P R O C E E D I N G S

8:31 a.m.

CHAIRMAN STETKAR: The meeting will now come to order. This is a meeting of the Reliability and PRA Subcommittee. I'm John Stetkar, chairman of the subcommittee meeting.

ACRS members in attendance are Harold Ray, Dana Powers, Mike Corradini, Dennis Bley, Ron Ballinger and Joy Rempe.

John Lai of the ACRS staff is the designated federal official for this meeting.

The subcommittee will hear discussions of a draft report on human reliability analysis and probabilistic risk assessment on the treatment of scenarios that require main control room abandonment in response to a fire event, so-called Supplement 1 to NUREG-1921.

There will be a phone bridge line. To preclude interruption of the meeting the phone will be placed in listen-in mode during the presentations and committee discussions.

We have received no written comments or requests for time to make oral statements from members of the public regarding today's meeting, and the entire meeting will be open to public

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 attendance.

2 The subcommittee will gather
3 information, analyze relevant issues and facts, and
4 formulate proposed positions and actions as
5 appropriate for deliberation by the full committee.

6 The rules for participation in today's
7 meeting have been announced as part of the notice
8 of this meeting previously published in the Federal
9 Register.

10 A transcript of the meeting is being
11 kept and will be made available as stated in the
12 Federal Register notice.

13 Therefore, we request that participants
14 in this meeting use the microphones located
15 throughout the meeting room when addressing the
16 subcommittee.

17 The participants should first identify
18 themselves and speak with sufficient clarity and
19 volume so that they may be readily heard.

20 I remind everyone to check your little
21 phones, beepy devices and other things. Turn them
22 off, please. If they beep during the meeting I
23 will smash them with my gavel. It says that, right
24 here.

25 Before we proceed with the meeting I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 understand that Dr. Powers has an introductory
2 remark he'd like to make. So, Dr. Powers.

3 MEMBER POWERS: Yes, Mr. Chairman. I
4 have an acquaintance with one of our presenters,
5 Ms. Hendrickson. She used to share an office next
6 door to me until I was able to drive her away with
7 my general level of obnoxiousness.

8 I have no particular knowledge or
9 involvement in this work. I will be happy to share
10 with the members during the breaks various colorful
11 anecdotes about Ms. Hendrickson that should reveal
12 some of her technical qualifications.

13 CHAIRMAN STETKAR: And for the record,
14 knowing your stellar personality you said before
15 you could drive her away. That means you
16 overlapped about 10 minutes.

17 MEMBER POWERS: I think it was not
18 quite a year. It took me awhile. It was your
19 buddy in crime that I got rid of really well.

20 CHAIRMAN STETKAR: I'll remind you all,
21 for those of you who haven't been here very
22 frequently or may have forgotten when you speak
23 push the -- right on the base of your microphone.
24 Turn it on. When you're not speaking leave it off.
25 That helps the transcript because -- and also any

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 members of the public that may be out on the bridge
2 line.

3 And with those introductory comments we
4 will now begin the meeting. And I'll turn it over
5 to Susan Cooper. Susan?

6 MS. COOPER: Good morning, everyone.
7 Thank you for the opportunity to be here this
8 morning with you. My name is Susan Cooper. I'm
9 from the Office of Research and I'm here with
10 fellow members of my team, or parts of the team
11 that will be presenting today on Supplement 1 on
12 NUREG-1921 which is focused on qualitative guidance
13 for HRA, specifically for the context of main
14 control room abandonment scenarios.

15 Other speakers today are up here at the
16 table with me with one exception. My counterpart
17 from EPRI, Ashley Lindeman here, and then Erin
18 Collins from Jensen Hughes, a contractor to EPRI,
19 and then Stacey Hendrickson, Sandia National Labs,
20 contractor to NRC. Mary Presley, also from EPRI,
21 is here at the table.

22 We'll introduce the rest of the team
23 later. I know that there are a few on the line and
24 I see one just walking into the room.

25 CHAIRMAN STETKAR: By the way, anybody

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 up front, if you need input from anybody on the
2 line we can get it open. We just keep it muted
3 because of pops and crackles and things.

4 MS. COOPER: Thank you. Excellent. We
5 expect to have two people on the line although we
6 didn't actually confirm that this morning. But we
7 expect that there are two of our team members on
8 the line.

9 Just as a preliminary, this
10 presentation today is information on an ongoing
11 research project. The report that we sent you and
12 the associated slides represent an interim project
13 of this research that builds on previous research
14 projects of this team and other research, and also
15 builds on experience in the NFP-805 fire PRA
16 submittals and experience using 1921.

17 MEMBER REMPE: Susan, for context could
18 you remind us where we are on the NFPA submittals,
19 805 submittals? How many have been submitted and
20 how many are coming in.

21 MS. COOPER: I think my colleagues from
22 NRR, one of them probably can answer that question
23 better. And we've got two of them here today. It
24 looks like J.S. Hyslop is going to handle that one.

25 MR. HYSLOP: Yes, my name is J.S.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Hyslop. We've issued 18 license amendments and
2 we've got 9 under review.

3 MEMBER REMPE: Okay, thank you.

4 MS. COOPER: Yes, I guess to that point
5 one thing that's a little bit different for this
6 particular report from 1921 is that this is in some
7 ways a knowledge capture as well as some research
8 as opposed to when we were developing 1921 that was
9 kind of alongside of the experience of developing
10 those submittals.

11 CHAIRMAN STETKAR: Susan, before you
12 start I might as well get it out on the table first
13 because you left me an in. You said it builds on
14 previous research and ongoing research.

15 Why does this report not even mention
16 anything about ideas or the fundamental basis for
17 ideas? Since that is a joint EPRI-NRC project on
18 human reliability analysis methods that would seem
19 to apply to these situations.

20 MS. COOPER: So, there is a reference
21 to NUREG-2114.

22 CHAIRMAN STETKAR: I'm sorry, I
23 couldn't find it.

24 MS. HENDRICKSON: That's primarily in
25 the PSF section. So that's where it's referenced

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 is in the PSF.

2 CHAIRMAN STETKAR: I didn't look at the
3 references in the PSF section.

4 MS. COOPER: Right.

5 MS. HENDRICKSON: And then it also
6 comes up some in the Appendix B, the command and
7 control.

8 CHAIRMAN STETKAR: It references a
9 paper. I'm sorry, I looked for it there and it
10 wasn't there.

11 MS. COLLINS: It should be there.

12 CHAIRMAN STETKAR: ATHEANA is
13 referenced heavily there. There's a 2011 paper
14 that is the old Ali Mosleh approach to life that's
15 referenced there. That has been superseded.

16 So my question is if you don't want to
17 acknowledge it we have a problem.

18 MS. COOPER: Okay.

19 CHAIRMAN STETKAR: If you do want to
20 acknowledge it my recommendation -- this is
21 subcommittee meeting -- would be to rewrite
22 Appendix B and in Appendix B explain the mapping
23 from ideas to what you're proposing here. And I
24 think that might work.

25 MS. COOPER: Okay. I'm glad to have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 that input.

2 The command and control appendix,
3 Appendix A as I recall, is one of the most recent
4 developments in this research in the sense that the
5 team kind of came to the realization that we needed
6 to write something about that.

7 I have done some recent outreach to
8 other colleagues in my branch in the Office of
9 Research, and that includes Jing Xing who you see
10 here sitting in the audience.

11 And I've discussed with her and with
12 others and also with some folks from Halden about
13 this topic.

14 With respect to ideas specifically I
15 would say that until yesterday I didn't have a
16 version of the report that I knew would be
17 reference-able.

18 We have -- I mean I know that as
19 recently as last November I think I met with Jing
20 and also Kendra Hill who I think might be --
21 Kendra's here.

22 We met to talk about some of the work
23 that they were doing on performance shaping factors
24 to see if it would be related. But that was a work
25 in progress.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But I would be delighted to reference
2 that work.

3 CHAIRMAN STETKAR: But it's not just
4 the command and control, it's, as Stacey mentioned,
5 the whole construct of how did you get to the
6 specific set of performance shaping factors, the
7 10.

8 Now, there's a legacy from 1921, but
9 1921 is now old news. IDEAS references 1921 as one
10 of the things that the IDEAS developers thought
11 about and borrowed things from as part of the
12 amalgamation of good practices if you will.

13 But that was then and we're now in an
14 environment that has at least a framework that
15 says, well, if you want to use a general
16 methodology that's proposed in IDEAS for a focused
17 application there's sort of a thought process that
18 one goes through.

19 And that thought process winnows down
20 sort of the general concepts down to, well, these
21 are the things that we think are appropriate for
22 this particular application.

23 There's already a demonstration of that
24 in the EPRI report. Not sure yet whether it's
25 going to be an EPRI-NRC report, but at least the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 EPRI guidance for full power, whatever it is,
2 internal events, procedure driven, at power if you
3 can narrow yourself down into that little box
4 application.

5 But I think going forward if we're
6 going to actually -- and the reason I bring this up
7 is that the ACRS is jointly on the hook with the
8 NRC staff to support the development of this new
9 methodology.

10 So I think anything in the HRA area if
11 indeed that methodology is to gain any type of
12 recognition and acceptance from this point going
13 forward ought to at least acknowledge it.

14 MS. COOPER: I agree and I just this
15 morning printed the thing out because I was -- I've
16 been asked to be a peer reviewer for it.

17 MEMBER REMPE: I have a question. And
18 I'll acknowledge up front that I did read the
19 reports that you submitted, and I am not an expert
20 so probably I don't understand and shouldn't be
21 reading this report based on what it was for.

22 But as a person who's trying to
23 understand, when I looked through what was in your
24 report and when I hear John's comment about IDEAS
25 with your familiarity of what's been proposed in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 IDEAS what exactly would you use from the IDEAS
2 methodology that would help you do what you've
3 documented in these reports?

4 (Simultaneous speaking)

5 MS. COOPER: So, I haven't yet looked
6 at the most up-to-date version. I looked at some
7 tables regarding performance shaping factors
8 sometime last fall and I've read versions of it
9 earlier.

10 From my standpoint whenever I'm using
11 guidance like that, generic guidance, and I'm
12 looking at a particular context I want to make sure
13 that I'm filtering and tailoring things to fit that
14 particular context.

15 So, in particular when looking at the
16 tables that Jing and I discussed some months ago my
17 first idea was, okay, if we had events what I'd
18 want to do would be to look at event histories and
19 stuff like that and see how things that happened in
20 events actually were played out or connected with
21 performance shaping factors.

22 In fact, we did do something like that
23 in ATHEANA.

24 We don't have events per se for main
25 control room abandonment. We have limited history

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 there.

2 So what we do have, however, is the
3 experience of the team members in doing analyses,
4 in particular talking with operators and other
5 people that are trying to prepare for these kinds
6 of events.

7 It's not documented in this current
8 version of the report, but we did conduct on the
9 order of six different interviews of NRC staff
10 across various offices here who have previous
11 operating experience to discuss what they were
12 familiar with respect to planning for main control
13 room abandonment at the specific facilities that
14 they were familiar with.

15 So that's our operating history basis.
16 So that's what I would say is I would understand
17 the context and the operating history, and then
18 compare that to --

19 MEMBER REMPE: But didn't you already
20 do that in this report? I mean, so what I'm
21 looking for is what's new about IDEAS that would
22 make this methodology you've proposed better.

23 MEMBER BLEY: Let me jump in a little
24 bit. It isn't so much what's new, it's do we have
25 an overall HRA framework within which all of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 HRAs that are going on can live and interact.

2 MEMBER REMPE: So if I were Susan
3 trying to address this --

4 MEMBER BLEY: That fits with the last
5 letter we wrote in this area very closely. And we
6 talked about how that interacted between the full
7 power, at power HRA at that time. This is another
8 special application. So that's all I wanted to
9 slip in there.

10 CHAIRMAN STETKAR: Joy and Susan, you
11 folks need to understand, it's obvious that you've
12 not read any of the material -- other than Stacey -
13 - any of the material that's been developed for
14 IDEAS.

15 It's obvious because when you try to
16 answer my questions you focus to operator
17 interviews, you talk about operating experiences.

18 IDEAS is a framework. For example,
19 they talk about mental models for the way the world
20 works. I don't see much discussion of this.

21 Is that important? I don't know. But
22 that framework says you need to challenge for your
23 particular application if that is important. And
24 if it's not you need to justify why it isn't.

25 Because if it is you need to somehow

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 account for that. You need to set your framework,
2 whether it's performance shaping factors, or the
3 way you organize your thought process for modeling
4 pre-response in that context.

5 And that's that funneling down from
6 saying here's what we understand about human
7 performance, here's a construct, a general
8 construct that's been laid out, and now when you
9 try to apply this generality which you can never --
10 it's too broad.

11 When you try to winnow it down to what
12 elements of that general approach do you need to
13 think about carefully for this particular
14 application there's a process of doing that.

15 And yes, we need to account for these
16 elements. No, in this particular situation we
17 don't.

18 For example, in the full power internal
19 events whatever the heck it is procedures are
20 really important. Some of the other elements
21 aren't. And there should be justification of why
22 that is.

23 And there may very well be things that
24 are important in this particular application you
25 haven't thought about. That you haven't thought

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 about because you've approached it from the
2 traditional way of thinking about this. You have.

3 MS. HENDRICKSON: So, let me say one
4 thing as well.

5 So, Appendix B, you're absolutely
6 right. So the language that's in there isn't
7 inconsistent with 2114.

8 But what hasn't been done, so what we
9 can go back and do, is the situational factors that
10 are in there currently kind of jump right to the
11 PSFs.

12 And so showing that linkage to the
13 proximate causes as well as the cognitive
14 mechanisms, that can be done.

15 CHAIRMAN STETKAR: I think you can make
16 it work in Appendix B presuming that the set of
17 PSFs actually fall out of that process in a logical
18 manner.

19 I think you can work it in Appendix B
20 without rewriting the whole report.

21 MS. HENDRICKSON: Right. But then I
22 think that can feed back to the PSF chapter even.

23 (Simultaneous speaking)

24 CHAIRMAN STETKAR: I'm not writing the
25 report, but ways of kind of getting around this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 without jacking up the title and putting a new body
2 on it.

3 MS. HENDRICKSON: Like some of the
4 discussion, and we'll get into this a little later
5 as well. Some of the discussion that's in the
6 tables at the end of the PSF chapter which start
7 getting at how can we help analysts in deciding
8 what the relevant PSF is that they should be
9 looking at.

10 What are some of the other qualifying
11 factors.

12 That's where I think we can really show
13 that linkage and come in strong.

14 CHAIRMAN STETKAR: And point them to
15 Appendix B where there's a more --

16 MS. HENDRICKSON: Exactly.

17 CHAIRMAN STETKAR: I had to get that
18 out somewhere, sorry.

19 MS. COOPER: I understand.

20 MEMBER BLEY: While we're on high
21 level, a quick question. I don't remember how we
22 and you disposed of this back on the original
23 methodology, but I don't see, and I'm still not
24 sure if there are anymore.

25 Susan, are there anymore SISBO plants

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 around? And if there are, there ought to at least
2 be lip service to the fact that that could matter
3 here.

4 Unless you would argue that that's
5 already been -- if you didn't get through that part
6 using the original methodology you wouldn't get to
7 it for a control room event.

8 MS. COOPER: A good question. We have
9 not returned to that.

10 I do know from some of the assistance
11 I've given to NRR and the NFPA 805 process that
12 some of the remaining SISBO plants are
13 transitioning. And in some cases that's because of
14 the kind of feedback to operations from HRA that
15 has been possible --

16 MEMBER BLEY: My only thought here, and
17 that's a self-induced --

18 MS. COOPER: Ashley and maybe Harry or
19 J.S. might be able to answer that question.

20 MEMBER BLEY: Well, I don't think we
21 need that. Self-induced station blackout is what
22 that stands for.

23 MS. COOPER: Right.

24 MEMBER BLEY: At least it seems to me
25 there ought to be a sentence that says if you're

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 one of those guys you need to go beyond what we've
2 got here. Something.

3 MS. COOPER: Okay.

4 MEMBER BLEY: Just a warning.

5 MS. COOPER: Yes. We are constantly
6 struggling as you might imagine with scope and
7 variety of specific plant variations. We can
8 certainly add something.

9 MEMBER BLEY: But that's a pretty
10 significant one if that's still around.

11 (Simultaneous speaking)

12 MS. COLLINS: I think over time -- you
13 know, originally --

14 MEMBER BLEY: But you're writing a
15 methodology that people might use next week.

16 MS. COLLINS: Understood, understood.
17 But I think the learning curve has been such that
18 even when we get to a plant that we're analyzing
19 that may have started out with SISBO all over the
20 place they have learned.

21 Now that we're in the process of
22 revising our procedures so this will no longer be
23 an issue.

24 But you're right. I mean, just for --

25 MEMBER BLEY: That's my hope

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 eventually. I don't know how far along that
2 process is.

3 And at this point if the others want to
4 say how far along that is that would be great.

5 MS. COOPER: Apparently they don't.
6 Wait a minute, Harry's changed his mind.

7 MR. BARRETT: Harry Barrett, NRR Fire
8 Protection.

9 We've encountered probably five or six
10 plants in the 805 process that have transitioned
11 away from SISBO completely.

12 But there are still some deterministic
13 plants that are doing that. And if they were to do
14 a PRA they would end up struggling with how to deal
15 with that for sure.

16 MEMBER BLEY: I think so. Thanks,
17 Harry.

18 MS. COOPER: Thanks. We can certainly
19 add something. That's a good point.

20 All right. I think I'm ready for the
21 next slide.

22 CHAIRMAN STETKAR: Well, but just on
23 high-level generalities. I brought up the IDEAS
24 because obviously ACRS is heavily invested in that.
25 Other elements of Research are heavily invested in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it.

2 As a general comment I thought the
3 report was well done, by the way. I think that it
4 hit a lot of the issues and presented them quite
5 well in terms of trying to remind analysts what
6 they ought to think about.

7 This notion of if we've got, you know,
8 99 operating units out there you might have 99
9 different philosophical approaches to how you might
10 approach this. I'm not sure whether two units co-
11 located at the same time would have different ones,
12 but they might if they kind of work different.

13 So, and I thought reading through the
14 whole report at a high level, I thought it was done
15 really well.

16 Because I tried to read through it in
17 terms of picking it up as an analyst giving me
18 guidance about what I ought to think about and
19 issues that might be a little different than what I
20 thought about in previous applications.

21 So I did want to give you that kudo
22 also up front.

23 MS. COOPER: Thank you. Appreciate
24 that very much.

25 CHAIRMAN STETKAR: And now you can get

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to slide number, what is it, 2.

2 MS. COOPER: Outline for the rest of
3 this morning. Ashley's going to give a brief
4 history of the project and some background, and
5 identify the full team.

6 I'm going to then talk about the
7 overview section in the report.

8 And then the selected topics that we'd
9 like to try to address for the rest of the morning
10 have to do with PRA modeling, the decision to
11 abandon, feasibility assessment, timing and
12 timelines, influencing factors, feedback to
13 operations.

14 And then we'll give you a brief status
15 and discussion of our future work.

16 And so now I'll turn it over to Ashley
17 Lindeman.

18 MS. LINDEMAN: Sure, thanks. So, as we
19 mentioned we're here working on research to
20 quantify the risk from abandonment in fire
21 scenarios.

22 In fire there's two different ways that
23 we postulate the control room be abandoned.

24 The first one is due to habitability.
25 So this is when smoke or fire combustion products

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 really challenge the environment of the main
2 control room and the operators need to leave.

3 And that criteria is pretty well
4 established in 6850.

5 The other way to abandon is on loss of
6 control. That's when you may lose instrumentation
7 or equipment and there's a decision to be made to
8 leave and shut down from --

9 CHAIRMAN STETKAR: Ashley, are we -- I
10 have to admit ignorance here because I didn't get a
11 chance to read through your slides first.

