SUMMARY

WNP-2 has completed American Society of Mechanical Engineers Boiler and Pressure Vessel Code (ASME) Section XI examinations for the fourth refueling outage of the second inspection interval (thirteenth refuel cycle, RF13, Spring, 1998). Feedwater nozzle inner radius, core spray sparger and supply piping, and Generic Letter 88-01 augmented examinations were also completed during this outage.

EXAMINATION RESULTS

This report summarizes the results of inservice inspection (ISI) of ASME Section III, Code Class 1, 2, 3, and MC components and their supports performed at Washington Public Power Supply System (Supply System) Nuclear Plant No. 2 (WNP-2) between July 10, 1997 and June 13, 1998. Both General Electric (GE) and Supply System personnel performed the examinations. During this period, WNP-2 completed its thirteenth scheduled refueling outage, RF13. This outage is the fourth refueling outage of the second inspection interval. This report includes a copy of the NIS-1 Owner's Report of Inservice Inspection for this refueling outage in Appendix A and copies of the NIS-2 Owner's Report of Repair or Replacement in Appendix B.

Documentation supporting this summary report is located in the WNP-2 Files (DIC 1100).

The ISI examinations are specified in ASME Section XI and required by 10CFR50.55a. In addition, the following examinations were performed to meet augmented requirements or commitments.

- o IGSCC (intergranular stress corrosion cracking) detection in stainless steel welds, based on Generic Letter 88-01.
- o Feedwater nozzle inner radius and bore region for NUREG 0619.
- o Core spray sparger and supply piping.

ASME SECTION XI EXAMINATIONS

The ASME Section XI examinations performed during the thirteenth refueling outage comply with the 1989 Edition with no Addenda.

A summary and the items examined for ASME Section XI requirements are included on the NIS-1 Owner's Data Report for Inservice Inspection. A copy is included as Appendix A.

AUGMENTED EXAMINATIONS

GL 88-01 IGSCC (ISI Program Plan Section 6.2.3)

During refuel outage RF9 (Spring, 1994) WNP-2 performed the mechanical stress improvement process on 25 category C welds. Eight of the welds were reinspected in accordance with Generic Letter 88-01 during refuel outage RF10 (Spring, 1995). The remaining seventeen Generic Letter 88-01 category C welds were examined this refueling outage in accordance with Supply System letter GO2-97-029, P.R. Bemis to NRC, "WNP-2, Operating License NPF-21, Request for Extension of Generic Letter 88-01 Category C Examination Interval", dated February 19, 1997 and Nuclear Regulatory Commission (NRC) letter, "Request for an Extension of the Examination Interval for IGSCC Category C Welds for Washington Nuclear Project No. 2 (WNP-2) (TAC No. M98036)", dated May 23, 1997. No IGSCC (intergranular stress corrosion cracking) was detected in the welds examined. The following welds were examined:

Feedwater Nozzle Inner Radius (ISI Program Plan Section 6.2.3)

One feedwater nozzle inner radius, bore, and associated safe-end were examined. No unacceptable indications were found.

The feedwater spargers were visually examined. Small crack-like indications were found on several of the flow holes. Engineering evaluation concluded that the flow hole cracking will not have an adverse impact on the functional performance of the feedwater spargers, and continued operation for at least 24 months was justified.

Core Spray Sparger and Supply Piping (ISI Program Plan Section 6.6.2)

A visual examination of the core spray sparger and supply piping was performed per the requirements of IE Bulletin 80-13, "Cracking in Core Spray Sparger". No unacceptable indications were observed.

Snubber Testing (ISI Program Plan section 6.2.2)

An initial sample of thirty-seven (37) snubbers was selected from the WNP-2 general population of 393 safety-related snubbers. These snubbers were randomly selected by computer subroutine which is part of the ISI System data base. The selected snubbers were then reviewed to determine if the sample was representative, as required by Licensee Controlled Specification Basis SR 1.7.3.1.e.

Testing of snubbers was performed using portable test devices called "Validators", supplied by the snubber manufacturer. There were no unacceptable results. MD-1285-14C and MS-91(W) had drag greater than 2%, but less than 5 % and were replaced due to service life monitoring considerations. MSRV-4B-3 and RWCU-1C-3(E) had drag less than 2%, but were replaced as a preventive maintenance activity. The snubbers tested are listed on the NIS-1 Owner's Report of Inservice Inspection form in Appendix A.

NON-REGULATORY AUGMENTED EXAMINATIONS

Additional Reactor Pressure Vessel (RPV) internal visual examinations were performed on jet pump sensing lines, jet pump adjusting screws and incore dry tubes with the guidance contained in General Electric Service Information Letters (SIL). These examinations were performed based on Supply System internal review of the applicable SILs and their application to WNP-2.

During refueling outage RF9 (Spring, 1994), a crack was found in jet pump 18 sensing line. The crack was reexamined during RF13. There was no noticeable change from RF9 data. No indications were found in the other nineteen lines.

A reinspection of the jet pump adjusting screws was performed to document any gaps between the set screw and inlet mixer. Jet pump 9 had a gap on vessel side adjusting screw. Engineering evaluation determined that it was acceptable to operate with the gap for two 12 month operating cycles.

During the inspection for jet pump adjusting screw gaps, two handles from auxiliary wedges were found on the annulus floor plate. Engineering evaluation determined that it was acceptable to operate with the wedges missing their handles. The handles were removed from the RPV.

All incore dry tubes were visually examined. No unacceptable indications were noted.

REPAIRS AND REPLACEMENTS

Six (6) significant ASME Section XI repair or replacement activities were performed during RF13 as listed below. A listing and NIS-2 Owner's Reports for these and other ASME Section XI repair or replacement work accomplished and closed out between July 10, 1997 and June 13, 1998 are provided in Appendix B.

13. Abstract of Examinations and Tests. Include a list of examinations and tests and a statement concerning status of work required for the Inspection Plan:
Approximately 31% of the examinations required for this interval have been completed. See pages 3-12 of this data report for a listing of examinations and tests completed during this refueling outage. Continued on page 3.
14. Abstract of Results of Examinations and Tests. All examinations and tests were acceptable except the following:
1) Two CRD flanges one LPRM flange, and PSR-V-77A/1 flange were found leaking during the post outage Class 1 leakage test; 2) Safe-end to nozzle weld 24RRC(2)A-1 had indication requiring evaluation under IWB-3600. All snubber functional tests were acceptable.
15. Abstract of Corrective Measures:
1) Relief Request 2ISI-06 and 2ISI-07 were implemented for the leaking flanges. The CRD flange leaks were evaluated for corrective action. They were accepted based on the leakage decreasing over time. The LPRM and PSR-V-77A/1 flanges were tightened to stop the leaks. 2) IWB-3600 evaluation of weld 24RRC(2)A-1 concluded it was acceptable for continued service without repair.

We certify that a) statements made in this report are correct b) the examinations and tests meet the Inspection Plan as required by ASME Code, Section XI, and c) corrective measures taken conform to the rules of the ASME Code, Section XI.
