
22 in eight to ten months, I think. Right?

23 DOCTOR SPEIS: Yes. They will be available  
24 in time.

25 DOCTOR MURLEY: Okay. I think this one is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 clear. It's just sensible design changes that people  
2 can make the help the issue.

3 CHAIRMAN CARR: But it's not a core catcher  
4 solution.

5 DOCTOR MURLEY: Not a core catcher, no.

6 CHAIRMAN CARR: Why not? I mean somebody is  
7 using core catcher, I gather.

8 DOCTOR MURLEY: I don't know if they are or  
9 not. People have tried for years to lay out the design  
10 requirements for a core catcher and also to somehow do  
11 an experiment or fashion an experiment that you could  
12 say met the requirements and that's the tough one. You  
13 don't know that what you've done can really contain a  
14 whole core. So, the idea here is do some sensible  
15 things that make sense.

16 MR. THADANI: The other thing that is done in  
17 association with this is the availability of water to  
18 cool the debris. So, you have the available area and  
19 the water and between the two it's the most sensible  
20 thing to pursue at this time.

21 DOCTOR MURLEY: Yes.

22 COMMISSIONER REMICK: And what's the  
23 difference now between the ABWR which has a design that  
24 would collect any core and then water come in. Why  
25 isn't that a core catcher or is there something I'm

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 missing here? They propose -- I remember some walls so  
2 that if the core did come down it would be retained  
3 underneath and then you have the provision of water  
4 coming in.

5 DOCTOR MURLEY: The classical notion of  
6 a --

7 CHAIRMAN CARR: But the steel lined thing  
8 though.

9 DOCTOR MURLEY: -- core catcher is a ceramic  
10 feature that sometimes even has active cooling and so  
11 forth.

12 COMMISSIONER REMICK: So, it's just the  
13 definition of core catcher in this case.

14 DOCTOR MURLEY: Yes.

15 COMMISSIONER REMICK: Because this is the  
16 design that retained the core that might melt and then  
17 cool it, right?

18 MR. THADANI: That's correct, yes.

19 COMMISSIONER REMICK: Okay. You're thinking  
20 of a ceramic or --

21 MR. THADANI: Yes.

22 COMMISSIONER REMICK: Okay.

23 DOCTOR MURLEY: The next issue is core melt  
24 ejection, another severe accident mitigation.

25 MR. THADANI: Okay. There are a number of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 issues that develop when one is addressing the high  
2 pressure melt situation. First, within the primary  
3 system itself, one can get natural circulation from the  
4 hot gases in the hot core and the rest of the system and  
5 some concerns have been developed that this might lead  
6 to a potential impact on steam-generated tubes and the  
7 potential failure of those tubes.

8 But even beyond that, if one does get into  
9 high pressure melt scenario where a vessel is breached,  
10 two issues come up. One is the issue of direct  
11 containment heating which you have heard a great deal  
12 about in the last year or two, and particularly last  
13 week. This is a phenomenon where core debris, under  
14 high pressure, is ejected into the containment  
15 atmosphere where it's dispersed in fine particles and  
16 could, could lead to rapid addition of energy and  
17 potential containment failure exists.

18 The other issue is that this dispersal of  
19 debris can also lead to production of hydrogen through  
20 reaction with steam. This hydrogen could, again, lead  
21 to combustion and so on and so forth.

22 And then Research briefed you last week  
23 indicated that the issue of direct containment heating  
24 would likely have a technical resolution in about two  
25 years.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1           For the advanced light water reactors, again  
2 there's no disagreement on this issue between the  
3 vendors, EPRI or us. We think there are two things,  
4 two useful ways to deal with all these concerns. First  
5 is to provide a depressurization system which EPRI is  
6 proposing and the vendors are also proposing, as well  
7 as to make sure that the cavity design up front is such  
8 as to minimize the potential for this ejection of debris  
9 to the containment atmosphere.

10           Again, this is one issue where I don't think  
11 there's any disagreement, but it goes beyond current  
12 requirements.

13           DOCTOR MURLEY: Okay.

14           COMMISSIONER CURTISS: Could you comment on  
15 the ACRS views?

16           MR. THADANI: You know, I think we probably  
17 are stuck with some words here. High pressure melt  
18 scenarios, you have concern within the primary system  
19 also. It's not only containment that you're worried  
20 about. You're worried about primary system as well.  
21 And if you have depressurization system, it deals with  
22 potential concerns for primary system. It can also deal  
23 with the discharge of elevated pressures in direct  
24 containment heating issue.

25           But a number of questions still remain

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 regarding the effectiveness of such a system, cut-off  
2 pressure, for example, where direct containment heating  
3 is no longer an issue. Timing of sequences and so on  
4 still remain.

5 It seems to us that prevention of  
6 depressurization system may be the answer to both  
7 issues, but we're not sure.

8 DOCTOR MURLEY: Let me add a thought here.  
9 They're quite right. They say this is an extremely  
10 improbable event and we see no need to require two modes  
11 of coping with it. Now, if we could be certain that  
12 either one of those were going to solve the problem,  
13 then I think we would say yes. But you don't know that  
14 either depressurization or the design features that  
15 people have thought about in the cavity for sure is  
16 going to fix this issue. So I think it's a matter of  
17 really just prudence in this case.

18 COMMISSIONER CURTISS: Okay.

19 COMMISSIONER REMICK: What kind of design  
20 features do you have in mind? One was described  
21 somewhere in here was at least three feet of concrete -  
22 -

23 MR. THADANI: Yes.

24 COMMISSIONER REMICK: -- above the line error  
25 and so forth. Is that the type of thing? I'm not sure

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 I could picture which --

2 MR. THADANI: No. I think the cavity design -  
3 - what you'd like to see is when the core debris comes  
4 down at elevated pressures, you'd like to have a design  
5 that will push it in a specific direction and then have  
6 some kind of, hopefully, a tortuous type of path which  
7 would lead to retention of a lot of the material and  
8 substantially minimize the likelihood of this stuff  
9 getting in the atmosphere, containment atmosphere. So,  
10 that kind of a design would deal with the issue.

11 COMMISSIONER REMICK: And I have no problem  
12 and what, I guess, concerns me here, somewhere there  
13 might be a tradeoff that by doing that there might be  
14 some adverse effects that affect it and I assume the  
15 staff is -- and it might be a tremendous cost, I don't  
16 know. Is the staff viewing this as an absolute  
17 requirement or a prudent type of thing in design that  
18 they would look for?

19 DOCTOR MURLEY: Are you talking about the  
20 depressurization?

21 COMMISSIONER REMICK: No, not the -- no, the  
22 features, the cavity design.

23 MR. THADANI: It's a prudent thing. And in  
24 fact, I quite agree with you, one has to be very careful  
25 that one doesn't introduce big down sides through this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 change. And we expect -- once we get to that stage of  
2 our discussions, we would certainly be addressing issues  
3 like that. Not just on this, I expect on other issues.

4 CHAIRMAN CARR: We've given the designer a  
5 problem here of predicting the most likely area of  
6 failure, it seems to me. Otherwise you're going to have  
7 to surround the whole pressure vessel with something.

8 MR. THADANI: No. In fact, we've seen, I  
9 believe, a design that I think Combustion Engineering  
10 discussed with us. It seemed to be a fairly effective  
11 way of retaining a bulk of the debris.

12 DOCTOR MURLEY: But let's answer --

13 CHAIRMAN CARR: Do you think it's going down  
14 or --

15 DOCTOR MURLEY: Yes. We're assuming that the  
16 melt goes downwards, right?

17 MR. THADANI: Yes.

18 DOCTOR SPEIS: The issue is --

19 CHAIRMAN CARR: Why are you doing that?

20 DOCTOR MURLEY: Well, we're reasonable and we  
21 had to draw the line somewhere.

22 DOCTOR SPEIS: The issue is one of entrainment  
23 here because the particles are entrained by steel and  
24 is there a potential to de-entrain to make sure that  
25 they fall right there before they get a chance to go

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 into the volume, and there are cavities already that can  
2 do things like that in existing plants. So, there is  
3 enough information to configure an appropriate cavity  
4 without adding substantial complications with designs.  
5 We think with some attention ahead of time, this can be  
6 taken care of.

7 DOCTOR MURLEY: We have not heard of any down  
8 sides to this, but you're exactly right, I think we need  
9 to be alert to that and we will be.

10 Let's move on to one where there is  
11 controversy, and that is the containment performance  
12 guideline. We have had a containment performance  
13 guideline in the LRB for the GE ABWR now for three  
14 years. EPRI does not agree with this. The staff  
15 believes that a containment performance guideline,  
16 either a conditional containment failure probability of  
17 0.1 or a deterministic performance goal that offers  
18 comparable protection is necessary to give the ALWR  
19 designers guidance on what is acceptable for containment  
20 performance under severe accident conditions.

21 The alternative to having a containment  
22 performance guideline is to design the containment for  
23 the traditional design basis accidents, primarily a  
24 large loss-of-coolant accident, and then to evaluate  
25 its severe accident failure probability after it's

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 designed and after the fact. That's the situation we  
2 find ourselves in now for current containments and  
3 that's the controversy, for example, that's surrounded  
4 the Mark I containment. It was not designed for severe  
5 accidents.