12 So, are you going to get back to the
13 loss of habitability criteria later?

14 MS. LINDEMAN: There is a slide a
15 little bit later, but it's not really explained in
16 much detail.

17 CHAIRMAN STETKAR: In the slides?

18 MS. LINDEMAN: Yes. I'd be happy to
19 explain it now.

20 CHAIRMAN STETKAR: When is it better to
21 discuss that? Later? Do you want to get through
22 the intro now?

23 MS. LINDEMAN: Oh no, just ask away.

24 CHAIRMAN STETKAR: Okay. I had a real
25 problem. Again, this is a high-level issue.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 I for the life of me cannot understand
2 why I should not as an analyst treat loss of
3 habitability in precisely the same way as you lay
4 out for loss of control.

5 I thought your loss of control
6 discussion. Now I'm talking about high. You want
7 to talk about details, we'll talk about details.

8 But at a high level I just don't
9 understand why loss of habitability is
10 fundamentally different from all of the good
11 guidance that you have in there for things to think
12 about and uncertainties, crew dynamics, decision-
13 making, criteria, cues for loss of control.

14 So, if you could explain to me why it
15 is fundamentally different we can get that out of
16 the way.

17 MS. LINDEMAN: Sure. It was recognized
18 early on in the project that it's very difficult to
19 define loss of control. And there's really no
20 guidance in any of the fire PRA reports. So that's
21 something that we took on that we thought would be
22 valuable to really suss out what would cause a loss
23 of control.

24 So I guess our approach was what was
25 published in 6850 and EPRI 1011989 had a pretty

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 rigid set of criteria. Smoke obscuration, heat
2 flux. Also when the smoke layer descends to 6
3 feet, irradiates around 200 degrees. And that
4 translates to visibility and seeing a light-
5 emitting object.

6 CHAIRMAN STETKAR: Yes. That -- I
7 probably will leave before I die, but maybe I
8 won't.

9 The real question is when do people
10 decide when it's so unbearable that they have to
11 leave, and what do they do between the time that
12 they get to that decision and the time when things
13 start to get really messy in the control room.

14 And if I'm in a control room and it's
15 starting to fill with smoke I'm probably going to
16 have people trying to get the smoke out of there.
17 In fact, I might be trying to get the smoke out of
18 there because I know that I've got an hour to get
19 aux feedwater back. So maybe it's more important
20 for me to hook up a fan -- me to hook up a fan to
21 get the smoke out of there.

22 How does that affect your decision on
23 when to abandon and what to do during that interim
24 period? And what is the time from the beginning of
25 what you call phase 2 to the end of what you call

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 phase 2? Wherever you define that time window.

2 MS. COLLINS: Well, I would say rightly
3 or wrongly the way it's handled currently in fire
4 PRA --

5 CHAIRMAN STETKAR: And it's wrong.

6 MS. COLLINS: -- is saying if you meet
7 these criteria and --

8 CHAIRMAN STETKAR: Yes, 200 degrees.
9 If it's 200 degrees and my skin is starting to
10 smoke I might leave. I probably will leave before
11 then. Maybe I will.

12 In fact, maybe I might leave as soon as
13 I see smoke coming in which is worse because in
14 these scenarios by doing that I might extremely
15 limit my options after I leave.

16 So leaving prematurely in a sense could
17 be worse than waiting until my skin starts to
18 smoke.

19 So, I honestly didn't see
20 philosophically any difference between this notion
21 of how do I determine that my indications,
22 controls, so forth for loss of control have
23 deteriorated far enough that somebody says okay,
24 it's too late, we've lost control. We need to
25 leave.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 That's a difficult situation compared
2 to the environment is so bad that we need to leave,
3 or that we're so absorbed with trying to retain
4 some barely tolerable environmental conditions that
5 we're ignoring a whole heck of a lot of other
6 things.

7 I just don't see it philosophically as
8 any different. Because those criteria, and I'll
9 read them so that we have them on the record. The
10 heat flux at 6 feet above the floor exceeds 1
11 kilowatt per meter squared. Relative short
12 exposure. This can be considered as the minimum
13 heat flux for pain to skin.

14 Approximate radiation the smoke layer
15 as -- I won't read the equation -- a smoke layer of
16 around 95 degrees C, 200 degrees Fahrenheit could
17 generate such heat flux.

18 Yes, if it's 200 degrees it's probably
19 not a good day.

20 The smoke layer descends below 6 feet
21 from the floor and optical density of the smoke is
22 less than 0.3 -- it says per meter, but it's --
23 with such optical density light-reflecting object
24 would not be seen if it's more than 0.4 meters
25 away. A light-emitting object will not be seen if

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it's more than 1 meter away.

2 So, if I can't see something more than
3 a foot in front of my face I have to leave. It
4 strikes me that those might be the absolute worst
5 latest time that I might decide to leave the
6 control room.

7 I might decide to leave earlier. I
8 might also be doing other things earlier.

9 And I don't want to get into the
10 details despite the fact that I've mentioned them.

11 MEMBER BLEY: You just did.

12 CHAIRMAN STETKAR: No, because I wanted
13 to get it on record. Because everybody refers to
14 those are very clear criteria written in NUREG/CR-
15 6850 by folks who obviously do fire modeling.

16 They are not operations people. This
17 was not written by operations people.

18 The other criterion, by the way, that
19 you did not cite for loss of control which was
20 curious is a fire inside the main control board
21 damaging internal targets 2.13 meters (7 feet)
22 apart.

23 Well, that sounds like a criterion for
24 loss of control to me, doesn't it? You didn't cite
25 that one.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MS. LINDEMAN: No.

2 CHAIRMAN STETKAR: No.

3 MEMBER CORRADINI: Can I ask a
4 question? Since I'm here to learn, but you guys
5 are -- if this is the high level I can imagine what
6 the weeds look like.

7 I'm struggling with Ms. Collins'
8 comment that currently -- I don't remember how you
9 said it, but what I heard is currently there are
10 certain procedures.

11 And then John's comment back is the
12 current procedures or operational actions are
13 wrong.

14 So my question is is his observation
15 correct? And maybe I misheard it. I just -- you
16 made some sort of comment currently we're doing X.
17 And John said X is wrong.

18 MS. COLLINS: Well, currently what
19 we're doing is we're basing the -- we're saying
20 that the decision to abandon is relevant to loss of
21 control, but the decision-making part is not
22 modeled for loss of habitability because the
23 presumption is once you reach these criteria that
24 the control room is no longer habitable and the
25 operators will go.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER CORRADINI: So, let me ask --
2 again, I know this is more of a research topic, but
3 so currently if I'm an operator how am I trained
4 relative to abandonment of control room?

5 (Simultaneous speaking)

6 MEMBER REMPE: -- more specific on page
7 49 out of 242 under the section Abandonment for
8 Loss of Habitability it has here in general plant
9 procedures and training provide specific cues to
10 indicate an abandonment condition.

11 So, to be more blunt, what is -- I
12 mean, there's been some of these submitted. What's
13 in the procedures and training?

14 MS. COLLINS: Well, that's a general
15 issue in terms of what cues are provided for
16 abandonment in procedures whether it's on the basis
17 of habitability or control.

18 And what we have found is a lack of
19 clarity of cues. And that's why the main control
20 room abandonment risk assessment is so key in the
21 HRA, because we can help to provide that clarity of
22 when a person gets to a procedure and it says the
23 decision to abandon the control room will be made
24 by the shift supervisor based on -- and we're not
25 sure. That may be dot dot dot there.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 That is how the main control room
2 abandonment HRA can provide significant benefit
3 because we speak with people. We look at their
4 training. We look at the simulator exercises and
5 see how much guidance is given to the shift
6 supervisor to make that difficult decision.

7 MEMBER REMPE: And what are you seeing
8 for the guidance?

9 MS. COLLINS: Not a lot.

10 MEMBER REMPE: He's saying that he's
11 reading from 6850 or whatever.

12 CHAIRMAN STETKAR: But remember, 6850
13 is a NUREG that was written primarily by people who
14 model fires, especially this section. It's a
15 research fire-oriented -- it has nothing to do with
16 real world operations in that area.

17 MEMBER REMPE: How do I have confidence
18 in what's been submitted?

19 CHAIRMAN STETKAR: Don't refer to it as
20 procedures. It's not.

21 MEMBER REMPE: It's in here as
22 procedures.

23 CHAIRMAN STETKAR: No, as Erin said and
24 Ashley said, what people are doing today is they're
25 having fire modelers start a fire in the control

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 room.

2 And when the fire modelers say
3 conditions get to A or B or in principle C people
4 leave. No uncertainty. They do not leave before
5 that and they are absolutely certain to leave at
6 that point. That's all the PRA is doing today.

7 It has nothing to do even with
8 procedures.

9 MEMBER REMPE: How do I have confidence
10 in what's been submitted if you're reviewing it
11 when there's no criteria for when they leave or
12 not?

13 MEMBER CORRADINI: So, can I just ask
14 Joy's a question a different way?

15 You guys are way into it better than I,
16 but I'm missing the linkage between what is
17 currently being trained on and what this is going
18 to improve.

19 Now, you're saying it's a fire-related.
20 Okay. But it seems to me there are -- so maybe
21 there's 99 different ways in which the operators
22 are trained on.

23 I bet you it's fleet-related. So if I
24 look at the 25 Exelon plants there's a common
25 training platform.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 So, what is that training platform?
2 Are they aware of the fact that it's uncertain? Do
3 they want improvements?

4 For example, I'd be curious what the
5 owners groups are saying relative to what EPRI is
6 doing with the NRC on this.

7 This sort of context, maybe John gets
8 it, but it's beyond me at this point.

9 MS. COOPER: So, one thing that is
10 important to understand is that any operator today
11 doesn't believe this is going to happen. And
12 they've never experienced it. And the notion of
13 leaving is bizarre.

14 For the most part training with respect
15 to main control room abandonment starts with you've
16 just decided to abandon. Exercise this procedure
17 to show that you know how to abandon.

18 The guidance, whatever procedure there
19 is for abandoning says something like it is at the
20 discretion of the shift supervisor to decide to
21 leave on (a) habitability, (b) loss of control, (c)
22 security event, (d) toxic gases. I mean, there's a
23 list. It's not just fire.

24 So, with respect to loss of control,
25 and we're going to talk about this some more and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the decision to abandon and also on feedback to
2 operators, Jensen Hughes in particular has been
3 able to convince specific utilities that it would
4 be operational beneficial to them to change their
5 procedures to identify specific cues for loss of
6 control.

7 You're right, we could do it for
8 habitability. At this point in time making that
9 argument that you need to change your procedure to
10 say, okay, you need to -- right now we're mostly
11 assuming that if they can't see they will leave.

12 But you're absolutely right. Someone
13 could have passed out before they made the decision
14 to leave because there are individual differences.

15 MEMBER BLEY: And there are two sides
16 to this. John's been talking about the
17 habitability one.

18 With these engineering kind of criteria
19 which aren't operational.

20 MS. COOPER: Right.

21 MEMBER BLEY: By the time you hit those
22 either you've left or you're no longer running the
23 plant. I mean, they're really severe.

24 You could leave a lot earlier. He's
25 expressed worry about that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 The opposite side is you can wait too
2 long. I think my own inclination is this is the
3 place that I can run the plant best of all, and I
4 wouldn't leave it until I was driven out.

5 MS. COOPER: Yes, we've heard that.
6 Everybody says that.

7 MEMBER BLEY: And that's kind of a wide
8 range.

9 MS. COOPER: Absolutely. We've heard
10 different philosophies altogether about what that
11 process would be like.

12 CHAIRMAN STETKAR: See, my point is
13 that in the report, as I read the report the
14 discussion brings out both of those concepts in the
15 loss of control.

16 It says well, if I leave too early I
17 might have been able to salvage things in the
18 control room because -- using alternate systems
19 even. But I don't have the option to use once I
20 leave because of my plant-specific configuration.

21 Or, I might wait too long such that I
22 don't have enough time left to save the plant with
23 what I have available out there at the remote
24 shutdown panel.

25 And the whole discussion about that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 loss of control concept brings out all of those.
2 Brings out the too early, brings out the too late,
3 brings out the ying and the yang of should I stay,
4 should I not.

5 I don't see why it isn't directly
6 analogous to the loss of habitability.

7 MEMBER BLEY: Well, you just have
8 engineering criteria which are essentially the
9 point at which you can't do it anymore from there.
10 I'm sorry, go ahead.

11 MS. LINDEMAN: I just want to say loss
12 of habitability also has many flavors. There could
13 be a fire in the weather panel and that may not
14 damage anything that we need for safe shutdown.

15 And the other extreme is it could be a
16 fire in the main control board.

17 MEMBER BLEY: But that's the kind of
18 thing that isn't there. And I agree with John on
19 that.

20 And the other thing is you haven't made
21 those engineering criteria operational, related
22 them operationally to show that the same kind of
23 things are going on in that area as they are in the
24 loss of control area.

25 CHAIRMAN STETKAR: See, it's one of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 these things where I mentioned that third bullet.
2 You didn't rely on the third bullet about the 2.13
3 meter size of a fire in the main control board
4 because that's the surrogate for loss of control in
5 6850. Again, not from an operational perspective
6 at all. From a fire modeler perspective.

7 You didn't do that. Correctly so.
8 Correctly so.

9 MS. LINDEMAN: Right, it's very
10 difficult to model the fire spread especially
11 within a --

12 CHAIRMAN STETKAR: I'm not a fire
13 modeler. I don't want to talk about fire modeling.
14 I'm talking now about structuring guidance for
15 people thinking about an environment in a control
16 room.

17 MEMBER BLEY: And what people will do.

18 CHAIRMAN STETKAR: And what people will
19 really try to -- try to do. Let's say that.

20 And this kind of artificial difference
21 that you've created between habitability and
22 control, I think it's clear from my perspective
23 ought not to exist.

24 I think you could write the guidance
25 exactly the same way and make it make a lot more

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 sense by not creating that artificial difference
2 and say look, in fact there's a range.

3 There's things that might affect only
4 habitability because it's smoke coming in through a
5 ventilation duct and it has nothing to do with a
6 fire physically in the control room envelope all
7 the way to a situation where, I don't know, I've
8 got loss of control again because I have a fire
9 completely outside of the control room with no
10 environmental effects that is causing
11 instrumentation to go wacko, to anything in between
12 where I have a fire in the control room that may or
13 may not affect the controls that I need to use to
14 save the plant that's also causing smoke and heat.

15 But I don't care in some sense about
16 guidance to an HRA analyst of which of those
17 specific conditions I have because you're going to
18 have -- in principle at any given plant you could
19 have several different flavors of those conditions
20 given the scenario.

21 It's important for the HRA analyst if
22 the need to abandon the control room arises and I
23 have cues for them to identify what those cues
24 might be regardless of whatever combination of
25 stuff is going on.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MS. COOPER: And I think that's what
2 happens ultimately is if you -- you were speaking
3 about correlating it to the criteria that would
4 require them to go on an operational basis.

5 And so in a sense what you're going to
6 be defining for loss of control may then also apply
7 to a loss of habitability where your fire is still
8 taking out essential equipment, and you're
9 stipulating here is the type of equipment loss you
10 would see, or instrumentation loss you would see
11 that should motivate you to go.

12 So, perhaps you could even say that
13 what we're stipulating for, loss of control, would
14 also apply to those scenarios for loss of
15 habitability where you're taking things out from an
16 --

17 MEMBER BLEY: The only problem with
18 habitability is I can no longer control the plant
19 from the control room. It is a control issue.

20 CHAIRMAN STETKAR: And -- yes. It's a
21 different way of control. I can't drive the car
22 because my windshield has become completely black.

23 I was going to say some more but I
24 don't need to right now. Let's keep going.

25 MS. COOPER: I think we understand what

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 you're saying. I think that probably -- we'll
2 discuss the status later, but we're going to do
3 another revision before we go to peer review.

4 I think we could probably develop some
5 discussion about how that would be done, how you
6 would develop operational cues for abandonment and
7 loss of habitability.

8 CHAIRMAN STETKAR: And it may not be as
9 -- don't necessarily think like fire modelers or
10 engineers when you're doing this. Think like human
11 people.

12 And rather than saying well, what are
13 the specific criteria that I need to define, I do
14 not have indicators A, B, C, D for loss of control,
15 or I have environmental conditions X, Y, Z for
16 habitability.

17 Think more about what is happening in
18 the scenario and how do people make the decision to
19 abandon the control room in the context of the
20 scenario.

21 Because you may very well have mixtures
22 of the two. And in the real world people aren't
23 going to pull up their, gee, do I have A, B, C, D,
24 or X, Y, Z.

25 They're going to say things are falling

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 apart, and I'm trying to get people in the plant to
2 restore power to stuff, and I'm trying to get
3 people to bring in little fans, an elephant trunk
4 to get the smoke out of the control room.

5 MR. STONE: I'm Jeff Stone. I'm a
6 senior manager for fire PRA at Exelon.

7 I just wanted to bring up one point,
8 and maybe it's already understood. The loss of
9 habitability is obviously a complete abandonment of
10 control room.

11 The loss of control may not mean a
12 complete abandonment of control room. It might
13 mean you control some functions from the control
14 room and other functions are controlled from other
15 stations around the plant.

16 CHAIRMAN STETKAR: And the guidance for
17 that -- and thanks, that is a difference because I
18 abandon ship when the ship is underwater.

19 The guidance does handle that partial
20 thing, the decision about what -- is command and
21 control transferred out of the control room,
22 leaving somebody there to control something that's
23 controllable from there.

24 Does command and control remain there
25 where somebody else goes out in the plant and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 controls something out there. It does handle sort
2 of the command and control portion of where people
3 are doing things.

4 And you're right, loss of habitability
5 means I abandon ship.

6 MS. COOPER: Okay.

7 CHAIRMAN STETKAR: All right. It'll
8 get easier as we go along. I just, I had to ask
9 now because LOH is the second sub-bullet and I
10 hadn't read far enough in your slides to see
11 whether I would rant about it later.

12 MS. LINDEMAN: No worries. So,
13 continuing on.

14 This was an area that was somewhat
15 looked at in 1921 but understood it was an area of
16 future research.

17 And some of the 805 submittals really
18 brought up the question about some of the legacy
19 screening values, and whether that would be
20 applicable in all cases.

21 Prior to the work by this team there
22 was a fire -- NEI/NRC fire PRA FAQ that lived for
23 about three years.

24 And after two or three years of
25 hundreds of pages going back and forth, and lots of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 discussion. Unfortunately that effort was really
2 centered around getting a screening value. And
3 ultimately we took the step back and tried to look
4 at this in a more holistic approach.

5 So as we got into this we realized it's
6 a really complex topic. And the plant-specific
7 considerations. And the capabilities of the
8 different remote shutdown panels are vast.

9 The safe shutdown strategies are very
10 different. So, making any type of generic guidance
11 is just extremely difficult.

12 So to do things in a practical manner,
13 that's why we determined to really phase 1 is look
14 at this qualitative foundation and understand the
15 differences that exist.

16 And then once we have a good foundation
17 to go onto phase 2 which is the quantification
18 approach.

19 So here today we're really looking at
20 the qualitative aspects. And you'll see what we've
21 sussed out.

22 So, the project team for this. We
23 really started with some of the foundation members
24 from 1921. We have here today Susan and Stacey.
25 And then Nick Melly is also in the audience and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Kendra.

2 And then we also have John Wreathall
3 from the NRC side.

4 From the EPRI side myself and Mary
5 Presley who are from EPRI. And then we also have
6 Erin Collins here today, Paul Amico who is not here
7 today, and Kaydee and Jeff Julius from Sciencetech.

8 So, those are the project team. So, a
9 lot of experience doing these type of assessments
10 for 805 and fire PRA from the EPRI side.

11 MS. COOPER: And John Wreathall and
12 Jeff Julius should be on the phone listening in.
13 And available as life lines.

14 CHAIRMAN STETKAR: We keep it muted
15 because they're both probably screaming at the
16 phone out there.

17 MS. COOPER: I'm going to be talking
18 about the overview chapter, chapter 2 in the
19 report.

20 The purpose of this chapter is to try
21 to sensitize the readers and potential analysts
22 that there are some things that are different about
23 a main control room abandonment for fire events
24 context.

