3.9.5 Reactor Pressure Vessel Internals

AP1000 reactor internals consist of two major assemblies—the lower internals and the upper internals. The reactor internals provide the protection, alignment, and support for the core, control rods, and gray rods to provide safe and reliable reactor operation. In addition, the reactor internals help to accomplish the following: direct the main coolant flow to and from the fuel assemblies; absorb control rod dynamic loads, fuel assembly loads, and other loads and transmit these loads to the reactor vessel; support instrumentation within the reactor vessel; provide protection for the reactor vessel against excessive radiation exposure from the core; and position and support reactor vessel radiation surveillance specimens.

Section 3.9 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 3.9.5, "Reactor Pressure Vessel Internals," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ On the basis of its review, the staff confirms that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

3.9.6 Inservice Testing of Pumps and Valves (Related to RG 1.206, Section C.III.1, Chapter 3, C.I.3.9.6, "Functional Design, Qualification, and Inservice Testing Programs for Pumps, Valves, and Dynamic Restraints")

3.9.6.1 Introduction

In this section, the NRC staff describes its review of the functional design, qualification, and inservice testing (IST) programs for pumps, valves, and dynamic restraints as required by the NRC regulations in 10 CFR Part 52 and 10 CFR 50.55, "Conditions of construction permits, early site permits, combined licenses, and manufacturing licenses," for Turkey Point Units 6 and 7. RG 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)," discusses the Commission's position provided in SECY-05-0197, "Review of Operational Programs in a Combined License Application and General Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," that operational programs should be fully described in COL applications to avoid the need to specify ITAAC for those programs. The applicant relies on the Turkey Point Units 6 and 7 COL FSAR with its incorporation by reference of the AP1000 DCD and supplemental information to fully describe the IST and motor-operated valve (MOV) testing operational programs in support of the COL application for Turkey Point Units 6 and 7.

3.9.6.2 Summary of Application

Section 3.9 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 3.9 of the AP1000 DCD, Revision 19. Section 3.9 of the DCD includes Section 3.9.6.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 3.9.6, the applicant provided the following:

Departure

- PTN DEP 6.4-2

The applicant provided additional information in Table 3.9-16R of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related PTN DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

AP1000 COL Information Item

- STD COL 3.9-4

The applicant provided additional information in several sections of Turkey Point Units 6 and 7 COL FSAR, Section 3.9.6 in response to STD COL 3.9-4 to supplement the AP1000 DCD provisions to fully describe the IST and MOV testing programs for Turkey Point Units 6 and 7. For example, the Turkey Point Units 6 and 7 COL FSAR supplements the provisions in the AP1000 DCD with respect to the Edition and Addenda of the ASME Code for Operation and Maintenance of Nuclear Power Plants (OM Code) applicable to the description of the IST program for Turkey Point Units 6 and 7, determination of the MOV testing frequency, operability testing of power-operated valves (POVs) other than MOVs, performance of check valve exercise tests, and plans to apply alternatives to the ASME OM Code. Under STD COL 3.9-3, the applicant supplemented the AP1000 DCD provisions for design, installation, preservice examination and testing, and inservice examination and testing of dynamic restraints (snubbers) in Turkey Point Units 6 and 7 COL FSAR, Section 3.9.3.4.4, "Inspection, Testing, Repair, and/or Replacement of Snubbers."

The AP1000 DCD addresses the functional design and qualification of mechanical equipment to be used at an AP1000 nuclear power plant in several DCD sections. For example, Section 3.9.3.2, "Pump and Valve Operability Assurance," states that criteria are developed to assess the functional capability of required components to operate. Section 3.9.3.2.2, "Valve Operability," indicates that operational tests will be performed to verify that valves open and close prior to installation. This section also specifies cold hydro tests, hot functional tests, periodic ISIs, and periodic inservice operations to be performed in situ to verify the functional capability of the valves. Section 5.4.8, "Valves," includes provisions regarding design and qualification, and preoperational testing of valves within the scope of those systems, and refers to these activities for other safety-related valves. Section 5.4.8.3, "Design Evaluations," specifies that the requirements for qualification testing of power-operated active valves are based on ASME Standard QME-1-2007, "Qualification of Active Mechanical Equipment Used in Nuclear Power Plants." Section 5.4.9, "Reactor Coolant System Pressure Relief Devices,"

includes provisions for design, testing, and inspection of relief devices in the reactor coolant system. Section 5.4.10, "Component Supports," includes provisions for design, testing, and inspection of component supports in the reactor coolant system. The Turkey Point Units 6 and 7 COL FSAR incorporates by reference these specific sections in the AP1000 DCD.

With respect to flow-induced vibration (FIV) of plant components, AP1000 DCD, Section 3.9.2, "Dynamic Testing and Analysis," describes tests to confirm that piping, components, restraints, and supports have been designed to withstand the dynamic effects of steady-state FIV and anticipated operational transient conditions. Section 14.2.9.1.7, "Expansion, Vibration and Dynamic Effects Testing," states that the purpose of the expansion, vibration, and dynamic effects testing is to verify that the safety-related, high-energy piping and components are properly installed and supported such that, in addition to other factors, vibrations caused by steady-state or dynamic effects do not result in excessive stress or fatigue to safety-related plant systems. The Turkey Point Units 6 and 7 COL FSAR incorporates by reference these sections in the AP1000 DCD.

AP1000 DCD, Section 3.9.3.4.4, "Inspection, Testing, Repair, and/or Replacement of Snubbers," specifies that a program for inservice examination and testing of dynamic supports (snubbers) to be used in the AP1000 reactor will be prepared in accordance with the requirements of the ASME OM Code, Subsection ISTD, "Preservice and Inservice Examination and Testing of Dynamic Restraints (Snubbers) in Light-Water Reactor Nuclear Power Plants." Section 3.9.3.4.4 indicates that details of the snubber inservice examination and testing program, including test schedules and frequencies, will be reported in the ISI and testing plan included in the IST Program required by Section 3.9.8.3, "Snubber Operability Testing." Section 3.9.8.3 states that COL applicants referencing the AP1000 design will develop a program to verify operability of essential snubbers. The Turkey Point Units 6 and 7 COL FSAR provides supplemental information for Section 3.9.3.4.4 regarding snubbers. For example, Turkey Point Units 6 and 7 COL FSAR, Section 3.9.3.4.4 includes provisions for snubber design and testing with specifications that snubber qualification and production testing will satisfy the applicable sections of the ASME Boiler and Pressure Vessel Code (BPV Code), the ASME OM Code, and ASME Standard QME-1-2007. Turkey Point Units 6 and 7 COL FSAR, Section 3.9.3.4.4 also describes the inservice examination and testing of safety-related snubbers in accordance with the requirements of the ASME OM Code, Subsection ISTD. The description includes specifications for initial and subsequent examination intervals, visual examination attributes, IST methods and intervals, establishment of snubber test groups, response to examination and test results, snubber repair and replacement, post-maintenance examination and testing, and establishment and monitoring of snubber service life. Turkey Point Units 6 and 7 COL FSAR, Table 3.9-201, "Safety Related Snubbers," provides a list of safety-related snubbers to be installed at Turkey Point Units 6 and 7, including the snubber identification number and the associated system or component.

AP1000 DCD, Section 3.9.6, "Inservice Testing of Pumps and Valves," provides a general description of the IST Program to be developed for AP1000 reactors. Table 3.9-16, "Valve Inservice Test Requirements," in AP1000 DCD, lists valves within the scope of the IST Program provided in support of the AP1000 DC, and indicates the valve tag number, valve and actuator type, safety-related missions, safety functions, ASME Code Class and IST Category, and IST type and frequency. Turkey Point Units 6 and 7 COL FSAR, Section 3.9.6 incorporates by reference AP1000 DCD, Section 3.9.6, with supplemental information in several areas. For example, the applicant stated that the description of the IST Program for Turkey Point Units 6 and 7 is based on the ASME OM Code, 2001 Edition through 2003 Addenda. The applicant

also indicated that the initial IST Program will incorporate the latest Edition and Addenda of the ASME OM Code approved in 10 CFR 50.55a(f) on the date 12 months before initial fuel load. In the Turkey Point Units 6 and 7 COL FSAR, the applicant describes the periodic testing program for POVs other than MOVs that incorporates lessons learned based on nuclear power plant operating experience and research programs for MOV performance. The applicant also indicated its plan to apply Revision 1 to ASME OM Code Case OMN-1, "Alternative Rules for the Preservice and Inservice Testing of Certain Electric Motor-Operated Valve Assemblies in Light Water Reactor Power Plants," as an alternative to the quarterly MOV stroke-time testing provisions in the ASME OM Code, and to satisfy the supplemental requirements specified in 10 CFR 50.55a(b)(3)(ii) to ensure that MOVs continue to be capable of performing their design-basis safety functions. The Turkey Point Units 6 and 7 COL FSAR does not identify any additional plant-specific valves to be included in the IST Program beyond those listed in AP1000 DCD, Table 3.9-16.

License Conditions

- Part 10, License Condition 3, Items G2 and G5

The applicant proposed a license condition providing the implementation milestones for the Preservice Testing Program and MOV Testing Program.

- Part 10, License Condition 6

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of operational programs including the Preservice Testing Program and MOV Testing Program.

3.9.6.3 Regulatory Basis

The regulatory basis of the design-related information incorporated by reference is addressed in NUREG-1793 and its supplements.

The regulatory basis for the NRC staff's review of the Turkey Point Units 6 and 7 COL FSAR is provided in 10 CFR Parts 50 and 52. Specifically, the NRC regulations in 10 CFR 52.79(a) require that the COL application include information at a level sufficient to enable the Commission to reach a final conclusion on all safety matters that must be resolved by the Commission before COL issuance. For example, paragraph (4)(i) in 10 CFR 52.79(a) requires that a COL application include the design of the facility with specific reference to the GDC in Appendix A to 10 CFR Part 50, which establish the necessary design, fabrication, construction, testing, and performance requirements for SSCs that provide reasonable assurance that the facility can be operated without undue risk to the health and safety of the public. Paragraph (11) in 10 CFR 52.79(a) requires that a COL application provide a description of the programs and their implementation necessary to ensure that the systems and components meet the requirements of the ASME BPV Code and the ASME OM Code in accordance with 10 CFR 50.55a. Paragraph (29)(i) in 10 CFR 52.79(a) requires that a COL application provide plans for conduct of normal operations, including maintenance, surveillance, and periodic testing of SSCs. Paragraph (37) in 10 CFR 52.79(a) requires that a COL application provide the information necessary to demonstrate how operating experience insights have been incorporated into the plant design.

RG 1.206 provides guidance for a COL applicant in preparing and submitting its COL application in accordance with the NRC regulations. For example, Section C.IV.4 in RG 1.206 discusses the requirement in 10 CFR 52.79(a) for descriptions of operational programs that need to be included in the FSAR for a COL application to allow a reasonable assurance finding of acceptability. In particular, a COL applicant should fully describe the IST, MOV testing, and other operational programs as defined in Commission Paper SECY-05-0197 to avoid the need for ITAAC for the implementation of those programs. The term “fully described” for an operational program should be understood to mean that the program is clearly and sufficiently described in terms of scope and level of detail to allow a reasonable assurance finding of acceptability. Further, operational programs should be described at a functional level and an increasing level of detail where implementation choices could materially and negatively affect the program effectiveness and acceptability. The Commission approved the use of a license condition for operational program implementation milestones that are fully described or referenced in the FSAR as discussed in the staff requirements memorandum (SRM) for SECY-05-0197, dated February 22, 2006.

The NRC staff followed Section 3.9.6, Revision 3, of NUREG-0800 in its review of the Turkey Point Units 6 and 7 COL application. The staff also compared the Turkey Point Units 6 and 7 COL FSAR information with the guidance provided in RG 1.206. Appendix 1AA, “Conformance with Regulatory Guides,” of the Turkey Point Units 6 and 7 FSAR, indicates that the COL application conforms to RG 1.206 without exceptions related to the IST Program. In addition, Table 1.9-202, “Conformance with SRP Acceptance Criteria,” in the Turkey Point Units 6 and 7 COL FSAR indicates that the COL application conforms to NUREG-0800, Section 3.9.6.

3.9.6.4 *Technical Evaluation*

The NRC staff reviewed Section 3.9.6 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to functional design, qualification, and IST programs for pumps, valves, and dynamic restraints. The results of the NRC staff’s evaluation of the design-related information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements. The results of the staff’s review of the material in the AP1000 DCD related to the IST operational program for pumps, valves, and dynamic restraints are in this SER section.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (VEGP, Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. The confirmatory items in the standard content material retain the numbers assigned in the VEGP SER.

The following portion of this technical evaluation section is reproduced from Section 3.9.6.4 of the VEGP SER:

In its letter dated December 17, 2008, Southern Nuclear Operating Company (SNC) listed the RAIs prepared by the NRC staff on the BLN Units 3 and 4 COL application. In that letter, SNC endorsed the responses, including proposed changes to the FSAR, submitted by the Tennessee Valley Authority (TVA) on 16 RAIs related to the functional design, qualification, and IST programs for pumps, valves, and dynamic restraints as applicable to the VEGP COL application. In letters dated December 14, 2009, and January 12, March 1, and May 14, 2010, SNC described its plans to resolve open items identified in the "SER with open items on the standard content information" prepared by the NRC staff on the description of the functional design, qualification, and IST programs for pumps, valves, and dynamic restraints in the BLN Units 3 and 4 COL application. The NRC staff has reviewed the SNC letters and Revision 2 to the VEGP COL FSAR to determine whether the description of the functional design, qualification, and IST programs for pumps, valves, and dynamic restraints in the VEGP COL application with its incorporation by reference of the AP1000 DCD meets the regulatory requirements to provide reasonable assurance that those components at VEGP will be capable of performing their safety functions if these programs are developed and implemented consistent with the description in the VEGP COL FSAR and AP1000 DCD.

The staff reviewed the information in the VEGP COL FSAR, and the staff's review of the standard content open item is provided.

AP1000 COL Information Item

- STD COL 3.9-4

The NRC staff reviewed STD COL 3.9-4 related to COL Information Item 3.9-4 included in AP1000 DCD Tier 2, Section 3.9.8.4. COL Information Item 3.9-4 states:

Combined License applicants referencing the AP1000 design will develop an inservice test program in conformance with the valve inservice test requirements outlined in subsection 3.9.6 and Table 3.9-16. For power-actuated valves, the requirements for

operability testing shall be based on subsection 3.9.6.2.2. This program will include provisions for nonintrusive check valve testing methods and the program for valve disassembly and inspection outlined in subsection 3.9.6.2.3. The Combined License applicant will complete an evaluation as identified in subsection 3.9.6.2.2 to determine the frequency of power-operated valve operability testing.

The information item for COL applicants to develop an IST Program was specified as COL Action Item 3.9.6.4-1 in Appendix F of NUREG-1793, which states:

The COL applicant will provide an inservice test (IST) program that complies with the inservice testing requirements for valves.

In STD COL 3.9-4, the applicant states that this COL item is addressed in Sections 3.9.6, 3.9.6.2.2, 3.9.6.2.3, 3.9.6.2.4, 3.9.6.2.5, and 3.9.6.3 for the VEGP COL application.

In this section of the SER, the NRC staff describes its review of the VEGP COL FSAR with the incorporation by reference of the AP1000 DCD for an acceptable description of the functional design, qualification, and IST programs, including the MOV Testing Program, for VEGP Units 3 and 4 to provide reasonable assurance that the safety-related components within the scope of the VEGP IST Program will be capable of performing their safety functions in accordance with the NRC regulations and the ASME Code requirements.

AP1000 DCD Tier 2, Section 3.9.6.1, "Inservice Testing of Pumps," specifies that the AP1000 reactor design does not include pumps with safety functions with the exception of the coastdown of the reactor coolant pumps. As determined in NUREG-1793, the NRC staff considers the IST Program scope for the AP1000 design with respect to pumps to be acceptable. Therefore, the NRC staff did not include pumps in the review of the IST Program for safety-related components at VEGP Units 3 and 4.

VEGP COL FSAR Section 3.9.6 states that the description of the IST Program for VEGP Units 3 and 4 is based on the ASME OM Code, 2001 Edition through 2003 Addenda, and that the limitations and modifications set forth in 10 CFR 50.55a will be incorporated. The NRC regulations in 10 CFR 50.55a incorporate by reference the ASME OM Code, 2001 Edition through 2003 Addenda, with certain limitations and modifications. Therefore, the NRC staff considers the application of the ASME OM Code, 2001 Edition through 2003 Addenda, as incorporated by reference in the NRC regulations with applicable limitations and modifications, to be acceptable for the VEGP IST Program description in support of the VEGP COL application. As specified in 10 CFR 50.55a, a COL licensee is required to incorporate in its IST Program the latest Edition and Addenda of the ASME OM Code approved in 10 CFR 50.55a(f) on the date 12 months before initial fuel load.

The VEGP COL FSAR incorporates by reference AP1000 DCD Tier 2, Table 3.9-16, "Valve Inservice Test Requirements," that includes the valve type, safety-related missions, safety functions, the ASME Code IST category, and IST type and frequency. The NRC staff considers this table to be sufficient in describing the IST Program in support of the VEGP COL application. Following the issuance of the VEGP COL, the guidance in NUREG-1482, "Guidelines for Inservice Testing at Nuclear Power Plants," can be used to develop the VEGP IST Program, including the specific information to be included in the IST Program documentation and tables for NRC inspection.

On March 26 and 27, 2008, the NRC staff held a public meeting to discuss the NRC's review of the description of the functional design, qualification, and IST programs for pumps, valves, and dynamic restraints in COL applications referencing the AP1000 certified design and the AP1000 DC amendment application. At the public meeting, Westinghouse stated that it would make information available on the functional design and qualification of safety-related valves and dynamic restraints within the scope of the AP1000 DCD in design and procurement specifications that will be applicable to AP1000 COL applications. On October 14 and 15, 2008, the NRC staff conducted an audit of design and procurement specifications for pumps, valves, and dynamic restraints to be used for the AP1000 reactor at the Westinghouse office in Monroeville, Pennsylvania. In a memorandum dated November 6, 2008, the NRC staff documented the results of the onsite review with specific open items. For example, the staff found that Westinghouse had included ASME Standard QME-1-2007 in its design and procurement specifications for AP1000 components. ASME QME-1-2007 incorporates lessons learned from valve testing and research programs performed by the nuclear industry and the NRC Office of Nuclear Regulatory Research. Also, AP1000 DCD Tier 2 has been revised in Section 5.4.8.3 to specify that the provisions for qualification testing of power-operated active valves will be based on ASME QME-1-2007. In September 2009, the NRC issued RG 1.100, "Seismic Qualification of Electric and Active Mechanical Equipment and Functional Qualification of Active Mechanical Equipment for Nuclear Power Plants," Revision 3, which accepts the use of ASME QME-1-2007, with certain staff positions, for the functional design and qualification of safety-related pumps, valves, and dynamic restraints. In a letter dated January 26, 2010, Westinghouse provided its planned response to the audit follow-up items. In a letter dated December 14, 2009, SNC stated, in response to Standard Content Open Item 3.9-1 in the "SER with open items" on the BLN COL application, that it had not identified any specific actions for the VEGP COL application based on the audit open items. The NRC staff discussion of the audit of the design and procurement specifications for pumps, valves, and dynamic restraints to be used for the AP1000 reactor is in the SER on the AP1000 DC amendment application. Therefore, the staff considers Standard Content Open Item 3.9-1 resolved.

The VEGP COL FSAR incorporates by reference AP1000 DCD Tier 2, Section 3.9.3.4, "Component and Piping Supports," and adds a new Section 3.9.3.4.4, "Inspection, Testing, Repair and/or Replacement of Snubbers." VEGP COL FSAR Section 3.9.3.4.4 specifies that snubber design and testing will satisfy the applicable sections of the ASME BPV Code, ASME OM Code, and

ASME QME-1-2007. Further, VEGP COL FSAR Section 3.9.3.4.4 describes the snubber inservice examination and testing program for VEGP Units 3 and 4. For example, the FSAR specifies that the inservice examination and testing of safety-related snubbers will be conducted in accordance with the requirements of the ASME OM Code, Subsection ISTD. The inservice visual examination will be performed to identify physical damage, leakage, corrosion, degradation, indication of binding, misalignment or deformation, and potential defects generic to a particular design. Snubbers will be tested in service to determine operational readiness during each fuel cycle, beginning no sooner than 60 days before the start of the refueling outage. Defined test plan groups will be established and snubbers in each group will be tested each fuel cycle according to an established sampling plan. Unacceptable snubbers will be adjusted, modified, or replaced. Service life for snubbers will be established, monitored, and adjusted in accordance with ASME OM Code, ISTD-6000, "Service Life Monitoring," and ASME OM Code, Appendix F, "Dynamic Restraints (Snubbers) Service Life Monitoring Methods." In addition, VEGP COL FSAR Table 3.9-201 provides a list of safety-related snubbers to be installed at VEGP, including the snubber identification number and the associated system or component. Revision 3 to RG 1.100 accepts with certain conditions the use of ASME QME-1-2007 for the functional design and qualification of dynamic restraints. The NRC staff finds that the provisions in the VEGP COL FSAR, together with the AP1000 DCD, provide an acceptable description of the inservice examination and testing program for dynamic restraints that support a finding that the program, when developed and implemented, will satisfy the 10 CFR 50.55a regulatory requirements.

The VEGP COL FSAR incorporates by reference AP1000 DCD Tier 2, Section 3.9.6.2.2, "Valve Testing," with supplemental information. Table 3.9-16 in AP1000 DCD lists the valves in the IST Program for the AP1000 design. VEGP COL FSAR Section 3.9.6.2.2 includes provisions for (a) the establishment of reference values; (b) the prohibition of preconditioning that undermines the purpose of IST activities; (c) comparison of stroke time to the reference value except for fast-acting valves for which a stroke-time limit of 2 seconds is assigned; (d) determination of valve obturator movement during valve exercise tests; (e) testing of solenoid-operated valves; (f) preoperational testing of check valves; (g) acceptance criteria for check valve tests; (h) use of nonintrusive techniques for check valve tests; (i) test conditions for check valve tests; (j) post-maintenance testing for check valves; (k) check valve disassembly and testing; and (l) re-establishment of reference values following maintenance. The VEGP COL FSAR also includes provisions for valve disassembly and inspection; valve preservice tests; and valve replacement, repair, and maintenance in Sections 3.9.6.2.3 to 3.9.6.2.5. The NRC staff finds that these provisions in the VEGP COL FSAR are consistent with Subsection ISTC of the ASME OM Code incorporated by reference in 10 CFR 50.55a, and therefore, are acceptable.

In its letter dated March 1, 2010, SNC provided its planned response for VEGP to Standard Content Open Item 3.9-2 on POV operability tests discussed in the "SER with open items" on the BLN COL application. The NRC staff review of the response by SNC to the three issues in this open item is discussed below.

First, SNC states in its letter dated March 1, 2010, that TVA had indicated in its response to BLN RAI 3.9.6-8 that the BLN COL FSAR would be revised to indicate that MOV testing will apply the provisions of ASME OM Code Case OMN-1 (Revision 1) and the guidance in the Joint Owners Group (JOG) MOV Periodic Verification Program including the applicable NRC safety evaluation (and its supplement) for periodic verification of the design-basis capability of safety-related MOVs. SNC did not consider additional changes to the VEGP COL FSAR to be necessary. The NRC staff finds that the VEGP COL FSAR with its incorporation by reference of the AP1000 DCD (including the planned DCD changes) will address the use of JOG MOV Periodic Verification Program. As the AP1000 IST Program applies the JOG MOV Periodic Verification Program, SNC will need to confirm that MOVs provided by the valve supplier and their application at VEGP Units 3 and 4 are within the scope of the JOG program. The planned use of ASME OM Code Case OMN-1 (Revision 1) is addressed below in this SER section.

Second, SNC provides in its letter dated March 1, 2010, a planned revision to the VEGP COL FSAR that specifies the use of Revision 1 to ASME OM Code Case OMN-1 as an alternative to the quarterly MOV stroke-time testing provisions in the ASME OM Code. In the letter, SNC notes that RG 1.192, "Operation and Maintenance Code Case Acceptability, ASME OM Code," accepts the use of Revision 0 to ASME OM Code Case OMN-1 with three conditions. SNC considers Revision 1 to ASME OM Code Case OMN-1 to represent a superior alternative to Revision 0 to ASME OM Code Case OMN-1 by addressing the conditions on the use of the Code case specified in RG 1.192. In a telephone discussion on April 13, 2010, the NRC staff requested that SNC address the specific provisions in RG 1.192 in justifying the use of Revision 1 to ASME OM Code Case OMN-1 as an alternative to the MOV stroke-time provisions in the ASME OM Code pursuant to 10 CFR 50.55a(a)(3)(i).

In a letter dated May 14, 2010, SNC modified its response to Standard Content Open Item 3.9-2 to provide a planned revision to the VEGP COL FSAR in Section 3.9.6.3 in support of the request to apply Revision 1 to Code Case OMN-1 as an alternative to the quarterly IST stroke-time provisions in the ASME OM Code. The NRC staff has accepted the application of ASME OM Code Case OMN-1 (Revision 0) in RG 1.192 with certain conditions. In the planned VEGP COL FSAR revision, SNC has addressed those conditions as they apply to the requested use of ASME OM Code Case OMN-1 (Revision 1) at VEGP Units 3 and 4. In particular, the VEGP COL FSAR revision specifies that the IST Program will incorporate the provisions in RG 1.192 by providing that the adequacy of the diagnostic test interval for each MOV will be evaluated and adjusted as necessary, but not later than 5 years or three refueling outages (whichever is longer) from the initial implementation of the Code case. The planned VEGP COL FSAR revision also states that the potential increase in core damage frequency (CDF) and risk associated with extending high-risk MOV test intervals beyond quarterly will be determined to be small and consistent with the intent of the Commission's Safety Goal Policy Statement. The VEGP COL FSAR also specifies this provision as consistent with the conditions specified in RG 1.192 for application of ASME OM Code Case OMN-11, "Risk-Informed Testing of Motor-Operated Valves," which has been incorporated into Revision 1

to ASME OM Code Case OMN-1. The planned VEGP COL FSAR revision specifies that risk insights will be applied using MOV risk ranking methodologies accepted by the NRC on a plant-specific or industry-wide basis, consistent with the conditions in the applicable safety evaluations. The planned VEGP COL FSAR revision also indicates that the benefits for performing any particular test will be balanced against the potential adverse effects placed on the valve or system caused by this testing. The VEGP COL FSAR indicates that use of Revision 1 to ASME OM Code Case OMN-1 will be appropriate for the ASME OM Code 2001 Edition with the 2003 Addenda that is the basis for the description of the VEGP Units 3 and 4 IST Program in support of the COL application. The NRC staff finds that the provisions to be specified in the VEGP COL FSAR for the use of Revision 1 to ASME OM Code Case OMN-1 satisfy the conditions specified in RG 1.192 for the use of Revision 0 to ASME OM Code Case OMN-1. The staff considers Revision 1 in ASME OM Code Case OMN-1 to continue to provide an acceptable technical approach for MOV diagnostic testing as an alternative to quarterly MOV stroke-time testing, and that the changes from Revision 0 to Revision 1 reflect improvements for user application and incorporation of ASME OM Code Case OMN-11. Pursuant to 10 CFR 50.55a(a)(3)(i), the staff authorizes the use of ASME OM Code Case OMN-1 (Revision 1) requested by SNC as an alternative to the quarterly MOV stroke-time testing provisions in the ASME OM Code for VEGP Units 3 and 4 on the basis that the proposed alternative provides an acceptable level of quality and safety and therefore, Standard Content Open Item 3.9-2 is resolved. The incorporation of the planned VEGP COL FSAR changes will be tracked as **Confirmatory Item 3.9-1**.

Resolution of Standard Content Confirmatory Item 3.9-1

Confirmatory Item 3.9-1 is an applicant commitment to revise its FSAR Table 1.9-201, Section 3.9.6.3, Section 3.9.6.2.2, and Section 3.9.9, to address IST of valves. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 3.9-1 is now closed.

Third, SNC in its March 1, 2010, submittal provides several planned changes to the VEGP COL FSAR to clarify the provisions that would be redundant when combined with the valve testing provisions in the AP1000 DCD. The NRC staff considers the proposed changes to the VEGP COL FSAR to be acceptable because these provisions are incorporated by reference as part of the AP1000 DCD. The incorporation of the planned VEGP COL FSAR changes will be tracked as part of **Confirmatory Item 3.9-2**.

Resolution of Standard Content Confirmatory Item 3.9-2

Confirmatory Item 3.9-2 is an applicant commitment to revise its FSAR. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 3.9-2 is now closed.

In light of the weaknesses in the IST provisions in the ASME OM Code for quarterly MOV stroke-time testing, the NRC issued Generic Letter (GL) 96-05, "Periodic Verification of Design-Basis Capability of Safety-Related

Motor-Operated Valves,” to request that nuclear power plant licensees establish programs to assure the capability of safety-related MOVs to perform their design-basis functions on a periodic basis. Further, the NRC revised 10 CFR 50.55a to require that nuclear power plant licensees supplement the quarterly MOV stroke-time testing provisions specified in the ASME OM Code with a program to ensure that MOVs continue to be capable of performing their design-basis safety functions. In its letter dated March 1, 2010, SNC provided its response to Standard Content Open Item 3.9-3 related to MOV testing in the “SER with open items” on the BLN COL application. The NRC staff review of the response by SNC to the six issues in this open item is discussed below:

First, SNC notes the planned use of Revision 1 to ASME OM Code Case OMN-1 as part of the IST Program to be developed for VEGP. As discussed above in this SER section, the NRC staff authorized the use of Revision 1 to ASME OM Code Case OMN-1 at VEGP Units 3 and 4.

Second, SNC states that the MOV Testing Program at VEGP will implement the JOG MOV Periodic Verification Program as described in the VEGP COL FSAR and AP1000 DCD. As indicated above, the NRC staff finds that the VEGP COL FSAR with its incorporation by reference of the AP1000 DCD (including the planned DCD changes) will address the use of the JOG MOV Periodic Verification Program. Other necessary changes to the VEGP COL FSAR regarding MOV testing are discussed in this SER section.

Third, SNC indicates that MOV output capability will be determined using the provisions of ASME OM Code Case OMN-1. The NRC staff has reviewed ASME OM Code Case OMN-1 as part of its acceptance in RG 1.192, and has determined that the Code case provides acceptable provisions for diagnostic testing to determine the output capability of MOVs.

Fourth, SNC describes MOV testing using the guidance in the JOG MOV Periodic Verification Program and Revision 1 to ASME OM Code Case OMN-1 to periodically determine the capability of MOVs to perform under design-basis conditions. The NRC staff has reviewed the JOG MOV Periodic Verification Program as part of its acceptance in an NRC safety evaluation dated September 25, 2006 with a supplement dated September 18, 2008, and has reviewed ASME OM Code Case OMN-1 as part of its acceptance in RG 1.192. From those evaluations, the staff has determined that the JOG MOV Periodic Verification Program and ASME OM Code Case OMN-1 will demonstrate continued MOV capability to open and close under design-basis conditions. As discussed above in this SER section, the NRC staff authorized the use of Revision 1 to ASME OM Code Case OMN-1 at VEGP Units 3 and 4.

Fifth, SNC notes that the initial test frequency of MOVs will be based on the ASME OM Code or applicable ASME OM Code cases. For example, the VEGP COL FSAR specifies that the IST frequency will be determined as specified by ASME OM Code Case OMN-1. Further, the JOG MOV Periodic Verification Program with the NRC safety evaluation and its supplement includes provisions for MOV test frequencies based on risk ranking and functional margin with a maximum diagnostic test interval of 10 years. The staff considers these

provisions in the VEGP COL FSAR and the AP1000 DCD for POV test frequency to incorporate lessons learned from MOV testing and research programs, and therefore, to be acceptable.

Sixth, SNC describes provisions for successful completion of MOV testing at VEGP in its March 1, 2010, letter, and provides several planned changes to the VEGP COL FSAR. For example, SNC provides a planned FSAR change to specify the use of ASME OM Code Case OMN-1, Revision 1. SNC also plans to revise the FSAR to specify that the design-basis capability testing of MOVs will apply guidance from GL 96-05 and the JOG MOV Periodic Verification Program. SNC will revise the FSAR to note the need to consider degraded voltage, control switch repeatability, and load-sensitive MOV behavior in ensuring that MOVs have adequate capability margin, in addition to the consideration of age-related degradation. SNC provides a proposed addition to the description of the MOV test frequency determination in the FSAR that will specify that maximum torque and/or thrust (as applicable) achieved by the MOV (allowing sufficient margin for diagnostic equipment inaccuracies and control switch repeatability) must not exceed the allowable structural and undervoltage motor capability limits for the individual parts of the MOV. SNC provides a proposed addition to the description of POV operability testing that specifies that successful completion of the preservice testing and IST of MOVs, in addition to MOV testing as required by 10 CFR 50.55a, will demonstrate that the following criteria are met for each valve tested: (i) valve fully opens and/or closes as required by its safety function; (ii) adequate margin exists and includes consideration of diagnostic equipment inaccuracies, degraded voltage, control switch repeatability, load-sensitive MOV behavior, and margin for degradation; and (iii) maximum torque and/or thrust (as applicable) achieved by the MOV (allowing sufficient margin for diagnostic equipment inaccuracies and control switch repeatability) does not exceed the allowable structural and undervoltage motor capability limits for the individual parts of the MOV. In its letter dated May 14, 2010, SNC provided an additional planned revision to the VEGP COL FSAR that clarifies the application of the JOG MOV Periodic Verification Program (including the applicable NRC safety evaluation and its supplement on the JOG program) in response to NRC staff comments provided during the telephone discussion on April 13, 2010. The NRC staff considers the planned changes to the VEGP COL FSAR to resolve Standard Content Open Item 3.9-3. The incorporation of the planned changes to the VEGP COL FSAR will be tracked as **Confirmatory Item 3.9-3**.

Resolution of Standard Content Confirmatory Item 3.9-3

Confirmatory Item 3.9-3 is an applicant commitment to revise its FSAR Section 3.9.6.2.2 to address MOV testing. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 3.9-3 is now closed.

In addition to incorporating by reference AP1000 DCD Tier 2 Section 3.9.6.2.2, the VEGP COL FSAR includes a paragraph titled "Other Power-Operated Valve Operability Tests," that states that POVs other than active MOVs are exercised quarterly in accordance with ASME OM Code, Subsection ISTC, unless justification is provided in the IST Program for testing these valves at other

Code-mandated frequencies. Lessons learned from the resolution of weaknesses in the design, qualification, and testing of MOVs are also applicable to other POVs used at nuclear power plants. In discussing the MOV lessons learned applicable to other POVs in Regulatory Issue Summary (RIS) 2000-03, "Resolution of Generic Safety Issue 158: Performance of Safety-Related Power-Operated Valves Under Design Basis Conditions," the NRC staff determined that the current regulations provide adequate requirements to ensure design-basis capability of safety-related POVs. For example, the staff noted that licensees are required by 10 CFR 50.65 (Maintenance Rule) to monitor the performance of SSCs in a manner sufficient to provide reasonable assurance that the SSCs are capable of fulfilling their intended functions. VEGP COL FSAR Section 3.9.6.2.2 provides a description of operability testing for POVs other than MOVs to be implemented at VEGP. For example, the FSAR states that subsequent to verification of the design-basis capability of POVs as part of the design and qualification program, POVs that perform an active safety function will be tested after installation to ensure valve setup is acceptable to perform their required functions consistent with valve qualification. This testing will document the baseline performance of the valves and will include measurement of critical parameters with consideration of uncertainties associated with the performance of these tests and use of the test results. Additional periodic testing will be performed as part of the air-operated valve (AOV) program based on the JOG AOV program discussed in RIS 2000-03 with specific reference to NRC staff comments on that program. The AOV program will also include the attributes for a successful POV periodic verification program described in RIS 2000-03 by incorporating lessons learned from nuclear power plant operations and research programs as they apply to the periodic testing of AOVs and other POVs in the IST Program. The FSAR specifies AOV program attributes including valve categorization based on safety significance and risk ranking, AOV setpoints based on current vendor information or valve qualification diagnostic testing, periodic static testing to identify potential degradation, use of sufficient diagnostics to collect relevant data to verify that the valve meets functional requirements, specification of test frequency and evaluation based on data trends, post-maintenance procedures to ensure baseline testing will be re-performed as necessary when high-risk valve performance could be affected, inclusion of lessons learned from other valve programs, and retention and periodic evaluation of AOV test documentation.

The NRC staff has reviewed the VEGP COL FSAR, including the incorporation by reference of the AP1000 DCD, to determine whether it addresses the lessons learned from MOV operating experience and research programs in describing the program for the periodic verification of the design-basis capability of POVs other than MOVs. In its letters dated December 14, 2009, and March 1, 2010, SNC provided a response to Standard Content Open Item 3.9-4 related to other POV operability testing in the "SER with open items" on the BLN COL application. In particular, SNC provided planned changes to the VEGP COL FSAR to clarify the potential need for periodic dynamic testing of POVs other than MOVs based on the design qualification results or valve operating experience. The planned FSAR change will also clarify that post-maintenance procedures will be implemented for all safety-related POVs consistent with the QA requirements in 10 CFR Part 50, Appendix B, "Quality Assurance Criteria for Nuclear Power

*Plants and Fuel Reprocessing Plants,” regardless of their specific risk ranking. SNC also provided a proposed change to the VEGP COL FSAR specifying that the attributes of the AOV testing program, to the extent that they apply to and can be implemented on other safety-related POVs (such as electro-hydraulic valves) will be applied to those other POVs. The NRC staff considers that the planned revision to the VEGP COL FSAR, when combined with the AP1000 DCD provisions incorporated by reference, will adequately describe the periodic testing program for POVs other than MOVs to be used at VEGP and resolves Standard Content Open Item 3.9-4. The incorporation of the planned changes to the VEGP COL FSAR will be tracked as **Confirmatory Item 3.9-4**.*

Resolution of Standard Content Confirmatory Item 3.9-4

Confirmatory Item 3.9-4 is an applicant commitment to revise its FSAR Section 3.9.6.2.2, to address POV testing. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 3.9-4 is now closed.

The VEGP COL FSAR incorporates by reference AP1000 DCD Tier 2, Section 3.9.6.3, “Relief Requests,” with a discussion of the planned use of ASME OM Code Case OMN-1, Revision 1. The applicant stated that use of Revision 1 to ASME OM Code Case OMN-1 will require request for relief, unless it is approved by the NRC in RG 1.192 or incorporated into the ASME OM Code on which the IST Program is based and that Code Edition is incorporated by reference in 10 CFR 50.55a. As discussed above in this SER section, the NRC staff authorized the use of Revision 1 to the ASME OM Code Case OMN-1 at VEGP Units 3 and 4.

AP1000 DCD Tier 2, Section 3.9.2, “Dynamic Testing and Analysis,” describes tests to confirm that piping, components, restraints, and supports have been designed to withstand the dynamic effects of steady-state FIV and anticipated operational transient conditions. Section 14.2.9.1.7, “Expansion, Vibration and Dynamic Effects Testing,” in AP1000 DCD Tier 2, Chapter 14, “Initial Test Program,” states that the purpose of the expansion, vibration and dynamic effects testing is to verify that safety-related, high energy piping and components are properly installed and supported such that, in addition to other factors, vibrations caused by steady-state or dynamic effects do not result in excessive stress or fatigue to safety-related plant systems. Nuclear power plant operating experience has revealed the potential for adverse flow effects from vibration caused by hydrodynamic loads and acoustic resonance on reactor coolant, steam, and feedwater systems. In its letter dated January 12, 2010, SNC provided its response for VEGP to Standard Content Open Item 3.9-5 related to FIV in the “SER with open items” on the BLN COL application. In its response, SNC stated that it intended to use the overall Initial Test Program to demonstrate that the plant has been constructed as designed and the systems perform consistent with design requirements. SNC referenced the provisions in the AP1000 DCD for vibration monitoring and testing to be implemented at VEGP. For example, the applicant notes that AP1000 DCD Tier 2, Section 3.9.2.1, “Piping Vibration, Thermal Expansion and Dynamic Effects,” specifies that the preoperational test program for ASME BPV Code, Section III, Class 1, 2, and 3

pipng systems simulates actual operating modes to demonstrate that components comprising these systems meet functional design requirements and that piping vibrations are within acceptable levels. SNC indicates that the planned vibration testing program described in AP1000 DCD Tier 2, Sections 14.2.9 and 14.2.10, with the preservice and IST programs described in AP1000 DCD Tier 2, Sections 3.9.3.4.4 and 3.9.6, will confirm component installation in accordance with design requirements, and address the effects of steady-state (flow-induced) and transient vibration to ensure the operability of valves and dynamic restraints in the IST Program. The NRC staff considers the response by SNC clarifies its application of the provisions in the AP1000 DCD to ensure that potential adverse flow effects will be addressed at VEGP. Therefore, the staff considers Standard Content Open Item 3.9-5 to be resolved for the VEGP COL application.

*Subsection ISTC-5260, "Explosively Actuated Valves," in the ASME OM Code specifies that at least 20 percent of the charges in explosively actuated valves shall be fired and replaced at least once every 2 years. If a charge fails to fire, the ASME OM Code states that all charges with the same batch number shall be removed, discarded, and replaced with charges from a different batch. In light of the updated design and safety significance of squib valves in new reactors, the need for improved surveillance activities for squib valves is being considered by the nuclear industry, ASME, and U.S. and international nuclear regulators. In RAI 3.9.6-1, the NRC staff requested that SNC describe its plans for addressing the surveillance of squib valves that will provide reasonable assurance of the operational readiness of those valves to perform their safety functions in support of the VEGP COL application. In a letter dated May 27, 2010, SNC submitted a planned revision to VEGP COL FSAR Section 3.9.6 to specify that industry and regulatory guidance will be considered in the development of the IST Program for squib valves. The FSAR will also state that the IST Program for squib valves will incorporate lessons learned from the design and qualification process for these valves such that surveillance activities provide reasonable assurance of the operational readiness of squib valves to perform their safety functions. The NRC staff finds that the planned changes to the VEGP COL FSAR are sufficient to describe the IST Program for squib valves for incorporating the lessons learned from the design and qualification process in developing surveillance activities that will provide reasonable assurance of the operational readiness for squib valves to perform their safety functions. Therefore, the NRC staff considers the planned changes to the VEGP COL FSAR to resolve this RAI acceptable. The incorporation of the planned changes to the VEGP COL FSAR will be tracked as **Confirmatory Item 3.9-5**.*

Resolution of Standard Content Confirmatory Item 3.9-5

Confirmatory Item 3.9-5 is an applicant commitment to revise its FSAR Section 3.9.6.2.2 to address squib valve testing. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 3.9-5 is now closed.

Technical Specifications

*In its letter dated December 14, 2009, SNC provided a response to an open item related to Part 4, "Technical Specifications," (Standard Content Open Item 3.9-6) in the "SER with open items" on the BLN COL application. In its response, SNC stated that Part 4 of the VEGP COL application will be revised to ensure that Technical Specifications and Technical Specification Bases are consistent with the ASME OM Code, 2001 Edition through the 2003 Addenda. Therefore the NRC staff considers the planned changes to the VEGP COL application in Part 4 to resolve Standard Content Open Item 3.9-6. The incorporation of the planned changes to the VEGP COL FSAR will be tracked as **Confirmatory Item 3.9-6**.*

Resolution of Standard Content Confirmatory Item 3.9-6

Confirmatory Item 3.9-6 is an applicant commitment to revise its FSAR Section 3.9.6.2.2 to address the ASME OM Code. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 3.9-6 is now closed.

License Conditions

- *Part 10, License Condition 3, Items G2 and G5*

The applicant proposed a license condition providing the implementation milestones for the Preservice Testing Program and MOV Testing Program.

- *Part 10, License Condition 6*

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of operational programs including the Preservice Testing Program and MOV Testing Program.

These license conditions are consistent with the policy established in SECY-05-0197 and are, thus, acceptable.

Squib Valves

During the uncontested hearing for the VEGP Units 3 and 4 COL application, the Commission discussed issues associated with the IST and inspection program for squib valves to be used to perform safety functions at VEGP Units 3 and 4. Tier 1 of the AP1000 DCD requires squib valves to undergo tests or type tests to demonstrate their operational capability under design conditions. Additionally, the Commission asked the staff questions on this topic after the VEGP and V.C. Summer Nuclear Station (VCSNS) COL uncontested hearings. For these COL applications, the Commission concluded that, although it found that the staff's review of the squib valve issues was rigorous, it had a concern similar to that initially raised by the Advisory Committee on Reactor Safeguards regarding the status of the IST and inspection program for this component. As such, the Commission imposed a license condition for each COL that directs the implementation of a surveillance program for squib valves at VEGP Units 3 and 4

and VCSNS Units 2 and 3, with the specific requirements described in the Commission orders authorizing issuance of the VEGP and VCSNS COLs.

The squib valves subject to the surveillance program license condition under the VEGP and VCSNS COLs are part of the AP1000 certified design, and the same squib valves are specified in the Turkey Point Units 6 and 7 COL application. Therefore, the staff determined that it was appropriate to apply the same surveillance program license condition to the Turkey Point Units 6 and 7 squib valves.

The surveillance program is established to provide reasonable assurance that the Turkey Point Units 6 and 7 squib valves are operational and ready to perform their safety function. The staff-proposed license condition follows the precedent set in the VEGP and VCSNS COLs (ADAMS Accession Nos. ML113540620 and ML113420105) to require such a surveillance program.

3.9.6.5 Post-Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated April 8, 2016 (ADAMS Accession No. ML16103A507), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

- License Condition (3-5) – Before initial fuel load, the licensee shall implement (1) the Preservice Testing Program and (2) the MOV Testing Program.
- License Condition (3-6) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO a schedule that supports planning for and conduct of NRC inspections of the IST Program (including preservice and MOV testing). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the IST Program (including preservice testing and the MOV testing) has been fully implemented.
- License Condition (3-7) – Before initial fuel load, the licensee shall implement a surveillance program for explosively actuated valves (squib valves) that includes the following provisions in addition to the requirements specified in the edition of the ASME OM Code as incorporated by reference in 10 CFR 50.55a.

a. Preservice Testing

All explosively actuated valves shall be preservice tested by verifying the operational readiness of the actuation logic and associated electrical circuits for each explosively actuated valve with its pyrotechnic charge removed from the valve. This must include confirmation that sufficient electrical parameters (voltage, current, resistance) are available at the explosively actuated valve from each circuit that is relied upon to actuate the valve. In addition, a sample of at least 20 percent of the pyrotechnic charges in all explosively actuated valves shall be tested in the valve or a qualified test fixture to confirm the capability of each sampled pyrotechnic charge to provide the necessary

motive force to operate the valve to perform its intended function without damage to the valve body or connected piping. The sampling must select at least one explosively actuated valve from each redundant safety train. Corrective action shall be taken to resolve any deficiencies identified in the operational readiness of the actuation logic or associated electrical circuits, or the capability of a pyrotechnic charge. If a charge fails to fire or its capability is not confirmed, all charges with the same batch number shall be removed, discarded, and replaced with charges from a different batch number that has demonstrated successful 20 percent sampling of the charges.

b. Operational Surveillance

Explosively actuated valves shall be subject to the following surveillance activities after commencing plant operation:

(1) At least once every 2 years, each explosively actuated valve shall undergo visual external examination and remote internal examination (including evaluation and removal of fluids or contaminants that may interfere with operation of the valve) to verify the operational readiness of the valve and its actuator. This examination shall also verify the appropriate position of the internal actuating mechanism and proper operation of remote position indicators. Corrective action shall be taken to resolve any deficiencies identified during the examination with post-maintenance testing conducted that satisfies the preservice testing requirements.

(2) At least once every 10 years, each explosively actuated valve shall be disassembled for internal examination of the valve and actuator to verify the operational readiness of the valve assembly and the integrity of individual components and to remove any foreign material, fluid, or corrosion. The examination schedule shall provide for both of the 2 valve designs used for explosively actuated valves at the facility to be included among the explosively actuated valves to be disassembled and examined every 2 years. Corrective action shall be taken to resolve any deficiencies identified during the examination with post-maintenance testing conducted that satisfies the preservice testing requirements.

(3) For explosively actuated valves selected for test sampling every 2 years in accordance with the ASME OM Code, the operational readiness of the actuation logic and associated electrical circuits shall be verified for each sampled explosively actuated valve following removal of its charge. This must include confirmation that sufficient electrical parameters (voltage, current, resistance) are available for each valve actuation circuit. Corrective action shall be taken to resolve any deficiencies identified in the actuation logic or associated electrical circuits.

(4) For explosively actuated valves selected for test sampling every 2 years in accordance with the ASME OM Code, the sampling must select at least 1 explosively actuated valve from each redundant safety train. Each sampled pyrotechnic charge shall be tested in the valve or a qualified test fixture to confirm the capability of the charge to provide the necessary motive force to operate the valve to perform its intended function without damage to the valve body or connected piping. Corrective action shall be taken to resolve any deficiencies identified in the capability of a pyrotechnic charge in accordance with the preservice testing requirements.

This license condition shall expire upon (1) incorporation of the above surveillance provisions for explosively actuated valves into the facility's IST program, or (2) incorporation of IST requirements for explosively actuated valves in new reactors (i.e., plants receiving a construction permit, or COL for construction and operation, after January 1, 2000) to be specified in a future edition of the ASME OM Code as incorporated by reference in 10 CFR 50.55a, including any conditions imposed by the NRC, into the facility's IST program.

3.9.6.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the design-related information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements. The results of the staff's review of the material in the AP1000 DCD related to the IST operational program for pumps, valves, and dynamic restraints are in this SER section.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the guidance in Section 3.9.6 of NUREG-0800 and in RG 1.206. The staff based its conclusion on the following:

- PTN DEP 6.4-2, related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.
- STD COL 3.9-4, regarding the operational program for pumps, valves, and dynamic restraints is acceptable because the requirements of 10 CFR 52.79(a) are satisfied.

3.9.7 Integrated Head Package

AP1000 DCD, Section 3.9.7, describes the integrated head package (IHP). The IHP combines several components in one assembly to simplify refueling the reactor. The IHP includes a lifting rig, seismic restraints for CRDM, support for reactor head vent piping, cable bridge, power cables, cables for in-core instrumentation, cable supports, and shroud assembly. The IHP provides the ability to rapidly disconnect cables, including the CRDM power cables, digital rod position indication cables, and in-core instrument cables from the components.

Section 3.9 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 3.9.7, "Integrated Head Package," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ On the basis of its review, the staff confirms that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

3.10 Seismic and Dynamic Qualification of Mechanical and Electrical Equipment

3.10.1 Introduction

Seismic and dynamic qualification of seismic Category I equipment includes the following types:

- safety-related active mechanical equipment that performs a mechanical motion while accomplishing a system safety-related function (e.g., pumps, valves, and valve operators)
- safety-related, nonactive mechanical equipment whose mechanical motion is not required while accomplishing a system safety-related function, but whose structural integrity must be maintained in order to fulfill its design safety-related function
- safety-related instrumentation and electrical equipment and certain monitoring equipment

Mechanical and electrical equipment (including instrumentation and controls), and where applicable, their supports classified as seismic Category I must demonstrate that they are capable of performing their intended safety-related functions under the full range of normal and accident (including seismic) loadings. This equipment includes devices associated with systems essential to safe shutdown, containment isolation, reactor core cooling, and containment and reactor heat removal, or is otherwise essential in preventing significant release of radioactive material to the environment or in mitigating the consequences of accidents.

The criteria for the seismic and dynamic qualification include the following considerations:

- adequacy of seismic and dynamic qualification input motions
- methods and procedures for qualifying electrical equipment, instrumentation, and mechanical components
- methods and procedures for qualifying supports of electrical equipment, instrumentation, and mechanical components
- documentation

3.10.2 Summary of Application

Section 3.10 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 3.10 of the AP1000 DCD, Revision 19.

Section 3.10 of the Turkey Point Units 6 and 7 COL FSAR does not include any COL information items or supplemental information related to AP1000 DCD, Section 3.10.

3.10.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the seismic and dynamic qualification of mechanical and electrical equipment are given in Section 3.10, Revision 3, of NUREG-0800.

3.10.4 Technical Evaluation

The NRC staff reviewed Section 3.10 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the seismic and dynamic qualification program. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP, Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting.

The following portion of this technical evaluation section is reproduced from Section 3.10.4 of the VEGP SER:

Implementation Program

In RAI 3.10-1, dated August 7, 2008, the applicant was requested to provide an implementation program, including milestones and completion dates with appropriate information submitted with sufficient time for staff review and approval prior to installation of the equipment, not prior to fuel loading, in accordance with Section C.I.3.10.4 of RG 1.206.

In its response, the applicant stated that details of the implementation milestones for the seismic and dynamic qualification program are not currently available, and are not expected to be available until after a detailed construction schedule of the plant has been developed. Appropriate scheduling information will be provided, when available, to the NRC as necessary to support timely completion of their inspection and audit functions. Additionally, seismic and dynamic qualification is the subject of ITAAC, and 10 CFR 52.99(a) does not require that a schedule for implementing ITAAC be provided to the NRC until one year after issuance of the COL.

*The NRC staff determined that the applicant's response to RAI 3.10-1 is not adequate because, in accordance with Section C.I.3.10.4 of RG 1.206, if the results of seismic and dynamic qualification is not available at the time of the COL application, the applicant is expected to submit the following before the issuance of the combined license: (1) descriptions of the implementation program such as identification of seismic qualification methods (Testing or Analysis) for each type of equipment; and (2) milestones for when the different aspects of the seismic qualification program will be complete - dates or condition should be such that the NRC staff will be able to audit the qualification results prior to the installation of the equipment (not before fuel loading as part of the ITAAC program). This is **Open Item 3.10-1**.*

Resolution of Open Item 3.10-1

*In its responses dated February 5, 2010 and April 2, 2010, the VEGP applicant submitted a table providing the planned methods of seismic qualification for safety-related, seismic Category I equipment types listed in AP1000 DCD, Chapter 3, Table 3.2-3. Furthermore, the applicant stated that the seismic qualification packages will be available to the NRC as necessary to support timely completion of its inspection and audit functions. Because not all packages are expected to be completed within a year of the issuance of the COL (or at the start of construction as defined in 10 CFR 50.10(a), whichever is later), a schedule for the availability of the seismic qualification packages will be included with the schedule information for closure of ITAAC (as required by 10 CFR 52.99(a)). The staff finds the applicant's response acceptable, and Open Item 3.10-1 is closed. The incorporation of the planned changes to the VEGP COL FSAR will be tracked as **Confirmatory Item 3.10-1**.*

Resolution of Standard Content Confirmatory Item 3.10-1

Confirmatory Item 3.10-1 is an applicant commitment to revise its FSAR to address seismic qualification for Category I equipment. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 3.10-1 is now closed.

3.10.5 Post-Combined License Activities

There are no post-COL activities related to this section.

3.10.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff compared the information in the application to the relevant NRC regulations and the acceptance criteria in Section 3.10 of NUREG-0800. The staff's review confirmed that the applicant has adequately addressed the seismic qualification of equipment in accordance with the requirements of GDC 2, GDC 4, and GDC 14.

3.11 Environmental Qualification of Mechanical and Electrical Equipment

3.11.1 Introduction

The objectives of environmental qualification (EQ) are to reduce the potential for common failure due to specified environmental and seismic events and to demonstrate that equipment within the scope of the EQ Program is capable of performing its intended design safety function under all conditions including environmental stresses resulting from design bases events. The information presented includes identification of the equipment required to be environmentally qualified and, for each item of equipment, the designated functional requirements, definition of the applicable environmental parameters, and documentation of the qualification process employed to demonstrate the required environmental capability. During plant operation, the licensee implements the EQ Program, which specifies the replacement frequencies of affected safety-related equipment in harsh environments, and nonsafety-related equipment whose failure under the postulated environmental conditions could prevent satisfactory performance of the safety functions of the safety-related equipment, and certain post-accident monitoring equipment. The seismic qualification of mechanical and electrical equipment is presented in Section 3.10. The portions of post-accident monitoring equipment required to be environmentally qualified are identified in AP1000 DCD, Table 7.5-1.

RG 1.206 discusses the Commission's position provided in SECY-05-0197, that operational programs should be fully described in COL applications to avoid the need to specify ITAAC for those programs. The applicant relies on the Turkey Point Units 6 and 7 COL application with its incorporation by reference of the AP1000 DCD and supplemental information to fully describe the EQ and other related operational programs in support of the COL application for Turkey Point Units 6 and 7.

3.11.2 Summary of Application

Section 3.11 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 3.11 of the AP1000 DCD, Revision 19. Section 3.11 of the AP1000 DCD describes the EQ Program for electrical and mechanical equipment to be used in the AP1000 certified design.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 3.11, the applicant provided the following:

Departures

- PTN DEP 3.11-1

The applicant provided additional information about PTN DEP 3.11-1 in Section 3.11.5 of the FSAR, related to the “Environmental Zone” for three spent fuel pool level instruments (SFS-JE-LT 019A, SFS-JE-LT 019B, and SFS JE LT 019C) from AP1000 DCD, Table 3.11-1, “Environmentally Qualified Electrical and Mechanical Equipment,” (Sheet 14 of 51) to correct the location of those instruments.

- PTN DEP 6.4-2

The applicant provided additional information in Tables 3.11-1R, 3I.6-2R, and 3I.6-3R and in Figure 3D.5-1R of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related PTN DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

AP1000 COL Information Item

- STD COL 3.11-1

In Turkey Point Units 6 and 7 COL FSAR, Section 3.11.5, “Combined License Information Item for Equipment Qualification File,” the applicant provided additional information to address COL Information Item 3.11-1 (COL Action Item 3.11.2-1) regarding administrative control of the EQ Program for Turkey Point Units 6 and 7.

License Conditions

- Part 10, License Condition 3, Item G1

The applicant proposed a license condition providing the implementation milestone for the EQ Program.

- Part 10, License Condition 6

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of operational programs, including the EQ Program.

3.11.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the EQ of mechanical and electrical equipment are given in Section 3.11, Revision 3, of NUREG-0800.

The applicable regulatory requirements for the Operational EQ Program are as follows:

10 CFR 52.79(a)(10) requires that a COL application provide a description of the program, and its implementation, required by 10 CFR 50.49(a) for the EQ of electric equipment important to safety and the list of electric equipment important to safety that is required by 10 CFR 50.49(d).

10 CFR 52.79(a)(29)(i) requires that a COL application provide plans for conduct of normal operations, including maintenance, surveillance, and periodic testing of SSCs.

RG 1.206 provides guidance for a COL applicant in preparing and submitting its COL application in accordance with the NRC regulations. For example, Section C.IV.4 in RG 1.206 discusses the requirement in 10 CFR 52.79(a) for descriptions of operational programs that need to be included in the FSAR for a COL application to allow a reasonable assurance finding of acceptability. In particular, a COL applicant should fully describe EQ and other operational programs as defined in Commission Paper SECY-05-0197 to avoid the need for ITAAC for the implementation of those programs. The term “fully described” for an operational program should be understood to mean that the program is clearly and sufficiently described in terms of scope and level of detail to allow a reasonable assurance finding of acceptability. Further, operational programs should be described at a functional level and an increasing level of detail where implementation choices could materially and negatively affect the program effectiveness and acceptability. The Commission approved the use of a license condition for operational program implementation milestones that are fully described or referenced in the FSAR as discussed in the SRM for SECY-05-0197, dated February 22, 2006.

3.11.4 Technical Evaluation

The NRC staff reviewed Section 3.11 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the EQ of mechanical and electrical equipment. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP, Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAls identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting.

Departure

- PTN DEP 3.11-1

In Turkey Point Units 6 and 7 COL FSAR, Table 3.11-1R, the applicant included a departure of “Environmental Zone” for three spent fuel pool level instruments (SFS-JE-LT019A, SFS-JE-LT019B, and SFS-JE-LT019C) from AP1000 DCD, Table 3.11-1, “Environmentally Qualified Electrical and Mechanical Equipment,” (Sheet 14 of 51) to correct the location of those instruments. This change updates DCD Table 3.11-1 and addresses the spent fuel pool level instruments concern related to the Fukushima Lessons Learned report. All the aforementioned instruments currently shown in an Environmental Zone (number) 11 will change (i.e., SFS-JE-LT019A to Environmental Zone 6, SFS-JE-LT019B to Environmental Zone 7, and SFS-JE-LT019C to Environmental Zone 6) in the proposed DCD Table 3.11-1.

The staff reviewed the departure that corrects the location of three spent fuel pool level instruments (i.e., Environmental Zone from 11 to 6 and 7). The staff finds that the above corrections do not result in any changes in the environmental qualification requirements (i.e., environment, “Function,” “Operating Time Required,” and “Qualification Program”). Thus, the staff concludes the departure is acceptable.

The following portion of this technical evaluation section is reproduced from Section 3.11.4 of the VEGP SER:

AP1000 COL Information Item

- STD COL 3.11-1

The COL information item for the EQ file in Section 3.11.5 of the AP1000 DCD, states:

Westinghouse Electric Company LLC will act as the agent for the COL holder during the equipment design phase, equipment selection and procurement phase, equipment qualification phase, plant construction phase, and ITAAC inspection phases.

The COL holder will define the process and procedures for which the equipment qualification files will be accepted from Westinghouse and how the files will be retained and maintained in an auditable format for the period that the equipment is installed and/or stored for future use in the nuclear power plant.

This commitment was also captured as COL Action Item 3.11.2-1 in the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

Pursuant to 10 CFR 50.49(j), the COL applicant shall keep the list and information in the file current and retain the file in auditable form for the entire period during which the covered item is installed in the nuclear power plant or is stored for the future use to permit verification that each item of electrical equipment important to safety (1) is qualified for its application, and (2) meets its specified performance requirements. To conform with 10 CFR 50.49, electrical equipment for PWRs referencing the AP1000 design should be qualified according to the criteria in Category I of NUREG-0588 and Revision 1 of RG 1.89.

This commitment was also listed as COL Action Item 3.11.2-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant is responsible for maintaining the equipment qualification file during the equipment selection and procurement phase.

In STD COL 3.11-1, the applicant describes under "Combined License Information Item for Equipment Qualification File," that the COL holder is responsible for the maintenance of the equipment qualification file. The NRC staff reviewed STD COL 3.11-1 related to equipment qualification file included under Section 3.11.5 of the BLN COL. The NRC staff's evaluation is as follows.

Section 3.11.5 of the BLN COL FSAR states that the COL holder is responsible for the maintenance of the equipment qualification file upon receipt from the reactor vendor. EQ files developed by the reactor vendor are maintained as applicable for equipment and certain post-accident monitoring devices that are subject to a harsh environment. The files are maintained for the operational life of the plant.

The Environmental Qualification Master Equipment List (EQMEL) identifies the electrical and mechanical equipment or components that must be environmentally qualified for use in a harsh environment. The BLN COL FSAR states that the EQMEL and a summary of equipment qualification results are maintained as part of the equipment qualification file for the operational life of the plant. Administrative programs are in place to control revision to the EQ files and the EQMEL. When adding or modifying components in the EQ Program, EQ files are generated or revised to support qualification. The EQMEL is revised to reflect these new components. Plant modifications and design basis changes are subject to change process reviews, e.g., reviews in accordance with 10 CFR 50.59 or Section VIII of Appendix D to 10 CFR Part 52, in accordance with appropriate plant procedures. Any changes to the EQMEL that are not the result of a modification or design basis change are subject to a separate review that is accomplished and documented in accordance with plant procedures.

Based on the above, the NRC staff concludes that the COL applicant would keep the equipment qualification file and information in the file current and retain the file in an auditable form for the entire period during which the covered item is installed in the nuclear power plant or is stored for the future use to permit verification that each item of electrical equipment important to safety: (1) is qualified for its application; and (2) meets its specified performance requirements. This is consistent with 10 CFR 50.49(j) and acceptable.

In addition, the staff requested additional information related to specific implementation of this program, which is discussed below.

*BLN COL FSAR Section 3.11 incorporates by reference AP1000 DCD Tier 2, Section 3.11.2.2, "Environmental Qualification of Mechanical Equipment," in the AP1000 DCD, which references Appendix 3D, "Methodology for Qualifying AP1000 Safety-Related Electrical and Mechanical Equipment." In RAI 3.11-1, the NRC staff requested that the applicant describe in more detail the EQ Program for safety-related mechanical equipment to be used at BLN Units 3 and 4. In its response, the applicant stated that the EQ Program will be performed as described in Section 3.11 and Appendix 3D of the AP1000 DCD, by reference as stated in the BLN COL FSAR. The EQ Program will be implemented through design specifications, equipment procurement documents, and equipment qualification procedures. Equipment qualification specifications and equipment design specifications will be developed based on the AP1000 EQ requirements. The incorporation of the AP1000 DCD, Section 3.11 and Appendix 3D into the BLN COL FSAR also includes future maintenance, surveillance, and replacement activities to maintain EQ over the life of the BLN plant through operational programs and procedures. AP1000 DCD, Table 3.11-1 provides a listing of the safety-related mechanical equipment, its location, and the environment to be considered in the EQ Program. AP1000 DCD, Appendix 3D, describes: (1) qualification methodology for the critical safety-related nonmetallic sub-components; (2) thermal and radiation information for the nonmetallic components used in safety-related mechanical equipment; (3) plant normal, abnormal, and accident environmental parameters; and (4) documentation requirements. On October 14 and 15, 2008, the NRC staff conducted an onsite review of design and procurement specifications, including EQ, for pumps, valves, and dynamic restraints to be used for the AP1000 reactor at the Westinghouse offices in Monroeville, PA. The staff found that Westinghouse had included ASME Standard QME-1-2007, "Qualification of Active Mechanical Equipment Used in Nuclear Power Plants," in its design and procurement specifications for AP1000 components, including ASME QME-1, Appendix QR-B, "Guide for Qualification of Nonmetallic Parts." At the conclusion of the onsite review, the staff provided comments on the AP1000 design procurement specifications, and Westinghouse indicated that those comments would be addressed in a future revision to the specifications. The staff also identified several items that remain open from the onsite review that are specified in Section 3.9.6 of the SER on the AP1000 DCD revision. As noted in Section 3.9.6 of the BLN COL FSAR, the NRC staff documented the results of the on-site review with follow-up items in a memorandum dated November 6, 2008, (ML083110154). **This is Open Item 3.11-1.***

Section 3D.6.2.3, "Analysis of Safety-Related Mechanical Equipment," in the AP1000 DCD, Appendix 3D, summarizes the EQ of safety-related mechanical equipment by analysis methods, but does not discuss implementation of the EQ approach. In RAI 3.11-2, the NRC staff requested that the applicant discuss the implementation of the EQ approach, including the application of industry standards, prescribed in Section 3D.6.2.3 in Appendix 3D to Chapter 3 in the AP1000 DCD. In its response to this RAI, the applicant stated that equipment qualification specifications and equipment design specifications have been developed based on the AP1000 DCD EQ requirements. The applicant stated that these procurement documents reference ASME QME-1 and Institute of Electrical and Electronic Engineers (IEEE) Standard 323 for the EQ of active safety-related mechanical equipment. As noted above, the NRC staff conducted an onsite review of the Westinghouse design and procurement specifications for the AP1000 components on October 14 and 15, 2008. The issues in this RAI are being addressed under **Open Item 3.11-1**. Therefore, RAI 3.11-2 is closed.

AP1000 DCD, Appendix 3D, Section 3D.6.3, "Operating Experience in the Equipment Qualification Program," states that the COL applicant will provide documentation of the EQ methodology where seismic experience data are used. In RAI 3.11-3, the NRC staff requested that the applicant discuss the documentation of the EQ methodology where seismic experience data are used. In its response to this RAI, the applicant stated that Westinghouse would revise the AP1000 DCD to resolve this issue. Revision 17 to the AP1000 DCD, Appendix 3D, Section 3D.6.3 specifies that qualification by experience is not employed in the AP1000 equipment qualification program as a method of qualification. The applicant revised the BLN COL FSAR to reflect the revision to the AP1000 DCD. Therefore, RAI 3.11-3 is resolved.

The section titled "In-Service Vibration" in Section B.4.5, "External Stresses," in Attachment B, "Aging Evaluation Program," to Appendix 3D to Chapter 3 in the AP1000 DCD, states that inservice pipe and FIV may be significant for line-mounted equipment. As a consequence, the section states that an additional vibration aging step is included in the aging sequence. Operating experience has revealed that FIV from acoustic resonance and hydraulic loading can adversely impact safety-related mechanical equipment at nuclear power plants. The COL applicant will demonstrate the performance of this additional vibration aging step specified in the AP1000 DCD in the EQ of safety-related mechanical equipment to be used at BLN Units 3 and 4. This technical issue is addressed in Section 3.9.6 of this SER.

License Conditions

Section 3, "Operational Program Implementation," in Part 10 of the BLN COL application provides proposed license conditions for operational program implementation. One specified license condition is that the EQ Program will be implemented prior to initial fuel loading. In addition, Section 6 in Part 10 provides a proposed license condition for operational program readiness that requires the licensee to submit a schedule no later than 12 months after COL issuance that supports planning and conducting NRC inspections of operational programs with

periodic updating. These license conditions are consistent with the policy established in SECY-05-0197 and are, thus, acceptable.

Resolution of Standard Content Open Item 3.11-1

Standard Content Open Item 3.11-1 resulted from the identification of items that remained open from the October 14 and 15, 2008, onsite review at Westinghouse offices of design and procurement specifications, including EQ, for pumps, valves, and dynamic restraints to be used for the AP1000 reactor. As noted in Section 3.9.6.4 of the BLN COL FSAR, the NRC staff documented the results of the onsite review with follow-up items in a memorandum dated November 6, 2008. In a letter dated December 14, 2009, the VEGP applicant stated that it had not identified any specific actions for the VEGP COL application based on the audit open items. The NRC staff's discussion of the audit of the EQ specifications, which includes the issues in RAI 3.11-2 addressed to the BLN applicant, is in NUREG-1793 and its supplements. Therefore, Standard Content Open Item 3.11-1 is resolved for the VEGP COL application.

Supplemental Review of Operational Aspects of the EQ Program

As discussed in RG 1.206 and Commission Paper SECY-05-0197, COL applicants must fully describe their operational programs to avoid the need for ITAAC regarding those programs. In addition to the initial EQ of electrical and mechanical equipment, the NRC staff reviewed the VEGP COL FSAR Section 3.11 with its incorporation by reference of the AP1000 DCD and supplemental information for operational aspects of the EQ Program. For example, AP1000 DCD Tier 2, Appendix 3D, Section 3D.7, "Documentation," states that information regarding maintenance, refurbishment, or replacement of the equipment will be included in the equipment qualification package if necessary to provide confidence in the equipment's capability to perform its safety function. Further, Section 3D.7.1, "Equipment Qualification Data Package," states that equipment qualification data packages will specify preventive maintenance that is required to support qualification or the qualified life, including maintenance or periodic activities assumed as part of the qualification program or necessary to support qualification. With respect to safety-related mechanical equipment, AP1000 DCD Tier 2, Section 3D.6.2.3.8, "Equipment Qualification Maintenance Requirements," specifies that maintenance requirements resulting from EQ activities will be based on: (1) qualification evaluation results (for example, periodic replacement of age-susceptible parts before the end of their qualified life); (2) equipment qualification-related maintenance activities derived from the qualification report; and (3) vendor recommended equipment qualification maintenance, if required, in order to maintain qualification. The staff finds that the VEGP COL applicant provides an acceptable description of the transition from the initial to the operational aspects of the EQ Program in support of the VEGP COL application through the VEGP COL FSAR with its incorporation by reference of the AP1000 DCD Tier 2, Section 3.11. The NRC staff will evaluate the implementation of the EQ Program through inspections conducted during plant construction and operation. The NRC inspection activities will include consideration of: (1) evaluation of EQ results for design life to establish activities

to support continued EQ; (2) determination of surveillance and preventive maintenance activities based on EQ results; (3) consideration of EQ maintenance recommendations from equipment vendors; (4) evaluation of operating experience in developing surveillance and preventive maintenance activities for specific equipment; (5) development of plant procedures that specify individual equipment identification, appropriate references, installation requirements, surveillance and maintenance requirements, post-maintenance testing requirements, condition monitoring requirements, replacement part identification, and applicable design changes and modifications; (6) development of plant procedures for reviewing equipment performance and EQ operational activities, and for trending the results to incorporate lessons learned through appropriate modifications to the EQ Program; and (7) development of plant procedures for the control and maintenance of EQ records.

Based on the above discussion, the NRC staff finds the information added to the VEGP COL application as part of STD COL 3.11-1 to be acceptable.

License Conditions

- *Part 10, License Condition 3, Item G1*

The applicant proposed a license condition providing the implementation milestone for the EQ Program.

- *Part 10, License Condition 6*

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of operational programs including the EQ Program.

These license conditions are consistent with the policy established in SECY-05-0197 and are, thus, acceptable.

3.11.5 Post-Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated April 8, 2016 (ADAMS Accession No. ML16103A507), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

- License Condition (3-8) – Before initial fuel load, the licensee shall implement the EQ Program.
- License Condition (3-9) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO a schedule that supports planning for and conduct of NRC inspections of the EQ Program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the EQ Program has been fully implemented.

3.11.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the guidance in Section 3.11 of NUREG-0800 and in RG 1.206. The staff based its conclusion on the following:

- PTN DEP 3.11-1, regarding a correction to the Environmental Zone designation for three level instruments for the spent fuel pool, is acceptable because the correction does not result in any changes in the environmental qualification requirements applicable to the instruments.
- PTN DEP 6.4-2, related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.
- STD COL 3.11-1, regarding the administrative control of the EQ Program for Turkey Point Units 6 and 7, is acceptable because the requirements of 10 CFR 52.79(a)(10) and 10 CFR 52.79(a)(29)(i) are satisfied.

3.12 Piping Design (Related to RG 1.206, Section C.III.1, Chapter 3, C.I.3.12, "Piping Design Review")

3.12.1 Introduction

This section covers the design of the piping system and piping support for seismic Category I, Category II, and nonsafety systems. It also discusses the adequacy of the structural integrity, as well as the functional capability, of the safety-related piping system, piping components, and their associated supports. The design of piping systems should ensure that they perform their safety-related functions under all postulated combinations of normal operating conditions, system operating transients, postulated pipe breaks, and seismic events. This includes pressure-retaining piping components and their supports, buried piping, instrumentation lines, and the interaction of NS Category I piping and associated supports with seismic Category I piping and associated supports. This section covers the design transients and resulting loads and load combinations with appropriate specified design and service limits for seismic Category I piping and piping support, including those designated as ASME Code Classes 1, 2, and 3.

3.12.2 Summary of Application

Chapter 3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Chapter 3 of the AP1000 DCD, Revision 19. Sections 3.7 and 3.9 of the AP1000 DCD address

Section 3.12, "ASME Code Class 1, 2, and 3 Piping Systems, Piping Components and Their Associated Supports" of NUREG-0800.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Sections 3.7 and 3.9, the applicant provided the following:

Supplemental Information

- PTN SUP 3.7-1

PTN SUP 3.7-1 adds a new Section 3.7.1.1.1 to demonstrate that the AP1000 DCD design values for the CSDRS and HRHF response spectra are acceptable for the Turkey Point Units 6 and 7 site.

AP1000 COL Information Items

- STD COL 3.9-2

The applicant provided additional information in STD COL 3.9-2 to address COL Information Item 3.9-2, which states that design specifications and design reports for the ASME Code, Section III, piping will be available for the NRC's review and that reconciliation of these documents is completed after construction and prior to fuel load.

- STD COL 3.9-5

The applicant provided additional information in STD COL 3.9-5 to address COL Information Item 3.9-5, which provides a description for pressurizer surge line monitoring.

- STD COL 3.9-7

In its letter dated November 15, 2010, the applicant endorsed the letter dated April 23, 2010, from the VEGP applicant, that proposed to add STD COL 3.9-7 to the FSAR. This COL item provides additional information on the process to be used to complete the piping design and ITAAC added to verify the design.

License Condition

- Part 10, License Condition 2, Item 3.9-7

In its letter dated November 15, 2010, the applicant endorsed the letter dated April 23, 2010, from the VEGP applicant, that proposed a license condition addressing the as-designed piping analysis completion schedule.

ITAAC

The applicant incorporated the information endorsed in the letter dated April 23, 2010, from the VEGP applicant, that proposed ITAAC requiring the completion of a design report referencing the as-designed piping calculation packages, including the ASME Code, Section III, piping

analysis, support evaluations, and piping component fatigue analysis for Class 1 piping using the methods and criteria outlined in AP1000 DCD, Table 3.9-19.

3.12.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the pipe and support analysis are given in Section 3.12, Revision 1, of NUREG-0800.

3.12.4 Technical Evaluation

The NRC staff reviewed Section 3.9 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the piping design review. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and uses this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP, Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAs.
- The staff confirmed that all responses to RAs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting.

The following portion of this technical evaluation section is reproduced from Section 3.12.4 of the VEGP SER:

Due to the significant amount of new information provided by both the VEGP applicant and Westinghouse on the piping design issues since the development

of the BLN SER for Section 3.12, the NRC staff decided not to use the BLN SER material as a starting point for the evaluation of these issues.

AP1000 COL Information Items

- STD COL 3.9-2

COL Information Item 3.9-2 states that design specifications and design reports for the ASME Code, Section III piping will be available for the NRC's review and that reconciliation of the piping is completed prior to fuel load in accordance with an ITAAC in AP1000 DCD Tier 1, Section 2. The discussion on STD COL 3.9-7 below addresses design specifications and design reports.

The staff acknowledged that an ITAAC in the AP1000 DCD Tier 1 addresses verification of this aspect of the design and that COL Information Item 3.9-2 has been addressed.

- STD COL 3.9-5

The staff reviewed STD COL 3.9-5 (surge line thermal monitoring) and determined that the proposed program did not provide sufficient information for the staff to determine reasonable assurance for safety. The staff issued RAI 3.12-2 to ask the applicant to provide additional information including a test abstract including stating the standard operating conditions in Chapter 14 that identifies the objective, prerequisites, test method, data required, and acceptance criteria for surge line thermal monitoring that complies with NRC Bulletin 88-11, "Pressurizer Surge Line Thermal Stratification." In this RAI, the staff also noted that:

For subsequent SCOLs, the design is such that assumptions are made that the layout will be the same such that monitoring of the follow-on plants is not required. However, all plants are required to comply with NRC Bulletin 88-11. Given that the heatup and cooldown procedures have not been developed and the affect on the plant, even with similar layout, will be different depending on the procedures used, subsequent plants will need to verify that they will be using the same heatup and cooldown procedures as the monitored plant to comply with NRC Bulletin 88-11.

In a letter dated July 2, 2010, the applicant provided its response to address the staff's concern. In the response, the applicant stated that VEGP COL FSAR Section 3.9.3.1.2 would be revised to add the following paragraph:

Subsequent AP1000 plants (after the first AP1000 plant) confirm that the heatup and cooldown procedures are consistent with the pertinent attributes of the first AP1000 plant surge line monitoring. In addition, changes to the heatup and cooldown procedures consider the potential impact on stress and fatigue analyses consistent with the concerns of NRC Bulletin 88-11.

In this letter, the applicant also added a new Section 14.2.9.2.22 to provide a test abstract. The test abstract included the purpose, prerequisites, general test methods, and acceptance criteria.

In a subsequent letter dated August 6, 2010, the applicant provided additional information for the location of test instruments. In the response, the applicant stated that VEGP COL FSAR Section 3.9.3.1.2 would be revised to add the following paragraph:

In addition to the existing permanent plant temperature instrumentation, temperature and displacement monitoring will be included at critical locations on the surge line. The additional locations utilized for monitoring during the hot functional testing and the first fuel cycle (see Subsection 14.2.9.2.22) are selected based on the capability to provide effective monitoring.

*The staff reviewed the RAI responses and concluded the position is acceptable to comply with NRC Bulletin 88-11. On this basis, the proposed program for surge line thermal monitoring is acceptable. The incorporation of the planned changes to the VEGP COL FSAR detailed in the applicant's July 2, 2010, and August 6, 2010, letters will be tracked as **Confirmatory Item 3.12-1**.*

Resolution of Standard Content Confirmatory Item 3.12-1

Confirmatory Item 3.12-1 is an applicant commitment to revise its FSAR Table 1.9-204 and Sections 3.9.3.1.2 and 3.9.8.5 for surge line monitoring testing. The staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 3.12-1 is now closed.

- **STD COL 3.9-7**

In letter dated April 23, 2010, the applicant proposes that the as-designed piping analysis is made available for NRC review. Additionally in this letter, License Condition 2, Item 3.9-7, proposed by the applicant, calls for the design to be made available for review prior to installation of the piping and adding a site-specific ITAAC in Table 3.8-# [where # is the next sequential number] of Part 10 of the VEGP COL application for verification of the ASME Code design reports. In this letter, the applicant also proposed adding Section 14.3.3.# [where # is the next sequential number] to the VEGP COL FSAR, describing the process to be followed to address closure of the piping DAC during the construction period, to complete the review of the piping design including an ITAAC to review the design, and an ITAAC to review reconciliation of the design after it is built.

The staff reviewed the applicant's proposed approach of including ITAAC for verification of the design and reconciliation of the design, and a license condition to address timing of when the initial design verification would occur. The approach, including the ITAAC and the license condition, is acceptable to the staff as it allows verification that the methodology described in the AP1000 DCD

and VEGP COL FSAR and the general requirements of the ASME Code, as specified in 10 CFR 50.55a, were met.

Proposed VEGP COL FSAR Section 14.3.3.# [where # is the next sequential number] also states that "The piping design completed for the first standard AP1000 plant will be available to subsequent standard AP1000 plants under the "one issue, one review, one position" approach for closure." Westinghouse letter dated August 17, 2010, as supplemented by letter dated August 23, 2010, stated that the ASME Code Class 1, 2 and 3 piping systems will be evaluated as part of the piping DAC for hard rock site to address hard rock site seismic issue. The standard AP1000 plant will have analysis that addresses both CSDRS and HRHF GMRS effect. Therefore, the one issue, one review, one position approach applies and the staff finds this acceptable for piping analysis.

*The incorporation of the planned changes to the VEGP COL application detailed in the applicant's April 23, 2010, letter and in response to hard rock seismic issues will be tracked as **Confirmatory Item 3.12-2**.*

Resolution of Standard Content Confirmatory Item 3.12-2

Confirmatory Item 3.12-2 is an applicant commitment to revise its FSAR Table 1.8-202, Section 3.9.8.2, Section 3.9.8.7, and Section 14.3.3.3 for pipe analysis and add an ITAAC (Table 3.8-2) for verification of the ASME Code design reports. The staff verified that the VEGP COL FSAR and Part 10 of the application (ITAAC Table 3.8-2) were appropriately updated. As a result, Confirmatory Item 3.12-2 is now closed.

Supplemental Information

- PTN SUP 3.7-1

Section 3.7.1.1.1 of the Turkey Point Units 6 and 7 COL FSAR states that a comparison of the Turkey Point Units 6 and 7 site-specific GMRS to the HRHF spectra and CSDRS is provided in Figures 2.0-201 and 2.0-202. These figures demonstrate that the Turkey Point Units 6 and 7 site-specific GMRS is enveloped by the AP1000 HRHF spectra. On this basis, the staff determined that the piping design with HRHF spectra input can be applied to Turkey Point Units 6 and 7 with adequate design margin.

3.12.5 Post-Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated April 8, 2016 (ADAMS Accession No. ML16103A507), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following ITAAC and license condition related to piping design analysis acceptable:

- The licensee shall perform and satisfy the piping design analysis ITAAC in SER Table 3-3.

- License Condition (3-10)—Before commencing installation of individual piping segments identified in AP1000 DCD, Revision 19, Section 3.9.8.7, and connected components in their final locations in the facility, the licensee shall complete the analysis of the as-designed individual piping segments and shall inform the Director of NRO, or the Director's designee, in writing, upon the completion of these analyses and the availability of the design reports for the selected piping packages.

3.12.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL application is acceptable and meets the NRC regulations. The staff based its conclusion on the following:

- STD COL 3.9-2 is acceptable because it meets the general requirements of the ASME Code, as specified by 10 CFR 50.55a.
- STD COL 3.9-5 is acceptable because it is consistent with pressurizer surge line monitoring discussed in 10 CFR Part 52, Appendix D, "Design Certification Rule for the AP1000 Design."
- STD COL 3.9-7 is acceptable because it meets the general requirements of the ASME Code, as specified by 10 CFR 50.55a.
- PTN SUP 3.7-1 is acceptable and meets the guidance in Section 3.12 of NUREG-0800 because the Turkey Point site-specific GMRS are enveloped by the HRHF spectra and, therefore, the AP1000 DCD design values for the CSDRS are acceptable for the Turkey Point site.

Table 3-3 Piping Design ITAAC

Design Commitment	Inspections, Tests, Analyses	Acceptance Criteria
The ASME Code, Section III piping is designed in accordance with the ASME Code, Section III requirements.	Inspection of the ASME Code Design Reports (NCA-3550) and required documents will be conducted for the set of lines chosen to demonstrate compliance.	The ASME Code Design Report(s) (NCA-3550) (certified, when required by the ASME Code) exist and conclude that the design of the piping for lines chosen to demonstrate all aspects of the piping design complies with the requirements of the ASME Code section.

5.0 REACTOR COOLANT SYSTEM AND CONNECTED SYSTEMS

5.1 Introduction

The reactor coolant system (RCS) consists of two heat transfer circuits, each with a steam generator, two reactor coolant pumps and a single hot leg and two cold legs for circulating reactor coolant. In addition, the system includes the pressurizer, interconnecting piping/valves and instrumentation for operational control and safeguards actuation. All RCS equipment is located in the reactor containment. The RCS is designed to transfer heat generated by the reactor core, located in the reactor vessel (RV), to the secondary side of the steam generators for plant power generation.

Section 5.1 of the Turkey Point Units 6 and 7 combined license (COL) Final Safety Analysis Report (FSAR), Revision 8, incorporates by reference, with no departures or supplements, Section 5.1 of Revision 19 of the AP1000 Design Control Document (DCD). The Nuclear Regulatory Commission (NRC) staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements.

5.2 Integrity of Reactor Coolant Pressure Boundary

5.2.1.1 *Compliance with 10 CFR 50.55a*

5.2.1.1.1 Introduction

Title 10 of the *Code of Federal Regulations* (10 CFR) 50.55a, "Codes and standards," incorporates by reference the American Society of Mechanical Engineers (ASME) *Boiler & Pressure Vessel Code* (BPV Code) and ASME Code for Operation and Maintenance for Nuclear Power Plants (OM Code), including Editions and Addenda for ASME Class 1, 2, and 3 components, required for component design, construction, inservice inspection (ISI), and inservice testing (IST).

AP1000 DCD, Tier 2, Table 3.2-1 classifies the pressure-retaining components of the reactor coolant pressure boundary (RCPB) as ASME BPV Code, Section III, Class 1 components. These Class 1 components are designated quality group (QG) A in conformance with Regulatory Guide (RG) 1.26, "Quality Group Classifications and Standards for Water-, Steam-, and Radioactive-Waste-Containing Components of Nuclear Power Plants," Revision 3.

5.2.1.1.2 Summary of Application

Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 5.2 of the AP1000 DCD, Revision 19. Section 5.2 of the DCD includes Section 5.2.1.1.

¹ See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 5.2.1.1, the applicant provided the following:

AP1000 COL Information Item

- STD COL 5.2-1

The applicant provided additional information in Standard (STD) COL 5.2-1 to address COL Action Item 5.2.1.1-1 identified in NUREG-1793, Appendix F, "Combined License Action Items" and COL Information Item 5.2-1 discussed in Section 5.2.6.1, "ASME Code and Addenda," of the AP1000 DCD. The portion of STD COL 5.2-1 evaluated here applies to ASME BPV Code reconciliation. The portion applicable to Code cases is reviewed in Section 5.2.1.2 of this safety evaluation report (SER).

In particular, Turkey Point Units 6 and 7 COL FSAR Section 5.2.1.1 states:

If a later Code edition/addenda than the Design Certification Code edition/addenda is used by the material and/or component supplier, then a code reconciliation to determine acceptability is performed as required by the ASME Code, Section III, NCA-1140. The later Code edition/addenda must be authorized in 10 CFR 50.55a or in a specific authorization as provided in 50.55a(a)(3). Code Cases to be used in design and construction are identified in the DCD; additional Code Cases for design and construction beyond those for the design certification are not required.

Inservice inspection of the reactor coolant pressure boundary is conducted in accordance with the applicable edition and addenda of the ASME Boiler and Pressure Vessel Code Section XI, as described in Subsection 5.2.4. Inservice testing of the reactor coolant pressure boundary components is in accordance with the edition and addenda of the ASME OM Code as discussed in Subsection 3.9.6 for pumps and valves, and as discussed in Subsection 3.9.3.4.4 for dynamic restraints.

5.2.1.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the ASME BPV Code reconciliation are given in Section 5.2.1 of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)."

The applicable regulatory requirements for the NRC staff's review of STD COL 5.2-1 are provided in 10 CFR 50.55a, as it relates to the establishment of the minimum quality standards for the design, fabrication, erection, construction, testing, and inspection of RCPB components and other safety-related fluid systems of pressurized-water reactor (PWR) nuclear power plants by compliance with appropriate editions of published industry codes and standards. The regulatory basis is also provided in 10 CFR Part 50, "Domestic licensing of production and utilization facilities," Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criterion (GDC) 1, "Quality Standards and Records," as it relates to requirements that

nuclear power plant structures, systems, and components (SSCs) important to safety be designed, fabricated, erected, and tested to quality standards commensurate with the importance of the safety function to be performed.

5.2.1.1.4 Technical Evaluation

The NRC staff reviewed Section 5.2.1.1 of the Turkey Point Units 6 and 7 COL FSAR and the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to integrity of the RCPB. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant [VEGP], Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application. There was a change to the AP1000 DCD and NUREG-1793 referenced in the standard content material. This change is discussed in this SER.

The following portion of this technical evaluation section is reproduced from Section 5.2.1.1.4 of the VEGP SER:

AP1000 COL Information Item

- STD COL 5.2-1

The NRC staff reviewed STD COL 5.2-1 related to ASME BPV Code reconciliation included under Section 5.2.1.1 of the BLN COL FSAR.

The regulations in 10 CFR 50.55a(a)(3) provide requirements to authorize alternatives to the regulations in 10 CFR 50.55a, while 10 CFR 50.55a(f)(6)(i) and 10 CFR 50.55(g)(6)(i) provide requirements to grant requests for relief from impractical ASME Code requirements. In addition, NUREG-1793, Section 5.2.1.1 provides a discussion on the need for allowing changes to the ASME Code Edition and Addenda during plant construction to ensure consistency between design and construction requirements.

Section 5.2.1.1 of the NRC staff's NUREG-1793 states:

DCD Tier 2, Section 5.2.1.1, states that the baseline code used to support the AP1000 DCD is ASME Code, Section III, 1998 Edition, up to and including the 2000 Addenda. However, the ASME Code, Section III, 1989 Edition, 1989 Addenda will be used for Articles NB-3200, NB-3600, NC-3600, and ND-3600 in lieu of the later edition and addenda. The use of these editions and addenda meets the requirements of 10 CFR 50.55a(b) and the associated modifications in 10 CFR 50.55a(b)(1)(iii) and is, thus, acceptable. Any proposed change to the use of the ASME Code editions or addenda by a Combined License (COL) applicant will require NRC approval prior to implementation.

The issue was also captured as COL Action Item 5.2.1.1-1 in Appendix F of NUREG-1793. The NRC staff states in Section 5.2.1.1 of NUREG-1793:

The COL applicant should ensure that the design is consistent with the construction practices (including inspection and examination methods) of the ASME Code edition and addenda, as endorsed in 10 CFR 50.55a. DCD Tier 2, Section 5.2.6.1, "ASME Code and Addenda," contains a commitment that the COL applicant will address consistency of the design with the construction practices (including inspection and examination methods) of the later ASME Code edition and addenda. The staff finds this to be an acceptable commitment. This is COL Action Item 5.2.1.1-1.

Specifically, the AP1000 DCD in Section 5.2.6.1 identified a COL information item stating:

The Combined License applicant will address in its application the portions of later Code editions and addenda to be used to construct components that will require NRC staff review and approval. The Combined License applicant will address consistency of the design with the construction practices

(including inspection and examination methods) of the later ASME Code edition and addenda added as part of the Combined License application. The Combined License applicant will address the addition of ASME Code cases approved subsequent to design certification.

The staff reviewed conformance of BLN's resolution to COL Action Item 5.2.1.1-1 to the guidance in NUREG-0800, Section 5.2.1.1, "Compliance with the Codes and Standards Rule, 10 CFR 50.55a." ASME Code, Section III, NCA-1140, "Use of Code Editions, Addenda, and Cases," states that specific provisions within an Edition or Addenda later than those established in the design specifications may be used, provided that all the related requirements are met. NCA-1140(a)(1) also states:

Under the rules of this Section [Section III], the Owner or his designee shall establish the Code Edition and Addenda to be included in the Design Specifications. All items of a nuclear power plant may be constructed to a single Code Edition and Addenda, or each item may be constructed to individually specified Code Editions and Addenda.

Accordingly, a COL applicant should establish whether it plans to use a single Code Edition and Addenda consistent with the certified design or to use individually specified Code Editions and Addenda. If individually specified Code Editions and Addenda are used, then differences between those Editions and Addenda are required to be reconciled consistent with requirements in the ASME BPV Code, Section III, NCA-1140.

The NRC staff found that Revision 0 to the BLN COL FSAR did not address NCA-1140 in describing the use of later Code Editions and Addenda. Therefore, in request for additional information (RAI) 5.2.1.1-1, the staff requested that the applicant explain the methodology for the ASME BPV Code reconciliation consistent with NCA-1140.

In its response to RAI 5.2.1.1-1 (this also applies to RAI 5.2.1.2-1 and RAI 5.2.1.1-3), the COL applicant described a revision to the FSAR to address this issue. Revision 1 to BLN COL FSAR Section 5.2.1.1, specifies that the methodology used to ensure consistency of design and construction practices when using later Section III Code Editions and Addenda would conform to the provisions of NCA-1140, and that all related requirements of the Code case(s) would be met. The use of NCA-1140 addresses the provisions to be followed for reconciliation of later Editions/Addenda of the ASME BPV Code. As a result, RAI 5.2.1.1-1 and RAI 5.2.1.2-1 are closed.

Revision 0 of the BLN COL FSAR referred to the use of ASME BPV Code, Section XI, as part of the reconciliation process if a later-Code year/Addenda than the DC Code year/Addenda is used by the material and/or component supplier. In RAI 5.2.1.1-3, the staff requested that the applicant provide justification for the use of ASME BPV Code, Section XI, which addresses ISI at operating nuclear power plants, in the reconciliation process for new reactor designs.

In its response to RAI 5.2.1.1-3 (referring to the response to RAI 5.2.1.1-1), the applicant noted that ASME BPV Code, Section III components are being designed using the baseline ASME BPV Code defined in DCD Section 5.2.1.1. Design specifications for component and material procurement will specify the ASME BPV Code to be used for design and construction to be that identified in the DCD. The applicant also noted that the reference in FSAR Section 5.2.1.1 to the ASME BPV Code, Section XI reconciliation process for repair and replacement was inappropriate for the original design and construction. Therefore, the applicant stated that this reference would be corrected. Revision 1 to the BLN COL FSAR in Section 5.2.1.1 removes the reference to ASME BPV Code, Section XI, and states, if a later Code Edition/Addenda than the DC Code Edition/Addenda is used by the material and/or component supplier, then a Code reconciliation to determine acceptability is performed as required by the ASME Code, Section III, NCA-1140. The staff finds that Revision 1 to the BLN COL FSAR meets the requirements of 10 CFR 50.55a. As a result, RAI 5.2.1.1-3 is closed.

Revision 0 of the BLN COL FSAR referenced Revision 16 of the AP1000 DCD. AP1000 DCD, Revision 16 required the use of the 1989 Edition, 1989 Addenda for NB-3200, NB-3600, NC-3600 and ND-3600 for construction of components and piping. In RAI 5.2.1.1-5, the NRC staff requested that the applicant identify components that are designed and constructed using the 1989 ASME BPV Code and discuss whether these components will meet the requirements of the 1998 Edition through and including the 2000 Addenda ASME BPV Code, which is the Code of record for the AP1000 DCD. In its response to RAI 5.2.1.1-5, the applicant indicated that in a letter dated May 16, 2008, Westinghouse submitted a document (APP-GW-GLE-005) to address the limitation on the use of ASME Section III Code for seismic design in accordance with 10 CFR 50.55a(b)(1)(iii) as related to the use of the above four articles. The AP1000 DCD was accordingly changed in Revision 17 to limit the use of the 1989 Edition, 1989 Addenda to piping design only. Since BLN COL FSAR, Revision 1 incorporated by reference Revision 17 of AP1000 DCD, no components will be constructed using the 1989 Edition, 1989 Addenda Code and they will be used for piping design only. As a result, RAI 5.2.1.1-5 is closed.

AP1000 DCD, Section 5.2.1.1 discusses the application of ASME BPV Code, Section III, for the design and fabrication of RCPB components. In RAI 5.2.1.1-2, the NRC staff requested that the applicant discuss the application of other sections of the ASME BPV Code and the ASME Code for Operation and Maintenance of Nuclear Power Plants (OM Code) not specified in the AP1000 DCD, Section 5.2.1.1. In its response to RAI 5.2.1.1-2, provided in a letter dated July 25, 2008, the applicant discussed other sections in the AP1000 DCD and the BLN COL FSAR that reference the ASME BPV Code and the ASME OM Code. In response to RAI 5.2.1.1-2, the applicant stated that BLN COL FSAR Section 5.2.1.1 would be revised to address this issue. Revision 1 to the BLN COL FSAR in Section 5.2.1.1, specifies that ISI of the RCPB will be conducted in accordance with the applicable Edition and Addenda of the ASME BPV Code, Section XI, as described in BLN COL FSAR Section 5.2.4, "Inservice Inspection and Testing of Class 1 Components." The BLN COL FSAR, Revision 1 also specifies that IST of the RCPB components will be performed in

accordance with the applicable Edition and Addenda of the ASME OM Code as discussed in BLN COL FSAR Section 3.9.6, "Inservice Testing of Pumps and Valves," and as discussed in BLN COL FSAR Section 3.9.3.4.4, "Inspection, Testing, Repair and/or Replacement of Snubbers." Revision 1 to the BLN COL FSAR clarified the application of other sections of the ASME BPV Code and the ASME OM Code in the design, construction, and operation of BLN Units 3 and 4. As a result, RAI 5.2.1.1-2 is closed.

As discussed in NUREG-1793, use of the ASME BPV Code for the AP1000 reactor is Tier 1 information while the specific Edition and Addenda are designated Tier 2 because of the continually evolving design and construction practices (including inspection and examination techniques) of the ASME BPV Code. The NRC staff finds that the design and construction of ASME BPV Code Class 1, 2, and 3 components and their supports will conform to the appropriate ASME BPV Code Editions and Addenda and, thus, meet the relevant NRC regulations governing the use of codes and standards. The use of Editions and Addenda of the ASME BPV Code, Section III issued subsequent to the AP1000 design code of record may be used provided the Edition and Addenda are incorporated by reference in the regulations, and NRC staff approval is obtained as required for Tier 2* changes to the AP1000 DC information. Generic NRC approval of the Tier 2* changes related to use of later Editions and Addenda during construction may be obtained by a COL applicant through NCA-1140(a)(1) for components other than piping. Further, the staff finds that quality standards used will be commensurate with the importance of the safety function of all safety-related components because the ASME BPV Code, Section III that is incorporated by reference into the NRC regulations will be used by the COL licensee to ensure consistency with design, construction, and inspection requirements. The staff finds this to be an acceptable basis for satisfying the requirements of GDC 1. Finally, STD COL 5.2-1 states that any proposed alternatives to the ASME BPV Code must be authorized by the NRC pursuant to 10 CFR 50.55a(a)(3). This meets the regulations and is, therefore, acceptable.*

Correction to the Standard Content Evaluation Text

The section of the technical evaluation above, which discusses the Tier 2* information is no longer valid. Westinghouse revised its DCD to change the Edition and Addenda of the ASME BPV Code from a Tier 2* designation to Tier 2. This change is evaluated in a supplement to NUREG-1793.

This change does not impact the conclusions of the BLN or VEGP standard content evaluations described above.

5.2.1.1.5 Post Combined License Activities

There are no post-COL activities related to this section.

5.2.1.1.6 Conclusion

The NRC staff reviewed the application and the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point

Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of 10 CFR 50.55a and GDC 1. The staff based its conclusion on the following:

- STD COL 5.2-1, as related to ASME Code reconciliation, is acceptable because the design and construction of ASME BPV Code Class 1, 2, and 3 components and their supports will conform to the appropriate ASME BPV Code Editions and Addenda and, thus, meet the relevant NRC regulations in 10 CFR 50.55a governing the use of codes and standards. Further, the staff finds that quality standards used will be commensurate with the importance of the safety function of all safety-related components and is an acceptable basis for satisfying the requirements of GDC 1. Also, STD COL 5.2-1 states that any proposed alternatives to the ASME BPV Code must be authorized by the NRC pursuant to 10 CFR 50.55a(a)(3).

5.2.1.2 Applicable Code Cases (Related to RG 1.206, Section C.III.1, Chapter 5, C.I.5.2.1.2, "Compliance with Applicable ASME Code Cases")

5.2.1.2.1 Introduction

This section addresses the ASME Code cases to be used at Turkey Point Units 6 and 7. In general, a Code case is developed by ASME based on inquiries from the nuclear industry associated with Code clarification, modification or alternative to the Code. All Code cases will remain valid and available for use until annulled by the ASME BPV Standards Committee. ASME Code cases acceptable to the NRC staff are published in RG 1.84, "Design and Fabrication Code Case Acceptability, ASME Section III, Division 1"; RG 1.147, "Inservice Inspection Code Case Acceptability, ASME Section XI, Division 1"; and RG 1.192, "Operation and Maintenance Code Case Acceptability, ASME OM Code"; in accordance with requirements of 10 CFR 50.55a(b)(4), 10 CFR 50.55a(b)(5) and 10 CFR 50.55a(b)(6).

5.2.1.2.2 Summary of Application

Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 5.2 of the AP1000 DCD, Revision 19. Section 5.2 of the DCD includes Section 5.2.1.2.

Turkey Point Units 6 and 7 COL FSAR Section 5.2 does not include supplemental information in the incorporation by reference of Section 5.2.1.2 of the AP1000 DCD. However, Turkey Point Units 6 and 7 COL FSAR Section 5.2 specifies supplementary information in STD COL 5.2-1 that relates to applicable Code cases.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 5.2.1.1, the applicant provided the following:

AP1000 COL Information Item

- STD COL 5.2-1

The applicant provided additional information in STD COL 5.2-1 to address COL Action Item 5.2.1.1-1 identified in NUREG-1793 and COL Information Item 5.2-1 discussed in Section 5.2.6.1, "ASME Code and Addenda," of the AP1000 DCD. The portion of STD COL 5.2-1 evaluated here applies to applicable Code cases.

5.2.1.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the applicable Code cases are given in Section 5.2.1.2 of NUREG-0800.

The applicable regulatory requirements for the NRC staff's review of the Turkey Point Units 6 and 7 COL application are as follows:

GDC 1 in Appendix A to 10 CFR Part 50 and 10 CFR 50.55a, as related to the establishment of the minimum quality standards for the design, fabrication, erection, construction, testing, and inspection of nuclear power plant components, require conformance with appropriate editions of published industry codes and standards.

As one means of meeting the applicable NRC regulations, RG 1.84 lists ASME BPV Code, Section III Code cases oriented to design, fabrication, materials, and testing, which are acceptable with applicable conditions for implementation at nuclear power plants. RG 1.147 lists ASME BPV Code, Section XI Code cases, which are acceptable with applicable conditions for use in the ISI of nuclear power plant components and their supports. RG 1.192 lists Code cases related to the ASME OM Code oriented to operation and maintenance of nuclear power plant components, which are acceptable with applicable conditions for implementation at nuclear power plants.

5.2.1.2.4 Technical Evaluation

The NRC staff reviewed Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR and the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to applicable Code cases. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In NUREG-1793 Section 5.2.1.2, the NRC staff states that the COL applicant may submit, with its COL application, future Code cases that are endorsed in RG 1.84 at the time of the application, provided that they do not alter the staff's safety findings on the AP1000 certified design. The staff also states that the COL applicant should submit those Code cases that are in effect at the time of the COL application and apply to operational programs involving ISI and IST. The supplement to NUREG-1793 describes the staff's technical evaluation of modifications to the list of ASME Code cases in Table 5.2-3 of Revision 19 to the AP1000 DCD.

The NRC staff followed the guidance provided in NUREG-0800, Section 5.2.1.2, "Applicable Code Cases," and RG 1.206, "Combined License Applications for Nuclear Power Plants

(LWR Edition),” Section C.III.1, Chapter 5, C.I.5.2.1.2, in evaluating Turkey Point Units 6 and 7 COL FSAR Section 5.2.1.2 for compliance with the NRC regulations.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 5.2.1.2.4 of the VEGP SER:

AP1000 COL Information Item

- *STD COL 5.2-1*

Revision 0 to the BLN COL FSAR in Section 5.2.1.1 had referenced ASME BPV Code, Section XI, as part of the reconciliation process for the use of ASME Code cases other than those included in AP1000 DCD Table 5.2-3. In RAI 5.2.1.1-4, the staff requested that the applicant explain how this met 10 CFR 50.55a(a)(3), 10 CFR 50.55a(b)(4), 10 CFR 50.55a(b)(5), and 10 CFR 50.55a(b)(6).

In its response to RAI 5.2.1.1-4, the applicant noted that no Code cases other than those included in the DCD have been identified as necessary at this time. Code cases approved by the NRC in RG 1.147 may be used, and if so, they will be identified in a revision to the FSAR. The applicant also indicated that the FSAR statement regarding reconciliation of Code cases was incorrect and would be revised. Revision 1 to the BLN COL FSAR in Section 5.2.1.1 specifies that Code cases to be used in design and construction are identified in the DCD and that additional Code cases for design and construction beyond those for the DC are not required. The staff considers Revision 1 to the BLN COL FSAR Section 5.2.1.1 to be acceptable. As a result, RAI 5.2.1.1-4 is closed.

AP1000 DCD, Revision 17, Section 5.2.1.2 indicated that use of Code cases approved in revisions of the RGs issued subsequent to the DC may be used as discussed in Section 5.2.6.1 by using the process outlined for updating the ASME Code Edition and Addenda. Section 5.2.6.1 stated that the COL applicant will address in its application, the addition of ASME Code cases approved subsequent to DC. Similar to the Section III Code cases listed in DCD Table 5.2-3, in RAI 5.2.1.2-2, the staff requested that the applicant identify the ASME BPV Code, Section XI ISI and the ASME OM Code cases that are used for BLN design and construction. The applicant was also requested to confirm whether these Code cases are approved by the NRC as documented in RGs 1.147 and 1.192. If not, these Code cases must be submitted to the NRC for authorization pursuant to 10 CFR 50.55a(a)(3).

In its response to RAI 5.2.1.2-2, the applicant referred to its response to RAI 5.2.1.1-4 and noted that there are no additional Code cases used for design and construction beyond those identified in the DCD. In its RAI response, the applicant stated that the IST Program described in BLN COL FSAR Section 3.9.6 will utilize Code Case OMN-1, Revision 1, "Alternative Rules for the Preservice and In-service Testing of Certain Electric Motor-Operated Valve Assemblies in Light Water Reactor Power Plants," which establishes alternate rules and requirements for preservice and IST to assess the operational readiness of certain motor operated valves. The staff notes that the current revision to RG 1.192 at the time of this COL review conditionally accepts the use of Code Case OMN-1, Revision 0, and does not address Revision 1 to Code Case OMN-1. The applicant will need to submit a request under 10 CFR 50.55a for authorization to apply Revision 1 to Code Case OMN-1, if RG 1.192 is not updated to accept this revision to the Code case prior to development of the IST Program for BLN. The NRC staff's review of the use of OMN-1, Revision 1, for BLN is discussed in Section 3.9.6 of this SER. In its response to RAI 5.2.1.2-2, the applicant stated that no code cases other than those included in the DCD are used for BLN and the FSAR would be revised as indicated in response to RAI 5.2.1.1-4. As noted above, Revision 1 to the BLN COL FSAR resolved RAI 5.2.1.1-4. Therefore, RAI 5.2.1.2-2 is also closed.

Based on its review, the NRC staff has determined that BLN COL FSAR Section 5.2 appropriately incorporates by reference AP1000 DCD, Section 5.2.1.2, in satisfying the NRC regulations for the design, fabrication, erection, testing, and inspection of plant SSCs commensurate with the importance of the safety function to be performed by referencing the use of accepted ASME Code cases. As a result, the staff concludes that compliance by the applicant with the provisions of the ASME Code cases accepted in RGs 1.84, 1.147, and 1.192, or individually reviewed and accepted in NUREG-1793 or its supplements, will result in component quality that is commensurate with the importance of the safety functions of the components at BLN Units 3 and 4. This satisfies the requirements of GDC 1, and, therefore, is acceptable.

AP1000 DCD, Section 5.2.6.1 states, in part, that the COL applicant will address the addition of ASME Code cases approved subsequent to the DC. As noted above, the applicant has not identified any Code cases other than those included in the AP1000 DCD as necessary at this time for the design and construction of

BLN Units 3 and 4. If the applicant determines the need to apply other ASME Code cases in the future, it may apply those ASME Code cases in accordance with their acceptance in RG 1.84, RG 1.147, or RG 1.192, including any applicable conditions, or must request NRC authorization to use those Code cases.

5.2.1.2.5 Post Combined License Activities

There are no post-COL activities related to this section.

5.2.1.2.6 Conclusion

The NRC staff reviewed the application and the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of 10 CFR 50.55a and GDC 1, and complies with the provisions of the ASME Code cases accepted in RGs 1.84, 1.147, and 1.192. The staff based its conclusion on the following:

- STD COL 5.2-1, as related to applicable ASME Code cases, is acceptable because the NRC staff has determined that Turkey Point Units 6 and 7 COL FSAR Section 5.2 appropriately incorporates by reference AP1000 DCD Section 5.2.1.2, in satisfying the NRC regulations for the design, fabrication, erection, testing, and inspection of plant SSCs commensurate with the importance of the safety function to be performed by referencing the use of accepted ASME Code cases. As a result, the staff concludes that compliance by the applicant with the provisions of the ASME Code cases accepted in RGs 1.84, 1.147, and 1.192, or individually reviewed and accepted in NUREG-1793 or its supplements, will result in component quality that is commensurate with the importance of the safety functions of the components at Turkey Point Units 6 and 7. This satisfies the requirements of GDC 1, and, therefore, is acceptable.

5.2.1.3 Alternate Classification

In the standard plant design, Westinghouse applies an alternate classification for the chemical and volume control system (CVCS).

Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 5.2.1.3, "Alternate Classification," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

5.2.2 Overpressure Protection

RCS and steam system overpressure protection during power operation is provided by the pressurizer safety valves and the steam generator safety valves, in conjunction with the action of the reactor protection system. In addition, a relief valve in the suction line of the normal residual heat removal system (RNS) provides low-temperature overpressure protection (LTOP) for the RCPB during low-temperature operation of the plant (startup, shutdown).

Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 5.2.2, "Overpressure Protection," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

5.2.3 Reactor Coolant Pressure Boundary Materials

5.2.3.1 Introduction

Materials selected for RCS components must be compatible with reactor coolant water chemistry, thermal insulation materials, and the atmosphere. The specific processes (including heat treatment and welding practices) used to fabricate RCS components must maximize the corrosion resistance and fracture toughness of the components.

5.2.3.2 Summary of Application

Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 5.2 of the AP1000 DCD, Revision 19. Section 5.2 of the DCD includes Section 5.2.3.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 5.2.3.2.1, the applicant provided the following:

Supplemental Information

- STD SUP 5.2-1

The applicant provided supplemental (SUP) information to describe the monitoring program for primary water chemistry to be implemented at the plant during plant operation.

5.2.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the RCPB materials are given in Section 5.2.3 of NUREG-0800.

The applicable regulatory requirements for acceptance of the supplementary information on water chemistry monitoring is established in GDC 14, "Reactor Coolant Pressure Boundary," of Appendix A to 10 CFR Part 50, which requires that the RCPB shall be designed, fabricated,

erected, and tested so as to have an extremely low probability of abnormal leakage, of rapidly propagating failure, and of gross rupture.

5.2.3.4 Technical Evaluation

The NRC staff reviewed Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to RCPB materials. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 5.2.3.4 of the VEGP SER:

Supplemental Information

- *STD SUP 5.2-1*

The NRC staff reviewed the standard supplementary information on water chemistry as discussed in Section 5.2.3.2.1 of the BLN COL FSAR. In its review of the supplemental information the staff used the applicable sections of NUREG-0800 and RG 1.206 as guidance. However, Section 5.2.3 of NUREG-0800 does not directly address PWR reactor coolant chemistry, but, rather, refers the reviewer to NUREG-0800, Section 9.3.4, "Chemical and

Volume Control System (PWR) Including Boron Recovery.” Section 9.3.4 of NUREG-0800 recommends that the Chemical and Volume Control System (CVCS) ensure that RCS chemistry meets GDC 14, by maintaining acceptable purity levels in the reactor coolant through the removal of insoluble corrosion products and dissolved ionic material by filtration and ion exchange. In addition, Section 9.3.4 of NUREG-0800 recommends that the CVCS maintain proper RCS chemistry by controlling total dissolved solids, pH, oxygen concentration, and halide concentrations within the acceptable ranges. RG 1.206, Section C.III.1, Chapter 5, C.I.5.2.3.2 recommends that COL applications referencing PWR standard designs describe the chemistry of the reactor coolant and the additives (such as inhibitors), the water chemistry, including maximum allowable content of chloride, fluoride, sulfate, and oxygen and permissible content of hydrogen and soluble poisons, the methods to control water chemistry, including pH, the industry-recommended methodologies to be used to monitor water chemistry, and provide appropriate references. Additionally, RG 1.206, Section C.III.1, Chapter 5, C.I.5.2.3.2 also states that “this section may reference the Electric Power Research Institute (EPRI) water chemistry guidelines to support the plant-specific program. However, this section should fully describe and discuss the plant-specific water coolant chemistry control program and its compatibility with the RCPB materials.”

The supplementary information in the BLN COL FSAR states that monitoring of water chemistry is implemented using the guidance of EPRI TR-1002884, “Pressurized Water Reactor Primary Water Chemistry Guidelines: Volume 1,” Appendix F (Revision 5, dated October 2003). The cited appendix pertains specifically to sampling of soluble and insoluble corrosion products from the RCS. Use of this appendix is consistent with the recommendation in NUREG-0800 that the CVCS system maintains acceptable purity levels in the reactor coolant through the removal of insoluble corrosion products and dissolved ionic material by filtration and ion exchange, and must maintain proper RCS chemistry by controlling total dissolved solids, pH, oxygen concentration, and halide concentrations within the acceptable ranges. Accurate sampling of corrosion products supports this recommendation.

Appendix F of the Primary Water Chemistry Guidelines only provides a recommended methodology for sampling RCS corrosion products, and does not provide acceptance criteria or methods for reducing/controlling RCS corrosion products. Further, other primary water chemistry parameters that NUREG-0800 and RG 1.206 recommend be addressed in the FSAR are not addressed by Appendix F, such as pH, oxygen, and halide concentrations. These parameters are addressed in DCD Section 5.2.3 and DCD Table 5.2.2, which provides maximum values of primary water chemistry parameters including oxygen, pH and halide concentration for the various plant operating modes. Referencing Appendix F only of the Primary Water Chemistry Guidelines does not add any more detail or specificity for these other parameters. Therefore, in a letter dated April 10, 2008, the staff requested additional information (RAI 5.2.3-1) from the applicant to address these items.

Specifically, the NRC staff requested that the applicant explain the rationale for referencing only Appendix F to the “Pressurized Water Reactor Primary Water Chemistry Guidelines” rather than referencing the entire guidelines document.

The applicant responded to RAI 5.2.3-1, in a letter dated May 23, 2008, stating that "the AP1000 Design Control Document (DCD) describes, in Section 5.2.3.2.1, the RCS chemistry specifications and the methods to control water chemistry. In addition, DCD Table 5.2-2 summarizes these specifications for conductivity, pH, oxygen, chloride, hydrogen, suspended solids (corrosion product particulates), pH control agent, boric acid, silica, aluminum, calcium, magnesium, and zinc."

The applicant's response further stated that FSAR Section 5.2 incorporates the aforementioned DCD section by reference and refers to Appendix F of EPRI TR-1002884 as the industry recommended methodology to be used to monitor water chemistry. As noted by the question, Appendix F of the EPRI document is limited to corrosion products and as such, is insufficient to address the remaining details of the program. As such, the text of FSAR Section 5.2.3.2.1 will be revised to reference the complete EPRI document which does address the requested program attributes not covered by the DCD.

The applicant also proposed changes to the BLN COL FSAR Chapter 5, Section 5.2.3.2.1. The following information is to replace the previous supplemental information:

The water chemistry program is based on industry guidelines as described in EPRI TR-1002884, "Pressurized Water Reactor Primary Water Chemistry." The program includes periodic monitoring and control of chemical additives and reactor coolant impurities listed in DCD Table 5.2-2. Detailed procedures implement the program requirements for sampling and analysis frequencies, and corrective actions for control of reactor water chemistry. The frequency of sampling water chemistry varies (e.g., continuous, daily, weekly, or as needed) based on plant operating conditions and the EPRI water chemistry guidelines. Whenever corrective actions are taken to address an abnormal chemistry condition, increased sampling is utilized to verify the effectiveness of these actions. When measured water chemistry parameters are outside the specified range, corrective actions are taken to bring the parameter back within the acceptable range and within the time period specified in the EPRI water chemistry guidelines. Following corrective actions, additional samples are taken and analyzed to verify that the corrective actions were effective in returning the concentrations of contaminants.

Chemistry procedures will provide guidance for the sampling and monitoring of primary coolant properties.

The staff finds the applicant's response, and the proposed COL application changes, acceptable because it meets the acceptance criteria in Section 9.3.4 of NUREG-0800 related to the evaluation of the proposed chemistry program using the latest version in the EPRI report series, "PWR Primary Water Guidelines." The staff verified that Revision 1 of the FSAR (STD SUP 5.2-1) adequately incorporates the above. As a result, RAI 5.2.3-1 is closed.

Additionally, the staff finds that the BLN FSAR meets the recommendation in RG 1.206, Section C.III.1, Chapter 5, C.I.5.2.3.2 to fully describe the primary water chemistry control program in the FSAR by referencing the most recent version of the “EPRI PWR Primary Water Guidelines” in its entirety. Although Section 5.2 of the AP1000 DCD, Revision 17, provides maximum values (and in some cases, normal ranges) for the key primary water chemistry parameters, referencing the EPRI PWR Primary Water Guidelines provides a more detailed description of the chemistry control program because various action levels (at which varying levels of corrective action are required) are specified for the key parameters for different reactor operating modes, as well as the required periodicity for sampling the various parameters.

Although the staff does not formally review or issue a safety evaluation of the revisions to the EPRI water chemistry guidelines (including the PWR Primary Water Chemistry Guidelines), the guidelines are recognized as representing industry best practices in water chemistry control. Extensive experience in operating reactors has demonstrated that following the EPRI guidelines minimizes the occurrence of corrosion related failures. Further, the EPRI guidelines are periodically revised to reflect evolving knowledge with respect to best practices in chemistry control. Therefore, the staff accepts the use of the EPRI PWR Primary Water Chemistry Guidelines as a basis for a primary water chemistry program for a COL referencing a standard reactor design.

5.2.3.5 Post Combined License Activities

There are no post-COL activities related to this section.

5.2.3.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of GDC 14. The staff based its conclusion on the following:

- STD SUP 5.2-1 meets the relevant guidance in Section 9.3.4 of NUREG-0800 with respect to developing a water chemistry program consistent with the latest EPRI guidelines and is acceptable. Conformance with these guidelines provides an acceptable basis for satisfying, in part, the requirements of GDC 14.

5.2.4 Inservice Inspection and Testing of Class 1 Components (Related to RG 1.206, Section C.III.1, Chapter 5, C.I.5.2.4, “Inservice Inspection and Testing of Reactor Coolant Pressure Boundary”)

5.2.4.1 Introduction

Components that are part of the RCPB must be designed to permit periodic inspection and testing of important areas and features to assess their structural and leaktight integrity. ISI programs are based on the requirements of 10 CFR 50.55a in that Code Class 1 components, as defined in Section III of the ASME BPV Code, meet the applicable inspection requirements set forth in Section XI of the ASME Code, “Rules for Inservice Inspection of Nuclear Power Plant Components.”

5.2.4.2 Summary of Application

Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 5.2 of the AP1000 DCD, Revision 19. Section 5.2 of the DCD includes Section 5.2.4. The advanced safety evaluation (ASE) with confirmatory items for Section 5.2.4 was based on the VEGP COL FSAR, Revision 2 and DCD Revision 17. After submitting DCD Revision 17 to the NRC, Westinghouse added a new COL Information Item (COL 5.3-7). This COL information item has been incorporated into Revision 18 of the DCD; however, the discussion of the COL information item below did not change.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 5.2.4, the applicant provided the following:

AP1000 COL Information Item

- STD COL 5.2-2

The applicant provided additional information in STD COL 5.2-2 to address COL Information Item 5.2-2. The information relates to plant-specific preservice inspection (PSI) and ISI programs.

- STD COL 5.3-7

In a letter dated August 27, 2010, the VEGP applicant proposed a new STD COL 5.3-7 to address AP1000 DCD COL Information Item 5.3-7 included in a Westinghouse letter dated August 3, 2010. The new information states that the COL holder will augment the plant-specific ISI program in VEGP COL FSAR Section 5.2.4.1, related to the Quickloc weld buildup on the reactor vessel head. In its letter dated April 20, 2011, the Turkey Point Units 6 and 7 applicant endorsed that VEGP letter as standard, thereby adopting STD COL 5.3-7 for the Turkey Point Units 6 and 7 COL application. The April 20, 2011 letter also stated that the information in the August 27, 2010, letter will be incorporated into the future revision to the Turkey Point Units 6 and 7 COL FSAR. Revision 5 of the Turkey Point Units 6 and 7 COL FSAR is appropriately revised.

Supplemental Information

- STD SUP 5.2-2

The applicant provided supplemental information regarding guidance for inspecting the integrity of bolting and threaded fasteners.

License Condition

- License Condition 6, regarding PSI/ISI program details

5.2.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for ISI are given in Section 5.2.4 of NUREG-0800.

The applicable regulatory requirements for acceptance of the resolution to COL Information Items 5.2-2 and 5.3-7 and supplementary information on ISI and testing of Class 1 components are established in GDC 32, "Inspection of Reactor Coolant Pressure Boundary," found in Appendix A to 10 CFR Part 50, as it relates to periodic inspection and testing of the RCPB, and 10 CFR 50.55a, as it relates to the requirements for inspecting and testing ASME Code Class 1 components of the RCPB.

The applicable policy for acceptance of COL Information Items 5.2-2 and 5.3-7, as it relates to fully describing an operational program, is found in SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," dated October 28, 2005.

5.2.4.4 Technical Evaluation

The NRC staff reviewed Section 5.2.4 of the Turkey Point Units 6 and 7 COL FSAR and the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the RCPB ISI and testing. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In Section 5.2.4 of NUREG-1793, the staff concluded that the AP1000 ISI program for Code Class 1 components is acceptable and meets the requirements of 10 CFR 50.55a with regard to the preservice and inservice inspectability of these components. The specific version of the ASME Code, Section XI used as the baseline Code in the AP1000 certified design is the 1998 Edition up to and including the 2000 Addenda. It should be noted that the staff did not identify any portions of the AP1000 ISI program for Class 1, 2, and 3 components that were excluded from the scope of the staff's review of the AP1000 DC (as the staff did for IST of valves in AP1000 FSER Section 3.9.6.4). Therefore, the staff's conclusions regarding the acceptability of the AP1000 ISI program based on the 1998 Edition up to and including the

2000 Addenda of the ASME Code, Section XI with regard to preservice and inservice inspectability of Class 1 components remains unchanged with Revision 17 of the AP1000 DCD, except for the newly identified STD COL Information Item 5.3-7, which is addressed below. Accordingly, the staff's evaluation of this section focused on the acceptability of the COL applicant's supplemental information and responses to AP1000 COL information items and action items. The staff's evaluation in this section also addresses the operational program aspects of the ASME Code Class 1, 2, and 3 PSI and ISI programs.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 5.2.4.4 of the VEGP SER:

AP1000 COL Information Item

The following portion of this technical evaluation section is reproduced from Section 5.2.4.4 of the BLN SER:

- *STD COL 5.2-2*

The COL applicant added the following after the first paragraph in DCD Section 5.2.4:

The initial inservice inspection program incorporates the latest edition and addenda of the ASME Boiler and Pressure Vessel Code approved in 10 CFR 50.55a(b) on the date 12 months before the initial fuel load. Inservice examination of components and system pressure tests conducted during successive

120-month inspection intervals must comply with the requirements of the latest edition and addenda of the Code incorporated by reference in 10 CFR 50.55a(b) 12 months before the start of the 120-month inspection interval (or the optional ASEM [sic] Code cases listed in NRC Regulatory Guide 1.147, that are incorporated by reference in 10 CFR 50.55a(b), subject to the limitations and modifications listed in 10 CFR 50.55a(b).

10 CFR 50.55a(g) requires that inservice examinations of components and system pressure tests conducted during the initial 120-month inspection interval must comply with the requirements in the latest edition and addenda of the Code incorporated by reference in paragraph (b) of 10 CFR 50.55a on the date 12 months before the date scheduled for initial loading of fuel under a combined license under 10 CFR Part 52. The staff concludes that the supplemental information provided by the COL applicant meets the NRC's regulations and is, therefore, acceptable.

The COL applicant added the following at the end of DCD Section 5.2.4.1:

The Class 1 system boundary for both preservice and inservice inspection programs and the system pressure test program include those items within the Class 1 and Quality Group A (Equipment Class A [in accordance with] DCD Section 3.2.2 and DCD Table 3.2-3 boundary). Based on 10 CFR Part 50 and Regulatory Guide 1.26, the Class 1 boundary includes the following:

- reactor pressure vessel;*
- portions of the reactor system (RXS);*
- portions of the chemical and volume control system (CVS);*
- portion of the incore instrumentation system (IIS);*
- portions of the passive core cooling system (PXS);*
- portions of the reactor coolant system;*
- portions of the normal residual heat removal system.*

Those portions of the above systems within the Class 1 boundary are those items that are part of the RCPB as defined in Section 5.2 of the Bellefonte COL FSAR.

Exclusions

Portions of the systems within the reactor coolant pressure boundary [RCPB], as defined above, that are excluded from the Class 1 boundary in accordance with 10 CFR Part 50, Section 50.55a, are as follows:

- Those components where, in the event of postulated failure of the component during normal operation, the reactor can be shut down and cooled down in an orderly manner, assuming makeup is provided by the reactor coolant makeup system only; or*

- *Components that are or can be isolated from the reactor coolant system by two valves (both closed, both open, or one closed and other open). Each open valve is capable of automatic actuation and, assuming the other valve is open, its closure time is such that, in the event of postulated failure of the component during normal reactor operation each valve remains operable and the reactor can be shut down and cooled down in an orderly manner, assuming makeup is provided by the reactor coolant makeup system only.*

The NRC staff compared the proposed description of the system boundary subject to inspection and the exclusions with ASME Section XI and 10 CFR 50.55a. The staff found that the proposed system boundary and exclusions were in agreement with the ASME guidelines and regulations, and are therefore, acceptable. This portion of STD COL 5.2-2 is acceptable.

In Revision 0 of the BLN COL FSAR, the COL applicant states that NRC First Revised Order, EA-03-009, "Interim Inspection Requirements for Reactor Pressure Vessel Heads at Pressurized Water Reactors," will be used to establish the required inspections of RPV heads and associated penetration nozzles to detect primary stress corrosion cracking. In addition, the COL applicant states that ASME Code Case N-729-1 (N-729-1), "Alternative Examination Requirements for Pressurized-Water Reactor (PWR) Vessel Upper Heads With Nozzles Having Pressure-Retaining Partial-Penetration Welds," will be used. N-729-1, as modified by the NRC staff may be used to perform the inspection of the AP1000 RPV head. Finally, a visual inspection to identify potential boric acid leaks from pressure-retaining components above the RPV head is performed each refueling outage.

COL Information Item 5.2-2 includes a commitment that the COL applicant's PSI program will include specific preservice examinations of the RV closure head equivalent to those outlined in AP1000 DCD Tier 2, Section 5.3.4.7. The BLN COL FSAR added supplemental information to the end of Section 5.2.4.3.1, describing the design of the RV closure head as it pertains to meeting the PSI requirements. The staff could not determine from the information provided, the extent of PSI examinations. Based on the information provided by the applicant, the staff requested additional information in RAI 5.2.4-1.

In response to RAI 5.2.4-1, the COL applicant stated that the PSI related to the RV closure head and penetrations as discussed in DCD Section 5.3.4.7 includes the regions identified in the first revised order, EA-03-009. The design specification includes a requirement for PSIs consistent with the first revised order EA-03-009. As part of the RPV and integrated head package design finalization, the RV closure head design and the design of components connected to, and in the region of, the RV closure head was reviewed.

The COL applicant determined that the required PSI/ISI examinations can be performed as required by ASME Section III and Section XI. Based on the information provided by the COL applicant, the staff concludes that the PSI and

ISI examinations will be accomplished in accordance with the first revised order, EA-03-009, ASME Sections III and XI, and are, thus, acceptable. As a result, RAI 5.2.4-1 is closed.

*In Revision 1 to the BLN COL FSAR, the COL applicant states that its augmented inspection for the reactor vessel top head uses N-729-1 as modified by the NRC in the proposed rulemaking dated April 5, 2007 (72 FR 16740). The COL applicant further noted in response to RAI 5.2.4-5, that the wording in the final rule will be adopted when the final rule is issued. The final rule to amend 10 CFR 50.55a was issued on September 10, 2008 (73 FR 52730) and includes a requirement to inspect the RPV head in accordance with N-729-1 as amended by 10 CFR 50.55a(g)(6)(ii)(D). The COL applicant's methodology to inspect the RPV head in accordance with N-729-1, as amended by 10 CFR 50.55a(g)(6)(ii)(D) meets the regulations, and is therefore acceptable. The staff will verify that the next update of the BLN COL FSAR (Section 5.2.4.1) adequately incorporates reference to the final rule. This is **Confirmatory Item 5.2-1**.*

The COL applicant added the following after the second sentence of the first paragraph of DCD Section 5.2.4.4:

Because 10 CFR 50.55a(g)(4) requires 120-month inspection intervals, inspection Program B of IWB-2400 must be chosen. The inspection interval is divided into three periods. Each period can be extended up to one year to enable an inspection to coincide with a plant outage. The adjustment of period end dates shall not alter the rules and requirements for scheduling inspection intervals.

RG 1.206 recommends that inspection intervals be described in comparison with the ASME Code. The information provided by the COL applicant indicated that Inspection Program B of IWB-2400 would be used over a 10-year interval. The three periods would be three, four, and three years to comprise the interval and extensions of a period may be performed up to a year to coincide with a plant outage. The staff finds that the supplemental information provided by the COL applicant meets the requirements of the ASME Code, Section XI and the guidelines of RG 1.206, and is, thus, acceptable.

The COL applicant proposed adding the following section after the last paragraph of DCD Section 5.2.4.7:

5.2.4.8 Relief Requests

The specific areas where the applicable ASME Code requirements cannot be met are identified after the initial examinations are performed. Should relief requests be required, they will be developed through the regulatory process and submitted to the NRC for approval in accordance with 10 CFR 50.55a(a)(3) or 10 CFR 50.55a(g)(5). The relief requests

include appropriate justifications and proposed alternative inspection methods.

In addition to the above, the COL applicant stated at the end of Section 5.2.4.3:

The RPV nozzle-to-shell welds are 100 percent accessible for preservice inspection but might have limited areas that may not be accessible from the outer surface for inservice examination techniques. If accessibility is limited, an inservice inspection program relief request is prepared and submitted for review approval by the NRC.

The information lead [sic] the staff to believe that areas where preservice and inservice examination requirements cannot be met or where compliance with the ASME Code is impractical will result in a need for the licensee to submit a request for relief from impractical Code requirements pursuant to 10 CFR 50.55a(g)(5)(iii). This is not consistent with the regulations in 10 CFR 50.55a(g)(3)(i) which state that Class 1 components must be designed and provided with access to enable the performance of preservice and inservice examinations in accordance with the requirements of the ASME Code, Section XI. Furthermore, the information is not consistent with AP1000 DCD Section 5.2.4.2, which states that the components will be designed to eliminate any hindrances to performing preservice or inservice examinations. The only time a relief request for a newly designed system or component should occur is when the updated edition and addenda to the ASME Code, Section XI is selected 1 year before the initial fuel load date for the first 120-month ISI interval and during subsequent ISI intervals when later edition and addenda of the ASME Code, Section XI that are incorporated by reference in 10 CFR 50.55a(b) change the examination requirements or coverage.

The staff considers accessibility to perform ISI on both sides of austenitic and dissimilar metal welds critical to making its safety determination in order to monitor structural integrity of these welds due to their history of cracking. Cracking of these welds due to primary water stress corrosion cracking (PWSCC) or intergranular stress corrosion cracking (IGSCC) is a well-known occurrence and a safety significant issue. Consequently, the NRC staff is not expecting to grant requests for relief from ISIs of these susceptible welds on the basis of design, geometry or materials of construction, since these factors can be rectified at the design stage before the plant is constructed. Based on the above discussion, the staff requested additional information from the COL applicant in RAIs 5.2.4-2 and 5.2.4-3 on accessibility for nondestructive examinations of the RV head and austenitic/dissimilar metal welds.

The COL applicant stated in its response to RAI 5.2.4-2 that as part of the design-for-inspectability process, the capability of examining the RV welds was assessed. The result was that with ISI tooling design and consideration of the AP1000 RV design, examinations from the inside of the AP1000 pressure vessel, including examinations of the reactor nozzle-to-shell welds, can be completed without a need for the applicant to request relief from the ASME Code, Section XI examination requirements. Based on the response provided by the applicant, the staff concludes that the reactor nozzle-to-shell welds are adequately designed to

enable the performance of inservice examinations in accordance with 10 CFR 50.55a(g)(3)(ii), and is, thus, acceptable. As a result, RAI 5.2.4-2 is closed.

The COL applicant stated in its response to RAI 5.2.4-3 that as part of the design-for-inspectability process, the ASME Class 1 portion of welds are designed for two-sided access for austenitic stainless steel piping welds wherever possible. Where two-sided access is not feasible, such as branch connection examination for circumferential degradation, the weld crowns are ground flush for one-sided examinations. The COL applicant stated that the examination procedures, equipment and personnel for one-sided examinations of austenitic/dissimilar metal welds would be qualified in accordance with Appendix VIII, as modified by 10 CFR 50.55a(b)(2)(xv)(A)(2) and 10 CFR 50.55a(b)(2)(xvi)(B). Based on the response provided by the applicant, in instances where one-sided examinations have to be performed for austenitic/dissimilar metal welds, the examinations will be conducted with ultrasonic systems that have demonstrated the capability to detect flaws, and is, thus, acceptable. As a result, RAI 5.2.4-3 is closed.

The COL applicant proposed adding the following section after the last paragraph of DCD Section 5.2.4.7:

5.2.4.9 Preservice Inspection of Class 1 Components

Preservice examinations required by design specification and preservice documentation are in accordance with ASME Section III, NB-5281. Volumetric and surface examinations are performed as specified in ASME Section III, NB-5282. Components described in ASME Section III, NB-5283 are exempt from preservice examination.

RG 1.206, Section C.III.1, Chapter 5, C.I.5.2.4 recommends that a preservice examination program that meets the standards of NB-5280 of ASME Code, Section III, Division 1, be described because it is an operational program and that the program implementation milestones should be fully described. The information indicated that preservice examinations and documentation are in accordance with ASME Code, Section III, NB-5281, and that volumetric and surface examinations are performed as specified in ASME Code, Section III, NB-5282. The information stated that components described in ASME Code, Section III, NB-5283 are exempt from preservice examination. The staff found that the information did not fully describe the preservice examination program, in scope and a level of detail, necessary for the staff to reach a reasonable assurance finding. Therefore, the staff requested additional information in RAI 5.2.4-4.

In its response to RAI 5.2.4-4, the applicant noted that AP1000 DCD Section 5.2.4.5, which is incorporated by reference in the COL FSAR, indicates PSI will meet the requirements in the ASME Code, Section XI, paragraph IWB-2200 consistent with NUREG-0800 acceptance criteria. FSAR Section 5.2.4.1 provides a discussion of the scope of the PSI and ISI programs by system. FSAR Section 5.2.4.3.1 describes the methods for examination for

both PSI and ISI. FSAR Section 5.2.4.3.1 [sic] [5.2.4.3.2] describes the qualification requirements of personnel performing ultrasonic examinations. In addition, DCD Section 5.2.4.5, incorporated by reference in the COL FSAR, indicates that PSIs of Class 1 components will meet the requirements of IWB-2200, and as indicated in the response to RAI 5.2.4-1, RV head preservice examinations are described in DCD Section 5.3.4.7, and are also incorporated by reference in the COL FSAR. These FSAR sections, combined with the DCD sections, provide a full description of the PSI program consistent with by SECY-05-0197. The response provided by the applicant addressed PSI program areas involving qualification requirements, scope, exemptions and methods of examination. The areas addressed meet the guidelines of Section 5.2.4 of NUREG-0800, and are therefore acceptable. Based on the information provided by the applicant, the staff concludes that the PSI program is fully described. As a result, RAI 5.2.4-4 is closed.

The COL applicant proposed adding the following section after the last paragraph of DCD Section 5.2.4.7:

5.2.4.10 Program Implementation

The milestones for preservice and inservice inspection program implementation are identified in Table 13.4-201.

RG 1.206 states that the detailed procedures for performing the examinations may not be available at the time of the COL application, and the COL applicant should make a commitment to provide sufficient information to demonstrate that the procedures meet ASME Code standards. This information should be provided at a predetermined time agreed upon by both parties. In the BLN COL FSAR, Part 10, "License Conditions and ITAAC," proposed License Condition 6, "Operational Program Readiness," the COL applicant states:

The licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of the NRC inspection of the operational programs listed in the operation program FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operation programs in the FSAR table have been fully implemented or the plant has been placed in commercial service.

The staff reviewed the BLN COL FSAR Table 13.4-201, and notes that both the PSI and ISI programs are listed as operational programs required by NRC regulations. The staff concludes that the commitment under proposed License Condition 6 meets the guidelines in RG 1.206, Section C.III.1, Chapter 5, C.I.5.2.4.1, and is, thus, acceptable.

The COL applicant proposed to add the following paragraphs at the end of Section 5.2.4.3 of the AP1000 DCD:

Ultrasonic Examination of the Reactor Vessel

Ultrasonic (UT) examination for the RPV is conducted in accordance with the ASME Code, Section XI. The RPV shell welds are designed for 100 percent accessibility for both preservice and inservice examinations. The RPV nozzle-to-shell welds are 100 percent accessible for preservice examinations but might have limited areas that may not be accessible from the outer surface for inservice examination techniques. If accessibility is limited, an inservice inspection program relief request is prepared and submitted for review approval by the NRC.

Inner radius examinations are performed from the outside of the nozzle using several compound angle transducer wedges to obtain complete coverage of the required examination volume. Alternatively, nozzle inner radius examinations may be performed using enhanced visual techniques as allowed by 10 CFR 50.55a(b)(2)(xxi).

The staff finds that the information provided by the COL applicant meets ASME Section XI and is in compliance with 10 CFR 50.55a. With respect to relief requests and accessibility, see the staff evaluation of BLN COL FSAR Section 5.4.2.8.

The COL applicant added the following after the first sentence of DCD Section 5.2.4.5:

Class 1 piping supports will be examined in accordance with ASME Section XI, IWF-2500.

Preservice examinations required by design specifications and preservice documentation are in accordance with ASME Section III, NB-5280. Components exempt from preservice examination are described in ASME Section III, NB-5283.

The staff finds that the information provided by the COL applicant meets ASME Section XI and is in compliance with 10 CFR 50.55a. With respect to preservice inspection, see the staff evaluation of BLN COL FSAR Section 5.4.2.9.

The COL applicant proposed adding the following after the last sentence of DCD Section 5.2.4.5:

The preservice examination is performed once in accordance with ASME Section XI, IWB-2200, on all of the items selected for inservice examination, with the exception of the examinations specifically excluded by ASME Section XI from preservice requirements, such ASME Section XI VT-3 examination of valve body and pump casing internal surfaces (B-L-2 and B-M-2 examination categories, respectively) and the visual VT-2 examinations for category B-P.

The staff finds that the information provided by the COL applicant meets ASME Section XI and is in compliance with 10 CFR 50.55a. With respect to preservice inspection, see the staff evaluation of BLN COL FSAR Section 5.4.2.9.

The COL applicant proposed adding the following after the last sentence of DCD Section 5.2.4.3:

Visual Examination

Visual examination methods VT-1, VT-2, and VT-3 are conducted in accordance with ASME Section XI, IWA-2210. In addition, VT-2 examinations will meet the requirements of IWA-5240.

Where direct VT-1 examinations are conducted without the use of mirrors or with other viewing aids, clearance is provided where feasible for the head and shoulders of a man within a working arm's length of the surface to be examined.

Surface Examination

Magnetic particle (MT) and liquid penetrant (PT) examination techniques are performed in accordance with ASME Section XI, IWA-2221 and IWA-2222, respectively. Direct examination access for magnetic particle [MT] and liquid penetrant [PT] examination is the same as that required for direct visual (VT-1) examination (See Visual Examination), except that the additional access is provided as necessary to enable physical contact with the item in order to perform the examination. Remote MT and PT generally are not appropriate as a standard examination process; however, boroscopes and mirrors can be used at close range to improve the angle of vision.

Alternative Examination Techniques

As provided by ASME Section XI, IWA-2240, alternative examination methods, a combination of methods, or newly developed techniques may be substituted for the methods specified for a given item in this section, provided that they are demonstrated to be equivalent or superior to the specified methods, techniques, etc., which may result in improvements in examination reliability and reductions in personnel exposure. In accordance with 10 CFR 50.55a(b)(2)(xix), IWA-2240 as written in the 1997 Addenda of ASME Section XI must be used when applying these provisions.

5.2.4.3.2 Qualification of Personnel and Examination Systems for Ultrasonic Examination

Personnel performing examinations shall be qualified in accordance with ASME Section XI, Appendix VII. Ultrasonic examination systems shall be qualified in accordance with industry

accepted programs for implementation of ASME Section XI, Appendix VIII. Qualification to ASME Section XI, Appendix VIII, in compliance with the provisions of 10 CFR 50.55a is considered as a satisfactory alternative to Regulatory Guide 1.150.

The COL applicant also proposed adding the following at the end of AP1000 DCD Section 5.2.4.6:

Components containing flaws or relevant conditions and accepted for continued service in accordance with the requirements of IWB-3132.4 or IWB-3142.4 are subjected to successive period examinations in accordance with the requirements of IWB-2420. Examinations that reveal flaws or relevant conditions exceeding Table IWB-3410-1 acceptance standards are extended to include additional examinations in accordance with the requirements of IWB-2430.

10 CFR 50.55a requires that nondestructive testing procedures, methods, and techniques meet ASME Code standards, including ASME Section XI, Appendix VIII requirements for ultrasonic examinations and methodology for evaluation of flaws. The COL applicant indicated that the qualification of ultrasonic testing personnel and procedures would be in accordance with ASME Section XI, Appendices VII and VIII, respectively. Based on the information provided by the COL applicant, the staff concludes that the COL applicant referenced the appropriate sections of the ASME Code to describe visual, surface volumetric and alternative examinations.

The staff concludes that the PSI and ISI programs will conform to the guidelines and requirements provided under NUREG-0800, Order EA-03-009, and the ASME Code. Therefore, the staff finds that the COL applicant's proposed resolution to the COL information items and its supplementary information are acceptable on the basis that it meets GDC 32 of Appendix A to 10 CFR Part 50, as it relates to periodic inspection and testing of the RCPB and 10 CFR 50.55a.

Resolution of Standard Content Confirmatory Item 5.2-1

Confirmatory Item 5.2-1 required the applicant to update its FSAR to incorporate reference to the final rule. The NRC staff verified that the VEGP COL FSAR was appropriately updated to incorporate reference to 10 CFR 50.55a(g)(6)(ii)(D). As a result, Confirmatory Item 5.2-1 is now resolved.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from the BLN SER, Section 5.2.4.4, that requires correction. The BLN SER quotes an applicant-proposed addition to its FSAR stating, in part:

Qualification to ASME Section XI, Appendix VIII, in compliance with the provisions of 10 CFR 50.55a is considered as a satisfactory alternative to Regulatory Guide 1.150.

That quote is from Revision 0 of the BLN FSAR. The correct quote from Revision 1 of the BLN FSAR is:

Qualification to ASME Section XI, Appendix VIII, is in compliance with the provisions of 10 CFR 50.55a.

This error does not impact the conclusions of the BLN or VEGP evaluations.

- **STD COL 5.3-7**

The NRC reviewed the applicant's proposal submitted in a letter dated August 27, 2010, to include additional information which addresses newly identified COL Information Item 5.3-7 in the AP1000 DCD. The applicant proposes to add the following item, STD COL 5.3-7, to the end of Section 5.2.4.1 of the VEGP COL FSAR:

The in-service inspection program is augmented to include the performance of a 100 percent volumetric examination of the weld build-up on the reactor vessel head for the instrumentation penetrations (Quickloc) conducted once during each 120-month inspection interval in accordance with the ASME Code, Section XI. The weld build-up acceptance standards are those provided in ASME Code, Section XI, IWB-3514. Personnel performing examinations and the ultrasonic examination systems are qualified in accordance with ASME Code, Section XI, Appendix VIII. Alternatively, an alternative inspection may be developed in conjunction with the voluntary consensus standards bodies (i.e., ASME) and submitted to the NRC for approval.

*The proposed information, which will augment the plant-specific ISI program to include a 100 percent volumetric examination of the weld build-up on the reactor vessel head for the instrumentation penetrations (Quickloc) conducted once during each 120-month inspection interval in accordance with the ASME Code, Section XI, is acceptable to the NRC staff because a volumetric examination ensures that potential degradation of the inside surface of the weld build-up during plant operation will be detected before it progresses through-wall. In addition, the NRC staff finds it acceptable that any alternative inspection will be submitted to the NRC for approval because it will ensure that (1) the NRC staff is informed of changes to inservice inspection requirements established in the reference design certification and (2) licensee submittals for NRC authorization to use alternatives to the regulations in 10 CFR 50.55a will be reviewed by the NRC staff pursuant to 10 CFR 50.55a(a)(3). The NRC staff finds that this adequately addresses COL Information Item 5.3-7 and will ensure the integrity of the reactor coolant pressure boundary weld during service. The staff notes that since this information augments the ISI program, this augmentation is part of License Condition (5-1) described in SER Section 5.2.4.5. The incorporation of the changes associated with proposed STD COL 5.3-7 into a future revision of the VEGP COL FSAR is **Confirmatory Item 5.2-2**.*

Resolution of Standard Content Confirmatory Item 5.2-2

Confirmatory Item 5.2-2 is an applicant commitment to revise its FSAR Table 1.8-202 and Section 5.2.4.1 to address COL Information Item STD COL 5.3-7. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 5.2-2 is now closed.

The following portion of this technical evaluation section is reproduced from Section 5.2.4.4 of the BLN SER:

License Condition

- *License Condition 6, regarding PSI/ISI program details*

The BLN COL FSAR addresses implementation milestones for the PSI/ISI programs in Part 10, or the application “Proposed License Conditions (Including ITAAC).” As discussed in Part 10, Section 6, the applicant proposes a license condition for BLN for all operational programs requiring that the licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs. This proposed license condition is consistent with the policy established in SECY-05-0197, and is therefore acceptable.

For PSI/ISI programs, the ASME Code, Section XI provides requirements for program implementation in Paragraph IWB-2200(a) for PSI programs and Paragraph IWA-2430(b) for ISI programs. As such, a license condition for program implementation requirements is not necessary in the BLN COL FSAR. However, submittal of the schedule for the program development is necessary to plan for and conduct NRC inspections during construction. The staff finds that the license condition complies with RG 1.206, and is therefore acceptable.

Operational programs are specific programs required by regulations. The COL application should fully describe operational programs as defined in SECY-05-0197. In addition, COL applicants should provide schedules for implementation milestones of these operational programs. The PSI and ISI programs are identified as operational programs in RG 1.206. This section of the SER addresses the PSI and ISI operational programs for ASME Code Class 1, 2, and 3 components.

As discussed in RG 1.206, a fully described PSI and ISI program should address: (1) system boundary subject to inspection; (2) accessibility; (3) examination categories and methods; (4) inspection intervals; (5) evaluation of examination results; (6) system pressure tests; (7) Code exemptions; (8) relief requests; and (9) ASME Code cases. For BLN, the applicant incorporated by reference the PSI and ISI programs descriptions from AP1000 DCD Sections 5.2.4 and 6.6. The DCD descriptions as supplemented by the BLN COL FSAR address these nine items and therefore fully describe the PSI/ISI operational programs.

Supplemental Information

- STD SUP 5.2-2

The COL applicant added the following text at the end of DCD Section 5.2.4.1:

The inservice inspection program, along with the boric acid corrosion control procedures, provides guidance for inspecting the integrity of bolting and threaded fasteners.

NUREG-0800, Section 3.13, "Threaded Fasteners – ASME Code Class 1, 2, and 3," acceptance criteria states that the inspection provisions are acceptable if they conform to ASME Section XI. In addition, the staff position in Generic Letter 88-05, "Staff Position on Boric Acid Corrosion of Carbon Steel Reactor Pressure Boundary Components in PWR Plants," specifically recommends inspection in accordance with a boric acid corrosion control program. GL 88-05 also recommends that a boric acid control program contain four elements consisting of inspections, discovery of leak path, assessment, and follow-up inspections. In its proposed changes to Section 5.2.4.1, the COL applicant described the boric acid corrosion control procedures. The staff noted that the program description was in compliance with the four elements described under GL 88-05. Based on compliance with both ASME Section XI and staff guidance, the staff concludes that the proposed change under STD SUP 5.2-2 is acceptable.

Exception to RG 1.65

The Bellefonte FSAR Appendix 1AA provides conformance discussions for Regulatory Guides (RGs) applicable to the Bellefonte COLA. RG 1.65, "Materials and Inspections for Reactor Vessel Closure Studs," was not addressed in Revision 0 of the FSAR. In a response to the staff's RAI-1-5, the COL applicant added a conformance discussion for RG 1.65 which takes an exception to RG position C.4. The exception states:

ASME XI ISI criteria for reactor vessel closure stud examinations are applied in lieu of the ASME Section III, NB-2545 and NB-2546 surface examinations. The volumetric examination currently required by ASME Section XI provides improved (since 1973) detection of bolting degradation.

The staff reviewed ASME Section XI, Table IWB-2500-1 examination requirements for the reactor vessel closure studs, Examination Category B-G-1, Item No. B 6.20. The subject table lists volumetric examination of the studs when in place. The staff finds that the COL applicant's proposed exception to RG 1.65 is in compliance with the 1998 Edition of the ASME Code with the 2000 Addenda, and is therefore, acceptable. This portion of RAI 1-5 is closed.

5.2.4.5 Post Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated April 8, 2016 (ADAMS Accession No. ML16103A507), the applicant

did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (5-1) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO, or the Director's designee, a schedule for implementation of the operational programs listed in FSAR Table 13.4-201, including the associated estimated date for initial loading of fuel. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until all the operational programs listed in FSAR Table 13.4-201 have been fully implemented.

5.2.4.6 Conclusion

The NRC staff reviewed the application and the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR meets the relevant acceptance criteria provided in Section 5.2.4 of NUREG-0800, the policy established in SECY-05-0197, the guidelines addressed in RG 1.206, and the requirements of GDC 32, staff positions, and 10 CFR 50.55a. The staff based its conclusion on the following:

- STD COL 5.2-2, relating to the PSI and ISI programs, conforms to the guidelines provided under NUREG-0800, Order EA-03-009, and the ASME Code. Therefore, the staff finds that the COL applicant's proposed resolution to the COL information items is acceptable on the basis that it meets GDC 32 of Appendix A to 10 CFR Part 50, as it relates to periodic inspection and testing of the RCPB and 10 CFR 50.55a.
- STD SUP 5.2-2, relating to guidance for inspecting the integrity of bolting and threaded fasteners, is acceptable because it meets the relevant guidelines in the ASME Code Section XI; NUREG-0800, Section 3.13; and GL 88-05.
- STD COL 5.3-7, relating to the ISI program augmentation to include 100 percent volumetric examination of the weld build-up on the reactor vessel head for the Quick lock penetrations ensures that the integrity of the reactor coolant pressure boundary weld will be maintained. Therefore, the staff finds that the applicant's proposed resolution as stated in their letter, dated April 20, 2011, and as incorporated into the Turkey Point Units 6 and 7 COL FSAR, to COL Information Item 5.3-7 is acceptable on the basis that it meets GDC 32 of Appendix A to 10 CFR Part 50, as it relates to periodic inspection to ensure the integrity of the RCPB is maintained.

5.2.5 Detection of Leakage through Reactor Coolant Pressure Boundary (Related to RG 1.206, Section C.III.1, Chapter 5, C.I.5.2.5, “Reactor Coolant Pressure Boundary Leakage Detection”)

5.2.5.1 Introduction

The RCPB leakage detection systems are designed to detect and, to the extent practical, identify the source of reactor coolant leakage.

5.2.5.2 Summary of Application

Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 5.2.5 of Revision 19 of the AP1000 DCD. The ASE with confirmatory items for Section 5.2.5 was based on the VEGP COL FSAR, Revision 2 and DCD Revision 17. After submitting DCD Revision 17 to the NRC, Westinghouse added a new COL Information Item (COL 5.2-3). This COL information item has been incorporated into Revision 19 of the DCD; however, the discussion of the COL information item below did not change.

In addition, the applicant proposed the following:

AP1000 COL Information Item

- STD COL 5.2-3

In a letter, dated August 5, 2010, the applicant for the reference COL (VEGP Units 3 and 4) provided additional information in the markups of VEGP COL FSAR Table 1.8-202, Section 5.2.6.3, and Section 5.2.5.3.5 to add STD COL 5.2-3 to address COL Information Item 5.2-3. The VEGP applicant provided additional information regarding the response to unidentified RCS leakage inside containment to deal with the prolonged low-level RCS leakage issue. In its letter dated April 20, 2011, the Turkey Point Units 6 and 7 applicant endorsed that VEGP letter as standard thereby adopting STD COL 5.2-3 for the Turkey Point Units 6 and 7 COL application.

5.2.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

The regulatory basis for raising the issue of prolonged low-level RCS leakage is in 10 CFR 52.79(a)(37), as it relates to “information necessary to demonstrate how operating experience insights have been incorporated into the plant design.” The applicable regulatory requirements for acceptance of the resolution to COL Information Item 5.2-3 are established in GDC 30, “Quality of Reactor Coolant Pressure Boundary,” found in Appendix A to 10 CFR Part 50, as it relates to detecting RCPB leakage. The guidance for the staff’s review is in RG 1.45, Revision 1, “Guidance on Monitoring and Responding to Reactor Coolant System Leakage.”

5.2.5.4 Technical Evaluation

Section 5.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 5.2.5 of Revision 19 of the AP1000 DCD. The NRC

staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section, with one exception. That exception is discussed in the standard content material below. The results of the NRC staff's technical evaluation of the information incorporated by reference in the VEGP COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 5.2.5.4 of the VEGP SER:

The exception, which the NRC staff identified in its review, pertains to the operating experiences at Davis Besse concerning prolonged low-level RCS leakage. The operating experiences at Davis Besse (NRC Bulletin 2002-01) indicated that prolonged low-level unidentified reactor coolant leakage inside containment could cause corrosion and material degradation such that it could compromise the integrity of a system leading to the gross rupture of the RCPB. Therefore, pursuant to 10 CFR 52.79(a) 37, "information necessary to demonstrate how operating experience insights have been incorporated into the plant design," the NRC staff requested additional information from both the DCD applicant (Westinghouse) and the COL applicant (Southern Nuclear Operating Company [SNC]) to address the issue of prolonged low-level RCS leakage. The NRC staff requested the COL applicant in VEGP RAI 5.2.5-1 and RAI 5.2.5-2 to address this issue as it relates to operating procedures. The NRC staff also asked Westinghouse in RAI-DCP-CN45-SBP-01 to address this issue as it related to Design Change Package (DCP) Change Number 45 for AP1000 DCD. The procedures should specify operator actions in response to prolonged

low-level unidentified reactor coolant leakage conditions that exist above normal leakage rates and below the Technical Specification (TS) limits to provide operators sufficient time to take action before the TS limit is reached. The procedures would include identifying, monitoring, trending, and managing prolonged low-level leakage.

In a letter, dated July 29, 2010, Westinghouse responded to RAI-DCP-CN45-SBP-01 by stating that Revision 18 of the AP1000 DCD would add new COL Information Item 5.2-3, and described the COL item in Section 5.2.6.3 of the AP1000 DCD to address the prolonged low-level RCS leakage. The staff's review of DCP 45 is in Chapter 23 of a supplement to NUREG-1793.

AP1000 COL Information Item

- STD COL 5.2-3

In a letter, dated August 5, 2010, SNC responded to VEGP RAI 5.2.5-1 and RAI 5.2.5-2 and provided additional information in the markups of VEGP COL FSAR Table 1.8-202, Section 5.2.6.3 and Section 5.2.5.3.5 to add STD COL 5.2-3 to address the COL information item. VEGP COL FSAR Section 5.2.6.3 states that the COL item is addressed in Section 5.2.5.3.5. The proposed Section 5.2.5.3.5 reads as follows:

5.2.5.3.5 Response to Reactor Coolant System Leakage

Operating procedures specify operator actions in response to prolonged low level unidentified reactor coolant leakage conditions that exist above normal leakage rates and below the Technical Specification (TS) limits to provide operators sufficient time to take action before the TS limit is reached. The procedures include identifying, monitoring, trending, and addressing prolonged low level leakage. The procedures for effective management of leakage, including low level leakage, are developed including the following operations related activities:

- *Trends in the unidentified leakage rates are periodically analyzed. When the leakage rate increases noticeably from the baseline leakage rate, the safety significance of the leak is evaluated. The rate of increase in the leakage is determined to verify that plant actions can be taken before the plant exceeds TS limits.*
- *Procedures are established for responding to leakage. These procedures address the following considerations to prevent adverse safety consequences from the leakage:*
 - *Plant procedures specify operator actions in response to leakage rates less than the limits set forth in the Technical Specifications. The procedures include actions for*

confirming the existence of a leak, identifying its source, increasing the frequency of monitoring, verifying the leakage rate (through a water inventory balance), responding to trends in the leakage rate, performing a walkdown outside containment, planning a containment entry, adjusting alarm setpoints, limiting the amount of time that operation is permitted when the sources of the leakage are unknown, and determining the safety significance of the leakage.

- Plant procedures specify the amount of time the leakage detection and monitoring instruments (other than those required by Technical Specifications) may be out of service to effectively monitor the leakage rate during plant operation (i.e., hot shutdown, hot standby, startup, transients, and power operation).*
- The output and alarms from leakage monitoring systems are provided in the main control room. Procedures are readily available to the operators for converting the instrument output to a common leakage rate. (Alternatively, these procedures may be part of a computer program so that the operators have a real-time indication of the leakage rate as determined from the output of these monitors.) Periodic calibration and testing of leakage monitoring systems are conducted. The alarm(s), and associated setpoint(s), provide operators an early warning signal so that they can take corrective actions, as discussed above, i.e., before the plant exceeds TS limits.*
- During maintenance and refueling outages, actions are taken to identify the source of any unidentified leakage that was detected during plant operation. In addition, corrective action is taken to eliminate the condition resulting in the leakage.*

The procedures described above will be available prior to fuel load.

The staff found in the RAI response that the COL applicant committed to develop operating procedures prior to fuel load, and the procedures include identifying, monitoring, trending, and managing the prolonged low-level RCS leakage. Further, the procedures include converting the instrument output to a common leakage rate and the alarm setpoints for early warning for the operators. Therefore, the staff determined that the RAI response addressed all the questions being asked in VEGP RAI 5.2.5-1 and RAI 5.2.5-2 regarding the procedures for the prolonged low-level RCS leakage. Further, the staff reviewed the description of the procedures in the proposed VEGP COL FSAR Section 5.2.5.3.5 and determined that it is consistent with the guidance in RG 1.45, Revision 1, pertaining to managing the prolonged low-level RCS leakage. Therefore, the staff finds that the RAI response is acceptable and concludes that GDC 30 is met based on the applicant's conformance to RG 1.45.

*The incorporation of the changes associated with proposed STD COL 5.2-3 into a future revision of the VEGP COL FSAR is **Confirmatory Item 5.2-3**.*

Resolution of Standard Content Confirmatory Item 5.2-3

Confirmatory Item 5.2-3 is an applicant commitment to revise its FSAR Table 1.8-202 and Section 5.2.5.3.5 to address COL Information Item STD COL 5.2-3. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 5.2-3 is now closed.

5.2.5.5 Post Combined License Activities

For the reasons discussed in the technical evaluation above, the following FSAR commitment is identified as the responsibility of the licensee:

- Prior to initial fuel load, the operating procedures, which include identifying, monitoring, trending, and managing the prolonged low-level RCS leakage, will be developed.

5.2.5.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of GDC 30. The staff based its conclusion on the following:

- STD COL 5.2-3 meets the relevant guidance in RG 1.45, Revision 1 with respect to operating procedures for the prolonged low-level RCS leakage detection. Conformance with these guidelines provides an acceptable basis for satisfying the requirements of GDC 30.

5.3 Reactor Vessel

5.3.1 Reactor Vessel Design

The RV, as an integral part of the RCPB, will be designed, fabricated, erected and tested to quality standards commensurate with the requirements set forth in 10 CFR Part 50, 10 CFR 50.55a, and GDC 1.

Section 5.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 5.3.1 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of

the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

5.3.2 Reactor Vessel Materials

5.3.2.1 Introduction

This section addresses material specifications, special processes used for manufacture and fabrication of components, special methods for nondestructive examination, special controls and special processes used for ferritic steels and austenitic stainless steels, fracture toughness, material surveillance (which will be referred to as the reactor vessel surveillance capsule program (RVSP) to avoid confusion with material surveillance programs that exist in other parts of a nuclear power plant), and RV fasteners. RCS components are addressed separately in Section 5.2.3 of this SER.

5.3.2.2 Summary of Application

Section 5.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 5.3 of the AP1000 DCD, Revision 19. Section 5.3 of the DCD includes Section 5.3.2.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 5.3.2.6, the applicant provided the following:

AP1000 COL Information Item

- STD COL 5.3-2

The applicant provided additional information in STD COL 5.3-2 to address COL Information Item 5.3-2 and COL Action Item 5.3.2.4-1 identified in Appendix F of NUREG-1793. The additional information discusses the RV material surveillance program.

License Conditions

- Part 10, License Condition 3.J.1, Reactor Vessel Material Surveillance

The COL Holder shall implement this operational program prior to initial criticality.

- Part 10, License Condition 6

The COL applicant shall provide an operational program schedule to support NRC inspections.

5.3.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the RV materials are given in Section 5.3.1 of NUREG-0800.

The applicable regulatory requirements and guidance for acceptance of the COL information item are as follows:

1. GDC 32 found in Appendix A to 10 CFR Part 50, as it relates to the design of the components of the RCPB to allow for an RVSP;
2. 10 CFR 50.60, "Acceptance criteria for fracture prevention measures for light water nuclear power reactors for normal operation," as it relates to compliance with the material surveillance program requirements of 10 CFR Part 50, Appendix G, "Fracture Toughness Requirements";
3. 10 CFR Part 50, Appendix G, as it relates to materials testing and acceptance criteria for fracture toughness;
4. 10 CFR 50.55a, as it relates to the requirements for testing and inspecting Code Class 1 components of the RCPB as specified in Section XI of the ASME Code;
5. SECY-05-0197, as it relates to fully describing an operational program; and
6. 10 CFR Part 50, Appendix H, "Reactor Vessel Material Surveillance Program Requirements," as it relates to RVSP requirements.

5.3.2.4 Technical Evaluation

The NRC staff reviewed Section 5.3.2 of the Turkey Point Units 6 and 7 COL FSAR and the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the relevant information related to the RV materials. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 5.3.2.4 of the VEGP SER:

The NRC staff reviewed conformance of Section 5.3 of the BLN COL FSAR to the guidance in RG 1.206, Section C.III.1, Chapter 5, C.I.5.3.1, "Reactor Vessel Materials." The RG 1.206 sections related to Material Specifications, Special Processes Used for Manufacturing and Fabrication, Special Methods for Nondestructive Examination, Special Controls for Ferritic and Austenitic Stainless Steels, Fracture Toughness and Reactor Vessel Fasteners all state that the COL applicants that reference a certified design do not need to include additional information. These topic areas were previously addressed in the AP1000 DCD and evaluated in NUREG-1793, Section 5.3.2. No COL action items were identified in these topic areas. The remaining topic area, RVSP, has a COL action item that must be addressed by a COL applicant.

