SUBJECT LOW TEMPERATURE OVERPRESSURIZATION PROTECTION (LTOP) SETPOINTSUMMARY OF CONCLUSIONS

FOR 1-NRV-152 OR 1-NRV-153, A SINGLE PORV OPERATION THE PEAK PRESSURE WILL REMAIN BELOW THE APPENDIX "G" LIMIT AS FOLLOWS:

SETPOINT - 435 PSIG WITH REACTOR VESSEL EXPOSURES TO 23 EF PY AND PORV STROKE OPEN TIMES BELOW 6 SECONDS

SETPOINT - 435 PSIG WITH REACTOR VESSEL EXPOSURES TO 37 EF PY AND PORV STROKE OPEN TIMES BELOW 6 SECONDS

FOR UNIT 1 A MINIMUM SETPOINT LIMIT TO PROTECT THE REACTOR COOLANT PUMP (RCP) NUMBER 1 SEAL DOES NOT EXIST. WITH THE 4 SECOND PORV CLOSURE TIME THERE IS NOT ENOUGH SEPARATION BETWEEN THE STEADY STATE PRESSURE-TEMPERATURE LIMIT AND THE MINIMUM RCS PRESSURE REQUIREMENTS FOR AN RCP START TO ENVELOPE THE PRESSURE SWING RESULTING FROM EITHER A HEAT INJECTION OR MASS INJECTION EVENT.

FOR UNIT 1 THE LTOP WILL BE ENABLED FOR TEMPERATURES BELOW 152 PF.

SUBJECT LOW TEMPERATURE OVERPRESSURIZATION PROTECTION (LTOP) SETPOINTINTRODUCTION

USNRC Regulatory Guide 1.99 Revision 2, "Radiation Embrittlement of Reactor Vessel Materials," dated May, 1988 became official with it's publication in the Federal Register on June 8, 1988. The guide revises the general procedures acceptable to the NRC staff for calculating the effects of neutron radiation embrittlement of the low alloy steels currently used for light water cooled reactor vessels.

Appendix G of 10 CFR Part 50 provides the fracture toughness requirements for reactor pressure vessels under certain conditions. To ensure that the Appendix G limits are not exceeded during any anticipated operational occurrence, technical specification pressure-temperature limits are provided during low temperature operations. The embrittlement algorithm specified by revision 2 of Regulatory Guide 1.99 is more conservative than revision 1, and requires that these limits be re-calculated.

The Low Temperature Overpressure Protection System (LTOPS) provides protection against exceeding the vessel ductility limits, as expressed by the Appendix G pressure-temperature limits, during cold shutdown, heatup, and cooldown operations. The limits resulting from implementation of the new revision to Regulatory Guide 1.99, requires that the LTOPS setpoints be re-evaluated.

PURPOSE

THE PURPOSE OF THIS CALCULATION IS TO RE-EVALUATE THE
UNIT 1 LTDA SETPOINT FOR 1-NRV-152 & 1-NRV-153.

Figure 1. The effect of the concentration of the *Agrobacterium* strain on the transformation efficiency of *Agrobacterium* strain 101. The concentration of the *Agrobacterium* strain 101 was varied from 10⁶ to 10⁹ cells/ml. The transformation efficiency was determined by the number of transformants per 10⁶ cells of the *Agrobacterium* strain 101. The data are the mean \pm SD of three independent experiments.

PLANT COOK NUCLEAR PLANT U 1SUBJECT LOW TEMPERATURE OVERPRESSURIZATION PROTECTION (LTOP) SETPOINTLTOP CALCULATION FOR UNIT 1

THE COOK NUCLEAR PLANT UNIT 2 LTOP SETPOINT EVALUATION (REF 1) WILL BE USED TO EVALUATE UNIT 1 (REF 2) USING WCAP 12483 PRESSURE-TEMPERATURE LIMITS (APP G CURVES) (REF 3).

