BRIEFING ON ACCIDENT MANAGEMENT PROGRAM

* * *

PUBLIC MEETING

* * *

Nuclear Regulatory Commission
One White Flint North
Rockville. Maryland

Monday. January 23. 1989

The Commission met in open session. pursuant
to notice. at 2:00 p.m.. the Honorable LANDO W. ZECH.
JR.. Chairman of the Commission. presiding.

COMMISSIONERS PRESENT:

- LANDO W. ZECH. JR.. Chairman of the Commission
- THOMAS M. ROBERTS. Member of the Commission
- KENNETH M. CARR. Member of the Commission
- KENNETH C. ROGERS. Member of the Commission
- JAMES R. CURTISS. Member of the Commission

1 STAFF AND PRESENTERS SEATED AT THE COMMISSION TABLE:

2 SAMUEL J. CHILK. Secretary

3 JAMES MURRAY. General Counsel

4 VICTOR STELLO. JR.. Executive Director for
5 Operations

6 TOM MURLEY. NRR

7 FRANK CONGEL. NRR

8 ERIC BECKJORD. Director. Office of Research

9 BRIAN SHERON. Director. Systems Research. Office of
10 Research

WASHINGTON, D.C. 20005

P R O C E E D I N G S

(2:00 p.m.)

CHAIRMAN ZECH: Good afternoon, ladies and gentlemen.

The purpose of the meeting this afternoon is for the NRC staff to brief the Commission concerning the staff plans for the Accident Management Regulatory and Research Program.

The staff last briefed the Commission on this subject as part of the briefing on the Integration Plan for the Severe Accidents Closure, SECY-88-147.

Today the staff will discuss the approach for implementing the Accident Management portion of the Integration Plan for closure of severe accident issues and describe the research projects to support this effort.

I was disappointed that we did not receive the staff's paper on this important subject earlier. Today's meeting is for information only. There will be no vote taken at this meeting. In SECY-89-012, which we just received, the staff requests Commission comments by Friday, this Friday, January 27th.

I would just say to the staff, I am not sure we can do that. I would ask the Commissioners to address this important matter as they can, and make

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

(202) 234-4433

(202) 232-6600

1 their comments when they are satisfied. But it would
2 have been much more helpful for the Commission to
3 receive this paper at an earlier date because it is a
4 very important subject.

5 I understand that copies of slides and the
6 staff paper are available as you enter the meeting room
7 today.

8 Do any of my fellow Commissioners have any
9 opening comments to make?

10 (No response)

11 CHAIRMAN ZECH: If not, Mr. Stello, you may
12 proceed.

13 MR. STELLO: Thank you, Mr. Chairman.

14 I apologize for the late date at which you
15 received the paper. And it is perfectly acceptable for
16 us to have the Commission reflect on this important
17 topic and make its decision at, hopefully, sometime in
18 the near future.

19 Our purpose today is, as you have already
20 outlined, to brief you on the status of how we intend to
21 deal with the accident management issue, which we
22 explained in the Integration Plan.

23 Briefly, in the way of background, as we
24 discussed and looked at this issue, it became apparent
25 that the agency had an enormous amount of data and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 information which we believe the utilities would find to
2 be very, very helpful as they were reviewing their
3 plants, in response to the IPE generic letter. And may
4 be able to accommodate as part of their process
5 implementing some of the lessons that we see are
6 apparent from looking at the many PRAs that are already
7 done and the vast experience within the agency and the
8 laboratories to help understand this issue.

9 In that context, our suggested approach is to
10 provide a list of about 20 procedures to the utilities
11 that they could evaluate with the insights from the
12 various PRAs, not to suggest that they are to consider
13 those as requirements, because each utility and each
14 facility has differences, but rather to have the benefit
15 of that experience as part of their consideration.

16 So we would propose to put those out in a
17 generic letter for their consideration as part of the
18 process.

19 We also, pursuant to the Commission's
20 instructions, have been asked to withhold certain
21 funding in accident management. And the paper that you
22 have that you have to refer to, 89-012, already reflects
23 our consideration of that program, and recommends to the
24 Commission its approval of going forward with various
25 research programs related to accident management, as

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 required by the SRM on that subject.

2 So what we would hope today to give you is the
3 background and rationale for the approach that we want
4 to take. And with that introduction, I will ask Dr.
5 Murley to begin the briefing. And then we will just go
6 around the table as we complete the briefing this
7 afternoon.

8 CHAIRMAN ZECH: Thank you very much.

9 Dr. Murley, you may proceed.

10 DR. MURLEY: Thank you, Mr. Chairman.

11 I will start with the second slide, if I
12 could, please.

13 (Slide)

14 The Accident -- Slide 2.

15 The Accident Management Program that we are
16 talking to the Commission about today is within the
17 Integrated Program that the Commission has approved for
18 closure of the Severe Accident Program. It is an
19 essential element of that plan. I think it's, if not
20 the most important, perhaps one of the most important
21 aspects of the entire Severe Accident Program.

22 The other elements, of course, that you are
23 aware of are the individual plant examinations, the
24 containment performance improvement, severe accident
25 research program, and there are other elements of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 improved operational safety performance that we are
2 working on.

3 Slide 3, please.

4 (Slide)

5 What is accident management? What do we mean
6 by it?

7 Well, it is in essence those actions taken by
8 the plant staff that either prevent core damage; or even
9 once a plant has exceeded its design basis, to terminate
10 the progress of any core damage, and to retain any
11 damaged fuel or debris within the vessel; or even once
12 the accident has progressed beyond that stage, to take
13 actions to maintain the containment integrity; or to
14 take actions to minimize off-site releases.

15 It involves, of course, a good deal of
16 analysis, pre-planning, preparatory measures, procedures
17 -- severe accident procedures for operators, additional
18 training, and perhaps even additional instruments and
19 equipment. By and large, the intent is to use the
20 capabilities of the plant that exist and to involve the
21 operators in dealing with the accident.

22 May I have Chart 4, please?

23 (Slide)

24 One way I like to look at accident management
25 is that it involves the operator and the operating staff

1 in the defense in-depth safety philosophy.
2 Traditionally, defense in-depth has been focused on
3 hardware, plant systems and safety systems but, in fact,
4 the operating staff can play a key role. By extending
5 the operating procedures well beyond the design basis
6 into severe fuel damage regimes, we can use the basic
7 design of a plant, we can use the innovative
8 capabilities of the operators to better cope with
9 accidents.

10 So I think that is the major emphasis in
11 accident management programs is the notion of bringing
12 the operators into the defense in-depth philosophy by
13 training them in a regime that heretofore they have not
14 been deeply trained in.

15 Can I have Chart 5, please.

16 (Slide)

17 The objective that we have is to have each
18 licensee implement an accident management plan for his
19 plant. We have been talking with NUMARC, and have had
20 several meetings with them on this subject. And, in
21 fact, I received a letter dated January 9th. Let me
22 just quote from that letter from NUMARC.

23 "With regard to accident management, we have
24 general agreement that we should proceed with the
25 development and implementation of an accident management

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 framework for each nuclear power plant."

2 So I think we have, in essence, the agreement
3 with the industry to proceed down this path. As Mr.
4 Stello said, we are not requiring, and we do not expect
5 to require at this stage, that there be any licensee to
6 implement detailed severe accident procedures. Rather,
7 we would ask them to develop a management plan -- an
8 accident management plan that would allow them to
9 evaluate information that we are sending them on severe
10 accidents, to prepare and implement operating procedures
11 for severe accidents, and to train the operators and
12 management in those procedures.

13 With that introduction then, I will turn it
14 over to Eric Beckjord.

15 COMMISSIONER CARR: Maybe I misunderstood you,
16 but I thought you said you wouldn't expect them to have
17 procedures, you would just expect them to have a plan, a
18 framework, and yet the last two things talk about
19 procedures there.

20 DR. MURLEY: Yes, at this stage I should say
21 we are not expecting them to implement right away,
22 procedures. We do expect them, as they analyze the
23 insights that we are sending them and the guidance that
24 we are sending them, to evaluate whether it applies to
25 their plant. And ultimately, if it does apply and we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

(202) 234-4433

(202) 232-6600

1 agree that it will lead to improved safety, that it
2 would lead down the road to severe accident procedures.

3 MR. STELLO: Let me help, isn't it fair to say
4 that there are already some plants that already not only
5 have the procedures but, in fact, have done some
6 training in this area?

7 DR. MURLEY: Absolutely.

8 MR. STELLO: And it is sort of a mixed bag at
9 the moment as to how much each utility has done.
10 Hopefully, as they implement this program, everyone will
11 get on essentially the same footing. And by looking at
12 these insights, then we would -- I would hope that any
13 utility that looks at something that can be a
14 significant contributor to reducing the potential for
15 core melt may, in fact, institute that procedure and
16 institute that training.

17 Now, they would certainly be encouraged that
18 they do so. There is no requirement that they have to
19 have it done at any time, or no requirement --

20 CHAIRMAN ZECH: It is your intention to make
21 it a requirement in the future?

22 MR. STELLO: As part of the IPE process, we
23 may see something that does, in fact, warrant
24 backfitting and, if so, we will.

25 COMMISSIONER ROBERTS: But any new requirement

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 would be a backfit.

2 MR. STELLO: Either a backfit, or a new rule.
3 But I don't think that -- or at least it is my
4 expectation it won't come to that because the bulk of
5 this is really -- it is minor in terms of what we see in
6 hardware, and major in terms of just writing procedures
7 and training. And I think they'll be, at least the
8 indications that I have from the industry, very
9 receptive of that.

10 COMMISSIONER CARR: Well, have you and NUMARC
11 agreed on the definition of framework?

12 DR. MURLEY: In principle, yes, but --

13 COMMISSIONER CARR: Because I must admit that
14 it didn't come clear to me in all this paper here, what
15 you really wanted.

16 DR. MURLEY: Well, we are working with NUMARC,
17 and EPRI is under the guidance, I would say, of NUMARC,
18 in developing what we mean by this accident management
19 plan, this framework, that we would expect each utility
20 to have.

21 When we talk at the conceptual level, we have
22 agreement. When we get down to details, sometimes there
23 is some different understandings. So, I would say, in
24 honesty, that we still have some work to go on what the
25 details mean.

1 Now, just to make sure we don't mislead, I
2 think there are some elements of the Accident Management
3 Program, for example, that are very similar to what we
4 will be talking to the Commission about later this week
5 on BWR Mark I containment that involves implementing
6 some hardware changes. There we might be expecting
7 some new requirements, and there we would follow the
8 backfit rule and procedures, and so forth.

9 But here all we are asking for -- and the
10 industry has agreed to -- is to have an accident
11 management plan at each plant. And then as time goes
12 on, the exact procedures, I think, will be so plant-
13 specific that it is really too early to expect details.
14 Although, as Mr. Stello mentioned, some plants have
15 already gone ahead and implemented some of these.

16 CHAIRMAN ZECH: But are we going to eventually
17 require an accident management program?

18 MR. STELLO: We already do. They are required
19 now to have in place emergency procedures for accidents.

20 CHAIRMAN ZECH: They have emergency
21 procedures, but I guess my thought is that as you
22 developed these IPEs, and as we go ahead with PRAs, and
23 if you come up with something that does, indeed, look
24 like it would be an improvement to safety, that we will
25 either take action to do it, if we think it doesn't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 require backfit; or, if it requires a backfit in
2 accordance with our procedures, we will subject it to
3 the backfit analysis.

4 I presume this is what we intend to do?

5 MR. STELLO: Correct. It may be either
6 procedure or hardware.

7 CHAIRMAN ZECH: Right.

8 MR. STELLO: There might be a piece of
9 hardware for which an analysis shows it is clearly cost-
10 beneficial to make that change. If so -- and you will
11 see some of that when we deal with the Mark I, where we
12 propose to, in fact, using the backfit rule, to go and
13 backfit plants. And they are both procedure and
14 hardware. It will be the same approach.

15 CHAIRMAN ZECH: Disciplined approach.

16 MR. STELLO: Yes, sir.

17 CHAIRMAN ZECH: Good, okay.

18 COMMISSIONER CARR: Have you got some sample
19 accident management plan I can look at? If I had this
20 kind of guidance, I couldn't put it together because I
21 don't really know what you want.

22 DR. MURLEY: No, we don't have it, but we are
23 working on it. We understand that EPRI is also working
24 on kind of a draft accident management plan. And that
25 would be our next step, really, is to work with the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 industry to make sure our ideas and theirs merge.

2 COMMISSIONER CARR: Well, we ought not to
3 request it from them until we know what it is we want.

4 DR. MURLEY: That's correct.

5 CHAIRMAN ZECH: All right, proceed.

6 MR. BECKJORD: Mr. Chairman, I would like to
7 make three points. First, on the purpose of accident
8 management, which Tom Murley already referred to on
9 Slide 3 -- that is, the goal of preventing core damage
10 after the initiation of an accident, and so forth -- I
11 note that the International Nuclear Safety Advisory
12 Group, INSAG, in its recent report on basic safety
13 principles for nuclear power plants -- I believe you all
14 have copies of it -- stated that "severe accident
15 management and mitigation measures should reduce by a
16 factor of at least ten the probability of large off-site
17 releases".

18 I am convinced that this is a realistic goal.

19 The second point --

20 COMMISSIONER CARR: But isn't that a
21 motherhood-type statement that says if you manage it
22 right, you will reduce the risk. Having said that,
23 though, it doesn't give you much more guidance on how to
24 do that.

25 MR. BECKJORD: No, there is no -- that's the

1 opinion of the authors of the INSAG report, and I think
2 it is a realistic goal.

3 COMMISSIONER CARR: Well, again, it says if
4 you are having an accident and you do things right, you
5 will reduce the risk, and I agree with that. It is the
6 what to do that bothers me.

7 MR. STELLO: Let me try to clear something up.

8 COMMISSIONER CARR: Accident management has
9 burst on the scene since I have been here, as the buzz
10 word in getting things something or another. and I
11 confess I am really confused as to what that means. And
12 I agree with the ACRS, you ought to give me a good
13 definition of what that is.

14 MR. STELLO: At the risk of doing it at the
15 table, let me try --

16 COMMISSIONER CARR: No, no, you don't have to
17 do it now.

18 MR. STELLO: Let me try. We have, after TMI,
19 instituted emergency procedures. Those emergency
20 procedures include accident considerations which are
21 both the design basis accidents, which we have come to
22 call -- those that are part of Chapter 15 analysis -- as
23 well as accidents that go beyond that. We developed
24 those procedures following TMI, and published in NUREG-
25 737, a whole list of specific kinds of requirements that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 detail procedures that ought to be developed for that
2 purpose.

3 COMMISSIONER CARR: To take care of a TMI-type
4 accident.

5 MR. STELLO: And some that are beyond that.
6 ATWS procedures, for example, were part of the process.
7 Containment venting in a BWR was issued as part of the
8 737 package, for the accidents beyond the TMI accident.

9 What we suggested is that the industry now
10 needs to think more carefully, and the industry agreed,
11 and the letter that Dr. Murley was reading speaks to the
12 fact that they have appointed a group that will put
13 together a program, a plan, for doing this, for each
14 utility to follow. So there is a portion of it that is
15 missing, and that's that guidance that you are asking
16 for that doesn't exist yet, that each utility would
17 follow in some systematic way to complete the entire
18 process of accident management. That's not done.