Appendix G to 10 CFR Part 50 specifies the fracture toughness requirements for ferritic materials of the pressure-retaining components of the RCPB. The RV beltline materials must have a Charpy Upper Shelf Energy (USE) in the transverse direction for base material and along the weld for weld material, of no less than 75 ft-lbs initially, and must maintain Charpy USE throughout the life of the vessel of no less than 50 ft-lbs. The fracture toughness tests required by ASME Code and by Appendix G to 10 CFR Part 50 provide reasonable assurance that adequate safety margins against the possibility of non-ductile behavior or rapidly propagating fracture can be established for all pressure-retaining components of the reactor coolant boundary. Appendix H to 10 CFR Part 50 presents the requirements for an RVSP to monitor the changes in the fracture toughness properties of the materials in the RV beltline region resulting from exposure to neutron irradiation and the thermal environment.

Operational programs are specific programs required by regulations. The COL application should fully describe operational programs as defined in SECY-05-0197. In addition, COL applicants should provide schedules for implementation milestones for these operational programs. The RVSP is identified as an operational program in RG 1.206. This section of the SER addresses the adequacy of the RVSP description as it relates to meeting the requirements of Appendix H to 10 CFR Part 50.

RG 1.206, Section C.III.1, Chapter 5, C.I.5.3.1.6, "Material Surveillance," provides guidelines for fully describing a material surveillance program. Specifically, this section states that the RVSP and its implementation must be described in sufficient detail to ensure that the program meets the requirements of Appendix H to 10 CFR Part 50.

In addition, the application should describe the method for calculating neutron fluence for the RV beltline and the surveillance capsules. RG 1.206 lists some of the topics that should be addressed in the description of the RVSP:

- *Basis for the selection of material in the program.*
- *Number and type of specimens in each capsule.*
- *Number of capsules and proposed withdrawal schedule in compliance with the edition of American Society for Testing Materials (ASTM) E-185 Annual Book of ASTM Standards, Part 30, referenced in Appendix H to 10 CFR Part 50.*
- *Neutron flux and fluence calculations for vessel wall and surveillance specimens.*
- *Projected radiation embrittlement on vessel wall.*
- *Location of capsules, method of attachment, and provisions to ensure that capsules are retained in position throughout the vessel lifetime.*

Section 5.3.2.6 of the AP1000 DCD addresses the description of the RVSP. The DCD states that the base metal specimens are oriented both parallel and normal to the principal rolling direction of the limiting base material located in the core region of the RV. In accordance with the current DCD, there are no welds in the beltline region. Therefore, the applicant has addressed the entire beltline region in their RVSP. The DCD also addresses the number and type of specimens by meeting the ASTM E-185 requirements and describing 8 capsules, along with their proposed withdrawal schedule, that contain 72 tensile specimens, 480 Charpy V-notch specimens, and 48 compact tension specimens.

The DCD states that the neutron fluence assessments of the AP1000 RV are conducted in accordance with the guidelines that are specified in RG 1.190. The vessel fracture toughness data are given in Table 5.3-3 of the AP1000 DCD, Revision 17. The end-of-life nil-ductility reference transition temperature (RT_{NDT}) and upper shelf energy projections were estimated using RG 1.99, Revision 2, "Radiation Embrittlement of Reactor Vessel Materials," for the end-of-life neutron fluence at the $\frac{1}{4}$ -thickness and inner-diameter RV locations.

Finally, BLN has addressed the location of the capsules, their method of attachment, and the provisions to ensure that capsules are retained in position throughout the vessel lifetime by referencing AP1000 DCD, Section 5.3.2.6, which states that the capsules are located in guide baskets welded to the outside of the core barrel and positioned directly opposite the center portion of the core. DCD Figure 5.3-4 shows the azimuthal locations of the capsules around the RV.

Information about the implementation of the BLN RVSP is provided in Part 10 of the BLN COL. Section 3 proposes the following license condition:

J. Initial Criticality – The licensee shall implement each operational program identified below prior to initial criticality.

J.1 – Reactor Vessel Material Surveillance

In addition, Section 6, “Operational Program Readiness,” states that the licensee will submit to the NRC a schedule, no later than 12 months after issuance of the COL, that supports the planning for and conduct of NRC inspections of operational programs, including RVSP.

AP1000 COL Information Item

- STD COL 5.3-2

The NRC staff reviewed STD COL 5.3-2 related to the COL information item included under Section 5.3.6.2 of the BLN COL FSAR, which states:

The Combined License applicant will address a Reactor Vessel Reactor Material Surveillance program based on Section 5.3.2.6.

The commitment was also captured as COL Action Item 5.3.2.4-1 in Appendix F of the NRC staff’s FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will provide its Reactor Vessel Material Surveillance program.

RG 1.206 clarifies the intent of the COL information item. RG 1.206 Section C.III.1, Chapter 5, C.I.5.3.1.6, provides guidelines for addressing an RVSP. The applicant should fully describe the program and identify the implementation milestones. As previously discussed, the applicant references Section 5.3.2 of the AP1000 DCD, which addresses the topics listed in RG 1.206 that should be included in the description of the RVSP. The applicant provided License Condition 3.J.1 to implement the RVSP and License Condition 6 to support scheduling of NRC staff inspections, consistent with SECY-05-0197.

In addition, the applicant provided supplemental information in its FSAR to address COL Information Item 5.3-2 regarding the RVSP. The applicant added text between the first and second paragraphs of Section 5.3.2.6 to the AP1000 DCD, Revision 17 to reference the milestone of initial criticality for RVSP implementation. The applicant also added a new Section 5.3.2.6.3, “Report of Test Results,” to the AP1000 DCD, Revision 17 to outline the reporting criteria associated with the RVSP. When each capsule is withdrawn, a summary technical report of the data required by ASTM E-185-82 and the results of the fracture toughness tests conducted on the beltline materials in the irradiated and unirradiated conditions will be submitted to the NRC within one year of the date of capsule withdrawal.

In its review of the FSAR, the staff noted that the information provided in Section 5.3.2 of the DCD, in addition to the RVSP program implementation

information provided in Part 10 of the BLN COL application, meets the minimum guidelines in RG 1.206 for a description of the RVSP and its implementation. However, the staff determined that more information was needed to fully describe the RVSP in accordance with SECY-05-0197 to reach a resolution of the COL information item. A description of the process for preparing the capsule specimens must confirm that the materials selected for the capsules are samples of the same materials used in the fabrication of the RV. Therefore, the staff must receive this information before the vessel is fabricated. Other information, such as the capsule environment and the material types of the capsule specimens, can be provided after the RV has been procured. Thus, the staff requested additional information in RAI 5.3.1-1 to complete its review.

First, the staff requested additional information about the RVSP description. The purpose of the RVSP, as described in ASTM E-185, is to monitor radiation effects on RV materials under operating conditions. Section C.III.1, Chapter 5, C.I.5.3.1.6 of RG 1.206 states, "because the material surveillance program is an operational program, as discussed in SECY-05-0197, the applicant must describe the program and its implementation in sufficient scope and level of detail for the staff to make a reasonable assurance finding on its acceptability." The NRC staff recognizes that certain information about the program, such as actual material properties of the RV, is not currently known, but in order to complete its review of the adequacy of the RVSP, the staff requested that the applicant describe its process for preparing the capsule specimens. This description should confirm that the materials selected for the capsules are samples of those materials most likely to limit the operation of the RV.

Secondly, the staff requested additional information about the RVSP. The COL applicant must fully describe its RVSP to ensure that it meets ASTM E-185 and other requirements listed in 10 CFR Part 50, Appendix H. Specifically, the NRC staff requested detailed information on the RVSP associated with the AP1000 design, including, but not limited to, the capsule environment and the material types of the capsule specimens.

In RAI 5.3.1-1, the staff requested that the applicant describe the process for preparing the capsule specimens and to include detailed information on the capsule environment and material types of the capsule specimens. The applicant responded with a detailed description of the capsule specimen preparation process to be incorporated into the next revision of the BLN COL FSAR. The applicant also stated that the capsule environment and the material types of the capsule specimens are addressed in AP1000 DCD, Section 5.3.2.6 which is incorporated by reference.

The staff finds that the response to RAI 5.3.1-1 is acceptable, provided that the BLN COL FSAR is revised as stated by the applicant, and that the applicant confirms the staff's understanding that the surveillance capsules are backfilled with inert gas. Therefore, the staff identifies **Confirmatory Item 5.3-1** to confirm that the BLN COL FSAR is revised as stated, and to confirm the staff's understanding that the surveillance capsules are backfilled with inert gas.

Generic Letter 92-01

Generic Letter (GL) 92-01, "Reactor Vessel Structural Integrity," addressed NRC concerns regarding compliance with the requirements of Appendices G and H to 10 CFR Part 50, which address fracture toughness requirements and RVSP requirements, respectively. Specifically, NRC had concerns about Charpy USE predictions for end-of-life for the limiting beltline weld and the plate or forging, RVs constructed to an ASME Code earlier than the Summer 1972 Addenda of the 1971 Edition, and use of RG 1.99, Revision 2, to estimate the embrittlement of the materials in the RV beltline. These topics have been addressed in the AP1000 DCD, Revision 17, which is incorporated by reference in the BLN COL FSAR.

The AP1000 DCD, Revision 17, also states that end-of-life RT_{NDT} and USE projections were estimated using RG 1.99. The construction of the RV to an ASME Code earlier than the Summer 1972 Addenda of the 1971 Edition is not a concern for new reactors, including BLN. In the BLN COL FSAR Section 5.3.2.6.3, the applicant provides additional information, which states that when each capsule is withdrawn, a summary technical report of the data required by ASTM E-185-82 and the results of the fracture toughness tests conducted on the beltline materials in the irradiated and unirradiated conditions will be submitted to the NRC within one year of the date of capsule withdrawal.

On the basis of the information discussed above, the NRC staff concludes that the applicant has adequately addressed the issues in GL 92-01.

Resolution of Standard Content Confirmatory Item 5.3-1

The NRC staff verified that the VEGP FSAR was updated to include a detailed description of the capsule specimen preparation process and to document that the surveillance capsules are backfilled with inert gas. As a result, Confirmatory Item 5.3-1 is resolved.

5.3.2.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license conditions related to the RV Material Surveillance program acceptable:

- License Condition (5-2) – The licensee shall implement the RV Material Surveillance program prior to initial criticality.
- License Condition (5-3) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO a schedule that supports planning for and conduct of NRC inspections of the RV Material Surveillance program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the RV Material Surveillance program has been fully implemented.

5.3.2.6 Conclusion

The NRC staff reviewed the application and the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the relevant regulatory guidance provided in Section 5.3.1 of NUREG-0800 and RG 1.206, the policy established in SECY-05-0197, and the requirements of Appendices G and H to 10 CFR Part 50. The staff based its conclusion on the following:

- STD COL 5.3-2, relating to the RV material surveillance program, is acceptable because the program is consistent with the relevant guidelines addressed in Section 5.3.1 of NUREG-0800 and in RG 1.206, Section C.III.1, Chapter 5, C.I.5.3.1. Conformance with these guidelines provides an acceptable basis for satisfying, in part, the requirements of Appendices G and H to 10 CFR Part 50.

5.3.3 Pressure Temperature Limits (Related to RG 1.206, Section C.III.1, Chapter 5, C.I.5.3.2, "Pressure-Temperature Limits, Pressurized Thermal Shock, and Charpy Upper-Shelf Energy Data and Analyses")

5.3.3.1 Introduction

Pressure Temperature (P-T) limits are required as a means of protecting the RV during startup and shut down to minimize the possibility of fast fracture. The methods outlined in Appendix G of Section XI of the ASME Code are employed in the analysis of protection against nonductile failure. Beltline material properties degrade with radiation exposure and this degradation is measured in terms of the adjusted reference temperature, which includes a reference nil-ductility temperature shift, initial RT_{NDT} , and margin.

5.3.3.2 Summary of Application

Section 5.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 5.3 of the AP1000 DCD, Revision 19. Section 5.3 of the AP1000 DCD includes Section 5.3.3.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 5.3.6.1, the applicant provided the following:

AP1000 COL Information Item

- STD COL 5.3-1

The applicant provided additional information in STD COL 5.3-1 to address COL Information Item 5.3-1 of the AP1000 DCD and COL Action Item 5.2.2.2-1 in NUREG-1793. The information relates to plant-specific P-T curves.

Supplemental Information

- STD SUP 5.3-1

The applicant provided supplemental information related to development of operating procedures as required by Technical Specification (TS) 5.6.6.

License Condition

- Part 10, License Condition 2, Item 5.3-1

The license condition related to COL Information Item 5.3-1 sets the implementation milestone for development of plant-specific P-T curves.

5.3.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for P-T limits are given in Section 5.3.2 of NUREG-0800.

5.3.3.4 Technical Evaluation

The NRC staff reviewed Section 5.3.3 of the Turkey Point Units 6 and 7 COL FSAR and the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to P-T limits. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 5.3.3.4 of the VEGP SER:

AP1000 COL Information Item

- STD COL 5.3-1

The NRC staff reviewed STD COL 5.3-1 related to COL Information Item 5.3-1 included under Section 5.3.6.1 of the COL FSAR. The applicant proposes to replace the text in AP1000 DCD Section 5.3.6.1 with the following:

The pressure-temperature curves shown in DCD Figures 5.3-2 and 5.3-3 are generic curves for AP1000 reactor vessel design, and they are limiting curves based on copper and nickel material composition. Plant-specific curves will be developed based on material composition of copper and nickel. Use of plant-specific curves will be addressed during procurement and fabrication of the reactor vessel. As noted in the bases to Technical Specification 3.4.14, use of plant-specific curves requires evaluation of the LTOP system. This includes an evaluation of the setpoint pressure for the RNS relief valve to determine if the setpoint pressure needs to be changed based on plant-specific pressure-temperature curves. The development of the plant-specific curves and evaluation of the setpoint pressure are required prior to fuel load.

In addition, in Section 5.3.3.2 of NUREG-1793, the staff identified related COL Action Item 5.2.2.2-1 in which the COL applicant will address the use of plant-specific curves during procurement of the RV.

The COL applicant stated that the P-T limits shown in DCD Figures 5.3-2 and 5.3-3 are generic curves for AP1000 RV design, and they are limiting curves based on copper and nickel material composition. The applicant committed to provide P-T limits using the plant-specific material composition after the combined license is issued and when the RV is procured. The applicant also stated that the development of the plant-specific P-T limits is required prior to fuel load. The staff found that a more specific implementation milestone for completing the plant-specific P-T limits was needed. Thus, the following additional information was requested.

In RAI 5.3.2-1, the staff noted Westinghouse's plan to: a) submit a generic PTLR [pressure temperature limits report] for the AP1000 RV using the bounding properties for NRC staff review and approval; and b) update the AP1000 DCD to include the use of the generic AP1000 PTLR by all COL applicants. The NRC

staff requested that Part 10 of the BLN COL, proposed license conditions, Section 2, COL holder items, and COL Information Item 5.3-1 be revised by adding the following statement:

The COL Holder shall update the P/T limits using the PTLR methodologies approved in the AP1000 DCD, and using the plant-specific material properties. The COL Holder will inform the NRC of the updated P/T limits.

The approach described above is consistent with that used for all operating reactors where licensees using PTLRs (reference: GL 96-03) inform the NRC staff of any subsequent change in P-T limits with no NRC approval necessary when there are no changes to the approved PTLR methodology. Subsequently, in a letter dated May 30, 2008, Westinghouse submitted a generic PTLR for AP1000 plants. The NRC staff reviewed the PTLR and approved its use for AP1000 RVs in a safety evaluation (ML083470258) dated December 30, 2008.

In response to RAI 5.3.2-1, the applicant proposed to modify the COL application Part 10, Proposed Combined License Conditions, Section 2, COL Holder Item 5.3-1. Accordingly, the modified license condition states, "The COL Holder shall update the P/T limits using the PTLR methodologies approved in the AP1000 DCD using plant-specific material properties or confirm that the reactor vessel material properties meet the specifications and use the Westinghouse generic PTLR curves."

The staff finds that the applicant's modification to the proposed license condition is adequate and the staff verified that the revision to Part 10 of the application incorporates the above. As a result, RAI 5.3.2-1 is closed.

Supplemental Information

- STD SUP 5.3-1

Development of plant operating procedures as required by TS 5.6.6 ensures that P-T limits are adhered to during normal and abnormal operating conditions and system tests and is therefore, acceptable.

5.3.3.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition related to P-T limits acceptable:

- License Condition (5-4) – Before initial fuel load, the licensee shall update the P-T limits using the pressure-temperature limits report (PTLR) methodologies approved in the AP1000 DCD using the plant-specific material properties or confirm that the RV material properties meet the specifications and use the Westinghouse generic PTLR curves.

5.3.3.6 Conclusion

The NRC staff reviewed the application and the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the regulatory basis addressed in NUREG-1793. Specifically, the relevant regulatory basis includes Section 5.3.2 of NUREG-0800; GL 96-03, "Relocation of the Pressure Temperature Limit Curves and Low Temperature Overpressure Protection System Limits"; and Appendix G to 10 CFR Part 50. The staff based its conclusion on the following:

- STD COL 5.3-1, relating to plant-specific P-T curves, is acceptable because the program is consistent with the guidelines addressed in Section 5.3.2 of NUREG-0800. Conformance with these guidelines provides an acceptable basis for satisfying in part, the requirements of Appendix G to 10 CFR Part 50.
- STD SUP 5.3-1, relating to development of operating procedures, is acceptable because it ensures that P-T limits are adhered to during normal and abnormal operating conditions and system tests.

5.3.4 Reactor Vessel Integrity (Related to RG 1.206, Section C.III.1, Chapter 5, C.I.5.3.3 "Reactor Vessel Integrity")

5.3.4.1 Introduction

Section 5.3.4 of the AP1000 DCD describes the RV integrity. The RV is the RCPB used to support and enclose the reactor core. It provides flow direction with the reactor internals through the core and maintains a volume of coolant around the core. The vessel is fabricated by welding together the lower head, the transition ring, the lower shell, and the upper shell. The upper shell contains the penetrations from the inlet and outlet nozzles and direct vessel injection nozzles.

As part of the RV integrity, this section also addresses the pressurized thermal shock (PTS) for the PWR RV. PTS events are potential transients in a PWR RV that can cause severe overcooling of the vessel wall, followed by repressurization. The thermal stresses, caused when the inside surface of the RV cools rapidly, combined with high-pressure stresses, will increase the potential for fracture if a flaw is present in a low-toughness material. The materials most susceptible to PTS are the materials in the RV beltline where neutron radiation gradually embrittles the material over time.

5.3.4.2 Summary of Application

Section 5.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 5.3 of the AP1000 DCD, Revision 19. Section 5.3 of the DCD includes Section 5.3.4.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 5.3.6, the applicant provided the following:

AP1000 COL Information Item

- STD COL 5.3-4

The applicant provided additional information in STD COL 5.3-4 to address COL Information Item 5.3-4 and related COL Action Item 5.3.4.3-1. The applicant proposed to verify the plant-specific beltline material properties consistent with the requirements in DCD Section 5.3.3.1 and DCD Tables 5.3-1 and 5.3-3 prior to fuel load. The applicant also proposed in STD COL 5.3-4 to perform a PTS evaluation based on as procured RV material data and the projected neutron fluences for the plant design objective of 60 years.

License Condition

- Part 10, License Condition 2, Item 5.3-4

The milestone for the implementation of the proposed actions related to RV material properties will be prior to initial fuel load.

5.3.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the RV integrity are given in Section 5.3.3 of NUREG-0800.

In addressing the COL information item, PWRs are required, in part, to have the pressurized thermal shock reference temperature (RT_{PTS}), evaluated for the end-of-life fluence for each of the RV beltline materials in accordance with requirements of 10 CFR 50.61, "Fracture toughness requirements for protection against pressurized thermal shock events."

5.3.4.4 Technical Evaluation

The NRC staff reviewed Section 5.3.4 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to RV integrity. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP

Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAs.
- The staff confirmed that all responses to RAs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 5.3.4.3 of the VEGP SER:

AP1000 COL Information Item

- *STD COL 5.3-4*

The NRC staff reviewed STD COL 5.3-4 related to COL Information Item 5.3-4 and related COL Action Item 5.3.4.3-1. The applicant proposed to verify the plant-specific beltline material properties consistent with the requirements in DCD Section 5.3.3.1 and DCD Tables 5.3-1 and 5.3-3 prior to fuel load. The applicant also proposed in STD COL 5.3-4 to perform a PTS evaluation based on as procured RV material data and the projected neutron fluences for the plant design objective of 60 years.

License Condition

- *Part 10, License Condition 2, Item 5.3-4*

In response to the COL information item, the applicant proposed a license condition (Part 10, Item 2, COL Information Item 5.3-4) that a plant-specific PTS evaluation would be performed by the COL holder using as-procured RV material data and submitted for NRC review prior to initial fuel loading.

The as-procured RV material properties will be available to the COL holder after the acceptance of the RV. In order to provide sufficient time for NRC review of the PTS evaluation using the as-procured RV material properties as required by 10 CFR 50.61, the staff requested a more specific and timely milestone for submitting the PTS evaluation to the NRC be established. Therefore, the staff requested that the proposed license condition for COL Information Item 5.3-4 be

revised to state that, within a reasonable period of time following acceptance of the RV, the COL holder submit to the NRC staff the plant-specific PTS evaluation, for example, one year after the acceptance of the RV. This was identified in RAI 5.3.3-1.

In response to RAI 5.3.3-1, the applicant proposed that the licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after the issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs listed in the operational program FSAR Table 13.4-201. This schedule shall include a submittal schedule for the RV pressurized thermal shock evaluation at least 18 months prior to initial fuel load. Accordingly, the applicant will revise the COL application, Part 10, proposed License Condition 6.

The staff finds that Revision 1 of the application incorporates the proposed change to the proposed License Condition 6, and therefore the applicant's response to COL Information Item 5.3-4 meets the implementation requirements of 10 CFR 50.61, and is therefore acceptable. As a result, RAI 5.3.3-1 is closed.

5.3.4.5 Post Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated April 8, 2016 (ADAMS Accession No. ML16103A507), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (5-5) – Before initial fuel load, the licensee shall verify that plant-specific belt line material properties are consistent with the properties given in AP1000 DCD Rev. 19, Section 5.3.3.1 and Tables 5.3-1 and 5.3-3. The verification must include a pressurized thermal shock (PTS) evaluation based on as-procured reactor vessel material data and the projected neutron fluence for the plant design objective. Submit this PTS evaluation report to the Director of NRO, or the Director's designee, in writing, at least 18 months before the latest date set forth in the schedule for completing the inspections, tests, and analyses in the ITAAC submitted in accordance with 10 CFR 52.99(a).

5.3.4.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR meets the relevant acceptance criteria provided in Section 5.3.3 of NUREG-0800, and the requirements of Appendix B to 10 CFR Part 50 and 10 CFR 50.61. The staff based its conclusion on the following:

- STD COL 5.3-4, relating to plant-specific beltline material properties, is acceptable because the applicant's proposed resolution meets the relevant acceptance criteria addressed in Section 5.3.3 of NUREG-0800 and thus provides an acceptable basis for satisfying, in part, the requirements of Appendix B to 10 CFR Part 50 and 10 CFR 50.61.

5.3.5 Reactor Vessel Insulation

RV insulation is provided to minimize heat losses from the primary system. Nonsafety-related reflective insulation similar to that in use in current PWRs is utilized.

Section 5.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 5.3.5 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

5.4 Component and Subsystem Design (Related to RG 1.206, Section C.III.1, Chapter 5, C.I.5.4, "Reactor Coolant System Component and Subsystem Design")

5.4.1 Introduction

This section pertains to the design of various components and subsystems within, or associated with, the RCS. Principal components or subsystems include the following:

- Reactor coolant pumps (RCPs)
- Steam generators (SGs), including materials and ISI
- RCS piping and valves
- Main steam line flow restriction
- Pressurizer and pressurizer relief discharge
- Automatic depressurization system valves
- Normal Residual Heat Removal System (RNS)
- RCS pressure relief devices
- Component supports
- RCS high point vents
- Core makeup tank
- Passive residual heat removal heat exchanger

The majority of the design-related information in the DCD is incorporated by reference in the COL application. Regarding the SGs, a program is developed by the COL applicant to ensure tube structural and leakage integrity will be maintained at a level comparable to that of the original design requirements. An effective program depends on both the program and the design features of the SGs.

The RNS is a nonsafety-related system. Since the RNS is not required to operate to mitigate design-basis events, it is not credited in the Chapter 15 safety analysis. However, the RNS is considered an important system because the RNS provides residual heat removal capability to several reactor systems. These major RNS nonsafety-related functions include the RCS

shutdown heat removal, RCS LTOP, RCS and refueling cavity purification during refueling operations, in-containment refueling water storage tank (IRWST) cooling, low pressure makeup to the RCS, and post-accident heat removal recovery. In addition, the RNS provides safety-related functions that include containment isolation of the RNS lines penetrating the containment, preservation of the RCS pressure boundary, and long term post-accident makeup to the containment inventory.

5.4.2 Summary of Application

Section 5.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 5.4 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 5.4, the applicant provided the following:

Departures

- PTN DEP 3.2-1 and PTN DEP 6.3-1

The applicant provided additional information in Turkey Point Units 6 and 7 COL FSAR Section 5.4 about PTN DEP 3.2-1 and PTN DEP 6.3-1 related to design modifications to the condensate return portion of the Passive Core Cooling System and quantifying the duration that the passive residual heat removal heat exchanger (PRHR-HX) can maintain safe shutdown conditions, respectively. This information, as well as related PTN DEP 3.2-1 and PTN DEP 6.3-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.1 of this SER.

- PTN DEP 2.0-3

In the Turkey Point Units 6 and 7 COL application, Part 7, and Turkey Point Units 6 and 7 COL FSAR Section 5.4.7.1, the applicant proposed a site-specific ambient design wet bulb air temperature of 87.4°Fahrenheit (F) as the basis for the component cooling water temperature to the RNS heat exchangers. That temperature exceeds the site parameter value for maximum safety wet bulb (noncoincident) air temperature specified in the DCD.

In Turkey Point Units 6 and 7 COL FSAR Section 5.4.7.1, the applicant replaced the second bulleted item regarding RNS cooling of the IRWST in DCD Section 5.4.7.1.2.3 with the following information:

The component cooling water system supply temperature to the normal residual heat removal system heat exchangers is based on an ambient design wet bulb temperature of no greater than 87.4°F (100 year return estimate of 2-hour duration). The 87.4°F value is assumed for normal conditions and transients that start at normal conditions.

The exemption request related to the AP1000 DCD maximum safety wet bulb (noncoincident) air temperature involves an exemption to 10 CFR Part 52, "Licenses, certifications, and approvals for nuclear power plants," Appendix D, "Design Certification Rule for the AP1000 Design," Section IV.A.2.d. Specifically, the Turkey Point Units 6 and 7 applicant requested an exemption from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1 for the maximum safety wet bulb (noncoincident) air temperature. The exemption request is evaluated in Section 9.2.2 of this SER.

AP1000 COL Information Item

- STD COL 5.4-1

The applicant provided additional information in STD COL 5.4-1 to address COL Information Item 5.4-1 as described in Section 5.4.15 of the AP1000 DCD. The information in STD COL 5.4-1 provides the SG program description, references the applicable ASME BPV Code, Section XI requirements and industry guidelines, and refers to the TS for the program requirements.

The detailed inspection and reporting requirements are provided in Turkey Point Units 6 and 7 COL FSAR, Part 4, "Technical Specifications," Sections 1.1 ("Definitions"), 3.4.7 ("RCS Operational Leakage"), 3.4.18 ("Steam Generator (SG) Tube Integrity"), 5.5.4 ("Steam Generator (SG) Program"), 5.6.8 ("Steam Generator Tube Inspection Report"), and in the associated bases sections of the TS.

5.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the component and subsystem design are given in Section 5.4.2 of NUREG-0800.

The applicable regulatory requirements for acceptance of the COL information item are 10 CFR 50.55a, as it relates to periodic inspection and testing of the RCPB as detailed in Section XI of the ASME Code, and 10 CFR Part 50, Appendix A, GDC 32, as it relates to the accessibility of SG tubes for periodic testing. In addition, 10 CFR 50.55a(b)(2)(iii) states that if the TS include SG surveillance requirements that are different than those in Article IWB-2000 of the ASME Code, Section XI, then the SG tube inspection requirements are governed by the TS.

The regulatory basis for evaluating the RNS is documented in Section 5.4.7 of NUREG-1793 and its supplements. While the RNS is a nonsafety-related system, it is considered to be important to safety because it provides the first line of defense during an accident to prevent unnecessary actuation of the passive core cooling systems. Regulatory oversight of the active nonsafety systems in passive plant designs is subject to a staff evaluation of the regulatory treatment of nonsafety systems (RTNSS). Chapter 22 of NUREG-1793 provides a detailed evaluation of the RTNSS issue in accordance with the Commission's policy for passive reactor plant designs. Nonsafety-related systems that provide defense-in-depth capabilities for the AP1000 design includes the RNS. For this defense-in-depth system to operate, the associated systems and structures to support these functions must also be operable, including nonsafety-related component cooling water system and the service water system. The staff's evaluation of the changes that are proposed focused primarily on confirming that the changes will not adversely affect safety-related SSCs or those that satisfy the criteria for RTNSS. Therefore, the proposed changes were evaluated using the guidance provided by NUREG-0800, Section 5.4.7, as it pertains to these considerations. Acceptability was determined based on conformance with the existing AP1000 licensing basis, the guidance specified by NUREG-0800, Section 5.4.7 (10 CFR Part 50, Appendix A, GDC 34, "Residual

Heat Removal,” as it relates to requirements for a RNS system), and the Commission’s policy with respect to RTNSS as discussed in SECY-94-084, “Policy and Technical Issues Associated With the Regulatory Treatment of Non-Safety Systems in Passive Plant Designs,” and SECY-95-132, “Policy and Technical Issues Associated with the Regulatory Treatment of Non-Safety Systems in Passive Plant Designs (SECY-94-084).”

5.4.4 Technical Evaluation

The NRC staff reviewed Section 5.4 of the Turkey Point Units 6 and 7 COL FSAR and the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to RCS component and subsystem design. The results of the NRC staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAls.
- The staff confirmed that all responses to RAls identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 5.4.4 of the VEGP SER:

AP1000 COL Information Item

- *STD COL 5.4-1*

In AP1000 DCD Section 5.4.15, Westinghouse identified COL Information Item 5.4-1 for the COL applicant to address the SG tube integrity with an SG Tube Surveillance Program and address the need to develop a program for

periodic monitoring of degradation of steam generator internals. Similarly, in NUREG-1793, Section 5.4.2.2.2, the staff identified COL Action Item 5.4.2.2.3-1 and noted that an SG tube surveillance program is necessary to address the concerns raised in GL 97-06, "Degradation of Steam Generator Internals."

In Revision 17 of the AP1000 DCD, Westinghouse proposed changes to the AP1000 generic TS related to adopting TS Task Force Traveler (TSTF) 449, Revision 4, "Steam Generator Tube Integrity." TSTF 449 is incorporated in the current Westinghouse Owners Group Standard Technical Specifications (STS), NUREG-1431, Revision 3.1, December 1, 2005. The TS and bases sections listed above for SG tube integrity in the BLN SER are identical to those in Revision 17 of the AP1000 DCD.

With respect to the information provided in STD COL 5.4-1, the staff reviewed the description in Chapter 5 of the FSAR using the guidelines in RG 1.206, Section C.III.1, Chapter 5, C.I.5.4.2.2; Section 5.4.2.2 of NUREG-0800; and the TS proposed in the AP1000 DCD (which are based on NUREG-1431, Revision 3.1 and are the STS for Westinghouse operating plants). The staff confirmed tube inspection will meet the requirements of Section XI of the ASME Code, and that the applicant referenced an acceptable method (RG 1.121) for determining the tube repair criteria for maintaining structural integrity. The staff determined the TS proposed for BLN Nuclear Plant, Units 3 and 4 are consistent with the approved STS and the leakage limits and SG tube integrity requirements are appropriate as they apply to BLN, and are therefore acceptable. In addition, the applicant took exception to the guidance contained in Regulatory Guide 1.83, Revision 1 and stated that the applicant's program will be implemented according to Nuclear Energy Institute (NEI) 97-06 ("Steam Generator Program Guidelines") and EPRI SG guidelines, which are referenced in the STS and, thus, provide acceptable methods for implementing ASME Code requirements. With respect to tube integrity considerations, the Model Delta-125 SG planned for the BLN units closely resembles the Model Delta-75 installed as replacement SGs at some operating plants.

According to Section 5.4.2.2 of NUREG-0800, because the SG program is part of the ISI requirements, it is an operational program that should be fully described, with implementation milestones listed in the appropriate table in Chapter 13 of the FSAR. In response to RAI 5.4.2.2-1 from the staff, in a letter dated June 5, 2008, the applicant proposed revising FSAR Chapter 13, Table 13.4-201 to add Section 5.4.2.5 ("Steam Generator Inservice Inspection") as one of the FSAR sections addressed by the operational program titled "Inservice Inspection Program." Similarly, in response to RAI 5.4.2.2-2, the applicant proposed revising Table 13.4-201 to add Section 5.4.2.5 as one of the FSAR sections addressed by the operational program titled "Preservice Inspection Program." These proposed revisions are acceptable because they make the SG tube ISI part of the operational programs and ensure PSIs will be performed, consistent with the acceptance criteria in Section 5.4.2.2 of NUREG-0800 and RG 1.206. The staff verified that Revision 1 of Table 13.4-201 adequately incorporates the above. As a result, RAI 5.4.2.2-1 and RAI 5.4.2.2-2 are closed.

Tier 1 and Tier 2 Departure

- PTN DEP 2.0-3

PTN DEP 2.0-3 proposes to increase the maximum safety wet bulb (noncoincident) air temperature from 86.1°F to 87.4°F. This change impacts the performance of various structures, systems, and components (SSCs) described in the AP1000 DCD. The staff's evaluation of this proposed change is also discussed in Sections 2.0, 2.3.1, 6.2, 6.4, 9.1.3, 9.2.2, and 9.2.7 of this SER.

The maximum safety noncoincident wet bulb temperature, referred to as the ambient design wet bulb temperature in Section 5.4.7, for the Turkey Point Units 6 and 7 site was recently reevaluated by Westinghouse and increased from the standard AP1000 DCD value to reflect expected site maximum temperature conditions. This change requires that an evaluation be performed for the various plant performance requirements and commitments affected by this parameter to confirm that the performance of the plant's nonsafety-related systems remains within the bounds described in the AP1000 DCD with respect to the ambient design wet bulb temperature. As described in AP1000 DCD Section 5.4.7.1.2.3, RNS cooling of the IRWST to maintain the IRWST temperature to within the temperature criteria during normal and abnormal conditions is dependent upon the RNS heat removal capacity to the component cooling water system (CCS). Since the CCS ambient design wet bulb temperature increased from the standard AP1000 DCD value used in nonsafety-related system analysis, the departure was reflected in a revision to the Turkey Point Units 6 and 7 COL application. For that reason, the staff considered the RNS as one of the systems that could be impacted by this change in that the ability to transfer heat to the CCS would be reduced.

The staff evaluated this departure and determined that additional information was needed to support this change regarding the RNS heat removal capability of cooling the IRWST. Therefore, the staff generated RAI 5403, Question 09.02.02-1 and RAI 5492, Question 09.02.02-2 to acquire additional information related to this change in the maximum safety design wet bulb temperature and the overall effects to various systems including the RNS heat transfer interface with CCS. These RAIs are discussed in chapter 9 of this SER.

In support of PTN DEP 2.0-3, maximum safety wet bulb (noncoincident) air temperature, the Turkey Point applicant provided a similar level of detail in revision 5 of Turkey Point Units 6 and 7 COL FSAR section 5.4.7.1 as did a previous AP1000 applicant addressing the same maximum safety wet bulb departure. The component cooling water system supply temperature to the normal residual heat removal system heat exchangers is based on an ambient design wet bulb temperature of no greater than 87.4°F (100 year return estimate of 2-hour duration). The 87.4°F value is assumed for normal conditions and transients that start at normal conditions.

The steaming prevention function is evaluated assuming the ambient wet bulb temperature is at the maximum safety value for the site. During plant operation, maximum IRWST temperature is reduced below 120°F whenever necessary by circulating IRWST water through one of the RNS heat exchangers, and removing the heat through the CCS and service water system SWS.

Since the RNS heat exchangers are not being used to remove decay heat with the plant at power, at least one is available for IRWST heat removal. Only one train of CCS (pump and heat exchanger) and one train of SWS (pump, strainer, and cooling tower cell) are normally in operation with the plant at power. There is sufficient margin in CCS pump flow capacity and

motor size, and in CCS heat exchanger overall heat transfer coefficient and effective heat transfer area (UA), to valve in one of the RNS heat exchangers and remove IRWST heat by directing CCS flow through the heat exchanger and transferring the excess heat to the SWS cooling tower. CCS temperature rises slightly above the normal full power CCS temperature during this evolution, but does not approach the maximum allowable value of 100°F.

Prevention of IRWST steaming following high-pressure heat removal operations with the Passive Residual Heat Removal (PRHR) heat exchanger is accomplished in the same manner, by lining up both RNS heat exchangers to the CCS and the IRWST. CCS is delivered to the RNS heat exchangers at a temperature consistent with the maximum safety ambient wet bulb temperature and the CCS and SWS heat duty and flow rates. Cooling is assumed to begin two hours after reactor trip, with decay heat appropriate for that time after the event. Calculations performed to determine the maximum IRWST temperature achieved following a high pressure heat removal event using the PRHR heat exchanger assumed CCS temperature is determined by use of a maximum safety ambient wet bulb temperature value of 87.4°F. The maximum predicted IRWST liquid temperature is 201°F. Therefore, it can be concluded that IRWST cooling performance (prevention of steaming) is acceptable.

The staff finds that during normal power plant operations, the maximum IRWST temperature is kept below 120 °F by removing the IRWST heat through one train of the RNS, CCS and SWS. This heat removal process can be performed since the RNS, CCS, and SWS are not being used to remove decay heat with the plant at power.

During high pressure operation events, the calculation of the CCS temperature is determined by the use of the maximum safety ambient wet bulb temperature and not the maximum normal wet bulb temperature. As related to RNS and its ability to support defense in depth, RTNSS, and cooling of the IRWST, the RNS performance is dependent upon the maximum normal wet bulb temperature. Therefore, the staff finds the applicant's response acceptable with regard to maintaining the IRWST temperature below 120 °F during normal operation and prevention of IRWST steaming during high-pressure heat removal operational events.

In summary, the staff concludes that the proposed change in the maximum safety noncoincident wet bulb temperature does not impact the RNS capacity to perform its functions as described in DCD Section 5.4.7.

5.4.5 Post Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated April 8, 2016 (ADAMS Accession No. ML16103A507), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (5-6) – No later than 12 months after the issuance of the COL, the licensee shall submit to the Director of NRO a schedule that supports planning for and conduct of NRC inspections of the PSI/ISI program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the PSI/ISI program has been fully implemented.

5.4.6 Conclusion

The NRC staff reviewed the application and the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the relevant regulatory requirements provided in Appendix A to 10 CFR Part 50, GDC 32 and 10 CFR 50.55a, and the regulatory guidance addressed in RG 1.206 and RG 1.121. The staff based its conclusion on the following:

- PTN DEP 3.2-1 and PTN DEP 6.3-1, related to design modifications to the condensate return portion of the Passive Core Cooling System and quantifying the duration that the passive residual heat removal heat exchanger can maintain safe shutdown conditions, respectively, are reviewed and found acceptable by the staff in Section 21.1 of this SER.
- PTN DEP 2.0-3 relating to IRWST temperature control with RNS cooling capacity is acceptable because the RNS cooling performance is determined based on the maximum safety wet bulb temperature and the cooling capability of the CCS to the RNS heat exchangers was evaluated and determined to provide sufficient cooling at the proposed ambient design wet bulb temperature. Therefore, the staff concludes that the Turkey Point Units 6 and 7 RNS, as described in Section 5.4.7 of the FSAR, is acceptable because GDC 34, as related to the requirements of a residual heat removal system, was not impacted by the proposed revision.
- STD COL 5.4-1 relating to the SG Program, is acceptable because it meets the relevant guidelines of RG 1.206, Section C.III.1, Chapter 5, C.I.5.4.2.2 and RG 1.121. Conformance with these guidelines provides an acceptable basis for satisfying, in part, the requirements of Appendix A to 10 CFR Part 50, GDC 32, and 10 CFR 50.55a including the specific modification provided in 10 CFR 50.55a(b)(2)(iii).

6.0 ENGINEERED SAFETY FEATURES

6.0 Engineered Safety Features

Engineered safety features (ESF) protect the public in the event of an accidental release of radioactive fission products from the reactor coolant system (RCS). The ESF function is to localize, control, mitigate, and terminate such accidents, and to maintain radiation exposure levels to the public below applicable limits and guidelines.

Section 6.0 of the Turkey Point Units 6 and 7 Combined License (COL) Final Safety Analysis Report (FSAR), Revision 8, incorporates by reference, with no departures or supplements, Section 6.0, "Engineered Safety Features," of Revision 19 of the AP1000 design control document (DCD). The U.S. Nuclear Regulatory Commission (NRC) staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that there is no outstanding issue related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements.

6.1 Engineered Safety Features Materials

This section provides the evaluation of the materials used in the fabrication of ESF components and of the provisions to avoid material interactions that could impair the operation of the ESF. The design information in Turkey Point Units 6 and 7 COL FSAR, Section 6.1 is divided into two sections, Section 6.1.1, "Metallic Materials"; and Section 6.1.2, "Organic Materials." The staff's evaluation of these two FSAR sections is provided below.

6.1.1 Metallic Materials

6.1.1.1 *Introduction*

In this section, the staff reviews metallic materials used in ESF components to ensure that they are compatible with one another and with ESF fluids. The compatibility of fluids in ESF systems should ensure that there is a low probability of causing abnormal leakage, of rapidly propagating failure, and of gross rupture of reactor coolant pressure boundary components. Metallic materials and fluids should also be compatible with the auxiliary systems that directly support ESF systems.

6.1.1.2 *Summary of Application*

Section 6.1 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 6.1 of the AP1000 DCD, Revision 19. Section 6.1 of the AP1000 DCD includes Section 6.1.1.

¹ See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC). This footnote will be referenced in several places throughout the chapter of this Safety Evaluation.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 6.1.1, the applicant provided the following:

AP1000 COL Information Item

- STD COL 6.1-1

The applicant provided additional information in Standard (STD) COL 6.1-1 to resolve COL Information Item 6.1-1. STD COL 6.1-1 describes quality assurance measures for special processes in fabricating austenitic stainless steels. In a letter dated April 7, 2010, the DCD applicant, Westinghouse, proposed to revise Appendix 1A of the AP1000 DCD to remove stated exceptions to conformance with Regulatory Guide (RG) 1.44, "Control of the Use of Sensitized Steel," Revision 0. The staff's review of STD COL 6.1-1 includes the information in the Westinghouse letter. The COL applicant did not submit additional information in response to this proposed DCD revision.

6.1.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the metallic materials are given in Section 6.1.1, Revision 2, of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)."

The regulatory basis of the COL information item is Title 10 of the *Code of Federal Regulations* (10 CFR) Part 50, "Domestic Licensing of Production and Utilization Facilities," Appendix B, "Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants," as it relates to the quality assurance requirements for the design, fabrication, and construction of safety-related structures, systems, and components (SSCs). Guidance for the COL information item is described in RG 1.31, "Control of Ferrite Content in Stainless Steel Weld Metal," Revision 3, and RG 1.44.

6.1.1.4 Technical Evaluation

The staff reviewed Section 6.1.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to metallic materials. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy the NRC used to perform one technical review for each standard issue outside the scope of the DC and used this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL

application (Vogtle Electric Generating Plant [VEGP], Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Plant (BLN) Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 6.1.1.4 of the VEGP SER:

AP1000 COL Information Item

- *STD COL 6.1-1*

The NRC staff reviewed STD COL 6.1-1 related to COL Information Item 6.1-1 included under Section 6.1.1.2 of the BLN COL FSAR, which addresses the COL information item identified in AP1000 DCD Section 6.1.3.1 related to the fabrication requirements for austenitic stainless steel.

The COL information item identified in AP1000 DCD Section 6.1.3.1 states:

The Combined License applicants referencing the AP1000 will address review of vendor fabrication and welding procedures or other quality assurance methods to judge conformance of austenitic stainless steels with Regulatory Guides 1.31 and 1.44.

This commitment was also documented as COL Action Item 6.1.1-1 in the NRC staff's FSR for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will review vendor fabrication and welding procedures or other quality assurance methods to ensure that austenitic stainless steels meet the guidelines of RGs 1.31 and 1.44.

The COL information in the FSAR that is to be added to AP1000 DCD Section 6.1.1.2 states:

In accordance with Appendix B to 10 CFR Part 50, the quality assurance program establishes measures to provide control of special processes. One element of control is the review and acceptance of vendor procedures that pertain to the fabrication, welding, and other quality assurance methods for safety related component [sic] to determine both code and regulatory conformance. Included in this review and acceptance process are those vendor procedures necessary to provide conformance with the requirements of Regulatory Guides 1.31 and 1.44 for engineered safety features components as discussed in DCD Section 6.1 and reactor coolant system components as discussed in DCD Section 5.2.3.

The staff finds the COL information provided by the applicant meets the quality assurance guidelines for austenitic stainless steels specified in RG 1.31 (weld metal ferrite content) and RG 1.44 (the use of sensitized stainless steel). The staff's conclusion is based on the applicant's statement affirming that its Appendix B quality assurance program will address the concerns of these RGs. It is also based on Appendix 1A of the AP1000 DCD, as modified by a letter dated April 7, 2010, from the AP1000 applicant. The modified DCD appendix will be incorporated by reference in a future version of the BLN COL FSAR and will indicate full conformance with these RGs. In addition, the discussions in AP1000 DCD Sections 6.1.1.2 and 5.2.3.4 provide details about how conformance will be accomplished.

6.1.1.5 Post Combined License Activities

There are no post-COL activities related to this section.

6.1.1.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable because it meets the requirements of 10 CFR Part 50, Appendix B, and the guidance provided in RGs 1.31 and 1.44. The staff based its conclusion on the following:

- STD COL 6.1-1 is acceptable because the Appendix B quality assurance program proposed by the applicant provides adequate controls over vendor fabrication and welding procedures to ensure that austenitic stainless steels meet the guidelines of RGs 1.31 and 1.44.

6.1.2 Organic Materials

6.1.2.1 Introduction

Protective coatings are applied for corrosion prevention to the interior and exterior surfaces of the containment vessel, radiologically controlled areas outside containment, and the remainder of the plant. The considerations for protective coatings differ for these four areas and the coatings selection process accounts for these differing considerations. The AP1000 design considers the function of the coatings, their potential failure modes, and their requirements for maintenance.

Other organic materials that may be present in the containment are associated with the specific type of equipment and the supplier selected to provide it. Materials are evaluated for potential interaction with the ESF to provide confidence that the performance of the ESF is not unacceptably affected.

6.1.2.2 Summary of Application

Section 6.1 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 6.1 of the AP1000 DCD, Revision 19. Section 6.1 of the AP1000 DCD includes Section 6.1.2.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 6.1.2, the applicant provided the following:

AP1000 COL Information Item

- STD COL 6.1-2

The applicant provided additional information in STD COL 6.1-2 to resolve COL Information Item 6.1-2. STD COL 6.1-2 discusses a program to control procurement, application, inspection, and monitoring of Service Level I and Service Level III coatings. In a letter dated March 31, 2010, the DCD applicant, Westinghouse, proposed revisions to COL Information Item 6.1-2 in Section 6.1.3.2 of the AP1000 DCD to address Service Level II coatings. Turkey Point Units 6 and 7 COL FSAR, Revision 7 revises the FSAR to address the updated COL Information Item 6.1-2.

6.1.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for protective coatings are given in Section 6.1.2, Revision 3, of NUREG-0800.

The applicable regulatory basis for the resolution of the COL information item is 10 CFR Part 50, Appendix B, as it relates to the quality assurance requirements for the design, fabrication, and construction of safety-related SSCs. Guidance for the resolution of the COL

information item is described in RG 1.54, "Service Level I, II, and III Protective Coatings Applied to Nuclear Power Plants," Revision 1.

6.1.2.4 Technical Evaluation

The staff reviewed Section 6.1.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to protective coatings and other organic materials inside containment. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application. Although the staff concluded that the evaluation performed for the standard content is directly applicable to the Turkey Point Units 6 and 7 COL application, there is a difference in how the VEGP applicant addressed STD COL 6.1-2 and how the BLN applicant addressed this review item. This difference, which is based on a change proposed in the AP1000 DCD, is evaluated by the staff below, following the standard content material for STD COL 6.1-2. The two confirmatory items in the standard content material retain the number assigned in the VEGP SER, and are also addressed in the standard content material.

The following portion of this technical evaluation section is reproduced from Section 6.1.2.4 of the VEGP SER:

AP1000 COL Information Item

- STD COL 6.1-2

The NRC staff reviewed STD COL 6.1-2 included under Section 6.1.2.1.6 of the BLN COL FSAR related to COL Information Item 6.1-2. COL Information Item 6.1-2 states:

The Combined License applicants referencing the AP1000 will provide a program to control procurement, application, and monitoring of Service Level I and Service Level III coatings. The program for the control of the use of these coatings will be consistent with [DCD] subsection 6.1.2.1.6.

This commitment was also captured as COL Action Item 6.1.2-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will prepare a program to control procurement, application, and monitoring of Service Level I and Service Level III coatings.

The added information in the BLN COL FSAR replaces the third paragraph under the section titled, "Service Level I and Service Level III Coatings," in AP1000 DCD Section 6.1.2.1.6 with the following:

During the design and construction phase the coatings program associated with selection, procurement and application of safety related coatings is performed to applicable quality standards. Regulatory Guide 1.54 and [American Society for Testing and Materials] ASTM D5144 form the basis for the coating program. During the operations phase, the coatings program is administratively controlled in accordance with the quality assurance program implemented to satisfy 10 CFR Part 50, Appendix B, and 10 CFR Part 52 requirements. The coatings program provides direction for the procurement, application, and monitoring of safety related coating systems. Coating system monitoring requirements for the containment coating systems are based on ASTM D5163, "Establishing Procedures to Monitor the Performance of Coating Service Level I Coating Systems in an Operating Nuclear Power Plant," and ASTM D7167, "Establishing Procedures to Monitor the Performance of Safety-Related Coating Service Level III Lining Systems in an Operating Nuclear Power Plant." Any anomalies identified during coating monitoring are resolved in accordance with applicable quality assurance requirements.

The AP1000 DCD, which the applicant incorporates by reference, includes the following description of the quality assurance program:

The quality assurance program for Service Level I and Service Level III coatings conforms to the requirements of [American

Society of Mechanical Engineers] ASME NQA-1-1983 as endorsed in Regulatory Guide 1.28 ["Quality Assurance Program Criteria (Design and Construction)"]. Safety related coatings meet the pertinent provisions of 10 CFR Part 50 Appendix B to 10 CFR Part 50. The service level classification of coatings is consistent with the positions given in Revision 1 of Regulatory Guide 1.54, "Service Level I, II, and III Protective Coatings Applied to Nuclear Power Plants." Service Level I and Service Level III coatings used in the AP1000 are tested for radiation tolerance and for performance under design basis accident conditions. Where decontaminability is desired, the coatings are evaluated for decontaminability. The coating applicator submits and follows acceptable procedures to control surface preparation, application of coatings and inspection of coatings. The painters are qualified and certified, and the inspectors are qualified and certified.

The inorganic zinc coating used on the inside surface (Service Level I coatings) and outside surface (Service Level III coatings) of the containment shell is inspected using a non-destructive dry film thickness test and a MEK rub test. These inspections are performed after the initial application and after recoating. Long term surveillance of the coating is provided by visual inspections performed during refueling outages. Other inspections are not required.

Section 6.1.2 of NUREG-0800 references RG 1.54 as providing an acceptable method of complying with the quality assurance requirements in regard to protective coatings applied to ferritic steels, aluminum, stainless steel, zinc-coated (galvanized) steel, concrete, or masonry surfaces of nuclear facilities. RG 1.54 lists a number of ASTM standards that provide guidance on practices and programs that are acceptable to the NRC staff for the selection, application, qualification, inspection, and maintenance of protective coatings applied in nuclear power plants. Section 6.1.2 of NUREG-0800 also states that a coating system to be applied inside the containment vessel is acceptable if it meets the regulatory positions of RG 1.54 and the standards of ASTM D5144-00 and ASTM D3911-03. By contrast, the AP1000 DCD references RG 1.54, but only with respect to classification of coating service level as I, II, or III.

The AP1000 DCD text to be replaced with the COL information item stated that the procurement, application, and monitoring of Service Level I and Service Level III coatings are controlled by a program prepared by the COL applicant. The information provided clarified that the applicant's coatings program, with respect to procurement, application, inspection, and monitoring, will be consistent with the recommendations of RG 1.54, which is endorsed in Section 6.1.2 of NUREG-0800 as an acceptable method of meeting the quality assurance requirements of 10 CFR Part 50, Appendix B for safety-related and nonsafety-related coatings. However, the information provided by the applicant to resolve the COL information item merely states that the protective coatings program complies with RG 1.54, when, in fact, the program was not yet

developed. Therefore, the COL applicant had not provided a coatings program as committed in COL Information Item 6.1-2.

To resolve this issue, in request for additional information (RAI) 6.1.2-1, the staff requested the following information:

1. The applicant should describe the standards to be applied to maintenance of the protective coatings in the program description. The description of the proposed coatings program should also describe the standards to be applied to selection and qualification of coatings, if the applicant intends to use coatings systems different than those described in the AP1000 DCD, either during construction or after plant operation commences.
2. The program description should describe the administrative controls that will be applied to the coatings program.
3. Provide the schedule for full implementation of the coatings program with respect to major milestones in the construction of the plant; for example, prior to application of coatings, prior to preparation of surfaces to be coated, or prior to procurement of coatings materials.

In a letter dated May 23, 2008, the applicant provided the following response:

- Item 1) The coating program will be based on Revision 1 of RG 1.54 and the referenced ASTM standards in ASTM D5144. Also, the guidance provided in ASTM D5163, "Establishing Procedures to Monitor the Performance of Coating Service Level I Coating Systems in an Operating Nuclear Power Plant," and in ASTM D7167, "Establishing Procedures to Monitor the Performance of Coating Service Level III Coating Systems in an Operating Nuclear Power Plant," will be used to specify monitoring (maintenance) requirements for the safety-related coating systems pertaining to containment. While a change in coating systems (from those described in the AP1000 DCD) is not anticipated, if a different safety-related coating system is needed, it will be evaluated in accordance with the appropriate change process, i.e., 10 CFR 50.59 or 10 CFR Part 52, Appendix D, Section VIII.
- Item 2) FSAR Section 6.1.3.2, Coating Program, will be revised to indicate compliance with 10 CFR Part 50, Appendix B, and 10 CFR Part 52 requirements implemented by the quality assurance program for the plant (see FSAR Chapter 17 and Part 11 of the COL application) for design, construction, and operation of the units.
- Item 3) During the design and construction phase, the requirements for the coating program will be contained in certified drawings and/or standards and specifications controlling the coating processes of the designer (Westinghouse); these design documents will be available prior to the

procurement and application of the coating material by the constructor of the plant. Prior to initial fuel loading, a consolidated plant coating program will be in place to address procurement, application, and monitoring (maintenance) of those coating system(s) for the life of the plant.

The staff finds the applicant's response to Item 1 acceptable because, pursuant to RG 1.54, ASTM D5163 provides guidelines that are acceptable to the NRC staff for establishing an in-service coatings monitoring program for Service Level I coating systems in operating nuclear power plants and for Service Level II and other areas outside containment (as applicable). The applicant also specified ASTM D7167 for monitoring (maintenance) requirements for the safety-related coating systems pertaining to containment. Although ASTM D7167 is not listed in RG 1.54 or ASTM D5144, the staff finds it an appropriate standard because it addresses maintenance of Service Level III coatings. Additionally, ASTM D7167 references ASTM D4541 and ASTM D3359, which are listed in RG 1.54 as acceptable standards for maintenance of protective coatings in nuclear power plants. Further, if a change in any of the originally specified coatings systems is necessary, the applicant will use an appropriate process, either the 10 CFR 50.59 or 10 CFR Part 52, Appendix D, Section VIII process, to evaluate the change. The staff finds the application of these regulations an appropriate alternative to control of the selection of coatings by the consolidated coatings program.

The BLN application references later versions of ASTM D5144 and ASTM D5163 than those referenced in RG 1.54, Revision 1. The use of the 2008 revision of ASTM D5144 is acceptable because it provides detailed requirements through reference to other coatings standards applicable to BLN. In this regard, it is not changed with respect to the 2000 revision referenced in the RG 1.54, Revision 1. Similarly, the 2005 revision of ASTM D5163 is referenced in the BLN COL application rather than the 1996 revision referenced in RG 1.54, Revision 1. The staff finds this acceptable because the NRC staff has accepted the 2005 revision of ASTM D5163 as the basis for the Aging Management Program XI.S8 in NUREG-1801, "Generic Aging Lessons Learned (GALL) Report," Volume 2, Revision 2 (license renewal). With respect to simulated design-basis accident qualification testing for coatings, the staff notes that the applicable version of ASTM D3911 is the 1995 revision, as indicated in Appendix 1A of the AP1000 DCD.

In response to Item 2, the applicant stated that the administrative controls spelled out in its Quality Assurance Program Document (QAPD) will be applied to the coatings program. The staff finds that this will ensure compliance with the requirements of 10 CFR Part 50, Appendix B, which is a regulatory acceptance criterion of Section 6.1.2 of NUREG-0800. However, the staff notes that the QAPD references ASME NQA-1-1994 as an acceptable means to implement the requirements of 10 CFR Part 50, Appendix B, rather than ASME NQA-1-1983 as referenced by AP1000 DCD Section 6.1.2.1.6. ASME NQA-1-1994 is used as the basis for NUREG-0800 Section 17.5, "Quality Assurance Program Description - Design Certification, Early Site Permit and New License

Applicants,” which is applicable to the quality assurance program for a COL. Therefore, the staff finds the use of ASME NQA-1-1994 acceptable with respect to quality assurance requirements for coatings.

The staff finds the response to Item 3 acceptable because the applicant indicated the consolidated plant coating program will be in place to address procurement, application, and monitoring (maintenance) of those coating system(s) for the life of the plant, prior to initial fuel loading. During the construction phase, the requirements for the coating program will be contained in certified drawings and/or standards and specifications controlling the coating processes, which meets the requirements of 10 CFR Part 50, Appendix B, Criterion III with respect to design control and instructions, Criterion IV with respect to procurement document control, and Criterion V with respect to procedures and drawings.

*The applicant also provided proposed changes to BLN COL FSAR Section 6.1.2.1.6 to incorporate the information included in the response to RAI 6.1.2-1. The staff confirmed that FSAR Section 6.1.2.1.6 has been revised to include information on the quality assurance program. However, since the information proposed to be added does not include the detailed information on control of coatings during the design and construction phase, the staff identified **Open Item 6.1.2-1** to ensure that BLN COL FSAR Section 6.1.2.1.6 is revised to include the information from the response to RAI 6.1.2-1, Item 3, related to control of the coating program during the design and construction phase and the schedule for full implementation of the consolidated coatings program.*

Resolution of Standard Content Open Item 6.1.2-1

Standard Content Open Item 6.1.2-1 was identified by the staff because the information the BLN applicant provided about the control of coatings during the design and construction phase, although acceptable, was not included in the BLN COL FSAR. In the July 2, 2010, letter, the VEGP applicant proposed inserting the three paragraphs below in Section 6.1.2.1.6 of the VEGP FSAR. These paragraphs would replace the third paragraph under “Service Level I and Service Level III Coatings” in DCD Section 6.1.2.1.6.

During the design and construction phase, the coatings program associated with selection, procurement and application of safety related coatings is performed to applicable quality standards. The requirements for the coatings program are contained in certified drawings and/or standards and specifications controlling the coating processes of the designer (Westinghouse) (these design documents will be available prior to the procurement and application of the coating material by the constructor of the plant). Regulatory Guide 1.54 and ASTM D5144 ([FSAR] Reference 201) form the basis for the coatings program.

During the operations phase, the coatings program is administratively controlled in accordance with the quality assurance program implemented to satisfy 10 CFR Part 50,

Appendix B, and 10 CFR Part 52 requirements. The coatings program provides direction for the procurement, application, inspection, and monitoring of safety related coating systems. Prior to initial fuel loading, a consolidated plant coatings program will be in place to address procurement, application, and monitoring (maintenance) of those coating system(s) for the life of the plant.

Coating system monitoring requirements for the containment coating systems are based on ASTM D5163 ([FSAR] Reference 202), "Standard Guide for Establishing Procedures to Monitor the Performance of Coating Service Level I Coating Systems in an Operating Nuclear Power Plant," and ASTM D7167 ([FSAR] Reference 203), "Standard Guide for Establishing Procedures to Monitor the Performance of Safety-Related Coating Service Level III Lining Systems in an Operating Nuclear Power Plant." Any anomalies identified during coating inspection or monitoring are resolved in accordance with applicable quality assurance requirements.

*As discussed above in the portion of the staff's evaluation reproduced from Section 6.1.2.4 of the BLN SER, the staff finds the COL information related to control of coatings during the design and construction phase acceptable. Subsequently, the staff finds the FSAR revisions proposed above consistent with the information reviewed for the BLN SER and applicable to VEGP. Therefore, the staff finds the FSAR revisions proposed in the July 2, 2010, letter acceptable for closing Open Item 6.1.2-1. The incorporation of these proposed revisions is being tracked as **Confirmatory Item 6.1-1**.*

Resolution of Standard Content Confirmatory Item 6.1-1

Confirmatory Item 6.1-1 is an applicant commitment to revise its FSAR Section 6.1.2.1.6 to provide information regarding Service Level I and Service Level III coatings. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 6.1-1 is now closed.

Evaluation of Additional Design Information

As discussed above, AP1000 DCD Section 6.1.3.2 requires the COL applicants to provide a program for procurement, application, and monitoring of Service Level I and Service Level III coatings consistent with DCD Section 6.1.2.1.6. However, DCD Section 6.1.2.1.6 also states that COL applicants will also address the program for Service Level II coatings, and that coatings programs for Service Level I, II, and III will include inspection. Therefore, in a letter dated March 31, 2010, the AP1000 DCD applicant proposed the following revision to DCD Section 6.1.3.2:

The Combined License applicants referencing the AP1000 will provide programs to control procurement, application, inspection,

and monitoring of Service Level I, Service Level II, and Service Level III coatings. The programs for the control of the use of these coatings will be consistent with subsection 6.1.2.1.6.

In letters dated July 2 and August 13, 2010, the VEGP applicant addressed the addition of Service Level II to the COL information item by proposing the following additions to Section 6.1.2.1.6 of the VEGP COL FSAR. The first is a new second paragraph under "Service Level II Coatings" in DCD Section 6.1.2.1.6.

Such safety-related Service Level II coatings used inside containment are procured to the same standards as Service Level I coatings with regard to radiation tolerance and performance under design basis accident conditions as discussed below.

The second addition replaces the second sentence of the third paragraph under "Service Level II Coatings" in DCD Section 6.1.2.1.6.

Coating system application, inspection, and monitoring requirements for the Service Level II coatings used inside containment will be performed in accordance with a program based on ASTM D5144 ([FSAR] Reference 201), "Standard Guide for Use of Protective Coating Standards in Nuclear Power Plants," and the guidance of ASTM D5163 ([FSAR] Reference 202), "Standard Guide for Establishing Procedures to Monitor the Performance of Coating Service Level I Coating Systems in an Operating Nuclear Power Plant." Any anomalies identified during coating inspection or monitoring are resolved in accordance with applicable quality requirements.

The NRC staff finds it acceptable to procure Service Level II coatings in containment to the same standards as Service Level I coatings because the staff, through RG 1.54, has endorsed the use of these standards to procure safety-related coatings inside containment. The staff also finds it acceptable to use ASTM D5144 and D5163 as a basis for application, inspection, and monitoring requirements for Service Level II coatings. As discussed in RG 1.54, ASTM D5144 is a top-level standard that provides general guidance on coating programs and detailed guidance by reference to other ASTM standards. Since it contains a single set of application requirements for all coatings, the staff finds it an acceptable basis for Service Level II coatings application and inspection. The staff finds ASTM D5163 acceptable for monitoring Service Level II coatings in containment because the use of ASTM D5163 conforms to the guidance in RG 1.54 for monitoring the performance of safety-related (Service Level I) coatings in containment, and there is no separate standard for Service Level II coatings. The incorporation of the proposed revisions to address Service Level II coatings into a future revision of the VEGP COL FSAR is being tracked as
Confirmatory Item 6.1-2.

Resolution of Standard Content Confirmatory Item 6.1-2

Confirmatory Item 6.1-2 is an applicant commitment to revise its FSAR Section 6.1.2.1.6 to provide information regarding the procurement of Service Level II coatings. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 6.1-2 is now closed.

6.1.2.5 Post Combined License Activities

There are no post-COL activities related to this section.

6.1.2.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of 10 CFR Part 50, Appendix B, and the guidance provided in RG 1.54. The staff based its conclusion on the following:

- STD COL 6.1-2 is acceptable because the Appendix B quality assurance program, with the additional guidance provided in RG 1.54, provides adequate controls over the programs to control procurement, application, inspection, and monitoring of Service Level I, Service Level II, and Service Level III coatings.

6.2 Containment Systems

6.2.1 Introduction

The containment systems (CSs), which include the primary containment, passive cooling system (heat removal system), isolation system, hydrogen control system, and leak rate test system, are discussed in this section. The containment encloses the reactor system and is the final barrier against the release of significant amounts of radioactive fission products in the event of an accident. The containment structure must be capable of withstanding, without loss of function, the pressure and temperature conditions resulting from postulated loss-of-coolant, steam line break, or feed water line break accidents. The containment structure must also maintain functional integrity in the long term following a postulated accident; i.e., it must remain a low leakage barrier against the release of fission products for as long as postulated accident conditions require.

6.2.2 Summary of Application

Section 6.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 6.2 of the AP1000 DCD, Revision 19. Section 6.2 of the DCD includes Sections 6.2.1,

“Containment Functional Design”; 6.2.2, “Passive Containment Cooling System”; 6.2.3, “Containment Isolation System”; 6.2.4, “Containment Hydrogen Control System”; and 6.2.5, “Containment Leak Rate Test System.” DCD Section 6.2.5 is evaluated by the staff in Section 6.2.6 of NUREG-1793. NUREG-1793 also includes the staff’s evaluation of the following issues:

- Fracture prevention of the containment pressure boundary in accordance with NUREG-0800, Section 6.2.7
- In-containment refueling water storage tank (IRWST) hydrodynamic loads

There are no COL information items associated with the review of either of these issues. The staff’s evaluation of the sections that address fracture prevention of the containment pressure boundary is found in Section 3.8 of this SER. With respect to the hydrodynamic loads, the staff’s evaluation is found in Section 6.2.8 of NUREG-1793.

The staff’s evaluation of the containment cleanliness program associated with Generic Safety Issue (GSI)-191, “Assessment of Debris Accumulation on PWR Sump Performance,” is evaluated in Section 6.3 of this SER.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 6.2, and in Parts 7 and 10 of the Turkey Point Units 6 and 7 COL application, the applicant provided the following:

Tier 1 and Tier 2 Departure and Exemption Request

The applicant proposed the following Tier 1 and Tier 2 departure (DEP) from the AP1000 DCD:

- PTN DEP 2.0-3

The Tier 1 departure request is from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1 for the maximum safety wet-bulb (noncoincident) air temperature, which is 30.78 °Celsius (C) (87.4 °Fahrenheit (F)). The Tier 2 departure request is because this site parameter value is also listed as the maximum safety wet-bulb (noncoincident) air temperature in AP1000 DCD Tier 2, Table 2-1.

The applicant added PTN DEP 2.0-3 to the Turkey Point Units 6 and 7 COL FSAR, revising Sections 6.2.1 and 6.2.2 to add information on the impact of the increased maximum safety wet-bulb temperature on CSs.

The exemption request related to the AP1000 DCD maximum safety wet-bulb (noncoincident) air temperature involves an exemption to 10 CFR Part 52, “Licenses, Certifications, and Approvals for Nuclear Power Plants,” Appendix D, “Design Certification Rule for the AP1000 Design,” Section IV.A.2.d. Specifically, the Turkey Point Units 6 and 7 applicant requested an exemption from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1 for the maximum safety wet-bulb (noncoincident) air temperature. The exemption request is evaluated in Section 9.2.2 of this SER.

Departures

- PTN DEP 6.2-1

The applicant provided additional information about PTN DEP 6.2-1 related to changes to the acceptance criteria applied to a specific ITAAC design commitment and associated inspection, test, or analysis in Tier 1, Table 2.3.9-3, Item 3 (for control of containment hydrogen concentration for beyond-design-basis accidents) to establish consistency with the current detailed design of the plant. This information, as well as related PTN DEP 6.2-1 information appearing in other chapters of the FSAR, is evaluated in Section 21.4 of this SER.

AP1000 COL Information Item

- STD COL 6.2-1

The applicant provided additional information in STD COL 6.2-1 to address COL Information Item 6.2-1 and COL Action Item 6.2.6-1, which addresses the containment leak rate test program. In addition, Turkey Point Units 6 and 7 COL FSAR Table 1.9-203, "Listing of Unresolved Safety Issues and Generic Safety Issues," includes a line item for Task Action Plan Item A-23, "Containment Leak Testing." This item is addressed in Turkey Point Units 6 and 7 COL FSAR, Section 6.2.5.1, STD COL 6.2-1.

License Conditions

- Part 10, License Condition 3, Item G.8

This proposed license condition states that the COL holder shall implement the containment leakage rate testing program before initial fuel load, as stated in Turkey Point Units 6 and 7 COL FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations."

- Part 10, License Condition 6

This proposed license condition states that the COL holder shall provide an operational program implementation schedule to support NRC inspections.

6.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

The acceptance criteria associated with the relevant requirements of the NRC regulations for containment functional design are given in Section 6.2.1.1A, Revision 3, of NUREG-0800. The regulatory requirements related to this section are 10 CFR Part 50, Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criteria (GDC) 16, "Containment Design"; GDC 38, "Containment Heat Removal"; and GDC 50, "Containment Design Basis."

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for containment leak rate testing are given in Section 6.2.6, Revision 3, of NUREG-0800. The regulatory requirements related to this section are GDC 52, "Capability for Containment Leakage Rate Testing"; GDC 53, "Provisions for Containment Testing and Inspection," GDC 54, "Piping System Penetrating Containment"; and 10 CFR Part 50,

Appendix J, "Primary Reactor Containment Leakage Testing for Water-Cooled Power Reactors."

Conformance with the requirements of Option A of Appendix J, or the requirements of Option B of Appendix J and the provisions of RG 1.163, "Performance-Based Containment Leak-Test Program," constitutes an acceptable basis for satisfying the requirements of the GDC applicable to containment leakage rate testing. In addition, the staff used guidance found in Nuclear Energy Institute (NEI) 94-01, as endorsed and modified by RG 1.163, "Performance-Based Containment Leak-Test Program."

The staff used the guidelines of NuStart Technical Report, AP-TR-NS01-A, Revision 2, "Containment Leak Rate Test Program," dated April 4, 2007, to review the operational program, Containment Leakage Rate Testing Program.

6.2.4 Technical Evaluation

The staff reviewed Section 6.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the CSs. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

Tier 1 and Tier 2 Departure (DEP)

- PTN DEP 2.0-3

PTN DEP 2.0-3 proposes to increase the maximum safety wet-bulb (noncoincident) air temperature from 30.06 °C (86.1 °F) to 30.78 °C (87.4 °F). This change affects the performance of various SSCs described in the AP1000 DCD. The staff's evaluation of this proposed change is also discussed in Sections 2.0, 2.3.1, 5.4, 6.4, 9.1.3, 9.2.2, and 9.2.7 of this SER.

The applicant stated that PTN DEP 2.0-3, which increased the maximum safety wet-bulb (noncoincident) external air temperature from 86.1 °F to 87.4 °F, had no impact on the performance of the safety system because the peak containment pressure remains bounded by the current AP1000 analysis. In their June 24, 2011, response to RAI 5403, Question 09.02.02-1, the applicant described a sensitivity analysis based on the NRC-approved AP1000 GOTHIC containment model. In this analysis, when the wet-bulb temperature was increased to 87.4 °F (which envelopes the PTN DEP 2.0-3 value of 87.4 °F), there was no increase to containment peak pressure resulting from a double-ended cold leg guillotine (DECLG) loss-of-coolant accident (LOCA), which is the limiting break identified in the DCD. The staff audited the supporting analysis, TPG-GW-GSC-001, Revision 0, "WGOthic Containment Peak Pressure Analysis for the Evaluation of FP&L COL Maximum Wet Bulb Temperature Departure from DCD," and found it to be conservative. The initial conditions in the AP1000 containment pressure analyses are the maximum dry-bulb temperature of 115 °F and maximum coincident wet-bulb temperature of 86.1 °F. As shown in Turkey Point Units 6 and 7 COL FSAR Table 2.0-201, the plant-specific values for both of these parameters are less than the AP1000 DCD values. However, because the maximum noncoincident safety wet-bulb temperature did increase, the applicant combined the maximum dry-bulb temperature from the AP1000 DCD with the maximum noncoincident wet-bulb temperature from PTN DEP 2.0-3, and demonstrated that this extreme combination did not change the values reported in the DCD for a DECLG LOCA. The staff ran confirmatory analyses using the CONTAIN model of the AP1000 containment. The results demonstrated there were no changes to the peak pressures (reported to the first decimal place) resulting from a main steam line break (MSLB) or DECLG LOCA or in the pressure 24 hours after the DECLG LOCA.

The following portion of this technical evaluation section is reproduced from Section 6.2.4 of the VEGP SER:

AP1000 COL Information Item

- STD COL 6.2-1

The NRC staff reviewed STD COL 6.2-1 related to COL Information Item 6.2-1 included under Section 6.2.5 of the BLN COL FSAR regarding the text added to Section 6.2.6 of the COL application. The added text references the program, which was reviewed and approved by the NRC in a letter from Stephanie Coffin, NRC, to Marilyn Kray, NuStart, "Final Safety Evaluation for AP1000 Technical Report No. AP-TR-NS01, Containment Leak Rate Test Program (TAC No. MD5136)," dated October 25, 2007.

License Conditions

- Part 10, License Condition 3, Item G.8
- Part 10, License Condition 6

The portion of License Conditions 3 and 6 relevant to this SER section is the containment leakage rate testing program listed in BLN COL FSAR Table 13.4-201. As noted in Section 13.4 of this SER, the containment leakage rate testing program meets the criteria for an operational program as specified in SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria." Therefore, the NRC staff finds License Conditions 3 and 6 acceptable, with respect to the inclusion of the containment leakage rate testing program in Table 13.4-201.

Due to discrepancies in the implementation milestones provided in various locations in the BLN COL application, RAI 6.2.6-1 was forwarded to the applicant. The applicant's response was that the milestones were meant to reflect the implementation of an approved testing program and when the tests were actually to be performed. However, the applicant agreed that this was not consistently reflected. The discrepancies have been addressed in BLN COL FSAR, Table 13.4-201, sheet 2 of 7, and Part 10, License Conditions and ITAAC. The changes indicate that the containment leak rate testing program will be implemented prior to initial fuel load. This RAI is closed.

6.2.5 Post-Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff proposes to include the following license conditions related to the containment leakage rate testing program:

- License Condition (6-1)—The licensee shall implement the containment leakage rate testing program before initial fuel load.
- License Condition (6-2)—No later than 12 months after issuance of the COL, the licensee shall submit to the appropriate Director of the Office of New Reactors (NRO) a schedule that supports planning for and conduct of NRC inspections of the containment leakage rate testing program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the containment leakage rate testing program has been fully implemented.

6.2.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and complies with the regulations listed in Sections 6.2.1, Revision 3, and 6.2.6, Revision 3, of NUREG-0800. The staff based its conclusion on the following:

- PTN DEP 2.0-3 is acceptable based on the analysis provided by Turkey Point Units 6 and 7 and the confirmatory analysis run by the staff demonstrating the containment functional capability described in the AP1000 DCD is unchanged by the increase in maximum safety wet-bulb (noncoincident) external air temperature to 30.8 °C (87.4 °F).
- PTN DEP 6.2-1, related to changes to the acceptance criteria applied to a specific ITAAC design commitment and associated inspection, test, or analysis in Tier 1, Table 2.3.9-3, Item 3 (for control of containment hydrogen concentration for beyond-design-basis accidents) to establish consistency with the current detailed design of the plant, is reviewed and found acceptable by the staff in Section 21.4 of this SER.
- STD COL 6.2-1, as related to the containment leak rate testing program, is acceptable because the staff has determined that the requirements of 10 CFR Part 50, Appendix J, have been met.

6.3 Passive Core Cooling System (Related to RG 1.206, Section C.III.1, Chapter 6, C.I.6.3, “Emergency Core Cooling System”)

6.3.1 Introduction

The passive core cooling system is designed to provide emergency core cooling to mitigate design-basis events that involve a decrease in the reactor coolant system (RCS) inventory, such as a LOCA, a decrease in heat removal by the secondary system, such as a feedwater system piping failure, or an increase in heat removal by the secondary system, such as a steam system piping failure. It also provides core cooling for shutdown events, such as a loss of the normal residual heat removal system during a shutdown operation. The passive core cooling system is designed to perform the following safety-related functions:

- emergency core decay heat removal
- RCS emergency makeup and boration
- safety injection
- containment sump pH control

During long-term operation, the AP1000 passive core cooling system must withstand the effects of debris loading on the containment recirculation screens, IRWST screens and the fuel assemblies. The concern that debris may lead to unacceptable head loss for the recirculating flow was raised in GSI-191 and it is the topic of Bulletin (BL) 2003-01, “Potential Impact of Debris Blockage on Emergency Sump Recirculation at Pressurized-Water Reactors,” and Generic Letter (GL) 2004-02, “Potential Impact of Debris Blockage on Emergency Recirculation during Design Basis Accidents at Pressurized-Water Reactors.” Section 6.3 of the AP1000 DCD includes an evaluation of this issue and Section 6.2.1.8 of NUREG-1793 includes the staff’s review, which was performed in accordance with the NRC-approved evaluation methodology.

6.3.2 Summary of Application

Section 6.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 6.3 of the AP1000 DCD, Revision 19. Section 6.3 of the DCD includes Section 6.3.2.2.7, "IRWST and Containment Recirculation Screens"; Section 6.3.8.1, "Containment Cleanliness Program"; and Section 6.3.8.2, "Verification of Water Sources for Long-Term Recirculation Cooling Following a LOCA."

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 6.3.8.1, the applicant provided the following:

Departures

- PTN DEP 3.2-1 and PTN DEP 6.3-1

The applicant provided additional information about PTN DEP 3.2-1 and PTN DEP 6.3-1 related to design modifications to the condensate return portion of the Passive Core Cooling System and quantifying the duration that the PRHR-HX can maintain safe shutdown conditions, respectively. This information, as well as related PTN DEP 3.2-1 and PTN DEP 6.3-1 information appearing in other chapters of the FSAR, is evaluated in Section 21.1 of this SER.

AP1000 COL Information Items

- STD COL 6.3-1

The applicant provided additional information in STD COL 6.3-1 to address COL Information Item 6.3-1 identified in AP1000 DCD Table 1.8-2, "Summary of AP1000 Standard Plant Combined License Information Items." STD COL 6.3-1 requires the applicant to develop a containment cleanliness program to limit the amount of debris that might be left in the containment following refueling and maintenance outages.

Section 1.9 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 1.9, "Compliance with Regulatory Criteria," of the AP1000 DCD. Section 1.9 of the DCD includes Section 1.9.4.2.3, "New Generic Issues," and Section 1.9.5.5, "Operational Experience."

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 1.9, the applicant provided the following information related to the effect of debris accumulation on long-term cooling:

- STD COL 1.9-3

The applicant provided additional information in STD COL 1.9-3 to address the review of GSI-191.

- STD COL 1.9-2

The applicant provided additional information in STD COL 1.9-2 to address the review of BL 03-01 and GL 04-02.

6.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In conducting its review of STD COL 6.3-1, the staff used the guidance and staff positions of RG 1.82, Revision 3, "Potential Impact of Debris Blockage on Emergency Recirculation during Design Basis Accidents at Pressurized-Water Reactors," and NEI 04-07, "Pressurized Water Reactor Sump Performance Evaluation Methodology," Revision 0, Volume 1, and in the "Safety Evaluation by the Office of Nuclear Reactor Regulation Related to NRC Generic Letter 2004-02," in NEI 04-07, Revision 0, Volume 2.

6.3.4 Technical Evaluation

The staff reviewed Section 6.3 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the passive core cooling system. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

AP1000 COL Information Items

The following portion of this technical evaluation section is reproduced from Section 6.3.4 of the VEGP SER:

AP1000 COL Information Items

- STD COL 6.3-1

The applicant provided additional information in STD COL 6.3-1 to address COL Action Item 6.2.1.8.1-1 identified in NUREG-1793 and COL Information Item 6.3-1 identified in Table 1.8-2 of the AP1000 DCD. The applicant added information to BLN COL FSAR Section 6.3.8.1, "Containment Cleanliness Program," providing details of the program and procedures to minimize the amount of debris that might be left in containment following refueling and maintenance outages, including requirements for cleanliness inspections and limits on materials introduced into containment. TVA states that the cleanliness program will be consistent with the evaluation discussed in the AP1000 DCD.

In its June 9, 2009, response to RAI 6.2.2-1, the applicant addressed the changes made to Revision 17 of the AP1000 DCD in APP-GW-GLE-002 and staff questions on cleanliness measurements with a modification to STD COL 6.3-1. This included adding that the cleanliness program will meet the DCD limits on latent debris, that housekeeping procedures will be implemented to return work areas to original conditions upon completion of work, and that a sampling program will be used to quantify the amount of latent debris. The sampling program is stated to be consistent with NEI 04-07 Volumes 1 (guidance report) and 2 (NRC safety evaluation). The sampling will be done after containment exit cleanliness inspections, prior to start up, and the results will be evaluated post-start up. Any non-conforming results will be addressed in the Corrective Action Program.

*The resulting cleanliness program is consistent with the RG 1.82 recommendation that procedures be in place to regularly clean the containment and to control and remove foreign materials from containment. The sampling program included in STD COL 6.3-1 is required to demonstrate that the latent debris found in containment is within the AP1000 DCD specified limits of 130 pounds, of which, up to 6.6 pounds may be fibrous material. The DCD specified limits were demonstrated to be acceptable through scale testing and analysis. Thus, STD COL 6.3-1 is consistent with the RG 1.82 recommendation that the cleanliness program be correlated to the amount of debris used in the long term cooling analysis. It is appropriate that the sampling program be in accordance with NEI 04-07, Volumes 1 and 2, because these documents contain the most recent NRC-approved evaluation methodology for cleanliness programs. The response to RAI 6.2.2-1 is acceptable and incorporation of the changes to STD COL 6.3-1 in the BLN FSAR will be tracked as **Confirmatory Item 6.3-1**.*

The staff reviewed the following information in the BLN COL FSAR as it relates to the effect of debris accumulation on long term cooling:

- STD COL 1.9-3

The applicant added information to Section 1.9.4.2.3, "New Generic Issues," regarding Issue 191. The applicant states that the design aspects are addressed by the AP1000 DCD and the COL applicant portions are the protective coatings program discussed in BLN COL FSAR Section 6.1.2.1.6 and the containment cleanliness program discussed in BLN COL FSAR Section 6.3.8.1. The staff agrees that these are the only two COL items identified in the staff's review of GSI-191 from Section 6.2.1.8 of NUREG-1793.

- STD COL 1.9-2

The applicant added line items for Bulletin 03-01 and GL 04-02 in Table 1.9-204, "Generic Communications Assessment." The new information states that the design aspects are addressed in the AP1000 DCD and that the COL applicant aspects are addressed in BLN COL FSAR Section 6.3 for Bulletin 03-01 and BLN COL FSAR Section 6.3.8.1 for GL 04-02. The staff agrees that the design aspects of these generic communications are addressed in the staff's review of GSI-191 from Section 6.2.1.8 of NUREG-1793. The COL applicant aspects are addressed in the staff's review of BLN COL FSAR Section 6.1.2.1.6 and BLN COL FSAR Section 6.3.8.1.

Resolution of Standard Content Confirmatory Item 6.3-1

Confirmatory Item 6.3-1 required the applicant to update its FSAR to include the information related to the cleanliness program provided in the BLN applicant's above-mentioned June 9, 2009, response to RAI 6.2.2-1 (which was endorsed by the VEGP applicant). The NRC staff verified that the VEGP COL FSAR was appropriately updated with this information. As a result, Confirmatory Item 6.3-1 is resolved.

6.3.5 Post-Combined License Activities

There are no post-COL activities related to this section.

6.3.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the regulatory requirements and guidance discussed in Section 6.3.3 of this SER. The staff based its conclusion on the following:

- PTN DEP 3.2-1 and PTN DEP 6.3-1, related to design modifications to the condensate return portion of the Passive Core Cooling System and quantifying the duration that the PRHR-HX can maintain safe shutdown conditions, respectively, are reviewed and found acceptable by the staff in Section 21.1 of this SER.
- STD COL 6.3-1 is acceptable because it meets 10 CFR 50.46(b)(5) requirements as it pertains to having sufficient water sources for long term recirculation cooling following a LOCA. The containment cleanliness program complies with the guidance in RG 1.82.
- STD COL 1.9-3, related to GSI-191, is acceptable because the only two items that need to be addressed by the COL applicant have been resolved. The protective coatings program is evaluated in SER Section 6.1.2, and the containment cleanliness program is evaluated under STD COL 6.3-1.
- STD COL 1.9-2, related to BL 03-01 and GL 04-02, is acceptable because the only two items that need to be addressed by the COL applicant have been resolved. The protective coatings program is evaluated in SER Section 6.1.2, and the containment cleanliness program is evaluated under STD COL 6.3-1.

6.4 Habitability Systems

6.4.1 Introduction

The design and operation of a set of systems provide habitability functions for the AP1000 design. These systems include the nuclear island non-radioactive ventilation system (VBS), the main control room (MCR) emergency habitability system (VES), the radiation monitoring system (RMS), the plant lighting system (ELS), and the fire protection system (FPS).

6.4.2 Summary of Application

Section 6.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 6.4 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 6.4, the applicant provided the following:

Tier 1 and Tier 2 Departure and Exemption Request

The applicant proposed the following Tier 1 and Tier 2 departure from the AP1000 DCD:

- PTN DEP 2.0-3

The Tier 1 departure request is from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1 for the maximum safety wet-bulb (noncoincident) air temperature, which is 30.06 °C

(86.1 °F). The Tier 2 departure request is because this site parameter value is also listed as the maximum safety wet-bulb (noncoincident) air temperature in AP1000 DCD Tier 2, Table 2-1.

The applicant added PTN DEP 2.0-3 to the Turkey Point Units 6 and 7 COL FSAR, revising Section 6.4 to add information on the effect of the increased maximum safety wet-bulb temperature on habitability systems.

The exemption request related to the AP1000 DCD maximum safety wet-bulb (noncoincident) air temperature involves an exemption to 10 CFR Part 52, Appendix D, Section IV.A.2.d. Specifically, the Turkey Point Units 6 and 7 applicant requested an exemption from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1 for the maximum safety wet-bulb (noncoincident) air temperature. The exemption request is evaluated in Section 9.2.2 of this SER.

Departures

- PTN DEP 6.4-1

The applicant provided information about PTN DEP 6.4-1 related to design changes affecting habitability of the MCR and changes to the calculated doses to control room operators. This information, as well as related PTN DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this report.

- PTN DEP 6.4-2

The applicant provided information about PTN DEP 6.4-2 related to design changes affecting habitability of the MCR and changes to the maximum temperatures and heat generated in the MCR. This information, as well as related PTN DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this report.

AP1000 COL Information Items

- STD COL 6.4-1

The applicant provided a list of onsite chemicals in Turkey Point Units 6 and 7 COL FSAR Table 6.4-201 to supplement the list of chemicals identified in Table 6.4-1 of the AP1000 DCD. The chemicals in Table 6.4-201 associated with STD COL 6.4-1 (as annotated in the left margin) include: hydrogen (both in a gas and liquid form), nitrogen, carbon dioxide, hydrazine, morpholine, sulfuric acid, sodium hydroxide, fuel oil, sodium molybdate, sodium hexametaphosphate, sodium hypochlorite, and ammonium comp polyethoxylate. In a letter dated April 20, 2011, the Turkey Point Units 6 and 7 applicant endorsed the July 30, 2010, letter from the VEGP applicant that proposed modifications to the COL FSAR related to the size and stated location of the liquid hydrogen storage tank.

- STD COL 6.4-2

The applicant provided additional information in STD COL 6.4-2 to address COL Information Item 6.4-2 regarding the procedures and training for control room (CR) habitability in accordance with the resolution of GSI-83, "Control Room Habitability."

- PTN COL 6.4-1 and PTN COL 9.4-1b

The applicant provided PTN COL 6.4-1 and COL 9.4-1b to address COL Information Item 6.4-1. The local toxic gas services are evaluated to determine the need for monitoring for CR habitability.

Supplemental Information

- STD SUP 6.4-1

The applicant provided supplemental information in STD SUP 6.4-1 to address CR doses for accident analyses in the downwind unit of a dual unit site.

- PTN SUP 6.4-2

The applicant provided supplemental information in PTN SUP 6.4-2 to address radiological dose(s) at Turkey Point Units 6 and 7 due to Design Basis Accident (DBA) from Units 3 and 4. This information is discussed in Section 2.2.3.1.6.1 of this SER.

6.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for habitability systems are given in Section 6.4, Revision 4, of NUREG-0800.

MCR habitability is addressed in the following regulations and guidance:

- GDC 4, "Environmental and Dynamic Effects Design Bases," as it relates to SSCs important to safety being designed to accommodate the effects of and to be compatible with the environmental conditions associated with postulated accidents.
- GDC 5, "Sharing of Structures, Systems and Components," as it relates to ensuring that sharing SSCs important to safety among nuclear power units will not significantly impair their ability to perform safety functions, including, in the event of an accident in one unit, an orderly shutdown and cooldown of the remaining unit(s).
- GDC 19, "Control Room," as it relates to maintaining the nuclear power unit in a safe condition under accident conditions and providing adequate radiation protection.
- 10 CFR 50.34(f)(2)(xxviii), as it relates to evaluations and design provisions to preclude certain MCR habitability problems.
- 10 CFR 52.80(a), which requires that a COL application address the proposed inspections, tests, and analyses, including those applicable to emergency planning, that the licensee shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the inspections, tests, and analyses

are performed and the acceptance criteria met, the facility has been constructed and will operate in conformity with the COL, the provisions of the Atomic Energy Act, and the NRC's regulations.

- NUREG-0737, "Clarification of TMI Action Plan Requirements," TMI Action Plan, Item III.D.3.4, "Control Room Habitability."
- RG 1.78, "Evaluating the Habitability of a Nuclear Power Plant Control Room During a Postulated Hazardous Chemical Release," Revision 1.
- RG 1.52, "Design, Inspection, and Testing Criteria for Air Filtration and Adsorption Units of Post-Accident Engineered-Safety-Feature Atmosphere Cleanup Systems in Light-Water-Cooled Nuclear Power Plants," Revision 3, June 2001.
- RG 1.196, "Control Room Habitability at Light Water Nuclear Power Reactors," May 2003.

6.4.4 Technical Evaluation

The staff reviewed Section 6.4 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to habitability systems. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR, except for the evaluation of STD SUP 6.4-2 and STD COL 6.4-1. For these two items, the staff compared the BLN COL FSAR, Revision 2 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting.

Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER. Confirmatory items that are first identified in this SER section have a Turkey Point Units 6 and 7 designation.

Tier 1 and Tier 2 Departure

- PTN DEP 2.0-3

PTN DEP 2.0-3 proposes to increase the maximum safety wet-bulb (noncoincident) air temperature from 30.06 °C (86.1 °F) to 30.78 °C (87.4 °F). This change affects the performance of various SSCs described in the AP1000 DCD. The staff's evaluation of this proposed change is also discussed in Sections 2.0, 2.3.1, 5.4, 6.2, 9.1.3, 9.2.2, and 9.2.7 of this SER.

Analysis of the maximum wet-bulb (noncoincident) air temperature at a bounding value of 87.4 °F has been performed by the applicant. The staff evaluated the effect of this departure on the habitability systems using the guidance in Section 6.4 of NUREG-0800 to demonstrate compliance with GDC 4.

The VBS is potentially affected by the departure, because the low capacity chilled water subsystem (LCCWS) uses the maximum safety temperature limits (dry and wet-bulb) as its design-basis temperatures. The applicant's calculation note APP-GW-M1C-002, "AP1000 High Humidity HVAC Systems Design Evaluation," assesses the effect of changes in both maximum safety and maximum normal ambient wet-bulb temperature on the design and performance of the LCCWS.

The applicant's conclusion, documented in the response to RAI 5403, Question 09.02.02-1, dated June 24, 2011, is that the increased heat load produced by operation at the higher Turkey Point Units 6 and 7 maximum safety ambient wet-bulb temperature of 87.4 °F can be accommodated within the available capacity margin of the chiller units, without affecting the LCCWS or supporting systems design or plant operation.

The applicant noted, and the staff agrees, that the cooling coil design calculations have shown, during operation at the standard plant design temperatures (115 °F dry-bulb, 86.1 °F wet-bulb), the VBS air handling units have margin. As a result, at the Turkey Point Units 6 and 7 site, design temperatures of 112 °F dry-bulb and 87.4 °F wet-bulb, the off coil temperature for VBS will be identical to the off coil temperature of the standard design based on the results of supplier coil performance calculations. The staff audited APP-GW-M1C-002 and found that the calculation package has accurate inputs and reasonable calculation methods.

The passive heat sinks associated with the MCR VES control the auxiliary building safety-related room temperatures post-accident. The temperature profiles of these rooms are affected only by ambient dry-bulb temperature. The Turkey Point Units 6 and 7 maximum ambient dry-bulb temperature (112 °F) is enveloped by the current AP1000 as well.

Therefore, the staff finds that the applicant's conclusion, documented in the response to RAI 5403, Question 09.02.02-1 acceptable that the habitability at the higher Turkey Point Units 6 and 7 site outside air wet-bulb temperature will be maintained.

AP1000 COL Information Items

The following portion of this technical evaluation section is reproduced from Section 6.4.4 of the VEGP SER:

- STD COL 6.4-1

The following portion of this technical evaluation section is reproduced from Section 6.4.4 of the BLN SER. The staff notes that Table 6.4-202 in the BLN FSAR, Revision 2, is equivalent to Table 6.4-201 in the VEGP COL FSAR. Information in the BLN COL FSAR having a left margin annotation STD SUP 6.4-2 was assigned a left margin annotation of STD SUP 6.4-3 in the VEGP COL FSAR, and revisions proposed by the applicant, described below, combined the information from STD SUP 6.4-3 and STD COL 6.4-1 under a single left margin annotation of STD COL 6.4-1. Therefore, the evaluation of STD COL 6.4-1 in this SER includes references to material identified as STD SUP 6.4-2 in the BLN COL FSAR.

AP1000 COL Information Items

- STD COL 6.4-1

STD COL 6.4-1 information also provides the chemical names, state of the chemical, quantity and location of the chemicals. The chemicals include: nitrogen, carbon dioxide, and ammonium comp polyethoxylate.

Subsequent to the issuance of Section 2.2.3 of this report, the staff reviewed the applicant's inventory of chemicals listed in STD COL 6.4-1, and screened out the toxic chemicals that do not pose a threat to CR habitability. The staff has determined that with the exception of carbon dioxide the STD COL 6.4-1 chemicals do not warrant additional analysis because they do not exceed the IDLH limit at ground level at the location of the CR.

Regarding carbon dioxide, analysis with the HABIT computer code (RG 1.78) finds that carbon dioxide will not exceed the IDLH limit at ground level. This analysis is based on a temperature of 25 °C and a wind speed of 1 m/sec, with meteorology F class, which are the conditions used by the applicant and RG 1.78. Hence, it is determined that the carbon dioxide contained in STD COL 6.4-1 will not pose a threat to CR habitability.

*The staff notes that the chemical analysis relied on by the COL applicant includes assumptions associated with design features, such as the intake location for the CR ventilation system. In RAI 6.4-8, the staff asked if any of the analyses of the chemicals in Table 6.4-202 credit design features, such as an elevated CR intake, to keep the chemical concentration in the CR below the IDLH levels, in which case a description of the design features credited in the safety analyses should be provided in the FSAR. This is **Open Item 6.4-1**.*

Resolution of Standard Content Open Item 6.4-1

*In a letter dated June 17, 2010, the applicant proposed modifications to Table 6.4-201 in the VEGP COL FSAR to address Open Item 6.4-1. The proposed modifications included addition of a column entitled “MCR Habitability Impact Evaluation” to the table that indicated when design features were considered in the impact evaluation, including either the MCR intake height or other design details beyond the intake height. The staff determined that the modifications sufficiently described the design assumptions considered by the applicant, and Open Item 6.4-1 is resolved. The incorporation of this modification to Table 6.4-201 into a future revision of the VEGP COL FSAR is being tracked as **Confirmatory Item 6.4-1**.*

Resolution of Standard Content Confirmatory Item 6.4-1

Confirmatory Item 6.4-1 is an applicant commitment to revise its FSAR Table 6.4-201 to add a column entitled “MCR Habitability Impact Evaluation” that will indicate when design features are considered in the impact evaluation, including either the MCR intake height or other design details beyond the intake height. The staff verified that VEGP COL FSAR Table 6.4-201 was appropriately revised. As a result, Confirmatory Item 6.4-1 is now closed.

Evaluation of Additional Revisions to STD COL 6.4-1

In the letter dated June 17, 2010, the applicant proposed additional voluntary revisions to Table 6.4-201 in the VEGP COL FSAR regarding the storage of standard chemicals described under STD COL 6.4-1. The proposed revisions included changes to the chemical quantities, evaluated distances, and storage locations, as well as changes to the table organization, column headings, and table notes. The proposed revisions also included combining the chemicals listed under separately STD COL 6.4-1 and STD SUP 6.4-3 under a single left margin annotation of STD COL 6.4-1, thereby eliminating STD SUP 6.4-3.

In a letter dated July 30, 2010, the applicant proposed additional revisions to STD COL 6.4-1 related to the evaluated maximum quantity and location of the liquid hydrogen storage tank.

On April 14 and June 7, 2010, the NRC staff audited the applicant’s proprietary calculation notes, APP-VES-M3C-006, entitled “Main Control Room Emergency Habitability from Toxic Chemical Effluents,” Revision 0 and Revision 1 to verify the information supporting STD COL 6.4-1 and VEGP COL FSAR Table 6.4-201. As a result of these audits, the staff issued RAI 6.4-5. The applicant subsequently prepared calculation notes APP-PGS-M3C-011, entitled “AP1000 Gas Spill or Release Effects on Control Room Habitability,” Revision 0 and Revision 1 that were audited by the staff on July 26 and August 23, 2010. In a letter dated September 3, 2010, the applicant proposed the following changes to the FSAR and provided the following additional information about calculated concentrations of chemicals that would occur at the MCR intake to address RAI 6.4-5:

- *Proposed to change the evaluated minimum distance between the MCR and the storage locations for liquid hydrogen, nitrogen, and carbon dioxide.*
- *For hydrogen, nitrogen, and carbon dioxide, proposed to indicate that MCR design details were considered in evaluating the potential impact to the MCR.*
- *Proposed to clarify that the MCR design details considered included MCR volume, envelope boundaries, ventilation systems, and occupancy factor.*
- *Provided information about how the analysis considered the effect of wind speeds less than 1 meter (m)/second.*
- *Provided information about concentrations occurring at the MCR intake more than two minutes after a potential release occurs.*
- *For hydrogen, nitrogen, and carbon dioxide, provided information about concentrations occurring at the MCR intake when no building wake effects are considered.*
- *For carbon dioxide, provided information about concentrations occurring in the MCR based on a corrected conservative value for the MCR outside air exchange rate.*

In the evaluation presented in Section 2.2.3 of this SER, the staff reviewed the applicant's revised chemical inventory information listed in STD COL 6.4-1, and screened out the toxic chemicals that do not pose a threat to MCR habitability. The staff determined that, with the exception of hydrazine and carbon dioxide, the STD COL 6.4-1 chemicals do not warrant additional analysis for MCR habitability because they would not exceed the IDLH limit at ground level below the MCR ventilation intake. Hydrazine and carbon dioxide are evaluated below.

Regarding hydrazine, the NRC staff used the HABIT computer code (as referenced in RG 1.78) to confirm that hydrazine concentration may exceed the IDLH limit at ground level below the MCR intake. The staff then conducted an additional analysis showing that the hydrazine concentration at the MCR intake and inside the MCR would not exceed the IDLH limit when crediting the design of the MCR ventilation intake located at the auxiliary building (which is located 17.37 m (57 feet (ft)) above ground). The applicant annotated "IH" in VEGP COL FSAR Table 6.4-201 to indicate that the credit of MCR ventilation intake height had been taken in the safety analysis.

Regarding carbon dioxide, the NRC staff has used the HABIT computer code to confirm that the carbon dioxide concentration may exceed the IDLH limit at the MCR intake. The staff then conducted an additional analysis showing that the carbon dioxide concentration inside the MCR would remain below the IDLH limit.

Based on the FSAR revisions proposed and additional information provided by the applicant and the confirmatory analyses performed by the staff, the staff determined that the hydrazine and carbon dioxide would not pose a threat to MCR habitability, and RAI 6.4-5 is closed.

*The incorporation of the revisions to STD COL 6.4-1 Table 6.4-201 into a future revision of the VEGP COL FSAR, as proposed in letters from the applicant dated June 17, July 30, and September 3, 2010, is being tracked as **Confirmatory Item 6.4-2**.*

Resolution of Standard Content Confirmatory Item 6.4-2

Confirmatory Item 6.4-2 is an applicant commitment to revise its FSAR Table 6.4-201 to revise information related to standard chemicals. The staff verified that VEGP COL FSAR Table 6.4-201 was appropriately revised. As a result, Confirmatory Item 6.4-2 is now closed.

The following portion of this technical evaluation section is reproduced from Section 6.4.4 of the BLN SER:

- *STD COL 6.4-2*

The NRC staff reviewed STD COL 6.4-2, related to COL Information Item 6.4-2 and COL Action Item 6.4-1, included under Section 6.4.3 of the BLN COL FSAR. The applicant stated that procedures and training for CR habitability are written in accordance with Section 13.5 for CR operating procedures, and Section 13.2 for operator training. In Section 6.4.3 of the FSAR, the applicant states that the procedures and training will be verified to be consistent with the intent of GSI-83.

However, the level of detail provided in the standard portion of BLN COL FSAR Section 6.4.3 is not adequate to determine if the regulatory requirements are met. As a result, the staff issued RAI 6.4-7, which asked the applicant to provide in the FSAR the essential elements of the training and procedures necessary to demonstrate that the regulatory requirements are met. The staff questioned what the operators would be directed and trained to do to meet the recommendations in RG 1.196. Specifically, in RAI 6.4-7, the staff requested information addressing the following:

- *RG 1.78, Regulatory Position C.5, "Emergency Planning"*
- *RG 1.196, Regulatory Position 2.5, "Hazardous Chemicals"*
- *RG 1.196, Regulatory Position 2.2.1, "Comparison of System Design, Configuration, and Operation with the Licensing Basis"*
- *RG 1.196, Regulatory Position 2.7.1, "Periodic Evaluations and Maintenance"*

*The resolution of RAI 6.4-7 is identified as **Open Item 6.4-2**.*

Resolution of Standard Content Open Item 6.4-2

*The BLN response to RAI 6.4-7 dated January 5, 2010, stated that the operational aspects of the identified guidance had been met as documented in BLN COL FSAR Appendix 1AA. The BLN applicant's response also stated that the additional information would be provided in a future revision to BLN COL FSAR Section 6.4.3, addressing how procedures, testing and training related to CR habitability would be consistent with the above stated regulatory positions in RG 1.78 and RG 1.196. The VEGP applicant endorsed the BLN response to RAI 6.4-7 in a letter dated June 17, 2010, and committed to appropriately update Section 6.4.3 of the VEGP COL FSAR. Therefore, Standard Content Open Item 6.4-2 is resolved for the VEGP application, and the incorporation of the proposed revision to Section 6.4.3 of the VEGP COL FSAR is being tracked as **Confirmatory Item 6.4-3**.*

Resolution of Standard Content Confirmatory Item 6.4-3

Confirmatory Item 6.4-3 is an applicant commitment to revise its FSAR Section 6.4.3 to include information regarding procedures, testing and training related to CR habitability. The staff verified that VEGP COL FSAR Section 6.4.3 was appropriately revised. As a result, Confirmatory Item 6.4-3 is now closed.

- PTN COL 6.4-1 and PTN COL 9.4-1b

The staff reviewed PTN COL 6.4-1 and PTN COL 9.4-1b, related to COL Information Item 6.4-1 included under Section 6.4.4 of the Turkey Point Units 6 and 7 COL FSAR. As part of PTN COL 6.4-1, Table 6.4-201 of the Turkey Point Units 6 and 7 COL FSAR provides information on the chemical names, physical states, quantities, locations, evaluated minimum distance between the chemical storage location and the MCR, and how the evaluation of MCR habitability impacts for each chemical was performed.

While reviewing the applicant's chemical spill calculations, it was understood that the control room fresh air exchange rate was 0.74 exchanges per hour. The staff issued RAI 7080, Question 06.04-2 requesting the applicant to explain how this air exchange rate was determined. The applicant responded, letter dated September 18, 2012, by revising its chemical spill calculations, selecting a value of 1.0 for the air exchange rate (consistent with the air exchange rate value used in DCD Table 6.4-1).

In the evaluation presented in Section 2.2.3 of this SER, the staff reviewed the applicant's chemical inventory information, and screened out the toxic chemicals that do not pose a threat to MCR habitability. The staff determined that, with the exception of the Turkey Point Units 1-5 chemicals ammonium hydroxide and chlorine and the Turkey Point Units 6-7 chemicals sodium hypochlorite (Reclaimed Water Treatment Facility) and sodium hypochlorite (cooling tower), the on-site and off-site chemicals do not warrant additional analysis for MCR habitability. Based on the revised air exchange rate, the staff performed confirmatory calculations using computer code ALOHA on these four selected chemicals as discussed below.

The staff's calculations show that the ammonium hydroxide, chlorine, and sodium hypochlorite (Reclaimed Water Treatment Facility) concentrations at the CR intake and inside the CR are less than the Immediately Dangerous to Life and Health (IDLH) limit. The staff's calculations show that the sodium hypochlorite (cooling tower) has concentrations above IDLH limit at the CR intake, but below IDLH limit inside the CR. Therefore, the staff determined that above four selected chemicals would not pose a threat to MCR habitability.

The applicant is taking credit for the virtual distance in its puddle area liquid chemical calculations. Area sources can be approximated by assuming that the source is further away from the receptor by a virtual distance, such that the width of the plume will be equal to the actual width at the source location. The procedure to calculate the virtual distance is recommended in the EPA report "D. Turner, Workbook of Atmospheric Dispersion Estimates, 1970," which the staff finds acceptable.

The ALOHA computer code is limited to calculating for a control room located one hour or less downwind of the source. Some Turkey Point Units 6 and 7 chemicals are affected by this situation. RG 1.78, Section C.1.1 states that chemicals stored or situated at distances greater than 5 miles from the plant need not be considered because, if a release occurs at such a distance, atmospheric dispersion will dilute and disperse the incoming plume to such a degree that either toxic limits will never be reached or there would be sufficient time for the control room operators to take appropriate action. In addition, RG 1.78 states that the probability of a plume remaining within a given sector for a long period of time is quite small. RG 1.78 allows use of a wave hazard analysis when hazardous chemicals are within a 5-mile radius of the plant. It is understood that the applicant's "60 minutes" screening criteria is different from RG 1.78's "5 miles" screening criteria. The staff believes that the essence of RG 1.78's "5 miles" screening criteria is captured in the applicant's "60 minutes" screening criteria. Therefore the staff has no further concern on the applicant's treatment.

The staff reviewed this COL information item 6.4-1 regarding the text added to Section 6.4 of the COL application and concluded PTN COL 6.4-1 is acceptable.

Supplemental Information

The following portion of this technical evaluation section is reproduced from Section 6.4.4 of the VEGP SER:

- *STD SUP 6.4-1*

The NRC staff reviewed STD SUP 6.4-1 related to the evaluation of CR doses in the other unit of a dual unit plant included under Section 6.4.4 of the BLN COL FSAR. The staff concludes that STD SUP 6.4-1 is acceptable because the dose to the CR operators at an adjacent AP1000 due to a radiological release from another unit is bounded by the dose to CR operators on the affected unit. Further, simultaneous accidents at multiple units at a common site are not considered to be a credible event, unless there is a reliance on shared systems between the two units. This is not the case for the AP1000 design.

The following supplemental information is site-specific for Turkey Point Units 6 and 7.

- PTN SUP 6.4-2

The applicant provided supplemental information in PTN SUP 6.4-2 to address radiological dose(s) at Turkey Point Units 6 and 7 due to DBA from Turkey Point Units 3 and 4. This information is discussed in FSAR Section 2.2.3.1.6.1. On March 28, 2012, the staff issued RAI 6340, Question 06.04-1, asking the applicant to address the potential impact on Turkey Point Units 6 and 7 CR habitability of an accident at Turkey Point Units 3 or 4, two operating nuclear units at the site. In letters dated May 23, 2012, and August 23, 2012, the applicant provided results of its dose calculation based on a postulated design basis LOCA at Turkey Point Unit 3 or 4, at uprated power conditions and using the alternative source term methodology consistent with the guidance in RG 1.183, "Alternative Radiological Source Terms for Evaluating Design Basis Accidents at Nuclear Power Reactors." The calculation is conservative because it does not credit any dose reduction resulting from CR filtration or shielding, and assumes a 100 percent occupancy factor. Using these assumptions, which are more conservative than the methodology accepted by NRC in RG 1.183, the applicant calculates that the postulated Turkey Point Unit 3 or 4 DBA would result in doses at the Turkey Point Units 6 and 7 control rooms of about 0.01 Sv (1 rem) total effective dose equivalent (TEDE). The staff finds this acceptable because the applicant used more conservative methodology than would be acceptable to NRC to show that estimated doses in the Turkey Point Unit 6 or 7 control room would be below the 0.05 Sv (5 rem) TEDE dose criterion in GDC 19 for a DBA at the adjacent Turkey Point Units 3 and 4.

6.4.5 Post-Combined License Activities

For the reasons discussed in the technical evaluation above, the following FSAR commitment is identified as the responsibility of the licensee:

- FSAR Commitment 6.4-1. The licensee's CR operator training program shall address the following:
 - Regulatory Position C.5, "Emergency Planning," of RG 1.78
 - Regulatory Position 2.5, "Hazardous Chemicals," of RG 1.196
 - Regulatory Position 2.2.1, "Comparison of System Design, Configuration, and Operation with Licensing Basis," of RG 1.196
 - Regulatory Position 2.7.1, "Periodic Evaluations and Maintenance," of RG 1.196

6.4.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable because it meets the acceptance criteria associated with the relevant requirements of the Commission regulations for habitability systems given in Section 6.4, Revision 3, of NUREG-0800. The staff based its conclusions on the following:

- PTN DEP 2.0-3 is acceptable because, at the increased maximum safety wet-bulb (noncoincident) air temperature 30.78 °C (87.4 °F), the performance of VBS will not change based on the results of supplier coil performance calculations, using the guidance in Section 6.4 of NUREG-0800.
- PTN DEP 6.4-1, relating to design changes affecting habitability of the MCR and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.
- PTN DEP 6.4-2, related to design changes affecting habitability of the MCR and changes to the maximum temperatures and heat generated in the MCR, is reviewed and found acceptable by the staff in Section 21.3 of this SER.
- STD COL 6.4-1 is acceptable because the chemicals do not exceed the IDLH limit at the intake of the MCR, using the regulatory guidance in RG 1.78.
- STD COL 6.4-2 is acceptable because the procedures, testing and training related to MCR habitability will be consistent with the stated regulatory positions in RG 1.78 and RG 1.196.
- PTN COL 6.4-1 and PTN COL 9.4-1b are acceptable because the plant-specific chemicals do not exceed the IDLH limit at the intake of the MCR, using the regulatory guidance in RG 1.78.
- STD SUP 6.4-1 is acceptable because the dose to the MCR operators at an adjacent AP1000 due to a radiological release from another unit is bounded by the dose to MCR operators on the affected unit, using the regulatory guidance in Section 6.4 of NUREG-0800.
- PTN SUP 6.4-2 is acceptable because the dose to the MCR operators at Turkey Point Units 6 or 7 due to a radiological release from either Turkey Point Units 3 or 4 meets the requirements of GDC 19, using regulatory guidance in Section 6.4 of NUREG-0800.

6.5 Fission Product Removal and Control Systems

In the event of a design-basis LOCA, there is an assumed core degradation that results in a significant release of radioactivity to the containment atmosphere. This activity would consist of noble gases, particulates, and a small amount of elemental and organic iodine. Fission product removal and control systems are considered to be those systems for which credit is taken in reducing accidental release of fission products. The AP1000 design has no active system to control fission products in the containment after a postulated accident. The fission product control system is the primary containment. AP1000 DCD, Appendix 15B, "Removal of Airborne Activity from the Containment Atmosphere Following a LOCA," discusses satisfactory removal

of airborne activity (elemental iodine and particulates) from the containment atmosphere by natural removal processes (e.g., deposition and sedimentation) without the use of containment spray.

Section 6.5 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 6.5 of Revision 19 of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that there is no outstanding issue related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

6.6 Inservice Inspection of Class 2, 3, and MC Components (Related to RG 1.206, Section C.III.1, Chapter 6, C.I.6.6, "Inservice Inspection of Class 2 and 3 Components")

6.6.1 Introduction

Inservice inspection (ISI) programs must meet requirements of 10 CFR 50.55a, "Codes and standards," in which Section XI of the ASME Boiler and Pressure Vessel Code (ASME Code) is incorporated by reference. This section addresses the ISI of ASME Code Class 2 and 3 components. ASME Code Class 2 and 3 components must meet the applicable inspection requirements set forth in Subsections IWC and IWD of Section XI of the ASME Code, "Rules for Inservice Inspection (ISI) of Nuclear Power Plant Components." Subsection IWC and IWD also include requirements for preservice examinations prior to initial plant startup as provided in Subarticles IWC-2200 and IWD-2200.

6.6.2 Summary of Application

Section 6.6 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 6.6 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 6.6, the applicant provided the following:

AP1000 COL Information Items

- STD COL 6.6-1

The applicant provided additional information in STD COL 6.6-1 to address COL Information Item 6.6-1. The information relates to plant-specific preservice inspection (PSI) and ISI programs.

- STD COL 6.6-2

The applicant provided additional information in STD COL 6.6-2 to address COL Information Item 6.6-2. The information relates to preservation of component accessibility design considerations during the construction phase.

Supplemental Information

- STD SUP 6.6-1

The applicant provided supplemental information related to the design stage consideration of component accessibility to enable the performance of ISI examinations.

License Condition

- Part 10, License Condition 6

This proposed license condition states that the COL holder shall provide an operational (PSI/ISI) program schedule to support NRC inspections.

6.6.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for ISI of Class 2 and 3 components are given in Section 6.6, Revision 2, of NUREG-0800.

The applicable regulatory requirements for acceptance of the resolution of COL information items and supplementary information on ISI and testing of Class 2 and 3 components are established in GDC 45, "Inspection of Cooling Water System" found in 10 CFR Part 50, Appendix A, as it relates to periodic inspection of important components, such as heat exchangers and piping to assure the integrity and capability of the system.

The applicable policy for acceptance of COL information items, as it relates to fully describing an operational program, is found in SECY-05-0197.

6.6.4 Technical Evaluation

The staff reviewed Section 6.6 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the ISI of Class 2 and 3 components. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAI.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 6.6.4 of the VEGP SER:

AP1000 COL Information Items

- *STD COL 6.6-1*

In Section 6.6 of the NRC staff FSER (NUREG-1793, dated September 2004), the staff concluded that the AP1000 ISI program for ASME Code Class 2 and 3 components is acceptable and meets the requirements of 10 CFR 50.55a with regard to the preservice and inservice inspectability of these components. The specific version of the ASME Code, Section XI used as the baseline Code in the AP1000 certified design, is the 1998 Edition up to and including the 2000 Addenda. It should be noted that the staff did not identify any portions of the AP1000 ISI program for Class 1, 2 and 3 components that were excluded from the scope of the staff's review of the AP1000 DC (as the staff did for inservice testing of valves in AP1000 FSER Section 3.9.6.4). Therefore, the staff's conclusions regarding the acceptability of the AP1000 ISI program based on the 1998 Edition up to and including the 2000 Addenda of the ASME Code, Section XI with regard to preservice and inservice inspectability of Class 2 and 3 components remains unchanged. The staff's evaluation of the operational program aspects of the ASME Code Class 2 and 3 ISI program is addressed with Class 1 ISI in Section 5.2.4 of this SER. The review of the COL applicant's supplemental information also includes the adequacy of the ISI program for reactor containment (Class MC). In Revision 17 of the AP1000 DCD, Class MC components were added to the DCD, Section 6.6, as being within the scope of the ISI Program. The COL applicant incorporated DCD Section 6.6 in its entirety under Revision 1 of its FSAR. Accordingly, the staff's evaluation of this section focused on the acceptability of the COL applicant's supplemental information and responses to AP1000 COL information items and action items as they relate to ISI of ASME Code Class 2, 3, and MC components.

As part of STD COL 6.6-1, the COL applicant added to the end of DCD Section 6.6.2 words to state that the initial ISI program will incorporate the latest Edition and Addenda of the ASME Code (Section XI) approved in 10 CFR 50.55a(b) on the date 12 months before initial fuel load. The COL applicant stated that successive 120-month inspection intervals must comply with the requirements of the latest Edition and Addenda of the Code incorporated by reference in 10 CFR 50.55a(b) 12 months before the start of the 120-month interval, subject to the limitations and modifications listed in 10 CFR 50.55a(b). The requirements in 10 CFR 50.55a(g) state that inservice examinations of components and system pressure tests conducted during the initial 120-month inspection interval must comply with the requirements in the latest Edition and Addenda of the Code incorporated by reference in paragraph (b) of 10 CFR 50.55a on the date 12 months before the date scheduled for initial loading of fuel under a COL under 10 CFR Part 52. The staff concludes that the supplemental information provided by the COL applicant meets the NRC's regulations and is, therefore, acceptable.

As part of STD COL 6.6-1, the COL applicant added to the end of DCD Section 6.6.1 words to state that Class 2 and 3 components are included in the equipment designation list contained in the ISI program. The requirements in 10 CFR 50.55a(g)(3)(ii) state, in part, that Class 2 and 3 components be designed and provided with access to enable the performance of ISI examinations. In addition, the inclusion of Class 2 and 3 components is consistent with the requirements of an ISI program as defined under ASME Section XI, and is, therefore, acceptable. The staff concludes that the supplemental information provided by the COL applicant meets the NRC's regulations and is, therefore, acceptable.

In Section 6.6 of the FSER (NUREG-1793), the staff identified COL Action Item 6.6-1 in which the COL applicant will prepare a PSI program and an ISI program for ASME Code, Class 2 and 3 systems, components and supports. The PSI and ISI programs will address the equipment and techniques used. As part of STD COL 6.6-1, the COL applicant describes the use of visual, surface, ultrasonic, alternative examination techniques, and the use of automated equipment to perform the examinations. The COL applicant referenced the relevant portions of the ASME Code, Section XI to describe the nondestructive examination techniques and alternative examinations. The COL applicant also added information to describe the 120-month inspection interval as defined by IWB-2400 for Inspection Program B and the evaluation of examination results as defined by the ASME Code, Section XI, paragraphs IWC-, IWD-, IWE-, or IWF-3400 acceptance criteria. In addition, the COL applicant appropriately referenced 10 CFR 50.55a(b)(2)(xix) and IWA-2240 as described in the 1997 Addenda of the ASME Code, Section XI when applying alternative examination provisions. The supplemental information provided by the COL applicant meets the requirements in 10 CFR 50.55a, the ASME Code, Section XI, and the guidelines in RG 1.206, Section C.III.1, Chapter 6, C.I.6.6.3, and is, therefore, acceptable. Based on the discussion above, the staff concludes that the supplemental information under STD COL 6.6-1 is acceptable.

- **STD COL 6.6-2**

As part of STD COL 6.6-2, the COL applicant states that during the construction phase of the project, anomalies and construction issues are addressed using change control procedures. Modifications reviewed following DC will adhere to the same level of review as the certified design, thus, control of accessibility is maintained during post-DC activities. Control of accessibility for inspectability and testing during post-DC activities is provided via procedures for design control and plant modifications. In the NRC staff's FSER (NUREG-1793), the staff identified COL Action Item 6.6-2, which recommends COL applicants referencing the AP1000 certified design address the controls to preserve accessibility and inspectability for ASME Code, Section III, Class 2 and 3 components and piping during construction or other post-DC activities. The NRC staff reviewed the applicant's proposed resolution of COL Action Item 6.6-2 using NUREG-0800, Section 6.6. The staff finds that the accessibility needed to perform PSI/ISI examinations is maintained during the design, construction and operational phases, which satisfies NUREG-0800, Section 6.6 recommendations for accessibility. In addition, the supplemental information meets the regulations under 10 CFR 50.55a(g)(3)(ii), which requires that Class 1, 2, and 3 components be designed and provided with access that enables the performance of ISI examinations, and the requirements under ASME Code, Section XI, IWA-1500. Based on the discussion above, the staff concludes that STD COL 6.6-2 is acceptable.

Supplemental Information

- **STD SUP 6.6-1**

As part of STD SUP 6.6-1, the COL applicant added supplemental information to the AP1000 DCD, Section 6.6.2, to address accessibility of Class 2, 3, and Class MC pressure retaining components to permit preservice and inservice examinations. Factors considered, such as examination requirements, techniques, accessibility, geometry, and material selections, are used in establishing the designs with the goals being to eliminate uninspectable components, reduce occupational radiation exposure, reduce inspection times, allow state-of-the-art inspection systems, and enhance detection and the reliability of flaw characterization.

The requirements in 10 CFR 50.55a(g)(3)(ii) state, in part, that Class 2 and 3 components be designed and provided with access to enable the performance of ISI examinations. ASME Code, Section XI, IWA-1500 requires that access be provided to enable the performance of ISI examinations, along with design considerations to render ISI practical. The staff finds that the supplemental information under STD SUP 6.6-1 meets the requirements of 10 CFR 50.55a and ASME Code, Section XI, and is, therefore, acceptable.

License Condition

- *Part 10, License Condition 6*

The COL applicant proposed a license condition for BLN for all operational programs requiring that the licensee shall submit to the appropriate Director of the NRC a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operational program has been implemented or the plant has been placed into commercial service. A separate license condition for PSI and ISI program implementation requirements is not necessary in the BLN COL FSAR since it is a requirement under 10 CFR 50.55a. However, submittal of the schedule for the PSI and ISI program development is necessary to plan for and conduct NRC inspections during construction. The staff finds that this schedule will enable the staff to adequately plan and schedule inspections of the PSI and ISI programs during the construction phase. This proposed license condition is consistent with the policy established in SECY-05-0197, and is acceptable.

6.6.5 Post-Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff proposes to include the following license condition associated with the PSI and ISI programs:

- License Condition (6-3)—No later than 12 months after issuance of the COL, the licensee shall submit to the appropriate Director of NRO a schedule that supports planning for and conduct of NRC inspections of the PSI and ISI programs. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the PSI and ISI programs have been fully implemented.

6.6.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of GDC 45 and 10 CFR 50.55a. The staff based its conclusion on the following:

- STD COL 6.6-1 is acceptable because the staff concluded that the applicant's AP1000 ISI program for ASME Code Class 2, 3, and MC (metal containment) components is acceptable and meets the requirements of 10 CFR 50.55a with regard to the preservice and inservice inspectability of these components.

- STD COL 6.6-2 is acceptable because the staff concluded that the accessibility needed to perform PSI/ISI examinations is maintained during the design, construction and operational phases, and satisfies NUREG-0800, Section 6.6 acceptance criteria for accessibility.
- STD SUP 6.6-1 is acceptable because the staff concluded that accessibility to perform ISI examinations would be incorporated into the design, and satisfies the requirements of 10 CFR 50.55a(g)(3)(ii).

7.0 INSTRUMENTATION AND CONTROLS

Nuclear power plant instrumentation senses various plant parameters and transmits appropriate signals to the control systems during normal operation and to the reactor trip and engineered safety feature systems during abnormal and accident conditions. The information provided in this chapter emphasizes those instruments and associated equipment that constitute the protection and safety systems.

7.1 Introduction

7.1.1 Introduction

The Westinghouse AP1000 Design Control Document (DCD) contains Combined License (COL) Information Item 7.1-1 that requires the COL applicant to address setpoint calculations for protective functions.

7.1.2 Summary of Application

Section 7.1 of the Turkey Point Units 6 and 7 COL Final Safety Analysis Report (FSAR), Revision 8 incorporates by reference Section 7.1 of the AP1000 DCD, Revision 19.

In addition, the applicant provided the following to address COL Information Item 7.1-1:

AP1000 COL Information Item

- STD COL 7.1-1

Standard (STD) COL 7.1-1 addresses setpoint calculations for protective functions.

7.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for Instrumentation and Controls are in Section 7.1 of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants."

The applicable regulatory requirements for the information being reviewed in this section are:

- Title 10 of the *Code of Federal Regulations* (10 CFR) 50.36
- 10 CFR 52.79(a)(30)

7.1.4 Technical Evaluation

The Nuclear Regulatory Commission (NRC) staff reviewed Section 7.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this

review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to setpoint calculations for protective functions. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP), Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) may include evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 7.1.4 of the VEGP SER:

*The applicant, in its letter dated May 21, 2010, proposed to incorporate the Setpoint Program (SP) that will be added to the AP1000 DCD into the VEGP Technical Specifications (TS). This proposal was made to address Open Item 16.1-1. In Chapter 16 of this safety evaluation report (SER), the staff concludes that the response to Open Item 16.1-1 is acceptable. The incorporation of this program into the VEGP TS in a later revision is being tracked as **Confirmatory Item 16.1-1**. The closure of this Confirmatory Item is provided in SER Section 16.1.*

In addition, in a letter dated June 4, 2010, the applicant proposed adding STD COL 7.1-1 as a new COL information item addressed in the VEGP COL FSAR.

¹ Section 1.2.2 contains a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC). This footnote will be referenced in several places throughout the chapter of this Safety Evaluation.

AP1000 COL Information Item

- STD COL 7.1-1

The applicant proposed adding a new line item to VEGP COL FSAR Table 1.8-202 to address COL Information Item 7.1-1. The applicant also proposed the following addition to VEGP COL FSAR Section 7.1:

7.1.6.1 Setpoint Calculations for Protective Functions

The Setpoint Program described in Technical Specifications Section 5.5 provides the appropriate controls for update of the instrumentation setpoints following completion of the calculation of setpoints for protective functions and the reconciliation of the setpoints against the final design.

The applicant states that the TS program identified in the proposed Section 7.1.6.1 was that addressed in the VEGP revised response to Bellefonte Nuclear Plant (BLN) Open Item 16.1-1, dated May 21, 2010, and that the calculation and reconciliation of the setpoints discussed is required by the AP1000 Inspections, Tests, Analyses and Acceptance Criteria (ITAAC) included in AP1000 DCD Tier 1, Table 2.5.2-8, Item 10. In Chapter 16 of this SER, the staff concludes that the May 21, 2010, response to BLN Open Item 16.1-1 is acceptable.

*Based on the ITAAC in Table 2.5.2-8, Item 10 and the TS controls in Section 5.5, the staff finds there are adequate controls for updating the instrumentation and controls (I&C) setpoints. Therefore, the staff finds STD COL 7.1-1 acceptable. The incorporation of the changes associated with proposed STD COL 7.1-1 into a future revision of the VEGP COL FSAR is **Confirmatory Item 7.1-1**.*

Resolution of Standard Content Confirmatory Item 7.1-1

Confirmatory Item 7.1-1 is an applicant commitment to revise its FSAR Table 1.8-202 and Section 7.1 to address COL Information Item STD COL 7.1-1. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 7.1-1 is now closed.

7.1.5 Post Combined License Activities

There are no post-COL activities related to this section.

7.1.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff has compared the application to the relevant NRC regulations and other NRC regulatory guides and concludes that the applicant is in compliance with the NRC regulations. The staff based its conclusion on the following:

- STD COL 7.1-1, the applicant provided a program for setpoint calculations for protective functions in accordance with the requirements of 10 CFR 50.36 and 10 CFR 52.79(a)(30).

7.2 Reactor Trip

Section 7.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8 incorporates by reference, Section 7.2, "Reactor Trip," of Revision 19 of the AP1000 DCD.

In addition, in the Turkey Point Units 6 and 7 FSAR, the applicant provided the following:

Departures

- PTN DEP 6.4-2

The applicant provided additional information in Section 7.2 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related PTN DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

- PTN DEP 7.3-1

The applicant provided additional information in Table 7.2-201 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 7.3-1 related to required design changes for the protection and safety monitoring system (PMS) source range neutron flux doubling logic to comply with the requirements of Institute of Electrical and Electronics Engineers (IEEE) Std. 603-1991, Clause 6.6. This information, as well as related PTN DEP 7.3-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.5 of this SER.

The NRC staff reviewed Section 7.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of the information relating to this section.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

7.3 Engineered Safety Features

Section 7.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8 incorporates by reference, Section 7.3, "Engineered Safety Features," of Revision 19 of the AP1000 DCD.

In addition, in the Turkey Point Units 6 and 7 FSAR the applicant provided the following:

Departures

- PTN DEP 6.4-1

The applicant provided additional information in Section 7.3.1.2.17 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related PTN DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

- PTN DEP 6.4-2

The applicant provided additional information in Section 7.3.1.2.17 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related PTN DEP 6.4-2 information appearing in other chapters of the FSAR is reviewed in Section 21.3 of this SER.

- PTN DEP 7.3-1

The applicant provided additional information in Section 7.3.1.2.14 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 7.3-1 related to required design changes for the PMS source range neutron flux doubling logic to comply with the requirements of IEEE Std. 603-1991, Clause 6.6. This information, as well as related PTN DEP 7.3-1 information appearing in other chapters of the FSAR is reviewed in Section 21.5 of this SER.

The NRC staff reviewed Section 7.3.1.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In RAI 1-4, issued to the applicant for the BLN, Units 3 and 4, the staff questioned how the applicant would verify that the as-built I&C system configuration conformed to schematics. In its response to RAI 1-4, the BLN applicant indicated that it or a designee would verify I&C cabinets as-built against the design drawings during manufacturing and would functionally test each system. In addition, the BLN applicant's response indicated that the I&C cabinets would be tested during preoperational testing and in accordance with several ITAAC related to the I&C system. The BLN response to RAI 1-4 was endorsed as standard for Turkey Point Units 6 and 7 by Florida Power & Light Company in its letter dated October 5, 2009.

The staff notes that vendor qualification testing, which may be done offsite, and preoperational testing fall under the applicant's quality assurance program. Any anomalies found during the testing or any problems identified from the time the testing is complete until the components are installed at the site would be corrected in accordance with the applicant's quality assurance program. The staff finds the verification of the as-built I&C system configuration against schematics using a combination of vendor and onsite testing that falls under the applicant's

quality assurance program acceptable. In addition, the staff finds that adequate program controls exist to ensure that once the testing was complete, the I&C system configuration would be maintained as valid throughout the life of the plant. Based on the above, the staff finds the response to BLN RAI 1-4 and the Florida Power & Light Company endorsement of that response acceptable.

7.4 Systems Required for Safe Shutdown

Section 7.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8 incorporates by reference, Section 7.4, "Systems Required for Safe Shutdown," of Revision 19 of the AP1000 DCD.

In addition, in the Turkey Point Units 6 and 7 FSAR the applicant provided the following:

Departures

- PTN DEP 6.3-1 and PTN DEP 3.2-1

The applicant provided additional information for PTN DEP 6.3-1 and PTN DEP 3.2-1 in Turkey Point Units 6 and 7 COL FSAR Section 7.4.1.1 related to extended operation of the PRHR-HX, the ability to maintain safe shutdown conditions, changing the indefinite duration to at least 72 hours, and operator directed actions to preserve battery capability. This information, as well as related PTN DEP 6.3-1 information appearing in other chapters of the FSAR is reviewed in Section 21.1 of this SER.

The staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 7.4.1.1 and checked the referenced DCD to ensure that the combination of the DCD and the Turkey Point Units 6 and 7 COL application represents the complete scope of information relating to this section. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements. Section 21.1 of this report evaluates the departures from the AP1000 DCD provided in PTN DEP 6.3-1 and PTN DEP 3.2-1.

7.5 Safety-Related Display Information (Related to RG 1.206, Section C.III.1, Chapter 7, C.1.7.5, "Information Systems Important to Safety")

7.5.1 Introduction

Safety-related display information includes equipment that processes safety-related information and displays it for use by the operator to monitor and maintain the safety of the AP1000 throughout operating conditions that include anticipated operational occurrences and accident and post-accident conditions.

The AP1000 DCD contains COL Information Item 7.5-1 that requires the COL applicant to address post accident monitoring variables listed as site specific in DCD Tables 7.5-1 and 7.5-8.

7.5.2 Summary of Application

Section 7.5 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8 incorporates by reference Section 7.5 of the AP1000 DCD, Revision 19.

In addition, in the Turkey Point Units 6 and 7 FSAR the applicant provided the following:

Departure

- PTN DEP 6.4-2

The applicant provided additional information in Section 7.5 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-2 related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance. This information, as well as related PTN DEP 6.4-2 information appearing in other chapters of the FSAR, is reviewed in Section 21.3 of this SER.

AP1000 Information Items

- STD COL 7.5-1 and PTN COL 7.5-1

The applicant provided additional information in Turkey Point Units 6 and 7 COL FSAR Section 7.5, "Safety-Related Display Information," describing the FSAR Table 7.5-201 supplement to DCD Table 7.5-1 and providing variable data shown in the DCD table as "site specific."

The applicant also provided additional information in Turkey Point Units 6 and 7 COL FSAR Section 7.5, describing the FSAR Table 7.5-202 supplement to DCD Table 7.5-8 and providing variable data shown in DCD Table 7.5-8 as "site specific."

7.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in the Final Safety Evaluation Report related to the DCD.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the information systems important to safety are given in Section 7.5 of NUREG-0800.

The applicable regulatory requirements, guidelines, and related acceptance criteria for the supplemental information item are as follows:

- General Design Criterion (GDC) 13, "Instrumentation and Control"
- GDC 64, "Monitoring Radioactivity Releases"

The regulatory bases require, in part, that instrumentation be provided to monitor variables and systems over their anticipated ranges for normal operation, for anticipated operational occurrences, and for accident conditions as appropriate to ensure adequate safety. Monitoring should include checking the plant environs for radioactivity that may be released from postulated accidents.

7.5.4 Technical Evaluation

The NRC staff reviewed Section 7.5 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to safety-related display information. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

Supplemental Information

- STD COL 7.5-1 and PTN COL 7.5-1

The AP1000 DCD references and commits to Regulatory Guide (RG) 1.97, "Instrumentation for Light-Water-Cooled Nuclear Power Plants to Assess Plant and Environs Conditions During and Following an Accident," Revision 3, as the method of complying with GDC 13 and GDC 64.

Appendix 1AA of Turkey Point Units 6 and 7 COL FSAR takes exception to Revision 4 of RG 1.97. The applicant, instead, states conformance to Revision 3 of RG 1.97. The applicant states, "Portable equipment outside the DCD scope conforms to Revision 3 of this Regulatory Guide for consistency with DCD scope since Revision 4 indicates that partial implementation is not advised." The staff discusses the acceptability of Revision 3 of RG 1.97 in Section 12.1 of this SER.

Revision 3 of RG 1.97 states that the variable and range information should be provided for environs radiation and radioactivity, and meteorological instrumentation.

The staff issued RAI 5191, Question 07.05-1 requesting information on boundary environs radiation and meteorological instrumentation. The staff finds that the range of the boundary environs radiation instruments is necessary to ensure that the instruments are adequate for monitoring radioactivity that may be released from a postulated accident. In a letter dated March 18, 2011 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML110800598), the applicant provided a supplemental response to RAI 5191, Question 07.05-1 with sufficient meteorological range and accuracy information for wind direction, wind speed, and differential temperature. In addition, the revised Turkey Point Units 6 and 7 COL FSAR Table 7.5-201 included the boundary environs radiation variable and the required range information for the post-accident monitoring system. The supplemental information conforms to the guidance of Revision 3 of RG 1.97. The staff confirmed that the Turkey Point Units 6 and 7 COL FSAR was updated to incorporate the instrumentation supplemental information. The staff finds the response acceptable and considers RAI 5191, Question 07.05-1 closed.

Additionally, the applicant identified a typographical error in FSAR Table 7.5-201, with respect to the range of the wind direction parameter. In its letter dated January 28, 2013, the applicant identified the proposed change for the wind direction range, from 0 - 36° to 0 - 360°. This proposed change will be tracked as **Confirmatory Item 7.5-1** pending the applicant's update of the FSAR.

Resolution of Turkey Point Confirmatory Item 7.5-1

Confirmatory Item 7.5-1 is an applicant commitment to revise its FSAR Table 7.5-201 regarding the wind direction range. The staff verified that the Turkey Point Units 6 and 7 COL FSAR, Revision 8 was appropriately revised. As a result, Confirmatory Item 7.5-1 is now closed.

7.5.5 Post Combined License Activities

There are no post-COL activities related to this section.

7.5.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff has compared the application to the relevant NRC regulations and other NRC RGs and concludes that the applicant is in compliance with the NRC regulations. The applicant has satisfactorily addressed the guidance of Revision 3 of RG 1.97 through the response to RAI 5191, Question 07.05-1. The staff based its conclusion on the following:

- PTN DEP 6.4-2, related to design changes affecting how the temperature and humidity in the main control room are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.
- STD COL 7.5-1 and PTN COL 7.5-1 provided sufficient information regarding the safety-related display information, which is, therefore, acceptable in accordance with the requirements of 10 CFR Part 50, Appendix A, GDC 13 and GDC 64.

7.6 Interlock Systems Important to Safety

Section 7.6 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8 incorporates by reference, with no departures or supplements, Section 7.6, "Interlock Systems Important to Safety," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review. The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

7.7 Control and Instrumentation Systems (Related to RG 1.206, Section C.III.1, Chapter 7, C.I.7.7, "Control Systems Not Required for Safety")

Section 7.7 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8 incorporates by reference, with no departures or supplements, Section 7.7, "Control and Instrumentation Systems," of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review. The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

8 ELECTRIC POWER

8.1 Introduction

The electric power system is the source of power for station auxiliaries during normal operation and for the reactor protection system and engineered safety features during abnormal and accident conditions at the Turkey Point, Units 6 and 7. This chapter provides information on the functional adequacy of the offsite electric power systems and safety-related onsite electric power systems, as applicable to the application, based on the Westinghouse AP1000 certified standard design, and ensures that these power systems have adequate capacity, capability, redundancy, independence, and testability in conformance with the current criteria established by the U.S. Nuclear Regulatory Commission (NRC).

Chapter 8, "Electric Power," of this advance safety evaluation (ASE) describes the results of the review by the NRC staff (the staff) of the Turkey Point Combined License (COL) Final Safety Analysis Report (FSAR), Part 2 of the COL application (COLA), submitted by Florida Power and Light Company (FPL), the COL applicant (the applicant).

8.1.1 Introduction

This section provides the applicant's description of the electric power system with regard to the interrelationships between the nuclear unit, the utility grid, and the interconnecting grids.

In addition, this section includes a regulatory requirements applicability matrix that lists all design bases, criteria, regulatory guides (RGs), standards, and other documents to be implemented in the design of the electrical systems that are beyond the scope of the AP1000 design certification (DC).

8.1.2 Summary of Application

Turkey Point Units 6 and 7 COL FSAR, Revision 8, Section 8.1 incorporates by reference AP1000 Design Control Document (DCD), Revision 19, Section 8.1, with some departures and/or supplements.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 8.1, the applicant provided the following:

Supplemental Information

- Turkey Point Supplement (PTN SUP) 8.1-1

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 8.1, "Introduction," describing Turkey Point's connections to the FPL electrical grid and the connection interfaces with neighboring utilities via the Turkey Point, Units 6 and 7, 500/230-kilovolt (kV) Clear Sky switchyard at the Turkey Point site.

- PTN SUP 8.1-2

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 8.1 describing additional information pertaining to regulatory guides and Institute of

Electrical and Electronics Engineers (IEEE) standards identified in AP1000 DCD FSAR, Table 8.1-1, and to other applicable regulatory guides as indicated in Turkey Point Units 6 and 7 COL FSAR Table 8.1-201, "Site-Specific Guidelines for Electric Power Systems."

8.1.3 Regulatory Basis

The regulatory basis for the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report [FSER] Related to Certification of the AP1000 Standard Design," and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for the introduction to the electric power systems are given in NUREG-0800, Section 8.1, "Standard Review Plan [SRP] for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR [light-water reactor] Edition)."

The applicable regulatory requirements, guidelines, and related acceptance criteria for the supplemental information items are as follows:

- Title 10 of the *Code of Federal Regulations* (10 CFR) Subsection 50.63, "Loss of All Alternating Current Power"
- RG 1.155, "Station Blackout"
- RG 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)"

8.1.4 Technical Evaluation

The NRC staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 8.1 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the introduction to the electric power systems. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the following information in the Turkey Point Units 6 and 7 COL FSAR:

Supplemental Information

- PTN SUP 8.1-1

The staff reviewed the supplemental information related to the FPL utility grid and its connection to neighboring utilities included under PTN SUP 8.1-1. The applicant's supplement to Turkey Point Units 6 and 7 Section 8.1.1 is summarized as follows:

¹ See Section 1.2.2 of this SER for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a DC. This footnote will be referenced in several places throughout the chapter of this Safety Evaluation.

The FPL power transmission system consists of transmission lines and substations that link various generation facilities, load centers, and grid interties within the FPL service territory at various voltages. FPL maintains multiple direct interconnections with neighboring utilities. These interconnections serve to increase the reliability of the FPL electrical grid.

Turkey Point, Units 6 and 7 are connected to a new common switchyard, the Clear Sky substation, having dual voltages 500 kV and 230kV. The switchyard also serves as units' preferred and maintenance source. The switchyard has two sections, one operating at 230 kV, and the other at 500 kV. These sections are interconnected with two 230-kV/500-kV autotransformers. The switchyard has both breaker-and-a-half (230 kV) and double breaker (500-kV) schemes. There are two 500-kV and two 230-kV transmission lines that connect the switchyard to the grid.

The NRC staff finds that the applicant has adequately described the Turkey Point, Units 6 and 7, connection to the utility grid and that the information provided is in accordance with the recommendations of RG 1.206 and the guidance in NUREG-0800, Section 8.1.

- PTN SUP 8.1-2

The staff also reviewed supplemental information included in PTN SUP 8.1-2, related to regulatory guidelines and industry standards and concluded that it was consistent with NUREG-0800, Section 8.1, with the exception of the information discussed below.

Turkey Point Units 6 and 7 COL FSAR Table 8.1-201, Item 1b, indicated that RG 1.155 is not applicable to Turkey Point. This item was deemed standard among COL applications being discussed in Bellefonte's (BLN) response to Request for Additional Information (RAI) 08.01-2. In an October 5, 2009, letter, the applicant stated that the standard response to RAI 08.01-2 applies to the Turkey Point Units 6 and 7 COL application.

The standard response submitted by BLN in a June 24, 2008, letter, is summarized as follows: BLN stated that the AP1000 design meets the requirements of 10 CFR 50.63 for 72 hours and, therefore, no specific procedures or training specific to station blackout (SBO) are necessary. The staff determined that the above response was inconsistent with the recommendations of RG 1.155 and the requirements of 10 CFR 50.63. The staff recognizes that the passive systems can maintain safe-shutdown conditions after design-basis events for 72 hours, without operator action, following a loss of both onsite and offsite alternating current (ac) power sources. However, the applicant needs to establish SBO procedures and training for operators to include actions necessary to restore offsite power after 72 hours by addressing alternating current (ac) power restoration (e.g., coordination with transmission system load dispatcher), and severe weather guidance (e.g., identification of site-specific actions to prepare for the onset of severe weather such as an impending tornado) in accordance with RG 1.155, Regulatory Positions C.2 and C.3.4.

Several discussions were held between the staff and the BLN applicant regarding this issue. Subsequently, in an April 15, 2009, letter, the BLN applicant stated that the training and procedures to support mitigation of an SBO event would be implemented in accordance with BLN COL FSAR Sections 13.2 and 13.5, respectively. As recommended by NUMARC 87-00, "Guidelines and Technical Bases for NUMARC Initiatives Addressing Station Blackout at Light Water Reactors," which is endorsed by RG 1.155, the loss of all ac power event mitigation procedures will address response (e.g., restoration of onsite power sources), ac power restoration (e.g., coordination with transmission system load dispatcher), and severe weather guidance (e.g., identification of actions to prepare for the onset of severe weather such as an

impending tornado), as applicable. In addition, the BLN applicant stated that there are no nearby large power sources, such as a gas turbine or black-start fossil fuel plant that can directly connect to the station to mitigate the event. The staff found the BNL applicant's response acceptable.

In a January 26, 2010, letter, the Turkey Point applicant stated that it did not endorse BLN's revised response because nearby large power sources exist at Turkey Point. However, the applicant updated Turkey Point Units 6 and 7 COL FSAR, Revision 6, Section 1.9.5.1.5 to include training and procedures to support mitigation of an SBO event.

The staff verified that the applicant updated Turkey Point Units 6 and 7 COL FSAR Sections 1.9.5.1.5 and 1.9.6 to include the above-mentioned items including the implementation of training and procedures to support mitigation of an SBO event. The staff finds that this update satisfies RG 1.155, Regulatory Positions C.2 and C.3.4. Based on the above, the staff considers this item resolved.

8.1.5 Post Combined License Activities

There are no post COL activities related to this section.

8.1.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to the introduction to the electric power systems, and there is no outstanding information expected to be addressed in the Turkey Point Units 6 and 7 COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point COL Units 6 and 7 application are documented in NUREG-1793 and its supplements.

In addition, the staff compared the additional COL-specific supplemental information in the application to the relevant NRC regulations; guidance in NUREG-0800, Section 8.1, and other NRC regulatory guides; and concluded that the applicant is in compliance with the NRC regulations. The staff based its conclusion on the following:

- PTN SUP 8.1-1 is acceptable because the applicant provided sufficient information regarding the FPL transmission system and its connection to neighboring utilities in accordance with the recommendations of RG 1.206.
- PTN SUP 8.1-2 is acceptable because the COL-specific regulatory guidelines and industry standards and additional new regulatory guidelines, are adequately addressed by the applicant. The applicant has also provided sufficient information to satisfy the requirements of 10 CFR 50.63 and the guidance in RG 1.155.

8.2 Offsite Power System

8.2.1 Introduction

The offsite power system is referred to in regulatory guides and industry standards as the "preferred power system." The offsite power system includes two or more physically independent circuits capable of operating independently of the onsite standby power sources

and encompasses the grid, transmission lines (overhead or underground), transmission line towers, transformers, and other switchyard components.

The AP1000 passive reactor plant standard design supports an exemption in 10 CFR Part 52, "Licenses, certifications, and approvals for nuclear power plants," Appendix D, "Design Certification Rule for the AP1000 Design," paragraph V.B.3, to the requirement of 10 CFR Part 50, "Domestic licensing of production and utilization facilities," Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criterion (GDC) 17, "Electric Power Systems," to have only one (not two) physically independent offsite circuit to provide for defense-in-depth. Therefore, for Turkey Point, Units 6 and 7, the single offsite power source provided from the transmission network is reviewed below to assure that it satisfies the requirements of GDC 17 with respect to its capacity and capability.

8.2.2 Summary of Application

Turkey Point Units 6 and 7 COL FSAR, Revision 8, Section 8.2 incorporates by reference AP1000 DCD FSAR, Revision 19, Section 8.2.

In addition in Turkey Point Units 6 and 7 COL FSAR Section 8.2, the applicant provided the following:

AP1000 COL Information Items

- **PTN COL 8.2-1**

The applicant provided additional information in PTN COL 8.2-1 to address COL Information Item 8.2-1 (COL Action Items 8.2.3-1 and 8.2.3.3-1) to address the design of the ac power transmission system and its testing and inspection plan. The information describes: (1) the designs of the plant site 500-kV/230-kV switchyard and the transmission lines connecting Units 6 and 7 to the switchyard and the 500-kV/230 kV switchyard to various substations throughout the transmission grid; (2) the connections of the generator step-up (GSU) transformers and the reserve auxiliary transformers (RATs) to the switchyard; (3) the ratings and arrangement of the switchyard circuit breakers and disconnect switches; (4) the transformer area arrangement for each unit; (5) the locations of the GSU transformers, unit auxiliary transformers (UATs), and RATs; (6) the design of the control building in the plant site 500-kV/230-kV switchyard; (7) the administrative control of the 500-kV/230-kV switchyard and transmission line circuit breakers; (8) the switchyard and transmission line testing and inspection plan; and (9) grid stability analysis. PTN COL 8.2-1 is addressed in Turkey Point Units 6 and 7 COL FSAR Sections 8.2.1, 8.2.1.1, 8.2.1.2, 8.2.1.3, and 8.2.1.4.

- **PTN COL 8.2-2**

The applicant provided additional information in PTN COL 8.2-2 to address COL Information Item 8.2-2 (COL Action Items 8.2.3.1-1, 8.2.3.1-2, and 8.2.3.1-3), describing: (1) the switchyard arrangement and design of the protective relaying scheme; and (2) a transmission system study performed regularly to verify grid stability, switchyard voltage, and frequency to confirm the transmission system capability to maintain reactor coolant pump (RCP) operation for 3 seconds following a turbine trip as specified in AP1000 DCD FSAR Section 8.2.2. PTN COL 8.2-2 is addressed in Turkey Point Units 6 and 7 COL FSAR Sections 8.2.1.2.1 and 8.2.2.

Site-Specific Information Replacing Conceptual Design Information (CDI)

- PTN CDI

The applicant provided site-specific information describing the transformer area located next to each unit's turbine building and containing the GSU transformers, the UATs, and the RATs. This replaced the CDI located in the AP1000 DCD FSAR.

Supplemental Information

- PTN SUP 8.2-1

The applicant provided supplemental information describing details of a failure modes and effects analysis (FMEA) performed for the offsite power distribution system, plant site switchyard, and the transmission system.

- PTN SUP 8.2-2

The applicant provided supplemental information describing the formal agreement between Turkey Point and FPL's Transmission Operations and Planning organization, which is the transmission system operator (TSO). The applicant provided supplemental information describing FPL's responsibility for assuring that adequate voltage is available to Turkey Point, Units 6 and 7; maintaining area bulk transmission system reliability and demonstrating, by power system simulation studies, projections, and analyses, the current and future reliability of the system. In addition, the applicant described the interfaces between Turkey Point and FPL's Transmission Operations explaining that protocols are in place for both entities to remain cognizant of grid vulnerabilities in order to make mutually informed decisions regarding maintenance activities critical to the electric system.

- PTN SUP 8.2-3

The applicant provided supplemental information describing the average grid availability of the 230 kV and 500 kV from the Turkey Point substation and transmission lines that feed the Turkey Point site for the period from January 1, 1988, to September 30, 2008.

- Turkey Point Units 6 and 7, response to RAI 6750

The applicant, in response to the staff concern related to the design vulnerability identified in Bulletin 2012-01, proposed the following additional information (ML15091A388):

8.2.1.2.2 Plant Response to High Voltage Open Phase Condition

"A monitoring system is installed on the credited GDC 17 offsite power circuit that provides continuous open phase condition monitoring of the MSU transformer HV input power supply (see Reference 202). The system detects an open phase condition (with or without a concurrent high impedance ground on the HV side of the transformer) on one or more phases under all transformer loading conditions. The open phase condition monitoring system provides an alarm to the operators in the control room should an open phase condition occur on the HV source to the MSU transformers. The system design utilizes commercially available components including state of the art digital relaying equipment and input parameters as required to provide loss of phase detection and alarm capability.

Additionally, a high-voltage open phase condition with or without a ground fault can manifest itself as an unacceptable voltage on the 6.9 kV medium voltage ES-1 and ES-2 buses during normal loading conditions. The presence of unacceptable voltages on the ES-1 and ES-2 buses results in isolation of the affected medium voltage bus from the offsite power supply and enables the onsite standby diesel generators to start and restore ac power to the ES-1 and ES-2 buses and associated defense-in-depth loads. The onsite ac power system is described in AP1000 DCD Section 8.3.1.

Motor management relays for the medium voltage motors on ES-1 and ES-2 provide detection of unacceptably high negative sequence currents. High negative sequence current motor trips or other running load trips provide alarms in the main control room (MCR), which can assist in the detection of a high-voltage open phase condition with or without a ground fault. Electric circuit protection for the medium voltage system and equipment is described in AP1000 DCD Section 8.3.1.1.1.1.

A high-voltage open phase condition with or without a ground fault can also manifest itself as an unacceptable voltage on the 480 VAC low-voltage buses powered from ES-1 and ES-2. The safety related IDS battery chargers are powered from the low-voltage buses and continue to charge the IDS batteries unless the battery charger input or output monitored electrical parameters are unacceptable. If the monitored electrical parameters degrade to the point that the battery charger no longer provides sufficient dc bus voltage, the Class IE electrical system dc bus receives power from the applicable IDS battery and the battery charger maintains isolation between the Non-Class IE ac and Class 1 E dc power systems which generates alarms in the MCR. The onsite AC power system is described in AP1000 DCD Section 8.3.1 and the Class 1 E DC power system is described in AP1000 DCD Section 8.3.2.1.1.

Operator actions and maintenance and testing activities are addressed in procedures, as described in Turkey Point Units 6 and 7 COL FSAR Section 13.5. Plant operating procedures, including off-normal operating procedures associated with the monitoring system will be developed prior to fuel load. Maintenance and testing procedures, including calibration, surveillance testing, set point determination and troubleshooting procedures associated with the monitoring system will be developed prior to fuel load.

Control Room operator and maintenance technician training associated with the operation and maintenance of the monitoring system will be conducted in accordance with the milestones for Non Licensed Plant Staff and Reactor Operator Training Programs provided in Turkey Point Units 6 and 7 COL FSAR Table 13.4-201.”

Interface Requirements

The plant offsite electrical power interfaces for the AP1000 standard design are discussed in AP1000 DCD Tier 2, Section 8.2.5, Table 1.8-1, Items 8.1, 8.2, and 8.3. These interfaces are identified as “non-nuclear safety (NNS)” interfaces in this table.

8.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for the offsite power system are given in NUREG-0800, Sections 8.1 and 8.2.

The regulatory bases for acceptance of the COL information and supplementary information items are established as follows:

- 10 CFR Part 10, "Domestic licensing of production and utilization facilities," Appendix A, "General Design Criteria for Nuclear Power Plants" (GDC) Criterion 17 "Electric power systems,"
- GDC 18, "Inspection and Testing of Electrical Power Systems,"
- 10 CFR 50.65, "Requirements for Monitoring the Effectiveness of Maintenance at Nuclear Power Plants,"
- RG 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition),"
- Generic Letter (GL) 2006-02, "Grid Reliability and the Impact on Plant Risk and the Operability of Offsite Power."

8.2.4 Technical Evaluation

The staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 8.2 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the Turkey Point Units 6 and 7 COL application and the DCD information incorporated by reference addresses the required information relating to the offsite power system. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generation Plant (VEGP) Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed by the Turkey Point Units 6 and 7 COL applicant.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER. Confirmatory items that are first identified in this SER section will have a specific designation (e.g., Confirmatory Item 8.2-1).

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

AP1000 COL Information Items

- PTN COL 8.2-1

The applicant provided additional information in PTN COL 8.2-1 to resolve COL Information Item 8.2-1, which states:

Combined License applicants referencing the AP1000 certified design will address the design of the ac power transmission system and its testing and inspection plan (DCD Section 8.2.5).

The commitment was also captured as COL Action Items 8.2.3-1 and 8.2.3.3-1 in NUREG-1793, Appendix F, which states:

The operating voltage for the high side of the AP1000 transformer and transmission switchyard, as well as the frequency decay rate are site-specific and, therefore, will be addressed in the COL application. The COL applicant will provide analysis of these matters, including transient stability, voltage operating range, and preservation of the grid connections, in the COL application (COL Action Item 8.2.3-1).

Combined License applicants referencing the AP1000 certified design will address the design of the ac power transmission system and its testing and inspection plan (COL Action Item 8.2.3.3-1).

The staff reviewed the resolution to COL information item, PTN COL 8.2-1, related to the transmission system design, testing, and inspection included in Turkey Point Units 6 and 7 COL FSAR Section 8.2. The staff's evaluation is as follows:

Turkey Point, Units 6 and 7, receive offsite ac power from a common 500/230-kV switchyard (Clear Sky substation), which is connected to the FPL transmission network through four transmission lines. The applicant described the connection of the RATs to the 230-kV bus in the switchyard. The normal power supply to the main ac power system is provided from the main generator through the UATs. Any of the four transmission lines can serve as the preferred power supply and is the recognized GDC 17 offsite power source for Turkey Point, Units 6 and 7. When either the normal power or the preferred power supply is available, the RATs serve as a source of maintenance power.

In Turkey Point Units 6 and 7 COL FSAR Section 8.2.1.3, regarding the switchyard control building, the applicant stated that the controls for switchyard breakers associated with the Turkey Point Units 6 and 7 main step-up transformers are located inside the plant and are under the administrative control of the plant. The system control center of FPL transmission and substation operations has operational control over the other breakers in the switchyard (including those associated with the reserve auxiliary transformers). Normal ac power for the switchyard is supplied from station service transformers supplied by the tertiary windings of the 500/230-kV autotransformers. A backup source of ac power to the switchyard is supplied from a plant source.

Regarding switchyard and transmission line testing and inspection, in Turkey Point Units 6 and 7 COL FSAR Section 8.2.1.4, the applicant stated that FPL uses a process called, "The

Phoenix Assurance Process,” to ensure the installations of new, relocated, or modified facilities are fully operational before being placed into service. FPL explained as follows: The objectives of the Phoenix Assurance Process are as follows: safety (zero injuries); correct operation of facilities after they are put into service; no rework associated with the installation of facilities; and documentation of new assets and lessons learned. The Phoenix Assurance Process covers acceptance, commissioning, and in-service testing for new equipment and defines the responsibility of each person associated with the project. The transmission switchyard interface agreement will specify that grid maintenance and testing activities that could affect offsite power reliability be closely coordinated with Turkey Point Units 6 and 7. This agreement will also specify that the plant switchyard equipment is maintained by FPL transmission and substation operations. FPL transmission and substation operations will conduct regular inspections of the plant switchyard and perform regular maintenance and necessary repair or replacement of equipment.

The staff reviewed the resolution to the COL information Item PTN COL 8.2-1 related to the description of the offsite power system. The staff determined that additional information was needed to complete the technical evaluation of this item.

Turkey Point Units 6 and 7 COL FSAR Section 8.2.1.1 describes the ratings for the 500-kV and 230-kV circuit breakers associated with the Turkey Point, Units 6 and 7 and states that the 500-kV switchyard is rated for a continuous current of 4000 amperes (A) and fault duty rating of 50 kilo amperes (kA) and 230-kV switchyard is rated for a continuous current of 4000 A and fault duty rating of 63 kA. Since no basis is provided for the specified ratings, in RAI 5993, Question 08.02-2, the staff requested that the applicant explain why the ratings for circuit breakers and disconnect switches in the switchyard are adequate for the application. Specifically, the staff requested that the applicant identify the maximum fault available from the system and confirm that the breaker interrupting ratings, both symmetrical and asymmetrical, are consistent with the available fault. In an October 31, 2011, response to RAI 5993, Question 08.02-2, the applicant stated that it had used steady state power flow simulations to determine the required current capability (amperes RMS) of the 500-kV and 230-kV circuit breakers and disconnect switches. The equipment ratings were determined for all line-in and line-out conditions. The applicant determined that the load current in the 500-kV and 230-kV circuit breakers and disconnect switches is less than 4000 amps for all conditions, and were therefore adequate.

The applicant also stated that they had used short circuit simulations to determine the required maximum interrupting capability of the circuit breakers. The applicant further indicated that the analysis assumed that all generating sources relevant to the facility were in service and that under this assumption, the maximum symmetrical (RMS) fault currents are 21.2 kA and 58.1 kA for the 500-kV and 230-kV circuit breakers, respectively. The applicant concluded that the 500-kV circuit breakers with 50 kA rating and the 230-kV circuit breakers with 63 kA rating have the capability to interrupt the maximum asymmetrical fault. The applicant further stated that Turkey Point Units 6 and 7 COL FSAR Section 8.2.1.1 will be revised to indicate rating for buses and disconnect switches. The staff finds the applicant’s response acceptable because the design of the offsite system components meets the requirements of GDC 17. Therefore, the staff finds the issues in RAI 5993, Question 08.02-2 are resolved and has verified that this change was incorporated in Revision 6 of the Turkey Point Units 6 and 7 COL FSAR.

Turkey Point Units 6 and 7 COL FSAR, Revision 2, Section 8.2.1.1 stated that the switchyard includes surge protective devices, and grounding and a lightning protection system in accordance with standard industry practice. Turkey Point Units 6 and 7 COL FSAR

Table 8.1-201 states that RG 1.204 is applicable to offsite and onsite power systems. In RAI 5993, Question 08.02-3, the staff requested that the applicant clarify if the surge protective devices, and grounding and lightning protection system will follow the guidelines of RG 1.204 and revise Turkey Point Units 6 and 7 COL FSAR Section 8.2.1.1 accordingly. In an October 31, 2011, response to RAI 5993, Question 08.02-3, the applicant stated that Turkey Point will comply with the applicable portions of the standards referenced in RG 1.204, Revision 0. Because the design will include the surge protection features recommended in RG 1.204, Rev 0, the staff finds the applicant's response acceptable and, therefore, considers RAI 5993, Question 08.02-3 resolved. The staff verified that this change was incorporated in Revision 4 of the Turkey Point Units 6 and 7 COL FSAR.

With regard to switchyard and transmission lines testing and inspections, described in Turkey Point Units 6 and 7 COL FSAR, Revision 2, Section 8.2.1.4, in RAI 5993, Question 08.02-4 the staff requested that the applicant indicate the extent to which maintenance and modifications to the switchyard and substation will be reviewed, controlled, and approved through the Turkey Point process. In addition, Turkey Point Units 6 and 7 COL FSAR Section 8.2.1.4 did not provide details regarding testing and inspection of switchyard components. Therefore, in RAI 5993, Question 08.02-5, the staff requested that the applicant provide details in the Turkey Point Units 6 and 7 COL FSAR regarding testing and inspection of switchyard components and the frequency at which these components will be tested/inspected. The staff also requested that the applicant discuss whether North American Electric Reliability Corporation (NERC) standards will be used for switchyard maintenance and testing. In an October 31, 2011, response to RAI 5993, Question 08.02-5, the applicant stated that Turkey Point Units 6 and 7 COL FSAR Section 8.2.1.4 will be revised to include additional details regarding testing and inspection of switchyard components and to discuss compliance with NERC reliability standards applicable to testing and maintenance. In response to RAI 5993, Questions 08.02-2, 08.02-3, 08.02-4, and 08.02-5, the applicant augmented Turkey Point Units 6 and 7 COL FSAR Section 8.2.1.4 in Revision 4 to address these issues. Additionally, the applicant provided the site-specific voltage and frequency variations expected at the Turkey Point, Units 6 and 7, switchyard during transient and steady state operating conditions and the site-specific frequency decay rate to satisfy PTN COL 8.2-1. Since the applicant provided all of the information necessary for the staff to complete the review, the staff finds the applicant's response acceptable and therefore, considers RAI 5993, Questions 08.02-4 and 08.02-5 resolved. The staff also verified that these changes were incorporated in Turkey Point Units 6 and 7 COL FSAR, Revision 6.