THE LTOP SETPOINT WILL BE BASED ON THE WOG REPORT METHODOLOGY. REF 1 PROVIDES A WESTINGHOUSE CORRELATION TO THE LOFTRAN BASE ANALYSIS SETPOINT. THE SETPOINT BASED ON THE WOG REPORT METHODOLOGY ENVELOPES THE SETPOINT DETERMINED BY THE WESTINGHOUSE CORRELATION TO THE LOFTRAN BASE ANALYSIS.

FOR UNIT 1 THE FOLLOWING CRITERIA APPLY: SINGLE PORU OPERATION - NRV-152 OR 1-NRV-153 OPENING TIME ≤ 6 SECONDS; CLOSING TIME ≤ 4 SECONDS; 23 EFPY AND 32 EFPY STEADY STATE COOLDOWNS; AND

THE RCS IS CONSIDERED "WATER SOLID" WITH ISOTHERMAL (STEADY STATE) HEATUP AND ISOTHERMAL (STEADY STATE) COOLDOWN.

APPENDIX G LIMITS WITHOUT INSTRUMENTATION UNCERTAINTY ARE USED, JUSTIFIED ON THE BASIS OF THE LARGE AMOUNT OF CONSERVATISM (RECOGNIZED BY THE NRC) INHERENT IN THE DEVELOPMENT OF THE LIMITS."

THE LTOP'S DESIGN BASIS TRANSIENTS ARE: 1) THE MASS INPUT TRANSIENT CAUSED BY A NORMAL CHARGING/LETDOWN FLOW MISMATCH AFTER TERMINATION OF LETDOWN FLOW AND 2) THE HEAT INPUT TRANSIENT CAUSED BY THE RESTART OF A RCP WHEN THE RHRIS IS NOT OPEN TO THE RCS.

THE SAME WOG METHODOLOGY AND MOST CONSERVATIVE (U1/U2) PLANT PARAMETERS (REF 2) HAVE BEEN USED FOR UNIT 2 LTOP SETPOINT EVALUATION. THE SETPOINT FOR U1 NEED ONLY TO BE FIT TO THE WCAP 12483 (REF 3). THESE TABLES 3.4

SUBJECT LOW TEMPERATURE OVERPRESSURIZATION PROTECTION (LTOP) SETPOINT

3, 5, & 3.6 OF REF 1 ARE APPLICABLE AND MUST FIT UNDER THE (WCAP 12483 REF 3) AEP COOLDOWN CURVES. REG. GUIDE 1.99 REV 2 (NO MARGIN FOR INSTRUMENT UNCERTAINTY) FOR 23 EFPY AND 32 EFPY.

THE TABLES B.4 3.5 & 3.6 ARE EVALUATED FOR SETPOINT PRESSURES OF BETWEEN 400-500 PSIG WITH A 6 SECOND PORV OPENING TIME FOR 23 EFPY AND 32 EFPY.

D THE INSTRUMENTATION TIME DELAYS, PRESSURIZER PORV FLOW CHARACTERISTICS AND PRESSURIZER PORV FULL FLOW CV ARE TO BE THE SAME AS IN REF 1.

SUBJECT LOW TEMPERATURE OVERPRESSURIZATION PROTECTION (LTOP) SETPOINT
PART ① CALCULATION OF LTOP SETPOINT

FOR 6 SECOND PORV OPENING TIME AND 23 EF PY

| | | | 23 EF PY | | 23 EF PY | |
|----------|----------------|------------------------------|--------------------------|-------------------------------|--------------------------|--|
| SETPOINT | MASS INJECTION | RES = 85°F
HEAT INJECTION | APPENDIX G
PRESS PSIG | RES = 150°F
HEAT INJECTION | APPENDIX G
PRESS PSIG | |
| PSIG | OVERSHOOT PSIG | OVERSHOOT PSIG | AT 85°F | OVERSHOOT PSIG | AT 150°F | |
| 400 | 473 | 427 | 524.39 | 475 | 621 | |
| * 435 | 505.55 | | 524.39 | | 621 | |
| + 445 | 514.85 | | 524.39 | | 621 | |
| ⊖ 455 | 524.15 | | 524.39 | | 621 | |
| 500 | 566 | 525 | 524.39 | 576 | 621 | |