6 So, the issue in our mind is as simple as  
7 that. We thought that we should give the designers some  
8 guideline to let them take into consideration severe  
9 accidents early in the design. The ACRS said that we  
10 believe the staff proposal will be adequate for ELWR  
11 review if it's supported by an appropriate reg guide,  
12 developed on a timely schedule, and if it can be  
13 reasonably demonstrated that a containment that meets  
14 this guidance has a conditional containment failure  
15 probability of not more than 0.1. We essentially agree  
16 with those comments and we will work with the ACRS on  
17 this, because we know they're working concurrently on  
18 a containment performance guideline.

19 Now EPRI does not agree with us. We have sent  
20 out the Chapter 5, where we've offered them the  
21 opportunity: if they did not like the one-tenth  
22 guideline, would they like to propose an alternative?  
23 And I don't know that we've heard back.

24 Charley, do you know if we heard back on that?

25 So I've had some private discussions with some

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 EPRI people where they took that as a challenge to come  
2 back. I mean, they didn't really disagree with the  
3 notion in general of a containment performance  
4 guideline, but they'd kind of like to come up with one  
5 of their own. So my sense is they're working on it, but  
6 I can't really tell you where they stand now.

7 CHAIRMAN CARR: If we require that one-tenth,  
8 will that lead to all future designs needing vents?

9 DOCTOR MURLEY: No, particularly not the large  
10 dry containments. But go ahead --

11 MR. THADANI: Certainly not the large dry  
12 containments. The ABWR type of design, yes.

13 CHAIRMAN CARR: It doesn't need a vent?

14 MR. THADANI: It would need a vent.

15 CHAIRMAN CARR: It does need a vent.

16 MR. THADANI: It does, yes.

17 COMMISSIONER CURTISS: Do I read the  
18 attachment on that issue correctly when I draw the  
19 conclusion that the ten percent criterion did lead to  
20 the vent in the case of the ABWR?

21 MR. THADANI: If one were to apply ten percent  
22 criterion, based on the PRA in-house, which the review  
23 has not been completed, yes, indeed, it would indicate  
24 that you would have to have a vent system to meet the  
25 ten percent criterion.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 DOCTOR MURLEY: I don't know if --

2 MR. THADANI: I might expand on that a little  
3 bit. The definition they used was 25 rem all-body dose  
4 at I think it was half a mile to say what do we mean by  
5 failure of a containment. That's not a straightforward  
6 issue itself.

7 So if one defines failure by using certain  
8 dose level at some distance, then I think the point one  
9 would be made if you have the vent system.

10 DOCTOR MURLEY: I don't know that I've  
11 actually directly asked GE that.

12 Do you know, Charley, would the vent be  
13 required to meet the one-tenth?

14 MR. MILLER: The way GE came to the vent was  
15 through their PRA analysis and the commitments that they  
16 had made up front in their LRB concerning .1 CCFP. And  
17 as a result of that --

18 DOCTOR MURLEY: So it did lead to the vent.

19 MR. MILLER: -- led to them putting that in  
20 initially. But I think the more that they looked at  
21 it, the more that they liked it as an over-pressure  
22 protection device in total.

23 CHAIRMAN CARR: What drives this requirement?  
24 I mean, what are we really trying to do with it?

25 DOCTOR MURLEY: I think it's fairly simple in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 my mind that a proper consideration of balancing of  
2 mitigation and prevention says that at some stage  
3 everything that you do to prevent an accident you do  
4 the best you can, but you can't really rule it out. If  
5 you could, you wouldn't need containment.

6 CHAIRMAN CARR: So mitigation really --

7 DOCTOR MURLEY: So it's mitigation, right.  
8 And if you're going to --

9 CHAIRMAN CARR: It's not a safety margin  
10 number, it's just mitigation of --

11 DOCTOR MURLEY: Right. And also, I think that  
12 the designer needs some guidance along this area. And  
13 just to design for a large LOCA is not enough, and so  
14 it's that simple.

15 CHAIRMAN CARR: And the ten percent is a magic  
16 number?

17 DOCTOR MURLEY: No, there's nothing magic.  
18 I think it's kind of, I thought, a reasonable target.  
19 It's the fact that we think we've driven the chances of  
20 a severe accident down fairly low anyhow. Be nice to  
21 get another order of magnitude protection beyond that,  
22 and it's about as simple as that.

23 COMMISSIONER REMICK: It's entirely consistent  
24 with the safety goal and the proposed large release  
25 guideline. There's some consistency in there.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. THADANI: I was going to say that it is  
2 in conformance with the thought process of core damage  
3 of  $10^{-5}$  and a release of  $10^{-6}$ . There's some relationship  
4 there.

5 DOCTOR MURLEY: Themis, were you going to say  
6 something?

7 DOCTOR SPEIS: No. I was going to say that,  
8 but Commissioner Remick --

9 COMMISSIONER CURTISS: Just a procedural  
10 question. If we vote the paper out tomorrow and approve  
11 this particular approach, where are we in terms of  
12 EPRI's look at alternatives here? How do we coordinate  
13 with that initiative? Or, to put it differently, should  
14 we defer on this one pending EPRI's response on Chapter  
15 5?

16 DOCTOR MURLEY: Well, see, what we're asking  
17 your approval for is either the .1 or an alternative.  
18 So we would even agree that we wouldn't impose the .1  
19 across the board if they could come up with a  
20 deterministic goal that is roughly comparable.

21 CHAIRMAN CARR: And the proposal gives them  
22 an option if they don't want to do the .1.

23 COMMISSIONER CURTISS: I guess I thought the  
24 deterministic one that we talked about last time was  
25 starting to firm-up on 48 hours.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 DOCTOR MURLEY: Yes.

2 COMMISSIONER CURTISS: Okay. That's the  
3 current staff thinking on deterministic?

4 DOCTOR MURLEY: That's the current staff  
5 thinking. I think it's a good goal. And if EPRI would  
6 prefer that, I think we would go along with that.

7 COMMISSIONER CURTISS: Okay. Let me ask  
8 what's the status of the staff's effort to develop some  
9 guidance on the implementation of either of the two  
10 alternatives, picking up on the ACRS comments?

11 DOCTOR SPEIS: We're working with Ashok here.  
12 We have some people at Brookhaven National Laboratory  
13 who are putting together a guide for PRA for future  
14 plants. And as part of that, these are issues  
15 associated with that: containment performance, how you  
16 calculate conditional containment value. So we're  
17 working and I don't know exactly -- in the next six  
18 months -- the coming year, I guess. We should have  
19 something by then, a year or so.

20 We have been discussing this with the ACRS,  
21 so this is something that is ongoing in a kind of open  
22 way. It's not some contractor working on a report and  
23 all of a sudden it will make its appearance.

24 COMMISSIONER CURTISS: Okay.

25 DOCTOR MURLEY: I suggest we move on. We want

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to make sure we talk about source term today.

2 The next issue is the containment vent design.

3 MR. THADANI: Well, we've already touched on  
4 the vent issue. Its value is maximum for pressure  
5 suppression type containment, and so we believe that it  
6 does offer some substantial benefit for ABWR design.

7 COMMISSIONER CURTISS: What's the timing of  
8 Brookhaven's review of GE's PRA? Can you tell us when  
9 that will be complete?

10 MR. THADANI: Well, they have a number of  
11 questions. They expect, assuming that they get a fairly  
12 rapid response to those questions, they expect to  
13 complete the review I think it's August of this year,  
14 I believe.

15 CHAIRMAN CARR: We're not addressing whether  
16 this vent ought to be filtered or not?

17 MR. THADANI: It's already filtered, because  
18 it's in the wet well area.

19 CHAIRMAN CARR: Okay.

20 DOCTOR MURLEY: But we're not requiring across  
21 the board for other designs either a vent or a filter.

22 CHAIRMAN CARR: All right.

23 DOCTOR MURLEY: This is just for the ABWR.

24 COMMISSIONER CURTISS: Just on this particular  
25 question, at the last meeting we got into some

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 discussion of whether it ought to be actuated by the  
2 rupture disks or human actuation. Does that issue get  
3 sorted out when we approve this, or is that still a  
4 subject of some discussion?

5 MR. THADANI: It's a subject of discussion,  
6 because what we want to make sure is whatever vent  
7 design is utilized it is one that:

8 (a) provides adequate control if it is needed;

9 (b) minimizes downsides venting.

10 So there are questions regarding the design  
11 that was proposed by GE, but we will pursue that once  
12 we come to the decision.

13 COMMISSIONER CURTISS: Okay.

14 DOCTOR MURLEY: Okay. The next issue is  
15 equipment survivability.

16 MR. THADANI: Okay. Since we're talking about  
17 very low probability events, we're not treating severe  
18 accidents like classical design based accidents, and  
19 since as we discussed the thought process that was  
20 utilized in coming up with some containment performance  
21 goal, we have applied the same approach to saying what  
22 would be considered adequate in terms of the equipment  
23 that would be needed to deal with severe accidents. To  
24 that extent, this equipment need not be safety grade,  
25 need not have redundancy, but that it be able to perform

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 its intended function in the environment it's expected  
2 to see, that it be designed to good engineering  
3 standards. This we believe, based on our experience to  
4 date would lead fairly reasonably reliable system to  
5 deal with severe accidents.