- PTN COL 8.2-2

The applicant provided additional information in PTN COL 8.2-2 to resolve COL Information Item 8.2-2, which states:

The Combined License applicant will address the technical interfaces listed in Table 1.8-1 and Section 8.2.2. These technical interfaces include those for ac power requirements from offsite and the analysis of the offsite transmission system and the setting of protective devices.

The staff's evaluation of the technical interfaces is addressed under "Interface Requirements" section of this report.

The commitment was also captured as COL Action Items 8.2.3.1-1, 8.2.3.1-2, and 8.2.3.1-3 in NUREG-1793, Appendix F, which states:

The COL applicant will perform a site-specific grid stability analysis to show that, with no electrical system failures, the grid will remain stable and the reactor coolant pump bus voltage will remain above the voltage necessary to maintain the flow assumed in the Chapter 15 analyses for a minimum of 3 seconds following a turbine trip (COL Action Items 8.2.3.1-1 and 8.2.3.1-3).

The COL applicant will set the protective devices controlling the switchyard breakers in such a way as to preserve the grid connection following a turbine trip (COL Action Item 8.2.3.1-2).

The staff reviewed the resolution to COL information item, PTN COL 8.2-2, related to the transmission system stability analysis and switchyard circuit breaker protective device settings included under Turkey Point Units 6 and 7 COL FSAR Section 8.2. The staff's evaluation is as follows.

PTN COL 8.2-2 was provided by the applicant describing details of the following: the switchyard's arrangement and design of the protective relaying scheme; and a transmission system study performed regularly to verify grid stability; switchyard voltage; and frequency to confirm the transmission system capability to maintain RCP operation for three seconds following a turbine trip as specified in AP1000 DCD FSAR Section 8.2.2. PTN COL 8.2-2 is addressed in Turkey Point Units 6 and 7 COL FSAR Sections 8.2.1.2.1 and 8.2.2.

The applicant stated that the 500-kV and 230-kV switchyards are locally interconnected and each designed with two full-capacity main buses and composite double-breaker/ breaker-and-a-half arrangement for reliability and maintainability. This arrangement allows for isolation of components and buses, while preserving the plant's connection to the grid. In addressing the switchyard protection relay scheme, the applicant stated that the relay protection schemes consist of primary and secondary relaying systems that use separate instrument current transformers, trip circuits, and direct current (dc) power supplies to achieve redundancy in their protection functions. The applicant also stated as follows: Each of the four transmission lines is protected by two independent pilot systems that provide high-speed clearing for a fault anywhere on the line. The 500/230-kV autotransformers and switchyard buses have primary and secondary protective relaying systems that provide high-speed clearing for a fault within the switchyard. The 230-kV circuits to the main step-up and reserve auxiliary transformers have primary and secondary protective relaying systems located in the switchyard control building that communicate via fiber optics to the associated protective relaying system located in the plant. Breaker failure relays are also provided for all switchyard breakers to isolate a failed breaker from all switchyard sources.

The staff finds that the switchyard breaker arrangement, the protection of lines by independent high speed relay schemes, and the breaker failure scheme would combine to preserve Turkey Point's Units 6 and 7 connection to the grid following a turbine trip. The staff considers COL Action Item 8.2.3.1-2 satisfied.

The applicant stated that FPL had performed the required studies to provide an analysis of the stability of the grid with the Turkey Point Units 6 and 7 nuclear units interconnected and integrated into the FPL transmission system. The applicant described the analysis as follows: The analysis included an assessment of how the generators and system would perform following potential severe grid disturbances. Models used for the analysis were based on the latest available load forecasts, generation expansion plan and system plans for 10 years into the future, in accordance with the NERC and Florida Reliability Coordinating Council (FRCC) reliability standards. The performance of the grid stability analysis study consisted of dynamic

simulation and power flow analysis that assessed the response of the transmission system to various system disturbances, including loss of the largest source; loss of the most critical transmission circuit; loss of the largest load; turbine trip (minimum of 3 seconds); and breaker failure. The simulation results were analyzed for any sign of instability, protective relay action, load shedding, voltage, or line-loading violations. The simulation results showed that the Turkey Point Units 6 and 7 plant and transmission system responses to the contingency events were acceptable. Specifically, the applicant found that, (1) the results of the grid stability analysis study do not indicate a loss of electric power from any remaining supplies as a result of, or coincident with, the loss of power generated by the nuclear power units or the loss of power from the transmission network; (2) the results of turbine trip simulations demonstrate that the voltage and frequency of the 230-kV switchyard buses remain within the limits required to maintain reactor coolant pump operation for at least 3 seconds following a turbine trip in either Turkey Point Unit 6 or 7; and (3) the transmission study confirmed that the interface requirements for steady-state load, in-rush kVA for motors, nominal voltage, allowable voltage regulation, nominal frequency, allowable frequency fluctuation, maximum frequency decay rate, and the limiting under frequency value for the reactor coolant pump are met.

In RAI 5993, Question 08.02-7, dated October 31, 2011, the staff requested that the applicant provide in the Turkey Point Units 6 and 7 COL FSAR the assumptions made, results (maximum and minimum voltage, frequency variations, and frequency decay rate, etc.) and acceptance criteria for each case. In the response to RAI 5993, Question 08.02-7, the applicant added Table 8.2-201 to provide the additional requested information. From the table, the results of the grid analysis shows the limiting under frequency value for the RCPs to be 57.7 Hz and the calculated value specific to Turkey Point to be 59.73 Hz. The staff confirmed that Table 8.2-201 and the results presented were included in the Turkey Point Units 6 and 7 FSAR and concludes that the expected grid performance is within the parameters specified in the AP1000 DCD. Therefore, the staff considers this issue resolved.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 8.2.4:

Submerged/Inaccessible Electrical Cables

In RAI 8.2-14, the staff asked the applicant to describe the inspection, testing and monitoring program to detect degradation of inaccessible or underground control and power cables that support equipment and other systems that are within the scope of 10 CFR 50.65. The description should include the frequency of testing and inspection. Guidance on the selection of electric cable condition monitoring can be found in Sections 3 and 4.5 of NUREG/CR-7000, "Essential Elements of an Electric Cable Condition Monitoring Program."

In a letter dated May 6, 2010, the applicant stated that the Maintenance Rule (MR) program will not be implemented until prior to fuel load; as such, specific information necessary to determine appropriate inspections, tests and monitoring is not available at this time. In order to determine the method and frequency, a review of detailed design and procurement information is needed. The applicant also stated that the latest industry experience and other available information, including NUREG/CR-7000, will be followed in developing a cable condition monitoring program as part of the MR program. The applicant also committed to revise its FSAR to include condition monitoring of underground or inaccessible

cables in its MR program. The commitment will be reflected in the COL application Part 2, FSAR Chapter 17, Section 17.6 as shown below.

The Condition monitoring of underground or inaccessible cables is incorporated into the maintenance rule program. The cable condition monitoring program incorporates lessons learned from industry operating experience, addresses regulatory guidance, and utilizes information from detailed design and procurement documents to determine the appropriate inspections, tests and monitoring criteria for underground and inaccessible cables within the scope of the maintenance rule (i.e., 10 CFR 50.65). The program takes into consideration Generic Letter 2007-01.

Based on the above, the staff concludes that the applicant's condition monitoring program for underground or inaccessible cables satisfies the recommendations of GL 2007-01, and the guidance in NUREG/CR-7000 and NUREG-0800 Section 8.2.III.1.L. Therefore, this item is resolved subject to the verification that the VEGP COL FSAR has been updated to include applicable portions of the RAI response. This is identified as Confirmatory Item 8.2-3.

Resolution of Standard Content Confirmatory Item 8.2-3

Confirmatory Item 8.2-3 is an applicant commitment to revise its FSAR Section 17.6 to address condition monitoring of underground or inaccessible cables. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 8.2-3 is now closed.

Supplemental Information

- PTN SUP 8.2-1

PTN SUP 8.2-1 was provided by the applicant describing details of a FMEA performed for the offsite power distribution system, plant site switchyard, and the FPL transmission system. The staff reviewed the FMEA of the Turkey Point switchyard and confirmed that the applicant has identified no single initiating event, such as a breaker not operating during a fault condition, a fault on a switchyard bus, a spurious relay trip, a loss of control power supply that would cause failure of more than one single offsite transmission line, or a loss of offsite power to either Turkey Point unit via the GSU transformer. This list conforms to the pertinent guidance of RG 1.206. Therefore, the staff considers PTN SUP 8.2-1 acceptable.

- PTN SUP 8.2-2

With regard to PTN SUP 8.2-2 the applicant provided, in part, the following information:

FPL is the transmission system provider/operator and it constructs, owns, and operates all substation and transmission facilities between the plant and the points of interconnection to the grid. An interface agreement in accordance with the North American Electric Reliability Corporation (NERC) Standard NUC-001-01, between FPL Transmission & Substation-Power Supply Department and Units 6 & 7 will establish the protocol to provide effective monitoring and oversight of all grid, switchyard, and plant activities. These activities include maintenance, testing, planned outages, load reductions, and

emergent conditions that could affect offsite power reliability. Department directives will implement the agreement and will facilitate prompt and effective communications between the FPL power supply system operator and Units 6 & 7 shift manager or unit supervisor. Procedures will be established to ensure switchyard maintenance and design changes are reviewed before implementation.

FPL uses a real-time contingency analysis computer program that is used by FPL's transmission system operators in determining the security level of the transmission system by performing an analysis using a predefined set of contingency criteria (e.g., single contingency). The computer program simulates a list of active contingencies on the current power system and produces an output of system conditions for each defined contingency. The program provides an updated output approximately every 5 minutes using real-time system conditions (e.g., real-time line outages, real-time flows and voltages, real-time breaker status, etc.). For each defined contingency simulated, specified elements are checked for limit violations (e.g. line overloads, voltage limits, and reactive limits at generator buses). All contingencies that cause violations are output along with the identification of the violations and information on the magnitude of the violation. The current and previous outputs are displayed to determine degree of change as compared to the previous contingency analysis output result.

A priority is also designated for each contingency. Violations of nuclear plant limits are assigned the highest priority and if a violation is detected by the contingency analysis computer program, it is reported at the top of the output violation list. The computer program alerts the system operator of abnormal voltages, overloads, or unit limitations that can be created by a loss of one or several elements of the transmission system. The output of the contingency analysis computer program is used continuously by the operators to make critical decisions in response to potential severe conditions.

Minimum and maximum voltage criteria specific to the Units 6 & 7 switchyard buses will be documented in the interface agreement. The Units 6 & 7 agreement will also specify that the Units 6 & 7 shift manager or unit supervisor be notified within 15 minutes if a condition exists or is forecasted to exist (i.e., via contingency analysis computer program) that would result in minimum or maximum switchyard voltage requirements for Units 6 & 7 switchyard being exceeded. This agreement, as well as the overall switchyard agreement, will require restoration of power to Units 6 & 7 on a first-priority basis in the event of a loss of offsite power. The goal for maximum restoration time will be 30 minutes.

The staff reviewed the information provided by the applicant on the functions of FPL and the transmission system operator (TSO). The staff observed that the scope of the interface agreement does not include communication to the grid operator of risk-sensitive plant maintenance activities that could affect grid conditions. Therefore, in RAI 5993 Question 08.02-9, the staff requested that the applicant indicate whether they coordinate maintenance activities that can have an impact on the transmission system with the TSO and have contacts with the TSO to determine current and anticipated grid conditions as part of the grid reliability evaluation performed before conducting grid-risk-sensitive maintenance activities. Additionally, the staff requested that the applicant indicate whether risk-sensitive maintenance

activities are shared between the units and confirm that a quantitative or qualitative grid reliability evaluation will be performed at Turkey Point, Units 6 and 7 as part of the maintenance risk assessment as required by 10 CFR 50.65(a)(4) before performing grid-risk-sensitive maintenance.

In an October 31, 2011, response to RAI 5993, Question 08.02-9, the applicant stated that interface agreement and associated communication protocols will be in accordance with the requirements of NERC reliability standard NUC-001. The applicant further stated that the interface agreement will require a qualitative risk assessment of plant maintenance and testing activities and will require these activities to be coordinated with TSO to prevent inadvertent reduction in nuclear plant defense-in-depth. The applicant indicated that the Turkey Point Units 6 and 7 operators will inform the power supply system dispatcher of planned outages and planned load reductions. The Turkey Point shift manager (SM) or unit supervisor (US) for maintenance and testing activities on the affected unit will provide early warning to the power supply system dispatcher and the SM and/or US of the unaffected units of potential or developing plant conditions that could cause grid instabilities. The detailed interface coordination for plant interface requirements and work controls for Turkey Point Units 6 and 7 will be controlled by plant procedures. The NRC staff has determined that the information provided by the applicant describes how risk-sensitive plant maintenance activities that could affect grid operations will be communicated to the grid operator. The NRC staff also has determined that all other proposed communication protocols between the plant operations staff and the grid operator are acceptable.

Based on the information provided by the applicant on the functions of TSO, and as explained above, the staff finds that the applicant has demonstrated that protocols are in place for Turkey Point Units 6 and 7 to remain cognizant of grid vulnerabilities in order to make informed decisions regarding maintenance activities critical to the electric system. This is consistent with Generic Letter (GL) 2006-2 of which one of the provisions is to reduce the likelihood of losing offsite power. The staff finds that the information provided is also consistent with the guidelines of RG 1.206 and, therefore, considers PTN SUP 8.2-2 acceptable.

- PTN SUP 8.2-3

With regard to PTN SUP 8.2-3, the applicant provided, in part, the following information:

For the period from January 1, 1988, through September 30, 2008, the average grid availability for the eight 230 kV lines from the existing Turkey Point substation and two 500 kV lines from Levee substation in the FPL system is approximately 99.8 percent with only 48 forced outages lasting more than one hour. The average frequency of forced line outages is approximately 1.4 line outages per year for these transmission lines. The majority of the outages where the cause was recorded were due to environmental conditions and equipment malfunction. Other causes for outages were foreign intervention, human error, and relay misoperation.

The guidance of RG 1.206 recommends the inclusion of historical availability performance of the grid at the plant site. Although the acceptability of grid availability is based upon the site with the new units present, history provides insight into the approval process. The staff reviewed the grid availability historical data information provided by the applicant and determined that the information provided by the applicant demonstrated that prior grid availability has not presented an issue of concern. Therefore, the staff considers PTN SUP 8.2-3 acceptable.

- PTN CDI

The CDI information provided by the applicant regarding the transformer area (containing the main step-up transformer, the unit auxiliary transformers, and reserve auxiliary transformers) being located next to each unit's turbine building is consistent with the AP1000 DCD FSAR Section 8.2.1.2 and satisfies the applicable requirements of GDC 17 and is acceptable.

In light of recent operating experience that involved the loss of one of the three phases of the offsite power circuit (i.e., loss of a single-phase) at Byron Station, Unit 2, the NRC issued Bulletin 2012-01, "Design Vulnerability in Electric Power System," on July 27, 2012, to all holders of operating and combined licenses requesting information about the facilities' electric power system designs. The above operating event resulted in neither the onsite nor the offsite electric power system being able to perform its intended safety functions (i.e., to provide electric power to the important to safety buses with sufficient capacity and capability to permit functioning of structures, systems, and components important to safety). NRC Bulletin 2012-01 was issued to operating and new reactor licensees to affirm compliance with GDC 17 requirements and to evaluate whether further NRC action is warranted to address this design vulnerability. Subsequently, in RAI 6750, Question 08-1, the staff requested that the Turkey Point Units 6 and 7 applicant address the matters described in NRC Bulletin 2012-01 and to ensure that the Turkey Point Units 6 and 7 design meets GDC 17.

In a December 4, 2012, letter, the applicant provided its response to RAI 6750, Question 08-1, "Single-Phase Open Circuit Condition," for Turkey Point Units 6 and 7. The proposed design utilized existing undervoltage relays on the ES-1 and ES-2 buses as well as existing undervoltage relays on the loads, on or downstream of the ES-1 and ES-2 buses. Based on review of this response, the staff was unable to determine whether the existing protection schemes would detect open circuit conditions on the high voltage side of a transformer connecting a GDC 17 offsite power circuit to the transmission system for all operating electrical system configurations and loading conditions.

On November 1, 2013, the NRC conducted a public meeting with representatives from the Nuclear Energy Institute (NEI) and other industry representatives to discuss the industry initiative associated with resolving NRC Bulletin 2012-01. During the meeting, industry representatives provided feedback regarding their review of an offsite power two-phase open circuit event that occurred at Forsmark Nuclear Power Plant in Sweden (see NRC Information Notice 2006-18, Supplement 1: "Significant Loss of Safety-Related Electrical Power at Forsmark Unit 1 in Sweden"). The industry representatives informed the staff that their detailed analyses of this condition indicated that the proposed single-open phase detection system may not be sensitive enough to detect a two-phase open circuit condition. Therefore, the industry has taken the position that a two-phase open circuit condition must be considered when developing a resolution for the NRC Bulletin open phase issue.

GDC 17 requires, in part, "An onsite electric power system and an offsite electric power system shall be provided to permit functioning of structures, systems, and components important to safety. The safety function for each system (assuming the other system is not functioning) shall be to provide sufficient capacity and capability to assure: (1) specified acceptable fuel design limits and design conditions of the reactor coolant pressure boundary are not exceeded as a result of anticipated operational occurrences; and (2) the core is cooled and containment integrity and other vital functions are maintained in the event of postulated accidents." For AP1000 reactors, the main ac power system is non-Class 1E and not safety-related. During a loss of offsite power, ac power is supplied by the onsite standby diesel generators, which are

also not safety-related. However, the ac power system is designed such that plant auxiliaries can be powered from the grid under all modes of operation. Furthermore, the ac power systems do supply power to equipment that is important to safety since that equipment serves defense-in-depth functions. The offsite power supply system provides power to the safety-related loads through the battery chargers, and both the offsite power system and the standby diesel generators provide defense-in-depth functions to supplement the capability of the safety-related passive systems for reactor coolant makeup and decay heat removal. In this regard, offsite power is the preferred power source, and supports the first line of defense. In addition, the safety analyses take credit for the grid remaining stable to maintain reactor coolant pump operation for three seconds following a turbine trip in accordance with the guidance of RG 1.206. Accordingly, these electric power systems are important to safety, and subject to the requirements of GDC 17. Consequently, it was the staff's position that AP1000 COL applicants address the design vulnerability identified in NRC Bulletin 2012-01.

Furthermore, it is the staff's position that an acceptable approach for passive designs includes the following four elements: (1) a dedicated automatic detection for an offsite power system single-phase open circuit condition with, and without, a high impedance ground fault condition on the high voltage side of the main power transformer including two open phase conditions under all loading and operating configurations; (2) an alarm in the main control room for operators to take manual actions if necessary; (3) an inspection, test, analysis, and acceptance criteria (ITAAC) to confirm that the analyses for developing the proper set points were completed in accordance with the acceptance criteria and to perform testing to demonstrate that the design functions as described in the Turkey Point Units 6 and 7 COL FSAR; and (4) procedures and training for the operating and maintenance staff. Since the system is continuously monitoring for open phase conditions using digital relays, the Staff concluded that the monitoring system automatically detects an open phase for either of the one or two open phase conditions (i.e. continuous monitoring meets the staff position of automatic detection). With regard staff position (4), Section 13.5 of this report states that the staff has reasonable assurance that the administrative procedures will be established to provide licensed operators and non-licensed plant staff with sufficient knowledge and operating experience to start up, operate, and maintain the plant in a safe manner. This approach ensures the required offsite ac power source with adequate capacity and capability is available to important safety equipment including safety-related battery chargers to meet their intended safety function in accordance with GDC 17 requirements.

The applicant provided a supplemental response to RAI 6750, Question 08-1, in a letter dated March 30, 2015. The response is technically identical to the Levy and Lee responses provided by Duke Energy. The staff reviewed this supplemental response. The supplement acceptably addresses the staff position, as described above, for measures necessary to protect a plant against an open phase condition as described in NRC Bulletin 2012-01. The applicant has provided (1) detection of an offsite power system open phase circuit condition, both with and without a high impedance ground fault condition, on the high voltage side of the MSU transformer under all loading and operating configurations, and (2) an alarm of an open phase condition in the MCR. The staff finds this acceptable since it meets the staff's position on passive reactor designs for open phase circuit conditions, as described above. The staff finds that the information provided in the above supplement is consistent with the information requested within RG 1.206 and the regulatory requirements and complies with the requirements of GDC 17. Therefore, the staff finds this acceptable and considers the issue resolved.

In the supplemental response to RAI 6750, Question 08-1, the applicant provided text that will be added to the next revision of the Turkey Point Units 6 and 7 COL FSAR, including but not

limited to, ITAAC to confirm that the analyses for developing the proper set points were completed in accordance with the acceptance criteria and to perform testing to demonstrate that the design functions as described in the Turkey Point Units 6 and 7 COL FSAR. These proposed additions to the Turkey Point Units 6 and 7 COL FSAR and the ITAAC acceptably address the staff's position as that which is necessary to protect a plant with regard to an open phase condition as described in NRC Bulletin 2012-01, and that the Turkey Point Units 6 and 7 design meets GDC 17. Therefore, the staff considers this issue resolved and RAI 6750, Question 08-1, closed pending the staff's confirmation that the revisions to the Turkey Point Units 6 and 7 COL FSAR identified in the application summary of this SE and provided in the Applicant's letter dated March 30, 2015 are incorporated in the next revision of the Turkey Point Units 6 and 7 application. The inclusion of the information provided in the RAI response in a future revision of the Turkey Point Units 6 and 7 COL FSAR was identified as **Confirmatory Item 8.2-1**.

Resolution of Turkey Point Confirmatory Item 8.2-1

Confirmatory Item 8.2-1 is an applicant commitment to revise its FSAR and ITAAC to include details necessary to protect a plant with regard to an open phase condition, described in NRC Bulletin 2012-01. The staff verified that the Turkey Point COL, Revision 8 was appropriately revised. As a result, Confirmatory Item 8.2-1 is now closed.

Interface Requirements

The plant interfaces for the standard design of the AP1000 are discussed in DCD Tier 2, Section 8.2.5, and in Items 8.1, 8.2, and 8.3 of AP1000 DCD Tier 2, Table 1.8-1, where they are identified as non-Nuclear Safety (NNS) interfaces.

The applicant incorporated by reference AP1000 DCD FSAR Section 1.8. This section of the AP1000 DCD FSAR identifies certain interfaces with the standard design that have to be addressed in accordance with 10 CFR 52.47(a)(1)(vii).² As required by 10 CFR 52.79(d)(2), the COL application must demonstrate how these interface items have been met.

To satisfy plant Interface Item 8.1 in AP1000 DCD FSAR Tier 2, Table 1.8-1, the applicant provided the design criteria, regulatory guides, and IEEE standards in Turkey Point Units 6 and 7 COL FSAR Section 8.1.4.3. The staff finds the information to be consistent with NUREG-0800, Section 8.1 and is acceptable. Therefore, this interface item for the offsite power system has been met.

With regard to plant Interface Item 8.2 in AP1000 DCD FSAR Tier 2 Table 1.8-1, the staff observed that in Turkey Point Units 6 and 7 COL FSAR Section 8.2.2, the applicant stated, "[the] transmission study has confirmed that the interface requirements for steady state load, inrush kVA for motors, nominal voltage, allowable voltage regulation, nominal frequency, allowable frequency fluctuation, maximum frequency decay rate, and the limiting under frequency value for the RCP have been met." In RAI 5993, Question 08.02-10, the staff requested that the applicant provide in the Turkey Point Units 6 and 7 COL FSAR a summary of the grid stability analysis results, the assumptions made, and the acceptance criteria for each case analyzed. Additionally, the staff requested that the applicant provide the nominal frequency, allowable frequency fluctuation, maximum frequency decay rate, and the limiting

² Following the update to 10 CFR Part 52 (72 *Federal Register* [FR] 49517), this provision has changed to 10 CFR 52.47(a)(25).

under-frequency values used for the reactor coolant pump (RCP) in the analysis. In an October 31, 2011, response to RAI 5993, Question 08.02-10, the applicant provided a table comparing the required parameter values (acceptance criteria) and the associated analysis results. Additionally, the applicant stated that the Turkey Point Units 6 and 7 COL FSAR would be revised to include such table. The staff verified that this information has been incorporated into Turkey Point Units 6 and 7 COL FSAR, Revision 4 (Table 8.2-201). The staff finds that the analysis results meet the AP1000 design requirements, the requirements of GDC 17 and the guidelines of RG 1.206. Therefore, the staff considers this issue resolved and Interface Item 8.2 in AP1000 DCD FSAR Tier 2, Table 1.8-1 is satisfied.

Regarding plant Interface Item 8.3 in AP1000 DCD FSAR Tier 2, Table 1.8-1, the applicant did not provide a statement affirming, "that the protective devices controlling the switchyard breakers are set with consideration given to preserving the plant grid connection following a turbine trip." Therefore, in RAI 5993, Question 08.02-11, the staff requested that the applicant provide a reference to where this issue is discussed in the Turkey Point Units 6 and 7 COL application, or to provide a proposed revision to the application to address the issue. In an October 31, 2011 response to RAI 5993, Question 08.02-11, the applicant stated that Turkey Point Units 6 and 7 COL FSAR Section 8.2.1.2.1 will be revised to include an affirmation that "the protective devices controlling the switchyard breakers are set with consideration given to preserving the plant grid connection following a turbine trip." The staff verified that the Turkey Point Units 6 and 7 COL FSAR was updated in Revision 6 to include this change and concludes that the switchyard arrangement, the protection of lines by independent high speed relaying, and breaker failure scheme would preserve the Turkey Point Units 6 and 7 connection to the grid following a turbine trip satisfying the requirements of GDC 17. Accordingly, the staff finds this interface has been met and the issue in RAI 5993, Question 08.02-11 resolved. On this basis, AP1000 DCD Interface Item 8.3 is resolved.

The staff reviewed the information supplied by the applicant and, as discussed directly above, concludes that the applicant has adequately addressed Interface Items 8.1, 8.2, and 8.3 of AP1000 DCD FSAR Tier 2, Table 1.8-1.

Inspections, Tests, Analyses and Acceptance Criteria

As part of the applicant's resolution of electrical power issues, discussed in the subsection NRC Bulletin 2012-01, "Design Vulnerability in Electric Power System," above, the applicant made changes to the Turkey Point Units 6 and 7 COL application, Part 10, Appendix B, "Inspections, Tests, Analysis and Acceptance Criteria."

The applicant proposed the following site-specific ITAAC for the offsite power system to be added in the Turkey Point Units 6 and 7 COL application, Part 10, Appendix B, as new line item 7, in Table 2.6.12-1. The inclusion of item 7 in Table 2.6.12-1 in a future revision of the Turkey Point Units 6 and 7 COL was identified as **Confirmatory Item 8.2-2**

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
<p>7. The credited GDC 17 off-site power source is monitored by an open phase condition monitoring system that can detect the following at the high voltage terminals of the transformer connecting to the off-site source, over the full range of transformer loading from no load to full load:</p> <p>(1) loss of one of the three phases of the offsite power source</p> <p>a. with a high impedance ground fault condition, or</p> <p>b. without a high impedance ground fault condition; or</p> <p>(2) loss of two of the three phases of the offsite power source</p> <p>a. with a high impedance ground fault condition, or</p> <p>b. without a high impedance ground fault condition.</p> <p>Upon detection of any condition described above, the system will actuate an alarm in the main control room.</p>	<p>i) Analysis shall be used to determine the required alarm set points for the open phase condition monitoring system to indicate the presence of open phase conditions described in the design commitment.</p> <p>ii) Testing of the credited GDC-17 off-site power source open phase condition monitoring system will be performed using simulated signals to verify that the as-built open phase condition monitoring system detects open phase conditions described in the design commitment and at the established set points actuates an alarm in the main control room.</p>	<p>i) Alarm set points for the open phase condition monitoring system to indicate the presence of open phase conditions as described in the design commitment have been determined by analysis.</p> <p>ii) Testing demonstrates the credited GDC 17 off-site power source open phase condition monitoring system detects open phase conditions described in the design commitment and at the established set points actuates an alarm in the main control room.</p>

The evaluation of the applicant-proposed site-specific ITAAC Item 7 is presented in the subsection, NRC Bulletin 2012-01, "Design Vulnerability in Electric Power System," above.

Resolution of Turkey Point Confirmatory Item 8.2-2

Confirmatory Item 8.2-2 is an applicant commitment to revise its Turkey Point Units 6 and 7 ITAAC regarding the offsite power system. The staff verified that the Turkey Point COL, Revision 8 was appropriately revised. As a result, Confirmatory Item 8.2-2 is now closed.

8.2.5 Post Combined License Activities

There are no post COL activities related to this section.

8.2.6 Conclusion

The staff reviewed the Turkey Point Units 6 and 7 COL application and checked the referenced DCD. The staff's review confirmed that the applicant adequately addressed the required information relating to the offsite power system, and there is no outstanding information expected to be addressed in the Turkey Point Units 6 and 7 COL FSAR related to this section. The results of the staff's technical evaluation of the AP1000 DCD information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented within the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of GDC 17 and GDC 18. The staff based its conclusion on the following:

- PTN COL 8.2-1 is acceptable because the applicant provided sufficient information involving the design details of the plant site switchyard, its interface with the local transmission grid, and its testing and inspection plan in accordance with the guidelines of RG 1.206.
- PTN COL 8.2-2 is acceptable because the applicant provided sufficient information to demonstrate that the grid will remain stable to maintain RCP operation for 3 seconds following a turbine trip in accordance with the guidelines of RG 1.206. In addition, the staff finds that the switchyard breaker arrangement, the protection of lines by independent high speed relay schemes, and the breaker failure scheme would preserve the Turkey Point Units 6 and 7 connection to the grid following a turbine trip.
- PTN CDI in Turkey Point Units 6 and 7 COL FSAR, Section 8.2.1 is acceptable because the applicant provided sufficient information involving the transformer area being located next to each unit's turbine building in accordance with the guidelines of RG 1.206
- PTN SUP 8.2-1 is acceptable because the applicant provided sufficient information describing details of a failure analysis performed for the offsite power distribution system, and plant site switchyard in accordance with the guidelines of RG 1.206.
- PTN SUP 8.2-2 is acceptable because the applicant provided sufficient information to describe FPL's responsibility for maintaining area bulk transmission system reliability. The applicant also provided sufficient information to demonstrate that protocols are in place for LNS to remain cognizant of grid vulnerabilities in order to make informed decisions regarding maintenance activities critical to the electric power system in accordance with the guidelines of RG 1.206 and GL 2006-2.

- PTN SUP 8.2-3 is acceptable because the applicant provided sufficient information regarding causes of outages of the transmission line over the past five years in accordance with the guidelines of RG 1.206.
- The applicant provided sufficient information regarding the interfaces for standard design from the AP1000 DCD FSAR Table 1.8-1, Items 8.1, 8.2, and 8.3.

8.2.A Site-Specific ITAAC for Offsite Power Systems

8.2.A.1 Introduction

This section specifically addresses the site-specific inspections, tests, analyses, and acceptance criteria (SS-ITAC), that the applicant proposed related to the offsite power system that is necessary and sufficient to provide reasonable assurance that the facility has been constructed and will operate in conformance with the COL, the provisions of the Atomic Energy Act of 1954, as amended, and NRC regulations.

8.2.A.2 Summary of Application

Turkey Point Units 6 and 7 COL FSAR, Revision 8, Section 14.3 incorporates by reference AP1000 DCD FSAR, Revision 19, Section 14.3 with departures and/or supplements.

To address the departures and/or supplements in Turkey Point Units 6 and 7 COL FSAR Section 14.3, the applicant provided the following additional information:

Supplemental Information

- STD. SUP 14.3-1

The applicant provided supplemental information related to the offsite power system in STD. SUP 14.3-1 in Turkey Point COL FSAR Section 14.3.2.3.

8.2.A.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for ITAAC are given in NUREG-0800, Section 14.3.

The applicable regulatory requirements for electrical SS-ITAC are in 10 CFR 52.80(a), "Contents of applications; additional technical information."

8.2.A.4 Technical Evaluation

The staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 14.3 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to SS-ITAC for offsite power systems. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 8.2.A.4:

Supplemental Information

- STD. SUP 14.3-1, addressing SS-ITAACs [COL Standard Content Evaluation]

ITAAC Screening Summary Table 14.3-201 of the BLN FSAR identified the transmission switchyard and offsite power system as a site-specific system and selected them for ITAAC, but the table indicated "title only, no entry for COLA." Consequently, Section 2.6.12 of Part 10 of Appendix B, "License Conditions and ITTAC" of the BLN COL application (COLA) provided no ITAAC information for the transmission switchyard and offsite power system. The COL applicant must provide this site-specific ITAAC for compliance with 10 CFR 52.79(d) and 10 CFR 52.80(a). In RAI 14.3-1, the NRC staff stated that RG 1.206, CIII.7.2, Site-Specific ITAAC, recommends that applicants develop ITAAC for the site-specific systems that are designed to meet the significant interface requirements of the standard certified design, that is, the site-specific systems that are needed for operation of the plant (e.g., offsite power). Therefore, the applicant should justify why there is no ITAAC entry associated with offsite power, or revise Table 14.3-201 of the BNL FSAR to include ITAAC entries for the transmission switchyard and the offsite power system.

By letter dated June 24, 2008, the applicant stated that approved DCD Section 14.3 refers to the selection criteria and processes used for developing the AP1000 Certified Design Material (CDM) and identifies no interfaces (e.g., systems for storm drain, raw water, and closed circuit TV system, etc.)

meeting this definition. Thus, according to the applicant, the CDM does not include ITAAC or a requirement for COL developed ITAAC for the offsite power interface system. The staff found the above response to be inconsistent with the requirements of 10 CFR 52.80(a), and guidance of NUREG-0800 Section 14.3 and RG 1.206.

Several discussions were held between the applicant and the NRC staff to discuss this issue. The staff pointed out that the offsite power system performs an important function in the passive designs as it provides power to the safety-related loads through battery chargers during normal, abnormal and accident conditions. It also provides power to those active systems that provide defense-in-depth capabilities for reactor coolant make-up and decay heat removal. These active systems are the first line of defense to reduce challenges to the passive systems in the event of plant transients. The above function of the offsite power system in passive designs supports the need for ITAAC for these systems so that the staff can verify that (1) the designed and installed systems, structures, or components of the offsite power systems will perform as designed and (2) the required single circuit from the transmission network satisfies the requirements of GDC 17.

Subsequently, in a letter dated May 11, 2009, the applicant revised its response to RAI 14.3-1 and provided an ITAAC for the offsite power system to verify that the as-built offsite portion of the power supply from the transmission network to the interface with the onsite ac power system will satisfy the applicable provisions of GDC 17. Specifically, the ITAAC shall verify:

- (1) A minimum of one offsite circuit supplies electric power from the transmission network to the interface with the onsite portions of the ac power system.*
- (2) Each offsite circuit interfacing with the onsite ac power system is adequately rated to supply assumed loads during normal, abnormal and accident conditions.*
- (3) During steady state operation, each offsite circuit is capable of supplying required voltage to the interface with the onsite ac power system that will support operation of assumed loads during normal, abnormal and accident conditions.*
- (4) During steady state operation, each offsite circuit is capable of supplying required frequency to the interface with the onsite ac power system that will support operation of assumed loads during normal, abnormal and accident conditions.*
- (5) The fault current contribution of each offsite portion circuit is compatible with the interrupting capability of the onsite ac power system fault current interrupting devices.*
- (6) The reactor coolant pumps continue to receive power from either the main generator or the grid for a minimum of 3 seconds following a turbine trip.*

To ensure that the requirements of GDC 17 for the adequacy of the offsite power source within the standard design scope are met, the proposed ITAAC would verify the capacity and capability of the offsite source to feed the onsite power system. The proposed ITAAC provides for the inspection of the connection of the offsite source to the onsite power system.

Additionally, the applicant identified all associated changes that will be made in a future revision of the Bellefonte FSAR. On the basis of its review, the staff finds that the applicant has adequately addressed the site-specific ITAAC for the offsite power system so that the staff can verify that the designed and installed systems, structures, or components of the offsite power system will perform as designed. Therefore, the staff concludes that the applicant meets the requirements of 10 CFR 52.79(d) and 10 CFR 52.80(a), and the guidance of SRP 14.3 and RG 1.206. The applicant will revise the BLN COL FSAR to include the proposed ITAAC for offsite power system. This is identified as Confirmatory Item 8.2A-1, pending NRC review and approval of the revised BLN COL FSAR.

Resolution of Standard Content Confirmatory Item 8.2A-1

The applicant proposed a license condition in Part 10 of the VEGP COL application, which will incorporate the ITAAC identified in Appendix B. Appendix B includes ITAAC for the offsite power system. The license condition's proposed text is evaluated in Chapter 1 of this SER.

Confirmatory Item 8.2A-1 required the applicant to update its FSAR to include proposed ITAAC for the offsite power system. The NRC staff verified that the VEGP COL application was appropriately updated. The ITAAC associated with the offsite power system are shown in VEGP COL Part 10, Appendix B, Table 2.6.12-1. Table 8.2A-1 of this SER reflects this table. As a result, Confirmatory Item 8.2A-1 is resolved. Therefore, the staff will include the ITAAC for the offsite power system in the license.

8.2.A.5 *Post Combined License Activities*

For the reasons discussed in the technical evaluation section above, the staff finds the following ITAAC proposed by the applicant acceptable:

- The licensee shall perform and satisfy the ITAAC defined in Turkey Point Units 6 and 7 COL FSAR Part 10, Appendix B, Table 2.6.12-1, "Offsite Power System."

8.2.A.6 *Conclusion*

The staff concludes that the relevant information presented within the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of GDC 17 and GDC 18.

8.3 Onsite Power Systems

8.3.1 Alternating Current Power Systems

8.3.1.1 *Introduction*

The onsite ac power system includes those standby power sources, distribution systems, and auxiliary supporting systems provided to supply power to safety-related equipment or equipment important to safety for all normal operating and accident conditions. In the AP1000 passive reactor design used at Turkey Point Units 6 and 7, the onsite ac power system is a non-Class 1E system that provides reliable ac power to the various system electrical loads. The onsite ac power system does not perform any safety-related functions. These loads enhance an orderly shutdown under emergency conditions when offsite power is not available. Additional loads for investment protection can be manually loaded on the standby power supplies. Diesel generator sets are used as the standby power source for the onsite ac power systems.

8.3.1.2 *Summary of Application*

Turkey Point Units 6 and 7 COL FSAR, Revision 8, Section 8.3 incorporates by reference AP1000 DCD FSAR, Revision 19, Section 8.3 with departures and supplements. AP1000 DCD FSAR Section 8.3 includes Section 8.3.1. In addition, in Turkey Point Units 6 and 7 COL FSAR Section 8.3.1, the applicant provided the following:

AP1000 COL Information Items

- PTN COL 8.3-1

PTN COL 8.3-1 describes the grounding grid system design within the plant boundary and a lightning protection risk assessment for the buildings comprising Turkey Point Units 6 and 7.

- STD. COL 8.3-2

STD. COL 8.3-2 describes the details of: (1) the bases of the recommendations in operation, inspection, and maintenance procedures for the onsite standby diesel generators; and (2) the procedures for the periodic testing of penetration overcurrent protective devices.

Supplemental Information

- PTN SUP 8.3-1

PTN SUP 8.3-1 provides supplemental information describing the site-specific switchyard and power transformer voltage.

- PTN SUP 8.3-2

PTN SUP 8.3-2 describes the site conditions provided in Turkey Point Units 6 and 7 COL FSAR Sections 2.1 and 2.3 that are bounded by the standard site conditions used to rate the diesel engine and the associated generator in AP1000 DCD Section 8.3.1.1.2.3.

- STD. SUP 8.3-4

STD. SUP 8.3-4 provides supplemental information regarding periodic verification of the onsite ac power system's capability to transfer between the preferred power supply and the maintenance power supply.

8.3.1.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG -1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for the ac power systems are given in NUREG-0800, Section 8.3.1.

The regulatory bases for acceptance of PTN COL 8.3-1, addressing the grounding and lightning protection systems, are the guidelines of the following documents:

- RG 1.204, "Guidelines for Lightning Protection of Nuclear Power Plants"
- IEEE Standard (Std.) 80, "Guide for Safety in AC Substation Grounding"
- IEEE Std. 665, "Guide for Generating Station Grounding"
- IEEE C.62.23, "Application Guide for Surge Protection of Electric Generating Plants"
- National Fire Protection Association (NFPA) 780, "Standard for the Installation of Lightning Protection Systems"

The bases for acceptance of the part of STD. COL 8.3-2, addressing the recommendations in operation, inspection, and maintenance procedures for the onsite standby diesel generators, are the guidelines of the manufacturer and the appropriate industry diesel generator working group recommendations.

The regulatory bases for acceptance of the part of STD. COL 8.3-2, addressing procedures for penetration protective device testing, are the guidelines of the following regulatory guide:

- RG 1.63, "Electric Penetration Assemblies in Containment Structures for Nuclear Power Plants"

8.3.1.4 *Technical Evaluation*

The staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 8.3.1 and checked the reference DCD to ensure that the combination of the DCD and the information in the COL represent the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information contained in the application and incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP

Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAs.

- The staff confirmed that all responses to RAs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The staff reviewed the information contained in the Turkey Point Units 6 and 7 COL FSAR:

AP1000 COL Information Items

- PTN COL 8.3-1

The staff reviewed PTN COL 8.3-1 related to COL Information Item 8.3-1. COL Information Item 8.3-1 states:

Combined License applicants referencing the AP1000 certified design will address the design of grounding and lightning protection.

The commitment was also captured as COL Action Item 8.3.1.6-1 in the staff's FSER for the AP1000 DCD FSER (NUREG-1793), Appendix F, which states:

The COL applicant will provide the design of the site-specific grounding and lightning protection.

The staff reviewed the resolution to COL information item, PTN COL 8.3-1, related to the ground grid system and lightning protection included in Turkey Point Units 6 and 7 COL FSAR Section 8.3. The staff's evaluation is described below.

The applicant stated that a grounding grid system design within the plant boundary includes a determination of step and touch potentials and ensuring that they are within the acceptable limit for personnel safety. Actual resistivity measurements from soil samples taken at the plant site were analyzed to create a soil model. The ground grid conductor size was then determined using the methodology outlined in IEEE Std. 80, "IEEE Guide for Safety in AC Substation Grounding," and a grid configuration for the site was created. The grid configuration was modeled in conjunction with the soil model.

The staff review of the grounding grid system design description observed that Turkey Point Units 6 and 7 COL FSAR Table 8.1-201 includes RG 1.204 which endorses IEEE Std. 665 for

generation station grounding. The staff also observed that the same subsection of the DCD indicates compliance with IEEE Std. 665. Therefore, in RAI 5995, Question 08.03-01-1 the staff requested that the applicant discuss the extent to which the Turkey Point Units 6 and 7 ground grid design complies with IEEE Std. 665 and confirm that their use of IEEE Std. 80 did not invalidate the Turkey Point conformance to the guidelines of RG 1.204. In an October 31, 2011, response to RAI 5995, Question 08.03-01-1, the applicant stated that IEEE Std. 80 methodology was used to determine the ground grid conductor size and that this methodology did not invalidate their conformance to the guidance of RG 1.204. The applicant also clarified that Turkey Point Units 6 and 7 COL FSAR, Appendix 1AA includes RG 1.204, Revision 0, with no exceptions taken. The staff finds the applicant's response acceptable because it is consistent with the guidelines of RG 1.206. Therefore, the staff considers the issues in RAI 5995, Question 08.03-01-1 resolved.

With regard to lightning protection, the applicant stated that, a lightning risk assessment was performed for the structures comprising Turkey Point, Units 6 and 7 based on the methodology of NFPA 780-2008 in accordance with IEEE Std. 665-1995 and lightning protection is provided for the structures in accordance with NFPA 780. Specifically, the applicant stated that the zone of protection is based on elevations and geometry of the structures. The zone of protection also includes the space covered by a rolling sphere having a radius sufficient enough to cover the building to be protected. The zone of protection method is based on the use of ground masts, air terminals, and shield wires. Lightning protection grounding is interconnected with the station/switchyard grounding system. The staff review of the applicant's description of the Turkey Point Units 6 and 7 lightning protection system design found that in Turkey Point Units 6 and 7 COL FSAR Table 8.1-201, where it is stated that RG 1.204 is implemented via IEEE Std. 665. Since the regulatory guide also endorses IEEE Std. 666-1991, "IEEE Design Guide for Electric Power Service Systems for Generating Systems"; IEEE Std. 1050-1996, "IEEE Guide for Instrumentation and Control Grounding in Generating Stations"; and IEEE C62.23-1995, "IEEE Application guide for Surge Protection of Electric Generating Plants"; in Question 08.03-02 the staff requested that the applicant discuss the applicability of these other standards. In an October 31, 2011 response, the applicant clarified that Turkey Point Units 6 and 7 COL FSAR Appendix 1AA includes RG 1.204, Revision 0, with no exceptions taken. Therefore, the applicant stated that they would also conform to the other standards in accordance with RG 1.204. Additionally, the applicant stated that Turkey Point Units 6 and 7 COL FSAR Table 8.1-201 will be revised to remove the note: "Implemented via IEEE Std. 665, IEEE Guide for Generating Station Grounding, (DCD section 8.3, and Reference 201)," under the "Remarks" column for RG 1.204. The staff verified this change to the Turkey Point Units 6 and 7 COL FSAR was accomplished in Revision 4. The staff finds the applicant's response acceptable because it is consistent with the guidelines of RG 1.206. Accordingly, the staff considers Question 08.03-02 resolved.

Based on the above, the staff concludes that IEEE Std. 665 provides an acceptable method for lightning protection; therefore, the supplemental information provided by the applicant on lightning protection is acceptable.

- STD. COL 8.3-2

The staff reviewed STD. COL 8.3-2 as follows.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 8.3.1.4 [which itself was reproduced from Section 8.3.1.4 of the Bellefonte SER]:

- **STD. COL 8.3-2**

The NRC staff reviewed STD. COL 8.3-2 related to COL Information Item 8.3-2. COL Information Item 8.3-2 states (in part):

The Combined License applicant will establish plant procedures as required for:

- Periodic testing of penetration protective devices*
- Diesel generator operation, inspection and maintenance in accordance with manufacturers' recommendations*

The commitment was also captured as COL Action Items 8.3.1.2-1 and 8.4.1-1 in [AP 1000 DCD, Section 8.3.3, "Combined License Information for Onsite Electrical Power," as discussed in] Appendix F of the NRC staff's FSER for the AP1000 [standard design] (NUREG-1793), which states:

The COL applicant will establish plant procedures for preoperational testing to verify proper operation of the ac power system. (COL Action Item 8.3.1.2-1)

The COL applicant will establish plant procedures for periodic testing of penetration protective devices. (COL Action Item 8.4.1-1)

A part of standard information item, STD. COL 8.3-2, was provided by the applicant describing the bases of the recommendations in operation, inspection, and maintenance procedures for the onsite standby diesel generators. This part of STD. COL 8.3-2 is addressed in BLN COL FSAR Section 8.3.1.1.2.4.

A portion of the standard information item, STD. COL 8.3-2, was provided by the applicant describing procedures for the testing of penetration protective devices. This portion of STD. COL 8.3-2 is addressed in BLN COL FSAR Section 8.3.1.1.6.

The NRC staff reviewed the resolution to COL information item, STD. COL 8.3-2, related to testing procedures for standby diesel generators and electrical penetrations included under Section 8.3 of the BLN COL FSAR. The NRC staff's evaluation follows.

For the operation, inspection and maintenance for diesel generators, the applicant's procedures will consider both the diesel generator manufacturer and industry diesel working group recommendations.

In RAI 8.3.1-2, the NRC staff stated that COL Action Item 8.3.1.2-1 in the NRC's FSER for the AP1000 DCD FSER (NUREG-1793), contains the following discussion:

Preoperational tests are conducted to verify proper operation of the ac power system. The preoperational tests include operational testing of the diesel load sequencer and diesel generator capacity testing. The diesel generators are not

safety-related and will be maintained in accordance with the requirements of the overall plant maintenance program. This program will cover the preventive, corrective, and predictive maintenance activities of the plant systems and equipment and will be presented in the COL application. This COL information is discussed in DCD Tier 2, Section 8.3.3, "Combined License Information for Onsite Electrical Power."

In RAI 8.3.1-2, the applicant was asked to provide a reference to where the preoperational testing program and the preventive, corrective, and predictive maintenance activities for the diesel generators are discussed in the application, or provide a proposed revision to the application to address this issue.

In a letter dated April 6, 2009, the applicant stated that COL Action Item 8.3.1.2-1 in Appendix F of the FSER does not indicate that "pre-operational testing" of the diesel generators has been addressed in the DCD. Pre-operational testing of the ac power system is described in FSER Section 14, DCD Section 14, and BLN COL FSAR Chapter 14. Specifically, DCD Sections 14.2.9.2.15 and 14.2.9.2.17 address the onsite ac power system and diesel generator testing, including diesel generator capacity and sequencer tests. BLN COL FSAR Section 14.2.9.4.23 describes testing of the offsite power system. The NRC staff agrees that pre-operational testing of the diesel generators is addressed in DCD Section 14.2.9.2.17 and was found acceptable by the staff as indicated in FSER NUREG-1793 Section 14.2.9. Based on the above, the NRC staff finds that the applicant's response to the portion of the RAI regarding COL areas of responsibility is acceptable.

In addition, the applicant stated that BLN COL FSAR Section 8.3.1.1.2.4 will be revised to include inspection and maintenance (including preventive, corrective, and predictive maintenance) procedures considering both the diesel generator manufacturer's recommendations and industry diesel working group recommendations.

The NRC staff concludes that following the manufacturer and industry diesel generator working group recommendations for onsite standby diesel generator inspection and maintenance including preventive, corrective, and predictive maintenance provides reasonable assurance that the diesel generators will be adequately maintained. Therefore, DCD COL Information Item 8.3-2 and FSER COL Action Item 8.3.1.2-1 are resolved subject to the verification that the BLN COL FSAR has been updated to include applicable portions of the RAI response. This is identified as Confirmatory Item 8.3.1-1.

With regard to establishing plant procedures for periodic testing of protective devices that provide penetration overcurrent protection, the applicant will implement procedures to periodically test a sample of each different type of overcurrent device. Testing includes:

- Verification of thermal and instantaneous trip characteristics of molded case circuit breakers*
- Verification of long time, short time, and instantaneous trips of medium voltage air circuit breakers*

- *Verification of long time, short time, and instantaneous trips of low voltage air circuit breakers*

Because the above testing is consistent with the recommendation of RG 1.63, the NRC staff concludes that the above information satisfies COL Information Item 8.3-2 and FSER COL Action Item 8.3.1.6-1, and that these items are resolved.

Resolution of Standard Content Confirmatory Item 8.3.1-1

Confirmatory Item 8.3.1-1 required the applicant to update its FSAR to specify that onsite standby diesel generator inspection and maintenance (including preventive, corrective, and predictive maintenance) procedures will consider both the diesel generator manufacturer's recommendations and industry diesel working group recommendations. The NRC staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 8.3.1-1 is resolved.

Supplemental Information

- PTN SUP 8.3-1

Because switchyard power transformer voltages are site-specific, the referenced DCD requires this information be provided in the COLA. The applicant provided information in PTN SUP 8.3-1 describing the site-specific switchyard and power transformer voltage. The staff finds this description adequate to allow the staff to complete its review of electrical power system.

- PTN SUP 8.3-2

The applicant stated in PTN SUP 8.3-2 that their site conditions are bounded by the standard site conditions in AP1000 DCD Section 8.3.1.1.2.3 used to rate the diesel generators. The staff agrees that the Turkey Point Units 6 and 7 site conditions are bounded by the standard site conditions used to determine the rating.

- STD. SUP 8.3-4

The applicant provided information in STD. SUP 8.3-4 to include implementation of procedures for periodic verification of proper operation of the onsite ac power system capability for automatic and manual transfer from the preferred power supply to the maintenance power supply and return from the maintenance power supply to the preferred power supply. The staff finds that the information satisfies the requirements of GDC 18 and is, therefore, acceptable.

8.3.1.5 *Post Combined License Activities*

There are no post COL activities related to this section.

8.3.1.6 *Conclusion*

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to ac power systems,

and there is no outstanding information expected to be addressed in the Turkey Point Units 6 and 7 COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff compared the COL information items, the supplemental information, the interfaces for standard design, and the proposed design changes and corrections within the application to the relevant NRC regulations, guidance in NUREG-0800, Section 8.3.1, and other NRC regulatory guides and concludes that the applicant is in compliance with the NRC regulations. The staff based its conclusion on the following:

- PTN COL 8.3-1 is acceptable because the applicant provided sufficient information related to the grounding grid system design and lightning protection consistent with the recommendations of RG 1.206 and RG 1.204.
- STD. COL 8.3-2 is acceptable because the applicant provided sufficient information related to preoperational testing of the diesel generators and periodic testing of the penetration overcurrent protective devices consistent with industry standards and the recommendations of RG 1.63.
- PTN SUP 8.3-1 is acceptable because the applicant adequately addressed the site-specific switchyard and transformer voltage.
- PTN SUP 8.3-2 is acceptable because the applicant demonstrated its site-specific conditions are bounded by the standard site conditions in the AP1000 DCD FSAR for rating the diesel generator.
- STD. SUP 8.3-4 is acceptable because the applicant will implement procedures for periodic verification of offsite power system capacity for automatic and manual transfer from the preferred power supply to the maintenance power supply and vice versa to satisfy the requirements of GDC 18.

8.3.2 Direct Current Power Systems

8.3.2.1 *Introduction*

The dc power systems include those dc power sources and their distribution systems provided to supply motive or control power to safety-related equipment. Batteries and battery chargers serve as the power sources for the dc power system and inverters convert dc from the dc distribution system to ac instrumentation and control power, as required. These three components, when combined, provide an uninterruptible power supply (UPS) that furnishes a continuous, highly reliable source of ac supply.

The AP1000 dc power system is comprised of independent Class 1E and non-Class 1E dc power systems. Each system consists of ungrounded stationary batteries, dc distribution equipment, and UPS.

8.3.2.2 *Summary of Application*

Turkey Point Units 6 and 7 COL FSAR, Revision 8, Section 8.3 incorporates by reference AP1000 DCD FSAR, Revision 19, Section 8.3 with several departures and/or supplements.

AP1000 DCD FSAR Section 8.3 includes Section 8.3.2. After submitting AP1000 DCD Revision 17 to the NRC, Westinghouse revised the COL information Item (COL 8.3-2) and the applicant took a departure (STD. DEP 8.3-1) to address the revised COL information item. This COL information item has been incorporated into AP1000 DCD, Revision 19; however, the discussion of the COL information item below did not change.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 8.3.2, the applicant provided the following:

Tier 2 Departure

- STD. DEP 8.3-1

In an April 20, 2011, letter to the NRC, the applicant endorsed an October 15, 2010, Southern Nuclear letter, for the VEGP application that proposed the following Tier 2 standard departure related to a proposed revision to AP1000 DCD FSAR Section 8.3.2.2. In the October 15, 2010, Southern Nuclear stated that the Class 1E battery chargers are designed to limit the input (ac) current to an acceptable value under faulted conditions on the output side, however, the voltage regulating transformers do not have active components to limit current. Therefore, the Class 1E voltage regulating transformer maximum current is determined by the impedance of the transformer. The voltage regulating transformer in combination with fuses and/or breakers will interrupt the input or output (ac) current under faulted conditions on the output side. Since AP1000 DCD FSAR Section 8.3.2.2 states that the Class 1E voltage regulating transformers are designed to limit the input (ac) current to an acceptable value under faulted conditions on the output side, the use of the breakers/fuses for the regulating transformers for isolation function, in lieu of current limiting characteristics as presented in the AP1000 DCD FSAR, is a departure for VEGP. Since the issue is identified as a standard item it is also a departure for Turkey Point Units 6 and 7.

AP1000 COL Information Item

- STD. COL 8.3-2

STD. COL 8.3-2 describes in detail the procedures for inspection, maintenance, and testing of Class 1E batteries, and the clearing of ground faults on the Class 1E dc power system. In an April 20, 2011, letter to the NRC, the applicant endorsed a Southern Nuclear October 15, 2010, letter for the VEGP application that proposed to revise STD. COL 8.3-2 by adding information related to periodic testing for the battery chargers and voltage regulating transformers.

Supplemental Information

- STD. SUP 8.3-3

The applicant provided supplemental information stating that no site-specific non-Class 1E dc loads were connected to the Class 1E dc system.

8.3.2.3 *Regulatory Basis*

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements. In addition, the acceptance criteria associated with the relevant requirements of NRC regulations for the dc power systems are given in NUREG-0800, Section 8.3.2.

The regulatory basis for acceptance of COL information item, STD. COL 8.3-2 and STD. SUP 8.3-3, is established in:

- GDC 17, "Electric Power Systems"
- GDC 18, "Inspection and Testing of Electric Power Systems"
- RG 1.206, "Combined License Applications for Nuclear Power Plants(LWR Edition)"
- RG 1.129, "Maintenance, Testing, and Replacement of Large Lead Storage Batteries for Nuclear Power Plants"
- IEEE Std. 450, "Recommended Practice for the Maintenance, Testing, and Replacement of Vented Lead-Acid Batteries for Stationary Applications"
- RG 1.75, "Criteria for Independence of Electrical Safety Systems," Revision 3

8.3.2.4 *Technical Evaluation*

The staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 8.3.2 and checked the referenced DCD to ensure that the combination of the DCD and the information in the Turkey Point Units 6 and 7 COL application represent the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information contained in the application and incorporated by reference addresses in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and concluded that the evaluation performed for the standard content is directly applicable to the Turkey Point COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 8.3.2.4:

AP1000 COL Information Item

- *STD. COL 8.3-2, involving the inspection, maintenance, and testing of Class 1E batteries and clearing of ground faults on the Class 1E dc system.*

The NRC staff reviewed STD. COL 8.3-2 related to COL Information Item 8.3-2. COL Information Item 8.3-2 states (in part):

The Combined License applicant will establish plant procedures as required for:

- *Clearing ground fault on the Class 1E dc system*
- *Checking sulfated battery plates or other anomalous conditions through periodic inspections*
- *Battery maintenance and surveillance (for battery surveillance requirements, refer to DCD Chapter 16, Section 3.8)*

The commitment was also captured as COL Action Item 8.4.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will establish plant procedures for periodic testing of penetration protective devices. (COL Action Item 8.4.1-1)

The Class 1E 125 volts direct current (Vdc) system components undergo periodic maintenance tests to determine the condition of the system. The applicant has established procedures for inspection and maintenance of Class 1E batteries and non-Class 1E batteries. Class 1E battery maintenance and service testing is performed in conformance with RG 1.129. Batteries are inspected periodically to verify proper electrolyte levels, specific gravity, cell temperature and battery float voltage. Cells are inspected in conformance with IEEE 450 and vendor recommendations. In addition, the applicant has established procedures for clearing of ground faults on the Class 1E dc system. The battery testing procedures are written in conformance with IEEE 450 and the Technical Specifications. The NRC staff concludes that the applicant has established procedures for inspection and maintenance of Class 1E and non-Class 1E batteries to satisfy COL Information Item 8.3-2; therefore, this item is resolved.

With regard to periodic testing of electrical penetration protective devices (COL Action Item 8.4.1-1) for dc systems, the applicant has not addressed periodic testing of the penetration over load protective devices related to dc systems. In RAI 8.3.1-1, the staff requested that the applicant address the periodic testing of the electrical penetration primary and backup protective devices protecting Class 1E and non-Class 1E dc circuits. In a letter dated January 2, 2009, the applicant stated that the BLN COL FSAR will be revised in the next COLA submittal to include periodic testing of the electrical penetration primary and backup protective devices protecting Class 1E and non-Class 1E dc circuits, as well as control of protective devices. The staff has reviewed the information in

the applicant's response, which provided for the testing of Class 1E and non-Class 1E dc penetration overload protection devices. The staff also reviewed the proposed change to BLN COL FSAR Section 8.3.1.1.6 and concludes that COL Action Item 8.4.1-1 is resolved subject to the verification that the BLN COL FSAR has been updated to include portions of the RAI response. This is identified as Confirmatory Item 8.3.2-1.

Resolution of Standard Content Confirmatory Item 8.3.2-1

Confirmatory Item 8.3.2-1 required the applicant to update its FSAR to provide for the testing of Class 1E and non-Class 1E dc penetration overload protection devices. The NRC staff verified that the VEGP COL FSAR was appropriately updated. As a result, Confirmatory Item 8.3.2-1 is resolved.

Evaluation of Tier 2 Departure STD. DEP 8.3-1 and Revised STD. COL 8.3-2

In a letter dated June 18, 2010, Westinghouse provided a response to Open Item OI-SRP 8.3.2-EEB-09, Revision 3, related to the periodic testing of battery chargers and voltage regulating transformers. The response included a COL information item to be added to AP1000 DCD Section 8.3.3 to ensure that periodic testing is performed on the battery chargers and voltage regulating transformers. Specifically, this section will be revised to include the following COL information item:

The Combined License applicant will establish plant procedures as required for:

Combined License applicants referencing the AP1000 certified design will ensure that periodic testing is performed on the battery chargers and voltage regulating transformers.

In a letter dated October 15, 2010, the applicant submitted its response to address the above-identified AP1000 DCD revision to the Section 8.3.3 COL information item regarding battery charger and voltage regulating transformer testing. The applicant stated that procedures are established for periodic testing of the Class 1E battery chargers and the Class 1E regulating transformers in accordance with the manufacturer recommendations. The battery chargers and regulating transformers are tested periodically in accordance with manufacturer recommendations. Circuit breakers in the Class 1E battery chargers and Class 1E voltage regulating transformers that are credited for an isolation function are tested through the use of breaker test equipment. This verification confirms the ability of the circuit to perform the designed coordination and corresponding isolation function between Class 1E and non-Class 1E components. Circuit breaker testing is done as part of the MR program and testing frequency is determined by that program. Fuses/fuse holders that are included in the isolation circuit are visually inspected. Class 1E battery chargers are tested to verify current limiting characteristic utilizing manufacturer recommendation and industry practices. Testing frequency is in accordance with that of the associated battery.

The applicant clarified that the voltage regulating transformers do not have active components to limit current and, therefore, the voltage regulating transformer in combination with fuses and/or breakers will interrupt the input or output (ac) current under faulted conditions on the output side. The NRC staff finds this to be inconsistent with AP1000 DCD Section 8.3.2.2, which states that Class 1E voltage regulating transformers are designed to limit the input (ac) current to an acceptable value under faulted conditions on the output side. As such the use of the breakers/fuses for regulating transformers for isolation function in lieu of current limiting characteristics as presented in the AP1000 DCD is a departure for VEGP. The applicant stated that Part 7 of the COL application will be revised to include a departure from AP1000 DCD Section 8.3.2.2 clarifying the current limiting feature of voltage regulating transformers. The applicant has included, in its response, the appropriate changes related to the above departure that will be included in VEGP COL FSAR Sections 8.3.2.1.4 and 8.3.2.2, in Chapter 1, Table 1.8-201 and in Part 7 of the VEGP COL application. These changes will be included in a future revision to the VEGP COL application.

The NRC staff has reviewed the proposed changes to the VEGP COL application and concludes that the applicant has provided sufficient information regarding the isolation function and the periodic inspection and testing of the isolating devices for the Class 1E battery chargers and Class 1E voltage regulating transformers. In addition, the staff finds that, although the use of the breakers/fuses for regulating transformers isolation function in lieu of current limiting characteristics as presented in the AP1000 DCD is a departure for VEGP, the departure is acceptable because the use of the breakers/fuses for regulating transformers for isolation function is consistent with the recommendations in IEEE-384, "IEEE Standard Criteria for Independence of Class 1E Equipment and Circuits," endorsed by RG 1.75. Therefore, AP1000 COL Information Item STD. DEP 8.3-1 and the revised STD. COL 8.3-2 are resolved subject to NRC staff verification of the revision to the VEGP COL FSAR sections discussed above. This is being tracked as Confirmatory Item 8.3.2-2.

Resolution of Standard Content Confirmatory Item 8.3.2-2

Confirmatory item 8.3.2-2 is an applicant commitment to revise its FSAR Table 1.8-201 and Section 8.3.2.1.4 to address COL Information Item STD. COL 8.3-2 and a departure, STD. DEP 8.3-1. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 8.3.2-2 is now closed.

The following portion of this technical evaluation section is reproduced from Section 8.3.2.4 of the BLN SER:

Supplemental Information

- **STD. SUP 8.3-1**

STD. SUP 8.3-1 was provided by the applicant indicating that there are no site-specific non-Class 1E dc loads connected to the Class 1E dc system. The staff finds this acceptable because it is consistent with the guidance in RG 1.206.

Evaluation of Site-specific Response to Standard Content

In VEGP COL FSAR, Revision 2, the VEGP applicant changed the number of the supplemental information item from STD. SUP 8.3-1 to STD. SUP 8.3-3. The associated VEGP COL FSAR, Revision 2 text, which is identical to the BLN COL FSAR, Revision 1 text accepted by the staff, was not changed. Therefore, the staff concludes that this difference is not relevant and that the staff's evaluation of STD. SUP 8.3-1 for BLN applies to STD. SUP 8.3-3 for VEGP.

8.3.2.5 *Post Combined License Activities*

There are no post COL activities related to this section.

8.3.2.6 *Conclusion*

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant addressed the required information relating to dc power systems, and there is no outstanding information expected to be addressed in the Turkey Point Units 6 and 7 COL FSAR related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented within the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the relevant NRC regulations, guidance in NUREG-0800, Section 8.3.2, and other NRC regulatory guides and concludes that the applicant is in compliance with NRC regulations. The staff based its conclusion on the following:

- STD. DEP 8.3-1 is acceptable because the applicant provided sufficient information involving the use of breakers/fuses for regulating transformers for isolation function that is consistent with IEEE-384, endorsed by RG 1.75.
- STD. COL 8.3-2 is acceptable because the applicant provided sufficient information involving the inspection, maintenance, and testing of Class 1E batteries and clearing of ground faults on the Class 1E dc system, and periodic testing of the battery chargers and voltage regulating transformers.
- STD. SUP 8.3-3 is acceptable because the applicant made a commitment that there are no site-specific non-Class 1E dc loads connected to the Class 1E dc system.

9.0 AUXILIARY SYSTEMS

The auxiliary systems provide support systems that support the safe shutdown of the plant or the protection of the health and safety of the public. This area covers a wide range of systems including fuel storage and handling, water systems, compressed air, process sampling, drains, heating, ventilation, and air conditioning (HVAC), fire protection (FP), communications, lighting, and emergency diesel generator support systems.

9.1 Fuel Storage and Handling

9.1.1 **New Fuel Storage (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.1, “Criticality Safety of Fresh and Spent Fuel Storage and Handling,” and C.I.9.1.2, “New and Spent Fuel Storage”)**

The new fuel storage facilities include the fuel assembly storage racks, the concrete storage pit that contains the storage racks, and auxiliary components including the spent fuel handling crane and pit cover. The storage facilities must maintain the new fuel in subcritical arrays during all credible storage conditions. In addition, new fuel must remain subcritical during fuel handling.

Section 9.1 of the Turkey Point Units 6 and 7 Combined License (COL) Final Safety Analysis Report (FSAR) incorporates by reference, with no departures (DEPs) or supplements, Section 9.1.1, “New Fuel Storage,” of the AP1000 Design Control Document (DCD). The U.S. Nuclear Regulatory Commission (NRC) staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793, “Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design,” and its supplements.

9.1.2 **Spent Fuel Storage (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.1, “Criticality Safety of Fresh and Spent Fuel Storage and Handling,” and C.I.9.1.2, “New and Spent Fuel Storage”)**

9.1.2.1 **Introduction**

The spent fuel storage facilities include the spent fuel storage racks, the spent fuel storage pool that contains the storage racks, and the associated equipment storage pits. The storage

¹ See “*Finality of Referenced NRC Approvals*” in Section 1.2.2 which contains a discussion of the staff’s review related to verification of the scope of information to be included in a COL application that references a design certification (DC). This SER refers to the Turkey Point Units 6 and 7 COL FSAR, Revision 8, and AP1000 DCD, Revision 19, unless otherwise specified. This footnote will be referenced in several places throughout the chapter of this Safety Evaluation.

facilities must maintain the spent fuel in subcritical arrays during all credible storage conditions. In addition, spent fuel must remain subcritical during fuel handling.

9.1.2.2 Summary of Application

Section 9.1 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.1 of the AP1000 DCD. Section 9.1 of the DCD includes Section 9.1.2.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.1.6, the applicant provided the following:

AP1000 COL Information Item

- STD COL 9.1-7

The applicant provided additional information in standard (STD) COL 9.1-7 to address COL Information Item 9.1-7.

License Condition

- Part 10, License Condition 2, Item 9.1-7

The applicant proposed a license condition related to STD COL 9.1-7 that sets the implementation milestone for the Metamic Coupon Monitoring Program.

- Part 10, License Condition 6

The applicant proposed a license condition to provide a schedule to support the staff's inspection of operational programs and proposed to add the Metamic Coupon Monitoring Program to this list.

The Turkey Point Units 6 and 7 applicant proposed these license conditions through its endorsement, in a letter dated November 15, 2010 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML103210407), of the letter dated April 23, 2010, from the Vogtle Electric Generating Plant (VEGP), Units 3 and 4, applicant on this issue.

9.1.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the fuel storage and handling are given in Sections 9.1.1 and 9.1.2 of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)."

The regulatory basis for acceptance of the COL information and supplementary information items is established in:

- Title 10 of the *Code of Federal Regulations* (10 CFR) Part 50, “Domestic Licensing of Production and Utilization Facilities,” Appendix A, General Design Criterion (GDC) 4, “Environmental and Dynamic Effects Design Bases”
- GDC 61, “Fuel Storage and Handling and Radioactivity Control”
- GDC 62, “Prevention of Criticality in Fuel Storage and Handling”
- 10 CFR 50.68, “Criticality Accident Requirements”

9.1.2.4 Technical Evaluation

The staff reviewed Section 9.1.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to spent fuel storage. The results of the staff’s evaluation of the information incorporated by reference in the Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the Design Certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP), Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4, COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER. Confirmatory items that are first identified in this SER section have a Turkey Point Units 6 and 7 designation (e.g., Confirmatory Item 9.1-1).

The following portion of this technical evaluation section is reproduced from Section 9.1.2.4 of the VEGP SER:

AP1000 COL Information Item

- STD COL 9.1-7

COL Information Item 9.1-7 states:

The Combined License holder will implement a spent fuel rack Metamic coupon monitoring program when the plant is placed into commercial operation. This program will include tests to monitor bubbling, blistering, cracking, or flaking; and a test to monitor for corrosion, such as weight loss measurements and or visual examination.

STD COL 9.1-7 states:

A spent fuel rack Metamic coupon monitoring program is to be implemented when the plant is placed into commercial operation. This program includes tests to monitor bubbling, blistering, cracking, or flaking; and a test to monitor for corrosion, such as weight loss measurements and or visual examination.

The NRC staff reviewed STD COL 9.1-7 related to the Metamic coupon monitoring program included under Section 9.1 of the BLN COL FSAR. No additional details on the Metamic Coupon Monitoring Program are provided in Section 9.1 of the FSAR.

Since the applicant's proposed resolution of COL Information Item 9.1-7 was a restatement of the text of the COL information item from the DCD, the staff required additional information to be able to evaluate the applicant's closure of the item. An additional Request for Additional Information (RAI) response related to AP1000 DCD Section 9.1.2 (ML091120720) proposed a modification to the text of COL Information Item 9.1-7. The modified wording added neutron attenuation and thickness testing to the list of tests to be included in the Metamic monitoring program to be implemented by the COL holder. In RAI 9.1.2-1, the NRC staff requested that the applicant describe in detail the implementation of the aspects of the Metamic coupon monitoring program that are listed in STD COL 9.1-7, as modified by the additional AP1000 RAI response. In response to RAI 9.1.2-1, the applicant proposed modified wording for STD COL 9.1-7 as follows:

STD COL 9.1-7

A spent fuel rack Metamic coupon monitoring program is to be implemented when the plant is placed into commercial operation. This program includes tests to monitor bubbling, blistering, cracking, or flaking; and a test to monitor for corrosion, such as weight loss

measurements and / or visual examination. The program will also include tests to monitor changes in physical properties of the absorber material, including neutron attenuation and thickness measurements.

*This proposed wording matches the proposed revised text for AP1000 COL Information Item 9.1-7. However, the proposed wording is still a restatement of the COL information item and does not contain the level of detail needed by the staff to evaluate the adequacy of the Metamic monitoring program. Therefore, in RAI 9.1.2-2, the staff requested that the applicant describe the methodology and acceptance criteria for the tests listed, provide the corrective action requirements and provide the administrative controls applicable to the program. Additionally, the applicant should confirm the number of coupons and the withdrawal schedule will be the same as recommended in the DCD or provide an alternative. The staff has identified this as **Open Item 9.1-1** to track resolution of this issue and to ensure that the additional details are included in the BLN COL FSAR.*

Resolution of Standard Content Open Item 9.1-1

To resolve Open Item 9.1-1, the VEGP applicant provided additional information in a letter dated April 23, 2010, which superseded the original response to Open Item 9.1-1 provided in a letter dated December 30, 2009.

With respect to the number of coupons and the withdrawal schedule, the applicant confirmed that the number of coupons and the withdrawal schedule will be the same as stated in AP1000 DCD, Section 9.1.2.2.1. The applicant further stated that since AP1000 DCD Section 9.1 is incorporated by reference into the FSAR, no additional FSAR change would be required. The staff finds the applicant's response regarding the number of coupons and withdrawal schedule acceptable, because the applicant has confirmed the number of coupons and schedule will be the same as described in the AP1000 DCD.

With respect to methodology and acceptance criteria, corrective actions and administrative controls, the applicant stated that since the Metamic Coupon Monitoring Program has not yet been established, the level of detail requested is not completely available. The applicant further stated, "As stated in FSAR Subsection 9.1.6, a Metamic monitoring program will be implemented when the plant is placed into commercial operation. This program will include methodology to be employed, acceptance criteria, corrective actions and a description of administrative controls based on vendor recommendations and industry operating experience."

The applicant additionally stated that the VEGP COL FSAR will be revised to add the following to the end of the STD COL 9.1-7 discussion:

The program will include the methodology and acceptance criteria for the tests listed and provide corrective action requirements based on vendor recommendations and industry operating experience. The program will be implemented through plant procedures.

Metamic Monitoring Acceptance Criteria:

- *Verification of continued presence of the boron is performed by neutron attenuation measurement. A decrease of no more than 5 percent in Boron-10 content, as determined by neutron attenuation, is acceptable. This is equivalent to a requirement for no loss in boron within the accuracy of the measurement.*
- *Coupons are monitored for unacceptable swelling by measuring coupon thickness. An increase in coupon thickness at any point of no more than 10 percent of the initial thickness at that point is acceptable.*

Changes in excess of either of the above two acceptance criteria are investigated under the corrective action program and may require early retrieval and measurement of one or more of the remaining coupons to provide validation that the indicated changes are real. If the deviation is determined to be real, an engineering evaluation is performed to identify further testing or any corrective action that may be necessary.

Additional parameters are examined for early indications of the potential onset of Metamic degradation that would suggest a need for further attention and possibly a change in the coupon withdrawal schedule. These include visual inspection for surface pitting, blistering, cracking, corrosion or edge deterioration, or unaccountable weight loss in excess of the measurement accuracy.

The NRC staff concludes that the above information to be added to the VEGP COL FSAR provides the necessary level of detail for the Metamic Monitoring Program, including the methodology and acceptance criteria for the tests listed, the corrective action requirements, and the administrative controls applicable to the program.

The applicant proposed a markup of the VEGP COL application, Part 10, License Condition 6, adding a line item for the Metamic Monitoring Program. After the addition of this line item, the version of License Condition 6 included in Part 10 of the COL application, Revision 2, would be:

The licensee shall develop a schedule that supports planning for and conduct of NRC inspection of the operational program listed in VEGP COL FSAR Table 13.4-201, "Operational Program Required by NRC Regulations." This schedule must be available to the NRC staff no later than 12 months after issuance of the COL. The schedule shall be updated every 6 months until 12 months before scheduled fuel load, and every month thereafter until the operational programs listed in VEGP COL FSAR Table 13.4-201 have been fully implemented or the plant has been

placed in commercial service, whichever comes first. This schedule shall address:

- a. the implementation of site-specific Severe Accident Management Guidance.*
- b. the reactor vessel pressurized thermal shock evaluation at least 18 months prior to initial fuel load.*
- c. the approved preoperational and startup test procedures in accordance with FSAR Section 14.2.3.*
- d. the flow accelerated corrosion (FAC) program implementation, including the construction phase activities.*
- #. the spent fuel rack Metamic coupon monitoring program implementation.*

(Where # will be replaced with the next sequential number in the final version of this license condition.)

*The inclusion of the Metamic Coupon Monitoring Program in License Condition 6 ensures that the program will be treated as an operational program with respect to providing a schedule to support the NRC's inspection; thus, the applicant must submit and update the schedule for program implementation following the issuance of the COL, in order to support planning of NRC inspections. The staff, therefore, finds the applicant's proposed resolution of **Open Item 9.1-1** acceptable because the applicant will modify proposed License Condition 6 to ensure the appropriate information is available for the staff's review of the details of the Metamic Monitoring Program prior to the start of plant operation. **Open Item 9.1-1** is, therefore, resolved. Incorporation of the proposed revision to Chapter 9 of the VEGP COL FSAR and to License Condition 6 in the VEGP COL application is being tracked as **Confirmatory Item 9.1-1**.*

Resolution of Standard Content Confirmatory Item 9.1-1

Confirmatory Item 9.1-1 is an applicant commitment to revise its FSAR Section 9.1.6 to include a requirement for inclusion of methodology, acceptance criteria and corrective action in the Metamic Coupon Monitoring Program. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 9.1-1 is now closed.

9.1.2.5 Post-Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (9-1) - Prior to initial fuel load, the licensee shall implement the spent fuel rack Metamic Coupon Monitoring Program. No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors

(NRO) a schedule that supports planning for and conduct of NRC inspections of the spent fuel rack Metamic Coupon Monitoring Program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the spent fuel rack Metamic Coupon Monitoring Program has been fully implemented.

9.1.2.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the guidelines given in Section 9.1.2 of NUREG-0800. The staff based its conclusion on the following:

- STD COL 9.1-7 is acceptable because the necessary level of detail for the Metamic Coupon Monitoring Program has been provided by the applicant, including the methodology and acceptance criteria for the tests listed, the corrective action requirements, and the administrative controls applicable to the program.

9.1.3 Spent Fuel Pool Cooling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.3, "Spent Fuel Pool Cooling and Cleanup System")

9.1.3.1 Introduction

The spent fuel pool cooling system (SFS) is designed to remove decay heat, which is generated by stored fuel assemblies from the water in the spent fuel pool (SFP). The safety-related portion of the SFS credits the water inventory in the pool and safety-related makeup water to remove the decay heat. The nonsafety-related portion of the system is an active system during normal operations that pumps the high-temperature water from within the fuel pool through a heat exchanger (HX) and then returns the water to the pool. The SFS HXs are cooled by the component cooling water system (CCS). A secondary function of the SFS is clarification and purification of the refueling water and the SFP.

9.1.3.2 Summary of Application

Section 9.1 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.1 of the AP1000 DCD. Section 9.1 of the DCD includes Section 9.1.3. Units 6 and 7 COL FSAR, Section 9.1.3 includes one departure request and one item of supplemental (SUP) information.

Tier 1 and Tier 2 Exemption and Departure Request

The applicant proposed the following Tier 1 and Tier 2 DEP from the AP1000 DCD:

- PTN DEP 2.0-3

The Tier 1 DEP request is from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1, for the maximum safety wet-bulb (noncoincident) air temperature, which is currently specified as 30.1 °Celsius (C) (86.1 °Fahrenheit (F)). The Tier 2 DEP was requested because this site parameter value is also listed as the maximum safety wet-bulb (noncoincident) air temperature in AP1000 DCD Tier 2, Table 2-1.

The applicant proposed to add the following information as part of PTN DEP 2.0-3, at the end of the third bullet in Turkey Point Units 6 and 7 COL FSAR, Section 9.1.3.1.3.1:

SFS performance following restart after a normal refueling is affected by a change in maximum safety wet-bulb temperature. Calculations confirm that spent fuel pool temperature remains below 46.1 °C (115 °F) with a CCS supply temperature of 36.1 °C (97 °F) at the specified SFP loading condition and decay time on the fuel fraction just replaced during the previous 17 day refueling outage.

While the maximum CCS temperature expected for Turkey Point Units 6 and 7 is 36.3 °C (97.4 °F), an increase of 0.2 °C (0.4 °F) in CCS supply temperature will produce a similar increase in the SFP maximum temperature; therefore, the requirement to maintain SFP temperature below 48.9 °C (120 °F) is met with margin.

The exemption request related to the AP1000 DCD maximum safety wet-bulb (noncoincident) air temperature involves an exemption to 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants," Appendix D, "Design Certification Rule for the AP1000 Design," Section IV.A.2.d. Specifically, the Turkey Point Units 6 and 7 applicant requested an exemption from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1, for the maximum safety wet-bulb (noncoincident) air temperature. The exemption request is evaluated in Section 2.0.4 of this SER.

The applicant proposed to add the following information as part of the response to NRC Orders EA-12-051 and EA-12-063, following the first paragraph of DCD Subsection 9.1.3.7.D:

All three safety-related spent fuel pool level instruments and associated instrument tubing lines are located below the fuel handling area operating deck and the cask washdown pit. This location provides protection from missiles that may result from damage to the structure over the spent fuel pool. The SFP level instruments associated with PMS divisions A and C are physically separated from the SFP level instrument associated with PMS division B. The safety-related spent fuel pool level instruments measure the water level from the top of the spent fuel pool to the top of the fuel racks. These instruments are conservatively calibrated at a reference temperature suitable for normal spent

fuel pool operation on a regular basis and accuracy is not affected by power interruptions.

The evaluation of the proposed supplemental information is included in Section 20.3 of this SER.

Supplemental Information

- PTN SUP 9.1-1

The applicant provided supplemental information in Section 9.1.3.7, "Instrumentation Requirements," describing the location of safety-related SFP level instruments and instrument tubing lines.

9.1.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the SFS are given in Section 9.1.3 of NUREG-0800.

9.1.3.4 Technical Evaluation

The staff reviewed Section 9.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the CCS. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL FSAR are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

Tier 1 and Tier 2 Departure

- PTN DEP 2.0-3

PTN DEP 2.0-3 proposes to increase the maximum safety wet-bulb (noncoincident) air temperature from 30.1 °C (86.1 °F) to 30.8 °C (87.4 °F). This change impacts the performance of various systems, structures, and components (SSCs) described in the AP1000 DCD. The staff's evaluation of this proposed change is also discussed in Sections 2.0, 2.3.1, 5.4, 6.2, 6.4, 9.2.2, and 9.2.7 of this SER.

The nonsafety portion of the SFS is designed to remove decay heat generated by the stored fuel assemblies from the water in the SFP and transfer it to the CCS. The site temperature (wet and dry bulb) impacts the cooling tower performance, which affects the temperature of the CCS. The SFS heat exchanger is cooled by the CCS, and a change in the CCS temperature affects the performance of the SFS. The impact of the proposed change on the CCS system is

evaluated in Section 9.2.2 of this SER. Since the safety-related portion of the SFS does not credit the use of the CCS, it remains unaffected by the proposed change.

The performance of the SFS is evaluated in the AP1000 DCD for several limiting offload scenarios. Of all the evaluated scenarios, only one scenario uses the maximum safety wet-bulb (noncoincident) air temperature as the basis to determine the system's heat removal performance. In this scenario, the analysis must demonstrate that the SFS is capable of maintaining the temperature of the SFP water below 48.9 °C (120 °F) following a partial core fuel shuffle refueling, with the wet-bulb temperature at the maximum safety wet-bulb (noncoincident) air temperature (most limiting case).

In letters dated June 24, 2011, the applicant responded to staff's RAI 9.2.2-1 and -2 (ADAMS Accession Nos. ML11178A231 and ML11178A232) and made reference to Calculation APP-SFS-M3C-042, Revision 0, "SFS HX Sizing Calculation Using Florida Power and Light (Turkey Point) Increased Wet-bulb Temperatures," as a demonstration that the Turkey Point Units 6 and 7 SFS still meets its design basis with the new wet-bulb temperature. Calculation APP-SFS-M3C-042 shows that, with a CCS temperature of 36.1 °C (97 °F), the SFP temperature remains below 46.1 °C (115 °F). The calculation in this report followed the same methodology used in Westinghouse Technical Report (TR)-36 (APP-GW-GLE-036), "Impact of a Revision to the Current Wet-bulb Temperature Identified in Table 5.0-1 (Tier 1) and Table 2-1 (Sheet 1 of 3) of the DCD (Revision 16)" for the AP1000 DC. The staff had evaluated this Westinghouse methodology as part of its AP1000 DCD review and found it acceptable in Supplement 2 of NUREG-1793. The staff has previously reviewed APP-SFS-M3C-042 while reviewing the V.C. Summer site-specific DEP 2.0-2 and found APP-SFS-M3C-042 acceptable as reference calculation.

As described in the markup for Turkey Point Units 6 and 7 COL FSAR, Section 9.2, the maximum design temperature for the CCS is 36.3 °C (97.4 °F). The Turkey Point Units 6 and 7 CCS maximum temperature is 0.2 °C (0.4 °F) higher than the temperature assumed for Turkey Point CCS in APP-SFS-M3C-042. The applicant stated that an increase in the CCS temperature will cause a proportional increase in the SFP temperature of approximately 0.2 °C (0.4 °F). This would result in a Turkey Point Units 6 and 7 SFP water temperature of approximately 46.3 °C (115.4 °F). Therefore, the staff finds that the Turkey Point Units 6 and 7 SFS is capable of maintaining the SFP water temperature below 48.9 °C (120 °F) following a partial core fuel shuffle refueling at the maximum safety wet-bulb (noncoincident) air temperature.

The applicant's departure request also proposed to revise Turkey Point Units 6 and 7 COL FSAR, Section 9.1.3.1.3.1 to reflect the impact of the change in the maximum safety wet-bulb (noncoincident) air temperature. Since the modification clarifies that only the refueling scenario discussed in this section (following a restart after a normal refueling, while the reactor is at power) has been impacted by the change in the maximum safety wet-bulb (noncoincident) air temperature, and that the Turkey Point Units 6 and 7 SFS is still capable of maintaining the SFP water temperature below the limit of 48.9 °C (120 °F), the staff finds the proposed departure with proposed Turkey Point Units 6 and 7 COL FSAR changes acceptable. The staff verified that the necessary changes were incorporated in the revised version of the Turkey Point Units 6 and 7 COL FSAR.

Supplemental Information

- PTN SUP 9.1-1

The applicant added supplemental regarding the location of safety-related SFP level instruments and instrument tubing lines. This supplemental information is reviewed above in this SER section.

9.1.3.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.1.3.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of NRC regulations and the acceptance criteria in NUREG-0800, Section 9.1.3. The staff based its conclusion on the following:

- PTN DEP 2.0-3 is acceptable because the staff determined that the SFS is capable of maintaining the SFP water temperature below 48.9 °C (120 °F) following a partial core fuel shuffle refueling, with the wet-bulb temperature at the maximum safety wet-bulb (noncoincident) air temperature of 30.8 °C (87.4 °F). Therefore, the staff concludes that the Turkey Point Units 6 and 7 SFS is acceptable.

9.1.4 Light Load Handling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.4, "Light Load Handling System (Related to Refueling)")

9.1.4.1 Introduction

The light load handling system (LLHS) consists of the equipment and structures needed for the refueling operation. This equipment comprises fuel assemblies, core component and reactor component hoisting equipment, handling equipment, and a dual basket fuel transfer system. The structures associated with the fuel handling equipment are the refueling cavity, the transfer canal, the fuel transfer tube, the SFP, the cask loading area, the new fuel storage area, and the new fuel receiving and inspection area.

9.1.4.2 Summary of Application

Section 9.1 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.1 of the AP1000 DCD. Section 9.1 of the DCD includes Section 9.1.4.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.1.4, the applicant provided the following:

AP1000 COL Information Items

- STD COL 9.1-5

The applicant provided additional information in STD COL 9.1-5 to address COL Information Item 9.1-5 (COL Action Item 9.1.6-5).

- STD COL 9.1-6

The applicant provided additional information in STD COL 9.1-6 to address COL Information Item 9.1-6 (COL Action Item 9.1.6-6).

9.1.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the LLHS are given in Section 9.1.4 of NUREG–0800.

The regulatory basis for acceptance of the COL information items is established in:

- 10 CFR Part 50, Appendix A, GDC 61
- American National Standards Institute/American Nuclear Society (ANSI/ANS) 57.1-1992, “Design Requirements for LWR Fuel Handling Systems”

9.1.4.4 Technical Evaluation

The staff reviewed Section 9.1.4 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the LLHS. The results of the staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL FSAR are documented in NUREG–1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3

and 4) were equally applicable to the Turkey Point Units 6 and 7 COL FSAR, the staff undertook the following reviews:

- The staff compared the VEGP FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAls.
- The staff confirmed that all responses to RAls identified in the corresponding standard content evaluation were endorsed.
- The staff verified that any site-specific differences were not relevant to the safety conclusion.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.1.4.4 of the VEGP SER:

AP1000 COL Information Items

- *STD COL 9.1-5*

COL Information Item 9.1-5 states:

The Combined License applicant is responsible for a program for inservice inspection of the light load handling system as specified in subsection 9.1.4.4 and the overhead heavy load handling system in accordance with ANSI B30.2, ANSI B30.9, ANSI N14.6, and ASME [American Society of Mechanical Engineers] NOG-1 as specified in subsection 9.1.5.4.

The commitment was also captured as COL Action Item 9.1.6-5 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The Combined License applicant is responsible for a program for inservice inspection of the light load handling system as specified in DCD Tier 2, Section 9.1.4.4 and the overhead heavy load handling system in accordance with ANSI B30.2, ANSI B30.9, ANSI N14.6, and ASME NOG-1 as specified in DCD Tier 2, Section 9.1.5.4.

STD COL 9.1-5 states:

The above requirements are part of the plant inspection program for the light load handling system, which is implemented through procedures. In addition to the above inspections, the procedures reflect the manufacturers' recommendations for inspection.

The staff reviewed STD COL 9.1-5, which addresses COL Information Item 9.1-5 on the inservice inspection (ISI) program for the LLHS. The applicant stated that the inspection program for the LLHS is implemented through procedures and reflect the manufacturer's recommendations. RAI 9.1.4-1 requested that the applicant provide a copy of the procedures for verification by the staff or provide the schedule in relation to fuel loading for issuance of the procedures.

The applicant stated in its response to RAI 9.1.4-1, that an inspection and testing program will be developed to address the LLHS. Procedures defining the program will address the testing and inspection requirements outlined in Section 9.1.4.4, "Inspection and Test Requirements," of the AP1000 DCD and the procedures will include applicable manufacturer's recommendations and industry standards. The applicant stated that procedure development is tracked by the overall plant construction and test schedule. The applicant further stated that details of the implementation milestones for development of procedures are not currently available and are not expected to be available until a detailed construction schedule has been developed. When it becomes available, scheduling information will be provided to the NRC as necessary to support timely completion of NRC inspection and audit functions.

*Although the response to RAI 9.1.4-1 states that the plant inspection program schedule information will be provided when available, BLN COL FSAR Table 1.8-202 lists STD COL 9.1-5 as having been completed by the applicant. The staff notes that STD COL 9.1-5 has not been fully addressed. The applicant is asked to revise BLN COL FSAR Table 1.8-202 to commit in the BLN COL FSAR to implementing the plant inspection program for the LLHS before receipt of fuel. This is **Open Item 9.1-2**.*

- STD COL 9.1-6

COL Information Item 9.1-6 states:

The Combined License applicant is responsible to ensure an operating radiation monitor is mounted on any crane or fuel handling machine when it is handling fuel.

The commitment was also captured as COL Action Item 9.1.6-6 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant/holder will ensure that an operating radiation monitor is mounted on any crane or fuel handling machine when it is handling fuel.

STD COL 9.1-6 states:

Plant procedures require that an operating radiation monitor is mounted on any machine when it is handling fuel. Refer to DCD Subsection 11.5.6.4, "Fuel Handling Area Criticality Monitors," for a discussion of augmented radiation monitoring during fuel handling operations.

The NRC staff reviewed STD COL 9.1-6, which addresses COL Information Item 9.1-6 related to radiation monitoring included under Section 9.1.4 of the BLN COL FSAR. The proposed mounting of an operating radiation monitor on any crane or fuel handling machine during fuel handling is included under Section 9.1.4.3.8 of the BLN COL FSAR. The applicant committed to develop plant procedures that will specify that an operating radiation monitor be mounted on any fuel handling machine when it is handling fuel. DCD Section 11.5.6.4 specifies the need to augment area radiation monitoring during fuel handling operations by a portable radiation monitor on the machine handling fuel. The staff finds that with the addition of the portable radiation monitor to any fuel handling machine when it is handling fuel, the BLN COL FSAR meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 61 for the prevention of unacceptable radiation exposure.

The staff finds that the applicant has adequately addressed COL Information Item 9.1-6 which would ensure that an operating portable radiation monitor is mounted on any fuel handling machine in the LLHS when it is handling fuel.

Resolution of Standard Content Open Item 9.1-2

*To resolve **Open Item 9.1-2**, in a letter dated December 30, 2009, the applicant proposed a change to VEGP COL FSAR Section 9.1.4.4 in response to this open item instead of a revision to Table 1.8-202. The applicant proposed a revision to FSAR Section 9.1.4.4 to clarify that the LLHS, including system inspections, is implemented prior to receipt of fuel onsite. The staff finds this acceptable since the commitment provided will ensure that these procedures will be in place prior to fuel movement. Therefore, **Open Item 9.1-2** is resolved. Incorporation of the proposed revision in the VEGP COL FSAR is being tracked as **Confirmatory Item 9.1-2**.*

Resolution of Standard Content Confirmatory Item 9.1-2

Confirmatory Item 9.1-2 is an applicant commitment to revise its FSAR Section 9.1.4.4 to include an inspection of the LLHS prior to receipt of fuel. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 9.1-2 is now closed.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from Section 9.1.4.4 of the BLN SER that requires correction. The BLN SER provides quoted material for COL Action Item 9.1.6-5, citing Appendix F of NUREG-1793

as the source. The source of the quoted material for COL Action Item 9.1.6-5 is in fact from Chapter 9 (Section 9.1.6) of NUREG-1793.

9.1.4.5 Post-Combined License Activities

For the reasons discussed in the technical evaluation above, the following FSAR commitment is identified as the responsibility of the licensee and is identified in Section 9.1.4.4 of the Turkey Point Units 6 and 7 COL FSAR:

- The light-load handling program, including system inspections, will be implemented prior to receipt of fuel onsite.

9.1.4.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable because it meets the requirements of the NRC's regulations and the acceptance criteria given in the guidelines found in Section 9.1.4 of NUREG-0800. The staff based its conclusion on the following:

- STD COL 9.1-5 is acceptable because the staff finds that the Turkey Point Units 6 and 7 COL FSAR provided information that ISI of the LLHS is part of the plant inspection program for the LLHS, which is implemented through procedures.
- STD COL 9.1-6 is acceptable because the staff finds that the Turkey Point Units 6 and 7 COL FSAR meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 61.

9.1.5 Overhead Heavy Load Handling Systems (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.1.5, "Overhead Load Handling System")

9.1.5.1 Introduction

The overhead heavy load handling systems (OHLHS) are used to lift loads whose weight is greater than the combined weight of a single spent fuel assembly and its handling device. The principal equipment is the containment polar crane, equipment hatch hoist, maintenance hatch hoist, and the cask handling crane. The OHLHS are designed to ensure that inadvertent operations or equipment malfunctions, separately or in combination, will not cause a release of radioactivity, a criticality accident, an inability to cool fuel within the reactor vessel or SFP, or prevent safe shutdown of the reactor.

9.1.5.2 Summary of Application

Section 9.1 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.1 of the AP1000 DCD. Section 9.1 of the AP1000 DCD includes Section 9.1.5.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.1.5, the applicant provided the following:

Supplemental Information

- STD SUP 9.1-1

The applicant provided supplemental (SUP) information in Section 9.1.5.3, "Safety Evaluation," describing heavy-load lifts outside those already described in the AP1000 DCD.

- STD SUP 9.1-2

The applicant provided supplemental information in Section 9.1.5, "Overhead Heavy Load Handling Systems," describing key elements of the heavy-loads handling program and a quality assurance (QA) program.

- STD SUP 9.1-3

The applicant provided supplemental information in Section 9.1.5.5, "Load Handling Procedures," describing load handling operations for heavy loads in the vicinity of irradiated fuel and safe shutdown equipment.

AP1000 COL Information Items

- STD COL 9.1-5

The applicant provided additional information in STD COL 9.1-5 to address COL Information Item 9.1-5 (COL Action Item 9.1.6-5).

- STD COL 9.1-6

The applicant provided additional information in STD COL 9.1-6 to address COL Information Item 9.1-6 (COL Action Item 9.1.6-6).

9.1.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the OHLHS are given in Section 9.1.5 of NUREG-0800.

The regulatory basis for acceptance of STD SUP 9.1-1, STD SUP 9.1-2, and STD SUP 9.1-3 addressing planned heavy-load lift programs includes the following:

- 10 CFR Part 50, Appendix A, GDC 4
- 10 CFR Part 50, Appendix A, GDC 61
- NUREG-0612, "Control of Heavy Loads at Nuclear Power Plants"

The regulatory basis for acceptance of STD COL 9.1-5, addressing the ISI program for the OHLHS, is based on GDC 4 and the guidelines of NUREG-0612, which references ANSI B30.2, "Overhead and Gantry Cranes," ANSI N14.6, "Special Lifting Devices for Shipping Containers Weighing 10,000 Pounds or More," ASME NOG-1, "Rules for Construction of Overhead and Gantry Cranes (Top Running Bridge, Multiple Girder)," and ANSI B30.9, "Slings."

The regulatory basis for acceptance of STD COL 9.1-6, addressing operating radiation monitor on any crane handling fuel, is based on the requirements of GDC 61.

9.1.5.4 Technical Evaluation

The staff reviewed Section 9.1.5 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to OHLHS. The results of the staff's evaluation of the information incorporated by reference in the Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that any site-specific differences were not relevant to the safety conclusion.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.1.5.4 of the VEGP SER:

Supplemental Information

- STD SUP 9.1-1, STD SUP 9.1-2, and STD SUP 9.1-3

The staff reviewed the information provided by the applicant for STD SUP 9.1-1. The applicant stated that it did not provide an itemized list of heavy load lifts outside the scope of heavy loads described in the AP1000 DCD because no such heavy load lifts are currently planned. The applicant provided a general description for addressing heavy load movements outside the planned scope if needed in the future. However, the applicant did not address all the program elements and detail listed in NUREG-0612 Section 5.1.1 and NUREG-0800 Section 9.1.5, nor did it provide a schedule for implementation of the heavy load handling program. A heavy load handling program that meets the guidelines of NUREG-0612 and NUREG-0800 Section 9.1.5, needs to be in place at a time before there is a possibility that a load drop could cause a release of radioactivity, a criticality accident, inability to cool fuel within the reactor vessel or spent fuel pool, or prevent safe shutdown of the reactor. The staff asked the applicant in RAI 9.1.5-1 to provide the program elements specified in NUREG-0612 Section 5.1.1 and NUREG-0800 Section 9.1.5, and a schedule for implementation.

In BLN COL FSAR, Revision 1, the applicant provided the missing and necessary information specified in NUREG-0612 Section 5.1.1 and NUREG-0800 Section 9.1.5. The applicant provided a description of the key elements of the heavy load handling system program in BLN COL FSAR Section 9.1.5. The key elements are: 1) Listing of heavy loads; 2) Listing of handling equipment; 3) Safe load paths definition, location and evaluation; 4) Procedures and maintenance manuals; 5) Inspection and testing; 6) Personnel qualification and training; and 7) Quality Assurance (QA) program to monitor and implement the heavy loads program. Also, the BLN COL FSAR, Revision 1 Section 9.1.5 describes the heavy loads handling system procedures. Because Section 9.1.5 of the BLN COL FSAR includes the key elements identified in NUREG-0612, the staff finds the aspects of RAI 9.1.5-1 regarding the key elements of the heavy loads program resolved. Therefore, the staff finds the applicant meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 4.

In its response to RAI 9.1.5-1, the applicant stated that details of the implementation milestones for the development of heavy load handling procedures and related engineering documents are not currently available, nor are the implementation milestones expected to be available until after a detailed construction schedule has been developed. The applicant stated that appropriate scheduling information will be provided, when available, to the NRC as necessary to support timely completion of inspection and audit functions. The applicant did not provide any schedule for when the heavy load handling program will be completed for the implementation of an approved heavy load handling program (including OHLHS procedures). The applicant is asked to revise

*BLN COL FSAR Table 1.8-202 to commit in the BLN COL FSAR to implementing the heavy load handling program before receipt of fuel. This is **Open Item 9.1-3**.*

AP1000 COL Information Items

- STD COL 9.1-5

The applicant provided additional information in STD COL 9.1-5 to address COL Information Item 9.1-5. COL Information Item 9.1-5 states:

The Combined License applicant is responsible for a program for inservice inspection of the light load handling system as specified in subsection 9.1.4.4 and the overhead heavy load handling system in accordance with ANSI B30.2, ANSI B30.9, ANSI N14.6, and ASME NOG-1 as specified in subsection 9.1.5.4.

The commitment was also captured as COL Action Item 9.1.6-5 in Chapter 9 of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The Combined License applicant is responsible for a program for inservice inspection of the light load handling system as specified in DCD Tier 2, Section 9.1.4.4 and the overhead heavy load handling system in accordance with ANSI B30.2, ANSI B30.9, ANSI N14.6, and ASME NOG-1 as specified in DCD Tier 2, Section 9.1.5.4.

The staff reviewed STD COL 9.1-5, which addresses COL Information Item 9.1-5 on the plant inspection program for the OHLHS. The applicant stated that the inspection program for the OHLHS is implemented through procedures and reflect the manufacturer's recommendations and the recommendations of NUREG-0612. The staff asked the applicant in RAI 9.1.5-2 to provide a copy of the procedures for verification by the staff.

In its response to RAI 9.1.5-2, the applicant stated that a plant inspection program for the OHLHS will be created using the manufacturer's recommendations and will meet the requirements outlined in applicable industry standards. The staff confirmed that BLN COL FSAR Section 9.1.5.4 was revised to provide additional information related to the description of implementing procedures. On the basis of its review, the staff finds the applicant adequately addressed that the OHLHS plant inspection program procedures will follow the equipment manufacturer's recommendations and will meet the requirements in applicable industry standards. With the addition to BLN COL FSAR Section 9.1.5.4 of a descriptive list of the minimum elements required to be addressed in the overhead heavy load handling equipment plant inspection program procedures, in addition to the other guidelines specified in Section 9.1.5 of NUREG-0800, the staff finds the applicant meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 4.

In the RAI response, the applicant stated that the schedule for issuing the procedures that implement the plant inspection program for the OHLHS are not

yet available. The applicant also stated that implementation milestones are not expected to be available until after a detailed construction schedule has been developed, but will be provided to the NRC when available to support timely completion of inspection and audit functions. Although the response to RAI 9.1.5-2 states that the plant inspection program schedule information will be provided when available, BLN COL FSAR Table 1.8-202 lists STD COL 9.1-5 as having been completed by the applicant. The staff notes that STD COL 9.1-5 has not been fully addressed. The applicant is asked to revise BLN COL FSAR Table 1.8-202 to commit in the BLN COL FSAR to implementing the plant inspection program for the OHLHS before receipt of fuel. This is **Open Item 9.1-4**.

- STD COL 9.1-6

The applicant provided additional information in STD COL 9.1-6 to address COL Information Item 9.1-6. COL Information Item 9.1-6 states:

The Combined License applicant is responsible to ensure an operating radiation monitor is mounted on any crane or fuel handling machine when it is handling fuel.

The commitment was also captured as COL Action Item 9.1.6-6 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant/holder will ensure that an operating radiation monitor is mounted on any crane or fuel handling machine when it is handling fuel.

The NRC staff reviewed STD COL 9.1-6, which addresses COL Information Item 9.1-6 related to radiation monitoring included under Section 9.1.5 of the BLN COL FSAR. The proposed mounting of an operating radiation monitor on any crane or fuel handling machine during fuel handling is included under Section 9.1.5.3 of the BLN COL FSAR. The applicant committed to develop plant procedures that will specify that an operating radiation monitor be mounted on any fuel handling machine when it is handling fuel. DCD Section 11.5.6.4 specifies the need to augment area radiation monitoring during fuel handling operations by a portable radiation monitor on the machine handling fuel. The staff finds that with the addition of the portable radiation monitor to any fuel handling machine when it is handling fuel, the BLN COL FSAR meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 61 for the prevention of unacceptable radiation exposure.

The staff finds that the applicant has adequately addressed COL Information Item 9.1-6 which would ensure that an operating portable radiation monitor is mounted on any crane when it is handling fuel.

Resolution of Standard Content Open Items 9.1-3 and 9.1-4

The VEGP applicant responded to **Open Items 9.1-3 and 9.1-4** in a letter dated December 30, 2009. The letter proposed a change to VEGP COL FSAR

*Section 9.1.5.4 in response to these open items instead of revising Table 1.8-202. The applicant proposed a revision to FSAR Section 9.1.5.4 to clarify that the OHLHS, including system inspections, will be implemented prior to receipt of fuel onsite. The staff finds this acceptable since the commitment provided will ensure that the procedures will be in place and the plant inspection program will be implemented for the OHLHS prior to fuel movement. Therefore, **Open Items 9.1-3 and 9.1-4** are resolved. Incorporation of the proposed revision in the FSAR is being tracked as **Confirmatory Item 9.1-3**.*

Resolution of Standard Content Confirmatory Item 9.1-3

Confirmatory Item 9.1-3 is an applicant commitment to revise its FSAR Section 9.1.5.4 to include an inspection of the OHLHS prior to receipt of fuel. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 9.1-3 is now closed.

9.1.5.5 Post-Combined License Activities

For the reasons discussed in the technical evaluation above, the following FSAR commitment is identified as the responsibility of the licensee in Turkey Point Units 6 and 7 COL FSAR, Section 9.1.5:

- The overhead heavy-load handling program, including system inspections, will be implemented prior to receipt of fuel onsite.

9.1.5.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of NRC regulations and the acceptance criteria given in Section 9.1.5 of NUREG-0800. The staff based its conclusion on the following:

- STD SUP 9.1-1, STD SUP 9.1-2, and STD SUP 9.1-3 are acceptable because the staff finds that the applicant provided supplemental information in accordance with NUREG-0612, NUREG-0800, Section 9.1.5, and RG 1.206, "Combined License Applications for Nuclear Power Plants (LWR Edition)," Section C.I.9.1.5, to describe the program and schedule for the implementation of the program governing heavy-load handling.
- STD COL 9.1-5 is acceptable because the staff finds that the Turkey Point Units 6 and 7 COL FSAR provided information that ISI of the OHLHS is part of the plant inspection

program for the OHLHS, which is implemented through procedures, in accordance with referenced national standards.

- STD COL 9.1-6 is acceptable because the staff finds that the Turkey Point Units 6 and 7 COL FSAR meets the applicable requirements of 10 CFR Part 50, Appendix A, GDC 61.

9.2 Water Systems

9.2.1 Service Water System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.2.1, “Station Service Water System (Open, Raw Water Cooling Systems)”)

9.2.1.1 Introduction

The service water system (SWS) is a nonsafety-related system that supplies cooling water to remove heat from the nonsafety-related CCS HXs in the turbine building. The SWS is arranged into two trains of components and piping. Each train includes one service water pump, one strainer, and a cooling tower cell as its heat sink. The heat sink for both trains is provided by a single cooling tower with two cells and a divided basin. Each train is capable of providing 100-percent of the required SWS flow for normal full-power operation.

9.2.1.2 Summary of Application

Section 9.2 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.2 of the AP1000 DCD. Section 9.2 of the DCD includes Section 9.2.1.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.1, the applicant provided the following:

Supplemental Information

- PTN SUP 9.2-1

The applicant provided supplemental information in Section 9.2.1.2.2, “Component Description,” by adding additional text to address the SWS cooling tower potential interactions.

The SWS cooling tower was evaluated for potential impacts from interference and air restriction effects due to yard equipment layout and tower operation in an adjacent unit. Based on unit spacing, yard equipment layout, and the margins inherent in the performance requirements and design conditions of the towers, no adverse impacts were determined.

Tier 2 Departure

- PTN DEP 2.0-2

This Tier 2 departure (request is from a site parameter value provided in AP1000 DCD Tier 2, Table 2-1, for the maximum normal wet-bulb (noncoincident) air temperature. AP1000 DCD Tier 2, Table 2-1, identified this value as 26.72 °C (80.1 °F). The proposed revised value is

27.5 °C (81.5 °F). The corresponding site characteristic value is 27.5 °C (81.5 °F) as reported in Turkey Point Units 6 and 7 COL FSAR, Section 2.3.1.5. This site characteristic exceeds the DCD site parameter by 0.78 °C (1.4 °F). This change requires an evaluation of the various plant performance requirements and commitments affected by this parameter to confirm that the performance of the plant's safety systems remains within the bounds described in the AP1000 DCD. The SWS is one system affected; therefore, the departure was reflected in Revision 3 of the Turkey Point Units 6 and 7 COL FSAR and in Turkey Point Units 6 and 7 COL Part 7. The staff's evaluation of this proposed change is also discussed in Sections 2.0, 2.3.1, 9.1.3, 9.2.2, and 9.2.7.

Replace the paragraph in DCD Section 9.2.1.2.3.4, "Plant Cooldown/Shutdown," with the following paragraph:

During the plant cooldown phase in which the normal residual heat removal system has been placed in service and is providing shutdown cooling, the service water cooling tower provides cooling water at a temperature of 89.8 °F or less when operating at design heat load and at an ambient wet-bulb temperature of no greater than the maximum normal wet-bulb temperature as defined in Chapter 2, Table 2.0-201. Two service water pumps and two cooling tower cells are normally used for plant cooldown, and the cross-connection valves between trains are normally closed. The service water system heat load and flow rate are shown in DCD Table 9.2.1-1. During these modes of operation the normal residual heat removal system and the component cooling water system remove sensible and decay heat from the reactor coolant system. The service water system cooling towers are designed with sufficient margin so that normal time-related degradation of tower performance will not prohibit their support of this heat removal function. In the event of failure of a service water system pump or cooling tower fan, the cooldown time is extended.

9.2.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

Although the SWS (including heat sink) is not safety related, it supports the normal (defense-in-depth) capability of removing reactor and spent fuel decay heat, it is part of the first line of defense for reducing challenges to passive safety systems in the event of transients and plant upsets, and its cooling function is important for reducing shutdown risk when the reactor coolant system (RCS) is open (e.g., during midloop conditions). The risk importance of the SWS makes it subject to regulatory treatment of nonsafety-related systems (RTNSS) in accordance with the Commission's policy for passive reactor plant designs in SECY-94-084, "Policy and Technical Issues Associated with the Regulatory Treatment of Non-Safety Systems in Passive Plant Designs."

The staff's evaluation of the SWS focuses primarily on confirming that the SWS is capable of performing its defense-in-depth and RTNSS functions; that it will not adversely impact safety-related structures, systems, and components (SSCs); and that inspections, tests, analyses, and acceptance criteria (ITAAC), test program specifications, and RTNSS availability controls for the SWS are appropriate.

The regulatory basis for acceptance of PTN SUP 9.2-1 and DEP 2.0-2, addressing the SWS cooling tower and the maximum normal wet-bulb revision, is the acceptance criteria in Sections 9.2.1 and 9.2.5 of NUREG-0800.

9.2.1.4 Technical Evaluation

The staff reviewed Section 9.2.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the SWS. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

Supplemental Information

- PTN SUP 9.2-1

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.1.2.2 by adding additional text to address the SWS cooling tower potential interactions.

The cooling capability of the SWS cooling towers for the Turkey Point Units 6 and 7 units can be adversely affected by interactions that exist between the SWS two mechanical draft cooling towers between units. In addition, interactions between cooling towers (circulating water system (CWS) versus SWS) may adversely affect the cooling capacity of the SWS. Since the Turkey Point Units 6 and 7 units utilize mechanical induced-draft towers for the CWS versus natural draft cooling towers as submitted by other COL applicants, interactions with the SWS cooling towers are now more likely due to the difference in height of the discharge plume. Adverse interactions can occur due to localized atmospheric influences caused by siting considerations, the locations of major structures, the locations of the mechanical draft cooling towers, mechanical draft cooling tower fan speed, and wind effects. Because AP1000 utilizes only one SWS mechanical draft cooling tower in its design, interaction effects between the mechanical draft cooling towers of multi-unit sites was not evaluated by the staff for AP1000. Therefore, the staff requested in RAI 28, Question 09.02.01-1 that the applicant provide analysis and additional information to address potential adverse interactions between the Turkey Point Units 6 and 7 mechanical draft SWS cooling towers and mechanical draft CWS cooling towers for the two Turkey Point Units 6 and 7 units and adjacent units to justify PTN SUP 9.2-1.

Based on its response dated August 17, 2011 (ADAMS Accession No. ML11231A983), the applicant addressed cooling tower interaction considerations as shown below.

Greater than 800 feet of separation will exist between the SWS cooling towers of adjacent Turkey Point Units 6 and 7 units and that the large turbine building structure is located between these two cooling towers. Also indicated that greater than 1,000 feet of separation will exist between each unit's SWS cooling towers and each unit's mechanical induced-draft towers for the CWS. Further, location of the Unit 5 cooling

tower is over 2,500 feet for the Turkey Point Units 6 and 7 SWS and over 3,000 ft for the CWS, respectively.

In addition, the CWS cooling towers for each Turkey Point Units 6 and 7 unit are mechanical induced draft towers. The plumes from the CWS cooling towers are directed upward by their fans and the buoyant effect of warm air. During normal power operation, the stack exit velocity is expected to be approximately 22.5 miles per hour. Based on the site arrangement (Turkey Point Units 6 and 7 COL FSAR, Figure 1.1-201), interactions of the CWS cooling towers with the SWS cooling towers may potentially result from winds from the south-southwest through south-southeast directions. The proposed design of the CWS cooling towers, including the circular shape and high stack exit velocity, in conjunction with the buoyant effect of the warm stack exhaust air, will tend to elevate and disperse the plume at elevations greater than the intakes of the SWS cooling towers, making it unlikely any significant interaction would occur. Strong SSW-SSE winds with velocities equal to or greater than the CWS cooling tower stack exit velocity would be necessary to have potential for interaction, but these winds occur less than 0.09 percent of the time based on site meteorological data (Turkey Point Units 6 and 7 COL FSAR, Table 2.3.2-205). Further, the SWS cooling towers are shielded by the larger and higher plant structures from winds from the south-southwest creating higher likelihood of dispersion of a plume from that direction. The low occurrence of winds from these directions and the large separation distances make any significant interaction unlikely under lower wind conditions; with higher wind velocities, greater dispersion is affected.

During conditions where the SWS cooling tower is subject to RTNSS requirements, the cooling tower is only operating at a small fraction of its operational heat load, leaving a substantial margin available to accommodate site specific adverse interactions, if they were to exist. Therefore, site specific performance degradation resulting from an interaction with a second unit would be minimal and would be readily accommodated by the design margins available to support RTNSS capability.

Based on the information that was provided in the response to RAI 28, Question 09.02.01-1, the staff finds the applicant's resolution of this issue to be acceptable since the SWS cooling tower interactions have been adequately addressed by at least 243 m (800 ft) of building separation and the large structure, the turbine building, being placed between the two SWS cooling towers. It is unlikely that an SWS cooling tower plume could travel to the vicinity of an SWS cooling tower on an adjacent unit. Distance and interfering structures in the path of the plume will disperse the plume, greatly minimizing any adverse effect on cooling tower performance. There is a minimal probability that a cooling tower plume will interact such that a significant degradation in performance would occur. Therefore, RAI 28, Question 09.02.01-1, is resolved.

Tier 2 Departure

- PTN DEP 2.0-2

The applicant, in PTN DEP 2.0-2, evaluated the DCD site parameter value for the maximum normal air temperature wet-bulb (noncoincident) in DCD Tier 2, Table 2-1, and proposed to increase the corresponding site characteristic value from 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F) to

reflect expected site conditions. The corresponding site characteristic value is 27.5 °C (81.5 °F) as reported in Turkey Point Units 6 and 7 COL FSAR, Section 2.3.1.5. This site characteristic exceeds the DCD site parameter by 0.8 °C (1.4 °F).

This increase in maximum normal wet-bulb air temperature impacts the SWS maximum cooling water temperature at design peak SWS heat duty, which occurs during plant cooldown. During plant cooldown, the SWS cooling tower provides cooling water to the CCS heat exchangers which in turn cool the normal residual heat removal system (RNS) heat exchangers while in shutdown cooling mode.

Turkey Point Units 6 and 7 COL FSAR, Section 9.2.1.2 and Units 6 and 7 COL Application Part 7, "Departures and Exemption Requests," state that, with this change in ambient wet-bulb temperature to 27.5 °C (81.5 °F), the SWS cold water temperature would rise to 32.1 °C (89.8 °F) (in lieu of 88.5 °F) during peak CCS/SWS heat duty 4 hours after reactor shutdown (beginning of cooldown), and that the change would not adversely affect the SWS function to provide adequate cooldown during maximum heat load conditions.

The applicant identified that multiple areas in the Turkey Point Units 6 and 7 COL FSAR are affected by the departure which includes Sections 2.0, 2.3.1.5, 9.2.1.2, and 9.2.7.2, as indicated in system tables for those systems affected. Additionally, the effects of the departure are discussed in Turkey Point Units 6 and 7 Application Part 7.

The staff evaluated this departure and determined there was a lack of information to support the proposed departure's effects on the maximum SWS cooling water tower outlet temperature of 32.1 °C (89.8 °F) to the CCS heat exchangers. Although the proposed change has been evaluated in Turkey Point Units 6 and 7 COL Part 7, it is not clear what aggregate effects there may be on other affected systems. Therefore, the staff, in RAI 23, Question 09.02.02-2, requested that the applicant provide analyses of the aggregate effects on integrated plant operation due to the implementation of PTN DEP 2.0-2.

In its response to RAI 23, Question 09.02.02-2, dated June 24, 2011 (ADAMS Accession No. ML11178A232), the applicant included all possible system effects, which included CCS and SWS related to the increase to maximum normal wet-bulb (noncoincidental) temperature. For completeness, systems outside the scope of the SWS that are affected by the rise in the maximum normal wet-bulb (noncoincident) air temperature are provided in the applicant's response. The applicant stated the following:

- The maximum normal wet-bulb (noncoincident) air temperature for the Turkey Point Unit 6 and 7 site was calculated for expected conditions at the site and increased from the standard value of 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F).
- These changes required an evaluation of the various plant performance requirements and commitments affected by each parameter to confirm that the performance for the plant's safety and nonsafety systems remain within the bounds described in the AP1000 DCD, and if necessary, identify changes to the design that are needed to ensure that performance is restored to within acceptable bounds.

- The following sections in the AP1000 DCD describe areas that could be affected by an increase in the maximum normal wet-bulb (noncoincident) air temperature.
 - DCD Section 5.4.7.1.2.1, “Normal Residual Heat removal System – Shutdown Heat Removal”
 - DCD Section 9.1.3.1.3.1, “Spent Fuel Pool Cooling - Partial Core – Plant Shutdown”
 - DCD Section 9.1.3.1.3.2, “Spent Fuel Pool Cooling – Full Core Off-load at 120 hours”
 - DCD Section 9.2.1.2.3.4, “Service Water System – Plant Cooldown/Shutdown”
 - DCD Section 9.2.2.1.2.2, “Component Cooling Water – Normal Plant Cooldown”
 - DCD Section 9.2.2.1.2.3, “Component Cooling Water – Refueling”
 - DCD Section 9.2.7.2.4, “Central Chilled Water System – Normal Operation”
- Each of these areas has been reviewed in detail and quantitative evaluations have been performed to determine the impact of the increases in the value of maximum normal wet-bulb (noncoincident) air temperature on the aggregate performance of all affected AP1000 systems. The increase in maximum normal wet-bulb (noncoincident) air temperature requires a modification to the design of the certified AP1000 central chilled water system (VWS) design to augment the total refrigeration capacity per train in the high capacity portion of the system by 351 kilowatts (kW) (100 tons). This will be accomplished by increasing the capacity of the two air-cooled chiller units in the high capacity portion of the VWS from 1055 kW (300 tons) to 1407 kW (400 tons).
- The impacts of the increase in the value of the maximum normal wet-bulb (noncoincident) air temperature were evaluated on a system by system basis. The same type of analyses have been performed twice previously for two required increases in AP1000 standard site temperature conditions, and once to justify a departure for a specific site whose site temperature conditions exceeded standard site temperature conditions documented in the DCD.
- Performance areas discussed in the DCD that can be affected by the increase in the maximum normal wet-bulb (noncoincident) air temperature include:
 - Plant cooldown with the RNS from 176.7 °C (350 °F) to 51.7 °C (125 °F) within 96 hours
 - Maximum SWS cold water temperature at peak system heat load conditions associated with the beginning of RNS cooldown

- Normal high capacity chilled water system design and performance
- Spent fuel pool cooling and design for maximum normal wet-bulb temperature cases (full core off-loading and normal refueling cases 150 hours after shutdown)
- Steam and power conversion systems performance

Plant Cooldown with the Normal Residual Heat Removal System (RNS) (Units 6 and 7 COL FSAR, Sections 5.4.7.1.2.1, 9.2.2.1.2.2, and 9.2.2.1.2.3)

Cooldown from 176.7 °C (350 °F) to 51.7 °C (125 °F) must be accomplished within 96 hours after reactor shutdown, using both trains of RNS, CCS, and SWS. This evolution produces the peak heat duty on the cooling water systems. The basis temperature for plant cooldown performance is the maximum normal wet-bulb (noncoincident) air temperature.

Calculation Note APP-RNS-M3C-093, Revision 0, "AP1000 Plant Cooldown Performance Calculation Considering the Higher Florida Power & Light Wet-bulb Temperature," demonstrates that the Turkey Point Units 6 and 7 plants can achieve a reactor coolant temperature of 48.9 °C (120 °F) within 83.5 hours after plant shutdown, with constant wet-bulb temperature of 27.5 °C (81.5 °F).

This performance satisfies the DCD requirement to reach 51.7 °C (125 °F) within 96 hours at an ambient wet-bulb temperature equal to the maximum normal wet-bulb (noncoincident) air temperature for the site.

SWS Cold Water Temperature at Beginning of Cool down (Turkey Point Units 6 and 7 COL FSAR, Section 9.2.1.2.3.4)

The DCD states that the maximum value of SWS cold water temperature (supply temperature to CCS heat exchangers) will be equal to or less than 31.4 °C (88.5 °F) at the beginning of cooldown, 4 hours after reactor shutdown. This performance is based on the use of the maximum normal wet-bulb (noncoincident) air temperature as the basis for determining SWS cooling tower performance.

Calculation Note APP-SWS-M3C-009, Revision 1, "Service Water Temperature Variation during RNS Cooldown," provides a detailed analysis of the time dependence of SWS cold water temperature for several different ambient wet-bulb temperatures at the expected cooldown peak heat duty. The calculated cold water temperature at 4 hours after reactor shutdown, for an ambient wet-bulb temperature of 27.5 °C (81.5 °F), is 31.1 °C (87.9 °F). This value satisfies the DCD commitment.

No design changes are necessary for Units 6 and 7 to allow the SWS to produce a cold water temperature of 31.4 °C (88.5 °F) or less at the beginning of cool down, with a wet-bulb temperature of 27.5 °C (81.5 °F).

Normal HVAC and High-Capacity Chilled Water System (HCCWS) Design and Performance (Turkey Point Units 6 and 7 COL FSAR, Section 9.2.7.2.4)

The high-capacity chilled water system (HCCWS) supplies chilled water to nonsafety-related HVAC cooling components throughout the plant, including the containment recirculation cooling system (VCS).

Calculation Note APP-GW-M1C-002, Revision A, "AP1000 High Humidity HVAC Systems Design Evaluation," assesses the impact of an increase in the value of the maximum normal wet-bulb (noncoincident) air temperature on the design and performance of the HCCWS. The performance of the HCCWS is affected by the increased humidity and temperature associated with an increase in the value of this wet-bulb temperature parameter from 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F) at the Turkey Point site. The calculation note demonstrates that an increase in the refrigeration capacity of the HCCWS of approximately 352 kW (100 t) per train will be required to restore HCCWS performance to the same level as achieved by the standard AP1000 HCCWS with a design-basis wet-bulb temperature of 26.7 °C (80.1 °F). This increased capacity will be obtained by changing the design capacity of the air-cooled chillers in the HCCWS from 1,055 to 1,407 kW (300 to 400 t).

Spent Fuel Pool Cooling Design and Performance for Maximum Normal Wet-bulb Temperature Cases (Turkey Point Units 6 and 7 COL FSAR, Sections 9.1.3.1.3.1 and 9.1.3.1.3.2)

Calculation Note APP-SFS-M3C-042, Revision 0, "SFS HX Sizing Calculation Using Florida Power and Light (Turkey Point) Increased Wet-bulb Temperatures," documents the anticipated SFS performance for these cases, which use maximum normal wet-bulb (noncoincident) air temperature as the basis for evaluation. They include a full core offloading case at 150 hours after shutdown, and a normal (fuel shuffle) refueling 120 hours after shutdown.

The calculations assume that the SFP holds 15 years (10 cycles) of spent fuel assemblies from operation of the plant with an 18-month refueling cycle, as well as the freshly discharged assemblies consistent with the respective type(s) of refueling operations just completed. For the full core offloading case, the performance requirement is to maintain SFS pool water temperature below 60 °C (140 °F) with a single train of SFS cooling and a CCS supply temperature consistent with wet-bulb temperature at the maximum normal (noncoincident) value. The calculation demonstrates that SFS pool temperature remains below 54.4 °C (130 °F) for this case. For the partial core offloading case at 120 hours, the requirement is that SFS pool temperature remain below 48.9 °C (120 °F) with two trains of SFS heat removal operating and CCS temperature consistent with maximum normal wet-bulb temperature. In this case, SFS temperature remains below 45.6 °C (114 °F).

All DCD case SFS performance requirements are satisfied with ambient wet-bulb temperature at the Turkey Point site elevated value of 27.5 °C (81.5 °F). Therefore, no changes to the plant design are required.

Steam and Power Systems Design and Performance

Westinghouse and the NuStart utilities have undertaken an effort to optimize the turbine generator and condenser designs and evaluate their performance over a range of CWS flow rates and inlet temperatures. The optimized standard condenser that has been developed for

the AP1000 will adequately accommodate the site conditions for Units 6 and 7 because the design cold water inlet temperature used for condenser and cooling tower sizing and CWS design was chosen to be 32.8 °C (91 °F). This cold water temperature is equivalent to an ambient wet-bulb temperature of between 25 °C (77 °F) and 28.9 °C (84 °F) for most cooling tower designs that are compatible with potential AP1000 sites.

Therefore, no changes to the standard AP1000 steam and power conversion systems are anticipated as a result of the increased value of the maximum normal wet-bulb (noncoincident) air temperature at the Turkey Point site.

The staff reviewed the applicant's response to RAI 23, Question 09.02.02-2, and finds it to be acceptable for the SWS as discussed below.

The applicant explained that the increase in maximum normal wet-bulb (noncoincident) air temperature from 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F) affects the RNS cooldown, maximum SWS cold water temperature at peak system heat load conditions associated with the beginning of RNS cooldown, normal high-capacity chilled water system design and performance, spent fuel pool cooling, and steam and power conversion systems performance. The staff's evaluation of these proposed changes outside the scope of the SWS is discussed in the corresponding SER sections.

Specifically for the SWS, the calculated cold water temperature at 4 hours after reactor shutdown, for an ambient wet-bulb temperature of 27.5 °C (81.5 °F), is 31.1 °C (87.9 °F). The staff finds that this value satisfies the AP1000 DCD Section 9.2.1.2.3.4 temperature value of 31.4 °C (88.5 °F) for plant cooldown/shutdown, which is the peak heat load condition.

Related to the SWS, the RNS cooldown from 176.7 °C (350 °F) to 51.7 °C (125 °F) must be accomplished within 96 hours after reactor shutdown, using both trains of RNS, CCS, and SWS. The Units 6 and 7 plants can achieve a reactor coolant temperature of 48.9 °C (120 °F) within 83.5 hours after plant shutdown, with constant wet-bulb temperature of 27.5 °C (81.5 °F). The staff finds that the 96-hour cooldown requirement is satisfied with the increased maximum normal wet-bulb (noncoincident) air temperature from 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F).

In summary, the staff's evaluation determined that the change in the maximum normal wet-bulb (noncoincident) air temperature from 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F) is acceptable because the 96-hour cooldown requirement is satisfied. Therefore, RAI 23, Question 09.02.02-2, as it relates to SWS which supports CCS and RNS, is considered resolved.

PTN DEP 2.0-3, which increases the maximum safety wet-bulb (noncoincident) air temperature from 30.1 °C (86.1 °F) to 30.8 °C (87.4 °F) and affects SWS, CCS, and nuclear island nonradioactive ventilation system (VBS) for normal power operations, is described in detail in Sections 9.2.2 and 9.2.7 of this report. Specifically, the SWS in the AP1000 is impacted because it used cooling towers that rely on evaporative cooling. With the 0.7 °C (1.3 °F) higher safety noncoincident wet-bulb temperature, there is slightly less evaporative cooling, so the systems and components directly or indirectly cooled by the SWS will have cooling water at a slightly higher temperature.

9.2.1.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.2.1.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the guidelines given in Sections 9.2.1 and 9.2.5 of NUREG-0800. The staff based its conclusion on the following:

- PTN SUP 9.2-1 is acceptable because the staff finds that the design of the SWS cooling towers meets the requirements of NRC regulations and the acceptance criteria in Sections 9.2.1 and 9.2.5 of NUREG-0800 regarding adverse interactions between the SWS cooling towers on the Turkey Point Units 6 and 7 site.
- PTN DEP 2.0-1 is acceptable because the staff finds that the staff's RAI related to the increase in normal safety wet-bulb (noncoincidental) air temperature has been adequately resolved. Therefore, the staff concludes that the Turkey Point Units 6 and 7 SWS, as described in Section 9.2.1 of the Turkey Point Units 6 and 7 COL FSAR, is in accordance with regulatory requirements, and is acceptable.

9.2.2 Component Cooling Water System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.2.2, "Cooling System for Reactor Auxiliaries (Closed Cooling Water Systems)")

9.2.2.1 Introduction

The CCS is a nonsafety-related (except for containment isolation functions), closed-loop cooling system that transfers heat from various plant components to the SWS during normal phases of operation. It removes heat from various components needed for plant operation and removes core decay heat and sensible heat for normal reactor shutdown and cooldown.

The CCS is arranged into two trains of components and piping. Each train includes one component cooling water pump and one component cooling water HX, with the two trains taking suction from a single return header. The CCS includes a single surge tank, which accommodates thermal expansion and contraction. Component cooling water is distributed to the components by a single supply/return header with components being grouped in branch lines according to plant arrangement, with one branch line cooling the components inside containment. Loads inside containment are remotely isolated in response to a safety injection signal, which also trips the reactor coolant pumps (RCPs).

The CCS pumps are within the scope of the AP1000 Design Reliability Assurance Program (D-RAP) as described in AP1000 DCD, Table 17.4-1, "Risk Significant SSCs within the Scope of D-RAP," since these pumps provide cooling for the RNS and spent fuel pool (SFP) heat exchangers. In addition, CCS is discussed in AP1000 DCD, Table 16.3-2, "Investment

Protection Short-Term Availability Controls,” for Modes 5 and 6 to support RNS cooling with the RCS open (SER Section 2.3).

9.2.2.2 Summary of Application

The Turkey Point Units 6 and 7 COL FSAR, Section 9.2 incorporates by reference Section 9.2 of the AP1000 DCD.¹ Section 9.2 of the DCD includes Section 9.2.2. In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.2 and in Turkey Point Units 6 and 7 COL Part 7, the applicant provided the following:

Tier 1 and Tier 2 Departure and Exemption Request

- PTN DEP 2.0-3

The Tier 1 departure (DEP) request is from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1, for the maximum safety wet-bulb (noncoincident) air temperature, which is 30.1 °C (86.1 °F). The Tier 2 departure was requested because this site parameter value is also listed as the maximum safety wet-bulb (noncoincident) air temperature in AP1000 DCD Tier 2, Table 2-1.

In Turkey Point Units 6 and 7 COL FSAR, Section 9.2.2.1, the applicant stated that the first bulleted item in the criteria for normal operation in AP1000 DCD Section 9.2.2.1.2.1 would be replaced with the following information:

The component cooling water supply temperature to plant components is not more than 100 °F assuming a 100-year return estimate of 2-hour duration wet-bulb temperature of 87.4 °F for service water cooling (per Table 2.0-201).

In addition, the applicant proposed to add the following to Turkey Point Units 6 and 7 COL FSAR, Section 9.2.2.1 in a letter dated April 23, 2013 (ADAMS Accession No. ML13115A176):

The most limiting component cooled by the CCS, the RCP motor cooling system, has been designed to operate for at least 6 hours continually with cooling water supplied at temperatures up to 100 °F.

The performance of the standard AP1000 CCS and SWS for single cooling water train, full power operation at a maximum safety wet-bulb temperature of 87.4 °F has demonstrated the highest CCS temperature achieved at these conditions is 97.4 °F, for a period of less than 2 hours. As ambient wet-bulb temperature decreases, the CCS temperature follows and will return to below 95 °F with ambient wet-bulb temperature slightly lower than 84 °F, assuming nominal performance of both the CCS and SWS. Since the definition of the maximum normal wet-bulb temperature value is the seasonal 1 percent exceedance value observed at the site, the annual total operating time for which CCS temperature could exceed 95 °F is less than 30 hours per year, for periods of a few hours at most. The maximum CCS temperature of 97.4 °F is bounded by the maximum allowable cooling water temperature for Reactor Coolant Pumps (the most limiting component) and the increase in maximum safety wet-bulb temperature is therefore acceptable on this basis.

The exemption request related to the AP1000 DCD maximum safety wet-bulb (noncoincident) air temperature involves an exemption to 10 CFR Part 52, Appendix D, Section IV.A.2.d. Specifically, the Units 6 and 7 applicant requested an exemption from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1, for the maximum safety wet-bulb (noncoincident) air temperature. The exemption request is evaluated in Section 2.0.4 of this SER.

9.2.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements.

While the CCS is a nonsafety-related system, it supports the normal (defense-in-depth) capability of removing reactor and spent fuel decay heat, it is part of the first line of defense for reducing challenges to passive safety systems in the event of transients and plant upsets, and its cooling function is important for reducing shutdown risk when the RCS is open (e.g., midloop condition). The risk importance of the CCS makes it subject to RTNSS in accordance with the Commission's policy for passive reactor plant designs.

The staff's evaluation of the changes that are proposed focused primarily on confirming that the changes will not adversely affect safety-related SSCs or those that satisfy the criteria for RTNSS; the capability of the CCS to perform its defense-in-depth and RTNSS functions; and the adequacy of ITAAC, test program specifications, and availability controls that have been established for the CCS.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the CCS are given in Section 9.2.2 of NUREG–0800.

9.2.2.4 Technical Evaluation

The staff reviewed Section 9.2.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the CCS. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

Tier 1 and Tier 2 Departure and Exemption Request

- PTN DEP 2.0-3

Turkey Point Units 6 and 7 COL FSAR, Section 9.2.2 and Turkey Point Units 6 and 7 COL Application Part 7 state that the maximum safety wet-bulb (noncoincident) air temperature for the Turkey Point Units 6 and 7 site was re-evaluated and increased from the standard AP1000 DCD value of 30.1 °C (86.1 °F) to 30.8 °C (87.4 °F) to reflect expected site maximum temperature conditions. This change requires that an evaluation be performed for the various plant performance requirements and commitments affected by this parameter to confirm that the performance of the plant's safety systems remains within the bounds described in the AP1000

DCD. The CCS was one of those systems that were affected; therefore, the departure was reflected in both the FSAR and Part 7 of the Turkey Point Units 6 and 7 COL application. The staff's evaluation of this proposed change is also discussed in Sections 2.0, 2.3.1, and 9.2.7 of this SER.

The AP1000 is impacted because it used cooling towers that rely on evaporative cooling. With the 0.7 °C (1.3 °F) higher safety noncoincident wet-bulb temperature, there is slightly less evaporative cooling, so the systems and components directly or indirectly cooled by the SWS will have cooling water at a slightly higher temperature.

The staff evaluated this departure and determined there was a lack of information to support this change to the CCS bounding temperature of 37.8 °C (100 °F). Therefore, the staff, in Letter No. 22, RAI 5403, Question 09.02.02-1, requested additional information related to this change in the maximum safety wet-bulb (noncoincident) temperature and the overall effects to various systems including CCS and SWS.

The applicant's response to RAI 5403, Question 09.02.01-1, dated June 24, 2011 (ADAMS Accession No. ML11178A231), included details related to all possible system effects, which included CCS and SWS with the increase to maximum safety wet-bulb (noncoincident) air temperature. The applicant in its response stated the following:

- The maximum safety wet-bulb (noncoincident) air temperature for the Turkey Point Units 6 and 7 site was calculated for expected conditions at the site and increased from the standard value of 30.1 °C (86.1 °F) to 30.8 °C (87.4 °F).
- The limiting temperature performance for the CCS and SWS occurs during normal power operation, with the site ambient wet-bulb temperature assumed to be at the maximum safety wet-bulb (noncoincident) value. The AP1000 DCD maximum safety wet-bulb (noncoincident) air temperature was originally defined to be the annual "0% exceedance" value measured at or calculated for the site. This measure of temperature is based on the maximum observed wet-bulb temperature value reached at a site, excluding periods of higher temperature extending less than 2 hours duration. For Turkey Point Units 6 and 7, the site maximum safety wet-bulb (noncoincident) air temperature value is defined as the 100-year return value for this parameter, excluding peaks of less than 2 hours duration.
- The original AP1000 design criterion for CCS and SWS performance was that the maximum CCS supply temperature should not exceed 35 °C (95 °F) for normal plant power operation with a single train of cooling water systems in service and ambient wet-bulb temperature at the maximum safety wet-bulb (noncoincident) air temperature value. Increases in the value of the standard site maximum safety wet-bulb (noncoincident) air temperature from 27.2 °C (81 °F) to 29.7 °C (85.5 °F) and finally (in DCD Revision 17) to 30.1 °C (86.1 °F) have been made to include a larger number of candidate sites within the standard site temperature envelope for AP1000 and are reflected in the current revision of the AP1000 DCD (Revision 19). The most limiting component cooled by the CCS, the RCP motor cooling system, has been designed to operate for at least 6 hours continuously with cooling water supplied at temperatures up to 37.8 °C (100 °F),

as a result of the increases in CCS temperature above 35 °C (95 °F) associated with the previous increases in limiting wet-bulb temperature. Each RCP is provided with four safety-related temperature sensors to monitor the stator cooling water temperature. These sensors generate a high temperature alarm when stator cooling water temperature rises above the normally expected operating range, and produce a reactor trip and RCP trip to protect the pumps if stator water temperature continues to rise beyond the trip setpoint. Operators monitor the cooling water temperature to verify that the RCPs are operating within normal temperature bounds at high ambient wet-bulb air temperature conditions.

- Calculation note TPG-CCS-M3C-001, Revision 0, *Turkey Point Units 6 and 7 Performance Evaluation using Elevated Maximum Non-Coincident Safety Wet-bulb Temperature* documents the performance of the standard AP1000 CCS and SWS for single cooling water train, full power operation at the higher maximum safety wet-bulb (noncoincident) air temperature of 37.8 °C (87.4 °F). The highest CCS temperature achieved at these conditions is 36.3 °C (97.4 °F) consistent with the maximum duration of the highest site ambient wet-bulb temperature. The SWS cooling water supply temperature assumed for this evaluation was determined in calculation note TPG-SWS-M3C-001, Revision 0, *Turkey Point Units 6 and 7 Cooling Tower Performance Evaluation Using Elevated Maximum Normal and Maximum Safety Wet-bulb Temperatures*. At the highest assumed value of wet-bulb temperature 37.8 °C (87.4 °F) the predicted value of SWS cold water temperature with the plant operating at full power is 33.2 °C (91.8 °F), which is lower than the DCD required upper limit of 34.2 °C (93.5 °F) for this value.
- As ambient wet-bulb temperature decreases, the SWS and CCS temperatures follow. CCS supply temperature will fall below 35 °C (95 °F) with ambient wet-bulb temperatures slightly lower than 28.9 °C (84 °F), assuming nominal performance of both the CCS and SWS. Since the definition of the maximum normal wet-bulb (noncoincident) air temperature value is the seasonal 1% exceedance wet-bulb temperature value observed at the site, the annual total operating time for which CCS temperatures could exceed 35 °C (95 °F) is less than 30 hours per year, for periods of a few hours at most. The maximum CCS temperature of 36.3 °C (97.4 °F) expected for Turkey Point Units 6 and 7 is well below the maximum allowable cooling water temperature of 37.8 °C (100 °F) for Reactor Coolant Pumps (the most limiting component) and the increase in maximum safety wet-bulb (noncoincident) air temperature for Turkey Point Units 6 and 7 is therefore acceptable on this basis.
- No changes to the design of the CCS or SWS are required for Turkey Point Units 6 and 7 to meet the DCD requirement that CCS temperature remains below 38 °C (100 °F) for normal power operation.
- The RTNSS function of the CCS and SWS is to remove decay heat during Mode 5 (cold shutdown) and Mode 6 (refueling) with reduced RCS inventory operations. Heat removal performance is reduced by increases in ambient wet-bulb temperature that cause increases in SWS cold water temperature and CCS

supply temperature. However, the total heat duty of the CCS and SWS is significantly lower during this mode of operation, as compared to the normal power or cooldown modes, because there is essentially no sensible heat to remove from the RCS and the core decay heat level is low. Primary plant component heat loads are also very small because no RCPs are in operation. Any slight increase in ambient wet-bulb temperature will not compromise the heat removal capability of the CCS and SWS. The impact of an increase in the applicant's maximum safety wet-bulb temperature from 30.1 °C (86.1 °F) to 30.8 °C (87.4 °F) on the RTNSS performance of the CCS and SWS is therefore acceptable. No changes are needed to the SWS or CCS Investment Protection Short Term Availability Control (IPSAC) requirements for the Turkey Point Units 6 and 7 as a result of the increased value of maximum safety ambient wet-bulb (noncoincident) air temperature.

- RCS cooldown from 176.6 °C to 51.7 °C (350 °F to 125 °F) must be accomplished within 96 hours after reactor shutdown, as addressed under RAI 5492, Question 09.02.02-2.

The staff reviewed the applicant's response to RAI 5403, Question 09.02.02-1, and finds it to be acceptable for the CCS as discussed below.

The increase of maximum safety wet-bulb (noncoincident) air temperature from 30.1 °C to 30.8 °C (86.1 °F to 87.4 °F) is seasonal and affects the CCS only during normal operations. This results in the highest CCS temperature of 36.3 °C (97.4 °F), for a period of less than 2 hours and, at the most, estimated to occur 30 hours per year. In addition, as ambient wet-bulb temperature decreases, the CCS temperature follows and will return to below 35 °C (95 °F), which is well below the normal operational temperature of the CCS in AP1000 DCD, Section 9.2.2.1.2.1, which states that the normal CCS supply temperature to plant components is not more than 37.8 °C (100 °F). Also, the most limited components cooled by CCS are the RCP's motor coolers, and they have been designed to operate for at least 6 hours continually with cooling water supplied at temperatures up to 37.8 °C (100 °F). Each RCP is provided with four sensors to monitor the stator cooling water temperature. These sensors generate a high-temperature alarm when stator cooling water temperature rises above the normally expected operating range, and produce trips to protect the pumps if stator water temperature continues to rise beyond the trip setpoint.

Related to CCS and its ability to support defense in depth, RTNSS, and cooldown of the reactor using RNS, the change to the maximum safety wet-bulb (noncoincident) air temperature affects only normal operations (at power). RNS cooldown does not utilize the maximum safety wet-bulb temperature but uses maximum normal wet-bulb air temperature. The RNS cooldown related to maximum normal wet-bulb (noncoincident) air is discussed in Section 9.2.1 of this report.

In summary, the staff's evaluation determined that the change in the maximum safety wet-bulb (noncoincident) air temperature from 30.1 °C to 30.8 °C (86.1 °F to 87.4 °F) is acceptable; therefore, Question 09.02.02-1, as it relates to CCS and SWS, is considered resolved. The staff has confirmed that the described changes appear in the revised version of the Turkey Point Units 6 and 7 COL FSAR and Part 7 of the application. No further changes to the Units 6 and 7 COL application text are required for PTN DEP 2.0-3.

The staff also confirmed that the applicant updated these figures on the revised Turkey Point Units 6 and 7 COL FSAR.

The staff's evaluation of the appropriateness of the 30.8 °C (87.4 °F) value for the Turkey Point Units 6 and 7 site is in Section 2.3 of this SER. The staff's evaluation of the effects that this higher temperature has on the operation of the AP1000 design is addressed in Sections 2.0, 2.3.1, 5.4, 6.2, 6.4, 9.1.3, and 9.2.7 of this SER.

Related information for PTN DEP 2.0-2, which increases the maximum normal wet-bulb (noncoincident) air temperature from 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F), and affects SWS, CCS, and RNS performance for plant cooldown/shutdown, is described in detail in SER Section 9.2.1.

9.2.2.5 *Post-Combined License Activities*

There are no post-COL activities related to this section.

9.2.2.6 *Conclusion*

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR meets the relevant acceptance criteria provided in Section 9.2.2 of NUREG-0800. The staff based its conclusion on the following:

- PTN DEP 2.0-3 is acceptable because the staff determined that the applicant's RAI response related to the increase in maximum safety wet-bulb (noncoincident) air temperature has been adequately resolved. Therefore, the staff concludes that the Turkey Point Units 6 and 7 CCS, as described in Section 9.2.2 of the Turkey Point Units 6 and 7 COL FSAR, is acceptable. In addition, the staff concludes that the exemption meets the requirements in 10 CFR Part 52, Appendix D, VIII.A.4, and is therefore acceptable.

9.2.3 *Demineralized Water Treatment System*

The demineralized water treatment system (DTS) provides the required supply of reactor coolant purity water to the demineralized water transfer and storage system. This system does not perform any safety-related function or accident mitigation, and its failure would not reduce the safety of the plant.

Section 9.2 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.2.3, "Demineralized Water Treatment System," of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding

information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.2.4 Demineralized Water Transfer and Storage System

The demineralized water transfer and storage system supplies demineralized water to fill the condensate storage tank and to the plant systems that demand a demineralized water supply. This system has no safety-related function other than containment isolation, and its failure does not affect the ability of safety-related systems to perform their safety-related functions.

The Turkey Point Units 6 and 7 COL FSAR, Section 9.2 incorporates by reference, with no departures or supplements, Section 9.2.4, "Demineralized Water Transfer and Storage System," of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.2.5 Potable Water System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.2.4, "Potable and Sanitary Water Systems")

9.2.5.1 Introduction

The potable water system (PWS) supplies clean water from a site-specific water system for domestic use and human consumption. The site-specific water system for Turkey Point Units 6 and 7 is the Miami-Dade Water and Sewer Department (MDWASD) potable water supply, which is further described below under PTN COL 9.2-1. This is a nonsafety-related system, with the exception of the main control room (MCR) boundary penetration, which includes design provisions for controlling the release of water containing radioactive material and preventing contamination of the PWS. A loop seal in the safety-related PWS piping that penetrates the MCR envelope boundary prevents unfiltered air in-leakage into the MCR envelope.

9.2.5.2 Summary of Application

Section 9.2 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.2 of the AP1000 DCD. Section 9.2 of the AP1000 DCD includes Section 9.2.5, "Potable Water System," which addresses Section 9.2.4, "Potable and Sanitary Water Systems," of NUREG-0800.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.5, the applicant provided the following:

AP1000 COL Information Item

- PTN COL 9.2-1

The applicant provided additional information in PTN COL 9.2-1 to address COL Information Item 9.2-1 identified in Table 1.8-202, "COL Item Tabulation."

Turkey Point Units 6 and 7 COL FSAR, Sections 9.2.5.2.1, "General Description," and 9.2.5.3, "System Operation," provided additional information concerning the source of water for the PWS.

Turkey Point Units 6 and 7 COL FSAR, Section 9.2.5.2.1 was modified to state that the source of water for the potable water system is the MDWASD potable water supply.

Turkey Point Units 6 and 7 COL FSAR, Section 9.2.5.3 was modified to state that the Miami-Dade Water and Sewer Department (MDWASD) potable water supply system provides filtered and disinfected water to the potable water distribution system. The MDWASD potable water supply system maintains the required pressure throughout the potable water distribution system. The source of potable water meets the [U.S. Environmental Protection Agency] EPA drinking water standards. No biocide or other water treatment is required.

9.2.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the PWS are given in Section 9.2.4 of NUREG-0800.

The regulatory basis for the review of the COL information item is established in 10 CFR Part 50, Appendix A, GDC 60, "Control of Releases of Radioactive Materials to the Environment."

9.2.5.4 Technical Evaluation

The staff reviewed Section 9.2.5 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the PWS. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

AP1000 COL Information Item

- PTN COL 9.2-1

The applicant provided additional information in PTN COL 9.2-1 to resolve COL Information Item 9.2-1. COL Information Item 9.2-1 states:

The Combined License applicant will address the components of the potable water system outside of the power block, including supply source required to meet design pressure and capacity requirements, specific chemical selected for use as a biocide, and any storage requirements deemed necessary. A biocide such as sodium hypochlorite is recommended. Toxic gases such as chlorine are not recommended. The impact of toxic gases on the main control room habitability is addressed in Section 6.4.

The staff reviewed the information provided by the applicant to address COL Information Item 9.2-1 on the source of water for the PWS included under Sections 9.2.5.2.1, 9.2.5.3, and 9.2.12.1 of the Turkey Point Units 6 and 7 COL FSAR.

The staff finds that the MDWASD potable water supply system provides filtered and disinfected water to the potable water distribution system. Since the source of potable water meets EPA standards, no biocide or other water treatment is required. Since there is no chemical treatment of the PWS on site, there are no toxic gases of concern related to the MCR habitability.

In addition, the MDWASD potable water supply source maintains the required pressure for the Turkey Point Units 6 and 7 PWS distribution system and capacity requirements from the AP1000 DCD, Section 9.2.5.1.2 are met. The PWS supply is not interconnected with any potentially radioactive system; therefore, the staff finds that GDC 60 is satisfied with respect to preventing contamination of the PWS by radioactive water.

As discussed above, the staff finds this an acceptable resolution of COL Information Item 9.2-1 because the applicant has adequately addressed the Turkey Point Units 6 and 7 potable water supply source.

9.2.5.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.2.5.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of NRC regulations and the acceptance criteria in Section 9.2.4 of NUREG-0800. The staff based its conclusion on the following:

- PTN COL 9.2-1 is acceptable because the applicant has provided sufficient information on the source of water for the PWS to satisfy GDC 60, with respect to preventing contamination by radioactive water.

9.2.6 Sanitary Drains (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.2.4, “Potable and Sanitary Water Systems”)

9.2.6.1 Introduction

The sanitary drain is a nonsafety-related system that collects sanitary wastes from plant restrooms and locker room facilities. The system design ensures that there is no possibility for radioactive contamination of the sanitary drains.

9.2.6.2 Summary of Application

Section 9.2 of the Units 6 and 7 COL FSAR incorporates by reference Section 9.2 of the AP1000 DCD. Section 9.2 of the AP1000 DCD includes Section 9.2.6, “Sanitary Drains,” which addresses Section 9.2.4, “Potable and Sanitary Water Systems,” of NUREG-0800.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.6, the applicant provided the following:

Departures

- PTN DEP 6.4-1

The applicant provided additional information in Section 9.2.6 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-1 related to design changes affecting habitability of the MCR and changes to the calculated doses to control room operators. This information, as well as related PTN DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

Supplemental Information

- PTN SUP 9.2-3

The applicant provided supplemental information by adding text to the end of Section 9.2.6.2.1, “General Description,” to state that sanitary waste is treated on the Units 6 and 7 plant area. The treatment facility has the capacity to treat the waste from Units 1 through 7. The liquid effluent from the sanitary treatment facility is pumped to the blowdown sump where it combines with other effluent streams.

9.2.6.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for PTN SUP 9.2-3 are given in Section 9.2.4 of NUREG–0800.

The regulatory basis for the review of the COL information item is established in 10 CFR Part 50, Appendix A, GDC 60.

9.2.6.4 Technical Evaluation

The staff reviewed Section 9.2.6 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to sanitary drains. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

Supplemental Information

- PTN SUP 9.2-3

The staff reviewed the location of the waste treatment plant included under Section 9.2.6.2.1 of the Turkey Point Units 6 and 7 COL FSAR. In Section 9.2.6.2.1 of the Turkey Point Units 6 and 7 COL FSAR, the applicant proposes an onsite sewage treatment plant for the treatment of sanitary waste. Treated effluent from the sanitary waste system is discharged to the blowdown sump where it combines with other effluent streams. The AP1000 DCD states that there are no interconnections between the sanitary drainage system and systems having the potential for containing radioactive material, and the sanitary drainage system does not service facilities in radiologically controlled areas. Therefore, the staff finds the proposed location of the waste treatment plant acceptable as it satisfies the requirements of GDC 60, with respect to preventing contamination by radioactive water.

9.2.6.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.2.6.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of NRC regulations and the acceptance criteria in NUREG-0800, Section 9.2.4. The staff based its conclusion on the following:

- PTN DEP 6.4-1, related to design changes affecting habitability of the MCR and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.
- PTN SUP 9.2-3 is acceptable because the applicant has provided sufficient information on the location of the waste treatment plant to satisfy GDC 60, with respect to preventing contamination by radioactive water.

9.2.7 Central Chilled Water System (Related to RG 1.206 Section C.III.1, Chapter 9, C.I.9.2.2, “Cooling System for Reactor Auxiliaries (Closed Cooling Water Systems)”)

9.2.7.1 Introduction

The plant's HVAC systems require chilled water as a cooling medium to satisfy the ambient air temperature requirements for the plant. The VWS supplies chilled water to the HVAC systems and is functional during reactor full-power and shutdown operation. The VWS provides chilled water to the cooling coils of the supply air handling units and unit coolers of the plant HVAC systems. It also supplies chilled water to the liquid radwaste system (WLS), gaseous radwaste system, secondary sampling system, and the temporary air supply units of the containment leak rate test system. The VWS is nonsafety related (except that the containment isolation interface is safety related).

The VWS consists of two closed loop subsystems: a high cooling capacity subsystem and a low cooling capacity subsystem. The HCCWS is the primary system used to provide chilled water to the majority of plant HVAC systems and other plant equipment requiring chilled water cooling. The low capacity chilled water subsystem (LCCWS) is dedicated to the nuclear island VBS, which includes the MCR, and the chemical and volume control system (CVS) makeup pump and normal residual heat removal pump compartment unit coolers.

The HCCWS consists of chilled water pumps, water-cooled chillers, air-cooled chillers, a chemical feed tank, an expansion tank, and associated valves, piping, and instrumentation. The LCCWS consists of two 100-percent-capacity chilled water loops. Each loop consists of a chilled water pump, an air-cooled chiller, an expansion tank, and associated valves, piping, and instrumentation.

The VWS pumps and chillers for the low capacity subsystem are within the scope of the AP1000 D-RAP as described in AP1000 DCD, Table 17.4-1, “Risk Significant SSCs within the Scope of D-RAP,” since these pumps and chillers provide cooling to the CVS makeup pump room. The pumps and chillers are important components of the VWS.

9.2.7.2 Summary of Application

Section 9.2 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.2 of the AP1000 DCD. Section 9.2 of the DCD includes Section 9.2.7. In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.2 and in Turkey Point Units 6 and 7 COL Part 7, the applicant provided the following:

Tier 1 and Tier 2 Departures and Exemption Request

The applicant proposed the following Tier 1 and Tier 2 departures from the AP1000 DCD:

- PTN DEP 2.0-3

The Tier 1 departure request is from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1, for the maximum safety wet-bulb (noncoincident) air temperature, which is 30.6 °C (86.1 °F). The Tier 2 DEP was requested because this site parameter value is also listed as the maximum safety wet-bulb (noncoincident) air temperature in AP1000 DCD Tier 2, Table 2-1.

For Section 9.2.7, no departures or supplements were identified in Revision 3 of the Turkey Point Units 6 and 7 COL FSAR; however, based on its response to RAI 22, Question 09.02.02-1, dated June 24, 2011, additional information was provided by the applicant as part of PTN DEP 2.0-3 which is related to the LCCWS.

The exemption request related to the AP1000 DCD maximum safety wet-bulb (noncoincident) air temperature involves an exemption to 10 CFR Part 52, Appendix D, Section IV.A.2.d. Specifically, the Units 6 and 7 applicant requested an exemption from a site parameter value provided in AP1000 DCD Tier 1, Table 5.0-1, for the maximum safety wet-bulb (noncoincident) air temperature. The exemption request is discussed in SER Section 2.0.4.

Tier 2 Departure

- PTN DEP 2.0-2

The Tier 2 DEP request is from a site parameter value provided in AP1000 DCD Tier 2, Table 2-1, for the maximum normal wet-bulb (noncoincident) air temperature. AP1000 DCD Tier 2, Table 2-1, identified this value as 26.72 °C (80.1 °F). The proposed revised value is 27.5 °C (81.5 °F). The corresponding site characteristic value is 27.5 °C (81.5 °F) as reported in Turkey Point Units 6 and 7 COL FSAR, Section 2.3.1.5. This site characteristic exceeds the DCD site parameter by 0.78 °C (1.4 °F). This change requires an evaluation of the various plant performance requirements and commitments affected by this parameter to confirm that the performance of the plant's safety systems remains within the bounds described in the AP1000 DCD. The VWS is one system affected; therefore, the departure was reflected in both the Turkey Point Units 6 and 7 COL FSAR and Part 7 of the Turkey Point Units 6 and 7 COL application. The staff's evaluation of this proposed change is also discussed in Sections 5.4.7, 9.1.3, and 9.2.7.

Replace the paragraph in DCD Section 9.2.7.2.1, "General Description," with the following paragraph:

The high capacity subsystem consists of two 80-percent capacity chilled water pumps, two 20-percent capacity chilled water pumps, two 80-percent capacity water-cooled chillers, two 20 percent air-cooled chillers, a chemical feed tank, an expansion tank, and associated valves, piping, and instrumentation. The subsystem is arranged in two parallel mechanical trains with common supply and return headers. Each train includes one 20-percent capacity pump, one 80-percent capacity pump, one 20-percent capacity chiller, and one 80-percent capacity chiller. A cross-connection at the discharge of each pump allows for each to feed a given chiller of matching capacity.

Based on a letter dated April 23, 2013 (ADAMS Accession No. ML13115A176), additional information was added by the applicant as part of PTN DEP 2.0-2, as described below:

Add the following information at the end of the first paragraph under “Normal Operation” in DCD Subsection 9.2.7.2.4.

The increased heat load produced by operation at the higher Turkey Point Units 6 and 7 maximum safety ambient wet-bulb temperature of 87.4 °F can be accommodated within the available capacity margin of the chiller units, without impacting the VWS low capacity subsystem or supporting systems design or plant operation. Cooling coil design calculations indicate that during operation at the standard plant design temperatures (115 °F dry bulb, 86.1 °F wet-bulb), the VBS air handling unit has cooling coil and system margin.

Modify Table 9.2.7-1R, “Component Data- Central Chilled Water System,” with the following information:

Air-Cooled Chillers: Capacity 400 nominal tons, Maximum power input 500 kW

9.2.7.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements.

Although the VWS is nonsafety-related, the LCCWS provides chilled water for cooling safety-related and defense-in-depth equipment rooms. The staff’s evaluation of the changes that are proposed focused primarily on confirming that the changes will not adversely affect safety-related SSCs or those that satisfy the criteria for RTNSS, the capability of the VWS to perform its RTNSS and defense-in-depth cooling functions, and the adequacy of ITAAC, test program specifications, and RTNSS availability controls that have been established for the VWS.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the CCS are given in Section 9.2.2 of NUREG–0800.

9.2.7.4 Technical Evaluation

The staff reviewed Section 9.2 of the Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff

confirms that the information in the application and incorporated by reference addresses the required information relating to the CCS. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

Tier 1 Departure

Related to PTN DEP 2.0-3, maximum safety wet-bulb (noncoincident) air temperature increased from the standard AP1000 DCD value of 30.06 °C (86.1 °F) to 30.78 °C (87.4 °F), the staff evaluated this departure for the VWS and determined there was a lack of information to support this change. Therefore, in RAI 22, Question 09.02.02-1, the staff requested additional information related to this change in the maximum normal wet-bulb (noncoincident) air temperature and the overall effects to various systems, including the CCS, SWS, and VWS.

In its response to RAI 22, Question 09.02.02-1, dated June 24, 2011 (ADAMS Accession No. ML11178A231), the applicant included all possible system effects, which included CCS, SWS, and VWS, related to the increase to maximum safety wet-bulb (noncoincident) air temperature.

- The nuclear island non-radioactive VBS is the only HVAC system that is designed to accommodate the maximum safety temperature limits. The LCCWS also uses the maximum safety temperature limits (dry and wet-bulb) as its design basis temperatures. The remainder of the HVAC systems are designed to accommodate the maximum normal temperature limits (1% exceedance values), including the HCCWS.
- The VBS maintains the safety-related heat sink temperatures and is designed with two 100 percent capacity subsystems. The VBS is served by the LCCWS exclusively. The LCCWS also serves the RNS and CVS pump room coolers. The nominal refrigeration capacity of each of the air-cooled chillers used in the LCCWS is 1055 kW (300 tons) at an ambient dry bulb temperature of 46.1 °C (115 °F).
- Calculation assesses the impact of changes in both maximum safety and maximum normal ambient wet-bulb temperature on the design and performance of the HCCWS and LCCWS. It assumes that maximum ambient wet-bulb temperature increases to 30.8 °C (87.4 °F) and maximum normal ambient wet-bulb temperature increases to 27.5 °C (81.5 °F).
- The increased heat load produced by operation at the higher Turkey Point Units 6 and 7 maximum safety ambient wet-bulb temperature of 30.8 °C (87.4 °F) can be accommodated within the available capacity margin of the chiller units, without impacting the LCCWS or supporting systems' design or plant operation. Since the LCCWS chillers are air-cooled, their performance is not affected by changes in wet-bulb temperature. Cooling coil design calculations indicate that during operation at the standard plant design temperatures 46.1 °C (115 °F) dry bulb, 30.1 °C (86.1 °F) wet-bulb, the VBS air handling unit has cooling coil and system margin.

- At the Turkey Point Units 6 and 7 site design temperatures of 44.4 °C (112 °F) dry bulb, 30.8 °C (87.4 °F) wet-bulb, the off coil temperatures for VBS do not change, based on the results of supplier coil performance calculations. Therefore, the MCR temperature and humidity at the higher site outside air wet-bulb temperature will remain at or below their desired design points during normal operation.
- No changes are needed in the AP1000 LCCWS design. Since these chillers are also air-cooled, their performance is not affected by changes in wet-bulb temperature. Therefore, the existing, standard air-cooled chillers and the associated VBS both perform acceptably at the increased Turkey Point Units 6 and 7 site maximum safety ambient wet-bulb temperature of 30.8 °C (87.4 °F).

The nuclear island nonradioactive VBS provides normal ventilation to the nuclear island including the control room and safety-related battery rooms. Although the system cools areas that contain safety-related components during normal operation, it is a nonsafety system. The associated safety-related habitability system, which relies on passive features, is designed to the maximum safety dry-bulb temperature, so it is unaffected by this exemption. The nuclear island nonradioactive VBS is affected because the higher wet-bulb temperature results in the higher heat load for the chillers.

The staff finds the applicant's response to RAI 22, Question 09.02.02-1, with respect to the VWS (HCCWS) because the increase of maximum safety wet-bulb (noncoincident) air temperature from 30.06 °C (86.1 °F) to 30.8 °C (87.4 °F) affects only the LCCWS air-cooled chillers.

Based on an audit of Turkey Point Units 6 and 7 HVAC calculations, the original chiller size based on the previous design wet-bulb air temperature resulted in a required rating of 577 kW (164 t). The revised calculated value including the revised wet-bulb air temperature resulted in a required rating of 641 kW (182 t). Based on calculations, no modifications are required to the existing specified chiller tonnage since the nominal refrigeration capacity of each of the LCCWS is 1,055 kW (300 t) at an ambient dry-bulb air temperature of 46.1 °C (115 °F); therefore, adequate margin is still maintained. Also, the MCR temperature and humidity at the higher Turkey Point Units 6 and 7 site outside air wet-bulb temperature will remain at or below their desired design points during normal operation. In addition, the VBS air handling unit has a cooling coil and system margin.

