MAP INFORMATION

The soil surveys that comprise your AOI were mapped at scales ranging from 1:20,000 to 1:31,700.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: <http://websoilsurvey.nrcs.usda.gov>
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Andrews County, Texas
Survey Area Data: Version 13, Sep 18, 2015

Soil Survey Area: Lea County, New Mexico
Survey Area Data: Version 12, Sep 29, 2015

Your area of interest (AOI) includes more than one soil survey area. These survey areas may have been mapped at different scales, with a different land use in mind, at different times, or at different levels of detail. This may result in map unit symbols, soil properties, and interpretations that do not completely agree across soil survey area boundaries.

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Data not available.

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Andrews County, Texas (TX003)			
Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
BcB	Blakeney and Conger soils, gently undulating	795.1	28.6%
FdB	Faskin and Douro soils, gently undulating	40.8	1.5%
ImB	Ima loamy fine sand, 0 to 3 percent slopes	61.8	2.2%
JPC	Jalmar-Penwell association, undulating	907.7	32.6%
KmB	Kimbrough soils, gently undulating	21.2	0.8%
RaB	Ratliff soils, gently undulating	342.7	12.3%
TwB	Triomas and Wickett soils, gently undulating	109.6	3.9%
Subtotals for Soil Survey Area		2,278.8	82.0%
Totals for Area of Interest		2,780.3	100.0%

Lea County, New Mexico (NM025)			
Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
AB	Amarillo-Arvana loamy fine sands association	12.5	0.5%
BO	Brownfield-Springer association	47.5	1.7%
BS	Brownfield-Springer association, hummocky	134.3	4.8%
KM	Kermit soils and dune land, 0 to 12 percent slopes	11.5	0.4%
MU	Mixed alluvial land	19.4	0.7%
PG	Portales and gomez fine sandy loams	17.9	0.6%
SE	Simona fine sandy loam, 0 to 3 percent slopes	117.0	4.2%
SR	Simona-Upton association	141.3	5.1%
Subtotals for Soil Survey Area		501.5	18.0%
Totals for Area of Interest		2,780.3	100.0%

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

Custom Soil Resource Report

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Andrews County, Texas

BcB—Blakeney and Conger soils, gently undulating

Map Unit Setting

National map unit symbol: d53f
Elevation: 1,500 to 3,600 feet
Mean annual precipitation: 10 to 17 inches
Mean annual air temperature: 63 to 68 degrees F
Frost-free period: 210 to 240 days
Farmland classification: Not prime farmland

Map Unit Composition

Blakeney and similar soils: 49 percent
Conger and similar soils: 47 percent
Minor components: 4 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Blakeney

Setting

Landform: Ridges, divides
Landform position (two-dimensional): Summit
Down-slope shape: Convex
Across-slope shape: Convex, linear
Parent material: Loamy eolian deposits in the blackwater draw formation of pleistocene age overlying calcareous loamy alluvium in the ogallala formation of miocene-pliocene age

Typical profile

H1 - 0 to 18 inches: fine sandy loam
H2 - 18 to 32 inches: cemented material
H3 - 32 to 68 inches: gravelly loam

Properties and qualities

Slope: 0 to 3 percent
Depth to restrictive feature: 7 to 20 inches to petrocalcic
Natural drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.57 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 70 percent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water storage in profile: Very low (about 2.0 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6e
Hydrologic Soil Group: D
Ecological site: Shallow 12-17" PZ (R077DY048TX)

Description of Conger

Setting

Landform: Ridges, divides

Landform position (two-dimensional): Summit

Down-slope shape: Convex

Across-slope shape: Convex, linear

Parent material: Loamy eolian deposits in the blackwater draw formation of pleistocene age overlying calcareous loamy alluvium in the ogallala formation of miocene-pliocene age