19 That guidance, that description you are
20 looking for --

21 COMMISSIONER CARR: That presumes you know
22 what the accident is.

23 MR. STELLO: You don't know what the accident
24 is. You know what the symptoms are that you are going
25 to try to deal with. You have a lack of water in the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 steam generator --

2 COMMISSIONER CARR: Well, we knew what the
3 symptoms were at Three Mile Island, only we
4 misinterpreted them.

5 MR. STELLO: That's correct. And that's what
6 we are trying to correct. But we are going beyond --

7 COMMISSIONER CARR: We may misinterpret them
8 in the next one, and do you have a plan for
9 misinterpreting? Is that what you are trying to give
10 me?

11 MR. STELLO: Well, if you misinterpret, you
12 have a core melt down and then you would be dealing with
13 core melt down severe accident procedures. But you will
14 have those procedures in place, too.

15 CHAIRMAN ZECH: Let me just step back a
16 minute. Isn't severe accidents, as we use that term,
17 meant to describe accidents beyond the design basis
18 accident?

19 MR. STELLO: Yes.

20 CHAIRMAN ZECH: And isn't accident management,
21 as we are discussing it here today, management of those
22 accidents that we term severe accidents -- that is,
23 above the design basis accident?

24 MR. STELLO: Yes.

25 CHAIRMAN ZECH: So we are talking about the

1 accidents beyond the design basis accident, when we talk
2 severe accidents and when we talk accident management.
3 I suppose the term accident management could really
4 refer to accidents of any kind. But in the way we are
5 presenting it, I believe, we are trying to say accident
6 management as it would refer to severe accidents, that
7 is accidents above the design basis accident. I think
8 that is what we are discussing, is that correct?

9 MR. STELLO: Yes.

10 CHAIRMAN ZECH: At least that's the
11 foundation.

12 COMMISSIONER CURTISS: Could I ask a point of
13 clarification? On Slide No. 3, you define accident
14 management as actions taken by plant staff to prevent
15 core damage. Does that assume that the severe accident
16 that the Chairman referred to, the sequence is already
17 initiated, or does this initiative include steps that
18 the plant staff would take to prevent a severe accident
19 --

20 DR. MURLEY: Can I tell you what I meant by
21 that?

22 COMMISSIONER CURTISS: -- after initiation.

23 DR. MURLEY: Yes. There are some situations
24 where the plant is beyond its design basis, but where
25 the core hasn't begun to be melted, or be damaged. And

1 there are some actions that the operators can take, that
2 can cope with situations like that.

3 Then the second bullet there means that even
4 once you are into severe damage, there are actions the
5 operators can take. Perhaps an example --

6 COMMISSIONER CARR: That presumes they
7 recognize the conditions and properly assess what is
8 going on which, in my opinion, if they had done that,
9 they probably wouldn't have been in the severe accident
10 position anyway.

11 DR. MURLEY: Well, to some extent that's
12 correct. If they misdiagnose the situation, as happened
13 at TMI --

14 COMMISSIONER CARR: That's how they got where
15 they were.

16 DR. MURLEY: -- then you will get to some
17 point. But what this is meant to do is that at some
18 point, if they then recognize the situation, that it is
19 much more serious than they had thought, and yet, say,
20 the fuel is melting, or even the containment -- or the
21 pressure vessel has been breached, the aim of this is to
22 provide them with something they can do at that stage,
23 whether it is to get another source of water, another
24 source of electrical power supply, or some action they
25 can take to recapture, or to bring the situation back to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 a stable state.

2 I agree with you that part of an accident
3 probably involves the operators misunderstanding or
4 misdiagnosing the situation, but the intent here is to
5 provide them with the tools and the means that once they
6 recognize they've got a problem, there are things they
7 can do.

8 MR. STELLO: Can I use a specific example to
9 illustrate this, it may help answer the question, to
10 prevent core damage. Let me assume that you had a
11 situation where you lost feedwater, normal feedwater.
12 Your emergency feedwater systems didn't work. And what
13 I would visualize they would have -- you are clearly
14 beyond the design basis -- is perhaps a mechanism to
15 depressurize the steam generator and hook up maybe even
16 with hose bits which some plants have, and hook up a
17 fire pump to put water, or another source of water, in
18 the steam generator to prevent the core from being
19 damaged. That, to me, would be within this accident
20 framework.

21 What they have to recognize is that what they
22 are dealing with is a problem where they didn't have
23 water in the steam generator, and have procedures
24 necessary to provide that source of water through some
25 other mechanism.

1 The hardware changes we might talk about for
2 this procedure then, for example, would be to make
3 modifications to the feedwater lines to put in the
4 proper connections, so you could use a fire pump. And
5 then you develop the procedures and the training, so
6 that the operators, if they were ever faced with that
7 situation, would then know how to use that backup source
8 of water, to prevent the core from being damaged, as an
9 EG.

10 I don't know if that helps clarify it, or not.

11 COMMISSIONER CURTISS: Let me ask one other
12 quick question, I don't want to spend too much time at
13 this point. But is the premise of this initiative that
14 we should do everything that we can in that situation, a
15 severe accident, to encourage the utilities, or require
16 the utilities to take all of the steps that we can
17 identify to manage the accident, or do we have some
18 target? Are we looking to reduce it by an order of
19 magnitude, as INSAG has suggested, or is there some
20 target where we say we have reached the necessary
21 plateau of things that we are going to require, or ask
22 the utilities to do, where we are comfortable saying
23 that they can manage the accident?

24 MR. STELLO: It is too early to say we have a
25 specific target, but rather at the present time what we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 have are some ideas that they ought to think about.
2 They may elect to do them, even though the contribution,
3 in a quantified sense, is not very large, but their
4 judgment is they are very easy to do, they are very
5 simple to do, and you go ahead and do them.

6 When they come to a more difficult procedure,
7 or a more difficult technique, then they may want to
8 analyze it further and make the judgment then, that it
9 really isn't worthwhile doing. And that judgment right
10 now is difficult to quantify until we have been into the
11 process.

12 Hopefully, the whole idea is to just get the
13 utilities to start to think this way, and then we will
14 go from there. It is the concept of getting it in front
15 of them, having them think about it, and then to the
16 extent it is an issue, if we feel strongly about it and
17 it is important, then we will in a very disciplined
18 manner go through the backfit process and make a
19 judgment and a decision on the basis of following our
20 rules and backfit it. Otherwise, they won't be required
21 to do anything. They will make their judgment first and
22 we will look at what they have done, and if they have
23 done a reasonably good job, we are finished.

24 If they haven't and we think that there is
25 more to do, then we have the option of using the

NEAL R. GROSS
COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVENUE, N.W.
WASHINGTON, D.C. 20005

1 Commission's backfit rule and going forward on that
2 basis.

3 And as the Commission has told us, if it
4 doesn't pass the test of the backfit rule and we still
5 feel strongly about it, then we will come to the
6 Commission and ask the Commission to look at what we
7 propose and go from there.

8 CHAIRMAN ZECH: All right, proceed.

9 MR. BECKJORD: Yes, sir, let me go on. The
10 second point, there is growing interest in accident
11 management development in NUMARC. EPRI is working on
12 this for NUMARC in the U.S. and also in the world
13 nuclear community. We have active cooperative efforts
14 now with the Federal Republic of Germany and Japan. And
15 I expect there will be more of these in the future.

16 The third point I want to make is that the
17 accident management research projects for fiscal 1989
18 and fiscal 1990 are summarized in the commission paper
19 which you have now, and also, specifically in the
20 attachment, Attachment I to that paper, and they are
21 going to be described in the presentations this
22 afternoon.

23 Research is working on the ongoing projects
24 now listed in Attachment I, but I need Commission
25 approval for the new projects in these two fiscal years.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 I do not include approval of the fiscal 1991 budget for
2 accident management in this request because you will
3 have the opportunity to review and approve the fiscal
4 1991 budget for research, including accident management,
5 in about three months.

6 So, my request applies to fiscal '89 and
7 fiscal 1990.

8 COMMISSIONER ROGERS: Could I just ask you to
9 add a little bit on the international -- there is some
10 reference in the SECY, or the appendices, or something,
11 that we seem to be a little bit behind in accident
12 management research, perhaps, compared to what is
13 happening overseas.

14 Can you elaborate a little bit on that? I
15 think there was a slight reference to that notion in
16 some of the materials that we have.

17 MR. BECKJORD: Well, I'm not sure whether we
18 are behind on the research aspect of that.

19 COMMISSIONER ROGERS: Well, it might not be
20 research, it might be implementation procedures.

21 MR. BECKJORD: In terms of implementation, the
22 Swedes were perhaps the first to look at this very
23 carefully. And they did studies of their own 10 plants,
24 beginning after Three Mile Island, and they have
25 installed a number of changes. And they have changed

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 procedures, and they've added additional features, as
2 you know. to their plants.

3 Likewise, the French have developed their
4 ultimate procedures and they've made some changes in
5 auxiliary systems, auxiliary feedwater, is an example.

6 The Germans have been working very actively on
7 it. And we signed an agreement on accident management
8 about a year ago with them. And I think we have been at
9 one of those meetings.

10 MR. SHERON: The Germans have required now
11 depressurization of their primary systems, to prevent
12 direct containment heat. And as I understand, they are
13 backfitting their plants with appropriate relief
14 capacity.

15 MR. BECKJORD: So, in summary, I think that it
16 is probably true that they are somewhat ahead in the
17 procedures part of it, but I don't think they are ahead
18 in the research. The research depends, in large part,
19 on the severe accident research. And I think we
20 continue to lead in that.

21 CHAIRMAN ZECH: All right, let's proceed.

22 MR. BECKJORD: That's all I have to say.

23 MR. CONGEL: Could we have slide 6, please.

24 (Slide)

25 Some of the material I will be discussing, I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 think, came up as a result of the questions and answers
2 that preceded this. But perhaps I can shed a little more
3 light in the area that the questions were being
4 directed.

5 I would like to point out first of all that we
6 have 30-plus PRAs that we have looked at in detail for
7 existing operating plants, with others in the process of
8 being prepared and reviewed.

9 As a result of these, there have been a number
10 of fixes, changes and procedures, other facts that have
11 popped out right away as a potential ending to a serious
12 accident progression. It's the information that the
13 staff has learned from reviewing these that we would
14 like to put out formally to the industry.

15 As has been said a number of times already,
16 this has been done in various forms, but we would like
17 to have it in one form, in an organized structured
18 approach. Consequently, on this slide where we list the
19 five key elements of an accident management framework,
20 the first one on the list is what we call accident
21 management procedures.

22 One of the tables that is attached to the
23 paper that was sent up to the Commission lists a number
24 of actions that we want each of the licensees to
25 consider. One is going through its accident management

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 evaluation. Evaluation of course would be specifically
2 for its plant. Consequently, not all of these actions
3 would be appropriate. It is up to the utility to
4 determine which ones are.

5 What we want to do is focus their attention in
6 this direction. Clearly, one of the side benefits would
7 be a situation where people understand better what
8 accident progressions may be, they may avoid actually
9 getting into that circumstance, as Commissioner Carr had
10 indicated earlier.

11 The five key elements include, as I just
12 mentioned, the procedures. The second is training. The
13 training for severe accidents is intended to go all the
14 way up and down the management and the operator chain.

15 So, not only are the operators to be briefed
16 and informed in this area, but also the technical
17 support staff and the managers, who would be responsible
18 for performing some actions, and have some
19 decisionmaking responsibility, should a severe accident
20 occur at their particular plant.

21 You will note that throughout our paper to
22 you, and our presentation today, we are making this all
23 at this point low key. It is once again what I consider
24 a technology transfer. But the implications of accepting
25 this technology and feeding it back into their everyday

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 operating procedures can, indeed, be significant.

2 After the training and the evaluation of the
3 severe accident, or accident management procedures, the
4 utilities are requested at this point to evaluate
5 preparing guidance. The guidance would essentially
6 formalize for the support staff and the managers just
7 what procedures exist in order to cope with severe
8 accidents.

9 Some of the evaluation and examination of
10 course would affect the hardware at the plant. Key in
11 determining accident progressions would be the
12 instrumentation that the plant presently has -- how
13 would it operate in the event of an accident? Would it
14 give you the right parameters? Are we measuring the
15 right parameters?

16 Once again, the emphasis here is what I
17 consider a first-cut approach, an evaluation of what
18 capabilities exist and what ones could be remedied
19 quickly and easily, as a result of an evaluation of what
20 things have already been determined as effective in
21 mitigating consequences of accidents.

22 The last one on the list is decisionmaking
23 responsibilities. This is something that has not been
24 given a lot of attention as yet, and it really gets into
25 the area of what capabilities exist, who would be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 contacted in the event that you were in the middle of a
2 severe accident. Everything else -- well, I can think
3 of several examples in the past where major questions
4 about policy may exist, once you are in a severe
5 accident mode, always handled on an ad hoc basis.

6 As part of this evaluation, thought would have
7 to be given as to how it would be handled in advance.
8 One of the examples we've used among staff is the so-
9 called Red Adair approach. Red Adair is the famous
10 firefighter for the oil platforms. And our desire is to
11 have the equivalent of a Red Adair staff at all of our
12 operating plants, so we don't have to depend upon the
13 right person being at the right place, at the right
14 time.

15 Next slide, please.

16 (Slide)

17 CHAIRMAN ZECH: By the same token, though, as
18 Commissioner Carr mentioned earlier, too, you just can't
19 always predict exactly the kind of accident you are
20 going to have. And, therefore, I certainly would agree
21 that it makes good sense to use as much foresight as you
22 can and try to have some kind of an organization that
23 would be thinking about a severe accident.

24 On the other hand, I think you can go too far
25 and try to accommodate a team that would meet every

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 conceivable type accident that you can conjecture, and I
2 don't think that is what you have in mind. But it
3 certainly would be important, I believe, to have the
4 capability at the plants to look ahead to severe
5 accidents, and I guess that's what you are saying.

6 MR. CONGEL: That's what I'm saying.

7 CHAIRMAN ZECH: You cannot predict everything,
8 but you should be thinking about everything. Do you see
9 what I mean?

10 MR. CONGEL: Yes, I was hoping to get that
11 point across when I was saying earlier that there is a
12 limit on the effort at this point, that we are asking
13 them to put in -- the utility to put in.

14 When you review the number of PRAs that we
15 have looked at, you will see that there are probably six
16 to eight dominant sequences that occur at a large number
17 of the plants. So, when you see those stick out as
18 dominant sequences, you want to be sure that everyone
19 shares the same insights and knowledge that we do here.

20 CHAIRMAN ZECH: Exactly. You want to focus on
21 those for each plant, perhaps, that may have more
22 possibility of happening, than those that have an
23 insignificant possibility of happening. Because we have
24 so many custom-built plants, as we know, there are
25 differences, and each plant cannot be generic in this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 way, in my judgment.

2 So when you think severe accidents, we are
3 thinking of very remote possibility, and so forth, as we
4 all know. But I think it is important to focus on the
5 fact that there are differences in the plants and some
6 plants would have a different orientation for severe
7 accidents than others. And I just want to make sure
8 that you would agree with that or, if not, please
9 comment.