As previously stated, the LCCWS is within the scope of the AP1000 D-RAP because these pumps and chillers provide cooling to the CVS makeup pump room. The pumps and chillers are important components of the VWS. The increase in the maximum safety wet-bulb (noncoincident) air temperature of 30.1 °C to 30.8 °C (86.1 °F to 87.4 °F) will not negatively affect or compromise the heat removal capability of the VWS since adequate margin remains between the capacity of each chiller and the calculated heat load.

In summary, the staff's evaluation determined that the change in the increase of maximum safety wet-bulb (noncoincident) air temperature from 30.1 °C to 30.8 °C (86.1 °F to 87.4 °F) affecting the LCCWS is acceptable; therefore, RAI 22, Question 09.02.02-1, as it relates to the

VWS, is considered resolved. The staff confirmed that the revised Turkey Point Units 6 and 7 COL FSAR has made the changes described in the April 23, 2013, letter.

Tier 2 Departure

- PTN DEP 2.0-2

The applicant, in PTN DEP 2.0-2, evaluated the DCD site parameter value for the maximum normal air temperature wet-bulb (noncoincident) in DCD Tier 2, Table 2-1, and proposed to increase the corresponding site characteristic value from 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F) to reflect expected site conditions. The corresponding site characteristic value is 27.4 °C (81.5 °F) as reported in Turkey Point Units 6 and 7 COL FSAR, Section 2.3.1.5. This site characteristic exceeds the DCD site parameter by 0.7 °C (1.4 °F).

The increase in wet-bulb temperature will impact the standard plant design of the HCCWS. To accommodate the impact of the higher wet-bulb temperature on HVAC margins, the size of the air-cooled chillers in the HCCWS will be increased. The current HCCWS has two 5,982-kW (1,700-t) water-cooled chillers coupled with two 300-t (1,055-kW) air-cooled chillers. Replacing the two 300-t (1,055-kW) air-cooled chillers with 400-t (1,407-kW) air-cooled chillers will maintain adequate HVAC design margins and allow the HCCWS to meet the increased load due to higher wet-bulb design basis. There is no impact on the performance of SSCs important to safety or to analysis methods as a result of the increase in maximum normal wet-bulb temperature.

The applicant identified that multiple areas in the Turkey Point Units 6 and 7 FSAR are affected by the departure, which includes Sections 2.0, 2.3.1.5, 9.2.1.2, and 9.2.7.2, as indicated in system tables for those systems affected. Additionally, the effects of the departure are discussed in Turkey Point Units 6 and 7 COL Application, Part 7, "Departures and Exemption Requests."

The staff evaluated DEP 2.0-2 for the VWS and determined there was a lack of information to support this change. Therefore, the staff, in RAI 23, Question 09.02.02-2, requested additional information related to this change in the maximum normal wet-bulb (noncoincident) air temperature and the overall effects to various systems including the CCS, SWS, and VWS.

In its response to RAI 23, Question 09.02.02-2, dated June 24, 2011 (ADAMS Accession No. ML11178A232), the applicant included all possible system effects, which included CCS, SWS, and VWS, related to the increase to maximum normal wet-bulb (noncoincident) temperature. The applicant stated the following, which is related to the VWS. The complete RAI response, including effects to other systems, is described in Section 9.2.1 of this report.

- Each of these areas has been reviewed in detail and quantitative evaluations have been performed to determine the impact of the increases in the value of maximum normal wet-bulb (noncoincident) air temperature on the aggregate performance of all affected AP1000 systems. The increase in maximum normal wet-bulb (noncoincident) air temperature requires a modification to the design of the certified AP1000 central chilled water system (VWS) design to augment the total refrigeration capacity per train in the high capacity portion of the system by 100 tons (352 kW). This will be accomplished by

increasing the capacity of the two air-cooled chiller units in the high capacity portion of the VWS from 300 tons (1055 kW) to 400 tons (1407 kW).

- The High Capacity Chilled Water System supplies chilled water to non-safety related HVAC cooling components throughout the plant, including the Containment Recirculation Cooling System (VCS).

Calculation note APP-GW-M1C-002 Revision A, *AP1000 High Humidity HVAC Systems Design Evaluation* assesses the impact of an increase in the value of the maximum normal wet-bulb (noncoincident) air temperature on the design and performance of the HCCWS. The performance of the HCCWS is affected by the increased humidity and temperature associated with an increase in the value of this wet-bulb temperature parameter from 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F) at the Turkey Point site. The calculation note demonstrates that an increase in the refrigeration capacity of the HCCWS of approximately 100 tons (1055 kW) per train will be required to restore HCCWS performance to the same level as achieved by the standard AP1000 HCCWS with a design basis wet-bulb temperature of 26.7 °C (80.1 °F). This increased capacity will be obtained by changing the design capacity of the air-cooled chillers in the HCCWS from 300 (1055 kW) tons to 400 tons (1407 kW).

- Conclusion: Each of the areas discussed in departure PTN DEP 2.0-2 has been reviewed in detail, and the results of the individual evaluations are described above.

The analyses indicate that one change to the certified AP1000 design is required to ensure that Turkey Point Units 6 and 7 meet the performance requirements and commitments potentially affected by an increase in the value of the site maximum normal wet-bulb (noncoincident) air temperature from 26.7 °C (80.1 °F) to 27.5 °C (81.5 °F). This change is an increase in the refrigeration capacity per train for each of the two high capacity trains of the VWS. Each train's chiller capacity must be increased by 100 tons (352 kW). This capacity increase will be implemented by increasing the size of each of the two air-cooled chillers in the HCCWS from 300 (1055 kW) tons to 400 tons (1407 kW).

The increase of maximum normal wet-bulb (noncoincident) air temperature from 26.7 °C (80.1 °F) to 27.4 °C (81.5 °F) affects only the HCCWS air-cooled chillers. Therefore, the staff finds the applicant's response to RAI 23, Question 09.02.02-2, with respect to the VWS and DEP 2.0-2, acceptable.

Based on an audit of Turkey Point Units 6 and 7 HVAC calculations, the original HCCWS chiller heat load was calculated to be 7,034 kW (1,999 t). Based on the increase of normal wet-bulb air temperatures, the new HCCWS heat load was calculated to be 7,594 kW (2,158 t), an approximate 8-percent increase in system load.

The AP1000 DCD chillers were rated for only 1,738 kW (2,000 t), a 5,982-kW (1,700-t) water-cooled chiller with a 1,055-kW (300-t) air-cooled chiller. Based on calculations, a modification to increase the capacity of the existing specified chiller tonnage in the nominal air-cooled refrigeration capacity of each of the HCCWSs, from 1,055 kW (300 t) to 1,407 kW

(400 t) at an ambient dry-bulb air temperature of 46.1 °C (115 °F), is required to ensure adequate HCCWS performance to the same level as achieved by the standard AP1000 HCCWS with a design-basis wet-bulb of 26.7 °C (80.1 °F). Therefore, RAI 23, Question 09.02.02-2, is considered resolved. The staff confirms that the changes described in the applicant's April 23, 2013, letter have been made in the Turkey Point Units 6 and 7 COL FSAR.

9.2.7.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.2.7.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the acceptance criteria in NUREG-0800, Section 9.2.2. The staff based its conclusion on the following:

- PTN DEP 2.0-2 is acceptable because the staff determined that the applicant's information related to the increase in maximum normal wet-bulb (noncoincident) air temperature meets NRC regulatory requirements. Therefore, the staff concludes that the Units 6 and 7 VWS is acceptable.
- PTN DEP 2.0-3 is acceptable because the staff determined that the applicant's information related to the increase in maximum safety wet-bulb (noncoincident) air temperature meets regulatory requirements. Therefore, the staff concludes that the Turkey Point Units 6 and 7 VWS is acceptable.

9.2.8 Turbine Building Closed Cooling Water System

9.2.8.1 Introduction

The turbine building closed cooling water system (TCS) is a nonsafety-related system that provides closed-loop cooling for the removal of heat from heat exchangers in the turbine building and rejects the heat to the CWS. The system consists of two 100-percent capacity pumps, three 40-percent capacity HXs (connected in parallel), one surge tank, one chemical addition tank, and associated piping, valves, controls, and instrumentation. Backwashable strainers are provided upstream of each TCS HX. System piping is made of carbon steel, except that nonmetallic piping may be used in accordance with ASME B31.1, if justified by evaluation.

9.2.8.2 Summary of Application

Section 9.2 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.2 of the AP1000 DCD. Section 9.2 of the DCD includes Section 9.2.8.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.8, the applicant provided the following:

Site-Specific Information Replacing Conceptual Design Information

- PTN CDI

The applicant provided additional information to replace conceptual design information (CDI) in Section 9.2.8 of the AP1000 DCD with information identifying the source of cooling water for the Turkey Point Units 6 and 7 TCS heat exchangers.

9.2.8.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the TCS are given in Section 9.2.2 of NUREG–0800.

9.2.8.4 Technical Evaluation

The staff reviewed Section 9.2.8 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the TCS. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

Site-Specific Information Replacing Conceptual Design Information

- PTN CDI

The AP1000 standard plant allows the use of circulating water for removing heat from the TCS HXs. Circulating water is bracketed, which means conceptual design in the AP1000 DCD. The AP1000 DCD leaves it up to the COL applicant to specify a specific source of cooling water for plant-specific applications.

In its site-specific information, the applicant identified CWS as the source of cooling for the TCS. The staff's evaluation of the supplementary information that is provided in place of the CDI confirms that the plant-specific information is consistent with AP1000 DCD, Section 9.2.8, as approved by the staff, and is consistent with guidance in NUREG–0800, Section 9.2.2.

Therefore, the CDI that was provided for the Turkey Point Units 6 and 7 TCS is acceptable because circulating water provides an adequate water supply, which is less than 37.8 °C (100 °F), in order for the TCS to perform its intended function.

9.2.8.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.2.8.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the acceptance criteria given in Section 9.2.2 of NUREG-0800. The staff based its conclusion on the following:

- PTN CDI is acceptable because the design of the TCS meets the guidance in Section 9.2.2 of NUREG-0800 with respect to the source of cooling water for removing heat from the TCS heat exchangers.

9.2.9 Waste Water System (Related to RG 1.206 Section C.III.1, Chapter 9, C.I.9.3.3, "Equipment and Floor Drainage System")

9.2.9.1 Introduction

The waste water system (WWS) collects and processes the waste water from the equipment and floor drains in the nonradioactive building areas during plant operations and outages. The WWS has no safety-related function other than MCR envelope isolation. The waste water from the turbine building sumps flows to a waste water retention basin (WWRB), if required, for settling of suspended solids and treatment before discharge. The WWRB transfer pumps discharge the basin effluent to a blowdown sump prior to discharge into deep injection wells. The design of the system precludes inadvertent discharge of radioactively contaminated drainage.

9.2.9.2 Summary of Application

Section 9.2 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.2 of the AP1000 DCD. Section 9.2 of the AP1000 DCD includes Section 9.2.9, "Waste Water System," which is reviewed in accordance with Section 9.3.3, "Equipment and Floor Drainage System," of NUREG-0800.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.2, the applicant provided the following:

AP1000 COL Information Item

- PTN COL 9.2-2

The applicant provided additional information in Turkey Point Units 6 and 7 FSAR Section 9.2-2 to address COL Information Item 9.2-2 by including additional design information to the waste water system of AP1000 DCD Section 9.2.9.2.2 and 9.2.9.5.

Supplemental Information

- PTN SUP 9.2-4

The applicant added supplemental information regarding the blowdown sump in AP1000 DCD Sections 9.2.9.2.2 and 9.2.9.5.

- PTN SUP 9.2-5

The applicant added supplemental information in Turkey Point Units 6 and 7 COL FSAR, Section 9.2 regarding the operation of pumps discharging to the deep injection wells.

9.2.9.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the WWS are given in Section 9.3.3 of NUREG–0800.

The regulatory basis for acceptance of the COL information item is established in the following GDC of 10 CFR Part 50, Appendix A:

- GDC 4
- GDC 60

9.2.9.4 Technical Evaluation

The staff reviewed Section 9.2.9 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the WWS. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

AP1000 COL Information Item

- PTN COL 9.2-2

The applicant provided additional information in Turkey Point Units 6 and 7 COL FSAR, Section 9.2-2 to resolve COL Information Item 9.2-2. COL Information Item 9.2-2 states:

The combined license applicant will address the final design and configuration of the plant waste water retention basins and associated discharge piping, including piping design pressure, basin transfer pump size, basin size, and location of the retention basins.

The staff reviewed the resolution to Turkey Point Units 6 and 7 COL Information Item 9.2-2 with respect to the design of the plant WWRB and associated components included under Section 9.2.9.2.2, "Component Description" of the Turkey Point Units 6 and 7 COL FSAR. To address Turkey Point Units 6 and 7 COL Information Item 9.2-2, details were provided in the Turkey Point Units 6 and 7 COL FSAR for the location of the WWRB and routing configuration.

The wastewater from the WWRB is discharged into deep injection wells through a blowdown sump. The method for forwarding the wastewater from the basin to the blowdown sump is by use of two 100-percent transfer pumps. The blowdown sump inventory is then pumped to the deep injection wells. The blowdown sump pumps, downstream piping, and injection wells are part of the deep well injection system (DIS) described in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.12.

In order to meet GDC 60, the applicant must demonstrate suitable control of the release of radioactive materials in liquid effluent. Upon review of PTN COL Information Item 9.2-2, the staff requested the applicant, in RAI Question 09.03.03-1 (eRAI 5080), to provide a discussion on whether all site-specific potentially radioactive fluid draining into and downstream of the water basin will be monitored prior to disposition or provide a justification for not providing radiation monitoring. The staff also requested that the applicant provide the additional details of the associated components (i.e., transfer pumps, size of basin, etc.) as requested in the COL information item.

The applicant responded to RAI Question 09.03.03-1 in a letter dated November 5, 2010 (ADAMS Accession No. ML103130131). The staff reviewed the RAI response and determined sufficient information was provided and RAI Question 09.03.03-01 is resolved, as discussed below. The response provided detailed information on radiation monitoring, level instrumentation, and components for the WWS. The applicant confirmed that the potentially contaminated fluids entering the WWRB from the turbine building sumps are monitored with a radiation monitor on common discharge piping. As indicated in the RAI response, there are several effluent lines within the scope of the certified design that bypass this radiation monitor. The RAI response clarifies that these lines do not come in contact with radioactive sources or contain radiation monitoring prior to discharge into WWRB. For Turkey Point Units 6 and 7, there are no additional site-specific system influent streams to the WWRB outside of those associated with the certified design. Wastewater can also be sampled prior to discharge from the WWRB.

The wastewater retention basin WWRB, located west of the turbine building for each unit, is a lined basin with two compartments constructed such that its contents (dissolved or suspended) do not penetrate the liner and leach into the ground. The configuration and sizing of the WWRB is to allow settling of solids larger than 10 microns that may be suspended in the wastewater stream. Each WWRB is divided into two separate compartments, which allows one compartment to be out of service while the other compartment is available. A level transmitter located in each WWRB is used to control operation of the basin transfer pumps.

The WWRB contains two 100-percent capacity transfer pumps (one per compartment). The transfer pumps are sized to meet the maximum expected influent flow and prevent overflow of the basin. In the event of oily waste leakage into the WWRB, a recirculation line is provided to recycle the oil waste and water waste from the basin to the oil separator. In the event of radioactive contamination, this same line can be used to send the contents of the basin to the WLS.

The blowdown sump accepts wastewater from both Turkey Point Units 6 and 7 units, CWS cooling tower blowdown from both units, and sanitary treatment facility. The blowdown sump is located southeast of the units near the makeup water reservoir (MWR). In the absence of CWS cooling tower blowdown, RWS supplies an alternate source of dilution water. The blowdown sump is sized and equipped with controls and instrumentation as necessary to manage the blowdown sump level without overflowing.

The locations of the WWRBs, blowdown sump, and deep injection wells are shown on Turkey Point Units 6 and 7 COL FSAR, Figure 1.1-201. The locations of the WWRBs and the blowdown sump along with site grading ensure there will be no adverse impact on safety-related or RTNSS structures, systems, or components in the event of an overflow, as indicated in PTN SUP 9.2-5.

Based on the content in the Turkey Point Units 6 and 7 COL FSAR, Section 9.2.9 and the RAI Question 09.03.03-01 response, the staff concludes that the design of the WWS complies with GDC 60, with respect to control of radiation release to environment.

To protect against flooding, level instrumentation is provided at the WWRB, and controls are provided for automatic or manual operation of the basin transfer pumps based on the level of the WWRB. Each unit's WWRB is located in the yard area outside of each unit's respective turbine building.

The blowdown sump, injection pumping station and associated piping to the injection wells is sized with adequate capacity to accommodate the highest expected influent flow rate to the blowdown sump without overflowing of the sump. An alarm is provided to alert operators when the water level reaches a predetermined setpoint. The blowdown sump is located southeast of the units near the MWR.

Based on the content in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.9 and the RAI Question 09.03.03-01 response, the staff concludes that the design of the WWS complies with GDC 4 with respect to flood protection. Based on the information in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.9 and the response to RAI Question 09.03.03-01, the staff finds that the Turkey Point Units 6 and 7 COL FSAR adequately addresses PTN COL Information Item 9.2-2. The staff finds that GDC 4 is met based on the WWS design to prevent flooding that could affect safety-related SSCs adversely, and that GDC 60 is met, based

on the requirements for controlling the release of radioactive materials by preventing the inadvertent transfer of contaminated fluids to system portions for noncontaminated drainage. Therefore, RAI 8, Question 09.03.03-1, is closed.

Supplemental Information

- PTN SUP 9.2-4

The applicant added supplemental information regarding the blowdown sump and instrumentation in AP1000 DCD Sections 9.2.9.2.2 and 9.2.9.5. The additional content describes components in the final site design and configuration. This supplemental information is reviewed above in this SER section.

- PTN SUP 9.2-5

The applicant added supplemental information regarding the operation of pumps discharging to the deep injection wells. This supplemental information is reviewed above in this SER section.

9.2.9.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.2.9.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the applicable guidelines of the associated acceptance criteria given in Section 9.3.3 of NUREG-0800 with respect to the WWS.

9.2.10 Hot Water Heating System

The hot water heating system is a nonsafety-related system that supplies heated water to selected nonsafety-related air handling units and unit heater in the plant during cold weather operation, and to the containment recirculation fan coil units during plant outages in cold weather.

Section 9.2 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.2.10 of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of

the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.2.11 Raw Water System

9.2.11.1 Introduction

Section 9.2.11, "Raw Water System," of the Turkey Point Units 6 and 7 COL FSAR describes the raw water system (RWS). The RWS provides makeup to the circulating water system (CWS) mechanical draft cooling towers, demineralized water treatment system (DTS), raw water storage tank, the fire protection system (FPS) water storage tanks, service water system (SWS) cooling tower basins, miscellaneous plant uses such as backwash, and provides dilution flow for liquid radwaste discharge. The RWS is a nonsafety-related system that provides a continuous supply of makeup water from three separate sources:

- reclaimed water supplied to the Florida Power and Light Company (FPL) reclaimed water treatment facility and MWR from the MDWASD potable water supply
- saltwater supplied from substratum radial collector wells recharged from the Biscayne Bay
- MDWASD potable water supply to the RWS storage tank

The RWS reclaimed water subsystem draws water from the makeup water reservoir for makeup to the CWS mechanical draft cooling tower basins, for filling the CWS, and for diluting liquid MWR radwaste. Major components include the FPL reclaimed water treatment facility (pumps, filters, clarifiers, and solid handling equipment), the MWR, the reclaimed makeup water pumps, piping, and screens. Each unit has three 50-percent-capacity reclaimed makeup water pumps that draw from the MWR. The reclaimed water subsystem at the pump discharge header can be cross-connected between the Turkey Point Units 6 and 7 units.

The RWS saltwater subsystem pumps water from four radial collector wells to supply water for makeup to the CWS mechanical draft cooling tower basins, for filling CWS, and for liquid radwaste dilution through the waste water system. Each unit consists of major components that include four radial collector wells, four 33-1/3-percent saltwater makeup pumps, piping, and valves. The saltwater subsystem at the pump discharge header can be cross-connected between the Units 6 and 7 units.

Finally, four RWS ancillary pumps provide MDWASD potable water from the RWS storage tank for normal makeup to the SWS cooling tower basins, supply the DTS, provide primary and secondary fire water tank fill for the FPS, and supply miscellaneous users to the Units 6 and 7 units. Major components include the one shared raw water storage tank, two 100-percent raw water ancillary pumps per unit, and associated piping. The SWS cooling tower basins rely upon makeup from the RWS storage tank in order to achieve and maintain cold shutdown conditions.

9.2.11.2 Summary of Application

Section 9.2.11 of the Turkey Point Units 6 and 7 COL FSAR provides information concerning the RWS design basis, system description, system operation, safety evaluation, tests and

inspections, and instrumentation. The RWS was referred to in the AP1000 DCD in relation to the CWS, SWS, DTS, and FPS, but an RWS section was not included in the AP1000 DCD for the staff to evaluate.

In addition, AP1000 DCD, Table 1.7-2, "AP1000 System Designators and System Diagrams," indicates that the RWS is "wholly out of scope." The RWS is needed in order to operate the Turkey Point Units 6 and 7 units; therefore, the applicant has provided a complete description of this system in the COL FSAR.

In Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11, the applicant provided the following:

Interface Requirements

The plant interfaces for the RWS are identified in Table 1.8-203, "Summary of FSAR Discussions of AP1000 Plant Interfaces," of the Turkey Point Units 6 and 7 COL FSAR as Item 9.4, "Plant makeup water quality limits," and Item 9.5, "Requirements for location and arrangement of raw and sanitary water systems." These items are identified as "non-nuclear safety (NNS)" interfaces.

Supplemental Information

- PTN SUP 9.2-2

The applicant provided supplemental information by adding the new Section 9.2.11 after AP1000 DCD Section 9.2.10.

9.2.11.3 Regulatory Basis

Because the RWS was not considered within the scope of the AP1000 DCD, a regulatory basis for this system was not established for the standard plant design. The regulatory basis of the RWS for the Turkey Point Units 6 and 7 units is provided in this section.

The acceptance criteria that pertain to CWS and RWS evaluations are given in NUREG-0800, Sections 10.4.5, "Circulating Water System," 9.2.1, "Station Service Water System," 9.2.5, "Ultimate Heat Sink," 3.4.1, "Flood Protection," and 3.5, "Barrier Design for Missile Protection."

The regulatory bases and guidance for acceptance of the SUP information and interface items are established in:

- 10 CFR Part 50, Appendix A, GDC 2, "Design Bases for Protection against Natural Phenomena"
- 10 CFR Part 50, Appendix A, GDC 4
- RG 1.29, "Seismic Design Classification," Revision 4, Position C.2
- 10 CFR 20.1406, "Minimization of Contamination"

- SECY-94-084

9.2.11.4 Technical Evaluation

The staff reviewed the information provided in Section 9.2.11 of the Turkey Point Units 6 and 7 COL FSAR that describes the RWS, including the information provided by Figure 9.2-201, "Raw Water System Flow Diagram." The staff's evaluation in this section focuses primarily on RWS failure considerations and on the capability and reliability of the RWS to perform its cooldown function. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The remainder of this SER section evaluates both PTN SUP 9.2-2 and Interface Items 9.4 and 9.5.

A. GDC 2, GDC 4, and RG 1.29

The staff reviewed the information in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11 to confirm that RWS failures will not adversely impact the control room occupants or adversely affect SSCs that are safety-related or designated for RTNSS. Although Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11.1.1, "Safety Design Basis," states that failures of the RWS or its components will not affect the ability of safety-related systems to perform their intended functions, it did not include sufficient information to adequately describe the consequences of RWS failures and to explain why safety-related SSCs are not affected. Likewise, it did not include sufficient information to explain why a failure of the RWS will not adversely affect RTNSS systems and components or impact the control room, or result in an unacceptable release of radioactive material to the environment. Because the applicant did not identify and address these considerations, the staff was unable to confirm compliance with GDC 2, GDC 4, and passive plant policy considerations, as described in SECY-94-084. Consequently, the staff requested, in RAI 5491, Question 09.02.01-2, that the applicant revise Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11 to address the impact of RWS failures, including development of plant-specific ITAAC and test program specifications, as appropriate.

In a letter dated August 17, 2011 (ADAMS Accession No. ML11234A011), the applicant provided a detailed response to the GDC 2, GDC 4, and ITAAC and testing questions. In its response, the applicant stated that the potential failures of the RWS and the corresponding impact on SSCs that are safety-related or AP1000 equipment Class D were considered. A summary of the applicant's response is described below.

- The RWS does not directly interface with any safety-related system as described in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11 and shown on Turkey Point Units 6 and 7 COL FSAR, Figure 9.2-201. The RWS storage tank is located more than 200 ft east of the nearest building or structure within the scope of the AP1000 DCD certification (DCD Figure 1.2.2 and Turkey Point Units 6 and 7 COL FSAR, Figure 1.1-201) and therefore is distant to any safety-related or RTNSS SSCs. Also, RWS piping is not routed in close proximity to any safety-related SSCs. The only RTNSS system that RWS piping is in close proximity to is the SWS.

- A resultant flood from a break in the RWS piping is bounded by the analysis for a break in the CWS piping. DCD Section 3.4.1.1.1 indicates that a failure of the CWS cooling tower, the SWS piping, or the CWS piping could result in a potential flood source. However, these potential sources are not located in close proximity to safety-related structures and the consequences of a failure in the yard would be enveloped by the analysis described in DCD Section 10.4.5 for failure of the CWS. Likewise, because the RWS storage tank is not located in close proximity to safety-related or RTNSS SSCs, including the control room, the consequences of a failure would be enveloped by the analysis described in DCD Section 10.4.5. Site grading is designed to carry water away from safety-related or AP1000 Class D SSCs.
- RWS piping, which supplies water from the RWS storage tank to RWS interface points, is routed in the yard area and inside the turbine building. Water that discharges from a break in the RWS piping prior to securing the ancillary RWS pumps could be a source of flooding in the turbine building. A break in the RWS is bounded by a break in the CWS piping. As discussed in DCD Section 3.4.1.2.2.3, the bounding flooding source inside the turbine building is a break in the CWS piping. Flow from any postulated pipe failures above DCD elevation 100'-0" (Turkey Point Units 6 and 7 equivalent plant NAVD88 elevation is 26'-0") would travel down to DCD elevation 100'-0" via floor gratings and stairwells. There is no safety-related equipment in the turbine building. The CCS and SWS components on DCD elevation 100'-0", which provides RTNSS support for the RNS, is expected to remain functional following a flooding event in the turbine building because the pump motors and valve operators are above the expected flood level. Therefore, failures of the RWS piping within the turbine building will not adversely impact any safety-related or RTNSS SSCs.
- The RWS-to-SWS interface is at the SWS makeup control valve V009, as shown in DCD Figure 9.2.1-1. The SWS piping is routed from the control valve V009 to the top of the SWS cooling tower basin. There is an air gap between the SWS cooling tower basin water level and the discharge into the basin. The air gap ensures any break upstream of the raw water makeup control valve will not result in the draining of the SWS cooling tower basin.
- The RWS provides an alternate dilution source for the WLS discharge. The RWS does not have the potential to be a flow path for radioactive fluids due to system interfaces. The liquid radwaste effluent interface is at a point in the wastewater discharge system to the deep injection wells that prevents the effluent from entering the RWS.
- In summary, failure of the RWS or its components will not affect the ability of any safety-related systems to perform their intended safety functions nor will it adversely affect any RTNSS systems. Postulated breaks in the RWS piping will not impact safety-related components, because the RWS is not located in the vicinity of any safety-related equipment and the water from the postulated break will not reach any safety-related equipment, result in physical impact to the control room, or result in a release of radioactivity to the environment.
- Because the RWS is not safety-related and its failure does not lead to the failure of any safety-related systems, the requirements of GDC 2 and GDC 4 and the guidance of NUREG-0800 Section 9.2.1, regarding safety-related systems, do not apply.

- RWS piping and structures are designed and constructed in accordance with nationally recognized codes and standards (such as American Society of Mechanical Engineers/American National Standards Institute (ASME/ANSI) B31.1, “Power Piping,” and American Water Works Association). Design features have been included (such as the use of material not susceptible to corrosion for buried piping, redundant pumps, and alternate power supplies) to ensure RWS is reliable and will be available to support normal plant operation and shutdown functions.
- As noted in Turkey Point Units 6 and 7 COL FSAR, Section 14.3.2.3.3, this site-specific system RWS does not meet the ITAAC selection criteria. ITAAC screening was performed for the RWS, using the screening criteria of Turkey Point Units 6 and 7 COL FSAR, Section 14.3.2.3, which concluded that ITAAC is not applicable, as indicated in Turkey Point Units 6 and 7 COL FSAR, Table 14.3-201.
- No specific technical specifications (TSSs) are required for the RWS and none are applicable. TSSs for the AP1000 are discussed in Units 6 and 7 COL FSAR Chapter 16 and AP1000 DCD Chapter 16, and were evaluated by the staff in NUREG–1793, Chapter 16.
- There are no availability controls for the RWS, and they are not required based on the RTNSS evaluation discussed in NUREG–1793, Chapter 22, and Westinghouse Commercial Atomic Power (WCAP)-15985, “AP1000 Implementation of the Regulatory Treatment of Nonsafety-Related Systems Process,” Revision 2. Also, Turkey Point Units 6 and 7 COL FSAR, Chapter 16, and AP1000 DCD, Chapter 16, do not identify any availability requirements for RWS.

The staff finds the applicant’s response to RAI Question 09.02.01-2 addresses the staff’s concerns because it clarifies the design features of the RWS that prevent adverse effects and interactions with safety-related and RTNSS systems. The staff determined that failure of the RWS will not affect the ability of any safety-related systems to perform their intended safety functions nor will it adversely affect any RTNSS. Postulated breaks in the RWS piping will not impact safety-related components, because the RWS is not located in the vicinity of any safety-related equipment and water from a postulated pipe break will not reach any safety-related equipment or result in injury to occupants of the control room nor will it result in a release of radioactivity to the environment. Testing of the RWS has been properly addressed. Since the RWS is not safety related and its failure does not lead to the failure of any safety-related systems, the staff concludes that the requirements of GDC 2, GDC 4, and RG 1.29 have been satisfied; therefore, RAI Question 09.02.01-2 is resolved.

B. Cold Shutdown

The RWS is relied upon for achieving and maintaining cold shutdown conditions, which (in addition to the passive plant policy considerations discussed above in the Regulatory Basis section) is necessary for satisfying TS requirements. In particular, the RWS is relied upon for cooling the RCS from Mode 4 to Mode 5 conditions within 36 hours. The staff finds that Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11 does not provide a clearly defined design basis with respect to the RWS cooldown function, and the reliability and capability of the RWS to perform this function for the most limiting situations have not been described and addressed in

this regard. For example, the minimum RWS flow rate, water inventory, temperature limitations, and corresponding bases for providing SWS makeup for the two Turkey Point Units 6 and 7 units were not described. Also, the suitability of RWS materials for the plant-specific application and measures being implemented to resolve vulnerabilities and degradation mechanisms to ensure RWS functionality over time were not addressed. Because the applicant did not adequately define and address RWS design-basis considerations with respect to its cool-down function, the staff was unable to confirm that the cool-down and policy considerations that apply to passive plant designs, as discussed in SECY-94-084, were satisfied. The staff requested, in RAI 5491, Question 09.02.01-3, that the applicant revise Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11 to address the design basis regarding the reliability and capability of the RWS cool-down function, including the capability of the RWS system to supply makeup during a loss of power.

In its response dated August 17, 2011 (ADAMS Accession No. ML11234A011), the applicant stated that the following was related to achieving and maintaining cold shutdown conditions:

- As described in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11 and shown on Turkey Point Units 6 and 7 COL FSAR, Figure 9.2-201 (Sheet 3 of 3), the RWS interfaces with the SWS. The other functions performed by RWS, as described in Section 9.2.11, do not have a direct interface with any system identified in the AP1000 DCD as safety related, designated for RTNSS, or designated as AP1000 Class D. Therefore, this response specifically focuses on the RWS interface with the SWS.
- The RWS provides a water fill/makeup function for the SWS. SWS has investment protection short-term availability controls, as described in AP1000 DCD, Table 16.3-2, which are applicable in Mode 5 with the RCS pressure boundary open and in Mode 6 with the upper internals in place or cavity level less than full. Under these conditions, the SWS is directly providing active core cooling and was evaluated by Westinghouse and determined to meet the RTNSS criteria as documented in NUREG-1793 and WCAP-15985. Unlike the SWS, the RWS does not directly provide core cooling and, as discussed in response to RAI Question 09.02.01-2, was evaluated in WCAP-15985 and determined not to meet the RTNSS criteria and not to require investment protection short-term availability controls.
- It is unlikely that a failure of RWS to provide adequate makeup flow to the SWS cooling tower basins would occur during the short time period in which the SWS is performing an RTNSS function, as described above. However, if a failure were to occur, the remaining available inventory in the service water cooling tower basins and the stored water, which is available in the additional excess volume of the secondary fire water tank, would provide ample time (more than 24 hours) to restore the RWS makeup flow or take the procedural actions necessary to exit the conditions for RTNSS applicability. Therefore, the RWS is not required to be an RTNSS system or subject to IPSAC. The RWS is designed to be a highly reliable and robust system capable of operating during a loss of normal alternating current (AC) power to provide makeup flow to the SWS under normal and abnormal conditions. Procedural controls, which provide for continued operation of the RWS or re-establishment of operations under off-normal conditions, will be described in the operating procedures, where appropriate.

- As defined in AP1000 DCD, Section 3.2.2.6, an SSC is classified as Class D when either of the following occurs:
 - The SSC directly acts to prevent unnecessary actuation of the passive safety systems.
 - The SSC supports those SSCs that directly act to prevent the actuation of passive safety systems.

Class D has normally been applied to AP1000 SSCs that perform defense-in-depth functions. While the SWS is designated in the AP1000 DCD as a defense-in-depth, Class D system, the RWS is designated as a Class E system (DCD Table 3.2-3). The basis for this classification is:

- A failure of the RWS will not directly cause an actuation of a passive system nor will it initiate the failure of an SSC that directly acts to prevent the actuation of a passive safety system.
- In the unlikely event of a failure of the RWS, the inventory in the service water cooling tower basin and available stored inventory in the additional excess volume of the secondary fire water tank ensure that the SWS can maintain the required defense-in-depth cooling functions for an extended period of time.
- As described in AP1000 DCD Section 5.4.7.1.2.1, the RNS in conjunction with its associated support systems, CCS and SWS (as a support system for CCS), are used for shutdown heat removal. The RWS provides indirect support for this function by providing a source of makeup water to the SWS cooling tower basins to compensate for evaporation, drift, and blowdown.
- The RWS provides this makeup water to support the cooling requirements for the SWS. During a normal plant cooldown, the RNS and CCS reduce the temperature of the RCS from approximately 177 °C (350 °F) to approximately 52 °C (125 °F) within 96 hours after shutdown. Each unit's RWS is designed to provide ample makeup flow during these conditions using the raw water ancillary pumps.
- If cooldown to Cold Shutdown (Mode 5) is required within 36 hours to comply with a limiting condition for operation, in accordance with the TSs, heat will be transferred from the RCS via the steam generators to the main steam system for a longer period of time, allowing the RNS to be placed in service at a lower temperature with lower decay heat levels. Because of the reduced RNS heat removal requirements associated with this cold shutdown sequence, the required RWS makeup flow to the SWS cooling towers is less than normal cooldown requirements.
- An ample inventory of raw water is available to provide makeup to the SWS cooling tower basins. As noted in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11.2.2.3, a raw water storage tank serving both units (note: GDC 5, "Sharing of Structures, Systems, and Components," does not apply, because the RWS is not an important-to-safety system as discussed previously) receives potable water supplied from the MDWASD. The potable water supply piping enters the Turkey Point Units 6

and 7 plant area from the north and is routed to the raw water storage tank located to the east of the two Turkey Point Units 6 and 7 units (Turkey Point Units 6 and 7 COL FSAR, Figure 1.1-201). The raw water ancillary pumps are located at grade elevation in close proximity to the above ground raw water storage tank, which continually receives makeup from the potable water supply. Should the potable water supply to the raw water storage tank be interrupted, the volume of water in the tank would provide sufficient time to temporarily supply water from another onsite water source, such as reclaimed water from the MWR. The MWR has a capacity well in excess of that needed to support cooldown to cold shutdown conditions and maintain the station in Mode 5 for more than 7 days.

RWS Design Reliability

- Underground RWS piping will be high-density polyethylene, which is not susceptible to corrosion. Therefore, periodic inspections of the underground RWS piping are not required.
- As discussed above, the lack of designation of the RWS as RTNSS or Class D indicates there is no performance requirement for the system during a loss of normal AC power or in the event of a single active failure. Nonetheless, the RWS is highly reliable based on its design. Each raw water ancillary pump can deliver makeup flow to the SWS cooling tower basins to meet demand during all modes of operation. Failure of an operating pump would not prevent the RWS from providing makeup to the SWS cooling towers. In the event of a loss of normal AC power, the raw water ancillary pumps may be manually loaded onto the appropriate diesel bus and may be manually started by the operator. The RWS, therefore, continues to maintain the capability to provide makeup water to the SWS cooling tower basins during the loss of normal AC power events.
- As discussed above, in the unlikely event that all the RWS flow to the SWS cooling towers is lost, there is ample time to identify and correct the situation or to align alternate sources of water to provide that makeup flow, and the RWS is shown not to be an RTNSS system nor subject to investment protection short-term availability controls. It is also important to note that the RNS, CCS, SWS, nor RWS are required to establish and maintain the AP1000 plant in a safe shutdown condition, since passive safety-related systems perform that function. This is explicitly recognized throughout the AP1000 DCD and NUREG-1793.
- Turkey Points Units 6 and 7 COL FSAR, Section 9.2.11 will be revised to include additional details to address the applicable system attributes requested in items-(a) through-(r) of this RAI.

The staff found that the response to RAI Question 09.02.01-3 was missing information and generated RAI Question 09.02.01-6 (eRAI 6346) to resolve the following issues:

- (1) Provide the volume of the RWS storage tank. A bounding volume of the RWS storage tank could be provided to support “sufficient time to restore the potable water supply” for various flow requirements, such as power operations, support for shutdown conditions, and SWS RTNSS conditions.

- (2) The flow rate of the RWS pumps was not provided and reviewed to the AP1000 required flow rate (to support RWS being adequately designed). Established AP1000 raw water makeup flow requirements can be found in the NRC's public document system at ADAMS Accession No. ML090760819.
- (3) The reclaimed water connections and system line-up from the MWR to support the SWS is not clearly defined in the Turkey Point Units 6 and 7 COL FSAR (drawings or text does not show interconnections). If temporary equipment is needed for this water makeup source, provide a statement that supports "sufficient time to restore the potable water supply."
- (4) Flow rate of the reclaimed makeup water pumps to support SWS makeup is not defined.
- (5) Since the MWR is a backup water source for the ESWS cooling tower, describe any negative SWS system performance issues with the cleanliness of the MWR water. Describe if the SWS cooling tower efficiency is affected by the change in water supply.

The applicant responded to RAI Question 09.02.01-6 on May 14, 2012, and provided the following response for each of the five requests.

- (1) The raw water storage tank minimum capacity is two million gallons. The installed available supply of makeup water to the SWS cooling tower basins would be 7571 m³ (2,000,000 gallons) (minimum raw water storage tank inventory), plus 1439 m³ (380,000 gallons) (secondary fire water tanks nominal volume not reserved for fire protection), plus 1741 m³ (460,000 gallons) (minimum usable SWS cooling tower basin inventory). This represents a combined capacity of 10,751 m³ (2,840,000 gallons). Twenty-four (24) hours from the loss of the potable water supply to the raw water storage tank should be sufficient time to either restore the supply or assess the situation and provide another source (such as the makeup water reservoir) of makeup water to the SWS cooling tower basins. At the normal makeup combined flow rate of approximately 1.68 m³/min (370 gpm) to both units' SWS cooling tower basins with blowdowns secured, greater than 72 hours of makeup flow would be available from the raw water storage tank alone.

For the case of shutdown of both units, the maximum makeup demand occurs at the beginning of cooldown, 4 hours after reactor shutdown. The maximum combined makeup requirement for simultaneous cooldown of both units, with blowdowns secured, is approximately 4.7 m³/min (1,250 gpm). Conservatively assuming this flow rate, a raw water storage tank minimum capacity of two million gallons can provide makeup to the SWS cooling tower basins for greater than 24 hours. In reality, the required makeup flow rate drops off significantly during the initial cooldown period and the required makeup flow rate during cooldown (96 hours) is estimated by Westinghouse to be approximately 1.68 m³/min (444 gpm) (combined average for both units with blowdowns secured). Based on this information, there is sufficient water in the raw water storage tank alone to provide makeup for at least 2 – 3 days to support simultaneous shutdown of both units while the potable water supply is

restored to the raw water storage tank or makeup water is provided from another source.

During Modes 5 and 6 (the modes when SWS RTNSS requirements could apply) the required makeup to the SWS cooling tower basins is much lower than during normal operation or cooldown during plant shutdown. Therefore, additional time would be available to restore the potable water supply to the raw water storage tank or provide SWS cooling tower basins makeup from another source.

Assuming normal power operations, the volume of raw water that is available in the raw water storage tank with blowdown secured is beyond 72 hours. Assuming the worst case raw water makeup requirements, the volume of raw water that is available in the raw water storage tank, in support of a shutdown of both units is beyond 24 hours. For the raw water makeup support for the SWS RTNSS functions, the available raw water volume will provide beyond 72 hours. Therefore, the staff finds that the raw water storage tank will adequately support power operations, shutdown, and RTNSS functions, and in the event that the raw water storage tanks become unavailable, there is adequate time (beyond 24 hours for worst case) to manually restore water makeup to the SWS basins. In addition, there is an initial 24 hours of SWS makeup water available within SWS basins and the FPS. The applicant provided a Turkey Point Units 6 and 7 COL FSAR markup adding the volume of the raw water storage tank, and the staff finds the Turkey Point Units 6 and 7 COL FSAR markup acceptable. The staff reviewed the applicant's response to RAI Question 09.02.01-6, Part 1, and finds it acceptable. The revised version of the Turkey Point Units 6 and 7 COL FSAR incorporates the associated revision to Section 9.2.11.2.2.3 as described in the applicant's letter of May 14, 2012.

- (2) Both Unit 6 and Unit 7 RWS have two (2) redundant ancillary pumps. Each of the four (4) pumps has a minimum capacity to provide 100 percent of the design maximum makeup requirement for the SWS of approximately 832 gpm which includes approximately 207 gpm for the SWS blowdown.

The staff reviewed the applicant's response to RAI Question 09.02.01-6, Part 2, and finds it acceptable. The Turkey Point Units 6 and 7 raw water ancillary pumps are adequately designed to the Westinghouse AP1000 design data, which is 3.1 m³/min (830 gpm) per unit, which includes a blowdown flow of 0.78 m³/min (205 gpm) per unit. Therefore, RAI Question 09.02.01-6, Part 2, is considered resolved.

- (3) Turkey Point Units 6 and 7 FSAR, Subsection 9.2.11.2.2.3 mentions the MWR as a potential temporary source of SWS makeup water in the event that the potable water supply to the raw water storage tank is interrupted. The Turkey Point Units 6 and 7 COL FSAR section specifically identifies the MWR as a potential temporary source of SWS makeup to convey that a sufficient volume of water would be available onsite should it be needed. Mention of the MWR does not preclude the use of water from other sources that may be determined to be suitable and available. The drawings and text do not show interconnections because the MWR is only identified as a potential temporary water source. Assuming water would be supplied from the MWR, determination of what interconnections, if any, would be used to transfer water from the MWR to the SWS cooling

tower basins will be made during the detailed design. The method of water transfer currently envisioned is the use of temporary pumps and hoses without the need for permanent connections/interconnections. This method would be procedurally controlled to ensure water would only be introduced into the SWS under controlled conditions to address a temporary need and that temporary equipment as necessary would be available for deployment and use.

As discussed in the response to RAI Question 09.02.05-6, Part 1, SWS makeup from another source of water, such as water from the MWR, would not be necessary for a number of days after the potable water supply to the raw water storage tank was interrupted. Therefore, there is ample time to restore the potable water supply or take steps to provide a temporary source of SWS makeup.

The staff reviewed the applicant's response to RAI Question 09.02.01-6, Part 3, and finds it acceptable. The MWR is considered a potential temporary source of SWS makeup and is not to be shown on Turkey Point Units 6 and 7 COL FSAR figures. Manual operator actions, with procedural controls, using temporary pumps and hoses are expected to be utilized in the water transfer from the MWR to the SWS, if the raw water storage tank becomes unavailable. Temporary equipment would be available for deployment. Therefore, RAI Question 09.02.01-6, Part 3, is considered resolved.

- (4) The maximum SWS makeup requirement is less than 6.4 m³/min (1700 gpm) (for two units), which is relatively small compared to the capacity of the reclaimed makeup water pumps (greater than 37.9 m³/min (10,000 gpm) anticipated). Therefore, use of the reclaimed makeup water pumps would not likely be considered to support SWS makeup because of the provisions in the permanent piping system that might be needed to accommodate the low flow condition. Procedurally controlled temporary pumps will be available (in appropriate quantity and capacity) to support SWS makeup requirements.

The staff reviewed the applicant's response to RAI 53, Question 09.02.01-6, Part 4, and finds it acceptable. The applicant stated in the response to item 3 above that temporary pumps would be utilized. The reclaimed makeup water pumps would not likely be used to support SWS makeup in the event that the raw water storage tank becomes unavailable. Therefore, RAI 53, Question 09.02.01-6, Part 4, is considered resolved.

- (5) Turkey Point Units 6 and 7 COL FSAR, Subsection 9.2.11.2.2.3 mentions the MWR as a potential temporary source of SWS makeup water in the event that the water supply to the raw water storage tank is interrupted. The Turkey Point Units 6 and 7 COL FSAR section specifically identifies the MWR as a potential temporary source of SWS makeup to convey that a sufficient volume of water would be available onsite should it be needed. Mention of the MWR does not preclude the use of water from other sources that may be determined to be suitable and available.

However, in the event a temporary source of SWS makeup water is needed and the MWR is used as the source, any negative impact to the

SWS cooling tower performance would not be significant during the short term use.

While the potable water supplied to the raw water storage tank is of higher quality than the water stored in the MWR, water from the MWR should be of sufficient quality for short term use in the SWS cooling towers. Finalization of the design will provide for additional treatment of the MWR water and/or another source that can supply sufficient water with acceptable chemistry, as necessary. The SWS includes permanent strainers and chemical injection to assist in controlling water quality. Additionally, during temporary operation with water from the MWR or another source, the SWS cooling towers would be subjected to heat loads lower than design capacity.

Plant procedures will control restoration of the normal potable water supply, including SWS cleanup, to ensure appropriate levels of chemical treatment and blowdown of the system.

The staff reviewed the applicant's response to RAI Question 09.02.01-6, Part 5, and finds it acceptable. MWR is to be utilized as a short-term potential temporary source of SWS makeup, and the MWR is not expected to cause any negative impact of the SWS cooling tower performance. Finalization of the design will provide for additional treatment of the MWR water or another source, or a combination of MWR water with another source that can supply sufficient water with acceptable chemistry, as necessary.

In addition as stated in AP1000 DCD Sections 9.2.1.2.1 and 9.2.1.2.2, the SWS is designed with permanent strainers and chemical injection to assist in controlling water quality. Therefore, RAI Question 09.02.01-6, Part 5, is considered resolved.

In summary, the staff notes that each RWS ancillary pump can deliver adequate makeup flow to the SWS cooling tower basins to meet demand during all modes of operation. Further, without RWS makeup to the SWS cooling tower basins, adequate inventory in the SWS cooling tower basins exists along with the stored water in the secondary fire water tanks that would provide more than 24 hours to restore RWS makeup flow. The raw water storage tank provides over 7,570 m³/min (2 million gal) of water for the SWS cooling tower basins, which are shared between the two nuclear units. The RWS is considered highly reliable based on its design, and a single failure of a structure or component in the RWS would not affect normal plant cooldown. The RWS ancillary pumps (two per unit) can be manually loaded onto the standby diesel generators to provide adequate makeup flow to the SWS cooling tower basins. Further, the staff reviewed the proposed Turkey Point Units 6 and 7 COL FSAR changes discussed in the RAI related to RWS operations and components. The staff finds that the Turkey Point Units 6 and 7 COL FSAR markup has been adequately incorporated into the revised version of the Turkey Point Units 6 and 7 COL FSAR for RAI 29, Questions 09.02.01-3. Therefore, the issues described in RAI Questions 09.02.01-3 and 09.02.01-6 are resolved. The staff confirms that the Turkey Point Units 6 and 7 COL FSAR has been revised accordingly.

C. Regulatory Treatment of Nonsafety-Related System

The RWS supports the SWS cooling function by providing makeup water to the SWS cooling tower basins. The staff noted that, while the SWS is designated for RTNSS during reduced

reactor inventory conditions, the RWS is not needed to support the SWS cooling function when the reactor water inventory is reduced, because the RWS is not designated for RTNSS. However, there is no explanation in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11 as to why the RWS is not considered an RTNSS. Also, because the SWS cooling tower basins are very limited in their capacity, it was not clear why the RWS makeup would not be required for this situation. Consequently, the staff requested, in RAI Question 09.02.01-4 (eRAI 5491), that the applicant revise Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11 to explain why the RWS makeup is not needed during reduced reactor inventory conditions and, in particular, to describe controls that will be implemented to ensure that assumptions remain valid.

In its response dated August 17, 2011 (ADAMS Accession No. ML11234A011), the applicant stated that a detailed response was provided to RAI 5491, Question 09.02.01-3, explaining why the RWS is not designated as RTNSS and makeup from the RWS to the SWS cooling tower basins is not required during reduced reactor inventory conditions. The referenced RAI response also discusses that procedural control will be established to take the required actions to exit the conditions for applicability of the SWS as an RTNSS system, in the unlikely event of a failure to re-establish the RWS makeup capability.

The staff finds the applicant's response to RAI 5491, Question 09.02.01-4 (ADAMS Accession No. ML11234A011), which references the response to RAI Question 09.02.01-3, acceptable because (1) the RWS was previously evaluated in WCAP-15985 in Table-1-1, "Nonsafety-related system evaluation in AP1000 RTNSS Process," which was previously approved by the staff, (2) the RWS does not directly provide core cooling, and (3) the RWS has adequate stored water within the SWS cooling towers and the secondary fire water tank for more than 24 hours to support the SWS RTNSS functions, plus the 24 hours stored onsite water supply provides ample time to restore the RWS makeup flow or take the procedural actions necessary to exit the condition of applicability for the SWS and its RTNSS function. Therefore, RAI Question 09.02.01-4 is resolved.

D. System Design Consideration

As specified by 10 CFR 20.1406, COL applicants are required to describe how facility design and procedures for operation will minimize the generation of radioactive waste and contamination of the facility and environment, and facilitate eventual plant decommissioning. The reclaimed water or saltwater portions of the RWS provide an alternate dilution source for liquid radwaste discharge when the CWS cooling tower blowdown is not available. Although the RWS has no interconnections with any systems that contain radioactive fluids, industry experience has shown that this alone may not be sufficient to prevent the RWS from becoming contaminated. For example, unplanned leaks or release of contaminated fluids as a result of component failures or transport, drainage problems in contaminated areas, and the migration of contamination through soils and other porous barriers over time have caused systems and areas of the plant that are not directly connected with contaminated systems to become contaminated. Therefore, the staff requested, in RAI Question 09.02.01-5 (eRAI 5491), that the applicant provide additional information to describe design provisions and other measures that will be implemented to satisfy the requirements specified by 10 CFR 20.1406, including measures that will be implemented to monitor the RWS for contamination and corrective actions that will be taken to eliminate any radioactive contamination that is identified.

In its response, dated August 17, 2011 (ADAMS Accession No. ML11234A011), as described in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11, "Raw Water System," reclaimed water from the MDWASD is supplied to the FPL reclaimed water treatment facility.

- Water from the reclaimed water facility is then stored in the MWR for use as makeup to the CWS mechanical draft cooling tower basins. Also as described in Section 9.2.11, saltwater from beneath Biscayne Bay is used for makeup to the CWS cooling tower basins directly when reclaimed water is unavailable in sufficient quantity, quality, or both.
- As further described in Section 9.2.11, potable water from the MDWASD is supplied to the raw water storage tank for makeup to the SWS mechanical draft cooling tower basins, DTS, and FPS. The reclaimed water or saltwater portions of the RWS also provide an alternate dilution source for liquid radwaste discharge when the CWS cooling tower blowdown is not available.
- Potential failures of the plant systems causing external and internal flooding are described in AP1000 DCD Section 3.4, and potential sources that could transport contaminants to the RWS are monitored in accordance with AP1000 DCD Section 11.5.
- As described in AP1000 DCD Section 11.5, the radiation monitoring system provides plant effluent monitoring, process fluid monitoring, airborne monitoring, and continuous indication of the radiation environment in plant areas where such information is needed.

Compliance with 10 CFR 20.1406:

- In support of COL application pre-application activities, Westinghouse has submitted to the staff the report, AP1000 Standard Combined License Technical Report APP-GW-GLN-098, Revision 0, "Compliance with 10 CFR 20.1406," dated April 10, 2007. This report summarizes the design approach and features incorporated into the AP1000 standard plant design that demonstrate compliance with 10 CFR 20.1406. The plant features described in this report will minimize contamination and radioactive waste generation for the AP1000 design.

Groundwater Transport:

- Turkey Point Units 6 and 7 COL FSAR, Section 2.4.13, "Accidental Release of Radioactive Liquid Effluents in Ground and Surface Waters," presents an analysis of the effect of an accidental release of liquid effluents to the groundwater environment through the postulated failure of the liquid waste system effluent holdup tank.

Groundwater Monitoring Program:

- In accordance with 10 CFR 20.1406 and as covered in Westinghouse Technical Report APP-GW-GLN-098, a groundwater monitoring program beyond the normal radioactive effluent monitoring program will be developed. Turkey Point Units 6 and 7 COL FSAR, Section 12AA.5.4.14 lists locations of areas to be monitored for the AP1000 design and states a groundwater monitoring program will be developed. Groundwater monitoring program implementation considerations are also described in Turkey Point Units 6 and 7 COL FSAR Section 12AA.5.4.13. A "Record of Operational Events of

Interest for Decommissioning” is described in Turkey Point Units 6 and 7 COL FSAR Section 12AA.5.4.15.

- Based on the above monitoring program, unplanned leakage or release of contaminated fluids will be detected.

Conclusion:

- The RWS piping system interfaces do not provide a potential to be a flow path for radioactive fluids, as indicated in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.11.1.1 and shown in Turkey Point Units 6 and 7 COL FSAR, Figure 9.2-201. Also, the possibility of contaminating the RWS from a release to the subsurface environment from Units 6 and 7 is remote. Therefore, direct monitoring of the RWS for contamination is not required.

The staff finds that the RWS does not have the potential to be a flow path for radioactive fluids. The Turkey Point Units 6 and 7 WLS effluent discharge release point is where the WLS effluent discharge pipe connects to the blowdown sump discharge pipe to deep injection wells. Both CWS and RWS provide dilution flow to the blowdown sump for the effluent discharge. The pumping station associated with the blowdown sump and the associated WLS discharge piping is designed to ensure that there is no potential for contamination of the blowdown sump due to radioactive water discharge. The staff finds that it is unlikely that liquid radwaste would be able to travel to the RWS interface, based on the design of the blowdown sump. The blowdown sump design is further described in Section 9.2.9 of this report, and the WLS is described in Section 11.2.1.

In addition, the applicant indicated that the groundwater monitoring program should minimize the possibility of contaminating the RWS from external subsurface sources. The applicant noted that the groundwater monitoring program is described in Turkey Point Units 6 and 7 COL FSAR Section 12AA.5.4.14, “Ground Monitoring Program.” The applicant stated, in Turkey Point Units 6 and 7 COL FSAR Section 12AA.5.4.14, that it has adopted Nuclear Energy Institute (NEI) 08-08A, “Generic FSAR Template Guidance for Life Cycle Minimization of Contamination,” for the groundwater monitoring program description. The staff’s evaluation of the groundwater monitoring program is provided in Chapter 12 of this SER.

Because there is no interconnection with any system that contains potentially radioactive fluids as indicated in Turkey Point Units 6 and 7 COL FSAR Section 9.2.11.1.1, the staff concludes that the requirements of 10 CFR 20.1406 are satisfied and considers this aspect of RAI Question 09.02.01-5 resolved.

Based on the above technical evaluation, the staff finds the information added to the Turkey Point Units 6 and 7 COL FSAR to address PTN SUP 9.2-2 and Interface Items 9.4 and 9.5 to be acceptable.

9.2.11.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.2.11.6 Conclusion

The staff evaluated the RWS as described in Turkey Point Units 6 and 7 COL FSAR Section 9.2.11. The staff's evaluation focused primarily on confirming that (a) the design of the RWS complies with the requirements of GDC 2 and GDC 4 and conforms with the guidance in RG 1.29, (b) the RWS reliance for the support of SWS for achieving and maintaining cold shutdown conditions and RTNSS considerations is consistent with the guidance in SECY-94-084, (c) the RWS is not considered RTNSS, and (d) other system design considerations meet the requirements of 10 CFR 20.1406.

Based upon the results of this evaluation, the staff concludes that the Turkey Point Units 6 and 7 RWS, as described under PTN SUP 9.2-2 in Section 9.2.11 of the Turkey Point Units 6 and 7 COL FSAR, including Interface Items 9.4 and 9.5, is acceptable.

9.2.12 Deep Well Injection System

9.2.12.1 Introduction

The DIS is used to dispose of plant wastewater, including both nonradioactive liquid waste (e.g., CWS blowdown) and radioactive liquid waste from the liquid radwaste processing system. The principal DIS components consist of 12 deep injection wells, 6 dual zone monitoring wells and associated piping, valving, pumps, and instrumentation for system operational monitoring. The DIS functions to dispose of and confine plant wastewater to the Boulder Zone. The DIS has no safety-related function, and does not affect the ability of safety-related systems to perform their intended functions.

9.2.12.2 Summary of Application

Section 9.2 of the AP1000 DCD does not include a section on deep well injection. In response to RAI 6985, Questions 11.02-6-5 (ADAMS Accession No. ML13225A029) to RAI 6985, Question 11.02-6-6 (ADAMS Accession No. ML14269A066), the applicant supplemented Section 9.2 of the AP1000 DCD, Revision 19, by adding Section 9.2.12, "Deep Well Injection System," to the Turkey Point Units 6 and 7 COL FSAR. Therefore, no COL action items are associated with the added FSAR section of the COL application. Section 9.2.12 describes the operation and use of DIS.

9.2.12.3 Regulatory Basis

As identified above, the AP1000 DCD does not include a section on deep well injection. Therefore, COL FSAR Section 9.2.12 does not incorporate by reference associated information from the AP1000 DCD.

The regulatory basis for acceptance of this added information is established in:

- 10 CFR 20.1406, "Minimization of contamination"
- 10 CFR 20.2002, "Method for obtaining approval of proposed disposal procedures"
- 10 CFR Part 20, Appendix B, Table 2
- 10 CFR Part 50, Appendix I, Section II.A

9.2.12.4 Technical Evaluation

As described in Section 9.2.12.2 of this SER, Section 9.2.12 of the Turkey Point Units 6 and 7 COL FSAR does not have a corresponding section in the AP1000 DCD. The added section of the COL FSAR was created in response to staff RAI questions about the DIS that were raised for the staff's review of COL FSAR Section 11.2.

When discharging liquid radioactive waste, the DIS must maintain a minimum dilution water flow rate to comply with the radioactive waste release design objectives and limits described in NUREG-0800, Chapter 11. If sufficient dilution water is not available for a given liquid radwaste flow rate, the radwaste discharge flow rate can be adjusted as described in Turkey Point Units 6 and 7 COL FSAR, Chapter 11.

Circulating water is the primary source of dilution water for Turkey Point Units 6 and 7. Turkey Point Units 6 and 7 provide for the use of other sources of dilution water besides circulating water. Other sources of dilution water include reclaimed water and alternate dilution flow paths when circulating water system blowdown is not sufficient or available for dilution. These other sources of dilution water are available to supply the blowdown sump, which is the basin from which the dilution water pumps take suction. Sufficient dilution water is available in all modes of operation to provide at least 6,000 gpm of dilution water for each unit discharging liquid radwaste.

As stated in Appendix 12AA of the Turkey Point Units 6 and 7 COL FSAR, NEI 08-08A is adopted for Turkey Point Units 6 and 7. The NEI 08-08A template guidance provides a description of the operational and programmatic elements and controls that serve to minimize contamination of the facility, site, and the environment, to meet the requirements of 10 CFR 20.1406. Each of the 12 deep injection wells is constructed with materials designed to isolate and protect groundwater from injected fluid. This design will minimize potential environmental contamination. Six monitoring wells are located in close proximity to the injection wells to provide indication of leakage. Injection pipe casings are encapsulated in cement to protect against exposure to groundwater. The deep injection wells are constructed of new and unused steel casings designed to last for the life expectancy of the wells; a nominal 18 in. diameter fiberglass reinforced plastic pipe is encapsulated within the steel pipe with the intervening annulus filled with a nonhazardous corrosion inhibitor and sealed at the base and top to create a pressure-tight annular space.

In order to direct the discharge flow to the appropriate combination of discharge wells for discharge, the injectate piping contains manifolds, valves, and controls. The injectate piping also includes appurtenances, such as air/vacuum release valves, vent lines, and accessways, as necessary, for proper operation and maintenance of the discharge piping. 10 CFR 20.1406 specifies that the facility should be designed to minimize contamination of the facility and the environment. In order to comply with these requirements of 10 CFR 20.1406, the discharge piping, manifolds, valves, controls, and appurtenances are designed to minimize inadvertent or unidentified releases to the environment. The integrity of the injectate piping and the valve fittings will be monitored for leakage by performing periodic visual inspections, where accessible, as part of routine operation and maintenance activities. In order to ensure that leakage is contained and controlled, the valves associated with the injectate piping are included in the preventive maintenance program. As part of this program, they are checked periodically and maintained within acceptable parameters. Additional information concerning design

features of the discharge piping and deep injection wells incorporated to comply with the requirements of 10 CFR 20.1406 are described in Section 12.3.4 of the safety evaluation.

The staff reviewed Section 9.2.12 of the Turkey Point Units 6 and 7 COL FSAR and the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic. On the basis of its review, the staff confirms that the information in the application addresses most of the required information relating to the DIS. In response to NRC RAIs, the applicant supplied a response in FPL Letter L-2014-102, "Supplemental Response to NRC Request for Additional Information Letter No. 72 (RAI 6985) SRP Section 11.02 – Liquid Waste Management System (ADAMS Accession No. ML14269A066)." In the applicant's response, the applicant agreed to change some of the information in Section 9.2.12 by including additional sections discussing information on the source of alternate dilution flow from the makeup water reservoir; providing material to discuss information relating to the effluent concentration limits contained in 10 CFR Part 20, Appendix B, "Annual Limits on Intake (ALIs) and Derived Air Concentrations (DACs) of Radionuclides for Occupational Exposure; Effluent Concentrations; Concentrations for Release to Sewerage," which is also discussed in SER Section 11; and describing typical monitoring and sampling systems used with the dual zone monitoring wells. The staff has reviewed the revised version of the Turkey Point Units 6 and 7 COL FSAR and has confirmed that the requested changes are incorporated and determined that the changes are acceptable. The staff considers those portions of RAI 6985, Questions 11.02-6-5 to 11.02-6-6 related to Section 9.2.12 closed.

9.2.12.5 *Post-Combined License Activities*

There are no post-COL activities related to this section.

9.2.12.6 *Conclusion*

The staff evaluated the DIS as described in Turkey Point Units 6 and 7 COL FSAR Section 9.2.12 and 11.2. The staff's evaluation of the DIS is found in 11.2 and focused primarily on complying with 10 CFR 20.2002, "Alternate Disposal Methods." Through the staff's review of the information provided in DCD Section 9.2.12 and 11.2 the staff concludes that the DIS complies with the requirements of 10 CFR 20.2002. The staff's full evaluation of the 10 CFR 20.2002 requirements is found in SER Section 11.2.4, "Compliance with 10 CFR 20.2002."

Based upon the results of this evaluation, the staff concludes that the Turkey Point Units 6 and 7, as described under DCD Sections 9.2.12 and 11.2 of the Turkey Point Units 6 and 7 COL FSAR is acceptable.

9.3 Process Auxiliaries

9.3.1 Compressed and Instrument Air System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.1, "Compressed Air Systems")

9.3.1.1 *Introduction*

The compressed and instrument air system delivers instrument air, service air, and high-pressure air. The instrument air subsystem provides high-quality instrument air for plant use. The service air subsystem supplies plant breathing air. The high-pressure air subsystem produces air for high-pressure applications.

9.3.1.2 Summary of Application

Section 9.3 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.3 of the AP1000 DCD. Section 9.3 of the AP1000 DCD includes Section 9.3.1.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 9.3, the applicant provided the following:

Departures

- PTN DEP 6.4-2

The applicant provided additional information in Section 9.3.1.1.2 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-2 related to design changes affecting how the temperature and humidity in the MCR are maintained within the limits for reliable human performance. This information, as well as related PTN DEP 6.4-2 information appearing in other chapters of the FSAR is reviewed in Section 21.3 of this SER.

AP1000 COL Information Item

- STD COL 9.3-1

The applicant provided additional information in STD COL 9.3-1 to address COL Information Item 9.3-1 (COL Action Item 9.3.1-1).

9.3.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements. In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the compressed and instrument air system are given in Section 9.3.1 of NUREG–0800. The regulatory basis for STD COL 9.3-1 addressing Generic Safety Issue 43, “Reliability of Air Systems,” as part of training and procedures, is:

- 10 CFR Part 50, Appendix A, GDC 1, “Quality Standards and Records,” as it relates to the reliability of safety-related equipment actuated or controlled by compressed air

9.3.1.4 Technical Evaluation

The staff reviewed Section 9.3.1 of the Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the compressed and instrument air system. The results of the staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

SER Section 1.2.3 provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside of the scope of the DC and use this review

in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that any site-specific differences were not relevant to the safety conclusion.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.3.1.4 of the VEGP SER:

AP1000 COL Information Item

- *STD COL 9.3-1 (COL Action Item 9.3.1-1), involving air systems (NUREG-0933, "Resolution of Generic Safety Issues," Issue 43)*

The NRC staff reviewed STD COL 9.3-1 related to COL Information Item 9.3-1. COL Information Item 9.3-1 states:

The Combined License applicant will address DCD 1.9.4.2.3, Issue 43 as part of training and procedures identified in section 13.5.

The commitment was also captured as COL Action Item 9.3.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will address NUREG-0933, Issue 43 as part of training and procedures.

The applicant proposed to resolve STD COL 9.3-1 by providing training and procedures for operations and maintenance of the instrument air subsystem and air operated valves. The methodology to develop system operating procedures, abnormal operating procedures, and alarm response procedures is reviewed in Section 13.5 of this SER. The training program for operators and maintenance

personnel is reviewed in Section 13.2 of this SER. The applicant also stated that the compressed and instrument air system will be maintained and tested in accordance with the manufacturers' recommendations and procedures and that the system will be periodically tested to demonstrate conformance with the quality requirements of ANSI/ISA-7.3-1981.

NUREG-0933, Issue 43 discusses that possible solutions for this issue, include better operator training, operator awareness of the importance of compressed air systems, and periodic testing and inspection of the compressed air systems. The NRC staff reviewed the applicant's proposed resolution to STD COL 9.3-1 and determined that the BLN COL FSAR meets the guidance in NUREG-0933, Issue 43; therefore, the staff finds STD COL 9.3-1 resolved.

9.3.1.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.3.1.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the guidelines given in Section 9.3.1 of NUREG-0800.

- PTN DEP 6.4-2, related to design changes affecting how the temperature and humidity in the MCR are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.
- STD COL 9.3-1, the staff evaluated Issue 43, "Reliability of Air Systems," as part of the training and procedures in accordance with the requirements of GDC 1, as it relates to the impact of a failure of the compressed and instrument air system on safety-related SSCs. Based on the results of this evaluation, the Turkey Point Units 6 and 7 COL FSAR meets the guidance in NUREG-0933, Issue 43, and is acceptable.

9.3.2 Plant Gas System (Related to RG 1.206 Section C.III.1, Chapter 9, C.I.9.3.1, "Compressed Air Systems)

The plant gas system is a nonsafety-related system that supplies hydrogen, carbon dioxide, and nitrogen gases to plant systems as required. Failure of the system does not compromise any safety-related system nor does it prevent safe reactor shutdown.

The Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.3.2, "Plant Gas System," of the AP1000 DCD. The staff reviewed the

application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.3.3 Primary Sampling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.2, "Process and Postaccident Sampling Systems")

The primary sampling system is used to collect samples during normal operations and following an accident. The system collects for analysis samples from the reactor coolant, auxiliary primary process streams, and containment atmosphere. Both the normal operation and post-accident requirements are carried out by this single system.

The Turkey Point Units 6 and 7 COL FSAR, Section 9.3 incorporates by reference, with no departures or supplements, Section 9.3.3, "Primary Sampling System," of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.3.4 Secondary Sampling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.2, "Process and Post Accident Sampling Systems")

The secondary sampling system delivers representative samples of fluids from secondary systems to sample analyzer packages. Continuous online secondary chemistry monitoring detects impurity ingress and provides early diagnosis of system chemistry excursions in the plant.

The Units 6 and 7 COL FSAR Section 9.3 incorporates by reference, with no departures or supplements, Section 9.3.4, "Secondary Sampling System," of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.3.5 Equipment and Floor Drainage Systems (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.3, "Equipment and Floor Drainage System")

The equipment and floor drainage system collects liquid wastes from equipment and floor drains during normal operation, startup, shutdown, and refueling. The equipment and floor drainage system consists of two subsystems: radioactive waste drains and nonradioactive waste drains.

The Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.3.5, "Equipment and Floor Drainage Systems," of the AP1000 DCD.

The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.3.6 Chemical and Volume Control System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.3.4, "Chemical and Volume Control System (PWR) including Boron Recovery System")

The CVS maintains the required water inventory and quality in the RCS, provides pressurizer auxiliary spray, controls the boron neutron absorber concentration in the reactor coolant, provides a means for filling and pressure testing the RCS, controls the primary water chemistry, and reduces coolant radioactivity level. Further, the system provides recycled coolant for demineralized water makeup for normal operation and provides borated makeup flow to the RCS in the event of some accidents, such as a small-break loss-of-coolant accident.

The Turkey Point Units 6 and 7 COL FSAR, Section 9.3 incorporates by reference, Section 9.3.6, "Chemical and Volume Control System," of the AP1000 DCD. In addition, in the Turkey Point Units 6 and 7 COL FSAR, the applicant provided the following:

Departures

- PTN DEP 7.3-1

The applicant provided additional information in Section 9.3.6 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 7.3-1 related to required design changes for the PMS source range neutron flux doubling logic to comply with the requirements of Institute of Electrical and Electronics Engineers (IEEE) Std. 603-1991, "IEEE Standard Criteria for Safety Systems for Nuclear Power Generating Stations," Clause 6.6. This information, as well as related PTN DEP 7.3-1 information appearing in other chapters of the Turkey Point Units 6 and 7 COL FSAR, is reviewed in Section 21.5 of this SER.

The NRC staff reviewed Section 9.3.6 of the Turkey Point Units 6 and 7 COL FSAR (letter dated April 29, 2016 (ADAMS Accession No. ML16124A921)) and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this section. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the WLS COL application are documented in NUREG-1793 and its supplements.

9.4 Air-Conditioning, Heating, Cooling, and Ventilation Systems

9.4.1 Nuclear Island Nonradioactive Ventilation System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.1, "Control Room Area Ventilation System")

9.4.1.1 Introduction

The VBS, in conjunction with the MCR emergency habitability system described in Section 6.4, provides a controlled environment for the comfort and safety of control room personnel and ensures the operability of control room and nearby components during normal operating, anticipated operational transient, and design-basis accident conditions.

9.4.1.2 Summary of Application

The Turkey Point Units 6 and 7 COL FSAR, Section 9.4 incorporates by reference Section 9.4 of the AP1000 DCD. Section 9.4 of the DCD includes Section 9.4.1, describing the VBS.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Sections 9.4.1, 9.4.1.4, and 9.4.12, (and in a letters dated May 6, 2016 and May 16, 2016 (ADAMS Accession Nos. ML16131A674, and ML16140A087 respectively)), the applicant provided the following:

Departures

- PTN DEP 6.4-1

The applicant provided additional information in Section 9.4.1 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-1 related to design changes affecting habitability of the MCR and changes to the calculated doses to control room operators. This information, as well as related PTN DEP 6.4-1 information appearing in other chapters of the FSAR is reviewed in Section 21.2 of this SER.

- PTN DEP 6.4-2

The applicant provided additional information in Section 9.4.1 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-2 related to design changes affecting how the temperature and humidity in the MCR are maintained within the limits for reliable human performance. This information, as well as related PTN DEP 6.4-2 information appearing in other chapters of the Turkey Point Units 6 and 7 COL FSAR is reviewed in Section 21.3 of this SER.

AP1000 COL Information Items

- STD COL 9.4-1a

The applicant provided additional information in STD COL 9.4-1a to address the first part of COL Information Item 9.4-1 (COL Action Item 9.4.1-1), related to a program for inspections and testing applicable to the VBS.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 9.4.12, the applicant provided the following:

- PTN COL 9.4-1b

The applicant provided additional information in VCS COL 9.4-1b to address the second part of COL Information Item 9.4-1 (COL Action Item 6.4-3). The local toxic gas services are evaluated to determine the need for monitoring for control room habitability.

9.4.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements. In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the VBS are given in Section 9.4.1 of NUREG-0800.

The applicable regulatory guidance for the VBS is as follows:

- RG 1.140, “Design, Inspection, and Testing Criteria for Air Filtration and Adsorption Units of Normal Atmosphere Cleanup Systems in Light-Water-Cooled Nuclear Power Plants,” Revision 2.

9.4.1.4 Technical Evaluation

The staff reviewed Section 9.4.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the VBS. The results of the staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAs.
- The staff confirmed that all responses to RAs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that any site-specific differences were not relevant to the safety conclusion.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.4.1.4 of the VEGP SER:

AP1000 COL Information Items

- STD COL 9.4-1a

The applicant provided additional information in STD COL 9.4-1a to resolve COL Information Item 9.4-1. COL Information Item 9.4-1a states:

The Combined License applicants referencing the AP1000 certified design will implement a program to maintain compliance with ASME AG-1, ASME N509, ASME N510 and Regulatory Guide 1.140 for portions of the nuclear island nonradioactive ventilation system and the containment air filtration system identified in subsection 9.4.1 and 9.4.7.

The commitment was also captured as COL Action Item 9.4.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will develop a program to maintain operability of the nuclear island nonradioactive ventilation system and the containment air filtration system.

The NRC staff reviewed STD COL 9.4-1a related to COL Action Item 9.4-1 included under Section 9.4.1.4 of the BLN COL FSAR. The NRC staff reviewed the resolution to STD COL 9.4-1a on the proposed implementation of a program to maintain compliance with industry standards and RGs for the VBS included under Section 9.4.1.4 and Section 9.4.12 of the BLN COL FSAR, and concludes that this item has been resolved for the VBS because the applicant has referenced the applicable regulatory guide and industry standards.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from Section 9.4.1.4 of the BLN SER that requires correction. The BLN SER includes the following statement: "The NRC staff reviewed STD COL 9.4-1a related to COL Action Item 9.4-1 included under Section 9.4.1.4 of the BLN COL FSAR." COL Action Item 9.4-1 does not exist and should be replaced with COL Information Item 9.4-1.

- PTN COL 9.4-1b

The applicant provided additional information in PTN COL 9.4-1b to resolve the second part of COL Information Item 9.4-1. The second part of COL Information Item 9.4-1 states:

The Combined License applicant will also provide a description of the [Main Control Room/Technical Support Center] MCR/TSC HVAC subsystem's recirculation mode during toxic emergencies, and how the subsystem equipment isolates and operates, as applicable, consistent with the toxic issues, including conformance with RG 1.78 to be addressed by the Combined License applicant as discussed in DCD Subsection 6.4.7.

The commitment was also captured as COL Action Item 6.4-3 in Appendix F of NUREG-1793, which states:

The COL applicant will determine the amount and location of possible sources of toxic chemicals in or near the plant and for seismic Category I Class 1E toxic gas monitoring, using methods discussed in RG 1.78.

The commitment was also captured as COL Action Item 9.4.1-1 in Appendix F of NUREG-1793, which states:

The COL applicant will develop a program to maintain operability of the nuclear island nonradioactive ventilation system and the containment air filtration system.

The staff review of PTN COL 9.4-1b is addressed in Section 6.4 of this SER.

9.4.1.5 *Post-Combined License Activities*

There are no post-COL activities related to this section.

9.4.1.6 *Conclusion*

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The applicant has provided sufficient information for satisfying the regulatory requirements and the acceptance criteria in Section 9.4.1 of NUREG-0800 and RG 1.140 related to the applicable inspection and testing standards. This addresses STD COL 9.4-1a for VBS. The staff based its conclusion on the following:

- PTN DEP 6.4-1, related to design changes affecting habitability of the MCR and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.

- PTN DEP 6.4-2, related to design changes affecting how the temperature and humidity in the MCR are maintained within the limits for reliable human performance, is reviewed and found acceptable by the staff in Section 21.3 of this SER.
- STD COL 9.4-1a, related to a program for inspections and testing applicable to the VBS, is adequately addressed by the applicant and is resolved.
- PTN COL 9.4-1b, addressing the local toxic gas services are evaluated to determine the need for monitoring for control room habitability, is reviewed by the staff in Section 6.4 of this SER.

9.4.2 Annex/Auxiliary Buildings Nonradioactive HVAC System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.3, “Auxiliary and Radwaste Area Ventilation System”)

The annex/auxiliary building nonradioactive HVAC system maintains ventilation, permits personnel access, and controls the concentration of airborne radioactive material in the nonradioactive personnel and equipment areas, electrical equipment rooms, clean corridors, the ancillary diesel generator room and demineralized water deoxygenating room in the annex building, and the main steam isolation valve compartments, reactor trip switchgear rooms, and piping and electrical penetration areas.

The Turkey Point Units 6 and 7 COL FSAR, Section 9.4.2 incorporates by reference, with no departures or supplements, Section 9.4.2, “Annex/Auxiliary Buildings Nonradioactive HVAC System,” of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.2.6 the applicant provided the following:

Tier 2 Departures

- PTN DEP 18.8-1

The Operations Support Center (OSC) is being moved from the location identified in DCD Subsections 18.8.3.6, 12.5.2.2, and 12.5.3.2 and as identified on DCD figures in Subsections 1.2, 12.3, and Appendix 9A. There will be a single OSC for Units 6 and 7 located as described in the Emergency Plan.

The applicant provided additional information in Section 9.4.2 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 18.8-1 related to the OSC. This information is reviewed in Section 13.3 of this SER.

9.4.3 Radiologically Controlled Area Ventilation System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.2, “Spent Fuel Pool Area Ventilation System,” and C.I.9.4.3, “Auxiliary and Radwaste Area Ventilation System”)

The radiologically controlled area VBS maintains ventilation, permits personnel access, and controls the concentration of airborne radioactive material in the fuel handling area, the radiologically controlled areas of the auxiliary and annex buildings.

The Turkey Point Units 6 and 7 COL FSAR, Section 9.4 incorporates by reference, with no departures or supplements, Section 9.4.3, “Radiologically Controlled Area Ventilation System,” of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff’s technical evaluation of the information incorporated by reference in the Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.4.4 Balance-of-Plant Interface

This section is not applicable to AP1000.

9.4.5 Engineered Safety Features Ventilation System

This section is not applicable to AP1000.

9.4.6 Containment Recirculation Cooling System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.5, “Engineered Safety Feature Ventilation System”)

The VCS provides a suitable and controlled environment for the containment building during normal plant operation and shutdown.

The Turkey Point Units 6 and 7 COL FSAR. Section 9.4 incorporates by reference, with no departures or supplements, Section 9.4.6, “Containment Recirculation Cooling System,” of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

9.4.7 Containment Air Filtration System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.4.5, “Engineered Safety Feature Ventilation System”)

9.4.7.1 Introduction

The containment air filtration system (VFS) serves no safety function, except containment isolation. The system conditions and filters outside air for the containment, the fuel handling

area, and the other radiologically controlled areas of the auxiliary and annex buildings, except for the hot machine shop and health physics areas, which are served by a separate VBS.

9.4.7.2 Summary of Application

Section 9.4 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.4 of the AP1000 DCD. Section 9.4 of the DCD includes Section 9.4.7, "Containment Air Filtration System," which addresses Section 9.4.5, "Engineered Safety Feature Ventilation System," of NUREG-0800.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 9.4.7.4, the applicant provided the following:

AP1000 COL Information Item

- STD COL 9.4-1a

The applicant provided additional information in STD COL 9.4-1a to address COL Information Item 9.4-1 related to a program for inspections and testing applicable to the VFS included under Section 9.4.7.4 of the Turkey Point Units 6 and 7 COL FSAR.

9.4.7.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the VFS are given in Section 9.4.5 of NUREG-0800.

The applicable regulatory guidance for the VFS is as follows:

- RG 1.140

9.4.7.4 Technical Evaluation

The staff reviewed Section 9.4.7 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the VFS. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that any site-specific differences were not relevant to the safety conclusion.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.4.7.4 of the VEGP SER:

AP1000 COL Information Item

- *STD COL 9.4-1a*

The applicant provided additional information in STD COL 9.4-1a to resolve COL Information Item 9.4-1. COL Information Item 9.4-1 states:

The Combined License applicants referencing the AP1000 certified design will implement a program to maintain compliance with ASME AG-1, ASME N509, ASME N510, and Regulatory Guide 1.140 for portions of the nuclear island nonradioactive ventilation system and the containment air filtration system identified in subsection 9.4.1 and 9.4.7. The Combined License applicant will also provide a description of the MCR/TSC HVAC subsystem's recirculation mode during toxic emergencies, and how the subsystem equipment isolates and operates, as applicable, consistent with the toxic issues, including conformance with Regulatory Guide 1.78, to be addressed by the Combined License applicant as discussed in DCD subsection 6.4.7.

The commitment was also captured as COL Action Item 9.4.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will develop a program to maintain operability of the nuclear island nonradioactive ventilation system and the containment air filtration system.

The NRC staff reviewed STD COL 9.4-1a related to COL Action Item 9.4-1 included under Section 9.4.7.4 of the BLN COL FSAR.

The NRC staff reviewed the resolution to STD COL 9.4-1a on the proposed implementation of a program to maintain compliance with industry standards and RGs for the VFS included under Section 9.4.7.4 of the BLN COL FSAR, and concludes that this item has been resolved for the VFS because the applicant has appropriately referenced the applicable regulatory guide and industry standards.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from Section 9.4.7.4 of the BLN SER that requires correction. The BLN SER includes the following statement: “The NRC staff reviewed STD COL 9.4-1a related to COL Action Item 9.4-1 included under Section 9.4.7.4 of the BLN COL FSAR.” COL Action Item 9.4-1 does not exist and should be replaced with COL Information Item 9.4-1.

9.4.7.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.4.7.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

In conclusion, the applicant has provided sufficient information for satisfying Section 9.4.7 of NUREG–0800 and RG 1.140 related to the applicable inspection and testing standards. This addresses STD COL 9.4-1a for the VFS.

9.4.8 Radwaste Building HVAC System

The radwaste building HVAC system serves the radwaste building, which includes the clean electrical/mechanical equipment room and the potentially contaminated HVAC equipment room, the packaged waste storage room, the waste accumulation room, and the mobile systems facility.

Section 9.4 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.4.8, “Radwaste Building HVAC System,” of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff’s technical evaluation of the information incorporated by

reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

9.4.9 Turbine Building Ventilation System

The turbine building VBS operates during startup, shutdown, and normal plant operations. The system maintains acceptable air temperatures in the turbine building for equipment operation and for personnel working in the building.

Section 9.4 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.4.9, “Turbine Building Ventilation System,” of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

9.4.10 Diesel Generator Building Heating and Ventilation System

The diesel generator building heating and VBS serves the standby diesel generator rooms, electrical equipment service modules, and diesel fuel oil day tank vaults in the diesel generator building and the two diesel oil transfer modules located in the yard near the fuel oil storage tanks. Local area heating and ventilation equipment is used to condition the air to the stairwell and security room.

Section 9.4 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.4.10, “Diesel Generator Building Heating and Ventilation System,” of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

9.4.11 Health Physics and Hot Machine Shop HVAC System

The health physics and hot machine shop HVAC system serves the annex building stairwell, S02; the personnel decontamination area; frisking and monitoring facilities; containment access corridor; and health physics facilities on the 100'-0" elevation of the annex building and the hot machine shop on the 107'-2" elevation of the annex building.

Section 9.4 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.4.11, “Health Physics and Hot Machine Shop HVAC System,” of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff’s review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point

Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.5 Other Auxiliary Systems

9.5.1 Fire Protection System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.1, "Fire Protection Program")

9.5.1.1 *Introduction*

The FPS provides assurance, through a defense-in-depth philosophy, that the Commission's FP objectives are satisfied. These objectives are (1) to prevent fires from starting, (2) to detect rapidly, control, and extinguish promptly those fires that do occur, and (3) to provide protection for SSCs important to safety so that a fire that is not promptly extinguished by the fire suppression activities will not prevent the safe shutdown of the plant. In addition, FPSs must be designed such that their failure or inadvertent operation does not adversely impact the ability of the SSCs important to safety to perform their safety functions. These objectives are stated in NUREG-0800, Section 9.5.1, "Fire Protection Program," and are identified as the FP Program goals and objectives in RG 1.189, "Fire Protection for Nuclear Power Plants."

9.5.1.2 *Summary of Application*

Section 9.5 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.5 of the AP1000 DCD. Section 9.5 of the AP1000 DCD includes Section 9.5.1.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.5.1 the applicant provided the following:

Departures

- PTN DEP 6.3-1

The applicant revised DCD Table 9.5.1-1, "AP1000 Fire Protection Program Compliance with BTP CMEB 9.5-1," Sheet 11 of 33, as new Turkey Point Units 6 and 7 COL FSAR, Table 9.5.1-1R, providing additional information about PTN DEP 6.3-1 related to quantifying the duration that the passive residual heat removal system heat exchanger can maintain safe shutdown conditions, changing the indefinite duration to greater than 14 days. This information, as well as related PTN DEP 6.3-1 information appearing in other chapters of the Turkey Point Units 6 and 7 COL FSAR is reviewed in Section 21.1 of the SER.

- PTN DEP 18.8-1

The applicant provided this departure from the AP1000 DCD to address the relocation of the OSC. This departure is evaluated both in this SER section and in SER Section 13.3.

AP1000 COL Information Items

- STD COL 9.5-1 and STD COL 9.5-3

The applicant provided additional information in STD COL 9.5-1 and STD COL 9.5-3 to resolve COL Information Items 9.5-1 and 9.5-3 (COL Action Item 9.5.1-1(a) through 9.5.1-1(o)) by establishing the site-specific implementation of the fire protection program in Section 9.5.1.8, “Fire Protection Program,” and in Appendix 9A of the Turkey Point Units 6 and 7 COL FSAR.

- STD COL 9.5-4

The applicant provided additional information in STD COL 9.5-4 to resolve COL Information Item 9.5-4 (COL Action Item 9.5.1-5) by establishing Table 9.5-201, “AP1000 Fire Protection Program Compliance with BTP CMEB 9.5-1,” and Table 9.5-202, “Exceptions to NFPA Standard Requirements,” of the Turkey Point Units 6 and 7 COL FSAR.

- STD COL 9.5-6

The applicant provided additional information in STD COL 9.5-6 to resolve COL Information Item 9.5-6 (COL Action Item 9.5.1-6) by specifying a preoperational testing program to verify field-installed fire barriers are as tested, and to provide disposition for any deviation.

- STD COL 9.5-8

The applicant provided additional information in STD COL 9.5-8 to resolve COL Information Item 9.5-8 (COL Action Item 9.5.1-3) by establishing an administrative control procedure to address fire barrier breaches.

- PTN COL 9.5-1

The applicant provided additional information in PTN COL 9.5-1 to resolve COL Information Item 9.5-1 for plant-specific fire protection issues in Turkey Point Units 6 and 7 COL FSAR Section 13.1.2.1.3.9.

- PTN COL 9.5-2

The applicant provided additional information in PTN COL 9.5-2 to resolve COL Information Item 9.5-2 (COL Action Item 9.5.1-2) by providing site-specific fire hazard analysis of the yard area and outlying buildings in Turkey Point Units 6 and 7 COL FSAR, Appendix 9A, Section 9A.3.3.

Supplemental Information

- STD SUP 9.5-1

The applicant provided supplemental information in Section 9.5.1.2.1.3, “Fire Water Supply System,” by adding additional text to address the piping threads compatibility requirement between onsite hydrants, hose couplings, and standpipe risers and equipment used by the offsite fire department.

License Conditions

- Part 10, License Condition 3, Items C.2, D.1, and G.6

The applicant proposed a license condition in Part 10 of the Turkey Point Units 6 and 7 COL application addressing the Fire Protection Program implementation milestones.

- Part 10, License Condition 6

The applicant proposed a license condition in Part 10 of the Turkey Point Units 6 and 7 COL application to provide a schedule to support the staff's inspection of operational programs, including the Fire Protection Program.

9.5.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the FPS are given in Section 9.5.1 of NUREG-0800.

The regulatory basis for acceptance of STD COL 9.5-1, STD COL 9.5-3, STD COL 9.5-4, STD COL 9.5-6, STD COL 9.5-8, PTN COL 9.5-1, and PTN COL 9.5-2 includes the following:

- RG 1.189
- Branch Technical Position Chemical Engineering Branch (BTP CMEB) 9.5-1, in NUREG-0800, Revision 3
- 10 CFR 50.48, "Fire Protection"

The regulatory basis for acceptance of STD SUP 9.5-1 includes the following:

- RG 1.189

9.5.1.4 Technical Evaluation

The staff reviewed Section 9.5.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the fire protection system. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard

content that were documented in the SER for the reference COL application (VEGP Units 3 and 4 COL application) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced ² from Section 9.5.1.4 of the VEGP SER:

Supplemental Information

- *STD SUP 9.5-1 provided supplemental information within Section 9.5.1.2.1.3, "Fire Water Supply System," addressing compatibility of piping threads with equipment used by the off-site fire department.*

The NRC staff reviewed the information on the compatibility of piping threads with off-site equipment included under Section 9.5.1.2.1.3 of the BLN COL, and determined that the applicant conforms to the guidance of RG 1.189. In accordance with the applicant's response to RAI 14.2-9, the requirement to verify fire equipment hose thread compatibility, or alternatively, an adequate supply of readily available thread adapters will be verified. This was added to the Initial Test Program outlined in Section 14.2 of the BLN COL FSAR.

AP1000 COL Information Items

- *STD COL 9.5-1 (COL Action Item 9.5-1(a)), involving qualification requirements for the fire protection program*

² Only the BLN SER text relevant to PTN is reproduced here. For example, the BLN SER included a discussion of BLN SUP 9.5-2 after the discussion of STD SUP 9.5-1. Since BLN SUP 9.5-2 does not apply to Virgil C. Summer Nuclear Station (VCSNS), it was not reproduced here. Also, the discussion of PTN COL 9.5-2 (corresponds to BLN COL 9.5-2) was moved to the end of this technical evaluation section.

The applicant provided additional information in STD COL 9.5-1 to resolve COL Information Item 9.5-1. COL Information Item 9.5-1 states:

The Combined License applicant will address qualification requirements for individuals responsible for development of the fire protection program, training of firefighting personnel, administrative procedures and controls governing the fire protection program during plant operation, and fire protection system maintenance.

The commitment was also captured as COL Action Item 9.5-1(a) in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will establish a fire protection program at the facility for the protection of structures, systems, and components (SSCs) important to safety. The COL applicant will also establish the procedures, equipment, and personnel needed to implement the program.

The NRC staff reviewed the resolution to STD COL 9.5-1 on the qualification requirements for the Fire Protection Program included under Section 9.5.1.6, Section 9.5.1.8, and Section 9.5.1.9 of the BLN COL application, and determined that the above sections provided adequate details to ensure conformance with the regulatory positions contained in RG 1.189 regarding the implementation of the BLN Fire Protection Program. Such details include personnel qualifications and training, organization and responsibilities, fire brigade training, etc.

- *STD COL 9.5-3 (COL Action Items 9.5.1-1(b) through 9.5.1-1(o)), addressing regulatory conformance*

The applicant provided additional information in STD COL 9.5-3 to resolve COL Information Item 9.5-3. COL Information Item 9.5-3 states:

The Combined License applicant will address BTP CMEB 9.5-1 issues. The acronym 'WA' is the identifier in Table 9.5.1-1 for "will address."

The commitment was also captured as COL Action Items 9.5.1-1(b) through 9.5.1-1(o) in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

9.5.1-1(b) – The COL applicant will implement the fire protection program prior to receiving fuel onsite for fuel storage areas, and for the entire unit prior to reactor startup.

9.5.1-1(c) – The COL applicant will establish administrative controls to maintain the performance of the fire protection system and personnel.

9.5.1-1(d) – The COL applicant will establish a site fire brigade that is trained and equipped for fire fighting to ensure adequate manual fire fighting capability for all plant areas containing SSCs important to safety.

9.5.1-1(e) – The COL applicant will establish a quality assurance (QA) program to ensure that the guidelines for the design, procurement, installation, and testing, as well as the administrative controls for fire protection systems are satisfied.

9.5.1-1(f) – The COL applicant is responsible for the inspection and maintenance of fire doors, access to keys for the fire brigade, and the marking of exit routes.

9.5.1-1(g) – The COL applicant is responsible for the collection and sampling of water drainage from areas that may contain radioactivity.

9.5.1-1(h) – The COL applicant is responsible for controlling the use of compressed gases inside structures.

9.5.1-1(i) – The COL applicant is responsible for the use of portable radio communication by the plant fire brigade.

9.5.1-1(j) – The COL applicant is responsible for fire protection inside containment during refueling and maintenance.

9.5.1-1(k) – The COL applicant is responsible for controlling combustible materials in the remote shutdown workstation.

9.5.1-1(l) – The COL applicant is responsible for fire protection for cooling towers.

9.5.1-1(m) – The COL applicant is responsible for the proper storage of welding gas cylinders.

9.5.1-1(n) – The COL applicant is responsible for the proper storage of ion exchange resins.

9.5.1-1(o) – The COL applicant is responsible for the proper storage of hazardous chemicals.

The NRC staff reviewed the resolution to STD COL 9.5-3 provided in Section 9.5.1.8, Fire Protection Program, and Table 9.5-201 of the BLN COL application. The staff determined that the applicant has incorporated the appropriate portions of RG 1.189 into the BLN Fire Protection Program, pending some changes to be included in Revision 2 to the BLN COL FSAR. The applicant provided the following clarifications related to the BLN Fire Protection Program:

- (1) *The applicant confirmed that no operator manual actions outside of the Main Control Room are credited or required for post-fire safe shutdown.*
- (2) *The applicant stated that the wireless telephone system is credited as the portable communication system used by the fire brigade. In the applicant's response to RAI 9.5.1-12, the wireless telephone system was confirmed to be designed with multiple antennas (repeaters) throughout the plant to maintain communication capability if individual repeater(s) are damaged from fire. Also, preoperational and periodic testing during fire drills will be performed to verify that the fire brigade portable communication system operates without excessive interference at different locations inside and outside the plant.*
- (3) *In its response to RAI 9.5.1-9, the applicant stated that a housekeeping program is provided in order to maintain cleanliness and minimize fire hazards in the Main Control Room areas.*
- (4) *In its response to RAI 9.5.1-14, the applicant stated that no probabilistic risk assessment (PRA) or fire modeling results will be credited to demonstrate acceptable fire hazards or post-fire safe shutdown capability for specific fire areas or scenarios.*
- (5) *In its response to RAI 9.5.1-15, the applicant confirmed that the supply of reserve air is sufficient to provide at least 6 hours of additional breathing air for "each" of the 10 self-contained breathing apparatus (SCBA) units.*
- (6) *In its response to RAI 9.5.1-16, the applicant proposed a change to BLN COL FSAR Section 9.5.1.8.6 to clarify that testing and inspection of fire protection systems are to be performed per NFPA 25 and NFPA 72 as appropriate. This is **Confirmatory Item 9.5-1**.*
- (7) *In its response to RAI 9.5.1-17, the applicant confirmed that the design pressure of the High Pressure Air Subsystem that is used to recharge fire brigade's SCBAs is 4000 psig, and that 2216 psig SCBAs are used to ensure that the cylinders are adequately charged to provide an operating life of at least 30 minutes.*

- *STD COL 9.5-4 (COL Action Item 9.5.1-5), involving NFPA exceptions*

The applicant provided additional information in STD COL 9.5-4 to resolve COL Information Item 9.5-4. COL Information Item 9.5-4 states:

The Combined License applicant will address updating the list of NFPA exceptions in the plant-specific DCD, if necessary.

The commitment was also captured as COL Action Item 9.5.1-5 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant is responsible for ensuring that any deviations from the applicable National Fire Protection Association (NFPA) codes and standards in addition to those in the DCD are incorporated into the final safety analysis report (FSAR) with appropriate technical justification.

The NRC staff reviewed the resolution to STD COL 9.5-4 under Section 9.5.1.8.1.1 and Section 9.5.1.9.4 of the BLN COL. The applicant provided for BLN COL FSAR Table 9.5-202, "Exceptions to NFPA Standard Requirement," to document and justify deviations from applicable NFPA codes and standards in addition to those identified in the DCD. This provision satisfies FSER Action Item 9.5.1-5. The staff also reviewed the exception to NFPA 804 related to the intake structure as documented in Table 9.5-202 although NFPA 804 is not formally endorsed by the NRC as a regulatory guidance document. Since the exception and the provided justification are consistent with the guidance of RG 1.189, the staff finds it acceptable. Based on the above, the staff concludes that FSER Action Item 9.5.1-5 is resolved.

- *STD COL 9.5-6 (COL Action Item 9.5.1-6), involving verification of field installed fire barriers, also designated as a COL information item*

The applicant provided additional information in STD COL 9.5-6 to resolve COL Information Item 9.5-6. COL Information Item 9.5-6 states:

The Combined License applicant will address the process for identifying deviations between the as-built installation of fire barriers and their tested configurations.

The commitment was also captured as COL Action Item 9.5.1-6 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will establish the process for identifying deviations between the as-built installation of fire barriers and their tested configurations.

The NRC staff reviewed the resolution to STD COL 9.5-6 under Section 9.5.1.8.6 and Section 9.5.1.9.6. The applicant provided that new installation or modification of fire barriers not part of the AP1000 DCD will be controlled through administrative procedures. These procedures impose inspection and testing requirements to ensure that the as-built fire barrier configurations match tested configurations. These procedures also describe the process for identifying and dispositioning deviations. Based on the above, the staff concluded that FSER Action Item 9.5.1-6 is resolved.

- *STD COL 9.5-8 (COL Action Item 9.5.1-3), establishing procedures to minimize risk for fire areas breached during maintenance*

The applicant provided additional information in STD COL 9.5-8 to resolve COL Information Item 9.5-7. COL Information Item 9.5-7 states:

The Combined License applicant will establish procedures to minimize risk when fire areas are breached during maintenance. These procedures will address a fire watch for fire areas breached during maintenance.

The commitment was also captured as COL Action Item 9.5.1-3 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will establish procedures to address a fire watch for fire areas breached during maintenance.

The NRC staff reviewed the resolution to STD COL 9.5-8 on the establishment of procedures to minimize risk for fire areas breached during maintenance included under Section 9.5.1.8.1.2 and Section 9.5.1.9.7 of the BLN COL, and determined that the applicant has adequately included a provision to have procedures and administrative controls in place, including fire watches, when fire barriers are breached.

License Conditions

- *License Condition 3, addressing the Fire Protection Program implementation milestones*
- *License Condition 6, addressing the Fire Protection Program implementation schedule*

In Part 10 of the BLN COL FSAR, License Condition 3, "Operational Program Implementation," the applicant proposed a license condition for the implementation of operational programs as described in Table 13.4-201 of the FSAR. This license condition included implementation milestones for the Fire Protection Program, namely D.1 and G.6. Specifically:

- *Milestone D.1 states that the applicable portions of the Fire Protection Program will be implemented prior to initial receipt of fuel onsite.*
- *Milestone G.6 states that the Fire Protection Program will be implemented prior to initial fuel load.*

In Part 10 of the BLN COL FSAR, proposed License Condition 6, "Operational Program Readiness," the applicant states:

The licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of the NRC inspection of the operational programs listed in the operation program

FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operation programs in the FSAR table have been fully implemented or the plant has been placed in commercial service.

Based on the above, the staff concludes that the applicant satisfied the documentation and implementation requirements for the Fire Protection Program in accordance with RG 1.189 by identifying and providing the implementation schedule for each of the operational program aspects of the Fire Protection Program.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from Section 9.5.1.4 of the BLN SER that requires correction. The BLN SER includes the following statement: "The applicant provided additional information in STD COL 9.5-8 to resolve COL Information Item 9.5-7. COL Information Item 9.5-7 states:" The reference to COL Information Item 9.5-7 should be to COL Information Item 9.5-8.

Resolution of Standard Content Confirmatory Item 9.5-1

To resolve Confirmatory Item 9.5-1, the VEGP applicant revised FSAR Section 9.5.1.8.6 to clarify that procedures governing the inspection, testing, and maintenance of fire protection alarm and detection systems, and water-based suppression and supply systems, use the guidance of NFPA 72 and NFPA 25 as appropriate. NFPA 25 standard is also added to VEGP COL FSAR Section 9.5.5. The staff determined that these documentation changes satisfy the requirement of standard content Confirmatory Item 9.5-1; therefore Confirmatory Item 9.5-1 is resolved.

Proposed License Condition 3, Item C.2

The VEGP applicant proposed to add another implementation milestone associated with the Fire Protection System to License Condition 3. Specifically, the applicant added Milestone C.2, which states that the applicable portions of the Fire Protection Program will be implemented prior to initial receipt of byproduct, source, or special nuclear materials onsite (excluding Exempt Quantities as described in 10 CFR 30.18). The staff concludes that the applicant satisfied the documentation and implementation requirements for the Fire Protection Program in accordance with RG 1.189 by identifying and providing the implementation schedule for each of the operational program aspects of the Fire Protection Program.

AP1000 COL Information Item

- PTN COL 9.5-1 (COL Information Item 9.5-1)

The applicant provided additional information in PTN COL 9.5-1 to resolve COL Information Item 9.5-1 for plant-specific fire protection issues. These plant-specific issues include:

- the responsibilities of the engineer in charge of fire protection and his staff
- the organization of the fire brigade
- the engineer in charge of fire protection being responsible for the formulation and implementation of the fire protection program and meeting the qualification requirements listed in Turkey Point Units 6 and 7 COL FSAR, Section 13.1.2.1.3.9

The staff reviewed the resolution of PTN COL 9.5-1 on the associated plant-specific fire protection issues and determined that the issues have been acceptably resolved by information provided in Turkey Point Units 6 and 7 COL FSAR, Sections 9.5 and 13.1.2.1.3.9.

- PTN COL 9.5-2 (COL Action Item 9.5.1-2), involving fire protection analysis information

The applicant provided additional information in PTN COL 9.5-2 to resolve COL Information Item 9.5-2. COL Information Item 9.5-2 states:

The combined license applicant will provide site-specific fire protection analysis information for the yard area, the administration building, and for other outlying buildings consistent with Appendix 9A.

The commitment was also captured as COL Action Item 9.5.1-2 in Appendix F of NUREG-1793, which states:

The COL applicant will provide site-specific fire protection analysis information for the yard area, the administration building, and other outlying buildings.

The staff reviewed the resolution to PTN COL 9.5-2 on the site-specific fire protection analysis information included under Section 9.5.1.9.2 and Section 9A.3.3 of the Turkey Point Units 6 and 7 COL FSAR and determined that the yard area, administration building, and other outlying areas are adequately described in the fire hazard analysis in accordance with RG 1.189, which is therefore acceptable.

Resolution of PTN DEP 18.8-1

The AP1000 annex building does not contain any system or equipment credited for achieving and maintaining post-fire safe shutdown. As such, the relocation of the OSC in the annex building as prescribed in PTN DEP 18.8-1 has no adverse impact on the post-fire safe shutdown capability. Therefore, the staff concludes that the proposed departure, relative to post-fire safe shutdown capability, is acceptable.

9.5.1.5 Post-Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated April 8, 2016 (ADAMS Accession No. ML16103A507), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

- License Condition (9-2) – The licensee shall implement the Fire Protection Program or applicable portions thereof as described in the milestones below:
 1. The fire protection measures in accordance with RG 1.189 for designated storage building areas (including adjacent fire areas that could affect the storage area) implemented before initial receipt of byproduct or special nuclear materials that are not fuel (excluding exempt quantities as described in 10 CFR 30.18);
 2. The fire protection measures in accordance with RG 1.189 for areas containing new fuel (including adjacent areas where a fire could affect the new fuel) implemented before receipt of fuel onsite;
 3. All fire protection program features implemented before initial fuel load;
- License Condition (9-3) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the NRO a schedule that supports planning for and conduct of NRC inspections of the FP Program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the FP Program has been fully implemented.

9.5.1.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the guidance in Section 9.5.1 of NUREG-0800 and RG 1.189. The staff based its conclusion on the following:

- PTN DEP 6.3-1, related to quantifying the duration that the passive residual heat removal system heat exchanger can maintain safe shutdown conditions, is reviewed and found acceptable by the staff in Section 21.1 of this SER.
- PTN DEP 18.8-1, regarding the relocation of the OSC relative to the post-fire safe shutdown capability, is adequately addressed by the applicant and is resolved.

- STD SUP 9.5-1, addressing compatibility of piping threads with equipment used by the offsite fire department, is adequately addressed by the applicant and is resolved.
- STD COL 9.5-1, addressing the qualification and training requirements for the fire protection program at Turkey Point Units 6 and 7, is adequately addressed by the applicant and is resolved.
- STD COL 9.5-4, addressing the deviations from the applicable NFPA codes and standards and to those in the AP1000 DCD, is also adequately addressed by the applicant and is resolved.
- STD COL 9.5-6, addressing the establishment of a process for identifying deviations between the as-built installation of fire barriers and their tested configurations, is adequately addressed by the applicant and is resolved.
- STD COL 9.5-8, addressing establishment of procedures to minimize risk for fire areas breached during maintenance, is adequately addressed by the applicant and is resolved.
- STD COL 9.5-3, addressing the site-specific implementation of the Fire Protection Program, is adequately addressed by the applicant and is resolved.
- PTN COL 9.5-1, addressing site-specific fire protection issues, is adequately addressed by the applicant and is resolved.
- PTN COL 9.5-2, regarding the site-specific fire protection analysis information for the Turkey Point Units 6 and 7 yard areas and outlying buildings, is adequately addressed by the applicant and is resolved.

9.5.2 Communication System

9.5.2.1 Introduction

The communication system provides intra-plant communications and plant-to-offsite communications during normal, maintenance, transient, fire, and accident conditions, including loss of offsite power (LOOP).

9.5.2.2 Summary of Application

Section 9.5 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.5 of the AP1000 DCD. Section 9.5 of the AP1000 DCD includes Section 9.5.2, which the Turkey Point Units 6 and 7 COL application references without departures.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 9.5.2, the applicant provided the following:

AP1000 COL Information Items

- PTN COL 9.5-9, involving offsite interfaces

The applicant provided additional information in PTN COL 9.5-9 to resolve COL Information Item 9.5-9 (COL Action Item 9.5.2-3).

- PTN COL 9.5-10, involving emergency offsite communications

The applicant provided additional information in PTN COL 9.5-10 to resolve COL Information Item 9.5-10 (COL Action Item 9.5.2-1).

- STD COL 9.5-11, involving security communications

The applicant provided additional information in STD COL 9.5-11 to resolve COL Information Item 9.5-11 (COL Action Item 9.5.2-2).

9.5.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the communications system are given in Section 9.5.2 of NUREG–0800.

The regulatory basis for PTN COL 9.5-9, addressing interfaces to offsite locations, is based on:

- 10 CFR Part 50, Appendix E, “Emergency Planning and Preparedness for Production and Utilization Facilities,” Subpart IV.E(9), “Emergency Planning and Preparedness for Production and Utilization Facilities”)

The regulatory basis for PTN COL 9.5-10, addressing the emergency offsite communication system, including the crisis management radio system, is based on:

- 10 CFR 50.47(b)(8), “Emergency Plans – Adequate Facilities and Equipment”

The regulatory basis for STD COL 9.5-11, addressing the description of the security communication system, is based on:

- 10 CFR 73.45(g)(4)(i), “Performance capabilities for fixed site physical protection systems-response”
- 10 CFR 73.46(f), “Fixed site physical protection systems, subsystem, components, and procedures-communications subsystems”

- 10 CFR 73.55(e), “Requirements for physical protection of licensed activities in nuclear power reactors against radiological sabotage-physical barriers”
- 10 CFR 73.55(f), “Requirements for physical protection of licensed activities in nuclear power reactors against radiological sabotage-target sets”

9.5.2.4 Technical Evaluation

The staff reviewed Section 9.5.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff review of this application is limited to information items described in Sections 9.5.2.2.5 through 9.5.2.5.3 of the Turkey Point Units 6 and 7 COL FSAR. On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the communications system. The results of the staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 9.5.2.2.5, the applicant provided the following:

AP1000 COL Information Items

- PTN COL 9.5-9

In PTN COL 9.5-9 the applicant provided additional information via its Emergency Plan to resolve COL Information Item 9.5-9. COL Information Item 9.5-9 states:

Combined license applicants referencing the AP1000 certified design will address interfaces to required offsite locations; this will include addressing the recommendations of BL-80-15 ([DCD] Reference 21) regarding loss of the emergency notification system due to a loss of offsite power.

The commitment was also captured as COL Action Item 9.5.2-3 in Appendix F of NUREG-1793, which states:

The COL applicant will address interfaces to offsite locations; this will include addressing the recommendations of NRC Bulletin (BL) 80-15 regarding loss of the emergency notification system as a result of loss of offsite power.

The staff reviewed PTN COL 9.5-9, which is included under Section 9.5.2.5.1 of the Turkey Point Units 6 and 7 COL FSAR, concerning offsite interfaces. Section 9.5.2.5.1 of the Turkey Point Units 6 and 7 COL FSAR states the Emergency Plan describes offsite interfaces to address PTN COL 9.5-9. Table 1.6-201 of the Turkey Point Units 6 and 7 COL FSAR maps the Emergency Plan to Turkey Point Units 6 and 7 COL FSAR, Section 13.3. Part 5, Section F, of the Emergency Plan, Revision 4, presents the methods used for emergency communications, including offsite interfaces.

The following excerpt from the Emergency Plan identifies communication equipment along with planned use:

- (1) **Plant Page System:** The Plant Page System is a public address system with speakers and handsets located throughout the plant, including the Control Rooms and TSC. The system provides for transmission of warning and instructions in the event of an emergency. Plant alarms are broadcast over the Plant Page System. The system is primarily used for intra-plant communications and permits merging with and separation from other units of the plant. Power to the system is supplied from a variety of sources, and an alternate power supply is provided.
- (2) **Private Branch Exchange (PBX) Telephone System:** The PBX telephone system provides communication capability between telephones located in the Turkey Point facilities through direct dialing. The PBX is used to connect the affected unit's Control Room, TSC, OSC, EOF and ENC. The PBX telephone system also provides for outside communications through interconnections with the FPL Intelligent Tandem Network (ITN) corporate telephone communications system and local commercial telephone lines. This system may be utilized as a secondary communication link to the county governments. Power to the PBX is provided from non-Class 1E dc and uninterruptible power supply system.
- (3) **Local Commercial Telephone System:** This system provides standard commercial telephone service which is installed by the local telephone company for normal dial telephone service in the plant. This system includes connections to the PBX and FPL ITN System, dedicated lines to emergency response facilities, and is the primary system for routine communication with areas outside the plant. This system may be utilized as a secondary communication link to the county governments. The commercial vendor provides primary and secondary power for their lines.
- (4) **FPL Intelligent Tandem Network (ITN) System:** The ITN System can be accessed in most plant locations and allows direct dial capability to company office locations, access to Wide Area Telephone Services (WATS) line, and local telephone calls.
- (5) **State Hot Ring Down Telephone:** The state hot ring down is a dedicated communications system that has been installed for the purpose of notifying state and county authorities of declared emergencies at Turkey Point. This system links together the Control Rooms, TSC, EOF and state and county government agencies as appropriate and is the primary means of communication.
- (6) **Emergency Satellite Communication System (EMNET):** EMNET is an emergency satellite communication system that is available in the Control Rooms, TSC, and EOF. The initial notification of all emergencies and other required notifications to the State Division of Emergency Management (DEM) and the County's Department of Public Safety will

be made via the Hot Ring Down telephone with EMNET as the alternate communications pathway.

- (7) **Automated ERO Callout System**: Turkey Point uses an automated callout system that employs pagers and telephones to notify the ERO. If the callout system fails, plant personnel may be required to manually activate the ERO group page feature and/or directly callout ERO personnel.
- (8) **Dedicated Phone Lines**: A dedicated phone link is established by limiting a phone line to one purpose, blocking its use for all other purposes. Several dedicated telephone links have been established for use by the ERO to perform key communication tasks.
- (9) **Satellite Telephones**: This satellite system is a portable satellite phone with international calling capabilities. The system is capable of communication with any telephone (public network, cellular, satellite, etc.). This system is available to Control Room, TSC, and EOF personnel and provides a backup or secondary communication link in the event that the landlines are rendered inoperative.
- (10) **Company Radio System**: Radio systems are provided for offsite communication with other FPL facilities and government agencies. This radio system consists of a variety of fixed base radio equipment. The system operations power coordinator's office, trouble dispatcher offices, service centers, power plants, and mobile service vehicles are equipped with one or more of these radio systems. The radio may be used to communicate with the EOF System Operations, Storm Headquarters, and other FPL facilities and mobile units throughout Miami-Dade County, including the EOC. The radio may be used for longer range communications to the EOF and FPL Corporate Offices in Juno Beach. A repeater channel for plant use is also available to DOH-BRC for communication with emergency response teams and/or from the Mobile Emergency Radiological Laboratory (MERL) sites. In addition, the U.S. Coast Guard and NOAA Weather Radio Channels are also available on the systems for emergency communications, as required, and to monitor weather conditions and receive weather advisories. In the event of interruption of onsite electric service to the base radio stations, backup power is available to equipment.
- (11) **900 Megahertz Radio System**: The 900 megahertz radio system is available to supplement fixed communications in the plant and is used for Field Monitoring Team communications. This system consists of necessary hardware to allow radio communication between the affected unit Control Room, EOF and mobile units in FPL vehicles. Commercial cell phones are available as backup to the primary field team communications system. This radio system also provides the ability to be used as a crisis management radio system.

The following excerpt from the Emergency Plan identifies phone lines dedicated for NRC communications along with planned use.

- (1) **Emergency Notification System (ENS)**: The ENS is used for initial notification from the plant to the NRC, as well as ongoing information on plant systems, status, and parameters. The ENS is located in each Control Room, the TSC, and EOF. A separate line is available in the EOF with the capability of being patched with the plant through the NRC. Backup power is provided for these lines, which complies with the requirements of NRC BL 80-15 regarding LOOP to the ENS.
- (2) **Health Physics Network (HPN)**: The HPN is used to transmit information to the NRC regarding radiological conditions (in-plant and offsite), meteorological conditions, and assessment of trends and needs for protective measures onsite and offsite. The HPN is located in the TSC and EOF and may be used as an open communication line with the NRC. Backup power is provided for these lines.
- (3) **Reactor Safety Counterpart Link (RSCL)**: This system allows for internal NRC discussions regarding plant and equipment conditions. RSCL lines are located in the TSC and EOF.
- (4) **Protective Measures Counterpart Link (PMCL)**: This system allows for conduct of internal NRC discussions on radiological releases, meteorological conditions, and protective measures. PMCL lines are located in the TSC and EOF.
- (5) **Management Counterpart Link (MCL)**: This system has been established for internal discussions between the NRC executive team director/members and the NRC Site Team Director or FPL management. MCL lines are located in the TSC and EOF.
- (6) **Emergency Response Data System (ERDS)**: As prescribed by 10 CFR 50 Appendix E.VI, ERDS will supply the NRC with selected plant data points on a near real-time basis. ERDS is activated by the ERO as soon as possible but not later than 1 hour after declaration of an *Alert, Site Area Emergency, or General Emergency*. The selected data points are transmitted via modem to the NRC at approximately 1-minute intervals. The ERO has backup methods available to provide required information to the NRC in the event that ERDS is inoperable during the declared emergency.

Appendix E to 10 CFR Part 50, Section IV.E (9), requires at least one onsite and one offsite communications system; each system shall have a backup power source. The applicant has stated that the PBX telephone system is powered by a “non-Class 1E dc and uninterruptible power supply”; power for the commercial telephone system is provided by the commercial vendor. In addition, NRC BL 80-15, “Possible Loss of Emergency Notification System (ENS) with Loss of Offsite Power,” states that the applicant should provide backup power sources for the ENS in case of LOOP. The applicant states that backup power is provided for the ENS, which conforms to the requirements of NRC BL 80-15.

On February 4, 2011, the staff sent RAI Question 09.05.02-1, requesting further details on the primary and secondary means of communications between the plant (CR and TSC) and State/local governments, Federal emergency response organizations (EROs), the emergency operations facility (EOF), the staff, the emergency operations centers (EOCs), and the field assessment teams, and for this information to be added to the FSAR or the Emergency Plan or both. In the letter dated March 3, 2011, the applicant provided its response to RAI 5192, Question 09.05.02-1 (ADAMS Accession No. ML110660200). The applicant response provides a more detailed description of the emergency response communications, including each party, organizational titles, initial notification paths, and primary and alternate methods of communications among the parties. Additionally, the response states the applicant would enhance its Emergency Plan to incorporate these details.

The applicant incorporated the additional details it had identified in the letter response within Emergency Plan, Revision 3, and these changes remain in Revision 4. As such, the Emergency Plan identifies the primary and secondary means of communication. The staff finds the applicant's response acceptable and that the applicant has demonstrated sufficient means for onsite and offsite communications, with adequate backup power sources, to meet the requirements of Appendix E to 10 CFR Part 50, Part IV.E(9). The staff also finds that the use of a battery system and a diesel generator to provide backup power to the ENS, in case of LOOP, adequately addresses NRC BL 80-15. Therefore, the staff concludes that COL Action Item 9.5-9 has been adequately addressed and RAI Question 09.05.02-1 is resolved.

- PTN COL 9.5-10

The applicant provided additional information in PTN COL 9.5-10 to resolve COL Information Item 9.5-10. COL Information Item 9.5-10 states:

The emergency offsite communication system, including the crisis management radio system, will be addressed by the combined license applicant.

The commitment was also captured as COL Action Item 9.5.2-1 in Appendix F of NUREG-1793, which states:

The COL applicant will provide a description of the emergency offsite communication system, including the crisis management radio system.

The staff reviewed PTN COL 9.5-10, which is included under Section 9.5.2.5.2 of the Turkey Point Units 6 and 7 COL FSAR, concerning the emergency offsite communication system and the crisis management radio system. The staff addressed offsite communications interfaces under its review of PTN COL 9.5-9 in this evaluation. Section 9.5.2.5.2 of the Turkey Point Units 6 and 7 COL FSAR states the Emergency Plan describes emergency offsite communications to address PTN COL 9.5-10. Table 1.6-201 of the Turkey Point Units 6 and 7 COL FSAR maps the Emergency Plan to Turkey Point Units 6 and 7 COL FSAR, Section 13.3.

On February 4, 2011, the staff sent RAI 5192, Question 09.05.02-1, in which the staff requested additional clarification as to the design of the site's crisis management radio system. In the letter, dated March 3, 2011, the applicant provided its response to RAI 5192, Question 09.05.02-1 (ML110660200). The applicant response provides a more detailed description of the

crisis management radio system including the use of the 900 Megahertz Radio System. Additionally, the response states the applicant would enhance its Emergency Plan to incorporate these details.

The applicant incorporated the additional details it had identified in the letter response within Emergency Plan, Revision 3. The changes to the Emergency Plan provide a more detailed description of the 900 Megahertz Radio System and identify its use as a crisis management radio system.

Section 50.47(b)(8) of 10 CFR requires provisions and maintenance of adequate emergency facilities and equipment to support the emergency response. As discussed in the evaluation of PTN COL 9.5-9, the staff finds the offsite communications systems provide adequate emergency communications equipment and facilities to meet the requirements of 10 CFR 50.47(b)(8). Furthermore, the staff finds the 900 Megahertz Radio System adequately serves as the crisis management radio system. Therefore, the staff concludes that COL Action Item 9.5.2-1 has been adequately addressed.

- **STD COL 9.5-11**

The applicant provided additional information in STD COL 9.5-11 to resolve COL Information Item 9.5-11. COL Information Item 9.5-11 states:

This COL item is addressed in the Physical Security Plan.

The commitment was also captured as COL Action Item 9.5.2-2 in Appendix F of NUREG-1793, which states:

The COL applicant will provide a description of the security communication system.

Table 1.6-201 of the Turkey Point Units 6 and 7 COL FSAR maps the Physical Security Plan to Turkey Point Units 6 and 7 COL FSAR, Section 13.6. The NRC Office of Nuclear Security and Incident Response evaluates compliance with 10 CFR 73.55(e) and 10 CFR 73.55(f) as part of its review of Physical Security for Turkey Point Units 6 and 7 COL FSAR, Section 13.6.

Therefore, the staff's review of STD COL 9.5-11, which relates to security communications, is provided under Section 13.6 of this SER, and Section 13.6 of this SER provides the staff's evaluation of the applicant's resolution of STD COL 9.5-11.

9.5.2.5 *Post-Combined License Activities*

There are no post-COL activities related to this section.

9.5.2.6 *Conclusion*

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the guidelines given in Section 9.5.2 of NUREG-0800. The staff based its conclusion on the following:

- PTN COL 9.5-9, has been adequately addressed by the applicant in that the onsite and offsite communications interfaces meet the communications requirements of 10 CFR Part 50, Appendix E, Section IV.E(9). In addition, the staff finds the use of a battery system and a diesel generator to provide backup power for the ENS in case of LOOP meets the guidance in NRC BL 80-15.
- PTN COL 9.5-10, has been adequately addressed by the applicant in that the Turkey Point Units 6 and 7 emergency offsite communications system, including the crisis management radio system, is capable of providing for notification of personnel and implementation of evacuation procedures in case of emergency and meets the requirements of 10 CFR 50.47(b)(8).
- STD COL 9.5-11, which involves security communications, is documented in Section 13.6 of this SER.

9.5.3 Plant Lighting System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.3, "Lighting Systems")

The plant lighting system provides normal, emergency, panel, and security lighting. The normal lighting provides normal illumination during plant operating, maintenance, and test conditions. The emergency lighting provides illumination in areas where emergency operations are performed upon loss of normal lighting. The panel and security lighting is designed to provide the minimum illumination required.

Section 9.5 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.5.3, "Plant Lighting System," of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ On the basis of its review, the staff confirms that there is no outstanding issue related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.5.4 Diesel Generator Fuel Oil System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.4, "Diesel Generator Fuel Oil Storage and Transfer System")

9.5.4.1 Introduction

The standby diesel generator fuel oil system maintains the fuel oil system for the diesel engines that provide backup onsite power. This system includes all piping up to the connection to the engine interface, fuel oil storage tanks, fuel oil transfer pumps, day tanks, and the tank storage vaults.

9.5.4.2 Summary of Application

Section 9.5 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference Section 9.5 of the AP1000 DCD. Section 9.5 of the AP1000 DCD includes Section 9.5.4.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 9.5.4.5.2, the applicant provided the following:

AP1000 COL Information Item

- STD COL 9.5-13

The applicant provided additional information in STD COL 9.5-13 to resolve fuel oil sampling and testing to protect against degradation.

9.5.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG–1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the NRC regulations for the diesel generator fuel oil system are given in Section 9.5.4 of NUREG–0800.

9.5.4.4 Technical Evaluation

The staff reviewed Section 9.5.4 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ On the basis of its review, the staff confirms that the information in the application and incorporated by reference addresses the required information relating to the diesel generator fuel oil system. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG–1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside of the scope of the DC and use this review in evaluating subsequent COL applications. To ensure the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.

- The staff verified that any site-specific differences were not relevant to the safety conclusion.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 9.5.4.4 of the VEGP SER:

AP1000 COL Information Item

- *STD COL 9.5-13*

The applicant provided additional information in STD COL 9.5-13 to resolve COL Information Item 9.5-13. COL Information Item 9.5-13 states:

Address the diesel fuel specifications grade and the fuel properties consistent with manufacturers' recommendations and the measures to protect against fuel degradation by a program of fuel sampling and testing.

The commitment was also captured as COL Action Item 9.5.9-2 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will develop site-specific factors in the fuel oil storage tank installation specification to reduce the effects of sun heat input into the stored fuel, as well as the diesel fuel specifications grade and fuel properties consistent with manufacturers' recommendations, and will develop a program of fuel sampling and testing to protect against fuel degradation.

Revision 17 of the DCD addressed the requirement for limiting heat input by specifying a white epoxy-urethane coating system. Therefore, this information is no longer required from COL applicants.

The COL information in Revision 0 of the applicant's FSAR added Section 9.5.4.5.2, "Fuel Oil Quality." The new section addressed fuel quality as follows:

High fuel oil quality is provided by specification of the required grade and properties of the fuel oil for procurement, by testing of samples of new fuel oil prior to addition into the tanks, and by monitoring the fuel oil for contamination and degradation with periodic testing of samples from the storage tanks in accordance with manufacturer's recommendations.

The fuel oil storage tanks are inspected at least once per 92 days to check for and remove accumulated water.

The fuel oil quality is verified by sampling and testing from the storage tanks at least once per 92 days. New fuel oil is tested prior to its addition to the storage tanks to verify that the sample meets the following minimum requirements:

- *Water and sediment content of less than or equal to 0.05 volume percent.*
- *Kinematic viscosity at 40°C of greater than or equal to 1.9 mm²/s (1.9 centistokes), but less than or equal to 4.1 mm²/s (4.1 centistokes).*
- *Specific gravity as specified by the manufacturer at 16/16°C (60/60°F), or an API [American Petroleum Institute] gravity at 16°C (60°F), within limits established in accordance with manufacturer's recommendations.*
- *Tested impurity level of less than 2 mg of insolubles per 100 ml. The analysis is completed within 7 days after obtaining the sample, but may be performed after the addition of new oil.*

As a result of the staff's review of BLN COL FSAR Section 9.5.4.5.2, the staff identified two questions that were submitted to the applicant in RAIs.

In RAI 9.5.4-1(a), the staff requested that the applicant identify the controls in place to ensure the fuel oil quality program is implemented according to BLN COL FSAR Section 9.5.4.5.2. In response, the applicant stated that implementation of the fuel oil program according to the FSAR is ensured by the Quality Assurance Program Description (QAPD) described in Chapter 17 and Part 11 of the COL application. The applicant stated QAPD Part III, Section 1, contains quality controls for non-safety-related SSCs that would require and verify implementation of the fuel oil program based on the FSAR description. The staff reviewed the information provided and concludes the proposed quality control requirements can ensure implementation of the fuel oil program in accordance with the BLN COL FSAR.

In RAI 9.5.4-1(b), the staff requested that the applicant provide quality requirements for the periodic testing of stored fuel oil. Section 9.5.4.5.2 of the BLN COL stated that diesel fuel oil from the storage tanks is sampled and tested, but no requirements were listed. The application listed quality requirements that appeared to apply only to new fuel oil. In its response, the applicant proposed the following revised BLN COL FSAR Section 9.5.4.5.2:

The diesel fuel oil testing program requires testing both new fuel oil and stored fuel oil. High fuel oil quality is provided by specifying the use of ASTM [American Society for Testing and Materials] Grade 2D fuel oil with a sulfur content as specified by the engine manufacturer.

A fuel sample is analyzed prior to addition of ASTM Grade 2D fuel oil to the storage tanks. The sample moisture content and particulate or color is verified per ASTM 4176. In addition, kinetic [sic] viscosity is tested to be within the limits specified in Table 1 of ASTM D975. The remaining critical parameters per Table 1 of ASTM D975 are verified compliant within 7 days.

Fuel oil quality is verified by sample every 92 days to meet ASTM Grade 2D fuel oil criteria. The addition of fuel stabilizers and other conditioners is based on sample results.

The fuel oil storage tanks are inspected on a monthly basis for the presence of water. Any accumulated water is to be removed.

The staff reviewed this revision and finds it acceptable because it addresses both the new and stored fuel oil and the requirements are the manufacturer's specifications and the same ASTM standards applied to safety-related diesel generators. The staff also confirmed that the revised fuel oil testing program was included as shown above in Revision 1 of the BLN COL FSAR.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from Section 9.5.4.4 of the BLN SER that requires correction. The BLN SER includes the following statement: "In addition, kinetic [sic] viscosity is tested to be within the limits specified in Table 1 of the ASTM D975." The word "kinetic" should read as "kinematic." The staff thought this was a typographical error on the applicant's part because Table 1 of ASTM D975, "Standard Specification for Diesel Fuel Oils," which is the appropriate reference, specifies "kinematic viscosity." Therefore, the staff concludes that STD COL 9.5-13 has been resolved pending incorporation of the proposed revision in the VEGP COL FSAR, which is being tracked as Confirmatory Item 9.5-3.

Resolution of Standard Content Confirmatory Item 9.5-3

Confirmatory Item 9.5-3 is an applicant commitment to revise its FSAR Section 9.5.4.4 to correct a typographical error. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 9.5-3 is now closed.

9.5.4.5 Post-Combined License Activities

There are no post-COL activities related to this section.

9.5.4.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the guidelines given in Section 9.5.4 of NUREG-0800. The staff based its conclusion on the following:

- STD COL 9.5-13 has been adequately addressed by the applicant in that it ensures that the manufacturers' recommendations using industry standards are met and provides a fuel sampling and testing program to protect against fuel degradation.

9.5.5 Standby Diesel Generator Cooling Water System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.5, "Diesel Generator Cooling Water System")

Section 9.5.5 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.5.5, "Standby Diesel Generator Cooling Water System," of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ On the basis of its review, the staff confirms that there is no outstanding issue related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.5.6 Standby Diesel Generator Starting Air System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.6, "Diesel Generator Starting System")

Section 9.5.6 of the Turkey Point Units 6 and 7 COL FSAR, incorporates by reference, with no departures or supplements, Section 9.5.6, "Standby Diesel Generator Starting Air System," of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.5.7 Standby Diesel Generator Lubrication System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.7, "Diesel Generator Lubrication System")

Section 9.5.7 of the Turkey Point Units 6 and 7 COL FSAR, incorporates by reference, with no departures or supplements, Section 9.5.7, "Standby Diesel Generator Lubrication System," of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point

Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

9.5.8 Standby Diesel Generator Combustion Air Intake and Exhaust System (Related to RG 1.206, Section C.III.1, Chapter 9, C.I.9.5.8, "Diesel Generator Combustion Air Intake and Exhaust System")

Section 9.5.8 of the Turkey Point Units 6 and 7 COL FSAR incorporates by reference, with no departures or supplements, Section 9.5.8, "Standby Diesel Generator Combustion Air Intake and Exhaust System," of the AP1000 DCD. The staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

10.0 STEAM AND POWER CONVERSION

10.1 Summary Description

10.1.1 Introduction

The steam and power conversion (S&PC) system is designed to remove heat energy from the reactor coolant system via the two main steam generators (SGs) and to convert it to electrical power in the turbine-generator (T-G). The main condenser deaerates the condensate and transfers heat that is not used in the steam cycle to the circulating water system (CWS). The regenerative turbine cycle heats the feedwater, and the main feedwater system returns it to the SG. This section also addresses the materials selection, fabrication, and fracture toughness requirements applicable to American Society of Mechanical Engineers (ASME) Code Section III, Class 2 and Class 3 pressure boundary components of the steam and feedwater systems and also discusses material issues identified through operating experience.

10.1.2 Summary of Application

Section 10.1 of the Florida Power and Light (FPL) combined license (COL) for Turkey Point Units 6 and 7 Final Safety Analysis Report (FSAR), Revision 8, incorporates by reference Section 10.1 of the AP1000 Design Control Document (DCD), Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 10.1.3, the applicant provided the following:

AP1000 COL Information Item

- Standard (STD) COL 10.1-1

The applicant provided additional information in STD COL 10.1-1 to address COL Information Item 10.1-1, providing information related to the monitoring of flow-accelerated corrosion (FAC).

License Condition

- Part 10, License Condition 6, Operational Program Readiness

The applicant proposed a license condition to provide a schedule to support the U.S. Nuclear Regulatory Commission's (NRC) inspection of operational programs including the FAC program.

10.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design."

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the FAC program are given in Section 10.3.6 of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)."

The applicable regulatory guidance for STD COL 10.1-1 is as follows:

- Generic Letter (GL) 89-08, “Erosion/Corrosion-Induced Pipe Wall Thinning”

The staff notes that request for additional information (RAI) numbering was based on NUREG-0800, Section 10.3.6. The evaluation is presented in this section because the applicant provided information in Section 10.1.3 of the Turkey Point Units 6 and 7 COL FSAR.

10.1.4 Technical Evaluation

The NRC staff reviewed Section 10.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the S&PC summary description. The results of the NRC staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP) Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application.

¹ See Section 1.2.2 for a discussion of the staff’s review related to verification of the scope of information to be included in a COL application that references a DC.

The following portion of this technical evaluation section is reproduced from Section 10.1.4 of the VEGP SER:

AP1000 COL Information Item

- STD COL 10.1-1

The applicant also provided information (STD COL 10.1-1) in BLN COL FSAR Section 10.1.3.1 to address a COL information item as described in AP1000 DCD Section 10.1.3. BLN COL FSAR Section 10.1.3.1, "Erosion-Corrosion Monitoring," describes general attributes of the applicant's program for monitoring and managing degradation (e.g., thinning) of piping and components susceptible to FAC, sometimes called erosion-corrosion.

In AP1000 DCD Section 10.1.3, Westinghouse identified a COL information item on FAC monitoring. The COL information item identified the need for a COL applicant to address the preparation of a FAC monitoring program for carbon steel portions of the S&PC systems that contain water or wet steam in order to address the concerns identified in GL 89-08. Similarly, in the NRC staff's FSER (NUREG-1793), Section 10.3.2, the staff identified COL Action Item 10.3.2-1 for the COL applicant to develop a FAC monitoring program to address industry guidelines and the concerns identified in GL 89-08.

The staff reviewed the information provided by the applicant in Section 10.1.3.1 of the BLN COL FSAR (STD COL 10.1-1) addressing a monitoring program for FAC. The staff also reviewed additional information provided in letters dated June 27, 2008 (ML081830410) and May 26, 2009 (ML091480012). In the letters, the applicant provided additional information requested by the staff about implementation of the FAC program during the plant construction phase, pre-service thickness measurements, and the basis for determining minimum allowable thickness.

In RAI 10.3.6-1, the staff requested that the applicant discuss its implementation schedule for the detailed FAC program (i.e., the FAC program activities that will be conducted during the plant construction phase and the schedule for those activities). This information was not provided in the application and was needed by the staff to make its reasonable assurance finding that the FAC concerns discussed in GL 89-08 are adequately addressed.

In RAI 10.3.6-2, the staff asked the applicant to confirm that its program for addressing and monitoring FAC will include pre-service thickness measurements of as-built components considered susceptible to FAC, and that these measurements will use grid locations and measurement methods most likely to be used for inservice inspection (ISI) according to industry guidelines. In addition, the staff requested that the applicant describe how the pre-service testing requirement was documented in the COL application.

In RAI 10.3.6-3, the staff asked the applicant to identify the industry guidelines or established procedures for determining the minimum allowable wall thickness at which components must be repaired or replaced.

In the June 27, 2008, letter, the applicant responded that susceptibility of piping and components to FAC will be evaluated prior to fuel load as design and as-built information becomes available, and those categorized as high risk for FAC failure will be evaluated for baseline testing prior to startup. For other piping, nominal dimensions may be used until baseline wall thickness is measured, but the applicant did not state when this will occur.

The applicant also proposed revising FSAR Section 10.1.3.1 by deleting the following sentence and replacing it with a paragraph that identifies a specific industry guideline (Electric Power Research Institute (EPRI) NSAC-202L) that contains more details about the approach to FAC monitoring.

In addition, the FAC monitoring program considers the information of Generic Letter 89-08 and industry guidelines.

This revision addressed the staff's concern about the basis for determining the minimum allowable thickness because it references the industry guidance (EPRI NSAC-202L) that addresses the concerns in GL 89-08. The response also addressed the staff's concern about pre-service thickness testing because it affirms the need for pre-service testing, and because the application will reference the guidance of NSAC-202L. The response confirmed that the EPRI CHECWORKS computer program will be used for wall thickness evaluations. Based on operating experience, the staff considers the EPRI guidance document and CHECWORKS program an effective approach to managing FAC. However, the staff also identified open items on this topic as discussed below. The open items are related to information that must be either clarified or added to the COL application.

The response to RAI 10.3.6-1 described how susceptibility to FAC will be evaluated as the design and as-built information becomes available, and high-risk (of FAC) components will be evaluated for baseline testing prior to startup. The staff had the following concerns:

- a) The applicant stated that piping and/or components with a high risk of FAC failure will be "evaluated for baseline testing prior to startup." This statement suggests baseline testing may not be performed on high-risk components.*
- b) The reference to piping and/or components "deemed to have a high risk of failure due to FAC" led the staff to question the extent to which FAC prevention was included in the plant design. Given that the plant has not yet been constructed and a predictive model such as CHECWORKS can estimate FAC rates, it is the staff's understanding that materials susceptible to FAC can be avoided where FAC is a potential degradation mechanism.*
- c) The applicant did not add the FAC program implementation schedule and construction phase activities to the COL application.*

The response to RAI 10.3.6-2 and the associated COL application revisions include the terms "Pass 1 analysis" and "Pass 2 analysis." Since these are terms

defined in EPRI NSAC-202L in the context of the CHECWORKS analysis program, reference to CHECWORKS needs to be addressed in the application.

The response to RAI 10.3.6-3 refers to "Systems Not Modeled components." Based on the context of this statement, the staff understands that this statement refers to "Susceptible Not Modeled lines," as discussed in EPRI NSAC-202L.

The applicant submitted a supplemental RAI response dated May 26, 2009 (ML091480012). In the revised responses to the RAIs the applicant clarified that the plant is designed to prevent FAC, and no piping/components are expected to have a high risk of FAC failure, but the possibility of a high-risk piping/component cannot be ruled out until the as-built design is analyzed. The response also clarified that baseline testing would be performed on all high-risk piping/components, and it corrected the wording to reference "Susceptible-Not-Modeled" lines. In the response to RAI 10.3.6-2 the applicant also proposed the following revision to FSAR Section 10.1.3.1:

In addition, the FAC monitoring program considers the information of Generic Letter 89-08, EPRI NSAC-202L-R3, and industry operating experience. The program requires a grid layout for obtaining consistent pipe thickness measurements when using Ultrasonic Test Techniques. The FAC program obtains actual thickness measurements for highly susceptible FAC locations for new lines as defined in EPRI NSAC-202L-R3. At a minimum, a CHECWORKS type Pass 1 Analysis is used for low susceptible FAC locations and a CHECWORKS type Pass 2 Analysis for highly susceptible FAC locations will be considered. To determine wear of piping and components where operating conditions are inconsistent or unknown the guidance provided in EPRI NSAC-202L is used to determine wear rates.

The revised response to RAIs 10.3.6-1, 10.3.6-2, and 10.3.6-3 therefore addressed all of the concerns identified above, with the exception of identifying the program implementation schedule in the application. This is **Open Item 10.1-1**. The staff identifies the FSAR revisions proposed by the applicant in its May 26, 2009 letter as **Confirmatory Item 10.1-1**. Pending resolution of the open item and confirmatory item, the staff finds the COL information item on the FAC program addresses the concerns expressed in GL 89-08.

Resolution of Standard Content Open Item 10.1-1

In a letter dated July 16, 2009, the VEGP applicant addressed Open Item 10.1-1 by proposing to include the FAC program as part of License Condition 6, "Operational Program Readiness." Specifically, the applicant stated that in a future application revision License Condition 6 will include the requirement to submit a FAC program implementation schedule, including the construction phase activities. The proposed license condition is consistent with SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and

Acceptance Criteria.” The staff verified that this change was incorporated into Revision 2 of the COL application. As a result, Open Item 10.1-1 is resolved.

Resolution of Standard Content Confirmatory Item 10.1-1

In a letter dated September 9, 2009, the BLN applicant revised the May 26, 2009, response to RAI 10.3.6-2 related to preservice inspection. The letter clarified that the CHECWORKS Pass 1 analysis (corrosion rates based on the plant model) would be performed for locations with both low and high FAC susceptibility. In addition, the response stated that the Pass 2 analysis (use of inspection data for model refinement, corrosion measurement, and trending) will be performed for high-susceptibility locations if warranted by the Pass 1 analysis. The original response stated that the Pass 2 analysis “will be considered” for high-susceptibility locations. The response includes the following revised wording in FSAR Section 10.1.3.1:

The FAC program obtains actual thickness measurements for highly susceptible FAC locations for new lines as defined in EPRI NSAC-202L-R3 (Reference 201). At a minimum, a CHECWORKS type Pass 1 analysis is used for low and highly susceptible FAC locations and a Pass 2 analysis is used for highly susceptible FAC locations when Pass 1 results warrant.

The staff determined that this revised FSAR text is acceptable because it clarified how the plant predictive model is used to perform FAC analysis, and the approach conforms to the EPRI NSAC-202L guidelines. The VEGP applicant has endorsed the standard RAI responses, and has incorporated the associated changes into Revision 2 of the FSAR. The staff determined that the VEGP applicant has fully addressed all RAI responses, and as a result, Confirmatory Item 10.1-1 is now resolved.

10.1.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff proposes to include the following license condition:

- License Condition (10-1) – Prior to initial fuel load, the licensee shall implement the flow accelerated corrosion (FAC) program including construction phase activities. No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors (NRO) a schedule that supports planning for and conduct of NRC inspections of the FAC program implementation including construction phase activities. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the FAC program has been fully implemented.

10.1.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to FAC, and there is no outstanding information to be addressed in the Turkey Point Units 6 and 7 COL

FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable because it meets the acceptance criteria provided in Section 10.3.6 of NUREG-0800 and the guidance in GL 89-08. The staff based its conclusion on the following:

- STD COL 10.1-1, relating to the monitoring of the FAC program, is acceptable because it conforms to the acceptance criteria and guidelines provided under Section 10.3.6 of NUREG-0800 and GL 89-08.

10.2 Turbine-Generator

10.2.1 Introduction

The turbine generator system (TGS) and its associated equipment (including moisture separator), involves the use of extraction steam for feedwater heating, and control functions. Details of TGS component construction materials are included in the AP1000 DCD. The T-G control and overspeed system is described in detail in the DCD; this detail includes redundancy and diversity of controls, types of control utilized, overspeed setpoints, and valve actions required for each set point. Because turbine rotors have large masses and rotate at relatively high speeds during normal reactor operation, failure of a rotor may cause excessive vibration of the turbine rotor assembly and result in the generation of high energy missiles. Measures taken by the applicant to ensure turbine rotor integrity and reduce the probability of turbine rotor failure are included in this section of the application.

10.2.2 Summary of Application

Section 10.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 10.2 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 10.2, the applicant provided the following:

Supplemental Information

- STD Supplement (SUP) 10.2-1

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 10.2.2, "System Description," which describes the probability of generating a turbine missile.

- STD SUP 10.2-3

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 10.2.3.6, "Maintenance and Inspection Program Plan," which describes the inservice inspection (ISI) program for the turbine assembly.

- STD SUP 10.2-4

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 10.2.2, "System Description," which describes the turbine assembly preoperational and startup tests.

- STD SUP 10.2-5

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 10.2.3, "Turbine-Rotor Integrity," which describes the turbine assembly operations and maintenance procedures.

AP1000 COL Information Item

- STD COL 10.2-1

The applicant provided additional information in STD COL 10.2-1, which states that a turbine maintenance and inspection program will be submitted to the NRC for review prior to initial fuel load. This addresses the COL information item in Section 10.2.6, "Combined License Information on Turbine Maintenance and Inspection," of the AP1000 DCD (COL Action Item 10.5-2).

License Condition

- License Condition 2, Item 10.2-1, relating to a turbine maintenance and inspection program

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of a turbine maintenance and inspection program.

10.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for turbine rotor integrity are given in Sections 10.2 and 10.2.3 of NUREG-0800.

10.2.4 Technical Evaluation

The NRC staff reviewed Section 10.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the T-G system design. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 10.2.4 of the VEGP SER:

Supplemental Information

- STD SUP 10.2-1

The applicant provided supplemental information as part of the BLN COL FSAR regarding the probability of generating a turbine missile. In FSAR Section 10.2.2, "System Description," the applicant stated that Section 3.5.1.3 addresses the probability of generation of a turbine missile for AP1000 plants in a side-by-side configuration. The staff's review of the acceptability of the probability of generating a turbine missile is documented in Section 3.5.1, "Missile Selection and Description," of this SER.

The following portion of this technical evaluation section is reproduced from Section 10.2.4 of the VEGP SER:

- STD SUP 10.2-3

The applicant provided supplemental information as part of the BLN COL FSAR regarding the ISI program for the turbine assembly. The applicant added text to the end of Section 10.2.3.6 of the AP1000 DCD, Revision 17, to describe the breadth of the turbine assembly ISI program.

The NRC staff reviewed the standard supplemental information provided in STD SUP 10.2-3 regarding the text added to Section 10.2.3.6 related to the turbine assembly ISI program. The staff concludes that STD SUP 10.2-3 is acceptable because it is a statement of the scope of the turbine ISI program consistent with the acceptance criteria of Section 10.2.3 of NUREG-0800.

- **STD SUP 10.2-4**

The applicant provided supplemental information as part of the FSAR regarding the turbine assembly preoperational and startup tests. The NRC staff reviewed the standard supplemental information provided in STD SUP 10.2-4 regarding the text added to Section 10.2.2 related to the turbine assembly preoperational and startup testing. The staff determined that this additional information provides further clarity regarding the turbine system startup tests. This additional information does not affect the design aspects of the system or its regulatory basis.

- **STD SUP 10.2-5**

The applicant provided supplemental information as part of the BLN COL FSAR regarding turbine assembly operations and maintenance procedures. The applicant added text to the end of Section 10.2.3 of the AP1000 DCD, Revision 17, to note that operations and maintenance procedures mitigate potential degradation mechanisms in the turbine rotor and buckets/blades. STD SUP 10.2-5 is a general statement about the purpose of operations and maintenance procedures and does not affect those procedures that are part of the staff's review of Section 10.2.3 of the DCD application.

AP1000 COL Information Item

- **STD COL 10.2-1**

The applicant provided additional information (STD COL 10.2-1) in BLN COL FSAR Section 10.2.6, "Combined License Information on Turbine Maintenance and Inspection," to resolve a COL information item identified in AP1000 DCD, Section 10.2.6. STD COL 10.2-1 identifies the turbine maintenance and inspection program, plant-specific turbine rotor test data, and plant-specific calculated toughness curves as items that must be submitted by the COL holder to the NRC staff for review prior to fuel load.

The AP1000 COL information item identified in DCD Section 10.2.6 states:

The Combined License holder will submit to the NRC staff for review prior to fuel load and then implement a turbine maintenance and inspection program. The program will be consistent with the maintenance and inspection program plan activities and inspection intervals identified in Subsection 10.2.3.6. The Combined License holder will have available plant-specific turbine rotor test data and calculated toughness curves that

support the material property assumptions in turbine rotor analysis after the fabrication of the turbine and prior to fuel load.

BLN COL FSAR Section 10.2.6, "Combined License Information on Turbine Maintenance and Inspection," replaces Section 10.2.6 of the AP1000 DCD with the following:

A turbine maintenance and inspection program will be submitted to the NRC staff for review prior to fuel load. The program will be consistent with the maintenance and inspection program plan activities and inspection intervals identified in DCD Subsection 10.2.3.6. Plant-specific turbine rotor test data and calculated toughness curves that support the material property assumptions in the turbine rotor analysis will be available for review after fabrication of the turbine and prior to fuel load.

The applicant proposed License Condition 2, Item 10.2-1 related to the above. The staff is currently reviewing Revision 17 of the DCD which contains the turbine maintenance and inspection program elements. License Condition 2 provides that the applicant will submit, prior to fuel load, its turbine maintenance and inspection program for the as-built rotor, including its material properties. The staff finds this condition acceptable because the inspection program, updated with as-built information, will be submitted to verify consistency with the maintenance and inspection program plan activities and inspection intervals identified in Section 10.2.3.6 of the DCD.

10.2.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff proposes to include the following license condition:

- License Condition (10-2) – Prior to initial fuel load, the licensee shall implement a turbine maintenance and inspection program, which will be consistent with the maintenance and inspection program plan activities and inspection intervals identified in FSAR Section 10.2.3.6. No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO a schedule that supports planning for and conduct of NRC inspections of the turbine maintenance and inspection program. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the turbine maintenance and inspection program has been fully implemented.

10.2.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the T-G, and there is no outstanding information expected to be addressed in the Turkey Point Units 6 and 7 COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the acceptance criteria of Section 10.2 of NUREG-0800. The staff based its conclusions on the following:

- STD SUP 10.2-1, related to the probability of generating a turbine missile, is reviewed by the staff in Section 3.5.1, "Missile Selection and Description," of this SER.
- STD SUP 10.2-3, related to the ISI program for the turbine assembly, is acceptable to the staff because the description of the ISI program is consistent with Section 10.2.3 of NUREG-0800.
- STD SUP 10.2-4, relating to the turbine assembly preoperational and startup tests, is acceptable to the staff because the proposed valve testing is consistent with the guidance in Section 10.2 of NUREG-0800.
- STD SUP 10.2-5, relating to mitigation of potential degradation mechanisms for the turbine rotor and buckets/blades, is acceptable to the staff because it is a general statement about the purpose of operations and maintenance procedures and does not affect those procedures that are part of the staff's review of Section 10.2.3 of the DCD application.
- STD COL 10.2-1, relating to the turbine maintenance and inspection program, is acceptable to the staff because the applicant proposed a license condition that appropriately addresses this information item.

10.3 Main Steam Supply System

10.3.1 Introduction

The main steam supply system (MSSS) transports the steam generated by the nuclear steam supply system to the S&PC system and various non-safety-related auxiliaries. Portions of the MSSS are used as part of the heat sink that removes heat from the reactor facility during certain operations. The MSSS for the pressurized-water reactor (PWR) plant extends from the connections to the secondary sides of the SGs up to and including the turbine stop valves.

10.3.2 Summary of Application

Section 10.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 10.3 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 10.3, the applicant provided the following:

Supplemental Information

- STD SUP 10.3-1

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 10.3.2.2.1, "Main Steam Piping," which addresses operations and maintenance procedures.

- STD SUP 10.3-2

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 10.3.5.4, "Chemical Addition," related to secondary-side water chemistry.

- STD SUP 10.3-3

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 10.3.6.2, "Material Selection and Fabrication," which addresses intergranular stress corrosion cracking (IGSCC).

10.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the MSSS are given in Sections 10.3 and 10.3.6 of NUREG-0800.

The applicable regulatory requirements and guidance for STD SUP 10.3-1, STD SUP 10.3-2, and STD SUP 10.3-3 are as follows:

- Title 10 of the *Code of Federal Regulations* (10 CFR) Part 50, Appendix A, General Design Criterion (GDC) 4, "Environmental and Dynamic Effects Design Bases"
- Regulatory Guide (RG) 1.37, Revision 1, "Quality Assurance Requirements for Cleaning of Fluid Systems and Associated Components of Water-Cooled Nuclear Power Plants"
- Branch Technical Position (BTP) 5-1, "Monitoring of Secondary Side Water Chemistry in PWR Steam Generators"

The regulatory basis for acceptance of the supplemental information on controls to prevent stress-corrosion cracking of stainless steels and nickel alloys is the quality assurance requirements in Appendix B, "Quality assurance criteria for nuclear power plants and fuel reprocessing plants," of 10 CFR Part 50, "Domestic licensing of production and utilization facilities," and the guidance in RG 1.37, as they relate to quality assurance requirements for the design, fabrication, and construction of safety-related structures, systems, and components (SSCs).

10.3.4 Technical Evaluation

The NRC staff reviewed Section 10.3 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the MSSS. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 10.3.4 of the VEGP SER:

Supplemental Information

- *STD SUP 10.3-1*

The applicant provided additional information as part of the BLN COL FSAR regarding operations and maintenance procedures. The applicant added text to Section 10.3.2.2.1 of the AP1000 DCD, Revision 17, to address steam hammer and relief valve discharge reaction loads.

The NRC staff reviewed the standard supplemental information provided in STD SUP 10.3-1 regarding the text added to Section 10.3.2.2.1 related to MSSS operations and maintenance procedures.

During its review of Revision 0 of the BLN COL FSAR, the staff did not find any further details regarding these procedures. Therefore, the staff raised a concern regarding the adequacy of these procedures. Also, Section 10.3 of NUREG-0800, "MAIN STEAM SUPPLY SYSTEM," Item II, related to GDC 4, describes that the main steam system should adequately consider water (steam) hammer and relief valve discharge loads to assure that system safety functions can be performed and should assure that operating and maintenance procedures include adequate precautions to prevent water (steam) hammer and relief valve loads. In order to ensure the adequacy of the MSSS and its agreement with the NUREG-0800 criteria, the staff requested the key elements of the procedures for staff's review in RAI 10.3-1.

In its response, dated July 21, 2008, concerning precluding or mitigating water hammer events, the applicant identified that good operating practice and operating experience including, but not limited to Institute of Nuclear Power Operations (INPO) significant event reports and significant operating event reports, NRC information notices and bulletins, and other industry operating experience information are programmatically integrated into the AP1000 Operations Procedure development. The applicant also stated that specific operating experience to preclude or mitigate water hammer is included in this population of operating experience. In addition, the applicant explained that the AP1000 has been designed to prevent or minimize steam and water hammer. The applicant stated that BLN COL FSAR Section 10.3.2.2.1 will be revised to include additional precautions, when appropriate, to minimize the potential for steam and water hammer.

With respect to the relief valve discharge loads, in its response, the applicant explained that Westinghouse addressed these loads for main steam safety valves in the AP1000 DCD, Section 10.3.2.2.2, "Main Steam Safety Valves," which BLN incorporated by reference with no departures and supplements. Further, the applicant stated that as described in NUREG-0927, Revision 1, "Evaluation of Water Hammer Occurrence in Nuclear Power Plants," preventive measures for relief valve loading are addressed by design. Therefore, the applicant stated that the COL application Part 2, BLN COL FSAR Section 10.3.2.2.1 will be revised to remove the associated procedure precautions as related to the relief valve discharge reaction loading. In addition, Section 10.3.2.2.1 will be revised to state that operations and maintenance procedures include precautions, when appropriate, to minimize the potential for steam and water hammer. The applicant listed several precautionary items, such as: prevention of rapid valve motion, process for avoiding voids and flashing in water-filled lines and venting these lines, process for avoiding introduction of water into steam lines and proper warm-up and drainage of these lines, and effects of valve alignments on line conditions.

Based on its review, the staff finds the applicant's response acceptable because a detailed list of the procedural precautions (identified above) is provided and

included as a proposed revision to COL application Part 2, BLN COL FSAR Section 10.3.2.2.1. The staff reviewed the precautions and compared them to the industry experience and staff guidance, and finds that they adequately address steam and water hammer. Therefore, the staff agrees that the deletion of the relief valve discharge reaction load occurrences from BLN COL FSAR Section 10.3.2.2.1 is acceptable, because its discussion was already identified in the AP1000 DCD Section 10.3.2.2.1. In BLN COL FSAR Section 10.3.2.2.1, Revision 1, the applicant revised STD SUP 10.3-1 as indicated above in its response to RAI 10.3-1. Therefore, the staff's concern in RAI 10.3-1 is resolved.

- **STD SUP 10.3-2**

The applicant provided additional information as part of the BLN COL FSAR regarding the secondary chemistry. In FSAR Section 10.3.5.4, "Chemical Addition," the applicant proposed adding the following at the end of DCD Subsection 10.3.5.4:

Alkaline chemistry supports maintaining iodine compounds in their nonvolatile form. When iodine is in its elemental form, it is volatile and free to react with organic compounds to create organic iodine compounds, which are not assumed to remain in solution. It is noted that no significant level of organic compounds is expected in the secondary system. The secondary water chemistry, thus, does not directly impact the radioactive iodine partition coefficients.

The staff reviewed the secondary water chemistry under Section 10.4.6 of this SER and found it acceptable with respect to the EPRI PWR Secondary Water Chemistry Guidelines. As discussed in Section 10.4.6, the staff considers application of the guidance of the EPRI PWR Secondary Water Chemistry Guidelines, and a programmatic commitment to use these guidelines, to be an acceptable method for the applicant to ensure compliance with GDC 14 as it relates to ensuring the integrity of the reactor coolant boundary (specifically, as the secondary water chemistry program ensures the integrity of the SG tubing). As the applicant stated in STD SUP 10.3-2, the secondary water chemistry does not directly impact the iodine partition coefficients. In addition, radioactive iodine is not a consideration in the EPRI Secondary Water Chemistry Guidelines. The staff finds that STD SUP 10.3-2 is a statement of fact that does not affect the staff's review. The management of radioactive compounds, including iodine, is addressed by the staff in Chapter 11.

- **STD SUP 10.3-3**

The applicant provided additional information as part of the BLN COL FSAR regarding IGSCC. The applicant added text to the end of Section 10.3.6.2 "Material Selection and Fabrication" of the AP1000 DCD, Revision 17, to include providing the necessary controls to minimize the susceptibility of components made of stainless steel and nickel-based materials to IGSCC. The applicant proposed adding the following at the end of DCD Section 10.3.6.2:

Appropriate operations and maintenance procedures provide the necessary controls during operation to minimize the susceptibility of components made of stainless steel and nickel-based materials to IGSCC by controlling chemicals that are used on system components.

The staff finds the supplemental information, addressing IGSCC concerns related to stainless steels and nickel-base alloys, acceptable because the AP1000 DCD meets the technical guidelines specified in RG 1.37. In addition, the staff notes that these materials are not proposed for use in the main steam and feedwater piping systems at BLN Units 3 and 4.

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from the BLN SER, Section 10.3.4, that requires correction. The BLN SER states that the staff reviewed the secondary water chemistry in Section 10.4.6 of the SER. Secondary water chemistry is actually reviewed in Section 10.4.7 of the SER.

10.3.5 Post Combined License Activities

There are no post-COL activities related to this section.

10.3.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to MSSS, and there is no outstanding information expected to be addressed in the Turkey Point Units 6 and 7 COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of GDC 4 and 10 CFR 52.79, "Contents of applications; technical information in final safety analysis report," through the methods described in Sections 10.3 and 10.3.6 of NUREG-0800, BTP 5-1, and RG 1.37. The staff based its conclusions on the following:

- STD SUP 10.3-1, relating to operations and maintenance procedures, is acceptable because the applicant provided sufficient information to satisfy GDC 4 as related to MSSS design considering the water (steam) hammer effects on the safety-related SSCs.
- STD SUP 10.3-2, relating to secondary chemistry, is a statement of fact that does not affect the staff's review.
- STD SUP 10.3-3, relating to IGSCC, is acceptable to the staff because the AP1000 DCD meets the technical guidelines specified in RG 1.37.

10.4 Other Features of Steam and Power Conversion System

10.4.1 Main Condensers

During normal operation, the main condenser receives, condenses and deaerates exhaust steam from the main turbine and the turbine bypass system whenever the turbine bypass system is operated. The main condenser is also a collection point for other steam cycle miscellaneous drains and vents.

Section 10.4 of the Turkey Point Units 6 and 7 FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 10.4.1 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

10.4.2 Main Condenser Evacuation System

10.4.2.1 *Introduction*

Main condenser evacuation is performed by the condenser air removal system. The system removes noncondensable gases and air from the main condenser during plant startup, cooldown, and normal operation. This action is performed by liquid ring vacuum pumps.

10.4.2.2 *Summary of Application*

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 10.4 of the AP1000 DCD, Revision 19. Section 10.4 of the DCD includes Section 10.4.2.2.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 10.4.2.2, the applicant provided the following:

Site-Specific Information Replacing Conceptual Design Information

- PTN CDI

The applicant provided additional information to replace conceptual design information (CDI) in Turkey Point Units 6 and 7 COL FSAR Section 10.4.2.2.1, "General Description," which describes the plant-specific cooling water source for the vacuum pump seal water heat exchangers.

- PTN CDI

The applicant provided additional information to replace CDI in Turkey Point Units 6 and 7 COL FSAR Section 10.4.2.2.2, "Component Description," which describes the plant-specific tube side water flow in the seal water heat exchangers.

10.4.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

Additionally, Appendix A to 10 CFR Part 50, GDC 60, "Control of Releases of Radioactive Materials to the Environment" forms a portion of the regulatory basis.

Acceptance criteria associated with the relevant requirements of the Commission regulations for the main condenser evacuation system are given in Section 10.4.2 of NUREG-0800.

10.4.2.4 Technical Evaluation

The NRC staff reviewed Section 10.4.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the main condenser evacuation system. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff's review of this application is limited to the following Turkey Point Units 6 and 7 plant-specific design information that replaces the CDI identified in the AP1000 DCD:

Site-Specific Information Replacing Conceptual Design Information

- PTN CDI

The plant-specific design information was annotated as "PTN CDI" in Turkey Point Units 6 and 7 COL FSAR Section 10.4.2. In this section, the applicant replaced bracketed (conceptual design) text in Sections 10.4.2.2.1, "General Description," and 10.4.2.2.2, "Component Description," of the AP1000 DCD to provide specific information regarding the sources of cooling water for the vacuum pump seal water heat exchangers.

The PTN CDI in Turkey Point Units 6 and 7 COL FSAR Section 10.4.2.2.1 is related to the CWS supplying cooling water for the vacuum pump seal water heat exchangers. The PTN CDI in FSAR Section 10.4.2.2.2 clarifies that the seal water flows through the shell side of the seal water heat exchanger and CWS water flows through the tube side. Based on its review of the application, the staff concludes that this Turkey Point Units 6 and 7 plant-specific design information will have no adverse effects on the capability of the main condenser evacuation system and CWS. Also, the staff concludes that adding this Turkey Point Units 6 and 7 plant-specific design information will not affect the functions of any safety-related equipment, components, or systems of the plant. The staff accepts the information provided in this PTN CDI because it meets the acceptance criteria in Section 10.4.2 of NUREG-0800, and therefore, meets GDC 60 as it relates to the main condenser evacuation system design for the control of releases of radioactive materials to the environment.

10.4.2.5 Post Combined License Activities

There are no post-COL activities related to this section.

10.4.2.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the main condenser evacuation system, and there is no outstanding information expected to be addressed in the Turkey Point Units 6 and 7 COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the acceptance criteria of Section 10.4.2 of NUREG-0800 and the requirements of GDC 60. The staff based its conclusions on the following:

- PTN CDI, relating to Turkey Point Units 6 and 7 COL FSAR Section 10.4.2.2.1, "General Description," concerning cooling water source for the vacuum pump seal water heat exchanger, is acceptable to the staff because it meets GDC 60 for the control of releases of radioactive materials to the environment.
- PTN CDI, relating to Turkey Point Units 6 and 7 COL FSAR Section 10.4.2.2.2, "Component Description," concerning the tube side water flow in the seal water heat exchangers, is acceptable to the staff because it meets GDC 60 for the control of releases of radioactive materials to the environment.

10.4.3 Gland Sealing System (Related to RG 1.206, Section C.III.1, Chapter 10, C.I.10.4.3, "Turbine Gland Sealing System")

The gland seal system prevents the escape of steam from the turbine shaft, turbine casing penetrations, and valve stems. The gland seal system also prevents air in-leakage through sub-atmospheric turbine glands. The system provides a source of sealing steam to the annulus space where the turbine and large steam valve shafts penetrate the turbine casings.

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 10.4.3 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

10.4.4 Turbine Bypass System

The turbine bypass system provides the capability to discharge a certain percentage of main steam from the steam generators directly to the main condenser, bypassing the turbine, which

minimizes load transient effects on the nuclear steam supply system. The system is also used to discharge main steam during reactor hot standby and cooldown operations.

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 10.4.4 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

10.4.5 Circulating Water System

10.4.5.1 Introduction

The CWS removes waste heat from the main condenser. This waste heat is subsequently transferred to the power cycle heat sink. The CWS provides a continuous supply of cooling water to the main condenser to remove the heat rejected by the turbine cycle and auxiliary systems.