6 COMMISSIONER REMICK: Want to address the ACRS  
7 comment that what you underline in the SECY isn't the  
8 whole story? I'm not sure what was meant there.

9 DOCTOR MURLEY: Yes. We should explain that.  
10 Charley, why don't you explain that?

11 MR. MILLER: In our dialogue with the ACRS,  
12 it was noted that if you look at the section in the SECY  
13 paper there are some things that the staff is talking  
14 about and asking for that didn't end up in the  
15 underlined portion at the bottom. And I think in our  
16 dialogue we agreed that the whole story just wasn't  
17 painted by what was underlined at the bottom.

18 The ACRS wanted to make sure that the  
19 Commission knew that they had to focus on the whole  
20 section to really capture everything that the staff was  
21 saying, not just on the underlined portion. I promised  
22 Chairman Michelson that I would address that.

23 COMMISSIONER REMICK: Okay. Could you quickly  
24 summarize what that includes?

25 MR. MILLER: Yes, I can. I think the best

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 thing would be for me to just take the excerpts from  
2 the paper.

3 We've said that the mitigation features must  
4 be designed so that there's reasonable assurance that  
5 they will operate in the severe accident environment  
6 for which they're intended.

7 We go on to say that for the ALWR designs for  
8 credible severe accident scenarios, the equipment needed  
9 to perform mitigative functions and the conditions under  
10 which the mitigative functions must function will be  
11 identified: equipment survivability expectations under  
12 these conditions, for example station blackout or  
13 earthquakes; and the environment, for example pressure,  
14 temperature, radiation, in which the equipment is relied  
15 upon to function.

16 What the ACRS was looking for is a measure  
17 of-- we're saying that we would like to see this  
18 equipment function for the period of time and for the  
19 purpose that it was designed for in the severe accident  
20 scenario. They wanted to make sure that we got to the  
21 bottom line, that we weren't trying to make it totally  
22 pedigree in accordance with equipment qualification.  
23 And I think that's where the dialogue ended up. We  
24 wanted to let them know that we expected it to function,  
25 but that it didn't have to be totally pedigreed.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1           And we went on to give some specifics in there  
2 concerning its capability: to be powered from an  
3 alternate power supply, as well as from the normal Class  
4 IE.

5           COMMISSIONER REMICK: It's all in there. It's  
6 just not underlined.

7           MR. MILLER: It's in the paper.

8           COMMISSIONER REMICK: It's not underlined,  
9 okay.

10          MR. MILLER: It wasn't underlined.

11          COMMISSIONER REMICK: All right.

12          MR. MILLER: And I think the ACRS felt, as a  
13 result of the dialogue and what would be approved, that  
14 maybe it should have been underlined and I conceded.

15          COMMISSIONER REMICK: Thank you.

16          DOCTOR MURLEY: The next issue is source term.  
17 There are policy aspects of source term that either are  
18 or will be before the Commission that go beyond what we  
19 have here, but there are some aspects that we would like  
20 some guidance on.

21          MR. THADANI: (Slide) Could I have viewgraph  
22 number 19, please?

23          Okay. The staff is considering decoupling  
24 siting from the Part 100, and as a matter of fact is  
25 meeting with the ACRS scheduled for next week on this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 issue, and it is our intention to brief you in the near  
2 future on this issue and also complete a paper, I  
3 believe, by end of June on this subject.

4 DOCTOR MURLEY: Excuse me. We do not need  
5 the Commission's action on that to proceed with these  
6 reviews.

7 MR. THADANI: (Slide) In fact, that's  
8 viewgraph number 20 is what we really need.

9 What we're doing on the evolutionary designs  
10 is to say they have to meet 10 CFR Part 100  
11 requirements. However, where there is adequate  
12 technical justification to deviate from the requirements  
13 -- for example, Reg Guide 1.3 and 1.4 assumptions --  
14 that we would provide relief in those areas. I'll give  
15 you two examples.

16 One has to do with, for the ABWR, giving  
17 credit for retention hold-up in the steam lines and the  
18 condenser. Even though the system is not designed to  
19 safe shutdown earthquake level, we believe there is--  
20 we're reviewing the information base, but we believe  
21 there is enough evidence to indicate that the pipes  
22 generally hang together, even in case of some very  
23 severe earthquakes and so on, that one can put together  
24 adequate technical bases to give such credit. And we  
25 expect to complete our review this summer on this issue.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 COMMISSIONER REMICK: Excuse me, if I can  
2 interrupt. Giving credit to that enters into the  
3 picture of whether one standby gas treatment system is  
4 sufficient? I'm not sure I --

5 MR. THADANI: It would basically do away with  
6 the requirement for leakage control systems.

7 COMMISSIONER REMICK: Leakage control systems.

8 MR. THADANI: Yes. And one can go to greater  
9 leakage through MSIV valves and so on.

10 We are also -- we expect to complete our  
11 technical evaluation on some parts of the source term:  
12 fission products release time, and the quantity of  
13 radionuclides released in the containment. Those two  
14 areas we expect to reach our conclusions this summer  
15 also, and depending on how that comes out we'll expect  
16 to apply these in an assessment of evolutionary designs.

17 So that's really what we're looking for from  
18 you.

19 COMMISSIONER REMICK: Can you help me? You  
20 discuss the one train -- or standby gas treatment, but  
21 somehow I got disconnected with what you finally  
22 recommend. What was the point you were making? I  
23 realize the ABWR is proposing one train and not safety  
24 grade, I guess. I'm not sure about that. But how does  
25 that relate to what you're talking about here? Is that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 one of the examples that you would consider if you had  
2 the flexibility to?

3 MR. THADANI: In fact, depending on how one  
4 comes out, the source term getting in the containment  
5 issue --

6 COMMISSIONER REMICK: Okay.

7 MR. THADANI: -- that would have an impact on  
8 the --

9 COMMISSIONER REMICK: Right, sure.

10 MR. THADANI: But the broader question also  
11 is, if one has to have filter, should one have two  
12 filters?

13 COMMISSIONER REMICK: Two filters.

14 MR. THADANI: Questions of what's active,  
15 what's a passive device. And unless there's some data  
16 out there that indicate much higher reliability of  
17 filters than what we've seen, we believe that filters  
18 are in fact active components. Currently, GDC, I  
19 believe, 41 and 43 would require such --

20 COMMISSIONER REMICK: Redundancy.

21 MR. THADANI: -- redundancy. And that's where  
22 we would be.

23 But the big impact we see would likely be on valve  
24 operations, leakage control system, leakage from  
25 containment, .5 percent or higher per day.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 COMMISSIONER REMICK: So if the Commission  
2 agreed with staff position here, you would be looking  
3 at those things on a case by case technical merit basis?  
4 Is that right, that's what you're --

5 MR. THADANI: Exactly, yes.

6 COMMISSIONER REMICK: Okay. I got  
7 disconnected when I read it. I wasn't quite sure what  
8 you -- okay.

9 DOCTOR MURLEY: Now EPRI would like to go  
10 further in this source term changes.

11 Charlie, would you like to sum up?

12 MR. MILLER: I think the crux of the kinds of  
13 things that Ashok talked about are encompassed in what  
14 EPRI wants. But I think the total goal there would go  
15 farther. I think we're going to get ultimately,  
16 hopefully, to some agreement with EPRI on some of these  
17 issues. Themis may be able to back me up on this.

18 We are trying to look at ways where we can  
19 stay within the regulations, but look at some of the  
20 reg guides and some of the assumptions that were used  
21 traditionally: for example, like the iodine form and  
22 the timing of the release and things like that. EPRI  
23 has asked for that as part of their source term  
24 submittal and we are looking at that.

25 But I think they want to go farther, in that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 I think the ultimate goal in doing some of this is the  
2 opportunity to be able to pull in the EPZs and the LPZs  
3 as a final goal. And I think the thing that we tried  
4 to make clear was that we don't see that as part of our  
5 planning horizon in the near future, that there's other  
6 reasons for why we might not want to take that on.

7 The source term refinements I think may lead  
8 to things like Ashok was talking about with regard to  
9 the valve closure times and the possibility of the  
10 leakage control system that may affect some of the  
11 system designs. But I think what we want to make clear  
12 is that we don't want to try to use that as a basis for  
13 altering siting considerations at this point.

14 DOCTOR MURLEY: They would like to see and I  
15 believe there's data that would allow us to modify,  
16 revise TID 14.844.

17 MR. MILLER: Yes. And the goal there would  
18 be to try to come up with a new source term itself to  
19 replace 14.84 in its total, but I think that that would  
20 be the basis for trying to get to the end, which was the  
21 siting consideration.

22 COMMISSIONER CURTISS: Well, let me follow up  
23 on that, because I guess we've talked about this in a  
24 number of meetings and the staff is, as you've  
25 indicated, going to continue to pursue it with the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 pieces that you've got coming back before us. But if  
2 I can be blunt, let me see if I can't get my arms around  
3 what I detect is going on.