25 And we want to try to highlight what

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 some of those differences are and what then the
2 implications might be for HRA and PRA, and then
3 more specifically talk about what the delta is
4 between 1921 and the guidance that we provide in
5 this report.

6 At this point in time we have three
7 appendices which we've already been discussing
8 some. We've got a background on the regulatory
9 requirements and what historical events there are
10 in main control room abandonment in Appendix A.

11 We have the discussion on command and
12 control in Appendix B. And then some guidance
13 sheets, forms and stuff like that, and other tips
14 for collecting plant information for main control
15 room abandonment.

16 Which you might appreciate that if this
17 is a context that isn't practiced frequently, or in
18 the simulator, or experienced as a real event that
19 there's some different challenges for HRA so far as
20 collecting information from operators and so forth.

21 MEMBER CORRADINI: So, I've got a
22 question. So, how is it practiced in the
23 simulator?

24 MS. COOPER: That varies. And I invite
25 my team to add to what I'm going to say.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 As I mentioned before I believe as
2 required by Appendix R they must at least rehearse
3 what steps are required to do in the control room
4 before they leave it given that there's something
5 going on that requires them to abandon.

6 I think most of --

7 CHAIRMAN STETKAR: Susan, back up a
8 little bit.

9 MS. COOPER: Yes.

10 CHAIRMAN STETKAR: How is it really
11 done?

12 MEMBER CORRADINI: I'm really
13 struggling to figure out -- I'm sorry.

14 MS. COOPER: So, there are some plants
15 that have actually done things in the simulator
16 where they have a mockup of the remote shutdown
17 panel in their simulator.

18 And they will go there and they will
19 exercise things.

20 CHAIRMAN STETKAR: Back up even more.

21 MS. COOPER: Even more.

22 CHAIRMAN STETKAR: Okay. Let me ask
23 you the question that I think will help Mike.

24 (Simultaneous speaking)

25 CHAIRMAN STETKAR: Is it practiced in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the simulator under the following conditions.
2 Okay, crew. Today we are now going to train on
3 control room abandonment. We had a control room
4 abandonment situation. Now exercise the
5 procedures. Is that how it's typically trained?

6 MS. COOPER: Not the first sentence.
7 Not today we are going to do abandonment.

8 However, they will start a scenario and
9 then at some point someone usually feeds them the
10 information to say we have -- and it's easiest to
11 say it's a security matter or something like this.
12 We have a condition XYZ. Now what do you do?

13 CHAIRMAN STETKAR: Now transition.

14 MS. COOPER: Now transition.

15 CHAIRMAN STETKAR: Okay, does that
16 help?

17 MS. COOPER: So they are kind of -- at
18 this point most of the time we see let's say a
19 force-feeding of the conditions without that
20 decision-making.

21 MEMBER CORRADINI: So, here's where I'm
22 going. I'm too empirical. Do you generate the
23 smoke and make them worry?

24 MS. COOPER: No.

25 MEMBER CORRADINI: Why not? It seems

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to me that if I'm going to get a human response I
2 would come up with a control room situation however
3 non-specific to a plant and put the operators in a
4 situation where they're uncertain and watch them
5 respond. Or am I missing something?

6 MR. BARRETT: This is Harry Barrett.
7 Having been a licensed operator at Nine Mile and
8 also worked a lot at Duke Oconee, I can tell you
9 that there are utilities out there that practice
10 the control room end of this where you end up
11 having a fire in the control room and they spring
12 it on them as a normal scenario that they don't
13 know ahead of time.

14 And they go through the decision
15 process to go -- as a matter of fact at Oconee they
16 actually put on Scott Air-Paks and stayed in the
17 control room even when ventilation was a problem.
18 They couldn't see, they had to get right up next to
19 the panel and everything.

20 So there are utilities that take that
21 to very extreme levels to train at.

22 MEMBER CORRADINI: Okay. But it's
23 quite widely varied.

24 MR. BARRETT: Yes. And it depends on
25 whether or not they have a simulator for their

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 remote shutdown panel. Because at Oconee they have
2 the SSF simulator. So they actually do that
3 training where they transition over to the SSF
4 which is their dedicated shutdown facility.

5 So there are utilities out there that
6 do this at a fairly extensive level.

7 And of course there's a lot of them out
8 there that don't do it much at all. They end up
9 having a JPM that runs it through.

10 MEMBER CORRADINI: What's a JPM?

11 MR. BARRETT: A job performance measure
12 which is a training tool for operators.

13 MEMBER CORRADINI: So the owners groups
14 are aware of this great diversity and are happy
15 with it? Or just don't speak about it?

16 I'm back to the owners groups because
17 it strikes me, I'm looking for a connection back to
18 those that actually have to deal with emergencies
19 and how they -- so is that the case? There's a
20 wide diversity and everybody's aware of it?

21 MR. BARRETT: I think so. And part of
22 that I think is how utilities choose to meet
23 Appendix R. It's mostly driven by regulatory
24 criteria for Appendix R.

25 And the systematic approach to training

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 drives you to end up doing the job task analysis
2 and figure out what level of training is needed on
3 what frequency and all that.

4 So, they should be more consistent than
5 they are, but I think there's a wide variety of
6 training levels there.

7 MEMBER CORRADINI: So then nobody says
8 plant X doesn't do it the way plant Y does it. But
9 we're interested. We'll send a crew of our
10 operators of plant X over to plant Y, different
11 thing, and just to see how they respond. Or is
12 that --

13 MR. BARRETT: Some of that's done by
14 INPO.

15 MEMBER CORRADINI: Okay.

16 MR. BARRETT: When INPO does both the
17 training accreditation and when they do a site
18 visit they'll observe simulator training and
19 they'll end up making comments that, well, you
20 know, you might want to go talk to this plant
21 because they do a real good job on that. But I
22 don't know --

23 MEMBER CORRADINI: That's part of their
24 accreditation process.

25 MR. BARRETT: Yes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER CORRADINI: Okay, thank you.

2 MEMBER REMPE: So in the --

3 CHAIRMAN STETKAR: Joy, Dennis has been
4 waiting.

5 MEMBER BLEY: Just two more points,
6 Mike. A follow-up. And I certainly agree with
7 what Harry said.

8 I've been to plants where they've told
9 me they never put on Scott Air-Paks because it
10 doesn't interfere with anything and nobody would
11 ever have a problem communicating or working in one
12 which some people disagree with.

13 And I've been to some plants where they
14 send a substantial portion of their operators to
15 actual firefighting schools so they get their head
16 in smoke. But not many. A handful perhaps.

17 MR. BARRETT: Yes, I agree.

18 CHAIRMAN STETKAR: Joy?

19 MEMBER REMPE: Before Harry sits down,
20 I'm sorry, but in the Cadillac example where they
21 put on the self-contained breathing apparatuses, do
22 they actually also go and practice the
23 communication from the remote panel and the various
24 places, and go through the whole thing?

25 MR. BARRETT: Yes. The people who stay

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in the control room continue to end up using the
2 Scott Air-Paks and communicate with the Scott Air-
3 Pak on which is more difficult obviously.

4 But that's one of the reasons why they
5 train on that is to actually show that they can
6 still do the command and control with the Scott
7 Air-Pak on.

8 MEMBER REMPE: Okay, thank you.

9 MS. COOPER: So, this discussion is
10 actually pertinent to what the overview section of
11 this report is about.

12 I mean, I guess one thing to your
13 point, your questions, Mike, there are differences
14 in what's required for abandoning the control room
15 and the remote shutdown panel than what we have
16 required -- the NRC required for main control room
17 operations.

18 And that's what the overview tries to
19 touch on. And I'll go to the next slide.

20 I already mentioned even within the
21 context of PRA events this is a rare event. And so
22 we've talked about the variations in training. So
23 not everyone is going to have the same kind of
24 training.

25 And for anything that's in the EOPs the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 operators have had training frequency in the
2 simulator at least every couple of years. That's
3 probably not the case in many plants.

4 The design of the control room is --
5 you can't say it's standardized, but it's much more
6 so than anything you can say about where they would
7 go when they leave the control room, the remote
8 shutdown panel.

9 The procedures that are used also are
10 not standard. They're not requirements for that.

11 Staffing and where people go is also
12 different, not standardized.

13 So, some of the discussion in the
14 overview is to try to cue in the HRA analysts that
15 some of the things that we could count on when we
16 were doing HRA and modeling internal events, things
17 where we were within the emergency operating
18 procedure set, we cannot make those assumptions
19 anymore when we're talking about a main control
20 room abandonment scenario.

21 So that's kind of the point of the
22 overview section.

23 And since we're running a little bit
24 late I'm going to charge onto the next slide.

25 So, what we're really trying to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 accomplish at a high level with this overview is to
2 try to cue in the HRA and PRA analysts that you're
3 going to need to shift your mindset.

4 While analyzing human failure events
5 that take place in the control room you can trust
6 that certain things are there. In abandonment you
7 have to trust but maybe verify on, say, design
8 things and stuff like that.

9 But it is a special case of a fire HRA
10 and PRA. You can't -- this is brand new analysis
11 that can't build on anything else that you've done
12 before for all of those reasons that I highlighted.

13 So you really have to sort of start
14 from scratch.

15 Command and control has kind of evolved
16 to be something that the team has focused on. And
17 I guess there are a lot of things that support
18 command and control in the main control room.

19 We're talking about it as a meta
20 performance shaping factor, but this is probably
21 going to be a topic for continuing research and
22 discussion, at least that's the way I see it.
23 Because I haven't so far in reaching out to people
24 found anything that really describes this and helps
25 us understand what's really even happening right

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 now in the main control room, much less what
2 happens when we start peeling the pieces away, and
3 breaking things up, and distributing people around
4 the plant.

5 So, we're going to charge onto some of
6 the rest of the topics that the report addresses.
7 And we'll try to get to as many of these as we can.

8 We're going to talk about PRA modeling,
9 decision to abandon, feasibility assessment,
10 timelines, influencing factors, and feedback to
11 operations.

12 And first up is going to be Erin
13 Collins to talk about PRA modeling. Or is it
14 Ashley?

15 MS. LINDEMAN: So, we acknowledge the
16 discussion we had on the loss of habitability
17 discussion.

18 But early on in the project we realized
19 that this was a good opportunity to take note of
20 some of the findings from peer reviews, and some of
21 the RAIs that have come out of the 805 process, and
22 really fill some gaps or holes in some of the
23 guidance on handling main control room abandonment
24 from a PRA and a modeling perspective.

25 So, for example, in some of the early

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 PRAs there was not a good integration of HFEs and
2 equipment failures in the model. So that was
3 something that section 3 tries to provide some more
4 complete guidance on that.

5 One of our foundations or starting
6 points was when does this happen. So we need to
7 understand when a loss of habitability or loss of
8 control may occur.

9 As the first bullet, we've discussed --
10 we have some very rigid fire modeling criteria.
11 Maybe we need to do a better job of understanding
12 how that translates operationally.

13 But what we did try and address in this
14 report was really hashing out in a more distinct
15 manner defining loss of control.

16 So, in the report in section 4 is
17 really where you'll find the expanded scenario
18 description of loss of control.

19 So, this is a process that involves
20 talking with operations, understanding their
21 hesitations of possibly leaving the control room,
22 and gaining an understanding of when you have
23 certain instrumentation or equipment out when would
24 they leave and either do a partial abandonment or
25 actually fully leave the control room.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 So, what we found is that this is
2 highly plant-specific. So it's not like you can
3 say for a certain vintage of PWR the criteria will
4 be the same.

5 So what we tried to do was not provide
6 explicit criteria, but provide a process that the
7 plant can use to figure out their plant-specific
8 considerations.

9 So, defining our scenarios is really
10 important. We need to know what will cause
11 abandonment and make sure that we properly model it
12 in our PRA model.

13 So we want to know what are the
14 conditions where we will reach abandonment. We can
15 use our procedure review to help suss that out, and
16 then include logic in the model to capture only
17 when those conditions occur.

18 And as we had some discussion, our loss
19 of habitability is really determined through fire
20 models, our zone and our CFD models.

21 But the point I'm trying to make here
22 is during a loss of habitability we talked about
23 it's likely they'll reach a threshold and have to
24 leave.

25 So we wanted to make sure that there

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 are certain post-trip actions that they might do.
2 Isolate the main control room circuits. Possibly
3 de-energize certain equipment to prevent spurious
4 operations. And finally, energize the remote
5 shutdown panel.

6 So those are likely the only things
7 that can be done. And some of those non-essential
8 actions that may be in other procedures, there's
9 really no time to credit those. So that was a
10 point that we clarified.

11 And then the last two bullets are
12 really making sure that we're doing kind of what we
13 would do for a normal scenario. We want to make
14 sure that we have our random failures in the
15 equipment that we're going to accredit for the
16 remote shutdown panel. So our controls and the
17 equipment we need for safe shutdown.

18 And we also want to make sure we
19 include any type of -- well, basically the last
20 bullet says we need to trace the remote shutdown
21 panel.

22 If there's a scenario where the cable
23 is damaged you may not or you will not be able to
24 use the remote shutdown panel.

25 So we wanted to clarify that that is --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it's not only a good practice, but an essential
2 practice.

3 And then finally there may be some
4 spurious operations that may damage equipment and
5 are non-recoverable. Similar to any other fire PRA
6 scenario we would not take credit for that.

7 And the last is really just a good
8 practice, but if these scenarios are some of your
9 dominant contributors you should account for any
10 type of fire protection system, suppression or
11 detection to make sure that we're characterizing
12 the scenario as realistic as possible.

13 So, in the end of section 3 there's
14 really an approach, really kind of the Cadillac
15 approach is to model this explicitly in your logic
16 model.

17 But there's other approaches that can
18 be taken such as binning based on certain scenario
19 characteristics, or developing a single bounding
20 failure that represents all the recoverable
21 scenarios that are postulated.

22 CHAIRMAN STETKAR: Ashley, on that last
23 one, I think the guidance makes it fairly clear
24 that the authors of the report prefer the -- not so
25 much binning approach to life.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 In practice people always need to
2 aggregate sequences because you can't do 10,000
3 separate human reliability analyses.

4 So, in any practical risk assessment
5 there's always some conceptual binning process.

6 Now, given that, I had a couple of
7 questions about the binning section.

8 In the section where you discuss the
9 use of -- I'll be polite and not use the acronym
10 that I always use -- where you use the single
11 number for suddenly the plant gets saved.

12 It says if the scenarios modeled
13 include operator actions that are time-critical
14 defined as time required within five minutes of
15 time available then a detailed analysis is needed.

16 By implication it means that if the
17 time required is 5.1 minutes less than the time
18 available I can get away with putting a single
19 number in there.

20 I have a real problem with that because
21 five minutes is a long time if I'm talking about
22 milliseconds. Is not a long time if I'm talking
23 about something on the order of, oh, an hour or so,
24 especially given all of the uncertainties in the
25 estimates of not only the time required to make a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 decision, the time required to perform an action,
2 but even the uncertainties in the time available
3 because believe it or not, there's uncertainties in
4 -- and he's left the room -- thermal hydraulics
5 models.

6 (Simultaneous speaking)

7 CHAIRMAN STETKAR: And if you read the
8 transcript it was one of the few things that is
9 probably coherent in anything that I said this
10 morning.

11 Now, my only concern seriously is if
12 you put it in this guidance people will apply that
13 on a 5.1 minutes I win, 4.9 minutes my God I've got
14 to do this God awful analysis. So I better justify
15 that it's 5.1.

16 I think that, you know, I have my own
17 ideas about how I would do it, but some notion
18 about relative margins might be better than an
19 absolute criterion of 5.0 minutes. So I just offer
20 that as a suggestion.

21 MS. COLLINS: That's a very good point.

22 CHAIRMAN STETKAR: The other thing, and
23 it's stated when you get into the not a single
24 number, and would even apply for a single number,
25 but where you get into kind of a more structured

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 approach to some subset of bins, the guidance
2 appropriately does say that you need to consider
3 the conditions that would apply in the most
4 restrictive scenario in each bin.

5 That's good to say. You really ought
6 to emphasize that strongly because it implies that
7 I have to do a lot of work going through a lot of
8 cut sets to figure out what the most restrictive
9 scenario is for a particular bin.

10 People in principle do that and have
11 done that. PRA people know how to do that,
12 conservative condensation and all that kind of
13 stuff.

14 But it's kind of hidden in there in
15 almost innocuous sounding words. And I think that
16 you ought to punch up the guidance, say look, in
17 any kind of binning process you need to make sure
18 that whatever you're doing is from a human
19 perspective. Because this is written for HRA.
20 From a human perspective the most challenging
21 scenario in that bin.

22 Not the most challenging because I only
23 have one and only one pump left in the entire world
24 that can save me. That's hardware. That may not
25 be the most challenging human scenario in there.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And that could be a lot of work. And I
2 think you need to punch up the guidance in that
3 area.

4 MS. COLLINS: Thank you, excellent
5 point. I kind of would like to add that to me this
6 particular chapter, this section 3 that we're
7 discussing about the modeling guidance is extremely
8 important because it goes beyond just the HRA
9 portion.

10 And it's the combination of the PRA and
11 the HRA which is we always talk about how important
12 that is, but it's really essential for main control
13 room abandonment and understanding all the various
14 flavors of what can happen here.

15 So to me this particular section is
16 crucial guidance not only for HRA analysts, but
17 especially we hope that PRA analysts will pay
18 attention.

19 CHAIRMAN STETKAR: I wish you hadn't
20 said that because you gave me an opening for
21 another comment.

22 (Laughter)

23 CHAIRMAN STETKAR: General comment.
24 The report correctly says that for these main
25 control room abandonment scenarios situations HRA

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 people need to get involved deeply and broadly from
2 time zero in the modeling.

3 However, the report still maintains
4 this traditional divide between I am the PRA
5 analyst because I draw fault trees and event trees,
6 and you are an HRA analyst and you put numbers in
7 little boxes that I create.

8 Anything that you can do to stop that
9 notion would -- especially in this report would be
10 good.

11 And that's the only reason you said,
12 well, the PRA analyst. This is important for PRA
13 analysts.

14 My comment was everybody ought to read
15 all sections of this report. In the introduction
16 you say well, chapter 3 is more important for PRA
17 people. Maybe HRA people ought to read it.

18 The other chapters are maybe more
19 important for HRA people, but maybe PRA people
20 ought to read those.

21 No.

22 MS. COLLINS: It's equally important
23 for everyone.

24 CHAIRMAN STETKAR: It's equally
25 important. The guidance in chapter 3, by the way,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the examples are really good as a practitioner.

2 MS. COLLINS: Thanks. I'm glad. I
3 really feel that way too. I have to give kudos to
4 Paul Amico.

5 Yes, no, I understand. We still have
6 kind of that artifice of different hats.

7 CHAIRMAN STETKAR: You do.

8 MS. COLLINS: But actually in terms of
9 how projects are structured it happens that way as
10 well.

11 And as you said, it may be happening,
12 it may not be correct, but maybe we can do better.
13 We're trying to do better and better as we keep
14 going with this guidance to bridge that gap.

15 CHAIRMAN STETKAR: The only way that
16 people are going to keep doing better and better
17 and better is if they're forced to read things that
18 tells them don't do it the way you've been doing
19 it.

20 If they read things that say well yes,
21 there's obviously -- we can keep doing it the way
22 we've been doing it.

23 So that's the only way to -- some of
24 these things that we as an HRA community or PRA
25 community for years have been trying to say that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 human reliability analysis is not like collecting
2 pump failure data that you put in a basic event for
3 pump fails to start, that the HRA people ought to
4 be integrally involved in development of the model.

5 And that means that HRA people need to
6 understand how plants work. And the people who
7 understand how plants work need to understand a
8 little bit about how people work, that you can't
9 keep this artificial separation because you get
10 into the problems we've had.