10 MR. CONGEL: Absolutely, yes. I agree.

11 COMMISSIONER CARR: It looks to me like what
12 you are looking at is not the probability, or
13 possibility of it happening, it is what happens if it
14 does happen, like loss of feedwater. You are saying
15 loss of feedwater is one of the things -- loss of
16 limited resources. So we have two feedwater systems.
17 You want three? Why don't we just make them have three.
18 Can we make them have four? That will reduce it even
19 more.

20 It is not how many systems they've got that
21 you are looking at, it is the result of losing those
22 systems -- some systems are more important not to lose
23 than others, and we have required them to have backups
24 for those. And now we are saying, but if the backup
25 fails -- we can say that throughout the plant. I can

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 build you accident sequences you will never take care
2 of. And we are back to that how safe is safe enough
3 routine.

4 DR. MURLEY: I don't think -- the intent of
5 this was not to push the risk down to some ridiculously
6 low level. It was partly as a result of looking at the
7 sequences, the ones that always seem to come out, like
8 station blackout and loss of all feedwater, and that
9 sort of thing.

10 Some of the utilities who are doing their own
11 PRAs said, "But we have other supplies of power on-site.
12 We have other supplies of water on-site".

13 And we said, "But how can you take credit for
14 it?"

15 And they said, "Well, we will rig up some
16 means", as Mr. Stello said, "of putting fire water into
17 the steam generator", that sort of thing.

18 So, as a natural result of these PRAs, they,
19 themselves, have developed means of using the capability
20 at the plant. And they realize they've got to have
21 procedures to do it.

22 So this didn't stem so much from trying to
23 push risk down to some low levels. It is no matter what
24 situation you find yourself in -- and it could very well
25 be because of operator errors, which are very hard to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 quantify -- that even if you find yourself in that
2 situation, there are capabilities at the plant that are
3 already there, that they can make use of. And that's
4 the essence, in my mind, of accident management.

5 COMMISSIONER CARR: I understand that, but you
6 are going to end up with spool pieces that in training
7 are going to get left connected, and if you can have a
8 way to connect salt water to the fresh water site, you
9 will get it. Sooner or later somebody will leave it
10 hooked up.

11 DR. MURLEY: That's a valid concern that we
12 have to be very careful of, that we don't make some
13 situation --

14 COMMISSIONER CARR: I think it is very
15 valuable to think about these things and to hold, if you
16 will, midnight sessions on what would we do, if we
17 needed to do this. I think they are very valuable. But
18 when you get to the point, as you are saying, if the
19 three ones that we are worried about, or the two of
20 them, add one more diesel, add one more source of
21 feedwater, then that's very simple, rather than going
22 into what all of these things can happen, and how should
23 we go about taking care of all of them, that gets to
24 worrying me, but go ahead.

25 You understand my problem, I'm sure.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. CONGEL: Next slide, please.

2 (Slide)

3 We have already touched on the mechanism we
4 have for interaction with the industry. It is primarily
5 through NUMARC. Of course, NUMARC represents the owners
6 group, and they also have a separate funded research
7 program going with EPRI, that is seeking some of the
8 same objectives that we are.

9 The manner in which we are going to carry out
10 the implementation is as follows:

11 The first thing on the agenda are the IPE
12 workshops. Part of the IPE workshop, which begins the
13 end of February, will have a session devoted to accident
14 management.

15 The generic letter is presently in draft form
16 -- it was attached to the commission paper -- and
17 outlines the features that we intend to emphasize when
18 we send it to the industry. The letter will not be
19 formalized until we have more interaction with industry,
20 and also, solidify some of our own thoughts and, clearly
21 the concerns that are being shown by you at this
22 meeting.

23 COMMISSIONER CARR: While you are on that, it
24 looks to me like we need to get our research work done,
25 before we do this because, if we are going to tell them

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to figure out ways to add water to the plant, we've got
2 to figure out when it is not beneficial to add water.
3 Otherwise, you are going to focus them on adding water
4 and sometimes it may be the wrong thing to do.

5 DR. MURLEY: Well, I think that that's
6 correct. We recognize that in some cases -- we think it
7 is fairly rare, as a matter of fact. It is almost
8 always the right thing to do, to add water, but we
9 recognize your point, and that's why I don't want to get
10 too far ahead of the research.

11 And I am afraid when you asked, Commissioner
12 Rogers, are some of the foreign countries ahead of us--
13 yes, they are, but they are also ahead of their own
14 research.

15 COMMISSIONER CARR: For instance, the direct
16 containment heating, if they are already taking and
17 putting MODS in to take care of that, I am still not
18 convinced that it is a problem from our research.

19 DR. MURLEY: Exactly. And there are some
20 accidents that can be made worse by implementing
21 depressurization systems. And that's why I want to move
22 cautiously.

23 But the things we are talking about, and that
24 are attached to the Commission paper, we are quite
25 confident --

1 COMMISSIONER CARR: Oh, I have no problem if
2 you put out something that says think on these. That's
3 good words. But when you tell the guy to come back with
4 your plan, I don't know -- I will give you a plan, I
5 will say, yes, I am going to think about them, I am
6 going to put them in my training session a day a month,
7 or a day every two months, we are going to talk about
8 when we want them to go defeat interlocks.

9 I am not sure I want to tell them to go defeat
10 interlocks. They get used to defeating interlocks, they
11 will think of a good way to do it, when they don't
12 really need to do it. It has happened.

13 DR. MURLEY: If the utilities were to get
14 beyond our own experience and our own evaluation of
15 these systems, we would look at them very closely,
16 before we would let them do it, yes, or to even put them
17 in their procedures.

18 But the sorts of things that we are talking
19 about here, and want them to evaluate, we believe we
20 have studied enough that we understand the pros and
21 cons.

22 Now, I agree, there are some areas in
23 research, and Brian Sheron is going to talk about those
24 in a minute -- that are well down the road. We are not
25 ready to talk about procedures for venting the primary

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 system, for example, in a core melt situation, but that
2 will come.

3 COMMISSIONER ROGERS: Just on this interaction
4 with industry topic, what has happened so far? What has
5 taken place with owners groups and with EPRI, and NRC on
6 this topic?

7 MR. CONGEL: We have had two formal meetings
8 with NUMARC to discuss this specific topic. And the
9 result of the second one was summarized by Dr. Murley
10 just a few moments ago, when he quoted from the letter.

11 COMMISSIONER CARR: You have had several
12 meetings, when was the last meeting?

13 DR. MURLEY: December 8th was the last
14 meeting, and we talked there, as I mentioned, about the
15 general principles, where they agreed to proceed with
16 this accident management framework for each nuclear
17 plant.

18 COMMISSIONER ROGERS: But can you give us some
19 flavor of the response? Is it a positive one? Is it--

20 DR. MURLEY: Yes, I think that the utilities
21 themselves, and particularly EPRI, realize the
22 importance of this. And they realize that it is a big
23 step to be gained in safety.

24 It is hard to quantify it right now, but the
25 feeling is there that there is a big step to be gained

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 in safety by utilizing the inherent capability of the
2 plant in off-normal accident conditions, and that by
3 planning ahead -- not trying to out-guess every accident
4 sequence that you can get -- but wherever you find
5 yourself in this situation, there are some things I can
6 do. They seem to be very positive.

7 CHAIRMAN ZECH: So you would say, in general,
8 that there seems to be an emerging consensus between NRC
9 and EPRI, as regards accident management is concerned?

10 DR. MURLEY: I believe so. Clearly, at the
11 level of the conceptual stage that we talked about,
12 there is clearly agreement there.

13 COMMISSIONER CARR: Well, they've all heard
14 the same words. Accident management is what we are
15 talking about these days. They can read that sign,
16 obviously, and I don't think there is any utility out
17 here that wants to have an accident. And if he does, he
18 wants to have it managed well, I'm sure.

19 DR. MURLEY: But there are enough examples
20 where utilities have gone on their own. And without
21 mentioning the plant, I can give one example. One of
22 the dominant accident sequences that they found in their
23 risk assessment was loss of all electrical power. And
24 they said, "But if I had a way to charge the batteries,
25 I could find means of opening some valves, and I could

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 get this water supply over here that is normally not
2 available".

3 So they brought in a gas-fired battery
4 charger, generator, a small thing that they have on-
5 site. They wrote some procedures for it, and they
6 trained their operators in those procedures.

7 So, their point is that even if they were to
8 find themselves for some reason in a loss of power, they
9 can get some electrical power back.

10 COMMISSIONER CARR: I think that's great. And
11 I think our responsibility, we ought to put out a notice
12 and tell everybody, hey, these guys found this problem,
13 and this is what they did about it.

14 DR. MURLEY: And this is exactly what we are
15 doing, Commissioner.

16 COMMISSIONER CARR: And if we do only that,
17 then I think it is a great idea. But it looks to me like
18 we are going a lot beyond that, if I end up saying not
19 only that, tell me everything else you are going to do.

20 DR. MURLEY: I don't think we meant to push
21 beyond our knowledge, because we don't intend to do
22 that. It is only once we understand these certain steps
23 --

24 COMMISSIONER CARR: So the plan doesn't have
25 to encompass everything they can think of.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 DR. MURLEY: No, no, certainly not, not at
2 this stage. As the research goes on, maybe five years,
3 or 10 years down the road, whenever, we find that we
4 think there are some additional steps to take, we would
5 send that out to them and ask them to evaluate that.

6 COMMISSIONER CARR: So our guidance may say
7 "Show me how you are going to consider additional
8 feedwater, or additional air supplies, another source of
9 power" -- are we going to be that specific in our
10 requests?

11 DR. MURLEY: Use the diesel-driven fire pump,
12 for example, to enhance containment spray. There is a
13 way to do that.

14 MR. STELLO: There is a table in the back of
15 the paper --

16 COMMISSIONER CARR: I read the table. I like
17 the table. If you just want to put out the table,
18 that's --

19 MR. STELLO: That's what we're talking about.

20 COMMISSIONER CARR: -- those are good thought
21 words. Just put out the table. It is the other words
22 that bother me.

23 MR. STELLO: The whole idea is to get this
24 table out in front of the industry, which is a
25 compilation of --

1 COMMISSIONER CARR: Well, we've made it a lot
2 more complex than that, it seems to me.

3 MR. STELLO: I am not sure I understand why it
4 should be viewed that way.

5 COMMISSIONER CARR: Well, watch the words
6 about framework, if all we want them to be aware of
7 things --

8 MR. STELLO: Maybe this has gotten so
9 formalized that we have lost sight of it. The whole idea
10 --

11 COMMISSIONER CARR: I agree with you.

12 MR. STELLO: -- is very simple. Here are 20
13 lessons that you can glean from PRAs. A way to think
14 about them -- and you might want to do something about
15 them -- how do you go about doing it? -- which are the
16 usual things of writing procedures, getting the guidance
17 and the training, and decide who has the decision to do
18 what. That's accident management framework. That is
19 accident management. I think it is that simple.

20 In the final analysis, what you are going to
21 have in front of you is a procedure for someone to do
22 something, and for someone to have the responsibility to
23 say "Go". It's that simple.

24 COMMISSIONER CARR: And the training.

25 MR. STELLO: Well, by definition you don't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 want someone --

2 COMMISSIONER CARR: Some procedures we don't
3 like to train in, we walk through, you know.

4 MR. STELLO: Well, I can't think of anything
5 we wouldn't want to have any training in. We want to
6 have some kind of training if they are procedures.

7 COMMISSIONER CARR: Even if it is a walk-
8 through?

9 MR. STELLO: If that's all you can do, yes.
10 Because some of these accidents, in terms of analyzing
11 them, you are beyond the state-of-the-art of putting
12 them on simulators, you can't simulate them.

13 COMMISSIONER CARR: Excuse me, go ahead.

14 MR. CONGEL: The only point I can make at this
15 stage is that the table that we were just referring to
16 is the first step. We certainly don't expect our
17 accumulation of knowledge to stop, and that as we gain
18 more knowledge we will be putting out analogous types of
19 tables.

20 The third bullet on the slide 7, the last item
21 on slide 7, says that there will be accident management
22 strategies that will be developed by the NRC-PRA people.

23 COMMISSIONER CARR: One of my hang-ups is why
24 did you pick the vehicle of a generic letter?

25 COMMISSIONER ROBERTS: The regulatory basis

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 is 50.54(f).

2 COMMISSIONER CARR: That's not the only way we
3 communicate.

4 MR. STELLO: No, we could issue an information
5 notice. We could put out a NUREG and just put them on a
6 distribution list. I didn't see anything wrong with a
7 generic letter.

8 COMMISSIONER CARR: Well, from all the words
9 you are telling me, what we want to do is just make sure
10 they are aware of these two tables. If that's all we
11 are going to require, I don't see why it requires a
12 generic letter.

13 DR. MURLEY: I think we do expect a little
14 more than just putting this in front of them, that's the
15 main purpose of this. But if they were to get a letter
16 --

17 COMMISSIONER CARR: That's what I meant, what
18 is it you expect? That's what I really wanted to know.

19 DR. MURLEY: Yes, okay. If they were to get
20 the letter that we were to sign out, and it goes, say,
21 to a vice president, and he puts a buck slip on it to
22 the plant manager and says, "Why don't you look into
23 this, or take care of it?" -- that's not enough.

24 There needs to be a framework that includes
25 their engineering staff looking at whether they can

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 bring in, for example, a gas-fired generator to charge
2 their batteries, and how they would hitch it up. It
3 needs -- once they decide that it is feasible for their
4 plant, they need to write some procedures for it. It
5 needs to go over to their training staff, to see how
6 they would work it into the curriculum.

7 There's a lot of things like that that we
8 regard as the framework. We want to work with EPRI, so
9 that we don't sit back here inventing it --

10 COMMISSIONER CARR: Okay, that's good.

11 DR. MURLEY: -- but that they do it in a
12 disciplined way.

13 COMMISSIONER CARR: Okay, post-IPE because, if
14 you are going to review it, you are going to review it
15 on the basis of their IPE look at it, I would assume, or
16 their PRA, or something plant-specific. That's what it
17 says on the next chart.

18 DR. MURLEY: It would move in parallel with
19 the IPE, because we think we know enough, generated from
20 all the PRAs we've done and that the industry has done,
21 that we can present this information to them. And those
22 that want to take advantage of it now, and want to
23 develop this disciplined way to take advantage of it,
24 can do it.

25 COMMISSIONER CARR: They can do that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. STELLO: Yes, but I think the simple
2 question you are asking, I think, is we will do our
3 review and make a decision after the IPE.

4 COMMISSIONER CARR: That's what I think.

5 MR. STELLO: The next slide says that, yes.
6 That's the way we are going to do it.

7 COMMISSIONER CARR: But you also say in here
8 we expect them to do some things before their IPE is
9 done. I don't know what those things are.

10 MR. STELLO: How about, as a minimum, look at
11 the list, read it. If you see something in here that
12 you already know, for whatever reason, that really is
13 significant to your plant, we would expect you to do
14 something about it.

15 If you do something about it, please do it in
16 a disciplined, careful manner.

17 COMMISSIONER CURTISS: Correct me if I am
18 wrong, but I guess I understood the next slide to say in
19 those instances where a utility doesn't agree with the
20 steps that ought to be taken, then the backfit decision
21 would be made after the IPE?

22 MR. STELLO: After the IPE is done and all of
23 the information is in front of you.

24 COMMISSIONER CURTISS: But isn't there a
25 considerable exchange of thoughts, and maybe

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 formalization of requirements, before the IPE process,
2 that a utility goes along either willingly, or less
3 willingly with the process?