4 My sense is that there's a great reluctance  
5 to go in and actually change TID 14.844, because of the  
6 consequences or implications or impacts that that would  
7 have on all of the plants that have been licensed out  
8 there to date, whatever regulatory implications that  
9 might have, whatever actions we might be petitioned to  
10 take once we change that TID 14.844.

11 Let me ask you just a narrowly focused  
12 question. Looking at what EPRI has submitted to us from  
13 a technical perspective on changing the existing TID,  
14 is the information incomplete or does it make a  
15 technically sound case? Leave aside the question of  
16 whether they're driving for a change in the EPZ or the  
17 LPZ or what the hidden agenda might be, if anything.  
18 Is there a technical case that can be made and that,  
19 indeed, has been made by EPRI to modify the existing  
20 TID 14.844?

21 DOCTOR SPEIS: Let me address that to some  
22 extent. Maybe I'll have Len Soffer say a few more  
23 things.

24 Some of the things that they're proposing to  
25 do, they have technical basis. Okay? Whether we'll

1 precisely reach agreement on the precise quantify, the  
2 precise timing, that's not a question we're discussing.  
3 For example, the timing of the appearance of the source  
4 term, we think that indeed there is information that  
5 shows that the source term does not appear  
6 instantaneously. Okay? There is some delay time. So  
7 whether they will accept the one hour or whatever they  
8 are demanding or whether it's something else, that's  
9 something that we're discussing right now. Okay? And  
10 we'll be coming to you, I guess, this summer or fall  
11 with our technical evaluation.

12 Also, the form of iodine, there is some  
13 technical information that indicates that indeed it is  
14 not all molecular iodine. Okay? But it's not also all  
15 in the other direction, because of the different type  
16 of environment that the accident creates and so on and  
17 so forth.

18 Now in addition to that, EPRI is proposing  
19 some more radical changes to the TID itself: reduce the  
20 amount of iodine, maybe add some additional nuclides.  
21 But their arguments are two-fold. One of them is  
22 technical, the chemistry, the physics. The other one  
23 is PRA-related, and I think it became very clear to us  
24 when we met with them two weeks ago that they say for  
25 passive plants some of the sequences will have such low

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 probability that therefore you should eliminate them  
2 completely, and therefore those sequences do not  
3 contribute to a specific source term which is integrated  
4 to the total source term. And that would be a more  
5 difficult one, because right now we don't have a design  
6 in front of us. We don't have a PRA. We don't know  
7 whether the containment will have sprays or no sprays.  
8 There are so many questions to be dealing with, whether  
9 we can accept those type of arguments.

10 So our process is one of, you know, indeed go  
11 forward and look at the chemistry and the physics and  
12 the technology and see what we can bite as we go  
13 forward. But as far as our going forward with those  
14 radical changes which rely substantially on a future  
15 design whose sequences of core melt are very low  
16 probability, I think it's premature.

17 Maybe Tom can say something.

18 DOCTOR MURLEY: I haven't anything to add.

19 DOCTOR SPEIS: Did I say it all?

20 CHAIRMAN CARR: Well, is the intent, then, as  
21 soon as you come to agreement on the technical issues,  
22 to change the portion we can change?

23 DOCTOR SPEIS: Yes, sir, and we're working to  
24 that. And in fact, we will be briefing the ACRS next -

25 -

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 CHAIRMAN CARR: Because, it does have a big  
2 impact on design and timing of closure of valves and  
3 things like that.

4 DOCTOR MURLEY: And we agree there are some  
5 things that can be changed right now, and that's what  
6 we're proposing to do in this review.

7 COMMISSIONER CURTISS: Just on the piecemeal  
8 changes you've made in here, we're supposed to -- the  
9 staff is supposed to have something up here for us on  
10 chemical form of iodine here pretty soon. Is that one  
11 on its way? What's the timing for that one?

12 DOCTOR SPEIS: It's on its way. It's on its  
13 way to you.

14 COMMISSIONER CURTISS: A week or month or --  
15 I'd like to know. It was due April 30th, as I recall.

16 CHAIRMAN CARR: They're a week late.

17 COMMISSIONER CURTISS: Okay. How about --  
18 you indicated that the timing of release paper was  
19 summer or fall. Is there some slippage in that paper?  
20 That was July, as I recall, that we're looking for.

21 CHAIRMAN CARR: Why don't you identify  
22 yourself at the microphone?

23 COMMISSIONER CURTISS: Could we just review  
24 the schedules for the submission of the papers that  
25 you're working on?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. SOFFER: Yes. I'm Len Soffer from the  
2 Office of Research. Yes, we expect to meet that by this  
3 summer, sir.

4 COMMISSIONER CURTISS: Okay. One final  
5 question on this one. I gather, from what you're saying  
6 here, Themis, that the approach that EPRI's arguing for,  
7 particularly on the probablistic front, is going to  
8 depend upon the particulars of the reactor design. Does  
9 that suggest that when we get closer to that in the EPRI  
10 Requirements Document and flesh that out in that context  
11 that you would expect to see the second prong of their  
12 argument addressed and perhaps resolved with a change  
13 for the passive plants?

14 DOCTOR SPEIS: I'm not so sure I can address  
15 that.

16 Ashok, you'll have to help me on that one.

17 MR. THADANI: EPRI proposed some numerical  
18 cut-off point for certain sequences that could be  
19 eliminated from consideration in terms of source term.  
20 That presumes we know a fair amount about the design.  
21 That presumes we know a fair amount about the  
22 probablistic study. That presumes a great deal of  
23 knowledge, and I think what Themis is saying is that  
24 might not be as simple a way to deal with the issue as  
25 it might appear on the surface, because one can easily

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 say, "Well, I'll pick a frequency and I won't consider  
2 anything below that frequency cut-off point." But  
3 there's a large set of questions regarding credibility  
4 of what is really above that frequency level. That's  
5 a tough --

6 COMMISSIONER CURTISS: Well, I gather what  
7 you're saying is that even as we get additional design  
8 information to address the uncertainties that you  
9 identified, Themis, you don't even envision with that  
10 further information reaching the point where the two  
11 arguments that EPRI is advancing would be addressed and  
12 perhaps resolved, say, in the passive requirements  
13 document?

14 MR. THADANI: I certainly don't know the  
15 answer today.

16 COMMISSIONER CURTISS: We'll get back to that.  
17 I'd be interested in pursuing that.

18 DOCTOR MURLEY: Okay. We have two final  
19 issues. Jim Richardson will talk about those.

20 The first is the separation of the OBE,  
21 operating basis earthquake, from the safe shutdown  
22 earthquake.

23 MR. RICHARDSON: The current regulations  
24 require that the OBE be at least one-half of the safe  
25 shutdown earthquake. What this has led to is that the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 OBE really dictates the design, because of the  
2 associated allowables associated with the SSE and the  
3 OBE, and this really doesn't make a lot of sense. What  
4 you're dictating is an overly conservative -- in  
5 general, overly conservative pipe design and structural  
6 design dictated by the OBE rather than the safe shutdown  
7 earthquake.

8 We're working with the Office of Research in  
9 a long-term solution to this problem, and it probably  
10 could very well result in a proposed rulemaking of  
11 Appendix A to the Part 100. But in the meantime, we  
12 plan to consider requests to decouple the OBE from the  
13 SSE on a design-specific basis for the ALWR designs.  
14 And I would just note we -- this is not unprecedented  
15 in that we have for some plants -- and there are about  
16 ten sites of operating plants where in fact we have  
17 granted exemptions from that rule and allowed the OBE  
18 to be somewhat less than half of the SSE. So we, in  
19 this case, are asking the Commission to grant an  
20 exemption to Appendix A to Part 100 to allow the OBE to  
21 be decoupled from the SSE.

22 In reality, the OBE ought to be an earthquake  
23 level such that you would shut the plant down and go in  
24 and perform inspections to determine if there's been any  
25 damage and then continue operation. It should not be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 the design basis earthquake. It makes more sense and  
2 more logic to have the SSE perform that function.

3 DOCTOR MURLEY: This is a relaxation. I think  
4 that's clear. That doesn't affect -- we don't think it  
5 affects safety at all, because the SSE is going to be  
6 whatever it is, and that should be the level that the  
7 plant is designed for to protect public health and  
8 safety.

9 The OBE is a level that was set such that as  
10 long as it wasn't exceeded a plant could just ride right  
11 through it and keep on operating, basically. It  
12 wouldn't have to shutdown or anything. As Jim has said,  
13 it doesn't make really too much sense to us that we  
14 ought to be regulating that sort of thing even, that  
15 maybe it makes sense after you've had a certain level  
16 of earthquake to go in and take a look rather than set  
17 very tight requirements on the operability that the  
18 plant can ride through a certain level earthquake.

19 COMMISSIONER REMICK: From what you're saying,  
20 is it -- are you saying that if you design for an OBE  
21 that's one-half the SSE, you've more than met the design  
22 for the SSE? Is that basically --

23 MR. RICHARDSON: By a -- it turns out to be  
24 a substantial margin in most cases.

25 DOCTOR MURLEY: If I can make an analogy, just

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to set ideas, it's like requiring your car to meet a ten  
2 mile per hour front end collision with no damage  
3 whatever, just back off and drive away, versus the  
4 requirement that your automobile be able to meet a 30  
5 mile an hour collision without a fatality. It would  
6 turn out that the no damage requirement is much tougher  
7 for the designer and costlier for him to meet.