11 MS. LINDEMAN: I hesitate to talk about
12 this slide because I feel like we've already had a
13 lot of discussion.

14 CHAIRMAN STETKAR: It's why you could
15 have put me off until this slide.

16 (Simultaneous speaking)

17 CHAIRMAN STETKAR: I don't think you
18 need to go through it now.

19 MS. LINDEMAN: So, can we pass in the
20 interest of time?

21 CHAIRMAN STETKAR: I think so.

22 MS. LINDEMAN: Okay. Thank you.

23 MS. COOPER: I feel like we've hit all
24 this also.

25 MS. LINDEMAN: Yes, I mean, I'm not

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 sure if we need to really spend too much time on
2 this.

3 CHAIRMAN STETKAR: The only thing that
4 I had on some of these is I got -- as I read
5 through the report, and this just might be because
6 of where it is in development, the notion of --
7 here you're characterizing it for loss of control
8 HRA.

9 The first sub-bullet under the key
10 aspects of loss of control is cues. I get -- as I
11 read through the whole report sometimes I get
12 confused about where time key zero is.

13 When I finally got to the end of the
14 report I think it's when the fire starts which is
15 good.

16 At times in the report I get the
17 impression that for some reason cues -- when I have
18 a loss of control room abandonment that the cues
19 for what you call phase 3 are indexed to the time
20 that I -- I'm not sure when I decide to leave the
21 control room, or after I reach the -- I'm not sure
22 whether it's the beginning of phase 2, or the end
23 of phase 2 in jargon.

24 And in one case in your examples when
25 you talk about this time, and I'll only bring it up

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 here, is I think you need an example where you have
2 cues. Let's say it's a loss of all feedwater
3 because it's easy to talk about the pressurized
4 water reactor where very shortly after the
5 initiating event the operators are aware that they
6 don't have feedwater. So that's the cue to tell
7 them that I need to get feedwater back.

8 At some time later, an ill-defined time
9 later at the moment because we need to figure that
10 time out we need to abandon the control room.

11 And there's obviously a delay time.
12 And then we need to continue restoring feedwater
13 after we abandon.

14 So that now my actions to restore
15 feedwater start in phase 1. They continue in
16 effect through phase 2, but they're delayed by the
17 relocation time at least which is part of phase 3 I
18 guess. And they continue into phase 3.

19 Now, why is that important? It's
20 important because it might affect my decision to
21 leave the main control room.

22 Because if I know I've got to get -- if
23 I have to get feedwater back, and I'm working on
24 it, I'm working on it. I'm going to get it back
25 anytime now. I've got people out there trying to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 get the pumps started.

2 I know the smoke is getting dense. I
3 know that the lights are going on and off. But by
4 God I've got to get this done before I leave. That
5 might affect the decision.

6 And none of the scenarios that you laid
7 out in your timing had that. They seemed to index
8 cues for event response on control room abandonment
9 to something that is either the decision to leave
10 or the start of your phase 3. And that could be
11 important.

12 Because there's this implicit
13 assumption that for some reason it's conservative
14 to assume that everything happens at zero.

15 And zero might be zero when the fire
16 starts, or zero might be zero when I get to the
17 remote shutdown panel but everything gets indexed
18 to those points.

19 And in the real world it might not work
20 that way. It probably won't.

21 MS. COOPER: We considered introducing
22 the discussion of the different time phases that we
23 defined earlier in the report. Any sense that that
24 might have helped you?

25 CHAIRMAN STETKAR: No. I didn't have a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 problem with that.

2 MS. COOPER: Okay.

3 CHAIRMAN STETKAR: I just, as I went
4 through, I was going to bring it up in chapter 2
5 because it's -- by the time I got to the end of the
6 report it was pretty clear to me that as I lay out
7 timelines they ought to begin when the fire
8 ignites.

9 MS. COOPER: That is correct.

10 CHAIRMAN STETKAR: Thermal hydraulics
11 analyses, everything to that, that's good. You may
12 want to reread the report and make sure that that's
13 crystal clear throughout the report.

14 I did though in the same notion of cues
15 and timing have in the examples that you brought
16 out, and I quite honestly am trying to look through
17 a lot of notes here so I don't remember exactly
18 what section it is.

19 But when you talk about timing of cues
20 the one example that I didn't see was this notion
21 where they know what they need to do sometime
22 pretty early on, and they're working on it as
23 conditions in the control room degrade. And that
24 could indeed affect decisions to abandon.

25 MS. COLLINS: I think we had some

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 internal discussions on our team about that. And
2 we do have some mention of it.

3 CHAIRMAN STETKAR: It --

4 MS. COLLINS: Some members also felt
5 that the conditions would be so bad, and you had
6 lost so much function during the scenarios that
7 we're talking about that that situation is less
8 likely.

9 CHAIRMAN STETKAR: But part of that,
10 Erin, is there are statements in there that says,
11 well, it's typically conservatively assumed that
12 everything is lost at zero.

13 That's true for thermal hydraulics
14 because pressures, temperatures and things like
15 that. Not necessarily true for operators.

16 And if you've done a detailed fire
17 analysis in areas where you do have information
18 about fire propagation from tray to tray and some
19 timing information those conditions that you talk
20 about may very well degrade over time.

21 And you may very well have that
22 information already in the fire modeling that you
23 have such that we know some broad uncertainty that
24 we won't get these degrading conditions for another
25 10, 15 minutes or something like that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Whereas the operators might know
2 because of the initial damage that something was
3 lost closer to T-0.

4 MS. LINDEMAN: We tried to characterize
5 that T equals zero was the start of the fire. But
6 I believe we recognized that that necessarily isn't
7 the start of the reactor trip, or fire damage. But
8 maybe that's not well written.

9 CHAIRMAN STETKAR: Just a general
10 comment. Go back and look at, make sure it's
11 crystal clear that I as a practitioner know what is
12 zero and how I index everything to zero.

13 And I don't care whether it's reactor
14 trip, or thermal hydraulics, or whatever because
15 what is zero.

16 And then, as I said, the examples I
17 thought were pretty good. The only thing that I
18 was missing was this notion of cues prompting
19 operator response to restore safety functions that
20 occur well before any conditions might degrade to a
21 point where people start to think about perhaps
22 leaving.

23 Because to me that would indicate
24 perhaps a strong reluctance to leave until I
25 complete the job that I was working on.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Compared to something that indeed was
2 such a devastating conflagration at T-0 the room
3 went away such that it became pretty clear what the
4 conditions that I have.

5 MEMBER BLEY: Just to follow up on his
6 and then two things from me. And I didn't read
7 through all the examples with care.

8 I don't know if you had any cases where
9 you begin to see symptoms before you know there's a
10 fire. That's the one I think about sometimes.
11 Because that could really create a tough spot for
12 the operators.

13 We've seen it often in loss of air
14 events where odd things happen that can happen with
15 fire too. I mean, it would be really hard to
16 model, but it's worth some thought.

17 The place I had a question was all
18 throughout you talk about the remote shutdown panel
19 and other areas. Once in awhile you say local
20 control.

21 I don't know how many plants have
22 remote shutdown panels, and how many have remote
23 shutdown areas or whatever we call them where
24 there's kind of distributed remote control.

25 My question is are there enough of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 those that it's worth a little more description
2 maybe in Appendix A about what some of the
3 alternatives to remote shutdown panels look like,
4 and any implications it would have with respect to
5 control, command and control, and your last bullet
6 here, trust in the remote shutdown panel
7 capability.

8 I know the answer to that, but I -- the
9 focus is on remote shutdown panels and I don't know
10 if 50 percent of the plants have them, or 90
11 percent have them. But some of them have kind of
12 oddly distributed systems that will be different to
13 model and deal with. And a few have two.

14 MS. COOPER: That is a good point. So,
15 was command and control your second question, or
16 was that still the first? Was that still the first
17 one?

18 CHAIRMAN STETKAR: Actually, I thought
19 you handled --

20 MEMBER BLEY: There were two there, but
21 I just wondered if something more concrete was --

22 CHAIRMAN STETKAR: Without getting into
23 77 different configurations.

24 When I read through it I thought that
25 you made this notion that there's a wide variety of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 things. Some plants might even have something that
2 kind of sort of looks a little bit like a main
3 control panel to things that have a couple of
4 panels that may not look much like the main control
5 panel, but has a couple of nobs and gauges on it.

6 And a lot of go out and tweak this
7 valve at this motor control center or whatever. So
8 you may want to think about it.

9 But I thought that you at least made
10 the point from the perspective of guidance to an
11 HRA person I need to go out and look at that plant.

12 MS. COOPER: That's exactly the
13 message. I mean, it's not like you can just assume
14 it looks like the last job you did.

15 MS. COLLINS: Right. And that, as you
16 said, Susan, that's part of that whole up front
17 mindset shift you have to get into, and then
18 evaluating this versus fire HRA versus internal
19 events is that whole progression of this is a very
20 different beast. And you really need to evaluate
21 the specific condition situations.

22 MS. COOPER: My turn. Okay, now we're
23 shifting gears to talking about feasibility
24 assessment.

25 CHAIRMAN STETKAR: Let's --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MS. COOPER: Take a break?

2 CHAIRMAN STETKAR: Yes. Before we
3 shift into this gear let's take a break and let's
4 come back at 10:15.

5 (Whereupon, the above-entitled matter
6 went off the record at 9:58 a.m. and resumed at
7 10:15 a.m.)

8 CHAIRMAN STETKAR: We're back in
9 session. Feasibility. It is feasible to finish
10 this meeting by the time we have to. It may not be
11 possible.

12 MS. COOPER: So, feasibility assessment
13 is Supplement 1 to 1921 on main control room
14 abandonment.

15 1921 established feasibility criteria
16 for modeling human failure events and fire PRAs,
17 and the team wanted to look at feasibility again in
18 the context of main control room abandonment.

19 This was not something that we were
20 able to do right off the bat. It took a
21 considerable amount of time, training, experiences
22 from doing the analyses or talking with operational
23 staff and so on and so forth.

24 But in the end we developed some new
25 guidance that's a consensus based on the team

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 discussion over time.

2 And in particular there are four new
3 types of guidance. We talked about feasibility
4 needing to be assessed on a scenario level in
5 addition to on the basis of individual HFES.

6 We have two new feasibility assessment
7 criteria that are specific to main control room
8 abandonment.

9 We talk about some additional issues
10 and provide some additional guidance on the
11 existing criteria that were already established in
12 1921.

13 And then we have a discussion about --
14 and this is a pretty important one due to the
15 unusual nature of this particular type of HRA, and
16 that is what do you do if in starting to do your
17 analysis it looks like this scenario is not
18 feasible, but that's not an acceptable answer.

19 And then we sort of begin the
20 discussion in chapter 6. And then there's also
21 some more in the discussion on feedback to
22 operations which is later in the report.

23 CHAIRMAN STETKAR: You're going to talk
24 about that in some other slides later?

25 MS. COOPER: Yes. Scenario level

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 feasibility basically says that you need to make
2 certain that the collective set of actions that are
3 required to safely shut down the plant can be
4 performed, for example, within the overall time
5 available.

6 And this is then going to be connecting
7 to the discussion of timelines which comes in the
8 report in the next chapter.

9 There's also -- we have to consider
10 manpower across the entire scenario which you may
11 or may not realize that you might be overlapping
12 responsibilities for somebody, especially if maybe
13 it's like a two-unit shutdown or whatever and
14 there's a swing operator, and both units are
15 perhaps counting on that one particular operator.

16 So, we have some discussion about
17 scenario-level feasibility.

18 Then the two new criteria are related
19 to command and control and communications. And we
20 specifically say that for command and control there
21 needs to be a pre-defined plan for command and
22 control that addresses what is different when
23 you've left the control room.

24 Everything from who now is staffing.
25 In the main control room you have the shift

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 supervisor and the principal. He's assisted by the
2 STA. But if your plan now when you've left the
3 main control room is that the STA is going to go
4 off and do something else, like he's going to be
5 like a field operator and do things then that shift
6 supervisor no longer has backup, or another set of
7 hands, or someone else to communicate with people.

8 And then because of the nature of main
9 control room abandonment strategies there may be
10 many people out in the field, or more people out in
11 the field, field operators doing different things,
12 and their actions might need to be coordinated.
13 There will probably be some kind of communication
14 required. And this is all an increased workload.

15 So, the plan needs to address these
16 kinds of changes. We haven't made any specific
17 recommendations because every plant is going to be
18 different, but those are the kinds of things that
19 need to be addressed.

20 Similar kind of approach is taken in
21 our guidance with regard to communications. Again,
22 they have to have a clear plan for communications
23 which addresses, again, the fact that there might
24 be more communications.

25 And they also need to have equipment to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 be able to perform these communications. I've seen
2 everything from, okay, we've got to take the radios
3 with us when we leave the control room to here's a
4 locker with some stuff in it that's supposed to be
5 working and so on and so forth. So that needs to
6 be all laid out and understood ahead of time. So
7 those are the two new criteria.

8 And that's all we're going to talk
9 about. We do have some backup slides if you want
10 to talk about some of the other aspects of
11 feasibility assessment. But that's all I was going
12 to talk about now unless you had any questions.

13 CHAIRMAN STETKAR: I think some of the
14 comments will come up when we get into the
15 timelines of some of those things.

16 MS. COOPER: Okay. All right. Well,
17 then we'll go to timelines.

18 MS. COLLINS: Speaking of timelines,
19 that's a good segue-way from feasibility because as
20 we've learned more and more so much of the
21 evaluation of feasibility in all our fire PRAs and
22 especially MCRA has to do with timing.

23 So, 1921 for fire PRA established how
24 crucial it is to evaluate a timeline for individual
25 human failure events. And that guidance still

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 applies from the individual HFE standpoint.

2 But what we found with main control
3 room abandonment, the timing is even more critical
4 and particularly when we're talking about scenario-
5 specific timelines.

6 So it's not just the individual
7 performance anymore, it's a group of operators
8 working together to resolve a very drastic
9 situation.

10 And as you mentioned, John Stetkar,
11 earlier it's important for us to evaluate this
12 timing from respect of -- the same origin. That
13 the T equals zero is the start of the fire.

14 So we're integrating various timing
15 sources together into a single timeline that begin
16 with fire progression. You know, how does the fire
17 start and progress, and what are you accounting for
18 suppression, and what are you accounting for damage
19 states.

20 Then we're also looking at the accident
21 progression, the thermal hydraulics in terms of how
22 would we normally evaluate a particular accident
23 condition, and when are you losing equipment.

24 And in this case we're also looking at
25 the procedure progression for main control room

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 abandonment and the operator response. Who is
2 doing what and where, and how much time did they
3 need to do that individually and especially
4 collectively.

5 I think one of the key things that this
6 document provides is the notion and the guidance
7 for these scenario-specific timelines, and the
8 correlated actions that are happening amongst a
9 group of operators.

10 Part of that is also the accounting for
11 command and control. A shift supervisor may be
12 stationed at a remote shutdown panel or wherever he
13 would be reporting to and then coordinating the
14 tasks between the various operators. So if there
15 is timing related to that that needs to be
16 addressed as well.

17 The next slide shows an example of --
18 we really feel that it's very important to do this
19 visually. And we recommend that the analysts put
20 together these actual visual timelines.

21 I know it's something we've evolved
22 over time in HRA, but from the standpoint of main
23 control room abandonment it really becomes
24 important because you're not just dealing with a
25 single operator, you're dealing with many.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And this is very simplified, but in our
2 document we show integration of a variety of
3 different operators. And we're even starting to
4 work on a more complex example if we can to show
5 how these different operators match up on a similar
6 timeline, and how that all progresses.

7 CHAIRMAN STETKAR: And I think you've
8 heard from us these are wonderful. They're great
9 for communicating with analysts who may not -- may
10 get too focused on what their job is rather than
11 understanding the whole scenario.

12 And they're wonderful for communicating
13 with people in plants because it allows you to
14 place things on a scale of things that they
15 understand.

16 And it's why I said earlier this notion
17 of suppose the cue for my action pops up in the
18 middle of that, what you've indicated is phase 1.
19 How does that affect where those arbitrary vertical
20 lines are on this drawing, and what decisions might
21 be made. So these graphics are really good for
22 communication.

23 MS. COLLINS: Even as an analyst
24 developing this, you may think that everything fits
25 well and is totally feasible, but then when you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 begin to add more and more let's say especially
2 into phase 3 when you have a lot of very
3 complicated actions it lets you know that, oh, I'm
4 running out of time here, and I have an issue, and
5 it's something I need to bring back to the plant
6 and discuss.

7 CHAIRMAN STETKAR: Erin, why don't you
8 finish your discussion of these phases. Leave the
9 graphic here though while you discuss the next
10 slide because we can read words. Because I want to
11 come back to this with a couple of questions.

12 MS. COLLINS: Okay. No, that's a very
13 good idea because it is harder to bounce back and
14 forth.

15 So, phase 1 is essentially the actions
16 or the mindset that is involved before you make
17 that decision to abandon. So, you're starting from
18 T-0 is the start of the fire. And at this point
19 the operators are getting cues, and they're getting
20 indications or losing indications and losing
21 systems. It's becoming clearer and clearer that
22 they have an extremely serious situation here.

23 They will probably be having somebody -
24 - they have fire alarms going off that indicate
25 where the fire is occurring if it's not occurring

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in the control room itself.

2 And they may even have somebody sent
3 down there to verify how severe the fire is. And
4 so that's part of the whole pre-decision process.

5 Then you get to phase 2 where you say
6 here is the actual timing involved in the decision
7 to abandon. So you have all this input information
8 but now it's the decision process on the part of
9 whoever the person is in control then conferring
10 with the crew as much as they can and saying we
11 have lost a significant amount of equipment. We've
12 lost a significant amount of instrumentation. How
13 do we make that decision that leaving the control
14 room where we feel comfortable is the right thing
15 to do and going to whatever alternatives we have.
16 So that's our phase 2.

17 At the end of phase 2 we presume the
18 decision to abandon has been made, and now you're
19 moving command and control outside the main control
20 room to wherever the station is.

21 And then you're sending most likely
22 individual operators out. Sometimes that happens
23 with a procedure where you have individual
24 attachments for various tasks and they're heading
25 out into the plant to take these actions.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And at the end of phase 3 we presume
2 that you have completed those particular actions
3 and you're in a safe and stable condition.

4 This just helps us to stage the timing
5 process more clearly so that we understand what's
6 happening when.

7 But obviously the goal is you need to
8 complete everything within this time frame. So you
9 need to be mindful of what's taking up more or less
10 time and might lead you into a circumstance where
11 you have feasibility issues.

12 So I don't know if that goes through --
13 you had particular questions.

14 CHAIRMAN STETKAR: That was the
15 introduction that you needed to get through before
16 I could ask the questions.

17 A couple of things. Just leave the
18 graphic up there because I don't think that any of
19 the other slides discuss this. And tell me that
20 they do and I'll wait.

21 When you talk about phase 3, and this
22 again is more, as I read the whole report beginning
23 to end, you talk about in phase 3 there are
24 execution actions. It's given that term, execution
25 actions.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MS. COLLINS: Correct.

2 CHAIRMAN STETKAR: And as I read
3 through the report I sometimes get confused what
4 you mean by that.

5 And in particular there are statements
6 in the report that say -- let me find one.
7 Execution actions that follow MCR abandonment will
8 not include cognitive evaluations unless a
9 procedure indicates that some diagnosis is
10 involved, e.g., if/then statements are used in the
11 procedure.

12 Well, other places you say, well yes,
13 phase 3 can certainly include cognition.

14 Now, why is that important? Because
15 other places you say I can -- it seems to say that
16 I can do a feasibility assessment for pick up the
17 cup. And I have how long is required to pick up
18 the cup.

19 And I have a different feasibility
20 assessment for walk to the door. And I can do
21 that.

22 And now if I must pick up the cup and
23 walk to the door I can take those bits and pieces
24 and put them together.

25 I'm a little bit concerned about that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And I got the implication from some of the
2 discussion because you can say, well, I can take a
3 collection of these things and then somehow fit
4 them together in my phase 3 because they're simply
5 execution. They're what I always talked about, the
6 push a button, eat a banana.

