Mr. Lawyer,

I our renewal application 10 MAR 16, Section 10.7, 20th CBRNE Command stated "Leak tests are not required if the sources contain 100 microcuries or less of beta-gamma emitting material or 10 uCi or less of alpha-emitting material." I believe that this was consistent with NUREG 1556, Vol. 7 guidance.

Amendment 8 does not include this provision.

If this statement is not in the license what is the threshold for performing a leak test? If the criterion for a leaking source is 0.005 microcuries, is that the minimum quantity needing leak testing?

Sincerely,

Scott