8 Okay. The last issue is in-service testing  
9 of pumps and valves.

10 Jim?

11 MR. RICHARDSON: (Slide) Could I have  
12 viewgraph 22, please?

13 The current regulations endorse Section 11 of  
14 the ASME Boiler Pressure Vessel Code and establish  
15 testing requirements for ASME Class I, II, and III pumps  
16 and valves. A combination of operating experience and  
17 research that's been conducted over the past few years  
18 have shown us that these testing criteria set forth in  
19 the Code really don't do a complete job for -- I think,  
20 in my opinion, even a sufficient job in verifying that  
21 pumps and valves are capable of carrying out their  
22 safety function under design basis conditions.

23 We are proposing that for ALWRs -- and I might  
24 also mention that we have issued two significant generic  
25 letters in the past two years that address this issue

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 for operating reactors in the IST arena and more  
2 specifically in operation of motor-operated valves. So  
3 the issue is being addressed by operating reactors in  
4 response to those generic letters. And we think in  
5 principle that the issues set forth in those generic  
6 letters are worthy of consideration by the ALWRs.

7 And they really fall into three basic areas:  
8 that we believe that pumps and check valves particularly  
9 ought to be tested under full-flow conditions where they  
10 are currently sometimes not tested under flow conditions  
11 at all in some cases of some check valves. And in the  
12 cases of pumps, they in many cases just use a bypass  
13 flow and do not test the pump at full-flow.

14 We also believe that it's important that  
15 motor-operated valves that are called upon to close  
16 under full differential pressure ought to demonstrate  
17 that by being tested under their full differential  
18 pressure.

19 We also believe that in the case of check  
20 valves the industry ought to be exploring and developing  
21 some advanced non-intrusive techniques for check valve  
22 testing. We believe there are ways of looking at the  
23 check valve to see if it is intact, its internals are  
24 intact. We believe that can be done. We're encouraging  
25 the industry to do that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1           Finally, one last point is that the frequency  
2 of inspection and disassembly of these valves needs to  
3 be studied. That should not be an arbitrary period of  
4 time, but based on some reliability calculations and  
5 tests to determine what is the proper time that you  
6 might perform these, one, non-intrusive tests, when you  
7 might need to perform full-flow or full differential  
8 pressure tests, and when you may in fact have to  
9 disassemble the valve to perform maintenance and  
10 determine if the valve in fact is intact.

11           So we're asking the Commission to again go  
12 beyond our current regulations and impose these  
13 additional requirements that we've asked the industry  
14 and the operating reactors to undertake currently.

15           DOCTOR MURLEY: Clarification, Jim. We're  
16 working with the Code Committee, is that right?

17           MR. RICHARDSON: Yes. We are also working  
18 closely with the ASME Code to change the Code to  
19 recognize these problems. But the Code is -- has a lot  
20 of built-in inertia. It takes a considerable amount of  
21 time to get the Code to change its ways.

22           DOCTOR MURLEY: But I think they're headed in  
23 the same direction that we're heading.

24           MR. RICHARDSON: Yes.

25           DOCTOR MURLEY: So I don't think we're at real

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 variance.

2 COMMISSIONER ROGERS: My question is that  
3 they're recognizing some of the problems that come about  
4 by not doing full-flow tests, that bypass tests very  
5 often damage pumps in doing the test.

6 MR. RICHARDSON: Yes, exactly.

7 COMMISSIONER ROGERS: So that that's really  
8 a bad idea very often in some situations, so that the  
9 full-flow test really is a safer way of doing the test  
10 on the equipment.

11 CHAIRMAN CARR: Is the intent to qualify these  
12 valves on a one-time test? But you're talking about,  
13 as I understand you, testing them in the pipe in  
14 service.

15 MR. RICHARDSON: We believe that that would  
16 be the --

17 CHAIRMAN CARR: But think of the test rig  
18 you've got to build to test something in service at  
19 full-flow.

20 MR. RICHARDSON: We understand that there may  
21 be cases where that is impractical and we would  
22 certainly consider that in looking for prototype testing  
23 and qualification tests, and then some lesser test in-  
24 situ. But we believe that in some cases there are some  
25 valves and pumps that, in fact, even in a practical

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 sense can be tested under full-flow conditions.

2 CHAIRMAN CARR: Yes, but full-flow and open  
3 end break are two different things, full-flow in  
4 operation, whereas full-flow against no head at all is  
5 a completely different test, and I don't know which one  
6 you're talking about.

7 MR. RICHARDSON: I'm talking about full-flow  
8 operational.

9 CHAIRMAN CARR: Well, that's not going to give  
10 you the same test as an open end.

11 MR. RICHARDSON: No, but we would expect that  
12 to be demonstrated in test rigs --

13 CHAIRMAN CARR: One-time check?

14 MR. RICHARDSON: -- and one-time checks  
15 outside the plant.

16 CHAIRMAN CARR: Well, designing that test  
17 system for in-service testing is going to be an  
18 engineer's dream.

19 DOCTOR MURLEY: In some cases, yes.

20 Do you know what --

21 COMMISSIONER ROGERS: Well, it's a very active  
22 code area right now.

23 MR. RICHARDSON: Oh, yes. Yes. And the  
24 industry is marshalling substantial resources to address  
25 this question and are planning to sink some substantial

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 resources into this area.

2 DOCTOR MURLEY: Do you know what EPRI's views  
3 are on this item?

4 MR. RICHARDSON: No. They fully understand  
5 our position. We have not received from them -- and  
6 Charlie will verify -- we've not really received a  
7 response from them on this area.

8 MR. MILLER: The original submittal was really  
9 silent on this kind of thing. Our views have been made  
10 known to EPRI. That will get back to --

11 CHAIRMAN CARR: I certainly have no trouble  
12 with the idea, but practical implementation of it is  
13 going to be a real tough job, in my opinion.

14 COMMISSIONER REMICK: On this matter, you  
15 discuss in-service testing of pumps and valves. What  
16 are the staff's expectations of non-intrusive in-service  
17 surveillance testing and maybe instrumentation and so  
18 forth? A lot of our transients result from people  
19 conducting surveillance testing on instrumentation. Has  
20 staff considered anything in that area, looking for  
21 improved methods, human factors considerations in  
22 surveillance testing, and so forth?

23 MR. THADANI: In terms of impact of  
24 surveillance testing, as you know we have reevaluated  
25 our requirements on operating reactors and have modified

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 our requirements, wherein the interval between testing  
2 is much greater now than it used to be because of just  
3 the concern you raised. We have raised this specific  
4 issue with EPRI. I'm not sure we have an answer to this  
5 specific issue.

6 Scott Newberry can expand on that.

7 MR. NEWBERRY: Scott Newberry,  
8 Instrumentations in NRR.

9 Yes, the issue has been identified as an issue  
10 with EPRI and of course is still under review. But  
11 clearly our expectation is that the systems, as we  
12 understand them to be designed, will have far better  
13 capability to perform on-line testing, diagnostic self-  
14 testing without -- with virtually no human intrusion.  
15 We expect they'll be vastly improved in this area.

16 CHAIRMAN CARR: Well, we certainly ought to  
17 get to the point where we don't have to open up panels  
18 and rig jumpers.

19 MR. NEWBERRY: Right. Yes, sir. Absolutely.

20 COMMISSIONER REMICK: I hope so.

21 DOCTOR MURLEY: Mr. Chairman, that concludes  
22 the discussion of the 15 items.

23 One point I would recall from the beginning  
24 of our discussion. Many of -- all of our positions, in  
25 fact, in this paper were based on our understanding that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 the guidance in the severe accident policy statement  
2 amounted to a requirement that future plants would be  
3 safer than the current generation of plants. If that's  
4 not the case, then I guess our understanding coming into  
5 this has been wrong. I should say that we would be  
6 uncomfortable if that understanding were incorrect, but  
7 that's -- you should understand that.

8 CHAIRMAN CARR: Commissioner Remick?

9 COMMISSIONER REMICK: Just a quick comment on  
10 that. To me, expect is expectation. I want to  
11 complement the staff on the SECY document. I think it  
12 was a particularly well-written concise summary of a  
13 number of very important policy issues. It was really,  
14 I thought, very well done and you should know that. And  
15 today's presentation was particularly helpful to me in  
16 preparing my vote sheet, enabled me to go ahead on that,  
17 so I appreciate that.

18 I assume we've had no request from EPRI or  
19 anybody else to address the Commission or anything on  
20 these items? I assume not.

21 DOCTOR MURLEY: We have not.

22 COMMISSIONER REMICK: And I also assume that  
23 your response to the ACRS comments now is your position,  
24 is a clarification of your position?

25 DOCTOR MURLEY: There are some clarifications.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 COMMISSIONER REMICK: The one question I have,  
2 as you've indicated, some of these things go beyond our  
3 current regulations, so our normal process would be to  
4 have some kind of a -- the words miss me. How we go  
5 about making regulations? I'm sorry.