7 And it doesn't seem to -- it seems to
8 strongly downplay the notion that once I leave the
9 main control room there still might be a heck of a
10 lot of cognition left.

11 So, just take that as a comment.
12 Because again, I was sensitive to it. And
13 different places as I read in the report the kind
14 of guidance for how to treat those phase 3 actions
15 were more I have a box full of different things,
16 and oh yes, well, this particular recovery -- bad
17 term because the next comment will be on that word
18 -- this particular response requires one of these,
19 and one of those, and two of these other things
20 because it's turn a crank on a valve.

21 And so I can put those things together
22 as if they were completely independent and they
23 didn't care about the whole context. So that's
24 just a caution. Maybe I was too sensitive to it.

25 The other thing, this is a little bit

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 perhaps more important. If I now look -- and you
2 don't have it here, but I'll point you to figure 7-
3 3 in the report.

4 The report does a good job about saying
5 the way you back out the time available for phase 2
6 is by running to the end to see how much total time
7 is available, looking at how much time is required
8 to implement phase 3 and then figure out what that
9 little middle slot is.

10 And I thought that conceptually it did
11 that very well. How do you do that in practice?
12 That's a different thing. But conceptually it did
13 that I thought quite well with one exception.

14 And well, the exception is that the
15 report uses this term recovery actions. And it's
16 used both in the context of phase 3. It's also
17 used throughout the report as if they are separate
18 things.

19 And to me that's a relic of Swain and
20 Guttman about I have a basic event for the basic
21 action to push a button, eat a banana, and then I
22 have a different basic event that I multiply it by
23 -- because my friend over here said that I pushed a
24 button and I picked up a grape.

25 And I'm not sure that the current

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 construct of understanding human performance is
2 that discrete.

3 And even if it is you do make the
4 notion that, well, a particular human reliability
5 analyst might decide to combine that in the
6 definition of a particular HFE and another analyst
7 might not.

8 Well, let's not do that. The reason I
9 bring it up in the context of the timeline is that
10 figure 7-3 says that at the tail end of what this
11 graphic shows as phase 3 I somehow need to allocate
12 a time available for recovery of phase 3 actions.

13 And in the figure it says 10 minutes is
14 the time available for recovery of the phase 3
15 actions. That now constrains me because at the end
16 I've thrown that arbitrary time 10 minutes in there
17 that I'm somehow going to assign some number to
18 that then has an implication about the whole
19 scenario progression in real time.

20 And that bothers me. I mean, that
21 bothers me more than this notion of defining a
22 basic event for recovery.

23 Because now you're talking about
24 artificially constraining a scenario timeline that
25 you're using for communications with HRA analysts,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 with people who are developing event trees and
2 fault trees, and with operators personnel by some
3 sort of arbitrary notion of what this recovery
4 thing is.

5 So I'd recommend you get rid of that.
6 Just make the development of the timeline the
7 development of a timeline. If you're screaming
8 toward the brick wall, the brick wall doesn't move
9 back 3 inches or ahead 3 inches so that you have
10 extra time to pump the brakes one more time, you
11 know.

12 Just that's the end. Thermal
13 hydraulics. The steam generators are dry. The
14 core is on the floor. Whatever it is.

15 MS. COOPER: That is a very good point,
16 yes.

17 CHAIRMAN STETKAR: And that notion of
18 recovery actions kind of creeps in here and there
19 throughout. So be a little sensitive to that.
20 That's my recommendation.

21 MS. COOPER: We would ordinarily scrub
22 that because we have already in 1921 five different
23 definitions of recovery. This is not the right one
24 anyway. This is different.

25 CHAIRMAN STETKAR: Yes, but I mean here

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 -- this is different and there's explicit guidance
2 about how I ought to think about developing this
3 simple graphic here that says I need to somehow put
4 some mushy thing at the end.

5 MS. COOPER: Thank you. Good point.

6 CHAIRMAN STETKAR: You're going to
7 switch to PSFs now, right? Any other -- because
8 timelines and feasibility are important. If
9 anybody else has things on timelines and
10 feasibility. Five seconds of silence.

11 MS. HENDRICKSON: Okay. Let's go onto
12 the PSFs. So with the PSFs we really tried to stay
13 consistent with --

14 CHAIRMAN STETKAR: Okay, I'm the
15 microphone police.

16 MS. HENDRICKSON: Thank you. So, with
17 the performance shaping factors we really tried to
18 stay consistent with 1921. We don't disagree with
19 anything that really 1921 says. So that's where we
20 started.

21 Now, from that though the realization
22 that the main control room abandonment scenarios
23 really go to a whole different level.

24 And one of the big things we focus on
25 is the command and control, this meta PSF that we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 define.

2 But the performance shaping factors you
3 see listed there primarily came from 1921 as a
4 starting point.

5 Then from that we look at the
6 experience of the analysts on the team as well as
7 the operator and trainer interviews that we
8 conducted to see what are those little catches that
9 are then going to take these performance shaping
10 factors to a different level. What are the other
11 issues that are going to start tripping people up.

12 And so on the discussion primarily in
13 this chapter it is not just a rehash of what 1921
14 said. It's the what is going to be specific about
15 leaving the control room, about being out at these
16 local actions, about having distribution of crew
17 that's going to be the issue.

18 One of the things that we really
19 struggled with, and I think this is what really
20 came to the consensus of talking more about the
21 command and control meta PSFs is it's very, very
22 difficult in these situations to try to tease apart
23 what are these influencing factors, and what do you
24 really call complexity versus what's workload
25 versus what's crew dynamics. Because you see such

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 overlap now happening.

2 When they go to abandon the control
3 room, and especially in those plants where they
4 don't have a dedicated remote shutdown panel and
5 they're going to many different local action
6 locations you now have the person who is in charge
7 or trying to lead the command have to communicate
8 over -- not face to face, over different
9 communication lines.

10 Also having to have information
11 communicated back to him from the local plants
12 because he may not have all the cues and indicators
13 at his disposal at the remote shutdown panel that
14 he's standing at. And so the communications has
15 taken a whole new level of entanglement.

16 But that then also impacts crew
17 dynamics as we've got all this additional
18 communications going on. The different reliance on
19 folks that have happened which then in turn impacts
20 complexity.

21 So you kind of see this growing web
22 going up.

23 And Susan, if you would, go to the next
24 slide because it's start to introduce.

25 That growing complexity, the overlap of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 all of them I think really points to the need of
2 having that command and control as this meta PSF,
3 this kind of overarching one.

4 But other issues that come up when
5 talking about the PSFs and trying to assess what
6 the impact is is the decision to abandon, when
7 they're still in the control room, what's going to
8 impact their actions there.

9 What are the types of motivation as
10 well as actions they're taking, and what are they
11 needing to do. What do they need to be sure to
12 take with them, to grab.

13 Then as they distribute how are they
14 distributing. Where are they going.

15 The shift supervisor who is probably
16 going to still be the person in command, but not
17 necessarily, is he going to have someone else with
18 him at the remote shutdown panel.

19 And so what actions will they need to
20 take. What actions would be local actions within
21 the plant. What information needs to be fed back
22 in that they're not going to be able to gather at
23 the remote shutdown panel.

24 MS. COLLINS: And one of the other --
25 you know, we were talking about human-machine

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 interface at the various locations.

2 We're used to -- Susan had to remind us
3 throughout the project we're used to a standard
4 control room layout and this type of thing.

5 That changes when you go to the remote
6 shutdown panel. It changes then again when you're
7 going to local stations throughout the plant. So
8 that becomes important.

9 CHAIRMAN STETKAR: I think -- and it is
10 important. I caution you don't -- as I said before
11 when you're talking about loss of habitability and
12 6850, that's driven by people who model fires for a
13 living.

14 Don't get too focused on NUREG whatever
15 it is, 0700 about I must have an orange indicator
16 that is 3 inches wide and 6 inches above normal
17 eyesight because people will focus on that and
18 perhaps lose context of the bigger picture.

19 Yes, indeed, if I have something that
20 only looks like a board and I mean a plank with no
21 indications whatsoever that's important. It might
22 not make too much difference whether it meets all
23 of the criteria of NUREG-0700.

24 MS. COLLINS: Exactly. It might not
25 matter --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN STETKAR: You point to that a
2 few times and you've just mentioned it, so.

3 MS. COLLINS: Well, you know, we used
4 to say you need to consider it within the PRA
5 context and what are they evaluating.

6 So, maybe I don't care if it's white
7 letters on a black background versus black letters
8 on a white background, but how that parameter is
9 presented may have a lot to do with how well
10 they're getting that information. So it might be
11 that.

12 CHAIRMAN STETKAR: That's true, but
13 also in the back you have a very good discussion
14 about resource allocation for doing this stuff.

15 And I certainly don't want an analyst
16 spending three hours measuring lettering and doing,
17 you know, is the tag for a particular valve the
18 appropriate color and the appropriate size as
19 compared to, you know.

20 MS. COLLINS: No, no.

21 CHAIRMAN STETKAR: Evaluating perhaps
22 instead of having two bins where they spend a lot
23 of time doing that rather than having six bins that
24 gives me better fidelity for the overall PRA.

25 MS. COOPER: That's a good point. I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 guess we should probably consider adding some more
2 discussion.

3 I mean, one of the --

4 CHAIRMAN STETKAR: It's important to
5 look at.

6 MS. COOPER: -- for us --

7 CHAIRMAN STETKAR: Susan, is your mike
8 on?

9 MS. COOPER: Sorry. One of the things
10 that we thought was important for people to know is
11 that a task analysis probably has been done for
12 actions that are taken in the control room with
13 considering the design, and the layout, and the
14 requirements or guidance given in 0700.

15 That may not be the case for the remote
16 shutdown panel. There is some discussion in 0700
17 about the remote shutdown panel. We followed up
18 with one of the few people I know who did the
19 design reviews following TMI and he said he didn't
20 remember ever looking at one. All the focus was on
21 the control room. So, this is the trust but
22 verify.

23 But your point is well taken. We
24 probably could write something more about what is
25 it that we need to be concerned about for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 operations in this context.

2 CHAIRMAN STETKAR: It's just I saw a
3 few references to it. And again, I'm sensitized to
4 not having analysts spend too much time on one
5 particular issue, especially if it's as
6 prescriptive if you will as 0700. And people like
7 to go measure heights of characters, and colors of
8 panels, and figure out if something makes a factor
9 1.7 difference.

10 MS. COOPER: Understood. Point taken.

11 MS. HENDRICKSON: So, at the end of the
12 PSF chapter there's these two tables. So, what we
13 wanted to do was within this qualitative guidance
14 is give some sort of guidance to the analyst of how
15 exactly can you start to evaluate these PSFs and
16 what are the things that you might look for.

17 This is not an exclusive list and at
18 this point we should probably consider the table
19 still preliminary. But it at least starts them in
20 the idea of -- the first table 8.1 tries to present
21 scenario characteristics that might be particularly
22 relevant. And then what would be the performance
23 shaping factors that might degrade that.

24 And then it also presents what PSFs
25 might actually help to offset it. Not to be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 thought of canceling out, but to be considered as
2 in its entirety as a whole of how it might impact
3 if they have that scenario.

4 CHAIRMAN STETKAR: Just a general
5 comment. I liked 8.2 much better than I liked 8.1.

6 MS. HENDRICKSON: Did you?

7 CHAIRMAN STETKAR: Well, if I'm an
8 analyst I'm going to think of all of those
9 offsetting things anyway.

10 And it always came down to procedures
11 and training anyway. So why have the table. 8.2
12 sort of gave me different things to think about.
13 So that's just a comment.

14 MS. HENDRICKSON: I would say 8.1 kind
15 of feeds more of the researcher's soul, right? It
16 goes from a scenario-specific analogy and then
17 feeds into the PSF.

18 The 8.2 I think probably would be more
19 useful for an analyst because it starts at the PSF
20 level and talks about how would you actually
21 measure it.

22 For example, the procedures and
23 trainers, they do not exist. They do not match
24 situations.

25 CHAIRMAN STETKAR: Again, guidance.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Bigger picture guidance. Anyway, just I liked 8.2
2 better than 8.1. Somebody else might have liked
3 8.1. And that's 8-1, 8-2 I think.

4 MS. HENDRICKSON: Returning to our
5 earlier conversation about NUREG-2114 8.2 is really
6 where you could see influences from that.

7 CHAIRMAN STETKAR: There were things
8 that -- well, I mean, you know, it's good because
9 you would hope that this is not at cross purposes
10 to 2114.

11 MS. HENDRICKSON: But the language, we
12 can pull it out definitely more. But that's where
13 I see the biggest influence from 2114 which is
14 showing the when would this PSF be consequential,
15 which is similar to the -- I can't remember if it's
16 the cognitive mechanisms, or the --

17 CHAIRMAN STETKAR: I always have to go
18 back to the pictures in the appendix.

19 MS. HENDRICKSON: Okay, so that's the
20 primary chapter on PSFs. And the PSFs that were
21 listed there. Let me ask first if there's any
22 questions before I go into the command and control
23 appendix. Okay, let's go onto this one.

24 So, command and control is currently
25 written as an appendix because we weren't trying to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 offer explicit guidance. It was more to make
2 people aware of it and really kind of start the
3 discussion.

4 We call it this meta PSF because it is
5 kind of this overarching. It's an overarching
6 factor that's impacted by many of the other ones
7 such as complexity, such as crew dynamics, and such
8 as communication.

9 And how does that really change when
10 we're seeing what we're used to within the control
11 room, and they're having face-to-face
12 conversations. They're in a relatively quiet
13 environment. Everyone is very familiar with the
14 jobs they need to know. That's what they're most
15 highly trained on.

16 And then switching then to the
17 abandonment situation where they're now distributed
18 across the plant. And how does that really change
19 the complexity as well as the dynamics between
20 them. Let's go onto the next one.

21 So, understanding the command and
22 control structure is key. The appendix first looks
23 at guidance on how that structure might be defined
24 and how it can be evaluated.

25 At this point it's mainly based on what

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Emily Roth, and Ali Mosleh and others have come up
2 with which isn't inconsistent with 2114, but the
3 language is a little different. So we can clean
4 that up definitely.

5 And then it goes through some of the
6 situation factors for command and control which --
7 actually, decision to abandon and the situational
8 awareness, the detecting, noticing, and all that
9 are the macrocognitive phases they'd be going
10 through.

11 CHAIRMAN STETKAR: That's why I say I
12 think you can rewrite it. It doesn't require
13 jacking up the roof and putting a new house under
14 it.

15 MS. HENDRICKSON: It's making the
16 language consistent. We can clean it up.

17 CHAIRMAN STETKAR: Right?

18 MS. HENDRICKSON: Yes. Yes. So, the
19 detecting and noticing are the macrocognitive
20 phases.

21 The situational factors drills in a
22 little more quickly. It kind of gets right into
23 the PIFs.

24 And so I think you're absolutely right
25 here that we can show that connection more of going

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 through the cognitive mechanisms and all, and show
2 how we got right to it.

3 But it goes through the situational
4 factors such as decision to abandon, what are the
5 performance shaping factors in kind of entirety and
6 in that kind of complex web that would impact it.

7 Oh, and then I forgot also the
8 reference to ATHEANA. So it's kind of that
9 macrocognitive work that we've looked at previously
10 as well as the ATHEANA and experience of teams and
11 operators and all.

12 So that's it for command and control
13 and then we're going to move on. So now is the
14 time if you all had any additional questions on
15 either PSF or command and control.

16 CHAIRMAN STETKAR: This is typical.
17 Five seconds of silence interprets move.

18 MS. COLLINS: As we mentioned way early
19 on in our discussions one of the wonderful things
20 about going through all this detail is not only to
21 provide input to the PRA analysts and the HRA
22 analysts themselves, but to provide feedback to the
23 operations staff so that we can have a genuine
24 impact on the improvement of how MCRA is viewed,
25 reviewed, trained, prepared for, et cetera.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But as part of that we need to as
2 analysts, and we hope that in our guideline
3 document we're providing some perspectives to
4 operations so that we can open their minds and eyes
5 to how you need to view this and make it a more
6 reliable, feasible process.

7 So, the key areas that we need to look
8 at are the PRA perspective that we can give to
9 them. They have an understandable reluctance to
10 leave the main control room even when things go
11 quite bad.

12 But if we can provide them that PRA
13 perspective and say that however rare it might be
14 you might actually achieve a fire of a severity
15 where that is necessary, and you're going to have
16 significant effects to instrumentation and
17 equipment availability and reliability such that
18 being in the main control room is not effective
19 anymore.

20 So, we often have a credibility problem
21 when we go in and discuss these things because, as
22 Susan said earlier, it's hard for them to visualize
23 it can happen.

24 So again, even though it's a rare event
25 from the PRA standpoint it is something we have to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 imbue them with this idea of it can happen. There
2 are these situations. So it's best to be prepared
3 for them and how can we help you be prepared for
4 them.

5 CHAIRMAN STETKAR: Let me ask you,
6 Erin. This is -- you know, miraculously we have
7 more than enough time to have these discussions.

8 As I read through this I oftentimes got
9 confused about what we are evaluating in the PRA
10 and when we are evaluating that. And let me
11 elaborate a little bit more.

12 There's one notion that says I should
13 do a risk assessment of the as-built as-operated
14 plant today which means I go in and I try to
15 understand as best as possible given the current
16 procedures, training, culture if you want to use
17 that term, how people would or would not respond
18 during a particular scenario. And I develop my
19 risk assessment based on that.

20 And the conclusion of that risk
21 assessment might be it's okay. It might be that
22 some improvement is needed. And some improvement
23 might be anywhere from fix the paper, to fix the
24 training, to fix the people, to fix the plant.

25 When I started to read some of the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 discussions of the interviews which is what we're
2 talking about here I got confused because they seem
3 to be telling me as an analyst to tell the
4 operators how they ought to fix it before I analyze
5 it.

6 And that starts to bother me because
7 then I'm not sure what we're analyzing.

8 And in particular you mention that we
9 as PRA practitioners have to convince those stupid
10 operators about how important these things are that
11 they don't believe in.

12 And once they understand that, once
13 they understand that if they don't know this
14 particular set of information, well then obviously
15 they must leave.

16 So now I've biased the as-built as-
17 operated plant by educating, hey wait a minute,
18 wait a minute, no. Don't think about that other
19 stuff that you've been trained to think about.
20 Think about this stuff that this little event tree,
21 fault tree nonsense has determined is important.

22 Because see me as an operator, I might
23 be more concerned about the fact that I've lost all
24 of the indications on the secondary side of the
25 plant, that I don't know what's happening out there

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 at all.

2 And those panels are on fire. It might
3 even be the fire protection panel. Maybe I've got
4 perfect displays of what the little stuff that's
5 been modeled in my event tree/fault tree thing is
6 that I as a PRA analyst know is the only thing in
7 the world.

8 And I might decide to bail out of the
9 control room because I don't feel comfortable with
10 the fact that I don't know anything that's going on
11 on that other unimportant side of the plant.

12 So, now you're telling me that no, no,
13 no, you can ignore that because the PRA doesn't
14 care about that stuff.

15 And look, in this other scenario when
16 you have damage to this and only this stuff that's
17 important so focus on this. That bothers me --

18 MS. COLLINS: -- that sense then I
19 agree with you.

20 CHAIRMAN STETKAR: I did, in a couple
21 of places where you discuss exactly where you were
22 starting to discuss in the context of this slide
23 that we've seen a reluctance on the part of the
24 operators to believe these PRA scenarios.

25 So we as PRA practitioners need to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 educate those operators on how important and what
2 they should really focus on in the construct of
3 this particular PRA scenario.

4 And that's not at least modeling going
5 in the as-built as-operated plant.

6 We had experience in PRA where people
7 have fixed procedures, and people, and plants, and
8 hardware, and things, but only after we've been
9 able to show them that we did the best job possible
10 to model the currently as-built as-operated plant.