FROM THE ABOVE TABLE IT IS EVIDENT THAT THE MOST LIMITING
TEMPERATURE WITH RESPECT TO APPENDIX G CRITERIA IS AT

① 85°F AND THAT THE MASS INJECTION EVENTS DOMINATE
ONCE THE MOST LIMITING TEMP OF 85°F IS USED THEN THE COMPARISON OF
MASS INJECTION OVERSHOOT TO HEAT INJECTION OVERSHOOT @ 85°F SHOWS THE MASS
INJECTION OVERSHOOT TO BE GREATER, THAT IS, IT DOMINATES

$$* \quad 500 - 400 \text{ PSI SETPOINT} = 35 \text{ PSI } \Delta \text{ SETPOINT}$$

$$566 - 473 \text{ PSI MASS INJECTION } \Delta \text{ MASS INJECTION OVERSHOOT (MIO)}$$

$$\Delta \text{ MIO} = 32.55$$

$$\text{MIO} = 32.55 + 473 = 505.55$$

$$+ \quad \frac{100}{73} = \frac{45}{\Delta \text{ MIO}}$$

$$\Delta \text{ MIO} = 41.85$$

$$\text{MIO} = 41.85 + 473 = 514.85$$

$$\ominus \quad \frac{100}{93} = \frac{55}{\Delta \text{ MIO}}$$

$$\Delta \text{ MIO} = 51.15$$

$$\text{MIO} = 51.15 + 473 = 524.15$$

| | | | 514.93 | | 609.59 |
| 500 | 566 | 525 | 514.93 | 576 | 609.59 |

FROM THE ABOVE TABLE IT IS EVIDENT THAT THE MOST LIMITING
TEMPERATURE WITH RESPECT TO APPENDIX G CRITERIA IS AT 85°F
AND THAT THE MASS INJECTION EVENTS DOMINATE. (SIMILAR TO
23 EFPPY DISCUSSION, SHEET 10 OF 13)

$$* \frac{500 - 400 \text{ PSI SETPOINT}}{566 - 473 \text{ PSI MASS INJECTION}} = \frac{35 \text{ PSI } \Delta \text{ SETPOINT}}{\Delta \text{ MASS INJECTION OVERSHOOT (MIO)}}$$

$$\Delta \text{MIO} = 32.55$$

$$\text{MIO} = 32.55 + 473 = 505.55$$

$$+ \frac{100}{931} = \frac{45}{\Delta \text{MIO}}$$

$$\Delta \text{MIO} = 41.85$$

$$\text{MIO} = 41.85 + 473 = 514.85$$

FOR UNIT 1 USE A LTOP SETPOINT OF 435 PSIG INCREASING
FOR UP TO 32 EFPPY PER REF 3

THE UNITED STATES OF AMERICA

IN SENATE

COMMITTEE ON THE JUDICIARY

HEARINGS

SUBJECT LOW TEMPERATURE OVERPRESSURIZATION PROTECTION (LTOP) SETPOINT

PART ② EVALUATION OF UNDER PRESSURE SETPOINT

FOR THE 4 SECOND PORV CLOSURE TIME TO PROTECT
THE RCP NUMBER 1 SEAL THE UNDERSHOOT PRESSURE
SHOULD REMAIN ABOVE 325 PSIG (REF 4).

SOLVING FOR THE MASS INJECTION UNDERSHOOT FROM A SETPOINT
OF 435 PSIG @ OPENING TIME = 6 SECONDS

$$\text{PSI } 500 - 400 = 35 \text{ PSI}$$

$$\text{PSI } (388 - 296)^* = \Delta \text{ MASS INJECTION UNDERSHOOT (MTU) (PSI)}$$