6 COMMISSIONER CURTISS: Rulemaking.

7 COMMISSIONER REMICK: Rulemaking, thank you.  
8 We'd have a normal rulemaking.

9 Now I understand that this has been considered  
10 and we plan to -- would add these additional  
11 requirements as part of the rulemaking of the  
12 certification process. But I don't fully see the  
13 mechanics of how that will be carried out. We'll have  
14 some kind of an application which will consist of the  
15 rulemaking, but we might be proposing something that  
16 goes beyond what's in the application. And maybe I  
17 needn't worry about that, but I hope somebody is on  
18 staff, OGC, about how do we conduct kind of a dual  
19 rulemaking I see, a rulemaking that's taking a  
20 particular design and application and then adding  
21 requirements perhaps beyond what's in that  
22 application.

23 DOCTOR MURLEY: My impression of how it would  
24 work -- and then perhaps Mr. Scinto could add to it --  
25 the application will be the applicant's proposal to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 meet what he understands to be our current requirements  
2 and our current thoughts, some of which will go beyond  
3 our current regulations: for example, if you approve  
4 some of these items. The staff will then review it and  
5 we'll come to -- through a series of questions and  
6 answers and information, we'll come and write a safety  
7 evaluation report, essentially a final design approval  
8 report.

9 But then it goes into hearings and other  
10 interested parties have the possibility to bring up what  
11 they consider even further requirements. And it could  
12 emerge from that hearing process that the proposed rule  
13 would have requirements beyond what even the staff  
14 wants. That would come to the Commission, then, for  
15 final decision. And once the Commission makes a  
16 decision on that final rule, those are the requirements  
17 that that design has to meet for all time, unless it's  
18 changed through a rulemaking process.

19 COMMISSIONER REMICK: So we basically on our  
20 SER, then, our position is it might go beyond what the  
21 applicant has proposed would be in the SER?

22 DOCTOR MURLEY: Yes.

23 CHAIRMAN CARR: Wouldn't it be better to make  
24 those rulemaking decisions first?

25 DOCTOR MURLEY: It would have been, yes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 CHAIRMAN CARR: Well, could we do it in  
2 parallel?

3 MR. TAYLOR: We have talked about doing it.  
4 We have talked about that subject of initiating a whole  
5 series in --

6 CHAIRMAN CARR: Avoid it at the hearing.

7 MR. TAYLOR: Right. And we, because of where  
8 we were, decided to proceed in the direction outlined  
9 by Doctor Murley, and I'll let Joe Scinto add to what  
10 I have to say.

11 Then, of course, you're going to have a lot  
12 of very specific issues with specific types of reactors.  
13 So your, quote, "generic rulemaking" may only cover one  
14 or two types. So that's how we got to where we are  
15 today.

16 To stop now and proceed, we've had several  
17 papers on the subject and talked about it, would be--  
18 literally, we'd have to stop everything and go into--

19 COMMISSIONER CURTISS: The horse is out of  
20 the barn for the evolutionary plants.

21 Is there any -- obviously, the passive plants  
22 are a ways off or at least further off than the  
23 evolutionary plants.

24 MR. TAYLOR: I think we're going to have to  
25 gauge this as we work through these years.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 CHAIRMAN CARR: But if manpower permitted a  
2 parallel approach, it seems that might work.

3 MR. TAYLOR: That might work, if we could have  
4 a --

5 COMMISSIONER CURTISS: Let me pursue that,  
6 and I'm not sure where I come down on this issue so I'm  
7 going to be asking questions to try to flesh-out both  
8 perspectives.

9 What is the advantage of doing a -- Tom, as  
10 I understood your description, these technical  
11 requirements will in fact be codified in a rulemaking.  
12 It's the design certification rulemaking.

13 MR. TAYLOR: Certification rulemaking.

14 COMMISSIONER CURTISS: Just a point of  
15 clarification. We may or may not have a hearing under  
16 Part 52. That could be an informal notice and comment  
17 rulemaking. Is that correct?

18 MR. SCINTO: Part 52 provides for an informal  
19 hearing. It's not notice and comment.

20 COMMISSIONER CURTISS: Okay. Would there be  
21 a hearing on it in the adjudicatory sense that we've  
22 had for reactor licensing?

23 MR. SCINTO: No. It's the informal hearing  
24 process. It provides that the Licensing Board can  
25 request the Commission on specific issues to go to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 formal adjudicatory process on specific issues.

2 COMMISSIONER CURTISS: Okay.

3 MR. SCINTO: But it's an informal hearing, not  
4 notice and comment.

5 COMMISSIONER CURTISS: All right.

6 Let me ask, since General Counsel raised it  
7 here in the SECY paper, what is the advantage of doing  
8 a rulemaking in addition to the design certification  
9 rulemaking that the staff has laid out here? You note  
10 in the SECY paper that, for example, let me just read  
11 it, "If the NRC staff can impose additional requirements  
12 for certification, other parties should be able to do  
13 so as well." It's not clear to me why that's the case.  
14 And more generally, what is the advantage of a generic  
15 rulemaking beyond the design certification rulemaking?

16 MR. SCINTO: OGC has, for a long time, always  
17 recommended the rulemaking processes to get rid of  
18 these. In connection with the design certification  
19 process, the design certification rulemaking process  
20 presently has a judgement standard in the rule.  
21 Commission put -- that was put in in Part 52 when it  
22 was promulgated. The standard is 50.48, which is that  
23 the designs must conform to the present regulations.

24 The staff here today is discussing at least  
25 15 areas in which the staff proposes that it go beyond

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 the present regulations in some regards, and in a few  
2 cases less than the present regulations. So the staff  
3 proposal going into the design certification rulemaking  
4 is not to conform to 50.48. It's to satisfy 50.48 and  
5 then some. Those points will be litigable in the design  
6 certification rulemaking process, litigable in this  
7 informal process, but those will be challengeable.

8 And the standard is -- if the staff can go in  
9 proposing standards beyond those presently required in  
10 the regulations, we don't see how the other parties are  
11 precluded from proposing requirements beyond the current  
12 regulations.

13 In order to preclude that, to preclude raising  
14 -- turning the design certification rulemaking process  
15 itself into a full-fledged rulemaking process on all of  
16 the additional things that one might add, you -- it  
17 would be possible -- we think it would be possible to  
18 develop a rulemaking process that goes on either  
19 simultaneously, slightly in advance, that couldn't occur  
20 until, of course, the staff had decided what the  
21 elements of such a rule -- what it thinks such a rule  
22 ought to be.

23 Now, in 89-311, that was discussed and it was  
24 a discussion at that point that the staff felt that it  
25 could not develop generic standards for all of the rules

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 in a timely fashion, that that would take a fairly  
2 extended period of time if we attempted to do that  
3 first.

4 There are some -- we've now got 15 points that  
5 the staff has at least identified and perhaps, for  
6 example, some limited rulemaking to go ahead with some  
7 portion of those. Those are the processes that we've  
8 now got ongoing discussions with NRR as to what would  
9 be desirable steps.

10 DOCTOR MURLEY: Can I point out -- just to  
11 add, Commissioner, to that point, I think our  
12 information, for example, on the passive plants has  
13 convinced me even stronger that we probably could not  
14 write a rule right now for severe accidents that would  
15 encompass both the evolutionary and the passive plants  
16 because the passive plants have such different  
17 approaches to accidents that I think it would be  
18 virtually impossible to write a comprehensive rule.

19 COMMISSIONER CURTISS: Could you write a rule  
20 just for the passive plants?

21 DOCTOR MURLEY: I don't think we could today,  
22 no. I don't think we know enough about how -- the  
23 approaches. For evolutionary plants, perhaps.

24 COMMISSIONER CURTISS: Let me --

25 CHAIRMAN CARR: When you get the essentially

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 complete design, you obviously can.

2 COMMISSIONER CURTISS: Let me just ask a  
3 hypothetical question here. If the plants, the  
4 evolutionary plants that will be certified came in and  
5 in all respects complied with 50.48, that is to say the  
6 existing regulations --

7 DOCTOR MURLEY: Right.

8 COMMISSIONER CURTISS: -- would that lead to  
9 the result that in the hearing no issues could be raised  
10 because you cannot challenge the regulations at a  
11 hearing?

12 MR. SCINTO: If we go into the hearing process  
13 with that, the issues can be raised. In our hearing  
14 process, you may challenge regulations. We have a  
15 procedure for challenging regulations and this is, in  
16 fact, a rulemaking type proceeding. So it's the kind  
17 of proceeding where you encourage -- we'll assist you  
18 in developing a rule. So, you can raise issues beyond  
19 the rule.

20 But in the statement of considerations, when  
21 they put out Part 52, when the provision that provided  
22 for specific standards was put in, the specific  
23 standards being compliance with the existing  
24 regulations, the Commission noted that there may be a  
25 need for additional standards and that those -- that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 was the genesis of the recommendation that the staff  
2 should advise the Commission as to the practicability  
3 of going ahead with some additional rulemakings now.  
4 That was 89-311. The staff felt it was not ready to go  
5 ahead with rulemaking "now" when -- and OGC does not  
6 recommend we go ahead with rulemaking when we're not  
7 ready to do so. But when we are ready, when the staff  
8 feels that they have identified issues that are generic  
9 that they believe should be imposed generically and  
10 settle an issue generically, we recommend going ahead  
11 with rulemaking.