Typical profile

H1 - 0 to 17 inches: loam

H2 - 17 to 39 inches: cemented material

H3 - 39 to 75 inches: gravelly loam

Properties and qualities

Slope: 0 to 3 percent

Depth to restrictive feature: 8 to 20 inches to petrocalcic

Natural drainage class: Well drained

Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.57 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Calcium carbonate, maximum in profile: 70 percent

Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

Available water storage in profile: Very low (about 2.9 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 6e

Hydrologic Soil Group: D

Ecological site: Shallow 12-17" PZ (R077DY048TX)

Minor Components

Unnamed

Percent of map unit: 4 percent

FdB—Faskin and Douro soils, gently undulating

Map Unit Setting

National map unit symbol: d53h

Elevation: 2,750 to 3,400 feet

Mean annual precipitation: 13 to 17 inches

Mean annual air temperature: 57 to 70 degrees F

Frost-free period: 210 to 240 days

Farmland classification: Not prime farmland

Map Unit Composition

Faskin and similar soils: 63 percent

Douro and similar soils: 21 percent

Minor components: 16 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Faskin

Setting

Landform: Plains

Down-slope shape: Convex

Across-slope shape: Linear

Parent material: Loamy eolian deposits from the blackwater draw formation of pleistocene age

Typical profile

H1 - 0 to 8 inches: fine sandy loam

H2 - 8 to 42 inches: sandy clay loam

H3 - 42 to 80 inches: sandy clay loam

Properties and qualities

Slope: 0 to 3 percent

Depth to restrictive feature: More than 80 inches

Natural drainage class: Well drained

Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Calcium carbonate, maximum in profile: 50 percent

Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

Available water storage in profile: Moderate (about 8.5 inches)

Interpretive groups

Land capability classification (irrigated): 3e

Land capability classification (nonirrigated): 4e

Hydrologic Soil Group: B

Ecological site: Sandy Loam 12-17" PZ (R077DY047TX)

Description of Douro

Setting

Landform: Plains

Down-slope shape: Convex

Across-slope shape: Linear

Parent material: Loamy eolian deposits in the blackwater draw formation of pleistocene age overlying calcareous loamy alluvium in the ogallala formation of miocene-pliocene age

Typical profile

H1 - 0 to 9 inches: fine sandy loam

H2 - 9 to 30 inches: sandy clay loam

H3 - 30 to 51 inches: cemented material

H4 - 51 to 75 inches: gravelly loam

Properties and qualities

Slope: 0 to 3 percent

Custom Soil Resource Report

Depth to restrictive feature: 20 to 40 inches to petrocalcic
Natural drainage class: Well drained

ImB—Ima loamy fine sand, 0 to 3 percent slopes

Map Unit Setting

National map unit symbol: d53j
Elevation: 4,000 to 4,600 feet
Mean annual precipitation: 12 to 17 inches
Mean annual air temperature: 57 to 63 degrees F
Frost-free period: 180 to 210 days
Farmland classification: Not prime farmland

Map Unit Composition

Ima and similar soils: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Ima

Setting

Landform: Plains
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Sandy alluvium and eolian deposits derived from calcareous sandstone of triassic and/or permian age

Typical profile

H1 - 0 to 14 inches: loamy fine sand
H2 - 14 to 55 inches: fine sandy loam
H3 - 55 to 80 inches: very fine sandy loam

Properties and qualities

Slope: 0 to 3 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 15 percent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Sodium adsorption ratio, maximum in profile: 4.0
Available water storage in profile: Moderate (about 7.1 inches)

Map Unit Setting

National map unit symbol: dmpj

Elevation: 3,500 to 4,400 feet

Mean annual precipitation: 12 to 16 inches

Mean annual air temperature: 58 to 60 degrees F

Frost-free period: 190 to 205 days

Farmland classification: Farmland of statewide importance

Map Unit Composition

Brownfield and similar soils: 60 percent

Springer and similar soils: 30 percent

Minor components: 10 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Brownfield