10.4.5.2 Summary of Application

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 10.4 of the AP1000 DCD, Revision 19. Section 10.4 of the DCD includes Section 10.4.5.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 10.4.5, the applicant provided the following:

AP1000 COL Information Item

- PTN COL 10.4-1

The applicant provided additional information related to the CWS design parameters in Turkey Point Units 6 and 7 COL 10.4-1 to resolve the COL information item in Section 10.4.12.1 of the AP1000 DCD (COL Action Item 10.5-3).

Site-Specific Information Replacing Conceptual Design Information

- PTN CDI

The applicant provided additional information to replace CDI in Turkey Point Units 6 and 7 COL FSAR Section 10.4.5, which describes the following aspects of the site-specific CWS:

- Power generation design basis
- General description
- Component description
- System operation
- Tests and inspections

- Instrumentation applications

10.4.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of COL Information Item 10.4-1 (COL Action Item 10.5-3) is established in GDC 4, as it relates to design provisions provided to accommodate the effects of discharging water that may result from a failure of a component or piping in the CWS.

In accordance with Section 10.4.5 of NUREG-0800, the requirements of GDC 4 are met when the CWS design includes provisions to accommodate the effects of discharging water that may result from failure of a component or piping in the CWS. Means should be provided to prevent or detect and control flooding of safety-related areas so that the intended safety function of a system or component will not be precluded due to leakage from the CWS. Malfunction or failure of a component or piping of the CWS, including an expansion joint, should not have unacceptable adverse effects on the functional performance capabilities of safety-related systems or components.

10.4.5.4 Technical Evaluation

The NRC staff reviewed Section 10.4.5 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the CWS. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

AP1000 COL Information Items

- PTN COL 10.4-1

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5, the applicant provided additional information in PTN COL 10.4-1 to resolve the COL information item in Section 10.4.12.1, "Circulating Water System," of the AP1000 DCD, which states:

The Combined License applicant will address the final configuration of the plant circulating water system including piping design pressure, the cooling tower or other site-specific heat sink.

As applicable, the Combined License applicant will address the acceptable Langelier or Stability Index range, the specific chemical selected for use in the CWS water chemistry control, pH adjuster, corrosion inhibitor, scale inhibitor, dispersant, algicide and biocide applications reflecting potential variations in site water chemistry and in micro macro biological life forms. A biocide such as

sodium hypochlorite is recommended. Toxic gases such as chlorine are not recommended. The impact of toxic gases on the main control room habitability is addressed in Section 6.4. The Combined License applicant will also be responsible for the design, routing, and disposition requirements associated with the main condenser water box drains.

This COL information item was also captured as COL Action Item 10.5-3 in Appendix F of NUREG-1793:

The COL applicant is responsible for the site-specific configuration of the plant circulating water system (including piping design pressure), the cooling tower, or other site-specific heat sink.

The applicant addressed the above COL information item of the AP1000 DCD in Turkey Point Units 6 and 7 COL FSAR Sections 10.4.5.2.1, "General Description"; 10.4.5.2.2, "Component Description"; and 10.4.5.5, "Instrumentation Applications"; by providing additional information concerning CWS heat sink capability, design parameters, cooling towers, water box drains, and CWS water chemistry control. The staff reviewed the applicant's information in these FSAR sections.

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.1, the applicant described the site-specific CWS. The CWS and the cooling towers provide a heat sink for waste heat exhausted from the main steam turbine. Also, to address COL Information Item 10.4-1 of the AP1000 DCD, the applicant provided specific design parameters in Turkey Point Units 6 and 7 COL FSAR Table 10.4-201, "Supplemental Design Parameters for Major Circulating Water System Components."

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.2, the applicant stated that the design pressure of the condenser portions of the piping is identified in AP1000 DCD Table 10.4.1-1, "Main Condenser Design Data," and the design pressure of the remaining piping is 110 pounds per square inch gauge (psig). The design pressure of the condenser portions of the piping (water box design pressure) is identified in the table as 90 psig. The staff finds the design pressure of 110 psig for the remaining piping is compatible with the 90 psig for the condenser portion and is, therefore, acceptable. The staff also reviewed the Turkey Point Units 6 and 7 COL FSAR Table 10.4-202 site-specific design parameters and compared them to the corresponding data in AP1000 DCD Table 10.4.5-1, "Design Parameters for Major Circulating Water Components," and finds them acceptable as the site-specific parameters are similar to those for the certified design.

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.2, the applicant provided information on the chemical treatment program for the CWS. Also, the applicant stated that specific chemicals used within the system are based on water conditions as determined by the CWS water chemistry, and as committed in FSAR Section 10.4.7.2.1 are consistent with the EPRI PWR Secondary Water Chemistry Guidelines. Additionally, in Section 10.4.5.5, the applicant identified that circulating water chemistry is controlled by regulating the CWS blowdown valve, and by chemical addition. The staff finds that the applicant addressed the site-specific chemicals and control and maintenance of CWS chemistry in order to be consistent with the DCD, Sections 10.4.5.2.2 and 10.4.5.5, and as specified in COL Information Item 10.4-1.

Further, in Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.2, the applicant provided information on the design, routing, and disposition requirements associated with the main condenser water box drains. The applicant stated that the condenser water box drains allow the condenser to be drained to the cooling tower basin. Piping is routed from each water box to the condenser water box drain pump, which in turn pumps the water back to the cooling tower basin. Each water box contains drain valves and vents so that a water box can be drained individually. Piping is sized to support an adequate drain down in the event of emergency maintenance. Based on the discussion above, the staff finds that the applicant adequately addressed the site-specific design, routing, and disposition requirements associated with the main condenser water box drains as specified in COL Information Item 10.4-1.

The staff reviewed the information provided in the above Turkey Point Units 6 and 7 COL FSAR sections and finds that the applicant addressed the final configuration of the CWS as specified in the COL Information Item 10.4-1. The staff finds that the CWS design parameters of temperature and flow rates in Turkey Point Units 6 and 7 COL FSAR Table 10.4-202 are consistent with the design parameters in AP1000 DCD Table 10.4.5-1. The staff also finds that the design piping pressures of the Turkey Point Units 6 and 7 CWS are consistent with the design pressures of the conceptual (non-site-specific) design of the AP1000 CWS, and are, therefore, acceptable.

The staff's evaluation of the CWS final configuration is addressed below under the CDI discussions.

Site-Specific Information Replacing Conceptual Design Information

- PTN CDI

The applicant provided Turkey Point Units 6 and 7 site-specific design information as part of the FSAR to replace the CDI in the AP1000 DCD regarding the CWS. The applicant replaced bracketed text throughout Section 10.4.5 of the AP1000 DCD to provide site-specific CWS power generation design basis information, general CWS description, component description, system operation, tests and inspections, and instrumentation applications. The staff reviewed the text added in PTN CDIs throughout Turkey Point Units 6 and 7 COL FSAR Section 10.4.5 related to the CWS system, and the following provides the staff's evaluation of these CDIs in the application.

In Turkey Point Units 6 and 7 COL FSAR Sections 10.4.5.1, "Design Bases," and 10.4.5.2, "System Description," the applicant provided a description of its CWS system configuration. The CWS is a non-safety-related system. The CWS supplies cooling water to remove heat from the main condensers, the turbine building closed cooling water system (TCS) heat exchangers and the condenser vacuum pump seal water heat exchangers under varying conditions of power plant loading and design weather conditions.

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.1, "General Description," the applicant provided site-specific design information in that the Turkey Point Units 6 and 7 CWS consists of three 33-1/3 percent capacity circulating water pumps. In addition, each pump discharge line has a motor-operated butterfly valve located between the pump discharge and the main header. This permits isolation of one pump for maintenance and allows two-pump operation.

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.2, "Component Description," the applicant provided specific design information regarding the CWS major components, such as circulating water pumps, cooling tower, cooling tower makeup and blowdown, and piping and valves, which address the final configuration of the CWS.

The three cooling towers are mechanically induced-draft, counterflow cooling towers. Each cooling tower is designed to cool the water to 91°F (32.7°C) with a hot water inlet temperature of 115.4°F (46.3 °C). The staff finds that the above temperature values are acceptable as they demonstrate an equally effective cooling tower design as listed in AP1000 DCD Table 10.4.5-1.

In its review of the Turkey Point Units 6 and 7 COL application, the staff notes that the applicant submitted PTN DEP 2.0-2 in its COL Part 7, which identified a departure (DEP) from the DCD site parameter value for the maximum normal air temperature wet-bulb (noncoincident) in DCD Tier 2, Table 2-1 from 80.1 °F to a site-specific value of 81.5 °F. The applicant stated that operation of the cooling towers during conditions that are more restrictive than design conditions may result in higher condenser back pressure. Further in a PTN CDI, in Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.2, the applicant stated that when more than one cooling tower is located on site, through the phenomenon of "interference," a portion of the saturated effluent of an upwind tower can intermix with the air entering a tower located downwind; therefore, elevating its inlet wet-bulb temperature. It is further stated that proper cooling tower placement and orientation can minimize the effect of this "interference" phenomenon and that since the Turkey Point Units 6 and 7 service water system (SWS) and CWS towers are located remotely to each other and the saturated effluent dissipates before it interferes with the intake of the SWS, the CWS towers would not adversely affect the performance of the SWS towers. Additionally, in response to the staff's RAI 5399, Question 09.02.01-1, dated August 17, 2011, the applicant stated that it is unlikely that a CWS cooling tower plumes would interact with the SWS cooling towers such that a significant degradation in performance would occur. Regarding the PTN DEP 2.0-2 and CWS cooling towers plume interference and interaction with the safety-related SWS cooling towers; more details are provided in Turkey Point Units 6 and 7 COL FSAR Section 9.2, "Water Systems," and associated NRC staff's SER.

The CWS cooling tower makeup is provided by the RWS, described in Turkey Point Units 6 and 7 COL FSAR Section 9.2.11, "Raw Water System." Makeup to and blowdown from the CWS is controlled by the makeup and blowdown control valves. The evaluation of RWS capabilities is provided in Section 9.2.11 of this SER.

The underground portions of the CWS piping are constructed of prestressed concrete pressure piping. The remainder of the piping is carbon steel and is coated internally with a corrosion resistant compound. Control valves provide regulation of cooling tower blowdown and makeup. The CWS is designed to withstand the maximum operating discharge pressure of the circulating water pumps. As discussed earlier in the staff's evaluation of PTN COL 10.4-1, the staff finds the CWS piping design pressure of 110 psig to be consistent with the DCD value and, therefore, acceptable.

With respect to flooding, the staff finds that the effects of flooding due to a CWS failure, which were evaluated in NUREG-1793 and its supplements, apply to the Turkey Point Units 6 and 7 CWS. CWS failures, such as a rupture of an expansion joint, will not result in detrimental effects on safety-related equipment, because the turbine building does not house safety-related equipment and the base slab of the turbine building is located at grade elevation. Water from a

system rupture will run out of the building through a relief panel in the turbine building west wall before the level could rise high enough to cause damage. Small CWS leaks in the turbine building will drain into the waste water system. Large CWS leaks due to pipe failures will be indicated in the control room by a loss of vacuum in the condenser shell. The staff finds that these provisions of the Turkey Point Units 6 and 7 CWS design meet the requirements of GDC 4, as described in NUREG-0800, Section 10.4.5, Section II, Acceptance Criteria, and as it relates to design provisions to accommodate the effects of discharging water that may result from a failure of a component or piping in the CWS.

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.2, "Component Description," the applicant describes that piping is routed from each water box to the condenser water box drain pump, which in turn pumps the water back to the cooling tower basin. GDC 60 requires plants to be designed to control the release of radioactive materials in gaseous and liquid effluents. To comply with GDC 60, the design and routing of the water box drains must conform to GDC 60, so that it prevents an inadvertent transfer of contaminated fluids to the noncontaminated cooling tower basin. Based on the information provided in the FSAR, the staff is unable to reach a conclusion regarding compliance to GDC 60, because it cannot verify that the effluents routed to the cooling tower basin through the water box drains will be monitored for radiation prior to disposition. Therefore, the staff requested, in RAI 10.4.5-2, that the applicant provide additional information verifying that radioactive sources, such as the water box drains, that will drain downstream to the cooling tower basin are appropriately monitored, and if contamination is detected that the effluent is appropriately routed to the radioactive waste system. On July 23, 2013, the applicant responded to RAI 7129, Question 10.04.05-2 by stating that standard design features of the turbine building sump system (WWS) and additional administrative controls will prevent an inadvertent transfer of contaminated fluids from the condenser water box to the noncontaminated cooling tower basin. If radioactivity is detected, the condenser water box drains will be appropriately routed to the radioactive waste system via the turbine building sumps. A radiation monitor located on the turbine building sump common discharge piping, initiates an alarm and trips the turbine building sump pumps when radioactivity above a preset high level point is detected in the waste stream. The staff finds that the applicant has provided adequate information to satisfy GDC 60 with respect to the inadvertent transfer of contaminated fluids to the noncontaminated cooling tower basin. The applicant proposed to update the FSAR Section 10.4.5.2.2 to include the discussion of controls to prevent the release of CWS radioactivity from a condenser water box to the cooling tower basin. The staff verified that the applicant incorporated the associated changes in the Turkey Point Units 6 and 7 COL FSAR, Revision 4.

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.3, "System Operation," the applicant stated that each of the mechanical draft cooling towers is positioned so that its collapse would have no potential to damage SSCs required for safe shutdown of the plant. However, the staff could not find sufficient detail describing how the cooling tower failure would have no effect on the nearby safety-related system, equipment and/or structure of the plant. As described in NUREG-0800 Section 10.4.5, "Acceptance Criteria," the requirements of GDC 4 are met when the CWS design includes provisions to accommodate the effects of discharging water that may result from a failure of a component or piping in the CWS. Therefore, in order for the NRC staff to complete its evaluation of the site-specific CWS with respect to GDC 4 requirements, the staff requested, in RAI 5405, Question 10.04.05-1, that the applicant provide additional information to ensure that failure of any of the towers will not affect the safety-related systems or equipment that are located in the proximity of the cooling towers. In a letter dated August 3, 2011, the applicant responded to RAI 5405, Question 10.04.05-1 by stating that the mechanical induced

draft towers are less than 100 feet in height with a diameter greater than its height. Additionally, the tower closest to the nearest safety-related building is over 600 feet away as depicted on FSAR Figure 1.1-201. The configuration of the cooling towers and the large separation distance preclude the collapse of a cooling tower from damaging safety-related SSCs or nonsafety-related SSCs considered important to regulatory treatment of nonsafety systems (RTNSS). The site is graded to direct water that may result from a cooling tower failure or a circulating water yard piping failure away from the nuclear islands. The staff finds that the applicant has provided adequate information to satisfy GDC 4 with respect to external flooding events due to CWS failures. The applicant proposed to update FSAR Section 10.4.5.2.3 to include the greater than 600 foot distance, described in its response. The staff verified that the applicant incorporated the associated changes in the Turkey Point Units 6 and 7 COL FSAR, Revision 3.

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.2.3, "System Operation," the applicant stated that, if the CWS malfunctions such that the main condenser is not available to adequately support unit operation, cooldown of the reactor may be accomplished by using the power-operated atmospheric steam relief valves or safety valves rather than the turbine bypass system. The staff finds that this alternate cooldown method is acceptable, because the turbine bypass system will not function during accident conditions and the CWS is not required for safe shutdown following an accident. Also, the applicant stated that provisions are made during cold weather in that circulating water flow to the cooling towers can be diverted to the basins, bypassing the cooling towers' internals, by opening the bypass valves during plant startup or partial load or to maintain CWS temperatures above 4.4 °C (40 °F). The staff finds that these provisions of the site-specific CWS design meet the requirements of GDC 4, as described in NUREG-0800, Section 10.4.5.

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.5.5, "Instrumentation Application," the applicant identified the configuration and function of the CWS pressure, temperature and level instrumentation at the Turkey Point Units 6 and 7 site. Also, the motor-operated valve at each pump discharge is interlocked with the pump, so that the pump trips if the discharge valve fails to reach the full-open position shortly after starting the pump.

Based on its review, the staff concludes that the site-specific design of the CWS meets the requirements of GDC 4 with respect to the effects of discharging water that may result from a failure of component or piping in the CWS. Further, the staff finds that the CWS meets the design recommendations provided in the AP1000 DCD.

10.4.5.5 *Post Combined License Activities*

There are no post-COL activities related to this section.

10.4.5.6 *Conclusion*

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the CWS, and there is no outstanding information expected to be addressed in the Turkey Point Units 6 and 7 COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, PTN CDI involving the CWS is adequately addressed by the applicant in its application to meet the requirements of the DCD. The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the acceptance criteria of Section 10.4.5 of NUREG-0800 and the requirements of GDC 4. The staff based its conclusions on the following:

- PTN COL 10.4-1, relating to the final configuration of the circulating water, is acceptable to the staff because the applicant addressed the site-specific chemicals and control and maintenance of the CWS chemistry in order to be consistent with AP1000 DCD.
- PTN CDI, relating to various aspects of the CWS, is acceptable to the staff because failure of the site-specific CWS design does not adversely impact any safety-related SSCs.

10.4.6 Condensate Polishing System (Related to RG 1.206, Section C.III.1, Chapter 10, C.I.10.4.6, “Condensate Cleanup System”)

The condensate polishing system can be used to remove corrosion products and ionic impurities from the condensate system during plant startup, hot standby, power operation with abnormal secondary cycle chemistry, safe shutdown, and cold shutdown operations.

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 10.4.6 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

10.4.7 Condensate and Feedwater System

10.4.7.1 Introduction

The condensate and feedwater system provides feedwater at the required temperature, pressure, and flow rate to the SGs. Condensate is pumped from the main condenser hot well by the condensate pumps, passes through the low-pressure feedwater heaters to the feedwater pumps, and then is pumped through the high-pressure feedwater heaters to the SGs.

10.4.7.2 Summary of Application

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 10.4 of the AP1000 DCD, Revision 19. Section 10.4 of the DCD includes Section 10.4.7.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 10.4.7.2.1, the applicant provided the following:

AP1000 COL Information Item

- PTN COL 10.4-2

The applicant provided additional information in PTN COL 10.4-2 to address the COL information item in Section 10.4.12.2, "Condensate, Feedwater and Auxiliary Steam System Chemistry Control," of the AP1000 DCD (COL Action Item 10.5-4).

Supplemental Information

- STD SUP 10.4-1

The applicant provided supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 10.4.7.2.1, "General Description," which addresses operations and maintenance procedures.

- PTN SUP 10.4-2

The applicant provided supplemental information, which states that the EPRI Secondary Water Chemistry Guidelines will be used for guidance on selection of pH control agents and pH optimization as described in Nuclear Energy Institute (NEI) 97-06, "Steam Generator Program Guidelines."

10.4.7.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of the COL information item and PTN SUP 10.4-2 is GDC 14, as it relates to ensuring the integrity of the reactor coolant pressure boundary (specifically as the secondary water chemistry program ensures the integrity of the SG tubing). The applicable acceptance criteria for meeting GDC 14 are found in NUREG-0800 Sections 10.4.6 and 5.4.2.1, including BTP 5-1. The regulatory basis for acceptance of STD SUP 10.4-1 is established in GDC 4, insofar as the GDC requires that the dynamic effects associated with possible fluid flow instabilities (e.g., water hammers) during normal plant operation, as well as during upset or accident conditions be considered, and that SSCs important to safety be designed to accommodate the effects of, and be compatible with the environmental conditions associated with normal operation, maintenance, testing, and postulated accidents.

GDC 4 can be complied with by meeting the relevant acceptance criteria specified in Section 10.4.7 of NUREG-0800, "Condensate and Feedwater System." In regard to fluid instabilities, the requirements of GDC 4, as related to protecting SSCs against the dynamic effects associated with possible fluid flow instabilities (e.g., water hammers) during normal plant operation, as well as during upset or accident conditions can be met by: (1) meeting the guidance in BTP 10-2, "Design Guidelines for Avoiding Water Hammers in Steam Generators,"

for reducing the potential for water hammers in SGs; and (2) meeting the guidance related to feedwater-control-induced water hammer. Guidance for water hammer prevention and mitigation is given in NUREG-0927, Revision 1.

10.4.7.4 Technical Evaluation

The NRC staff reviewed Section 10.4.7 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The NRC staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the condensate and feedwater system. The results of the NRC staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAs.
- The staff confirmed that all responses to RAs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COL application.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

AP1000 COL Information Item

- PTN COL 10.4-2

In Turkey Point Units 6 and 7 COL FSAR Section 10.4.7.2.1, the applicant provided additional information in PTN COL 10.4-2 to address the COL information item in Section 10.4.12.2,

“Condensate, Feedwater and Auxiliary Steam System Chemistry Control,” of the AP1000 DCD, which states:

The Combined License applicant will address the oxygen scavenging agent and pH adjuster selection for the turbine island chemical feed system.

The commitment was also captured as COL Action Item 10.5-4 in Appendix F of NUREG-1793:

The COL applicant is responsible for chemistry control of the condensate, feedwater, and auxiliary steam system.

The Turkey Point Units 6 and 7 COL FSAR modified Section 10.4.7.2.1 of the AP1000 DCD, to state:

The oxygen scavenger agent is hydrazine and/or carbohydrazide and the pH control agent is morpholine.

The NRC staff reviewed the resolution to PTN COL 10.4-2 regarding the text added to Section 10.4.7.2.1, related to condensate, feedwater, and auxiliary steam system chemistry control.

The description of the secondary water chemistry control program is addressed in the AP1000 DCD, Section 10.3.5. Consistency with industry guidelines was addressed in the AP1000 DCD, Section 10.3.5.5, which stated that action taken when chemistry parameters are outside normal operating ranges will, in general, be consistent with action levels described in Reference 1 (“PWR Secondary Water Chemistry Guidelines,” EPRI technical report (TR) TR-102134-R5, March 2000). However, the AP1000 DCD does not specify the oxygen scavenger or pH control chemicals to be used. This is to be addressed by COL Information Item 10.4-2 of the AP1000 DCD.

Revision 6 of the EPRI Secondary Water Chemistry Guidelines (EPRI Guidelines), which is the latest published version of these guidelines, does not require a specific oxygen scavenging agent. However, the guidelines do note that hydrazine is the most commonly used oxygen scavenger for PWR secondary systems and is generally recognized as effective for this purpose. Therefore, the staff finds the identified oxygen scavenger agent is consistent with the EPRI guidelines identified in the AP1000 DCD.

For pH control, the EPRI secondary water chemistry guidelines do not require specific amines. Section 3.3.1 of the EPRI Guidelines recommends a plant-specific amine be selected based on a number of listed factors. Section 3.3.1 of the EPRI Guidelines lists several amines that have been used or are being used in PWR plants as pH control agents, including morpholine. Section 3.3.1.2 of the EPRI Guidelines states that if implementing advanced amine treatment, a site-specific materials compatibility review will be necessary to ensure that components, particularly elastomers, are compatible with the amine. The EPRI Guidelines, in Table 5-4, “Recirculating Steam Generator Power Operation ($\geq 30\%$ Reactor Power) Feedwater Sample,” refer to several other EPRI reports for guidance for optimization of the pH in conjunction with the amine selected.

Although the applicant did not explicitly describe how the selected amines were qualified, STD SUP 10.4-2 ensures that the qualification of the chosen oxygen scavenging and pH control

chemicals will be consistent with the EPRI PWR Secondary Water Chemistry Guidelines. (See evaluation of STD SUP 10.4-2 below under evaluation of supplemental information).

The staff finds the pH control and oxygen scavenger chemical acceptable because the proposed chemicals will be qualified and the resulting pH optimized following the guidance of the EPRI PWR Secondary Water Chemistry Guidelines, which is referenced in Section 10.4.7 of NUREG-0800 as acceptable guidance to ensure that the secondary water chemistry program meets GDC 14. On the basis of the information provided by the applicant and the acceptance criteria in BTP 5-1, the staff concludes that the proposed secondary chemistry that uses hydrazine and/or carbohydrazide and morpholine is acceptable.

The following portion of this technical evaluation section is reproduced from Section 10.4.7.4 of the VEGP SER:

Supplemental Information

- STD SUP 10.4-1

The applicant provided supplemental information as part of the BLN COL FSAR regarding operations and maintenance procedures. The applicant added the following text to the end of Section 10.4.7.2.1 of the AP1000 DCD, Revision 17:

Operations and maintenance procedures include appropriate precautions to avoid steam/water hammer occurrences.

The NRC staff reviewed the standard supplemental information provided in STD SUP 10.4-1 regarding the text added to Section 10.4.7.2.1 related to operations and maintenance procedures.

In Section 10.4.7 of NUREG-0800, Acceptance Criteria 2, provides acceptable methods of compliance with the requirements in GDC 4, as it applies to fluid flow instabilities, (e.g., water hammer). Criteria 2B, "Meeting the guidance related to feedwater-control-induced water hammer," states that guidance for water hammer and mitigation is found in NUREG-0927. The supplemental information added to the BLN COL FSAR states that operations and maintenance procedures include appropriate precautions to avoid steam/water hammer occurrences; however, the supplemental information being proposed by the applicant did not identify what type of precautions included in the procedures minimize the potential for water hammer occurrences. In order to ensure that the procedures adequately address water hammer prevention and mitigation, the staff requested in RAI 10.4-7-1, in a letter dated June 3, 2008, that the applicant provide a more detailed statement concerning the use of operations and maintenance procedures, including information on what specific elements in the procedures (i.e., venting) will result in reduced potential of water hammer occurrences.

In its response, dated July 17, 2008, concerning reducing the potential for water hammer events, the applicant identified that they programmatically integrate into the AP1000 Operations Procedure development good operating practice and operating experience including, but not limited to, Institute of Nuclear Power

Operations (INPO) significant event reports and significant operating event reports, NRC information notices and bulletins, and other industry operating experience information. Further, the applicant explained that specific operating experience to preclude or mitigate water hammer is included in this population of operating experience. In addition, the applicant explained that the AP1000 has been designed to prevent or minimize steam and water hammer. The applicant agreed to revise the procedure elements in BLN COL FSAR Section 10.4.7.2.1, and described in STD SUP 10.4-1, to include additional precautions to minimize the potential for steam and water hammer.

The revised STD SUP 10.4-1, in BLN COL FSAR Section 10.4.7.2.1 now reads as follows:

Operations and maintenance procedures include precautions, when appropriate, to minimize the potential for steam and water hammer, including:

- Prevention of rapid valve motion.*
- Process for avoiding introduction of voids into water-filled lines and components.*
- Proper filling and venting of water-filled lines and components.*
- Process for avoiding introduction of steam or heated water that can flash into water-filled lines and components.*
- Cautions for introduction of water into steam-filled lines or components.*
- Proper warmup of steam-filled lines.*
- Proper drainage of steam-filled lines.*
- The effects of valve alignments on line conditions.*

Based on its review, the staff finds the applicant's response acceptable because a detailed list of the procedural precautions that would reduce or minimize the occurrence of water hammer was provided and included as a proposed revision to the COL application, Part 2, BLN COL FSAR Section 10.4.7.2.1. Further, the staff reviewed the precautions and compared them to the industry experience and staff guidance in accordance with Section 10.4.7 of NUREG-0800 and BTP 10-2. The staff finds that the applicant has adequately addressed the steam and water hammer. Therefore, the staff's concern described in RAI 10.4.7-1 is resolved.

- STD SUP 10.4-2 [PTN SUP 10.4-2 for the Turkey Point Units 6 and 7]*

The applicant provided supplemental information explaining that the EPRI PWR Secondary Water Chemistry Guidelines will be used for guidance on selection of pH control agents and pH optimization as described in NEI 97-06.

EPRI documents provide detailed guidelines for both qualification of the selected pH control chemicals and the optimization of the secondary pH. While the staff does not review or accept the EPRI PWR Secondary Water Chemistry Guidelines through a safety evaluation, these guidelines are recognized as representing the industry consensus on best practices in water chemistry control and have been proven to be effective via many years of successful operating experience. As such, the staff finds the application of the guidance of the EPRI PWR Secondary Water Chemistry Guidelines, and a programmatic commitment to use these guidelines, to be an acceptable method for the applicant to ensure compliance with GDC 14. As discussed in a Federal Register (FR) notice, dated March 2, 2005, 70 FR 10298, the reference to NEI 97-06 and the associated water chemistry guidelines provide reasonable assurance that SG tube integrity will be maintained.

10.4.7.5 Post Combined License Activities

There are no post-COL activities related to this section.

10.4.7.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The NRC staff's review confirmed that the applicant addressed the required information relating to the condensate and feedwater system, and there is no outstanding information expected to be addressed in the Turkey Point Units 6 and 7 COL FSAR related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the requirements of GDC 4 and GDC 14 through the methods described in Sections 10.4.6, 10.4.7, and 5.4.2.1 of NUREG-0800, NUREG-0927, BTP 5-1, and BTP 10-2. The staff based its conclusions on the following:

- PTN COL 10.4-2 and PTN SUP 10.4-2, relating to the condensate, feedwater, and auxiliary system chemistry control program, are in accordance with EPRI PWR Secondary Water Chemistry Guidelines, which is referenced in NUREG-0800 Sections 10.4.6 and 5.4.2.1, including BTP 5-1 of NUREG-0800. Meeting these guidelines ensures that GDC 14 is met with respect to integrity of the reactor coolant pressure boundary, specifically as the secondary water chemistry program ensures the integrity of the SG tubing.
- STD SUP 10.4-1, relating to operations and maintenance, is acceptable to the staff because the applicant has provided a detailed list of the procedural precautions that are consistent with Section 10.4.7 of NUREG-0800 and the BTP 10-2 acceptance criteria.

10.4.8 Steam Generator Blowdown System (Related to RG 1.206, Section C.III.1, Chapter 10, C.I.10.4.8, “Steam Generator Blowdown System (PWR)”)

The SG blowdown system assists in maintaining acceptable secondary coolant water chemistry during normal operation and during anticipated operational occurrences, such as main condenser inleakage or primary to secondary SG tube leakage. It does this by processing water from each SG and removing impurities.

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 10.4.8 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

10.4.9 Startup Feedwater System

The startup feedwater system provides a supply of feedwater to the SGs during plant startup, hot standby and shutdown conditions, and during transients in the event of main feedwater system unavailability. The startup feedwater system is composed of components from the AP1000 main and startup feedwater system and SG system.

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 10.4.9 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

10.4.10 Auxiliary Steam System

The auxiliary steam system provides the steam required for plant use during startup, shutdown, and normal operation. Steam is supplied from either the auxiliary boiler or the main steam system.

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 10.4.10 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff’s review confirmed that there is no outstanding issue related to this section. The results of the NRC staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

10.4.11 Turbine Island Chemical Feed

The turbine island chemical feed system injects required chemicals into the condensate, feedwater, auxiliary steam, service water, and demineralized water treatment. Chemical feed system components are located in the turbine building.

Section 10.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference, with no departures or supplements, Section 10.4.11 of Revision 19 of the AP1000 DCD. The NRC staff reviewed the application and checked the referenced DCD to ensure that no issue relating to this section remained for review.¹ The NRC staff's review confirmed that there is no outstanding issue related to this section. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

10.4.12 Combined License Information

Section 10.4.12 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference with no departures or supplements, Section 10.4.12, "Combined License Information," of Revision 19 of the AP1000 DCD. The NRC staff reviewed Section 10.4.12 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹

The applicant addressed COL Information Items 10.4-1, 10.4-2, and 10.4-3. These items are discussed and evaluated in Sections 10.4.5, 10.4.7, and 9.2.5 of this SER, respectively.

11.0 RADIOACTIVE WASTE MANAGEMENT

The radioactive waste management systems (RWMSs) are designed to control, collect, handle, process, store, and dispose of liquid, gaseous, and solid wastes that may contain radioactive materials. The systems include the instrumentation used to monitor and control the release of radioactive effluents and wastes and are designed for normal operation (including refueling; purging; fuel handling and storage; radioactive material handling, processing, use, storage, and disposal; maintenance; routine operational surveillance; inservice inspection (ISI); and calibration) and anticipated operational occurrences (AOOs).

11.1 Source Terms

The radioactive source terms are used to identify the potential dose to members of the public and plant employees as a result of plant operation. This includes consideration of parameters used to determine the concentration of each isotope in the reactor coolant, fraction of fission product activity released to the reactor coolant, and concentrations of all nonfission product radioactive isotopes in the reactor coolant. Gaseous and liquid waste sources are considered in the evaluation of effluent releases.

Section 11.1 of the Turkey Point Units 6 and 7 combined license (COL) Final Safety Analysis Report (FSAR), Revision 8, incorporates by reference, Section 11.1, "Source Terms," of Revision 19 of the AP1000 Design Control Document (DCD).

In addition, in the Turkey Point Units 6 and 7 COL FSAR, the applicant provided the following:

Departure

- PTN DEP 6.4-1

The applicant provided information in Section 11.1 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related PTN DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this report.

The U.S. Nuclear Regulatory Commission (NRC) staff reviewed Section 11.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that no issue relating to this section remained for review. The staff's review confirmed that there is no outstanding issue related to this section. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG 1793, "Final Safety Evaluation Report [FSER] Related to Certification of the AP1000 Standard Design," and its supplements.

11.2 Liquid Waste Management Systems

11.2.1 Introduction

The liquid waste management system (LWMS) is designed to control, collect, process, handle, store, and dispose of liquid radioactive waste generated as the result of normal operation, including AOOs.

11.2.2 Summary of Application

Section 11.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 11.2 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 11.2, the applicant provided the following:

AP1000 COL Information Items

- STD COL 11.2-1

The applicant provided additional information in Standard (STD) COL 11.2-1 to resolve COL Information Item 11.2-1 (COL Action Item 11.2-1). The additional information addresses the use of mobile or temporary equipment to process liquid effluents in Turkey Point Units 6 and 7 COL FSAR, Sections 11.2.1.2.5.2 and 11.2.5.1.

- PTN COL 11.2-2

The applicant provided additional information in Turkey Point Nuclear Plant (PTN) COL 11.2-2 to resolve COL Information Item 11.2-2 (COL Action Item 11.2-2). The additional information addresses the dilution factors used for dose calculations and the cost-benefit analysis of population doses in Turkey Point Units 6 and 7 COL FSAR, Sections 11.2.3.5 and 11.2.5.2.

- PTN COL 2.4-5 and PTN COL 15.7-1

Turkey Point Units 6 and 7 COL FSAR, Section 11.2, does not identify PTN COL 2.4-5 and PTN COL 15.7-1 as COL information items applicable to Section 11.2. However, PTN COL 2.4-5 and PTN COL 15.7-1 provide information regarding a postulated liquid waste tank failure, which is evaluated by the staff as part of LWMS. Therefore, PTN COL 2.4-5 and PTN COL 15.7-1 are evaluated in Section 11.2.4 of this safety evaluation report (SER). In Turkey Point Units 6 and 7 COL FSAR, Section 2.4.13, the applicant performed the consequence analysis of a postulated liquid waste tank failure to address COL Information Items 2.4-5 and 15.7-1.

- PTN COL 11.5-3

The applicant provided additional information in PTN COL 11.5-3 to resolve COL Information Item 11.5-3 (COL Action Item 11.5-3). The additional information addresses compliance with Title 10 of the *Code of Federal Regulations* (CFR) Part 50, "Domestic Licensing of Production and Utilization Facilities," Appendix I, "Numerical Guides for Design Objectives and Limiting Conditions for Operation To Meet the Criterion 'As Low as Is Reasonably Achievable' for Radioactive Material in Light-Water-Cooled Nuclear Power Reactor Effluents," Section II.A in Turkey Point Units 6 and 7 COL FSAR, Section 11.2.3.5.

Supplemental Information

- STD SUP 11.2-1

The applicant added, in Turkey Point Units 6 and 7 COL FSAR, Section 11.2.3.6, supplemental information to address the quality assurance (QA) program to be applied to the LWMS.

- PTN SUP 11.2-1

The applicant added, in Turkey Point Units 6 and 7 COL FSAR, Section 11.2.3.6, supplemental information related to the discharge of effluent to deep well injection wells.

- PTN SUP 11.2-2

The applicant added in, Turkey Point Units 6 and 7 COL FSAR, Section 11.2.3.5, supplemental information related to the QA program.

11.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

The regulatory requirements applicable to the LWMS are as follows:

- 10 CFR 20.1301(e)
- 10 CFR 20.1302, "Compliance with dose limits for individual members of the public"
- 10 CFR 20.1406, "Minimization of contamination"
- 10 CFR 20.2002, "Method for obtaining approval of proposed disposal procedures"
- 10 CFR 50.34a, "Design objectives for equipment to control releases of radioactive material in effluents—nuclear power reactors"
- 10 CFR Part 50, Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criterion (GDC) 60, "Control of releases of radioactive materials to the environment"
- 10 CFR Part 50, Appendix A, GDC 61, "Fuel storage and handling and radioactivity control"
- 10 CFR Part 50, Appendix I, Sections II.A and II.D
- 10 CFR 52.80(a)

- 40 CFR Part 190, “Environmental Radiation Protection Standards for Nuclear Power Operations”

Guidance for accepting the supplementary information on the LWMS is in:

- the codes and standards listed in Table 1 of Regulatory Guide (RG) 1.143, Revision 2, “Design Guidance for Radioactive Waste Management Systems, Structures, and Components Installed in Light-Water-Cooled Nuclear Power Plants”
- Regulatory Position C.1.1 of RG 1.143, Revision 2
- RG 1.109, Revision 1, “Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I”
- RG 1.110, “Cost-Benefit Analysis for Radwaste Systems for Light-Water-Cooled Nuclear Power Reactors”
- RG 1.113, Revision 1, “Estimating Aquatic Dispersion of Effluents from Accidental and Routine Reactor Releases for the Purpose of Implementing Appendix I”
- RG 4.21, “Minimization of Contamination and Radioactive Waste Generation: Life-Cycle Planning”
- SECY-07-0060, “Basis and Justification for Approval Process for 10 CFR 20.2002 Authorizations and Options for Change”

The acceptance criteria associated with the LWMS are given in Section 11.2 of NUREG-0800, “Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition,” and NUREG-0800, Section 2.4.13, Acceptance Criterion No. 5, including Branch Technical Position (BTP) 11-6.

11.2.4 Technical Evaluation

The staff reviewed Section 11.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic. The staff’s review confirmed that the information in the application and incorporated by reference addresses the required information relating to the LWMS. The results of the staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff’s review of this application included the following COL information and supplementary items:

- STD COL 11.2-1, Processing of Liquid Waste by Mobile Equipment
- PTN COL 11.2-2, Liquid Radwaste Cost-Benefit Analysis Methodology
- PTN COL 2.4-5, Accidental Release of Liquid Effluents into Groundwater and Surface Water
- PTN COL 15.7-1, Consequences of Tank Failure
- PTN COL 11.5-3, Individual Dose Limits in 10 CFR Part 50, Appendix I
- STD SUP 11.2-1, Quality Assurance
- PTN SUP 11.2-1, Effluent Discharge Point
- PTN SUP 11.2-2, Quality Assurance

In addition to the above items, the staff reviewed the entire section against Section 11.2 of NUREG-0800 to determine whether the information in Turkey Point Units 6 and 7 COL FSAR, Section 11.2, met the regulatory requirements in the regulations stated above (SER Section 11.2.3) and the NUREG-0800 acceptance criteria. The relevant NUREG-0800 acceptance criteria are as follows:

- The LWMS should have the capability to meet the dose design objectives and include provisions to treat liquid radioactive wastes such that the following is true:
 - A. The calculated annual total quantity of all radioactive materials released from each reactor at the site to unrestricted areas will not result in an estimated annual dose or dose commitment from liquid effluents for any individual in an unrestricted area from all pathways of exposure in excess of 0.03 millisievert (mSv) (3 millirem (mrem)) to the total body or 0.1 mSv (10 mrem) to any organ. RGs 1.109, 1.112, and 1.113 provide acceptable methods for performing this analysis.
 - B. The LWMS should include all items of reasonably demonstrated technology that, when added to the system sequentially and in order of diminishing cost-benefit return for a favorable cost-benefit ratio, can effect reductions in doses to the population reasonably expected to be within 80 kilometers (km) (50 miles (mi)) of the reactor. RG 1.110 provides an acceptable method for performing this analysis.
 - C. The concentrations of radioactive materials in liquid effluents released to unrestricted areas should not exceed the concentration limits in Table 2, Column 2, of Appendix B, "Annual Limits on Intake (ALIs) and Derived Air Concentrations (DACs) of Radionuclides for Occupational Exposure; Effluent

Concentrations; Concentrations for Release to Sewerage” to
10 CFR Part 20, “Standards for protection against radiation.”

- The LWMS should be designed to meet the anticipated processing requirements of the plant. Adequate capacity should be provided to process liquid wastes during periods when major processing equipment may be down for maintenance (single failures) and during periods of excessive waste generation. Systems that have adequate capacity to process the anticipated wastes and that are capable of operating within the design objectives during normal operation, including anticipated operational occurrences, are acceptable. To meet these processing demands, interconnections between subsystems, redundant equipment, mobile equipment, and reserve storage capacity will be considered.
- System designs should describe features that will minimize, to the extent practicable, contamination of the facility and environment; facilitate eventual decommissioning; and minimize, to the extent practicable, the generation of radioactive waste, in accordance with the guidelines of RG 1.143, for liquids and liquid wastes produced during normal operation and anticipated operational occurrences, and the requirements of 10 CFR 20.1406. These system design features should be provided in the FSAR, or the COL application, to the extent that they are not addressed in a referenced certified design.
- BTP 11-6, as it relates to the assessment of a potential release of radioactive liquids following the postulated failure of a tank and its components, located outside of containment, and impacts of the release of radioactive materials at the nearest potable water supply, located in an unrestricted area, for direct human consumption or indirectly through animals, crops, and food processing.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (Vogtle Electric Generating Plant (VEGP) Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).
- The staff confirmed that all responses to RAIs identified in the corresponding STD content evaluation were endorsed.
- The staff confirmed that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the STD content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This STD content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the

reference COL application (VEGP) contains evaluation material from the SER for the Bellefonte Nuclear Plant (BLN) Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the VEGP SER:

AP1000 COL Information Items

The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the BLN SER:

- *STD COL 11.2-1*

The applicant provided additional information in STD COL 11.2-1 to resolve COL Information Item 11.2-1. COL Information Item 11.2-1 states:

The Combined License applicant will discuss how any mobile or temporary equipment used for storing or processing liquid radwaste conforms to Regulatory Guide 1.143. For example, this includes discussion of equipment containing radioactive liquid radwaste in the non-seismic Radwaste Building.

The commitment was also captured in COL Action Item 11.2-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will provide information on how any mobile or temporary equipment used for storing or processing liquid radwaste conforms to RG 1.143.

The applicant provided information in BLN COL FSAR Section 11.2.1.2.5.2 that addresses how any mobile or temporary equipment that will be used for storing or processing liquid radwaste conforms to RG 1.143. For example, this includes discussion of equipment containing radioactive liquid radwaste in the non-seismic Radwaste Building. The staff issued Request for Additional Information (RAI) 11.2-5 to clarify some of the language used in the COL concerning the extent of compliance with RG 1.143 for the temporary and mobile equipment. The applicant responded to this RAI by proposing a revision to the BLN COL FSAR text to clearly state that the applicable requirements in RG 1.143 pertain to mobile and temporary equipment.

The NRC staff reviewed the resolution of COL Information Item 11.2-1 related to the use of mobile or temporary equipment included under Section 11.2 of the BLN COL FSAR and found that the applicant's commitments for installing and operating mobile systems meets the acceptance criteria in Section 11.2 of NUREG-0800 and RG 1.143. The NRC staff verified that Revision 1 of the BLN COL FSAR (STD COL 11.2-1) adequately incorporates the above. As a result, RAI 11.2-5 is closed.

While BLN RAI 11.2-5 and COL FSAR, Section 11.2.1.2.5.2, address mobile and temporary processing equipment, neither the response to BLN RAI 11.2-5 nor information already contained in this FSAR section included a discussion of how the cumulative source term inventories of all relevant radioactive materials present in the radwaste building (RWB), including that in mobile or temporary equipment, conform with the RG 1.143, Revision 2, dose acceptance criteria. Specifically, Regulatory Position C.5.1 of RG 1.143, Revision 2, states, “for a given structure housing radwaste processing systems or components, if the total design basis unmitigated radiological release (considering the maximum inventory) at the boundary of the unprotected area is greater than 500 millirem per year or the maximum unmitigated exposure to site personnel within the protected area is greater than 5 rem per year, the external structures are classified as RW-IIa.” Since the AP1000 RWB is classified as RW-IIc (a classification less stringent than RW-IIa), the inventories of radioactive materials in this building should be managed and controlled in a way that will not result in these dose criteria being exceeded.

After reviewing the response to BLN RAI 11.2-5 and the FSAR information addressing COL Information Item 11.2-1, the staff issued RAI 11.02-4 to the Levy Nuclear Plant (LNP) requesting that the applicant provide information related to the types and quantities of radioactive material within the RWB and describe how the unmitigated dose criteria to a worker and members of the public will be met, given the guidance and acceptance criteria of RG 1.143, Revision 2.

In a letter dated October 23, 2014, Florida Power & Light Company (FPL) submitted a site-specific response to LNP RAI 11.02-4 applicable to the Turkey Point Units 6 and 7 COL application. This response also resolved questions asked in LNP RAI 11.02-5, for the Turkey Point Units 6 and 7 COL application. The staff notes that Turkey Point Units 6 and 7 each has its own RWB; however, in following the guidance of RG 1.143, Revision 2, each RWB is considered independently for determining the building classifications. Since each RWB is essentially the same and contains the same equipment (the only difference between the buildings for the purposes of radiological classification is the distance to the protected area boundary, in which case the applicant assumed the most limiting distance as applicable to both buildings), the analysis provided by the applicant and discussion below applies to both RWBs, equivalently.

In the response, the applicant indicated that there will be three primary types of radioactive waste within the RWBs. The three types of waste are: (1) liquid waste stored within the three 56,780-L (15,000-gal) monitor tanks, (2) waste associated with liquid mobile waste processing systems, which may be utilized within the radwaste buildings (the AP1000 DCD Chapter 11 indicates that up to three mobile skids may be located in the radwaste building), and (3) solid wastes and wastes that have been packaged and are ready for shipment.

The applicant provided information explaining how operational programs and procedures will ensure that the RG 1.143, Revision 2, dose criteria are not exceeded from the monitor tanks and mobile equipment. In its response, the applicant assumed that each monitor tank and mobile skid-mounted processing system located in the radwaste buildings have the same radionuclide distributions and inventories as the design-basis (0.25-percent failed fuel fraction) reactor coolant activity listed in FSAR Table 2.4.13-201, normalized to the 10 CFR Part 71, Appendix A, A₂ limit. The total radioactivity in each mobile skid-mounted processing skid was assumed to be analogous to the radioactivity that would be contained in a 1,415.8-L (50-ft³) demineralizer used for the same functional purpose (the monitoring tanks and the mobile equipment each have the same activity; however, each mobile skid is modeled as a 1,415.8-L

(50-ft³) demineralizer and the monitoring tanks are modeled based on the specific dimensions of the monitoring tanks). The A₂ activity for radionuclides in monitor tanks and mobile equipment can be found in Table 1 of the response.

Using the source term for the monitoring tanks and mobile equipment, as described above, the applicant calculated the dose rate at the nearest protected area boundary for an unmitigated release from the Turkey Point Units 6 and 7 RWBs. The applicant indicated that the closest distance to the protected area boundary from either of the Turkey Point Units 6 and 7 RWBs is 110 m (360.9 ft). This distance appears consistent with figures found within Chapter 1 of the FSAR. Since the monitoring tanks contain liquid radwaste, the applicant conservatively assumed that the entire liquid inventory of all three monitor tanks combined is released from the building and flows on the surface of the ground to the protected area boundary. The source is modeled as a rectangular source 53.3 m (175 ft) by 110 m (360 ft), with a depth of 2.92 cm (1.15 in.), extending from the radwaste building to the protected area boundary.

This source term is conservative as it does not account for any drainage of the liquid into the ground. The applicant calculated a dose rate 3 ft above the surface of the water of 0.47 mSv/hr (47.0 mrem/hr) to a member of the public at the protected area boundary. The applicant also calculated the dose from each mobile skid assuming that the activity in each skid remains attached to the media used to remove radioactive contaminants from the process fluids. The direct dose from the mobile skids was calculated at the protected area boundary from each skid. The total dose rate from three skids was calculated at 6.46E-3 mSv/hr (0.646 mrem/hr). Therefore, the total dose at the protected area boundary over a period of 2 hours was calculated as 0.952 mSv (95.2 mrem). The 2-hour timeframe is consistent with the timeframe used in similar radiological analyses and is therefore acceptable. The staff confirmed that the assumptions, calculations, and results seem reasonable and finds them to be acceptable for the dose at the protected area boundary, in accordance with RG 1.143, Revision 2.

To calculate the unmitigated exposure to a worker, the applicant assumed that a worker stood 3 m (10 ft) away from the unshielded monitor tank source term and separately 3 m (10 ft) away from the unshielded mobile processing system source term. The resulting worker doses were calculated as 0.49 mSv/hr (49 mrem/hr) and 3.23 mSv/hr (323 mrem/hr), respectively. Both dose rates were multiplied by 3 and added together to account for the total dose from three tanks and three mobile skids. The resulting 2-hour unmitigated exposure to site personnel was calculated as 22.3 mSv (2,230 mrem). This dose is less than the 50 mSv (5,000 mrem) specified in RG 1.143, Revision 2. The 3-m (10-ft) distance was chosen because unlimited worker occupancy workstations and low dose rate waiting areas are located no closer than 3 m (10 ft) from a mobile radwaste processing system or a waste monitoring tank. In addition, routine work practices limit stay times in close proximity to high dose rate radiation sources. Therefore, the staff finds the 3-m (10-ft) distance to be acceptable for the purposes of calculating the unmitigated dose to a worker for the purposes of RG 1.143, Revision 2. The staff confirmed the applicant's calculation results for the dose to a worker and finds these doses to be acceptable.

In the response, the applicant also provided additional information in FSAR Sections 11.2.1.2.5.2, 11.4.6, and 13.5.2.2.6, which fully address COL Information Items 11.2-1 and 11.4-1 (a parallel discussion related to the resolution of COL Information Item 11.4-1 is provided in SER Section 11.4.4 below) and the guidance and criteria of RG 1.143, Revision 2. In order to ensure that the total activity in the RWB is accounted for, the revisions to FSAR Sections 11.4.6 and 13.5.2.2.5 include a statement indicating that the waste removed from mobile radwaste processing systems will be packaged and ready for shipment

prior to placing the processing equipment back into service. Waste that is packaged and ready for shipment is outside the scope of RG 1.143, Revision 2.

While the calculations described above are acceptable for determining the unmitigated dose at the protected area boundary and the unmitigated exposure to workers for preoperational calculational purposes, the applicant and the staff acknowledge that, during operation, there will be unknown quantities of low to moderate activity unpackaged solid waste stored in the RWB. Since the exact types and quantities of this material cannot be determined at this time and because the procedures for ensuring that the criteria in RG 1.143, Revision 2, and the FSAR are being met have not yet been developed, the applicant proposed a license condition. The license condition ensures that procedural controls will be developed to ensure that the source terms are appropriately limited (the monitor tanks and mobile equipment are limited to the 10 CFR Part 71, Appendix A, A_2 values), that the total cumulative inventory of all unpackaged radioactive materials are accounted for in the unmitigated release and exposure calculations, and that doses are calculated, in accordance with RG 1.143, Revision 2. The license condition is discussed in more detail in SER Section 11.2.5 below.

While the applicant's response generally satisfies the staff's questions and concerns related to LNP RAI 11.02-4, the response indicated that high-activity filter cartridges are stored in shielded portable casks in the RWB. This statement is inconsistent with DCD Section 11.4.2.1, which indicates that high-activity filter cartridges are stored in the auxiliary building. High-activity dry waste is defined, in DCD Section 11.4.2.3.3, as waste with a contact dose rate greater than 1 mSv/hr (100 mrem/hr). A modification allowing storage of high-activity filter cartridges in the radwaste building would have to be reviewed in accordance with RG 1.143, Revision 2, if unpackaged, or SRP Section 11.4-A, if packaged, and this evaluation was not performed in the applicant's RAI response. Therefore, on February 3, 2015, the applicant submitted a revision to the initial response, removing the statement indicating that high-activity filter cartridges will be stored in the RWB. The staff finds this to be acceptable.

In summary, the applicant's responses, FSAR changes, and proposed license condition provide reasonable assurance that the total cumulative inventory of all unpackaged waste in the RWB (including the waste in the monitoring tanks, mobile processing systems, and any additional equipment, as well as any other unpackaged waste in the radwaste building) is limited consistent with the RG 1.143, Revision 2, dose acceptance criteria, given the safety classification RW-IIc assigned to the radwaste building. In addition, the response fully and adequately addresses COL Information Items 11.2-1 and 11.4-1. The proposed FSAR changes have been incorporated into the FSAR.

- PTN COL 11.2-2, Liquid Radwaste Cost-Benefit Analysis Methodology

The discussion of PTN COL 11.2-2 addresses the site-specific cost-benefit analysis performed to address the requirements of 10 CFR Part 50, Appendix I, regarding population doses due to liquid effluents. The applicant provided additional information in PTN COL 11.2-2 to resolve COL Information Item 11.2-2 with regard to the cost-benefit analysis methodology.

The staff reviewed the resolution to COL Information Item 11.2-2 related to the cost-benefit analysis methodology described in Turkey Point Units 6 and 7 FSAR, Revision 4, Section 11.2.3.5, and issued RAI 5695, Questions 11.02-1 and 11.02-2 dated May 21, 2012 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML12142A044). RAI 5695, Question 11.02-1 stated that the applicant needed to provide information to support dose estimates or explain why some exposure scenarios

(e.g., hypothetical future intrusion) may be excluded from consideration. The staff reviewed the applicant's response to RAI 5695, Question 11.02-1 in its letter dated July 13, 2012 (ADAMS Accession No. ML12199A149), and has summarized key points below.

The applicant's analysis indicated no credible exposure scenarios for drinking water existed since the Boulder Zone is highly brackish (i.e., not potable), is more than 883.9 m (2,900 ft) below soil level, and more than 274.3 m (900 ft) below the base of any drinking water source. The applicant then concluded that no cost-benefit analysis was required since no credible exposure pathway existed. The staff issued RAI 6985, Question 11.02-6, dated February 20, 2013, which requested additional information on other potential exposure pathways.

RAI 5695, Question 11.02-2 asked the applicant for clarification regarding the applicant's cost-benefit analysis. In two responses to RAI 5695, Question 11.02-2 dated July 13, 2012, and supplemental response dated April 7, 2015, the applicant proposed to include clarifying details to address the calculation for the cost-benefit analysis. The details of this analysis are provided in the discussion below.

After RAI 5695, Questions 11.02-1 and 11.02-2 were issued on May 21, 2012, the staff recognized additional unique challenges related to the use of deep injection wells. Supplemental RAI 6985, Question 11.02-6 expanded upon and replaced RAI 5695, Questions 11.02-1 and 11.02-2. RAI 5695, Questions 11.02-1 and 11.02-2 were closed pending resolution of Supplemental RAI 6985, Question 11.02-6.

As described in FSAR Section 11.2.3.5, Turkey Point Units 6 and 7 will use a nontraditional disposal method for U.S. Nuclear Regulatory Commission (NRC)-licensed radioactive material in liquid effluents (i.e., deep well injection into the Boulder Zone (about 883.9 m (2,900 ft) below ground surface)) versus the traditional liquid effluent disposal methods that involve the direct discharge into surface waters where the liquid effluent is diluted and dispersed in the receiving waters and is immediately available for potential dose to members of the public.

Migration within and out of the injection zone (Boulder Zone) was evaluated as part of the liquid effluent pathway analysis portion of the performance assessment (PA), to determine if the potential exists for increasing activity concentrations of long-lived radionuclides over the total assumed operation time period of 60 years for each unit. The applicant's evaluation focused on four long-lived radionuclides (tritium, cesium-134 (Cs-134), cesium-137 (Cs-137), and strontium-90 (Sr-90)) which were considered to be the most significant potential dose contributors.

The applicant's analysis of the potential for migration within the injection zone determined that the injectate plume is not expected to reach the hypothesized receptor location—3.54 km (2.2 mi) from the injection point in the Boulder Zone, the distance to the nearest privately owned land parcel—until more than 10 years after initiation of injection. Maximum activity concentrations over the model duration (100 years) at the hypothesized receptor location were estimated for the four radionuclides under consideration, which indicated maximum concentrations would be less than the as-injected concentrations. These maximum concentrations were used to compute the annual doses.

Additionally, the potential for vertical migration out of the injection zone toward drinking water sources in higher strata was evaluated. This analysis concluded that it is not anticipated, under normal operating conditions, that radioactivity injected into the Boulder Zone would reach either

an underground source of drinking water or the surface environment—primarily due to confinement, slow movement, and radioactive decay of the injectate plume.

Although the applicant intends to use a nontraditional disposal method which will serve to isolate the liquid radioactive waste, a cost-benefit analysis (in accordance with 10 CFR Part 50, Appendix I, Section II.D) is required to determine whether radwaste system augments can yield reductions in the 80.5-km (50-mi) population doses at a cost of less than \$10 per person-Sv (\$1,000 per person-rem). In estimating the potential 80.5-km (50-mi) population dose, the applicant selected the maximally exposed individual (MEI) doses in the inadvertent intrusion scenario because they bound those due to off-normal operation. The applicant calculated these annual doses to the MEI due to the ingestion of water and irrigated foods to be $2.7\text{E-}2$ mSv (2.7 mrem) to the total body and $3.8\text{E-}2$ mSv (3.8 mrem) to the liver (the organ receiving the maximum dose) per unit. While these doses are based on consumption rates for the MEI, it is conservatively assumed that the average member of the population also receives these doses.

The applicant's analysis noted that, of the liquid radwaste system (WLS) augments listed in RG 1.110, the one with the lowest annual cost (and thus the first potentially justifiable augment based on an averted dose consideration) is a 20-gpm cartridge filter at \$11,140. To be justified for installation, this augment would need to avert at least $1.11\text{E-}1$ person-Sv (11.14 person-rem) in a 50-mi population (\$11,400 divided by \$1,000 per person-rem averted).

Although 10 CFR Part 50, Appendix I, indicates that the thyroid is the only organ to be considered in the cost-benefit analysis, it is conservatively assumed that the bounding organ dose ($3.8\text{E-}2$ mSv (3.8 mrem) to the liver per unit) applies to the thyroid. Dividing $1.11\text{E-}1$ person-Sv (11.14 person-rem) by the MEI doses of $2.7\text{E-}5$ Sv ($2.7\text{E-}3$ rem) to the total body and $3.8\text{E-}5$ Sv ($3.8\text{E-}3$ rem) to the organ yields populations of 4,125 and 2,931 persons, respectively. Accordingly, the minimum 80.5-km (50-mi) population justifying installation of the cartridge filter augment is 2,931 persons. Consistent with the intruder exposure analysis, each member of this exposed population (cohort) would need to obtain all of their water from a well located 3.54 km (2.2 mi) from Turkey Point Units 6 and 7. The applicant stated that this cohort does not now exist, nor is it considered reasonable to assume it will exist in the future.

The applicant concluded that, due to regulatory constraints and the quality of water in the Boulder Zone, the postulated inadvertent intrusion scenario is not considered reasonable given that the cohort population would need to ingest water and irrigated foods produced from the postulated well on privately owned land.

The staff performed a thorough review of the applicant's analysis and, considering the conservatisms used in the analysis, the regulatory constraints, and the quality of water in the Boulder Zone, concurs with the applicant's conclusion that no liquid radwaste treatment system augment is justified.

- PTN COL 2.4-5 and PTN COL 15.7-1

The applicant provided additional information in PTN COL 2.4-5 and PTN COL 15.7-1 to resolve COL Information Items 2.4-5 and 15.7-1.

COL Information Item 2.4-5 states:

Combined License applicants referencing the AP1000 certified design will address site-specific information on the ability of the ground and surface water to

disperse, dilute, or concentrate accidental releases of liquid effluents. Effects of these releases on existing and known future use of surface water resources will also be addressed.

The commitment was also captured as COL Action Item 2.4.1-1 in Appendix F of NUREG-1793, which states:

The COL applicant will provide site-specific information on the ability of the ground and surface water to disperse, dilute, or concentrate accidental releases of liquid effluents. The COL applicant will also address the effects of such releases on existing and known future use of surface water resources.

COL Information Item 15.7-1 states:

Combined License applicants referencing the AP1000 certified design will perform an analysis of the consequences of potential release of radioactivity to the environment due to a liquid tank failure as outlined in subsection 15.7.3.

The commitment was also captured as COL Action Item 15.3.8-1 in Appendix F of NUREG-1793, which states:

The COL applicant will perform a site-specific analysis of the consequences of a potential release of radioactivity to the environment as a result of a liquid tank failure.

Section 2.4.13 of the applicant's FSAR addresses accidental release of liquid effluents into ground and surface water. The applicant postulated a release of the contents of the waste liquid system effluent hold-up tank, consistent with the guidance provided in BTP 11-6. BTP 11-6 provides guidance in assessing potential release of radioactive liquids at the nearest potable water supply located in an unrestricted area. BTP 11-6 states the evaluation of the release should consider the use of water for direct human consumption or indirect consumption through animals (livestock watering), crops (agricultural irrigation), and food processing (water as an ingredient).

The staff performed an independent dose assessment using the applicant's groundwater (GW) transport modeling coupled with the pathway modeling of RG 1.109. The staff's evaluation of the primary conceptual model resulted in a potential dose of 0.44 mSv (44 mrem) (fish and invertebrate pathways), where the primary difference with the applicant's doses is due to differences in consumption rates. The staff assumed the recommended maximum individual consumption rates of 27 kg/year fish and 5 kg/year invertebrate. For the alternate conceptual model, the staff's analysis resulted in a potential total body dose of 0.52 mSv (52 mrem), based on consumption of 27 kg/year fish and 5 kg/year invertebrate and inclusion of a near-field dilution factor for the receiving water body of Biscayne Bay.

The applicant's calculation presented radionuclide concentration in sediment at the entry point into Biscayne Bay. To model the aquatic food pathway, no additional dilution is taken for the invertebrate calculation, assuming the invertebrates reside in the sediments. However, for the fish pathway, tidal dilution is assumed, recognizing that the fish do not reside in the sediments and significant dilution is afforded by the tidal flow. A contaminated GW flux (conservatively evaluated based on applicant's data) into Biscayne Bay is diluted by the tidal flux. This application is consistent with DC/COL-ISG-013, where credit for the near-field dilution in the

receiving water body is acceptable. The assigned near-field dilution is evaluated, considering conservative tidal flow and the release rate into Biscayne Bay.

The staff's independent calculations yielded a dose of 0.52 mSv (52 mrem) total body for the invertebrate and fish pathways using consumption rates for the maximum exposed individual (adult) from RG 1.109, Revision 1. Based on the applicant's response to RAI 5643, Question 2.04.12-6, dated June 27, 2011, and the above evaluation, the staff finds potential doses to members of the public resulting from an accidental release of liquid effluents meet Acceptance Criterion 5 and the referenced BTP 11-6.

The staff confirmed the estimated total dose rate from radionuclides in the bay was below the exposure level of 1 mSv/yr (100 mrem/year) given in 10 CFR 20.1301, "Dose limits for individual members of the public."

- PTN COL 11.5-3

The applicant provided additional information in PTN COL 11.5-3 to resolve the COL responsibilities stated in Section 11.5.7 of the AP1000 DCD, which states:

The COL applicant is responsible for addressing the 10 CFR Part 50, Appendix I, Sections II.A and II.D guidelines for maximally exposed offsite individual doses and population doses via liquid and gaseous effluents.

The commitment was also captured in COL Action Item 11.5-3 in Appendix F of the staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant is responsible for addressing the guidelines of Appendix I to 10 CFR Part 50, as they relate to maximally exposed offsite individual doses and population doses attributable to liquid and gaseous effluents.

The applicant, in FSAR Section 11.2.3.5, discussed the planned discharge of liquid radioactive effluents via deep well injection to the Boulder Zone of the Lower Floridan aquifer, contending that this means of disposal would result in no doses to the population from normal operations. There was no other discussion presented relevant to ensuring that individual and estimated population doses are maintained "as low as is reasonably achievable" (ALARA) in accordance with 10 CFR Part 50, Appendix I (this information is also applicable to FSAR Sections 11.3.3.4 and 11.4).

The staff reviewed the applicant's response to PTN COL 11.5-3 related to compliance with 10 CFR Part 50, Appendix I, Sections II.A and II.D; determined that the proposed method of disposal of liquid radioactive effluents falls under alternate disposal requirements of 10 CFR 20.2002; and issued RAI 5695, Question 11.02-2 requesting the applicant to specifically address those requirements. As previously noted, the staff issued Supplemental RAI 6985, Question 11.02-6, on February 20, 2013, which expanded upon and replaced RAI 5695, Questions 11.02-1 and 11.02-2 (RAI 5695, Questions 11.02-1 and 11.02-2 were closed pending resolution of Supplemental RAI 6985, Question 11.02-6).

The staff's review of the applicant's described intrusion scenario raised a number of questions. The staff issued RAI 5695, Question 11.02-4 asking the applicant to address those questions. RAI 6985, Question 11.02-6 requested that the applicant provide an evaluation of potential

leakage of injectate along well casings upward toward the Upper Floridan and Biscayne Aquifers.

The staff's evaluation and conclusion of the acceptability of the proposed disposal method via deep well injection, potential radiological impacts to offsite intruders, and regulatory compliance with 10 CFR 20.1301, 20.1302, 20.1406, and 20.2002, and 10 CFR Part 50, Appendix I, design objectives and ALARA provisions are described below under "Demonstrating Compliance with 10 CFR 20.2002."

The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the VEGP SER:

Supplemental Information

The following portion of this technical evaluation section is reproduced from Section 11.2.4 of the BLN SER:

- *STD SUP 11.2-1*

The applicant provided supplemental information in BLN COL FSAR Section 11.2.3.6, "Quality Assurance," addressing the quality assurance program to be applied to the liquid waste system and stated that the program complies with the guidance presented in RG 1.143.

The NRC staff reviewed this supplemental quality assurance information included in BLN COL FSAR Section 11.2.3.6 and finds that this supplemental statement commits the applicant to the regulatory positions in RG 1.143 related to quality assurance and is acceptable.

- PTN SUP 11.2-1

The applicant provided additional information in PTN SUP 11.2-1 stating that the liquid radwaste discharge release point is where the LWMS effluent discharge pipe connects to the blowdown sump discharge pipe to deep injection wells. The applicant also stated that the LWMS effluent discharge piping is double-walled piping up to this point.

The staff reviewed this supplemental information included in Turkey Point Units 6 and 7 COL FSAR Section 11.2.1.2.4 and finds that this supplemental statement is acceptable. A detailed evaluation of PTN SUP 11.2-1 is contained in Section 12.3 of this SER.

- PTN SUP 11.2-2

The applicant provided additional information in PTN SUP 11.2-2 stating that the quality assurance program for design, construction, procurement, materials, welding, fabrication, inspection, and testing activities conforms to the quality control provisions of the codes and standards recommended in Table 1 of RG 1.143.

Following a review of FPL, Turkey Point Units 6 and 7 FSAR, Revision 4, Section 11.2.3.6, the staff identified an issue on the QA plan and commitment to follow the guidance of RG 1.143 given that its guidance applies to LWMS systems and components not covered by the

requirements of Appendix B to 10 CFR Part 50. In RAI 7097, Question 11.02-7, the staff closed out the prior RAI on the same topic for the purpose of consolidating the technical and regulatory review. The closed RAI is RAI 6919, Question 11.02-5. In RAI 7097, Question 11.02-7, the applicant was requested to address and resolve the following regulatory and technical aspects in defining the scope of the QA program for the LWMS.

Turkey Point Units 6 and 7 FSAR, Revision 4, Section 11.2.3.6, presented supplemental information on QA and commits to follow the guidance of RG 1.143 in recognition that the guidance of RG 1.143 would apply to LWMS subsystems and components not covered by the requirements of Appendix B to 10 CFR Part 50. A review of FPL Quality Assurance Program Description (FPL-2, Revision 3, September 30, 2012) indicated that the commitment to NRC regulatory guides and quality standards did not identify the guidance of RG 1.143 for RWMSs.

Similarly, a review of FSAR, Revision 4, Section 17.3 (as related to design, procurement, fabrication, and installation) and Section 17.5 (as related to QA program descriptions) found the sections did not acknowledge the guidance of RG 1.143 in light of the provisions of Appendix B to 10 CFR Part 50. While Turkey Point Units 6 and 7 FSAR, Revision 4, Sections 11.2 to 11.4, on RWMS stated that the extent of control of Appendix B to 10 CFR Part 50 to such systems is limited, procedural controls would be established to ensure compliance with the guidance of RG 1.143.

However, the staff review of FSAR Revision 4, Sections 13.4 and 13.5, indicated that there was no information identifying the unique aspect of RG 1.143 on the development of a QA program since it was outside of the scope of Appendix B to 10 CFR Part 50. Since the applicant planned to rely on skid-mounted RWMS, there were no commitments as to how the guidance of RG 1.143 would be evaluated and applied in specifying design performance criteria, developing procurement specifications, and confirming proper installation and interfaces with permanently installed RWMS and building services. For permanently installed RWMS, the AP1000 DCD addresses the guidance of RG 1.143 for its design, but leaves the implementation of a supporting QA program to the applicant. Note that, for one type of skid-mounted RWMS, FSAR, Revision 19, Section 11.2.5.1, of the AP1000 DCD states that the applicant will address how mobile or temporary equipment used to process and store wastes will conform with the guidance of RG 1.143. The staff concludes that the applicant's COL FSAR, Revision 4, did not provide such information.

In light of the above, the staff finds that the application was incomplete in demonstrating how the provisions of RG 1.143 would be applied when using skid-mounted RWMS and silent on the implementation of operational programs (including QA) and procedures for all RWMSs. Accordingly, the staff issued RAI 7097, Question 11.02-7 on June 13, 2013, which requested that the applicant address the following concerns and revise the corresponding sections of the FSAR on the use of RWMS.

- (1) Describe how the guidance of RG 1.143 will be evaluated and applied in specifying design performance criteria, developing procuring specifications, and confirming the proper installation and operation, including operational system interfaces with radioactive systems and features in protecting nonradioactive plant systems and building services.
- (2) Describe the elements of the QA program for all RWMSs under the provisions of RG 1.143 and how this aspect of the QA program will be applied and integrated in operational programs and procedures in FSAR, Sections 13.4 and 13.5.

- (3) Given the above, the applicant is requested to make parallel reviews and revisions in FSAR, Section 11.2.3.6 (QA) for the LWMS; Section 11.3.3.6 (QA) for the gaseous waste management system (GWMS); and FSAR, Section 11.4.5 (QA) for the solid waste management system (SWMS).

The staff reviewed the applicant's response to RAI 7097, Question 11.02-7, dated July 31, 2013. The applicant explained how the provisions of RG 1.143 will be applied when using skid-mounted RWMS and on the implementation of operational programs (including QA) and procedures for all RWMSs. The staff finds that this clarifying information is acceptable because the applicant committed to the guidance of RG 1.143, and committed to the regulatory positions established within the RG for C.1 through C.6 by highlighting the DCD sections where the commitments were made and this requirement is also captured by License Condition (11-1). These commitments will ensure that the necessary regulatory requirements are met and this requirement is also captured by License Condition (11-1). NRC RAI 7097, Question 11.02-7 is therefore resolved.

Demonstrating Compliance with 10 CFR 20.1301(e)

In 10 CFR 20.1301(e), the staff requires that NRC-licensed facilities comply with the U.S. Environmental Protection Agency (EPA) generally applicable environmental radiation standards of 40 CFR Part 190 for facilities that are part of the fuel cycle. The EPA annual dose limits are 0.25 mSv (25 mrem) to the whole body, 0.75 mSv (75 mrem) to the thyroid, and 0.25 mSv (25 mrem) to any other organ. Meeting the requirements of 10 CFR 20.1301(e) requires the consideration of all potential sources of external radiation and radioactivity, including liquid and gaseous effluents and external radiation exposures from buildings, storage tanks, radioactive waste storage areas, and nitrogen-16 skyshine from boiling-water reactor (BWR) turbine buildings. The EPA STDs apply to the entire site or facility, whether it has single or multiple units.

The staff's review of the FSAR (Revision 0) revealed that the applicant did not provide any information demonstrating compliance with 10 CFR 20.1301(e). Because of this, the staff issued RAI 5695, Question 11.02-1 requesting that the FSAR demonstrate compliance with the EPA standard.

The applicant provided the demonstration (FSAR Revision 4) by summing the annual individual liquid and gaseous effluent doses for the proposed Turkey Point Units 6 and 7 as well as the existing Units 3 and 4. It listed the results in FSAR Table 11.3-206. Table 11.2-1 below lists these dose summations and compares them to the dose requirements in 40 CFR Part 190. The expected doses are below the EPA dose limits.

**Table 11.2-1 Comparison of Maximum Individual Doses to
40 CFR Part 190 (mSv/yr) (mrem/year)**

Organ/Body	Application *	40 CFR Part 190
Total Body	7.8E-2 (7.8)	2.5E-1 (25)
Thyroid	1.5E-1 (15)	7.5E-1 (75)
Other Organ (Lung)	8.4E-2 (8.4)	2.5E-1 (25)
* Taken from FSAR Table 11.3-206		

Demonstrating Compliance with 10 CFR 20.1302

The annual average concentration of radioactive material released in liquid effluents at the boundary of the unrestricted area must not exceed the values specified in Table 2 of Appendix B to 10 CFR Part 20. The applicant demonstrated compliance with this requirement by referencing the AP1000 DCD. Subsection 11.2.3.4 of the DCD shows that even at the Technical Specification (TS) limit for percent failed fuel defects, the nominal blowdown flow provides sufficient dilution to ensure that the expected effluent release concentrations will be less than those specified in Table 2 of Appendix B to 10 CFR Part 20.

However, the liquid waste disposal for Turkey Point Units 6 and 7 is via deep injection well, not as an effluent with dilution by the normal blowdown flow. In response to RAI 6985, Question 11.02-6, Item 6, the applicant addresses the minimum dilution flow required to control liquid radwaste discharges. The applicant incorporates changes to Sections 11.2.1.2.4 and 11.5.3 that included a discussion about maintaining the effluent concentration limits (ECLs) found in 10 CFR Part 20, Appendix B, by specifying and maintaining flow rates at the blowdown sump discharge to at least the minimum dilution factor. To ensure compliance with the ECLs, the applicant calculated and applied dilution flow prior to each batch release of liquid radwaste. The staff has reviewed the description of the stated flow rates in its response and finds the response to item 6 of RAI 6985, Question 11.02-6 acceptable.

Based on this acceptance, the staff concludes that the applicant has complied with 10 CFR 20.1302.

Demonstrating Compliance with 10 CFR 20.1406

In 10 CFR 20.1406, the staff requires the applicant to provide a description of how facility design and procedures for operation will minimize, to the extent practicable, contamination of the facility and the environment; facilitate eventual decommissioning; and minimize, to the extent practicable, the generation of radioactive waste. The applicant demonstrated compliance with this requirement by incorporating by reference the design descriptions provided in the AP1000 DCD and providing the description of operating programs in SER Section 12.3.

With respect to the use of deep well injection for the disposal of treated liquid waste, the staff's evaluation of the related operational considerations in controlling and monitoring such discharges, via the Offsite Dose Calculation Manual (ODCM) and implementation of the Radiological Environmental Monitoring Program (REMP) for monitoring wells, is presented in

SER Section 11.5, using information drawn from this SER section and SER Sections 9.2.12 and 12.3. SER Section 12.3 contains the staff's evaluation and conclusion pertaining to compliance with 10 CFR 20.1406.

Evaluation of Proposed Disposal Method for Liquid Radioactive Effluents and Demonstrating Compliance with 10 CFR 20.2002

Following a review of FPL, Turkey Point Units 6 and 7 FSAR, Revision 4, Section 11.2, the staff identified several issues associated with the proposed disposal method for liquid radioactive waste via deep well injection into the Boulder Zone, using 12 injection wells and 6 monitoring wells installed on the site.

Regulatory Background

In FSAR Revision 6, Section 11.2.3.5, PTN COL 11.2-2, the applicant proposes a disposal method for liquid radioactive effluents using deep well injection into the Boulder Zone. When compared to routine effluent discharges in surface waters, the radioactivity injected in the Boulder Zone is expected to be isolated from the surface environment and out of reach of traditional radiation exposure scenarios and pathways considered by NRC regulations and guidance. Traditional effluent discharge methods dilute and disperse the radioactivity in the environment, but this disposal method confines the radioactivity into a slow-moving and expanding plume with the total inventory of long-lived radionuclides increasing over the operating life of the plant. As a result, radiological assessment methods and assumed exposure scenarios used to quantify radiological impacts and compliance with NRC regulations for effluents discharged in surface water bodies are not directly applicable.

The deep well injection method involves technical and regulatory considerations that are not explicitly addressed under 10 CFR 50.34a and 50.36a, "Technical specifications on effluents from nuclear power reactors," and 10 CFR Part 50, Appendix I, design objectives and ALARA provisions in controlling radioactive effluent releases. Similarly, the requirements of 10 CFR 20.1301 and 20.1302 and 40 CFR Part 190 (under 10 CFR 20.1301(e)), in complying with ECLs and doses to members of the public, also do not explicitly address deep well injection. However, the applicant must still meet applicable requirements under these regulations in applying the deep well injection method for waste disposal.

Accordingly, the applicant has performed and provided an analysis in its current application under the provisions of 10 CFR 20.2002.

In 10 CFR 20.2002, the staff provides an applicant with a method to obtain approval for proposed procedures, not otherwise authorized in the regulations, for disposal of licensed material generated in the applicant's activities. Under 10 CFR 20.2002, an applicant has to provide (a) a description of the waste, including the chemical and physical properties important to risk evaluation and the proposed manner and conditions of disposal; (b) an analysis of the environment in which wastes will be disposed; (c) the nature and location of other potentially affected licensed and unlicensed facilities; and (d) analyses and procedures to ensure that doses are maintained ALARA and within the dose limits of 10 CFR Part 20. The staff typically approves 10 CFR 20.2002 requests that will result in a dose to a member of the public (including all exposure groups) that is no more than "a few millirem/year" (this information is in SECY-07-0060, Attachment 1, and NUREG-1757, Volume 1, Revision 2, "Decommissioning Process for Materials Licensees," Section 15.12). As is noted in the SECY paper, the staff selected this criterion because it is a fraction of the dose associated with naturally occurring

background radiation, a fraction of the annual public dose limit, and an attainable objective in the majority of cases.

In this context, the staff considers its well-established 10 CFR Part 50 light-water-reactor criteria (including those prescribed by Appendix I) in determining whether all releases of radioactive material to the environment are ALARA and what monitoring, design criteria, and other conditions apply. As a result, the staff's evaluation of this disposal method under 10 CFR 20.2002 does not preclude the staff from considering the substantial technical requirements, design criteria, technical specification (TS), monitoring, and annual reporting called for by other provisions of 10 CFR Parts 20 and 50.

Moreover, the staff notes that there is a need to ensure that NRC and Florida Department of Environmental Protection (FDEP) requirements, when issued, are not conflicting and do not impose duplicative requirements, such as for radiological monitoring, periodic inspections and testing in confirming the mechanical integrity of the injection and monitoring wells, and requirements for well abandonment and closure at the end of their operational cycles or in the event of well failures and migration of radioactive materials in Upper Floridan aquifers.

For these reasons, there are a number of issues that the staff needed to consider in bridging and integrating these regulatory requirements and NRC acceptance criteria. The issues involved the resolution of geohydrological characteristics of the Boulder Zone; use of information described in the construction and testing of the first exploratory and monitoring wells (this information is in FPL reports of September 2012); development of an appropriate radioactive source term confined within an amorphous plume; development of an approach and method for modeling potential exposure scenarios that consider well failures and intrusion scenarios as expected operational occurrences using current land-use practices for this part of Florida; identification of surrogate criteria in achieving the same regulatory objectives since some current regulatory requirements do not apply to this disposal method; identification of FDEP permit conditions that would fulfill or supplement NRC requirements on installation, testing, operation, and environmental monitoring; and insertion of specific license conditions on the design features of injection and monitoring wells whose construction would not be completed before the issuance of the combined license.

RAI Questions on Proposed Deep Well Injection Disposal Method

The information provided in FSAR Revision 6, Sections 9.2, 10.4.5, and 11.2, and responses to the staff RAIs presented in FPL correspondence (May 22, 2012, and July 13, 2012) were not sufficient to validate and confirm the estimated doses of the assumed exposure scenario. Additional detail needed to be provided to enable the staff to confirm that the estimated doses in the FSAR are bounding and acceptable. Without this information, the staff was unable to make a determination that the applicant meets the acceptance criteria in SRP Section 11.2 and complies with the requirements of 10 CFR 20.2002, 20.1301, 20.1302, and 20.1406, and 10 CFR Part 50, Appendix I, numerical guides, design objectives, and ALARA provisions. A Supplemental RAI (RAI 6985, Question 11.02-6) on the proposed deep well injection method consolidates and subsumes the issues identified in prior NRC staff RAIs. As a result, the following RAIs are closed: RAI 5695, Questions 11.02-1, 11.02-2, 11.02-3, and 11.02-4.

The applicant provided responses to RAI 6985, Question 11.02-6, in two parts. In a letter dated August 9, 2013, the applicant provided responses to RAI 6985, Questions 11.02-6(5) to 11.02-6(11), while a January 15, 2014, letter included responses to RAI 6985,

Questions 11.02-6(1) to 11.02-6(4). The staff's evaluation and determination of acceptability of the responses are presented below.

In items 1 through 4 of RAI 6985, Question 11.02-6, the applicant was requested to consider radiological impacts of the disposal method should radioactivity be brought up to the surface by (1) drilling activities undertaken at a location beyond the control of the applicant and expose well drillers to radioactive material, (2) failure of a well casing or packing that could contaminate the Upper Floridan Aquifer and expose water users to radioactive material, and (3) upward migration of the injectate flow from the Boulder Zone into the base of the Upper Floridan aquifer. In item 2, the applicant was asked to consider several scenarios when assessing the radiological impacts of dose as seen in the original question above. Item 3 asked the applicant to consider the cumulative inventories of long-lived radionuclides expected to be present after 40 years of operation for both reactors. Item 4 requested the applicant to consider its application of retardation factors and to indicate the presence of residual concentrations of organic compounds in reclaimed municipal waste water was considered in developing distribution coefficients and retardation factors.

The response to RAI 6985, Question 11.02-6 (1-4), described three models used by the applicant to evaluate transport of radionuclides from the deep well injection. These models were evaluated by NRC hydrology staff to determine whether they provide a reasonable and conservative basis for dose calculations. The model results were also compared to results from independent confirmatory simulations conducted by the staff.

Radial Transport Model

The applicant used a two-dimensional cross-sectional model of the Boulder Zone to evaluate the maximum extent of injectate and radionuclide transport within the Boulder Zone. In addition, this model provided radionuclide concentrations as a function of distance from the injection well. The description of the model implementation in the SEAWAT code was reviewed, although a detailed examination of the input files was not conducted. The model implementation appears to use technically sound procedures. Parameters used in the modeling were based on data from the site investigation, appropriate literature values, and conservative assumptions. Transport was driven by advection, dispersion, and density differences. Radionuclide decay was considered, but no adsorption to solids was assumed. The applicant conducted an analysis to evaluate the sensitivity of model results to changes in parameter values. Key findings were that the injectate plume did not extend the 12.4 km (7.7 mi) to the Ocean Reef receptor location, but it did extend the 3.54 km (2.2 mi) to the closest private land parcel. Maximum tritium concentration 3.54 km (2.2 mi) from the injection location occurred at about 22 years after the start of injection. The maximum tritium concentration ratio (concentration at the receptor divided by the injectate concentration) was about 0.3.

The staff's confirmatory analysis assumed the injection displaced native water within the Boulder Zone to a constant depth of 74 m (242.8 ft) (the depth of the injection well) to create an expanding cylinder of injectate in the Boulder Zone. The radius of the injectate cylinder expands over time, reaching a radius of 3.54 km (2.2 mi) after 23.5 years. Assuming radionuclide decay, this travel time results in a concentration ratio for tritium of 0.27. The staff's results are bounded by the analysis of the applicant.

Vertical Transport Model

The applicant used a three-dimensional model, also implemented with SEAWAT, to evaluate vertical transport through the middle confining unit (MCU). No preferential pathway in the MCU was assumed. The primary model parameter controlling vertical flow in the MCU is the value of vertical hydraulic conductivity. Literature values reported for this parameter range over 10 orders of magnitude. The applicant used a value that is about 10 times smaller than the geometric mean, and one-half the harmonic mean, of the exploratory well EW-1 measurements. (Three of 16 values reported there were less than the value used by the applicant in the model.) Based on model results, the applicant reported that the injectate travelled approximately 94.4 m (310 ft) upward into the MCU during the 100-year simulation. The applicant evaluated the sensitivity of these results and reported that the travel distance into the MCU is linearly related to the vertical hydraulic conductivity and the inverse porosity.

The staff's confirmatory analysis used a one-dimensional analysis of density-dependent flow. Using the applicant's value of vertical hydraulic conductivity in the MCU, the staff's analysis results in the injectate travelling about 100 ft into the MCU in 100 years. For a layered hydrogeologic unit, vertical flow would be proportional to the harmonic mean of the individual layer hydraulic conductivities. Using the harmonic mean of the exploratory well EW-1 measurements, the staff estimated that the injectate would travel 68.9 m (226 ft) in 100 years. The staff's results are bounded by the applicant's results.

Liquid Dose Pathway

The applicant made conservative assumptions in evaluating transport through a preferential pathway in the MCU. The applicant assumed a continuous pathway from the Boulder Zone to the Upper Floridan aquifer and assumed that injectate in the Boulder Zone would be instantaneously transported, without dilution, through the pathway. Concentrations in the Upper Floridan aquifer were assumed to be those calculated using the Radial Transport model. The staff evaluated the applicant's assumptions and determined that these assumptions represent a bounding transport pathway between the Boulder Zone and the Upper Floridan aquifer.

The applicant performed a screening analysis using the LADTAP II code to determine what radionuclides were the largest contributors to dose from AP1000 DCD Table 11.2-7, considering the ingestion pathways of drinking water, and irrigated milk, meat, and vegetables for decay times spanning 5 to 100 years. The cumulative inventory present in the Boulder Zone at the end of Turkey Point Units 6 and 7 plant operations was also determined. The applicant presented a comparison of the subsurface activity present at the year in which both units cease operation. The applicant's analysis determined that tritium, Sr-90, Cs-134, and Cs-137 contribute over 99 percent of the dose to the total body and all organs after a decay time of 10 years or more from this comparison. This decay time is used because, according to the radial transport model, the plume does not reach the nearest resident until 10 years after the first injection. These four radionuclides would be retained and used as input for the dose analysis.

The model presented by the applicant contains the following assumptions: no soil retention or retardation by soil absorption is being accounted for, model period time of 60 years per unit, 1-year interval between startup for Turkey Point Units 6 and 7; entire simulation is 100 years leaving a 39-year interval to evaluate radionuclide migration after injection stops. Outages of 30 days or less are not modeled, and it is assumed that injection is continuous for 60 years per

reactor. The continuous injection assumption maximizes radionuclide concentrations at the receptors since it assumes greater liquid radwaste generation, release, and plume expansion. Since the plume expands faster, there is less time for radionuclides to decay before reaching the receptor. Considering these assumptions, the applicant stated that the approximate average annual injection rate is 23,583 L/min (6,230 gpm) for a single unit or 47,166 L/min (12,460 gpm) for two units. These flow rates are based on the DCD minimum dilution flow rate of 22,712 L/min (6,000 gpm), as found in DCD Section 11.2.3.3. Based on these assumptions, the staff determines that this approach appears to be conservative for an offsite exposure scenario.

The applicant identified two potential receptor locations. The first receptor location is 3.54 km (2.2 mi) northwest (NW) from the injection point, and the second is 12.4 km (7.7 mi) southeast. The receptor at 3.54 km (2.2 mi) is considered a highly improbable receptor since the flow of the Upper Floridan Aquifer is to the east of this location. The receptor located at 12.4 km (7.7 mi), however, does use water from the Upper Floridan Aquifer for irrigation purposes.

To provide a bounding analysis, the applicant determined that a tritium concentration of 1,369 Bq/L (37,000 pCi/L) would yield a limiting child total body dose of $6\text{E-}2$ mSv/yr (6 mrem/year) which is equivalent to the total body design objective of $3\text{E-}2$ mSv/yr (3 mrem/year) per unit. Tritium was used since it was also determined by the applicant to contribute 90 percent of the total dose. Then using the radial transport GW model, as discussed above, the applicant determined the distance that the 1,369 Bq/L (37,000 pCi/L) would travel over the selected timeframes of 5, 10, 25, 50, 75, and 100 years.

Based on the liquid pathway analysis, the applicant provided detailed dose calculations for the two locations identified above. From this analysis, the applicant determined that the model projected it would take more than 10 years for the plume to reach the nearest receptor at 3.54 km (2.2 mi) and the plume would not reach the receptor at 12.4 km (7.7 mi) during the 100-year simulation. The applicant's analysis showed that, for times after 100 years, the size of the plume, as a function of radionuclide concentration, is decreasing at a faster rate due to decay than increasing by migration since injection into the deep well stops at year 61 of the simulation.

As a result of the GW modeling, the applicant determined that the bounding exposure scenario was the extraction and use of water from directly above a hypothetical failure of the MCU after injection and flow through the Boulder Zone.

A detailed discussion was provided regarding potential future land uses, based on (a) Miami-Dade County Comprehensive Development Master Plan, considering wetlands identification; (b) the Future Land Use Map for Homestead; and (c) proposed Comprehensive Everglades Restoration Plan. This discussion determined that there were no future land uses that required special consideration in the GW use and exposure modeling.

In item 1 of RAI 6985, Question 11.02-6, the staff stated three different exposure scenarios for the applicant to consider. In the applicant's response, the applicant provided scenarios for analysis for each of the following: (1) Normal Operations, (2) Off-Normal Operations, and (3) Inadvertent Intrusion. In addition, the following areas were considered: (1) Plant Area, (2) Property Area, and (3) Beyond Property Area. Because of well design/construction, FDEP requirements, the applicant's site access restrictions, and the GW modeling, no Plant Area or Property Area exposure scenarios were identified as feasible since the restrictions to the site area and GW modeling did not yield a scenario where members of the public would be exposed.

However, for the Beyond Property Area scenario, the failure of the middle confining area and GW migration into the Upper Floridan Aquifer was considered. For this Beyond Property Area scenario, the 3.54-km (2.2-mi) and 12.4-km (7.7-mi) receptors were both considered.

The exposure scenarios described include: (1) off-normal operation with an MCU failure located 3.54 km (2.2 mi) from the effluent injection point and member of the public Upper Floridan aquifer use resulting in exposure through the drinking water pathway, (2) MCU failure and individual member of the public Upper Floridan aquifer use at 12.4 km (7.7 mi) for drinking water only, and (3) inadvertent intrusion with a member of the public drilling a well into the Upper Floridan aquifer immediately above a failure of the MCU located 3.54 km (2.2 mi) from the effluent injection point then unknowing use of the contaminated Upper Floridan groundwater for the use of drinking water ingestion, irrigation, milk animals, and livestock.

For the water exposure pathway, the dose modeling parameters as used for the RAI response were based on RG 1.109 exposure assumptions, such as age groups, exposure times, as used in the LADTAP II code. The GW modeling calculated was used to calculate the maximum radionuclide concentration in the Upper Floridan aquifer at the offsite location 3.54 km (2.2 mi) away. This modeling resulting in the following radionuclide concentrations:

- Tritium: 1.1E3 Bq/L (3.1E04 pCi/L)
- Cs-134: 2.9E-4 Bq/L (7.7E-03 pCi/L)
- Cs-137: 2.8E-2 Bq/L (7.6E-01 pCi/L)
- Sr-90: 2.1E-5 Bq/L (5.6E-04 pCi/L)

The annual effluent source term, conservatively adjusted to reflect a longer annual operations time and coupled with the GW migration and transit time, was used in the dose calculation. These maximum concentrations were assumed to occur concurrently for purposes of the dose calculations. The applicant's description of the dose modeling then proceeds to explain the use of the LADTAP II code, which requires the extrapolation of the source term and a derived dilution and transit time, for performing the dose calculations.

For the inadvertent intruder, it was assumed that a drinking water well was drilled into the Upper Floridan aquifer at the 3.54-km (2.2-mi) distance. It was assumed the well was located directly above a conduit (between the Boulder zone and the Upper Floridan aquifer). Exposure assumptions were presented addressing the drilling process, where the drillers would be exposed to the radioactive concentrations as modeled at the 2.2-mi distance. Direct exposure to the drilling mud (containing the transported injectate radionuclide concentration) and inhalation exposure to an evaporating puddle are assumed in this calculation.

The applicant's dose calculations, for Turkey Point Units 6 and 7, yielded a total body dose of 5.5E-2 mSv/yr (5.5 mrem/year) for the inadvertent intruder at 3.54 km (2.2 mi) NW of the injection point: 1.8E-2 mSv/yr (1.8 mrem/year) from drinking water and 3.6E-2 mSv/yr (3.6 mrem/year) from irrigated foods. Tritium accounted for 99 percent of the drinking water dose and 92 percent of the irrigated foods dose. The maximum organ (liver) dose was 7.6E-2 mSv/yr (7.6 mrem/year), with drinking water being 25 percent and irrigated foods 75 percent of total. Tritium constituted 95 percent of the organ drinking water dose and 58 percent of the irrigated food dose. The dose from the drilling operation was calculated to be less than 1E-3 mSv (0.1 mrem) (total body and maximum organ-liver).

In a supplemental clarification question asked by the staff, on RAI 6985, Question 11.02-6, the staff requested that the applicant provide a clarification to the response concerning the distribution coefficients (Kd). In the supplemental response dated June 4, 2014, the applicant provided a revision to its original response. This revision provided clarification on the use of Kd in evaluating the dose calculations in the scenario for a driller. The response from the applicant emphasized the contribution of tritium on the total dose and the small impact the other three radionuclides would have if they were retained in soil. To confirm this, the staff performed independent calculations to confirm that the doses from inhalation and immersion in the drilling scenario were small. The results of the staff's analysis agreed that the contribution from Sr-90, Cs-134, and Cs-137 is a small contributor to dose and the staff agrees with the approach taken by the applicant.

The staff reviewed the source term used to assess doses to a member of the public via the deep well injection pathway. In its review, the staff raised a question on whether the source term described in 11.2 for the inadvertent intruder scenario was based on a one-unit or two-unit source term contribution. In RAI 7908, Question 11.02-8, the staff requested clarification on the dose assessment included in FSAR Section 11.2, Revision 6, for the intruder scenario to show how doses, when calculated on a per-unit basis, remain in compliance with the design objective of 10 CFR Part 50, Appendix I.

In its response to RAI 7908, Question 11.02-8, dated June 23, 2015, the applicant described the plant blowdown sump pump discharge to the Lower Floridan aquifer (Boulder Zone) by the deep well injection system (DIS). In FSAR Section 11.2.3.5, the applicant described its PA to assess the environmental fate and transport of Turkey Point Units 6 and 7 liquid effluent releases by deep well injection. The PA coupled numerical GW modeling techniques with a liquid pathway analysis to identify the maximum exposed members of the public (MEI) in unrestricted areas as a result of the Turkey Point Units 6 and 7 liquid effluent releases. For the dose assessment, the AP1000 DCD single-unit source term is divided by dilution flow from a single unit to yield the injectate concentration. As described, the injectate concentrations in FSAR Table 11.2-201 are independent of the number of units operating since two units would produce twice the source term as well as twice the dilution flow.

The applicant's analysis indicated that concentrations at offsite receptors are sensitive to the number of units operating, since migration times to offsite locations would be influenced based on the injectate flow rate. Modeling two-unit source term and flows yields the highest calculated offsite dose. As indicated in FSAR Section 11.2.3.5.2.2, "the two-unit case is more limiting as it results in a greater extent of plume expansion at any given point in time as well as a higher cumulative radionuclide inventory." Also in response to RAI 7908, Question 11.02-8, the applicant provided some clarifying details on June 23, 2015, to make clear that the source term found in Section 11.2 is for two units. The staff finds this response and clarifying information acceptable because the basis of the source term is now clearly described in the DCD, and staff can confirm resulting dose calculations. The information provided in response to the RAI 7908, Question 11.02-8 is found acceptable and, hence, RAI 7908, Question 11.02-8 is resolved.

The applicant's dose assessment, as presented in FSAR Table 11.2-209, was based on RG 1.109 modeling assumptions, supplemented by an EPA model for exposure to a sludge or slurry from well excavation to model the potential dose during a well drilling operation. The resulting doses were divided by 2 to yield the doses per unit to facilitate comparisons with the per-unit limits in 10 CFR Part 50, Appendix I. The doses in Tables 11.2-208 and 11.2-210 are both for two units.

The staff's design-basis doses of 10 CFR Part 50, Appendix I, have been selected as suitable doses for evaluating compliance with the ALARA dose requirement of 10 CFR 20.2002(d). The 10 CFR Part 50, Appendix I, design objective doses are 3 mrem/year to total body and 10 mrem/year maximum organ from liquid effluents. These doses are consistent with the staff's acceptance criterion of a "few millirem" (this information is in SECY-07-0060, Attachment 1, and NUREG-1757, Volume 1, Revision 2, Section 15.12) for compliance with the ALARA requirement of 10 CFR 20.2002(d).

The applicant's dose assessment identified an intruder as the controlling scenario. This pathway analysis modeled a failure in the MCU with this failure occurring at the nearest offsite location of private ownership and with a private well used for irrigation purposes. The calculated maximum dose was to the child from the drinking water and irrigated crops pathway, where the total body dose was 5.5 mrem/year and maximum organ (liver) was 7.6 mrem/year.

The staff performed an independent dose assessment for the intruder scenario. The staff's verification calculations were in general agreement with the applicant's calculations, based on the assumptions and modeling assumptions presented by the applicant. The staff's calculation confirmed the overall conservatism of the applicant assessment, where the staff's results indicated a maximum individual (child) potential dose of $4.0\text{E-}2$ mSv/yr (4.0 mrem/year) to total body and $4.2\text{E-}2$ mSv/yr (4.2 mrem/year) to liver for the drinking water and irrigated crop pathways combined.

As identified in the applicant's response by letter dated January 15, 2014, in response to RAI 6985, Question 11.02-6, the assumed location for the intruder scenario (3.54 km (2.2 mi)) represents the closest privately owned land parcel, that could be occupied at some time in the future. Considering water use practices and the Miami-Dade County Comprehensive Development Master Plan, individual potable water systems, including private wells, are considered interim facilities with use when alternative public water supply is not available and land use and water resources are suitable for interim use. Considering these limitations, the assumption that the resident well is the primary drinking water source for the intruder scenario represents a highly unlikely situation. There are numerous situations of the use of GW for irrigation purposes; therefore, this exposure pathway is considered plausible.

Considering the above, the staff based its compliance dose assessment on the irrigated crop exposure scenario alone. For this assessment, MEI is $2.4\text{E-}2$ mSv/yr (2.4 mrem/year) child total body and $3.1\text{E-}2$ mSv/yr (3.1 mrem/year) child liver from the irrigated vegetable pathway. This dose is less than the Appendix I design objective doses of $3\text{E-}2$ mSv/yr (3 mrem/year) total body and $1\text{E-}1$ mSv/yr (10 mrem/year) maximum organ for liquid radioactive effluents, and therefore considered ALARA from a design standpoint.

The staff evaluated and agrees with the modeling scenarios proposed by the applicant and determines that the assumptions taken are conservative and acceptable for evaluating potential offsite doses. SER Table 11.2-2 provides a comparison of the resulting dose estimates between the applicant's analyses, the staff's analysis, and the 10 CFR Part 50, Appendix I, criteria. All doses are below the Appendix I, Section II.A, criteria. The staff concludes that the applicant has provided a bounding assessment demonstrating its capability to comply with regulatory requirements in 10 CFR Part 20 and Appendix I to 10 CFR Part 50.

**Table 11.2-2 Comparison of Maximum Annual Individual Doses with NRC Dose Limits
(mSv/yr) (mrem/year)**

Pathway of Exposure	COL Application *	NRC Staff's Analysis	10 CFR Part 50, Appendix I Section II.A Criteria
Drinking Water <ul style="list-style-type: none"> Total Body mSv (mrem) Liver mSv (mrem) 	** 0.018 (1.8) ** 0.036 (3.6)	0.018 (1.8) 0.020 (2.0)	Total Body 3E-2 (3)
Irrigated Vegetables <ul style="list-style-type: none"> Total Body mSv (mrem) Liver mSv (mrem) 	0.036 (3.6) 0.057 (5.7)	0.024 (2.4) 0.031 (3.1)	Max Organ 1E-1(10)
* Adapted from RAI 11.02-6 response ** Applicant presented one-half these values in FSAR Revision 6, Table 11.2-209, to represent a per-unit application for compliance with the Appendix I design basis, which is also on a per-unit basis.			

The applicant responded to RAI 6985, Questions 11.02-06-5 to 11.02-0-11 on August 9, 2013. On April 22, 2014, the applicant provided a supplement to RAI 11.02-6-5 to 11.02-6-11.

In item 5 of RAI 6985, Question 11.02-6 dated February 20, 2013, the applicant was requested to address: (1) a rise in pressure given the combined operation of multiple wells and (2) potential fractures and formation of hydraulic connections, followed by upwelling into the above confining units. In the supplemental response dated April 22, 2014, the applicant provided a detailed response to supplement questions the staff raised on the August 9, 2013, response. The response included information discussing the potential pressure rises, upwelling, or both due to the DIS and included short-term injection tests on the deep injection wells to establish a range of pressures. These short-term injection tests were also used to verify the SEAWAT models described above to estimate transport distances and times.

Within the discussion, the applicant made the following assumptions regarding to the deep well injection operational parameters: all 12 injection wells are operating concurrently at a rate of 26,498 L/min (7,000 gpm) (assumed maximum anticipated injection rate), there is no dissipation of the increased formation pressure between operating injection wells, and the cumulative formation pressure is additive for each well.

In observing the analysis conducted in the response, the applicant determined that the total pressure increase in the Boulder Zone due to pressure and buoyant forces is approximately 50.2 psi. Using the equations described by the applicant in its response, the applicant calculated the pressure increase needed to create a potential fracture in the confining zone to be 582.9 psi, a pressure that is about 12 times larger than the original calculated pressure increase. Additionally, the applicant calculated a minimum downhole pressure increase needed to create a potential fracture of 377 psi, a number 7.5 times greater than the calculated pressure increase.

The applicant also highlighted that Rule 62-528.415(1)(a) of the Florida Administrative Code (F.A.C.) prohibits operating at pressures that would initiate new fractures or propagate existing fractures in the injection zone, initiate new fractures in the confining zone, or significantly alter the fluid containment capabilities of the confining zone.

To address the second request of item 5, the applicant provided details regarding the integrity of the deep injection wells by describing the well casings, joints, and mechanic integrity of the system over time. Each injection well is constructed with concentric steel casing to isolate and protect GW from the injected fluid. Each well will be constructed with new and unused steel casings designed to last for at least 60 years. The well casings are selected to provide protection against casing failures during cementing operations, protect against failures during the operation of the well and subsequent pressure testing, and provide sufficient corrosion protection. Groundwater protection is achieved through encasing select piping in cement; the injection tubing is reinforced with a fiberglass reinforced plastic (FRP) injection tubing to protect the environment from injection fluids and subsequent corrosion. A corrosion inhibitor also fills the gaps of the injection tubing to maintain corrosion control.

To ensure proper installation, testing will be conducted prior to the operation of the DIS. The testing programs include testing each injection well and hydraulic pressure testing of the pipeline. Mechanical integrity testing is defined by FDEP and consists of a video survey, pressure testing of the annular space between the 61-cm (24-in.) diameter casing and the FRP injection tubing, performance of high-resolution temperature log, and a performance of a radioactive tracer survey to detect the presence of breaches in the cement at the base of the casing.

Should any upwelling or failures of the injection occur, the applicant has first identified that 11 wells (9 active and 2 backup) are sufficient for disposal of the cooling water. If GW monitoring detects an upwelling of the injected fluid, FPL is required to report this information to FDEP. Based on the nature of the problem, FPL would remove the problematic wells from service, investigate the problem, and repair the problematic wells. FPL must comply with the remedial measure set up by FDEP, and if plugging and abandonment is required, FPL will follow the imposed requirements of FDEP. Well Plugging and Abandonment procedures are described in the applicant's response and the response references Rule 62-528.435, F.A.C. A proposed plugging and abandonment plan for each Class I injection well is required to be submitted with each Class I injection well construction and operation permit application. The staff reviewed the description, including design and operational controls, to minimize potential for hydraulic connectivity following an upwelling into the above confining units. The staff finds the response to item 5 of RAI 6985, Question 11.02-6 acceptable because FPL is required to follow the programs and procedures set in place by FDEP, and the information provided to staff to describe the efforts in place to address upwelling is adequate.

In item 6 of RAI 6985, Question 11.02-6, the applicant was asked to reconcile differences in stated flow rates and citations for the location of such information. Several examples are provided in the question stated above. In the response dated April 22, 2014, the applicant provided clarifications on the stated flow rates and citations. The applicant provided discussions for the reclaimed water supply, makeup water supply using saltwater, makeup flow rates when using the reclaimed water supply, and makeup flow rates when using saltwater as cooling water. Each discussion contained the information about amounts and flow rates of water used.

The cooling tower blowdown flow to the blowdown sump is 36,770 L/min (9,714 gpm) for Turkey Point Units 6 and 7, and therefore an additional dilution flow of 8,650 L/min (2,286 gpm) is required to meet the 45,420 L/min (12,000 gpm) dilution flow requirement. This makeup flow will be supplied from the makeup reservoir. The makeup water reservoir will have a capacity of 1040-1140 million L (275-300 million gallons) of reclaimed water and is capable of supplying the plant makeup and alternate dilution flow for approximately 5 days of full power with no

replenishment. When using saltwater as cooling water there is sufficient blowdown from cooling towers to supply the 45420 L/min (12,000 gpm) dilution flow requirement. To maintain chemistry of the makeup water reservoir the saltwater makeup to the cooling towers will be supplied directly into the cooling tower basins and not into the makeup water reservoir.

The estimated makeup flow when using reclaimed water for the cooling water system is 145,360 L/min (38,400 gpm). The total flow to all of the deep injection wells is approximately 47,320 L/min (12,500 gpm) and 49,210 L/min (13,000 gpm) for normal and maximum flow rates. A minimum of two deep injection wells will be used, resulting in a normal and maximum flow rate per injection well of 23,660 L/min (6,250 gpm) and 24,610 L/min (6,500 gpm), respectively. When using saltwater as cooling, the estimated flow rate is 327,060 L/min (86,400 gpm). The estimated flow into the deep injection well is 219,550 L/min (58,000 gpm) and 223,340 L/min (59,000 gpm) for normal and maximum flow rates. For this injection, a minimum of nine wells will be used resulting in 24,430 L/min (6,445 gpm) and 24,810 L/min (6,555 gpm) for normal and maximum flow rates per injection well.

FDEP set up a maximum linear injection velocity of 3 m/s (10 fps) into the deep injection well. To meet these requirements, the applicant provided a calculation in its response. The resulting calculation shows that using 3.0 m/s (10 fps) allows for 49,020 L/min (12,950 gpm) of flow into the deep injection well. As discussed before, the applicant calculated 24,610-L/min (6,500-gpm) maximum flow rate per injection well that will be used, which is significantly less than the calculated FDEP requirement. To account for the estimated makeup water flow of 327,060 L (86400 gallons), a back calculation was performed using the 24,810-L/min (6,555-gpm) maximum flow rate. Using 16.62-in. inside diameter piping and the maximum flow of 24,810 L/min (6,555 gpm), it was calculated that the maximum velocity of fluid into a deep injection well would be 3.0 m/s (9.7 fps). The staff finds that this complies with FDEP's requirement of 3.0 m/s (10 fps), and is acceptable.

In the response to item 6, the applicant also addressed the minimum dilution flow required to control liquid radwaste discharges. The applicant incorporated changes to Sections 11.2.1.2.4 and 11.5.3 that include a discussion about maintaining the ECLs found in 10 CFR Part 20, Appendix B, by specifying and maintaining flow rates at the blowdown sump discharge to at least the minimum dilution factor. To ensure compliance with the ECLs, the dilution flow is calculated and applied prior to each batch release of liquid radwaste. The staff reviewed the description of the stated flow rates in its response and finds the response to item 6 of Question 11.02-6 acceptable because the DCD changes to reflect maintaining a minimum flow rate to ensure compliance with the ECLs are clear and adequate and staff can ensure that the applicant will be in compliance with 10 CFR Part 20, Appendix B limits.

In item 7 of RAI 6985, Question 11.02-6, the applicant was asked to describe deep well injection rates under different plant conditions, procedural controls for the disposal of liquid effluents whenever the plant is in an outage mode, sources of dilution flow rates in this operating status, and expected dilution flow rates. The applicant was also requested to address whether it will impose in the ODCM and standard radiological effluent control (SREC) restrictions such that discharges of liquid effluents will not be initiated unless a minimum dilution flow rate is established in demonstrating compliance with effluent concentration limits and unity rule of 10 CFR Part 20, Appendix B, Table 2, Column 2; dose limits of 10 CFR 20.1301, 20.1302, and 20.1301(e); and numerical guides, design objectives, and ALARA provisions of Appendix I to 10 CFR Part 50 for liquid effluents.

In the response to item 7 dated April 22, 2014, the applicant provided information regarding the injection paths. The applicant stated that the injection from the blowdown sump may be used during outage mode. The alternate dilution water, which is only required when reclaimed water is being used as the cooling water, is provided from the makeup water reservoir or radial collector wells. In cases where dilution water is unavailable, the liquid radwaste discharges can be temporarily stored and released when sufficient dilution flow is made available. As with the response to item 6 above, the applicant referenced the changes into Sections 11.2.1.2.4 and 11.5.3 to describe efforts to maintain effluents to the ECLs in 10 CFR Part 20, Appendix B. The staff reviewed and finds the descriptions of the deep well injection rates acceptable and finds the response to item 7 of RAI 6985, Question 11.02-6 acceptable because the applicant adequately describes the provisions in place to maintain a minimum dilution flow to meet the ECLs in 10 CFR Part 20, Appendix B.

In item 8 of RAI 6985, Question 11.02-6, the applicant was asked to assess a postulated event involving the failure of some injection equipment and to consider programs and procedures used to control radiation exposures and doses to plant workers in responding to accidental spills of injectate. In the response to item 8, dated April 22, 2014, the applicant stated that the DIS is designed to have redundant measures to allow for isolation of failed equipment. The DIS also has overpressure protection measures in place to prevent overpressurization from the blowout of seals and operator errors.

The applicant stated that redundant isolation valves will be installed on the injectate main line to allow for isolation of the main line in case of damage or failures of the line. Each feeder line will also have redundant isolation valves that will allow for isolation of each individual injectate line. There are multiple valves on each deep injection well to prevent upward flow of injected fluid and discharge onto the concrete containment pad. The valve arrangement consists of 18-in. gate valve on the wellhead, which is located 3 ft above the injection well exit into the group, and an 18-in. butterfly valve located on the horizontal run of surface pipe on the concrete containment pad. The aboveground piping at the injection wells will be accessible for visual inspection to detect any leakage from pipes and valves.

The applicant stated that vent and drain valves will be installed on multiple locations of each branch line. The vent valves are installed to remove air coming out of the solution or air that is introduced by the air/vacuum release valves. The vents are located on the high points of each DIS, the points where air is most likely to collect. During normal operations, the vent and drain lines will be capped and the valves locked closed to prevent inadvertent operation. The valves will be manually operated as needed for pump startup. Personnel will be present to allow air to escape and then close the vent valves when the line fills with water. Each DIS is designed to minimize inadvertent or unidentified release to the environment. Integrity of each system is monitored for leakage by performing periodic walkdowns.

The applicant stated that each DIS is designed to minimize damage to the injection equipment. These design measures aim to minimize the likelihood of damage by a moving vehicle, overpressurization, blowout of seals, or joint failures. In the event of equipment failure, such as damage caused by a moving vehicle, valves would close to isolate the damaged equipment to minimize the volume of spilled injectate, and the affected injection wells would be removed from service for repairs. Once repairs are complete, the system would be pressure tested to confirm a leakproof repair. In this scenario, one of the redundant injection wells would be placed into service to make up for the temporarily out-of-service injection well. Once the repair and pressure testing is completed, the well affected by damage could be returned to service. In the

case in which the main pipe is damaged, all feeder lines in addition to the main line would isolate to prevent injectate from backflowing into the main piping.

In the case in which injectate is spilled and pooled on the ground, it would be contained and properly managed as potentially contaminated material in accordance with Radiation Protection and ALARA program requirements. Any spillage would be pumped into a tank for transport to a pumping station where it will be pumped down into an injection well, and any soil impacted by an injectate spill would be removed and managed as potential radioactive waste. The staff reviewed the response to item 8 of RAI 6985, Question 11.02-6 and finds the response acceptable because as seen in the preceding text, the applicant describes the redundant isolation valves, the vent and drain valves used to isolate DIS for maintenance or removal. The staff finds that this information adequately addresses features used to minimize the spread of contamination as is required by 10 CFR 20.1406

In Item 9 of RAI 6985, Question 11.02-6, the applicant was asked to describe how facility design and procedures for operation will minimize, to the extent practicable, contamination of the facility and the environment; facilitate eventual decommissioning; and minimize, to the extent practicable, the generation of radioactive waste. In the response to Item 9, dated April 22, 2014, the applicant provided information to support 10 CFR 20.1406 criteria, for minimization of contamination.

As discussed above for Item 8, the applicant described several measures in effect to minimize the sources of contamination by describing the use of isolation valves to isolated damaged lines and to prevent backflow into lines. Description of periodic visual walkdowns of the system and a discussion about the treatment of potential spills if there would be a spillage on the pad are described. Since the pad is made of concrete, water would pool from a leak, any pooled water would be pumped into a tank, and any affected soil would be treated as potentially contaminated material.

The applicant also discussed requirements set in place by the State to conduct mechanic integrity tests to ensure there is no fluid movement into an underground water source. The wells also require periodic sampling that will first be performed on a weekly basis during the first 6 months of operation. After 6 months, the applicant intends to request the State allow a reduced frequency for sampling to perform monthly integrity testing. The staff reviewed the information contained in the response to Item 9 to describe the practices in place to minimize, to the extent practicable, the generation of radioactive waste and finds the response to item 9 of Question 11.02-6 acceptable because the applicant adequately describes additional features used to minimize the spread of contamination as is required by 10 CFR 20.1406.

In Item 10 of RAI 6985, Question 11.02-6, the applicant was asked to describe sampling locations and elevations above the Boulder Zone, sampling frequency, and analytical programs for detecting the presence of long-lived and environmentally mobile radionuclides. In the response to Item 10, dated April 22, 2014, the applicant provided information on the baseline GW monitoring prior to the start of operations, monitoring of GW at the plant during operations, and a determination through the sampling of tritium to confirm whether there is any radioactivity present in GW.

The description of the monitoring program identifies tritium as the largest contributor to the activities released per year per reactor. As such, the applicant stated that tritium will be monitored on a monthly basis at the dual zone monitoring wells. Tritium will serve as an indicator of well failure or confining unit layer breakthrough. The other nuclides described in the

AP1000 DCD will also be considered in the monitoring program based on half-life, mobility, and detectability. After the baseline readings have been obtained, the applicant plans to adjust monitoring to a quarterly frequency. Gamma isotopic and gross beta will also be monitored first monthly, then quarterly once a baseline has been established.

In the event in which operational and radiochemical monitoring of the deep injection wells indicates the presence of plant effluent, through the detection of tritium, the following production wells will be sampled on a monthly basis for tritium and gross alpha/beta radioactivity: PW-1, PW-3, and PW-4. This monitoring is done to check any potential movements of plant effluent to the Upper Floridan aquifer. If these production wells indicate the presence of tritium due to Turkey Point Units 6 and 7 operations, FPL's mitigating actions will include removal of the applicable water supply well from operation and investigation of the DIS for well failure or confining unit failures.

Additional responses to controlling and radioactive material include confirmatory monitoring, removal of affected DIS components from service, and other actions as needed to protect the members of the public and plant workers. The off-normal operations prompt detection and a mitigating strategies program will be a part of the Turkey Point Units 6 and 7 ODCM/REMP. The staff reviewed the response to item 10 to describe sampling locations and elevations above the Boulder Zone, sampling frequency, and analytical programs in detecting the presence of long-lived and environmentally mobile radionuclides and finds the response to item 10 of Question 11.02-6 acceptable because the applicant adequately describes the measures in place to monitor radioactive releases, also describes efforts to control radioactive releases.

In item 11 of Question 11.02-6, the applicant was asked to address the presence of naturally occurring radioactivity in the Upper and Lower Floridan aquifers as part of the REMP. In the response to item 11, the applicant stated that FDEP regulates deep injection wells through its Underground Injection control program. Inside this program, FPL will have radiological monitoring to assess the operation of the injection wells to include gross alpha and combined radium-226 and radium-228, which will be sampled monthly. The frequency will be reduced to quarterly sampling once the operation testing phase is completed.

In addition to the State-regulated program, the applicant will have additional background and operational system monitoring to check for injection well failure and confining unit layer breakthrough, using tritium as an indicator to show leakage or breakthrough at the site. Prior to deep well injection startup, a baseline radiochemical sampling will be performed for gross alpha/beta radioactivity, gamma isotropic, and tritium. FPL proposes to have 6 months' worth of weekly sampling at the available dual zone monitoring wells prior to plant operations. FPL will not have continual background monitoring of naturally occurring radioactivity since tritium monitoring is what will determine injection well failure or confining unit layer breakthrough at the site. The staff reviewed the response to Item 11, in which the applicant described the use of the REMP to address the presence of naturally occurring radioactive material in the Upper and Lower Floridan aquifers, and finds the response to Item 11 of Question 11.02-6 acceptable. The response is acceptable because the applicant adequately describes additional monitoring for naturally occurring radioactive material.

The staff reviewed the entirety of NRC 6985, Question 11.02-6, dated February 20, 2013, and as indicated above, finds the response acceptable. Accordingly, RAI 6985, Question 11.02-6 is resolved.

Compliance with 10 CFR 20.2002

As stated in 10 CFR 20.2002: "A licensee or applicant for a license may apply to the Commission for approval of proposed procedures, not otherwise authorized in the regulations in this chapter, to dispose of licensed material generated in the licensee's activities. Each application shall include:

- (a) A description of the waste containing licensed material to be disposed of, including the physical and chemical properties important to risk evaluation, and the proposed manner and conditions of waste disposal; and*
- (b) An analysis and evaluation of pertinent information on the nature of the environment; and*
- (c) The nature and location of other potentially affected licensed and unlicensed facilities; and*
- (d) Analyses and procedures to ensure that doses are maintained ALARA and within the dose limits in this part.*

The staff's evaluation of the applicant's proposed disposal of liquid waste in compliance with 10 CFR 20.2002 is addressed below.

10 CFR 20.2002(a) A description of the waste containing licensed material to be disposed of, including the physical and chemical properties.

In FSAR Section 11.2, the applicant describes disposal of liquid wastewater effluent via deep well injection into the Boulder Zone. Based on a screening analysis of the DCD Table 11.2-7 inventory, the applicant identifies four radionuclides (tritium, cesium-134, cesium-137 and strontium-90) as the most significant dose contributors to the total body and organs of a child and then proceeds with modelling and evaluation based on those nuclides. Details of the deep well injection system design are presented in FSAR Section 9.2.12.

In FSAR Section 11.5.3, the applicant states that the activity concentration of the radwaste portion of the effluent is controlled to meet 10 CFR Part 20, Appendix B, ECLs, by maintaining sufficient dilution through the blowdown sump discharge pumps, which will provide at least the minimum dilution needed to reduce concentrations to below the ECL values. The required minimum dilution is calculated and applied before the release of liquid radwaste to the sump (batch is the only release mode anticipated) to ensure the activity concentration of the mixture is less than the 10 CFR Part 20, Appendix B, ECLs. The procedural methods and controls are to be in accordance with the Turkey Point Turkey Point Units 6 and 7 ODCM.

Staff review of the liquid radwaste system confirmed a design meeting the guidance of RG1.143, "Design Guidance for Radioactive Waste Management Systems, Structures, and Components Installed in Light-Water-Cooled Nuclear Power Plants." As defined in the Guide, "for the purposes of this guide, the radwaste systems are considered to begin at the interface valves in each line

from other systems provided for collecting wastes that may contain radioactive materials and to include related instrumentation and control systems. The radwaste system terminates at the point of controlled discharge to the environment, at the point of recycle to the primary or secondary water system storage tanks, or at the point of storage of packaged solid wastes.”

Processed liquid radioactive waste from Turkey Point Turkey Point Units 6 and 7 operation is discharged to the plant blowdown sump pump discharge line before release to the Lower Floridan aquifer (Boulder Zone) by the DIS. Piping from the blowdown sump dilution connection point is routed to the deep injection wells, distributed in two branches; one branch is oriented in a north-south direction and located to the east of Unit 6. The second branch is oriented in the east-west direction and located to the south of Turkey Point Units 6 and 7.

The applicant describes that this injectate piping to each deep injection well isolation valve is single-walled, partially buried, and constructed of material suitable for the range of injectate composition, flow rates, and pressures, as well as environmental factors. The injectate piping contains manifolds, valves, and controls necessary to supply any appropriate combination of the deep injection wells. The injectate piping also includes appurtenances, such as vacuum breakers, vent lines, and access ways, as necessary, for proper operation and maintenance of the piping. The piping, manifolds, valves, controls, and appurtenances are designed to minimize inadvertent or unidentified releases to the environment. Integrity of the injectate piping will be monitored for leakage or will be accessible for visual inspection or remote surveillance in conjunction with groundwater monitoring, as necessary, as part of the Turkey Point Units 6 and 7 Groundwater Monitoring Program.

The applicant provided additional information in PTN SUP 11.2-2 stating that the liquid radwaste discharge release point is where the WLS effluent discharge pipe connects to the blowdown sump discharge pipe to deep injection wells.

The applicant defines the DIS as the point of controlled discharge to the environment. Dilution of the liquid radwaste is initiated as the radwaste enters the DIS in the discharge stream from the blowdown sump. The guard pipe-enclosed radwaste discharge piping connects to the blowdown sump discharge piping downstream of the blowdown sump pumps. Dilution of the liquid radwaste is initiated as the radwaste enters the blowdown sump discharge stream. The content of the blowdown sump is a combination of waste streams largely comprised of reclaimed water or seawater from circulating water system blowdown during plant operation or from the alternate dilution flow paths when circulating water system (CWS) blowdown is not sufficient or available for dilution. Failure of the DIS does not affect the ability of safety-related systems to perform their intended function. The DIS is a flow path for liquid radwaste and liquid nonradioactive waste discharge and provides underground disposal of plant wastewater, including CWS blowdown and liquid radwaste, into the Boulder Zone. The applicant has also stated that the WLS effluent discharge piping is double-walled piping up to this point.

Typically, all other nuclear plants operating in the United States that release radioactive waste release it to surface waters – and are not controlled nor

restricted by NRC regulations beyond that point. The DIS injection wells proposed are governed by Florida Department of Environmental Protection (FL-DEP) regulations and also subject to EPA regulations. They are classified and regulated as hazardous Class 1 injection wells. The staff concludes that because the FL-DEP is experienced in regulation injection wells and its associated regulations are comprehensive in this area, issues associated with integrity of the well, protection of the strata of the injection zone and the confining zone are adequately addressed through the FL-DEP regulations and permitting system. Consequently, the applicant has provided adequate information to provide reasonable assurance that requirements of 10 CFR 20.2002(a) are being met.

10 CFR 20.2002(b) An analysis and evaluation of pertinent information on the nature of the environment; and

The applicant analysis and evaluation of the nature of the environment in described in detail in FSAR Chapter 2, and additionally in the FSAR Section 11.2 dose modelling evaluation and the FSAR Section 2.4.13 liquid tank failure analysis. Additional analysis is described in the applicant's ER, section 2.3.2.2. The staff concludes that the information provided in response to staff RAIs on the DIS is sufficient to support the analysis of hazards associated with the proposed deep well injection disposal. Consequently, the applicant has provided adequate information to provide reasonable assurance that the requirements of 10 CFR 20.2002(b) are being met.

10 CFR 20.2002(c) The nature and location of other potentially affected licensed and unlicensed facilities; and

The applicant describes the nature and location of other potentially licensed and unlicensed facilities in detail in FSAR Chapter 2, and additionally in the FSAR Section 11.2 dose modelling evaluation. Additionally, the nature and location of other potentially affected licensed and unlicensed facilities will have to be described in the applicant's construction permit for the deep wells. The staff concludes that the information provided in response to staff RAIs on the DIS is sufficient to support the analysis of hazards associated with the proposed deep well injection disposal. Consequently the applicant has provided adequate information to provide reasonable assurance that the requirements of 10 CFR 20.2002(c) are being met.

10 CFR 20.2002(d) Analyses and procedures to ensure that doses are maintained ALARA and within the dose limits in this part.

In its response to RAI 6985, Question 11.2-06, Items 1-4, dated January 15, 2014 the applicant provided detailed modeling of groundwater migration and potential doses due to both normal offsite water use as well as intruder scenario. The resulting hypothetical dose to a maximum exposed offsite individual was $5.5\text{E-}2$ mSv (5.5 mrem) per year. This dose is consistent with the NRC's acceptance criterion of a few millirem, as stated in SECY-07-0060, Attachment 1, and NUREG-1757, Vol. 1, Rev. 2, Section 15.12.

Additionally, in response to RAI 5695, Question 11.02-2, regarding the need for a cost benefit analysis, the applicant provided a credible argument concluding that no liquid radwaste system augment is justified for installation based on an Appendix I averted dose cost-benefit evaluation of the hypothetical exposed population. Refer to the discussion on “PTN COL 11.2-2, Liquid Radwaste Cost-benefit Analysis Methodology” above for details.

The staff concludes that the information provided by the applicant in response to staff RAIs is considered adequate for demonstration of compliance with 10 CFR 20.2002 given the discussions provided above for meeting the subparts of 10 CFR 20.2002.

11.2.5 Post-Combined License Activities

The applicant proposed a license condition to ensure that radionuclide inventories in the Turkey Point Units 6 and 7 RWBs are properly controlled and that all relevant sources of radioactive material are accounted for and appropriately calculated in accordance with RG 1.143, Revision 2, and the RWB classification of RW-IIc. The license condition language in this section has been modified, per a letter from the applicant dated April 8, 2016 (ADAMS Accession No. ML16103A507), confirming the acceptability of the following license conditions, proposed by the staff. These changes do not affect the staff’s above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

License Condition (11-1) – Before initial fuel load, the licensee shall develop, implement, and maintain procedural controls limiting radionuclide inventory in each of the Radwaste Building Monitor Tanks, and separately in each of up to three (3) Radwaste Building mobile radwaste processing systems to below A_2 quantities for radionuclides specified in Appendix A to 10 CFR Part 71 (Tables A-1 and A-3), as described in FSAR Subsection 13.5.2.2.5. The procedures shall also ensure that any additional equipment located in the RWB is limited to below A_2 quantities and that the total cumulative radioactive inventory contained in unpackaged wastes (including liquid waste, wet waste, solid waste, gaseous waste, activated or contaminated metals and components, and contaminated waste present at any time in the Radwaste Building) is limited so that an unmitigated release, occurring over a two hour time period, would not result in a dose of greater than 500 millirem at the protected area boundary or an unmitigated exposure, occurring over a two hour time period, would not result in a dose of greater than 5 rem to site personnel located 10 feet from the total cumulative radioactive inventory.

11.2.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff’s review confirmed that the applicant has addressed the required information related to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff’s technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application is documented in NUREG-1793 and its supplements.

In addition, the staff evaluated the additional COL information items (STD COL 11.2-1, PTN COL 11.2-2, PTN COL 11.5-3, PTN COL 2.4-5, PTN COL 15.7-1, STD SUP 11.2-1, and PTN SUP 11.2-2) in the application against the relevant NRC regulations, acceptance criteria defined in NUREG-0800, Section 11.2, and other NRC regulatory guides. The staff reviewed

the applicant's proposed methodology on the deep well injection. The methods and calculations discussed by the applicant have been reviewed and confirmed by independent NRC staff calculations. The staff determines that the applicant has demonstrated the ability to control, track, and evaluate liquid effluent releases from Turkey Point Units 6 and 7. The applicant has satisfactorily addressed all RAIs related to Section 11.2.

The staff confirmed that the applicant provided sufficient information and that the review and calculations support the conclusions that follow. The staff concludes that the LWMS (as a permanently installed system or in combination with mobile systems) includes the equipment necessary to control releases of radioactive materials in liquid effluents in accordance with GDC 60 and 61 of Appendix A to 10 CFR Part 50 and the requirements of 10 CFR 50.34a. Therefore, subject to the resolution of the two confirmatory items discussed above, the staff concludes that the design of the LWMS is acceptable and meets the requirements of 10 CFR 20.1301(e), 10 CFR 20.1302, 10 CFR 20.1406, 10 CFR 50.34a, GDC 60 and 61, and 10 CFR 20.2002.

11.3 Gaseous Waste Management System

11.3.1 Introduction

The GWMS is designed to control, collect, process, handle, store, and dispose of gaseous radioactive waste generated as the result of normal operation, including AOOs.

11.3.2 Summary of Application

Section 11.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 11.3 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 11.3, the applicant provided the following:

AP1000 COL Information Items

- PTN COL 11.3-1

The applicant added additional information in PTN COL 11.3-1 regarding gaseous radwaste cost-benefit analysis methodology (PTN COL FSAR, Section 11.3.3.4.3), as well as additional information to resolve COL Information Item 11.3-1 (COL Action Item 11.3-1), which addresses the estimated doses to the public from the gaseous waste system and the associated cost-benefit analysis in PTN COL FSAR, Section 11.3.3.4.3.4.

- PTN COL 11.5-3

The applicant provided additional information in PTN COL 11.5-3 to resolve COL Information Item 11.5-3 (COL Action Item 11.5-3). The additional information addresses compliance with 10 CFR Part 50, Appendix I, Sections II.B and II.C, related to operation of the gaseous waste system in PTN COL FSAR, Section 11.3.3.4.

Supplemental Information

- STD SUP 11.3-1

The applicant added supplemental information in PTN COL FSAR, Section 11.3.3.6, to address the QA program to be applied to the GWMS.

- PTN SUP 11.3-1

The applicant added supplemental information in Turkey Point Units 6 and 7 COL FSAR, Section 11.3.3.6, to address conformance of the QA program to RG 1.143.

11.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of the supplementary information on the GWMS is established in:

- 10 CFR 20.1301(e) as it relates to compliance with 40 CFR 190
- 10 CFR 20.1302, "Compliance with dose limits for individual members of the public"
- 10 CFR 20.1406, "Minimization of contamination"
- 10 CFR 50.34a, "Design objectives for equipment to control releases of radioactive material in effluents – nuclear power reactors"
- 10 CFR Part 50, Appendix A, "General Design Criteria for Nuclear Power Plants," GDC 3, "Fire protection"
- 10 CFR Part 50, Appendix A, "General Design Criteria for Nuclear Power Plants," GDC 60, "Control of releases of radioactive materials to the environment"
- 10 CFR Part 50, Appendix A, "General Design Criteria for Nuclear Power Plants," GDC 61, "Fuel storage and handling and radioactivity control"
- 10 CFR Part 50, Appendix I, Sections II.B, II.C, and II.D, as they relate to gaseous effluent dose objectives and associated cost-benefit analysis
- 10 CFR 52.80(a) as it relates to those inspections, tests, analysis that the applicant shall perform, and the necessary acceptance criteria that are necessary to show the facility shall be constructed and operated in conformity with the COL

Guidance for meeting these requirements is in:

- Regulatory Position C.2 of RG 1.143
- RG 1.109, Revision 1, "Calculation of Annual Doses to Man from Routine Releases of Reactor Effluents for the Purpose of Evaluating Compliance with 10 CFR Part 50, Appendix I"
- RG 1.110, "Cost-Benefit Analysis for Radwaste Systems for Light-Water-Cooled Nuclear Power Reactors"

- RG 1.111, Revision 1, “Methods for Estimating Atmospheric Transport and Dispersion of Gaseous Effluents in Routine Releases from Light-Water-Cooled Nuclear Power Reactors”
- RG 4.21, “Minimization of Contamination and Radioactive Waste Generation: Life-Cycle Planning”

The acceptance criteria associated with the GWMS are given in Section 11.3 of NUREG-0800, including BTP 11-5.

11.3.4 Technical Evaluation

The staff reviewed Section 11.3 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the information in the COL represent the complete scope of information relating to this review topic.¹ The staff’s review confirmed that the information contained in the application and incorporated by reference addresses the required information relating to the GWMS. The results of the staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff’s review of this application included the following COL information and supplementary items:

- PTN COL 11.3-1, Gaseous Radwaste Cost-Benefit Analysis Methodology
- PTN COL 11.3-3, Cost-Benefit Analysis of Population Doses, and 10 CFR Part 50, Appendix I, Sections II.B and II.C
- STD SUP 11.3-1, Supplemental Information on Quality Assurance
- PTN SUP 11.3-1, Supplemental Information on RG 1.143 Conformance

In addition to the above items, the staff reviewed the entire section against Section 11.3 of NUREG-0800 to determine if the information in Turkey Point Units 6 and 7 COL FSAR Section 11.3 met the regulatory requirements in the regulations stated above (SER Section 11.3.3) and NUREG-0800 acceptance criteria. The relevant NUREG-0800 acceptance criteria are as follows:

- The GWMS should have the capability to meet the dose design objectives and should include provisions to treat gaseous radioactive wastes, such that the following is true:
 - A. The calculated annual total quantity of all radioactive materials released from each reactor to the atmosphere will not result in an estimated annual external dose from gaseous effluents to any individual in unrestricted areas in excess of 0.05 mSv (5 mrem) to the total body or 0.15 mSv (15 mrem) to the skin. RGs 1.109 and 1.111 provide acceptable methods for performing this analysis.
 - B. The calculated annual total quantity of radioactive materials released from each reactor to the atmosphere will not result in an

¹ Section 1.2.2 contains a discussion on the staff’s review related to verification of the scope of information to be included within a COL application that references a DC.

estimated annual air dose from gaseous effluents at any location near ground level which could be occupied by individuals in unrestricted areas in excess of 0.01 cGy (10 millirads) for gamma radiation or 0.02 cGy (20 millirads) for beta radiation. RGs 1.109 and 1.111 provide acceptable methods for performing this analysis.

- C. The calculated annual total quantity of radioiodines, carbon-14, tritium, and all radioactive materials in particulate form released from each reactor at the site in effluents to the atmosphere will not result in an estimated annual dose or dose commitment from such releases for any individual in an unrestricted area from all pathways of exposure in excess of 0.15 mSv (15 mrem) to any organ. RGs 1.109 and 1.111 provide acceptable methods for performing this analysis.
 - D. In addition to 1.A, 1.B, and 1.C, above, the GWMS should include all items of reasonably demonstrated technology that, when added to the system sequentially and in order of diminishing cost-benefit return, for a favorable cost-benefit ratio, can effect reductions in dose to the population reasonably expected to be within 80 km (50 mi) of the reactor. RG 1.110 provides an acceptable method for performing this analysis.
 - E. The concentrations of radioactive materials in gaseous effluents released to an unrestricted area should not exceed the limits specified in Table 2, Column 1, of Appendix B to 10 CFR Part 20.
 - F. The regulatory position contained in RG 1.143 is met, as it relates to the definition of the boundary of the GWMS, beginning at the interface from plant systems to the point of controlled discharges to the environment as defined in the ODCM, or at the point of storage in holdup tanks or decay beds for gaseous wastes produced during normal operation and anticipated operational occurrences.
- System designs should describe features that will minimize, to the extent practicable, contamination of the facility and environment; facilitate eventual decommissioning; and minimize, to the extent practicable, the generation of radioactive waste in accordance with RG 1.143, for gaseous wastes produced during normal operation and anticipated operational occurrences, and the requirements of 10 CFR 20.1406 or the DC application, update in the SAR, or the COL application to the extent not addressed in a referenced certified design.
 - BTP 11-5, as it relates to potential releases of radioactive materials (noble gases) as a result of postulated leakage or failure of a waste gas storage tank or off-gas charcoal delay bed.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3

and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAs.
- The staff confirmed that all responses to RAs identified in the corresponding STD content evaluation were endorsed.
- The staff confirmed that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the STD content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This STD content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

AP1000 COL Information Items

- PTN COL 11.3-1, Gaseous Radwaste Cost-Benefit Analysis

The applicant provided additional information in PTN COL 11.3-1 to resolve COL Information Item 11.3-1. COL Information Item 11.3-1 states:

The analysis performed to determine offsite dose due to gaseous effluents is based upon the AP1000 generic site parameters included in Chapter 1 and Tables 11.3-1, 11.3-2 and 11.3-4. The Combined License applicant will provide a site-specific cost-benefit analysis to demonstrate compliance with 10 CFR 50, Appendix I, regarding population doses due to gaseous effluents.

The commitment was also captured in COL Action Item 11.5-3 in Appendix F of the staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will provide a site-specific cost-benefit analysis to demonstrate compliance with 10 CFR 50, Appendix I, regarding population doses due to gaseous effluents.

The applicant performed a site-specific analysis to determine that the offsite dose due to gaseous effluents is bounded by the AP1000 site parameters included in FSAR, Revision 5, Chapter 1, and Tables 11.3-1, 11.3-2, and 11.3-4 from the DCD. The applicant discussed the site-specific cost-benefit analysis in Turkey Point Units 6 and 7 COL FSAR, Section 11.3.3.4.4, to address the requirements of 10 CFR Part 50, Appendix I, Section II.D, regarding population doses due to gaseous effluents. The dose and dose rate to man was calculated using the GASPARI computer code, which is based on the methodology presented in RG 1.109.

The applicant's analysis showed that the lowest-cost option for gaseous radwaste treatment system augments is the Steam Generator Flash Tank Vent to Main Condenser at \$6,320 per year. The population doses, 4.0 person-rem total body per reactor and 7.5 person-rem thyroid

per reactor, are given in the FSAR Table 11.3-207. Assuming that this augment will eliminate all radioactivity from the liquid effluent, the resulting cost per dose reduction was \$1,580 per total body person-rem ($\$6,320/4.0$) and \$843 per thyroid person-rem ($\$6,320/7.5$). While the costs per person-rem reduction exceed the \$1,000 per person-rem criterion considering the total body dose, the costs considering the thyroid dose are below the \$1,000 per person-rem and, therefore, warrant further evaluation.

Since the estimated thyroid dose of 7.5 person-rem exceeds the 6.32 person-rem threshold value (\$6,320 augment at \$1,000 per person-rem), those system augments listed in RG 1.110 with a total annual cost less than \$7,500 were evaluated to determine if they would be cost beneficial. The only such augment is the one already mentioned above. Addition of this augment presumes that the design already includes a steam generator flash tank. The AP1000 design does not include a steam generator flash tank, but instead uses steam generator piping blowdown heat exchangers that provide cooling of the blowdown fluid and prevent flashing prior to blowdown entering the main condenser. Adding the installation of a flash tank to this augment is expected to cause the estimated total annual cost to be \$1,170 and would result in the conclusion that this augment is not cost beneficial.

The applicant went on to state that, although the cost of thyroid dose reduction is just below the threshold, this is assuming the augment completely eliminates the dose. As shown in Table 11.3-1 below (based on Turkey Point Units 6 and 7 COL, Revision 5, FSAR Table 11.3-207), 2.1 of the 7.5 person-rem thyroid dose is due to noble gases, which will not be mitigated by the steam generator flash tank vent to main condenser. With the noble gas contribution unaffected by the augment, the cost of thyroid dose reduction is \$1,170 per person-rem thyroid and is, therefore, not cost beneficial.

The staff reviewed this evaluation and concurs with the applicant's results, as shown in Table 11.3-2, predicated on the applicant's calculated population doses. The staff-derived total annual cost is estimated to be \$6,654, \$1,663 per person-rem total body and \$887 per person-rem thyroid. The thyroid augmented cost, once adjusted for radionuclides contributing doses to the thyroid, is estimated to be \$1,230 per person-rem thyroid. This evaluation confirms the applicant's results, given their relatively close agreements.

Table 11.3-1 Applicant Population Doses Breakdown by Source

Source	Total Body (person-rem)	Thyroid (person-rem)
Noble Gases	2.1	2.1
Iodine	0.013	3.5
Particulates	1.2	1.2
C-14	0.21	0.21
H-3	0.48	0.48
Total	4.0	7.5
Source: Turkey Point Units 6 and 7, Revision 7, FSAR Table 11.3-207		

Table 11.3-2 NRC Staff Population Doses and Breakdown

Source	Total Body (person-rem)	Thyroid (person-rem)
Noble Gases	2.14	2.14
Iodine	0.013	3.50
Particulates	1.23	1.21
C-14	0.12	0.12
H-3	0.45	0.45
Total	3.95	7.42

The augment considered is already the lowest cost augment available. This is above the costs criterion of \$1,000 per person-rem for an augment in 10 CFR Part 50, Appendix I, Section II.D. Thus, when the applicant's calculated population doses are confirmed, the staff will be able to conclude that the GWMS meets ALARA requirements and requires no augments.

- PTN COL 11.5-3

The applicant provided additional information in PTN COL 11.5-3 to resolve COL Information Item 11.5-3. COL Information Item 11.5-3 states:

The Combined License applicant is responsible for addressing the 10 CFR 50, Appendix I guidelines for maximally exposed offsite individual doses and population doses via liquid and gaseous effluents.

The commitment was also captured in COL Action Item 11.5-3 in Appendix F of the staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant is responsible for addressing the guidelines of Appendix I to 10 CFR Part 50, as they relate to maximally exposed offsite individual doses and population doses attributable to liquid and gaseous effluents.

The staff reviewed the resolution to COL Information Item 11.5-3 related to the compliance with Appendix I to 10 CFR Part 50 included under Section 11.3.3.4 of the COL and issued RAI 7112, Question 11.03-1 requesting the applicant to provide more of the details of the individual and population dose analysis, since the information presented in Turkey Point Units 6 and 7 FSAR (Revision 0) is incomplete.

If built, the postulated two new units at the site would release gaseous effluents into the atmosphere. The applicant calculated doses for several airborne pathways, including direct exposure to a radioactive plume, direct exposure to radioactivity deposited on the ground, inhalation of airborne radioactivity and ingestion of contaminated agricultural products, including vegetables and meat. The applicant assumed that the 50-mile population around the plant consumes both cow and goat milk, while the nearest resident who receives the maximum estimate does drinks no milk.

Using radiological exposure models based on RG 1.109 and the GASPAR II computer program (NUREG/CR-4653, "GASPAR II: Technical Reference and User Guide," March 1987), the applicant calculated the estimated doses to a hypothetical MEI of the public and to the population within 50 mi (80 km) from the postulated gaseous effluents discharged.

The applicant maximized the estimated MEI doses by choosing conservative locations and dispersion data for the calculations.

Turkey Point Units 6 and 7 COL, Revision 8, FSAR Tables 11.3-201, -202, and -203 describe assumptions and include gaseous pathway parameters used as input in dose calculations, including population data, and site-specific agricultural usage information. Turkey Point Units 6 and 7 COL, Revision 8, FSAR Tables 11.3-204, -205, and -206 list doses for gaseous releases and exposure pathways for the MEI and surrounding population, respectively.

The applicant calculated the gaseous pathway doses to the MEI. The results (FSAR Revision 8, Tables 11.3-204 and -205) show, for assumed conservative locations, a gamma annual air dose of 0.042 mGy or 4.2 mrad, a beta annual air dose of 0.18 mGy or 18 mrad, a total annual body dose of 0.00038 mSv or 0.038 mrem, and an annual skin dose of 0.00053 mSv or 0.053 mrem. The most limiting age group is the child, with organ doses of 0.0015 mSv or 0.15 mrem to bone and 0.0024 mSv or 0.24 mrem to the thyroid. The calculated annual population doses listed in revised FSAR Revision 5, Table 11.3-207 are 0.04 person-Sv (4.0 person-rem) to the total body and 0.075 person-Sv (7.5 person-rem) to the thyroid. The applicant uses the population doses in the cost-benefit analysis described in this SER.

Table 11.3-3 Comparison of Maximum Annual Individual Doses with NRC Dose Limits

Description	COL Application	10 CFR Part 50, Appendix I, Sections II.B and II.C Criteria
Noble Gases <ul style="list-style-type: none"> Gamma Dose [mGy (mrad)] Beta Dose [mGy (mrad)] Total Body [mSv (mrem)] Skin [mSv (mrem)] 	* 4.2E-2 (4.2) * 1.8E-1 (18) 2.6E-2 (2.6) 1.3E-1 (13)	1.0E-1 (10) 2.0E-1 (20) 5.0E-2 (5) 1.5E-1 (15)
Radioiodines and Particulates <ul style="list-style-type: none"> Maximum Organ [mSv (mrem)] 	** (0.24)	1.5E-1 (15)
* Taken from FSAR Revision 7, Table 11.3-205 ** Dose for the child thyroid, taken from FSAR Revision 7, Table 11.3-204		

The staff performed an independent assessment using the GASPAR II computer code and compared its results to the applicant's and Part 50, Appendix I, criteria and Part 20, Appendix B, ECLs for gaseous effluents. Following a review of COL FSAR, Revision 4, Section 11.3, the staff identified eight issues in demonstrating compliance with gaseous effluent releases and dose limits to members of the public under 10 CFR 20.1301, 20.1302, and 20.1301(e) and Part 50, Appendix I, design objectives and ALARA provisions. Based on this review of the information and conduct of confirmatory analyses, the staff identified inconsistencies and a need to clarify assumptions used in the analyses and results presented by the applicant and include site-specific information and analyses in demonstrating compliance with gaseous effluent releases and dose limits to members of the public under 10 CFR 20.1301, 20.1302, and 20.1301(e) and Part 50, Appendix I, design objectives and ALARA provisions. In RAI 7112, Question 11.03-1, dated August 7, 2013, the applicant was requested to address and resolve the issues identified by the staff. In a response dated September 9, 2013, to RAI 7112, Question 11.03-1, the applicant provided supplemental information for the staff's evaluation.

The staff evaluated and agrees with the approach taken by the applicant to calculate maximum annual individual doses from gaseous effluents. Using this same approach, the staff confirmed the individual doses in the FSAR by independently running the GASPAR II computer code with the applicant's parameter values. SER Table 11.3-4 provides a comparison of the resulting dose estimates between the applicant's analyses and the Part 50, Appendix I criteria. All doses are well below the Appendix I, Sections II.B and II.C, criteria. The staff concludes that the applicant has provided a bounding assessment demonstrating its capability to comply with the regulatory requirements in 10 CFR Part 20 and Appendix I to 10 CFR Part 50.

Table 11.3-4 Comparison of COL MEI Doses with the Staff Results

Pathway	Age Group	Organ	COL Application * mSv/yr (mrem/year)	The Staff's Analysis mSv/yr (mrem/year)
Plume and ground deposition	Teen	Whole body	2.6E-2 (2.6)	2.55E-2 (2.55)
External plume exposure	All	Skin	1.3E-1 (1.3E1)	1.28E-1 (1.28E1)
External ground exposure	All	Skin	1.2E-2 (1.2)	1.23E-2 (1.23)
Inhalation	Child	Thyroid	1.4E-4 (1.4E-2)	1.37E-4 (1.37E-2)
Meat	Child	Bone	1.8E-4 (1.8E-2)	1.79E-4 (1.79E-2)
Vegetables	Child	Thyroid	2.1E-3 (2.1E-1)	2.06E-3 (2.06E-1)
Most limiting	Child	T-Body Bone Thyroid	3.8E-4 (3.8E-2) 1.5E-3 (1.5E-1) 2.4E-3 (2.4E-1)	3.8E-4 (3.8E-2) 1.5E-3 (1.5E-1) 2.4E-3 (2.4E-1)

* Taken from FSAR Section 11.3.3.4 and Table 11.3-206

In confirming that gaseous effluent concentrations are in compliance with Part 20, Appendix B, Table 2, Column 1, limits and the unity rule for radionuclide mixtures, the applicant provided an updated evaluation by comparing the exclusion area boundary (EAB) atmospheric dispersion parameter of AP1000 DCD, FSAR, Revision 19, Section 11.3.3.2 and Table 11.3-4 (sheet 2), with the corresponding FPL site-specific EAB atmospheric dispersion parameter presented in FSAR, Revision 5, Section 2.3.5. The applicant presented a comparison in COL Revision 5, FSAR 11.3.3.2 in demonstrating compliance with Part 20, Appendix B, Table 2, Column 1, limits and the unity rule since the result of this analysis and regulatory compliance are dependent on site-specific meteorological data. Using a site-specific EAB atmospheric dispersion parameter, the applicant adjusted upward the results of the sum-of-the-ratio by a factor of 1.7, as the difference between the EAB atmospheric dispersion parameters. The adjusted sum-of-the-ratio is 0.051 for routine effluent releases and 0.56 for maximum effluent releases. The staff confirmed this adjustment with a sum-of-the-ratio of 0.051 for routine releases and 0.58 for maximum releases. The adjusted sum-of-the-ratio is acceptable since it is less than the calculated value for unity and in conformance with Part 20, Appendix B, Footnote 4. The staff

confirmed that the corresponding revisions were made to COL Revision 7, FSAR Section 11.3.3.2 and, therefore, closes out this item in RAI 7117, Question 11.03-1.

In confirming that gaseous effluent concentrations are in compliance with the guidance of NUREG-0800, SRP Section 11.3, and BTP 11-5 (Postulated Radioactive Releases Due to a Waste Gas System Leak or Failure), the applicant did not compare the results of AP1000 DCD FSAR, Revision 19, Section 11.3.3.4 (2nd paragraph), and the EAB atmospheric dispersion parameter of AP1000 DCD, FSAR, Revision 19, Section 2.1, Table 2-1 (sheet 3), with the corresponding site-specific EAB atmospheric dispersion parameter (0-2 hour X/Q) presented in COL FSAR, Revision 5, Section 2.3.4. As part of RAI 7112, Question 11.03-1, the applicant was requested to address and acknowledge this comparison in COL FSAR 11.3.3 in demonstrating compliance with AP1000 DCD FSAR, Revision 19, Section 11.3.3.4, and SRP Section 11.3 and BTP 11-5 since the dose result of this analysis and regulatory compliance are dependent on site-specific meteorological data. In a response dated March 6, 2014, to RAI 7112, Question 11.03-1, the applicant provided supplemental information for the staff's evaluation. In its evaluation, the staff determined that the applicant's response provided clarifying text in the FSAR Section 11.3.3.4, to state that: "The site-specific atmospheric dispersion factor for the site boundary is bounded by the value given in DCD Table 2-1. Hence the single failure of an active component in the gaseous radwaste system yields a whole body dose less than 0.1 rem." The staff finds this response acceptable because the staff has confirmed that the atmospheric dispersion factor for the site boundary is less than the value described in the AP1000 DCD and also determines that the calculated value would be less than what is currently estimated in the DCD. Therefore, the staff's findings made in NUREG-1793 and its supplements are still valid. The staff has confirmed the changes in Revision 6 of the application. RAI 7117, Question 11.03-1 is resolved.

The following portion of this technical evaluation section is reproduced from Section 11.3.4 of the VEGP SER:

Supplemental Information

The following portion of this technical evaluation section is reproduced from Section 11.3.4 of the BLN SER:

- *STD SUP 11.3-1*

The applicant provided supplemental information in BLN COL FSAR Section 11.3.3.6, "Quality Assurance," addressing the quality assurance program to be applied to the gaseous waste system and stated that the program complies with the guidance presented in RG 1.143.

The NRC staff reviewed this supplemental quality assurance information included in BLN COL FSAR Section 11.3.3.6 and finds that this supplemental statement commits the applicant to the regulatory positions in RG 1.143 related to quality assurance and is acceptable.

- *PTN SUP 11.3-1*

The applicant provided additional information in PTN SUP 11.3-1 stating that the quality assurance program for design, construction, procurement, materials, welding, fabrication,

inspection and testing activities conforms to the quality control provisions of the codes and STDs recommended in Table 1 of RG 1.143.

The following portion of this technical evaluation section is reproduced from Section 11.3.4 of the VEGP SER:

Postulated Radioactive Release Due to a Waste Gas Leak or Failure

NUREG-0800, Section 11.3, acceptance criteria and BTP 11-5 require the staff to evaluate the results of a postulated radioactive release resulting from a leakage or failure of a waste gas storage tank or offgas charcoal delay bed.

*The AP1000 DCD and NUREG-1793 addressed the results of this analysis. In response to RAI SRP11.3-CHPB-02 covering AP1000 DCD, Revision 17, Westinghouse detailed the results of this analysis for inclusion in the next revision of the DCD. As documented in the staff's SER for the AP1000 DCD, the staff found this analysis acceptable and that it encompassed the site-specific parameters for the VEGP site. Once the staff confirms the inclusion of the failure analysis in a future revision of the AP1000 DCD and the incorporation by reference of that DCD revision by the applicant, the staff will consider this item closed for the VEGP COL FSAR. This is considered **Confirmatory Item 11.3-1**.*

Resolution of Standard Content Confirmatory Item 11.3-1

Confirmatory Item 11.3-1 is a commitment by the applicant to incorporate changes, by reference, proposed by Westinghouse to Section 11.3.3.4 of the AP1000 DCD to include the results of the postulated radioactive release resulting from a leakage or failure of a waste gas storage tank or offgas charcoal delay bed. The staff verified that the applicant has incorporated the AP1000 DCD Revision 18 that includes the above changes. As a result, Confirmatory Item 11.3-1 is now closed.

Demonstrating Compliance with 10 CFR 20.1301(e)

The staff discusses compliance with 10 CFR 20.1301(e) in Section 11.2.4 of this SER.

Demonstrating Compliance with 10 CFR 20.1302

The annual average concentration of radioactive material released in gaseous effluents at the boundary of the unrestricted area must not exceed the values specified in Table 2 of Appendix B to 10 CFR Part 20. The applicant demonstrated compliance with this requirement by referencing the AP1000 DCD. Section 11.3.3.5 of the DCD shows that, even at the TS limit for percent failed fuel defects, the site provides sufficient atmospheric dilution to ensure that the expected effluent release concentrations will be less than those specified in Table 2 of Appendix B to 10 CFR Part 20.

In NUREG-1793, the staff evaluated and accepted the conclusions of Section 11.3.3.5 of the DCD. Based on this acceptance, the staff concludes that the applicant complies with 10 CFR 20.1302.

Demonstrating Compliance with 10 CFR 20.1406

The staff discusses compliance with 10 CFR 20.1406 in Section 11.2.4 of this SER.

Demonstrating Compliance with 10 CFR Part 50 Appendix I

Pursuant to 10 CFR Part 50, Appendix I, Sections II.B, II.C, and II.D, the applicant is responsible for addressing the requirements for dose objectives in controlling doses to a hypothetical maximally exposed member of the public and populations living near the proposed nuclear power plant. The requirements define dose objectives for gaseous effluents and require a cost-benefit analysis in justifying installed processing and treatment equipment of the GWMS, including any augmentation to the design in complying with 10 CFR Part 50, Appendix I. The applicant demonstrated compliance with 10 CFR Part 50, Appendix I, Sections II.B, II.C, and II.D requirements, by performing the required cost-benefit analysis through PTN COL 11.3-1, and performed the required dose compliance through PTN COL 11.5-3. The staff independently confirmed the results of the cost-benefit analysis and compliance with the dose objectives and finds that the applicant is in compliance with 10 CFR Part 50, Appendix I, Sections II.B, II.C, and II.D.

11.3.5 Post-Combined License Activities

There are no post-COL activities related to this section.

11.3.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the NRC staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff evaluated the additional COL information (PTN COL 11.3-1, PTN COL 11.5-3, and STD SUP 11.3-1) in the application against the relevant NRC regulations, acceptance criteria defined in NUREG-0800, Section 11.3, and other NRC regulatory guides.

In other areas of the evaluation of the GWMS, the staff confirmed that the applicant provided sufficient information and that the review and calculations support the conclusion that the GWMS includes the equipment necessary to control releases of radioactive materials in gaseous effluents in accordance with GDC 3, 60, and 61 of Appendix A to 10 CFR Part 50 and the requirements of 10 CFR 50.34a. The staff finds that the applicant has met the requirements in GDC 3 by conforming to the guidance in BTP 11-5. The staff also concludes that the design of the GWMS meets the requirements of 10 CFR 20.1301(e), 10 CFR 20.1302, 10 CFR 20.1406, 10 CFR 50.34a, GDC 3, 60, and 61, and Appendix I to 10 CFR Part 50.

11.4 Solid Waste Management System

11.4.1 Introduction

The SWMS is designed to collect and accumulate spent ion exchange resins and deep-bed filtration media, spent filter cartridges, dry active wastes, and mixed wastes generated from normal plant operation, including AOOs. Processing and packaging of wastes are by mobile systems, and the packaged waste is stored in the auxiliary and radwaste buildings until it is shipped off site to a licensed disposal facility.

11.4.2 Summary of Application

Section 11.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 11.4 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point COL FSAR, Section 11.4, the applicant provided the following:

AP1000 COL Information Items

- STD COL 11.4-1

The applicant provided additional information in STD COL 11.4-1 to address COL Information Item 11.4-1 (COL Action Item 11.4-1). The additional information provides a process control program (PCP) for both wet and dry solid wastes.

Supplemental Information

- STD SUP 11.4-1

The applicant provided supplemental information in PTN COL FSAR Section 11.4.5 to address how the solid radwaste system complies with the guidance in RG 1.143. STD SUP 11.4-1 also addresses the processes to be followed to ship waste that complies with 10 CFR 61.55, "Waste classification," and 10 CFR 61.56, "Waste characteristics," in PTN COL FSAR, Section 11.4.6.1.

- PTN SUP 11.4-1

The applicant provided additional information in PTN SUP 11.4-1 to describe its disposition of packaged waste.

- PTN SUP 11.4-2

The applicant added in Turkey Point Units 6 and 7 COL FSAR, Section 11.4.5, supplemental information to address conformance of the QA program to RG 1.143.

License Condition

- Part 10, License Condition 3, Operational Program Implementation

PTN COL FSAR, Section 13.4, Table 13.4-201, "Operational Programs Required by NRC Regulations," identifies item 9, the process control program, as a program required by

regulations that must be implemented by a milestone (prior to initial fuel load) to be identified as a license condition.

- Part 10, License Condition 6, Operational Program Readiness

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs, including the PCP.

11.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in the FSER related to the DCD.

In addition, the regulatory basis for acceptance of the supplemental information on the SWMS is established in several codes and STDs. These include:

- 10 CFR Part 20, "Standards for Protection Against Radiation"
- 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities"
- 10 CFR 52.79, "Contents of applications; technical information in final safety analysis report"
- 10 CFR Part 71, "Packaging and Transportation of Radioactive Material"
- 49 CFR Part 173, "Shippers—General Requirements for Shipments and Packagings"
- State regulations and disposal site waste form requirements for burial at a low-level waste disposal site that is licensed in accordance with 10 CFR Part 61, "Licensing Requirements for Land Disposal of Radioactive Waste," or equivalent State regulations
- Table 1 and Regulatory Positions C.3.2 and C.3.3 of RG 1.143

The acceptance criteria associated with the SWMS are given in NUREG-0800, Section 11.4, including BTP 11-3.

11.4.4 Technical Evaluation

The staff reviewed Section 11.4 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the information in the COL represent the complete scope of information relating to this review topic.² The staff's review confirmed that the information contained in the application and incorporated by reference addresses the required information relating to the SWMS. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff's review of this application included the following COL information item and supplemental information:

- STD COL 11.4-1, Solid Waste Management System Process Control Program
- STD SUP 11.4-1, Quality Assurance

² Section 1.2.2 contains a discussion on the staff's review related to verification of the scope of information to be included within a COL application that references a DC.

- PTN SUP 11.4-1, Disposition of Packaged Waste
- PTN SUP 11.4-2, Supplemental Information on RG 1.143 Conformance

In addition to the above items, the staff reviewed the entire section against NUREG-0800, Section 11.4, to determine if the information in BLN COL FSAR Section 11.4 met the regulatory requirements in the regulations stated above (SER Section 11.4.3) and NUREG-0800 acceptance criteria. The relevant NUREG-0800 acceptance criteria are as follows:

- All effluent releases (gaseous and liquid) associated with the operation (normal and anticipated operational occurrences) of the SWMS will comply with 10 CFR Part 20 and RG 1.143, as they relate to the definition of the boundary of the SWMS beginning at the interface from plant systems, including multiunit stations, to the points of controlled liquid and gaseous effluent discharges to the environment or designated onsite storage locations, as defined in the PCP and ODCM.
- Operational Programs. For COL reviews, the description of the operational program and proposed implementation milestone for the PCP aspect of the Process and Effluent Monitoring and Sampling Program are reviewed in accordance with 10 CFR 20.1301, 10 CFR 20.1302, 10 CFR 50.34a, 10 CFR 50.36a, and 10 CFR Part 50, Appendix I, Sections II and IV. Its implementation is required by a license condition.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP, Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAs.
- The staff confirmed that all responses to RAs identified in the corresponding STD content evaluation were endorsed.
- The staff confirmed that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the STD content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This STD content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN, Units 3 and 4, COL application.

Although the staff concluded that the evaluation performed for the standard content is directly applicable to the Turkey Point Units 6 and 7 COL application, there is a difference in how the Turkey Point Units 6 and 7 applicant addressed STD COL 11.4-1 and how the VEGP applicant addressed this review item. This difference is evaluated by the staff below, following the STD content material for STD COL 11.4-1.

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the VEGP SER:

AP1000 COL Information Items

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the BLN SER:

- **STD COL 11.4-1**

The applicant provided additional information in STD COL 11.4-1 to resolve COL Information Item 11.4-1. COL Information Item 11.4-1 states:

The Combined License applicant will develop a process control program in compliance with 10 CFR Sections 61.55 and 61.56 for wet solid wastes and 10 CFR Part 71 and DOT regulations for both wet and dry solid wastes. Process control programs will also be provided by vendors providing mobile or portable processing or storage systems. It will be the plant operator's responsibility to assure that the vendors have appropriate process control programs for the scope of work being contracted at any particular time. The process control program will identify the operating procedures for storing or processing wet solid wastes. The mobile systems process control program will include a discussion of conformance to Regulatory Guide 1.143, Generic Letter GL-80-009, and Generic Letter GL-81-039 and, information of equipment containing wet solid wastes in the non-seismic Radwaste Building. In the event additional onsite storage facilities are a part of Combined License plans, this program will include a discussion of conformance to Generic Letter GL-81-038.

The commitment was also captured as COL Action Item 11.4-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will develop a process control program for both wet and dry solid wastes.

In BLN COL FSAR Section 11.4.6, the applicant addressed this COL information item. The applicant adopted NEI 07-10[A], "FSAR Template Guidance for Process Control Program (PCP) Description." The PCP describes the administrative and operational controls used for the solidification of liquid or wet solid waste and the dewatering of wet solid waste. It provides the necessary controls such that the final disposal waste product meets applicable federal regulations (10 CFR Parts 20, 50, 61, 71 and 49 CFR Part 173), state regulations, and disposal site waste form requirements for burial at a low level waste disposal site licensed in accordance with 10 CFR Part 61. Waste processing equipment and services may be provided by the plant or by

*third-party vendors. In a letter dated January 8, 2009, (ML082910077), the NRC accepted NEI 07-10[A], Revision 3. Specifically, the NRC staff indicated that for COL applications NEI 07-10[A], Revision 3, provides an acceptable template for assuring that the administrative and operational controls for waste processing, processing parameters, and surveillance requirements within the scope of the PCP will meet the requirements of 10 CFR 52.79. In a letter dated April 23, 2009 (ML091170073), the applicant proposed to revise BLN FSAR Section 11.4 to incorporate the approved NEI 07-10[A] Revision 3. Since the BLN COL FSAR Section 11.4 has not adopted the approved version of the NEI Template, this is **Confirmatory Item 11.4-1**. Each process used meets the applicable requirements of the PCP. BLN COL FSAR Table 13.4-201 provides milestones for PCP implementation and is acceptable.*

*In STD COL 11.4-1, the applicant states that “no additional onsite radwaste storage is required beyond that described in the DCD.” The applicant should explain why this statement is included or should remove it. In section 11.4 of NUREG-1793, the staff stated that if a need for onsite storage of low-level waste has been identified beyond that provided in AP1000 Standard Design because of unavailability of offsite storage, the applicant should submit the details of any proposed onsite storage facility to the NRC. The applicant needs to provide any arrangements for offsite storage for low-level waste or to submit plans for onsite storage. This is identified as **Open Item 11.4-1**.*

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the VEGP SER:

Resolution of Standard Content Confirmatory Item 11.4-1

To address Confirmatory Item 11.4-1 in the BLN SER with open items, the applicant updated VEGP FSAR Section 11.4.6 to indicate adoption of the NRC-approved version of NEI 07-10A. VEGP adoption of this template effectively resolves Confirmatory Item 11.4-1.