4 MR. STELLO: Well, I expect most utilities
5 will take those things that they see in this list, or
6 that they get out of the IPE that they do, and they will
7 do them on their own. And, hopefully, when we are
8 finished, there is nothing left to do, there is no
9 backfit, nothing. It will all come to pass as just part
10 of their own process, and we will look at it and say,
11 "Yes, thank you. You did a good job", we're done. I
12 hope that that is in most of the cases.

13 COMMISSIONER CARR: But if we want them to do
14 something as a result of this, we ought to put a rule
15 out that says, "Do it".

16 MR. STELLO: A rule, or backfit?

17 COMMISSIONER CARR: If we write this generic
18 letter, they don't have to do anything.

19 COMMISSIONER ROBERTS: We are arguing over
20 semantics. But when I go to your presentation "each NRC
21 licensee shall implement an accident management plan".
22 I think that's a new requirement.

23 COMMISSIONER CARR: But the plan doesn't
24 require them to do anything. Unfortunately, that --

25 COMMISSIONER ROBERTS: We are arguing over

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 words.

2 CHAIRMAN ZECH: Part of our problem, as far as
3 I am concerned is we have, again, so many custom-built
4 plants. We are talking individual plants, and that's why
5 it is so difficult to come up with something.

6 It sure seems to me that the whole discussion
7 would show us, if we had standardized plants, we would
8 be an awful lot better off, but we don't. So, we have
9 to use judgment. I do think involving the plants
10 themselves -- the IPE program, I think, makes sense--
11 and involving them to the point that they tell us their
12 views and involve them, involve EPRI, because we do,
13 indeed, have to look at each plant individually.

14 And I think that's what your program is
15 designed to do. And I think perhaps that is the
16 difficulty the Commission is having in following it,
17 because we keep coming back to the point that each plant
18 is different and, therefore, that is real. And because
19 that is real, we do, indeed, have to look at where are
20 the weaknesses. And we are thinking about, of course,
21 very severe accidents.

22 So, because of the difference in the plants, I
23 think it is appropriate. I think what you are doing is
24 appropriate. But I think it is very difficult to
25 articulate this program because we have so many

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 different plants. It is important that they be looked
2 at individually. I think that's what you are telling
3 us.

4 MR. STELLO: They will have to be looked at
5 individually.

6 CHAIRMAN ZECH: And you are trying to put out
7 some rules that will apply to all of them, to make those
8 rules general enough that they will apply, yet specific
9 enough so that at least they will be involved in this
10 thinking on severe accidents.

11 Isn't that what we are trying to do?

12 MR. STELLO: Yes.

13 CHAIRMAN ZECH: And it would be a lot easier
14 if we had standardized plants, but we don't. So we are
15 trying to manage individual plants. And we are trying to
16 develop a severe accident type management approach to
17 things, with individual plants. That's the challenge
18 that we have. It is a real one, but I think the
19 endeavor is extremely important.

20 So, I would say let's proceed, if we can.

21 DR. MURLEY: Okay, can we move to Slide 8
22 then, which we've covered, in essence, in the
23 conversations today.

24 (Slide)

25 We would expect to work with each licensee,

NEAL R. GROSS
COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVENUE, N.W.
WASHINGTON, D.C. 20005

1 but before that even, we are working with NUMARC and
2 EPRI to outline what would be an appropriate accident
3 management framework. And the intent of that is to make
4 sure that the accident management procedures are
5 developed, as we said, on a disciplined basis, that it
6 involves all the appropriate people at the staff, like
7 engineering, like operations, like training and so
8 forth.

9 Now, that is our fundamental goal right now.
10 And we believe -- I believe, that we have the
11 industries, NUMARC's agreement, on that goal.

12 Then once we have that framework, we are also
13 asking them to look at individual procedures that they
14 might look at for their plant, that could be implemented
15 within this framework that we talk about, this
16 disciplined framework.

17 Now, if there are disagreements where we think
18 clearly for some plant that he really ought to have a
19 way to have a backup battery charger, for example, and
20 he disagrees, and we think that it ought to be made a
21 requirement, then we would, after the IPE is completed,
22 and we understand the risk analysis that has been done
23 for that plant, then we would make backfit decisions at
24 that time. It is not our intent right now to make
25 individual plant backfit decisions.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 That concludes the implementation section, and
2 there is now a discussion of the research program.

3 CHAIRMAN ZECH: All right, let's proceed.

4 MR. SHERON: Slide 9, please.

5 (Slide)

6 The role of the research program is, as it
7 says, to provide insights for accident management,
8 filling in gaps in knowledge on the progression,
9 mitigation and stabilization of severe accidents.

10 I would digress for one second, and give you a
11 little different perspective on accident management and
12 its benefits. And that is that if we look at our risk
13 assessments right now, we really don't treat the
14 operator, and the operator's intervention very well.
15 And it does contribute a substantial uncertainty to a
16 risk assessment. I see one of the real benefits of
17 accident management is, basically, making the operator
18 more predictable in the event of a severe accident.

19 It is obvious that an operator is going to try
20 and intervene in a severe accident, and do something.
21 He is not going to just stand there and watch this thing
22 happen. I think one thing we would like to do is make
23 that more predictable. That would, I think, reduce a
24 lot of the uncertainty introduced into risk assessments,
25 and I think it would go a long way towards shoring up

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 credibility on our PRA assessments.

2 So, I suggest that --

3 ~~CHAIRMAN ZECH~~ ~~COMMISSIONER ROBERTS~~ ^{up} To just suggest a quick
4 thought on that, before you go off that subject. I
5 understand fully your point that it is human nature to
6 want to do something when you see something severe
7 happening. But on the other hand, sometimes an action
8 that is very appropriate might be to do nothing. And I
9 hope that at least that kind of thinking would take
10 place. And we wouldn't just tell people "never mind
11 thinking, just do something".

12 I recognize the human tendency is to do
13 something, and we all have that, I'm sure. But on the
14 other hand, there are times when it is appropriate, in
15 the interest of safety, to think and watch, and do
16 nothing -- watching what is going on, and perhaps, that
17 action itself could be more appropriate than just doing
18 something, without thinking.

19 MR. SHERON: Yes, sir. I think one of the
20 major elements of our program is to look at the adverse
21 consequences of actions. As mentioned before --

22 CHAIRMAN ZECH: Actions that you take should
23 be very confident that they are going to help.

24 MR. SHERON: Yes.

25 CHAIRMAN ZECH: That's all part of our new

1 program, or at least new since Three Mile Island. As
2 you know, the new event, or diagnostic-oriented type
3 procedures for taking actions, that every action helps
4 prevent the more severe state.

5 So that philosophy, I think, should carry into
6 even the severe accidents, in my judgment. That's the
7 point I am trying to make.

8 MR. SHERON: Yes. And we are doing that
9 extensively. In the depressurization, for example, as
10 Dr. Murley said, you know, there are situations where
11 depressurization is detrimental to the event.

12 CHAIRMAN ZECH: The action should make sense.

13 MR. SHERON: Correct.

14 CHAIRMAN ZECH: Or even if it is no action,
15 that should make sense, too.

16 COMMISSIONER CARR: The experience around
17 accidents, though, is there is always a bunch of
18 managers there trying to figure out what the accident
19 is, and what they should do. And you can't always do
20 that.

21 So, I'm not sure we are helping them here--
22 we are helping them prevent having the accident in the
23 first place.

24 MR. SHERON: I think what we want to do is
25 make sure that the operators have the best information

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 and tools available to them, in the event they have to
2 manage such an accident. They should have the best
3 information. If there is information that can be
4 obtained in advance, that would help them make their
5 decisions. then --

6 COMMISSIONER CARR: The thing we are
7 discussing here, though, is having them available to
8 them -- another source of water, or another source of
9 air, or another source of electricity.

10 MR. SHERON: Yes, that's one portion. That's
11 the prevention portion.

12 COMMISSIONER CARR: That's different than what
13 they are going to be facing in this accident.

14 MR. SHERON: Yes, sir, that's the prevention
15 portion. Given that, even despite a lot of efforts, one
16 may still be faced with a core melt, you know, scenario.

17 Then there are other actions. For example,
18 one that is classic that's been brought up is the
19 question of should one dump water onto a molten core,
20 and what are the consequences. There are questions,
21 does a steam explosion occur? Do you generate so much
22 additional steam that it overpressurizes containment,
23 the additional hydrogen that is generated? Is the
24 operator prepared and understand the consequences of
25 such an action?

1 Spraying down -- if I recover electric power,
2 after I have melted through and have a containment full
3 of steam and hydrogen, if I divert water to the
4 containment sprays and spray down the containment in an
5 attempt to lower the pressure, I condense the steam -- I
6 look for a lot of hydrogen, which could detonate.

7 A lot of questions like that we don't know the
8 answers to --

9 COMMISSIONER CARR: That's the one we're
10 waiting on you for.

11 MR. SHERON: -- but we feel that with research
12 and analyses, looking at uncertainties, the pros and
13 cons, we can get much better insights on whether those
14 are, indeed, good actions to take.

15 (Slide)

16 On Slide 10, the Accident Management Research
17 Program is a two-part program. We have a short-term,
18 which is basically an assistance type of program to NRR,
19 which is to assist in the closure aspects of accident
20 management.

21 If you remember in the integration plan we
22 said that one element of closure was the accident
23 management portion. And that was when plants have in
24 place a framework for accident management, which meant
25 that as information, strategies, et cetera, come

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 available, they had a way of systematically putting it
2 into this program.

3 We will be assisting them in developing the
4 candidate accident management strategies, refining them
5 -- the ones in the table; looking at helping develop an
6 outline, what an acceptable framework for an accident
7 management program would be. This would be done, again,
8 in cooperation with EPRI and the NUMARC people.

9 And then assisting in the development of the
10 appendices to the proposed generic letter, which
11 basically are the table of candidate strategies, and
12 then the development of a framework.

13 The second part of the program is a longer-
14 term program, we call this confirmatory and it is post-
15 closure. It is not required for the closure process at
16 all. But, basically, it is to look very systematically
17 and in a comprehensive manner at some of these accident
18 management strategies -- primarily, once one has a core
19 melt situation, what does the operator see and do?

20 (Slide)

21 On Slide 11, you will see one of the chief
22 elements there is to, basically, provide technical
23 information and guidance for the staff, for when we are
24 faced with reviewing the industry's proposed programs.

25 If the industry comes in and proposes, for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 example, to depressurize, to alleviate direct
2 containment heating, we are probably going to be called
3 upon to decide is that a good thing to do, or not. We
4 need to get that information, all the information we
5 have on the subject, to the reviewers, so that they can
6 either agree, or disagree with that conclusion.

7 We will be defining a lot of supporting
8 studies that are needed from other ongoing programs--
9 for example, the Severe Accident Research Program
10 itself, our Human Factors Research Program, the PRAs
11 which are being done like 1150.

12 We also want to gather information that is
13 being generated elsewhere, for example, by the
14 Containment Performance Improvements Program which you
15 will hear more about later this week, the IPEs which
16 will be developing other information, and international
17 programs -- work that is being done by Germany and
18 Japan, for example, and what they are learning.

19 (Slide)

20 On Slide 12, as you know, we already have some
21 ongoing projects which were started last year, the last
22 fiscal year, in this area. We are continuing to study
23 the efficacy of the depressurization for alleviating
24 direct containment heating. The question is can an
25 operator depressurize? At what time in an accident must

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 the decision be made to depressurize? Are the relief
2 capacities on the existing plants adequate to
3 depressurize? Are there any adverse consequences to
4 depressurization.

5 Obviously, if you have a core that is
6 degrading and you are depressurizing it, you are dumping
7 a lot of steam and hydrogen into the containment. The
8 question then -- you are also reducing the coolant
9 inventory in the reactor, which means you are leading to
10 a core melt faster.

11 So we are trying to look at, for example, does
12 this really -- do the benefits of this outweigh the
13 possible detriments?

14 Recriticality, this is a small program. It is
15 a question that in some plants the control rods will
16 melt before the fuel will. There is a potential that if
17 the control rods melt out of the core, and then you
18 reflood it with unborated water, are there any adverse
19 consequences that need to be brought to the attention of
20 an operator?

21 COMMISSIONER CARR: You say there is a
22 potential for that in some plants?

23 MR. SHERON: Yes, sir.

24 COMMISSIONER CARR: How can we let them build
25 them like that?

1 MR. SHERON: Well, it is just the fact that
2 the melting points of the control rods in the BWR, for
3 example, are lower than the fuel in the stainless -- in
4 the channel boxes, and stuff. So the control rods will
5 melt out first.

6 MR. STELLO: I think theoretically is a better
7 word than potential. You could, because of the
8 difference in melting points, do calculations.

9 MR. SHERON: Experimentally, we have shown
10 that this occurs.

11 COMMISSIONER CARR: That's not very good. I'm
12 not sure it makes any difference.

13 MR. SHERON: No. All the control rods have a
14 lower melting temperature than fuel.

15 COMMISSIONER CARR: I guess the question is,
16 should they have?

17 MR. STELLO: I think by their nature they have
18 to.

19 DR. MURLEY: We didn't require these plants be
20 designed to accommodate core melting conditions, we
21 obviously didn't think of this.

22 I'm not so sure -- there is a lot of research
23 that needs to be done, but I am not at all sure that
24 recriticality is such a problem, even if it
25 theoretically were to occur because inherent Doppler

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 feedbacks and things like that may just let the plant
2 sit there and boil. I think we need to study that. But
3 I am not at all alarmed that this is a serious concern.

4 MR. SHERON: I would point out, a lot of the
5 research we are doing is to gain insights on what an
6 operator may see as a consequence of his actions. And
7 to make sure that the operator doesn't misinterpret
8 those reactions.

9 In other words, if recriticality may occur,
10 but it is not a big problem. I think that is something
11 we would like the operators to know. And they should
12 not worry about it, if they see things happen in their
13 plant.

14 We are looking at the instrumentation
15 requirements that an operator may need during a severe
16 accident. Again, the misinterpretation, if the
17 instruments are not reading correctly, or giving false
18 information, the operator can take a false action. So,
19 we want to look at those. We want to see if an operator
20 is, indeed, called upon to take a certain action, based
21 on certain symptoms, that the information he is
22 receiving is, indeed, correct.

23 And then with the appendices to the generic
24 letter, we will be continuing to do more research in
25 those areas, looking at, again, accident candidate

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 strategies. As we discover things, we will be
2 continuing to do PRAs in the future, and will be
3 learning things. And as these become available, we will
4 be analyzing them and assessing them, and passing them
5 on to the industry.

6 (Slide)

7 On Slide 13, you will see that the new
8 projects which we are requesting your approval is \$1.37
9 million in this fiscal year and in FY90 we propose \$3.9
10 million --

11 COMMISSIONER ROBERTS: Excuse me, could I ask
12 a question?

13 MR. SHERON: Yes, sir.

14 COMMISSIONER ROBERTS: Can you relate Slide 13
15 to Slide 10? And are these items long-term,
16 confirmatory, post-closure?

17 MR. SHERON: Yes, you've given us the -- I
18 think we have already gotten approval for the funding
19 for the short-term work, which is not much, I think it
20 was 300K.