Setting

Landform: Plains

Landform position (three-dimensional): Rise

Down-slope shape: Linear

Across-slope shape: Linear

Parent material: Eolian deposits derived from sedimentary rock

Typical profile

A - 0 to 22 inches: fine sand

Bt - 22 to 60 inches: sandy clay loam

Properties and qualities

Slope: 0 to 3 percent

Depth to restrictive feature: More than 80 inches

Natural drainage class: Well drained

Runoff class: Very low

Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high
(0.60 to 2.00 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

Sodium adsorption ratio, maximum in profile: 2.0

Available water storage in profile: Moderate (about 7.0 inches)

Manning's Roughness Coefficient

Eq. 3
$$n = (n_0 + n_1 + n_2 + n_3 + n_4)m$$

Where:

- n_0 = a base value of n for straight, uniform, smooth channel in natural materials
- n_1 = a value added to correct for the effect of surface irregularities
- n_2 = a value for variations in shape and size of the channel cross section
- n_3 = a value for obstructions
- n_4 = a value for vegetation and flow conditions
- m= a correction factor for meandering of the channel

Channel Roughness

n_0 =	0.020 earth	Table1
n_1 =	0.000 smooth	Table 2
n_2 =	0.000 gradual	Table 2
n_3 =	0.000 negligible	Table 2
n_4 =	0.008 low	Table 2
m=	1.0 minor	Table 2

$$n = (0.02 + 0.000 + 0.000 + 0.000 + 0.008)1.0$$

$$= 0.028$$

APPENDIX C **WCS - CISF FLOOD ANALYSIS** **POST-DEVELOPMENT PAD OVERLAND DEPTH OF FLOW**

WCS	DES	CHK
	AVV 3/8/2016	DD 3/8/2016
Revised 11/11/16	Clarifications	DD

Reference:

1. Reference Drawing: Figure 1.1.2-1
2. Fundamentals of Hydraulic Engineering Systems, Ned H.C. Hwang, 1982

Manning Equation

$$v = 1.49/n * R_h^{2/3} * s^{1/2}$$

Where,

v= velocity (ft/s)
n= Manning's n
R_h= hydraulic radius
s= slope (ft/ft)

And

$$q = v * y$$

Where,

q= unit discharge (ft²/s)
y= depth

For sheet flow and a wide rectangular channel:

$$R_h \cong y \quad \text{Reference 2, page 182}$$

Therefore

$$q = (1.49/n * y^{2/3} * s^{1/2})(y) \\ = 1.49/n * y^{5/3} * s^{1/2}$$

And

$$y = (q / (1.49/n * s^{1/2}))^{3/5} \\ v = q/y$$

Where,

q= unit discharge (ft²/s)
v= velocity (ft/s)
n= Manning's n
y= depth
s= slope (ft/ft)

Max flow

$$q_{Max} = I * L$$

Where,

q_{Max}= maximum unit discharge (ft²/s)
I= maximum rainfall Intensity
L= Length of Pad

Max depth

$$y_{\max} = (q_{\max} / (1.49 / n * s^{1/2}))^{3/5}$$

Where,

y_{\max} = Maximum depth of flow (ft)

q_{\max} = Maximum unit discharge

n = Manning's n

s = slope (ft/ft)

Max velocity

$$v_{\max} = q_{\max} / y_{\max}$$

Where,

q_{\max} = maximum unit discharge (ft²/s)

y_{\max} = Maximum depth of flow (ft)

Inputs

s =	0.0075 ft/ft	phase slope
L =	515 ft	length of phase
I =	0.210 in/min	Max 500 yr-24hr rainfall intensity (HEC-HMS 500 yr SCS Storm)
	2.92E-04 ft/s	
n =	0.015	manning's n for concrete

Calculation

$$q_{\max} = I * L$$

$$q_{\max} = 1.50E-01 \text{ ft}^2/\text{s}$$

$y_{\max} = 0.088154 \text{ ft}$ $= 1.1 \text{ in}$
--

$v_{\max} = 1.7 \text{ ft/s}$
