## General Comment

I understand that the U.S. Nuclear Regulatory Commission (NRC) is considering a rule change that would adopt HORMESIS as the radiation-exposure-model instead of the present Linear No-Threshold radiation model.

According to my information however, almost all reputable scientific opinion is of the view that there is no safe level of radiation and the more radiation you receive the greater your chances of developing radiation-linked cancers such as leukaemia.

In view of this, the current (arbitrary) permissible level of radiation should under no account be raised but every effort should be made to reduce it.