21 COMMISSIONER ROBERTS: So all of this is long-
22 term, confirmatory, post-closure?

23 MR. SHERON: Yes, sir.

24 COMMISSIONER CARR: And all of them start in
25 '89? Or all of them are funded by that 1370, or some of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 them pick up in '90?

2 MR. SHERON: I think some of them pick up in
3 '90. We start some in FY89, we will be starting some in
4 FY90.

5 COMMISSIONER ROBERTS: Does it go beyond FY90?

6 MR. SHERON: Yes, sir.

7 COMMISSIONER CARR: The way I read it it is \$4
8 million a year, after FY90.

9 MR. SHERON: Yes. But we said we would
10 request your approval through the normal budget approval
11 process.

12 CHAIRMAN ZECH: Are all of these figures you
13 are giving us here on Slide 13, accommodated in the
14 five-year plan?

15 MR. SHERON: Yes, they are. I xeroxed a copy
16 here, and the numbers you see in the five-year plan are
17 slightly higher. That's primarily because they also
18 include the ongoing programs which we already had. This
19 is only for the new starts.

20 CHAIRMAN ZECH: I understand. But they are
21 accommodated in your --

22 MR. SHERON: Yes, sir.

23 CHAIRMAN ZECH: And beyond 1990, they would
24 also be in the five-year plan?

25 MR. SHERON: Yes, sir. We are not asking for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 any new money.

2 COMMISSIONER CARR: At about 4 million a year,
3 it says.

4 CHAIRMAN ZECH: All right, you may proceed.

5 MR. SHERON: The areas we would be looking at,
6 as I mentioned before, in-vessel strategies, primarily
7 consequences of cooling a degraded core, or just ways
8 that one might be able to cool a core that has started
9 to melt down, but is still in the vessel -- questions
10 about having it retained in the vessel.

11 Ex-vessel strategies, ways to reduce releases,
12 possible paths on which one can filter any effluent.
13 Questions, as I mentioned before, about if I recover
14 systems -- what strategy should an operator use? Should
15 he put water -- if the containment is at pressure
16 already and you put water on a molten vessel, you are
17 going to generate a lot more steam, you may over-
18 pressurize the containment right then and there. Should
19 I put water on the vessel, should I put it in the
20 containment -- questions like that.

21 COMMISSIONER CARR: Those are tactics, right?
22 Strategies are should you put water in at all? And
23 tactics is where should you put it.

24 MR. SHERON: Well, that would be a question,
25 as we said -- should you even put water in? If you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 recover it, I think it would be -- right now, if an
2 operator had the opportunity to put water back into the
3 system, I think he would do it. I'm not sure we have a
4 basis to tell him not to, at least now. Hopefully, the
5 research will answer that.

6 As we said, we will be looking at the
7 information needs for accident management -- what does
8 an operator need in terms of information in the control
9 room, to make the right decisions? We will be giving
10 assistance to NRR in the implementation of a framework
11 that the utilities are developing.

12 As I said before, consequences of cooling a
13 degraded core, that's basically, the in-vessel
14 strategies. The uncertainties affecting accident
15 management, I think, is a very key area. Given our
16 understanding of phenomena associated with severe
17 accidents, which is, indeed, very complex, uncertainties
18 are going to play a large role in what we would
19 ultimately recommend to the industry.

20 One of the things we want to do is get a real
21 handle on how big these uncertainties are and whether
22 they affect -- whether our decision would go one way, or
23 the other.

24 And diagnostic computational aids, these are
25 things that a support team in the tech support center,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 for example, might have available. These might be
2 graphs and monographs that we would normally use for
3 calculating, for example, times to core uncover, and
4 the like. We have been experimenting with some of
5 these in the incident response center as part of the
6 drills. So, I think there is some information available
7 on their usefulness.

8 (Slide)

9 Slide 14, is our conclusion -- mainly, we
10 think we have a realistic regulatory approach formulated
11 which would assure the implementation of it by the
12 utilities. I would just point out again, this is a key
13 element in our closure process. We think we have a
14 focused accident management research program developed.
15 We've put a lot of thought into it in terms of what the
16 programs are that we want to pursue.

17 We have broken it up into a small program
18 which will support the closure process, and then a
19 longer-term confirmatory research program which will
20 complement the ongoing efforts by the industry, and I
21 think, also, provide a vehicle for utilizing much of the
22 information coming out of the research program in severe
23 accidents.

24 And, finally, we are requesting your approval
25 to get started on this program. Our contractors are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 ready and waiting to start work on this.

2 MR. STELLO: We're through, Mr. Chairman.

3 CHAIRMAN ZECH: Thank you very much.

4 Any questions from my fellow Commissioners?
5 Commissioner Roberts?

6 COMMISSIONER ROBERTS: No question, but a
7 comment, and I'm supportive of what you're doing, but
8 the draft letter attached to the SECY paper says the
9 regulatory basis for the issuance of the letter is 10
10 CFR 50.54(f), and that's a request for information, but
11 the draft letter requires licensees to implement a plan,
12 and to me that's a new requirement, and has to be
13 justified under 10 CFR 50.54(f). That is my opinion.
14 I'm not asking for discussion. That's all I have.

15 CHAIRMAN ZECH: All right. We'll ask the
16 staff to take that for consideration. Commissioner
17 Carr?

18 COMMISSIONER CARR: I've got a lot of
19 questions, most of which I have addressed. One is
20 global strategies we haven't addressed, and the other
21 one is framework. I still don't know, when you say
22 we're going to assess this thing in global strategies.

23 On page 3 of your paper -- we've already
24 discussed that this is going to be part of the IPE in
25 some point, and that's fine.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 Point one up there says you're going to
2 develop technically sound strategies. I've worked with
3 strategies all my life, and I don't understand the term
4 strategy in the approach we're taking here, but in
5 paragraph three there, you say -- you're assuring that
6 the nuclear plant staff is trained in procedures and
7 guidance to follow in the event of an accident beyond
8 the design basis, and that the utility management is
9 trained and prepared to deal with severe accidents.

10 I would say maybe they'll be prepared to deal
11 with some or a range of severe accidents, if we've
12 thought about it ahead of time.

13 MR. STELLO: Those for which you have the
14 procedures and at least some insight --

15 COMMISSIONER CARR: For the ones that
16 somebody's conjured up and it happens like they conjured
17 it, they may be able to hack it.

18 MR. STELLO: Well, let me try to use this
19 without generating a new example.

20 COMMISSIONER CARR: Very few guys will get
21 mixed up again on TMI type accidents.

22 MR. STELLO: Yes, I agree with you, but there
23 are probably a whole host of scenarios that can lead to,
24 say, a loss of feedwater. It doesn't make any
25 difference how you lose it, it's how you deal with it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 There are many ways in which you can come
2 there, how are you going to deal with that, but there
3 are probably some particular accidents, severe accident
4 sequences, that are going to be beyond what you will
5 have in the procedure, and I would expect that that
6 will, in fact, be the case; not all.

7 COMMISSIONER CARR: In para four there, it
8 looks like that ought to go first, before the first
9 three. We ought to provide the technical basis before
10 we require them to do something.

11 I'm still hung up on strategy. On page 4 you
12 talk about "On the basis of existing PRAs the staff has
13 identified several generic accident management
14 strategies", and my question is, for instance?

15 The first bullet on page 4 in the SECY paper.
16 I just throw that on the table because when I'm trying
17 to understand this thing --

18 DR. MURLEY: I wonder if maybe we're using
19 "strategies" a little different from what you're used
20 to.

21 MR. STELLO: We are.

22 COMMISSIONER CARR: We are.

23 MR. STELLO: You are. In Table I.

24 MR. CONGEL: It refers to the table.

25 DR. MURLEY: Table I.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. STELLO: Table I.

2 COMMISSIONER CARR: "Several generic accident
3 management strategies".

4 CHAIRMAN ZECH: I hope you mean tactics.

5 COMMISSIONER CARR: I think those are -- yeah.
6 Why don't you just say, hey, you need more feedwater,
7 you put in another feedwater system, or if you want more
8 electricity, you give them another generator.

9 CHAIRMAN ZECH: Tactics, not strategies.

10 COMMISSIONER CARR: In the second bullet,
11 "Operators, technical support staff, and managers
12 responsible for responding in the event of an accident
13 should be generally aware of the progression -- (i.e.,
14 their symptoms) -- ". That's where you're going to get
15 hung up, is telling them the symptoms of these severe
16 accidents.

17 I'm not -- that's where we always get the
18 accidents from, is somebody didn't recognize the
19 symptoms, and we go around and patch that up after it's
20 over.

21 Most of our accident things we've put into
22 place is because somebody almost had one, or somebody
23 did have one, and we said, "Oh, now we know what the
24 symptoms are and we can put those on the simulator and
25 we can train in those".

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 Figuring out the symptoms for accidents that
2 haven't happened yet is a pretty tough especially when,
3 as you say, you can't put it on the simulator.

4 MR. STELLO: But I think the idea prior to
5 TMI, the procedures were based on understanding events.
6 We've gotten away from that, and now we key on what are
7 the symptoms you're trying to respond to, and you ought
8 to understand symptoms.

9 I mean, if you don't have radiation, you
10 haven't damaged the core yet, but if the temperatures
11 are starting to rise in core exit, you're uncovered.
12 Symptoms. To the extent you can. You're never going to
13 get it all or be perfect, that's the whole idea.

14 Someone will have made a mistake, that's what
15 got you in trouble, most likely.

16 COMMISSIONER CARR: But you're going to come
17 up with those symptoms and their timing and give them to
18 these guys so they can train with them, that's what it
19 says there.

20 MR. STELLO: Yes.

21 COMMISSIONER CARR: That's going to be an
22 awfully tough job.

23 MR. STELLO: In a general sense, the types of
24 things that Sher was talking about a moment ago in terms
25 of timing -- how long without water will the core

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 uncover --

2 COMMISSIONER CARR: The reason it's going to
3 be tough is, you're going to make the licensee do it.
4 The next bullet says "Each licensee will be expected to
5 make available for the technical support staff and
6 managers, a set of guidance for diagnosing the progress
7 of severe accidents".

8 MR. STELLO: I think you would have to have
9 some of that in order to operate from the tech support
10 center -- already have, in many cases.

11 COMMISSIONER CARR: On page 5, "Approach for
12 Accident Management Implementation. . . . In addition,
13 we expect NUMARC to provide industry's perspective and
14 bring about the necessary industry-supported initiatives
15 on accident management". What and when do you expect
16 those?

17 DR. MURLEY: Well, we are working now with
18 NUMARC, and their agent in this -- in the details, is
19 EPRI. And my understanding is they are working quite
20 vigorously on this, and I think -- did we have a plan
21 for meeting with EPRI soon, Frank?

22 MR. CONGEL: Yes, we have a meeting Thursday,
23 this coming Thursday.

24 COMMISSIONER CARR: Well, I'm trying to get a
25 handle on what initiatives you expect to come out of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 that, and when do you expect to get them. Have we
2 outlined that yet?

3 DR. MURLEY: Why don't you discuss --

4 MR. CONGEL: On Thursday, we're going to
5 discuss the results of actually the meeting that we're
6 having today, with NUMARC. We have a couple of other
7 things on the table, and I might have one of my staff
8 people come up with the outline, but as a result of the
9 last meeting that we had with Dr. Murley involved, all
10 of our philosophy was laid on the table.

11 The respective staffs went separate ways to
12 develop some of the matters which we want to carry out
13 to actual implementation. Our next meeting is going to
14 be the next round of discussions on the manner in which
15 we plan to do this implementation.

16 MR. STELLO: Do you know, Frank, when NUMARC
17 -- do they have a schedule of when they expect to have a
18 product?

19 MR. CONGEL: No.

20 MR. STELLO: Can you make a guess? You
21 haven't made an estimate? No guess?

22 CHAIRMAN ZECH: You're going to talk about
23 this Thursday? Is that what you're telling us?

24 MR. CONGEL: We'll probably talk about it
25 Thursday.

1 COMMISSIONER CARR: Don't give me a guess if
2 you haven't got one.

3 MR. CONGEL: Pardon?

4 COMMISSIONER CARR: I said don't give me a
5 guess if you haven't got one.

6 MR. CONGEL: I do not have a guess.

7 COMMISSIONER CARR: The next paragraph I
8 discussed -- "The regulatory mechanism for obtaining
9 improvements in industry accident management
10 capabilities will be through the issuance of a generic
11 letter". I guess my question is, why not a rule? When
12 you come back, you can tell me why not.

13 MR. STELLO: It can be a rule.

14 COMMISSIONER CARR: Can't be?

15 MR. STELLO: Sure, it can.

16 COMMISSIONER CARR: Oh. Well, we're going to
17 require improvements.

18 MR. STELLO: But I wouldn't know what to put
19 in a rule except to tell each licensee, "Do good on a
20 case-by-case basis. Tell us what you did and we'll
21 decide if you do good".

22 COMMISSIONER CARR: Is that the way we write
23 generic letters?

24 MR. STELLO: That's basically what you're
25 writing. You're putting out a generic letter saying

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 "Here are some ideas. Put together a program as part of
2 your IPE, look at them, and tell us what you propose to
3 do for your accident management plan for your facility".
4 It's case-by-case. They're all going to be different.

5 Rules are very good when you know, or have a
6 fairly good idea of what you want to require, but I
7 don't know how we could justify with any kind of
8 specificity now, nor do I think it would be wise to do
9 so.

10 COMMISSIONER CARR: I agree with that. I'm
11 just not sure that a generic letter is going to
12 accomplish what you want to accomplish. The last
13 sentence in this thing says what we're requiring them to
14 do -- let me get the generic letter out.

15 The last sentence in the generic letter--
16 "Within 90 days of receipt of this letter, licensees
17 should submit a response certifying their commitment to
18 implement an Accident Management Plan that provides a
19 framework for evaluating and implementing severe
20 accident procedures".

21 So, the guy writes back and says "I commit to
22 doing it", period, end of commitment. That's all he's
23 required to do.

24 MR. STELLO: And it will probably be some
25 years as he's actually going about the process of doing

1 it.

2 COMMISSIONER CARR: If that's what you want,
3 then I can understand. Okay.

4 On page 6, "... improvements in accident
5 management capabilities can be realized prior to
6 completion of an IPE. Examples of such improvements
7 include near term implementation of certain accident
8 management procedures (to be included in the Generic
9 Letter on accident management) ..." Is that your table?
10 I'm at the top of page 6, second sentence.

11 DR. MURLEY: Yes, that was the intention, was
12 the examples that we've listed in the attachment to the
13 Generic Letter.

14 COMMISSIONER CARR: They are not all-
15 inclusive?

16 DR. MURLEY: Oh, no.

17 MR. STELLO: But while they are not all-
18 inclusive, they are the best judgment of the staff of
19 those that are most important.

20 COMMISSIONER CARR: Those are the only ones we
21 know about now, from what you've told me.

22 MR. STELLO: That's correct.

23 COMMISSIONER CARR: But we're giving them the
24 benefit of our expertise and what we've gathered
25 together, and those are the examples we're going to give

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 them.

2 MR. STELLO: That's correct, and we think
3 that's not a bad list.

4 COMMISSIONER CARR: Okay.

5 DR. MURLEY: And my guess is that as the IPE
6 proceeds for each plant, they will find some of their
7 own. It depends on their involvement --

8 COMMISSIONER CARR: But we've got to wait for
9 the end of the IPE to get their plan back.

10 MR. STELLO: For it to be finished, for sure.

11 DR. MURLEY: To be finished.

12 COMMISSIONER CARR: But you're saying that
13 this is outside the plan. Take care of these examples
14 outside the plan, is what you're saying.