Resolution of Standard Content Open Item 11.4-1

To address Open Item 11.4-1 in the BLN SER with open items, the applicant updated VEGP FSAR Section 11.4 with information supporting the statement that no additional onsite radwaste storage was required beyond that described in the DCD. This additional information is in VEGP COL 11.4-1 and VEGP SUP 11.4-1 and is evaluated below.

Evaluation of Site-Specific Information for STD COL 11.4-1

Regarding the Resolution of STD Content Open Item 11.4-1, the staff does not consider the open item relevant to the Turkey Point Units 6 and 7 COL application because the applicant has available offsite disposal of all types of low-level radioactive waste through its membership in

the Atlantic Compact. Therefore, an update of the Turkey Point Units 6 and 7 COL FSAR is not necessary to resolve this item.

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the VEGP SER:

Supplemental Information

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the BLN SER:

- *STD SUP 11.4-1*

The applicant provided supplemental information in Section 11.4.5 of the PTN COL FSAR to describe the QA program applicable to design, construction, installation and testing provisions of the solid radwaste system. This QA program is established by procedures and complies with the guidance presented in RG 1.143.

In BLN FSAR Section 11.4.6, the applicant also added a description of procedures relating to waste shipments, waste stream processing, verifying waste as non-radioactive, periodic system maintenance, personnel training, and document revision, clearing with third party vendors. The staff reviewed the descriptions and found them to be comprehensive and acceptable.

The NRC staff reviewed the supplemental information provided in STD SUP 11.4-1 related to the QA program for the solid radwaste system included under Section 11.4.4 of the BLN COL FSAR and finds that this supplemental statement commits the applicant to the regulatory positions in RG 1.143 related to quality assurance.

In addition to the above, the applicant provided a site-specific response to LNP RAI 11.02-4. The Turkey Point Units 6 and 7 response to LNP RAI 11.02-4 also resolved questions asked in LNP RAI 11.02-5. The response was dated October 23, 2014, and was partially revised by a response received February 3, 2015. In the response, the applicant provided additional information in relation to COL Information Item 11.4-1 in order to ensure that the inventory of radioactive materials contained in all unpackaged waste held in the RWB is controlled in accordance with the RG 1.143, Revision 2, dose acceptance criteria. This response, along with the associated operational commitments and proposed license condition ensure that all unpackaged waste held in the RWB is controlled in accordance with the provisions of RG 1.143, Revision 2. A detailed discussion of these responses, including aspects related to SER Section 11.4, is provided in Section 11.2.4 of this SER. The FSAR changes proposed in the response are being tracked as **Confirmatory Item 11.4-1** pending the applicant's update of the FSAR.

Resolution of Turkey Point Confirmatory Item 11.4-1

Confirmatory Item 11.4-1 is an applicant commitment to revise its FSAR Sections 11.2.1.2.5.2, 11.4.6, and 13.5.2.2.5 regarding the solid waste management system process control program.

The staff verified that the Turkey Point Units 6 and 7 COL FSAR, Revision 8 was appropriately revised. As a result, Confirmatory Item 11.4-1 is now closed.

Additionally, the applicant provided the following supplemental information item:

- PTN SUP 11.4-1

The applicant provided supplemental information in Section 11.4.5 of the Turkey Point Units 6 and 7 COL FSAR to describe its planned contracting arrangement for disposal of low-level radioactive waste. This is related to STD COL 11.4-1 above and Open Item 11.4-1. The staff has issued RAI 7104, Question 11.04-1, requesting the applicant to provide additional information related to its long-term disposition of low-level radioactive waste. This discussion is provided in the section below, titled "Compliance with 10 CFR Part 50, Appendix I, Design Criteria."

- PTN SUP 11.4-2

The applicant provided additional information in PTN SUP 11.3-1, stating that the quality assurance program for design, construction, procurement, materials, welding, fabrication, inspection, and testing activities conforms to the quality control provisions of the codes and STDs recommended in Table 1 of RG 1.143.

The following portion of this technical evaluation section is reproduced from Section 11.4.4 of the VEGP SER:

License Conditions

- *Part 10, License Condition 3, Operational Program Implementation*

VEGP COL FSAR Section 11.4.6 describes the process control program. VEGP COL FSAR Table 13.4-201 provides the milestone (prior to initial fuel load) for implementation of the process control program and is acceptable as described in the staff's SER related to NEI 07-10.

- *Part 10, License Condition 6, Operational Program Readiness*

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs including the process control program. The proposed license condition is consistent with the policy established in SECY-05-0197 and is acceptable.

These above license conditions are captured in section 11.4.5 of this SER as License Conditions 11-2 and 11-3.

Compliance with 10 CFR Part 50, Appendix I, Design Criteria

The design of the SWMS described in the AP1000 DCD has no release points directly to the environment. Compliance with Appendix I ALARA criteria is strictly based on the releases from the LWMS and GWMS and not the SWMS.

The following portion of this technical evaluation is based on the staff's review of Turkey Point Units 6 and 7 COL FSAR Section 11.4 of the application:

Following a review of Turkey Point Units 6 and 7 FSAR, Revision 4, Section 11.4, the staff identified three issues. The first issue was with the development of a radioactive waste management program for 10 CFR 61.55 Class C wastes. The second issue involved plant-specific operational considerations associated that there is a commitment to comply with the guidance of RG 1.143 and AP1000 DCD in not exceeding the 10 CFR Part 71, Appendix A, A₂ quantities of radioactive materials contained in skid-mounted solid waste processing equipment when installed in the radwaste building to meet RW-IIc requirements (as discussed in detail in Section 11.2.4 of this SER). In the final issue staff requested a correction of inconsistent listing of references dealing with topics covered in COL FSAR Section 11.3. In RAI 7104, Question 11.04-1 and RAI 6920, Question 11.04.02, the applicant was requested to address and resolve the following technical aspects:

- (1) FPL, Turkey Point Units 6 and 7 FSAR, Revision 4, Section 11.4.2.4.3, and PTN SUP 11.4-2 present supplemental information on plans to develop additional storage capacity if warranted by operational needs. In describing the approach, PTN SUP 11.4-2 refers to AP1000 DCD FSAR, Section 11.4.2.4.2, on generation rates of radioactive wastes by referring to "paragraph ten" in that DCD subsection. However, a review of AP1000 DCD FSAR, Revision 19, Section 11.4.2.4.2, indicates that it only describes an option involving the potential use of a licensed central radwaste processing facility for waste processing and disposal, and does not present any data on waste generation rates. Moreover, this subsection consists of only one brief paragraph, without any subparagraphs. In RAI 7104, Question 11.04-1, dated August 7, 2013, the applicant was requested to review the supplemental information provided in PTN SUP 11.4-2 and change the DCD citation to the correct one. In a response dated September 9, 2013 to RAI 7104, Question 11.04-1, the applicant agreed to make the necessary revisions and provide supplemental information in developing contingency plans for the storage of low-level radioactive wastes in the event that access to offsite storage and disposal are not available. In COL Revision 7, FSAR Section 11.4.2.4.3, the applicant made the necessary corrections and added supplemental information on contingency plans for waste storage and disposal and identified the use of NRC guidance in developing such plans. The staff confirmed that the corresponding revisions were made to COL Revision 7, FSAR Section 11.4.2.4.3 and, therefore, closes out this item in RAI 7104, Question 11.04-1.
- (2) On a separate matter, the staff noted that, in Turkey Point Units 6 and 7 FSAR, Revision 4, Section 11.4.7, the citation of references 202, 203, and 204 are incorrectly located in this FSAR section. A review of Turkey Point Units 6 and 7 FSAR, Revision 4, Section 11.3 and Table 11.3-203, indicates that these three references support the dose assessment analysis used in demonstrating regulatory compliance with releases of gaseous effluents in unrestricted areas. In RAI 7112, Question 11.03-1, the applicant was requested to delete references 202, 203, and 204 in FSAR Section 11.4.7 (or explain why the references are included in that FSAR section), or relocate them to the reference section of FSAR Section 11.3. In a response dated September 9, 2013, the applicant agreed to make the corrections by deleting the extraneous references in COL FSAR Section 11.4.7. The staff confirmed that the corresponding revisions were made to COL Revision 7, FSAR Section 11.4.7, and, therefore, closes out this item in NRC 7112, Question 11.03-1.

11.4.5 Post-Combined License Activities

The staff proposes two license conditions. The first license condition, 11-1 relates to STD COL 11.4-1 in that a PCP will be developed and implemented. The second license condition, 11-2, captures the concepts related to STD COL 13.4-1. The intent is to highlight that the PCP, among other operational programs, is an operational program that will be inspected prior to fuel load. The license condition language in this section has been modified, per a letter from the applicant dated April 8, 2016 (ADAMS Accession No. ML16103A507), confirming the acceptability of the following license conditions, proposed by the staff. These changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

License Condition (11-2) – Before initial fuel load, the licensee shall implement an operational program for process and effluent monitoring and sampling. The program shall include the subprogram and documents for a Process Control Program.

License Condition (11-3) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors (NRO) a schedule that supports planning for and conduct of NRC inspections of the operational program for process and effluent monitoring and sampling (including process control program). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the operational program for process and effluent monitoring and sampling (including process control program) has been fully implemented.

11.4.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff evaluated the additional COL information (STD COL 11.4-1, STD SUP 11.4-1, and PTN SUP 11.4-1) in the application against the relevant NRC regulations, acceptance criteria in NUREG-0800, Section 11.4, and other NRC regulatory guides. The staff also confirmed that the PCP will be developed and implemented in accordance with the recommendations and guidance of NEI 07-10A.

The staff confirmed that the applicant has provided sufficient information and that the review supports the conclusion that follows. The staff concludes that the design and operation of the SWMS, which discharges radioactive releases through the LWMS and GWMS, is acceptable and meets the requirements of GDC 3, 60, and 61 of Appendix A of 10 CFR Part 50, 10 CFR 50.34a, 20.1301(e), 20.1406, and Appendix I to 10 CFR Part 50, and 10 CFR Parts 61 and 71.

11.5 Radiation Monitoring

11.5.1 Introduction

The radiation monitoring systems are used to monitor liquid and gaseous process streams and effluents from the LWMS, GWMS, and SWMS. The radiation monitoring system includes subsystems used to collect process and effluent samples during normal operation and AOOs and under post-accident conditions.

11.5.2 Summary of Application

Section 11.5 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 11.5 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 11.5, the applicant provided the following:

Departures

- PTN DEP 6.4-1

The applicant provided information in Section 11.5 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related PTN DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this report.

AP1000 COL Information Items

- STD COL 11.5-1

The applicant provided additional information in STD COL 11.5-1 to resolve COL Information Item 11.5-1 (COL Action Item 11.5-1). The information addresses the ODCM.

- STD COL 11.5-2

The applicant provided additional information in STD COL 11.5-2 to resolve COL Information Item 11.5-2 (COL Action Item 11.5-2). The information provides programmatic aspects of the effluent monitoring and sampling program.

- PTN COL 11.5-2

The applicant provided additional information in PTN COL 11.5-2 to add language to Turkey Point Units 6 and 7 COL FSAR Section 11.5.3 addressing extension of the existing Unit 1 program for QA of radioactive effluent and environmental monitoring to apply to Turkey Point Units 6 and 7.

- PTN COL 11.5-3

The applicant provided additional information in PTN COL 11.5-3 to resolve COL Information Item 11.5-3 (COL Action Item 11.5-3). The information relates to the 10 CFR Part 50, Appendix I guidelines.

License Condition

- Part 10, License Condition 3, Operational Program Implementation, Item G.3

Turkey Point Units 6 and 7 COL FSAR Section 13.4, Table 13.4-201, "Operational Programs Required by NRC Regulations," identifies three entries under item 9, "Process and Effluent Monitoring and Sampling Program," as follows: (1) Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls; (2) Offsite Dose Calculation Manual; and (3) Radiological Environmental Monitoring program, as programs identified in FSAR Section 11.5 required to be implemented by a milestone. In accordance with License Condition 3, item G.3, these programs are to be implemented prior to initial fuel load.

- Part 10, License Condition 6, Operational Program Readiness

The applicant proposed a license condition to provide a schedule to support the staff's inspection of operational programs including the Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls, the ODCM, and the REMP.

11.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in the FSER related to the DCD.

In addition, the regulatory basis for acceptance of the supplementary information on radiation monitoring addressed in COL Information Items 11.5-1, 11.5-2, and 11.5-3 is established in the requirements and guidelines of:

- 10 CFR Part 50, Appendix A, GDC 64, "Monitoring radioactivity releases"
- 10 CFR Part 20, "Standards for Protection against Radiation"
- 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities"
- 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants"
- 10 CFR Part 61, "Licensing Requirements for Land Disposal of Radioactive Waste"
- 10 CFR Part 71, "Packaging and Transportation of Radioactive Material"
- American National Standards Institute/Health Physics Society (ANSI/HPS) N13.1, "Sampling and Monitoring Releases of Airborne Radioactive Substances from the Stacks and Ducts of Nuclear Facilities"
- ANSI N42.18, "Specification and Performance of On-Site Instrumentation for Continuously Monitoring Radioactivity in Effluents"
- RG 1.21, Revision 2, "Measuring, Evaluating, and Reporting Radioactive Material in Liquid and Gaseous Effluents and Solid Waste"

- RG 4.15, Revision 2, “Quality Assurance for Radiological Monitoring Programs (Inception through Normal Operations to License Termination) – Effluent Streams and the Environment”

The applicable acceptance criteria associated with the radiation monitoring system are given in NUREG-0800, Section 11.5.

11.5.4 Technical Evaluation

The staff reviewed Section 11.5 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the information in the COL represent the complete scope of information relating to this review topic.³ The staff’s review confirmed that the information contained in the application and incorporated by reference addresses the required information relating to the radiation monitoring system. The results of the staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff reviewed the information contained in the Turkey Point Units 6 and 7 COL FSAR:

AP1000 COL Information Items

- STD COL 11.5-1, ODCM
- STD COL 11.5-2, Programmatic Aspects of the Effluent Monitoring and Sampling Program
- PTN COL 11.5-2 adds language to Turkey Point Units 6 and 7 COL FSAR Section 11.5.3 addressing extension of the existing Unit 1 program for quality assurance of radioactive effluent and environmental monitoring to apply to Turkey Point Units 6 and 7.
- PTN COL 11.5-3, 10 CFR Part 50, Appendix I Guidelines

In addition to the above items, the staff reviewed the entire section against NUREG-0800, Section 11.5, to determine if the information in Turkey Point Units 6 and 7 COL FSAR Section 11.5 met the regulatory requirements in the regulations stated above (SER Section 11.5.3) and NUREG-0800 acceptance criteria. The relevant NUREG-0800 acceptance criteria are as follows:

- Provisions should be made to ensure representative sampling from radioactive process streams and tank contents. Recirculation pumps for liquid waste tanks (collection or sample test tanks) should be capable of recirculating at a rate of not less than two tank volumes in 8 hours. For gaseous and liquid process stream samples, provisions should be made for purging sampling lines and for reducing the plate-out of radioactive materials in sample lines. Provisions for gaseous sampling from ducts and stacks should be consistent with ANSI/HPS N13.1-1999.
- For COL reviews, the description of the operational program and proposed implementation milestone for the radiological effluent technical specification (RETS)/SREC, ODCM, and Radiological Environmental Monitoring Program aspects of

³ Section 1.2.2 contains a discussion on the staff’s review related to verification of the scope of information to be included within a COL application that references a DC.

the Process and Effluent Monitoring and Sampling Program are reviewed in accordance with 10 CFR 20.1301, 10 CFR 20.1302, 10 CFR 50.34a, 10 CFR 50.36a, and 10 CFR Part 50, Appendix I, Sections II and IV. Its implementation is required by a license condition.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP, Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAls.
- The staff confirmed that all responses to RAls identified in the corresponding STD content evaluation were endorsed.
- The staff confirmed that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the STD content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This STD content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN, Units 3 and 4, COL application.

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the VEGP SER:

AP1000 COL Information Items

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the BLN SER:

- *STD COL 11.5-1*

The applicant provided additional information in STD COL 11.5-1 to resolve COL Information Item 11.5-1. COL Information Item 11.5-1 states:

The Combined License applicant will develop an offsite dose calculation manual that contains the methodology and parameters used for calculation of offsite doses resulting from gaseous and liquid effluents. The Combined License applicant will address operational setpoints for the radiation monitors and address programs for monitoring and controlling the release of radioactive material to the environment, which eliminates the potential for

unmonitored and uncontrolled release. The offsite dose calculation manual will include planned discharge flow rates.

This commitment was also captured as COL Action Item 11.5-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will develop an offsite dose calculation manual that contains the methodology and parameters used to calculate offsite doses resulting from gaseous and liquid effluents.

*In BLN COL FSAR Section 11.5.7, the applicant adopts NEI 07-09[A], "FSAR Template Guidance for Offsite Dose Calculation Manual (ODCM) Program Description." The ODCM program description contains: (1) the methodology and parameters used for calculating doses resulting from liquid and gaseous effluents; (2) operational setpoints, including planned discharge rates, for radiation monitors and monitoring programs; and (3) the limitations on operation of the radwaste systems, including functional capability of monitoring instruments, concentrations of effluents, sampling, analysis, 10 CFR Part 50, Appendix I dose and dose commitments and reporting. In a letter dated January 27, 2009 (ML083530745), the NRC accepted NEI 07-09[A], Revision 4. Specifically, the NRC indicated that for COL applications, NEI 07-09[A], Revision 4 provides an acceptable template assuring that the ODCM program meets applicable NRC regulations and guidance. In a letter dated April 23, 2009 (ML091170073), the applicant proposed to revise BLN COL FSAR Section 11.5 to incorporate the approved NEI 07-09[A], Revision 4. Since the BLN COL FSAR Section 11.5 has not adopted the approved version of the NEI Template, this is **Confirmatory Item 11.5-1**. BLN COL FSAR Table 13.4-201 provides milestones for ODCM implementation. This section also addresses Plant Interface Item 11.4, "requirements for offsite sampling and monitoring of effluent concentrations." The staff finds the applicant's consideration of Plant Interface Item 11.4 to be acceptable based on a review of the ODCM program (NEI 07-09[A]). The NRC staff reviewed the resolution of STD COL 11.5-1 related to the ODCM included under Section 11.5.7 of the BLN COL FSAR and considers it adequately addressed in NEI 07-09[A].*

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the VEGP SER:

Resolution of Standard Content Confirmatory Item 11.5-1

To address Confirmatory Item 11.5-1, the applicant updated the VEGP FSAR Section 11.5.7 to indicate adoption of the NRC-approved version of NEI 07-09A. VEGP adoption of this template effectively resolves Confirmatory Item 11.5-1.

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the BLN SER:

- **STD COL 11.5-2**

The applicant provided additional information in STD COL 11.5-2 to resolve COL Information Item 11.5-2 (COL Action Item 11.5-2). COL Information Item 11.5-2 states:

The Combined License applicant is responsible for the site-specific and program aspects of the process and effluent monitoring and sampling in accordance with ANSI N13.1 and RGs 1.21 and 4.15.

The commitment was also captured as COL Action Item 11.5-2 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant is responsible for ensuring that the process and effluent monitoring and sampling program at its site conforms to the guidelines of ANSI N13.1-1969, RG 1.21, and RG 4.15.

In BLN COL FSAR Sections 11.5.1.2, 11.5.2.4, 11.5.4, 11.5.4.1, 11.5.4.2 and 11.5.6.5, the applicant described the programmatic aspects of the effluent monitoring and sampling program. In addition, the applicant provided in BLN COL 11.5-2 specific language regarding the applicant's extension of the existing TVA program for quality assurance of radiological effluent and environmental monitoring which is based on RG 4.15, Revision 1, instead of the most current Revision 2. To maintain consistency, the applicant proposes to apply the same program to BLN Units 3 and 4.

The NRC staff reviewed the resolution of BLN COL 11.5-2 related to the effluent monitoring and sampling program included under Sections 11.5.1.2, 11.5.2.4, 11.5.3, 11.5.4, 11.5.4.1, 11.5.4.2 and 11.5.6.5 of the BLN COL FSAR and considers it adequately addressed in NEI 07-09.

In STD COL 11.5-2, the applicant adopted RG 4.15, Revision 2, instead of the Revision 1, which was adopted by BLN. The staff concludes that Revision 2 is acceptable because it is the more current version.

- **PTN COL 11.5-2**

In PTN COL 11.5-2, the applicant extended the existing NRC-approved Progress Energy QA program, including RG 4.15, Revision 1, for effluent and environmental monitoring to Turkey Point Units 6 and 7. The staff finds this acceptable because the current program is a proven methodology. By using the current program, the applicant will also avoid confusion and the potential for error because the program for the existing and planned units will share the same equipment and personnel.

- PTN COL 11.5-3

The applicant provided additional information in PTN COL 11.5-3 to resolve COL Information Item 11.5-3. COL Information Item 11.5-3 states:

The Combined License applicant is responsible for addressing the 10 CFR 50, Appendix I guidelines for maximally exposed offsite individual doses and population doses via liquid and gaseous effluents.

The commitment was also captured as COL Action Item 11.5-3 in Appendix F of the staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant is responsible for addressing the guidelines of Appendix I to 10 CFR Part 50, as they relate to maximally exposed offsite individual doses and population doses attributable to liquid and gaseous effluents.

The applicant addressed this COL item by adding information to Turkey Point Units 6 and 7 COL FSAR Sections 11.2.3.5 and 11.3.3.4 for liquid and gaseous effluents, respectively.

The staff reviewed the resolution of PTN COL 11.5-3 related to compliance with 10 CFR Part 50, Appendix I, as discussed in SER Sections 11.2.4 and 11.3.4, and considers that the applicant adequately addressed applicable regulatory requirements based on the evaluations provided in SER sections 11.2.4 and 11.3.4 to calculate and verify estimated annual releases.

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the VEGP SER:

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the BLN SER:

Section 11.5.4.2, Representative Sampling

In this section, the applicant describes how it will take representative samples for analysis. Based on the staff's review, the staff issued RAIs 11.5-1 and 11.5-2. RAI 11.5-1 requested clarification about the use of ANSI/HPS N13.1-1999. RAI 11.5-2 requested more information concerning how the applicant ensures representative liquid effluent and environmental sampling.

In response to RAI 11.5-1, the applicant revised its commitment to use the 1999 standard. Because the applicant made no changes to the certified design, it removed the commitment to use ANSI/HPS N13.1-1999, and committed to ANSI N13.1-1969 to be consistent with the AP1000 certified design. ANSI withdrew the 1969 standard and replaced it with ANSI/HPS N13.1-1999 because the approach taken in the 1969 standard did not provide assurance that the sample in the effluent vent would be representative. The 1999 standard differs significantly from the earlier version in that it is now performance based. NUREG-0800 Section 11.5 (2007) uses the 1999 standard as acceptance criteria. The staff is pursuing this issue through the DC

because it deals with the design of the sampling systems for radioactive gas streams.

The applicant provided a response to RAI 11.5-2 and the staff finds the response acceptable. The response provided a more detailed description of how the applicant will assure that liquid samples will be representative. The applicant committed to follow the recommendations in ANSI N42.18 and RG 1.21. In addition, the applicant provided more operational descriptions for composite sampling. The NRC staff verified that Revision 1 of the BLN COL FSAR adequately addressed the above. As a result, RAI 11.5-2 is closed.

The following portion of this technical evaluation section is reproduced from Section 11.5.4 of the VEGP SER:

License Condition

- *Part 10, License Condition 3, Operational Program Implementation, Item G.3*

VEGP FSAR Section 11.5.3 describes effluent monitoring and sampling and Section 11.5.7 describes the offsite dose calculation manual. License Condition 3, Item G.3 requires the licensee to implement the "Process and Effluent Monitoring and Sampling" program prior to initial fuel load. VEGP COL FSAR Section 13.4, Table 13.4-201, "Operational Programs Required by NRC Regulations," identifies three entries under Item 9, "Process and Effluent Monitoring and Sampling Program," as follows: (1) Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls, (2) Offsite Dose Calculation Manual; and (3) Radiological Environmental Monitoring program, as programs identified in FSAR Section 11.5 required to be implemented by a milestone. The ODCM includes the Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls and the Radiological Environmental Monitoring program. In accordance with License Condition 3, Item G.3, these programs are to be implemented prior to initial fuel load. VEGP COL FSAR Table 13.4-201 provides the milestones (prior to initial fuel load) for implementation of these elements of the Process and Effluent Monitoring and Sampling Program and is acceptable as described in the staff's SER related to NEI 07-09[A].

- *Part 10, License Condition 6, Operational Program Readiness*

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs, including the ODCM, effluent technical specifications, and the radiological environmental monitoring program. The proposed license condition is consistent with the policy established in SECY-05-0197 and is acceptable.

The following portion of this technical evaluation is based on the staff's review of FPL COL FSAR Section 11.5 of the Turkey Point Units 6 and 7 application:

Following a review of FPL, Turkey Point Units 6 and 7 FSAR, Revision 4, Section 11.5, the staff identified four issues with the development of a plant- and site-specific ODCM and associated regulatory compliance using NRC and industry technical guidance. In RAIs 6919, Question 11.05-1 and 7103, Question 11.05-2, the applicant was requested to address and resolve the following technical aspects:

- (1) FSAR, Revision 3, Section 11.5.8, endorses the use of Nuclear Energy Institute (NEI) ODCM Template 07-09A (Revision 0, March 2009) to meet COL Information Item 11.5-1 until a plant- and site-specific ODCM is prepared, before fuel load, under the requirements of a license condition described in FSAR Section 13.4, Table 13.4-201, item 9. The development of the site-specific ODCM and implementing procedures should meet the provisions of GL 89-01 (Supplement No. 1), Radiological Assessment Branch Technical Position (Revision 1, November 1979) included as Appendix A in NUREG-1301, as ODCM guidance for pressurized-water reactors (PWRs), and the guidance of NUREG-0133, "Preparation of Radiological Effluent Technical Specifications for Nuclear Power Plants," October 1978, and NUREG-0543, "Methods for Demonstrating LWR Compliance with the EPA Uranium Fuel Cycle Standard (40 CFR Part 190)." However, FSAR, Revision 3, Section 11.5.8, does not address unique site-specific conditions that are not covered in the NEI ODCM Template 07-09A. The FSAR does not consider how the ODCM will control gaseous effluent releases and doses to members of the public given that Units 3 and 4 and Turkey Point Units 6 and 7 will be contributing to and sharing a single dose allocation to members of the public under 10 CFR 20.1301 and 20.1302, 10 CFR 20.1301(e) in complying with 40 CFR Part 190, and the unity rule in meeting liquid and gaseous effluent concentration limits of 10 CFR Part 20 (Appendix B, Table 2, Columns 1 and 2). NUREG-0543 addresses compliance issues for sites with multiple reactor units when considering all sources of radiation exposures, including doses due to liquid and gaseous effluent releases and contributions from external radiation from buildings and staging areas containing radioactive materials and wastes. Accordingly, the applicant is requested to describe in FSAR, Section 11.5.8, the administrative program and procedures that will be used to coordinate all liquid and gaseous effluent releases and dose allocations to members of the public between Units 3 and 4 and Turkey Point Units 6 and 7 in complying with NRC regulations, as noted above.
- (2) FPL, Turkey Point Units 6 and 7 FSAR, Revision 4, Sections 11.5.3 and 11.5.4, present supplemental information on effluent and process monitoring and sampling. Based on a review of the corresponding information presented in the AP1000 DCD Section 11.5.2 and Table 11.5-1 and parallel discussions presented in the Turkey Point Units 6 and 7 ER, Revision 4, Section 3.6.3.2, the staff notes that the ER commits to the use of a radiation monitor installed on the common discharge line of the turbine building sumps. This monitor performs an automatic control function by tripping the discharge pump upon detecting elevated levels of radioactivity in the common discharge line. The description also states that, if necessary, contaminated wastewater from the turbine building sumps will be diverted to the WLS for processing and disposal. The applicant is requested to introduce this information in FSAR, Sections 11.2 and 11.5, since the radiation monitor and its operating features are not described there. The applicant should describe the design features of the turbine building sumps and connections to a common discharge line, provide the basis for the placement and type of radiation monitor installed on the common discharge line of the sumps, describe the associated automatic control features and alarm functions, and describe how discharges will be diverted (manual or automatic

method) to the liquid radwaste processing system upon tripping an alarm setpoint. In addressing associated regulatory requirements and guidance, the applicant is requested to integrate this potential radioactive discharge path in the Turkey Point Units 6 and 7 Offsite Dose Calculation Manual in demonstrating compliance with 10 CFR Part 20 liquid effluent concentration and dose limits for members of the public, 10 CFR 20.1406 in minimizing the contamination of plant facilities and the environment, Part 50, Appendix I, on design objectives and ALARA provisions; and describe equipment features and operational commitments that are consistent with the guidance of NUREG-0800, SRP Sections 11.2 and 11.5, RGs 1.206, 1.143, and 4.21, IE Bulletin 80-10, and NEI 08-08A in avoiding unmonitored and uncontrolled releases of radioactive materials in unrestricted areas.

- (3) FPL, Turkey Point Units 6 and 7, FSAR, Revision 4, Section 11.5.8, endorses the use of NEI ODCM Template 07-09A (Revision 0, March 2009) to meet COL Information Item 11.5-1 until a plant- and site-specific ODCM is prepared, before fuel load, under the requirements of a license condition described in FSAR Section 13.4, Table 13.4-201, item 9. However, a comparison of FSAR, Revision 4, Section 11.5.8, and Turkey Point Units 6 and 7 ER, Revision 4, Sections 3.3, 6.2.2, and 6.7.4, indicates that a simple endorsement of NEI ODCM Template 07-09A and Units 3 and 4 ODCM does not address the unique site-specific conditions associated with deep well injection for the disposal of radioactive effluents and associated radiological environmental monitoring. The applicant is requested to introduce this information in FSAR, Sections 11.2 and 11.5, since it is not contained there. The applicant should identify which portions of NEI ODCM Template 07-09A will need to be modified, describe the new information addressing deep well injection, describe methods that will be used in controlling and monitoring discharges of liquid effluents via deep well injection, and describe how water samples will be collected and sampled from each dual zone monitoring well, including well development and purging, containment and processing of purged well water, and sample processing including sample collection, sample preservation, and quality control.
- (4) FPL, Turkey Point Units 6 and 7 ER, Revision 4, Section 3.3.1 and Figure 3.3-1 (sheet 1), describe how Miami-Dade Water and Sewer Department (MDWASD) reclaimed water will be further treated on site by the FPL reclaimed water treatment facility prior to being pumped into the circulating water system. The treatment process is described as including trickling filters, clarifiers, deep bed filters, and equipment to handle solid wastes generated by the onsite treatment system. A review of Turkey Point Units 6 and 7 ER, Revision 4, Figure 3.3-1 (sheet 1), indicates that some end products of the processing may be bypassed to the plant blowdown sump as warranted by operational conditions. Solid waste would be disposed using current operating practices, such as recycling and landfill disposal, as described in Turkey Point Units 6 and 7 ER, Revision 4, Section 3.6.3.3. The staff notes that the corresponding information presented in the Turkey Point Units 6 and 7 ER, Revision 4, Section 3.6.3, and FSAR, Section 11.5, does not acknowledge that the use of an onsite treatment for MDWASD reclaimed water might result in the reconcentration of naturally occurring radioactivity and other forms of radioactivity, which should not be attributed to plant operations. In addition, the potential presence of such radioactive materials in sludge and solids generated by the FPL reclaimed water treatment facility might pose operational and disposal challenges, given an estimated daily generation rate of over 400 t of solids per day under normal operations (ER, Revision 4, Section 3.6.3.3). Moreover, the bypass of liquid wastes from the onsite treatment facility to the plant blowdown sump may introduce radioactivity (if present in MDWASD reclaimed water) which would then need to be accounted for in demonstrating compliance with Part 20

and Part 50, Appendix I, requirements once discharged via deep well injections. As a result, the applicant is requested to expand its radiological monitoring program, at least initially, to routinely collect and analyze samples from reclaimed waste water obtained from the MDWASD, reclaimed waste water treated by the FPL reclaimed water treatment facility, and solid wastes and sludge generated by the FPL reclaimed water treatment facility. The applicant is requested to expand the scope of its site waste management program to include provisions and procedures to handle, store, contain, and ship for disposal solid wastes and sludge should radioactive materials be detected with radiological characteristics not associated with the operations of Turkey Point Units 6 and 7. The procedure should describe steps that, if radioactive materials of other origins are detected in MDWASD reclaimed water, will cause the bypass from the onsite reclaimed water treatment system to be locked out (manually or automatically) to prevent the inadvertent introduction of radioactive materials in the plant blowdown sump. If such measures cannot be readily implemented, the applicant is requested to augment the scope of the radiological monitoring and sampling program to include waste treatment products and treated water from the onsite reclaimed water treatment facility and commit to revise the site- and plant-specific ODCM accordingly.

In letters dated January 16, 2013, and July 31, 2013, the applicant provided responses to RAI 6918, Question 11.05-1 and RAI 7103, Question 11.05-2. In the responses, the applicant proposed the following changes and corrections to the information presented in the noted FSAR sections. The staff's evaluation and determination of acceptability of the responses are presented below.

In response to RAI 6918, Question 11.05-1, the applicant described the administrative controls to be implemented by the licenses of Turkey Point Units 6 and 7 and Turkey Point Units 3 and 4 by coordinating the direct radiation contributions and liquid and gaseous effluent releases so that the site dose limits for 10 CFR Part 20 and 40 CFR Part 190 are not exceeded. The administrative controls and coordination process will be described in the ODCM. To support this description, the applicant provided text to be inserted in Section 11.5.8 describing administrative controls that will coordinate direct doses, liquid effluent, and gaseous effluent that will be released from the site. The staff has reviewed the response to RAI 6918, Question 11.05-1 and the staff finds that the applicant provided sufficient information because the licensee commits to controlling effluent releases in accordance with acceptable methods. The staff has confirmed the additional text has been incorporated in Revision 6 of Turkey Point Units 6 and 7 COL Application and the staff considers RAI 6918, Question 11.05-1 resolved.

In response to RAI 7103, Question 11.05-2, the applicant provided clarification on the above-stated RAI. To address the concern of the stated radiation monitor being referenced in ER Section 3.6.3.2 and not in FSAR Section 11, the applicant stated that the stated monitor in the ER is the same monitor as the waste water discharge radiation monitor mentioned in Section 11.5.2.3.3 of the AP1000 DCD. The DCD information has been incorporated by reference in the Turkey Point Units 6 and 7 FSAR Section 11.5 as a result. The applicant also stated that DCD Section 9.2.9.2, supplemented by FSAR Section 9.2.9.2.2, describes the oil-water separator for discharge flowpaths. This information is again supplemented in Section 9.2.12 for the DIS.

In response to the concern that the NEI ODCM template was not developed to specifically accommodate radioactive discharges to the subsurface environment, the applicant provided a discussion to explain the use of maintaining effluent controls that can be adopted directly into Turkey Point Units 6 and 7 ODCM. The ODCM, which will be made available for the staff's

review prior to fuel load, will reflect the operations of the DIS operations fate-transport-dosimetry model for normal operations and AOOs. The analysis for dose modeling is assessed in RAI 6985, Question 11.02-6 in Section 11.2 of this SER.

In response to the question by the staff to address the presence of and reconcentration of radioactive materials from the MDWASD, the staff also requested that the applicant address the potential presence of such radioactive materials in sludge and solids generated by the FPL reclaimed water treatment facility. The applicant stated that, if present, a fraction of this radioactive material will be adsorbed in the radioactive waste treatment facility (RWTF) treatment sludge and another fraction will remain in the treated RWTF effluent provided as circulation water supply to Turkey Point Units 6 and 7. The RWTF effluent fraction will ultimately be comingled with Turkey Point Units 6 and 7 blowdown and be disposed during DIS operations. The RWTF sludge fraction will be characterized as required to demonstrate compliance with the waste acceptance criteria established by commercial disposal facilities. The applicant also stated that effluent end products that may be bypassed to the plant blowdown sump will be characterized to enable their differentiation from radioactive materials that are attributed from Turkey Point Units 6 and 7 operations.

The staff reviewed the response to RAI 7103, Question, 11.05-2, and finds the response acceptable because the applicant has provided a sufficient description of the aspects that differ from NEI ODCM template, and the applicant highlights that the ODCM will be available for staff review prior to fuel load. License condition (11-5) also captures the fact that staff will have the opportunity to inspect the ODCM, among other documents, prior to fuel load. The staff has confirmed that the applicant has incorporated these revisions in Revision 6, and the staff considers RAI 7103, Question 11.5-02 resolved.

11.5.5 Post-Combined License Activities

The license condition language in this section has been modified, per a letter from the applicant dated April 8, 2016 (ADAMS Accession No. ML16103A507), confirming the acceptability of the following license conditions, proposed by the staff. These changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

License Condition (11-4) – Prior to initial fuel load, the licensee shall implement an operational program for process and effluent monitoring and sampling. The program shall include the following subprograms and documents:

- a. Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls
- b. Offsite Dose Calculation Manual
- c. Radiological Environmental Monitoring Program

License Condition (11-5) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of NRO a schedule that supports planning for and conduct of NRC inspections of the operational program for process and effluent monitoring and sampling (including Radiological Effluent Technical Specifications/Standard Radiological Effluent Controls, Offsite Dose Calculation Manual, and Radiological Environmental Monitoring Program). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until the above operational program has been fully implemented.

11.5.6 Conclusion

The NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the required information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff evaluated the additional COL information (STD COL 11.5-1, STD COL 11.5-2, PTN COL 11.5-2, and PTN COL 11.5-3) in the application against the relevant NRC regulations, acceptance criteria defined in NUREG-0800, Section 11.5, and other NRC regulatory guides. The staff concludes that the applicant has satisfactorily addressed all RAIs related to Section 11.5.

PTN DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this report.

The staff confirmed that the applicant has provided sufficient information and that the review supports the conclusion that follows: The staff concludes that the Process and Effluent Radiological Monitoring and Sampling Systems is sufficient to comply with applicable portions of GDC 64 of Appendix A of 10 CFR Part 50; applicable requirements of 10 CFR Parts 20, 50, and 52; ANSI/HPS N13.1, ANSI N42.18, RGs 1.21 and 4.15, NEI ODCM Template 07-09A, and applicable acceptance criteria in NUREG-0800, Section 11.5.

12 RADIATION PROTECTION

This chapter provides information on radiation protection methods and estimated occupational radiation exposures (OREs) of operating and construction personnel during normal operations including refueling; purging; fuel handling and storage; radioactive material handling, processing, use, storage, and disposal; maintenance; routine operational surveillance; inservice inspection (ISI); and calibration, and anticipated operational occurrences (AOOs). Specifically, this chapter provides information on facility and equipment design, planning and procedures programs, and techniques and practices employed by the applicant to meet the radiation protection standards set forth in Title 10 of the Code of *Federal Regulations* (10 CFR) Part 20, and to be consistent with the guidance given in the appropriate regulatory guides (RGs), where the practices set forth in such guides are used to and in the implementation the U.S. Nuclear Regulatory Commission (NRC)'s regulations.

12.1 Assuring That Occupational Radiation Exposures are As-Low-As-Reasonably Achievable (Related to RG 1.206, Section C.III.1, Chapter 12, C.I.12.1, "Ensuring that Occupational Radiation Exposures are As Low As Is Reasonably Achievable")

12.1.1 Introduction

Section 12.1 addresses policy and design considerations to ensure that the ORE to personnel will be kept As Low As Is Reasonably Achievable (ALARA). The ALARA program is addressed in this section and in Appendix 12AA of the Turkey Point Units 6 and 7 combined license (COL) Final Safety Analysis Report (FSAR).

12.1.2 Summary of Application

Section 12.1 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 12.1 of the AP1000 Design Control Document (DCD), Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 12.1, the applicant provided the following:

AP1000 COL Information Items

- STD COL 12.1-1

The applicant provided additional information in Standard (STD) COL 12.1-1 to resolve COL Information Item 12.1-1 (COL Action Item 12.2.1-1), which addresses ALARA and operational policies and compliance with RGs. The applicant provided additional information to incorporate Nuclear Energy Institute (NEI) NEI 07-08A, "Generic FSAR Template Guidance for Ensuring That Occupational Radiation Exposures Are As Low As Is Reasonably Achievable (ALARA)," into Turkey Point Units 6 and 7 COL FSAR Section 12.1 and NEI 07-03A, "Generic FSAR Template Guidance for Radiation Protection Program Description," in Appendix 12AA.

The applicant also provided site specific information in their FSAR that was not included in NEI 07-08A, Section 12.1.2, to specify that the applicant's quality assurance criteria are described in Part III of the Quality Assurance Program Description which is discussed in Turkey Point Units 6 and 7 COL FSAR Section 17.5.

Supplemental Information

- STD SUP 12.1-1

The applicant provided supplemental (SUP) information by addressing equipment layout at the end of AP1000 DCD Section 12.1.2.4.2.

12.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report [FSER] Related to Certification of the AP1000 Standard Design," and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the ALARA program are given in NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants (LWR Edition)," Section 12.1.

The applicable regulatory requirements and guidance for STD COL 12.1-1 and STD SUP 12.1-1 are as follows:

- 10 CFR Part 20, "Standards for Protection against Radiation"
- 10 CFR 19.12, "Instructions to workers"
- RG 1.8, "Qualification and Training of Personnel for Nuclear Power Plants," Revision 3
- RG 1.33, "Quality Assurance Program Requirements (Operation)," Revision 2
- RG 1.97, "Criteria for Accident Monitoring Instrumentation for Nuclear Power Plants," Revision 4
- RG 8.8, "Information Relevant to Ensuring that Occupational Radiation Exposures at Nuclear Power Stations Will Be As Low As Is Reasonably Achievable," Revision 3
- RG 8.10, "Operating Philosophy for Maintaining Occupational Radiation Exposures As Low As Is Reasonably A achievable," Revision 1-R
- NUREG-1736, "Consolidated Guidance: 10 CFR Part 20 – Standards for Protection Against Radiation"

12.1.4 Technical Evaluation

The NRC staff (the staff) reviewed Section 12.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COL

application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information contained in the application and incorporated by reference addresses the required information relating to ensuring that the ORE to personnel will be kept ALARA. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this safety evaluation report (SER) provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the design certification (DC) and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application Vogtle Electric Generating Plant (VEGP) Units 3 and 4 were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from requests for additional information (RAIs).
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the Bellefonte Nuclear Plant (BLN), Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.1.4:

¹ See Section 1.2.2 of this SER for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC). This footnote will be referenced in several places throughout the chapter of this Safety Evaluation.

The following portion of this technical evaluation section is reproduced from Section 12.1.4 of the BLN SER

AP1000 COL Information Items

- *STD COL 12.1-1*

The applicant provided additional information in STD COL 12.1-1, related to ALARA and Operational Policies, to resolve COL Information Item 12.1-1. COL Information Item 12.1-1 states:

Operational considerations of ALARA, as well as operational policies and continued compliance with 10 CFR 20 and RGs 1.8, 8.8, and 8.10, will be addressed by the Combined Operating License applicant. In addition, the Combined Operating License applicant will address operational considerations of the Standard Review Plan to the level of detail provided in RG 1.70. RGs that will be addressed include: 8.2, 8.7, 8.9, 8.13, 8.15, 8.20, 8.25, 8.26, 8.27, 8.28, 8.29, 8.34, 8.35, 8.36, and 8.38.

The commitment was also captured as COL Action Item 12.2.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will review all plant procedures and modification plans that involve personnel radiation exposure to ensure that the ALARA policy is applied. In addition, a COL applicant referencing the AP1000 certified design will address operational ALARA concerns and will submit an operational ALARA policy which conforms to the requirements of 10 CFR Part 20 and the recommendations of Revision 2 to RG 1.8, RG 8.8, and Revision 1-R to RG 8.10

In response to COL Action Item 12.2.1-1 the following is stated in the BLN COL FSAR (Revision 1) as STD COL 12.1-1:

This section incorporates by reference [Nuclear Energy Institute] NEI 07-08, "Generic FSAR Template Guidance for Ensuring That Occupational Radiation Exposures Are As Low As Is Reasonably Achievable (ALARA)," Revision 2, which is currently under review by the NRC staff. See Table 1.6-201. ALARA practices are developed in a phased milestone approach as part of the procedures necessary to support the Radiation Protection Program. Table 13.4-201 describes the major milestones for ALARA procedures development and implementation

STD COL 12.1-1 includes a commitment to the use of a "Generic FSAR Template Guidance for Ensuring That Occupational Radiation Exposures Are as Low as Is Reasonably Achievable (ALARA)," as an operational program document, based on draft NEI Template 07-08, Revision 2. The NEI template

*presents the functional elements of an ALARA program, which, if met, would demonstrate compliance with 10 CFR 20.1101 and 10 CFR 19.12. Accordingly, BLN FSAR Section 12.1, STD COL 12.1-1 needs to be updated as to its commitment to the final NEI ALARA template if it is accepted by the NRC staff. Therefore, the staff cannot find the applicant's reference to the NEI 07-08 template to be acceptable until the staff completes its review of this template as a method to meet the regulatory requirements of an ALARA program, and the BLN FSAR is updated to reference the final version of this template. This is identified as **Open Item 12.1-1***

The NRC staff review finds that BLN FSAR Section 12.1 and Appendix 12AA describe programs and procedures that ensure ORE will be ALARA in accordance with the training requirements in 10 CFR 19.12 and the ALARA provisions of 10 CFR 20.1101(b). The ALARA policy will be described, displayed, and implemented in accordance with the provisions of RG 8.8 (Regulatory Position C.1) and RG 8.10 (Regulatory Position C.1) and NUREG-1736, as it relates to maintaining doses ALARA.

According to BLN FSAR Appendix 12AA, NEI 07-03, NEI 07-08, and Chapter 13, "Conduct of Operations," specific individual(s) will be designated and assigned responsibility and authority for implementing ALARA policy at the BLN site. The Functional Manager in charge of Radiation Protection and the Radiation Protection staff periodically will review, update, and modify as appropriate, plant design features and changes, as well as all operating and maintenance features, using exposure data and experience gained from operating nuclear power plants to ensure that occupational exposures will be kept ALARA in accordance with RG 8.8 guidance.

Using the guidance of Section 12.1 of NUREG-0800, the staff finds BLN FSAR Section 12.1 and Appendix 12AA are in accordance with the ALARA provisions of 10 CFR 20.1101(b) and RG 8.8 (Regulatory Position C.2) and will include incorporation of measures for reducing the need for time spent in radiological areas; measures to control access to radiological areas; measures to reduce the production, distribution, and retention of activated corrosion products throughout the primary system; measures for assuring that ORE during decommissioning will be ALARA; reviews of design modifications by competent radiation protection personnel; instructions to engineers regarding ALARA design; experience from operating plants and past designs; and continuing facility design reviews.

Using the guidance of Section 12.1 of NUREG-0800, the staff finds that BLN COL FSAR Section 12.1 and Appendix 12AA describe an acceptable program to develop plans and procedures in accordance with RGs 1.33, 1.8, 8.8, and 8.10 that can incorporate the experiences obtained from facility operation into facility and equipment design and operations planning and that will implement specific exposure control techniques.

Initially, it was not clear to the NRC staff when the appropriate ALARA program and planning procedures would be implemented as described in the proposed License Conditions (Part 10 of the BLN, Units 3 and 4 COL application).

Therefore, the staff issued request for additional information (RAI) 12.1-1. In a letter dated September 22, 2008, the applicant stated that ALARA focused procedures are developed in conjunction with the Radiation Protection Program (RPP) and thus will follow the RPP milestones for implementation found in FSAR Table 13.4-201. The applicant stated that FSAR Section 12.1, STD COL 12.1-1 text will be updated as to its commitment to the final ALARA program implementation. The NRC staff finds the RAI response acceptable because it clearly identified that ALARA practices will be in place at the same time as the RPP. The NRC staff verified that Revision 1 of the BLN COL FSAR adequately incorporates the above. As a result, RAI 12.1-1 is closed. For a discussion related to the proposed license condition related to the RPP, which includes ALARA practices, refer to SER Section 12.5.5.

In accordance with 10 CFR 20.1101(b), the staff finds that overall facility operations, as well as the RPP as described in BLN COL FSAR Section 12.5, Appendix 12AA, and NEI 07-03 will integrate the procedures necessary to ensure that radiation doses are ALARA, including work scheduling, work planning, design modifications, and radiological considerations. Operating and maintenance personnel will follow specific plans and procedures to ensure that goals related to keeping exposures ALARA are achieved in the operation of the plant. Engineering controls for the protection of personnel will be optimized. Operations involving high person-sievert (person-rem) exposures will be carefully preplanned and carried out by personnel who are well trained in radiation protection and using proper equipment. During maintenance activities, in radiological areas, personnel will be monitored for exposure to radiation and contamination. Their radiation exposures will be reviewed and used to make changes in future job procedures and techniques.

The BLN FSAR states that COL information item, STD COL 12.1-1 is addressed in NEI 07-08, and Appendix 12AA of the BLN COL FSAR, which references NEI 07-03. The staff has reviewed the current version of NEI 07-03 and NEI 07-08 with respect to compliance with RG 1.8. The NEI 07-03 template states that the Radiation Protection Manager, Radiation Protection Technicians, and Radiation Protection Supervisory and Technical Staff will be trained and qualified in accordance with the guidance of RG 1.8. In a letter dated March 18, 2009 (ML090510379), the NRC accepted NEI 07-03, Revision 7. Specifically, the NRC staff indicated that for COL applications, NEI 07-03, Revision 7 provides an acceptable template for assuring that the RPP meets the applicable NRC regulations and guidance. Since the BLN COL FSAR has not yet adopted the approved version of the NEI template, this is identified as Confirmatory Item 12.1-1. At present, the NRC has not accepted NEI-07-08 as an acceptable template to be used by the COL applicants. As a result, this is identified as Open Item 12.1-1.

Supplemental Information

- STD SUP 12.1-1

The applicant added the following text to the end of Section 12.1.2.3, "Facility Layout General Design Considerations for ALARA," of the DCD included in the DC amendment:

A video record of the equipment layout in areas where radiation fields are expected to be high following operations may be used to assist in ALARA planning and to facilitate decommissioning.

The NRC staff acknowledges STD SUP 12.1-1 as a statement of fact not requiring NRC review.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.1.4:

Resolution of Standard Content Open Item 12.1-1 and Confirmatory Item 12.1-1

The NRC staff compared the VEGP and BLN COL applications and found them to be essentially identical, with two exceptions: first, the application material under STD COL 12.1-1 in Section 12.1 of the VEGP application references NEI 07-08A and the application material under STD COL 12.1-1 in Section 12.1 of the BLN application references NEI 07-08, Revision 2; and second, the VEGP FSAR Appendix 12AA references NEI 07-03A and the BLN FSAR Appendix 12AA references Revision 3 of NEI 07-03. Regarding these exceptions, the differing material associated with STD COL 12.1-1 in the VEGP FSAR is associated with adopting NEI 07-08A and NEI 07-03A, which are evaluated below as part of resolving Open Item 12.1-1 and Confirmatory Item 12.1-1.

In a letter from NEI to NRC dated October 29, 2009, NEI submitted NEI 07-08A to the NRC, which is the version of NEI 07-08 that has been accepted by the NRC. Accordingly, Open Item 12.1-1 is resolved for VEGP.

Confirmatory Item 12.1-1 is resolved for VEGP because the applicant has adopted the approved version of NEI 07-03, i.e., NEI 07-03A, (see paragraph below).

In Revision 2 of the VEGP COL FSAR, the applicant modified parts of FSAR Chapter 12, Appendix 12.AA that relate to STD COL 12.1-1. Specifically, in the FSAR, Revision 2, NEI 07-03A, is referenced. Accordingly, because NEI 07-03A is the approved version of NEI 07-03, the above conclusions regarding Confirmatory Item 12.1-1 are not affected by the changes to Revision 2 of the FSAR. One other change is the modification of a reference at the end of Appendix 12AA where the reference to RG 1.97 is changed from Revision 4 to Revision 3. The staff found the change acceptable, since Revision 3 provides for a more comprehensive version of the RG and also provides for portable radiation

monitoring equipment. Revision 4 of RG 1.97 indicates that partial implementation is not recommended.

12.1.5 Post Combined License Application

The post COL activities related to ALARA practices (part of the RPP) are discussed in Section 12.5.5 of this SER.

12.1.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable based on the relevant acceptance criteria provided in NUREG-0800, Section 12.1. The staff based its conclusion on the following:

- STD COL 12.1-1, relating to ALARA and operational policies and compliance with relevant regulatory guidance, is acceptable because the applicant incorporates approved references NEI 07-03A and NEI 07-08A into the Turkey Point Units 6 and 7 COL FSAR and meets the applicable regulatory requirements and guidance specified in Sections 12.1.3 and 12.1.4 of this SER.
- STD SUP 12.1-1, relating to the use of video recording of equipment layout in areas where radiation fields are expected to be high, is acceptable because it is a statement of fact not requiring NRC approval.

12.2 Radiation Sources

12.2.1 Introduction

This section addresses the issues related to contained radiation sources and airborne radioactive material sources during normal operations, AOOs, and accident conditions affecting in-plant radiation protection.

12.2.2 Summary of Application

Turkey Point Units 6 and 7 COL FSAR, Revision 8, Section 12.2 incorporates by reference AP1000 DCD, Revision 19, Section 12.2.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 12.2 (and in letter dated May 16, 2016 (ADAMS Accession No. ML16140A087)), the applicant provided the following:

Departures

- PTN DEP 6.4-1

The applicant provided additional information in Section 12.2 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related PTN DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

AP1000 COL Information Item

- STD COL 12.2-1

The applicant provided additional information in STD COL 12.2-1 to resolve COL Information Item 12.2-1 (COL Action Item 12.3.1-1), which addresses miscellaneous sources.

12.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the radiation sources are given in NUREG-0800, Section 12.2.

The applicable regulatory requirements for STD COL 12.2-1 are as follows:

- 10 CFR 20.1801, "Security of stored material"
- 10 CFR 20.1802, "Control of material not in storage"
- 10 CFR Part 50, "Domestic licensing of production and utilization facilities," Appendix A, "General Design Criteria for Nuclear Power Plants," General Design Criterion (GDC) 61, "Fuel Storage and Handling and Radioactivity Control"

12.2.4 Technical Evaluation

The staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 12.2 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information contained in the application and incorporated by reference addresses the required information relating to radiation sources. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP

Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAls.
- The staff confirmed that all responses to RAls identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.2.4:

The following portion of this technical evaluation section is reproduced from Section 12.2.4 of the BLN SER:

AP1000 COL Information Item

• *STD COL 12.2-1*

The applicant provided additional information in STD COL 12.2-1, related to miscellaneous sources, to resolve COL Information Item 12.2-1. COL Information Item 12.1-1 states:

The Combined License applicant will address any additional contained radiation sources not identified in subsection 12.2.1, including radiation sources used for instrument calibration or radiography. The same commitment was also captured as COL Action Item 12.3.1-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793).

The applicant provided additional information in the BLN COL FSAR to address the plant STD COL 12.2-1 dealing with miscellaneous sources. The applicant stated that licensed sources containing byproduct, source and special nuclear material that warrant shielding consideration will meet the applicable requirements of 10 CFR Parts 20, 30, 31, 32, 33, 34, 40, 50 and 70. The applicant indicated that there are byproducts and source materials with known isotopes and activity manufactured for the purpose of measuring, checking, calibrating, or controlling processes quantitatively or qualitatively. Accordingly, written procedures will be established and implemented that address procurement, receipt, inventory, labeling, leak testing, surveillance, control,

transfer, disposal, storage, issuance and use of these radioactive sources. Also, the applicant indicated that sources maintained on-site for instrument calibration purposes will be shielded while in storage to keep personnel exposure ALARA.

*The regulatory requirements cited in the above paragraph address the requirements applicable to sources that would likely be used in conjunction with construction, preoperational, and initial testing. The applicant will implement the practices for radioactive material control as described in NEI 07-03, Section 12.5.4.10, "Radioactive Material Control." In a letter dated March 18, 2009 (ML090510379), the NRC accepted NEI 07-03, Revision 7. Specifically, the NRC staff indicated that for COL applications, NEI 07-03, Revision 7 provides an acceptable template for assuring that the RPP meets the applicable NRC regulations and guidance. Since the BLN FSAR has not adopted the approved version of the NEI template, this is identified as **Confirmatory Item 12.1-1.***

The staff concludes that the information provided by the applicant with respect to radiation sources is acceptable and meets the requirements of 10 CFR Sections 20.1801 and 20.1802 and GDC 61. This conclusion is based on the applicant's commitment to the NEI 07-03 administrative controls to meet the regulatory requirements. These controls apply to the additional contained radiation sources discussed in the COL item. The staff notes that its review did not encompass the entire set of regulatory requirements cited by the applicant (10 CFR Parts 20, 30, 31, 32, 33, 34, 40, 50 and 70), since the staff's review is focused on radiation protection requirements on sources used in conjunction with the RPP.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.2.4:

Resolution of Standard Content Confirmatory Item 12.1-1

The NRC staff compared the VEGP and BLN COL applications regarding STD COL 12.2-1, and found them to be essentially identical, with the exception that VEGP FSAR Appendix 12AA references NEI 07-03A, whereas, the BLN FSAR references NEI 07-03, Revision 3. As indicated in Section 12.1.4 above, Confirmatory Item 12.1-1, is resolved for VEGP because the applicant has adopted the approved version of NEI 07-03, which is now designated as NEI 07-03A.

12.2.5 Post Combined License Activities

There are no post-COL activities related to this section.

12.2.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point

Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable based on the relevant acceptance criteria provided in NUREG-0800, Section 12.2. The staff based its conclusion on the following:

- PTN DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.
- STD COL 12.2-1, which addresses miscellaneous radiation sources, is acceptable because the applicant has incorporated the approved reference NEI 07-03A into the Turkey Point Units 6 and 7 COL FSAR and meets the requirements of 10 CFR 20.1801, 10 CFR 20.1802, and GDC 61.

12.3 Radiation Protection Design Features

Section 12.3, "Radiation Protection Design Features" and the following Section 12.4, "Dose Assessment," are treated as separate sections in this SER (as well as in the AP1000 DCD). However, these two sections are listed as a single section, Section 12.3-12.4, "Radiation Protection Design Features," in both RG 1.206 and NUREG-0800, with the material discussed under the section "Dose Assessment" included in a section at the end of Section 12.3-12.4.

12.3.1 Introduction

This section addresses the issues related to radiation protection equipment and design features used to ensure that OREs are ALARA. It takes into account design dose rates, AOOs, and accident conditions. These issues include the facility design features, shielding, ventilation, area radiation and airborne radioactivity monitoring instrumentation, and dose assessment.

12.3.2 Summary of Application

Turkey Point Units 6 and 7 COL FSAR, Revision 7, Section 12.3 incorporates by reference AP1000 DCD, Revision 19, Section 12.3.

In addition, in Turkey Point Units 6 and 7 COL FSAR, Section 12.3 (and in letter dated May 16, 2016 (ADAMS Accession No. ML16140A087)), the applicant provided the following:

Departures

- PTN DEP 6.4-1

The applicant provided additional information in Section 12.3 of the Turkey Point Units 6 and 7 COL FSAR about PTN DEP 6.4-1 related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators. This information, as well as related PTN DEP 6.4-1 information appearing in other chapters of the FSAR, is reviewed in Section 21.2 of this SER.

- PTN DEP 18.8-1

The applicant described the following portion of the Tier 2 departure (DEP) from the AP1000 DCD related to the radiation design protection features. The applicant proposed revising several AP1000 DCD figures in Section 12.3 to reflect the relocation of the Operations Support Center (OSC). Other aspects of this Tier 2 departure are evaluated in Sections 12.5, 13.3, and 18.8 of this SER.

AP1000 COL Information Items

- STD COL 12.3-1

The applicant provided additional information in STD COL 12.3-1 to resolve COL Information Item 12.3-1 (COL Action Item 12.4.2-1), which addresses the administrative controls for use of the design features provided to control access to radiologically restricted areas.

- STD COL 12.3-2

The applicant provided additional information in STD COL 12.3-2 to resolve COL Information Item 12.3-2 (COL Action Item 12.4.4-1), which addresses the criteria and methods for obtaining representative measurement of radiological conditions, including airborne radioactivity concentrations in work areas.

- STD COL 12.3-3

The applicant provided additional information in STD COL 12.3-3 to resolve COL Information Item 12.3-3, which addresses the groundwater monitoring program beyond the normal radioactive effluent monitoring program.

- STD COL 12.3-4

The applicant provided additional information in STD COL 12.3-4 to resolve COL Information Item 12.3-4, which addresses the program to ensure documentation of operational events deemed to be of interest for decommissioning.

Supplemental Information

- PTN SUP 11.2-1

In a May 22, 2012, letter, the applicant provided supplemental information to be added to Turkey Point Units 6 and 7 COL FSAR Section 11.2.1.2.4. This supplemental information, which was added to Turkey Point Units 6 and 7 COL FSAR Section 11.2.1.2.4, describes some of the features of the liquid radwaste discharge pipeline incorporated to minimize leakage to the environment. This section also states that the diluted liquid radwaste effluent will be routed to the deep injection wells.

12.3.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the radiation protection design features are given in NUREG-0800, Section 12.3-12.4.

The applicable regulatory requirements and guidance for STD COL 12.3-1 are as follows:

- 10 CFR Part 20
- RG 1.8, Revision 3
- RG 8.9, "Acceptable Concepts, Models, Equations, and Assumptions for a Bioassay Program," Revision 1
- RG 8.38 "Control of Access to High and Very High Radiation Areas in Nuclear Power Plants," Revision 1
- NUREG-1736, "Consolidated Guidance: 10 CFR Part 20-Standards for Protection Against Radiation"

The applicable regulatory requirements and guidance for STD COL 12.3-2 are as follows:

- 10 CFR Parts 19, "Notices, instructions and reports to workers: inspection and investigations"
- 10 CFR Part 20
- 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities"
- NUREG-0737, "Clarification of TMI Action Plan Requirements," Item III.D.3.3
- RG 1.8, Revision 3
- RG 8.2, "Guide for Administrative Practices in Radiation Monitoring," Revision 0
- RG 8.8, Revision 3
- RG 8.10, Revision 1-R
- RG 1.21, "Measuring, Evaluating, and Reporting Radioactivity in Solid Wastes and Releases of Radioactive Materials in Liquid and Gaseous Effluents from Light-Water-Cooled Nuclear Power Plants," Revision 1, Appendix A, "Measuring, Evaluating, and Reporting Radioactive Material in Liquid and Gaseous Effluents and Solid Waste"
- RG 1.97, , "Criteria for Accident Monitoring Instrumentation for Nuclear Power Plants," Revision 4

The applicable regulatory requirements and guidance for STD COL 12.3-3 and STD COL 12.3-4 are as follows:

- 10 CFR 20.1406, “Minimization of contamination”
- 10 CFR 50.75, “Reporting and recordkeeping for decommissioning planning”
- RG 4.21, “Minimization of Contamination and Radioactive Waste Generation: Life Cycle Planning,” Revision 0

12.3.4 Technical Evaluation

The staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 12.3 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff’s review confirmed that the information contained in the application and incorporated by reference addresses the required information relating to radiation protection design features. The results of the staff’s evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff’s findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application. Any confirmatory items in the standard content material retain the numbers assigned in the VEGP SER. Confirmatory items that are first identified in this SER section have a Turkey Point Units 6 and 7 designation (e.g., **Turkey Point Units 6 and 7 Confirmatory Item 12.3-1**).

Tier 2 Departure

- PTN DEP 18.8-1

PTN DEP 18.8-1 pertains to the relocation of the OSC from the location specified in the AP1000 DCD. In the AP1000 DCD description, the OSC is located in the same room as the ALARA Briefing Room in the Annex Building. For Turkey Point Units 6 and 7, the OSC was relocated to the Maintenance Shop/Office Building, which is inside the Protected Area but separate from the Units 6 and 7 Nuclear Islands. This departure to relocate the OSC for Turkey Point Units 6 and 7 is acceptable insofar as the health physics (HP) facility design is concerned because the location of the OSC does not have an impact on the radiation protection facilities design. The ALARA briefing room remains as stated in the AP1000 DCD, so there is no impact on radiation protection facilities, programs or functions.

The evaluation of the effect of the OSC relocation is addressed in SER Section 12.5 for the HP facilities, in Section 13.3 of this SER for emergency preparedness, and in Section 18.8 of this SER for the human system interface design.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4:

The following portion of this technical evaluation section is reproduced from Section 12.3.4 of the BLN SER:

AP1000 COL Information Items

- STD COL 12.3-1

The applicant provided additional information in STD COL 12.3-1, related to the administrative controls for radiological protection, to resolve COL Information Item 12.3-1. COL Information Item 12.3-1 states:

The Combined License applicant will address the administrative controls for use of the design features provided to control access to radiologically restricted areas, including potentially very high radiation areas, such as the fuel transfer tube during refueling operations and to the reactor cavity.

The commitment was also captured as COL Action Item 12.4.2-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will address the administrative controls for use of the design features provided to control access to radiologically restricted areas, including potentially very high radiation areas, such as the reactor cavity and the fuel transfer canal during refueling operations. The hatch to the spent fuel transfer canal will be treated as an entrance to a very high radiation area under 10 CFR Part 20 and will be locked during spent fuel transfer operations.

The applicant addressed this STD COL item in BLN COL FSAR, Appendix 12AA. This appendix incorporates by reference NEI 07-03, Revision 7. The NEI template directs COL applicants to describe the site-specific plant information for

areas requiring administrative controls for very high radiation areas. To supplement NEI 07-03, Section 12.5.4.4, "Access Control," the applicant provided additional measures in Appendix 12AA for access controls such as signs, locks, plant manager (or designee) approval for entry, and radiation protection personnel accompaniment and exposure control for entry into very high radiation areas. The applicant also stated that a closed circuit television system may be installed in high radiation areas to allow remote monitoring of individuals entering high radiation areas by personnel qualified in radiation protection procedures.

The COL applicant will apply the administrative controls for the use of the design features to control access to very high radiation areas, such as the fuel transfer tube during refueling and to the reactor cavity during operations, and other radiologically restricted areas to comply with 10 CFR Sections 20.1601 and 20.1602. The opening of the fuel transfer hatch is administratively controlled, treated as an entrance to a very high radiation area, and is in place during spent fuel transfer operation.

The staff finds the applicant's approach meets the requirements of 10 CFR Sections 20.1601 and 20.1602, and is consistent with RG 8.38, Regulatory Position C1 and C3, which will ensure that an individual is unable to gain unauthorized or inadvertent access to such areas.

In a letter dated March 18, 2009 (ML090510379), the NRC accepted NEI 07-03, Revision 7. Specifically, the NRC staff indicated that for COL applications, NEI 07-03, Revision 7 provides an acceptable template for assuring that the RPP meets the applicable NRC regulations and guidance. Since the BLN FSAR has not adopted the approved version of the NEI template, this is identified as **Confirmatory Item 12.1-1**.

The NRC staff reviewed STD COL 12.3-1 dealing with administrative controls for radiological protection, using the text added in Appendix 12AA. The BLN COL FSAR Appendix 12AA, incorporates by reference NEI 07-03.

In Appendix 12AA, the applicant has taken exception to NEI 07-03, Section 12.5 to not conform to the guidance of the following regulatory guides:

RG 8.20, "Applications for Bioassay for I-125 and I-131"

RG 8.26 [sic], "Bioassay at Uranium Mills"

RG 8.32, "Criteria for Establishing a Tritium Bioassay Program"

The guidance documents were identified as outdated regulatory guidance in NUREG-1736, Consolidated Guidance: 10 CFR Part 20, "Standards for Protection Against Radiation," October 2001. NUREG-1736 describes that in conjunction with 10 CFR 20.1502(b), which requires licensees to monitor for likely intakes; 10 CFR 20.1204(a) and (b) prescribe how information obtained through monitoring is to be used when assessing exposures to workers from

intakes. The NUREG recommends that licensees (and therefore applicants) consider the methods described in RG 8.9, "Acceptable Concepts, Models, Equations, and Assumptions for a Bioassay Program," for estimating intakes of radionuclides and determining the frequency of bioassay measurements. RG 8.9 provides updated methods and guidance that was previously contained in positions of the three RGs above. The applicant's commitment to RG 8.9 is sufficient to assure proper monitoring for intake of radionuclides.

In BLN COL FSAR, Appendix 12AA, the applicant took exception to the first paragraph of NEI 07-03, Section 12.5.2 to describe the equivalent key radiological protection positions for the BLN site. The description of organizational positions with specific radiation protection responsibilities is in BLN COL FSAR Section 13.1. BLN COL FSAR Section 13.1, "Organizational Structure of the Applicant," provides specific radiation protection responsibilities for key positions within the plant organization and the plant organization overall. Managers and supervisors within the plant operating organization are responsible for establishing goals and expectations for their organization and to reinforce behaviors that promote radiation protection. BLN COL FSAR Section 13.1.1, "Management and Technical Support Organization," and Section 13.1.2, "Operating Organization," provide the responsibilities of the organizations and positions to assure that radiological safety goals and expectations are adhered to.

The staff finds that the applicant's exception to NEI 07-03, Section 12.5.2 is acceptable because BLN COL FSAR Section 13.1 provides the key radiological safety responsibilities and organization consistent with RG 1.8.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4:

Correction of Errors in the Standard Content Evaluation Text

The NRC staff identified an error in the text reproduced above from the BLN SER, Section 12.3.4, that requires correction. The BLN SER states that Appendix 12AA of the BLN COL FSAR incorporates by reference NEI 07-03, Revision 7. The appendix actually incorporates by reference NEI 07-03, Revision 3. The NRC staff also identified an error in the text reproduced above from the BLN SER, Section 12.3.4 regarding the reference to RG 8.22, which was incorrectly referred to as RG 8.26.

Resolution of Standard Content Confirmatory Item 12.1-1

The NRC staff compared the VEGP and BLN COL applications regarding STD COL 12.3-1, and found them to be essentially identical, with the exception that VEGP FSAR Appendix 12AA references NEI 07-03A and BLN FSAR Appendix 12AA references Revision 3 of NEI 07-03. Additional clarifying information has been added to the VEGP FSAR regarding STD COL 12.3-1, which is discussed below. As indicated in Section 12.1.4 above, Confirmatory

Item 12.1-1, is resolved for VEGP because the applicant has adopted the approved version of NEI 07-03, which is now designated as NEI 07-03A.

In addition, changes have been made in Revision 2 of the VEGP FSAR Chapter 12 that relate to STD COL 12.3-1. The changes are as follows:

- 1. A new Table 12AA-201 has been added to Appendix 12AA that provides information concerning access to very high radiation areas (VHRA). The table provides VHRA locations, DCD cross references, radiation sources in the locations and other conditions and restrictions.*
- 2. In FSAR Appendix 12AA, new text was added to Section 12.5.4.4 of NEI 07-03A. The text references new Table 12AA-201 and describes the information in it, discusses removal of the primary sources of radiation from the VHRA areas, and discusses verification walk downs of VHRA to ensure consistency with RG 8.38. In addition to the changes to Appendix 12AA discussed above, the applicant has also added text to Section 12.5.4 regarding the possible use of closed circuit television system to allow remote monitoring of individuals entering high radiation areas.*

These items (i.e., the addition of the table, reference to it and discussion of walk downs, and the closed circuit television system) are acceptable because they provide additional clarity and site-specific information regarding controls to VHRAs and more completely describe features that address STD COL 12.3-1.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4:

The following portion of this technical evaluation section is reproduced from Section 12.3.4 of the BLN SER

- *STD COL 12.3-2*

The applicant provided additional information in STD COL 12.3-2, related to the criteria and methods for radiological protection, to resolve COL Information Item 12.3-2. COL Information Item 12.3-2 states:

The Combined License applicant will address the criteria and methods for obtaining representative measurement of radiological conditions, including airborne radioactivity concentrations in work areas. The Combined License applicant will also address the use of portable instruments, and the associated training and procedures, to accurately determine the airborne iodine concentration in areas within the facility where plant personnel may be present during an accident.

The same commitment was also captured as COL Action Item 12.4.4-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793).

The staff reviewed STD COL 12.3-2, dealing with criteria and methods for radiological protection. In BLN COL FSAR Section 12.3.4, the applicant presented the procedure detailing the criteria and methods for obtaining representative measurement of radiological conditions, including in-plant airborne radioactivity concentrations in accordance with applicable portions of 10 CFR Part 20 and consistent with the guidance in RGs 1.21, Appendix A, 8.2, 8.8, and 8.10.

The applicant also discussed the surveillance requirements and the frequency of scheduled surveillance that are consistent with the operational philosophy in RG 8.10. In Section 12.3.4, "Area Radiation and Airborne Radioactivity Monitoring Instrumentation," the applicant described the typical survey frequencies and varieties of surveys. The surveys described in general terms include radiation, contamination, airborne radioactivity, and job coverage surveys for occupational radiation workers during normal and off-normal conditions.

Appendix 12AA also describes qualification and training criteria for site personnel consistent with the guidance in RG 1.8 and as described in FSAR Chapter 13. Section 13.2, "Training," incorporates NEI 06-13A, "Template for an Industry Training Program Description." NEI 06-13A, Section 1.2.7, provides training for the use of survey instruments, use of analytical equipment, radiation protection procedures and emergency plan procedures.

The applicant discussed a portable iodine monitoring system used to determine the airborne iodine concentration in areas where plant personnel may be present routinely and during an accident which meets the guidance of NUREG-0737, Item III.D.3.3 and complies with 10 CFR Part 50, Appendix A. The applicant will incorporate the use of this sampling system into the emergency plan implementing procedures.

The NRC staff reviewed BLN COL FSAR Section 12.3.4 and Appendix 12AA, dealing with standards applied to the calibration and maintenance of portable radiation survey instruments. The applicant describes Area and Airborne Radioactivity Monitoring Instrumentation in BLN COL FSAR Section 12.3.4 and also in Section 14.2.9.4.27, "Portable Personnel Monitors and Radiation Survey Instruments."

The portable personnel monitor and radiation survey instrument testing verifies that the devices operate in accordance with their intended function in support of the RPP as described in Chapter 12. The applicant stated as a prerequisite that the monitors, instruments and certified test sources are on site. The applicant also stated that the general test method and acceptance criteria for the monitors and instruments would be source checked and tested in accordance with the manufactures' recommendations. The NRC staff determined that additional information should be provided in addition to the use of manufacturers' recommendations. Additional standards such as American National Standards Institute (ANSI) N42.17A-1989, as it relates to the accuracy and overall performance of portable survey instruments, and ANSI N323A-1997, as it relates to the calibration and maintenance of portable radiation survey instruments

should be provided. In response to RAI 12.3-12.4-5, in a letter from the applicant, dated September 22, 2008; the applicant stated that it intends to revise the BLN COL FSAR to include maintenance and calibration of survey instruments and to update the version of the ANSI standard in a future revision of the COL application. The NRC staff finds that Revision 1 of the BLN COL FSAR adequately addresses the above. As a result, RAI 12.3-12.4-5 is closed.

- **STD COL 12.3-3**

The applicant provided additional information in STD COL 12.3-3, related to the groundwater monitoring program, to resolve COL Information Item 12.3-3. COL Information Item 12.3-3 states:

The Combined License applicant will establish a groundwater monitoring program beyond the normal radioactive effluent monitoring program. If and as necessary to support this groundwater monitoring program, the Combined License applicant will install groundwater monitoring wells during the plant construction process. Areas of the site to be specifically considered in this groundwater monitoring program are as follows:

- *West of the auxiliary building in the area of the fuel transfer canal*
- *West and south of the radwaste building*
- *East of the auxiliary building rail bay and the radwaste building truck doors*

The applicant added text in BLN COL FSAR Appendix 12AA, Section 12AA.5.4.14 to the information incorporated from NEI 07-03 regarding the groundwater monitoring program.

The applicant stated that a groundwater monitoring program beyond the normal radioactive effluent monitoring program will be developed, if, and as necessary to support this groundwater monitoring program, design features will be installed during the plant construction process. The applicant discussed areas of the site to be specifically considered in this groundwater monitoring program.

The NRC staff evaluated the applicant's groundwater monitoring program to the criteria in 10 CFR 20.1406. 10 CFR 20.1406 requires the applicant to provide a description of how facility design and procedures for operation will minimize, to the extent practicable, contamination of the facility and the environment; facilitate eventual decommissioning; and minimize, to the extent practicable, the generation of radioactive waste. The regulatory guidance which describes an acceptable method for meeting the regulation was published in June 2008, RG 4.21, Revision 0, "Minimization of Contamination and Radioactive Waste Generation: Life Cycle Planning."

The groundwater monitoring program as described in BLN COL FSAR Appendix 12AA included some implementation considerations, but the program lacked a description of the key components of the program such as, types and periodicity of routine samples, threshold activity to be detected, actions to be taken upon detection, and quality assurance practices to be used to ensure reasonable assurance of prompt identification of leakage into the groundwater (RAI 12.3-12.4-1 and RAI 12.3-12.4-2).

*The applicant stated in a letter dated September 22, 2008, that it will adopt the NEI 08-08, "Generic FSAR Template Guidance for Life Cycle Minimization of Contamination," Revision 0 template. If approved by the NRC, the applicant will provide additional description of site specific design features and procedures for operation that minimize contamination of the facility, site, and environment. NEI 08-08 is currently under staff review. This is identified as **Open Item 12.3-1**.*

*As described in Section 11.2.1 2.4 of the AP1000 DCD, Revision 17, the exterior monitored liquid effluent discharge pipe is engineered to preclude leakage by either enclosure within a guard pipe and leakage monitoring, or is accessible for visual inspection in total from the Radwaste Building to the licensed release point for dilution and discharge. No valves, vacuum breakers, or other fittings are incorporated outside of buildings. In a supplemental response dated December 16, 2008, to RAI 12.3-12.4-1, the applicant provided a proposed revision to the BLN COL FSAR to describe the site-specific design of the external radioactive waste discharge line. The staff agrees with the applicant that the site-specific design will minimize the potential for undetected leakage from this discharge to the environment at a non-licensed release point, and complies with 10 CFR 20.1406. The proposed change to the BLN COL FSAR is acceptable subject to a formal revision to the BLN COL FSAR. Accordingly, this is identified as **Confirmatory Item 12.3-1**.*

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4:

Resolution of Standard Content Open Item 12.3-1

Revision 2 of the FSAR references NEI 08-08A, which is the version of NEI 08-08 that has been accepted by NRC. Accordingly, Open Item 12.3-1 is resolved for VEGP.

Resolution of Standard Content Confirmatory Item 12.3-1

The NRC staff verified that Section 11.2.1.2.4 of the VEGP FSAR was updated to include the information identified in BLN Confirmatory Item 12.3-1; therefore, Confirmatory Item 12.3-1 is resolved for VEGP.

Supplemental Information

- PTN SUP 11.2-1

The exterior radwaste discharge piping, described above, runs from the Auxiliary Building to the Radwaste Building and then out of the Radwaste Buildings for both units to the licensed release point for dilution and discharge into the deep injection wells. The last paragraph of the standard content evaluation of STD COL 12.3-3, reproduced from Section 12.3.4 of the BLN SER above, provides the staff's evaluation of the exterior radwaste discharge piping for BLN. In an October 12, 2009, letter to NRC (Agencywide Documents and Management System (ADAMS) ML092870439), the Turkey Point Units 6 and 7 applicant endorsed BNL's response to BLN RAI 109, Question 12.3-12.4-1.

The applicant described the above-mentioned portions of the radwaste discharge piping in Turkey Point Units 6 and 7 COL FSAR Section 11.2. However, the Turkey Point Units 6 and 7 COL FSAR did not initially describe the site-specific design portions of the external radioactive waste discharge line. Following discussions with the staff, in a May 22, 2012, letter, (ML12144A360), the applicant proposed to modify Turkey Point Units 6 and 7 COL FSAR Section 11.2.1.2.4 by providing supplemental information (PTN SUP 11.2-1) regarding site-specific design features of the external radioactive waste discharge line. The staff verified that the applicant has incorporated these changes into Turkey Point Units 6 and 7 COL FSAR, Revision 4. In PTN SUP 11.2-1, the applicant stated that the exterior radwaste discharge piping is enclosed within a guard pipe and is monitored for leakage. The use of a guard pipe enclosure and leakage monitoring for the external radioactive waste discharge line complies with 10 CFR 20.1406. The exterior radwaste discharge piping runs from each of the Radwaste Buildings to where it connects to the blowdown sump discharge piping downstream of the blowdown sump pumps. At this connection point, the liquid radwaste in the discharge piping is mixed with the high volume circulating water system blowdown stream and is diluted so that the resulting mixture meets the release limits of 10 CFR Part 20, Appendix B Table II, Column 2. Downstream of this blowdown sump dilution connection point, the diluted radwaste solution flow is distributed through two separate piping branches. One of the piping branches is orientated in a North-South direction and is located to the East of Unit 6, and the second branch is orientated in the East-West direction and is located to the south of Turkey Point Units 6 and 7. Each of these piping branches contains six deep injection wells and three monitoring wells.

To obtain additional information about the layout and design features of the discharge piping and deep injection wells and how these components are designed to minimize leakage and contamination of the environment, the staff issued RAI 72, Questions 11.02-6-6 through 11.02-6-9. On August 9, 2013, the applicant provided an initial response to RAI 72, Questions 11.02-6-6 through 11.02-6-9. On April 22, 2014, the applicant provided a supplemental response to RAI 72, Question 11.02-6-6. The applicant submitted an additional supplemental response to RAI 72, Question 11.02-6-6 on September 23, 2014. As part of the applicant's response to these RAIs, the applicant amended the Turkey Point Units 6 and 7 COL FSAR to add Section 9.2.12.2.2, "Component Design," which provides a description of the deep injection wells and lists some of the design features of the associated piping, valves, and other components which make up the deep well injection system. The injectate piping connecting the pump station to the deep injection wells is a single-walled steel pipe. The diameter of the injectate piping varies from 152.4 cm (60 inches (in.)) closest to the pump station near the blowdown sump to 61 cm (24 in.) at the last well in each piping branch. This section of injectate piping between the pump station and the edge of the curbed concrete containment pad that will surround each injection well is buried. The above ground 15.2 meters (m) (50 feet (ft)) portion of the injectate piping from where the piping exits the underground to the injection tubing is accessible for visual inspection to detect for any potential leakage from pipe and valve fittings.

During discharge operations, the diluted radwaste flow will be routed to a number of deep injection wells for discharge. The number of wells used will be dependent on the volume of the radwaste discharge flow.

To direct the discharge flow to the appropriate combination of discharge wells for discharge, the injectate piping contains manifolds, valves, and controls. In addition, the injectate piping also includes appurtenances, such as air/vacuum release valves, vent lines, and access ways, as necessary, for proper operation and maintenance of the discharge piping. The air/vacuum release valves are used to prevent potential water column separation in the branch pipelines when pumps may be started and stopped or valves cycled. These air/vacuum release valves provide assurance of continued integrity of the blowdown lines. To ensure that leakage is contained and controlled, these valves are included in the preventive maintenance program. As part of this program, the valves are checked periodically and maintained within acceptable parameters. The air/vacuum release valves are also included in the site routine maintenance program. Vent and drain lines, installed at system high points or where air would be most likely to collect on each branch line, are included to remove any air that may be introduced into the lines by the air/vacuum release valves or that is not swept out of the blowdown line during system startup. As required during pump startup, personnel will be present at the vent valve locations to allow air to escape from the blowdown lines and then to close the vent valves when the vent lines fill with water. To prevent leakage from these valves during system operation, the vent lines and drain lines will be capped and the valves will be locked to prevent inadvertent operation. The applicant will contain any spillage that could occur from the vent valves during pump startup or during normal operations and properly manage this spillage as being potentially contaminated, in accordance with Radiation Protection and ALARA Program requirements. The applicant will remove any soil impacted by an injectate spill and manage this as potential radioactive waste.

10 CFR 20.1406 specifies that applicants for licenses shall describe how the facility will minimize contamination of the facility and the environment. To comply with these requirements of 10 CFR 20.1406, the discharge piping, manifolds, valves, controls, and appurtenances are designed to minimize inadvertent or unidentified releases to the environment. The integrity of the injectate piping and the valve fittings will be monitored for leakage by performing periodic visual inspections, where accessible, as part of routine operation and maintenance activities. For those portions of the injectate piping that are not accessible, leakage monitoring will be performed through remote surveillance in conjunction with groundwater monitoring, as necessary, as part of the Units 6 and 7 Groundwater Monitoring Program. Monitoring points are provided to facilitate sampling for leakage consistent with contamination minimization requirements. Leakage monitoring of the liquid radwaste system discharge pipeline and the underground pit where the liquid radwaste pipe ties into the blowdown sump discharge pipe is implemented as part of the Radiation Protection Program. The staff notes that the monitoring and leakage detection program complies with the requirements of 10 CFR 20.1406 and utilizes the applicable guidance contained in RG 4.21 and NEI 08-08A.

To ensure that the appurtenances are maintained in good condition to minimize the potential for leakage and to minimize, to the extent practicable, contamination of the facility and the environment, the piping and fittings are included in the site's routine preventive maintenance program. The deep well injection system equipment will be designed to minimize the possibility of damage to the injection equipment. Each deep injection well will be located on a curbed concrete containment pad to contain any leakage in the event of a spill. To eliminate

unauthorized personnel access or vehicle damage to the injection well and associated piping, the above ground portion of the piping at each well will be surrounded by locked protective fencing and/or closely spaced bollards of steel or concrete. In the event of a failure of some injection equipment, valves would be closed to isolate the damaged equipment and minimize the volume of spilled injectate. Each injectate feeder line is equipped with redundant isolation valves. These valves are used to isolate each individual injectate feeder line in the event of equipment failure and to prevent the upward flow of injected fluid from the well onto the containment pad due to a damaged injectate feeder line. As stated earlier, each injection well will be located on a curbed concrete containment pad to contain any injectate spilled from the injection well or from the surface piping. Any spills would be contained and managed in accordance with Radiation Protection and ALARA Program requirements. Any injectate that spills and pools on the ground would be pumped into a tank and ultimately pumped down one of the injection wells. Any soil impacted by an injectate spill would be removed and treated as radioactive waste. On the basis that the applicant has adequately described features of the discharge piping and deep injection wells to minimize leakage and contamination of the environment in accordance with 10 CFR 20.1406, the staff finds the applicant's response to the applicable portions of RAI 72, Questions 11.02-6-6 through 11.02-6-9 addressing these subjects acceptable.

RG 4.21 states that applicant should strive to minimize leaks and spills, provide containment in areas where such events might occur, and provide for detection that supports timely assessment and appropriate response. For the reasons stated above, the staff finds that the design features of the site-specific design portion of the external radioactive waste discharge line, which are described in PTN SUP 11.2-1 and in Turkey Point Units 6 and 7 COL FSAR Section 9.2.12.2.2, will minimize the potential for undetected leakage from this discharge to the environment in accordance with the guidance of RG 4.21. In addition, as stated above, the monitoring and leakage detection program complies with the requirements of 10 CFR 20.1406.

NEI 08-08A, "Generic FSAR Template Guidance for Life Cycle Minimization of Contamination," provides a description of the operational and programmatic elements and controls that minimize contamination of the facility, site, and the environment, in order to meet the requirements of 10 CFR 20.1406. NEI 08-08A also states that the COL applicant should establish an on-site groundwater monitoring program to ensure timely detection of inadvertent radiological releases to the groundwater. In accordance with NEI 08-08A, the applicant has modified its radiation protection program described in Turkey Point Units 6 and 7 COL FSAR Section 12AA to include the development of a Groundwater Monitoring Program that is beyond the normal radioactive effluent monitoring program. This groundwater monitoring program will include a network of wells to ensure timely detection of inadvertent radiological releases to the ground water.

On the basis of the staff's review of the information provided in Turkey Point Units 6 and 7 COL FSAR PTN SUP 11.2-1, the responses to RAI 72, Questions 11.02.06-6 through 11.02.06-9, and the pertinent sections of Turkey Point Units 6 and 7 COL FSAR Section 9.2.12.2., the staff concludes that the discharge piping design features and implementation of the groundwater monitoring program meet the requirements of 10 CFR 20.1406 for minimizing the potential for the contamination of the environment. Thus, the staff finds this information acceptable.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4.

The following portion of this technical evaluation section is reproduced from Section 12.3.4 of the BLN SER.

- **STD COL 12.3-4**

The applicant provided additional information in STD COL 12.3-4, related to the record of operational events of interest for decommissioning, to resolve COL Information Item 12.3-4. COL Information Item 12.3-4 states:

The Combined License applicant will establish a program to ensure documentation of operational events deemed to be of interest for decommissioning, beyond that required by 10 CFR 50.75. This or another program will include remediation of any leaks that have the potential to contaminate groundwater. The applicant added text in Appendix 12AA, Section 12AA.5.4.15 to the information incorporated from NEI 07-03 dealing with a record of operational events of interest for decommissioning. The applicant discussed procedures established to document the operational events that are deemed of interest for decommissioning, beyond that required by 10 CFR 50.75. These documented operational events assist in developing a historical assessment of the nuclear facilities, thereby reducing time, effort, and hazards to personnel during decommissioning planning. This documentation will include identification of the remediation of any leaks, which have the potential to contaminate groundwater. The procedures that govern retention of these records, and the records themselves, should specify the retention period required to assure availability when they may be required (e.g., life of facility plus 30 years). The NRC staff requested in RAI 12.3-12.4-3 that the applicant include the operational and design COL information items that fully meet the objectives of RG 4.21, Revision 0 and hence the requirements of 10 CFR 20.1406, 'Minimization of Contamination.'

*In response to the RAI, in a letter dated September 22, 2008, the applicant stated that it intended to adopt NEI 08-08. This document is intended to provide the description of additional site procedures for decommissioning records which will demonstrate compliance with 10 CFR 20.1406. This is identified as **Open Item 12.3-1**.*

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.3.4:

Resolution of Standard Content Open Item 12.3-1

Revision 2 of the FSAR references NEI 08-08A, which is the version of NEI 08-08 that has been accepted by NRC. Accordingly, Open Item 12.3-1 is resolved for VEGP.

12.3.5 Post Combined license Activities

The post COL activities related to the RPP are discussed in Section 12.5.5 of this report.

12.3.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements. In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable. The staff based its conclusion on the relevant acceptance criteria provided in Section 12.3-12.4 of NUREG-0800 and on the following:

- PTN DEP 6.4-1, related to design changes affecting habitability of the main control room and changes to the calculated doses to control room operators, is reviewed and found acceptable by the staff in Section 21.2 of this SER.
- PTN DEP 18.8-1, in which the applicant proposed to relocate the OSC from the location described in the AP 1000 DCD Section 12.5.2.2, is acceptable from a radiation design features perspective. The location of the OSC does not have an impact on the radiation protection facilities design. The ALARA briefing room remains as stated in the AP1000 DCD, so there is no impact on radiation protection facilities, programs or functions.
- STD COL 12.3-1, which addresses the administrative controls for use of the design features provided to control access to radiological restricted areas, is acceptable because the applicant has incorporated the approved reference NEI 07-03A into the Turkey Point Units 6 and 7 COL FSAR and meets the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this SER.
- STD COL 12.3-2, which addresses the criteria and methods for obtaining representative measurement of radiological conditions, including airborne radioactivity concentrations in work areas, is acceptable because the applicant has demonstrated compliance with the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this SER.
- STD COL 12.3-3 and PTN SUP 11.2-1, which address the groundwater monitoring program beyond the normal radioactive effluent monitoring program, are acceptable because the applicant has incorporated the approved reference NEI 08-08A into the Turkey Point Units 6 and 7 COL FSAR in order to

demonstrate conformance with the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this SER.

- STD COL 12.3-4, which addresses the program to ensure documentation of operational events deemed to be of interest for decommissioning, is acceptable because the applicant has incorporated the approved reference NEI 08-08A into the Turkey Point Units 6 and 7 COL FSAR in order to demonstrate conformance with the applicable regulatory requirements and guidance specified in Sections 12.3.3 and 12.3.4 of this report.

12.4 Dose Assessment

12.4.1 Introduction

This section addresses the issues related to estimating the annual personnel doses associated with operation, normal maintenance, radwaste handling, refueling, in-service inspection and special maintenance (e.g., maintenance that goes beyond routine scheduled maintenance, modification of equipment to upgrade the plant, and repairs to failed components), and construction.

12.4.2 Summary of Application

Turkey Point Units 6 and 7 COL FSAR, Revision 8, Section 12.4, incorporates by reference Section 12.4 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 12.4, the applicant provided the following:

Supplemental Information

- STD SUP 12.4-1

The applicant provided supplemental information to address dose to construction workers by adding new sections after AP1000 DCD Section 12.4.1.8.

- STD SUP 12.4-1

The applicant provided supplemental information regarding conduct of radiological surveys in unrestricted and controlled areas and for radioactive materials in effluents discharged to unrestricted and controlled areas.

12.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the dose assessment are given in NUREG-0800, Section 12.4.

The applicable regulatory requirements for PTN SUP 12.4-1 and STD SUP 12.4-1 are as follows:

- 10 CFR 20.1101, "Radiation Protection Programs"
- 10 CFR 20.1301, "Dose limits for individual members of the public"
- 10 CFR 20.1302, "Compliance with dose limits for individual members of the public"

12.4.4 Technical Evaluation

The staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 12.4 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information contained in the application and incorporated by reference addresses the required information relating to dose assessment. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content material is identified in this SER by use of italicized, double-indented formatting.

The staff reviewed the information contained in the Turkey Point Units 6 and 7 COL FSAR:

Supplemental Information

- PTN SUP 12.4-1

The applicant provided supplemental information regarding dose to construction workers in Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9 (Sections 12.4.1.9.1 through 12.4.1.9.6), "Dose to Construction Workers." Turkey Point Units 6 and 7, Section 12.4.1.9.1,

"Site Layout," describes the site layout as depicted in Turkey Point Units 6 and 7 COL FSAR, Figure 2.1203.

Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9.2, "Radiation Sources," describes the sources of radiation that will be encountered by construction workers. Turkey Point Units 6 and 7 construction workers will be exposed to direct radiation and gaseous effluents from the operation of existing Turkey Point Units 3 and Unit 4. Turkey Point Unit 7 construction workers could also be exposed to direct radiation and gaseous effluent from Unit 6 once Unit 6 becomes operational. The applicant stated that, on the basis of operational environmental thermoluminescent detector (TLD) measurements, direct radiation from the existing operating units (Turkey Point Units 3 and 4) to Turkey Point Units 6 and 7 is negligible. The applicant also stated that the exposure to Units 6 and 7 construction workers from a proposed Independent Spent Fuel Storage Installation (ISFSI) will be negligible. Based on analysis described in AP1000 DCD Section 12.4.2, the applicant stated that direct exposure to Turkey Point Unit 7 construction workers from the Turkey Point Unit 6 containment and other plant buildings is considered negligible.

To evaluate the applicant's statement that direct radiation from Turkey Point Units 3 and 4 is negligible, the staff issued RAI 31, Question 12.4.1.9.2-1 to request additional information, such as TLD data, measurement locations and dates. In an August 19, 2011, response to RAI 31, Question 12.4.1.9.2-1, the applicant provided the requested TLD data. This RAI response showed that the Turkey Point site pre-operational (1970 – 1971) direct radiation exposures (as measured by TLD) were similar to the exposures received after Turkey Point Units 3 and 4 became operational. Based on this information, the staff agrees that the potential direct radiation component of Units 6 and 7 construction worker exposures from the existing units will be negligible.

The applicant stated that construction workers will be exposed to routine gaseous effluents from Turkey Point Units 3 and 4. The applicant used the annual effluent reports from Units 3 and 4 to estimate the gaseous effluent doses from these units. Additionally, Turkey Point Unit 7 construction workers will be exposed to gaseous effluents released from Unit 6. The source term from these effluents is listed in the AP1000 DCD, Table 11.3-3.

The applicant stated that construction workers receive no exposure from the liquid effluent pathway since potable water is provided from an external source that is unaffected by the liquid discharge from Turkey Point Unit 6 or operating Units 3 and 4. The staff issued RAI 31, Question 12.4.1.9.2-2 to request that the applicant provide additional information concerning potential worker exposures to liquid effluents, specifically during activities related to the installation of liquid effluent discharge lines for Turkey Point Units 6 and 7. In an August 19, 2011, response to RAI 31, Question 12.4.1.9.2-2, the applicant stated that, during Turkey Point Unit 7 construction, any work involving contaminated Unit 6 liquid waste effluent discharge piping connections would be performed by trained and qualified radiation workers from Turkey Point Unit 6. The applicant revised Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9.2 to address this issue. The staff reviewed the RAI response and agrees that there is no exposure to Turkey Point Unit 7 construction workers from the liquid effluent pathway.

In Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9.3, "Construction Worker Dose Estimates," the applicant stated that although there has been no measurable direct radiation component from Turkey Point Units 3 and 4, and the calculated dose rate from the planned

ISFSI is only 0.009 millirem (mrem) ($9\text{E-}5$ millisievert (mSv)) per year, the applicant assumes a direct radiation dose rate of 1 mrem (0.01 mSv) per year per unit in the Units 6 and 7 construction area.

The staff notes that the applicant's assumption that construction workers would receive a direct radiation exposure of 1 mrem (0.01 mSv) per year per unit from the existing units is a reasonable and conservative assumption, based on the results of direct radiation measurements (TLD data). This exposure, adjusted by the assumed construction worker occupancy time, is used to estimate the annual construction worker direct radiation exposure from the existing units. The Turkey Point Units 6 and 7 COL FSAR, however, did not provide any basis for the calculated exposure of 0.009 mrem ($9\text{E-}5$ mSv) per year from the loaded ISFSI. Therefore, in RAI 31, Question 12.4.1.9.3-1, the staff requested that the applicant provide additional information to validate the calculated construction worker exposure from this potential pathway. In an August 19, 2011, response to RAI 31, Question 12.4.1.9.3-1, the applicant stated that the ISFSI is assumed to be fully loaded with 52 horizontal storage modules, each containing design basis pressurized water reactor (PWR) fuel. Turkey Point Units 6 and 7 are at least 914.4 m (3000 ft) from the ISFSI. Using Monte Carlo N-Particle Transport Code, Version 5 (MCNP5), the applicant calculated that the construction workers at Units 6 and 7 would be exposed to a dose rate of approximately 0.009 mrem ($9\text{E-}5$ mSv) per year from the planned ISFSI. The applicant's August 19, 2011, response to RAI 31, Question 12.4.1.9.3-1, stated that the detailed calculations performed to model the dose rates from the ISFSI are described in the applicant's electronic reading room. The staff performed an audit (ADAMS Accession No. ML15124A949, April 30, 2015) of these calculations and determined that the results are reasonable and acceptable. Compared to the direct radiation exposure to the Turkey Point Units 6 and 7 construction workers of 1 mrem (0.01 mSv) per year per unit from Turkey Point Units 3 and 4, the calculated annual dose of 0.009 mrem ($9\text{E-}5$ mSv) from the ISFSI is considered negligible. Adjusting for construction worker residence time, the applicant calculated (see Turkey Point Units 6 and 7 COL FSAR Table 12.4-201) a total direct radiation dose to the construction workers from Turkey Point Units 3 and 4 of 0.47 mrem ($4.7\text{E-}3$ mSv) per year. An independent evaluation by the staff produced comparable results.

In an October 22, 2014, supplemental response to RAI 31, Question 12.4.1.9.3-1, the applicant increased the storage capacity of the ISFSI from 52 spent fuel storage modules to 66 storage modules. This increase in the number of spent fuel storage modules in the ISFSI results in an increase in the dose rate to Units 6 and 7 construction workers from approximately 0.009 mrem ($9\text{E-}5$ mSv) per year to approximately 0.013 mrem ($1.3\text{E-}4$ mSv) per year. Although this revised dose rate is based on a fully loaded ISFSI containing 66 storage modules, the applicant stated that the ISFSI will be loaded with a maximum of only 38 storage modules during the construction of Turkey Point Unit 7. This revised dose of 0.013 mrem ($1.3\text{E-}4$ mSv) per year is still considered negligible compared to the combined direct radiation exposure from Units 3 and 4 to Units 6 and 7 construction workers of 2 mrem (0.02 mSv) per year. Therefore, the total direct radiation dose to construction workers from Turkey Point Units 3 and 4, adjusted for construction worker residence time, remains unchanged at 0.47 mrem ($4.7\text{E-}3$ mSv) per year.

The Turkey Point Units 6 and 7 COL FSAR states that construction worker doses from gaseous effluents from Turkey Point Units 3 and 4 were estimated from annual release reports, but did not identify the details of this estimation, such as which annual reports were used, what source term was used, the location of the calculated exposure or the dispersion and deposition parameters. To ascertain how the applicant determined the potential construction worker

exposure from gaseous effluents from Turkey Point Units 3 and 4, in RAI 31, Question 12.4.1.9.3-3, the staff requested that the applicant provide additional details on the assumptions used to calculate this exposure, including the applicable annual reports, assumed source terms, locations and assumed dispersion and deposition factors. In August 19, 2011, and October 22, 2014, responses to RAI 31, Question 12.4.1.9.3-3, the applicant stated that the gaseous effluent doses from Turkey Point Units 3 and 4 are the maximum values from the annual effluent reports for 2004 to 2008, adjusted for the annual construction worker occupancy of 2080 hours per year. The resulting annual estimated dose from gaseous effluent releases from Turkey Point Units 3 and 4 is 0.0023 mrem ($2.3\text{E-}5$ mSv). The RAI response stated that the data and the detailed calculations to determine the construction worker dose for the gaseous effluents for Turkey Point Units 3 and 4 are described in the applicant's electronic reading room. The staff performed an audit (ADAMS Accession No. ML15124A949) of this information and found that the calculation assumptions and methodology were appropriate and acceptable. Additionally, the staff performed an independent evaluation of the assumed construction worker exposure as a result of Turkey Point Units 3 and 4 gaseous effluents and determined that the applicant's assessment (0.0023 mrem ($2.3\text{E-}5$ mSv) per year, as indicated in Turkey Point Units 6 and 7 COL FSAR Table 12.4-201) is reasonable.

The Turkey Point Units 6 and 7 COL FSAR identifies the pathways and basic assumptions used to calculate the construction worker exposure from Turkey Point Unit 6 gaseous effluents. However, Turkey Point Units 6 and 7 COL FSAR did not provide the calculational details or the estimated Turkey Point Unit 7 construction worker exposure due to gaseous effluents from Unit 6 operation. Therefore, in RAI 34, Question 12.4.1.9.3-2, the staff requested that the applicant provide additional information on the subject. In an August 19, 2011, response to RAI 31, Question 12.4.1.9.3-2, the applicant referenced the Turkey Point Units 6 and 7 COL FSAR tables that contained the requested input information used for the dose calculation. In addition, the applicant amended the Turkey Point Units 6 and 7 COL FSAR to add Table 12.4-201, which summarizes the source, pathway and calculated dose to construction workers. The applicant estimated that the Turkey Point Unit 7 construction workers would receive an annual dose of 5.5 mrem (0.055 mSv), corrected for worker occupancy, from gaseous effluents from Turkey Point Unit 6. The staff verified that the calculation assumptions and methodology were appropriate. Additionally, the staff performed an independent evaluation of the assumed Turkey Point Unit 7 construction worker exposure as a result of Unit 6 gaseous effluents and concluded that the applicant's assessment of 5.5 mrem (0.055 mSv) per year to Turkey Point Unit 7 construction workers, per Turkey Point Units 6 and 7 COL FSAR Table 12.4-201, is reasonable.

In Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9.4, "Compliance with Dose Regulations," the applicant stated that the construction workers are considered to be members of the public and, therefore, are limited by 10 CFR 20.1301, to an annual dose of 100 mrem (1 mSv) and 2 mrem (0.02 mSv) in any one hour. The applicant also committed to comply with the requirements of 10 CFR 20.1302 and 10 CFR Part 50, Appendix I, which govern dose rates to members of the general public.

In Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9.5, "Collective Doses to Unit 7 Workers," the applicant stated assumptions for the estimated maximum number of construction workers onsite per year and their annual exposure time, which result in a calculated total worker collective dose of 17 person-rem (0.17 person-Sv) per year. As a result of a discrepancy noticed between information provided in Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9.5 and the estimated construction worker dose shown in Turkey Point Units 6

and 7 FSAR Table 12.4-201, the staff issued RAI 31, Question 12.4.1.9.5-2. In an August 19, 2011, response to RAI 31, Question 12.4.1.9.5-2, the applicant changed the estimated annual construction worker peak loading from 2600 to 2800 workers to make the information in Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9.5 consistent with the information in Turkey Point Units 6 and 7 COL FSAR Table 12.4-201. The staff finds the applicant's response to this RAI acceptable and, therefore, considers this RAI resolved.

Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9.5 also refers to Turkey Point Units 6 and 7 COL FSAR Table 12.4-202, where the results of the dose assessments are presented and compared to the applicable regulatory limits. Turkey Point Units 6 and 7 COL FSAR Table 12.4-202 states that the total estimated individual construction worker dose is 6.0 mrem (0.06 mSv) per year with a maximum dose in any one hour of 2.9E-03 mrem (2.9E-5 mSv). Since both of these worker dose estimates are within the public dose limits specified in 10 CFR 20.1301, the staff finds these worker dose estimates acceptable and, therefore, considers this RAI resolved.

The staff finds that the information provided in PTN SUP 12.4-1, regarding dose to construction workers, in Turkey Point Units 6 and 7 COL FSAR Section 12.4.1.9, is acceptable, for the reasons described above. On the basis of the reasons discussed in the above paragraphs, the staff finds the applicant's responses to RAI 31, Questions 12.4.1.9.2-1, 12.4.1.9.2-2, 12.4.1.9.3-1, 12.4.1.9.3-2, 12.4.1.9.3-3, and 12.4.1.9.5-2 acceptable and, therefore, considers this RAI resolved.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.4.4

- *STD SUP 12.4-1*

The applicant provided supplemental information regarding conduct of radiological surveys in unrestricted and controlled areas and for radioactive materials in effluents discharged to unrestricted and controlled areas. The supplemental text states that these surveys are conducted by the operating unit for the purposes of implementing 10 CFR 20.1302 and to demonstrate compliance with the standards of 10 CFR 20.1301 for construction workers. This text is acceptable because it is consistent with applicable regulatory requirements.

12.4.5 Post Combined License Activities

There are no post COL activities related to this section.

12.4.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable based on the relevant acceptance criteria provided in NUREG-0800, Section 12.3-12.4. The staff based its conclusion on the following:

- PTN SUP 12.4-1, which provides supplemental information to address dose to construction workers, is acceptable because the applicant has demonstrated compliance with the applicable requirements of 10 CFR 20.1101; 10 CFR 20.1301; 10 CFR 20.1302; and the applicable acceptance criteria provided in NUREG-0800, Section 12.3-12.4.
- STD SUP 12.4-1, which provides supplemental information regarding conduct of radiological surveys in unrestricted and controlled areas and for radioactive materials in effluents discharged to unrestricted and controlled areas is acceptable because the applicant has demonstrated compliance with the applicable requirements of 10 CFR 20.1301 and 10 CFR 20.1302.

12.5 Health Physics Facilities Design (Related to RG 1.206, Section C.III.1, Chapter 12, C.I.12.5, “Operational Radiation Protection Program”)

12.5.1 Introduction

This section addresses the objectives and design of the health physics (HP) facilities. The HP facilities are designed with the objectives of the following:

- Providing capability for administrative control of the activities of plant personnel to limit personnel exposure to radiation and radioactive materials ALARA and within the requirements of 10 CFR Part 20.
- Providing capability for administrative control of effluent releases from the plant to maintain the releases ALARA and within the limits of 10 CFR Part 20 and the plant Technical Specifications.

12.5.2 Summary of Application

Turkey Point Units 6 and 7 COL FSAR, Revision 8, Section 12.5, incorporates by reference AP1000 DCD, Revision 19, Section 12.5.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 12.5, the applicant provided the following:

Tier 2 Departure

- PTN DEP 18.8-1

The applicant described the following Tier 2 departure from the AP1000 DCD. The AP1000 DCD states that the ALARA briefing room and OSC share the same location in the Annex Building. The applicant proposed to move the OSC from the location identified in the AP1000

DCD to a location described in the Emergency Plan and revise the AP1000 DCD Section 12.5.2.2 to exclude the reference to the OSC.

AP1000 COL Information Item

- STD COL 12.3-1

The applicant added additional information in STD COL 12.3-1 to resolve COL information item 12.3-1, which addresses the administrative controls for use of the design features provided to control access to radiologically restricted areas. This information pertains to the possible installation of a closed circuit television system in high radiation areas to allow remote monitoring of individuals entering high radiation areas by personnel qualified in radiation protection procedures

Although a sentence describing the possible use of such a system appears in Section 12.5.4 of the Turkey Point Units 6 and 7 COL FSAR, it is also addressed in Turkey Point Units 6 and 7 COL FSAR Section 12.3.5.1. The staff's evaluation of this STD COL item is addressed in Section 12.3.4 of this SER.

- STD COL 12.5-1

The applicant provided additional information in STD COL 12.5-1 to resolve COL Information Item 12.5-1 (COL Action Item 12.6-1), which addresses the RPP description.

License Conditions

- Part 10, License Condition 3, Items C.1, D.2, G.4, and K.1

The actual milestones for the RPP are listed in Turkey Point Units 6 and 7 COL FSAR Table 13.4-201.

- Part 10, License Condition 6, Operational Program Readiness

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs including the RPP.

12.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the HP facilities design are given in NUREG-0800, Section 12.5.

The applicable regulatory requirements and guidance for STD COL 12.5-1 are as follows:

- 10 CFR Part 20
- RG 8.2, Revision 0

- RG 8.4, "Direct Reading and Indirect Reading Pocket Dosimeters," Revision 0
- RG 8.6, "Standard Test Procedures for Gieger-Muller Counters," Revision 0
- RG 8.8, Revision 3
- RG 8.9, Revision 1
- RG 8.10, Revision 1
- RG 8.28, "Audible-Alarm Dosimeters," Revision 0
- NUREG-1736, "Consolidated Guidance: 10 CFR Part 20-Standards for Protection Against Radiation"

The applicable regulatory requirement for License Condition 3, Items C.1, D.2, G.4, and K.1 is as follows:

- 10 CFR 20.1101

12.5.4 Technical Evaluation

The staff reviewed Turkey Point Units 6 and 7 COL FSAR Section 12.5 and checked the referenced DCD to ensure that the combination of the DCD and the COL application represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information contained in the application and incorporated by reference addresses the required information relating to the HP facilities design. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the staff to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COL applications. To ensure that the staff's findings on standard content that were documented in the SER for the reference COL application (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COL application, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COL application, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COL application. This standard content

material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COL application (VEGP) contains evaluation material from the SER for the BLN Units 3 and 4 COL application.

The staff reviewed the information contained in the Turkey Point Units 6 and 7 COL FSAR:

Tier 2 Departure

- PTN DEP 18.8-1

The location of the OSC for Turkey Point Units 6 and 7 differs from the OSC location described in the AP1000 DCD. Therefore, the applicant proposed to eliminate the reference to the OSC that appears in the first sentence of AP1000 DCD Section 12.5.2.2. The applicant proposed to revise the text in the first sentence of AP1000 DCD Section 12.5.2.2 to read: "The ALARA briefing room is located off the main corridor immediately beyond the main entry to the annex building."

This departure is acceptable to the staff insofar as the HP facility design is concerned because the location of the OSC does not have an impact on the radiation protection facilities design. The location of the ALARA briefing room remains as stated in the AP1000 DCD, so there is no impact on radiation protection facilities, programs or functions. The staff's evaluation of the OSC relocation on emergency preparedness is addressed in Section 13.3 of this SER and the evaluation on human system interface design is addressed in Section 18.8 of this SER.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.5.4

The following portion of this technical evaluation section is reproduced from Section 12.5.4 of the BLN SER:

AP1000 COL Information Item

- STD COL 12.5-1

The applicant provided additional information in STD COL 12.5-1, addressing the RPP description, to resolve COL Information Item 12.5-1. COL Information Item 12.5-1 states:

The Combined License applicant will address the organization and procedures used for adequate radiological protection and to provide methods so that personnel radiation exposures will be maintained ALARA.

The same commitment was also captured as COL Action Item 12.6-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793). The applicant stated that STD COL 12.5-1 is addressed in Appendix 12AA of the BLN COL FSAR. This appendix incorporates by reference NEI 07-03, Revision 3. The applicant described revisions to NEI 07-03 and supplemental information in Appendix 12AA of the BLN COL FSAR. The staff evaluated the revised text and

supplemental information provided in conjunction with the referenced NEI 07-03, Revision 3 template. These revisions and supplements address STD COL Items 12.1-1, 12.3-1, 12.3-3, 12.3-4, and 12.5-1. The applicant's proposed revisions and supplements are:

- 1. Specific organizational positions were described in Chapter 13 of BLN COL FSAR; and Sections 12.5.2.1 through 12.5.2.5 are not incorporated in Appendix 12AA.*
- 2. Facilities, as described in general terms in NEI 07-03, Revision 3 are not incorporated in BLN COL FSAR Appendix 12AA; facilities, instrumentation, and equipment are described in DCD Section 12.5.2.*
- 3. Supplemental information was provided for NEI 07-03, Section 12.5.3.3 to describe compliance with 10 CFR 20.1703(b) and 10 CFR 20.1705 when National Institute for Occupational Safety and Health (U.S. Public Health Service) tested and certified respiratory protection equipment is not used.*
- 4. The following headings and associated material that are described in general terms in NEI 07-03, Revision 3 are not incorporated in Appendix 12AA. Radwaste Handling, Spent Fuel Handling, Normal Operation, and Sampling are described in DCD Section 12.5.3.*
- 5. Supplemental information was provided for NEI 07-03, Section 12.5.4.4 [12.5.4.2 is the correct section number] to describe the use of a closed circuit television system to allow remote monitoring for high radiation areas access.*
- 6. Supplemental information was provided for NEI 07-03, Section 12.5.4.4 to describe access control measures for very high radiation areas. Locations and radiological controls of the radiation zones are described on plant diagrams in DCD Section 12.5.3.*
- 7. Appendix 12AA revised NEI 07-03, Section 12.5.4.7 to clarify the location of the COL applicant's management policy, organizational responsibility authorities for implementing an effective ALARA program, and the establishment and implementation of radiation protection.*
- 8. The applicant revised the second bullet of NEI 07-03, Section 12.5.4.7 II to require that the functional manager in charge of radiation protection be responsible for defining the value for "Significant exposures" and the associated activities within written procedures. The example value described in NEI 07-03 includes activities that are estimated to involve greater than 1 person-rem of collective dose.*
- 9. The COL applicant added text after the last bullet of NEI 07-03, Section 12.5.4.8 to adopt NEI 08-08 that is currently under review by the NRC staff.*

10. The COL applicant added information to NEI 07-03, Section 12AA.5.4.14 and Section 12AA.5.4.15 [sic] to adopt NEI 08-08 that is currently under review by the NRC staff.

The applicant describes the exceptions and supplemental information to NEI 07-03 that reference additional design and site-specific information necessary to clearly identify the source of the information addressed in the RPP as described in Appendix 12AA. The applicant's description provides sufficient detailed information supporting the exceptions or revisions such that the information described provides clear direction as to organizational structure, facilities, management policy for ALARA, and where the threshold for significant with exposures will be described. The NRC staff agrees that the applicant's exceptions to NEI 07-03, noted above are acceptable because these exceptions and the supplemental information satisfy the regulatory requirements of 10 CFR 20.1106 (b), the acceptance criteria of Sections 12.1 and 12.5 of NUREG-0800 and the regulatory guidance in RG 8.8, Position C.1.b, RG 8.9, and RG 8.10, Positions C.1.a, and C.2.

The applicant added Appendix 12AA, "Appendix 12AA, Radiation Protection Program Description," after Section 12.5 of the DCD. In this appendix the applicant incorporates by reference NEI 07-03, Revision 3. The applicant indicated that Table 13.4-201 provides milestones for radiation protection operational program implementation.

The NRC staff reviewed STD COL 12.5-1 dealing with the RPP description in BLN COL FSAR Appendix 12AA. The additional controls described in STD COL 12.5-1 are consistent with the discussion in NUREG-1736 regarding Bioassay programs for personnel monitoring and are consistent with the applicant's commitment to RG 8.9. The staff reviewed the threshold for determining significant exposures. The applicant stated that the functional manager in charge of radiation protection determines the threshold within procedures. Initially, the staff did not consider that the applicant exercised sufficient control related to maintaining ALARA (RAI 12.5-1).

*In response to RAI 12.5-1, in a letter dated September 22, 2008, the applicant provided additional information that the final NEI 07-03 template (Revision 7) would be incorporated without departure concerning significant exposures. In a letter dated March 18, 2009 (ML090510379), the NRC accepted NEI 07-03, Revision 7. Specifically, the NRC staff indicated that for COL applications, NEI 07-03, Revision 7 provides an acceptable template for assuring that the RPP meets the applicable regulations and guidance. Since the BLN COL FSAR has not yet adopted the approved version of the NEI template, this is identified as **Confirmatory Item 12.1-1**.*

The NRC staff reviewed Revision 0 of the BLN COL FSAR Appendix 1AA, which listed the applicant's conformance with radiation protection related RGs. The applicant stated that it will conform in general to RG 8.28, "Audible Alarm Dosimeters," Revision 0, dated August 1981, and specifically stated that it conforms to ANSI N13.7-1981, which was reaffirmed in 1992. ANSI N13.7-1983

is the "American National Standard for Radiation Protection-Photographic Film Dosimeters Criteria for Performance." RG 8.28, Revision 0, endorsed ANSI N13.27-1981, "Performance Specifications for Pocket-Sized Alarming Dosimeters/Ratemeters." This discrepancy was identified in RAI 1-10. In response to RAI 1-10, the applicant stated that BLN COL FSAR Appendix 1AA would be revised to the correct reference of the ANSI standard in a future revision of the BLN COL FSAR. The NRC staff verified that Revision 1 of the BLN COL FSAR adequately addresses the proposed change. As a result, RAI 1-10 is closed.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.5.4:

*The staff notes that the VEGP FSAR has not been updated to correct the discrepancy identified in RAI 1-10 regarding the reference to ANSI N13.27-1981. Revision 2 of the VEGP FSAR currently references the incorrect standard, ANSI N13.7-1981, under RG 8.28 in Appendix 1AA. Since the VEGP applicant has endorsed RAI 1-10, the staff expects this discrepancy to be corrected in a future revision of the VEGP FSAR. This is **VEGP Confirmatory Item 12.5-2**.*

Correction of Error in the Standard Content Evaluation Text

The NRC staff identified two errors in the text reproduced above from the BLN SER, Section 12.5.4 that require correction. In the change numbered 5 above, the reference to "NEI 07-03, Section 12.5.4.4," is incorrect. The correct reference is to "NEI 07-03, Section 12.5.4.2." In the change numbered 10, above, the reference to "Section 12AA.5.4.14 and Section 12AA.5.4.15" is incorrect. The correct reference is to "Section 12.5.4.14 and Section 12.5.4.15."

Resolution of Standard Content Confirmatory Item 12.1-1

The NRC staff compared the VEGP and BLN COL applications regarding STD COL 12.5-1, and found them to be essentially identical, with the exception that VEGP FSAR Appendix 12AA references NEI 07-03A and BLN FSAR Appendix 12AA references Revision 3 of NEI 07-03. Additional clarifying information has been added to the VEGP FSAR regarding STD COL 12.5-1, which is discussed below. As indicated in Section 12.1.4 above, Confirmatory Item 12.1-1, is resolved for VEGP because the applicant has adopted the approved version of NEI 07-03, which is now designated as NEI 07-03A.

In Revision 2 of the FSAR, the applicant modified parts of FSAR Chapter 12, Appendix 12AA, that relate to STD COL 12.5-1. The changes are as follows:

1. *Text describing a closed circuit television system associated with high radiation areas has been moved from Appendix 12AA to Section 12.5.2.2 (this text is associated with STD COL 12.3-1, and is evaluated in Section 12.3.4 of this SER).*

2. *References in NEI 07-03A have been revised to reflect the appropriate sections of the FSAR.*
3. *Proposed modifications to the second bullet of NEI 07-03, Section 12.5.4.7 have been withdrawn.*
4. *Bullet number 3 of NEI 07-03A, Section 12.5, has been revised to address aspects of the radiation program functional areas that must be in place at various milestones.*
5. *A cross reference to NEI 08-08A has been added in NEI 07-03A.*
6. *The first paragraph of Section 12.5.4.12 of NEI 07-03A has been revised to address 10 CFR 20.1101 and the Quality Assurance Program.*

Items 1, 2, and 5 are acceptable because they are editorial and do not affect content. The change described in Item 3 is acceptable because NEI 07-03A is acceptable without modification. The changes described in Item 4 are acceptable because they are consistent with the milestones described in FSAR Table 13.4-201 and with applicable regulatory requirements. The changes described in Item 6 are acceptable because they are consistent with 10 CFR 20.1101 and the Quality Assurance Program described in FSAR Section 17.5.

Resolution of VEGP Confirmatory Item 12.5-2

Turkey Point Units 6 and 7 COL FSAR, Appendix 1AA correctly references ANSI N13.27-1981 under the conformance discussion of RG 8.28. Therefore, the staff considers VEGP Confirmatory Item 12.5-2 resolved for the Turkey Point Units 6 and 7 COL application.

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.5.4:

Exceptions to RGs 8.2, 8.4, 8.6, and Section C.3.b of RG 8.8

The following portion of this technical evaluation section is reproduced from Section 12.5.4 of the BLN SER.

The applicant took exception to RG 8.2, "Guide for Administrative Practices in Radiation Monitoring," regarding a reference to a previous version of 10 CFR Part 20 (10 CFR 20.401), because it is no longer valid. The staff agrees with the applicant's exception.

The applicant took exception to RG 8.4, "Direct Reading and Indirect Reading Pocket Dosimeters," regarding references to previous versions of 10 CFR Part 20 (10 CFR 20.202(a), and 10 CFR 20.401) because they are no longer valid. The staff agrees with the applicant's exception. The applicant also took exception to ANSI N13.5-1972 (R-1989), in that two performance criteria, accuracy and leakage, specified in the guidance, are to be met by acceptance standards in ANSI N322-1997, "ANSI Test, Construction, and Performance

requirements for Direct Reading Electrostatic/Electroscope Type Dosimeters." The staff finds that by using ANSI N322-1997 for performance criteria, 10 CFR 20 requirements are still met, as the major change is the allowance of an additional one percent leakage over a comparable time period. Test and calibration intervals recommended by RG 8.4 are not affected.

The applicant took exception to RG 8.6, "Standard Test Procedures for Geiger Mueller Counters," to reference an instrument calibration program based upon ANSI Criteria N323A-1997 (with 2004 Correction Sheet), "Radiation Protection Instrumentation Test and Calibration, Portable Survey Instruments." This methodology is acceptable over the previous program referenced in RG 8.6 because the ANSI standard reflects current industry practices. The staff agrees with the applicant's position.

The applicant took exception to part of Position C.3.b in RG 8.8, "Information Relevant to Ensuring that Occupational Radiation Exposure at Nuclear Power Stations will be ALARA." This exception was to the reporting requirements associated with operating exposure. The applicant's basis for justifying the exception to RG 8.8, Position C.3.b, is that reporting of operating exposure information is no longer required. The staff agrees with the applicant's exception to RG 8.8, Position C3.b, because this specific reporting requirement has been superseded. All licensees are now required to report records of ionizing exposure to the NRC annually in accordance with 10 CFR 20.2206.

License Condition

- License Condition 3, Items C.1, D.2, G.4, and K.1

Implementation milestones were provided by the applicant to address the RPP required by 10 CFR 20.1101. A phased-in implementation should include appropriate milestones in the construction of the facility. Staffing levels, equipment, facilities, and procedures necessary to ensure radiation safety of the workers and public for each phase of implementation should be identified. In RAI 12.5-2, the staff requested that the applicant provide the specific programs to be implemented at each milestone identified in Table 13.4-201 of the BLN COL FSAR. In its response to the RAI, the applicant provided clarifying information regarding Table 13.4-201.

*In a supplemental response to RAI 12.5-2, dated December 16, 2008, the applicant provided a proposed revision to BLN COL FSAR Table 13.4-201 to show the specific program(s) for each milestone and assignment of a Radiation Protection Manager and Supervisor. The proposed change to BLN COL FSAR Table 13.4-201 is acceptable subject to a formal revision to the BLN COL FSAR, based on the specific commitment to establish an individual responsible for each milestone. Accordingly, this is identified as **Confirmatory Item 12.5-1**.*

The following portion of this technical evaluation section is reproduced from VEGP SER Section 12.5.4:

Resolution of Standard Content Confirmatory Item 12.5-1

The NRC staff verified that the VEGP FSAR was updated to include the information identified in the initial and supplemental BLN response to RAI 12.5-2. Accordingly, Standard Content Confirmatory Item 12.5-1 is resolved for the VEGP COL FSAR.

- *Part 10, License Condition 6, Operational Program Readiness*

The applicant proposed a license condition to provide a schedule to support NRC inspection of operational programs, including the RPP. The proposed license condition is consistent with the policy established in SECY-05-0197, "Review of Operational Programs in a Combined License Application and General Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," and is acceptable.

12.5.5 Post Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated April 8, 2016 (ADAMS Accession No. ML16103A507), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following license conditions acceptable:

- License Condition (12-1) – The licensee shall implement the Radiation Protection Program (RPP) (including the ALARA principle) or applicable portions thereof (as identified in FSAR Section 12.5) as described in the milestones below:
 1. RPP features (including the ALARA principle) applicable to receipt of by-product, source, or special nuclear materials (excluding exempt quantities as described in 10 CFR 30.18) implemented before initial receipt of such materials;
 2. RPP features (including the ALARA principle) applicable to new fuel implemented before receipt of initial fuel on site;
 3. All other RPP features (including the ALARA principle) except for those applicable to control radioactive waste shipment implemented before initial fuel load;
 4. RPP features (including the ALARA principle) applicable to radioactive waste shipment implemented before first shipment of radioactive waste;
- License Condition (12-2) – No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors a schedule that supports planning for and conduct of NRC inspections of the operational program (RPP). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until this operational program has been fully implemented.

12.5.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COL application are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable based on the relevant acceptance criteria provided in NUREG-0800, Section 12.5. The staff based its conclusion on the following:

- STD COL 12.5-1, which addresses the RPP description, is acceptable because the applicant incorporates NEI 07-03A into the Turkey Point Units 6 and 7 COL FSAR in order to meet the applicable regulatory requirements and guidance specified in Sections 12.5.3 and 12.5.4 of this SER.
- PTN DEP 18.1-1, in which the applicant proposes to relocate the OSC from the location described in the AP1000 DCD Section 12.5.2.2, is acceptable insofar as the HP facility is concerned because the location of the OSC does not have an impact on the radiation protection facilities design. The ALARA briefing room remains as stated in the AP1000 DCD, so there is no impact on radiation protection facilities, programs or functions.

13.0 CONDUCT OF OPERATIONS

13.1 Organizational Structure of Applicant

13.1.1 Introduction

The organizational structure includes the design, construction, and preoperational responsibilities of the applicant organizations described in the applicant's final safety analysis report (FSAR). The management and technical support organization includes a description of the corporate or home office organization, its functions and responsibilities, and the number and the qualifications of personnel. Its activities include facility design, design review, design approval, construction management, testing, and operation of the plant. The descriptions of the design, and construction and preoperational responsibilities include the following:

- how these responsibilities are assigned by the headquarters staff and implemented within the organizational units
- the responsible working- or performance-level organizational unit
- the estimated number of persons to be assigned to each unit with responsibility for the project
- the general educational and experience requirements for identified positions or classes of positions
- early plans for providing technical support for the operation of the facility

This section also describes the structure, functions, and responsibilities of the onsite organization established to operate and maintain the plant.

13.1.2 Summary of Application

Section 13.1 of the Turkey Point Units 6 and 7 combined license (COL) FSAR, Revision 8, incorporates by reference Section 13.1 of the AP1000 design control document (DCD), Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 13.1, the applicant provided to the U.S. Nuclear Regulatory Commission (NRC) the following:

AP1000 COL Information Items

- PTN COL 13.1-1

The applicant provided additional information in PTN COL 13.1-1 to resolve COL Information Item 13.1-1 (COL Action Item 13.1-1). COL Information Item 13.1-1 states the COL applicant will address the adequacy of its organizational structure. 10 CFR 50.33 requires this information. PTN COL 13.1-1 describes organizational positions of the nuclear power station and owner/applicant corporations and associated functions and responsibilities. Table 1.8-202, "COL Item Tabulation," provides PTN COL 13.1-1 cross-references.

- PTN COL 9.5-1

The applicant provided additional information in PTN COL 9.5-1, describing the fire protection program in Section 9.5.1.8. PTN COL 9.5-1 is addressed under Section 13.1.1.2.10, "Fire Protection" and Section 13.1.2.1.3.9, "Fire Protection Supervisor and Fire Protection Engineer." Table 1.8-202, "COL Item Tabulation," provides PTN COL 9.5-1 cross-references.

- PTN COL 18.6-1

The applicant provided additional information in PTN COL 18.6-1, describing the qualifications of the nuclear plant technical support personnel. PTN COL 18.6-1 is addressed under Section 13.1.1.4, "Qualifications of Technical Support Personnel"; Section 13.1.3.1, "Minimum Qualification Requirements"; Section 13.1.3.2, "Qualification Documentation"; Table 13.1-201, "Generic Position/Site-Specific Position Cross-Reference"; and Table 13.1-202, "Minimum On-Duty Operations Shift Organization for Two-Unit Plant." Table 1.8-202, "COL Item Tabulation," provides PTN COL 18.6-1 cross-references.

- PTN COL 18.10-1

The applicant provided additional information in PTN COL 18.10-1 to address the responsibilities of the manager in charge of nuclear training. PTN COL 18.10-1 is addressed in Section 13.1.1.3.2.5, "Training Manager." Table 1.8-202, "COL Item Tabulation," provides PTN COL 18.10-1 cross-references.

13.1.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for PTN COL 13.1-1, PTN COL 9.5-1, PTN COL 18.6-1, and PTN COL 18.10-1 are given in Sections 13.1.1, "Management and Technical Support Organization," and 13.1.2-13.1.3, "Operating Organization," of NUREG-0800, "Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition" (SRP).

The applicable regulatory guidance for the organizational structure of the applicant is as follows:

- American National Standards Institute (ANSI)/American Nuclear Society (ANS)-3.1-1993, "American National Standard for Selection, Qualification, and Training of Personnel for Nuclear Power Plants," as endorsed and amended by Regulatory Guide (RG) 1.8, Revision 3, "Qualification and Training of Personnel for Nuclear Power Plants."

The applicable regulations for the management, technical support, and operating organizations of the applicant are as follows:

- 10 CFR 52.79, "Contents of applications; technical information in final safety analysis report"
- 10 CFR 50.40, "Common standards"

- 10 CFR 50.48, “Fire Protection”
- 10 CFR 50.71, “Maintenance of records, making of reports”
- 10 CFR Part 50, Appendix B, “Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants”
- 10 CFR 50.54, “Conditions of licenses”
- 10 CFR Part 55, “Operator’s Licenses”

The applicable regulatory guidance for the management, technical support, and operating organizations of the applicant is as follows:

- RG 1.8, “Qualification and Training of Personnel for Nuclear Power Plants”
- RG 1.28, “Quality Assurance Program Criteria (Design and Construction)”
- RG 1.33, “Quality Assurance Program Requirements (Operation)”
- RG 1.68, “Initial Test Programs for Water-cooled Nuclear Power Plants”
- RG 1.114, “Guidance to Operators at the Controls and to Senior Operators in the Control Room of a Nuclear Power Unit”
- RG 1.160, “Monitoring the Effectiveness of Maintenance at Nuclear Power Plants”
- RG 1.174, “An Approach for Using Probabilistic Risk Assessment in Risk-Informed Decisions on Plant-Specific Changes to the Licensing Basis”
- RG 1.175, “An Approach for Plant-Specific, Risk-Informed Decisionmaking: Inservice Testing”
- RG 1.177, “An Approach for Plant-Specific, Risk-Informed Decisionmaking: Technical Specifications”
- RG 1.178, “An Approach for Plant-Specific Risk-Informed Decisionmaking for Inservice Inspection of Piping”
- RG 1.182, “Assessing and Managing Risk Before Maintenance Activities at Nuclear Power Plants”
- RG 1.206 “Combined License Applications for Nuclear Power Plants (LWR Edition)”
- NUREG-0660, “NRC Action Plan Developed as a Result of the Three Mile Island Accident”
- NUREG-0694, “TMI-Related Requirements for New Operating Licenses”
- NUREG-0711, “Human Factors Engineering Program Review Model”
- NUREG-0718, “Licensing Requirements for Pending Applications for Construction Permits and Manufacturing License”
- NUREG-0737 and Supplement 1, “Clarification of TMI Action Plan Requirements”

13.1.4 Technical Evaluation

The NRC staff reviewed Section 13.1 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COLA represents the

complete scope of information relating to this review topic.¹ The staff confirmed that the information in the application and incorporated by reference addresses the required information relating to the organizational structure of the applicant. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

The staff reviewed the information in the Turkey Point Units 6 and 7 COL FSAR:

AP1000 COL Information Items

- PTN COL 13.1-1

The staff reviewed Turkey Point Units 6 and 7 site-specific information to resolve PTN COL 13.1-1. PTN COL 13.1-1 is related to the organizational structure of the COL applicant included under Section 13.1 of the Turkey Point Units 6 and 7 COL FSAR. Section 13.1 of the Turkey Point Units 6 and 7 COL FSAR describes the organizational positions of a nuclear power plant and owner/applicant corporations and associated functions and responsibilities.

The applicant provided the following additional Turkey Point Units 6 and 7 site-specific COL information to resolve COL Information Item 13.1-1, which addresses the organizational structure of the COL applicant. COL Information Item 13.1-1 states:

Combined License applicants referencing the AP1000 certified design will address adequacy of the organizational structure.

The commitment was also captured as COL Action Item 13.1-1 in Appendix F of NUREG-1793, which states:

The COL applicant will describe its organizational structure.

The applicant provided additional information as part of the Turkey Point Units 6 and 7 COL FSAR to describe the organizational positions of a nuclear power station and owner/applicant corporations and associated functions and responsibilities. The applicant included a table in the FSAR (Turkey Point Units 6 and 7 COL FSAR Table 13.1-201, "Generic Position/Site-Specific Position Cross-Reference") to provide a cross-reference to identify site-specific position titles.

The applicant added new sections and information related to the site-specific organizational structure to Turkey Point Units 6 and 7 COL FSAR Section 13.1 beyond the structure given in RG 1.206, "Combined License Applications for Nuclear Power Plants: LWR Edition." The new section titles are:

- 13.1.1, "Management and Technical Support Organization"
- 13.1.2, "Operating Organization"
- 13.1.3, "Qualifications Requirements of Nuclear Plant Personnel"
- 13.1.4, "Combined License Information Item"
- 13.1.5, "References"
- Table 13.1-201, "Generic Position/Site-Specific Position Cross-Reference"
- Table 13.1-202, "Minimum On-Duty Operations Shift Organization for Two-Unit Plant"

¹ See Section 1.2.2 for a discussion of the staff's review related to verification of the scope of information to be included in a COL application that references a design certification (DC).

Figure 13.1-201, "Plant Management Organization"
Figure 13.1-202, "Shift Operations Organization"
Figure 13.1-203, "Corporate and Engineering Organization"
Figure 13AA-201, "Construction Management Organization"
Figure 13AA-202, "Hiring Schedule for Plant Staff"

In addition, the applicant added a new appendix to Chapter 13 titled "Appendix 13AA Construction-Related Organization." This appendix describes the applicant's construction organization. The applicant states "The information in this appendix is included for future designation as historical information".

Turkey Point Units 6 and 7 FSAR Sections 11.4 and 11.5 describe the implementation of a site specific Process Control Program (PCP) (The PCP describes the administrative and operational controls used for the solidification of liquid or wet solid waste and the dewatering of wet solid waste.), and a site-specific Offsite Dose Calculation Manual (ODCM) (the ODCM contains the methodology and parameters used for calculating doses resulting from liquid and gaseous effluents.). These were not discussed in FSAR Section 13.1.2.1.2.6. In request for additional information (RAI) 6917, Question 13.01.01-5, the staff requested the applicant to demonstrate compliance with 10 CFR 20.1301 and 20.1302, and Appendix I to 10 CFR Part 50. The applicant was also requested to revise FSAR Tier 2, Section 13.1.2.1.2.6 to include programs for implementing the PCP and the ODCM. In a response dated April 2, 2013 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML13093A410), the applicant agreed to update the FSAR text. The staff has confirmed this change in Revision 7 of the FSAR and the staff finds this response acceptable since the FSAR was revised to include a statement to develop, implement, direct and coordinate the radioactive waste materials management program for the assigned units, Turkey Point Units 6 and 7. The staff considers RAI 6917, Question 13.01.01-5, resolved and closed.

The staff has reviewed PTN COL 13.1-1 and, for the reasons set forth below, concludes that the management, technical support, and operating organizations, as described, are acceptable and meet the requirements of 10 CFR 50.34, 10 CFR 50.40, 10 CFR 50.48, Appendix B to 10 CFR Part 50, 10 CFR 52.79, and 10 CFR 50.80, as applicable. This conclusion is based on the following:

The applicant has described clear responsibilities and definite resources for the design and construction of the facility and has described its plans for managing the project and utilizing the nuclear steam supply system (NSSS) vendor and architect-engineer (AE). The staff reviewed these plans and determined these plans provide reasonable assurance that the applicant will establish an acceptable organization and that sufficient resources are available to provide offsite technical support and to satisfy the applicant's commitments for the design, construction, and operation of the facility. These findings contribute to the staff's judgment that the applicant complies with the requirements of 10 CFR 50.34, 10 CFR 50.40, 10 CFR 50.48, 10 CFR Part 50 Appendix B, 10 CFR 52.79, and 10 CFR 50.80, as applicable; that is, the applicant is technically qualified to engage in design and construction activities.

The applicant has described the assignment of plant operating responsibilities; the reporting chain up through the chief executive officer; the proposed size of the regular plant staff; the functions and responsibilities of each major plant staff group; the proposed shift crew complement for single-unit or multiple-unit operation; the qualification requirements for members of its plant staff; and staff qualifications of plant managerial and supervisory positions (through personnel resumes for plant managerial and principle supervisory and technical positions as

submitted during the later stages of plant design, construction, and licensing). In Table 1.9-202, "Conformance with SRP Acceptance Criteria," of the Turkey Point Units 6 and 7 COL FSAR, the applicant noted an exception to the criteria of NUREG-0800, Section 13.1.2–13.1.3 that suggests resumes of personnel holding plant managerial and supervisory positions be included in the FSAR. The staff finds this exception to the criteria of NUREG-0800, Section 13.1.2–13.1.3 acceptable because personnel filling the management and principal supervisory and technical positions will meet the education and experience requirements of the ANSI/American Nuclear Society (ANS)-3.1-1993, as endorsed and amended by RG 1.8, Revision 3. Resumes for the personnel filling the plant managerial and principle supervisory and technical positions will be verified during the Construction Inspection Program.

NUREG-0800, Section 13.1.2–13.1.3, "Operating Organization," provides the following acceptable characteristics for an applicant's operating organization:

1. An adequate number of licensed operators will be available at all required times to satisfy the minimum staffing requirements of 10 CFR 50.54(j)–(m).
2. On-shift personnel are able to provide initial facility response in the event of an emergency.
3. Organizational requirements for the plant manager and radiation protection manager have been satisfied.
4. Qualification requirements and qualifications of plant personnel conform to the guidance of RG 1.8.
5. Organizational requirements conform to the guidance of RG 1.33.
6. The applicant has complied with TMI Action Plan items I.A.1.1 and I.A.1.3.

The staff reviewed the application in regard to the characteristics identified in items 1-6 above, and finds that the operating organization proposed by the applicant will comply with these characteristics. That is, the applicant is technically qualified to engage in design and construction activities, and to operate a nuclear power plant; that the applicant will have the necessary managerial and technical resources, and financial resources as Florida Power and Light (FPL) is a regulated utility, to support the plant staff in the event of an emergency; and that the applicant has identified the organizational positions responsible for fire protection matters and delegated the authorities to these positions to implement fire protection requirements. These findings contribute to the judgment that the applicant complies with the requirements of 10 CFR 50.40(b).

- PTN COL 9.5-1

The staff reviewed Turkey Point Units 6 and 7 site-specific information to resolve PTN COL Item 9.5-1. PTN COL Item 9.5-1 addresses the fire protection program responsibilities as shown on Figure 13.1-201 of the COL. This item is cross-referenced to Turkey Point Units 6 and 7 COL FSAR Section 9.5.1 in Table 1.8-202, "COL Item Tabulation."

The applicant added text to Turkey Point Units 6 and 7 COL FSAR Section 13.1.1.2.10, "Fire Protection," indicating that the nuclear power station is committed to maintaining a fire protection program as described in Turkey Point Units 6 and 7 COL FSAR Section 9.5. The

applicant also added text to Turkey Point Units 6 and 7 COL FSAR Section 13.1.2.1.3.9, "Fire Protection Supervisor and Fire Protection Engineer," describing the responsibilities for the fire protection supervisor and the fire protection engineer. From Figure 13.1-201 of the COL FSAR, the staff determined that the fire protection supervisor reports through the program engineering manager to the site vice president, who has ultimate responsibility for the fire protection program. Fire Protection Program implementation and maintenance are the responsibilities of the fire protection engineer. The fire protection supervisor is qualified in accordance with ANSI/ANS-3.1-1993 and the fire protection engineer is qualified in accordance with RG 1.189, "Fire Protection for Nuclear Power Plants."

The staff reviewed Section 13.1.1.2.10 and Section 13.1.2.1.3.9 of the COLA. Based on these section's descriptions of management, responsibilities, and qualification requirements, as described above, the staff finds the applicant's fire protection organization meets the organizational criteria of 10 CFR 50.48. The technical review for PTN COL 9.5-1 as it relates to the fire protection program programmatic requirements is addressed in Section 9.5 of this safety evaluation report (SER).

- PTN COL 18.6-1

The staff reviewed Turkey Point Units 6 and 7 site-specific information to resolve PTN COL 18.6-1. PTN COL 18.6-1 requires the COL applicant to address the staffing levels and qualifications of plant personnel. This item is cross-referenced to Turkey Point Units 6 and 7 COL FSAR Section 18.6 in Table 1.8-202, "COL Item Tabulation."

In Table 1.9-202, "Conformance with SRP Acceptance Criteria," of the Turkey Point Units 6 and 7 COL FSAR, the applicant noted an exception to the criteria of NUREG-0800 Section 13.1.1 that suggest the experience necessary for managers and supervisors of the technical support organization be included in the FSAR. The staff finds this exception to the criteria of NUREG-0800 Section 13.1.1 acceptable because the applicant added text to Turkey Point Units 6 and 7 COL FSAR Section 13.1.1.4, "Qualifications of Technical Support Personnel," stating the qualifications of managers and supervisors of the technical support organization will meet the education and experience standards described in ANSI/ANS-3.1-1993 and RG 1.8, which specifies qualifications for these positions that are acceptable to the staff.

The applicant added text to Turkey Point Units 6 and 7 COL FSAR Section 13.1.3.1, "Qualification Requirements," stating the qualifications of managers, supervisors, operators, and technicians of the operating organization "will meet the education and experience requirements described in ANSI/ANS-3.1-1993 (Reference 201) as endorsed and amended by and RG 1.8." In addition, Section 13.1.3.2 states that resumes and other documentation of the qualifications and experience of initial appointees to appropriate management and supervisory positions will be available for NRC inspection after position vacancies are filled. The staff finds this acceptable because personnel filling the management and principal supervisory and technical positions will meet the education and experience standards of the ANSI/ANS-3.1-1993, as endorsed and amended by RG 1.8, Revision 3 and their resumes will be available for NRC review after position vacancies are filled.

The applicant added Turkey Point Units 6 and 7 COL FSAR Table 13.1-201, "Generic Position/Site-Specific Position Cross Reference" and Turkey Point Units 6 and 7 COL FSAR Table 13.1-202, "Minimum On-Duty Operations Shift Organization for Two-Unit Plant." Table 13.1-201 describes the plant management, technical support, and plant operating

organizations, expected staffing, and a cross-reference to identify the corresponding generic and site-specific position titles. Table 13.1-202 describes the minimum composition of the operating shift crew for all modes of operation and meets the staffing levels of 10 CFR 50.54 (m). Position titles, license requirements, and minimum shift manning for the various modes of operation are in the Technical Specifications, administrative procedures, Table 13.1-201, Table 13.1-202, and illustrated in Figure 13.1-202.

The staff reviewed the text added to Turkey Point Units 6 and 7 COL FSAR Sections 13.1.1.4 and 13.1.3.1 relative to PTN COL 18.6-1 and concludes that the provisions for qualification of managers and supervisors are acceptable and meet 10 CFR 50.40(b) based on the following:

The applicant has described its organization for the management of, and its means of providing, technical support for the plant staff for the design, construction, and operation of the facility and has described its plans for managing the project and utilizing the NSSS vendor and AE. These plans give reasonable assurance that the applicant will establish an acceptable organization and that sufficient resources are available to provide offsite technical support and to satisfy the applicant's commitments for the design, construction, and operation of the facility.

- PTN COL 18.10-1

The staff reviewed Turkey Point Units 6 and 7 site-specific information to resolve PTN COL 18.10-1. PTN COL 18.10-1 requires the COL applicant to address training program development. This item is cross-referenced to Turkey Point Units 6 and 7 COL FSAR Section 13.2 and Section 18.10 in Table 1.8-202, "COL Item Tabulation."

PTN COL 18.10-1 is discussed in Section 13.1.1.3.2.5, "Training Manager." PTN COL 18.10-1 describes the responsibilities of the manager responsible for training programs upon which the applicant relies for the safe and proper operation and maintenance of the plant. The staff concludes that the training manager responsibilities described in Section 13.1.1.3.2.5 are acceptable and meet the regulatory guidelines identified in NUREG-0800 Sections 13.1.1, 13.1.2-13.1.3, and 13.2, as the applicant has described how the training manager will carry out his or her position responsibilities for designing, developing, implementing, and maintaining training programs for the safe and proper operation and maintenance of the plant. Accordingly, the application meets the requirements of 10 CFR 50.40(b) in regard to the qualifications of the training manager. The technical review for PTN COL 18.10-1 is addressed in Section 18.10 of this SER.

13.1.5 Post Combined License Activities

There are no post-COL activities related to this section.

13.1.6 Conclusion

The staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA related to information incorporated by reference is in NUREG-1793 and its supplements. NRC staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. Pursuant to 10 CFR 52.63(a)(5) and 10 CFR Part 52, Appendix D, Section VI.B.1, all nuclear safety issues relating to this section that were incorporated by reference have been resolved.

The applicant has described clear responsibilities and definite resources for the design and construction of the facility, and has described its plans for managing the project and utilizing the NSSS vendor and AE. The staff reviewed these plans, and for the reasons set forth above, finds that they give adequate assurance that an acceptable organization has been established and that sufficient resources are available such that the applicant will satisfy its commitments in the application for the design and construction of the facility. These findings contribute to the judgment that the applicant complies with the requirements of 10 CFR 50.34, 10 CFR 50.40, 10 CFR 50.48, 10 CFR Part 50 Appendix B, 10 CFR 52.79, and 10 CFR 50.80, as applicable; that is, the applicant is technically qualified to engage in design and construction activities.

The applicant has described its organization for the management of, and its means of providing, technical support for the plant staff during operation of the facility. The NRC staff has reviewed these measures, and, for the reasons set forth above, concludes that the applicant has an acceptable organization and adequate resources to provide offsite technical support for the operation of the facility under both normal and off-normal conditions.

The applicant has described the assignment of plant operating responsibilities; the reporting chain up to the chief executive office of the applicant; the proposed size of the regular plant staff; the functions and responsibilities of each major plant staff group; the proposed shift crew complement for single-unit or multiple-unit operation; the qualification of its plant staff; and staff qualifications.

For the reasons described above, the staff finds that the operating organization proposed by the applicant will conform to these characteristics, and will comply with the requirements of 10 CFR 50.40(b) and 10 CFR 50.80, as applicable. That is, the applicant is technically qualified to operate a nuclear power plant; the applicant will have the necessary managerial and technical resources to support the plant staff in the event of an emergency; and the applicant has identified the organizational positions responsible for fire protection matters and delegated the authorities to these positions to implement fire protection requirements.

In addition, the staff concludes that the information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable because it meets the acceptance criteria identified in RGs 1.8, 1.28, 1.33 and 1.114. For the reasons set forth above the staff concludes that the organizational structure of the COL applicant is acceptable because it meets the requirements of 10 CFR 50.40(b) and 10 CFR 50.80, as applicable.

13.2 Training

13.2.1 Introduction

This section addresses the description and schedule of the training program for reactor operators (ROs) and senior reactor operators (SROs) (i.e., licensed operators). It addresses the scope of licensing examinations as well as training requirements of 10 CFR 55. The licensed operator training program also includes the requalification programs as required in 10 CFR 50.54(i)(i-1) and 10 CFR 55.59, "Requalification." In addition, this section of the Turkey Point Units 6 and 7 COL FSAR includes the description and schedule of the training program for nonlicensed plant staff, including the programs required by 10 CFR Parts 50.120.

13.2.2 Summary of Application

Section 13.2 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 13.2 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 13.2, the applicant provides the following:

AP1000 COL Information Items

- STD COL 13.2-1

The applicant provided additional information in Standard (STD) COL 13.2-1 to resolve COL Information Item 13.2-1 (COL Action Item 13.2-1), which incorporates the provisions of Nuclear Energy Institute (NEI) 06-13A, "Template for an Industry Training Program Description," providing the description and scheduling of the training program for plant personnel, including the requalification program for licensed operators.

- STD COL 18.10-1

The applicant provided additional information in STD COL 18.10-1 to address training for those operators involved in the Human Factors Engineering (HFE) Verification and Validation (V&V) Program, using a systematic approach to training and Westinghouse Commercial Atomic Power (WCAP)-14655, "Designer's Input to the Training of the Human Factors Engineering Verification and Validation Personnel."

License Conditions

- Part 10, License Condition 3, Items B.1, C.3

The applicant proposed a license condition in Part 10 of the Turkey Point Units 6 and 7 COL application, which provides the milestones for implementing the Reactor Operator Training (B.1) and the applicable portions of the Non-Licensed Plant Staff Training Program (C.3) (required in accordance with 10 CFR 50.120, "Training and qualification of nuclear power plant personnel"). The license condition related to the portions of the Non-Licensed Plant Staff Training Program applicable to radioactive material is addressed in Chapter 1 of this SER.

- Part 10, License Condition 6

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of operational programs included in Turkey Point Units 6 and 7 COL FSAR Table 13.4-201, including the Non-Licensed Plant Staff Training Program (required in accordance with 10 CFR 50.120), Reactor Operator Training Program, and the Reactor Operator Requalification Program.

13.2.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for the description and schedule of the training program for licensed operators are given in Sections 13.2.1 and 13.2.2, and Chapter 18 of NUREG-0800.

The applicable regulations for STD COL 13.2-1 are as follows:

- 10 CFR 50.54(m)
- 10 CFR Part 55

The applicable regulations for the Non-Licensed Plant Staff Training Program are as follows:

- 10 CFR 50.120
- 10 CFR 52.79(a)(33), "Contents of applications; technical information"

The applicable regulations for the licensed operators training program are as follows:

- 10 CFR 55.13, "General exemptions"
- 10 CFR 55.31, "How to apply"
- 10 CFR 55.41, "Written examinations: Operators"
- 10 CFR 55.43, "Written examinations: Senior operators"
- 10 CFR 55.45, "Operating tests"

The applicable regulations for the licensed operator's requalification program are found in:

- 10 CFR 50.34(b), "Final safety analysis report"
- 10 CFR 50.54(i)
- 10 CFR 55.59

The applicable regulatory guidance documents for STD COL 13.2-1 are as follows:

- RG 1.8
- RG 1.149, "Nuclear Power Plant Simulation Facilities for Use in Operator Training and License Examinations"
- NUREG-1021, "Operator Licensing Examination Standards for Power Reactors"

The applicable regulatory guidance for STD COL 18.10-1 is as follows:

- NUREG-0711, "Human Factors Engineering Program Review Model"

13.2.4 Technical Evaluation

The staff reviewed Section 13.2 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COLA represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to the description and schedule of the training programs for nuclear plant personnel. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COLAs. To ensure that the staff's findings on standard content that were documented in the SER for the reference COLA (Vogtle Electric Generating Plant (VEGP), Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COLA, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COLA, as applicable) resulting from VEGP COL FSAR RAIs.
- The staff confirmed that all responses to VEGP COL FSAR RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and has verified that the Turkey Point Units 6 and 7 application incorporates the standard content information included in the Vogtle application. Accordingly, the staff finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COLA. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COLA (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Plant (BLN) Units 3 and 4 COLA. In addition, the Staff did not pose any RAIs to FPL regarding the standard content described above, and there was no need to evaluate any information in addition to the standard content.

The following portion of this technical evaluation section is reproduced from Section 13.2.4 of the VEGP SER:

AP1000 COL Information Items

- STD COL 13.2-1

The NRC staff reviewed STD COL 13.2-1 related to COL Information Item 13.2-1 (COL Action Item 13.2-1) included under Section 13.2 of the BLN COL FSAR. COL Information Item 13.2-1 states:

The Combined License applicants referencing the AP1000 certified design will develop and implement training programs for plant personnel. This includes the training program for the operations personnel who participate as subjects in the human factors engineering verification and validation. These Combined License applicant training programs will address the scope of licensing examinations as well as new training requirements.

The commitment was also captured as COL Action Item 13.2-1 in Appendix F of the NRC staff FSER for the AP1000 DCD (NUREG-1793), which states:

The COL applicant will develop and implement training programs for plant personnel.

The applicant provided the following text to supplement Section 13.2, "Training," of the AP1000 DCD, dealing with the training program for plant personnel.

This section incorporates by reference NEI 06-13 (sic) [NEI 06-13A], Template for an Industry Training Program Description. See Table 1.6-201.

This technical report provides a complete training program description for use with COL applications. The staff has endorsed NEI 06-13A, Revision 1, as it provides an acceptable template for describing licensed operators and non-licensed plant staff training programs. The applicant has incorporated by reference NEI 06-13A.

The applicant provided the following text to supplement Section 13.2, "Training," of the AP1000 DCD, which is included in the [design certification] DC amendment as part of the BLN COL FSAR to address STD COL 13.2-1, dealing with the training program for plant personnel.

Table 13.4-201 provides milestones for training implementation.

NUREG-0800, Section 13.2.1, establishes milestones for the licensed operators and non-licensed plant staff training programs and for the licensed operator requalification training program. The BLN COL FSAR has identified those milestones in Table 13.4-201. The staff determined that this is acceptable, as the milestone information included in this table meets the criteria found in NUREG-0800.

- *STD COL 18.10-1*

The NRC staff reviewed STD COL 18.10-1, related to COL Information Item 18.10-1 (COL Action Item 18.10.3-1). COL Information Item 18.10-1 states:

Combined License applicants referencing the AP1000 certified design will develop and implement training programs for plant personnel. This includes the training program for the operations personnel who participate as subjects in the human factors engineering verification and validation. These Combined License applicant training programs will address the scope of licensing examinations as well as new training requirements.

The commitment was also captured as COL Action Item 18.10.3-1 in Appendix F of the NRC staff's FSER for the AP1000 DCD (NUREG-1793), which states:

With regard to the training program development, the COL applicant will: (1) address the training program development

considerations in NUREG-0711, (2) address relevant concerns identified in this report [NUREG-1793], and (3) identify the minimum documentation that the COL applicant will provide to enable the staff to complete its review.

This section refers to Sections 13.1, "Organizational Structure of Applicant" and 13.2, "Training" regarding the training program development.

The NRC staff reviewed the resolution to STD COL 18.10-1, related to staffing and qualifications included under Section 18.10 of the BLN COL FSAR. The applicant provided the referenced NRC-endorsed NEI 06-13A, Revision 1, to address COL Information Item 18.10-1.

NEI 06-13A, Revision 1 was written to provide COL applicants with a generic program description for use with COL application submittals. In a letter dated December 5, 2008, the staff stated that the training template of NEI 06-13A, Revision 1, was an acceptable means for describing licensed operator and non-licensed plant staff training programs. The staff finds the applicant's incorporation of NEI 06-13A, Revision 1 to be acceptable because it utilizes an NRC-endorsed methodology.

In Table 1.9-202, "Conformance with SRP Acceptance Criteria," of the BLN COL FSAR, the applicant identified two exceptions to the criteria of NUREG-0800, Section 13.2, which recommends following the guidance in NUREG-0711 and RG 1.149. Further, the applicant stated in Table 1.9-202 that NEI 06-13A is incorporated by reference into the BLN COL FSAR. The staff's safety evaluation report for NEI 06-13A (ML0709504790) states that NEI 06-13A complies with the guidance in NUREG-0711 and RG 1.149. Therefore, the staff finds the two exceptions to the criteria in NUREG-0800, Section 13.2 to be acceptable because NEI 06-13A complies with the guidance in NUREG-0711 and RG 1.149.

License Conditions

- *Part 10, License Condition 3, Item B1*

The NRC staff finds the implementation milestone for the Reactor Operator Training Program (18 months prior to schedule date of initial fuel load) to be acceptable because it is consistent with 10 CFR 50.120.

- *Part 10, License Condition 6*

The applicant proposed a license condition in Part 10 of the VEGP COL application to provide a schedule to support the NRC's inspection of operational programs, including the Non-Licensed Plant Staff Training Program, (required in accordance with 10 CFR 50.120), Reactor Operator Training Program, and Reactor Operation Requalification Program. The proposed license condition is consistent with the policy established in SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," for operational programs in general, and is acceptable.

The Turkey Point Units 6 and 7 application incorporates the standard content information included in the Vogtle application and there is no additional Turkey Point specific information that required evaluation by the staff and as such the Staff did not pose any RALs to FPL on this section as described above. The staff finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COLA.

13.2.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license conditions proposed by the applicant acceptable:

- License Condition (13-1)—The licensee shall implement the Reactor Operator Training Program at least 18 months before scheduled date of initial fuel load.
- License Condition (13-2)—No later than 12 months after issuance of the COL, the licensee shall submit to the Director of the Office of New Reactors (NRO) a schedule that supports planning for and conduct of NRC inspection of the operational programs (the Non-Licensed Plant Staff Training Program (required in accordance with 10 CFR 50.120), Reactor Operator Training Program, and Reactor Operation Requalification Program). The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until these operational programs have been fully implemented.

13.2.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable because it meets the acceptance criteria provided in RGs 1.8 and 1.149. The staff based its conclusion on the following:

- STD COL 13.2-1 incorporates by reference NEI 06-13A, Revision 1, which provides an acceptable template for describing licensed operators and nonlicensed plant staff training programs. The staff determined that this is acceptable, as it applies an NRC-endorsed approach.
- STD COL 18.10-1, relating to training, references Section 13.2 of the Turkey Point Units 6 and 7 COL FSAR, in which the applicant has committed to use WCAP-14655 to ensure a systematic approach to training development, and has referenced NEI 06-13A, Revision 1. The staff finds this acceptable because it applies an NRC-endorsed approach.

13.3 Emergency Planning

13.3.1 Introduction

This section addresses the plans, design features, facilities, functions, and equipment necessary for radiological emergency planning (EP) that must be considered in a COL application (COLA). This includes both the COL applicant's onsite emergency plan and State and local (offsite) emergency plans, which the NRC and the Federal Emergency Management Agency (FEMA) evaluated to determine whether the plans are adequate, and whether there is reasonable assurance that they can be implemented. The emergency plans are an expression of the overall concept of operation, and describe the essential elements of advanced planning that have been considered and the provisions that have been made to cope with radiological emergency situations.

FPL is the applicant for the Turkey Point Units 6 and 7 COLs. FPL submitted its COLA (Revision 0) on June 30, 2009 (ADAMS Accession No. ML091830589), for two new nuclear reactors that will be located on the approximately 9,400 acres of Turkey Point plant property, designated as Turkey Point Units 6 and 7, in Miami-Dade County, Florida. The NRC docketed the application on September 4, 2009 (Docket Nos. 52-040 and 52-041) (ADAMS Accession No. ML092380248). FPL submitted COLA Revisions 1, 2, 3, 4, 5, 6, and 7 on September 3, 2010, December 21, 2010, December 16, 2011, December 14, 2012, December 16, 2013, October 29, 2014, and October 14, 2015, respectively. This SER section reflects the results of the staff's evaluation of the application, with regard to radiological emergency planning, which are based on COLA Revision 7 (ADAMS Accession No. ML15301A741).

Currently located on the site are five FPL power plants: two natural gas/oil steam electric generating units (Units 1 and 2), two pressurized-water reactor nuclear units (Units 3 and 4), and a natural gas combined cycle steam electric generating unit (Unit 5). The new reactors, Units 6 and 7, will be constructed on an approximately 218-acre area, south of Units 3 and 4. The boundary for the site footprints for Units 6 and 7 is entirely within the existing Turkey Point site exclusion area boundary, so that for purposes of emergency planning, little distinction exists between the existing reactor units (i.e., Units 3 and 4) and the new Units 6 and 7 proposed to be on the Turkey Point site. The COLA takes advantage of the emergency planning resources, capabilities, and organization that exist at the Turkey Point site for Units 3 and 4.

The applicant has submitted a complete and integrated emergency plan for Units 3, 4, 6, and 7 pursuant to Title 10 of the *Code of Federal Regulations* (10 CFR 52.79(a)(21)), which consists of the Turkey Point Plant Radiological Emergency Plan in Part 5 of the COLA (hereinafter referred to as "emergency plan" or "COL Plan"), and supplemental information that includes the offsite radiological emergency response plans for the State of Florida and Counties of Miami-Dade and Monroe, letters of agreement with various supporting offsite agencies and organizations, and the PTN Evacuation Time Estimate (ETE) Report No. KLD TR-509, Corrected Final Report, Revision 4, "Turkey Point Nuclear Power Plant—Development of Evacuation Time Estimates," April 15, 2015 (ADAMS Accession No. ML15301A346) (hereinafter referred to as "ETE Report"). The application also includes Table 3.8-1, "Emergency Plan Inspections, Tests, Analyses, and Acceptance Criteria," in Part 10, "Proposed License Conditions (Including ITAAC)," which provides a listing of EP inspections, tests, analyses, and acceptance criteria (ITAAC) that address required elements of emergency planning that cannot be completed during the COLA stage, and which will be completed before initial fuel load. The COLA also references the AP1000 standard design certification.

As described below, in consultation with FEMA, the staff reviewed the COLA, ETE Report, the applicant's responses to RAIs, and generally available reference material in accordance with the guidance provided in NUREG-0800 Section 13.3, "Emergency Planning," and Section 14.3.10, "Emergency Planning—Inspections, Tests, Analyses, and Acceptance Criteria." FEMA reviewed the offsite radiological emergency response plans of the State of Florida and local government plans for Miami-Dade and Monroe Counties in Florida.

In a letter dated December 23, 2009 (ADAMS Accession No. ML100980173), FEMA provided the NRC with its Interim Finding Report for Reasonable Assurance for the Turkey Point COLA, dated October 5, 2009 (ADAMS Accession No. ML100980192), which found that all planning standards associated with their review were adequate, and that the State and local emergency plans and preparedness are adequate and continue to be capable of implementation at the Turkey Point site in support of Units 6 and 7. The staff reviewed the FEMA findings, and the overall FEMA conclusions are reflected below in SER Sections 13.3.4 and 13.3.6.

13.3.2 Summary of Application

Section 13.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Revision 19 of the Westinghouse AP1000 DCD, Tier 2 Section 13.3.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 13.3, the applicant provided the following:

Tier 2 Departures

In COLA Part 2, Tier 2,² Table 1.8-201, "Summary of FSAR Departures from the DCD," and COLA Part 7, "Departures and Exemption Requests," the applicant identified the following two (Units 6 and 7) plant-specific departures from the AP1000 generic DCD, which are associated with emergency planning:

- PTN DEP 18.8-1

The Operations Support Center (OSC) is being moved from the location identified in DCD Subsections 18.8.3.6, 12.5.2.2, and 12.5.3.2 and as identified on DCD figures in Subsections 1.2, 12.3, and Appendix 9A. There will be a single OSC for Units 6 and 7 located as described in the Emergency Plan.

- PTN DEP 18.8-2

The Technical Support Center (TSC) is not located in the control support area as identified in DCD Subsection 18.8.3.5. The TSC is common for Turkey Point Units 3, 4, 6, and 7 and is located as described in the Emergency Plan.

The staff's evaluation of the applicant's description of these two DCD departures is addressed below in SER Section 13.3.4.8.

