## Nine Mile Point Unit 2 EQD

For a zone to be classified as mild, the total integrated dose for 40 yr plus 100 days post-accident service is no more than  $10^4$  rads and generally less than  $10^3$  rads. This value is conservative since organic compounds with the least radiation resistance have damage thresholds greater than  $10^4$  rads. Most electronic components have a threshold damage level above  $10^4$  rads. Semiconductors, in particular, metal oxide semiconductor (MOS) devices, have a threshold damage level in the range of  $10^3$  to  $10^4$  rads. N-channel metal oxide semiconductor (NMOS) devices are most vulnerable to radiation damage; the failure dose can be as low as  $10^3$  rads (Si)<sup>(11)</sup>. The damage is usually caused by total dose gamma radiation. No damage was identified due to beta radiation. Semiconductor devices are resistant to beta radiation since they are sealed in molded plastic, ceramic-to-metal, or glass-to-metal packages. Neutron radiation may cause damage in semiconductor devices; however, there is no neutron radiation in mild environment zones. Dose rate thresholds are higher than total dose damage threshold levels. The lowest threshold for dose rate upset is  $10^5$  rads (Si)/s for silicone-controlled rectifiers, and dose rate damage occurs above  $10^6$  rads (Si)/s<sup>(11)</sup>. Since the maximum dose rate for these zones is much lower than the above threshold levels, no transient or permanent failures will occur in any mild environment zones due to dose rate effects.

Radiation effects on the above conditions in a mild environment are considered negligible because the calculated radiation doses for mild environment zones are less than  $10^4$  rads.

The radiation required to produce one rad in silicon (Si) is 1.15 R in the energy range of 0.5 to 1.0 Mev<sup>(12)</sup>. Therefore, semiconductor devices, including MOS devices, are considered qualified for a specified radiation dose of  $10^3$  rads.

Equipment located in mild environment zones which exceed  $10^3$  rads were reviewed to identify equipment that contains electronic components. These were qualified based on approved vendor qualification reports which envelope the specific radiation exposure.

Equipment located in the zones listed in Table 2-2 are not exposed to environmental conditions that may cause common mode failures due to environmental conditions during DBE. Immediate access following a DBE is not required other than normal and periodic maintenance. Therefore, these plant zones may be considered mild environment areas.

### 4.2.1 BOP Equipment Mild Environment Qualification Program

Safety-related equipment located in a mild environment meeting the following requirements is considered adequately qualified.

1. A Certificate of Compliance (C of C) stating that the functional requirements of the equipment subjected to the specified Unit 2 environmental conditions have been met.
2. The C of C shall identify the supplied equipment by equipment mark number.

### 4.2.1 BOP Equipment Mild Environment Qualification Program

Safety-related equipment located in a mild environment meeting the following requirements is considered adequately qualified.

1. A Certificate of Compliance (C of C) stating that the functional requirements of the equipment subjected to the specified Unit 2 environmental conditions have been met.
2. The C of C shall identify the supplied equipment by equipment mark number.

SECTION 5

QUALIFICATION DOCUMENTATION

5.1 MASTER LISTS (ML)

The equipment and components that are within the scope of 10CFR50.49(b) are listed in the ML in Appendix A and are included in the qualification program.

All safety-related equipment added as a result of the TMI action items (see FSAR Section 1.10) have been included in the Unit 2 qualification program and qualified as required.

Also included are post-accident monitoring equipment located in harsh environment, and specified as Category 1 and 2, Revision 2 of Regulatory Guide 1.97. The identity of categories (classifications) of equipment included in the EQ program in response to Regulatory Guide 1.97 can be found in the response to FSAR Question F421.36.

An important feature of the ML is its capability to identify all qualification documentation associated with any of the listed safety-related electrical equipment or components through reference to the associated SCEW sheets for that particular equipment or component. The identity of any qualification document associated with any of the listed items can be accessed through either the individual equipment identification number, (e.g., 2CSL\*FV114) or through a generic equipment manufacturer and model number (e.g., Rosemount 1153B pressure transmitter).