11 And look, these scenarios are risk
12 significant. So now decision-makers, managers who
13 have money and resources need to make a decision of
14 do I fix the hardware, do I fix the people, do I
15 fix the procedures.

16 MS. COLLINS: And maybe it is as you
17 said at the very beginning when does this all
18 happen.

19 And typically we do tend to do the main
20 control room abandonment toward the later stages
21 when we have gone through a lot of the fire PRA
22 assessment. Then we're evaluating this and we do
23 have that knowledge about what the risk significant
24 sequences are.

25 But you're right. I mean, obviously --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN STETKAR: You know that. I
2 don't know that as an operator. All I know is what
3 I'm trained about. And I understand how the plant
4 works. And I understand critical safety functions.
5 I understand what's been drummed into my head for
6 the last 15 years of my life, my procedures, all of
7 that kind of stuff.

8 There's just a bit of a concern that
9 we're trying to force attention in an area where we
10 want to have that attention from our particular PRA
11 focus that might not necessarily be an unbiased
12 objective assessment of the currently as-built as-
13 operated plant.

14 I have experience in doing this. Not
15 in main control room abandonment, it was for ATWS
16 procedures. I was doing -- not in the United
17 States again.

18 We did an assessment and it showed ATWS
19 scenarios were not nearly as unimportant at a
20 particular plant as everybody knows they are.

21 And it was because the operators, you
22 know, the operator performance during ATWS came out
23 to be important.

24 And the plant staff came back and said
25 well, this is absurd. Obviously our operators will

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 perform.

2 I said gee, you know, we talked to the
3 operators. They said they don't have procedures
4 for ATWS. You never do any training on ATWS. They
5 don't even believe an ATWS is going to occur. So
6 how would you expect them to perform as 1 failure
7 in 10,000 ATWS events?

8 And they -- oh yes, maybe we ought to
9 write some ATWS procedures.

10 Now, had we told them that ATWS is
11 going to be the most important thing in the PRA if
12 the operators always fail they might have become
13 awfully creative now in my interviews about yes,
14 well, we have these other panels. We can shut down
15 from over here. We can trip the motor generator
16 sets. There's a bunch of things we could do --
17 would certainly bias their feedback to me.

18 MS. COLLINS: No, you're right. We may
19 start out with this slide and say oh, the first
20 thing we do is we impose a PRA perspective on them.

21 From my standpoint that's really not
22 what we do. We start out saying these guys have
23 the nuggets of gold we understand in terms of how
24 are they going to respond.

25 But then once we've discussed with

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 them, and once we find out where the pitfalls are,
2 if we know from a PRA perspective having gone
3 through the analysis that main control room
4 abandonment is risk significant then it's incumbent
5 on us to provide that perspective and then say
6 let's work together to find the remedy to your
7 MCRA.

8 CHAIRMAN STETKAR: And that's very
9 important. All I'm saying is as you read through
10 the report it's something that I got sensitized to
11 in primarily the discussions of this interviewing
12 the operators and providing feedback.

13 Are we trying to inadvertently provide
14 feedback too early such that we're biasing that
15 interview process before we understand clearly how
16 they would respond today.

17 MS. COLLINS: Yes, I see what you mean.
18 No, that's a very good point because we do try very
19 hard in our interview process to go in with a --
20 not totally clean slate. We've done our homework
21 and understand what the procedures are.

22 But you're right, we shouldn't come
23 with our hammer first before we have their
24 information.

25 CHAIRMAN STETKAR: You know, my notes

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 on Appendix C that discusses a lot of this stuff is
2 -- it's really good.

3 And the only exception is I had one
4 paragraph that I pulled out in section C.3.1 that
5 talks about this extensive discussion to break
6 through the paradigm, direct focus on critical
7 actions, yada yada yada.

8 MS. COLLINS: Yes.

9 CHAIRMAN STETKAR: And there was a
10 section in another part of the report. But if I've
11 sensitized you to it you can then read through the
12 report.

13 MS. COLLINS: Yes. At this point I'll
14 look at it again with that mindset.

15 CHAIRMAN STETKAR: Just look at it from
16 that perspective.

17 MS. COLLINS: Yes.

18 MS. COOPER: I don't remember the
19 specific discussion, but I do know that one of the
20 things that we wanted to capture in our discussions
21 of feedback to operations is that when there is a
22 result and we see that, for example, there isn't
23 enough time given the number of actions they have
24 people performing, then the notion of PRA insights,
25 and which actions are critical for the PRA versus

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 others, that's when the conversation with
2 operations begins, and the working together starts,
3 and you try to figure out if there's a way to
4 shorten the amount of time required up front so you
5 can meet the time available deadline.

6 CHAIRMAN STETKAR: I think that
7 certainly is important. I think that's in theory
8 why we're doing risk assessment, to improve plant
9 response.

10 MS. COOPER: Absolutely.

11 CHAIRMAN STETKAR: The operators on the
12 other hand, there might be perfectly good reasons
13 why they're spending attention to things that from
14 a PRA perspective we don't even think about.

15 And it's why I always in fire analyses
16 say that when you collect the information going in,
17 you have a good section in there about collecting
18 information.

19 I want to know what's going on out in
20 all of those panels, in the control room that we
21 don't model in the PRA.

22 And people will say well, they're
23 unimportant because they don't show up in my PRA
24 model. They're not an aux feedwater pump. They're
25 not a high-pressure injection. They're heater

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 drain pumps for crying out loud. They're turbine
2 lube oil systems for crying out loud and it's not a
3 fire in the turbine.

4 Yes, maybe I care as an operator who
5 runs this power plant day in and day out in my life
6 that I don't know whether or not the turbine is
7 coasting down and I don't have any lube oil. I
8 don't know.

9 Maybe I'm going to wipe out the whole
10 freaking turbine. And that might distract me, for
11 example. And we have actual operating experience
12 where people have been distracted by that sort of
13 stuff.

14 So that there may be certain reasons
15 why they're focusing in a fire scenario on things
16 that we don't put in our little fault trees and
17 event trees at all.

18 MS. COLLINS: I think even, Susan, if
19 you can go to the next slide, we talk in this
20 second grouping about procedure and training
21 updates.

22 And the final bullet talks about
23 consolidation or reordering your procedure steps
24 that might allow them to take certain non-risk
25 significant actions, but not at the time when we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 need them to for the PRA.

2 And so you're right, we need to be very
3 sensitive to that though in terms of why are they
4 taking those actions and what comfort does it give
5 them.

6 CHAIRMAN STETKAR: You do because
7 seizing the main turbine might not be what I want
8 to do when it's coasting down.

9 If I can take care of that in 2 minutes
10 at least give me assurance that it's not going to
11 seize compared to having a time window of 45
12 minutes to take care of the other thing.

13 MS. COLLINS: Right.

14 CHAIRMAN STETKAR: Because if I focus
15 attention always on the thing that I have 45
16 minutes for, and I seize the main turbine the day
17 might get worse for me.

18 MS. COLLINS: So it's more of a --
19 we've done the evaluation and we look at it from
20 that timeline perspective and we see that there is
21 a feasibility issue here.

22 So again, we would go back and say you
23 have a variety of steps in here. Why are you
24 performing these? What's the goal of this? And
25 that's the perspective.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN STETKAR: That's the important
2 part approach, not my God, you have to focus on
3 these things because our little PRA says you have
4 to focus on these things.

5 MS. COLLINS: It's more of a we need to
6 understand why you're taking these steps because --
7 and we would just like to let you know that from
8 our perspective this can compromise the amount of
9 time you have to focus on the goal of going to safe
10 and stable shutdown.

11 So if we understand better where we
12 might make a compromise here so that you can get
13 the ultimate goal done, but you can also have these
14 pieces of equipment, or this information that you
15 need that you consider to be important, how can we
16 work that out together. So, yes.

17 But it is important to not have that
18 heavy-handed approach up front.

19 And then similarly sometimes we find
20 from a feasibility standpoint that you're really at
21 a time crunch factor. And the only way to really
22 remedy that might be to have a physical plant mod.

23 Now, that's never a popular thing is to
24 say let's spend a whole lot of money on a plant
25 mod.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN STETKAR: I was going to say
2 oh my God, a capital expenditure?

3 MS. COLLINS: Well, and that's usually
4 -- but, again from the PRA, from the standpoint we
5 can show them that we really can't achieve this
6 goal without having something change. So, can we
7 do it by a procedure or training mod? Perhaps we
8 can.

9 But if we really can't maybe we have to
10 recommend a plant mod and see how that flies.

11 These are the type of ways that we
12 would start out by building our timeline. We see
13 how things fit. We see how they don't fit. And
14 then if we have difficulties in terms of that time
15 crunch, or functional crunch, then we need to
16 discuss with operations how we can meet together to
17 accomplish that overall goal, and what does that
18 take.

19 MS. COOPER: From my perspective I
20 think it's not only important to discuss these
21 kinds of things. Like you said, this is what PRA
22 and HRA is supposed to do.

23 But that it has been done in this
24 context. And remembering even back to when we were
25 developing 1921 I can recall feedback from various

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 members of our team who said they were sitting
2 around a table having these unpopular discussions
3 with operations.

4 And they're all pointing to the HRA
5 analyst and saying fix your number. And it's like
6 what do you want me to do?

7 So, I think putting this down that it
8 can be done, it has been done, can be helpful
9 support to the HRA analyst who might find
10 themselves in that kind of situation.

11 CHAIRMAN STETKAR: Again, all of this
12 comes back though because this process of necessity
13 is going to rely heavily on the understanding of
14 the plant and discussions with operators. Because
15 you by and large can't pick up a rote procedure and
16 understand how it would be done.

17 The guidance -- in places it does say
18 that the people doing the interviews have to
19 develop an operations perspective.

20 You can't go in saying I'm the PRA
21 analyst and you have to understand what I do. And
22 this is why you need to deal with me.

23 You can't say I'm an HRA analyst and I
24 understand how you will fail.

25 You have to say I want to understand

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 how the plant works and I understand a lot about
2 plants.

3 MS. COOPER: Agreed.

4 CHAIRMAN STETKAR: So, make sure the
5 guidance is written, you know, because
6 practitioners are going to pick this up and you've
7 even got a script for crying out loud in Appendix
8 C.

9 Hello, my name is Ron Burgundy and I'm
10 not wearing pants.

11 (Laughter)

12 MS. COLLINS: No, you're right, I guess
13 from that perspective we have not emphasized well
14 enough what a team effort we consider this to be,
15 and how important it is for the HRA person to learn
16 more than we're imposing.

17 MEMBER BLEY: Not that I don't agree
18 with almost everything you've said, but having a
19 script and some guidance on how to interview people
20 is long, long, long overdue. I'm glad you took a
21 shot at it.

22 CHAIRMAN STETKAR: In fact, the script
23 isn't bad. It's just -- the point I'm trying to
24 make is the less you talk about PRA and HRA the
25 more credibility you will have in that interview

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 process.

2 The more you talk about how plants
3 work, and let them tell you what they will do and
4 why they will do it the better the whole process.

5 MS. COLLINS: My perspective usually is
6 I have the script to kind of remind me while I'm
7 going through the process of what I need to
8 accomplish.

9 But I let them talk as much as possible
10 and I write as much as possible and have some other
11 team members there so we all capture it because I'm
12 there to learn from them.

13 And the script is to keep me focused a
14 bit to make sure I've covered all my bases. But,
15 yes.

16 CHAIRMAN STETKAR: I'm going to switch
17 gears here and get to a slide that says expected
18 usage which starts to sound like closeout stuff.

19 So, before we get to closeout one area
20 that I noted that is addressed minimally is how do
21 you account for uncertainty in timing?

22 There are statements in there that say
23 things like, well, we need to develop -- for the
24 feasibility assessment we need to use estimates of
25 mean values for time available and time required,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 let's say.

2 And I think that's reasonable for a
3 feasibility assessment because that's expected
4 response. So on average we would expect it to be
5 feasible.

6 On the other hand there are also
7 correct statements made that there can be I would
8 think very large uncertainties in some of these
9 time estimates.

10 The guidance doesn't seem -- other than
11 saying that maybe I ought to interview more than
12 one operator to look for variability in their
13 responses it doesn't seem to tell me that I need to
14 look for uncertainties. So that when I interview
15 an operator don't ask them how long do you think it
16 will take to do this, or don't count the number of
17 steps to the door under average locomotion.

18 That I go in as an interviewer because
19 I'm probably only going to have one shot at doing
20 this and ask everybody for a range. And perhaps go
21 in asking them first for a range so that I get some
22 sense of could it be a variability from 30 seconds
23 to an hour and a half to get to the door, and then
24 what's, well, the best estimate might be a minute
25 and a half.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 There's none of that sense. Because
2 then I don't know how the uncertainty will be used.

3 There's discussions that says well, to
4 account for uncertainty I can do sensitivity
5 analyses. Well okay, the ACRS is on record I think
6 saying that sensitivity analyses are a poor
7 surrogate for uncertainty evaluation.

8 And indeed there's guidance now, I'll
9 go back to the generic IDEAS methodology about how
10 one can explicitly account for uncertainty at least
11 in the sense of timing as part of the
12 quantification such that if there's a 15 percent
13 probability that the time required will exceed the
14 time available based on the uncertainty in those
15 two parameters the best I can do is 85 percent
16 success. And there might be some small fraction of
17 that that I don't succeed based on, performance
18 shaping factors and all of that other stuff.

19 So, I think you need to think a lot
20 better at how uncertainty will be treated in this
21 whole process from the perspective of --
22 feasibility, as I say, it's okay to use mean values
23 I think for feasibility. Others might have
24 different opinions.

25 But if the purpose of the interview

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 process and the walkdowns, and the talkthroughs,
2 and all of that sort of stuff is to develop a sense
3 of not just is it feasible, but what might be the
4 variability or the uncertainty in those estimates,
5 make sure the analysts go in with that perspective.
6 And that they know why they're going in with that
7 perspective because indeed some of that measure of
8 uncertainty will be used later in the
9 quantification process. It's not just something as
10 an adjunct piece of information that you might do
11 some sort of parametric sensitivity study on.

12 MS. COOPER: That's a good point. We
13 do have some discussion in 1921 about building
14 those ranges. But for this particular context
15 where the experience of the operator may not be
16 such that you can -- he knows or has thought it
17 through to be able to develop it, be able to tease
18 that out.

19 CHAIRMAN STETKAR: And here again is
20 where the generic IDEAS methodology has built on
21 some of that guidance from 1921 and gone on further
22 to say that indeed there's a construct of using
23 those uncertainties in the actual quantification
24 process which did not exist in 1921.

25 MS. COOPER: The DELORES fire, I think

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 I got that right, the incipient fire detector
2 report that just had a public workshop last week.
3 The HRA on that which I did, and it's been updated
4 since the draft significantly. I know, Dennis, we
5 talked about the draft some time ago, but it's been
6 updated rather substantially.

7 That does look at a probability
8 distribution of time available and actually uses
9 sample points to do the HRA. And there are
10 partially feasible cases. So that's been done in
11 that report. Probably not the same way as it is in
12 IDEAS, but we did do that.

13 CHAIRMAN STETKAR: And as I said, it's
14 important going in because this is -- I read this,
15 it's guidance to a practitioner. And if it's
16 guidance to a practitioner that says, well, I need
17 as a practitioner now to be sensitive to the notion
18 of uncertainty in timing.

19 (A) I need to be sensitive to it. Why
20 is it I as a practitioner need to be sensitive to
21 it? Because it will be used later.

22 Now I don't need to telegraph that to
23 the operators that my God, be careful to make these
24 ranges small because if you don't they might
25 reflect on your performance.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But I need to be able to communicate
2 the fact that I'm looking for a range of values
3 based on their experience.

4 Especially as I get into these notions
5 where I'm trying to select something that might be
6 representative of a bin of things.

7 Because when I'm selecting those bins
8 there might be -- I might need to differentiate
9 between bins because of broader uncertainties in
10 usually not time available, but maybe -- time
11 available versus response time rather than other
12 criteria that I'm using to do that binning
13 algorithm.

14 MS. COLLINS: I think we kind of felt
15 oh, you know, when we're talking about uncertainty
16 it tends to slide more over into the quantification
17 aspect.

18 But there is this qualitative aspect
19 obviously of saying once you're interviewing people
20 and you're in that mode anyway you can be thinking
21 of trying to tweak the levels of their experience
22 and see what the range might be.

23 CHAIRMAN STETKAR: If you don't get it
24 then you're not going to get it. Who are you going
25 to leave it? You going to leave it to me as an HRA

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 analyst who's never operated a plant, and
2 especially not that plant, to say well, it might be
3 +/- 3 minutes because somebody wrote a report
4 someplace saying that that's a standard deviation
5 on a normal distribution. You know, push a button,
6 eat a banana.

7 MS. COLLINS: Understood. Yes, in one
8 case I was very fortunate even to have a variety of
9 timing from several simulator exercises of the MCRA
10 procedure which was phenomenal. Because then I
11 could see even in the training exercise the point
12 where they would stop and discuss.

13 You actually had many ranges there and
14 I could factor that into the analysis.

15 But if you don't have that type of data
16 you need to extract it carefully when you're doing
17 the interview process. Again, not to bias, but in
18 order to obtain some feeling for their sensitivity
19 for the timing of those various actions.

20 CHAIRMAN STETKAR: Usually there's
21 differences of opinion about how one does that. I
22 personally usually like to go in and say well,
23 here's the scenario. How long do you think it
24 might take you to do this. How quickly might you
25 be able to do it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And then get them to think about what
2 factors would affect both of those bounds. And
3 then try to focus on where the middle point is
4 rather than by saying what's your best estimate of
5 how long it will take you.

6 MS. COOPER: Elicitation approach.

7 MS. COLLINS: Exactly. You're scoping
8 out the upper and lower bounds first and then going
9 to the middle. Yes. That's a point well taken.

10 CHAIRMAN STETKAR: Okay. Any other
11 comments? There are others of us who were
12 interested in uncertainty in timing.

13 MEMBER BLEY: Not on that particular
14 issue.

15 MS. COLLINS: Okay.

16 MEMBER BLEY: But before you go onto
17 the next slide, I just want to whine about two
18 sentences at the end of the report. Section 10.2.

19 It's noted throughout this report MCRA
20 is a unique case of fire HRA. The high degree of
21 interface between PRA, HRA ... necessitate a solid
22 qualitative analysis.

23 Come on. It's true here, but there's a
24 high degree of interface everywhere between PRA and
25 HRA. And this kind of tells people don't think

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 about it anywhere else. So I'm just complaining
2 about the sentiment somebody might get from that.

3 MS. COLLINS: Yes, I see what you're
4 saying. I mean, we want to try to make sure that
5 there's that great correlation throughout in any
6 PRA that you do.

7 But I will say that it's particularly
8 critical here when you're considering -- we had
9 that whole chapter 3 on the modeling and how that
10 has to be an integral part, and you have to think
11 differently and then have --

12 MEMBER BLEY: I've seen PRAs set up
13 with required operator actions that they want to
14 hand off to some poor HRA analyst that don't match
15 the procedures. Because the way they set up their
16 PRA model.

17 The interaction is important
18 everywhere. You get some nonsense in this. It's
19 very important here, I agree.

20 MS. COLLINS: Okay.

21 MS. COOPER: Okay. We can massage
22 that.

23 MEMBER BLEY: Make it three sentences.
24 Say as always, it's important.

25 CHAIRMAN STETKAR: That comes back to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 my earlier whining about the distinction between
2 the PRA analyst and the HRA analyst, and who should
3 read what chapter, despite the fact that everybody
4 might want to read the whole report.

5 MEMBER BLEY: Exactly.

6 MS. COLLINS: All right. So, who do we
7 expect and why do we expect they're going to use
8 this thing anyway?

9 Well, because as we go forth and do
10 various fire PRAs it's become clear that this is a
11 bit of a different beast, and there is the
12 necessity to have particular guidance on main
13 control room abandonment analyses for fire PRA and
14 HRA.