12 COMMISSIONER CURTISS: What you're suggesting  
13 is an approach that sounds kind of akin to plant life  
14 extension where the technical requirements are being  
15 developed and they'll be tested out in the first couple  
16 of pilot cases and then at some point, as soon as we  
17 can, we're going to codify those in a rule. Is it along  
18 the same lines? First question.

19 Second, if it is, is that something that the  
20 technical side thinks is feasible here?

21 MR. SCINTO: Yes. Plant life extension rule,  
22 the last I saw it, doesn't quite sound like that. That  
23 may be an element to what the plant life extension rule  
24 right now identifies the nature of the review process  
25 that the licensees are to carry out to identify aging

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 issues on the basis of the current licensing basis. I'm  
2 not quite sure it identifies the additional technical  
3 standards that will be developed and added on in the  
4 future.

5 COMMISSIONER CURTISS: Okay.

6 MR. SCINTO: And that is in the same sense  
7 what we have here when Part 52 was promulgated, a  
8 recognition -- in Part 52 particularly there was a  
9 recognition that there may very well be additional  
10 technical standards that need to be imposed and that  
11 those should be done when they're practical to do so.

12 DOCTOR MURLEY: The license renewal rule was a  
13 process rule much like Part 52.

14 COMMISSIONER CURTISS: Okay.

15 DOCTOR MURLEY: This would be much like -- I  
16 mean a rule here would be really just extending the  
17 general design criteria for severe accidents.

18 COMMISSIONER CURTISS: One final question from  
19 the Research perspective. Do NRR and Research share the  
20 same views about rulemaking on particularly the passive  
21 plants at this stage?

22 DOCTOR MURLEY: I don't know.

23 Themis, do you want to speak to that?

24 DOCTOR SPEIS: Definitely because we know very  
25 little about passive plants right now and what we have heard keeps

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 changing to fast. So --

2 COMMISSIONER CURTISS: Okay.

3 DOCTOR SPEIS: But once we know more about  
4 it, it might be -- we'll see if it makes sense to make  
5 an example of issues that could be handled --

6 DOCTOR MURLEY: By the rulemaking.

7 COMMISSIONER CURTISS: That's all I have.

8 CHAIRMAN CARR: Commissioner Remick, your  
9 time.

10 COMMISSIONER REMICK: I can't resist making  
11 the point that if we're thinking about rulemaking in  
12 passive plants, it reinforces my view that the staff  
13 has to be involved up early with these designs so we  
14 know what the issues are early, that we can consider  
15 rulemaking.

16 MR. TAYLOR: I was just saying the same thing.

17 COMMISSIONER REMICK: Okay. Fine. That's  
18 all.

19 CHAIRMAN CARR: Commissioner Roberts?

20 Commissioner Rogers?

21 COMMISSIONER ROGERS: Well, I just want to  
22 say I think this was a very excellent presentation. I  
23 got a great deal out of it and I think that it was very  
24 clear and very helpful certainly to me and I'm sure to  
25 others. I certainly want to congratulate all the staff

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 for a very fine job today. I think it was excellent.

2 The ARCS letter in response to one of the  
3 SECYS, 90-016 I guess it was, had some additional  
4 comments from some of the other members of the ACRS that  
5 I just wanted to touch on very briefly. I know we've  
6 been here a long time and probably you're getting a  
7 little jaded. But one was some criticism that none of  
8 us are looking sufficiently at what we've learned from  
9 past experience of the last ten years ago and  
10 incorporating that into these requirements for new  
11 designs. It seems to me that you are doing that to some  
12 extent. We're hearing about it here.

13 I wonder if there couldn't be some  
14 clarification sought from ACRS on exactly what they  
15 think is required more in this regard because it does  
16 appear to me that you are using past experience and  
17 relaxing some requirements. Maybe they think you  
18 haven't gone far enough. I don't know. But their  
19 criticism did not seem to fit what I heard here today  
20 and I felt that I wanted to say something on that.

21 The other matter is the question --

22 CHAIRMAN CARR: I guess it's fair to say staff  
23 didn't respond to those additional comments.

24 DOCTOR MURLEY: We did not.

25 COMMISSIONER ROGERS: No.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 DOCTOR MURLEY: No, we normally don't respond.

2 COMMISSIONER ROGERS: But it's an issue that  
3 I think is a general issue that's worth considering.

4 The other one is the so-called criticism of  
5 lack of coherence in our processes, wrapping together  
6 the requirements for new reactors, design requirements,  
7 and the safety goals and an attack on the lack of  
8 coherence in Commission processes and positions.

9 I'd like to just say a few words about the  
10 use of that term "coherent," because I think that it is  
11 a very unfortunate term. As a physicist and probably  
12 in the minds of those who wrote the criticism using that  
13 term "coherence," it has a relatively neutral  
14 connotation. It means in phase, working together in  
15 some sense, some degree of consistency outside the  
16 scientific domain. But if you look in your dictionary,  
17 you'll see that the very first meaning of the word  
18 "coherent" is capable of intelligent speech. Therefore,  
19 if we're not operating in a coherent fashion, we're  
20 unintelligible.

21 I think that's what the average man on the  
22 street is apt to interpret a criticism of lack of  
23 coherence in our processes and I think it doesn't fit  
24 at all. I do think we -- I think the notion that we  
25 should be trying to achieve a degree of consistency in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 what we're doing, in our total view of regulatory  
2 practice, but I don't think what we've done is  
3 incoherent. I think it's very understandable, very  
4 intelligible, but it may not always be entirely  
5 consistent.

6 I think that's probably what the ACRS  
7 commentators had in mind was the physicist's point of view  
8 that our activities should be in phase and fit together  
9 neatly and I certainly think that's a very laudable goal  
10 and one that we should strive for. But I don't think  
11 the word "incoherent" in the first meaning of the  
12 dictionary fits our processes and I wanted to get that  
13 on record.

14 Thank you.

15 CHAIRMAN CARR: Commissioner Curtiss?

16 COMMISSIONER CURTISS: I don't have any  
17 questions. I'd just like to thank all the staff that  
18 I know put a lot of time and effort. I thought this  
19 was an excellent meeting. I'm glad we set aside the  
20 separate time to do it and the effort that went it. I  
21 know across the board on all of these issues in response  
22 to an earlier Commission request to have exactly this  
23 kind of discussion I think has been most helpful for me  
24 and I commend all of you for that.

25 CHAIRMAN CARR: Well, I'd also like to thank

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005

1 the staff for this presentation. I'd also like to thank  
2 the Advisory Committee on Reactor Safeguards, in  
3 absentia, for their diligent efforts to provide their  
4 views to the Commission before this Commission meeting.  
5 They spent a lot of time to get ready for us in a hurry.

6 Currently, the Commission has several papers  
7 before it dealing with various aspects of advanced light  
8 water reactor reviews. Since the advanced reactor  
9 review schedules depend on Commission guidance in many  
10 of these areas, I would urge those of my fellow  
11 Commissioners who have not already done so to vote on  
12 these papers.

13 In reviewing the issues in SECY-90-016, which  
14 you've described today, it seems to me that staff is  
15 advising the Commission of generic criteria for judging  
16 the safety of these designs which go beyond existing  
17 standards. Consistent with the statement of  
18 considerations in Part 52, the Commission must decide  
19 whether additional rulemaking beyond the design  
20 certification process is needed to resolve these generic  
21 questions.

22 Accordingly, I request the staff once  
23 Commission guidance is received on these certification  
24 issues to provide the Commission with a paper detailing  
25 the advantages and disadvantage of proceeding with

1 generic rulemaking, including resource impacts, in  
2 parallel with reviewing the specific designs.

3 Do any of my fellow Commissioners have any  
4 additional comments?

5 COMMISSIONER CURTISS: No. I think that's a  
6 good suggestion. I'm glad you proposed that.

7 CHAIRMAN CARR: And no comments? We stand  
8 adjourned.

9 (Whereupon, at 12:25 p.m., the above-entitled  
10 matter was adjourned.)  
11  
12

CERTIFICATE OF TRANSCRIBER

This is to certify that the attached events of a meeting  
of the United States Nuclear Regulatory Commission entitled:

TITLE OF MEETING: BRIEFING ON EVOLUTIONARY LIGHT WATER REACTOR CERTIFICATION  
ISSUES AND RELATED REGULATORY REQUIREMENTS

PLACE OF MEETING: ROCKVILLE, MARYLAND

DATE OF MEETING: MAY 3, 1990

were transcribed by me. I further certify that said transcription  
is accurate and complete, to the best of my ability, and that the  
transcript is a true and accurate record of the foregoing events.