## Nine Mile Point Unit 2 EQD

Examples of documentation accessible through the ML reference to the SCEW sheets are purchase specifications, vendor records (e.g., test plans and test reports), and SWEC-generated documentation (e.g., aging analyses of mechanical equipment and equipment operability periods).

For each device, the ML provides a summary of the key elements of the Environmental Qualification Program. Tables 5-1a and 5-1b contain the heading for the ML, with a description of each entry. For BOP equipment, the first four characters of the device indicate the unit number and the major system in which the device is used. For NSSS equipment, the major system in which the device is used is indicated by the first three characters of the mark number. The subsequent characters are used to further segregate the devices by specific type and number.

### 5.1.1 Methodology for Selection of Equipment to be Qualified - BOP

The list of equipment requiring qualification (Appendix A - Equipment Qualification Master List) was taken from the Unit 2 BOP project equipment system equipment list (PES). The PES identifies equipment provided for the Unit 2 plant and is developed based on an engineering review of the Unit 2 engineering and design diagrams. Safety-related equipment is indicated in this list with an asterisk in the equipment identification number, e.g., 2CMS\*SOV33A.

From this encompassing equipment list, which is a computer-based document, certain equipment is deleted for various reasons, as follows, by appropriate coding of specific computer fields with the final list encompassing the scope described by 10CFR50.49(b)(1) and (b)(2) results.

Equipment is deleted from the list typically for the following reasons:

1. Nonsafety-related equipment which is isolated from a Class 1E circuit.
2. Equipment qualified under GE-NSSS programs.
3. Equipment which has a passive safety function such as pressure integrity, has no electrical safety function, and is not associated with Class 1E power.
4. Items that are determined to be in mild environment zones.

## Nine Mile Point Unit 2 EQD

### SECTION 6

#### MAINTENANCE/SURVEILLANCE PROGRAM

A maintenance and surveillance program will be implemented by NMPC prior to fuel load to ensure the continued environmental qualification of equipment during plant operation.

The objectives of this preventive maintenance and surveillance program are to ensure that the qualified equipment will perform its intended function in the environment in which it is expected to operate and to maintain retrievable records.

The list of environmentally qualified equipment identifies equipment to be included in the preventive maintenance and surveillance program. The list will be kept current to include mechanical equipment and ensure that equipment added to the plant because of design modifications is incorporated into the qualification program and the preventive maintenance and surveillance program.

For each piece of equipment, a preventive maintenance and surveillance program is being developed based on information such as requirements resulting from the equipment qualification report, and Unit 2 plant specific thermal and radiation qualified life calculations, manufacturer's recommendations, previous experience with similar equipment, etc. The qualification specific requirements are identified for each piece of equipment.

The initially developed preventive maintenance and surveillance programs will be modified during plant life if additional information, such as corrective maintenance frequency, surveillance testing, and industry experience (e.g., NRC information notices, circulars or bulletins, manufacturers' alert, LER's, reliability data bases, etc.), identifies any unanticipated degradation trends. In addition, the preventive maintenance and surveillance program identifies the lubricants suitable for each application and environment. These preventive maintenance and surveillance activities are performed by personnel using detailed procedures, as necessary.

The plant maintenance program will incorporate the scheduling and documentation of maintenance requirements and activities. Schedules will identify when equipment maintenance, replacement, testing, or calibration is

## Nine Mile Point Unit 2 EQD

work. On completion of scheduled activities, a notification will be made indicating work completion, which will document completion and facilitate rescheduling. This scheduling program will be used to alert appropriate plant departments of preventive maintenance, surveillance, and replacement requirements for environmentally qualified equipment.

Quality assurance and control programs will require inspections, verifications, and audits of activities and procedures important to safety. These programs will be performed on environmentally qualified equipment to ensure that schedules, maintenance, procedures, replacements, and documentation are completed in a correct and timely manner.

The preventive maintenance and surveillance program is in accordance with Regulatory Guide 1.33 as described in FSAR Section 1.8. Replacement parts will be qualified in accordance with the requirements of 10CFR50.49(1) and Regulatory Guide 1.89.