* SEE TABLE 3.4 SHEET 7

$$\Delta \text{ MTU} = 32.2 \text{ PSI}$$

$$\text{MTU} = 32.2 + 296 = 328.2 \text{ PSIG}$$

SOLVING FOR THE HEAT INJECTION UNDERSHOOTS FROM A
SETPPOINT OF 435 PSIG

$$500 - 400 = 35$$

$$(400 - 311)^* = \Delta \text{ MTU}_{85^{\circ}\text{F}}$$

* SEE TABLE 3.5 SHEET 8

$$\Delta \text{ MTU}_{85^{\circ}\text{F}} = 31.15$$

$$\text{MTU}_{85^{\circ}\text{F}} = 342.15 \text{ PSIG}$$

$$500 - 400 = 35$$

$$395 - 311 = \Delta \text{ MTU}_{150^{\circ}\text{F}}$$

$$\Delta \text{ MTU}_{150^{\circ}\text{F}} = 29.9$$

$$\text{MTU}_{150^{\circ}\text{F}} = 340.4 \text{ PSIG}$$

HOWEVER, SINCE THE OPENING TIME IS EXPECTED TO BE
LESS THAN* OR EQUAL TO 6 SECONDS THE UNDERSHOOT
PRESSURES WILL TEND TO BE LESS THAN 325 PSIG (REF 4)
AND SO A MINIMUM SETPOINT LIMIT TO PROTECT
THE RCP NUMBER 1 SEAL DOES NOT EXIST.

* SEE PERFORMANCE TRENDS, APP III REF 3.

SUBJECT LOW TEMPERATURE OVERPRESSURIZATION PROTECTION (LTOP) SETPOINT

PART ③ DETERMINATION OF LTOP ENABLE TEMPERATURE

BY INSPECTION THE 32 EF PY CURVE IS MORE LIMITING THAN THE 23 EF PY.
FOR 32 EF PY THE APPENDIX G CURVE PRESSURE AT
152° IS \approx

$$\frac{(621.28 - 609.59) \text{ PSI}}{(155 - 150) \text{ °F}} \approx \Delta \text{ APP G PRESS}$$

* SEE DATA FOR 32 EF PY SHEET 9 OR THE APPENDIX G CURVE
4.676 $\approx \Delta \text{ APP G PRESS}$

$$609.59 + 4.68 \approx \text{APP G PRESS}$$

$$614.27 \text{ PSI} \approx \text{APP G PRESS}$$

FOR THE 435 PSIG LTOP SETPOINT THE MAXIMUM
OVERSHOOT IS 505.55 PSIG WHICH IS LESS THAN
THE 614.27 PSIG APP G PRESSURE AND THIS
IS ACCEPTABLE. ALSO THERE WILL GENERALLY BE A
STEAM BUBBLE IN THE PRESSURIZER WHEN THE REACTOR
COOLANT TEMPERATURE IS ABOVE ABOUT 150° F DURING
PLANT COOL DOWN SO THAT WATER SOLID CONDITIONS ARE
LIMITED TO RELATIVELY LOW TEMPERATURE CONDITIONS.

THEREFORE THE LTOP ENABLE TEMPERATURE IS 152° F.

Subject COOK NUCLEAR PLANT
Low Temperature Overpressure Protection System
Setpoint Evaluation Report

From P. G. Schoepf *PGS*

To R. C. Carruth

Attached, for your use, is an approved copy of the Westinghouse Report, "D. C. Cook (Unit 2) Low Temperature Overpressure Protection System (LTOPS) Setpoint Evaluation." This report provides a Cook Plant specific application of the Westinghouse Owner's Group methodology for LTOPS setpoint determination, including a sensitivity study on PORV opening time.

Although the report title indicates "Unit 2", the evaluation was intentionally performed using the most conservative of Unit 1 and Unit 2 plant parameters. Therefore, the methodology described may be applied to either unit's isothermal heatup/cooldown curves to calculate that unit's LTOP setpoint. This report should be used to calculate future LTOPS setpoints based on the results of reactor vessel material surveillance program capsule analyses.

Please note that this report provides justification to retain the current Unit 2 LTOPS setpoint (T/S value) of 435 psig (provided PORV stroke open times remain below 6.5 seconds) when the heatup/cooldown curves developed per Regulatory Guide 1.99, Rev. 2 are instituted. These new curves were submitted to the NRC via AEP:NRC:0894L, and are scheduled for implementation during the 1990 Unit 2 refueling outage.