² The definitions of Tier 1, Tier 2, and Tier 2*, which reflect design-related information contained in the generic AP1000 DCD, are provided in 10 CFR Part 52, Appendix D, "Design Certification Rule for the AP1000 Design," Section II.

AP1000 COL Items

Consistent with the AP1000 Tier 2 DCD, in COLA Part 2 Table 1.8-202, “COL Item Tabulation,” the applicant identified DCD COL (information) items, including the DCD subsections and FSAR sections where each COL item is resolved. In COLA Part 2 Section 13.3, the applicant identified the following two COL items relating to emergency planning:

- STD COL 13.3-1

The applicant provided additional information in STD COL 13.3-1 to address COL Information Item 13.3-1 (COL Action Item 13.3-1) of the AP1000 DCD, which states:

Combined License applicants referencing the AP1000 certified design will address emergency planning including post-72 hour actions and its communication interface.

- STD COL 13.3-2

The applicant provided additional information in STD COL 13.3-2 to address COL Information Item 13.3-2 (COL Action Item 13.3.3.3.5-1) of the AP1000 DCD, which states:

Combined License applicants referencing the AP1000 certified design will address the activation of the emergency operations facility [EOF] consistent with current operating practice and NUREG-0654/FEMA-REP-1 [“Criteria for Preparation and Evaluation of Radiological Emergency Response Plans and Preparedness in Support of Nuclear Power Plants,” Revision 1 (hereinafter referred to as “NUREG-0654”)].

The applicant also identified the following three additional COL items in their respective FSAR sections, which relate to emergency planning:

- PTN COL 9.5-9 and PTN COL 9.5-10

In COLA Part 2, Subsection 9.5.2.2.5, “Offsite Interfaces and Emergency Offsite Communications,” the applicant provided additional information in PTN COL 9.5-9 and PTN COL 9.5-10 to address COL Information Items 9.5-9 and 9.5.10 (COL Action Items 9.5.2-3 and 9.5.2-1, respectively) of the AP1000 DCD. Specifically, the applicant stated that offsite interfaces and emergency offsite communications are described in the emergency plan. COL Information Items 9.5-9 and 9.5-10 are as follows:

PTN COL 9.5-9—Combined License applicants referencing the AP1000 certified design will address interfaces to required offsite locations; this will include addressing the recommendations of BL-80-15 ([DCD] Reference 21)³ regarding loss of the emergency notification system due to a loss of offsite power.

PTN COL 9.5-10—The emergency offsite communication system, including the crisis management radio system, will be addressed by the Combined License applicant.

³ NRC IE Bulletin No. 80-15 (BL-80-15), “Possible Loss of Emergency Notification System (ENS) with Loss of Offsite Power,” June 18, 1980.

- PTN COL 18.2-2

In COLA Part 2, Section 18.2, “Human Factors Engineering Program Management,” the applicant provided additional information in PTN COL 18.2-2 to address COL Information Item 18.2-2 (COL Action Item 18.2.3.1-1) of the AP1000 DCD. Specifically, the applicant stated that the EOF and TSC communication strategies and human factors attributes are described in the emergency plan. As reflected in DCD Tier 2 Subsection 18.2.6.2, “Emergency Operations Facility,” COL Information Item 18.2-2 states:⁴

Specific information regarding EOF and TSC communications, and EOF and TSC human factors attributes will be provided by the Combined Operating License applicant to address the Combined License information requested in this subsection [i.e., DCD Tier 2 Subsection 18.2.6].

The staff’s evaluation of the applicant’s resolution of these five COL items is addressed below in SER Section 13.3.4.18.

Supplemental Information

- STD SUP 13.3-1

In COLA Part 2, Section 13.3, “Emergency Planning,” the applicant provided supplemental information in STD Supplement (SUP) 13.3-1, which states that FSAR Table 13.4-201, “Operational Programs Required by NRC Regulations,” provides milestones for emergency planning program implementation. STD SUP 13.3-1 is evaluated by the staff as part of its evaluation of implementation milestones and proposed License Condition 6 in SER Section 13.3.4.19.

- PTN SUP 14.3-1

The applicant provided the following statement in COLA Part 2, Subsection 14.3.2.3.1, “Emergency Planning ITAAC (EP-ITAAC),” with regard to EP ITAAC:

EP-ITAAC have been developed to address implementation of elements of the Emergency Plan. Site-specific EP-ITAAC are based on the generic ITAAC provided in Appendix C.II.1-B of Regulatory Guide 1.206 [“Combined License Application for Nuclear Power Plants (LWR Edition)”]. These ITAAC have been tailored to the specific reactor design and emergency planning program requirements.

The EP ITAAC are identified below under *ITAAC*, and PTN SUP 14.3-1 is evaluated by the staff as part of its evaluation of ITAAC and proposed License Condition 1 in SER Section 13.3.4.19.

Onsite Emergency Plan

⁴ See also, Section 18.2.7, “Evaluation of COL Information Item 18.2-2 (no comparable NUREG-1793 section),” of NUREG-1793, Supplement 2, Volume 2, “Final Safety Evaluation Report Related to Certification of the AP1000 Standard Plant Design – Docket No. 52-006,” August 5, 2011 (published September 2011) (ADAMS Accession No. ML112061231).

Emergency planning for Units 6 and 7 is addressed throughout COLA Part 2, with the Turkey Point Plant Radiological Emergency Plan for Units 6 and 7 (provided in COLA Part 5). The COL Plan consists of a full and integrated emergency plan, which includes three annexes that describe unit-specific information. Specifically, Annex 1 applies to the existing Units 3 and 4; Annex 2 applies to the new Unit 6; and Annex 3 applies to the new Units 6 and 7. The COL Plan also includes six appendices (listed below), which provide additional detailed information on various aspects of the COLA and emergency plan. The staff's review and findings in this SER section apply only to the proposed Units 6 and 7.

- Appendix 1 References
- Appendix 2 Letters of Agreement
- Appendix 3 Procedure Cross-Reference to the Emergency Plan
- Appendix 4 Abbreviations, Acronyms, and Definitions
- Appendix 5 Evacuation Time Estimate
- Appendix 6 NUREG-0654 Cross Reference

Offsite Emergency Plans

Pursuant to 10 CFR 50.33(g), a COL applicant is required to submit the radiological emergency response plans of State and local governments that are wholly or partially within the 16-kilometer (km) (10-mile (mi)) plume exposure pathway emergency planning zone (EPZ), as well as plans of State governments wholly or partially within the 80-km (50-mi) ingestion pathway EPZ (hereinafter referred to as the "10-mi EPZ" and "50-mi EPZ"). The COLA includes supplemental information consisting of the offsite radiological emergency response plans for the State of Florida and Miami-Dade and Monroe Counties in Florida. The supplemental information also includes letters of agreement with various supporting offsite agencies and organization (discussed below in SER Sections 13.3.4.1, 13.3.4.2, 13.3.4.3, and 13.3.4.12), and the detailed ETE Report for the 10-mi EPZ (discussed below in SER Section 13.3.4.17).

License Conditions

COLA Part 10, "Proposed License Conditions (Including ITAAC)," includes the following proposed license conditions related to emergency planning:

- License Condition 1 (ITAAC)

The ITAAC identified in the tables in Appendix B are hereby incorporated into this Combined License. After the Commission has made the finding required by 10 CFR 52.103(g), the ITAAC do not constitute regulatory requirements; except for specific ITAAC, which are the subject of a Section 103(a) hearing, their expiration will occur upon final NRC action in such proceeding.

- License Condition 6 (Operational Program Readiness)

The licensee shall submit to the appropriate director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs listed in the operational program FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operational programs in the FSAR table have been fully implemented

or the plant has been placed in commercial service, whichever comes first. This schedule shall also address:

- a. the emergency planning implementation procedures are consistent with 10 CFR Part 50, Appendix E, Section V
- e. an emergency response data system (ERDS) implementation program plan consistent with 10 CFR Part 50, Appendix E, Section [VI]
- g. full implementation of the operational and programmatic elements of responding to an event associated with a loss of large areas of the plant due to explosions or fire, prior to initial fuel load

- License Condition 11.A (Emergency Planning Actions—Emergency Action Levels)

The licensee shall submit a fully developed set of site-specific Emergency Action Levels (EALs) to the NRC in accordance with the NRC-endorsed version of [Nuclear Energy Institute] NEI 07-01, "Methodology for Development of Emergency Action Levels—Advanced Passive Light Water Reactors," Revision 0, July 2009 (ADAMS Accession No. ML090930549), with no deviations. The EALs shall have been discussed and agreed upon with State and local officials. These fully developed EALs shall be submitted to the NRC for confirmation at least 180 days prior to initial fuel load.

- License Condition 11.B (Emergency Planning Actions—On-Shift Staffing Assessment)

At least two (2) years before scheduled initial fuel load, the licensee shall have performed an assessment of emergency response staffing in accordance with NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," or other NRC-endorsed guidance in effect six (6) months prior to commencement of the assessment.

- License Condition 12.C (Fukushima Actions – Emergency Planning Actions)

Staffing

At least two (2) years prior to scheduled initial fuel load, the licensee shall have performed an assessment of the onsite and augmented staffing capability to satisfy the regulatory requirements for response to a multi-unit event. The staffing assessment will be performed in accordance with NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," or other NRC-endorsed guidance in effect six (6) months prior to commencement of the assessment.

At least two (2) years prior to scheduled initial fuel load, the licensee will revise the Emergency Plan to include the following:

- Incorporation of corrective actions identified in the staffing assessment described above.

- Identification of how the augmented staff will be notified given degraded communications capabilities.

Communications

At least two (2) years prior to scheduled fuel load, the licensee shall have performed an assessment of on-site and off-site communications systems and equipment required during an emergency event to ensure communications capabilities can be maintained during prolonged station blackout conditions. The communications capability assessment will be performed in accordance with NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," or other NRC-endorsed guidance in effect six (6) months prior to commencement of the assessment.

At least one hundred eighty (180) days prior to scheduled initial fuel load, the licensee shall complete implementation of corrective actions identified in the communications capability assessment described above, including any related emergency plan and implementing procedure changes and associated training.

The staff's evaluation of these five proposed license conditions is addressed below in SER Sections 13.3.4.2, 13.3.4.4, 13.3.4.6, and 13.3.4.19.

ITAAC

COLA Part 10 proposes License Condition 1 (described above), which incorporates the ITAAC identified in Part 10 Appendix B into the COL. Appendix B includes Table 3.8-1 (EP ITAAC) and incorporates by reference the AP1000 DCD ITAAC. The DCD ITAAC include the six AP1000 design-related EP ITAAC in DCD Tier 1 Table 3.1-1, "Inspections, Tests, Analyses, and Acceptance Criteria." Four of these EP ITAAC in DCD Table 3.1-1 duplicate or overlap similar EP ITAAC in Part 10 Table 3.8-1 (e.g., TSC floor space). The remaining two EP ITAAC in DCD Table 3.1-1 address the display of various plant parameters in the TSC and Control Support Area (CSA) habitability. DCD Table 3.1-1 also addresses the AP1000 locations of the OSC and TSC, which are moved by COLA Tier 2 Departures PTN DEP 18.8-1 and PTN DEP 18.8-2, respectively, and evaluated below in SER Section 13.3.4.8. The EP ITAAC are evaluated below in SER Section 13.3.4.19, and specific EP ITAAC are identified within their respective planning standard in SER Section 13.3.4.

13.3.3 Regulatory Basis

The regulatory basis of the AP1000 DCD information incorporated by reference is addressed in NUREG-1793, "Final Safety Evaluation Report Related to Certification of the AP1000 Standard Design," and its supplements. The applicable regulatory requirements for emergency planning are as follows:

- 10 CFR 52.79(a)(21) requires that the FSAR include emergency plans that comply with the requirements of 10 CFR 50.47, "Emergency plans," and 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities," Appendix E, "Emergency Planning and Preparedness for Production and Utilization Facilities." In addition, 10 CFR 52.79(a)(22)(i) requires certifications from State and local governmental agencies with emergency planning responsibilities. Under 10 CFR 50.47(a)(1)(ii), no initial COL under 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear

Power Plants,” will be issued unless a finding is made by the NRC that there is reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency. In addition, under 10 CFR 50.47(a)(2), the NRC will base its findings on a review of the FEMA findings and determinations as to whether State and local emergency plans are adequate, and whether there is reasonable assurance that they can be implemented, and on the NRC assessment as to whether the applicant’s onsite emergency plans are adequate and whether there is reasonable assurance that they can be implemented.

- The staff also considered the applicable requirements in Subsection (g) of 10 CFR 50.33, “Contents of applications; general information”; 10 CFR 50.72, “Immediate notification requirements for operating nuclear power reactors”; 10 CFR 52.80, “Contents of applications; additional technical information”; 10 CFR 52.83, “Finality of referenced NRC approvals; partial initial decision on site suitability”; and 10 CFR 100.21, “Non-seismic siting criteria.”

The applicable regulatory guidance for emergency planning is as follows:

- NUREG-0800 identifies NUREG-0654 and other related guidance that the staff should consider during its review. The related acceptance criteria are identified in NUREG-0800, Section 13.3.II, and the applicable regulatory guidance for reviewing emergency preparedness as an operational program is established in NUREG-0800, Section 13.4. In addition, the staff considered NUREG/CR-7002, “Criteria for Development of Evacuation Time Estimate Studies” (November 2011); NUREG/CR-6863, “Development of Evacuation Time Estimate Studies for Nuclear Power Plants” (January 2005); and Interim Staff Guidance (ISG) NSIR/DPR-ISG-01.⁵
- 44 CFR Part 350, “Review and Approval of State and Local Radiological Emergency Plans and Preparedness,” and 44 CFR Part 352, “Commercial Nuclear Power Plants: Emergency Preparedness Planning,” provide procedures for FEMA’s review and evaluation of the adequacy of offsite radiological emergency planning and preparedness. Pursuant to 44 CFR Part 353, “Memorandum of Understanding between Federal Emergency Management Agency and Nuclear Regulatory Commission Relating to Radiological Emergency Planning and Preparedness,” Appendix A, “Memorandum of Understanding Between Federal Emergency Management Agency and Nuclear Regulatory Commission” (58 FR 47996, September 14, 1993), FEMA provides its findings and determinations on offsite planning and preparedness to the NRC for its use in the licensing process.

13.3.4 Technical Evaluation

The staff reviewed the information in the COLA, including FSAR Section 13.3, “Emergency Planning,” and the COL Plan for conformance with applicable standards and requirements identified in NUREG-0800 Sections 13.3 and 14.3.10. The emergency planning ITAAC for the new reactors are provided below in SER Table 13.3-1, “PTN Units 6 and 7 ITAAC,” which

⁵ NSIR/DPR-ISG-01, Revision 0, “Emergency Planning for Nuclear Power Plants,” November 2011 (ADAMS Accession No. ML113010523), provides updated guidance based on changes to emergency planning regulations in 10 CFR 50.47 and 10 CFR Part 50, Appendix E, that were published as a final rule in the *Federal Register* (FR) on November 23, 2011 (76 FR 72560), and on integrated offsite response organization event response concepts with onsite emergency planning programs.

reflects the EP ITAAC in Part 10 Table 3.8-1, and are supplemented by the EP ITAAC in DCD Tier 1 Table 3.1-1. The EP ITAAC are evaluated below in SER Section 13.3.4.19, and specific EP ITAAC are identified within their respective planning standard.

In addition, the staff reviewed selected portions of the emergency response plans for the State of Florida and Miami-Dade and Monroe Counties for understanding and content, in relation to consistency with various sections of the COL Plan that address offsite support and response. The staff checked the referenced DCD to ensure that the combination of the DCD and the COLA represents the complete scope of information relating to this review topic.⁶ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to emergency planning. The results of the staff's evaluation of the referenced DCD are documented in NUREG-1793 and its supplements.

The staff's and FEMA's technical reviews of the COLA addressed all of the relevant evaluation criteria in the 16 planning standards (i.e., A through P) of NUREG-0654, consistent with NUREG-0800 Section 13.3, which cites the applicable regulations. As stated above, the proposed boundary for the site footprints for Units 6 and 7 is entirely within the existing Turkey Point site exclusion area boundary, so that for purposes of emergency planning, little distinction exists between the Turkey Point site (for existing reactor Units 3 and 4) and the new Units 6 and 7. The COLA takes advantage of the emergency planning resources, capabilities, and organization that currently exist at the Turkey Point site for Units 3 and 4. NUREG-0800 Section 13 Subsection I, "Areas of Review," provides, in part, the following guidance to the staff regarding the appropriate level of review:

In general, if an application is for an additional reactor at an operating reactor site, and the application proposes to incorporate and extend elements of the existing emergency planning program to the new reactor (including by reference), those existing elements should be considered acceptable and adequate. The reviewer will generally focus the review on the extension of the existing program to the new reactor, and will determine whether the incorporated emergency planning program information from the existing reactor site (1) is applicable to the proposed reactor, (2) is up-to-date when the application is submitted, and (3) reflects use of the site for construction of a new reactor (or reactors) and appropriately incorporates the new reactor(s) into the existing plan.

Consistent with this guidance, the staff focused its review on the extension of the existing (Units 3 and 4) site emergency preparedness program to Units 6 and 7, and considered those elements of the existing program that are unchanged in their applicability to Units 6 and 7 as acceptable and adequate.

In COLA Part 1, the applicant incorporated by reference the AP1000 DCD. Section 13.3 of COLA Part 2 further incorporates by reference Tier 2 Section 13.3, "Emergency Planning," of the referenced DCD. COLA Part 5 provides the Plan, which consists of the basic emergency plan, three annexes, and six appendices. The basic plan follows the format of NUREG-0654, and provides detailed information regarding each of the 16 planning standards and associated evaluation criteria in NUREG-0654. The format of the staff's review of the onsite emergency plan (provided below) is patterned after these 16 planning standards, which reflect the requirements in 10 CFR 50.47(b)(1) through (b)(16). Regulations in 10 CFR Part 50,

⁶ See Section 1.2.2 for a discussion on the staff's review related to verification of the scope of information to be included within a COL application that references a design certification (DC).

Appendix E, provide additional requirements that add detail and supplement the evaluation criteria associated with the planning standards. The staff's review of the various aspects of how the application proposes to satisfy 10 CFR Part 50 Appendix E is included within the associated planning standard review. The staff's review and findings apply only to the proposed Units 6 and 7, and any changes to the emergency plan for Units 3 and 4 would be addressed as a separate licensing action, in accordance with 10 CFR 50.54(q).

13.3.4.1 *Assignment of Responsibility (Organization Control)*

As reflected in NUREG-0654 Planning Standard A, "Assignment of Responsibility (Organization Control)," 10 CFR 50.47(b)(1) requires that primary responsibilities for emergency response by the nuclear facility licensee and by State and local organizations within the EPZs have been assigned, the emergency responsibilities of the various supporting organizations have been specifically established, and each principal response organization has staff to respond and to augment its initial response on a continuous basis. In addition, 10 CFR Part 50 Appendix E Section III requires that the emergency plans incorporate information regarding the emergency response roles of supporting organizations and offsite agencies, and that information shall be sufficient to ensure coordination among the supporting groups and with the licensee. Regulations in 10 CFR Part 50 Appendix E Section IV.A require a description of the local offsite services to be provided in support of the licensee's emergency organization; identification of, and a description of the assistance expected from, appropriate local, State, and Federal agencies with responsibilities for coping with emergencies, including hostile action at the site; and identification of the State and local officials responsible for planning for, ordering, and controlling appropriate protective actions, including evacuations when necessary.

In COL Plan Section A, "Assignment of Responsibility," the applicant described the primary responsibilities and organizational control of FPL, Federal, State, county, and other emergency response organizations (EROs) within the 10-mi EPZ and the 50-mi EPZ. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654 Planning Standard A, which provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(1).

COL Plan Section A.1, "Concept of Operations," describes the relationships and concept of operations for the organizations and agencies that are a part of the overall ERO, and identifies the various Federal, State, and county/local government agencies and organizations that are involved in a response to an emergency at Turkey Point. COL Plan Figure A-1 illustrates the agency response organization interrelationships in a block diagram. The National Response Framework (NRF) (73 FR 4887, January 28, 2008) outlines Federal responsibilities during incidents warranting a coordinated Federal response. Within the sphere of the NRF, the NRC provides technical assistance, and acts as a coordinating agency. Section A.1 addresses the primary Federal response for supporting an emergency at Turkey Point, and describes the support and resources for the various agencies. The Department of Homeland Security (DHS) is responsible for the overall coordination of a multi-agency Federal response to a significant radiological incident, and FEMA acts as the lead Federal agency for offsite, nontechnical concerns. Federal agencies are addressed further in COL Plan Section C, and discussed below in SER Section 13.3.4.3.

The State of Florida and Miami-Dade and Monroe Counties have emergency response plans that specify the responsibilities and functions for the major agencies, departments, and key individuals of their emergency response organizations. The State of Florida has the statutory responsibility and authority for responding to emergencies and protecting the health and safety of the public in Florida. The State of Florida Radiological Emergency Preparedness Annex (provided as COL Plan Supplemental Information 6 and 7), which supports the State of Florida Comprehensive Emergency Management Plan, addresses the ability of State and local government to respond to radiological emergencies, and defines responsibilities of State agencies. COL Plan Section A.1 describes the responsibilities of State and local agencies, in the event of a nuclear power plant emergency. The Governor has overall command authority for radiological and nonradiological aspects of a nuclear incident, and will provide for public protection through assignment of appropriate State resources and agencies.

The counties within the 10-mi EPZ include Miami-Dade County and Monroe County. Counties within the 50-mi EPZ include Miami-Dade, Monroe, Broward, and Collier Counties. Miami-Dade and Monroe Counties are responsible for plume exposure risk response, hosting of evacuees, and ingestion pathway protection. Broward and Collier Counties are responsible for ingestion pathway protective measures. The applicant included the plans for the State of Florida and Counties of Miami-Dade and Monroe as COLA supplemental information.

The onsite ERO, directed by the emergency coordinator, provides for control and operation of the plant, mitigation of the emergency condition, protection of plant personnel inside the Protected Area, and emergency support for operations, engineering, maintenance, firefighting, material acquisition, security, and first aid. The offsite ERO, directed by the emergency offsite manager, provides for offsite radiological accident assessment, protection of plant personnel outside the Protected Area, emergency support for acquisition of materials and support of personnel, and interface between Turkey Point personnel and outside organizations responsible for the protection of the public. The Emergency News Center (ENC) organization, directed by the FPL public information officer, coordinates with public information officers from other organizations to provide information to the public through the news media. (The ENC is addressed further in COL Plan Section H.3, and discussed below in SER Section 13.3.4.7.)

At Turkey Point, FPL maintains 24-hour emergency response capability. The normal on-shift complement provides the initial response to an emergency. This group is trained to handle emergency situations (e.g., initiate implementation of the emergency plan, make initial accident assessment, emergency classification, notifications, communications, and protective action recommendations (PARs)) until the augmented ERO arrives. Personnel from the unaffected unit(s) are available and respond when notified. During an emergency condition classified as an Alert, Site Area Emergency, or General Emergency, the plant's augmented ERO is notified and responds to replace the normal plant organization. (Staff augmentation is addressed further in COL Plan Section B, and discussed below in SER Section 13.3.4.2.) The emergency coordinator and recovery manager will assess the emergency situation and expand the ERO, if necessary. The augmented ERO consists of three major response sub-organizations with interrelationships, as illustrated in COL Plan Figure A-2. The recovery manager, located in the EOF, has the authority to request Federal assistance, and the responsibility for assuring continuity of resources (technical, administrative, and material) in the event of ERO activation.

COL Plan Section A.3, "Agreements in Planning Effort," states that written agreements have been developed that establish the concept of operations between the applicant and other support organizations having an emergency response role in support of the COL Plan. These agreements identify the services to be provided, the mutually accepted criteria for

implementation, and the arrangements for exchange of information. COL Plan Appendix 2 provides a list of the 14 letters of agreement, and copies of the letters are included in COLA Supplemental Information 4. In addition, COLA Supplemental Information 3 includes copies of State and county certification letters, which address commitments to continue to support emergency response for the proposed Units 6 and 7 (pursuant to 10 CFR 52.79(a)(22)).

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that the applicant has adequately assigned primary responsibilities for emergency response, and has the staff to respond to and to augment its initial response on a continuous basis. The applicant is capable of providing 24-hour-per-day emergency response and staffing of communications links, including continuous (24-hour) operations for a protracted period. In addition, the applicant has identified the appropriate organizations that are intended to be part of the overall response organization, and has established the emergency responsibilities of the various supporting organizations, including providing adequate written agreements. The applicant has specified the concept of operations and its relationship to the total effort, illustrated the interrelationships in a block diagram, and has identified the individuals in charge of the emergency response and for ensuring continuity of resources.

In addition, the staff finds that the applicant has incorporated information about the emergency response roles of supporting organizations and offsite agencies, and that information is sufficient to ensure coordination among the supporting groups and with the licensee. Furthermore, the applicant has described the local offsite services to be provided in support of the licensee's emergency organization, and has identified the assistance expected from appropriate local, State, and Federal agencies, including State and local officials responsible for planning for, ordering, and controlling appropriate protective actions.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard A. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(1) and 10 CFR Part 50, Appendix E, Sections III and IV.A, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.2 *Onsite Emergency Organization*

As reflected in NUREG-0654 Planning Standard B, "Onsite Emergency Organization," 10 CFR 50.47(b)(2) requires that on-shift facility licensee responsibilities for emergency response are unambiguously defined, adequate staffing to provide initial facility accident response in key functional areas is maintained at all times, timely augmentation of response capabilities is available, and interfaces among various onsite response activities and offsite support and response activities are specified. In addition, 10 CFR Part 50 Appendix E Section IV.A requires a description of the organization for coping with radiological emergencies, including definition of authorities, responsibilities, and duties of individuals assigned to the licensee's emergency organization, and the means for notification of such individuals in the event of an emergency. This shall include a description of the normal plant operating organization, onsite emergency response organization, headquarters personnel who will

augment the onsite emergency organization, and local offsite services to be provided in support of the licensee's emergency organization. The emergency plan shall identify persons within the licensee organization who will be responsible for making offsite dose projections, and other employees with special qualifications for coping with emergency conditions that may arise. Other persons with special qualifications, who are not licensee employees and who may be called upon for assistance, shall also be identified, including a description of the special qualifications. Regulations in 10 CFR Part 50, Appendix E, Section IV.A.9, require a detailed analysis demonstrating that on-shift personnel assigned emergency plan implementation functions are not assigned responsibilities that would prevent the timely performance of their assigned functions, as specified in the emergency plan.

In COL Plan Section B, "Emergency Response Organization," the applicant described the ERO, its key positions and associated responsibilities, including outlining the staffing requirements that provide initial emergency response actions and provisions for timely augmentation of on-shift personnel when required. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard B, "Onsite Emergency Organization." Planning Standard B provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(2).

The normal plant personnel complement is established with the Site Vice President having overall authority for plant operations. The Site Vice President directs the site organization in the management of the various departments, while the shift manager retains the responsibility for actual operation of plant systems. The plant has personnel on-shift at all times that can provide an initial response to an emergency event. In Part 5 of the COLA, Annex 2 and Annex 3, Table 2-1, "Turkey Point Emergency Response Organization On-Shift Staffing," and Table B-1a, "Shift Emergency Response Organization" outline the unit on-shift ERO and its relation to the normal staff complement. On-shift staffing will be augmented with additional ERO personnel at an Alert (and higher) emergency classification or earlier, as deemed necessary.

Section 2.3, "Shift Emergency Response Positional Responsibilities," states that the affected unit's on-shift personnel may be augmented by personnel from the other site units, and that these additional personnel will provide the needed resources to enhance the response to the event until the on-call ERO personnel respond and are ready to activate the emergency response facilities. Those individuals identified to augment the on-shift personnel within 60 minutes are part of the on-call ERO. Personnel from corporate management, administrative and technical support personnel may be used at the EOF and ENC to augment plant staff and possibly interface with governmental authorities.

COL Plan Section B.1, "On-Shift Emergency Response Organization Assignments," includes a list of on-shift personnel with emergency responsibilities. The shift manager (from the affected unit) has the responsibility and authority to declare an emergency, and then becomes the emergency coordinator. In that role, the emergency coordinator will initiate the appropriate immediate actions in accordance with written procedure, mitigate the consequences of the emergency, and activate the ERO and notify offsite agencies (as appropriate). The line of succession in the Control Room for the emergency coordinator is the shift manager, unit supervisor, and then any other member of the plant staff with an active SRO license. In the event there is a simultaneous emergency condition affecting multiple units, or the site is in an

emergency because of natural phenomena or a security event, the Unit 3 shift manager will typically be designated as the emergency coordinator.

The shift manager, acting as emergency coordinator is responsible for direction and control of the emergency until relieved by another qualified emergency coordinator in the TSC. Upon relieving the shift manager, the emergency coordinator (TSC) is responsible for continued assessment of the severity of the emergency, and for coordinating and directing the combined activities of personnel in the Control Room, TSC, OSC, elsewhere on owner-controlled property and field team monitoring activities. When the EOF is declared operational, overall direction and control of the emergency response is transferred to the recovery manager in the EOF. The emergency coordinator (TSC) maintains responsibility for onsite direction and control for the duration of the event. Prior to transfer of command and control and emergency response functions to the TSC and EOF, various listed conditions must be met.

The emergency coordinator has the responsibility and authority to initiate emergency actions necessary to protect the life, health, and safety of both the plant staff and affected public. The responsibilities include classifying the emergency; authorizing notifications to the State, counties, and the NRC; issuing PARs; authorizing emergency exposure limits; authorizing the distribution and use of potassium iodide (KI); mobilizing the ERO and initiating activation of emergency response facilities; directing onsite emergency response activities; and implementing severe accident management guidelines. Emergency coordinator responsibilities that may not be delegated to other elements of the emergency organization include event classification, notification of offsite authorities, and providing Protective actions recommendations for the general public. Upon activation of the EOF, the responsibilities of notification of offsite authorities and issuance of PARs are transferred to the recovery manager. COLA, Part 5, Appendix 3, "Procedure Cross-Reference to the Emergency Plan," lists an emergency plan implementing procedure (EPIP) titled "Protective Action Recommendations."

In view of the foregoing, the staff finds that the applicant has adequately designated an individual as the emergency coordinator who has the authority and responsibility to initiate emergency actions, including recommending protective actions to the authorities responsible for implementing offsite emergency measures. The staff also finds that the applicant has clearly specified which responsibilities may not be delegated to other elements of the emergency organization, and has identified an adequate line of succession for the emergency coordinator position.

The overall ERO is made up of three sub-organizations (i.e., onsite ERO, offsite ERO, and ENC), and is illustrated in COL Plan Figures B-1a through B-1d. COL Plan Section B.5, "Emergency Response Organization Positional Responsibilities," identifies the specific emergency response positions (by title), including the major tasks (responsibilities) to be performed for each position. Table 2-1 and Table B-1a (located in each unit annex) and COL Plan Table B-1b, "Staffing Requirements for the Turkey Point Plant Emergency Response Organization," list key ERO positions and the supporting positions assigned to interface with Federal, State, and county authorities. Table 2-1 and Table B-1a outline ERO positions required to meet minimum staffing and describe full augmentation of the on-shift complement at an Alert (or higher) classification, including major tasks assigned to each position. The full augmentation staffing levels are used as a planning basis to cover a wide range of possible events. For extended events (i.e., those that are expected to continue for more than 24 hours), actual staffing will be established by the emergency coordinator based on the event and personnel availability. Reduced staffing will only occur after discussion with the recovery manager concerning the impact on plant operations and emergency response.

COL Plan Section A.1 describes the relationships and the concept of operations for the organizations and agencies that are a part of the overall emergency response organization, and the interfaces are shown in COL Plan Figure A-1, "Agency Response Organization Interrelationships." COL Plan Figure A-2, "Turkey Point Plant Augmented Emergency Response Organization Interrelationships," illustrates the interface between the OSC, TSC, and Control Room with the EOF, field monitoring teams, and the ENC. Collectively, the figures in COL Plan Sections A and B illustrate (in block diagrams) the interfaces between and among the onsite functional areas of emergency response, licensee headquarters support, local services support, and State and local government response organizations.

The staff reviewed Tables 2-1, "Turkey Point Unit Emergency Response Organization On-Shift Staffing," B-1a, "Unit Shift Emergency Response Organization," and B-1b, "Staff Requirements for the Turkey Point Plant Emergency Response Organization," which are based on the guidance in NUREG-0654, Table B-1, "Minimum Staffing Requirements for NRC Licensees for Nuclear Power Plant Emergencies," and finds that the required minimum on-shift and augmentation staffing in support of the new plants is acceptable because it is consistent with NUREG-0654, Table B-1.

Fukushima Dai-ichi—NTTF Recommendation 9.3

On March 12, 2012, the NRC requested additional information from all power reactor licensees and holders of construction permits, associated with the NRC Near-Term Task Force (NTTF) review of the accident at the Fukushima Dai-ichi nuclear facility (ADAMS Accession No. ML12053A340). In Recommendation 9.3, the NTTF addressed staffing and communications provisions for enhancing emergency preparedness. On January 23, 2013, the NRC issued a follow-up letter (ADAMS Accession No. ML13010A162),⁷ which identified eight generic technical issues that need to be addressed as part of the Recommendation 9.3 communications capability assessment.⁸

With regard to staffing, the accident at Fukushima highlighted the need to determine and implement the required staff to fill all necessary positions responding to a multi-unit event. Specifically, the March 12, 2012, letter requests that all power reactor licensees and holders of construction permits (in active or deferred status) assess their current staffing levels and determine the appropriate staff to fill all necessary positions for responding to a multi-unit event during a beyond design basis natural event, and determine if any enhancements are appropriate. Single unit sites should provide the requested information, as it pertains to an extended loss of all ac (alternating current) power and impeded access to the site. Emergency communications are addressed below in License Condition (13-4) and SER Section 13.3.4.6. (See also, STD COL 13.3-2 in SER Section 13.3.4.18, with regard to EOF staffing and communications.)

In RAI 6434, Question 01.05-4, May 1, 2012 (ADAMS Accession No. ML12122A973), the staff requested additional information from the applicant, regarding how FPL plans to address the various NRC-approved actions related to the Fukushima Dai-ichi accident in the Turkey Point

⁷ See also, NRC document package at ADAMS Accession No. ML13016A111.

⁸ For Turkey Point, Units 3 and 4, FPL responded to NRC's March 12, 2012, letter on (1) May 10, 2012, FPL Letter No. L-2012-208 (ADAMS Accession No. ML12144A158), and (2) October 25, 2012, FPL Letter No. L-2012-388 (ADAMS Accession No. ML12300A425). FPL responded to NRC's January 23, 2013, letter on February 15, 2013, FPL Letter No. L-2013-060 (ADAMS Accession No. ML13064A359).

Units 6 and 7 COLA. In a June 29, 2012, response to RAI 6434, Question 01.05-4 (ADAMS Accession No. ML121850685), the applicant proposed License Condition 12.C, "Fukushima Actions—Emergency Planning Actions," which addresses both the staffing and communications areas addressed in NTTF Recommendation 9.3. FPL added this license condition to Part 10 of COLA Revision 4.

The staff reviewed proposed License Condition 12.C, and, with the exception of the timeframes for completion and submission of the staffing and communications capability assessments, finds that it is acceptable because it is consistent with NTTF Recommendation 9.3 and reflects the use of NEI technical report NEI 12-01, which the NRC has endorsed as an acceptable method for licensees to employ when addressing NTTF Recommendation 9.3.⁹ However, the staff identified a possible (optional) change in License Condition 12.C that the applicant could make, with regard to the 2-year timeframe for revising the emergency plan to reflect the staffing assessment results. Specifically, the timeframe could be changed from 2 years to 180 days, in order to be consistent with the 180-day timeframe for implementation of corrective actions identified in the communications capability assessment, including revisions to the emergency plan (which is also included in License Condition 12.C).

On September 24, 2014, the staff discussed making this license condition change with the applicant. Subsequently, the applicant informed the staff that this optional change would not be made, and the proposed License Condition 12.C retained the 2-year timeframe in COLA Revision 6. Despite the applicant's preference to retain the 2-year timeframe, the staff believes that the change from 2 years to 180 days in its proposed License Condition (13-3) (below) is necessary and appropriate (see 10 CFR 52.97(c)) for the following reasons:

- (1) There is no regulatory basis for requiring a 2-year timeframe.
- (2) More time will be allowed for the licensee to revise the emergency plan, thus providing additional flexibility.
- (3) Irrespective of a 180-day timeframe, the licensee may still revise the emergency plan 2 years prior to initial fuel load, if so desired.
- (4) The change will provide consistency with the 180-day emergency plan changes required as a result of corrective actions identified in the communications capability assessment (also included in License Condition 12.C).
- (5) The change will support the staff's objective of consistency for this NTTF Recommendation 9.3-related license condition, since it is a common license condition for all other (prior and ongoing) COLA reviews.

The staff also proposes an 18-month timeframe for completion of the staffing and communications capability assessments, which is based on the latest date set forth in the schedule for completing the inspections, tests, and analyses in the ITAAC submitted in

⁹ See (1) NRC May 15, 2012, letter, "U.S. Nuclear Regulatory Commission Review of NEI 12-01, 'Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,' Revision 0, dated May 2012" (ADAMS Accession No. ML12131A043), (2) NEI May 3, 2012, letter, "Transmittal of NEI 12-01, 'Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities,' Revision 0, dated May 2012" (ADAMS Accession No. ML12125A411), and (3) NEI Report No. 12-01, Revision 0, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," May 2012 (ADAMS Accession No. ML12125A412).

accordance with 10 CFR 52.99(a). In addition, the staff proposes a common 180-day timeframe for submission of the assessments to the NRC, which is based on the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a). Therefore, with these staff-proposed license condition changes, the staff considers RAI 6434, Question 01.05-4, resolved, with regard to emergency planning.

Consistent with the applicant's proposed License Condition 12.C, and staff-proposed license condition changes (discussed above), the staff identified License Condition (13-3) and License Condition (13-4), which address enhanced staffing and communications capabilities, respectively, and include the staff's proposed timeframes for completion of the assessments and their submission to the NRC. License Condition (13-4) is addressed further in SER Section 13.3.4.6, with regard to communications.

License Condition (13-3)

No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Florida Power & Light Company shall have performed an assessment of the on-site and augmented staffing capability for response to a multi-unit event. The staffing assessment shall be performed in accordance with NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0.

No later than one hundred eighty (180) days before the date scheduled for initial fuel load, as set forth in the notification submitted in accordance with 10 CFR 52.103(a), Florida Power & Light Company shall revise the Emergency Plan to include the following:

- (a) Incorporation of corrective actions identified in the staffing assessment required by this license condition; and
- (b) Identification of how the augmented staff will be notified, given degraded communications capabilities.

License Condition (13-4)

No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Florida Power & Light Company shall have performed an assessment of on-site and off-site communications systems and equipment relied upon during an emergency event to ensure communications capabilities can be maintained during an extended loss of alternating current power. The communications capability assessment shall be performed in accordance with NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0.

No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Florida Power & Light Company shall have completed

implementation of corrective actions identified in the communications capability assessment, including revisions to the Emergency Plan.

Enhancements to Emergency Preparedness Regulations

In addition to appropriate staffing levels associated with multi-unit events (discussed above), on November 23, 2011, the NRC published a Final Rule, titled “Enhancements to Emergency Preparedness Regulations” (76 FR 72560) (hereinafter referred to as “Final Rule”), which included a new requirement in 10 CFR Part 50, Appendix E, Section IV.A, associated with on-shift ERO personnel. Specifically, Section IV.A.9 requires—by December 24, 2012, for nuclear power reactor licensees—a detailed analysis demonstrating that on-shift personnel assigned emergency plan implementation functions are not assigned responsibilities that would prevent the timely performance of their assigned functions, as specified in the emergency plan.

In Enclosure 1, “Summary of COL Application Revision 4 Changes,” of its December 14, 2012, submittal letter for COLA Revision 4 (ADAMS Accession No. ML123660081), FPL stated that the updates to COLA Part 5 (Emergency Plan) include information and changes that address the recent NRC emergency planning rule change (i.e., Final Rule). In COL Plan Section B, the applicant discussed on-shift staffing, including augmented staffing with additional ERO personnel (at an Alert or higher classification, or earlier if deemed necessary). The applicant did not, however, provide a detailed on-shift staffing analysis that addresses the new Final Rule requirements. COL Plan Section B does state that shift personnel have the capability at all times to perform detection, mitigation, classification, and notification functions required in the early phases of an emergency. In addition, shift augmentation and further ERO involvement will be determined by the extent and magnitude of the event. Furthermore, when plant conditions warrant entry into the Severe Accident Management Guidelines (SAMG), the on-shift crew assumes the duties and responsibilities for mitigating actions in accordance with the SAMG.

As part of the issuance of the Final Rule, NRC issued associated guidance in Interim Staff Guidance NSIR/DPR-ISG-01. In Section IV.C, “On-Shift Staffing Analysis,” of NSIR/DPR-ISG-01, NRC endorsed NEI Technical Report NEI 10-05, “Assessment of On-Shift Emergency Response Organization Staffing and Capabilities,” Revision 0, dated June 2011 (ADAMS Accession No. ML111751698)—stating in part that NEI 10-05 establishes a standard methodology for a licensee to perform the required staffing analysis (in 10 CFR Part 50, Appendix E, Section IV.A.9), and that the NRC has reviewed NEI 10-05 and found it to be an acceptable methodology for this purpose.

In COLA Part 10, the applicant proposed License Condition 11.B, which addresses the requirements in 10 CFR Part 50, Appendix E, Section IV.A.9 for a detailed on-shift staffing analysis associated with the emergency plan. The staff reviewed License Condition 11.B, and, with the exception of the timeframe for submission of the on-shift staffing analysis and changes to the emergency plan, finds that it is acceptable because it is consistent with the Final Rule and NSIR/DPR-ISG-01.

The staff proposes a similar timeframe for submission of the on-shift staffing analysis to the NRC, which is based on the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a). Therefore, consistent with the applicant’s proposed License Condition 11.B, the staff identified the following License Condition (13-5), which addresses an analysis of on-shift personnel assigned emergency plan implementation functions, and includes the staff’s proposed timeframe for submission of the on-shift staffing analysis to the NRC. This license condition is written to be consistent with License Condition

(13-3) (above), including an 18-month timeframe for completion of the staffing assessment for multi-unit events.¹⁰

License Condition (13-5)

No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Florida Power & Light Company shall have performed a detailed staffing analysis, in accordance with NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," Revision 0.

No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Florida Power & Light Company shall have revised the Emergency Plan to incorporate any changes identified in the staffing analysis that are needed to bring staffing to the required levels.

COL Plan Section B.7, "Industry/Private Support Organizations," states that Turkey Point retains contractors to provide supporting services, and uses a contract/purchase order in lieu of an agreement letter. Agency, contractor, and private organizations who may be requested to provide technical assistance to, and augmentation of the emergency organization include the Institute of Nuclear Power Operations (INPO), Electric Power Research Institute (EPRI), NEI, American Nuclear Insurers (ANI), Department of Energy (DOE) Radiation Emergency Assistance Center/Training Site (REAC/TS), Bechtel Power Corporation, URS Washington Division, and AREVA. (REAC/TS is addressed in COL Plan Section L.3, "Medical Service Facilities," and discussed below in SER Section 13.3.4.12.)

Agreements are maintained with outside support agencies that provide assistance when called on during an emergency or during the recovery phase, which identify emergency measures to be provided, the mutually accepted criteria for implementation, and the arrangements for exchange of information. These support agencies (listed in Appendix 2) provide services of law enforcement, fire protection, ambulance services, and medical and hospital support services. (Support groups providing transportation and treatment of injured plant personnel are described in COL Plan Section L, and addressed below in SER Section 13.3.4.12.) COLA Supplemental Information 4 includes copies of the signed letters of agreement with agencies and organizations, which describe the scope of services to be provided, types of resources available, and points of contact.

In view of the above, and subject to License Condition (13-3) and License Condition (13-5), the staff finds that the applicant has unambiguously defined its responsibilities for emergency response, has adequate staffing to provide and maintain at all times initial facility accident response in key functional areas, and is capable of timely augmentation of the response capabilities. In addition, the applicant has adequately specified the interfaces among various onsite and offsite support and response activities. In addition, the applicant has described the organization for coping with radiological emergencies, including the authorities, responsibilities, and duties of individuals assigned to the licensee's emergency organization, and the means for

¹⁰ FPL Letter No. L-2012-208 (May 10, 2012) discusses the approach taken by FPL for Turkey Point, Units 3 and 4 to address staffing associated with the NTTF recommendations and emergency planning program enhancements in the NRC's November 23, 2011, Final Rule.

their notification in the event of an emergency. The applicant has also described the normal plant operating organization, the onsite ERO, and headquarters and local offsite personnel and services that will augment and support the onsite organization. Furthermore, licensee employees who are responsible for making offsite dose projections, and licensee and other persons with special qualifications for coping with emergency conditions, are also identified. A detailed analysis of on-shift staffing personnel responsibilities is addressed in License Condition (13-5). Communications capabilities addressed in NTTF Recommendation 9.3, associated with License Condition (13-4), are discussed further in SER Section 13.3.4.6.

Conclusion

Subject to License Condition (13-3) and License Condition (13-5), the staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard B. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(2) and 10 CFR Part 50, Appendix E, Section IV.A, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.3 *Emergency Response Support and Resources*

As reflected in NUREG-0654, Planning Standard C, “Emergency Response Support and Resources,” 10 CFR 50.47(b)(3) requires that arrangements for requesting and effectively using assistance resources have been made, arrangements to accommodate State and local staff at the licensee EOF have been made, and other organizations capable of augmenting the planned response have been identified. In addition, 10 CFR Part 50, Appendix E, Section III requires that the emergency plans incorporate information about the emergency response roles of supporting organizations and offsite agencies, and that information shall be sufficient to ensure coordination among the supporting groups and with the licensee. Regulations in 10 CFR Part 50, Appendix E, Section IV.A.7, require identification of, and a description of the assistance expected from, appropriate local, State, and Federal agencies with responsibilities for coping with emergencies, including hostile action at the site.

In COL Plan Section C, “Emergency Response Support and Resources,” the applicant described the provisions for requesting and effectively using support resources and for accommodating offsite officials at the emergency response facilities. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard C, “Emergency Response Support and Resources.” Planning Standard C provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(3).

COL Plan Section C.1, “Federal Response Support and Resources,” states that during an emergency, Federal agencies provide assistance through the National Response Framework. The NRC is the lead Federal agency that provides direct assistance to Turkey Point, with other Federal agencies—such as the Department of Homeland Security (DHS) and Department of Energy (DOE)—providing assistance to the State of Florida through implementation of the NRF. COL Plan Sections A and B identify the specific individuals by title who are authorized to request Federal assistance. COL Plan Section A.4 states that the recovery manager in the EOF has the authority to request Federal assistance, and COL Plan Section B.4 states that the

emergency coordinator has the responsibility and authority to initiate emergency actions necessary to protect the life, health, and safety of plant staff and the affected public.

COL Plan Section A identifies Federal agencies that may provide assistance to Turkey Point. NRC personnel are expected to arrive at the site within 6 hours after declaration of a Site Area Emergency or General Emergency, and FEMA may send a representative for near-site coordination. COL Plan Section A describes the various supporting organizations, and includes the roles of the NRC, DHS, DOE, Environmental Protection Agency (EPA), Federal Bureau of Investigation, National Weather Service (NWS), and U.S. Coast Guard. FPL has reserved space for Federal and State agency personnel in the emergency response facilities, which have equipment and communications capability necessary for a continuous high level of response, interaction, and communication among key personnel during emergency conditions. The NRC, FEMA, State of Florida, and Miami-Dade and Monroe Counties may dispatch representatives to the EOF, where accommodations have been provided. At the Alert level and above, Turkey Point personnel are assigned as liaisons to the State of Florida and Miami-Dade and Monroe County emergency operations centers (EOCs) when they are activated. These representatives act as technical liaisons to interpret EALs, explain accident conditions, and provide technical information regarding the affected unit's actions by the plant's ERO.

COL Plan Section C.3, "Radiological Laboratories," states that radiation monitoring and analysis is provided by an onsite laboratory, which is the central point of receipt and analysis for all onsite samples, and includes equipment for chemical and radiological analyses. Additional laboratory facilities that can provide support include the Radiation Protection counting room facilities, St. Lucie Plant radiological facilities, and the State of Florida Mobile Emergency Radiological Laboratory, which can be in position near the site within approximately 6 to 8 hours of notification. A State of Florida Department of Health (DOH) Bureau of Radiation Control (BRC) representative dispatched to the EOF will coordinate all State offsite field monitoring data and sample media.

Through INPO, other utilities with operating nuclear facilities are available to provide certain types of assistance and support, including technicians, engineering, design, consultation, whole body counting, and dosimetry evaluation and equipment. Additional facilities, organizations, and individuals—listed in the Emergency Response Directory (see COL Plan Appendix 3)—are available and may be used in support of emergency response. In addition, American Nuclear Insurers provides insurance to cover FPL's legal liability up to the limits imposed by the Price-Anderson Act, for bodily injury or property damage caused by the nuclear energy hazard resulting from an incident at the plant. COL Plan Section B.7 describes assistance available through INPO, EPRI, NEI, ANI, DOE, Bechtel Power Corporation, URS Washington Division, and AREVA. Written agreement (listed in COL Plan Appendix 2) that describe the level of assistance and resources provided to FPL by external sources are included in COLA Supplemental Information 4.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that the applicant has made arrangements for requesting and effectively using assistance resources, including arrangements to accommodate State and local staff at the EOF, and has identified other organizations capable of augmenting the planned response. In addition, the applicant has made adequate provisions for incorporating the Federal response capability into its operation plan, and has identified radiological laboratories and other

organizations that can be relied on in an emergency to provide assistance. The staff also finds that the emergency plans incorporate information about the emergency response roles of supporting organizations and offsite agencies, and that the information is sufficient to ensure coordination among the supporting groups and the licensee. Finally, the applicant has identified appropriate State, local, and Federal agencies with responsibilities for coping with emergencies, including the expected assistance from each.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard C. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(3) and 10 CFR Part 50, Appendix E, Sections III and IV.A.7, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.4 *Emergency Classification System*

As reflected in NUREG-0654, Planning Standard D, "Emergency Classification System," 10 CFR 50.47(b)(4) requires that a standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, is in use by the nuclear facility licensee, and that State and local response plans call for reliance on information provided by facility licensees for determinations of minimum initial offsite response measures. In addition, 10 CFR Part 50, Appendix E, Section IV.B, requires a description of the means to be used for determining the magnitude, and for continually assessing the impact, of the release of radioactive materials, including emergency action levels (EALs) that are to be used as criteria for determining the need for offsite agency notifications and participation, and when and what types of protective measures should be considered. The EALs must include hostile actions that may adversely affect the nuclear power plant. The initial EALs shall be discussed and agreed on by the applicant or licensee and State and local governmental authorities, and approved by the NRC. Thereafter, EALs shall be reviewed with State and local governmental authorities on an annual basis. Regulations in 10 CFR Part 50, Appendix E, Section IV.C, require a description of EALs and emergency conditions that involve alerting or activating the total emergency organization, including communication steps to be taken under each emergency class. The emergency classes defined shall include (1) notification of unusual event, (2) alert, (3) site area emergency, and (4) general emergency. Regulations in 10 CFR Part 50, Appendix E, Section IV.C.2, require the capability to assess, classify, and declare an emergency condition within 15 minutes after the availability of indications to plant operators that an EAL has been exceeded, and to promptly declare the emergency conditions as soon as possible following identification of the appropriate emergency classification level.

In COL Plan Section D, "Emergency Classification System," the applicant described the classification and EAL scheme used to determine the minimum response to an abnormal event at the plant. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard D, "Emergency Classification System." Planning Standard D provides detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(4).

The classification and EAL scheme is based on plant systems, effluent parameters, and operating procedures for each unit. The emergency plan provides for classification of emergencies into four categories or conditions, covering the postulated spectrum of emergency situations. COL Plan Appendix 3 lists an EPIP titled "Emergency Classification." ITAAC 9.1 addresses the licensee's submission to the NRC of detailed EIPs for the onsite emergency plan no less than 180 days before fuel load. Submission of EIPs is also addressed in STD SUP 13.3-1, and discussed below in SER Section 13.3.4.19. In addition, the adequacy of the procedures will be demonstrated through a review of their use during an exercise pursuant to ITAAC 8.1.1 and ITAAC 8.1.2.

Each emergency classification is characterized by EALs (or event initiating conditions) and addresses emergencies of increasing severity, including security threats to facility protection or a security event that results from intentional malicious dedicated efforts of hostile action. Security-based emergency classification levels and EALs are also addressed in NRC Bulletin 2005-02 (BL 2005-02), "Emergency Preparedness and Response Actions for Security-Based Events," July 18, 2005 (ADAMS Accession No. ML051740058). (See also, SER Section 13.3.4.10, which addresses other areas of concern in BL 2005-02, and the protective actions that the applicant would take in response to a hostile action event.)

An initiating condition is one of a predetermined subset of unit conditions where either the potential exists for a radiological emergency, or such an emergency has occurred. An emergency is classified after assessing abnormal plant conditions and comparing them to EAL threshold values for the appropriate initiating condition. EAL matrix tables, organized by recognition categories, are used to facilitate the comparison. ITAAC 1.1.1 and ITAAC 1.1.2 address the ability of the main control room, TSC, and EOF to retrieve and display the facility system and effluent parameters specified in the emergency classification and EAL technical basis document.

In RAI 5681, Question 13.03-6, August 15, 2011 (ADAMS Accession No. ML11227A063), the staff requested additional information from the applicant, regarding two staff-identified options associated with submission of an EAL scheme in support of the COLA for Units 6 and 7. The staff asked the applicant to identify its preferred option and to provide the required EAL information in support of this option. Option 1 was the submission of an entire EAL scheme, which includes all site-specific information. Option 2 had four parts No. ML092030210), to develop the remainder of the EAL scheme, (critical elements) that address (1) the submission of an overview of the EAL scheme, (2) use of NEI technical report NEI 07-01, , (3) the proposal of a license condition that addresses EAL completion and submission to the NRC, and (4) how the EALs are maintained and controlled.

In a September 14, 2011, response to RAI 5681, Question 13.03-6 (ADAMS Accession No. ML11259A053), the applicant committed to Option 2, addressed the associated four critical elements, and proposed associated conforming revisions to COLA Part 5 and Part 10. The applicant stated that the remainder of the EAL scheme will be developed using NEI 07-01 and proposed a license condition, which addresses completion of plant-specific EALs and submission to the NRC. In addition, the applicant proposed to maintain the EALs in a document that is controlled by the 10 CFR 50.54(q) change process (e.g., in the emergency plan or EIPs). The applicant's response to Option 2 is reflected in Attachment 1, "Emergency Action Levels," to COL Plan Annex 2 and Annex 3. In addition, in COLA Part 10, the applicant proposed License Condition 11.A, which addresses the submission of EALs in accordance with NEI 07-01. Furthermore, in COL Plan Section D.1, "Emergency Classification System," the applicant provided an overview of the EAL scheme, including a definition of the four emergency

classification levels (i.e., Unusual Event, Alert, Site Area Emergency, and General Emergency) and a general list of licensee actions for each level. Required actions for each classification include 15-minute notification of the State and counties, and PARs (if appropriate).

The staff reviewed the applicant's response to RAI 5681, Question 13.03-6, including COLA revisions and proposed License Condition 11.A, and finds that it is acceptable because it adequately addresses the four critical elements of Option 2 (identified above). Therefore, the staff considers RAI 5681, Question 13.03-6, resolved. In addition, the staff finds that proposed License Condition 11.A is acceptable, with the exception of the timeframe for submission of the EALs, because it uses NEI 07-01, Revision 0, to develop the remainder of the EAL scheme. The staff proposes a similar timeframe for submission of the EALs to the NRC, which is based on the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a). Therefore, consistent with the applicant's proposed License Condition 11.A, the staff identified the following License Condition (13-6), which includes the staff's proposed timeframe for submission of the EALs to the NRC.

License Condition (13-6)

No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Florida Power & Light Company shall submit to the Director of NRO, or the Director's designee, in writing, a fully developed set of plant-specific emergency action levels (EALs), in accordance with NEI 07-01, "Methodology for Development of Emergency Action Levels—Advanced Passive Light Water Reactors," Revision 0, with no deviations. The EALs shall have been discussed and agreed upon with State and local officials.

In COL Plan Section D, the applicant also stated that the initial response of Federal, State, and county agencies depends on information provided by the ERO, and that emergency preparedness staff works closely with the State of Florida and county agencies to ensure consistency in classification schemes and procedural interfaces. In addition, the content of the EALs is reviewed with the State and county authorities on an annual basis, and the State and counties are informed regarding any EAL changes that significantly impact the initiating conditions or technical basis. In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, and subject to License Condition (13-6), the staff finds that the applicant has established a standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, which includes the four emergency classes identified above. The applicant has described EALs and emergency conditions that involve ERO activation, including steps to be taken under each emergency class. The applicant also has described the means to determine the magnitude of, and for continually assessing the impact of, the release of radioactive materials, and EALs (including hostile actions) that are used to determine the need for offsite notifications and protective measures. In addition, the applicant has the capability to assess, classify, and declare an emergency condition within 15 minutes after the availability of indications to plant operators that an EAL has been exceeded, and to promptly declare the emergency condition.

In addition, the State and local response plans call for reliance on information provided by the applicant for determination of minimum initial offsite response measures. Under the license

condition identified above, the initial EALs will be discussed and agreed upon with State and local officials, and the fully developed EALs will be submitted to the NRC for confirmation no later than 180 days prior to initial fuel load. Thereafter, the EALs will be reviewed with State and local governmental authorities on an annual basis.

Conclusion

Subject to License Condition (13-6), the staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard D. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(4) and 10 CFR Part 50, Appendix E, Sections IV.B and IV.C, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.5 *Notification Methods and Procedures*

As reflected in NUREG-0654, Planning Standard E, "Notification Methods and Procedures," 10 CFR 50.47(b)(5) requires that procedures have been established for notification, by the licensee, of State and local response organizations and for notification of emergency personnel by all organizations; the content of initial and follow-up messages to response organizations and the public has been established; and means to provide early notification and clear instruction to the populace within the 16-km (10-mi) plume exposure pathway EPZ have been established. In addition, 10 CFR Part 50, Appendix E, Section IV.A.4, requires a description of how offsite dose projections will be made and the results transmitted to State and local authorities, NRC, and other appropriate governmental entities. Regulations in 10 CFR Part 50, Appendix E, Section IV.C, require a description of EALs and emergency conditions that involve alerting or activating the emergency organization, including communication steps to be taken under each class of emergency, and the existence of a message authentication scheme. Regulations in 10 CFR Part 50, Appendix E, Section IV.D.1, require a description of administrative and physical means for notifying local, State and Federal officials and agencies and agreements reached with these officials and agencies for the prompt notification of the public and for public evacuation or other protective measures. The description shall include identification of the appropriate officials, by title and agency, of the State and local government agencies within the EPZs. Regulations in 10 CFR Part 50, Appendix E, Section IV.D.3, require the licensee to have the capability to notify responsible State and local governmental agencies within 15 minutes after declaring an emergency. The licensee shall demonstrate that appropriate governmental authorities have the capability to make a public alerting and notification decision promptly on being informed by the licensee of an emergency condition, and that administrative and physical means have been established for alerting and providing prompt instructions to the public within the plume exposure pathway EPZ. The alerting and notification capability shall include a backup method. Finally, 10 CFR 50.72(a)(3) requires NRC notification no later than one hour after declaring an emergency.

In COL Plan Section E, "Notification Methods and Procedures," the applicant described notification of ERO personnel; State, county, and Federal agencies; and the general public during a declared emergency at Turkey Point. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard E, "Notification Methods and Procedures." Planning Standard E provides the detailed evaluation

criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(5).

COL Plan Section E.1, "Bases for Emergency Response Organization Notification," states that FPL, in cooperation with State and county authorities, has established mutually agreeable methods and procedures for notification of offsite response organizations, consistent with the emergency classification and action level scheme. (The emergency classification system is addressed in COL Plan Section D, and discussed above in SER Section 13.3.4.4.) Notifications to offsite agencies includes a means of verification or authentication, such as the use of dedicated communications networks, verification code words, or providing call-back verification telephone numbers.

If an emergency classification involves all units (i.e., Units 3, 4, 6, and 7) (i.e., for a natural phenomenon emergency or security-related event), and the classification for each unit is the same, the emergency shall be reported as affecting all units at the site. Unit 3 is typically designated as the lead unit for site-wide emergencies that include offsite notifications, unless conditions warrant otherwise. When an event affecting the site is detected, Unit 3 personnel will be contacted and provided information for emergency declaration. If an emergency classification involves only one unit, personnel at the affected unit will declare the emergency and initiate required notifications.

COL Plan Section E.2, "Notification and Mobilization of Emergency Response Personnel," states that EPIPs are established for notification and mobilization of emergency response personnel, and COL Plan Appendix 3 lists an EPIP titled Notifications/Communications. Details regarding notification responsibilities, communications systems, information required to be transmitted to offsite agencies, and notification techniques are specifically described in appropriate EPIPs. (Notification of onsite personnel is addressed in COL Plan Section J.1, and discussed below in SER Section 13.3.4.10.)

After these EPIPs, State and county agencies can be notified of an emergency event within 15 minutes of the initial emergency classification using a dedicated notification system. The emergency warning points are notified using a dedicated notification system, and personnel receiving the information are designated by the State and county agencies. Commercial telephone lines, satellite telephone (i.e., Emergency Satellite Communications System (EMNET)), cellular telephones, or radios are available as backup notification methods. In addition, the State of Florida is responsible for notifying government agencies that are within the 50-mi ingestion pathway EPZ. ITAAC 2.1 tests the capability to notify State and local authorities within 15 minutes after the declaration of an emergency in the main control room and the EOF. State and county authorities are responsible for notifying the general public.

An event will be reported to the NRC Operations Center immediately after notification of the appropriate State and county agencies, but not later than one hour after the time of initial classification, escalation, or event termination. The primary means of notification between the plant and the NRC is a dedicated system called the Emergency Notification System (ENS). The ENS is also addressed in PTN COL 9.5-9. Commercial telephone lines, cellular telephones, and EMNET are available as a backup notification method. The ERDS, which is a computerized data link to the NRC, will be initiated within one hour of the declaration of an Alert classification or higher.¹¹ The ERDS supplements the ENS, and an ERDS implementation

¹¹ See 10 CFR 50.72(a)(4), which states, in part, that the licensee shall activate ERDS as soon as possible, but not later than one hour, after declaring an emergency class of Alert or greater.

program plan is addressed in the applicant's proposed License Condition 6.e (see SER Section 13.3.4.19, below). Emergency communications are addressed in COL Plan Section F, and discussed below in SER Section 13.3.4.6 (see also, PTN COL 9.5-10 and PTN COL 18.2-2 in SER Section 13.3.4.18).

When an emergency is declared, reclassified or terminated, an announcement is made (over the plant public address system or by other means) that includes the emergency classification declared and response actions to be taken by site personnel. At the Unusual Event classification, select ERO augmentation personnel may be notified and requested to remain available to respond. At an Alert classification or higher, ERO augmentation personnel are notified for activation of the TSC, OSC, EOF and ENC using an automated callout system (pagers), or call lists in the Emergency Response Directory (listed as an administrative procedure in COL Plan Appendix 3) using commercial telephone as a backup. ITAAC 2.2 includes a test of the primary and backup ERO notification systems. If required, additional notifications to various support organizations will be made.

COL Plan Section E.3, "Initial Notification Messages," states that FPL, in conjunction with State and county authorities, has established the contents of the Florida Nuclear Plant Emergency Notification Form, which is completed and transmitted to the State and counties during a classified [declared] emergency. For an initial notification, the form includes, at a minimum, the emergency classification, whether a release is taking place, basic meteorological data, potentially affected population/areas, and any recommended protective actions. As additional information describing the emergency situation and local conditions becomes available, supplemental messages containing more detail will be provided. The NRC is notified of a classified [declared] emergency after State/county notification, using the Event Notification Worksheet (NRC Form 361) for initial notifications, and may require an open line of communications (e.g., using ENS or Health Physics Network (HPN)). Follow-up messages to State and county authorities will be provided—to the extent the information is available and appropriate—on a prearranged frequency to provide further description of the emergency. Follow-up notifications are provided to the NRC Operations Center as soon as possible, but not later than one hour after significant new information is available.

COL Plan Section E.6, "Notification of the Public," states that it is the responsibility of FPL, along with State and local governmental organizations, to provide adequate means for prompt notification of the general public within the 10-mi EPZ around Turkey Point. Administrative and physical means have been established for providing early initial warning and subsequent clear instructions to the public within the 10-mi EPZ. This notification capability consists of the Alert and Notification System (ANS) and the Emergency Alert System (EAS) radio and television stations.

The ANS consists of fixed sirens located throughout the 10-mi EPZ, which will alert the public to tune to a local radio or television station affiliated with the EAS for detailed emergency information. ITAAC 2.3 states that notification and clear instructions to the public are accomplished in accordance with the emergency plan requirements. Local and State actions are then initiated in accordance with the State of Florida radiological emergency response plan to ensure the implementation of appropriate protective measures. The ANS will be activated by Miami-Dade County from the EOC or Miami-Dade County 911, upon coordination and direction by State or local authorities, as specified in existing agreements concerning system activation. The siren system is designed in such a fashion that it can be operationally segregated by county boundary within the (Turkey Point) 16-km (10-mi) radius. In the unlikely event that the ANS

would fail to activate, the State of Florida Radiological Emergency Plan and Miami-Dade and Monroe Counties maintain the capacity to perform backup route alerting.

COL Plan Section E.7, "Messages to the Public," states that the offsite response organizations have developed EAS messages, which are consistent with the classification scheme and contain instructions with regard to specific protective actions to be taken by occupants and visitors of affected areas. FPL will provide offsite authorities with supporting information for messages to the public. The messages provide information on the nature of the emergency and recommended protective actions, including sheltering, evacuation, and the use of KI, as appropriate. The State and/or counties control the distribution of KI to the general public. Protective response is addressed in COL Plan Section J, and discussed below in SER Section 13.3.4.10.)

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that procedures for notification of State and local response organizations and emergency personnel by all organizations have been established, and the licensee has the capability to notify offsite officials and agencies, including State and local governmental agencies within 15 minutes, and the NRC no later than one hour, after declaring an emergency. The appropriate officials of the State and local government agencies within the EPZs have been identified. The licensee has described the entire spectrum of emergency conditions that involve alerting or activating the emergency organization, including EALs for offsite agency notification and communication steps to be taken under each class of emergency. Message authentication is described in the State and local emergency plans. The appropriate governmental authorities have the capability to make a public alerting and notification decision promptly following notification of an emergency by the licensee, and administrative and physical means have been established for alerting and providing prompt instruction to the public within the plume exposure pathway EPZ (including a backup method to alert populations), and for public evacuation and other protective measures. In addition, the applicant has described how offsite dose projections will be made and the results transmitted to State and local authorities, NRC, and other appropriate governmental entities.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard E. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(5), 10 CFR 50.72(a)(3), and 10 CFR Part 50, Appendix E, Sections IV.A.4, IV.C, and IV.D.1, and IV.D.3, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.6 *Emergency Communications*

As reflected in NUREG-0654, Planning Standard F, "Emergency Communications," 10 CFR 50.47(b)(6) requires that provisions exist for prompt communications among principal response organizations to emergency personnel and to the public. In addition, 10 CFR Part 50, Appendix E, Section IV.E.9, requires onsite and offsite communication systems with backup power sources, including provisions for communications with State and local governments within the plume exposure EPZ, and Federal emergency response organizations and the NRC.

Also required are provisions for communications among the Control Room, TSC, EOF, principal State and local EOCs, and field assessment teams. Communication systems shall be tested at designated frequencies.

In COL Plan Section F, "Emergency Communications," the applicant described the provisions used for communications between Turkey Point and principal response organizations, and communications between the emergency response facilities. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard F, "Emergency Communications." Planning Standard F provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(6).

COL Plan Section F.1, "Communications/Notifications," provides detailed descriptions of the various communications equipment and capabilities. FPL has extensive and reliable communication systems installed at Turkey Point, which include systems such as normal and dedicated telephone lines on landlines, fiber-optic voice channels, cellular telephones, satellite telephones, mobile radio units, portable radios, and computer peripherals. This network capability serves to maintain communication links to the emergency response facilities and offsite authorities; communications between emergency vehicles and fixed locations; and facsimile, computer network, and modem transmission.

The plant page system, Private Branch Exchange (PBX) telephone system, FPL Intelligent Tandem Network (ITN) System, automated ERO callout system, and commercial telephone system are used for alerting personnel. Separate, dedicated telephone lines provide for communications with NRC headquarters, the NRC Regional Office EOC, and the EOF. These include the HPN, Reactor Safety Counterpart Link (RSCL), Protective Measures Counterpart Link (PMCL), Management Counterpart Link (MCL), ERDS, and ENS. Backup power is provided for the ENS lines, in compliance with the guidance of BL-80-15 regarding loss of offsite power to the ENS (see PTN COL 9.5-9 in SER Section 13.3.4.18). See also, *Fukushima Dai-ichi—NTTF Recommendation 9.3* (below), regarding the availability of communications equipment during a prolonged station blackout and staff identified License Condition (13-4). COL Plan Figures F-2 and F-3 illustrate the primary and alternate methods of communication between FPL emergency response facilities and the NRC communications network.

FPL has established several communication systems that ensure reliable and timely exchange of information necessary to provide effective command and control over any emergency response (1) between the plant and State and county agencies within the EPZs, (2) with Federal EROs, (3) between the plant, the EOF, and State and county EOCs, and (4) between the emergency response facilities and field monitoring teams. FPL maintains the capability to make initial notifications to the designated offsite agencies on a 24-hour-per-day basis. (Notification methods and procedures are addressed in COL Plan Section E, and discussed above in SER Section 13.3.4.5.) The offsite notification system State "hot ring down" telephone provides primary communications to State and county warning points and EOCs from each Control Room, TSC, and the EOF. Backup or secondary methods include commercial telephone lines, EMNET, cellular telephones, and radios (see also, PTN COL 9.5-10 and PTN COL 18.2-2 in SER Section 13.3.4.18). State and county warning points are continuously staffed. COL Plan Figure F-1 shows the initial notification paths and the organizational titles from the Turkey Point emergency response facilities to Federal, State, and county EROs, and industry support agencies.

COL Plan Section F.2, "Communications with Fixed and Mobile Medical Support Facilities," states that communications are established from the site to the primary and backup medical hospitals and transportation services via telephone or radio. In all cases, site personnel notify the hospital by telephone concerning the pending arrival of injured personnel. If a helicopter is needed for transport, the hospital can maintain ground-to-air communications. Cellular telephones are available on site to be used as an alternate means of communications.

COL Plan Section N.2 states that communication between the Control Rooms, TSC, EOF, NRC, State and county warning points and EOCs, and NRC are tested monthly. ERDS is tested quarterly. Annual testing includes communications between Turkey Point and the State and local EOCs and field monitoring teams, and communications between the Control Rooms, TSC, EOF, and ENC. In addition, communications between Turkey Point emergency response facilities and the appropriate offsite response organizations are tested during annual drills. (Communication drills are addressed in COL Plan Section N.2, and discussed in SER Section 13.3.4.14.) ITAAC 3.1 and ITAAC 3.2 address the establishment of onsite and offsite communications (both primary and secondary methods/systems), including the availability of an access port for ERDS (or its successor system) and transfer of data from the unit to the NRC operations center.

Fukushima Dai-ichi—NTTF Recommendation 9.3

On March 12, 2012 (ADAMS Accession No. ML12053A340), the NRC requested additional information from all power reactor licensees and holders of construction permits, associated with the NRC NTTF review of the accident at the Fukushima Dai-ichi nuclear facility. In Recommendation 9.3, the NTTF addressed staffing and communications provisions for enhancing emergency preparedness. On January 23, 2013, the NRC issued a follow-up letter, which identified eight generic technical issues that need to be addressed as part of the Recommendation 9.3 communications capability assessment.

With regard to communications, the accident at Fukushima highlighted the need to ensure that the communications equipment relied upon to coordinate the event response during a prolonged station blackout can be powered. Specifically, the March 12, 2012, letter requests that all power reactor licensees and holders of construction permits (in active or deferred status) assess their current communications systems and equipment used during an emergency event, including consideration of any enhancements that may be appropriate for the emergency plan with respect to communications requirements of 10 CFR 50.47, Appendix E to 10 CFR Part 50, and NUREG-0696, "Functional Criteria for Emergency Response Facilities." In addition, the means necessary to power the new and existing communications equipment during a prolonged station blackout should be considered. Onsite emergency organization and staffing is addressed above in SER Section 13.3.4.2. (See also, COL STD 13.3-2 in SER Section 13.3.4.18.)

In COLA Part 10, the applicant proposed License Condition 12.C, "Fukushima Actions—Emergency Planning Actions," which addresses both the staffing and communications areas addressed in Recommendation 9.3. Consistent with License Condition 12.C—with regard to the communications capability assessment—the staff identified License Condition (13-4), which is addressed above in SER Section 13.3.4.2.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, and subject to License Condition (13-4), the staff finds that provisions exist for prompt communications among principal response organizations to emergency personnel and to the public. Specifically, the applicant has established a reliable primary and backup means of communications for alerting and activating the response organizations and personnel, including 24-hour manning of communications links. Provisions also exist for communications among the Control Room, TSC, EOF, State and local governments within the EPZs, and field assessment teams. In addition, the applicant has provided a coordinated communication link for fixed and mobile medical support facilities. Onsite and offsite communications systems have backup power sources, and are tested at designated frequencies.

Conclusion

Subject to License Condition (13-4), the staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard F. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(6) and 10 CFR Part 50, Appendix E, Section IV.E.9, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.7 *Public Education and Information*

As reflected in NUREG-0654, Planning Standard G, "Public Education and Information," 10 CFR 50.47(b)(7) requires that information be made available periodically to members of the public concerning notification methods and initial actions they should take in an emergency (e.g., listening to a local broadcast station and remaining indoors), that the principal points of contact with the news media for dissemination of information during an emergency (including the physical location or locations) be established in advance, and that procedures for coordinating dissemination of information to the public be established. In addition, 10 CFR Part 50, Appendix E, Section IV.D.2, requires a description of provisions for yearly dissemination to the public within the plume exposure EPZ of basic emergency planning information, such as methods for public notifications and protective actions planned if an accident occurs, general information as to the nature and effects of radiation, and a listing of local broadcast stations that will be used for dissemination of information during an emergency. Signs or other measures shall also be used to disseminate information to any transient population within the plume exposure pathway 10-mi EPZ.

In COL Plan Section G, "Public Education and Information," the applicant described the FPL public education and information program, including the process for keeping the public in the 10-mi EPZ informed in the event of an emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard G, "Public Education and Information." Planning Standard G provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(7).

COL Plan Section G.1, "Public Information Publication," states that FPL is responsible for maintaining a public information program, with support from the State of Florida Division of Emergency Management (DEM) and the Miami-Dade and Monroe Counties emergency management offices. The State of Florida has overall responsibility for maintaining a continuing

disaster preparedness public education program. The Turkey Point public information publication is updated annually, in coordination with State and county agencies, and distributed to all residents within the 10-mi EPZ and to locations where the transient population may obtain a copy. The public information material explains how the public will be notified and what their actions should be during an emergency, and includes educational information on radiation, a description of possible protective measures for the public, a map of major evacuation routes, a list of reception centers, instructions on how to obtain information regarding the disabled or their caretakers, and those without transportation, and who to contact for additional information.

The publications instruct the public to go indoors and turn on their televisions or radios when they hear the ANS sirens operating, and identify the local television and radio stations that will provide information related to the emergency. Information is also provided to the transient population by means of signs on siren poles that instruct them (in English and Spanish) to turn to EAS stations. Public notices at local business establishments, parks, beaches, and other outdoor recreational facilities around Turkey Point provide a list of television and radio stations that will transmit emergency information and numbers where additional information can be obtained.

COL Plan Section G.3, "Media Accommodations," states that the FPL Marketing and Communications Department is notified upon declaration of an Unusual Event or higher emergency classification, and will handle public and media inquiries until the ENC is activated. The ENC is on the second floor of the FPL General Office Building in Miami, FL, and is collocated with the EOF. Once the ENC is activated at an Alert or higher emergency classification, or at an earlier classification if conditions warrant, it has the responsibility and authority for issuing news releases to the public. The FPL public information officer directs activities at the ENC. FPL spokespersons and ENC staff coordinate emergency information with the EOF, Marketing and Communications personnel in the Juno Beach office, and Federal, State, and county spokespersons located in the ENC. COL Plan Appendix 3 lists an EPIP titled "Emergency News Center Activation and Operation," and an administrative procedure titled "Public Education and Information."

The ENC serves as a location where media personnel gather to receive information related to the emergency event, and approved news releases will be provided to the media for dissemination to the public. The ENC functions as the single point of contact to interface with Federal, State, and local authorities that are responsible for disseminating information to the public. Public information personnel coordinate development and distribution of news releases from the EOF and the ENC. The ENC is equipped with appropriate seating, lighting, and visual aids to allow for public announcements and briefings to be given to the news media. Additionally, the ENC is equipped with commercial telephone lines for making outgoing calls. Functions of the ENC include serving as the primary location for accumulating information and developing news releases; providing work space and telephones for public information personnel from the State, counties, NRC, FEMA, and industry organizations; providing work space and telephones for news media personnel; and providing responses to media inquiries. ITAAC 4.1 addresses the adequacy of ENC size, equipment, and communications capabilities.

The ENC is staffed by FPL and government public information representatives who will be the source of public information during an emergency at the plant, and who will coordinate information. The FPL public information officer, who has direct access to all necessary emergency information, is the primary spokesperson for FPL, and is assisted by the chief nuclear spokesperson. The timely exchange of information between designated spokespersons will enhance communications flow to the public and news media, and also aid in dispelling

rumors. Media Monitors and Rumor Control personnel in the ENC may identify rumors or misinformation when responding to telephone calls from the general public and the news media, and from monitoring media reports. In addition, the Miami-Dade County Office of Emergency Management maintains telephones designated for rumor control, and State and local plans and procedures provide further details for control of rumors and other misinformation. FPL, in cooperation with the State of Florida and Counties of Miami-Dade and Monroe, will conduct an annual program to acquaint the news media with information concerning nuclear power, and points of contact for release of public information in an emergency.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that the applicant has provided for a coordinated and periodic dissemination of information to the public—including the permanent and transient adult population within the plume exposure EPZ—regarding how they will be notified and what their actions should be in an emergency. The applicant has also established the principal points of contact with the news media for dissemination of information during an emergency, and procedures for coordinated dissemination of information to the public. In addition, the applicant has described the provisions for yearly dissemination to the public within the plume exposure EPZ of basic emergency planning information, including the use of signs or other measures to disseminate information to any transient population within the plume exposure EPZ.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard G. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(7) and 10 CFR Part 50, Appendix E, Section IV.D.2, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.8 Emergency Facilities and Equipment

As reflected in NUREG-0654, Planning Standard H, “Emergency Facilities and Equipment,” 10 CFR 50.47(b)(8) requires that adequate emergency facilities and equipment to support the emergency response be provided and maintained. In addition, 10 CFR Part 50, Appendix E, Section IV.E.8, requires that adequate provision shall be made and described for emergency facilities and equipment, including an onsite OSC and TSC, and an EOF from which effective direction can be given and effective control can be exercised during an emergency. Regulations in 10 CFR Part 50, Appendix E, Section IV.E.8.b, address various requirements associated with EOF locations and required provisions, which are not applicable to an existing EOF pursuant to 10 CFR Part 50, Appendix E, Section IV.E.8.e. Regulations in 10 CFR Part 50, Appendix E, Section IV.E.8.c, require various EOF capabilities, which include supporting response to multiple reactors/sites and simultaneous events, as applicable. Regulations in 10 CFR Part 50, Appendix E, Section IV.E.8.d, require an alternative facility (for use when onsite emergency facilities cannot be safely accessed during hostile actions) that would be accessible to function as a staging area for augmentation of emergency response staff. Regulations in 10 CFR Part 50, Appendix E, Section IV.G, require a description of provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up to date. Regulations in 10 CFR Part 50, Appendix E, Section VI.1, require an ERDS data link between the licensee’s onsite computer

system and the NRC Operations Center, which provides for the automatic transmission of a limited data set of selected parameters.

In COL Plan Section H, "Emergency Facilities and Equipment," the applicant described the functions and locations of the emergency response facilities and equipment that will be used and maintained by FPL in coordinating and performing emergency response activities, and the surveillance programs used to monitor and ensure that these facilities and equipment are maintained in a high degree of constant readiness. In addition, COL Plan Appendix 3 lists an administrative procedure titled "Emergency Response Facilities and Equipment." The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard H, "Emergency Facilities and Equipment." Planning Standard H provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(8).

Control Room

There is a Control Room for each of the units on the site where major plant systems are operated. Each Control Room is equipped with instrumentation to supply detailed information on the reactor and major systems. The Control Room for the affected unit is the first onsite facility to become involved with the response to emergency events, and will be the designated location for the emergency coordinator. Emergency coordinator responsibilities will transfer to the TSC and EOF when the facilities are properly staffed and prepared to take over these responsibilities. Control Room personnel must evaluate and effect control over the emergency and initiate activities necessary for coping with the emergency until such time that the augmented emergency response facilities can be activated.

The emergency response facilities that have been established at Turkey Point to assist Control Room personnel in mitigating the consequences of accidents include the TSC, EOF and OSC (discussed below), and the ENC. In FSAR Table 1.8-201 and Section A of COLA Part 7, the applicant described two Tier 2 departures from the AP1000 DCD, which address moving the locations of the OSC and TSC that support Units 6 and 7 (i.e., PTN DEP 18.8-1 and PTN DEP 18.8-2, respectively). These two departures are discussed below under the applicable OSC and TSC subsections.

Technical Support Center

The TSC is located in the Turkey Point Nuclear Training Building, which is outside of the Protected Areas between the Control Rooms for Units 3 and 4 and the Control Rooms for Units 6 and 7. The applicant stated in COL Plan Section H.1.b that this location provides the ability to respond and activate the facility in a timely fashion independent of the unit(s) that may be affected by the emergency, and will permit the use of the TSC in a security event that may curtail the entry of ERO personnel into a Protected Area of the affected unit(s). ITAAC 5.1.2 states that the TSC is located outside the Protected Area, and procedures are in place to enhance passage through security checkpoints expeditiously. The Nuclear Training Building is identified in COL Plan Annex 1 (Units 3 and 4), Figure A1-1, "Units 3 and 4 Facility Layout," and can be seen in COL Plan Part 1 Figure 1-2, "Turkey Point Site Layout," and COLA Part 2 (FSAR) Figure 2.1-204, "Turkey Point Enlarged Site Area Map."

The location of the TSC is addressed in Tier 2 departure PTN DEP 18.8-2, which moves the TSC for Units 6 and 7 from the AP1000 DCD CSA (Room 40403) to a common TSC—supporting Units 3, 4, 6, and 7—in the Nuclear Training Building. In COLA Part 7, the applicant assessed PTN DEP 18.8-2 pursuant to Section VIII.B.5.b of Appendix D to 10 CFR Part 52, and concluded that the departure has no safety significance. Specifically, the departure is for a nonsafety-related system, the alternate location of the TSC meets applicable requirements, and relocating the TSC does not impair its function. The staff agrees with the applicant's evaluation, for the reasons described below.

Pursuant to 10 CFR 50.47(b)(8), the applicant must provide and maintain adequate emergency facilities and equipment to support the emergency response, which includes the TSC. As stated in NUREG-0696, Section 2.1, "Function," the TSC provides guidance and technical assistance to the Control Room, and all plant manipulations shall be performed by the Control Room licensed operators. With regard to the applicant's proposed common TSC location, the staff considered the applicable guidance in NUREG-0696, which states the following in Section 2.2, "Location":

The onsite TSC is to provide facilities near the control room for detailed analyses of plant conditions during abnormal conditions or emergencies by trained and competent technical staff. During recent events at nuclear power plants, telephone communications between the facilities were ineffective in providing all of the necessary management interaction and technical information exchange. This demonstrates the need for face-to-face communications between TSC and control room personnel. To accomplish this, the TSC shall be as close as possible to the control room, preferably located within the same building. The walking time from the TSC to the control room shall not exceed 2 minutes. This close location will facilitate face-to-face interaction between control room personnel and the senior plant manager working in the TSC. This proximity also will provide access to information in the control room that is not available in the TSC data system.

Provisions shall be made for the safe and timely movement of personnel between the TSC and the control room under emergency conditions. These provisions shall include consideration of the effects of direct radiation and airborne radioactivity from inplant sources on personnel traveling between the two facilities. Anticontamination clothing, respiratory protection, and other protective gear may be used to help protect personnel in transit. The 2-minute travel time between the TSC and the control room does not include time required to put on any necessary radiological protective gear, but it does include the time required to clear any security checkpoints. There should be no major security barriers between these two facilities other than access control stations for the TSC and control room.

Further guidance is provided in Supplement 1 to NUREG-0737, "Clarification of TMI Action Plan Requirements—Requirements for Emergency Response Capability (Generic Letter No. 82-33)," in relation to the TSC location. Specifically, Section 8.2, "Technical Support Center (TSC)," states that the TSC will be located within the site protected area so as to facilitate necessary interaction with control room, OSC, EOF and other personnel involved with the emergency. See also, DCD Tier 2 Subsection 18.8.3.5, "Technical Support Center Mission and Major Tasks," which describes various aspects of the TSC, including human factors considerations.

In RAI 5681, Question 13.03-8 (H-1), the staff requested additional information from the applicant, regarding the applicant's justification for locating the TSC outside of the Protected Area, a description of any impediments that could impact or delay the transit time between the TSC and Control Rooms, and a description of communication capabilities that compensate for the increased distance and transit time between the TSC and the Control Rooms. In a September 14, 2011, response to RAI 5681, Question 13.03-8 (H-1), the applicant stated the following:

FPL has chosen to develop a TSC that will support the response to Turkey Point Units 3, 4, 6, & 7. The TSC will be located north of Turkey Point Units 6 & 7 and south of Turkey Point Units 3 & 4. The separation of the TSC from the three control rooms will be approximately 2600 feet [792 m] or within approximately a 10 to 15 minute walk. Use of current technologies such as updated computer equipment, teleconferencing, real time system monitoring through plant computer networks, and telephone and radio systems for primary and emergency communications will bridge the physical separation. The facility will have access to plant drawings, procedures, and computer applications needed to support the evaluation and decision-making processes of the Emergency Response Organization (ERO). The TSC will be a larger dedicated facility located in the Training Building. Procedures are in place to ensure that passage from outside the Protected Area into the Control Room is not hindered during the emergency. The placement of the TSC outside of the Protected Area enhances the ability to reach minimum staffing levels and for activation for the TSC especially during the off-hours. This location also provides an enhanced capability for staff to activate the facility during a hostile action event inside the Protected Area.

The staff had previously considered the "2 minute walking time" criterion associated with the TSC location as part of the development of the emergency planning ITAAC addressed in SECY-05-0197.¹² In relation to the TSC location, generic ITAAC acceptance criterion 5.1.2 of SECY-05-0197 includes the statement that "[t]he COL applicant will adopt design certification criteria, if applicable, or otherwise specify TSC location." The equivalent ITAAC acceptance criterion 8.1.2 of NUREG-0800 (Table 14.3.10-1) and RG 1.206 (Table C.II.1-B1), added a statement that "[a]dvanced communication capabilities may be used to satisfy the two minute travel time."

¹² SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," October 28, 2005 (ADAMS Accession No. ML052770225). See also, the associated February 22, 2006, Staff Requirements Memorandum (ADAMS Accession No. ML060530316).

The staff evaluated various factors to determine the appropriateness and acceptability of providing flexibility relating to the 2-minute walking time between the TSC and Control Room in the guidance documents, including technical advances in both communication and data system technologies since NUREG-0696 and Supplement 1 to NUREG-0737 were published in 1981 and 1983, respectively.¹³ In addition, having a common TSC that supports multiple reactor units and is located a moderate distance (i.e., more than 2 minutes) from the Control Rooms presents distinct advantages. These advantages include the increased efficiency of a centralized point of support for the entire site, the elimination of confusion regarding which TSC on a multiple-unit site would be staffed during an emergency, not having to staff multiple TSCs if an incident involved more than one unit, a single point of contact for offsite support, and consideration of security-related (i.e., hostile action) events. (Additional TSC requirements are addressed within this report section.) From a support and functional standpoint, and subject to a demonstration of adequacy during the full participation exercise (addressed in ITAAC 8.1), the staff finds that the applicant's proposed TSC location outside the Protected Area is acceptable for the following two reasons: First, compared to TSCs in the early 1980's, the proposed TSC will have enhanced staffing and activation capabilities, including use of current technologies for communication and data systems. Second, the location provides an enhanced capability for activation of the TSC during a hostile action event inside the Protected Area. Therefore, the staff finds that the applicant's response is acceptable and considers RAI 5681, Question 13.03-8 (H-1), resolved.

In COL Plan Section H.1.b, "Technical Support Center (TSC)," the applicant stated that the TSC provides plant management and technical support to Control Room personnel and technical data and information to the EOF, and is sized to accommodate a minimum of 40 people and their supporting equipment (including six NRC representatives). ITAAC 5.1.1 states that the TSC has at least 3,000 square feet (279 square meters) of floor space consistent with NUREG-0696 (75 square feet/person, or 6.97 square meters/person) and is large enough for required systems, equipment, records and storage. ITAAC 5.1.5 states that the TSC has the means to receive, store, process, and display various plant and environmental information, and to initiate emergency measures and conduct emergency assessment. Plant parameters that can be retrieved in the TSC are also addressed in DCD Tier 1 Table 3.1-1, ITAAC 3.

The TSC is activated for all emergencies classified as Alert or higher, and may be activated at an Unusual Event if deemed necessary by the emergency coordinator. ITAAC 8.1.1.D.1.a states that the TSC and OSC are activated within 60 minutes from notification of an Alert or higher event classification, with at least minimum staffing. When operational, the TSC provides support for the affected Control Room's emergency response efforts; continued evaluation of event classification; assessment of plant status and potential offsite impact; coordination of emergency response action within the Protected Area; protective actions onsite and offsite (until the EOF is operational); and communication with offsite government agencies (until the EOF is operational). COL Plan Appendix 3 lists an EPIP titled "TSC Activation and Operation." ITAAC 8.1.1.C.1.a states that command and control is demonstrated by the main control room in the early phase of the emergency, and by the TSC within 60 minutes from notification of an Alert or higher event classification, with at least minimum staffing. In addition, ITAAC 8.1.1.C.2 states that the exercise will demonstrate the ability to transfer emergency direction from the main control room (simulator) to the TSC.

¹³ On March 12, 2007, the NRC approved a TSC location that is approximately 15 minutes from the control room for the Clinton Power Station (ADAMS Accession No. ML070540270). See also, Section 13.3, "Emergency Planning," of NUREG-2124, "Final Safety Evaluation Report—Related to the Combined Licenses for Vogtle Electric Generating Plant, Units 3 and 4," Volume 2, September 2012 (ADAMS Accession No. ML12271A048), where the NRC approved the Vogtle site's common TSC location that is approximately 10 minutes from the control room.

Although the TSC does not provide for face-to-face communications with the affected Control Room(s), it has communication links that can transmit and receive direct voice and data communications from the affected Control Room. The TSC is the primary onsite communications center during an emergency and provides reliable voice communications to the Control Room, OSC, EOF, NRC, and other offsite agencies. (The availability of an ERDS data link between the licensee's onsite computer system and the NRC Operations Center is addressed in COL Plan Sections E, F, and N, and is discussed in SER Sections 13.3.4.5, 13.3.4.6, and 13.3.4.14, respectively.) Security personnel are positioned in the TSC to expedite personnel movement between the TSC and Control Room, as necessary. Communication capabilities are addressed further in COL Plan Section F, and discussed above in SER Section 13.3.4.6. ITAAC 5.1.3 addresses the TSC communications equipment and capabilities. In addition, TSC and EOF communications strategies and human functions attributes are addressed in PTN COL 18.2-2, and discussed below in SER Section 13.3.4.18.

In COL Plan Section H.1.b, the applicant stated that personnel in the TSC shall be protected from radiological hazards, including direct radiation and airborne contaminants under accident conditions, with similar radiological habitability as Control Room personnel. Adequate radiological protection will be ensured through permanent Radiation Monitoring Systems (RMSs) or periodic radiation surveys. These systems indicate radiation dose rates and airborne radioactivity inside the TSC while it is in use. In addition, KI is available in the TSC, if needed. If the TSC becomes uninhabitable for any reason, implementing procedures will provide guidance on the transfer of duties and relocation of the staff. ITAAC 5.1.4 addresses radiological and nonradiological protection features for the TSC, and ITAAC 5.1.6 states that a reliable and backup electrical power supply is available for the TSC. In addition, ITAAC 8.1.1.D.2 includes a demonstration of the adequacy of TSC habitability precautions.

In SRP Section 15.0.3, "Design Basis Accident Radiological Consequence Analyses for Advanced Light Water Reactors," Acceptance Criterion 3 states that the radiation protection design of the TSC is acceptable if the total calculated radiological consequences for the postulated fission product release fall within the exposure acceptance criteria specified for the Control Room of 0.05 sievert (Sv) (5 rem) total effective dose equivalent (TEDE) for the duration of the accident.¹⁴ (See also, SER Section 15.0, "Accident Analysis.") In RAI 5997, Question 13.03-17(b), October 26, 2011 (ADAMS Accession No. ML11299A096), the staff requested additional information from the applicant regarding the radiological consequence analyses for the Turkey Point common TSC, for the postulated design basis accidents (DBAs) for the proposed Units 6 and 7 and existing Units 3 and 4. In addition, the staff asked the applicant to describe relevant TSC ventilation system design parameters and assumptions that were used in the radiological habitability analysis.

In a March 19, 2012, response to RAI 5997, Question 13.03-17(b) (ADAMS Accession No. ML12080A085), the applicant stated that the TSC structure and ventilation system will be designed to ensure that the TSC personnel are protected from radiological hazards. In addition, dose calculations have been completed using bounding TSC design considerations for the facility, and the parameters for the ventilation system have been selected to limit the dose in the TSC to less than 0.05 Sv (5 rem) TEDE. The applicant described the radiological habitability

¹⁴ TEDE means the sum of the effective dose equivalent for external exposures and the committed effective dose equivalent for internal exposures (see 10 CFR 20.1003). Rem is a special unit of radiation dose equivalent (see 10 CFR 20.1004). 10 CFR Part 50, Appendix A, "General Design Criteria for Nuclear Power Plants," includes Criterion 19—Control Room, which requires adequate radiation protection for control room personnel under accident conditions for the duration of the accident.

analysis for the TSC, and evaluated the radiological consequences in the TSC of a loss-of-coolant accident (LOCA) at Unit 3, 4, 6, or 7 to show compliance with the TSC radiological habitability requirements. The LOCA is the bounding DBA for TSC habitability.

Using the bounding values for heating, ventilation, and air conditioning (HVAC) system flow rates, unfiltered in-leakage, recirculation flow rate and filtration efficiencies, the final TSC design is anticipated to result in a lower dose in the TSC in an accident condition. The applicant provided atmospheric dispersion factors (χ/Q values) for a release from the Unit 4 equipment hatch and emergency core cooling system (ECCS) leakage point, and the Units 6 and 7 release point to the TSC air intake. The highest calculated dose resulted from the Unit 4 postulated LOCA, and was estimated by the applicant to be 0.0437 Sv (4.37 rem).

The staff performed an independent verification of the applicant's TSC χ/Q values based on information given in COLA Part 2 (FSAR) and the COL Plan, and determined that the TSC χ/Q values are reasonable. The staff reviewed the description of the radiological habitability analysis inputs and assumptions—including information provided in FPL's June 25, 2009, License Amendment Request 196 to revise the accident source term for Units 3 and 4 (ADAMS Accession No. ML092050277)—and determined that the inputs and assumptions are reasonable and consistent with the guidance in RG 1.183, "Alternative Radiological Source Terms for Evaluating Design Basis Accidents at Nuclear Power Reactors" (July 2000), for performing DBA radiological consequences analyses. The staff performed an independent calculation using the design values in the applicant's RAI response, and calculated a dose of 0.047 Sv (4.7 rem). As a result, the staff concludes that the applicant has demonstrated, using conservative design parameters and assumptions, that the 0.05 Sv (5 rem) TEDE criterion will be met in the TSC for the duration of an accident at Units 3, 4, 6, or 7.

The TSC-related ITAAC will verify the TSC design, which was bounded by the TSC radiological habitability analysis discussed in response to RAI 5997, Question 13.03-17(b). Based on the above discussion, the staff finds that the radiation protection design of the TSC is acceptable and the TSC radiological habitability requirements will be met, because the total calculated radiological consequences for the postulated fission product release fall within the exposure acceptance criterion identified above. In addition, the staff finds that the TSC will provide adequate nonradiological protection, which includes facility cooling, heating, humidity, electrical power, ventilation and air filtration. Therefore, the staff considers RAI 5997, Question 13.03-17(b), resolved.

COL Plan Section H.1.b further states that the TSC has access to a complete set of drawings, other records, general arrangement diagrams, electrical schematics, and piping and instrument diagrams. The TSC has the capability to record and display vital plant data in real time (e.g., using the Safety Parameter Display System (SPDS)), to be used by knowledgeable individuals responsible for engineering and management support of reactor operations, and for implementation of emergency procedures. As described in COL Plan Section H.6, "Monitoring Equipment Onsite," the SPDS provides a display of plant parameters from which the safety status of operation may be assessed in the Control Room, TSC, and EOF for the plant. The SPDS or other display systems in the TSC and EOF promote the exchange of information between these facilities and the Control Room, and assist the emergency organization in the decisionmaking process.

AP1000 DCD Tier 2 Section 7.5, "Safety-Related Display Information," describes the monitored plant parameter variables, which are based on the guidance in RG 1.97, "Criteria for Accident Monitoring Instrumentation for Nuclear Power Plants." The safety-related display information is

used by the operator to monitor and maintain the safety of the AP1000 throughout operating conditions that include anticipated operational occurrences and accident and post-accident conditions. In RAI 5681, Question 13.03-8 (H-2), the staff requested additional information from the applicant regarding a description of how plant parameter variables, based on RG 1.97, are made available in the TSC. In a September 30, 2011, response to RAI 5681, Question 13.03-8 (H-2) (ADAMS Accession No. ML11276A101), the applicant stated that the TSC is equipped with voice and data communications to each of the unit Control Rooms, and that the data that is provided to the Control Room is provided to the TSC to enable the TSC staff to support the technical response to the emergency. The AP1000 DCD provides the information in Section 7.5.1 and DCD Table 7.5-1. In addition, FPL has provided the site-specific information in FSAR Table 7.5-201. The availability of this information in the TSC is addressed in ITAAC 5.1.5. The staff reviewed DCD Table 7.5-1 and FSAR Table 7.5-201, and finds this acceptable because it is consistent with NUREG-0696. Therefore, the staff considers RAI 5681, Question 13.03-8 (H-2), resolved. Information systems associated with emergency response facilities and the accident monitoring and display systems are discussed in SER Section 7.5, "Information Systems Important to Safety."

COL Plan Section H.6 states that there are two permanent meteorological monitoring stations near the plant for display and recording of wind speed, and direction, and ambient and differential temperature for use in making offsite dose projections. Meteorological information is presented in the Control Room, TSC, and EOF by means of the plant computer system. In addition, COLA Part 2 Section 2.3.3.1.7, "Emergency Preparedness Support," states that provisions are in place to obtain representative regional meteorological data during an emergency if the site meteorological system is unavailable.

For the reasons set forth above, the staff finds that the common TSC provides an area that meets the applicable regulatory guidance in NUREG-0696 and Supplement 1 to NUREG-0737, except for the TSC distance from the Unit 6 and 7 control rooms, which the applicant has justified, and as such, the TSC will adequately support its intended emergency response functions. Therefore, the staff concludes that PTN DEP 18.8-2 is acceptable.

Emergency Operations Facility

The Emergency Operations Facility (EOF) provides management of overall emergency response; notification of offsite government agencies; coordination of radiological and environmental assessments and emergency response activities with government agencies; determination of recommended public protective actions, and management of recovery operations. The COL Plan utilizes the same EOF that currently supports Units 3 and 4, which is located 41.8 km (26 mi) from the Turkey Point site at the existing FPL General Office building in Miami, FL.

The EOF is sized to accommodate about 75 personnel, including FPL, State, county and NRC representatives, and is equipped with reliable voice communications systems including communications to the Control Room, TSC, ENC, offsite State and county EOCs, NRC, and offsite field monitoring teams. In addition, EOF and TSC communications strategies and human functions attributes are addressed in PTN COL 18.2-2, and discussed below in SER Section 13.3.4.18. ITAAC 5.2.1 states that the EOF working space size is a minimum of 5,625 square feet (523 square meters) consistent with NUREG-0696 (75 square feet/person, or 6.97 square meters/person), and is large enough for required systems, equipment, records, and storage. Communication capabilities are addressed further in COL Plan Section F and discussed in SER Section 13.3.4.6.

The EOF contains equipment to gather, store, and display data needed in the EOF to analyze and exchange plant condition information with the plant, and the EOF technical data system receives, stores, processes, and displays information sufficient to perform assessments of actual and potential onsite and offsite environment consequences of an emergency. The EOF has ready access to plant records, procedures, and emergency plans, including RMS information and parameters that are required of the SPDS, needed for overall management of emergency response resources. As described in COL Plan Section H.6, the SPDS provides a display of plant parameters from which the safety status of operation may be assessed in the Control Room, TSC, and EOF for the plant. The SPDS or other display systems in the TSC and EOF promote the exchange of information between these facilities and the Control Room, and assist the emergency organization in the decisionmaking process. COL Plan Appendix 3 lists an EPIP titled “EOF Activation and Operation.” See also, SER Section 13.3.4.10, which addresses FPL’s designation of the EOF as an alternative facility to support the ERO augmentation—including functioning as a back-up TSC and OSC—during hostile action events. ITAAC 5.2 addresses the EOF size, communications capabilities, and availability of environmental and plant system data. ITAAC 8.1.1.D.1.b states that the EOF is activated within 60 minutes from notification of a Site Area Emergency or higher event classification, with at least minimum staffing.

Operations Support Center

Each Protected Area has an OSC to support each unit, which is separate from the Control Room. (In the NRC guidance documents referenced below, the OSC is referred to as the Operational Support Center.) The OSC provides an area for staging and coordination of shift personnel to support emergency response operations, including first aid, search and rescue, and emergency repair and damage control activities. Disciplines reporting to the OSC include, but are not limited to non-Control Room operating personnel, radiation protection, chemistry, and maintenance personnel. (See also, DCD Subsection 18.8.3.6, “Operations Support Center Mission and Major Tasks.”)

The location of the OSC is addressed in Tier 2 departure PTN DEP 18.8-1, which moves the OSC for Units 6 and 7 from the AP1000 DCD ALARA (as low as reasonably achievable) Briefing Room and OSC (Room 40318) to a single OSC—supporting Units 6 and 7—in the Maintenance Shop/Office Building inside the Protected Area. The OSC location is described in Section 4, “Emergency Facilities and Equipment,” of COL Plan Annexes 1, 2, and 3, and shown on Annex 2, Figure B1-1, “Unit 6 Facility Layout,” and Annex 3, Figure C1-1, “Units 6 and 7 Facility Layout.” Room 40318 is renamed the ALARA Briefing Room (see FSAR Section 1.2.3, “Plant Arrangement Description,” and FSAR Section 12.3.1.2, “Radiation Zoning and Access Control”). FSAR Figure 1.1-201, “Units 6 and 7 Layout,” shows the location of the Maintenance Shop/Office (building number 30), which is north of Units 6 and 7 and near the Security Building. ITAAC 5.1.7 states that there is an OSC located inside the Protected Area, and it is separate from the main control room. If the OSC becomes uninhabitable, the emergency coordinator will designate an alternate location in accordance with EIPs. COL Plan Appendix 3 lists an EPIP titled “OSC Activation and Operation.”

In COLA Part 7, the applicant evaluated PTN DEP 18.8-1 under Section VIII.B.5.b of Appendix D to 10 CFR Part 52, and determined that the departure is for a nonsafety-related system, that the alternate location of the OSC meets applicable requirements, and that relocating the OSC does not impair its function. The staff agrees with the applicant’s evaluation, for the reasons described below.

In accordance with 10 CFR 50.47(b)(8), the applicant must provide adequate emergency facilities (including the OSC) to support the emergency response. With regard to the applicant's proposed common OSC location, the staff considered the applicable guidance in NUREG-0696, which states the following in Section 3.0, "Operational Support Center":

The operational support center (OSC) is an onsite area separate from the control room and the TSC where licensee operations support personnel will assemble in an emergency. The OSC shall:

- Provide a location where plant logistic support can be coordinated during an emergency, and
- Restrict control room access to those support personnel specifically requested by the shift supervisor

NUREG-0696 indicates in part that no specific habitability criteria are established for the OSC, and the OSC should have direct communications with the control room and with the TSC so that the personnel reporting to the OSC can be assigned to duties in support of emergency operations.

In addition, the staff considered the applicable guidance in Supplement 1 to NUREG-0737, which indicates in Section 8.3, "Operational Support Center (OSC)," that, when activated, the OSC will be the onsite area separate from the control room where pre-designated operations support personnel will assemble, and that a pre-designated licensee official should be responsible for coordinating and assigning the personnel to tasks designated by control room, TSC, and EOF personnel. The OSC will be located onsite to serve as an assembly point for support personnel and to facilitate performance of support functions and tasks, and capable of reliable voice communications with the control room, TSC, and EOF.

Section 4.1 of COL Plan Annexes 2 and 3 states that the OSC manager is responsible for managing OSC activities including personnel accountability of anyone dispatched from the OSC, radiological exposure control for individuals within the OSC, and mobilizing individuals on the emergency roster needed to fill OSC and other support positions. COL Plan Section B.5 states that the OSC manager supervises the activities of OSC personnel and is responsible for directing OSC operations—including assigning tasks to designated OSC leads, maintaining OSC resources, and maintaining accountability of OSC personnel.

COL Plan Section H.10, "OSC Capabilities," identifies various equipment and supplies that are stored in or near the OSC and available for damage control use, as necessary. This includes first aid and medical treatment equipment and supplies, portable lighting and communications equipment, protective clothing, respiratory protection gear, KI, and other health physics equipment and supplies. Damage control team equipment is available in the maintenance shops near the OSC. Additional supplies can be obtained from other unaffected units and through corporate resources.

COL Plan Table H-1, "Typical Emergency Supplies Available for Emergency Response Facilities," lists typical equipment and supplies available to emergency response personnel. Emergency equipment is listed, maintained, and inspected in accordance with radiation protection procedures. Specific equipment and supplies for each facility are described in emergency plan administrative procedures and other plant procedures. COL Plan Appendix 3

lists an administrative procedure titled “Emergency Response Facilities and Equipment.” Emergency equipment and supplies are addressed further in COL Plan Sections J and K (see SER Sections 13.3.4.10 and 13.3.4.11, respectively), and in Section 4 of COLA Plan Annexes 1, 2, and 3.

COL Plan Section J.6 states that Turkey Point maintains an inventory of adequate supplies of radiation protection equipment for personnel remaining in (or entering) the Protected Area or emergency response facilities, including respiratory protection equipment, protective clothing, and KI. COL Plan Section F.1 describes dedicated phone lines for communications between the affected unit’s Control Room, TSC, and OSC to coordinate dispatch of teams from the OSC. ITAAC 5.1.3 and ITAAC 5.1.8 address the OSC communications equipment and capabilities. In addition, ITAAC 8.1.1.D.1 addresses the activation and functional capabilities (i.e., adequacy of equipment, security provisions, and habitability precautions) of the OSC during the full participation exercise.

The staff finds that the relocation of the units’ OSC to a common OSC in the Maintenance Shop/Office Building is acceptable because the common OSC provides an area that meets the applicable regulatory guidance in NUREG-0696 and Supplement 1 to NUREG-0737; and as such, will allow the OSC to adequately support its intended emergency response functions. From a support and functional standpoint, the staff finds that the applicant’s proposed OSC location is acceptable, subject to a demonstration of adequacy during the full participation exercise (addressed in ITAAC 8.1). Therefore, the staff concludes that PTN DEP 18.8-1 is acceptable.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In light of the above, the staff finds that the applicant has described, provided, and maintains adequate emergency facilities and equipment to support the emergency response, including a licensee onsite OSC and TSC, and an EOF from which effective direction can be given and effective control can be exercised during an emergency. This includes onsite and offsite radiological and meteorological monitoring systems. The applicant has also described provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up to date. In addition, the applicant has provided for an ERDS data link between the onsite computer system and the NRC Operations Center.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard H. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(8) and 10 CFR Part 50, Appendix E, Sections IV.E.8, IV.G, and VI.1, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.9 Accident Assessment

As reflected in NUREG-0654, Planning Standard I, “Accident Assessment,” 10 CFR 50.47(b)(9) requires the use of adequate methods, systems, and equipment for assessing and monitoring the actual or potential offsite consequences of a radiological emergency condition. In addition,

10 CFR Part 50, Appendix E, Section IV.A.4 requires the identification of persons within the licensee organization who will be responsible for making offsite dose projections, and a description of how these projections will be made and the results transmitted to State and local authorities, NRC, and other appropriate governmental entities. Regulations in 10 CFR Part 50, Appendix E, Section IV.B, require a description of the means to be used for determining the magnitude of, and for continually assessing the impact of, the release of radioactive materials. Regulations in 10 CFR Part 50, Appendix E, Section IV.E.2, require that adequate provisions shall be made and described for emergency facilities and equipment, including equipment for determining the magnitude of, and for continuously assessing the effect of, the release of radioactive materials to the environment.

In COL Plan Section I, "Accident Assessment," the applicant described the methods, systems, and equipment available for assessing and monitoring actual or potential consequences of a radiological emergency. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard I, "Accident Assessment." Planning Standard I provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(9).

COL Plan Section I.1, "Plant Parameters and Corresponding Emergency Classification," states that plant system and effluent parameter values are used in determining accident severity and subsequent emergency classification. An emergency condition can be the result of just one parameter or condition change, or a combination of several. The specific symptoms, parameter values, or events for each level of emergency classification are detailed in EIPs. Specific plant system and effluent parameters that characterize a classifiable event (EALs) are presented in each unit annex (EALs are addressed in COL Plan Section D, and discussed above in SER Section 13.3.4.4).

To adequately assess the emergency condition, each facility has the necessary equipment and instrumentation installed to make available essential plant information on a continuous basis. Evaluation of plant conditions is accomplished through the monitoring of plant parameters from indication in the Control Room and within the plant. Some of the more important plant parameters to be monitored in the Control Room are assembled into a single display location, which is called the SPDS. The SPDS monitors parameters relative to the plant design, such as reactor coolant system pressure, reactor or pressurizer water level, containment pressure, reactor power, safety system status, containment radiation level, and effluent monitor readings. Resources available to provide initial and continuing information for accident assessment throughout the course of an event include plant parameter display systems, liquid and gaseous sampling system, and area, process and accident RMSs.

COL Plan Appendix 3 identifies EIPs titled "Dose Assessment Methodology," "Core Damage Assessment," and "Offsite Radiological Monitoring." Instrumentation and equipment capabilities are described in COL Plan Section H, and discussed above in SER Section 13.3.4.8. Post-accident monitoring and sampling systems, including capabilities, are also addressed in AP1000 DCD Tier 2 Chapter 7, "Instrumentation and Controls," and Section 9.3.3.1.2.2, "Post-Accident Sampling." ITAAC 6.1 addresses the availability of the means to provide initial and continuing radiological assessment through displays of instrumentation indicators in the main control room, TSC, and EOF during the course of drills or exercises.

COL Plan Section I.3, "Source Term Determination," describes the methods used to estimate the amount or type of core damage occurring under accident conditions, which include containment radiation monitors, core temperatures and coverage, source range monitor readings, containment hydrogen concentration, and sample analyses. Core damage considerations are used as the bases for several of the EAL initiating conditions, and as the threshold for the declaration of a General Emergency. ITAAC 6.2 addresses the use of EIPs to calculate the source terms and the magnitude of the release of postulated accident scenario releases.

COL Plan Section I.4, "Effluent Monitor Data and Dose Projection," states that during an accident, the plant parameter display system and personal computers will provide the ERO with the timely information required to make decisions. Radiological and meteorological instrumentation readings are used to project dose rates at predetermined distances from the plant, and to determine the integrated dose received. Dose assessment methods used by the ERO to project offsite doses include monitored release points, containment failure, or leak rates, release point samples, and field monitoring team data. Computer applications are used to provide dose calculations to evaluate dose against the EPA protective action guides (PAGs). These evaluations are used to determine the necessity for offsite PARs. ITAAC 6.3 demonstrates that the means exist to continuously assess the impact of the release of radioactive materials to the environment, accounting for the relationship between effluent monitor readings, and onsite and offsite exposures and contamination for various meteorological conditions under drill conditions.

Meteorological data is collected at the Turkey Point 10-meter tower, the South Dade Site 60-meter tower, or obtained directly from the NWS in Miami. COL Plan Table I-1 summarizes the available key meteorological parameters (e.g., wind speed and wind direction) that are available at each unit's Control Room, TSC, and EOF via the plant monitoring/information system. COL Plan Table I-2 summarizes meteorological data that represents primary and backup sources. Meteorological data is provided to the State through initial and follow-up notifications, and response to direct inquiries from DEM and DOH-BRC. The EOF and NRC can receive timely meteorological information through the TSC (upon request), from direct data logger and fiber optic modem connection, or the plant monitoring/information system. ITAAC 6.4 states that meteorological data exists at the EOF, TSC, main control room, offsite NRC operations center, and the State of Florida; and that this data is in the format needed for the appropriate EIPs.

Dose projections can be made during a release through use of actual sample data when effluent monitors are off-scale or inoperative, or a release occurs by an unmonitored flow path. In the absence of effluent sample data, a dose projection can be performed by specifying the accident category as a default, which defines the mix, total curies, and release pathway(s). The total number of curies from a default mix for each isotope is used to provide an upper bound for release concentration, and hence, an upper bound for the dose rate and dose to the public. ITAAC 6.5 states that the release rate and projected doses can be determined with off-scale or inoperable instrumentation during training or a drill.

Turkey Point maintains the ability to take offsite soil, water, vegetation, and air samples, and to directly measure gamma dose rates in the event of an airborne or liquid release. The environmental monitoring equipment includes portable survey, counting, and air sampling instrumentation and other radiological monitoring equipment and supplies to be used by the field monitoring teams. Samples are taken at predetermined locations (illustrated in COL Plan Figure I-1), as well as those specified both during and after a release. Environmental measurements are used as an aid in the determination and assessment of protective and

recovery actions for the general public. (See COL Plan Sections J and M, which are addressed in SER Sections 13.3.4.10 and 13.3.4.13, respectively.) ITAAC 6.6 states that the field monitoring teams were dispatched and demonstrated ability to locate and monitor a radiological release within the plume exposure EPZ.

Field monitoring teams are dispatched to perform field monitoring in the 10-mi EPZ during conditions that may involve significant releases of radioactive materials from the plant. These teams are trained, and have the capability, to conduct field surveys and take offsite air, soil, water, and vegetation samples. The State of Florida DOH-BRC has the ability to dispatch their own field monitoring teams to track the airborne radioactive plume, and can be used to perform collection, shipment, and analysis of environmental sample media. DOE offsite monitoring assistance is also available, if needed.

EIPs provide guidance for performance of the field monitoring team activities. Each team is provided with air sampling equipment, personnel dosimetry, radiological survey instruments, procedures, communications equipment, and supplies to facilitate performance of radiation, surface contamination, and airborne radioactivity monitoring. Radiological survey and sample data (e.g., soil, water, and vegetation sampling)—transmitted to the emergency facilities—is used to define affected area boundaries, verify or modify dose projections and PARs, and assess the actual magnitude, extent, and significance of a liquid or gaseous release. The teams are available onsite on a 24-hour basis, and are dispatched into the surrounding area when a release is ongoing or is expected to occur. A minimum of two offsite field monitoring teams are notified and activated at an Alert or higher classification. ITAAC 6.7 addresses the activation of the field monitoring teams, including the ability to make rapid assessments of actual or potential magnitude and locations of any radiological hazards through simulated liquid or gaseous release pathways. Information from FPL offsite radiological assessment is exchanged and coordinated with the State. COL Plan Section B addresses ERO job description, including those associated with licensee radiological accident assessment and dose projection, and offsite field monitoring teams.

Field monitoring equipment has the capability to detect and measure airborne radioiodine concentrations as low as 1×10^{-7} microcuries per cubic centimeter ($\mu\text{Ci/cc}$) in the field. Interference from the presence of noble gas and background radiation will be minimized by ensuring that monitoring teams move to areas of low background before analyzing the sample cartridge. The collected air sample is measured by hand-held survey meter as an initial check of the projection derived from plant data to determine if significant quantities of elemental iodine have actually been released. ITAAC 6.8 states that a field monitoring team was dispatched during a radiological release scenario and demonstrated the use of sampling and detection equipment for air concentrations in the plume exposure EPZ, as low as $10^{-7} \mu\text{Ci/cc}$. Procedures exist for the correlation of air activity levels to dose rate, and provide a method to estimate the integrated dose from the projected and actual dose rates and for the comparison of these estimates with the EPA PAGs. ITAAC 6.9 states that the means are available to estimate integrated dose from the dose assessment program and the field monitoring team reading during a radioactive release scenario, and the results were compared with the EPA PAGs.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that the applicant has described and provided adequate facilities, systems, equipment, and means for assessing and monitoring the actual or potential

offsite consequences of a radiological emergency condition, including determining the magnitude of, and for continually assessing the impact of, the release of radioactive materials. The applicant has also described the capability and resources for field monitoring within the 10-mi EPZ, and has the methods, equipment, and expertise to rapidly assess actual or potential radiological hazards. This includes the capability to detect and measure radioiodine airborne concentrations within the 10-mi EPZ as low as 10^{-7} $\mu\text{Ci/cc}$ under field conditions, and to relate the various measured parameters to dose rates for key isotopes and gross radioactivity measurements. In addition, the applicant has identified, by position and function to be performed, persons within the licensee organization who will be responsible for making offsite dose projections, and has described how these projections will be made and the results transmitted to State and local authorities, NRC, and other appropriate governmental entities.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard I. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(9) and 10 CFR Part 50, Appendix E, Sections IV.A.4, IV.B, and IV.E.2, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.10 Protective Response

As reflected in NUREG-0654, Planning Standard J, "Protective Response," 10 CFR 50.47(b)(10) requires that a range of protective actions have been developed for the (10-mi) plume exposure pathway EPZ for emergency workers and the public. In developing this range of actions, consideration has been given to evacuation, sheltering, and as a supplement to these, the prophylactic use of KI. ETEs have been developed by applicants and licensees, and licensees shall update the ETEs on a periodic basis. Guidelines for the choice of protective actions during an emergency, consistent with Federal guidance, are developed and in place, and protective actions for the 80-km (50-mi) ingestion exposure pathway EPZ appropriate to the locale have been developed. In addition, 10 CFR 50.47(c)(2) and 10 CFR Part 50, Appendix E, Section I require that the size and configuration of the EPZs be determined in relation to local emergency response needs and capabilities, as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. Regulations in 10 CFR Part 50, Appendix E, Section IV.I, require the development of a range of protective actions to protect onsite personnel during hostile action to ensure the continued ability of the licensee to safely shut down the reactor and perform the functions of the emergency plan.

In COL Plan Section J, "Protective Response," the applicant described the range of protective actions that have been developed for Turkey Point emergency workers and the general public in the 10-mi EPZ. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard J, "Protective Response." Planning Standard J provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(10).

Protective response consists of emergency actions taken during or after an emergency situation, which are intended to minimize or eliminate hazards to the health and safety of the

public and plant personnel. FPL is responsible for onsite actions, and the responsibility for offsite actions rests with the State, counties, and other offsite response agencies. Detailed information describing onsite and offsite protective response actions is located in EIPs and the State and county emergency plans.

The same EPZs for Turkey Point Units 3 and 4 are used for the new Units 6 and 7, which are based on the requirements in 10 CFR Part 50, Appendix E. As such, the size and configuration of the existing EPZs for Units 3 and 4 were determined in relation to local emergency response needs and capabilities, as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. The staff finds that it is appropriate (and necessary) for Turkey Point Units 6 and 7 to use the existing Units 3 and 4 EPZs, because the size and configuration of the EPZs are dependent upon the local (offsite) emergency response needs, and not on the number of reactors on the combined and contiguous sites for Units 3 and 4 and Units 6 and 7.

COL Plan Part 1 Section B.2 describes the plume exposure pathway EPZ and the ingestion exposure pathway EPZ, which are illustrated in COL Plan Figures 1-3 and 1-4, respectively. The 10-mi and 50-mi EPZs are also shown in COLA FSAR Figures 2.1-202 and 2.1-201, respectively. The EPZs are the areas for which planning is performed to assure that prompt effective actions can be taken to protect the public in the event of an accident. The plume exposure pathway (10-mi) EPZ for Turkey Point is an area surrounding the plant with Unit 3 at the center and a radius of approximately 16 km (10 mi), including portions of Miami-Dade and Monroe Counties in Florida. (COL Plan Section J.8 and Appendix 5 address the ETE Report and evacuation of the 10-mi EPZ, which is discussed in SER Section 13.3.4.17.) The principal exposure sources from this pathway are whole body external exposure to beta and gamma radiation from the plume and deposited material, and internal exposure resulting from the inhalation of radioactive material in the plume. The time of potential exposure can range from hours to days.

The ingestion exposure pathway (50-mi) EPZ is an area surrounding the plant with Unit 3 as the center and a radius of approximately 50 mi. The principal exposure sources are from the ingestion of contaminated agricultural products such as milk, fresh fruits and vegetables, aquatic foods, or from contaminated surface water sources. The planning effort for this pathway involves the identification of potentially contaminated food and water, and associated control measures that will be used to minimize danger to the public. Ingestion pathway exposures in general would represent a problem in the days or weeks following an accident, although some early protective actions to minimize subsequent contamination of milk are provided in the State plans.

In COL Plan Section J.1, "Notification of Onsite Personnel," the applicant stated that methods are established for notifying personnel within the Protected Areas and Owner-Controlled Area for all emergency classifications. The primary means of notification within the Protected Areas is the plant public address system and evacuation alarms, as described in COL Plan Section F and discussed in SER Section 13.3.4.6. Announcements include the emergency classification and response actions to be taken by personnel onsite, and are made within 15 minutes of the emergency declaration. Provisions are made to alert personnel in high noise areas and outbuildings within the Protected Areas, and individuals located outside the Protected Areas—but inside the Owner-Controlled Area—are informed via public address system announcements, alarms, and by the Security Force within approximately 30 minutes of the emergency declaration. Information regarding the meaning of the various warning systems and the appropriate response actions is provided via plant training programs, visitor orientation, escort

instructions, posted instructions, or within the content of audible messages. Escorts provide instructions to visitors who may not be trained to take specific emergency response actions. (Notification methods and procedures are addressed in COL Plan Section E, and discussed above in SER Section 13.3.4.5.) (OCA) ITAAC 7.1 states that the means exist to successfully warn and advise various onsite individuals, including those in the Owner-Controlled Area and immediate vicinity.

If a local area evacuation is warranted, personnel will be directed to assemble at a location designated by the emergency coordinator. FPL establishes and maintains preplanned primary and alternate site evacuation routes and assembly areas, which are illustrated in COL Plan Figure J-3. A secondary route is provided for evacuation in the event the primary route is rendered impassable because of radiological or weather conditions, or other impediments. The directions of travel and offsite assembly area(s) are determined by the emergency coordinator based on current meteorological and emergency conditions. Section 5, "Emergency Measures," of Annexes 1, 2, and 3 describes the assembly areas and evacuation routes associated with the respective Turkey Point reactor units.

If an Owner-Controlled Area (OCA) evacuation is warranted, nonessential personnel, including those in the Protected Areas, are directed to exit the site via the primary or alternate evacuation route and reassemble at an offsite location or proceed to their homes. Visitors to the plant will assemble with, and follow the instructions of, their escorts. Affected individuals evacuate the site via personnel vehicles, and personnel without transportation will be identified and provided transportation, as necessary. Security is responsible for traffic direction and control, including special provisions under adverse conditions (e.g., weather-related, radiological, or traffic density conditions). COL Plan Appendix 3 lists an EPIP titled "Evacuation and Accountability."

The emergency coordinator directs contamination monitoring of personnel, vehicles, and personal property if conditions warrant. Personnel evacuating the site will be monitored for contamination using portal monitors as they exit the Protected Areas, or sent to offsite assembly areas and monitored with portable friskers. If there is no release of radioactive materials within the affected unit, limited monitoring may be used to speed the evacuation process. Personnel and vehicle monitoring and decontamination will be conducted in accordance with radiation protection procedures and EIPs. COL Plan Appendix 3 lists an EPIP titled "Offsite Radiological Monitoring."

COL Plan Section J.4, "Protective Actions for Onsite Personnel," describes onsite protective actions and evacuation of onsite personnel for the various emergency classes, including personnel not needed to shut down the fossil units at Turkey Point. Evacuation is the primary protective action anticipated for onsite personnel within the Protected Area who are not filling ERO positions. If conditions warrant, the Owner-Controlled Area outside the Protected Area is evacuated of all non-FPL personnel at an Alert or higher emergency classification. As conditions warrant, the emergency coordinator may delay, postpone, or make special arrangements on the evacuation. Special circumstances can include radiological conditions, security events, certain plant conditions, and onsite hazards. In the event that evacuation is not the best protective action, onsite personnel will be directed to take other protective actions, such as sheltering for extremely inclement weather or during an ongoing radiological release, or taking immediate cover for security events when evacuation will place personnel in jeopardy.

In RAI 5681, Question 13.03-14, the staff requested additional information regarding the applicant's response to a hostile action event (including consideration of BL 2005-02), concerning (1) the availability of an alternative facility to support rapid response, (2) specific

provisions to protect onsite emergency responders and personnel, and (3) how NRC notification would occur. In an October 31, 2011, response to RAI 5681, Question 13.03-14 (ADAMS Accession No. ML11306A140), the applicant stated that FPL has designated the EOF as an alternative facility to support the ERO augmentation during hostile action events. In addition, the EOF also functions as a backup TSC and backup OSC staging areas in the event of an emergency that limits access to the site during a hostile action. FPL will develop implementing procedures (see ITAAC 9.1) to address applicable portions of BL 2005-02 by providing a strategy and direction to protect emergency responders and personnel during a security-based event, including an emergency resulting from a hostile action event. See also, COLA Part 9 (Mitigative Strategies Table),¹⁵ Section 5.2 (“Assembly Areas”) in each annex of the COLA Plan, and COLA Plan Section J.5 (“Accountability”). Finally, NRC notification—within about 15 minutes after recognition of a security event—will be addressed in implementing procedures. The staff finds this response acceptable because it conforms to the guidance in BL 2005-02 and NUREG-0800, and therefore addresses the requirement in 10 CFR Part 50, Appendix E, Section IV.I. Therefore, the staff considers RAI 5681, Question 13.03-14, resolved.

At the declaration of an Owner-Controlled Area evacuation, all nonessential personnel are evacuated. All individuals in the Protected Areas are accounted for, and those who have not been accounted for are identified within 30 minutes of the initiation of the evacuation. Upon notification that personnel are missing, the emergency coordinator initiates search and rescue operations. Accountability is coordinated by personnel in the TSC, and results are forwarded to the emergency coordinator. Once established, accountability within the Protected Areas is maintained throughout the event, unless specifically terminated by the emergency coordinator. Accountability of individuals within the Owner-Controlled Area, but outside the Protected Area, is not required. The movement of personnel for the purposes of accountability may be delayed if their health and safety could be in jeopardy, such as during severe weather or for security concerns. ITAAC 8.1.1.C.4 states that during the full participation exercise, FPL will demonstrate the ability to perform assembly and accountability for all personnel in the Protected Area within 30 minutes of an emergency calling for Protected Area assembly and accountability.

COL Plan Section J.6 indicates that FPL maintains an inventory of adequate supplies of radiation protection equipment for personnel remaining in (or entering) the Protected Area or emergency response facilities, including respiratory protection equipment, protective clothing, and KI. COL Plan Table H-1 lists typical emergency equipment and supplies available to emergency response personnel. Emergency equipment is listed, maintained, and inspected in accordance with radiation protection procedures. Specific equipment and supplies for each facility are described in emergency plan administrative procedures and other plant procedures. COL Plan Appendix 3 lists an administrative procedure titled “Emergency Response Facilities and Equipment.” Section J.6 also describes the use of respirators, protective clothing, and KI. Emergency equipment and supplies are addressed further in COL Plan Sections H and K, and in Section 4 of COLA Plan Annexes 1, 2, and 3.

In COL Plan Section J.7, “Mechanism for Implementing Protective Action Recommendations,” the applicant stated that plant conditions, projected dose and dose rates, or field monitoring data are evaluated to develop PARs for the purpose of preventing or minimizing exposure to the general public. (Accident assessment is addressed in COL Plan Section I, and discussed in SER Section 13.3.4.10.) PARs are approved by the emergency coordinator and provided to the offsite agencies responsible for implementing protective actions for the general public. In an

¹⁵ COLA Part 9, “Withheld Information,” includes information designated as Security-Related Information, and is withheld from public disclosure under 10 CFR 2.390, “Public Inspections, Exemptions, Requests for Withholding.”

emergency that warrants immediate protective actions be taken before activation of the offsite emergency facilities, PARs are provided directly to the State and county 24-hour warning points. COL Plan Figure J-2 provides guidance for plant personnel to determine PARs based on plant conditions and offsite dose estimates. COL Plan Appendix 3 lists an EPIP titled “Protective Action Recommendations.”

As described in EIPs, FPL recommends protective actions to the State of Florida and Counties of Miami-Dade and Monroe, which are responsible for implementing protective measures based on PAGs for the offsite population at risk. ITAAC 2.3 states that notification and clear instructions to the public are accomplished in accordance with the emergency plan requirements. COL Plan Appendix 5 references the ETE Report, which the applicant provided as COLA Supplemental Information 1, “Turkey Point Nuclear Power Plant Evacuation Time Estimate.” Evacuation time estimates provide FPL and State and local governments with site-specific information needed for protective action decisionmaking. If plant conditions are stable and offsite radiological conditions do not pose a danger to public health and safety, FPL may discuss a return to evacuated areas with the State. The State authorities are then responsible for recommending whether return is advisable or not, and transmitting this recommendation to the general public. (Recovery and reentry is addressed in COL Plan Section M, and discussed below in SER Section 13.3.4.13.) Finally, the State is responsible for specifying protective measures for the 50-mi EPZ, including methods for protecting the public from consumption of contaminated water and foodstuffs.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that the applicant has developed a range of protective actions for the 10-mi EPZ for emergency workers and the public, including consideration of evacuation, sheltering, and the prophylactic use of KI. The applicant has developed guidelines for the choice of protective actions during an emergency that are consistent with Federal guidance, including protective actions for the 50-mi EPZ that are appropriate to the locale. The size and configuration of the EPZs have been determined in relation to local emergency response needs and capabilities, as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. In addition, the applicant has developed a range of protective actions to protect onsite personnel during hostile action. Development of ETEs is addressed below in SER Section 13.3.4.17.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard J. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(10), 10 CFR 50.47(c)(2), and 10 CFR Part 50, Appendix E, Sections I and IV.I, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.11 *Radiological Exposure Control*

As reflected in NUREG-0654, Planning Standard K, “Radiological Exposure Control,” 10 CFR 50.47(b)(11) requires that the means for controlling radiological exposures in an emergency be established for emergency workers. The means for controlling radiological

exposures shall include exposure guidelines consistent with EPA “Manual of Protective Action Guides and Protective Actions for Nuclear Incidents,” EPA 400-R-92-001, May 1992 (EPA-400). In addition, 10 CFR Part 50, Appendix E, Section IV.E.3 requires that adequate provisions shall be made and described for emergency facilities and equipment, including facilities and supplies at the site for decontamination of onsite individuals.

In COL Plan Section K, “Radiological Exposure Control,” the applicant described the means for controlling emergency worker radiological exposures during an emergency, including measures to provide assistance to persons injured or exposed to radioactive materials. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard K, “Radiological Exposure Control.” Planning Standard K provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(11).

COL Plan Section K.1, “Emergency Exposure Guidelines,” states that in an emergency situation, all reasonable measures will be made to maintain the radiation exposure within the applicable limits specified in 10 CFR Part 20, “Standards for Protection Against Radiation,” for emergency response personnel providing medical treatment, first aid and rescue, corrective and assessment actions, and decontamination. Conditions may warrant entry into high-radiation areas, resulting in exposures in excess of the regulatory limits, and the emergency coordinator is assigned the nondelegable responsibility for authorizing personnel exposures under emergency conditions, consistent with EPA-400. The emergency worker dose guidelines are shown in COL Plan Table K-1, “Emergency Exposure Guidelines,” and are consistent with EPA-400 Table 2-2, “Guidance on Dose Limits for Workers Performing Emergency Services.”

COL Plan Section K.2, “Emergency Radiation Protection Program,” states that the radiation protection manager is responsible for implementing radiation protection actions during an emergency, and describes the relevant guidelines. FPL maintains a site personnel radiation dosimetry program that includes the capability for determining external and internal doses—consistent with 10 CFR Part 20—on a 24-hour-per-day basis. All emergency response personnel under the authority of FPL who potentially will be exposed to radiation in the course of their duties will be monitored by the plant radiation exposure monitoring program. Emergency workers will receive thermoluminescent dosimeter (TLD) badges and personal self-reading dosimeters capable of measuring expected exposures on a real time basis. Emergency worker dose records are maintained by the radiation protection manager, in accordance with the emergency and radiological protection procedures. COL Plan Appendix 3 identifies two implementing procedures—titled “OSC Activation and Operation,” and “EOF Activation and Operation”—that are applicable to personnel monitoring and maintenance of emergency worker dose records. ITAAC 8.1.1.E.2 states that during the full participation exercise, FPL will demonstrate the ability to continuously monitor and control radiation exposure to emergency workers.

COL Plan Section K.5, “Contamination and Decontamination,” describes contamination control measures and decontamination areas. During emergency conditions, normal plant contamination control criteria will be adhered to as much as possible. The limits may be modified by Radiation Protection, in accordance with radiation protection procedures, should conditions warrant. Contaminated personnel will normally be attended to at decontamination areas located onsite, which include decontamination showers, equipment, and supplies.

Personnel with injuries involving radiation or radioactive contamination will be handled by an offsite medical facility, as described in COL Plan Section L.

Controls are established and maintained 24 hours per day to contain the spread of loose surface radioactive contamination. If personnel are contaminated above acceptable levels, they will be decontaminated in accordance with radiation protection procedures. If normal decontamination procedures do not reduce personnel contamination to acceptable levels, the contaminated individuals will be referred to a competent medical authority. Supplies, instruments, and equipment will be monitored and contaminated materials will be disposed of as radwaste. Contaminated vehicles will be decontaminated before being released, and ambulances will be monitored and decontaminated before departing the medical facility by Turkey Point personnel. Measures will be taken to control onsite access to potentially contaminated food and potable water supplies. Under emergency conditions with uncontrolled releases, eating, drinking and chewing are prohibited in all Turkey Point emergency response facilities until habitability surveys indicate these activities are permissible. Contamination control criteria for returning areas and items to normal use are contained in the radiation protection procedures.

In RAI 5681, Question 13.03-10 (K-2), the staff requested additional information from the applicant regarding the action levels for determining the need for decontamination. In a September 30, 2011, response to RAI 5681, Question 13.03-10 (K-2), the applicant stated that Turkey Point Units 6 and 7 radiological procedure 0-HPS-021.3, "Identification, Survey and Release of Material for Unrestricted Use," sets a standard of no detectable radioactivity for releasing material from a radiologically controlled area. In addition, this is the standard that is currently used at Units 3 and 4, and will be used for Units 6 and 7. The staff finds this response acceptable because it is consistent with NUREG-0654, and, therefore, considers RAI 5681, Question 13.03-10 (K-2), resolved.

Efforts will be made to prevent contaminated vehicles operated by nonessential personnel to depart the Turkey Point site, and alternate forms of transportation may be made available to reduce the possibilities of transporting contamination offsite with suspected contaminated vehicles. As conditions warrant, radiological protection personnel at the assembly area monitor evacuees and determine the need for decontamination. Provisions for extra clothing are made and suitable decontaminates are available for the expected types of contamination.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that the applicant has established the means for controlling radiological exposures for emergency workers, consistent with the exposure guidelines in EPA-400. In addition, the applicant has made and described adequate provisions for emergency facilities and equipment, including facilities and supplies for monitoring and decontamination of onsite and relocated personnel, vehicles, and other affected materials, and has established appropriate contamination control measures.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard K. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(11) and 10 CFR Part 50, Appendix E,

Section IV.E.3, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.12 *Medical and Public Health Support*

As reflected in NUREG-0654, Planning Standard L, "Medical and Public Health Support," 10 CFR 50.47(b)(12) requires that arrangements be made for medical services for contaminated injured individuals. In addition, 10 CFR Part 50, Appendix E, Section IV.E requires facilities and medical supplies at the site for appropriate emergency first aid treatment, and arrangements for medical service providers qualified to handle radiation emergencies onsite. Arrangements are also required for transportation of contaminated injured individuals from the site to specifically identified treatment facilities outside the site boundary.

In COL Plan Section L, "Medical and Public Health Support," the applicant described the arrangements for medical services for contaminated injured personnel at the Turkey Point site. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. In this evaluation, the staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard L, "Medical and Public Health Support." Planning Standard L provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(12).

COL Plan Section L.1, "Offsite Hospital and Medical Services," describes arrangements for medical treatment of Turkey Point personnel who may have injuries complicated by the presence of radioactive contamination or overexposure to radiation. Sheridan Emergency Physicians Services of South Dade, at Baptist Hospital of Miami, is available on a 24-hour basis and provides for the immediate availability of fully equipped medical facilities with a staff of physicians and nurses skilled in the treatment of personal injury accompanied by radioactive contamination. Emergency Room Medical Associates, within Mercy Hospital of Miami, is available on a 24-hour basis and also provides for the immediate availability of medical facilities for treatment of personal injury accompanied by radioactive contamination. Letters of agreement with these two organizations are listed in COL Plan Appendix 2, with copies of the letters included in COLA Supplemental Information 4. Turkey Point personnel are available to assist medical personnel with decontamination, radiation exposure, and contamination control.

The site maintains an onsite first aid facility and an emergency vehicle with first aid supplies and equipment necessary for the treatment of contaminated or injured persons. In addition, standard first aid kits are maintained at numerous locations throughout the plant. The First Aid Team, which comprises on-shift personnel who are American Red Cross Multimedia first aid qualified, is dispatched by the Control Room or the OSC (when activated). At least two of these individuals are available on shift at all times to support immediate response in each Protected Area. In addition, FPL may staff their onsite clinic with additional medical support personnel who can aid in the response. Radiation protection personnel at Turkey Point are experienced and trained in the control of radioactive contamination and decontamination activities for injured or ill personnel, and are dispatched to support medical response if there is a possibility of contamination associated with the injury/illness. COL Plan Appendix 3 lists an EPIP titled "Medical Response."

First aid facilities at the site are designed to provide basic first aid to injured or ill personnel before arrival of offsite medical support. Emergency treatment areas, which include medical

equipment and supplies, are in each of the units. In the event of a mass casualty incident, where plant and local response resources are exceeded by the number of casualties, FPL may request additional resources through the State of Florida DEM. Because of the specialized nature of the diagnosis and treatment of radiation injuries, FPL maintains an agreement with the DOE Radiation Emergency Assistance Center/Training Site (REAC/TS) ¹⁶ in Oak Ridge, TN. REAC/TS has a radiological emergency response team of physicians, nurses, health physicists, and necessary support personnel on 24-hour call to provide consultative or direct medical or radiological assistance. The letters of agreement with DOE and the National Nuclear Security Administration (Savannah River Site Office) are listed in COL Plan Appendix 2, with a copy of the letters included in COLA Supplemental Information 4.

Arrangements are in place for transport of persons with injuries and/or illness involving radioactivity from the site to Sheridan Emergency Physicians Services of South Dade or to Emergency Room Medical Associates in Miami. FPL maintains an onsite emergency vehicle that is equipped to provide prompt transport of an injured and/or contaminated victim(s) to an offsite medical facility. The Miami-Dade Fire Rescue Department is available 24 hours a day to provide ambulance support if offsite medical transportation is warranted. The letter of agreement between FPL and Miami-Dade Fire Rescue Department is listed in COL Plan Appendix 2, with a copy of the letter included in COLA Supplemental Information 4. In a life-threatening situation, victims can also be transported to a designated hospital by helicopter provided by the U.S. Coast Guard and Miami-Dade Fire Rescue on an as available basis. A qualified radiation protection person shall accompany the ambulance to the hospital upon the determination that the injured or ill person is contaminated, or if the determination cannot be made that the individual is free of surface contamination.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

The staff reviewed the certification letters from the medical service providers described above and the additional information provided in COL Plan Section L, as described above. In view of the emergency plan provisions, the staff determines that the applicant has made arrangements for hospital and medical services that have the capability of evaluating radiation exposure and uptake, and that persons providing these services are adequately prepared to handle contaminated individuals. In addition, the applicant has provided for appropriate emergency first aid treatment at the site, including qualified medical personnel to handle radiation emergencies, and arrangements for transporting victims of radiological accidents (i.e., contaminated injured individuals) to offsite medical support facilities.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard L. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(12) and 10 CFR Part 50, Appendix E,

¹⁶ U.S. Department of Energy REAC/TS staff is available 24 hours a day/seven days a week to deploy and provide emergency medical consultation for incidents involving radiation anywhere in the world. REAC/TS provides direct support for the National Nuclear Security Administration's Office of Emergency Response and the Federal Radiological Monitoring and Assessment Center (FRMAC) (Source: <http://orise.orau.gov/reacts/>, visited March 25, 2013).

Section IV.E, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.13 *Recovery and Reentry Planning and Post-Accident Operations*

As reflected in NUREG-0654, Planning Standard M, "Recovery and Reentry Planning and Post-Accident Operations," 10 CFR 50.47(b)(13), as reflected in the Planning Standard M, requires that general plans for recovery and reentry be developed. In addition, 10 CFR Part 50, Appendix E, Section IV.H requires a description of criteria to be used to determine when, following an accident, reentry of the facility would be appropriate or when operation could be resumed.

In COL Plan Section M, "Reentry and Recovery Planning," the applicant described activities for reentry into the areas of the plant that have been evacuated because of an accident, and the recovery organization and its concepts of operation. The staff reviewed this section, as well as other relevant portions, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard M. Planning Standard M provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(13).

Reentry during the emergency phase of an accident is performed to save a life, control a release of radioactive material, prevent further damage to plant equipment, or restore plant equipment. If necessary, reentry may be performed using emergency exposure limits. During the recovery phase of an accident, normal exposure limits are used. Items considered when planning for reentry include review of available radiation surveillance data to determine plant areas potentially affected by radiation or contamination; review of radiation exposure history of personnel needed to participate in the accident mitigation or recovery operations; determination of the need for additional personnel; review of adequacy of radiation survey instrumentation and equipment; review of nonradiological hazards and required protective measures; preplanning of activities and reentry team briefings; and review of security controls.

The recovery phase is that period when major repairs are being performed to return the plant to an acceptable condition, and the possibility of the emergency condition degrading no longer exists. When the plant has been stabilized, contained, and controlled, the recovery phase may be entered. The emergency plan lists guidelines that will be used to determine when the recovery phase will begin, including determining when to relax protective measures, and include informing the State and county emergency management agencies and the NRC concerning de-escalation of the emergency classification and initiation of the recovery phase. Detailed information describing reentry and recovery activities is contained in the EIPs. COL Plan Appendix 3 identifies an EIP titled "Reentry and Recovery."

COL Plan Section M.2, "Recovery Organization," describes the authorities and responsibilities of four key positions, consisting of the recovery manager, recovery coordinator, recovery offsite manager, and FPL public information officer. The recovery manager, with assistance from senior management, will determine the extent of staffing for the recovery organization, and is responsible for directing the activities of the plant recovery organization. This includes ensuring sufficient personnel, equipment, and other resources are available to support recovery; directing the development of a recovery plan and procedures; deactivating any of the plant ERO that was retained to aid in recovery; coordinating the integration of available Federal and State

assistance into onsite recovery activities; and determining when the recovery phase is terminated.

The recovery coordinator reports to the recovery manager, and is responsible for coordinating the development and implementation of the recovery plan and procedures, directing all onsite activities, and designating other plant recovery positions needed to support onsite recovery activities. The recovery offsite manager reports to the recovery manager, and is responsible for providing liaison with offsite agencies and coordinating plant assistance for offsite recovery activities, coordinating plant ingestion exposure pathway (50-mi) EPZ sampling activities, developing an offsite accident analysis report and radiological release report, and designating other plant recovery positions necessary to support offsite recovery activities. The FPL public information officer reports to the recovery manager, and is the official spokesperson to the press on all matters relating to the accident or recovery. This includes coordinating with all public information groups—including media monitoring and rumor control—and determining what public information portions of the ERO will remain activated.

When the decision is made to enter the recovery phase, all members of the ERO are informed of the change. All plant personnel are instructed on the recovery organization and their responsibilities associated with the recovery effort. The recovery manager will initiate notification to offsite governmental authorities that the site is transitioning to a recovery organization, and provides information concerning changes in the organizational structure that may occur.

Total population exposure calculations are performed and periodically updated during the recovery phase. Total population exposure is determined (estimated) through a variety of processes, including examination of pre-positioned environment monitoring TLDs, bioassay, estimates based on release rates and meteorology, and estimates based on environmental monitoring of food, water, and ambient dose rates. The State is responsible for environmental monitoring activities to support the plant, and is the lead agency for the collection and analysis of environmental samples—including air, soil, foliage, food, and water. The State is also responsible for generating the radiation monitoring reports.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that the applicant has developed general plans for recovery and reentry, including describing criteria to be used to determine when, after an accident, reentry of the facility is appropriate or operation can be resumed. In addition, the applicant has designated the individuals who will fill key positions in the facility recovery organization. The plans adequately specify the means for informing members of the response organizations that a recovery operation is to be initiated, describe how decisions to relax protective measures are made, and include a method for periodically estimating total population exposure.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard M. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(13) and 10 CFR Part 50, Appendix E, Section IV.H, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.14 Exercises and Drills

As reflected in NUREG-0654, Planning Standard N, “Exercises and Drills,” 10 CFR 50.47(b)(14) requires that periodic exercises be conducted to evaluate major portions of emergency response capabilities, periodic drills be conducted to develop and maintain key skills, and deficiencies identified as a result of exercises or drills be corrected. In addition, 10 CFR Part 50, Appendix E, Section IV.F, requires a description of the program that provides for training of employees, exercising by periodic drills, and participation by other assisting persons. The exercises (including hostile action exercises of the onsite and offsite emergency plans) shall test the adequacy of timing and content of implementing procedures and methods, test emergency equipment and communications networks, test the public alert and notification system, and ensure that emergency organization personnel are familiar with their duties. Regulations in 10 CFR Part 50, Appendix E, Section IV.F, further describe the full participation exercise (including timing), participation by each offsite authority having a role under the radiological response plan, deficiencies identified during the exercise, remedial exercises, exercise scenarios and eight-year exercise cycle.

In COL Plan Section N, “Drill and Exercise Program,” the applicant described the program for drills and exercises conducted to practice, test, and evaluate the adequacy of the emergency preparedness program, including facilities, equipment, procedures, communication links, actions of ERO personnel, and coordination between Turkey Point and offsite EROs. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard N, “Exercises and Drills.” Planning Standard N provides the detailed evaluation criteria that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(14).

Exercises are conducted to ensure that all major elements of the emergency plan and preparedness program are demonstrated at least once per 8-year cycle, including during off-hour periods and under various weather conditions. A hostile action-based exercise of the onsite emergency plan is conducted each exercise cycle, including conducting full or partial offsite participation in alternating exercise cycles. Exercises provide the opportunity for ERO teams to demonstrate key skills specific to emergency response duties. If key skills are not successfully demonstrated, a remedial exercise may result. Ingestion pathway exercises are conducted on an 8-year cycle, and Turkey Point participates on a rotating basis with the other fixed nuclear facilities in the State of Florida. ITAAC 8.1 states that a full participation exercise (test) will be conducted within the specified time periods of 10 CFR Part 50, Appendix E, and ITAAC 8.1.1 lists onsite exercise objectives. In addition, ITAAC 8.1.2 addresses personnel mobilization and performance of assigned responsibilities.

In addition to the exercises, FPL conducts drills for the purpose of testing, developing, and maintaining the proficiency of emergency responders. Drills are conducted to ensure that adequate emergency response capabilities are maintained. At a minimum, the following drills will be conducted:

- Communication Drills—Communication between the Control Rooms, TSC, EOF, and State and county warning points and EOCs shall be tested monthly. Communication between the Control Rooms, TSC, and EOF to the NRC Operations Center shall be tested using the ENS. ERDS will be activated and tested quarterly to ensure capability

for data to be transferred to the NRC. Communications between Turkey Point and the State and local EOCs and field monitoring teams shall be tested annually. Communications between the Control Rooms, TSC, EOF and ENC shall be tested annually. Communications between the Turkey Point emergency response facilities and appropriate offsite response organizations shall be tested during annual drills.

- Fire Drills—Fire drills shall be conducted in accordance with the plant Technical Specifications, fire protection plan, or plant procedures.
- Medical Emergency Drills—A medical emergency drill, involving a simulated contaminated individual and containing provisions for participation by local support services organizations (i.e., ambulance and support hospital), shall be conducted annually. The offsite portions of the medical drill may be performed as part of the required biennial exercise.
- Radiological Monitoring Drills—Plant environs and radiological monitoring drills (onsite and offsite) are conducted annually. These drills include collection and analysis of sample media and provisions for communications and record keeping.
- Radiation Protection Drills—Radiation protection drills involving a response to, and analysis of, simulated elevated airborne and liquid samples and direct radiation measurements within the plant are conducted semiannually in each Protected Area.
- Augmentation (off-hour) Drills—Augmentation drills shall be run at least once per 8-year cycle, and are planned outside of normal working hours.
- Assembly and Accountability Drills—Accountability drills are conducted at least once per 8-year cycle. The drill includes ascertaining the names of all missing individuals within the Protected Area, and accounting for all individuals within the Protected Area continuously throughout the event.
- Hostile Action-Based (HAB) Drills—At least once per 8-year cycle, an HAB drill will be conducted with offsite participation.

The emergency preparedness manager will be responsible for planning, scheduling, and coordinating all drills and exercises involving offsite agencies. Advance knowledge of the scenario will be kept to a minimum to allow “free-play” decisionmaking and to ensure realistic participation by those involved. Before the drill or exercise, a package will be distributed to the controllers and evaluators that will include the scenario, a list of performance objectives, and a description of the expected responses. During the drill or exercise, qualified evaluators will evaluate drill/exercise performance objectives against measurable demonstration criteria.

As soon as possible following the conclusion of each drill or exercise, a critique is conducted to evaluate the ability of the ERO to implement the emergency plan and its implementing procedures. The emergency preparedness manager (or designee) will prepare a formal written critique report, which will document the ability of the ERO to respond to simulated emergency situation or sequence of events, and may identify the need for changes to the emergency plan, procedures, equipment, facilities, or other components of the emergency preparedness program. The report will also contain corrective actions and recommendations for improvement. Official observers from Federal, State, or local governments will observe, evaluate, and critique

the required biennial exercise, in which the State and counties participate. In addition, representatives from the NRC will observe and evaluate Turkey Point's ability to conduct an adequate self-critique.

The emergency preparedness manager (or designee) is responsible for evaluating recommendations and comments to determine which items will be incorporated into the program or warrant corrective actions, and for the scheduling, tracking, and evaluation of the resolution to the items. The items designated as corrective actions will be placed and tracked in the station's corrective action program. The emergency preparedness manager is responsible for initiating changes to the emergency plan or supporting procedures resulting from drill/exercise critiques. COL Plan Appendix 3 lists an administrative procedure titled "Drills and Exercises."

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654. In addition, ITAAC 8.1.3 addresses offsite exercise objectives and the absence of uncorrected offsite exercise deficiencies prior to reactor operation above 5 percent of rated power.

In view of the above, the staff finds that the applicant has described provisions for conducting periodic exercises and drills to evaluate major portions of emergency response capabilities, and develop and maintain key skills. The exercises will test the adequacy of implementing procedures, emergency equipment and communications networks, and public notification system, and will ensure the ERO personnel are familiar with their duties. In addition, the applicant has described the full participation exercise, participation by offsite authorities, and how exercise and drill deficiencies will be identified and corrected.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard N. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(14) and 10 CFR Part 50, Appendix E, Section IV.F, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.15 *Radiological Emergency Response Training*

As reflected in NUREG-0654, Planning Standard O, "Radiological Emergency Response Training," 10 CFR 50.47(b)(15) requires that radiological emergency response training is provided to those who may be called on to assist in an emergency. In addition, 10 CFR Part 50, Appendix E, Section IV.F.1, requires a description of the program that provides for training of employees, exercising by periodic drills, and participation by other assisting persons.

In COL Plan Section O, "Emergency Response Training," the applicant described the radiological emergency response training program which ensures the training, qualification, and re-qualification of individuals who will be required to provide assistance during an emergency at Turkey Point. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff's primary focus was to evaluate the emergency plan against NUREG-0654, Planning Standard O, "Radiological Emergency Response Training." Planning Standard O provides the detailed evaluation criteria that the staff

should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(15).

FPL implements a training program that provides for initial training and retraining for individuals who have been assigned emergency response duties, including both Turkey Point ERO personnel and offsite support agencies that may be requested to provide assistance. The Turkey Point emergency preparedness manager has the overall responsibility for the training program, and is responsible for the content and accuracy of the emergency preparedness training. The Turkey Point training manager is responsible for ensuring that initial training and annual retraining of ERO personnel is conducted and documented. The Turkey Point departments of Emergency Preparedness and Nuclear Training share the responsibility for ensuring that the ERO receives all necessary initial training and retraining. Discipline supervisors ensure the attendance of onsite personnel for ERO training, and are responsible for ensuring their personnel maintain current qualifications.

ERO personnel are trained in accordance with the Turkey Point emergency preparedness training program. This training is typically performed every year. The training program ensures the training, qualification, and requalification of individuals who may be called on for assistance during an emergency. The ERO training program consists of lesson plans, written examinations and supporting materials, as described in the Nuclear Training Department Program Manual and administrative guidelines. In addition, COL Plan Section O.3, "First-Aid Response," states that personnel assigned to emergency teams that provide first aid will complete American Red Cross Multi-Media First Aid (or equivalent) on a schedule compatible with the American Red Cross specifications.

General Employee Training (GET) provides initial and annual requalification training on the basic elements of the emergency plan for all personnel working at the plant. New ERO personnel also receive an initial overview course that familiarizes them with the emergency plan by providing basic information in the following areas:

- planning basis
- emergency classifications
- ERO and responsibilities
- call-out of ERO
- emergency response facilities
- offsite organizations

In addition to general and specialized classroom training, members of the onsite ERO may receive periodic performance-based emergency response training, including a facility walk-through and various drills, as described in COL Plan Section N.

In RAI 5681, Question 13.03-12 (O-1_, the staff requested additional information from the applicant regarding a description of specialized training and periodic retraining for various emergency response personnel. In a September 30, 2011, response to RAI 5681, Question 13.03-12 (ADAMS Accession No. ML11227A063), the applicant stated that FPL delineates the training requirements for the ERO in an EPIP. (COL Plan Appendix 3 lists an administrative procedure titled "Radiological Emergency Response Training.") The applicant also provided a detailed description of the training procedure in Enclosure 1 to its response, titled "Emergency Response Organization Training Program." The staff reviewed Enclosure 1, and finds it

acceptable because it is consistent with NUREG-0654. Therefore, the staff considers RAI 5681, Question 13.01-12 (O-1), resolved.

Offsite training is provided to support organizations that may be called upon to provide assistance in the event of an emergency. Training for local law enforcement, fire and rescue, medical support, and principal decisionmakers for the State and county is offered annually, and is designed to acquaint the participants with the special problems potentially encountered during a nuclear plant emergency, notification procedures, and their expected emergency response roles. Training of State and local emergency management agency personnel includes a review of the EALs. Site-specific training is also offered to those organizations that must enter the site. Training of offsite EROs is also described in their respective radiological emergency plans.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that the applicant has provided for radiological emergency response training to those who may be called on to assist in an emergency. In addition, the applicant has described the program that provides for the training of employees to ensure they are familiar with their specific emergency response duties, including exercising by periodic drills. The applicant has also described the participation in training and drill by other persons whose assistance may be needed, including specialized initial training and periodic retraining.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard O. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(15) and 10 CFR Part 50, Appendix E, Section IV.F.1, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.16 *Responsibility for the Planning Effort—Development, Periodic Review, and Distribution of Emergency Plans*

As reflected in NUREG-0654, Planning Standard P, “Responsibility for the Planning Effort—Development, Periodic Review, and Distribution of Emergency Plans,” 10 CFR 50.47(b)(16), as reflected in the Planning Standard P, requires that responsibilities for plan development and review and for distribution of emergency plans are established and that planners are properly trained. In addition, 10 CFR Part 50, Appendix E, Section IV.G requires a description of provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up to date.

In COL Plan Section P, “Responsibility for the Planning Effort,” the applicant described the responsibilities associated with maintaining the emergency preparedness program, including the development, review, and distribution of the emergency plan. The staff reviewed this section, as well as other relevant portions of the application, to determine whether the application conforms to the applicable guidance and complies with the pertinent regulatory requirements. The staff’s primary focus was to evaluate the emergency plan compared to NUREG-0654, Planning Standard P, “Responsibility for the Planning Effort: Development, Periodic Review and Distribution of Emergency Plans.” Planning Standard P provides the detailed evaluation criteria

that the staff should consider to determine whether the emergency plan meets the applicable regulatory requirements in 10 CFR 50.47(b)(16).

COL Plan Section P.1, "Emergency Preparedness Staff Training," states that the Emergency Preparedness staff is involved in maintaining an adequate knowledge of regulatory requirements, guidance, and accepted good practices on a regular basis. Each member of the staff is normally involved in one of the following activities:

- training courses specific or related to emergency preparedness
- observation of, or participation in, drills or exercises at other plants
- participation in industry review and evaluation programs aimed toward emergency preparedness programs/issues
- participation in regional or national emergency preparedness seminars, committees, workshops, or forums
- specific training courses in related areas, such as systems, equipment, operations, radiological protection, or problem identification and resolution

The Chief Nuclear Officer has overall authority and responsible for radiological emergency preparedness and planning, and is responsible for overall emergency plan implementation. The director, emergency preparedness and the emergency preparedness manager at the site are jointly responsible for the overall radiological emergency preparedness program, including program administration and maintenance. Specific responsibilities include staffing and training, drills and exercises, maintenance of the emergency plan and EIPs, and operational readiness of plant facilities, communication systems, and emergency equipment and supplies.

The Turkey Point emergency preparedness manager is assisted by other staff members to ensure that the program is appropriately implemented and maintained in accordance with EIPs, emergency plan administrative procedures (see COL Plan Appendix 3, which lists an administrative procedure titled "Maintaining Emergency Preparedness"), and plant procedures. The emergency plan and unit annexes are reviewed every year, and implementing procedures are reviewed on a continuing basis through their use in drills, exercises, and actual emergency events. The annual emergency plan review/update includes necessary changes, including those identified during audits, assessments, training, drills, and exercises.

The Turkey Point emergency preparedness manager is responsible for coordinating the annual review of the emergency plan, and determining the need for emergency plan or implementing procedure changes. Additional responsibilities include ensuring that elements of the emergency organization (e.g., FPL, local, State, and Federal) are informed of amendments and revisions to the emergency plan. The emergency plan, unit annexes, and implementing procedures are distributed as necessary on a controlled basis to the emergency response facilities and designated offsite locations, and all controlled document holders are issued revision changes upon approval. The names and telephone numbers in the EIPs and Emergency Response Directory (listed as an administrative procedure in COL Plan Appendix 3) are reviewed and updated at least quarterly.

The Turkey Point nuclear oversight manager will perform an independent audit of the emergency preparedness program at least every 12 months, or as necessary. Results of the audits are submitted to management, and any findings that deal with offsite interfaces are reviewed with the appropriate agencies. The results of independent reviews of the emergency preparedness program, including recommendations for improvement, are retained for a period of five years.

COL Plan Section P.6, "Supporting Emergency Response Plans," contains a detailed list of supporting plans from Federal, State, and county organizations. The format for the emergency plan is outlined in the (COLA Part 5) Table of Contents, and a cross-reference of the plan to the evaluation criteria in NUREG-0654 is provided in COL Plan Appendix 6. In addition, COL Plan Appendix 3 provides a list of procedures used to implement specific sections of the emergency plan.

In its Interim Finding Report for Reasonable Assurance, FEMA found that the offsite emergency plans are adequate for this planning standard and associated evaluation criteria in NUREG-0654.

In view of the above, the staff finds that the applicant has established the responsibilities for plan development and review, including distribution of the emergency plans. In addition, the applicant has established provisions to properly train the planners (i.e., individuals responsible for the emergency planning effort), and has described the provisions to be employed to ensure that the emergency plan, its implementing procedures, and emergency equipment and supplies are maintained up-to-date.

Conclusion

The staff concludes that the information provided in the COLA is consistent with the guidelines in NUREG-0654, Planning Standard P. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(16) and 10 CFR Part 50, Appendix E, Section IV.G, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.17 *Evacuation Time Estimate Analysis*

10 CFR 50.47(b)(10) requires in part that ETEs have been developed by applicants and licensees, and that licensees shall update the ETEs on a periodic basis. In addition, 10 CFR Part 50, Appendix E, Section IV, requires that the applicant provide an analysis of the time required to evacuate various sectors and distances within the plume exposure pathway EPZ for transient and permanent populations, using the most recent U.S. Census Bureau data as of the application submission date. NUREG-0654, Appendix 4, "Evacuation Time Estimates within the Plume Exposure Pathway Emergency Planning Zone," contains the detailed guidance to be used by the staff to determine whether the ETE Report meets the applicable regulatory requirements in 10 CFR Part 50, Appendix E. Additional guidance is contained in NUREG/CR-6863 and NUREG/CR-7002. ETEs are part of the required emergency planning basis and provide FPL and State and local governments with site-specific information needed for protective action decisionmaking.

In COLA Revision 7, Part 5, Supplement 1, the applicant included a corrected final report (Revision 4) of the Turkey Point Nuclear Power Plant—Development of Evacuation Time Estimate, dated April 15, 2015 (the ETE Report). This replaces the version in Revision 6 of the

application (i.e., Revision 4, dated August 22, 2014), which in turn replaced ETE Report Revision 3 (dated August 2012, ADAMS Accession No. ML13357A442). The staff had previously evaluated ETE Report Revision 3 against the applicable criteria set forth in Appendix 4 to NUREG-0654, NUREG/CR-6863, and NUREG/CR-7002. Revision 4 of the ETE Report made changes that include the addition of three new evacuation regions and ETE sensitivity studies, which were requested by Miami-Dade County, and incorporate the applicant's responses to NRC RAIs that were based on ETE Report Revision 3 (discussed below).

The Turkey Point Nuclear Plant is along the shore of Biscayne Bay within parts of Miami-Dade and Monroe Counties, approximately 40.2 km (25 mi) south of Miami, FL. Figure 3-1, "PTN EPZ," and Figure 6-1, "PTN EPZ Areas," of the ETE Report show the 10-mi EPZ (protective action) Areas and surrounding communities, and illustrate the plant's location with regard to major highways and geographic features. Appendix L of the ETE Report describes the physical boundaries of each of the 10 EPZ Areas, which are typically bounded by major roadways or the shoreline. Evacuation time estimates were determined for the 23 evacuation regions (i.e., Regions R01 through R23), which encompass all the groupings of areas considered. The evacuation regions are listed in the ETE Report in Tables 6-1 and H-1, and shown in Figures H-1 through H-23.

COL Plan Section J.8 states that an independent ETE study has been performed to provide estimates of the time required to evacuate resident and transient populations surrounding the Turkey Point site for various times of the year under favorable and adverse weather conditions. Referenced in COL Plan Appendix 5, the ETE Report is based on 2010 U.S. Census Bureau data files, local information and a telephone survey, and is included in the COLA as Supplemental Information 1 to the COL Plan. The ETE Report was prepared by KLD Engineering, P.C., in coordination with FPL personnel and emergency management personnel representing State and local governments, and provides a complete review of the evacuation road network. The EPZ Areas were used to define evacuation regions, which approximated keyhole sections within the EPZ. The ETE Report consists of these 13 sections and has detailed supporting information in Appendices A-H and J-N.