15 DR. MURLEY: Yes, because we have done enough
16 study and know enough ourselves, of the generic
17 applicability of these examples, that we're quite
18 confident they will apply to most, if not all, plants.
19 So, let's not wait. Go ahead and look at these.

20 COMMISSIONER CARR: You give the option to the
21 guy in the third paragraph to do this -- "Generic
22 accident management procedures could be incorporated
23 into emergency procedure guidelines by the vendor owners
24 groups and assessed by NRC according to existing
25 channels of review".

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 Suppose he opts to do that? That will delay
2 the program, won't it?

3 DR. MURLEY: No, I don't think so because, for
4 example, take the BWR emergency operating procedures.
5 They are going through periodic upgrades, and we're now
6 on revision four of the emergency procedure guidelines.
7 It could be that revision five might include some of
8 these advance notions of severe accident procedures, in
9 which case we would review it the way we normally review
10 EOPs.

11 COMMISSIONER CARR: Okay. Next page, there's
12 a lot more on strategy that I don't understand, that
13 somehow you've got to explain strategy to me. We won't
14 take the time to do it now.

15 And the same on page 8. You're still talking
16 strategies. And you've got the paragraph, next to the
17 bottom on page 8 that says "Even though this research
18 will concentrate on all consequences of potential
19 actions, ... currently expected that the ultimate
20 guidance to the operating staff is to always add water
21 during the course of a severe accident". We really want
22 to tell them that, huh?

23 DR. MURLEY: Well, at this stage, yes, because
24 we're fairly confident that -- you know, we're talking
25 about probabilities, to some extent, and it's always --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 COMMISSIONER CARR: Well, all these are low
2 probabilities we're talking about anyway.

3 DR. MURLEY: Once you get into this situation,
4 our knowledge today tells us that in most cases, if not
5 all, but let's say most cases, it's going to be proper
6 to add water.

7 COMMISSIONER CARR: Unless he's got a solid
8 plan.

9 CHAIRMAN ZECH: So, you want to keep the core
10 covered?

11 MR. STELLO: Yes.

12 CHAIRMAN ZECH: I think.

13 MR. STELLO: I think the issue here is, if the
14 core was uncovered or partially uncovered and you were
15 operating the plant, would you add water? I think our
16 judgment is yes.

17 COMMISSIONER CARR: If you know the core is
18 uncovered or partially uncovered --

19 MR. STELLO: If you know it was covered or
20 partially uncovered, you'd add water.

21 COMMISSIONER CARR: I mean, we've got all
22 those "iffies" in there.

23 DR. MURLEY: If you don't know, you'd still
24 want to add water because you may have a bubble in the
25 head, the top of the vessel, that leads you to think

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 your pressurizer is full and --

2 COMMISSIONER CARR: Three Mile Island thought
3 they were solid, so they didn't want to add water.

4 DR. MURLEY: Exactly right.

5 COMMISSIONER CARR: And I would bet you the
6 next guy that thinks he's solid isn't going to want to
7 add water either.

8 DR. MURLEY: Well, what we're saying here is
9 we think you ought to.

10 COMMISSIONER CARR: I want to be sure you want
11 to tell them that, that's all I'm saying.

12 MR. STELLO: Yes. For that case, yes.

13 COMMISSIONER CARR: Okay.

14 MR. BECKJORD: There may be situations in
15 which you want to limit the amount of water that you're
16 adding, limit the rate.

17 CHAIRMAN ZECH: But you generally want to keep
18 the core covered.

19 MR. BECKJORD: That's right. That's right.

20 DR. MURLEY: And if you don't know --

21 COMMISSIONER CARR: I'm not arguing that
22 point. That's not what they're telling him to do,
23 though.

24 On the Generic Letter, Attachment 2, first
25 page, the guidelines -- it says "NRC staff through

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 NUMARC is going to develop guidelines that define a
2 generic framework", which are great words, but it says
3 "These guidelines, to be developed as part of an
4 industry initiative" -- bottom paragraph -- "should
5 address each of the key attributes of a utility Accident
6 Management Plan". What are the key attributes of a
7 utility Accident Management Plan? Is that those things
8 you listed over there that says the parts?

9 DR. MURLEY: Page 3 of the commission paper,
10 Commissioner.

11 COMMISSIONER CARR: Are the key attributes?

12 DR. MURLEY: Yes.

13 COMMISSIONER CARR: One, two, three, four?

14 DR. MURLEY: Yes.

15 COMMISSIONER CARR: That's what the guy, in
16 responding to the Generic Letter, has got to do.

17 DR. MURLEY: Yes. Maybe we haven't stated it
18 as eloquently as we could, but the essence is to do it
19 in a systematic, disciplined way -- have your
20 engineering staff look at, as you said, item 4 of those
21 four is probably the most important, do a technical
22 basis for assessing the effectiveness of --

23 COMMISSIONER CARR: But this plan -- this is
24 outside of appendix where you give them the samples.
25 All these things only affect the plan, and you're

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 telling them the samples are different than --

2 DR. MURLEY: We're saying "Here are some
3 sample strategies" -- or "tactics" I think is a better
4 phrase -- but "Here are some samples that we believe
5 might apply to your plant because we've done a lot of
6 study of them", but what the framework is, is they've
7 got to have a means for taking these examples and
8 evaluating them for their plant, doing it in a
9 systematic way.

10 COMMISSIONER CARR: And the utility response
11 says "Within 90 days submit" -- what you were talking
12 about -- and "in each case, the best estimate schedule,
13 including for implementing the accident management
14 plan". I guess I don't understand how you implement a
15 framework. What we're requiring them to submit is a
16 framework for evaluating and implementing, and now we
17 want a schedule for implementing. I think we're ahead
18 of ourselves.

19 DR. MURLEY: Well, perhaps, but what we have
20 in mind here is "tell us when you're going to have a
21 procedure in place so that you can take one of these
22 examples we've given you and do the analysis in your own
23 organization, to see whether it applies to your plant.
24 Also tell us whether you've got a procedure in place so
25 that you can take this same example, assuming it applies

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to your plant, and write a procedure for it".

2 So, this framework is really, if you will, a
3 large superstructure of procedures for taking these
4 examples and developing, analyzing and developing
5 procedures --

6 COMMISSIONER CARR: Well, the framework is not
7 doing anything except laying out the system that's going
8 to do something later.

9 DR. MURLEY: Well, that's a way of saying it,
10 yes, because right now most utilities don't have a means
11 of making use of this great information we're giving
12 them. They don't know what to do with it other than
13 send it on a buck slip down to the plant manager or
14 something.

15 COMMISSIONER CARR: Well, then they may not
16 'til they have their PRA or their IPE done, which is
17 what I think may happen.

18 DR. MURLEY: Well, I think these examples are
19 simple enough and generic enough that they could analyze
20 now, but in some cases it may be that they decide they
21 want to wait until their PRA is done.

22 MR. STELLO: Over half the plants have either
23 a PRA or IPE equivalent.

24 COMMISSIONER CARR: I hate to say it, but I
25 think we ought to make them all have one right away and

1 we get through with that problem.

2 I don't have anymore questions, but I would
3 advise you to sit one of your guys down and have them
4 try to comply with that Generic Letter before you mail
5 it.

6 MR. STELLO: Okay.

7 CHAIRMAN ZECH: Commissioner Rogers?

8 COMMISSIONER ROGERS: On your research
9 program, new research program, I notice that the list of
10 topics in your slides is a shorter list than that in
11 Attachment 1, and one of the missing items in that list
12 of new projects is the BWR accident management insights.
13 There are four items left off that list on the slides
14 that were in the list in Attachment 1 -- BWR accident
15 management insights, strategies related to direct
16 containment heating, guidelines for industry audit, and
17 support for plant exercises.

18 Are those located someplace else in your
19 research program, or where are those? They are not
20 dropped, presumably, but they are not explicitly
21 mentioned in the list, on the slide list.

22 MR. SHERON: I think it was just a matter of
23 trying to condense it down into something that would fit
24 on the screen.

25 COMMISSIONER ROGERS: I see, the slide isn't

1 big enough to hold everything. Okay. If that's the
2 answer, so be it. I think it would have been nice to
3 have seen or heard about that because they just seemed
4 to disappear from the scene, but they all are included
5 in --

6 MR. SHERON: Yes, sir.

7 COMMISSIONER ROGERS: -- because the numbers
8 are the same, the dollars are the same. Okay.

9 Some of the questions that Commissioner Carr
10 raised in the very early discussions, I think were some
11 items that I was particularly concerned about as well--
12 the whole question of introducing new elements of
13 complexity into the system to deal with these already
14 remote circumstances that might occur. It seems to me
15 that this is something we have to approach with a great
16 deal of care.

17 Adding new hardware to deal with a very
18 unlikely eventuality, but hardware which could easily
19 create another problem of its own through an error is
20 something that I, frankly, would be quite worried about.

21 I think that the saltwater example that
22 Commissioner Carr gave is just the kind of thing that
23 one can well imagine happening. Cross-connects that are
24 added -- we've already heard in the last year or so
25 about an occasional cross-connect valve that was open

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 when it shouldn't have been, nobody knew about it, so on
2 and so forth.

3 So, it seems to me that a very thorough
4 analysis has to be done of each of the proposed fixes,
5 and I'm concerned about that because it seems to me, in
6 some cases, they are going to require pretty
7 sophisticated systems analysis to make sure that what
8 looks at first blush to be something that would help, in
9 fact, doesn't have some consequences that are pretty
10 tough to see but if you look at it very carefully you
11 see there is a circumstance under which further problems
12 could arise, and I just wonder how that very close look
13 is going to be taken.

14 Is it going to be taken by us? Is it going to
15 be taken entirely by the licensee? How are we going to
16 analyze the innovative solutions that are proposed by,
17 let's say, operators that might sound very good but it
18 really takes a very sophisticated design engineer to
19 look at the possible consequences of something like
20 that, to decide that that isn't such a great idea after
21 all, and how are we going to do that?

22 DR. MURLEY: In the first instance, we would
23 expect the licensee to do the analysis himself, to
24 assure that any changes that he's proposing are
25 appropriate for his plant and won't make the situation

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 worse.

2 COMMISSIONER ROGERS: Even if they are just
3 procedural changes?

4 DR. MURLEY: Yes, even if they are procedural
5 changes, that's correct. We would, in the normal course
6 of events, review those. We're going to discuss later
7 this week, an item on direct core's venting in the BWR
8 Mark Is, and you'll recall that we required the owners
9 group and some utilities to do very careful analysis
10 before we were satisfied ourselves that they had covered
11 all the bases.

12 So, to summarize, we would expect the utility
13 to do his own analysis, and hold them responsible for
14 making sure it's a safe change to make. We would also
15 do our own independent reviews, generally.

16 COMMISSIONER ROGERS: Well, it seems to me
17 it's something that requires a great deal of look, hard
18 look, when new procedures are suggested to deal with a
19 very unlikely set of circumstances that led you into
20 this accident mode in the first place, and --

21 DR. MURLEY: I agree wholeheartedly.

22 COMMISSIONER ROGERS: -- that they can't be
23 entered easily at all, and that they really have to be
24 analyzed very, very carefully. And that's why the
25 Appendix 1, with some of the procedures for developing

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 global strategies, including procedures for defeating
2 interlocks and overriding component protective trips in
3 emergency situations -- that one really, I think, raises
4 the hackles on the back of all of our necks when we see
5 something like that because we know how careful one has
6 to be to not casually move into something like that, and
7 the question is, are you going to turn the ACRS loose on
8 some of these possible fixes? I would hope so.

9 MR. STELLO: Oh, they will be involved, no
10 question, if some of these come up, and have been.

11 MR. SHERON: We did brief them last week.

12 CHAIRMAN ZECH: You briefed them last week,
13 you say?

14 MR. SHERON: Yes, sir.

15 CHAIRMAN ZECH: Thank you.

16 COMMISSIONER ROGERS: The whole question of
17 moving ahead on some of these things before the IPEs are
18 completed has been difficult to appreciate. I think the
19 protracted questions that we've had here today have been
20 because we've had a lot of trouble dealing with that
21 suggestion that it was possible to move ahead before the
22 IPEs, and I think that some of your comments about the
23 significance of the table at the end have helped to
24 straighten us out a little bit on that, but I think we
25 did not enter this meeting -- at least I didn't -- with

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 a full appreciation of the significance of that table in
2 terms of how key it is to what you expect could be done
3 early on, and it seems to me that this generic letter
4 and how you present it has to clarify that more than the
5 proposed draft does.

6 DR. MURLEY: I might just add, Commissioner,
7 that to some extent the generic letter outline was just
8 that, an outline. We realize it's not close to final
9 form, but we felt we ought to tell the Commission this
10 is the direction that we're heading.

11 We expect to work with NUMARC and with EPRI to
12 flesh out more clearly what we mean by this framework,
13 and I guess I agree with you that it's not immediately
14 clear from reading this, just how to go about it, but we
15 expect to do that, and when they get our letter, we will
16 have had many, many meetings working with them, so
17 they'll know exactly what we mean.

18 COMMISSIONER CARR: I took it as a draft
19 letter. I just thought you wanted some comment on it,
20 so I gave you some.

21 DR. MURLEY: And we appreciate it.

22 COMMISSIONER ROGERS: Very generously, I
23 think.

24 I'd just like to stress in your new projects,
25 the cite that there are two main purposes of the long-

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 term research -- the second one, to evaluate the
2 potential disadvantages of seemingly advantageous
3 accident management actions, and I certainly would like
4 to stress that that be looked at very, very hard in each
5 case. I think that's as important as the first
6 objective.

7 Thank you very much.

8 CHAIRMAN ZECH: Thank you. Commissioner
9 Curtiss?

10 COMMISSIONER CURTISS: I just have a couple of
11 quick questions. On the funding issue for the research,
12 the \$4-5 million that we begin in FY90 and continue on
13 at that point, how much of that is going to be recovered
14 through user fees on the industry? Is it envisioned a
15 large part of that would come back to the agency?

16 MR. STELLO: The way we are structured at the
17 moment, it would be 55 percent, or 45 -- which number?

18 COMMISSIONER CARR: Well, if the law goes to
19 100 percent, it would be 100 percent.

20 MR. STELLO: If the law goes to 100, it will
21 be 100, but it's whatever was in the fee now. I think
22 it's either 45 or 50.

23 COMMISSIONER CURTISS: Forty-five percent of
24 that amount would be recovered?

25 MR. STELLO: Oh, yes, that's included.

1 COMMISSIONER CURTISS: Okay. Second question.
2 On the equipment operability issue, what are we doing on
3 the research side with fire and seismic, and how much
4 research remains to be done on the severe accident
5 context on those two issues?

6 MR. BECKJORD: Well, with regard to fire, we
7 don't have anything active now except a study, a fire
8 risk scoping study, and we have some elements that we
9 would expect to begin in the next fiscal year, fiscal
10 '90.