15 And the coordination is crucial as it
16 might be for every aspect of PRA and HRA, but it is
17 quite important here to have good coordination
18 between those two aspects, and make sure everything
19 comes together properly in the big soup.

20 CHAIRMAN STETKAR: Erin, I understand
21 why you might not answer, or why Harry might not
22 answer.

23 In practice why has the staff and EPRI
24 spent a reasonable amount of resources on
25 developing as I said going in, in general pretty

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 good guidance for this particular aspect of fire
2 scenarios.

3 I mean, what's the force and function?
4 Indeed, are main control room abandonment scenarios
5 driving the fire risk for many plants coming out of
6 the NFPA 805 process? Or is this something that
7 we're just trying to make better in fire PRA
8 overall?

9 MS. COLLINS: I think it's a
10 combination. There are cases where it does
11 dominate, and then there are other cases where the
12 explanations for how the analysis was being
13 performed, we were finding that we were getting
14 significant RAIs, you know, requests for additional
15 information. Tell us more about that process.
16 Tell us more about how have you looked at these
17 things.

18 Especially when you're talking about
19 that decision process to abandon the main control
20 room. I think a lot of that motivated it. Ashley?

21 MS. LINDEMAN: No, I completely agree
22 with what you said.

23 MS. COLLINS: Oh, and Harry?

24 CHAIRMAN STETKAR: I'll let Harry.
25 We've not seen any of these things, that's why I'm

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 asking the question.

2 MR. BARRETT: One thing I'd like to
3 point out that I think is somewhat applicable to
4 your whole idea about feedback operations.

5 Several of the plants that have been
6 through very detailed main control room abandonment
7 scenarios also got rid of SISBO.

8 And because of that there was an
9 iterative process to rewrite those procedures. And
10 it was a massive effort. I know V.C. Summer went
11 through quite a bit of effort and so did Ginna.

12 So, this is probably a good poster
13 child for saying this is the right way to do it
14 because in fact you're not going to operators and
15 telling them no, you're not doing it right.

16 You're actually saying we've got to
17 change our philosophy here and we've got a lot of
18 work to do. Let's use the PRA to inform that, work
19 with the operators and have them tell us how they
20 do their job. And it's back and forth.

21 So I think that's key. This has been
22 almost a test case for this, these guys going
23 through this very detailed analysis process.

24 CHAIRMAN STETKAR: I'm glad to hear
25 that people are actually doing that rather than

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 other things.

2 MR. BARRETT: But I would say as far as
3 the across the board on the 805s we've seen main
4 control room abandonment be like in the middle of
5 the pack as far as fire areas.

6 We've seen a couple of them percolate
7 up to very, very high importance. Typically it's
8 cable spreading rooms and switch gear rooms that
9 are the most important.

10 CHAIRMAN STETKAR: That was going to be
11 the second half of my question. You already
12 answered it. So it's mostly the loss of control
13 type things.

14 MR. BARRETT: Yes.

15 CHAIRMAN STETKAR: And that's why the
16 emphasis.

17 MR. BARRETT: Usually the habitability
18 is not a big hitter. There are some that are, but
19 you know.

20 CHAIRMAN STETKAR: Well, it's not a big
21 hitter because it's got to be a pretty darn bad
22 fire to get them out of there according to those
23 discrete criteria in 6850.

24 MS. COLLINS: That's a very good point.
25 I appreciate you mentioned how iterative the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 process has been is that you may start out with a
2 certain set of procedures. And as we learned from
3 the PRA how important this is and what type of
4 guidance needs to be provided, again, factoring it
5 all in.

6 And so we've had to, you know, our
7 analyses have had to keep modifying because we keep
8 learning more, and they change the procedures, and
9 we factor different things in.

10 CHAIRMAN STETKAR: I think it's -- and
11 I hope, and it sounds like from what Harry's saying
12 plants are actually using it productively.

13 I think that the more we can get away
14 from the artificially defined Appendix R, you will
15 not have X, and you will by definition have Y. And
16 therefore you must do Z approach to life. And get
17 something that's much more realistic and that
18 people have confidence in.

19 And is much more flexible in a sense.

20 MR. BARRETT: Yes, and we've seen it
21 the other way with modifications as well. Some
22 plants decided to put modifications in to make some
23 of these actions outside the control room more
24 rapid or easier to do.

25 CHAIRMAN STETKAR: I will spare you.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Just imagine a stout defense of Appendix R has been
2 elicited.

3 MS. COLLINS: So, this pretty much
4 summarizes a lot of the issues that we've gone
5 through in our whole presentation.

6 But we provide expanded guidance for
7 the scenarios of loss of control and how to guide
8 people on providing better guidance in procedures
9 for that decision.

10 We're looking at an explanation of the
11 go or no-go criteria for certain performance
12 shaping factors from the feasibility standpoint
13 that we didn't necessarily have in 1921.

14 And especially we have quite a bit on
15 developing those timelines, and how important it is
16 to have that integrated approach between the
17 various type of information that you have from fire
18 modeling and from accident sequence analysis and
19 all this. And then the integrated communication
20 between operators and how that all comes together
21 in a total timeline.

22 That's something that wasn't really
23 addressed as well in 1921.

24 Then the whole concept of whether you
25 call it feedback to plant operations, or feedback

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 to analysts from operations that's recommendations
2 for how we can all work together to make those
3 scenarios more successful.

4 And then ultimately this particular
5 document focuses on the qualitative insights, but
6 obviously next will be porting that information
7 over into quantification. So, what type of
8 insights are we getting. As you said, what are we
9 getting now from interviews and putting it all
10 together so that we can then be prepared to come
11 out with those numbers we so dearly want and love.

12 And hopefully we've made it -- in the
13 qualitative analysis portion we have done it from
14 the standpoint so that no matter what actual
15 quantification method you're using later this is
16 all valuable input information that you can port
17 over to any particular method you choose to use.

18 So, from my standpoint having learned
19 how to do this by just kind of saying oh, Houston
20 we have a problem here, we have to roll up our
21 sleeves and figure out with the plant how are we
22 going to address it.

23 Ourselves and Scientech, we have tried
24 to port into this document the experience that
25 we've had, the variety of experiences so that we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 can give guidance to other analysts.

2 And we fed back into it information
3 from the performance shaping factors psychology
4 side. So we have a nice well rounded basis and
5 EPRI experience and NRC experience.

6 So I think altogether we put together -
7 - I'm quite pleased with what we've been able to
8 put together.

9 I'm glad though that we're getting very
10 good feedback from you in the cases where perhaps
11 we didn't include guidance where we should have, or
12 our language is more stilted than it should be to
13 give a different perspective than we intended.

14 MS. COOPER: All right. Just a quick
15 status on where we are.

16 The report that was sent to you to look
17 at in preparation for this meeting is the starting
18 point for a report that we plan to prepare for peer
19 review.

20 We're actually having discussions
21 yesterday and then later today about action items.
22 We've had a parking lot of things that came up
23 while we were furiously developing what you were
24 given and other things.

25 NRR is looking at it now. But we're

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 planning for the peer review and that is the next
2 step to get a next revision ready for the peer
3 review.

4 And then looking forward we're planning
5 on having the peer review this summer. We're
6 already working on and have identified or locked
7 down a few peer reviewers at this point in time.

8 As we did with 1921 we anticipate -- we
9 plan to include both NRC and industry reviewers.
10 We looked back at who we had included in the 1921
11 peer review. Also, who we got comments from during
12 the public comment period for 1921.

13 And we're trying to capture that
14 audience within the peer review because we don't
15 plan to have a draft for public comment.

16 Ashley and Mary are both working their
17 contacts through EPRI to try to make sure we
18 represent some of those people.

19 We may also be able to include some
20 additional reviewers. Right now I have a tentative
21 commitment from Halden, from someone there to take
22 a look at the report.

23 They've had an interest in this issue
24 of command and control and so forth. And Claire
25 Taylor's been working on developing qualitative

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 guidance for HRA also. So there's some dovetailing
2 with her work on that.

3 So we're working on that. And then the
4 next step is developing quantification guidance.

5 Hopefully we can get that started sort
6 of alongside the peer review.

7 When that work happens we intend for
8 that to be a more formal process. We will have a
9 draft for public comment. We will have testing
10 along with the peer review because we feel like we
11 need to go through all those steps for that
12 particular piece.

13 CHAIRMAN STETKAR: Here too, Susan,
14 just on the quantification we haven't seen
15 anything, but again a caution.

16 Take a look at the IDEAS framework.
17 There's not a lot in the general methodology.
18 There are ways to think about quantification, but
19 not in the general methodology.

20 But there's kind of a framework set up
21 at least on the internal events, at power procedure
22 driven stuff about how quantification might be done
23 rather than relying on Swain and Guttman, or
24 something like that.

25 MS. COOPER: So, not the generalized.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN STETKAR: Generalized kind of
2 gives you a way of thinking about it. Dennis may
3 help out better here because you can speak about
4 facts, right?

5 MS. COOPER: Well, we'll take a look at
6 it because --

7 CHAIRMAN STETKAR: Take a look at it
8 because you don't want the guidance on the
9 quantification to become orthogonal, or too
10 divergent just because it relies on things that
11 were done in the past or other frameworks.

12 And as I said, I already mentioned this
13 convolution of the time required and time available
14 which the only place I've seen that so far is in --
15 it's in the general guidance and in the
16 specialized. But that notion exists there.

17 MS. COOPER: Okay. We'll definitely
18 take that into consideration.

19 We've had some small discussions about
20 quantification, but I personally have been trying
21 to say just wait, wait, we need to understand
22 everything here before we make any decisions.

23 And I think it's going to be easier for
24 us to build consensus on different approaches. But
25 anyway, that's the plan going forward. And that's

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the end of the prepared material.

2 I want to invite Ashley or Mary if they
3 want to add anything here in closing also so I
4 don't have the last words.

5 MS. LINDEMAN: Yes, I just wanted to
6 thank you guys for your feedback. I think up until
7 this point the team has obviously become intimately
8 familiar with the draft, and it's just really
9 valuable to get an outsider to provide constructive
10 comments.

11 I think that just further enforces the
12 need for a very solid peer review. So, thank you.

13 CHAIRMAN STETKAR: Mary, do you have
14 anything or are you going to remain silent? Mary's
15 going to remain silent. Good. Well, not good.

16 (Laughter)

17 CHAIRMAN STETKAR: Let me, before we go
18 around the table get the phone line open. Because
19 I know there are people out there who may or may
20 not want to say anything.

21 While we're doing that, if there's
22 anyone in the room who'd like to make any comments
23 please come up to the microphone and do so.

24 Well, it's been a little quieter the
25 last couple of times so since John is here and he

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 is --

2 MR. LAI: I've been told the line's
3 open but nobody's on.

4 CHAIRMAN STETKAR: The line's open but
5 nobody -- another scintillating meeting.

6 Let me just try. If there's anyone out
7 there and you're actually on the line just please
8 say something.

9 Okay, well, we did that. So, as we
10 always do in subcommittee meetings I like to go
11 around the table and see if any of the members have
12 any final comments that they'd like to make. And
13 I'll start with Joy.

14 MEMBER REMPE: Wow, I get to go first
15 for a change.

16 Again, as I mentioned at the beginning
17 of this I'm not a practitioner, but nevertheless I
18 actually found the report very well written. I
19 liked the graphics, the trees and the discussion
20 within the text about what things to consider.

21 And I was interested in the topic
22 because of it being well written.

23 There were a lot of suggestions from
24 folks that are more knowledgeable in this area than
25 me. And I actually also would like to comment that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 it's good to have this interaction now.

2 So I believe I heard you say you were
3 going to update it before you sent it out to peer
4 review. And I think it's good to see that
5 interaction with ACRS now rather than it's about
6 ready to go out the door and we don't have time to
7 deal with these comments.

8 Even though I'm not a practitioner
9 there was a lot of discussion in here that I heard
10 today that I did not get from reading the text.
11 And it could be my ignorance, but I learned about
12 the fact that -- comments and sentences in the text
13 that talk about that there are cues to decide when
14 to abandon.

15 May not be exactly honest from the
16 discussion here today that there is a little more
17 fuzziness about when to do it. And I hope that
18 that's clarified.

19 And there were a couple of other
20 comments about what's really at the plants versus
21 what I read in the text that I would like to see
22 beefed up.

23 Let's see. Also, I actually like the
24 discussion toward the end here about what's
25 motivating this work. Because that was something

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 when I read I was really curious about.

2 There's been some of these license
3 amendment requests submitted and approved and more
4 in the pipeline. But hearing that there's been
5 some changes, there's been a lot of RAIs, I think
6 the motivation section could be beefed up to really
7 help the reader with this document too about why
8 this is important.

9 And then last but not least I guess I'm
10 more skeptical or curious about what John brought
11 up at the beginning of the meeting about the
12 benefits of the IDEAS methodology.

13 And during the discussion John actually
14 talked about that there might be some nuggets
15 related to quantifying uncertainties.

16 I don't think I just want to see
17 references. As a person who's been listening to
18 the IDEAS discussion I'd really like to have some -
19 - when you go through and look at this document
20 give us an honest assessment of how your effort has
21 benefitted from reading that document and the
22 framework. And be honest about it.

23 And if you see some things where it's
24 not complete be honest about that too. Because I
25 am curious.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 When you're having a specific example
2 it's easier for me to follow things than the more
3 higher level IDEAS methodology document when I read
4 it. And so I think that that interaction would be
5 good both ways, to what's good about it and how it
6 helped you but also where it's needing some
7 improvements to cover your particular situation.

8 And with that I'll turn it back to you.

9 CHAIRMAN STETKAR: Mary?

10 MS. PRESLEY: We just got a text.
11 Apparently audio is back now and John and Jeff are
12 on the bridge line.

13 CHAIRMAN STETKAR: They are. Well,
14 let's see. I was really surprised that they had
15 just abandoned. I know somebody's paying them so
16 they had to acknowledge the fact that they're out
17 there getting paid.

18 (Laughter)

19 CHAIRMAN STETKAR: It's been a little
20 quieter for some reason the last couple of times.
21 So we'll try that again and interrupt our march
22 around the table. I was going to skip Ron only
23 because he made a wisecrack.

24 (Simultaneous speaking)

25 CHAIRMAN STETKAR: I heard a pop. So

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 first of all, somebody just please do me a favor
2 and just say hello. Anybody out there, just say
3 hello.

4 MR. WREATHALL: Hello, John.

5 CHAIRMAN STETKAR: Thank you very much.
6 Hello, John.

7 MR. WREATHALL: Yes, this is -- I've
8 been following along.

9 CHAIRMAN STETKAR: John, John?

10 MR. WREATHALL: Yes?

11 CHAIRMAN STETKAR: I know who you are,
12 but you have to actually state your name for the
13 record because you're going to be on the
14 transcript.

15 MR. WREATHALL: Okay. This is John
16 Wreathall.

17 CHAIRMAN STETKAR: Thank you.

18 MR. WREATHALL: I've been following all
19 the way from the very beginning. And in the early
20 part of the discussion, actually when you were
21 initially talking about the role of IDEAS the line
22 I was on was breaking up. So I actually missed
23 quite a bit of that.

24 So, I'm hoping I can get updated by the
25 presenters, or looking in the transcript.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But the issue of command and control,
2 I'll just deal with one thing that I think is --
3 because it's still evolving.

4 The issue of what we mean by command
5 and control, we initially call it a meta PSF
6 because it represents the outcome of multiple types
7 of PSFs we separate, complexity, crew interaction,
8 workload, and so on.

9 But it's actually a work process that
10 may or may not have its own failure mechanisms
11 associated with it as well as having PSFs in some
12 ways attached to it.

13 And I think we need to expand that
14 understanding before we can say how any particular
15 quantification framework, let alone individual
16 tool, would be useful for that.

17 So, I think there will be a little bit
18 of further development in that area. And then
19 start looking at what kinds of quantitative
20 frameworks might be relevant rather than picking a
21 particular quantitative framework and then force
22 fitting it into what our understanding of command
23 and control is.

24 I've got a bunch of notes, but I think
25 that was the only one I wanted to specifically

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 address in this opportunity.

2 CHAIRMAN STETKAR: Thank you. Anybody
3 else on the line who'd like to make a comment?

4 MR. JULIUS: Yes, hi, this is Jeff
5 Julius.

6 CHAIRMAN STETKAR: Hi, Jeff.

7 MR. JULIUS: Hi. Like John I've been
8 on since the start and have followed along. It was
9 a good discussion through the ideas and loss of
10 habitability versus loss of control.

11 The one comment I wanted to make was on
12 the discussion of phase 3 and the cognition.

13 And I think the point -- my takeaway
14 was we need a better description on how the
15 cognition changes from in the phase 2 where we're
16 making the decision to abandon, and in phase 3 it's
17 not that there isn't cognition. It changes to this
18 coordination of control and sustaining the
19 functions through the mission time.

20 And so there are -- the cognitive
21 aspects change as you go from phase to phase.

22 CHAIRMAN STETKAR: And again, for the
23 benefit of the record I think -- I agree with Jeff
24 that as I read through the report there seemed to
25 be not a clear sensitivity to this notion of how

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 cognition is treated in phase 3.

2 Because I get everything from
3 statements saying there is no cognition, and I
4 don't want to go find where that's made, but indeed
5 it's made, to something that says well yes, you do
6 have to account for it, but only under certain
7 conditions.

8 So, I don't think it's a fundamental --
9 it's just a sensitivity that you have to build in
10 the guidance.

11 Anyone else on the public line who'd
12 like to make a comment?

13 If not, and having assurance that it's
14 open we'll re-close the line so it stops popping.
15 And I'll continue going around the table with Dr.
16 Ballinger, sir. Turn your mike on.

17 MEMBER BALLINGER: Okay. This is of
18 course not my area. I'm a metallurgist so that
19 means I'm an idiot. But I find this fascinating.

20 I did read both reports so myself and
21 probably Dennis were involved, I was involved with
22 two cases where we couldn't abandon the control
23 room unless we could swim and breathe at 300 feet.
24 One was with a fire and the other was with
25 flooding.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 But the one with fire was a scenario
2 which carried out over a period of half an hour.
3 And so I'm very sensitive to that kind of thing.

4 So I personally believe that when it
5 comes to these kind of very severe events that it's
6 human reliability and human actions that really
7 drive eventually anyway.

8 So thank you very much for the
9 presentation.

10 CHAIRMAN STETKAR: Dennis?

11 MEMBER BLEY: Well, before my comments
12 I want to mention that -- because I've heard the
13 word you have not received ACRS comments today.
14 You've had a discussion with members of a
15 subcommittee and the ACRS has made no comments yet
16 in this area, except our previous written reports.

17 As with the previous fire HRA I really
18 like the depth to which you examine the things
19 people ought to think about when they do this
20 analysis. I appreciate that a lot.

21 I especially agree with Jeff's comment
22 that came in the midst of ours and I won't say
23 anymore about that. Nothing more to add.

24 CHAIRMAN STETKAR: Dr. Corradini, sir.

25 MEMBER CORRADINI: I'm new to all this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 so I just thank the group for their explanations
2 and indulging me in my questions. Thanks.

3 CHAIRMAN STETKAR: Dr. Powers, sir.
4 You realize everybody who has a doctorate I call a
5 sir.

6 MEMBER POWERS: Well, I of course feel
7 some constraint about not commenting on this
8 particular piece of work.

9 I will say that it does drive me to
10 more sympathy for Mr. Ostendorff's opinion on this
11 area.

12 And for those that caught me at the
13 break I have not exhausted my inventory of
14 anecdotes about Stacey.

15 (Laughter) CHAIRMAN STETKAR: As
16 final closing I'd like to thank everybody. Despite
17 the comments that I made about bits and pieces of
18 the thing I think you've done a really good job
19 about as I mentioned earlier to try to highlight
20 considerations from an analyst perspective all the
21 way through how I might construct the framework of
22 a logic model to capture this type of process
23 through things that people might think about when
24 they go in and talk to operators who are
25 justifiably skeptical of the fact that they would

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 ever even consider the notion of leaving the main
2 control room.