Carol Lynch

Reporter's name: Peter Lynch

ALWR TECHNICAL ISSUES

NRR BRIEFING TO COMMISSION

MAY 3, 1990

ASHOK THADANI

JAMES RICHARDSON

## STAFF APPROACH TO ALWR SAFETY

EXPECTATION OF IMPROVED SAFETY

PROPOSAL BY VENDORS AND EPRI

- MEAN CORE DAMAGE FREQUENCY TARGET  
     $< 10^{-5}$  EVENT/REACTOR YEAR, AND
- DOSE AT 0.5 MILE BOUNDARY  $< 25$  REM  
    FOR EVENTS WHOSE CUMULATIVE  
    FREQUENCY  $> 10^{-6}$ /REACTOR YEAR

MAINTAIN DEFENSE-IN-DEPTH

VG-1

## DEFENSE -IN-DEPTH APPROACH

### RECOGNIZE UNCERTAINTIES IN PRAS

- LEVEL OF INFORMATION
- MAJOR PARTS NOT MODELED
- DIFFICULTIES IN MODELS FOR COMMON  
CAUSE FAILURES AND HUMAN ACTIONS

### FOCUS ON CONTAINMENT

- ESTABLISH A PERFORMANCE GOAL

VG-2

## BACKGROUND INFORMATION

### REVIEW

- OPERATING EXPERIENCE
- PRA INSIGHTS
- NRC SEVERE ACCIDENT STUDIES

IDENTIFY SIGNIFICANT ISSUES AND,  
IF PRACTICABLE, ELIMINATE THROUGH  
DESIGN FEATURES

VG-3

ATWS

SHOULD PROVIDE DIVERSE SCRAM SYSTEM  
LOGIC (PWR) UNLESS CONSEQUENCES  
ACCEPTABLE

MANUALLY ACTUATED STANDBY LIQUID  
CONTROL SYSTEM FOR ABWR REPRESENTS  
DEVIATION FROM 10 CFR 50.62 (ATWS RULE)

VG-4

### MID-LOOP OPERATION (PWR)

SHOULD INCLUDE DESIGN FEATURES TO  
REDUCE LIKELIHOOD AND VULNERABILITY  
TO LOSS OF SHUTDOWN COOLING WHEN IN  
MID-LOOP OPERATION.

EXAMPLES ARE AIR INGESTION BREAKERS AND  
ELIMINATION OF HIGH POINTS IN DHR  
SUCTION PIPING

VG-5

### STATION BLACKOUT

SHOULD INCLUDE AN ALTERNATE AC SOURCE  
OF DIVERSE DESIGN FOR EVOLUTIONARY  
ALWRs (REQUIREMENT VS OPTION IN  
10 CFR 50.63).

AAC SOURCE SHOULD BE CAPABLE OF  
POWERING AT LEAST ONE COMPLETE SET  
OF NORMAL SHUTDOWN LOADS.

VG-6

STATION BLACKOUT (CON'T)

DIVERSITY REQUIREMENT WOULD NOT PRE-  
CLUDE USE OF DIESEL GENERATORS AS AN  
AAC SOURCE

VG-7

## FIRE PROTECTION

SHOULD INCLUDE ENHANCEMENTS TO FIRE  
PROTECTION ACCEPTANCE CRITERIA INCLUDING:

- ABILITY TO ACHIEVE SAFE SHUTDOWN  
ASSUMING TOTAL LOSS OF ALL EQUIP-  
MENT IN ANY FIRE AREA, WITHOUT RE-  
ENTRY OR REPAIR
- ALTERNATE SHUTDOWN CAPABILITY FOR  
CONTROL ROOM FIRE.

VG-8

### FIRE PROTECTION (CONT'D)

- FOR FIRES IN CONTAINMENT, REDUNDANT SHUTDOWN TRAINS MUST ENSURE, TO EXTENT PRACTICABLE, ONE SHUTDOWN DIVISION WILL BE FREE OF FIRE.
- SPREAD OF SMOKE, GASES OR FIRE SUPPRESSANT WILL NOT ADVERSELY AFFECT SAFE SHUTDOWN CAPABILITY.

VG-9

### INTERSYSTEM LOCA

TO EXTENT PRACTICABLE, LOW-PRESSURE  
SYSTEMS EXTERNAL TO CONTAINMENT SHOULD  
BE CAPABLE OF WITHSTANDING FULL RCS  
PRESSURE.

VG-10

### INTERSYSTEM LOCA (CONT'D)

SYSTEMS NOT DESIGNED TO WITHSTAND FULL  
PRESSURE SHOULD HAVE:

- LEAK TESTING CAPABILITY FOR VALVES  
ACTING AS PRESSURE ISOLATION BARRIER
- VALVE POSITION INDICATION IN CONTROL  
ROOM
- HIGH PRESSURE ALARMS FOR INTERFACING  
SYSTEMS

VG-11

### HYDROGEN GENERATION AND CONTROL

SHOULD ACCOMODATE HYDROGEN EQUIVALENT  
TO 100% METAL-WATER REACTION OF ACTIVE  
FUEL CLADDING (10 CFR 50.34(F)).

SHOULD LIMIT CONTAINMENT HYDROGEN  
CONCENTRATION TO  $\leq 10\%$  (10 CFR 50.34(F)).  
ALTERNATE HYDROGEN CONTROL REQUIRED,  
(I.E., INERTED CONTAINMENT OR IGNITORS)  
IF CONCENTRATION CRITERIA NOT MET.

VG-12

CORE-CONCRETE INTERACTION/  
ABILITY TO COOL CORE DEBRIS

SHOULD PROVIDE SUFFICIENT REACTOR  
CAVITY FLOOR SPACE FOR DEBRIS  
SPREADING TO ENHANCE COOLABILITY.

SHOULD PROVIDE FOR QUENCHING DEBRIS IN  
REACTOR CAVITY.

### HIGH PRESSURE CORE MELT EJECTION

SHOULD INCLUDE:

- DEPRESSURIZATION SYSTEM
- CAVITY DESIGN FEATURES TO REDUCE  
DISPERSAL EFFECTS OF EJECTED CORE  
DEBRIS.

VG-14

### CONTAINMENT PERFORMANCE

SHOULD PROPOSE A CONDITIONAL CONTAINMENT FAILURE PROBABILITY THAT DOES NOT EXCEED 10% FOR THE DOMINANT CORE DAMAGE SEQUENCES, OR A DETERMINISTIC CONTAINMENT PERFORMANCE OBJECTIVE(S) THAT OFFERS COMPARABLE PROTECTION.

ABWR CONTAINMENT "VENT" DESIGN

ABWR DESIGN SHOULD INCLUDE CONTAINMENT  
OVERPRESSURE PROTECTION SYSTEM.

VG-16

### EQUIPMENT SURVIVABILITY

FEATURES PROVIDED FOR SEVERE-ACCIDENT PROTECTION SHOULD BE CAPABLE OF PERFORMING THEIR INTENDED FUNCTION UNDER THE ENVIRONMENTAL CONDITIONS THEY WILL BE EXPOSED TO DURING A SEVERE ACCIDENT.

EQUIPMENT SURVIVABILITY (CONT'D)

SUCH EQUIPMENT NEED NOT MEET REQUIREMENTS OF 10 CFR 50.49, AND APPENDICES A AND B OF 10 CFR PART 50 IF NOT OTHERWISE SAFETY-RELATED.

### SOURCE TERM

STAFF CONSIDERING DECOUPLING SITING FROM  
PLANT DESIGN FOR FUTURE REACTORS,  
REQUIRING REVISIONS TO 10 CFR PART 100.

STAFF WILL, TO EXTENT PRACTICABLE AND  
JUSTIFIABLE, USE NEW SOURCE TERM INFOR-  
MATION IN ITS DESIGN-RELATED DECISIONS.

SOURCE TERM (CONT'D)

IN INTERIM:

- EVOLUTIONARY DESIGNS SHOULD MEET  
REQUIREMENTS OF 10 CFR PART 100
- DEVIATIONS MUST HAVE TECHNICAL BASES  
WHICH JUSTIFIES TREATMENT DIFFERENT  
FROM CURRENT PRACTICES

VG-20

OPERATING BASES EARTHQUAKE/  
SAFE SHUTDOWN EARTHQUAKE (OBE/SSE)

OBE SHOULD NOT LOGICALLY CONTROL THE  
DESIGN OF SAFETY SYSTEMS, STRUCTURES,  
AND COMPONENTS.

REQUESTS TO DECOUPLE THE OBE FROM THE  
SSE WILL BE CONSIDERED ON A DESIGN-  
SPECIFIC BASIS, AS HAS BEEN DONE ON  
SOME EXISTING PLANTS.

VG-21

### INSERVICE TESTING OF PUMPS AND VALVES

SHOULD APPLY FOLLOWING TO ALL SAFETY-RELATED PUMPS AND VALVES:

- FULL FLOW TEST OF PUMPS AND CHECK VALVES
- TEST MOVs UNDER DESIGN-BASIS DIFFERENTIAL PRESSURE

VG-22

INSERVICE TESTING OF PUMPS AND VALVES  
(CONT'D)

- USE ADVANCED NON-INTRUSIVE TECHNIQUES  
FOR CHECK VALVE TESTING
- DETERMINE FREQUENCY NECESSARY FOR  
DISASSEMBLY AND INSPECTION OF VALVES.

VG-23