11 COMMISSIONER CURTISS: Does any of that
12 research affect what you're doing here?

13 MR. BECKJORD: No.

14 COMMISSIONER CURTISS: Okay. That's all I
15 have.

16 CHAIRMAN ZECH: Thank you.

17 Well, just a comment or two. First of all,
18 this whole subject of accident management in severe
19 accidents I think is very important. I think it's
20 responsible action to take. Again, we are talking about
21 very remote possibility accidents, but we're talking
22 about accidents above the design basis accident, beyond
23 the design basis accident, and it's also a very complex
24 subject because I think most of us have realized that
25 the plants out there are complex enough already.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 We would hope to enter into some kind of
2 simplicity as far as not only the hardware but the
3 procedures are concerned, but we recognize also that it
4 is very responsible -- at least I do -- to consider this
5 very remote possibility of a very severe accident. And,
6 so, to have the utilities involved and have EPRI
7 involved I think is very good, and I would commend the
8 staff to continue working with EPRI as you have done,
9 continue working with the ACRS and with other industry
10 groups that could contribute to this subject.

11 I do think we have to look very carefully at
12 any requirements we lay on in this regard because,
13 again, we don't want to adversely affect safety. We
14 want to enhance safety.

15 I think the IPE process and the PRA programs
16 that are already underway are excellent programs. They
17 certainly relate with this program. I think what we are
18 trying to do is logically make procedural and perhaps
19 hardware changes that would, indeed, give us added
20 confidence that if a severe accident did happen, that it
21 could be handled, could be managed, and I think that's
22 what we're trying to do, but it's a very complex
23 subject.

24 I think the staff, frankly, is doing a very
25 commendable job. I recognize the difficulty of what

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 you're trying to do. I think the regulatory people
2 working hand-in-hand with the research people is the
3 right thing to do. I think we've certainly got some
4 top-notch people in this agency involved in this
5 program.

6 So, I would just say that I think the staff is
7 doing the right thing in a very complex area, but also a
8 very important area. I would encourage you to continue
9 your associations with the outside agencies, and we'll
10 look forward to reviewing, again, the paper you've
11 presented us. We've already given you plenty to think
12 about today, but we'll get back to you also with
13 specific comments as you've requested, on the SECY
14 paper. But, again, I think it's been a very informative
15 and very important briefing, and I commend the staff for
16 the actions that you're taking.

17 Any other comments from fellow Commissioners?

18 (No response.)

19 If not, thank you very much. We stand
20 adjourned.

21 (Whereupon, at 3:57 p.m., the meeting was
22 adjourned.)

23

AS OF JANUARY 23, 1989

COMMISSION BRIEFING ON
ACCIDENT MANAGEMENT
MONDAY, JANUARY 23, 1989

OBJECTIVES OF PRESENTATION

1. TO OBTAIN APPROVAL OF THE NRC
ACCIDENT MANAGEMENT PROGRAM PLAN,
AS PART OF THE PREVIOUSLY APPROVED
INTEGRATION PLAN FOR SEVERE
ACCIDENTS.
2. TO OBTAIN APPROVAL OF THE ACCIDENT
MANAGEMENT RESEARCH PROGRAM THROUGH
FY 90.

1
1

ACCIDENT MANAGEMENT IS AN ESSENTIAL
ELEMENT OF THE NRC INTEGRATION PLAN FOR
CLOSURE OF SEVERE ACCIDENT ISSUES,
PRESENTED IN SECY-88-147 (MAY, 1988).

OTHER KEY ELEMENTS OF THIS PLAN INCLUDE
INDIVIDUAL PLANT EXAMINATIONS,
CONTAINMENT PERFORMANCE IMPROVEMENT AND
THE SEVERE ACCIDENT RESEARCH PROGRAM.

ACCIDENT MANAGEMENT

- 0 ACTIONS TAKEN BY PLANT STAFF TO:
 - PREVENT CORE DAMAGE
 - TERMINATE PROGRESS OF CORE DAMAGE AND RETAIN WITHIN VESSEL
 - MAINTAIN CONTAINMENT INTEGRITY
 - MINIMIZE OFF-SITE RELEASES
- 0 INVOLVES PRE-PLANNING AND PREPARATORY MEASURES

IN EFFECT, ACCIDENT MANAGEMENT:

- O EXTENDS THE DEFENSE IN DEPTH PRINCIPLE TO THE OPERATING STAFF
- O EXTENDS THE OPERATING PROCEDURES WELL BEYOND THE DESIGN BASIS INTO SEVERE FUEL DAMAGE REGIMES
- O HAS THE GOAL OF ENHANCING OPERATOR SKILLS AND CREATIVITY TO TERMINATE SEVERE ACCIDENTS BY PROVIDING FOR INNOVATIVE USE OF EXISTING PLANT CAPABILITIES.

FUNDAMENTAL OBJECTIVE OF ACCIDENT
MANAGEMENT PROGRAM:

EACH NRC LICENSEE SHALL PREPARE AN
ACCIDENT MANAGEMENT PLAN WHICH PROVIDES
A FRAMEWORK FOR

- O EVALUATING INFORMATION ON
SEVERE ACCIDENTS
- O PREPARING SEVERE ACCIDENT
OPERATING PROCEDURES
- O TRAINING OPERATORS AND
MANAGERS IN THE PROCEDURES

**FIVE ELEMENTS OF A FRAMEWORK FOR
ACCIDENT MANAGEMENT:**

- 1. ACCIDENT MANAGEMENT PROCEDURES**
- 2. TRAINING IN SEVERE ACCIDENTS**
- 3. ACCIDENT MANAGEMENT GUIDANCE**
- 4. INSTRUMENTATION**
- 5. DECISION MAKING RESPONSIBILITIES**

1
1

INTERACTION WITH INDUSTRY

- O IN-VESSEL STRATEGIES
- O EX-VESSEL STRATEGIES
- O INFORMATION NEEDS FOR A/M
- O A/M FRAMEWORK IMPLEMENTATION
- O BOUNDS OF COOLABILITY OF A DEGRADED
CORE
- O UNCERTAINTIES AFFECTING A/M
- O DIAGNOSTIC COMPUTATIONAL AIDS

CONCLUSION

- ° A REALISTIC REGULATORY APPROACH TO ACCIDENT MANAGEMENT HAS BEEN FORMULATED TO ASSURE IMPLEMENTATION AT UTILITIES
- ° A FOCUSSED ACCIDENT MANAGEMENT RESEARCH PROGRAM HAS BEEN DEFINED TO SUPPORT BOTH REGULATORY CLOSURE AND POST-CLOSURE CONFIRMATION
- ° REQUEST COMMISSION NOTE THE REGULATORY APPROACH AND APPROVE THE RESEARCH PROGRAM THROUGH FY90

POLICY ISSUE **(Notation Vote)**

January 18, 1989

SECY-89-012

For:

The Commissioners

From:

Victor Stello, Jr.
Executive Director for Operations

Subject:

STAFF PLANS FOR ACCIDENT MANAGEMENT REGULATORY AND
RESEARCH PROGRAMS

Purpose:

The purposes of this paper are:

1. To describe the major goals, framework, and elements of NRC's accident management program, and the approach of implementing the Accident Management portion of the integration plan for severe accident closure (SECY-88-147), and
2. To summarize the research efforts planned or now underway to furnish confirmatory information and technical support to the staff in support of Accident Management,
3. To obtain approval of the Accident Management research program through FY90.

Background:

Accident Management encompasses those actions taken during the course of an accident by the plant operating and technical staff to: (1) prevent core damage, (2) terminate the progress of core damage if it begins and retain the core within the reactor vessel, (3) maintain containment integrity as long as possible, and (4) minimize offsite releases. Accident management, in effect, extends the defense-in-depth principle to plant operating staff by extending the operating procedures well beyond the plant design basis into severe fuel damage regimes, with the goal of taking advantage of existing plant equipment and operator skills and creativity to find ways to terminate accidents beyond the design basis or to limit offsite releases.

CONTACT:

L. Shotkin, RES, 49-23530
R. Barrett, WRR, 49-21089

The NRC staff has concluded, based upon PRAs and severe accident analyses, that the risk associated with severe core damage accidents can be further reduced through effective accident management. In this context, effective accident management would ensure that optimal and maximum safety benefits are derived from available, existing systems and plant operating staff through pre-planned strategies. Furthermore, the International Nuclear Safety Advisory Group (INSAG) in its report on Basic Safety Principles for Nuclear Power Plants concluded that accident management and mitigation measures can significantly reduce risk. Accordingly, accident management is considered to be an essential element of the severe accident closure process described in the Integration Plan for Closure of Severe Accident Issues (SECY-88-147) and the Generic Letter on the Individual Plant Examination (Generic Letter 88-20).

In the IPE Generic Letter, the staff deferred the requirement to develop an accident management plan, stating that we are currently developing more specific guidance on this matter and are working with NUMARC to (1) define the scope and content of acceptable accident management programs, and (2) identify a plan of action that will ultimately result in incorporating any plant-specific actions deemed necessary, as a result of the IPE, into an overall severe accident management program. Since that time we have made considerable progress towards development of an Accident Management Program that would lead to enhanced accident management capabilities in the nuclear industry. This program will be supported by an Accident Management Research Program, which will be coordinated with and use the results of other programs, including the Containment Performance Improvement Program (CPI), the Severe Accident Research Program (SARP), and the Human Factors Research Program. A summary description of the Accident Management Program and supporting research programs is presented below, and in Attachment 1.

Discussion:

The fundamental objective of the proposed Accident Management Program is the following:

Each NRC licensee shall implement for each nuclear plant an "Accident Management Plan" which provides a framework for evaluating information on severe accidents, including that developed through conduct of the Individual Plant Examinations (IPEs), for preparing and implementing severe accident operating procedures, and for training operators and managers in these procedures.

The "Accident Management Plan" developed by licensees for each plant will be expected to have four subsidiary objectives which are:

- (1) Developing technically sound strategies for maximizing the effectiveness of personnel and equipment in preventing and mitigating potential severe accidents. This includes ensuring that guidance and procedures to implement these strategies are in place at all plants,
- (2) Assuring that installed instrumentation and equipment called for in the diagnosis and control of accidents beyond the design basis are identified and assessed to determine their availability and capabilities, and the need for incremental improvements to existing systems to assure their availability is assessed,
- (3) Assuring that nuclear plant staff are trained in the procedures and guidance to follow in the event of an accident beyond the design basis of the plant, and utility management is trained and prepared to deal with severe accidents, and
- (4) Providing a technical basis for assessing the effectiveness of specific accident management strategies and capabilities.

The NRC Accident Management Program is aimed at promoting the most effective use of available utility resources (people and hardware) to prevent and mitigate severe accidents. This would largely be achieved through incremental improvements in the existing emergency procedures and training programs, and by additional planning for severe accidents that could strengthen the support provided to the plant operating staff in case of a severe accident. Hardware changes or other plant modifications to reduce the frequency of severe accidents are not a central aim of this program, although limited, minor modifications may be identified during the process of developing an Accident Management Plan.

Elements of a Utility Accident Management Plan

To varying degrees, accident management capabilities already exist at all U.S. reactors, largely in response to regulatory requirements, implementation guidance, and review criteria, such as that set forth in 10 CFR 50.47 and NUREG-0737 Supplement 1. However, these capabilities are not as strong and comprehensive as they might be

through use of a more disciplined approach. The risks associated with severe reactor accidents can be further reduced through implementation of utility accident management plans which incorporate improvements to current utility capabilities in five general areas:

- ° Accident Management Procedures

On the basis of existing PRAs the staff has identified several generic accident management strategies that can greatly enhance a licensee's ability to cope with the accident scenarios that tend to dominate risk in PRAs. This information will be provided to each licensee with the request that they evaluate its benefits for their plants.

- ° Training In Severe Accidents

Operators, technical support staff, and managers responsible for responding in the event of an accident should be generally aware of the progression of severe accidents (i.e., their symptoms and timing) and should be proficient in potential response strategies. Licensees' accident management plans are expected to be aimed at upgrading existing training programs as needed to ensure that training for these personnel includes an appropriate treatment of severe accident management. This will be done with as little impact as possible on the current training curricula for licensed plant operators.

- ° Accident Management Guidance

Each licensee will be expected to make available for the technical support staff and managers a set of guidance for diagnosing the progress of severe accidents and planning the appropriate response. The NRC staff will work with industry (e.g., NUMARC/EPRI) towards the development of generic guidance to licensees in this area.

- ° Instrumentation

Licensees will be expected to review instrumentation changes that might be needed at their plants in order to implement their accident management procedures. Currently, the NRC Office of Nuclear Regulatory Research and EPRI are independently assessing the need for and availability of instrumentation during various accident scenarios. When comparing the

results of this assessment to Regulatory Guide 1.97 which describes acceptable standards for post accident monitoring instrumentation, it is expected that the impact on existing instrumentation will be minimal.

° Decisionmaking Responsibilities

Each licensee's "Accident Management Plan" will be expected to include a review, and modification if necessary, of the plant's current decisionmaking authority for accident management strategies, to assure: well-established, clear lines of authority and communications for severe accident conditions, assigned responsibilities for specific key decisions and established authority and criteria for procedural overrides and ad-hoc equipment/procedure modifications.

Approach For Accident Management Implementation

The staff intends to work with industry to define the scope and attributes of a utility accident management plan which meets the four major plan objectives, and to develop guidelines which describe the plant-specific implementation of such a plan. The principal interaction to date with industry on accident management has been through the Nuclear Management and Resources Council (NUMARC). A working group has been established by NUMARC to address the matter of severe accidents, with accident management being a high priority. In addition, we expect NUMARC to provide industry's perspective and bring about the necessary industry-supported initiatives on accident management. The staff also plans to interact through NUMARC with the owners' groups for each reactor vendor since the prospective accident management procedures and equipment improvements are closely related to the emergency procedures guidelines that have already been developed by the owners' groups.

The regulatory mechanism for obtaining improvements in industry accident management capabilities will be through issuance of a generic letter. A draft of the generic letter will be circulated to utilities through NUMARC and to the public for comment. Additionally, the contents of the generic letter will be discussed at workshops associated with the IPE generic letter. An outline of the generic letter is attached to this Commission Paper (Attachment 2).

It is the staff's view that many elements of accident management are sufficiently well understood and separate from the IPE analysis, that improvements in accident management capabilities can be realized prior to completion of an IPE. Examples of such improvements include near term implementation of certain accident management procedures (to be included in the Generic Letter on accident management) and the revision of training curricula for emergency response personnel to include current insights on severe accident progression and phenomena. In this regard, industry will be encouraged to implement accident management improvements as soon as practical.

The staff intends to be flexible with regard to implementation of aspects of accident management requiring plant-specific information to be learned from the IPE, recognizing that some licensees are well advanced in PRA and severe accident studies for their plants, whereas other licensees are only beginning to consider severe accident analysis in response to the IPE Generic Letter. Indeed, some licensees have already made significant advances in several of the general areas of accident management mentioned previously. Thus, the details of the development and implementation of plant-specific accident management plans will be pursued with each licensee on an individual basis.

Implementation of the Accident Management Program is expected to be accomplished through an extension of existing industry programs, and evaluated through existing regulatory mechanisms. For instance, new training requirements could be integrated with the existing INPO training program. Generic accident management procedures could be incorporated into emergency procedure guidelines by the vendor owners groups and assessed by NRC according to existing channels of review. Other aspects of the program, such as hardware modifications and implementation of computational tools, could be implemented through internal utility mechanisms such as their 10 CFR 50.59 process, and would be subject to NRC audit and inspection in the usual way.