3 So, and I think you've done quite a
4 good job at doing that. And I really appreciate
5 all the thought that's gone into it from everybody.

6 It's been -- with all of the logos
7 everywhere in the report I know it's been a massive
8 effort. So I really appreciate that.

9 And I wish you luck getting something
10 out for the peer review. And I'm sure we'll be
11 interested in hearing about it.

12 We'll have to talk about your schedule.
13 I think the subcommittee would certainly be
14 interested in hearing about it I'm going to say
15 probably after the peer review because you're on a
16 tight schedule and you might get additional
17 feedback.

18 Just scheduling interim meetings
19 doesn't help. So we should keep track of that
20 process and try to get another briefing of the
21 subcommittee after you get the peer review done and
22 have sort of a path forward from that which
23 obviously would be fall time, somewhere in there.

24 And if there are no other comments, any
25 closing comments, I'd like to thank everyone and we

Supplement 1, NUREG-1921 Qualitative HRA for Main Control Room Abandonment

**Susan E. Cooper (NRC/RES)
Ashley Lindeman & Mary Presley (EPRI)
Erin Collins (Jensen Hughes)
Stacey Hendrickson (Sandia National
Laboratories)**

**ACRS PRA Subcommittee Meeting
May 4, 2016
Rockville, MD**

Status of Fire HRA Modeling on Main Control Room Abandonment (MCRA)

- Today's presentation:
 - Provides information on an on-going research project
 - Limited to an interim product of this research which:
 - Builds on previous research products (e.g., NUREG-1921 / EPRI 1023001)
 - Uses the experience developing NUREG-1921 & supporting NFPA 805 submittals

Presentation Outline

- Project history and background
- Project team
- Overview
- Selected topics:
 - PRA aspects
 - Decision to abandon
 - Feasibility assessment
 - Timing and timelines
 - Influencing factors
 - Feedback to operations
- Status and future work
- Closing

Project History and Background

- Research underway to quantify risk from abandonment of main control room due to fire generated conditions
 - Loss of habitability (LOH)
 - Loss of control (LOC)
- Identified as an area of future research in EPRI 1023001 / NUREG-1921
- Complex topic and plant specific considerations (e.g., capabilities of and procedures for remote shutdown panel [RSDP]) complicate development of generic guidance
- To provide analysts guidance as soon as practical, the project is divided into two phases
 - Phase I - qualitative guidance
 - Phase II - quantification

Project Team

■ NRC/RES

- Susan E. Cooper, NRC
- Stacey Hendrickson, Sandia National Laboratory
- John Wreathall, John Wreathall & Co., Inc.
- Nick Melly, NRC
- Kendra Hill, NRC

■ EPRI

- Mary Presley, EPRI
- Ashley Lindeman, EPRI
- Erin Collins, Jensen Hughes
- Paul Amico, Jensen Hughes
- Kaydee Kohlhepp, Scientech
- Jeff Julius, Scientech

Overview

- Purpose of “Overview” (Section 2) is to help readers understand why more & different qualitative analysis activities may be necessary to address MCRA scenarios
- Topics:
 - What’s unique about MCRA contexts?
 - Implications for HRA/PRA
 - What’s different from NUREG-1921 for MCRA?
- Pointers to appendices:
 - Appendix A - background & historical events
 - Appendix B – discussion of command and control
 - Appendix C – guidance for collecting plant information for MCRA

Overview (continued)

- What's unique about MCRA contexts?
 - MCRA is rare NPP event
 - Internal events HRA/PRA benefits from nearly standardized MCR designs, EOP content & format, staffing, etc.
 - MCRA HRA/HRA must address variations (even within NPP type and vendor) in, for example:
 - Remote shutdown panel (RSDP) design & capabilities
 - General plant design
 - Procedure(s) & associated strategy taken for safe shutdown

Overview (continued)

- HRA/PRA, shift in “mindset” is needed
 - MCRA is a special case of fire HRA/PRA that does not build on internal events HRA/PRA
 - Without MCR environment, EOPs, etc., common HRA assumptions (e.g., all crew members working off same procedure and providing backup to other crew members) cannot be used for MCRA
 - Command-and-control (as a “meta-PSF”) can become important for MCRA due to changes in staffing, communications, etc.

Selected Topics

- PRA aspects
- Decision to abandon
- Feasibility assessment
- Timelines
- Influencing factors
- Feedback to operations

Qualitative Guidance: PRA Aspects

- Expanded MCRA process and guidance from EPRI 1011989 / NUREG/CR-6850
 - Fills gaps in existing methodology where additional guidance is needed
 - Integrating HFEs and equipment failures in model
- Determine plant conditions when LOH or LOC may occur
 - Entry criteria for LOH based on specific thresholds and calculated from fire modeling
 - Entry criteria for LOC not well defined in current methodology
- Expanded LOC scenario definition
 - Identified in MCRA procedure entry conditions or, more likely, through interviews with operations
 - What loss of function and instrumentation would lead to shutdown using RSDP?
 - Identification is highly plant specific

Expanded Process and Guidance for MCRA

- Modeling guidance considerations for MCRA:
 - Define plant conditions that constitute LOC or LOH based on procedure review, then include appropriate logic in the model to capture when those conditions occur
 - Based on fire modeling, determine scenarios that would result in LOH and generally only credit abandonment for those scenarios (i.e., do not credit actions in the control room that only appear in other procedures)
 - Include random failures of equipment required for remote shutdown (including controls located at the RSDP) in the PRA model
 - Include mitigatable fire-induced failures of equipment required for remote shutdown (including controls located at the RSDP) in the model, based on circuit analysis of RSDP and control circuits to determine if any abandonment scenarios can cause failure

Expanded Process and Guidance for MCRA (continued)

- Modeling guidance considerations (continued):
 - Include non-mitigatable fire-induced failures of equipment required for remote shutdown in the model
 - Spurious operations that can damage equipment catastrophically before it can be recovered (e.g., diesel overload, pump running with suction closed, etc.)
 - For scenarios modeled with detailed fire modeling, account for detection and suppression to the extent required to ensure realism in the dominant scenarios
- Three approaches discussed and examples provided:
 - Integration of the MCRA modeling into the plant logic model for the fire PRA
 - Other approaches: scenario bins or a single bounding MCRA failure probability for all recoverable MCRA scenarios

Decision to Abandon

- Two situations can lead to a decision to abandon the MCR
 - Loss of habitability (LOH)
 - Loss of control (LOC)
- Abandonment on LOH
 - Applies to fires in the MCR
 - May apply to fires in adjacent rooms that “communicate” with the MCR
 - Represented by fire modeling, not HRA
 - Fire modeling determines when habitability conditions are exceeded
 - Due to threat of personnel safety, it is assumed operators leave when conditions are exceeded

Decision to Abandon (continued)

■ Abandonment on LOC

- By procedure, applies only to certain areas of the plant containing enough cables that MCR functions could be lost. Examples include:
 - MCR
 - Cable spreading room
 - Relay room
 - Cable tunnels/chases
- Key aspects of LOC HRA
 - Cues (symptoms) can range from very subjective to objective
 - Need to develop understanding of crew interpretation of LOC conditions
 - Decision dynamics are very important (single decision-maker or collaborative)
 - Crew “degree-of-belief/trust” in remote shutdown capability must be assessed

Feasibility Assessment for MCRA

- NUREG-1921 established feasibility criteria for modeling HFEs in fire PRAs
- Section 6 of Supplement 1, NUREG-1921 discusses additional needs for MCRA scenarios:
 - Developed based on authors' experience (interviewing plant staff), interviews with NRC staff with operations experience, etc.
 - Developed as a consensus through team discussions
- Four new types of guidance are discussed:
 - Feasibility must be assessed on a **scenario level**, in addition to with respect to individual HFEs
 - Two new criteria have been identified
 - Some additional guidance on assessing existing criteria
 - What to do if “not feasible” is not acceptable
 - Discussed later under Feedback to Operations

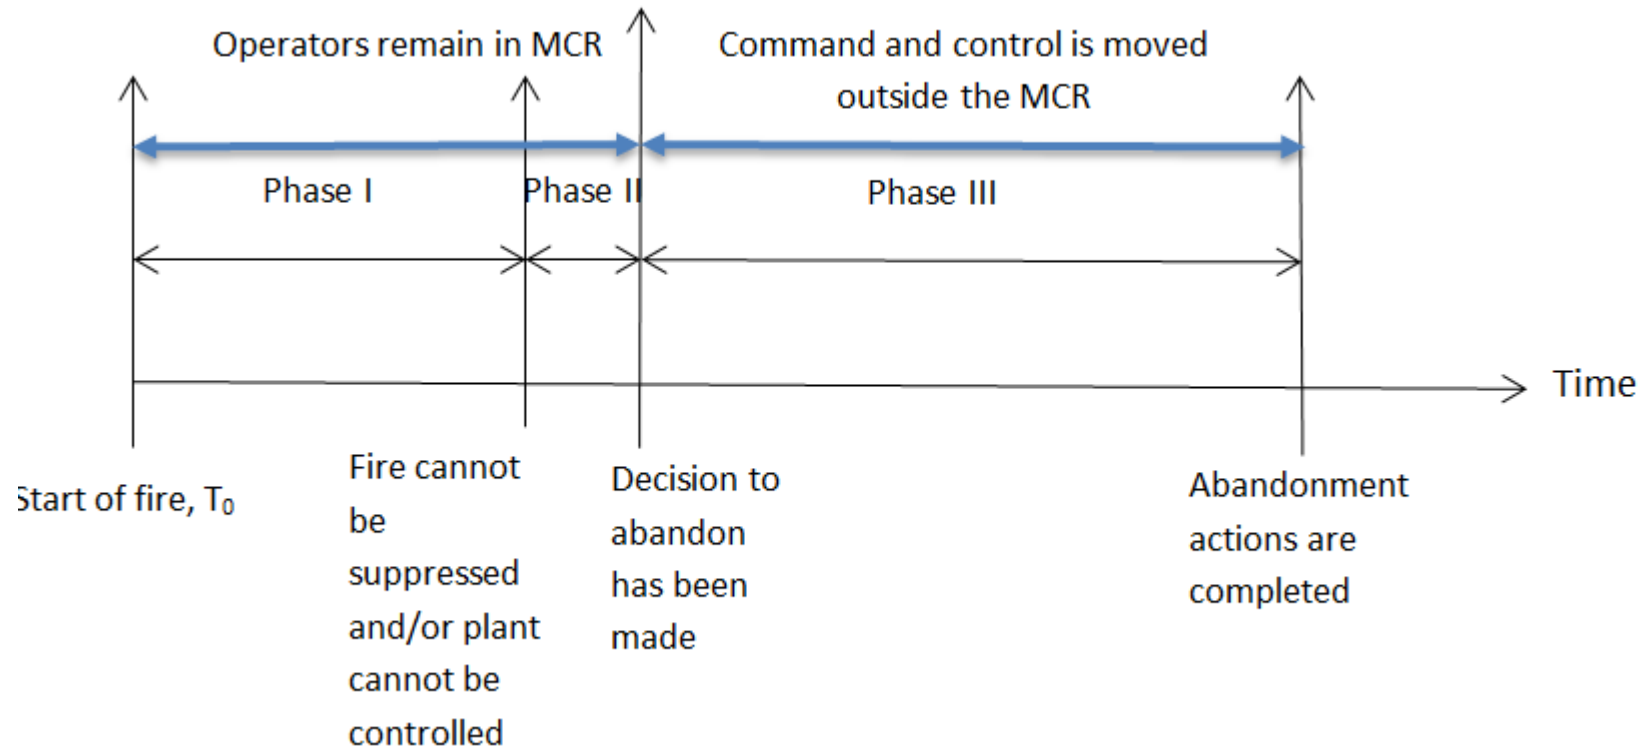

Feasibility Assessment for MCRA (continued)

- Scenario level feasibility assessment, e.g.,
 - Can all actions, collectively, be performed within overall time available (accounting for possible coordinated actions, hold points, etc.)?
 - Is there sufficient manpower across the entire scenario?
 - Is strategy feasible with respect to procedural support, equipment availability, & RSDP capability?
- Two new criteria:
 1. Must have a pre-defined plan for command-and-control, e.g.,
 - To address changes in staffing support, increased workload (e.g., coordination of actions, increased communications)
 2. Must have a clear communications plan, e.g.,
 - To address increase in communications needed, & have necessary equipment available

Timing and Timelines

- NUREG-1921 established a timeline for individual HFES
 - The guidance in NUREG-1921 can be applied to MCR abandonment HFES
- For MCRA, timing is even more critical, so the supplementary guidance recommends:
 - Developing scenario specific timelines that show who is doing what and when, all with respect to the same time origin
 - Accounting for command and control and coordination of tasks by various operators stationed at different locations
 - Integrating the various different timing sources into a single timeline with the same time origin
 - fire progression
 - accident progression
 - procedure progression and operator response

Timing and Timelines – Three Time Phases of MCRA

Phase I – Time period before abandonment decision

Phase II – Time period for the decision to abandon

Phase III – Time period after abandon has been made

Timing and Timelines – Three Time Phases of MCRA

- **Phase I** - associated with actions taken before the decision to abandon
 - May or may not be considered as part of Appendix R
- **Phase II** – timing for the decision to abandon is plant-specific and requires agreement between plant operations, fire PRA modeling and fire HRA
 - Typically the team will need to define conditions which require abandonment and the time at which these conditions will exist. Good example of FPRA feedback to training and/or procedures.
- **Phase III** – timeline accounts for execution time after the leaving the MCR, the same as NUREG-1921
 - Also addresses extra time required for command & control, coordination and communications

Influencing Factors

- Performance shaping factors
- Command-and-control

Performance Shaping Factors

- Guidance for evaluating PSFs primarily derived from:
 - List of PSFs developed in NUREG-1921
 - Experience of PRA analysts in identifying MCRA sequences modeled
- The following PSFs identified in NUREG-1921 are just as critical for MCRA (and in some cases, more so):
 - Complexity
 - Crew dynamics
 - Crew communications
 - Cues and indications
 - Procedures
 - Training
 - Timing
 - Time pressure and stress
 - Human-machine interface
 - Environment
 - Staffing and availability
 - Special equipment
 - Special fitness needs

Performance Shaping Factors (Continued)

- In general, assessment of the PSFs for MCRA needs to consider:
 - Decision to abandon the MCR
 - Actions at the RSDP
 - Local actions in the plant
 - Command and control issues
- Guidance to the analyst in this section:
 - Provides table of examples of the PSF impacts related to distinguishing features of MCRA scenarios
 - Assists the analyst in determining which PSFs are the more significant contributors to the qualitative analysis of a particular MCRA scenario by identifying the contexts that make a PSF consequential, and why
 - Content of these tables is considered preliminary

Command and Control (C&C)

- “Meta-PSF” that describes the need for a central body of authority to make decisions but have them carried out by a distributed group
- C&C during in-MCR operations:
 - Shift supervisor is aided by ROs and STA, who are monitoring and providing information input
 - Staff are co-located, allowing face-to-face communication and shared access to information in a relatively quiet atmosphere
- MCRA is more complex and person-in-charge must transition through a series of contexts:
 - Decision to abandon the MCR
 - Transition to the RSDP
 - Communication of instructions to staff located elsewhere, sometimes based on reports of measurements from the field

Command and Control (continued)

- Understanding the C&C structure outside the MCR is the key to understanding the impact on the reliability
- Command and Control appendix provides:
 - Guidance on how the C&C structure can be defined and evaluated, such as:
 - Identifying where the person or people leading the response will be located
 - Identifying how procedures will be used by the person or people in charge and by the field operators
 - Situational factors (e.g., detecting/noticing or directing attention/managing workload) for C&C that could negatively impact:
 - Decision to abandon
 - Post-abandonment responses at RSDP or out in the plant
 - C&C based on macrocognition work by Roth, Mosleh, et al., with adaptation from ATHEANA

Feedback to Operations

- Findings from the analysis can be fed back into operations, training, or even design to ensure feasibility and improve reliability of MCRA
- PRA perspective
 - Addresses (understandable) reluctance of operators to leave MCR and credibility of MCRA scenarios
 - Analysts have to assist in providing the PRA perspective regarding the severity of the fire
 - Fires large enough to result in significant effects on instrumentation availability and reliability will also be large enough to impact systems capable of providing sufficient cooling to reactor vessel – both may render MCR ineffective
 - Provide operators with list of failed equipment and indications for the most risk-significant plant-specific scenarios that would trigger MCRA – could be used as simulator exercises

Feedback to Operations (Continued)

■ Plant Modifications

- Where time is particularly constrained and the action is essential, plant modifications may be appropriate to provide rapid response mechanism or improved human-machine interface
- Example: installation of a (or several) MCR “disconnect switch” to address spurious operation of valves (e.g., mitigates spurious opening by causing the valve to re-close)

■ Procedure and Training Updates

- MCRA analysis can assist in clarifying or emphasizing certain steps to ensure they are performed in a sufficiently timely manner
 - Providing better guidance to the Shift Supervisor on making the decision to abandon the MCR
 - Consolidation or re-ordering of procedure step performance that might still allow non-risk significant actions to be taken in addition to the PRA critical actions

Expected Usage

- Guidance to both fire PRA and HRA on modeling MCRA
 - Coordination is crucial for successful analysis
- Expanded guidance for LOC scenarios
 - Special attention to decision to abandon, unique to MCRA
- Expanded criteria for feasibility assessments
 - Explanation of go/no-go criteria for PSFs
- Expanded guidance on developing MCRA timelines
 - Detailed discussion of approach, inputs, and feasibility considerations
- Feedback to plant operations
 - Recommendations for increasing likelihood of MCRA success
- Inputs to feed into quantification
 - Qualitative insights, PSFs, timing information used in all HRA methods

Current Status

- Draft report provided to ACRS PRA SC will be starting point for developing a report ready for peer review (then publication)
- Peer Review:
 - Team is reviewing “parking lot” items before finalizing report for peer review
 - Team is developing a peer review plan

Future Work

- Supplement 1, Qualitative Analysis Guidance:
 - Peer review (Summer 2016):
 - NRC – RES and NRR reviewers planned
 - Industry – outreach for reviewers underway
 - Final publication (Summer/Fall 2016)

- Supplement 2, Quantification:
 - Begin work in Summer 2016
 - Plans include:
 - Testing
 - Publication of a draft for public comment
 - Peer review
 - Final publication (with update to Supplement 1, as needed)

Closing

- Remarks from EPRI and NRC/RES management
- Questions?

JENSEN HUGHES

Advancing the Science of Safety

**Sandia
National
Laboratories**

Backup Slides

Feasibility Assessment for MCRA

- Additional guidance for MCRA scenarios:
 - Sufficient time: Time required for all tasks must be considered, including any dependencies.
 - Sufficient staffing: Staff needed to support command-and-control must be considered, in addition to other operator actions
 - Primary cues available/sufficient: Cues for all actions (in MCR, at RSDP, or at local stations) must be available & sufficient
 - Proceduralized & trained:
 1. Must be sufficient for all actions required for MCRA scenario
 2. Actions that are not needed for PRA-modeled MCRA scenario should not prevent success of strategy (e.g., do not take up more time than available)

Feasibility Assessment for MCRA (continued)

- Additional guidance for MCRA scenarios: (continued)
 - Accessible location:
 - Each MCRA location is accessible w/r to travel path & remaining in place for duration of actions
 - Availability & accessibility of equipment & tools:
 - Ability to gather all necessary tools & equipment, demonstrate use, etc.
 - Operability of relevant components & systems:
 - Evaluate availability of required controls at RSDP & local stations, confirm functionality

Timing Sources Used As Input to MCRA Timeline

- Fire progression – from fire modeling
- Accident progression – typically from thermal-hydraulic analyses
- Procedure progression and operator response timeline
 - Following the decision to abandon, there are typically multiple inputs (one for each operator)
- Timing model for the decision to abandon

The key to MCRA timing is to integrate the several different timing sources into a single timeline with respect to the same time origin.