NRC Accident Management Research Program

The NRC research program has an important role to play in contributing to the Accident Management Program. Our understanding of the physical progression of severe core damage accidents is incomplete, and the NRC will rely on the research program to supply needed information and provide insights for accident management, particularly in the area of limiting

potential radioactive releases and stabilizing conditions should the reactor vessel be breached. Research information will be developed in this severe accident regime for many years, and as a result we can expect that licensees' accident management plans will be further upgraded as new research information is evaluated and a consensus reached that revisions to severe accident strategies can reduce risks further.

Research activities will center on assessing the feasibility of various strategies that might be implemented by utilities to prevent or mitigate severe accidents, and on identifying those which should be considered for inclusion in utility accident management plans. This will include an investigation of specific accident management strategies applicable to the period before the core would penetrate the reactor vessel (in-vessel accident management) and those applicable following postulated reactor vessel penetration (containment and release management). In all cases, the design and operational requirements for strategy execution will be evaluated, but emphasis will also be given to examining potential circumstances under which certain operator actions could worsen accident consequences or adversely impact the ability to achieve a long-term, stable state. Much of the information needed for accident management research will be drawn from several existing NRC programs (e.g., the CPI and Severe Accident Research Programs), as well as existing programs in other countries.

Research activities are divided into a short-term effort and a long-term program. The short-term effort will support two principal elements in the closure plan: (1) definition of example severe accident management strategies (primarily preventative) which can be formulated from existing insights reports, PRA studies, and completed research; and (2) development of a framework which defines the necessary components of a functioning utility severe accident management plan. The products will be documents to be included as appendices to the generic letter on accident management.

The long-term research program includes those activities of a confirmatory nature, which are not required for closure. The short-term program to achieve closure is proceeding effectively with the present knowledge base. The long-term program can be considered as an augmentation to the existing Severe Accident Research Program (SARP) and will draw heavily from the results of SARP. In fact, SARP will provide improved knowledge and phenomenological modeling for such complex processes as steam explosions,

degraded core coolability, crust formation, hydrogen behavior, vessel depressurization, direct containment heating, etc., which will then be used to evaluate both the benefits and the adverse effects of candidate strategies. The research program has been formulated to provide the NRC staff with an organized, comprehensive basis for evaluation of generic accident management strategies. The program will define supporting studies needed from related programs (e.g., SARP, Human Factors research, PRA studies). It will also integrate all appropriate results from these programs, and others related to accident management (e.g., CPI, IPE and international research), into a practical assessment for generic accident management strategies. It is anticipated that these strategies will be primarily mitigative in nature. Upon completion, it will provide a reasonably detailed evaluation of both the instrumentation and training capabilities needed to support these strategies.

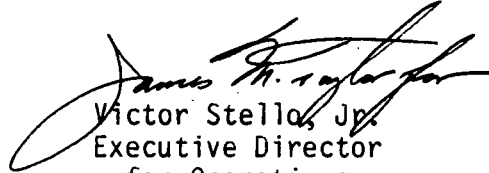

The long-term program will also evaluate the potential adverse effects that could occur if and when these strategies are applied. Examples are strategies such as water addition to a degraded core and use of special emergency equipment. Each must be analyzed carefully to fully understand the consequences of these strategies. Some of the specific issues to be addressed include: instrumentation needs for proper diagnosis of the course of events and their observable symptoms; the capability of existing equipment to bring the reactor to a long-term stable state; the effect of timing of human action on the success of candidate strategies; the consequences of adding water to a degraded core; and the uncertainties in phenomenological knowledge and its consequences on strategy development.

Even though this research will concentrate on all consequences of potential actions, it is currently expected that the ultimate guidance to the operating staff is to always add water during the course of a severe accident.

The NRC resources associated with reaching closure on accident management will be approximately 5 FTE of staff effort and about \$500K of contractor assistance over the next twelve months. Resources for the long-term research program are \$1.4M in FY89 and \$4M in FY90 (See Attachment 1). Resource needs beyond FY90 are expected to be similar, and will be submitted for Commission approval as part of the normal budgetary process.

Recommendation: That the Commission note the approach proposed herein for implementing the accident management portion of the Integration Plan for Closure of Severe Accident Issues (SECY-88-147), and approve the accident management research projects for FY89 and FY90.

Scheduling: This paper is scheduled to be considered at an open meeting on January 23, 1989.

Victor Stello, Jr.
Executive Director
for Operations

Attachments:
1. NRC A/M Research Projects for FY89/90
2. Outline of Generic Letter

Commissioners' comments or consent should be provided directly to the Office of the Secretary by c.o.b. Friday, February 3, 1989.

Commission Staff Office comments, if any, should be submitted to the Commissioners NLT Friday, January 27, 1989, with an information copy to the Office of the Secretary. If the paper is of such a nature that it requires additional time for analytical review and comment, the Commissioners and the Secretariat should be apprised of when comments may be expected.

NRC A/M RESEARCH PROJECTS FOR FY 89/90

A. Ongoing Projects

1. Depressurization to minimize direct containment heating.
An analytic study of station blackout (TMLB') at the Surry plant, using depressurization through the PORV. Results indicate that the pressurizer surge line could overheat and rupture, leading to reasonably early depressurization.
2. LWR recriticality.
An analytic study of injecting unborated water, as well as water with increasing levels of boron concentration, into an LWR core: (1) when the control blades have melted, but the fuel rods are intact; and (2) when the core geometry has degraded.
3. Instrumentation requirements.
Development and demonstration of a structured methodology to determine adequacy of existing plant instrumentation to monitor severe accidents.
4. Report on candidate A/M strategies; Appendix I to the Generic Letter.
5. Report on framework of an A/M program; Appendix II to the Generic Letter.

B. New Projects (FY 89/90)

NRC has a longer-term program to conduct research directly related to A/M. This longer-term research would focus on assuring integration of completed ongoing research (from CPI, SARP, PRA, and international cooperative programs) to effectively evaluate A/M guidance, while simultaneously evaluating potential disadvantages of seemingly advantageous accident management actions. Our longer-term research program has been thought out in detail and discussed with the various contractors scheduled to conduct the research. The following tasks will be covered by this program in FY 89/90.

- In-vessel A/M candidate procedures
- Ex-vessel A/M candidate procedures
- Information needs for A/M
- A/M framework implementation
- Bounds of coolability of a degraded core
- Uncertainties affecting A/M
- BWR A/M insights (MARK-I, III)
- Strategies related to DCH
- Diagnostic Computational Aids
- Guidelines for industry audit
- Support for Plant Exercises

The total funding required to complete these tasks is \$1370K in FY 89 and \$3935K in FY 90.

Outline of Generic Letter

SUBJECT: Accident Management
(Supplement to Generic Letter 88-20, "Individual Plant Examination.")

1. Objective

Licensees shall certify to the NRC that they have put in place an "Accident Management Plan" providing a framework for evaluating information on severe accidents, for preparing and implementing severe accident procedures, and for training operators and managers in those procedures.

2. Elements of a utility Accident Management Plan should include the following:

- Procedures: Each licensee should, in the context of performing their IPE, evaluate and implement severe accident procedures. The staff has identified general strategies which should be included and has compiled a list of "example" procedures (see Appendix I) which should be considered for early implementation (e.g., prior to completion of the IPE where the licensee determines this to be of benefit to his plant protection and to public safety).
- Training in severe accidents should be provided for operators, technical staff and managers responsible for responding in the event of a severe accident.
- Guidance and computational aids for diagnosing and responding to accidents should be provided to technical support staff and managers.
- An assessment of the need for and availability of instrumentation should be performed.
- A review of utility decisionmaking processes for severe accident response should be conducted.

3. NRC/NUMARC Interaction

NRC staff will work closely with industry groups (e.g., owner's groups and EPRI) through the NUMARC Severe Accident Working Group (SAWG) to better define the attributes of an Accident Management Plan and to develop guidelines that define a generic framework for a utility to evaluate and organize its resources to prepare for and respond to severe accidents (to be supplied as Appendix II). These guidelines, to be developed as part of an industry initiative, should address each of the key attributes of a utility Accident Management Plan and provide a basis for responding to the generic letter.

4. Utility Response

- ° Within 90 days of receipt of this letter, licensees should submit a response certifying their commitment to implement an Accident Management Plan that provides a framework for evaluating and implementing severe accident procedures.
- ° In each case, a best estimate schedule should be included for implementing their Accident Management Plan.

5. Regulatory Basis 10 CFR 50.54(F)

6. Appendices:

- I. Candidate Procedures for Near Term Implementation (draft attached)
- II. Framework of an Accident Management Program (under development)

Each utility should systematically seek to identify and implement effective procedures (and associated hardware) to optimize the plant's accident management resources. These procedures should at least address three global strategies derived from operational experience and PRA insights which have significant potential for reducing plant risk:

- ° Procedures for conserving and/or replenishing limited utility resources during the course of an accident. These resources would include, for example battery capacity, borated water, and compressed air.
- ° Procedures for using plant systems and components for innovative applications during an accident. This would include enabling crossties of support systems or the use of fire systems, or CRD pumps (in the case of a BWR), for decay heat removal. In addition, this category includes procedures to connect alternate electrical power sources to meet critical safety needs during an accident scenario.
- ° Procedures for defeating interlocks and overriding component protective trips in emergency situations. An example of this strategy would be the ability to reopen MSIV's in a BWR ATWS event.

These three strategies, and others as appropriate, should be applied to each of the applicable major safety functions of the plant: reactivity control, coolant inventory control, heat removal and containment performance; as well as to the principle support functions: RCS depressurization, electric power, equipment cooling, and air systems. In the context of performing the IPE, each utility should be alert to identify and implement effective procedures associated with these strategies. Your evaluation should not be limited to the strategies given in Table 1. For instance, procedures to maintain containment function and delay or prevent possible early containment failure should also be assessed.

Table 1 contains a list of "example" procedures for each global strategy. These procedures are categorized according to the safety functions they relate to and the types of plants they apply to. These procedures are to be evaluated on a plant-specific basis and considered for near term implementation prior to completion of the IPE (absent sound arguments to the contrary).

This letter assumes implementation of existing EPGs addressed in the ATWS and Station Blackout rules, in addition to feed-and-bleed and BWR containment venting provisions of the EPGs. There may be some areas of overlap between these existing emergency operating procedures and the procedures described in Table 1, however, the NRC believes the benefits from additional utility review and strengthening of existing procedures would include both reduction of risk magnitude and uncertainty from severe accidents and moreover would outweigh the costs of any duplication of effort.

TABLE I

Generic Accident Management Procedures For
Near Term Evaluation and Implementation

| <u>Global Strategy</u> | <u>Example Procedure</u> | <u>Affected Safety Function</u> | <u>Plant Applicability</u> | | <u>Principal Safety Objective</u> | |
|--|---|--|----------------------------|------------|-----------------------------------|-------------------|
| | | | <u>BWR</u> | <u>PWR</u> | <u>Prevention</u> | <u>Mitigation</u> |
| I. Conserving and Replenishing Limited Resources | | | | | | |
| | • Procedure to refill RWST with borated water, or CST with condensate. Assure adequate supply of boron on site. | Coolant Inventory Containment Performance | X | X | X | X |
| | • Maintain ECCS suction to condensate systems to avoid pump failure due to high suppression pool temperature. | Coolant Inventory | X | | X | |
| | • Procedures for throttling containment sprays to conserve water for core injection. | Coolant Inventory | X | X | X | |
| | • Procedures to conserve battery capacity by shedding non-essential loads. | Electric Power | X | X | X | X |
| | • Procedures for use of portable battery chargers or other power sources to recharge batteries. | Electric Power | X | X | X | X |

¹ This may require re-examination to defeat existing interlocks

TABLE 1 (CONTINUED)

| Global Strategy | Example Procedure | Affected Safety Function | Plant Applicability | | Principal Safety Objective | |
|--|---|--|---------------------|-----|----------------------------|------------|
| | | | BWR | PWR | Prevention | Mitigation |
| | " Procedures to enable emergency replenishment of gas supply, or otherwise assure operability of air operated components. | Air/N ₂ | X | X | X | X |
| | " Procedures to enable early detection, isolation, or otherwise mitigate the effects of an interfacing LOCA. | Coolant Inventory Containment Perf. | X | X | X | X |
| II. Use of Systems/Components In Innovative Applications | | | | | | |
| | " Procedures to enable emergency use of available pumps to accomplish safety functions | | | | | |
| | - Use of diesel fire systems for injection to BWR core, PWR steam generators, or containment sprays. | Coolant Inventory Heat Removal Containment Perf. | X | X | X | X |
| | - Use of CRD pumps (BWR) or charging pumps (PWR) for core injection. | Coolant Inventory | X | X | X | |
| | - Use of alternate injection (e.g., hydro test pump) ² when RCP seal cooling is lost. | Coolant Inventory | X | X | X | |
| | - Procedures (and associated hardware) to enable emergency crosstie of service water and CCW to RHR (BWR) or Feedwater (PWR). | Heat Removal Coolant Inventory | X | X | X | |

² Risk significance of seal failure is strongly dependent on the seal design.

TABLE 1 (CONTINUED)

| Global Strategy | Example Procedure | Affected Safety Function | Plant Applicability | | Principal Safety Objective | |
|-----------------|---|-----------------------------------|---------------------|--------|----------------------------|------------|
| | | | BWR | PWR | Prevention | Mitigation |
| | - Use of condensate, or startup pumps for feedwater injection. | Heat Removal | | X | X | |
| " | Procedures (and hardware) to enable emergency connection of available AC power sources to meet critical safety needs. | Heat Removal | X | X | X | X |
| | - Use of diesel generator or gas turbine generator to drive CRD pumps for core injection. | Coolant Inventory | X | | X | |
| | - Procedures to enable emergency crosstie of AC power between two units or to onsite gas turbine generator. | Electric Power | X | X | X | X |
| " | Procedures to enable emergency connection of injection systems to alternate water sources | | | | | |
| | - Procedures to assure appropriate recirculation switchover and to cope with the failure to switchover in LOCA. | Coolant Inventory Heat Removal | | X | X | X |
| | - Procedures to enable emergency connection of service water or feedwater systems to rivers, reservoirs or municipal water systems. | Heat removal Equipment Cooling | X X | X X | X X | X |
| " | Procedures for Reactivity Control | | | | | |

TABLE I (CONTINUED)

| Global Strategy | Example Procedure | Affected Safety Function | Plant Applicability | | Principal Safety Objective | |
|--|---|-----------------------------|---------------------|-----|----------------------------|------------|
| | | | BWR | PWR | Prevention | Mitigation |
| | - Procedure to initiate SLCS in case of potential core damage and to guard against boron dilution when core injection is restored. | Reactivity Control | X | | X | X |
| | - Ensure abundant supply of borated makeup for long-term accident control. | Reactivity Control | X | X | X | X |
| III. Defeating Interlocks and Component Protective Trips in Emergencies. | | | | | | |
| " | Procedures to reopen MSIVs and Turbine Bypass Valves to regain the condenser as a heat sink. | Heat Removal | X | X | X | |
| " | Procedure to extend RCIC availability by either raising the turbine exhaust pressure trip set point, or overriding the trip function. | Coolant Inventory | X | | X | |
| " | Procedures to enable emergency bypass of protective trips for diesel generators and injection pumps. | All | X | X | | |