The Executive Summary of the ETE Report includes a summary of the conclusions reached in the report. Specifically, general population (i.e., permanent residents and transients) ETEs were computed for 276 unique cases, consisting of a combination of 23 unique evacuation regions (described in Table 6-1) and 12 unique evacuation scenarios (defined in Table 6-2). The 12 evacuation scenarios address different times of day, days of the week, weather conditions, a special event (i.e., NASCAR championship race at the Homestead-Miami Speedway), and one roadway impact scenario (i.e., a single lane closure on the Florida Turnpike northbound for the duration of the evacuation). The adverse weather condition is identified as rain. The highway capacity and free flow speed were each reduced to 90 percent of the good weather conditions to address the impact of adverse weather. For each evacuation scenario, an analysis was included of the applicable population segments, including permanent residents and transient populations, transit-dependent permanent residents, special facility residents, and schools. In addition, the ETEs considered a *shadow evacuation* in each analysis to reflect evacuation of residents from outside of the official evacuation area.¹⁷ The shadow

¹⁷ NUREG/CR-7002 includes consideration of shadow evacuation in ETE analyses, and states that a shadow evacuation occurs when people outside of any officially declared evacuation zone evacuate without having been

region covered the region between the 10-mi EPZ boundary and approximately 15-mi radius from the plant.

The telephone survey results were used to establish demographic characteristics and auto occupancy information. Section 3.1, "Permanent Residents," explains the values for the average household size of 3.13 persons per household and 1.37 vehicles per household were adapted from the survey. Table 3-2, "Permanent Resident Population and Vehicles by Area," quantifies the residents by evacuation area showing a population of 206,329 using 90,352 vehicles for a ratio of 2.28 permanent residents per vehicle. Figure 3-2, "Permanent Resident Population by Sector," shows the 206,329 residents distributed within radial sectors of the EPZ. In addition to the population segments that will be directed to evacuate, a shadow evacuation is considered in the analysis. Following the guidance in NUREG/CR-7002, the ETE study includes an assumption that 20 percent of the permanent resident population living in the region 5 mi beyond the EPZ will evacuate. The estimated shadow population by sector is shown in Figure 3-4, "Shadow Population by Sector." The transit-dependent population is evaluated separately. The process included identifying the population demand, identifying the evacuation resources and associated response times. The ETE identifies 17,463 transit-dependent residents and assumes 50 percent of these will rideshare. Population demand estimates were adjusted to account for the location of residents when the notification is received. The populations for evening and daytime scenarios as presented in Table 6-3, "Percent of Population Groups Evacuating for Various Scenarios."

Major facilities frequented by transients include lodging, marinas, campgrounds, golf courses, shopping centers, sports complexes, and museums and art centers. Population and vehicle estimates are provided for each type of facility along with the supporting basis for the estimates. Table 3-4, "Summary of Transients and Transient Vehicles," of the ETE report provides estimates by evacuation area and shows a total transient population of 33,075, which would need 13,434 vehicles to evacuate. A separate estimate, based on the Florida journey-to-work data, was developed for employee commuters who live outside the EPZ and commute to jobs within the EPZ. A vehicle occupancy factor of 1.09 employees per vehicle, developed from the telephone survey, was used to estimate the number of evacuating vehicles.

As described in Section 2.1, "Data Estimates," the special facility populations are based on county data and direct contact with facilities. Appendix E, "Special Facility Data," includes lists of schools and special facilities with demographic information provided for each institution. The location and enrollment for public and private schools is provided for Miami-Dade and Monroe Counties. To estimate the school evacuation demand, Table 8-2, "School Population Demand Estimation," identifies each school by area and shows that 38,108 students would need 615 school buses to complete evacuation. This assumes 100 percent of students are in attendance, parents do not pick up children, and high school students who drive will leave their vehicle and evacuate by bus. The location and capacity of medical facilities within the EPZ is also provided. The types of patients are listed as ambulatory, wheelchair, and bedridden to support the quantification of specialized vehicles needed to support the evacuation. The Dade Juvenile Resident Facility is identified as a correctional facility located within the EPZ. The capacity and resources needed to support an evacuation of the facility are described in Section 8.6, "Correctional Facilities," and an ETE for the facility is provided.

instructed to do so. Shadow evacuations are considered in developing the demand estimation because the additional traffic generated has the potential to impede an evacuation of the EPZ.

The computation of ETE assumes that 20 percent of the population within the EPZ, but outside the impacted region, will elect to voluntarily evacuate. In addition, 20 percent of the population in the shadow region will also elect to evacuate. These voluntary evacuees could impede those who are evacuating from within the impacted region. The impedance that could be caused by voluntary evacuees is considered in the computation of ETE for the impacted region.

An analysis of evacuation times, which is consistent with guidance in NUREG/CR-7002, is presented for the permanent resident and transient populations, transit-dependent permanent residents, special facility residents, and schools. The population of the EPZ is largely concentrated in the northwest quadrant such that all available roadways in this area need to be considered in the evacuation. In Revision 4 of the ETE study, potential locations of congestion are illustrated in Figure 7-3, "Congestion Patterns at 1 hour after the Advisory to Evacuate," through Figure 7-7, "Congestion Patterns at 9 Hours and 30 Minutes after the Advisory to Evacuate." These figures illustrate congestion patterns at various hours after the advisory to evacuate. These figures show a level of service F, which represents heavy congestion, in the northwest quadrant of the EPZ beginning immediately and lasting more than 7 hours. For the remaining quadrants of the EPZ, the roadway level of service is generally good.

The ETE statistics provide the elapsed times for 90 percent and 100 percent of the population to evacuate from within the affected region. The 90th percentile ETEs have been identified as the values that should be considered when making protective action decision. The ETEs for the general population range from 1:20 (hr:min) to 8:20 at the 90th percentile. The ETEs for the 100th percentile are significantly longer than those for the 90th percentile as a result of the traffic congestion within the EPZ, and have a maximum ETE of 11:45. U.S. Highway 1, Krome Ave., and the Florida Turnpike northbound are the most congested evacuation routes.

The ETEs for the 8-km (5-mi) region are significantly longer when evacuating additional areas beyond 5 mi because of the routing of vehicles from beyond 5 mi into the 5-mi region to access the Florida Turnpike. A NASCAR race at the Homestead-Miami Speedway was considered as the special event scenario, and has a material effect on the 100th percentile ETEs for regions that evacuate beyond 5 mi from the plant. The event occurs on a winter weekend midday under good weather conditions and represents the peak tourist condition within the EPZ. Approximately 100,000 people and 32,600 corresponding vehicles are considered in the analysis. For this event, a special traffic control plan that includes 54 traffic control points and contraflow on Speedway Boulevard is established.

The computation of ETEs considered *staged evacuation* for those regions wherein the 5-mi radius and sectors downwind to the EPZ boundary were evacuated.¹⁸ Those people within the 5-mi region evacuated immediately, while those beyond 5 mi, but within the EPZ, shelter-in-place. Once 90 percent of the 5-mi region is evacuated, those people beyond 5 mi begin to evacuate. Staged evacuation was shown to expedite the evacuation of those evacuees from within the 5-mi region. Although Federal guidance suggests staged evacuation of the 3.2-km (2-mi) regions and sectors downwind to 5 mi, there are no EPZ residents within 2 mi and only 14 residents within 5 mi. Miami-Dade and Monroe Counties only consider

¹⁸ NUREG/CR-7002 establishes an approach to develop ETEs for the staged evacuation protective actions, and states that evacuation research has shown that implementation of a staged keyhole evacuation can be more beneficial to the public health and safety than the normal keyhole evacuation. A staged evacuation is where one area is ordered to evacuate while adjacent areas are ordered to shelter-in-place until directed to evacuate. . The term "keyhole evacuation" is used to indicate the area around a nuclear power plant that resembles a keyhole, in that it includes a 360 degree area around the plant with a two-mile radius, and continuing in a downwind direction, typically out to five miles from the plant. The keyhole includes the downwind sector and adjoining sectors on each side.

keyhole evacuations wherein the 5-mi region and sectors downwind to the EPZ boundary evacuate. However, the current traffic management plans for Miami-Dade and Monroe Counties are sufficient, and the ETE study has not identified any necessary changes to the plans.

Separate ETEs were computed for schools, medical facilities, transit-dependent persons, homebound special needs persons, and correctional facilities. The average single-wave ETEs for these facilities are comparable to the general population ETEs at the 90th percentile. While the ETE for the full EPZ (Region R03) is sensitive to changes in population growth, a full ETE update would be needed for population growth of 6 percent or more between decennial Censuses. Because of the planned traffic treatments to be implemented during the construction of Units 6 and 7, the ETE for the 2-mi region is not materially impacted (i.e., 15 min decreases for the 90th percentile ETE). However, the 90th and 100th percentile ETEs for the full EPZ increases by 3:10 and 3:40, respectively, due to the significant increase in permanent resident and shadow populations from the extrapolation to year 2019.

The staff evaluated the ETE Report against the criteria set forth in Appendix 4 to NUREG-0654, NUREG/CR-6863, and NUREG/CR-7002. The evaluation included checking the ETE Report for internal consistency, consistency with other parts of the emergency plan, and consistency with other parts of the COLA (including the FSAR). Citations in the ETE Report were verified by comparison to the cited document text. General descriptions of the Turkey Point site region, population, and highways were verified using internet searches, aerial photographs, and field survey observations. Demographic information was gathered, a field survey of the EPZ performed, trip generation times estimated, evacuation regions defined, the procedures specified in the 2010 Highway Capacity Manual applied, the site was modeled using the DYNEV II System traffic simulation model,¹⁹ and ETEs were generated.

ETE Report Section 5.4.3, "Trip Generation for Waterways and Recreational Areas," states that boaters in the waters within the 10-mi EPZ will be notified of the emergency by VHF Radio and loudspeakers from boats and aircraft. As indicated in Table 5-2, "Time Distribution for Notifying the Public," the ETE Report assumes 100 percent notification in 45 minutes, with a 2-hour timeframe for boaters, campers, and other transients to return to their vehicles and begin their evacuation trip. In Revision 3 of ETE Report Section 3.3, "Transient Population," the applicant described visitors to Biscayne National Park, including those arriving by car and boat, and stated in Footnote 2 that waterborne vehicles are not considered in the ETE analysis.

In addition, as shown in ETE Report Figures 3-1 and 6-1, approximately one half of the total 10-mi EPZ surface area consists of the ocean and Biscayne Bay. Furthermore, the majority of this water area is not included within any of the 10 EPZ Areas, or the evacuation regions that are considered in the ETE study. Specifically, only EPZ Areas 2, 3, and 10 include water areas within the 10-mi EPZ. As such, the staff determined that it was unclear whether the evacuation of boaters—located on the water outside of the 10 EPZ Areas, but within the 10-mi EPZ—had been considered in the ETE study.

In RAI 7215, Question 13.03-18.A, August 28, 2013 (ADAMS Accession No. ML13240A502), the staff requested additional information from the applicant regarding an estimate of the number of Biscayne National Park visitors that would evacuate the EPZ by vehicle and by boat;

¹⁹ The DYNEV traffic simulation model is a macroscopic model that describes the operations of traffic flow in terms of aggregate variables: vehicles, flow rate, mean speed, volume, density, queue length, on each link, for each turn movement, during each Time Interval (i.e., simulation time step).

including the ETE for each mode of transportation. In addition, in RAI 7215, Question 13.03-18.B, the staff asked the applicant to describe whether, and how, the ETE includes time for boaters to evacuate the EPZ waterways within 10 mi of the plant, including the Biscayne Bay area. Furthermore, in ETE Report Table 1-1, "Stakeholder Interaction," the applicant identified various interactions among the State and local government agencies, but did not specify if the ETE Report (Revision 3) had been reviewed by them. In RAI 7215, Question 13.03-18.C, the staff requested information regarding the applicant's interactions with State and local stakeholders, including the identification of the offsite agencies that have reviewed the updated (Revision 3) ETE Report.

In an October 15, 2013, response to RAI 7215, Questions 13.03-18.A-C (ADAMS Accession No. ML13290A140), the applicant provided estimated peak transient numbers of 5,050 boat visitors and 1,870 boats for the Biscayne National Park. The number of boat visitors is based on the Biscayne National Park Information Guide,²⁰ which states that the park attracts nearly 500,000 visitors a year, and that most of these visitors enter the park by private boat. The applicant used the peak transient numbers of 9,013 vehicle (nonboat) visitors and 2,774 vehicles in ETE Report Table E-4, "Parks/Recreational Attractions within the EPZ"—reflecting visitors to Biscayne National Park (Convoy Point), Black Point Park and Marina, and Homestead Bayfront Park—to estimate what portion of the park's 500,000 visitors are there via boat. With regard to visitors entering the park via boat, Footnote 2 of ETE Report Section 3.3 states that on a typical day, vehicle occupancy is higher than normal because campsites at the park are only accessible by boat.

Footnote 2 is significant with regard to the applicant's estimates of vehicle versus boat evacuations, in that the staff finds it reasonable to assume that most of the visitors, who arrive by vehicles and enter the park by boat, would return to their vehicles for evacuation. In contrast, those visitors arriving at (and entering) the park by boat, would evacuate by boat. Thus, the staff does not see an inconsistency with the applicant's distinction between vehicle and boat evacuations, with regard to the Information Guide's statement that most of the estimated 500,000 visitors enter the park by private boat.

The applicant described notification of the boating transients, and stated that the 2-hour mobilization time for transients presented in Table 5-8, "Trip Generation Histograms for the EPZ Population for Unstaged Evacuation," of the ETE Report is sufficient time for the boating transients to prepare to evacuate. The applicant calculated boat evacuation times using a conservative boat evacuation speed of 5 mph (4.3 knots) and approximated distances to clear the EPZ. The calculated boat (100th percentile) ETEs (including mobilization time) for the 2-mi and 5-mi regions, and the full EPZ, range from 2:12 to 4:12. The 90th percentile ETEs ranged from 1:27 to 3:27. The applicant stated that the results of the boat ETEs were either less than or in good agreement with their respective (vehicular ETE) regions in Table 7-1 (90th percentile ETEs) and Table 7-2 (100th percentile ETEs). The staff finds the applicant's estimated boat evacuation times reasonable, including consideration that their exit from the 10-mi EPZ water area would not be constrained by exit route capacities; equivalent to highway capacity limitations that affect vehicle evacuations, which are described in ETE Report Section 4, "Estimation of Highway Capacity."

The applicant also provided additional details regarding stakeholder interactions, and stated that on July 26, 2012, the results of the ETE Report (Revision 3) were presented to emergency

²⁰ Uhler, John W., "Biscayne National Park Information Guide," Copyright © 1995-2007, Hillclimb Media. Available at <http://www.biscayne.national-park.com/info.htm>, visited August 28, 2014.

planning personnel from the State of Florida, Miami-Dade County, and Monroe County. The State and counties were provided copies of the ETE before the meeting, and all feedback was discussed and addressed at the meeting on July 26, 2012. All comments were resolved in the final ETE Report (Revision 3). FPL Fleet (Turkey Point Units 3 and 4), the State of Florida, and counties subsequently used the ETE results to formulate a protective action strategy.

The applicant's response to RAI 7215, Questions 13.03-18.A-C included proposed changes that were incorporated into COLA Revision 7, corrected final ETE Report Revision 4. These changes consist of a detailed description of how the applicant determined the estimated number of boat visitors, including the associated ETEs. The applicant also deleted the statement in Footnote 2 of ETE Report Section 3.3, which stated that waterborne vehicles are not considered in the ETE analysis. In addition, the applicant proposed an update to ETE Report Table 1-1 to reflect its interactions with State and local governmental authorities for ETE Report (Revision 4), including discussions of ETE methods and review results, and comments received on the draft ETE Report. The staff reviewed the proposed ETE changes, and finds them acceptable because they are consistent with 10 CFR Part 50, Appendix E, Section IV. In addition, the staff confirmed that the ETE changes were included in ETE Report, Revision 4, of COLA Revision 6. Therefore, the staff considers RAI 7215, Questions 13.03-18.A, 18.B and 18.C, resolved, with regard to emergency planning.

In Section 13, "Recommendations," suggestions are provided that have the potential to reduce the ETE. One suggestion is contacting schools before dispatching buses to get an accurate count of the number of buses required. The ETE uses a conservative estimate assuming 100 percent of the students are at the school, and reducing the number of buses to serve actual needs could eliminate the need for a second evacuation wave. A recommendation for a physical improvement is made based on scenario 12 of the ETE, which evaluated the effect of a lane closure on the Florida Turnpike. The results showed an increase in the ETE of as much as 1.5 hours for the lane closure scenario, and recommends the shoulder be used as an additional lane to increase capacity.

In view of the above, the staff finds that the applicant has developed adequate ETEs for the plume exposure pathway EPZ for transient and permanent populations using the most recent U.S. Census Bureau data (i.e., for the year 2010) as of the application revision submission date (i.e., October 14, 2015, for COLA Revision 7.) In addition, the ETEs are consistent with Appendix 4 to NUREG-0654, NUREG/CR-6863, and NUREG/CR-7002

Conclusion

The staff concludes that the ETE Report (Revision 4) is consistent with the guidelines in Appendix 4 to NUREG-0654, NUREG/CR-6863, and NUREG/CR-7002. Therefore, the staff finds the information acceptable and meets the relevant requirements of 10 CFR 50.47(b)(10) and 10 CFR Part 50, Appendix E, Section IV, insofar as the information describes the essential elements of advanced planning and the provisions made to cope with emergency situations.

13.3.4.18 AP1000 COL Items

COLA FSAR Table 1.8-202, "COL Item Tabulation," identifies two COL information items from AP1000 DCD Tier 2 Section 13.3.1, relating to EP. These consist of STD COL 13.3-1 and STD COL 13.3-2, which correspond to COL Action Items 13.3-1 and 13.3.3.3.5-1 (respectively) in Section 13.3 of NUREG-1793. The following addresses the resolution of these two COL information items.

- STD COL 13.3-1

STD COL Information Item 13.3-1 requires that COL applicants referencing the AP1000 certified design will address EP, including post-72 hour actions and its communications interface. In FSAR Section 13.3, the applicant addressed STD COL 13.3-1 by stating the following:

The emergency planning information is submitted to the Nuclear Regulatory Commission as a separate licensing document and is incorporated by reference (see [FSAR] Table 1.6-201).

Post-72 hour support actions, as discussed in DCD Subsections 1.9.5.4 and 6.3.4, are addressed in DCD Subsections 6.2.2, 8.3, and 9.1.3. Provisions for establishing post-72 hour ventilation for the main control room, instrumentation and control rooms, and dc [direct current] equipment rooms are established in operating procedures.

COLA FSAR Table 1.6-201, "Additional Material Referenced," lists the Turkey Point Plant Radiological Emergency Plan and references FSAR Section 13.3. The staff's evaluation of communications interfaces is addressed above in SER Section 13.3.4.6, "Emergency Communications." With regard to post-72 hour actions associated with the AP1000 DCD, the applicant referenced operating procedures and various DCD Tier 2 sections (identified above) that address post-72 hour support actions. The staff identified additional AP1000 DCD sections that address post-72 hour support actions, which include DCD Tier 2 Sections 6.4, "Habitability Systems"; 9.4, "Air-Conditioning, Heating, Cooling, and Ventilation System"; and 9.5, "Other Auxiliary Systems" (e.g., plant lighting systems described in Subsection 9.5.3).

As discussed in AP1000 DCD Tier 2 Section 1.9.5.4, post-72 hour support actions relate to an extended loss of the nonsafety-related systems for both offsite and onsite alternating current (ac) power sources for more than 72 hours. For purposes of the staff's review of EP information in the COLA, and in the context of COL Action Item 13.3-1, the reference to post-72 hour support actions is limited and indirectly related to the habitability and functionality of the TSC. Specifically, it is limited to the reliability of the electrical power supply (post-72 hours) to the TSC ventilation system and communications equipment. The evaluation of the reliability of the electrical power supplies, including the power supplies to the TSC, is addressed in the AP1000 DCD sections referenced above. The habitability and functionality of the TSC is further addressed in SER Section 13.3.4.8.

The staff finds that the applicant has addressed emergency planning (including communication interfaces—see STD COL 13.3-2, below) in support of Units 6 and 7 in the COL Plan. In addition, the applicant has addressed post-72 hour actions through reference to the AP1000 DCD sections (identified above) that specifically address an extended loss of the nonsafety-related systems for both offsite and onsite ac power sources for more than 72 hours. The staff's evaluation of those systems and power sources, including the establishment of associated operating procedures, are addressed in their respective sections of this report. Therefore, the staff finds that the COL applicant has adequately addressed STD COL 13.3-1.

- STD COL 13.3-2

STD COL 13.3-2 requires that COL applicants referencing the AP1000 certified design will address the activation of the EOF, consistent with current operating practice and NUREG-0654.

In FSAR Section 13.3, the applicant addressed STD COL 13.3-2 by stating that the emergency plan describes the plans for coping with emergency situations, including communications interfaces and staffing of the EOF.

Activation and staffing of the EOF is described in the COL Plan, and the staff's evaluation of this information is addressed above in Section 13.3.4.2, "Onsite Emergency Organization," Section 13.3.4.3, "Emergency Response Support and Resources," Section 13.3.4.5, "Notification Methods and Procedures," and Section 13.3.4.8, "Emergency Facilities and Equipment," of this report. Communication interfaces are addressed in SER Section 13.3.4.6, "Emergency Communications." Integral to EOF activation is augmentation of plant staff by corporate support personnel (addressed in License Condition (13-3)) and reliable communications systems (addressed in License Condition (13-4)), which are addressed in SER Sections 13.3.4.2 and 13.3.4.6, respectively. Therefore, subject to License Condition (13-3) and License Condition (13-4), the staff finds that the COL applicant has adequately addressed STD COL 13.3-2.

- PTN COL 9.5-9 and PTN COL 9.5-10

PTN COL 9.5-9 requires that COL applicants referencing the AP1000 certified design will address interfaces to required offsite locations, including the recommendations of BL-80-15 regarding loss of the emergency notification system due to a loss of offsite power. In addition, PTN COL 9.5-10 requires that COL applicants referencing the AP1000 certified design will address the emergency offsite communication system, including the crisis management radio system. In FSAR Section 9.5.2.2.5, the applicant addressed PTN COL 9.5-9 and PTN COL 9.5-10 together by stating that offsite interfaces and emergency offsite communications are described in the emergency plan (see also, FSAR Table 1.8-202).

The applicant described the emergency notification systems (including the ENS) in COL Plan Section E, and the emergency communications systems in COL Plan Section F. The staff's evaluation of offsite emergency notification and communications systems is addressed above in SER Sections 13.3.4.5 and 13.3.4.6, respectively. Therefore, the staff finds that the COL applicant has adequately addressed PTN COL 9.5-9 and PTN COL 9.5-10, with regard to emergency planning for Units 6 and 7. Offsite interfaces and emergency offsite communications are discussed further in SER Section 9.5.2, "Communication System."

- PTN COL 18.2-2

PTN COL 18.2-2 requires that COL applicants referencing the AP1000 certified design will provide specific information regarding EOF and TSC communications and human factors attributes. FSAR Table 1.8-202 identifies FSAR Section 18.2.1.3 as the location where PTN COL 18.2-2 is addressed. In FSAR Section 18.2.1.3, the applicant addressed PTN COL 18.2-2 by stating that the EOF and TSC communication strategies, as well as the EOF and TSC human factors attributes, are described in the emergency plan.

The applicant described EOF and TSC communications and human factors attributes in COL Plan Sections E, F, and H. The staff's evaluation is addressed above in SER Sections 13.3.4.5, 13.3.4.6, and 13.3.4.8, respectively. Therefore, the staff finds that the COL applicant has adequately addressed PTN COL 18.2-2, with regard to emergency planning for Units 6 and 7. PTN COL 18.2-1 is discussed further in SER Section 18.2, "Human Factors Engineering Program Management."

13.3.4.19 *Supplemental Information, Implementation Milestones, and ITAAC*

- STD SUP 13.3-1

Activities applicable to emergency planning that the COL holder (i.e., licensee) shall perform after the COL is issued consist of the implementation milestones and license conditions listed below. The applicant provided supplemental information in STD SUP 13.3-1, which states that FSAR Table 13.4-201 provides milestones for emergency planning implementation. Table 13.4-201 identifies the emergency planning program as operational program (Item) No. 14, and includes the three associated implementation milestones listed below (see also, SER Table 13.3-1, ITAAC 8.1 and ITAAC 9.1). The staff reviewed Table 13.4-201, and finds that the identified implementation milestones associated with the emergency planning program are acceptable because they are consistent with the relevant guidance and acceptance criteria in NUREG-0800, and therefore meet the respective requirements in 10 CFR Part 50, Appendix E. Implementation milestones associated with emergency planning are also addressed below under *License Condition 6*, and in SER Section 13.4, "Operational Programs."

Implementation Milestones

- Full participation exercise conducted within 2 years of the scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section IV.F.2(a)(ii).
- Onsite exercise conducted within 1 year before the scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section IV.F.2(a)(ii).
- Applicant's detailed implementing procedures for its emergency plan submitted at least 180 days prior to the scheduled date for initial loading of fuel, as required by 10 CFR Part 50, Appendix E, Section V.

License Condition 6

Part 10 of the COLA proposes License Condition 6, which provides for submission of a schedule that supports NRC's inspections of operational programs. With regard to emergency planning, the schedule shall address EIPs (Item 6.a), an ERDS implementation program plan (Item 6.e), and responding to explosions or fire (Item 6.g). Specifically, the applicant proposed the following:

The licensee shall submit to the appropriate director of the NRC, a schedule, no later than 12 months after issuance of the COL, that supports planning for and conduct of NRC inspections of operational programs listed in the operational program FSAR Table 13.4-201. The schedule shall be updated every six months until 12 months before scheduled fuel loading, and every month thereafter until either the operational programs in the FSAR table have been fully implemented or the plant has been placed in commercial service, whichever comes first. This schedule shall also address:

- a. the emergency planning implementation procedures to the NRC consistent with 10 CFR Part 50, Appendix E, Section V
- e. an emergency response data system (ERDS) implementation program plan consistent with 10 CFR Part 50, Appendix E, Section [VI]

- g. full implementation of the operational and programmatic elements of responding to an event associated with a loss of large areas of the plant due to explosions or fire, prior to initial fuel load

The schedule for submission of the EIPs to the NRC (Item 6.a) is also addressed above in STD SUP 13.3-1 and Implementation Milestones, and in ITAAC 9.1. The ERDS program, including implementation (Item 6.e), is addressed above in SER Sections 13.3.4.5, 13.3.4.6, 13.3.4.8 and 13.3.4.14, and in ITAAC 3.2. With regard to Item 6.g, 10 CFR Part 50, Appendix E, Section IV, addresses various aspects of the emergency preparedness program related to hostile actions toward the site, which are addressed above in SER Sections 13.3.4.1, 13.3.4.3, 13.3.4.4, 13.3.4.8, 13.3.4.10, and 13.3.4.14. The staff reviewed proposed License Condition 6, and finds that the identified implementation milestones associated with the emergency planning program (i.e., Items 6.a, 6.e, and 6.g) are acceptable because they are consistent with the relevant guidance and acceptance criteria in NUREG-0800 and SECY-05-0197, and therefore meet the respective requirements in 10 CFR Part 50, Appendix E. The staff's review of operational program readiness, including proposed License Condition 6, is addressed further in SER Section 13.4. In addition, implementation milestones associated with emergency planning for source, byproduct, and special nuclear materials are addressed in SER Section 1.5.5.²¹

ITAAC and License Condition 1

- PTN SUP 14.3-1

In COLA Part 2, Subsection 14.3.2.3.1, the applicant provided supplemental information in PTN SUP 14.3-1, which states:

EP-ITAAC have been developed to address implementation of elements of the Emergency Plan. Site-specific EP-ITAAC are based on the generic ITAAC provided in Appendix C.II.1-B of Regulatory Guide 1.206. These ITAAC have been tailored to the specific reactor design and emergency planning program requirements.

As stated above in SER Section 13.3.2, proposed License Condition 1 states that the ITAAC identified in the tables in COLA Part 10 Appendix B are hereby incorporated into the COL. Appendix B includes Table 3.8-1 (EP ITAAC) and incorporates by reference the AP1000 DCD ITAAC. The DCD ITAAC include the six AP1000 design-related EP ITAAC in DCD Tier 1 Table 3.1-1. Four of these EP ITAAC in DCD Table 3.1-1 duplicate or overlap similar EP ITAAC in Part 10 Table 3.8-1 (e.g., TSC floor space). The remaining two EP ITAAC in DCD Table 3.1-1 address the availability of various plant parameters in the TSC and a habitable workspace environment for the CSA. DCD Table 3.1-1 also addresses the AP1000 locations of the OSC and TSC, which are changed by COLA Departures PTN DEP 18.8-1 and PTN DEP 18.8-2, respectively, and evaluated above in SER Section 13.3.4.8.

²¹ Section 1.5.5, "Receipt, Possession, and Use of Source, Byproduct, and Special Nuclear Material Authorized by 10 CFR Part 52 [Subpart C] Combined Licenses," of this report addresses implementation milestones for the various operational programs (including emergency planning) relating to byproduct, source, and special nuclear material—in accordance with 10 CFR Part 30, "Rules of General Applicability to Domestic Licensing of Byproduct Material"; 10 CFR Part 40, "Domestic Licensing of Source Material"; and 10 CFR Part 70, "Domestic Licensing of Special Nuclear Material."

The staff reviewed the complete set of EP ITAAC for Turkey Point Units 6 and 7, which consists of the EP ITAAC in COLA Part 10 Table 3.8-1, plus the (EP-related) ITAAC in AP1000 DCD Tier 1 Table 3.1-1, and finds that they are adequate because they conform to the respective generic EP ITAAC and acceptance criteria in NUREG-0800, Section 14.3.10.²² Specific EP ITAAC in Part 10 Table 3.8-1 and DCD Table 3.1-1 are also identified above in SER Section 13.3.4, as they relate to the staff's evaluation of the various planning standards. Therefore, the staff finds that the EP ITAAC in Part 10 Table 3.8-1 (reflected below in SER Table 13.3-1) and DCD Table 3.1-1 are acceptable because they are consistent with NUREG-0800 and RG 1.206.

13.3.5 Post Combined License Activities

The license condition language in this section has been clarified from previously considered language. In a letter dated April 8, 2016 (ADAMS Accession No. ML16103A507), the applicant did not identify any concerns with the clarified license condition language. The changes do not affect the staff's above analysis of the conditions, and therefore, for the reasons discussed in the technical evaluation section above, the staff finds the following ITAAC and license conditions acceptable:

The licensee shall perform and satisfy the acceptance criteria of the EP ITAAC set forth in SER Table 13.3-1 and AP1000 DCD Tier 1 Table 3.1-1.

- License Condition (13-3) - No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Florida Power & Light Company shall have performed an assessment of the on-site and augmented staffing capability for response to a multi-unit event. The staffing assessment shall be performed in accordance with NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0.

No later than one hundred eighty (180) days before the date scheduled for initial fuel load, as set forth in the notification submitted in accordance with 10 CFR 52.103(a), Florida Power & Light Company shall revise the Emergency Plan to include the following:

- (a) Incorporation of corrective actions identified in the staffing assessment required by this license condition; and
- (b) Identification of how the augmented staff will be notified, given degraded communications capabilities.

(See SER Section 13.3.4.2.)

- License Condition (13-4) - No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Florida Power & Light Company shall have performed an assessment of on-site and off-site communications systems and equipment relied upon during an emergency event to ensure communications

²² The generic EP ITAAC in Table C.II.1-B1 of Appendix B to Regulatory Guide (RG) 1.206 are identical to the generic EP ITAAC in Table 14.3.10-1 of Section 14.3.10 to NUREG-0800.

capabilities can be maintained during an extended loss of alternating current power. The communications capability assessment shall be performed in accordance with NEI 12-01, "Guideline for Assessing Beyond Design Basis Accident Response Staffing and Communications Capabilities," Revision 0.

No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Florida Power & Light Company shall have completed implementation of corrective actions identified in the communications capability assessment, including revisions to the Emergency Plan.

(See SER Sections 13.3.4.2 and 13.3.4.6.)

- License Condition (13-5) - No later than eighteen (18) months before the latest date set forth in the schedule submitted in accordance with 10 CFR 52.99(a) for completing the inspections, tests, and analyses in the ITAAC, Florida Power & Light Company shall have performed a detailed staffing analysis, in accordance with NEI 10-05, "Assessment of On-Shift Emergency Response Organization Staffing and Capabilities," Revision 0.

No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Florida Power & Light Company shall have revised the Emergency Plan to incorporate any changes identified in the staffing analysis that are needed to bring staffing to the required levels.

(See SER Section 13.3.4.2.)

- License Condition (13-6) - No later than one hundred eighty (180) days before the date scheduled for initial fuel load set forth in the notification submitted in accordance with 10 CFR 52.103(a), Florida Power & Light Company shall submit to the Director of NRO, or the Director's designee, in writing, a fully developed set of plant-specific emergency action levels (EALs), in accordance with NEI 07-01, "Methodology for Development of Emergency Action Levels—Advanced Passive Light Water Reactors," Revision 0, with no deviations. The EALs shall have been discussed and agreed upon with State and local officials.

(See SER Section 13.3.4.4.)

13.3.6 Conclusions

As described in detail above, the staff reviewed the application, including applicable portions of the referenced AP1000 DCD. The staff confirmed that the applicant addressed the required information relating to emergency planning, and there is no additional information needed to support the Turkey Point Units 6 and 7 COLA. The results of the staff's technical evaluation of the information incorporated by reference in the application are documented in NUREG-1793 and its supplements for the AP1000 DCD.

The EP ITAAC that are applicable to Turkey Point Units 6 and 7 are provided below in SER Table 13.3-1, which reflects the ITAAC in COLA Part 10 Table 3.8-1, and in DCD Tier 1 Table 3.1-1. The staff concludes that, pursuant to 10 CFR 52.80(a), the applicant included in

the Turkey Point COLA the proposed inspections, tests, and analyses that the licensee shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the inspections, tests, and analyses are performed and the acceptance criteria met, the facility has been constructed and will operate in conformity with the license, the provisions of the Atomic Energy Act of 1954, as amended, and the NRC's rules and regulations in regard to emergency planning.

As part of its review of the Turkey Point Units 6 and 7 COLA, FEMA provided its findings and determinations concerning the adequacy of offsite emergency planning and preparedness, which are based on its review of State and local emergency plans. FEMA concluded that the offsite State and local emergency plans are adequate to cope with an incident at the Turkey Point site, and there is reasonable assurance that these plans can be implemented. On the basis of its review of the FEMA findings and determinations, the staff concludes that the State and local emergency plans are adequate, and there is reasonable assurance that they can be implemented.

Based on its evaluation, as set forth above, the staff concludes that the onsite emergency plan establishes an adequate planning basis for an acceptable state of onsite emergency preparedness, and there is reasonable assurance that the plan can be implemented.

The staff concludes that the emergency plans provide an adequate expression of the overall concept of operation and describe the essential elements of advanced planning and the provisions made to cope with emergency situations. Therefore, the staff concludes that the overall state of onsite and offsite emergency preparedness, when fully implemented, will meet the requirements of 10 CFR 50.33(g), 10 CFR 50.47, Appendix E to 10 CFR Part 50, 10 CFR 50.72, 10 CFR 52.79(a)(21), 10 CFR 52.79(a)(22)(i), 10 CFR 52.80, 10 CFR 52.83, and 10 CFR 100.21.

Furthermore, pursuant to 10 CFR 50.47(a), the staff concludes that, subject to the required conditions and limitations of the full-power license and satisfactory completion of the ITAAC, there is reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency at the new units, and that emergency preparedness at Turkey Point Units 6 and 7, is adequate to support full-power operations.

Table 13.3-1 Turkey Point Units 6 and 7 ITAAC

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
1.0 Emergency Classification System			
10 CFR 50.47(b)(4)—A standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, is in use by the nuclear facility licensee, and State and local response plans call for reliance on information provided by facility licensees for determinations of minimum initial offsite response measures.	1.1 A standard emergency classification and emergency action level (EAL) scheme exists, and identifies facility system and effluent parameters constituting the bases for the classification scheme. [D.1**] [**D.1 corresponds to NUREG-0654/ FEMA-REP-1 evaluation criteria.]	1.1.1 An inspection of the main control room, Technical Support Center (TSC), and Emergency Operations Facility (EOF) will be performed to verify that they have displays for retrieving facility system and effluent parameters as specified in the Emergency Classification and EAL technical basis document for the unit, and the displays are functional.	1.1.1 The specified parameters are retrievable in the main control room, TSC and EOF, and the ranges of the displays encompass the values specified in the Emergency Classification and EAL technical basis document for the unit.
		1.1.2 An analysis of the EAL technical bases will be performed to verify as-built, site-specific implementation of the EAL scheme.	1.1.2 The ranges available in the main control room, TSC, and EOF envelop the values for the specific parameters identified in the EALs in Emergency Plan, Annex 2 and 3, Attachment 1.
2.0 Notification Methods and Procedures			
10 CFR 50.47(b)(5)—Procedures have been established for notification, by the licensee, of State and local response organizations and for notification of emergency personnel by all organizations; the content of initial and follow-up messages to response organizations and the	2.1 The means exist to notify responsible State and local organizations within 15 minutes after the licensee declares an emergency. [E.1]	2.1 A test will be performed to demonstrate the capabilities for providing initial notification to the offsite authorities after a simulated emergency classification.	2.1 The State of Florida and the counties of Miami-Dade, and Monroe received notification within 15 minutes after the declaration of an emergency in the main control room and the EOF.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
public has been established; and means to provide early notification and clear instruction to the populace within the plume exposure pathway Emergency Planning Zone (EPZ) have been established.			
	2.2 The means exists to notify emergency response personnel. [E.2]	2.2 A test of the primary and backup emergency response organization (ERO) notification systems will be performed.	2.2 A test of the primary and backup ERO notification systems results in: <ul style="list-style-type: none"> • ERO personnel received the notification message; • Mobilization communication was validated by personnel response to the notification system or by telephone • Response to electronic notification and plant page system was demonstrated during normal working hours, and off hours.
	2.3 The means exists to notify and provide instructions to the populace within the plume exposure emergency planning zone (EPZ). [E.6]	2.3 A full test of the alert and notification system and emergency alert system capabilities will be conducted.	2.3 Notification and clear instructions to the public are accomplished in accordance with the emergency plan requirements.
3.0 Emergency Communications			
10 CFR 50.47(b)(6)—Provisions exist for prompt communications among principal response organizations to	3.1 The means exists for communications between the main control room, TSC, EOF, principal State and local emergency operations centers (EOCs), and field	3.1 A test will be performed of the capabilities. The test for the contact with the principal EOCs and the field monitoring teams will be from the main control room and the EOF. The TSC	3.1 Communications (both primary and secondary methods/systems) are established among the main control room and the EOF with the State of Florida Division of Emergency Management warning point and EOC,

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
emergency personnel and to the public.	monitoring teams. [F.1.d]	communication with the main control room and the EOF will be performed.	Miami-Dade County warning point and EOC, and Monroe County warning point and EOC. Communications are established between the main control room and the EOF with the Turkey Point Nuclear Plant (PTN) field monitoring teams.
	3.2 The means exists for communications from the main control room, TSC and EOF to the Nuclear Regulatory Commission (NRC) headquarters and regional office EOCs (including establishment of the emergency response data system (ERDS) or its successor system between the onsite computer system and the NRC operations center). [F.1.f]	3.2 A test is performed of the capabilities to communicate using the emergency notification system from the main control room, TSC and EOF to the NRC headquarters and regional office EOCs. The health physics network is tested to ensure communications between the TSC and EOF with the NRC operations center. The ERDS is established, or its successor system, between the onsite computer systems and the NRC operations center.	3.2 Communications are established from the main control room, TSC and EOF to the NRC headquarters and regional office EOCs using the emergency notification system. The TSC and EOF demonstrated communications with the NRC operations center using the health physics network. The access port for ERDS, or its successor system, is provided and successfully completes a transfer of data from the unit to the NRC operations center.
4.0 Public Education and Information			
10 CFR 50.47(b)7)—Information is made available to the public on a periodic basis on how they will be notified and what their initial actions should be in an emergency (e.g., listening to a local broadcast station and remaining indoors), the principal points of contact with the news media for dissemination of	4.1 The licensee has provided space that may be used for a limited number of news media. [G.3.b]	4.1 An inspection of the facility/area provided for the news media will be performed in the emergency news center (ENC). The space provides adequate equipment to support the ENC operation, including communications with the site and with the EOCs in the State and counties as well as a	4.1 The ENC includes equipment to support the ENC operations, including communications with the EOF and State and county EOCs. Designated space is available for news media briefings.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
information during an emergency (including the physical location or locations) are established in advance, and procedures for coordinated dissemination of information to the public are established.		limited number of news media.	
5.0 Emergency Facilities and Equipment			
10 CFR 50.47(b)(8)—Adequate emergency facilities and equipment to support the emergency response are provided and maintained.	5.1 The licensee has established a TSC and onsite operations support center (OSC). [H.1]	5.1 An inspection of the TSC and OSC will be performed, including a test of their capabilities.	<p>5.1.1 The TSC has at least 3,000 square feet of floor space consistent with NUREG-0696 (75 square feet/person) and is large enough for required systems, equipment, records and storage.</p> <p>5.1.2 The TSC is located outside the Protected Area, and procedures are in place to enhance passage through security checkpoints expeditiously.</p> <p>5.1.3 Communications equipment is installed and voice transmission and reception are accomplished between the main control room, the OSC, and EOF.</p> <p>5.1.4 The TSC ventilation system includes a high-efficiency particulate air (HEPA), and charcoal filter and radiation monitors are installed. Controls and displays exist in the TSC to control and monitor the status of the TSC ventilation system including heating and cooling, and the activation of the HEPA and charcoal filter system</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			<p>upon detection of high radiation in the TSC.</p> <p>5.1.5 The TSC has the means to receive, store, process, and display plant and environmental information, as listed in design control document (DCD) Table 7.5-1 and Final Safety Analysis Report (FSAR) Table 7.5-201, and to initiate emergency measures and conduct emergency assessment.</p> <p>5.1.6 A reliable and backup electrical power supply is available for the TSC.</p> <p>5.1.7 There is an OSC located inside the Protected Area. It is separate from the main control room.</p> <p>5.1.8 Communications equipment is installed, and voice transmission and reception are accomplished between the OSC and OSC teams, the TSC and the main control room.</p>
	5.2 The licensee has established an EOF. [H.2]	5.2 An inspection of the EOF will be performed, including a test of the capabilities.	<p>5.2.1 The EOF working space is a minimum of 5625 square feet consistent with NUREG-0696 (75 square feet/person) and is large enough for required systems, equipment, records, and storage.</p> <p>5.2.2 Communications equipment is installed, and voice transmission and reception are accomplished between the main control room, TSC, EOF, field monitoring teams, NRC,</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			State and county agencies, and ENC. 5.2.3 Radiological data identified in each Plan Annex, meteorological data, and plant system data pertinent to determining offsite protective measures as listed in DCD Table 7.5-1 and FSAR Table 7.5-201 are available and displayed in the EOF, when activated.
6.0 Accident Assessment			
10 CFR 50.47(b)(9)—Adequate methods, systems, and equipment for assessing and monitoring actual or potential offsite consequences of a radiological emergency condition are in use.	6.1 The means exist to provide initial and continuing radiological assessment throughout the course of an accident. [I.2]	6.1 A test will be performed to demonstrate that the means exist to provide initial and continuing radiological assessment throughout the course of an accident through the plant computer or communications with the main control room, TSC, and EOF during the course of drills and/or exercises.	6.1 The means are available to provide initial and continuing radiological assessment through displays of instrumentation indicators in the main control room, TSC and EOF during the course of drills and/or exercises.
	6.2 The means exist to determine the source term of releases of radioactive material within plant systems, and the magnitude of the release of radioactive materials based on plant system parameters and effluent monitors. [I.3]	6.2 A test will be performed to demonstrate that the means exist to determine the source term of releases of radioactive material within plant systems, and the magnitude of the release of radioactive materials based on plant system parameters and effluent monitors.	6.2 Emergency plan implementing procedures (EPIPs), through use in training and drills, provide direction to accurately calculate the source terms and the magnitude of the release of postulated accident scenario releases.
	6.3 The means exist to continuously assess the impact of the release of	6.3 A test will be performed to provide evidence that the impact of a radiological	6.3 Demonstrate that the means exist to continuously assess the impact of the release of

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
	radioactive materials to the environment, accounting for the relationship between effluent monitor readings, and onsite and offsite exposures and contamination for various meteorological conditions. [I.4]	release to the environment is able to be assessed by using the relationship between effluent monitor readings, and onsite and offsite exposures and contamination for various meteorological conditions.	radioactive materials to the environment, accounting for the relationship between effluent monitor readings, and onsite and offsite exposures and contamination for various meteorological conditions under drill conditions.
	6.4 The means exist to acquire and evaluate meteorological information. [I.5]	6.4 A test will be performed to acquire and evaluate meteorological data/information.	6.4 Meteorological data exists at the EOF, TSC, main control room, offsite NRC operations center, and the State of Florida, and that this data is in the format needed for the appropriate EIPs.
	6.5 The means exist to determine the release rate and projected doses if the instrumentation used for assessment is off-scale or inoperable. [I.6]	6.5 A test will be performed of the capabilities to determine the release rate and projected doses if the instrumentation used for assessment is off-scale or inoperable.	6.5 The release rate and projected doses can be determined with off-scale or inoperable instrumentation during training or a drill.
	6.6 The means exist for field monitoring within the plume exposure EPZ. [I.7]	6.6 A test will be performed of the capabilities for field monitoring within the plume exposure EPZ.	6.6 The field monitoring teams were dispatched and demonstrated ability to locate and monitor a radiological release within the plume exposure EPZ.
	6.7 The means exist to make rapid assessments of actual or potential magnitude and locations of radiological hazards through liquid or gaseous release pathways, including activation, notification means, field team composition, transportation,	6.7 A test will be performed of the capabilities to make rapid assessments of actual or potential magnitude and locations of radiological hazards through liquid or gaseous release pathways, including activation, notification means, field team composition,	6.7 The field monitoring teams were activated. They demonstrate an ability to make rapid assessment of actual or potential magnitude and locations of any radiological hazards through simulated liquid or gaseous release pathways. A qualified field monitoring team was notified, activated, briefed, and dispatched from the

	communication, monitoring equipment, and estimated deployment times. [I.8]	transportation, communication, monitoring equipment, and estimated deployment times.	EOF during a radiological release scenario. The team demonstrated the procedural guidance in team composition, use of monitoring equipment, communication from the field, and locating specific sampling locations.
	6.8 The capability exists to detect and measure radioiodine concentrations in air in the plume exposure EPZ, as low as 10^{-7} $\mu\text{Ci/cc}$ (microcuries per cubic centimeter) under field conditions. [I.9]	6.8 A test will be performed of the capabilities to detect and measure radioiodine concentrations in air in the plume exposure EPZ, as low as 10^{-7} $\mu\text{Ci/cc}$ under field conditions.	6.8 A field monitoring team was dispatched during a radiological release scenario and demonstrated the use of sampling and detection equipment for air concentrations in the plume exposure EPZ, as low as 10^{-7} $\mu\text{Ci/cc}$.
	6.9 The means exist to estimate integrated dose from the projected and actual dose rates, and for comparing these estimates with the Environmental Protection Agency (EPA) protective action guides. [I.10]	6.9 A test will be performed of the capabilities to estimate integrated dose from the projected and actual dose rates, and for comparing these estimates with the EPA protective action guides.	6.9 The means are available to estimate integrated dose from the dose assessment program and the field monitoring team reading during a radioactive release scenario. The results were compared with the EPA protective action guides.
7.0 Protective Response			
10 CFR 50.47(b)(10)—A range of protective actions has been developed for the plume exposure EPZ for emergency workers and the public. In developing this range of actions, consideration has been given to evacuation, sheltering, and, as a supplement to these, the prophylactic use	7.1 The means exist to warn and advise onsite individuals of an emergency, including those in areas controlled by the operator, including: [J.1] <ul style="list-style-type: none"> employees not having emergency assignments visitors 	7.1 A test will be performed of the capabilities to warn and advise onsite individuals of an emergency, including those in the Owner-Controlled Area, and the immediate vicinity.	7.1 Means exist to successfully warn and advise onsite individuals including: <ul style="list-style-type: none"> nonessential employees visitors contractor and construction personnel other personnel within the Owner-Controlled Area, and the immediate vicinity.

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
of potassium iodide (KI), as appropriate. Guidelines for the choice of protective actions during an emergency, consistent with Federal guidance, are developed and in place, and protective actions for the ingestion exposure EPZ appropriate to the locale have been developed.	<ul style="list-style-type: none"> contractor and construction personnel other persons who may be in the public access areas, on or passing through the site, or within the Owner-Controlled Area. 		
8.0 Exercises and Drills			
10 CFR 50.47(b)(14)—Periodic exercises are (will be) conducted to evaluate major portions of emergency response capabilities, periodic drills are (will be) conducted to develop and maintain key skills, and deficiencies identified as a result of exercises or drills are (will be) corrected.	8.1 Licensee conducts a full participation exercise to evaluate major portions of emergency response capabilities, which includes participation by the State and local agency within the plume exposure EPZ, and the State within the ingestion control EPZ. [N.1]	8.1 A full participation exercise (test) will be conducted within the specified time periods of Appendix E to 10 CFR Part 50.	<p>8.1.1 The exercise is completed within the specified time periods of 10 CFR Part 50, Appendix E; onsite exercise objectives listed below have been met, and there are no uncorrected onsite exercise deficiencies.</p> <p><i>A. Accident Assessment and Classification</i></p> <p>1. Demonstrate the ability to identify initiating conditions, determine emergency action level (EAL) parameters, and correctly classify the emergency throughout the exercise.</p> <p>Standard Criteria:</p> <p>a. Determine the correct highest emergency classification level based on events which were in progress, considering past events and their impact on the current conditions, within 15 minutes from the time the initiating condition(s) or EAL is identified.</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			<p>B. Notifications</p> <p>1. Demonstrate the ability to alert, notify and mobilize site emergency response personnel.</p> <p>Standard Criteria:</p> <p>a. Complete the designated checklist and perform the announcement concerning the initial event classification of Alert or higher.</p> <p>b. Activate the emergency recall system within 5 minutes of the initial event classification for an Alert or higher.</p> <p>2. Demonstrate the ability to notify responsible State and local government agencies within 15 minutes and the NRC within 60 minutes after declaring an emergency.</p> <p>Standard Criteria:</p> <p>a. Transmit information using the designated checklist in accordance with approved EIPs within 15 minutes of event classification.</p> <p>b. Transmit information using the designated checklist in accordance with approved EIPs within 60 minutes of last transmittal for a follow-up notification to State and local authorities.</p> <p>c. Transmit information using designated checklist within 60 minutes of event classification for an initial notification of the NRC.</p> <p>3. Demonstrate the ability to warn or advise onsite</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			<p>individuals of emergency conditions.</p> <p>Standard Criteria:</p> <p>a. Initiate notification of onsite individuals (via plant page or telephone) using designated checklist.</p> <p>4. Demonstrate the capability of the Alert and Notification System (ANS) for the public, to operate properly when required.</p> <p>Standard Criteria:</p> <p>a. ≥ 94 percent of the sirens operate properly as indicated by the siren feedback system.</p> <p><i>C. Emergency Response</i></p> <p>1. Demonstrate the capability to direct and control emergency operations.</p> <p>Standard Criteria:</p> <p>a. Command and control is demonstrated by the main control room in the early phase of the emergency and by the TSC within 60 minutes from notification of an Alert or higher event classification with at least minimum staffing.</p> <p>2. Demonstrate the ability to transfer emergency direction from the main control room (simulator) to the TSC.</p> <p>Standard Criteria:</p> <p>a. Evaluation of briefings that were conducted prior to turnover responsibility. Personnel document transfer of duties.</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			<p>3. Demonstrate the ability to prepare for 24-hour staffing requirements.</p> <p>Standard Criteria:</p> <p>a. Complete 24-hour staff assignments.</p> <p>4. Demonstrate the ability to perform assembly and accountability for all personnel in the Protected Area within 30 minutes of an emergency requiring Protected Area assembly and accountability.</p> <p>Standard Criteria:</p> <p>a. Protected Area personnel assembly and accountability completed within 30 minutes of an emergency requiring Protected Area assembly and accountability.</p> <p><i>D. Emergency Response Facilities</i></p> <p>1. Demonstrate activation of the OSC and the TSC and EOF within 60 minutes of event classification with at least minimum staffing.</p> <p>Standard Criteria:</p> <p>a. The TSC and OSC are activated within 60 minutes from notification of an Alert or higher event classification with at least minimum staffing.</p> <p>b. The EOF is activated within 60 minutes from notification of a Site Area Emergency or higher event classification with at least minimum staffing.</p> <p>2. Demonstrate the adequacy of equipment, security provisions, and</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			<p>habitability precautions for the TSC, OSC, EOF and ENC, as appropriate.</p> <p>Standard Criteria:</p> <p>a. Evaluation of the adequacy of the emergency equipment in the emergency response facilities including availability and general consistency with the EIPs.</p> <p>b. The security manager implements and follows applicable EIPs.</p> <p>c. The radiation protection manager (TSC) implements the designated checklist if an onsite/offsite release has occurred.</p> <p>d. Demonstrate the capability of TSC and EOF equipment and data displays to clearly identify and reflect the affected unit.</p> <p>3. Demonstrate the adequacy of communications for all emergency support resources.</p> <p>Standard Criteria:</p> <p>a. Emergency response communications listed in the EIPs are available and operational.</p> <p>b. Communications systems are tested in accordance with the TSC, OSC, EOF and ENC activation checklists.</p> <p>c. Emergency response facility personnel are able to operate all specified communications systems.</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			<p>d. Clear primary and backup communications links are established and maintained for the duration of the exercise.</p> <p><i>E. Radiological Assessment and Control</i></p> <p>1. Demonstrate the ability to obtain onsite radiological surveys and samples.</p> <p>Standard Criteria:</p> <p>a. Radiation Protection Technicians demonstrate the ability to obtain appropriate instruments (range and type) and perform surveys.</p> <p>b. Airborne samples are taken when the conditions indicate the need for the information.</p> <p>2. Demonstrate the ability to continuously monitor and control radiation exposure to emergency workers.</p> <p>Standard Criteria:</p> <p>a. Emergency workers are issued self-reading dosimeters when radiation levels require, and exposures are controlled to 10 CFR Part 20 limits (unless the emergency coordinator authorizes emergency limits for onsite ERO personnel and the emergency offsite manager authorizes emergency exposures for offsite ERO personnel).</p> <p>b. Exposure records are available either from the Site database or a hard copy dose report.</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			<p>c. Emergency workers include Security and personnel within all emergency facilities.</p> <p>3. Demonstrate the ability to assemble and dispatch field monitoring teams within 60 minutes from the decision to do so.</p> <p>Standard Criteria:</p> <p>a. One field monitoring team is ready to be deployed within 60 minutes of being requested and no later than 90 minutes from the declaration of an Alert or higher.</p> <p>4. Demonstrate the ability to satisfactorily collect and disseminate field team data.</p> <p>Standard Criteria:</p> <p>a. Field team data to be collected is dose rate or counts per minute (cpm) from the plume, both open and closed window, and air sample (gross/net cpm) for particulate and iodine, if applicable.</p> <p>b. Radiological data is satisfactorily disseminated from the field team to the dose assessment coordinator.</p> <p>5. Demonstrate the ability to develop dose projections.</p> <p>Standard Criteria:</p> <p>a. The on-shift Chemistry Technician performs timely and accurate dose projections, in accordance with the EIPs.</p> <p>6. Demonstrate the ability to develop appropriate</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			<p>Protective Action Recommendations (PARs), and notify appropriate authorities within 15 minutes of a General Emergency declaration or changes in parameters that affect the previously issued PARs.</p> <p>Standard Criteria:</p> <p>a. Total Effective Dose Equivalent (TEDE) and Committed Dose Equivalent (CDE) dose projections from the dose assessment computer code or a backup method are established in accordance with the EIPs.</p> <p>b. PARs are developed within 15 minutes of data availability.</p> <p>c. PARs are transmitted via voice, fax, or electronically within 15 minutes as required by the EIPs.</p>
			<p>8.1.2 Onsite emergency response personnel were mobilized in sufficient numbers to fill emergency response positions identified in the Radiological Emergency Plan, Part 2, Section B, Emergency Response Organization, and they successfully performed their assigned responsibilities.</p>
			<p>8.1.3 The exercise was completed within the specified time periods of Appendix E to 10 CFR Part 50, offsite exercise objectives were met, and there were no</p>

Planning Standard	EP Program Elements	Inspections, Tests, Analyses	Acceptance Criteria
			uncorrected offsite exercise deficiencies, or a license condition requires offsite deficiencies to be corrected prior to operation above 5 percent of rated power.
9.0 Implementing Procedures			
10 CFR Part 50, Appendix E.V—No less than 180 days prior to the scheduled issuance of an operating license for a nuclear power reactor or a license to possess nuclear material, the applicant's detailed implementing procedures for its emergency plan shall be submitted to the Commission.	9.1 The licensee has submitted detailed implementing procedures for its emergency plan no less than 180 days prior to fuel load.	9.1 Confirm that the submittal letter was submitted on time.	9.1 The date of the submittal letter from the licensee demonstrates that the detailed EIPs for the onsite emergency plan were submitted no less than 180 days prior to fuel load.

13.4 Operational Programs (Related to RG 1.206, Section C.III.1, Chapter 13, C.I.13.4, "Operational Program Implementation")

13.4.1 Introduction

In SECY-05-0197, the staff detailed its plan for reviewing operational programs in a COLA. The Commission approved the staff's plan in the related Staff Requirements Memorandum (SRM), dated February 22, 2006. Although numerous programs support the operation of a nuclear power plant, SECY-05-0197 focused on those programs that meet the following three criteria:

1. Required by regulation
2. Reviewed in a COLA
3. Inspected to verify program implementation as described in the FSAR

The programs that meet the above criteria are collectively referred to as "operational programs" and most are identified in SECY-05-0197.

13.4.2 Summary of Application

Section 13.4 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 13.4 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 13.4 and in Part 10 of the Turkey Point Units 6 and 7 COLA, "Proposed License Conditions and ITAAC," the applicant provided the following:

AP1000 COL Information Item

- STD COL 13.4-1

The applicant provided additional information in STD COL 13.4-1 to address COL Information Item 13.4-1 and COL Action Item 13.4-1, identified in Appendix F of NUREG-1793 and its supplements. This item states that COL applicants referencing the AP1000 certified design will address each operational program.

License Conditions

- Part 10, License Condition 3, "Operational Program Implementation"
- Part 10, License Condition 6, "Operational Program Readiness"

Both license conditions are related to STD COL 13.4-1. License Condition 3 addresses implementation milestones for those operational programs whose implementation is not addressed in the regulations. License Condition 6 includes the timing of information related to operational programs to support NRC inspection activities.

13.4.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the regulatory basis for acceptance of the supplementary information presented in this application is identified in the individual chapters of this SER that address the evaluations of the specific operational programs, which are itemized in the next section, as clarified by the regulatory guidance in SECY-05-0197 and RG 1.206.

13.4.4 Technical Evaluation

The staff reviewed Section 13.4 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COLA represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to operational programs. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COLAs. To ensure that the staff's findings on standard content that were documented in the SER for the reference COLA (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COLA, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COLA, as applicable) resulting from RAIs.
- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and has verified that the Turkey Point Units 6 and 7 application incorporates the standard content information included in the Vogtle application. Accordingly, the staff finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COLA. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COLA (VEGP) includes evaluation material from the SER for the Bellefonte Nuclear Plant (BLN) Units 3 and 4 COLA. In addition, the Staff did not pose any RAIs to FPL regarding the standard content described above, and there was no need to evaluate any information in addition to the standard content.

The following portion of this technical evaluation section is reproduced from Section 13.4.4 of the VEGP SER:

Although the staff concluded that the evaluation performed for the standard content is directly applicable to the VEGP COL application, there were differences in the response provided by the VEGP applicant from that provided by the BLN applicant regarding the standard content material. These differences affect the two license conditions and the table listing the operational programs. These differences are evaluated by the staff below, following the standard content material.

AP1000 COL Information Item

- STD COL 13.4-1

The applicant provided supplemental information by adding the following statement to Section 13.4 of the VEGP COL FSAR:

Operational programs are specific programs that are required by regulations. Table 13.4-201 lists each operational program, the regulatory source for the program, the section of the FSAR in which the operational program is described, and the associated implementation milestone(s).

Each operational program is evaluated by the staff in the applicable SER chapters.

License Conditions

- License Condition 3, “Operational Program Implementation”
- License Condition 6, “Operational Program Readiness”

These two proposed license conditions are evaluated by the NRC staff as part of its evaluation of each of the operational programs in the applicable SER chapters.

The following portion of this technical evaluation section provides the staff's general evaluation of the operational programs and associated license conditions and is reproduced from Section 13.4.4 of the BLN SER:

The NRC staff's review of the acceptability of the supplemental information added by STD COL 13.4-1 and the proposed license conditions is based on four considerations. The first consideration is the acceptability of the individual operational programs, including the implementation of the different phases of these operational programs. The second consideration is whether the applicant correctly identified those operational programs whose implementation requirements are not addressed in the regulations, and, therefore, need to be included in License Condition 3. The third consideration is whether the applicant correctly specified in License Condition 6 the timing of information related to operational programs to support NRC inspection activities. The fourth consideration is whether the list of operational programs in BLN COL FSAR Table 13.4-201 is complete.

In regard to the first consideration, the SER sections referenced in the above table address the NRC staff's regulatory evaluation of the individual operational programs. For each of these operational programs, the staff has either concluded that the applicant has satisfied the applicable regulatory guidance (including the implementation requirements when specified in the regulations), or the staff's review is still ongoing. For those operational program reviews that are ongoing, the staff's final conclusions will be provided in the SER sections referenced in the above table at a later date.

In regard to the second consideration, the NRC staff verified that those operational programs, whose implementation requirements are not specified in the regulations, are captured in License Condition 3.

In regard to the third consideration, the NRC staff compared License Condition 6 to the recommended license condition in SECY-05-0197 related to the timing of information to support NRC inspection activities of operational programs. The staff finds that the applicant used language similar to the recommended license condition specified in SECY-05-0197 to develop License Condition 6. It should be noted that License Condition 6 addresses additional scheduler requirements (Sections b. through d.) that are not related to the operational programs evaluated in this section of the SER, and, therefore, are not evaluated in this SER section.

In regard to the fourth consideration, the NRC staff compared the operational programs provided by the applicant in BLN COL FSAR Table 13.4-201 (included

in the above table) to the operational programs specified in SECY-05-0197. The staff finds that the applicant has included all the operational programs specified in SECY-05-0197, including the two operational programs (Motor-Operated Valve Testing Program and the Safeguards Contingency Program) added by the NRC to the list of operational programs provided by the NEI in its letter dated August 31, 2005.

There are differences between BLN COL FSAR Table 13.4-201 and the table of operational programs in SECY-05-0197 with respect to implementation milestone information. The first difference is the SECY paper states that there are no required implementation milestones in the regulations for the Maintenance Rule Program and the Quality Assurance Program (Operation), while BLN COL FSAR Table 13.4-201 references regulations that require implementation milestones for these two programs. The staff has reviewed the regulation references provided by the applicant and concludes that they do provide appropriate requirements for implementation milestones. Further support for this conclusion is the regulatory guidance in Section C.I.13.4 of RG 1.206. The example table located in this section of the RG references the same implementation regulatory guidance for the Maintenance Rule Program and the Quality Assurance Program (Operation) as does BLN COL FSAR Table 13.4-201.

The second difference is that the SECY paper states that 10 CFR Part 50, Appendix J, specifies implementation requirements for the Containment Leakage Rate Testing Program, while BLN COL FSAR Table 13.4-201 states that the implementation milestones for this program will be controlled by a license condition. The staff has reviewed the implementation milestone proposed in License Condition 3 for the Containment Leakage Rate Testing Program, and finds that it is more stringent than the regulatory guidance in Appendix J. Therefore, the staff finds this difference to be acceptable.

The applicant added an operational program to BLN COL FSAR Table 13.4-201, the Initial Test Program, which is not in the list of operational programs specified in SECY-05-0197. The option of adding operational programs to this list is specifically allowed by SECY-05-0197. Further support for the acceptability of adding the Initial Test Program is that the example table located in Section C.I.13.4 of RG 1.206 also lists this operational program.

Therefore, the NRC staff concludes that the additional information (STD COL 13.4-1) provided by the applicant in BLN COL FSAR Section 13.4, in conjunction with the conditions specified in BLN COL FSAR, Part 10, License Conditions 3 and 6, complies with the applicable regulatory guidance provided in SECY-05-0197.

Evaluation of Site-specific Response to Standard Content

The staff notes that the VEGP applicant separated the fitness-for-duty (FFD) program from the overall security program and added a new operational program, Cyber Security, to the list of operational programs in FSAR Table 13.4-201. The implementation requirements for these additional operational programs comply with the considerations identified above in the standard content material, and are, therefore, acceptable. In addition, the VEGP

applicant also made minor changes to operational program implementation details in License Condition 3 and also modified Sections a. through d. associated with License Condition 6. The changes to these two license conditions are evaluated by the staff in the applicable SER chapters and do not affect the evaluation of operational programs covered in this section of the SER. Therefore, the conclusions reached by the NRC staff related to STD COL 13.4-1 are directly applicable to the VEGP COL application.

The BLN SER text refers to an SER table listing operational programs. This table was not reproduced for the VEGP SER since it duplicates the information in VEGP COL FSAR Table 13.4-201.

The staff notes that standard format License Condition 6, "Operational Program Readiness" identified above (under "License Conditions") was modified in the Vogtle Unit 3 and 4 licenses to cover all operational programs in a single license condition. For the reasons discussed in the technical evaluation section above, the substance of the requirements of License Condition 6 acceptable, and the substance of those requirements will be included in the license in a more general condition that covers the implementation of all programs as follows:

- License Condition 6:

No later than 12 months after issuance of the COL, FPL shall submit to the Director of NRO, or the Director's designee, a schedule for implementation of the operational programs listed in FSAR Table 13.4-201, including the associated estimated date for initial loading of fuel. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until all the operational programs listed in FSAR Table 13.4-201 have been fully implemented.

The NRC will conform the above license condition to the general format (numbering, etc.) of a license, if any, issued for Turkey Point Units 6 and 7. The staff also notes that the Turkey Point Units 6 and 7 applicant added the operational program, Special Nuclear Material Control and Accounting Program, to the list of operational programs in FSAR Table 13.4-201. The implementation requirements for this additional operational program comply with the considerations identified above in the standard content material and is therefore acceptable.

13.4.5 Post Combined License Activities

The license conditions for each of the operational programs are discussed in the applicable SER chapters. Therefore, there are no post-COL activities related to this section. As discussed above, however, the form and content of these license conditions may need to be modified to conform to the general format of any license that may be issued.

13.4.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable based on the regulatory guidance in SECY-05-0197, in conjunction with the applicable regulations specified in the individual sections of this SER that evaluated each of the operational programs discussed above. The staff based its conclusion on the following:

- STD COL 13.4-1, as related to operational programs, is acceptable because each of the operational programs in Turkey Point Units 6 and 7 COL FSAR Table 13.4-201 has been found acceptable by the staff in other sections of this SER, as noted in Section 13.4.4 above. In addition, the guidance in SECY-05-0197 and RG 1.206 was used to verify that the applicant's list of operational programs is complete.

13.5 Plant Procedures

13.5.1 Introduction

Descriptions of the administrative and operating procedures that the applicant uses to ensure routine operating, off-normal, and emergency activities are conducted in a safe manner are provided. The applicant, in its plant procedures, provided a brief description of the nature and content of the procedures and a schedule for the preparation of appropriate written administrative and operating procedures. The applicant delineated in the description of the procedures the functional position for procedural revision and approval prior to implementation. Inspection of procedures will occur as part of the construction inspection program.

13.5.2 Summary of Application

Section 13.5 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 13.5 of the AP1000 DCD, Revision 19.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 13.5, the applicant provided the following:

AP1000 COL Information Item

- STD COL 13.5-1

The applicant provided additional information in STD COL 13.5-1 to resolve COL Information Item 13.5-1 (COL Action Item 13.5-1), which addresses plant procedures.

- PTN COL 13.5-1

The applicant provided additional information in PTN COL 13.5-1 to address standing orders to shift personnel and to address the nuclear shift manager's administrative duties.

The applicant also provided additional information in PTN COL 13.5-1 to address a process for implementing 10 CFR 73.58, "Safety/Security Interface Requirements for Nuclear Power Reactors," while the security procedures and the emergency plan implementing procedures are being developed and implemented. This information is reviewed in Section 13.6.4.1.17 of the SER.

13.5.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations for plant procedures are given in Sections 13.5.1.1 and 13.5.2.1 of NUREG-0800.

The applicable regulations are as follows:

- 10 CFR 50.34(a), "Preliminary safety analysis report"
- 10 CFR 50.34(b), "Final safety analysis report"
 - The applicable regulatory guidance is as follows:
- RG 1.33, "Quality Assurance Program Requirements (Operation)"

13.5.4 Technical Evaluation

The staff reviewed Section 13.5 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COLA represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to plant procedures. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COLAs. To ensure that the staff's findings on standard content that were documented in the SER for the reference COLA (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COLA, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COLA, as applicable).
- The staff confirmed that all responses to VEGP COL FSAR RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and has verified that the Turkey Point Units 6 and 7 application incorporates the standard content information included in the Vogtle application. Accordingly, the staff finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COLA. This standard content material is identified in this SER by use of italicized, double-indented formatting. Section 1.2.3 of this SER provides an explanation of why the standard content material from the SER for the reference COLA (VEGP) includes evaluation material from the SER for the BLN Units 3 and 4 COLA.

The following portion of this technical evaluation section is reproduced from Section 13.5.4 of the VEGP SER:

AP1000 COL Information Item

- STD COL 13.5-1, addressing plant procedures

The applicant provided the following additional information to resolve COL Information Item 13.5-1, which addresses the plant procedures of the COL applicant. COL Information Item 13.5-1 states:

Combined License applicants referencing the AP1000 certified design will address plant procedures including the following:

- Normal operation
- Abnormal operation
- Emergency operation
- Refueling and outage planning
- Alarm response
- Maintenance, inspection, test and surveillance
- Administrative
- Operation of post-72 hour equipment

The commitment was also captured as COL Action Item 13.5-1 in Appendix F of the staff's FSER for the AP1000 DCD (NUREG-1793).

The applicant provided additional text in BLN COL FSAR Section 13.5 to describe the administrative, operating and maintenance procedures that the operating organizational staff uses to conduct routine operating, abnormal, and emergency activities in a safe manner.

In BLN COL FSAR Section 13.5, the applicant described the different classifications of procedures that the operators will use, including normal, abnormal, emergency, refueling and outage, and alarm response procedures. The staff finds this information acceptable because it meets the criteria in NUREG-0800, Chapter 13.5.2.1.

In BLN COL FSAR Section 13.5, the applicant stated that the format and content of procedures are controlled by the applicable AP1000 writer's guideline. The DCD, Section 13.5.1, describes a referenced document, APP-GW-GLR-040, "Plant Operations Maintenance and Surveillance Procedures," dated August 23, 2007, which includes the AP1000 writer's guidelines. The staff finds this acceptable because the applicant-provided procedure format and content are consistent with the guidance in NUREG-0800, Section 13.5.2.1.

In BLN COL FSAR Section 13.5.1, the applicant describes the nature and content of administrative procedures for both Category (A) - Controls, and Category (B) - Specific Procedures. The staff finds this acceptable because the listed procedures are consistent with the guidance in NUREG-0800, Section 13.5.1.1.

In BLN COL FSAR Section 13.5.2, the applicant stated that EP procedures are discussed in the Emergency Plan and that security procedures are discussed in the Security Plan. The evaluation of EP procedures may be found in Section 13.3 of this SER. The evaluation of security procedures is found in Section 13.6 of this SER.

In BLN COL FSAR Section 13.5.2, the applicant stated the Quality Assurance Program description (QAPD) provides a description of procedural requirements for maintenance, instrument calibration and testing, inspection, and material control. The evaluation of QAPD procedures is found in Section 17.5 of this SER.

In BLN COL FSAR, Section 13.5.2.1, the applicant stated that information related to EOPs is addressed in the DCD. The DCD, Section 13.5.1, describes the program for developing and implementing EOPs and the required content of EOPs procedures in the referenced document, APP-GW-GLR-040. In addition, this information clarifies the procedure development program (PDP) as described in the procedures generation package (PGP) for EOPs, provides a description of the EOP [emergency operating procedures] verification and validation (V&V) program, and describes the program for training operators on EOPs, including an explanation of how the recommendations of TMI Action Plan, Item I.C.1, will be met. The staff finds the program for developing and implementing EOPs acceptable because it meets the criteria in NUREG-0800, Section 13.5.2.1.

Evaluation of Plant Procedure Issues Not Address in the Standard Content Evaluation

In VEGP COL FSAR Table 1.9-202, "Conformance with SRP Acceptance Criteria," the applicant identified two exceptions to the criteria of NUREG-0800, Section 13.5, which recommend[s] providing a schedule for procedure development in the FSAR, and including a description of procedures to be used by operators in the FSAR. The staff notes that the BLN COL FSAR Table 1.9-202 includes these same two exceptions to the criteria of Section 13.5 of NUREG-0800. The guidance of NUREG-0800, Section 13.5.2.1, states that while the submittal should describe the different classifications of procedures that operators will use, it is not necessary that each applicant's procedures conform precisely. In addition, the procedures, regardless of title or classification, are to be available to accomplish the functions identified in RG 1.33. NUREG-0800 makes allowance for "general areas." The staff finds the two exceptions to the criteria of NUREG-0800, Section 13.5 to be acceptable because the applicant's procedure classification follows the guidance in NUREG-0800, Section 13.5.

In RAI [request for additional information] 13.6-36, the staff requested the VEGP applicant address the requirements of 10 CFR 73.58, "Safety/security requirements for nuclear power plants." In its response dated May 14, 2010, the applicant stated that management controls and processes used to establish and maintain an effective interface between nuclear safety and physical security are addressed by administrative controls. The VEGP applicant committed to revise FSAR Section 13.5.1 to include the safety/security interface implementation process in the list of procedural instructions provided in plant administrative procedures. The NRC staff's review of this safety/security procedural issue,

which includes tracking the incorporation of the relevant material into the VEGP COL application, is addressed in Section 13.6.4.1.17 of this SER.

Supplemental Information

- PTN COL 13.5-1

The staff reviewed PTN COL 13.5-1 related to the applicant providing procedural instructions for standing orders for shift personnel, including the authority and responsibility of the shift manager, unit supervisor, reactor control operator, and shift technical advisor. The staff finds these changes acceptable as they are only changes of position title and meet the guidance of NUREG-0800, Section 13.5.1.1.

The applicant provided additional information in FSAR Section 13.5.1 related to the process for implementing the safety/security interface requirements of 10 CFR 73.58. This information is reviewed in Section 13.4.1.17 of the SER.

The Turkey Point Units 6 and 7 application incorporates the standard content information included in the Vogtle application and there is no additional Turkey Point specific information that required evaluation by the staff and as such the Staff did not pose any RAs to FPL on this section as described above. The staff finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COLA.

13.5.5 Post Combined License Activities

There are no post-COL activities related to this section.

13.5.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

In addition, the staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable and meets the recommendations of NUREG-0800, Sections 13.5.1.1 and 13.5.2.1. The staff based its conclusion on the following:

- STD COL 13.5-1, as related to plant procedures, is acceptable because it describes the procedures used by the applicant's operating organizational staff to conduct routine administrative, operating, abnormal, and emergency activities in a safe manner, in accordance with the regulatory guidance in NUREG-0800, Sections 13.5.1.1 and 13.5.2.1.
- In Turkey Point Units 6 and 7 COL FSAR Table 1.9-202, the applicant identified two exceptions to the criteria of NUREG-0800, Section 13.5, related to providing FSAR descriptions of, and a development schedule for, procedures to be used by operators. The guidance of NUREG-0800, Section 13.5.2.1, makes allowances for "general areas,"

stating that while the FSAR submittal should describe the different classifications of procedures used by operators, it is not expected that each applicant's procedures conform precisely. The staff finds the two exceptions to be acceptable because the applicant's procedure classification follows the guidance in RG 1.33.

13.6 Physical Security

13.6.1 Introduction

The COLA for the Turkey Point Units 6 and 7 describes the COL applicant's physical protection program, which is intended to meet NRC regulations for protection against the design-basis threat (DBT) of radiological sabotage as stated in 10 CFR 73.1, "Purpose and Scope," and provide a high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

The physical protection program includes the design of a physical protection system that ensures the capabilities to detect, assess, interdict, and neutralize threats of radiological sabotage are maintained at all times. The applicant incorporates by reference the standard AP1000 design that includes design of physical protection systems within the design of the vital island and vital structures, as described in the Westinghouse DC document for the AP1000 standard design Tier 1 and Tier 2 information, including TR-49, "AP1000 Enhancement Report"; TR-94; "AP1000 Safeguards Assessment Report"; and TR-96, "Interim Compensatory Measures Report." Part 8 of the COLA consists of the Turkey Point Units 6 and 7 Physical Security Plan (PSP), Training and Qualification Plan (T&QP), and Safeguards Contingency Plan (SCP). Section 13.6 of the Turkey Point COL FSAR describes the physical protection program and the physical protection system that are not addressed within the scope of the standard AP1000 design for meeting NRC performance and prescriptive requirements for physical protection stated in 10 CFR Part 73, "Physical Protection of Plants and Material." The staff evaluation of the physical protection program is provided in detail in the safeguards information version of the Turkey Point Units 6 and 7 COLA Section 13.6 SER, and includes a complete set of the staff bases for its findings regarding the program. Because of security constraints, the staff evaluation of the physical security protection program presented in this publicly available SER does not include the same level of detail as the safeguards information version. Those persons with the correct access authorization and need-to-know may view the safeguards information version of the Turkey Point COLA Section 13.6 SER, which is located in the NRC's Secure Local Area Network.

13.6.2 Summary of Application

Section 13.6 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 13.6 of the AP1000 DCD, Revision 19.

Part 8—Safeguards/Security Plans

In a letter dated June 30, 2009, FPL, submitted a Security Plan to the NRC as part of the COLA for proposed Turkey Point Units 6 and 7. In a letter dated September 3, 2010, FPL submitted Revision 1 to the Security Plan. In a letter dated December 21, 2010, FPL submitted Revision 2 to its Security Plan. In a letter dated December 16, 2011, FPL submitted Revision 3 to its Security Plan.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 13.6, the applicant provided the following:

AP1000 COL Information Items

- STD COL 13.6-1

The applicant provided additional information in STD COL 13.6-1 to address COL Information Item 13.6-1, which provides information related to the security plan. The security plan consists of three parts, the PSP, T&QP, and SCP.

- STD COL 13.6-5

The applicant provided additional information in STD COL 13.6-5 to address COL Information Item 13.6-5, which provides information related to the cyber security program. This COL item is evaluated in Section 13.8 of this SER.

License Conditions

- Part 10, License Condition 3, Items C.5, D.3, and G.9

The applicant proposed a license condition in Part 10 of the Turkey Point Units 6 and 7 COLA, which provides the milestones for implementing applicable portions of the Security Program.

- Part 10, License Condition 5

The applicant proposed a license condition in Part 10 of the Turkey Point Units 6 and 7 COLA, which proposed the maintenance of the PSP, T&QP, and the SCP when nuclear fuel is onsite (protected area), and continuing until all nuclear fuel is permanently removed from the site.

- Part 10, License Condition 6

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of operational programs including the PSP, T&QP, and the SCP.

13.6.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793, and its supplements. In addition, the relevant requirements of the Commission regulations for the physical security, and the associated acceptance criteria, are summarized in Subsection 13.6.1 of NUREG-0800.

The applicable regulatory requirements for physical protection are as follows:

- The provisions of 10 CFR 52.79(a)(35)(i) and (ii), require that information submitted for a COL describe how the applicant will meet the requirements of 10 CFR Part 73; and provide a description of the implementation of the PSP. The provisions of 10 CFR 52.79(a)(36)(i) through (v), require that the application include an SCP in accordance with the criteria set forth in Appendix C, "Nuclear Power Plant Safeguards Contingency Plans" to 10 CFR Part 73, and a T&QP in accordance with Appendix B, "General Criteria for Security Personnel" of 10 CFR Part 73. The provisions also require

that the applicant provide a description of the implementation of the SCP and the T&QP; and that the applicant protect the PSP, T&QP and SCP, and other related safeguards information in accordance with the requirements of 10 CFR 73.21, "Protection of Safeguards Information: Performance Requirements" and 10 CFR 73.22, "Protection of Safeguards Information: Specific requirements."

- The provisions of 10 CFR Part 73 include performance-based and prescriptive regulatory requirements that, when adequately met and implemented, provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. A COL applicant must describe how it will meet the regulatory requirements of 10 CFR Part 73 that are applicable to nuclear power plants.
- The provisions of 10 CFR 52.79(a)(41) require an evaluation of the facility against the SRP in effect 6 months before the docket date of the application. The evaluation required by this section shall include an identification and description of all differences in design features, analytical techniques, and procedural measures proposed for a facility and those corresponding features, techniques, and measures given in the SRP acceptance criteria. Where a difference exists, the evaluation shall discuss how the proposed alternative provides an acceptable method of complying with the Commission's regulations, or portions thereof, that underlie the corresponding SRP acceptance criteria. The SRP is not a substitute for the regulations, and compliance is not a requirement.

The staff used NUREG-0800 Section 13.6.1, Revision 1, dated October 2010, to complete the physical security COL review.

Regulatory guidance documents, technical reports (TRs), accepted industry codes and standards that an applicant may apply to meet regulatory requirements include, but are not limited to the following:

- RG 5.7, Revision 1 "Entry/Exit Control for Protected Areas, Vital Areas, and Material Access Areas," May 1980
- RG 5.12, "General Use of Locks in the Protection and Control of Facilities and Special Nuclear Materials," November 1973.
- RG 5.44, Revision 3 "Perimeter Intrusion Alarm Systems," October 1997.
- RG 5.62, Revision 1 "Reporting of Safeguards Events," November 1987.
- RG 5.65, "Vital Area Access Controls, Protection of Physical Protection Security Equipment and Key and Lock Controls," September 1986.
- RG 5.66, Revision 1, "Access Authorization Program for Nuclear Power Plants," July 2009.
- RG 5.68, "Protection Against Malevolent Use of Vehicles at Nuclear Power Plants," August 1994.
- RG 5.74, "Managing the Safety/Security Interface," March 2009.

- RG 5.75, "Training and Qualification of Security Personnel at Nuclear Power Reactor Facilities," June 2009.
- NRC letter dated April 9, 2009, NRC Staff Review of NEI 03-12, "Template for Security Plan, Training and Qualification, Safeguards Contingency Plan, [and Independent Spent Fuel Storage Installation Security Program]" (Revision 6) (ADAMS Accession No. ML090920528)
- SECY-05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," October 28, 2005 (ADAMS Accession No. ML052770257)

The following documents include security-related or safeguards information and are not publicly available:

- RG 5.69, "Guidance for the Application of Radiological Sabotage Design Basis Threat in the Design, Development, and Implementation of a Physical Security Protection Program that Meets 10 CFR 73.55 Requirements," June 2006.
- RG 5.76, "Physical Protection Programs at Nuclear Power Reactors," July 2009.
- RG 5.77, "Insider Mitigation Program" March 2009
- NEI 03-12, Revision 6, "Template for the Security Plan, Training and Qualification Plan, Safeguards Contingency Plan, and Independent Spent Fuel Installation Security Program"
- NUREG/CR-6190, "Update of NUREG/CR-6190 Material to Reflect Postulated Threat Requirements," March 27, 2003.

13.6.4 Technical Evaluation

The staff reviewed Section 13.6 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COLA represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to physical security. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COLAs. To ensure that the staff's findings on standard content that were documented in the SER for the reference COLA (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COLA, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COLA, as applicable) resulting from RAls.

- The staff compared the VEGP PSP, T&QP, and SCP to the corresponding Turkey Point Units 6 and 7 programs. The staff has determined that these plans are sufficiently similar to warrant standard content treatment.
- The staff confirmed that all responses to RAls identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COLA, with the exception discussed in the following paragraph. This standard content material is identified in this SER by use of italicized, double-indented formatting. One clarification to the standard content material presented below is that the staff's detailed evaluation of the physical protection program, which is site-specific, is provided in the safeguards information version of the Turkey Point Units 6 and 7 COL application Section 13.6 SER.

There were site-specific RAls issued to the Turkey Point Units 6 and 7 applicant that resulted in site-specific evaluations for several of the Security Plan review areas. There were also site-specific RAls issued to the VEGP applicant that were not applicable to the Turkey Point Units 6 and 7 application. In addition, there are several Security Plan review areas with site-specific characteristics requiring a specific review by the staff. For these cases, the staff provides the Turkey Point Units 6 and 7 evaluation in the same location as provided in the VEGP SER, but without the use of italicized, double-indented formatting.

The following portion of this technical evaluation section is reproduced from Section 13.6.4 of the VEGP SER:

AP1000 COL Information Item

- STD COL 13.6-1

The NRC staff reviewed STD COL 13.6-1 related to COL Information Item 13.6-1, which identified the need for a COL applicant to address the security plan. STD COL 13.6-1 supplemented Section 13.6 of the VEGP COL FSAR by stating the following text is to be added after Section 13.6 of the VEGP ESP SSAR:

The Security Plan consists of the Physical Security Plan, the Training and Qualification Plan, and the Safeguards Contingency Plan. The Security Plan is submitted to the Nuclear Regulatory Commission as a separate licensing document in order to fulfill the requirements of 10 CFR 52.79(a)(35) and 52.79(a)(36). The Security Plan meets the requirements contained in 10 CFR Part 73 and will be maintained in accordance with the requirements of 10 CFR 52.98. The Plan is categorized as Security Safeguards Information and is withheld from public disclosure pursuant to 10 CFR 73.21.

Section 13.6 of the VEGP COL FSAR also refers to FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations," as providing the milestones for implementing the security program and cyber security program.

The NRC staff's evaluation of the PSP is documented in Section 13.6.4.1 of this SER. The NRC staff's evaluation of the T&QP is documented in Section 13.6.4.2 of this SER. The NRC staff's evaluation of the SCP is documented in Section 13.6.4.3 of this SER. The NRC staff's evaluation of the safety/security interface is documented in Section 13.6.4.1.17 of this SER. Section 13.6.5 of this SER includes the post-combined license activities. Section 13.6.6 of this SER includes the NRC staff's overall conclusions regarding each of the plan submissions.

The NRC staff's evaluation of the physical protection program is provided in detail in the safeguards information version of the VEGP COL application Section 13.6 SER, which is located in the NRC's Secure Local Area Network, document number ES1000015157. Due to security restraints, the NRC staff's evaluation of the physical protection program presented in this publicly-available SER does not include the same level of detail as the safeguards information version. Those persons with the correct access authorization and need-to-know may view the safeguards information version of the VEGP COL application Section 13.6 SER.

License Conditions

- Part 10, License Condition 3, Items C.5, D.3, and G.9

The applicant provided a license condition in Part 10 of the VEGP COL application, which provides the milestones for implementing applicable portions of the Security Program. Specifically, the applicant proposed the following:

C. Receipt of Materials – The licensee shall implement each operational program identified below prior to initial receipt of byproduct, source, or special nuclear materials onsite (excluding Exempt Quantities as described in 10 CFR 30.18).

C.5 – Security Program (applicable portions)

D. Fuel Receipt – The licensee shall implement each operational program identified below prior to initial receipt of fuel onsite.

D.3 – Security Program (applicable portions)

G. Fuel Loading – The licensee shall implement each operational program identified below prior to initial fuel load.

G.9 – Physical Security

- *Part 10, License Condition 5*

The applicant provided a license condition in Part 10 of the VEGP COL application, which proposed the maintenance of the PSP, T&QP, and the SCP when nuclear fuel is onsite, and continuing until all nuclear fuel is permanently removed from the site. Specifically, the applicant proposed the following:

The licensee shall maintain in effect the provisions of the physical security plan, security personnel training and qualification plan, and safeguards contingency plan, and all amendments made pursuant to the authority of 10 CFR 50.90, 50.54(p), 52.97, and Section VIII of Appendix D to Part 52 when nuclear fuel is onsite, and continuing until all nuclear fuel is permanently removed from the site.

*In a letter dated October 22, 2010, the applicant proposed to revise the [security plan] milestone included in VEGP COL FSAR Table 13.4-201 to implement the [security plan] prior to receipt of fuel onsite (protected area.) The NRC staff finds the implementation milestone for the security program [security plan] (security prior to receipt of fuel onsite (protected area)) appropriate and in accordance with the requirement in 10 CFR 73.55. Therefore the staff finds that the proposed License Condition 3, Items C.5, D.3, and G.9 and License Condition 5 are not necessary. The incorporation of proposed changes to the VEGP COL FSAR are tracked as **Confirmatory Item 13.6-1**.*

Resolution of Standard Content Confirmatory Item 13.6-1

Confirmatory Item 13.6-1 is an applicant commitment to revise its FSAR Table 13.4-201 regarding the implementation milestones for the security program. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 13.6-1 is now closed.

In a letter dated April 20, 2011, the applicant proposed to revise the security plan milestone included in Turkey Point Units 6 and 7 COL FSAR Table 13.4-201 to implement the security plan before receipt of fuel onsite (protected area.) The staff verified that the Turkey Point Units 6 and 7 COL FSAR Table 13.4-201 was appropriately revised in Revision 3. As a result Confirmatory Item 13.6-1 is now closed.

- *Part 10, License Condition 6*

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of operational programs including the PSP, T&QP, and the SCP. Specifically, the applicant proposed the following:

The licensee shall submit to the appropriate Director of the NRC, a schedule, no later than 12 months after issuance of the COL,

that supports planning for and conduct of NRC inspections of operational programs listed in the operational program FSAR Table 13.4-201. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until either the operational programs in the FSAR table have been fully implemented or the plant has been placed in commercial service, whichever comes first.

The staff reviewed the above proposed license condition against the recommendations in SECY-05-0197 as endorsed by the related SRM dated February 22, 2006. The staff concludes these proposed license conditions conform to the guidance in SECY-05-0197 and is [sic], therefore, acceptable.

13.6.4.1 Physical Security Plan

The applicant submitted Part 8 of the COL application for the VEGP PSP, T&QP and SCP, to meet the requirements of 10 CFR 52.79(a)(35) and (36). Part 2, FSAR, Chapter 13, Section 13.6 references the VEGP PSP, T&QP, and SCP in describing the licensing basis for establishing a physical protection program, design of a physical protection system, and security organization, which will have, as its objective, to provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. The VEGP submitted PSP makes references to 10 CFR 50.34(c)(2) and (d)(2). The correct references should be 10 CFR 52.79(a)(35) and (36). It is noted that this is a template error, and both references require that the same criteria be met.

Security plans must describe how the applicant will implement Commission requirements and those site-specific conditions that affect implementation as required by 10 CFR 73.55(c)(1)(i).

The requirements are provided in 10 CFR 73.55(c), and (d) to establish, maintain, and implement a PSP to meet the requirements of 10 CFR 73.55, and 10 CFR Part 73, Appendices B and C. The applicant must show establishment and maintenance of a security organization, the use of security equipment and technology, the training and qualification of security personnel, the implementation of predetermined response plans and strategies, and the protection of digital computer and communication systems and networks. The applicant must have a management system for development, implementation, revision, and oversight of security implementing procedures. The approval process for implementing security procedures will be documented.

The NRC staff has reviewed the applicant's description in PSP Section 1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(c) and (d), and is, therefore, acceptable.

13.6.4.1.1 Introduction and Physical Facility Layout

The provisions of 10 CFR 52.79(a)(35):

- (i) A PSP, describing how the applicant will meet the requirements of 10 CFR Part 73 (and 10 CFR Part 11, if applicable, including the identification and description of jobs as required by 10 CFR 11.11(a) of this chapter, at the proposed facility). The plan must list tests, inspections, audits, and other means to be used to demonstrate compliance with the requirements of 10 CFR Parts 11 and 73, if applicable;
- (ii) A description of the implementation of the PSP;

The provisions of 10 CFR 52.79(a)(36) require:

- (i) An SCP in accordance with the criteria set forth in Appendix C to 10 CFR Part 73. The safeguards contingency plan shall include plans for dealing with threats, thefts, and radiological sabotage, as defined in 10 CFR Part 73 of this chapter, relating to the special nuclear material and nuclear facilities licensed under this chapter and in the applicant's possession and control. Each application for this type of license shall include the information in the applicant's SCP. (Implementing procedures required for this plan need not be submitted for approval);
- (ii) A T&QP in accordance with the criteria set forth in Appendix B to 10 CFR Part 73;
- (iii) A cyber security plan (CSP) in accordance with the criteria set forth in 10 CFR 73.54 of this chapter;
- (iv) A description of the implementation of the SCP, T&QP, and CSP; and
- (v) Each applicant who prepares a PSP, an SCP, a T&QP, or a CSP, shall protect the plans and other related Safeguards Information against unauthorized disclosure in accordance with the requirements of 10 CFR 73.21 of this chapter.

The provisions of 10 CFR 52.79(a)(44) require a description of the FFD program required by 10 CFR Part 26 and its implementation.

Requirements are established in 10 CFR 73.55(c)(2) to ensure protection of safeguards information (SGI) against unauthorized disclosure in accordance with 10 CFR 73.21. The applicant's submittal acknowledges that the PSP, the TQ&P and the SCP discuss specific features of the physical security system or response procedures and are SGI.

Section 1 of the PSP describes the applicant's commitment to satisfying 10 CFR 50.34(c), 10 CFR 50.34(d) and 10 CFR Part 73 by submitting a PSP, and to controlling the PSP and appendices as Safeguards Information according to 10 CFR 73.21.

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.b, requires a description of the physical layout of the site.

Section 1.1 of the PSP provides descriptions of location, site layout, and facility configuration. The PSP describes the physical structures and their locations on the site, description of the protected area, and a description of the site in relation to nearby town, roads, and other environmental features important to the coordination of response operations. The plant layout

includes identification of main and alternate entry routes for law enforcement assistance forces and the location of control points for marshalling and coordinating response activities.

In addition, FSAR, Chapter 2, "Site Characteristics" of the Turkey Point Units 6 and 7 COLA, provides general plant descriptions that include details of the 10- to 50-mile radius of the geographical area of the Turkey Point Units 6 and 7 site, a site area map, and general plant and site descriptions. Turkey Point Units 6 and 7 COL FSAR, Chapter 1, references the AP1000 DCD for the principal design and operating characteristics for the design and construction of the Turkey Point Units 6 and 7. Part 1, "General Information," of the Turkey Point Units 6 and 7 COLA describes the name of the applicant and principal business locations.

The staff has reviewed the facility physical layout provided in Section 1.1 of the PSP and as supplemented by Turkey Point Units 6 and 7 COL FSAR. The staff determined that the applicant included site-specific conditions that affect the applicant's capability to satisfy the requirements of a comprehensive PSP. The applicant has adequately described the physical structures and their locations onsite and the site in relation to nearby towns, roads, and other environmental features important to the effective coordination of response operations. The applicant described the main and alternate entry routes for law-enforcement assistance forces and the location of control points for marshaling and coordinating response activities in the site-specific law enforcement response plan. The staff concludes that the applicant's security plans have met the requirements for content of a PSP as stated above. Therefore, the staff finds the "Facility Layout" described in the PSP and the Turkey Point Units 6 and 7 COL FSAR is adequate.

The following portion of this technical evaluation section is reproduced from Section 13.6.4.1 of the VEGP SER:

13.6.4.1.2 Performance Objectives

The provisions of 10 CFR 73.55(b)(1) requires, in part, that the applicant shall establish and maintain a physical protection program with an objective to provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. The provisions of 10 CFR 73.55(b)(2) establish, in part, the requirement to protect a nuclear power reactor against the DBT of radiological sabotage as described in 10 CFR 73.1, [. The provisions of] 10 CFR 73.55(b)(3)(i), and 10 CFR 73.55(b)(3)(ii) require the applicant to establish a physical protection program designed to ensure the capabilities to detect, assess, interdict, and neutralize threats up to and including the DBT of radiological sabotage as stated in 10 CFR 73.1, are maintained at all times, provide defense-in-depth, supporting processes, and implementing procedures, which ensure the effectiveness of the physical protection program.

Section 2 of the PSP outlines the requirements for the establishment and maintenance of an onsite physical protection system, security organization, and integrated response capability. As part of the objective, the security program design shall incorporate supporting processes such that no single event can disable the security response capability because of defense-in-depth principles including diversity and redundancy. The physical protection systems and programs described herein are designed to protect against the DBT of radiological sabotage in accordance with the requirements of 10 CFR 73.55(a)

through (r) or equivalent measures that meet the same high assurance objectives provided by paragraph (a) through (r). VEGP Units 3 and 4 uses the corrective action program to track, trend, correct and prevent recurrence of failures and deficiencies in the physical protection program.

The NRC staff has reviewed the applicant's description in PSP Section 2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(b), and is, therefore, acceptable.

13.6.4.1.3 Performance Evaluation Program

Requirements are established in 10 CFR 73.55(b)(4) through (b)(11) for the applicant to analyze and identify site-specific conditions, establish programs, plans, and procedures that address performance evaluations, access authorization, cyber security, insider mitigation, fitness for duty (FFD), corrective actions, and operating procedures. 10 CFR 73.55(b)(6) prescribes specific requirements to establish, maintain, and implement a performance evaluation program in accordance with 10 CFR Part 73, Appendix B, Section VI for implementation of the plant protective strategy.

Section 3.0 of the PSP describes that drills and exercises, as discussed in the T&QP, will be used to assess the effectiveness of the contingency response plan and the effectiveness of the applicant's response strategy. Other assessment methods include formal and informal exercises or drills, self-assessments, internal and external audits and evaluations.

The performance evaluation processes and criteria that assess the effectiveness of the security program, including adequate protection against radiological sabotage, will be established in facility procedures and the deficiencies identified are managed through the corrective action program.

Section 3.0 of the PSP references Section 4.0 of the T&QP, which provides additional details related to the performance evaluation of security personnel in accordance with 10 CFR Part 73, Appendix B, Section VI. Section 4.0 of the T&QP includes the requirements to conduct security force tactical ~~drills~~ [drills] and force-on-force exercises to evaluate security systems effectiveness and response performances of security personnel. In addition, Section 17 of the PSP describes additional detail regarding the applicant's processes for reviews, evaluations and audits that will complement the performance evaluation program.

The NRC staff has reviewed the applicant's description in PSP Section 3, and the T&QP Section 4 (evaluated separately) for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(b)(6), and is, therefore, acceptable.

13.6.4.1.4 Establishment of Security Organization

The provisions of 10 CFR 73.55(d) establish requirements to describe a security organization, including the management system for oversight of the physical protection program. The security organization must be designed, staffed, trained, qualified, re-qualified, and equipped to implement the physical protection program as required by 10 CFR 73.55(b) and 10 CFR Part 73, Appendices B and C.

Section 4.0 of the PSP describes how the applicant meets the requirements of 10 CFR 73.55(d)(1).

Security Organization Management

Section 4.1 of the PSP describes the organization's management structure. The PSP establishes that the security organization is a critical component of the physical protection program and is responsible for the effective application of engineered systems, technologies, programs, equipment, procedures, and personnel necessary to detect, assess, interdict, and neutralize threats up to and including the DBT of radiological sabotage. The security organization may be proprietary, contractor, or other qualified personnel.

The PSP describes that the organization will be staffed with appropriately trained and equipped personnel, in a command structure with administrative controls and procedures, to provide a comprehensive response. Section 4.1 of the PSP also describes the roles and responsibilities of the Security Organization. The PSP provides that at least one full-time, Security Shift Supervisor that has the authority for command and control of all security operations is onsite at all times.

The security force implementing the security functions as described in this section of the plan will be either a proprietary force, contractor, or other qualified personnel. The training qualification requirements are described in the T&QP.

The staff has reviewed the applicant's description in PSP Sections 4 and 4.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(d) and is, therefore, acceptable.

The following portion of this technical evaluation section is reproduced from Section 13.6.4.1 of the VEGP SER:

13.6.4.1.5 Qualification for Employment in Security

The requirements of 10 CFR 73.55(d)(3) state, in part, that the applicant may not permit any individual to implement any part of the physical protection program unless the individual has been trained, equipped and qualified to perform assigned duties and responsibilities in accordance with Appendix B to 10 CFR Part 73 and the applicant's T&QP.

Section 5 of the PSP describes that employment qualifications for members of the security force are delineated in the T&QP.

The NRC staff has reviewed the applicant's description in PSP Section 5 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(d)(3), and is, therefore, acceptable.

13.6.4.1.6 Training of Facility Personnel

Consistent with requirements in 10 CFR 73.55(d)(3), 10 CFR 73.56 and 10 CFR Part 73, Appendix B, Section VI.C.1, all personnel who are authorized unescorted access to the applicant's PA receive training, in part to ensure that they understand their role in security and their responsibilities in the event of a security incident. Individuals assigned to perform security-related duties or responsibilities, such as, but not limited to, material searches and vehicle escort are trained and qualified in accordance with the T&QP to perform these duties and responsibilities and to ensure that each individual has the minimum knowledge, skills, and abilities required for effective performance of assigned duties and responsibilities.

Section 6 of the PSP describes the training provided for all personnel who have been granted unescorted access to the applicant's PA.

The NRC staff has reviewed the applicant's description in PSP Section 6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.56 and 10 CFR Part 73, Appendix B, and is, therefore, acceptable.

13.6.4.1.7 Security Personnel Training

The provisions of 10 CFR 73.55(d) require that all security personnel are trained and qualified in accordance with 10 CFR Part 73, Appendix B, Section VI prior to performing their duties.

Section 7 of the PSP describes that all security personnel are trained, qualified and perform tasks at levels specific for their assignments in accordance with the applicant's T&QP.

The NRC staff has reviewed the applicant's description in PSP Section 7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(d), and is, therefore, acceptable. The NRC staff's review of the licensee T&QP is located in Section 13.6.4.2 of this SER.

13.6.4.1.8 Local Law Enforcement Liaison

The following requirement is stated in 10 CFR 73.55(k)(9) "To the extent practicable, licensees shall document and maintain current agreements with applicable law enforcement agencies to include estimated response times and capabilities." In addition, 10 CFR 73.55(m)(2) requires, in part, that an evaluation of the effectiveness of the physical protection system include an audit of response commitments by local, State and Federal law enforcement authorities.

Section 8 of the PSP provides a detailed discussion of its ongoing relationship with local law enforcement agencies (LLEAs). The plans addressing response, communication methodologies and protocols, command and control structures and marshaling locations are located in the operations procedures, emergency plan procedures and the site-specific law enforcement response plan. The law enforcement response plan is reviewed biennially concurrent with the PSP effectiveness review.

The NRC staff has reviewed the applicant's description in PSP Section 8 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR 73.55(m)(2), and is, therefore, acceptable.

13.6.4.1.9 Security Personnel Equipment

The requirements of 10 CFR 73.55(d)(3) state, in part, the applicant may not permit any individual to implement any part of the physical protection program unless the individual has been trained, equipped and qualified in accordance with 10 CFR Part 73, Appendix B, and the T&QP. The provisions of 10 CFR Part 73, Appendix B, Section VI.G.2(a), state, in part, that the applicant must ensure that each individual is equipped or has ready access to all personal equipment or devices required for the effective implementation of the NRC-approved security plans, the applicant's protective strategy, and implementing procedures. The provisions of 10 CFR Part 73, Appendix B, Sections VI.G.2(b) and (c), delineate the minimum equipment requirements for security personnel and armed response personnel.

Section 9 of the PSP describes the equipment, including armament, ammunition, and communications equipment that is provided to security personnel in order to ensure that security personnel are capable of performing the function stated in the Commission-approved security plans, applicant's protective strategy, and implementing procedures.

The staff has reviewed the applicant's description in PSP Section 9 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(d)(3) and Appendix B, Section VI.G.2, and is, therefore, acceptable.

The following portion of this technical evaluation section is reproduced from Section 13.6.4.1 of the VEGP SER:

13.6.4.1.10 Work Hour Controls

The provisions of 10 CFR Part 26, "Fitness for Duty Programs," Subpart I, "Managing Fatigue," establish the requirements for managing fatigue. 10 CFR 26.205 establishes requirements for work hours. 10 CFR 26.205(a) requires that any individual who performs duties identified in 10 CFR 26.4(a)(1) through (a)(5) shall be subject to the requirements of this section.

Section 10 of the PSP describes that the site will implement work hour controls consistent with 10 CFR Part 26, Subpart I, and that site procedures shall describe performance objectives and implementing procedures.

The NRC staff's review of the fitness-for-duty program is found in Section 13.7 of this SER.

13.6.4.1.11 Physical Barriers

The following requirements are established in 10 CFR 73.55(e): "Each applicant shall identify and analyze site-specific conditions to determine the specific use, type, function, and placement of physical barriers needed to satisfy the physical protection program design requirements of 10 CFR 73.55(b). (1) The applicant shall: (i) Design, construct, install and maintain physical barriers as necessary to control access into facility areas for which access must be controlled or denied to satisfy the physical protection program design requirements of paragraph (b) of this section." The regulation 10 CFR 73.55(b)(3)(ii) states, "Provide defense-in-depth through the integration of systems, technologies, programs, equipment, supporting processes, and implementing procedures as needed to ensure the effectiveness of the physical protection program."

Section 11 of the PSP provides a general description of how the applicant has implemented its program for physical barriers, and that this implementation is in accordance with the performance objectives and requirements of 10 CFR 73.55(b).

OCA Barriers

Section 11.1 of the PSP describes Turkey Point Units 6 and 7 use of OCA barriers at the site.

Vehicle Barriers

PSP Subsections 11.2.1 and 11.2.2 provides for vehicle control measures to protect against the DBT of radiological sabotage. The staff has verified that such measures are in accordance with site-specific analysis. Furthermore, the staff has determined that these measures integrate systems, technologies, programs, supporting processes, and implementing procedures to provide defense-in-depth against the DBT land vehicle bomb assault. The staff has also determined that such measures provide for a vehicle barrier system at a stand-off distance adequate to protect personnel, equipment, and systems necessary to prevent significant core damage and spent fuel sabotage against the effects of such an assault. Furthermore, the staff confirmed that the applicant's PSP provides that the inspection, monitoring, and maintenance of the vehicle barrier system are included in facility procedures. In view of the above, the staff

concludes that the PSP identifies measures taken to provide high assurance that a land vehicle bomb assault can be defended against.

Accordingly, the staff concludes that the proposed vehicle control measures are consistent with the physical protection program design requirements of 10 CFR 73.55(b)(3)(ii) and 10 CFR 73.55(e)(10)(i).

Waterborne Threat Measures

The provisions of 10 CFR 73.55(e)(10)(ii) require the applicant to “[i]dentify areas from which a waterborne vehicle must be restricted, and where possible, in coordination with local, State, and Federal agencies having jurisdiction over waterway approaches, deploy buoys, markers, or other equipment. In accordance with the site-specific analysis, provide periodic surveillance and observation of waterway approaches and adjacent areas.”

Section 11.2.3 of the PSP describes that a site-specific analysis for a water-borne DBT has been conducted and documented. However, there is no waterborne access to Turkey Point Units 6 and 7.

Protected Area Barriers

The provisions of 10 CFR 73.55(e)(8)(i) require that the protected area perimeter must be protected by physical barriers that are designed and constructed to: (1) limit access to only those personnel, vehicles, and materials required to perform official duties, (2) channel personnel, vehicles, and materials to designated access control portals, and (3) be separated from any other barrier designated as a vital area physical barrier, unless otherwise identified in the PSP.

The descriptions of the protected area (PA) barrier are provided in the PSP Section 11.3. These descriptions meet the definitions of physical barriers and protected areas in 10 CFR 73.2 and requirements of 10 CFR 73.55(e)(8).

Section 11.3 of the PSP describes the extent to which the protected area barrier at the perimeter is separated from a vital area/island barrier. The security plan identifies where the PA barrier is not separated from a vital area barrier as required in 10 CFR 73.55(e)(8)(i)(c).

Section 11.3 of the PSP describes isolation zones. As required in 10 CFR 73.55(e)(7), the isolation zone is maintained in outdoor areas adjacent to the protected area perimeter barrier and is designed to ensure the ability to observe and assess activities on either side of the protected area perimeter.

These descriptions meet the definitions of physical barrier and PA in 10 CFR 73.2 and the requirements of 10 CFR 73.55(e)(8).

Vital Area Barriers

The provisions of 10 CFR 73.55(e)(9) require that “[v]ital equipment must be located only within vital areas, which must be located within a protected area so that access to vital equipment requires passage through at least two physical barriers, except as otherwise approved by the Commission and identified in the security plans.” In addition, 10 CFR 73.55(e)(5) requires that certain vital areas shall be bullet resisting.

Section 11.4 of the PSP describes that vital areas are restricted access areas surrounded by physical barriers with the capability to restrict access to only authorized individuals. All vital areas are constructed in accordance with established regulatory requirements. Section 11.4 also describes that the reactor control room, central alarm station (CAS) and the location within which the last access control function for access to the protected area is performed, must be bullet resisting.

The staff finds Section 11.4 describes that the reactor control room, CAS, SAS and the location within which the last access control function for access to the PA is performed must be bullet resisting. Accordingly, the staff finds all vital areas are constructed in accordance with established regulatory requirements.

Target Set Equipment

The provisions of 10 CFR 73.55(f) require the following:

The licensee shall document and maintain the process used to develop and identify target sets, to include the site-specific analyses and methodologies used to determine and group the target set equipment or elements. The licensee shall consider cyber attacks in the development and identification of target sets. Target set equipment or elements that are not contained within a protected or vital area must be identified and documented consistent with the requirements in § 73.55(f)(1) and be accounted for in the licensee's protective strategy. The licensee shall implement a process for the oversight of target set equipment and systems to ensure that changes to the configuration of the identified equipment and systems are considered in the licensee's protective strategy. Where appropriate, changes must be made to documented target sets.

Section 11.5 of the PSP describes that target set equipment or elements that are not contained within a protected or vital area are identified and accounted for in the site protective strategy.

The staff identified several RAIs relating to target sets for the purpose of reviewing the Westinghouse physical protection program. Westinghouse provided design details as background information to assist an applicant with the development of site-specific target set analyses. The staff evaluated the applicant's responses, and found them to be acceptable for the DC review of the AP1000 physical protection program. Westinghouse stated, in Technical Report TR-94, APP-GW-GLR-066, "AP1000 Safeguards Assessment Report," that target sets were created to aid in the development of the AP1000 physical security system, and that final target sets will be developed by the COL applicant prior to fuel onsite (inside PA).

The staff has reviewed the applicant's description in Sections 11.5 and 14.5 of the PSP, Section 7 of the SCP and information in Westinghouse TR-94 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in Sections 11.5 and 14.5 of the PSP, Section 7 of the SCP, and the information in Westinghouse TR-94 are consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in Sections 11.5 and 14.5 of the PSP and Section 7 of the SCP meets the requirements of 10 CFR 73.55(f)(1), (3), and (4), and is, therefore, acceptable. The target sets, target set analysis, and site protective strategy are in the facility implementing procedures, which were not subject to an NRC staff review as part of this COLA, and are, therefore, subject

to future NRC inspections in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii).

Delay Barriers

The provisions of 10 CFR 73.55(e)(3)(ii) require that physical barriers must “provide deterrence, delay, or support access control” to perform the required function of the applicant physical protection program. The PSP describes the use of delay barriers at Turkey Point Units 6 and 7.

Section 11.6 of the PSP includes a description of the use of Delay Barriers to meet requirement of 10 CFR 73.55(e).

The staff has reviewed the applicant’s description in PSP Sections 11, 11.1, 11.2, 11.2.1, 11.2.2, 11.2.3, and Sections 11.3 through 11.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(e), and are, therefore, acceptable.

The following portion of this technical evaluation section is reproduced from Section 13.6.4.1 of the VEGP SER:

13.6.4.1.12 Security Posts and Structures

The provisions of 10 CFR 73.55(e)(5) require that the reactor control room, the CAS, and the location within which the last access control function for access to the PA is performed, must be bullet-resisting.

Section 12 of the PSP describes that security posts and structures are qualified to a level commensurate with their application within the site protective strategy, and that these positions are constructed of bullet resisting materials.

The NRC staff has reviewed the applicant’s description in PSP Section 12 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(e)(5), and is, therefore, acceptable.

13.6.4.1.13 Access Control Devices

It is stated in 10 CFR 73.55(g)(1) that, consistent with the function of each barrier or barrier system, the applicant shall control personnel, vehicle, and material access, as applicable, at each access control point in accordance with the physical protection program design requirements of 10 CFR 73.55(b).

The provisions of 10 CFR 73.55(g)(6) require control of access control devices as stated: “The licensee shall control all keys, locks, combinations, passwords

and related access control devices used to control access to protected areas, vital areas and security systems to reduce the probability of compromise.”

Types of Security-Related Access Control Devices

Section 13.1 of the PSP describes that the applicant uses security-related access control devices to control access to protected and vital areas and security systems.

Control and Accountability

Section 13.2.1 of the PSP describes the control of security related locks. Section 13.2.2 of the PSP describes the controls associated with the changes to and replacements of access control devices and the accountability and inventory control process, and the circumstances that require changes in security-related locks. The applicant uses facility procedures to produce, control, and recover keys, locks, and combinations for all areas and equipment, which serve to reduce the probability of compromise. The issue of access control devices is limited to individuals who have unescorted access authorization and require access to perform official duties and responsibilities. Keys and locks are accounted for through a key inventory control process as described in facility procedures.

The NRC staff has reviewed the applicant’s description in PSP Sections 13, 13.1, 13.2, 13.2.1, and 13.2.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meet the requirements of 10 CFR 73.55(g)(1) and (6), and are, therefore, acceptable.

13.6.4.1.14 Access Requirements

Access Authorization and Fitness for Duty

The provisions of 10 CFR 73.55(b)(7) require the applicant to establish, maintain, and implement an access authorization program in accordance with 10 CFR 73.56 and to describe the program in the PSP. The provisions of 10 CFR Part 26 require the applicant to establish and maintain a FFD program.

Section 14.1 of the PSP describes that the access authorization program implements regulatory requirements utilizing the provisions in RG 5.66. The staff finds that RG 5.66, is an acceptable method for meeting the requirements of 10 CFR 73.55(b)(7).

The staff has reviewed the applicant’s description in PSP Section 14.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant’s description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(b)(7), 10 CFR 73.56 and 10 CFR Part 26 and is, therefore, acceptable.

Insider Mitigation Program

The provisions of 10 CFR 73.55(b)(9) require that the applicant shall establish, maintain, and implement an insider mitigation program and shall describe the program in the PSP. The insider mitigation program must monitor the initial and continuing trustworthiness and reliability of individuals granted or retaining unescorted access authorization to a protected or vital area, and implement defense-in-depth methods to minimize the potential for an insider to impede, either directly or indirectly, the applicant's capability to prevent significant core damage and spent fuel sabotage. The insider mitigation program must include elements from: the access authorization program, the FFD program, the cyber security program and the physical protection program.

Section 14.2 of the PSP describes how the applicant will establish, maintain, and implement an insider mitigation program using the guidance in RG 5.77. The insider mitigation program requires elements from the access authorization program described in 10 CFR 73.56; FFD program described in 10 CFR Part 26; the cyber security program described in 10 CFR 73.54; and the physical security program described in 10 CFR 73.55. In addition, Section 14.2 describes the integration of the programs mentioned above to form a cohesive and effective insider mitigation program. The applicant addresses the observations for the detection of tampering. The staff finds that this approach is an acceptable method for meeting the requirements 10 CFR 73.55(b)(9).

The staff has reviewed the applicant's description in PSP Section 14.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(b)(9) and is, therefore, acceptable.

Picture Badge Systems

Requirements for badges are stated in 10 CFR 73.55(g)(6)(ii). "The licensee shall implement a numbered photo identification badge system for all individuals authorized unescorted access to the protected area and vital areas." In addition, identification badges may be removed from the protected area under limited conditions and only by authorized personnel. Records of all badges shall be retained and shall include name and areas to which persons are granted unescorted access.

The provisions of 10 CFR 73.55(g)(7)(ii) require that individuals not employed by the applicant but who require frequent or extended unescorted access to the protected area and/or vital areas to perform duties and responsibilities required by the applicant at irregular or intermittent intervals, shall satisfy the access authorization requirements of 10 CFR 73.56 and 10 CFR Part 26 of this chapter, and shall be issued a nonemployee photo identification badge that is easily distinguished from other identification badges before being allowed unescorted access to the protected and vital areas. Nonemployee photo identification badges must visually reflect that the individual is a nonemployee and that no escort is required.

Section 14.3 of the PSP describes the site picture badge system, as follows: Identification badges will be displayed while individuals are inside the protected area or vital areas. When not in use, badges may be removed from the protected area by authorized holders, provided that a process exists to deactivate the badge upon exit and positively confirm the individual's true

identity and authorization for unescorted access prior to entry into the protected area. Records are maintained to include the name and areas to which unescorted access is granted of all individuals to whom photo identification badges have been issued.

The staff has reviewed the applicant's description in PSP Section 14.3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(g)(6)(ii) and (7)(ii) and is, therefore, acceptable.

Searches

The provisions of 10 CFR 73.55(h) require, in part, that applicants meet the objective to detect, deter, and prevent the introduction of firearms, explosives, incendiary devices, or other items, which could be used to commit radiological sabotage. To accomplish this, applicant's shall search individuals, vehicles, and materials consistent with the physical protection program design requirements in paragraph (b) of this section, and the function to be performed at each access control point or portal before granting access.

Section 14.4 of the PSP provides an overview description of the search process for vehicle, personnel and materials. The search process is conducted using security personnel, specifically trained nonsecurity personnel, and technology. Detailed discussions of actions to be taken in the event unauthorized materials are discovered are found in implementing procedures.

Vehicle Barrier Access Control Point

The provisions of 10 CFR 73.55(h)(2)(ii) through (v) provide the requirements for an applicant to search vehicles at the owner-controlled area and 10 CFR 73.55(h)(3) provides requirements for searches of personnel, vehicles and materials prior to entering the protected area.

Section 14.4.1 of the PSP describes the process for the search of personnel, vehicles and materials at predetermined locations prior to granting access to designated facility areas identified by the applicant as needed to satisfy the physical protection program. The applicant states that it has developed specific implementing procedures to address vehicle and materials searches at these locations. Hence the staff finds this acceptable.

PA Packages and Materials Search

Section 14.4.2 of the PSP describes the process for conducting searches of packages and materials for firearms, explosives, incendiary devices, or other items, which could be used to commit radiological sabotage using equipment capable of detecting these items or through visual and physical searches, or both, to ensure that all items are clearly identified before these items can enter the Turkey Point Units 6 and 7 protected area. Detailed requirements for conducting these searches are found in applicant implementing procedures and include the search and control of bulk materials and products. Applicant implementing procedures also discuss the control of packages and materials previously searched and tamper sealed by personnel trained in accordance with the T&QP.

PA Vehicle Search

Section 14.4.3 of the PSP describes the process for the search of vehicles for firearms, explosives, incendiary devices, or other items, which could be used to commit radiological sabotage using equipment capable of detecting these items or through visual and physical searches, or both, to ensure that all items are clearly identified at the protected area. Detailed requirements for conducting these searches are found in the applicant's implementing procedures. The applicant's implementing procedures also address the search methodologies for vehicles that must enter the protected area under emergency conditions.

PA Personnel Searches

Section 14.4.4 of the PSP describes the process for searches of all personnel requesting access into protected areas. The PSP describes the search for firearms, explosives, incendiary devices, or other items, which could be used to commit radiological sabotage using equipment capable of detecting these items or through visual and physical searches or both to ensure that all items are clearly identified prior to granting access into the protected area. All persons except official Federal, State, and LLEA personnel on official duty are subject to these searches upon entry to the protected area. Detailed discussions of observation and control measures are found in implementing procedures.

PA Access Controls

Section 14.4.5 of the PSP describes the process for controlling access at all points where personnel or vehicles could gain access into the applicant's protected area. The plan notes that principal personnel access to the protected area is through a lockable portal. Personnel are only permitted into the PA after positive ID verification, access authorization verification, and a search is performed per Section 14.4 of the PSP. Vehicles are controlled through positive control methods described in the facility procedures.

Escort and Visitor Requirements

The provisions of 10 CFR 73.55(g)(7) and (8) state in part, that the applicant may permit escorted access to protected and vital areas to individuals who have not been granted unescorted access in accordance with the requirements of 10 CFR 73.56 and 10 CFR Part 26 of this chapter. Regulations in 10 CFR 73.55(g)(8) discuss escort requirements. Applicants are required to implement procedures for processing, escorting and controlling visitors. Procedures shall address confirmation of identity of visitors, maintenance of a visitor control register, visitor badging and escort controls including, training, communications, and escort ratios.

Section 14.4.6 of the PSP describes the process for control of visitors. The PSP affirms that procedures address the identification, processing, and escorting of visitors and the maintenance of a visitor control register. Training requirements for escorting visitors includes responsibilities, communications and escort ratios. All escorts are trained to perform escort duties in accordance with site requirements. All visitors wear a badge that clearly indicates that an escort is required.

The staff has reviewed the applicant's description in PSP Sections 14.4, and 14.4.1 through 14.4.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800,

Section 13.6.1, the staff finds that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(h)(2), (h)(3), (g)(7), and (g)(8), and are, therefore, acceptable.

Vital Area Access Controls

The provisions of 10 CFR 73.55(g)(4) require that applicants control access into vital areas consistent with established access authorization lists. In response to a site-specific credible threat or other credible information, applicants shall implement a two-person (line-of-sight) rule for all personnel in vital areas so that no one individual is permitted access to a vital area.

The provisions of 10 CFR 73.56(j) require the applicant to establish, implement, and maintain a list of individuals who are authorized to have unescorted access to specific nuclear power plant vital areas during nonemergency conditions. The list must include only those individuals who have a continued need for access to those specific vital areas in order to perform their duties and responsibilities. The list must be approved by a cognizant applicant manager or supervisor who is responsible for directing the work activities of the individual who is granted unescorted access to each vital area, and updated and re-approved no less frequently than every 31 days.

Section 14.5 of the PSP describes vital areas and states that the applicant maintains vital areas locked and protected by an active intrusion alarm system. An access authorization system is established to limit unescorted access that is controlled by an access authorization list, which is reassessed and reapproved at least once every 31 days. Additional access control measures are described in the facility procedures.

The staff has reviewed the applicant's description in PSP Section 14.5 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(g)(4) and is, therefore, acceptable.

The following portion of this technical evaluation section is reproduced from Section 13.6.4.1 of the VEGP SER:

13.6.4.1.15 Surveillance Observation and Monitoring

The provisions of 10 CFR 73.55(i)(1) require that the applicant establish and maintain intrusion detection systems that satisfy the design requirements of 10 CFR 73.55(b) and provide, at all times, the capability to detect and assess unauthorized persons and facilitate the effective implementation of the protective strategy.

Illumination

The provisions of 10 CFR 73.55(i)(6) require, in part, that all areas of the facility are provided with illumination necessary to satisfy the design requirements of 10 CFR 73.55(b) and implement the protective strategy. Specific requirements include providing a minimum illumination level of 0.2 foot-candles, measured horizontally at ground level, in the isolation zones and appropriate exterior areas within the PA. Alternatively, the applicant may augment the facility illumination

system by means of low-light technology to meet the requirements of this section or otherwise implement the protective strategy. The applicant shall describe in the security plans how the lighting requirements of this section are met and, if used, the type(s) and application of low-light technology.

Section 15.1 of the PSP describes that all isolation zones and appropriate exterior areas within the PA have lighting capabilities that provide illumination sufficient for the initiation of an adequate response to an attempted intrusion of the isolation zone, a PA, or a vital area. A discussion of the implementation of technology using fixed and non-fixed low light level cameras or alternative technological means is provided. The applicant has addressed the potential for loss of lighting and the compensatory actions that would be taken if that event were to occur.

Surveillance Systems

The provisions of 10 CFR 73.55(i)(1) require, in part, that the applicant implement, establish, and maintain intrusion detection and assessment, surveillance, observation and monitoring systems to satisfy the design requirements of 10 CFR 73.55(b), and of the applicant's OCA.

Section 15.2 of the PSP describes that surveillance is accomplished by human observation and technology. Surveillance systems include a variety of cameras, video display, and annunciation systems designed to assist the security organization in observing, detecting assessing alarms or unauthorized activities. Certain systems provide real-time and recorded play back of recorded video images. The specifics of surveillance systems are described in facility implementing procedures.

Intrusion Detection Equipment

Section 15.3 of the PSP describes the perimeter intrusion detection system, and the PA and vital area intrusion detection systems. These systems are capable of detecting attempted penetration of the PA perimeter barrier; are monitored with assessment equipment designed to satisfy the requirements of 10 CFR 73.55(i) and provide real-time and play-back/recorded video images of the detected activities before and after each alarm annunciation. The PSP describes how the applicant will meet regulatory requirements for redundancy, tamper indication and uninterruptable power supply.

Central Alarm Station (CAS) and Secondary Alarm Station (SAS) Operation

The provisions of 10 CFR 73.55(i)(4) provide requirements for alarm stations. It is required, in 10 CFR 73.55(i)(4)(i), that both alarm stations must be designed and equipped to ensure that a single act, in accordance with the DBT of radiological sabotage defined in 10 CFR 73.1, cannot disable both alarm stations. The applicant shall ensure the survivability of at least one alarm station to maintain the ability to perform the following functions: 1) detect and assess alarms; 2) initiate and coordinate an adequate response to an alarm; 3) summon offsite assistance; and 4) provide command and control. 10 CFR 73.55(i)(4)(iii) requires that alarm stations must be equal and redundant.

Section 15.4 of the PSP describes the functional operations of the CAS and the SAS. The PSP provides that the alarm stations are equipped, such that no single act will disable both alarm stations. The applicant's PSP provides that each alarm station is properly manned and that no activities are permitted that would interfere with the operator's ability to execute assigned duties and responsibilities.

Security Patrols

Owner Controlled Area (OCA) Surveillance and Response

The provisions of 10 CFR 73.55(e)(6) require that the applicant establish and maintain physical barriers in the OCA as needed to satisfy the physical protection program design requirements of 10 CFR 73.55(b). It is required, in 10 CFR 73.55(i)(5)(ii), in part, that the applicant provide continuous surveillance, observation and monitoring of the OCA and that these responsibilities may be performed by security personnel during continuous patrols, through the use of video technology, or by a combination of both.

Section 15.5.1 of the PSP describes the processes used to meet this requirement. The PSP discusses the process to be used and provides that details regarding the implementation of OCA surveillance techniques are found in facility procedures. The PSP provides a discussion regarding the implementation of manned and video options for patrolling and surveillance of the OCA.

Protected and Vital Area Patrols

The provisions of 10 CFR 73.55(i)(5)(iii) through (viii) require, in part, that armed patrols check unattended openings that intersect a security boundary, such as an underground pathways, check external areas of the PA and vital area portals, periodically inspect vital areas, conduct random patrols of accessible target set equipment, be trained to recognize obvious tampering and if detected, initiate an appropriate response in accordance with established plans and procedures.

Section 15.5.2 of the PSP describes the process employed by the applicant to meet the above requirements. The PSP describes the areas of the facility that will be patrolled and observed, as well as the frequency of these patrols and observations. The applicant has addressed the observations for the detection of tampering in Section 14.2 of the PSP and in the facility procedures.

The NRC staff has reviewed the applicant's description in PSP Sections 15, 15.1 through 15.4, 15.5.1, and 15.5.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(b) and (i), and are, therefore, acceptable.

13.6.4.1.16 Communications

The provisions of 10 CFR 73.55(j)(1) through (6) describe the requirements for establishment and maintenance of continuous communication capabilities with both onsite and offsite resources to ensure effective command and control during both normal and emergency situations. Alarm stations must be capable of calling for assistance, on-duty security force personnel must be capable of maintaining continuous communication with each alarm station and vehicle escorts, and personnel escorts must maintain timely communication with security personnel. Continuous communication capabilities must terminate in both alarm stations, between LLEA and the control room. Non-portable communications must remain operable from independence power sources. The applicant must identify areas where communications could be interrupted or not maintained.

Notifications (Security Contingency Event Notifications)

Section 16.1 of the PSP describes that the applicant have a process to ensure that continuous communications are established and maintained between the onsite security force staff and the offsite support agencies.

System Descriptions

Section 16.2 of the PSP describes the establishment and maintenance of the communications system. Detailed descriptions of security systems are included in the facility procedures. VEGP has access to both hard wired and alternate communications systems. Site security personnel are assigned communications devices with which to maintain continuous communications with the CAS and SAS. All personnel and vehicles are assigned communications resources with which to maintain continuous communications. Continuous communication protocols are available between the CAS, SAS and the control room.

The NRC staff has reviewed the applicant's description in PSP Sections 16, 16.1 and 16.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(j)(1) through (6), and are, therefore, acceptable.

13.6.4.1.17 Review, Evaluation and Audit of the Physical Security Program

The provisions of 10 CFR 73.55(m) require, in part, that each element of the physical protection program will be reviewed at least every 24 months. An initial review is required within 12 months after original plan implementation, or a change in personnel, procedures, equipment or facilities, which could have a potentially adverse affect on security, or as necessary based on site-specific analysis assessments, or other performance indicators. Reviews must be conducted by individuals independent of the security program and must include the plans, implementing procedures and local law enforcement commitments. Results of reviews shall be presented to senior management above the level of the security manager and findings must be entered in the site corrective action program.

Section 17 of the PSP describes that the physical security program is reviewed 12 months following initial implementation and at least every 24 months by individuals independent of both security program management and personnel who have a direct responsibility for implementation of the security program. The physical security program review includes, but is not limited to, an audit of the effectiveness of the physical security program, cyber security plans, implementing procedures, safety/security interface activities, the testing, maintenance, and calibration program, and response commitments by local, State, and Federal law enforcement authorities.

A review shall be conducted as necessary based upon site-specific analyses, assessments, or other performance indicators and as soon as reasonably practical, but no longer than 12 months, after changes occur in personnel, procedures, equipment, or facilities that potentially could adversely affect safety/security.

The results and recommendations of the physical security program review, management's finding on whether the physical security program is currently effective and any actions taken as a result of recommendations from prior program reviews are documented in a report to plant management and to appropriate corporate management at least one level higher than that having responsibility for the day-to-day plant operation. These reports are maintained in an auditable form and maintained for inspection.

Findings from the onsite physical security program reviews are entered into the facility corrective action program.

In RAI 13.6-36, the NRC staff requested that the applicant address the requirements of 10 CFR 73.58, "Safety/security requirements for nuclear power reactors." In its response dated May 14, 2010, the applicant stated that management controls and processes used to establish and maintain an effective interface between nuclear safety and physical security are addressed by administrative procedures. The applicant committed to revise VEGP COL FSAR Section 13.5.1 to include the safety/security interface implementation process in the list of procedural instructions provided in plant administrative procedures.

*On the basis of its review, the NRC staff finds that since the applicant will revise VEGP COL FSAR Section 13.5.1 to incorporate the requirements for safety/security interfaces, the response to RAI 13.6-36 meets the requirements of 10 CFR 73.58 and is, therefore, acceptable. The incorporation of changes to the VEGP COL FSAR Section 13.5.1 is being tracked as **Confirmatory Item 13.6-2**.*

Resolution of Standard Content Confirmatory Item 13.6-2

Confirmatory Item 13.6-2 is an applicant commitment to revise its FSAR Section 13.5 regarding the requirements of safety/security interfaces. The staff verified that the VEGP COL FSAR was appropriately revised. As a result, Confirmatory Item 13.6-2 is now closed.

In Revision 6, of Turkey Point Units 6 and 7, COL FSAR, Section 13.5.1, the applicant provided additional information for clarifications of how the applicant, once licensed, would analyze and

identify changes in the site-specific conditions related to the AP1000's structures, systems, and components (SSCs) (described in certain technical reports), resulting from changes made to the Turkey Point Units 6 and 7 COL between issuance of the COL and the security program implementation milestones provided in FSAR Table 13.4-201 to ensure that the security plan continues to meet 10 CFR 73.55(b)(4):

A process is in effect at the time of issuance of the combined license and was developed using NRC endorsed industry guidance. This process is used to manage safety/security interface while the security procedures and emergency plan implementing procedures are being developed and implemented.

The staff reviewed the applicant's description in PSP Section 17 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. As set forth above, the applicant's description in the FSAR Section 13.5.1 in Revision 6 and the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(b)(4), and 10 CFR 73.55(m), and therefore is acceptable.

13.6.4.1.18 Response Requirements

The provisions of 10 CFR 73.55(k) require, in part, that the applicant establish and maintain a properly trained, qualified, and equipped security force required to interdict and neutralize threats up to and including the DBT defined in 10 CFR 73.1, to prevent significant core damage and spent fuel sabotage. To meet this objective, the applicant must ensure that necessary equipment is in sufficient supply, in working condition, and readily available. The applicant must ensure training has been provided to all armed members of the security organization who will be available onsite to implement the applicant's protective strategy as described in the facility procedures and 10 CFR Part 73, Appendix C. The applicant must have facility procedures to reconstitute armed response personnel and have established working agreement(s) with LLEA. The applicant must have implemented a threat warning system to accommodate heightened security threats and coordination with NRC representatives.

Section 18 of the PSP describes an armed response team, responsibilities, training, and equipment, and requires an adequate number of armed response force personnel immediately available at all times to implement each site's protective strategy. The applicant ensures that training is conducted in accordance with the requirements of 10 CFR Part 73, Appendix B that will ensure implementation of the site protective strategy in accordance with 10 CFR Part 73, Appendix C. Procedures are in place to reconstitute the armed response personnel as are agreements with LLEA. Procedures are in place to manage the threat warning system.

In RAI 4899, Questions 13.06-23 and 13.06-24 the staff requested that the applicant clarify PSP, Section 18, which details the minimum number of armed responders continuously in the protected area. The staff requested the applicant explain how this number correlates with the expected number detailed in Westinghouse TR-94, AP1000 Safeguards Assessment Report.

In a letter dated September 6, 2011 (ADAMS Accession No. ML11251A165), the applicant provided an explanation of how they determined the minimum numbers of armed responders needed for the Turkey Point Units 6 and 7 Site. The applicant also provided a metric showing the staffing relationship between Westinghouse TR 94, AP1000 Safeguards Assessment Report, and staffing positions and responsibility for Turkey Point Site Units 6 and 7.

On the basis of its review, the staff finds the response to RAI 4899, Questions 13.06-23 and 13.06-24 to be acceptable. The applicant's metric provided the needed clarification on the minimum number of armed responders continuously in the protected area and the expected number detailed in Westinghouse TR-94.

The staff has reviewed the applicant's description in PSP Section 18 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP provides reasonable assurance that the licensee will meet the requirements of 10 CFR 73.55(k) and is, therefore, acceptable.

The following portion of this technical evaluation section is reproduced from Section 13.6.4.1 of the VEGP SER:

13.6.4.1.19 Special Situations Affecting Security

The provisions of 10 CFR 73.58 require that each operating nuclear power reactor applicant with a license issued under 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities" or 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants" shall comply with the following requirements: the applicant shall assess and manage the potential for adverse effects on safety and security, including the site emergency plan, before implementing changes to plant configurations, facility conditions, or security; the scope of changes to be assessed and managed must include planned and emergent activities (such as, but not limited to, physical modifications, procedural changes, changes to operator actions or security assignments, maintenance activities, system reconfiguration, access modification or restrictions, and changes to the security plan and its implementation); where potential conflicts are identified, the applicant shall communicate them to appropriate personnel and take compensatory and/or mitigative actions to maintain safety and security under applicable Commission regulations, requirements, and license conditions.

Section 19 of the PSP includes requirements for assessments to manage increased risk of special situations affecting security.

Refueling/Major Maintenance

Section 19.1 of the PSP describes that, for refueling or major maintenance activities, the PSP describes that security procedures identify measures for implementation of actions prior to refueling or major maintenance activities. These measures include controls to ensure that a search is conducted prior to revitalizing an area, that protective barriers and alarms are fully operational, and post-maintenance performance testing to ensure operational readiness of equipment in accordance with 10 CFR 73.55(n)(8).

Construction and Maintenance

Section 19.2 of the PSP describes that during periods of construction and maintenance when temporary modifications are necessary, that the applicant will implement measures that provide for equivalency in the physical protective

measures and features impacted by the activities, such that physical protection measures are not degraded. The process for making such changes or modifications is included in the facility procedures.

The NRC staff has reviewed the applicant's description in PSP Sections 19, 19.1, and 19.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(n)(8) and 10 CFR 73.58, and are, therefore, acceptable.

13.6.4.1.20 Maintenance, Testing and Calibration

In accordance with 10 CFR 73.55(n), the applicant is required to establish, maintain, and implement a maintenance, testing, and calibration program to ensure that security systems and equipment, including secondary and uninterruptible power supplies, are tested for operability and performance at predetermined intervals, maintained in operable condition, and have the capability of performing their intended functions. The regulation requires that the applicant describe their maintenance testing and calibrations program in the PSP, and that the implementing procedures describe the details and intervals for conducting these activities. Applicant procedures must identify criteria for documenting deficiencies in the corrective action program and ensuring data protection in accordance with 10 CFR 73.21. The applicant must conduct periodic operability testing of the intrusion alarm system and must conduct performance testing in accordance with the PSP and implementing procedures. Communication equipment must be tested not less than daily, and search equipment must also be tested periodically. Procedures must be established for testing equipment located in hazardous areas, and procedures must be established for returning equipment to service after each repair.

Sections 20.1 through 20.6 of the PSP describe the maintenance, testing and calibration program for security-related equipment. Section 20.1 states that the applicant shall conduct intrusion detection testing in accordance with recommended testing procedures described in RG 5.44, "Perimeter Intrusion Alarm System". Each operational component required for the implementation of the security program is at a minimum, tested in accordance with 10 CFR 73.55(n), the PSP and implementing procedures.

The NRC staff has reviewed the applicant's description in PSP Section 20 and 20.1 through 20.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(n), and are, therefore, acceptable.

13.6.4.1.21 Compensatory Measures

The provisions of 10 CFR 73.55(o) require, in part, that the applicant shall identify criteria and measures to compensate for degraded or inoperable equipment, systems, and components to meet the requirements of this section. Compensatory measures must provide a level of protection that is equivalent to the protection that was provided by the degraded or inoperable, equipment, system, or components. Compensatory measures must be implemented within specific time frames necessary to meet the appropriate portions of 10 CFR 73.55(b) and described in the security plans.

Section 21 of the PSP identifies measures and criteria required to compensate for degraded or inoperable equipment, systems, and components in accordance with 10 CFR 73.55(o) to assure that the effectiveness of the physical protection system is not reduced by failure or other contingencies affecting the operation of the security-related equipment or structures. Sections 21.1 through 21.12 of the PSP address PA and vital area barriers, intrusion detection and alarm systems, lighting, fixed and non-fixed closed circuit television, play-back and recorded video systems, computer systems, access control devices, vehicle barrier systems, channeling barrier systems, and other security-related equipment.

The NRC staff has reviewed the applicant's description in PSP Sections 21 and 21.1 through 21.12, for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(o), and are, therefore, acceptable.

13.6.4.1.22 Records

The provisions of 10 CFR Part 26, 10 CFR 73.55(q), 10 CFR 73.56(k) and (o), 10 CFR Part 73, Appendix B, Section VI.H., Appendix C, Section II.C and 10 CFR 73.70, require that the applicant must retain and maintain all records required to be kept by the Commission regulations, orders, or license conditions until the Commission terminates the license for which the records were developed, and shall maintain superseded portions of these records for at least three years after the record is superseded, unless otherwise specified by the Commission. The applicant is required to keep records of contracts with any contracted security force that implements any portion of the onsite physical protection program for the duration of the contract. The applicant must make all records, required to be kept by the Commission, available to the Commission and the Commission may inspect, copy, retain and remove all such records, reports and documents, whether kept by the applicant or a contractor. Review and audit reports must be maintained and available for inspection for a period of three years.

Section 22.0 of the PSP addresses the requirements to maintain records. Sections 22.1 through 22.13 address each kind of record that the applicant will maintain and the duration of retention for each record. The following types of records are maintained in accordance with the above mention regulations: access authorization records; suitability, physical and psychological qualification records for security personnel; PA and vital area access control records; PA

visitor access records; PA vehicle access; vital area access transaction records; vitalization and de-vitalization records; vital area access list reviews; security plans and procedures; security patrols, inspections and tests; maintenance; CAS and SAS alarm annunciation and security response records; local law enforcement agency records; records of audits and reviews; access control devices; security training and qualification records; firearms testing and maintenance records; and engineering analysis for the vehicle barrier system.

The NRC staff has reviewed the applicant's description in PSP Sections 22 and 22.1 through 22.13 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(q), 10 CFR 73.55(o) and 10 CFR 73.70, and are, therefore, acceptable.

13.6.4.1.23 Digital Systems Security

Section 23 of the PSP addresses digital systems security. The applicant stated in its PSP that it has implemented the requirements of 10 CFR 73.54 and maintains a cyber security plan that describes how it has provided high assurance that safety, security, and emergency preparedness functions are protected against the DBT.

The NRC staff's review of the cyber security plan is found Section 13.8 of this SER.

13.6.4.1.24 Temporary Suspension of Security Measures

The provisions of 10 CFR 73.55(p) allow the applicant to "suspend implementation of affected requirements of this section under the following conditions: In accordance with 10 CFR 50.54(x) and 50.54(y) of this chapter, the licensee may suspend any security measures under this section in an emergency when this action is immediately needed to protect the public health and safety and no action consistent with license conditions and technical specifications that can provide adequate or equivalent protection is immediately apparent. This suspension of security measures must be approved as a minimum by a licensed senior operator before taking this action. During severe weather when the suspension of affected security measures is immediately needed to protect the personal health and safety of security force personnel and no other immediately apparent action consistent with the license conditions and technical specifications can provide adequate or equivalent protection. This suspension of security measures must be approved, as a minimum, by a licensed senior operator, with input from the security supervisor or manager, before taking this action."

Suspension of Security Measures in Accordance with 10 CFR 50.54(x) and (y)

Section 24.1 of the PSP addresses suspension of security measures in accordance with 10 CFR 50.54(x) and 10 CFR 50.54(y). Specifically, the plan provides a description of the conditions under which suspension is permissible,

the authority for suspension, and the requirements for reporting such a suspension.

Suspension of Security Measures during Severe Weather or Other Hazardous Conditions

As required in 10 CFR 73.55(p), suspension of security measures are reported and documented in accordance with the provisions of 10 CFR 73.71. This suspension of security measures must be approved, as a minimum, by a licensed senior operator, with input from the security supervisor or manager, before taking this action. Suspended security measures must be reinstated as soon as conditions permit.

Section 24.2 of the PSP provides that certain security measures may be temporarily suspended during circumstances such as imminent, severe or hazardous weather conditions, but only when such action is immediately needed to protect the personal health and safety of security force personnel and no other immediately apparent action consistent with the security measures can provide adequate or equivalent protection. Under the PSP, suspended security measures shall be restored as soon as practical.

The NRC staff has reviewed the applicant's description in PSP Sections 24, 24.1, and 24.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the PSP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the PSP meets the requirements of 10 CFR 73.55(p), and are, therefore, acceptable.

13.6.4.1.25 Appendix A Glossary of Terms and Acronyms

Appendix A, "Glossary of Terms and Acronyms," was reviewed and found to be consistent with the NRC endorsed NEI 03-12, Revision 6 template.

13.6.4.1.26 Conclusions on the Physical Security Plan

On the basis of the NRC staff's review described in Sections 13.6.4.1.1 through 13.6.4.1.25 of this SER, the PSP meets the requirements of 10 CFR 73.55(a) through (r). The target sets, Target Set Analysis and Site Protective Strategy are in the facility implementing procedures, which were not subject to NRC staff review as part of this COL application and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). The NRC staff concludes that complete and procedurally correct implementation of the PSP will provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

13.6.4.2 Appendix B Training and Qualification Plan

13.6.4.2.1 Introduction

The provisions of 10 CFR 73.55(c)(4) state that the applicant establish, maintain, implement, and follow a T&QP that describes how the criteria set forth in 10 CFR Part 73, Appendix B will be implemented.

The provisions of 10 CFR 73.55(d)(3) state that the applicant may not permit any individual to implement any part of the physical protection program unless the individual has been trained, equipped, and qualified to perform their assigned duties and responsibilities in accordance with 10 CFR Part 73, Appendix B and the T&QP. Non-security personnel may be assigned duties and responsibilities required to implement the physical protection program and shall:

- (i) Be trained through established applicant training programs to ensure each individual is trained, qualified, and periodically requalified to perform assigned duties.*
- (ii) Be properly equipped to perform assigned duties.*
- (iii) Possess the knowledge, skills, and abilities to include physical attributes, such as sight and hearing, required to perform their assigned duties and responsibilities.*

In addition, 10 CFR Part 73, Appendix B, Section VI.D.2(a) states armed and unarmed individuals shall be requalified at least annually in accordance with the requirements of the Commission-approved T&QP.

The T&QP describes that it is written to address the requirements found in 10 CFR Part 73, Appendix B, Section VI. The objective of the plan is to provide a mechanism to ensure that members of the security organization, and all others who have duties and responsibilities in implementing the security requirements and protective strategy, are properly trained, equipped and qualified. Deficiencies identified during the administration of T&QP requirements are documented in the site corrective action program.

The NRC staff has reviewed the introduction section in the T&QP and has determined that it includes all of the programmatic elements necessary to satisfy the requirements of 10 CFR 73.55 and 10 CFR Part 73, Appendix B, Section VI applicable to the T&QP. Additional section-by-section evaluations and discussions are found in the following paragraphs.

13.6.4.2.2 Employment Suitability and Qualification

The requirements for mental qualifications, documentation, and physical requalification for security personnel (applicant employee and contractor) are described in the following T&QP sections.

Suitability

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.1(a) require, in part, that before employment, or assignment to the security organization, an individual shall: (1) possess a high school diploma or pass an equivalent performance examination designed to measure basic mathematical, language, and reasoning skills, abilities, and knowledge required to perform security duties and responsibilities; (2) attained the age of 21 for an armed capacity or the age of 18 for an unarmed capacity; (3) not have any felony convictions that reflect on the individual's reliability; and (4) individuals in an armed capacity would not be disqualified from possessing or using firearms or ammunition in accordance with applicable State or Federal law, to include 18 U.S.C. 922. Applicants shall use information that has been obtained during the completion of the individual's background investigation for unescorted access to determine suitability. Satisfactory completion of a firearms background check for the individual under 10 CFR 73.19 of this part will also fulfill this requirement. The provisions of 10 CFR Part 73, Appendix B, Section VI.B.1(b) require the qualification of each individual to perform assigned duties and responsibilities must be documented by a qualified training instructor and attested to by a security supervisor.

Section 2.1 of the T&QP details the requirements of qualifications for employment in the security organization that follows the regulation in 10 CFR Part 73, Appendix B, Section VI.B.1(a).

Physical Qualifications

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2 require, in part, that individuals whose duties and responsibilities are directly associated with the effective implementation of the Commission-approved security plans, applicant protective strategy, and implementing procedures, may not have any physical conditions that would adversely affect their performance of assigned security duties and responsibilities.

Section 2.2 of the T&QP details those individuals that are directly associated with implementation of the security plans. Protective strategy and procedures may not have any physical conditions that would adversely affect their performance of assigned security duties and responsibilities. All individuals that are found on the critical task matrix shall demonstrate the necessary physical qualifications prior to duty.

Physical Examination

It is stated in 10 CFR Part 73, Appendix B, Section VI.B.2(a)(2), that armed and unarmed individuals assigned security duties and responsibilities shall be subject to a physical examination designed to measure the individual's physical ability to perform assigned duties and responsibilities as identified in the Commission-approved security plans, applicant protective strategy, and implementing procedures.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2(a)(3) state, in part, that the physical examination must be administered by a licensed health professional with the final determination being made by a licensed physician to

verify the individual's physical capability to perform assigned duties and responsibilities.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2(b) through (e) provide the minimum requirements that individuals must meet, and include requirements for vision, hearing, review of existing medical conditions, and examination for potential addictions.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.2(f) address medical examinations before returning to assigned duties following any incapacitation.

Section 2.3 of the T&QP describes the physical examinations for armed and unarmed individuals assigned security duties, as well as other individuals that implement parts of the physical protection program. Minimum requirements exist for physical examinations of vision, hearing, existing medical conditions, addiction or other physical requirements.

The NRC staff has reviewed the applicant's description in T&QP Sections 2.1, 2.2, and 2.3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73 Appendix B, Sections VI.B.1 and VI.B.2, and are, therefore, acceptable.

Medical Examinations and Physical Fitness Qualifications

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.4(a) require, in part, that armed members of the security organization shall be subject to a medical examination by a licensed physician, to determine the individual's fitness to participate in physical fitness tests, and that the applicant shall obtain and retain a written certification from the licensed physician that no medical conditions were disclosed by the medical examination that would preclude the individual's ability to participate in the physical fitness tests or meet the physical fitness attributes or objectives associated with assigned duties.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.4(b) require, in part, that before assignment, armed members of the security organization shall demonstrate physical fitness for assigned duties and responsibilities by performing a practical physical fitness test. The physical fitness test must consider physical conditions such as strenuous activity, physical exertion, levels of stress, and exposure to the elements as they pertain to each individual's assigned security duties. The physical fitness qualification of each armed member of the security organization must be documented by a qualified training instructor and attested to by a security supervisor.

Section 2.4 of the T&QP is explicit in its requirements for medical examinations and physical qualifications.

The NRC staff has reviewed the applicant's description in T&QP Section 2.4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.B.4(a) and 10 CFR Part 73, Appendix B, Section VI.B.4(b), and is, therefore, acceptable.

Psychological Qualifications

General Psychological Qualifications

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.3(a) require, in part, that armed and unarmed individuals shall demonstrate the ability to apply good judgment, mental alertness, the capability to implement instructions and assigned tasks, and possess the acuity of senses and ability of expression sufficient to permit accurate communication by written, spoken, audible, visible, or other signals required by assigned duties and responsibilities.

Section 2.5.1 of the T&QP details that individuals whose security tasks and jobs directly associated with the effective implementation of the security plan and protective strategy shall demonstrate the qualities in 10 CFR Part 73, Appendix B, Section VI.B.3(a).

Professional Psychological Examination

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.3(b) require, in part, that a licensed psychologist, psychiatrist, or physician trained in part to identify emotional instability shall determine whether armed members of the security organization and alarm station operators in addition to meeting the requirement stated in paragraph (a) of this section, have no emotional instability that would interfere with the effective performance of assigned duties and responsibilities.

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.3(c) require that a person professionally trained to identify emotional instability shall determine whether unarmed individuals, in addition to meeting the requirement stated in paragraph (a) of this section, have no emotional instability that would interfere with the effective performance of assigned duties and responsibilities.

Section 2.5.2 of the T&QP provides for the administration of psychological and emotional determination that will be conducted by appropriately licensed and trained individuals.

The NRC staff has reviewed the applicant's description in T&QP Sections 2.5.1 and 2.5.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Sections VI.B.3(a), (b) and (c), and are, therefore, acceptable.

Documentation

The provisions of 10 CFR Part 73, Appendix B, Section VI.H.1 require, in part, the retention of all reports, records, or other documentation required by Appendix B and 10 CFR 75.55(q).

Section 2.6 of the T&QP describes that qualified training instructors create the documentation of training activities and that security supervisors attest to these records as required. Records are retained in accordance with Section 22 of the PSP.

The NRC staff has reviewed the applicant's description in T&QP Section 2.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.H.1 and is, therefore, acceptable.

Physical Regualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.B.5 require that: (a) at least annually, armed and unarmed individuals shall be required to demonstrate the capability to meet the physical requirements of this appendix and the applicant's T&QP; and (b) the physical requalification of each armed and unarmed individual must be documented by a qualified training instructor and attested to by a security supervisor.

Section 2.7 of the T&QP describes that physical requalification is conducted at least annually, and documented as described in the PSP.

The NRC staff has reviewed the applicant's description in T&QP Section 2.7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.B.5 and is, therefore, acceptable.

13.6.4.2.3 Individual Training and Qualification

Duty Training

The provisions of 10 CFR Part 73, Appendix B, Section VI.C.1 provide for duty training and qualification requirements. The regulation states, in part, that all personnel who are assigned to perform any security-related duty or responsibility shall be trained and qualified to perform assigned duties and responsibilities to ensure that each individual possesses the minimum knowledge, skills, and abilities required to effectively carry out those assigned duties and responsibilities. These areas of training include performing assigned duties and responsibilities in accordance with the requirements of the T&QP and the PSP, and be trained and qualified in

the use of all equipment or devices required to effectively perform all assigned duties and responsibilities.

Section 3.1 of the T&QP details the requirements that individuals assigned duties must be trained in their duties, meet minimum qualifications, and be trained and qualified in all equipment or devices required to perform their duties.

The staff has reviewed the applicant's description in T&QP Sections 3.0 and 3.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.C.1, and is, therefore, acceptable.

On-the-job Training

The provisions of 10 CFR Part 73, Appendix B, Sections VI.C.2(a) through (c), provides requirements for on-the-job training. On-the-job training must include individual demonstration of the knowledge, skills and abilities provided during the training process. Individuals assigned contingency duties must complete a minimum of 40 hours of on-the-job training.

On-the-job training for contingency activities and drills must include, but is not limited to, hands-on application of knowledge, skills, and abilities related to: (1) response team duties, (2) use of force, (3) tactical movement, (4) cover and concealment, (5) defensive positions, (6) fields-of-fire, (7) re-deployment, (8) communications (primary and alternate), (9) use of assigned equipment, (10) target sets, (11) table top drills, (12) command and control duties, and (13) applicant's protective strategy.

The T&QP provides a comprehensive discussion of the applicant's approach to meeting the requirements for on-the-job training.

The staff has reviewed the applicant's description in T&QP Section 3.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Sections VI.C.2(a) through (c), and is, therefore, acceptable.

Critical Task Matrix

The provisions of 10 CFR Part 73, Appendix B, Section VI.C.1(b) require, in part, that each individual who is assigned duties and responsibilities identified in the Commission-approved security plans, licensee protective strategy, and implementing procedures shall, before assignment, demonstrate proficiencies in implementing the knowledge, skills and abilities to perform assigned duties.

The T&QP includes a critical task matrix as Table 1 of the T&QP. This matrix addresses the means through which each individual will demonstrate the required proficiencies. Tasks that individuals must perform are listed in RG 5.75.

The staff has reviewed the applicant's description in T&QP Section 3.3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.C.1(b), and is, therefore, acceptable.

Initial Training and Qualification Requirements

The provisions of 10 CFR Part 73, Appendix B, Sections VI.C.1(a) through (b), provide the requirements for duty training.

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1 and (2), provide the requirements for demonstration of qualification.

Section 3.4 of the T&QP details that individuals are trained and qualified prior to performing security-related duties within a security organization and must meet the minimum qualifying standards in Sections 3.4.1 and 3.4.2.

Written Examination

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1(b)(1) provide that written exams must include those elements listed in the Commission-approved T&QP to demonstrate an acceptable understanding of assigned duties and responsibilities, to include the recognition of potential tampering involving both safety and security equipment and systems.

Subsection 3.4.1 of the T&QP describe the measures that are implemented by the applicant to meet the requirements in 10 CFR Part 73, Appendix B, Section VI.D.1(b)(1).

Hands on Performance Demonstration

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.1(b)(2) require that armed and unarmed individuals shall demonstrate hands-on performance for assigned duties and responsibilities by performing a practical hands-on demonstration for required tasks. The hands-on demonstration must ensure that theory and associated learning objectives for each required task are considered and each individual demonstrates the knowledge, skills, and abilities required to effectively perform the task.

Section 3.4.2 of the T&QP describe the measures that are implemented by the applicant that meet the requirements in 10 CFR Part 73, Appendix B, Section VI.D.1(b)(2).

The staff has reviewed the applicant's description in T&QP Sections 3.4, 3.4.1, and 3.4.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Sections VI.C.1(b)(1) and D.1(b)(2), and is, therefore, acceptable.

Continuing Training and Qualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.2 state, in part, that armed and unarmed individuals shall be re-qualified at least annually in accordance with the requirements of this appendix and the Commission-approved T&QP. The results of requalification must be documented by a qualified training instructor and attested by a security supervisor.

Section 3.5 of the T&QP provides discussion regarding the management of the requalification program to ensure that each individual is trained and qualified. In part, the applicant's plan provides that annual requalification may be completed up to 3 months before or 3 months after the scheduled date. However, the next annual training must be scheduled 12 months from the previously scheduled date rather than the date the training was actually completed.

The staff has reviewed the applicant's description in T&QP Section 3.5 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.D.2, and is, therefore, acceptable.

Annual Written Examination

The provisions of 10 CFR Part 73, Appendix B, Section VI.D.(b)(3), provide that armed individuals shall be administered an annual written exam that demonstrates the required knowledge, skills, and abilities to carry out assigned duties and responsibilities as an armed member of the security organization. The annual written exam must include those elements listed in the Commission-approved T&QP to demonstrate an acceptable understanding of assigned duties and responsibilities.

Section 3.5.1 of the T&QP provides that each individual will be tested, in part, with an annual written exam that, at a minimum, covers: the role of security personnel; use of deadly force; the requirements in 10 CFR 73.21; authority of private security personnel; power of arrest; search and seizure; offsite law enforcement response; tactics and tactical deployment and engagement.

The staff has reviewed the applicant's description in T&QP Section 3.5.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.D.1.(b)(3), and is, therefore, acceptable.

Demonstration of Knowledge Skills and Abilities

The provisions of 10 CFR Part 73, Appendix B, Sections VI, A., B., C., and D., (A.4, C.3(d), D.1(a), and D.1(b)(2)) state, in part, that an individual must demonstrate required knowledge, skills and abilities, to carry out assigned duties and responsibilities.

Section 3.5.2 of the T&QP provides that all knowledge, skills and abilities will be demonstrated in accordance with a systematic approach to training (SAT) program, similar to what is described in RG 5.75.

The staff has reviewed the applicant's description in T&QP Section 3.5.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Sections VI.A., B., C., and D. and is, therefore, acceptable.

Weapons Training and Qualification

General Firearms Training

The provisions of 10 CFR Part 73, Appendix B, Section VI.E, provide that armed members of the security organization shall be trained and qualified in accordance with the requirements of this appendix and the Commission-approved T&QP. Training must be conducted by certified firearms instructors who shall be recertified at least every 3 years. Applicants shall conduct annual firearms familiarization, and armed members of the security organization must participate in weapons range activities on a nominal 4-month period.

Section 3.6.1 of the T&QP addresses the requirements in 10 CFR Part 73, Appendix B, Sections VI.E.1(d)(1) through (11), and includes the requirements for training in the use of deadly force and participation in weapons range activities on a nominal four 4-month period. Each armed member of the security organization is trained and qualified by a certified firearms instructor for the use and maintenance of each assigned weapon to include but not limited to, marksmanship, assembly, disassembly, cleaning, storage, handling, clearing, loading, unloading, and reloading, for each assigned weapon.

The staff has reviewed the applicant's description in T&QP Section 3.6.1 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.E.1, and is, therefore, acceptable.

General Weapons Qualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.1, Weapons Qualification and Requalification Program require that qualification firing must be accomplished in accordance with Commission requirements and the Commission-approved T&QP for assigned weapons. The results of weapons qualification and requalification must be documented and retained as a record.

Section 3.6.2 of the T&QP provides that all armed personnel are qualified and re-qualified with assigned weapons. All weapons qualification and re-qualification must be documented and retained as a record.

The staff has reviewed the applicant's description in T&QP Section 3.6.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.F.1, and is, therefore, acceptable.

Tactical Weapons Qualification

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.2, require that the applicant conduct tactical weapons qualification. The applicant T&QP must describe the firearms used, the firearms qualification program, and other tactical training required to implement the Commission-approved security plans, applicant protective strategy, and implementing procedures. Applicant-developed tactical qualification and requalification courses must describe the performance criteria needed to include the site specific conditions (such as lighting, elevation, fields-of-fire) under which assigned personnel shall be required to carry out their assigned duties.

Section 3.6.3 of the T&QP provides that a tactical qualification course of fire is used to assess armed security force personnel in tactical situations to ensure they are able to demonstrate required tactical knowledge, skills and abilities remain proficient.

The staff has reviewed the applicant's description in T&QP Section 3.6.3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.F.2 and is, therefore, acceptable.

Firearms Qualification Courses

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.3, state, in part, that the applicant shall conduct the following qualification courses for each weapon used: (a) an annual daylight fire qualification course; and (b) an annual night fire qualification course.

Courses of Fire

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.4, describe required courses of fire.

Section 3.6.4 of the T&QP provides a description of the firearms qualification courses used to ensure armed members of the security organization are properly trained and qualified. Courses of fire are used individually for handguns, shotguns and semiautomatic rifles, and enhanced weapons.

The staff has reviewed the applicant's description in T&QP Section 3.6.4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.F.3, and 10 CFR Part 73, Appendix B, Section VI.F.4, and is, therefore, acceptable.

Firearms Requalification

The provisions of 10 CFR Part 73, Appendix B, Section VI.F.5, provide that armed members of the security organization shall be re-qualified for each assigned weapon at least annually in accordance with Commission requirements and the Commission-approved T&QP, and the results documented and retained as a record. Firearms requalification must be conducted using the courses of fire outlined in 10 CFR Part 73, Appendix B, Sections VI.F.2, VI.F.3, and VI.F.4.

Section 3.6.5 of the T&QP describes that armed members of the security organization re-qualify at least annually with each weapon assigned, using the courses of fire provided in the T&QP.

The staff has reviewed the applicant's description in T&QP Section 3.6.5 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.F.5, and is, therefore, acceptable.

Weapons, Personal Equipment and Maintenance

The provisions of 10 CFR Part 73, Appendix B, Section VI.G, provide the requirements for the maintenance of weapons and personal equipment. These requirements provide that the applicant shall provide armed personnel with weapons that are capable of performing the function stated in the Commission-approved security plans, applicant protective strategy, and implementing procedures. In addition, the applicant shall ensure that each individual is equipped or has ready access to all personal equipment or devices required for the effective implementation of the Commission-approved security plans, applicant protective strategy, and implementing procedures.

Section 3.7 of the T&QP describes that personnel are provided with weapons and personal equipment necessary to meet the plans and the protective strategy. The equipment provided is described in Section 9.0 of the PSP, and maintenance is performed as described in Section 20.0 of the PSP. The staff's review of Section 9, "Security Personnel Training" and Section 20, "Maintenance, Testing, and Calibration," of the PSP is in Subsections 13.6.4.1.9 and 13.6.4.1.20 of this SER.

The staff has reviewed the applicant's description in T&QP Section 3.7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.G, and is, therefore, acceptable.

Documentation

The provisions of 10 CFR Part 73, Appendix B, Section VI.H, require that the applicant shall retain all reports, records, or other documentation required by this appendix in accordance with the requirements of 10 CFR 73.55(q). The applicant shall retain each individual's initial qualification record for three (3) years after termination of the individual's employment and shall retain each re-qualification record for three (3) years after it is superseded. The applicant shall document data and test results from each individual's suitability, physical, and psychological

qualification and shall retain this documentation as a record for three (3) years from the date of obtaining and recording these results.

Section 3.8 of the T&QP provides that records are retained in accordance with Section 22 "Records" of the PSP. PSP, Section 22.11 describes how the applicant will retain each individual's initial qualification record for three (3) years after termination of the individual's employment and shall retain each re-qualification record for three (3) years after it is superseded.

The staff has reviewed the applicant's description in T&QP Section 3.8 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix B, Section VI.H and is, therefore, acceptable.

The following portion of this technical evaluation section is reproduced from Section 13.6.4.2 of the VEGP SER:

13.6.4.2.4 Performance Evaluation Program

10 CFR Part 73, Appendix B, Section VI.C.3, Performance Evaluation Program

(a) Applicants shall develop, implement and maintain a performance evaluation program that is documented in procedures, which describes how the applicant will demonstrate and assess the effectiveness of their onsite physical protection program and protective strategy, including the capability of the armed response team to carry out their assigned duties and responsibilities during safeguards contingency events. The performance evaluation program and procedures shall be referenced in the applicant's T&QP.

(b) The performance evaluation program shall include procedures for the conduct of tactical response drills and force-on-force exercises designed to demonstrate and assess the effectiveness of the applicant's physical protection program, protective strategy and contingency event response by all individuals with responsibilities for implementing the SCP. The performance evaluation program must be designed to ensure, in part, that each member of each shift who is assigned duties and responsibilities required to implement the SCP and applicant protective strategy participates in at least one tactical response drill on a quarterly basis and one force-on-force exercise on an annual basis.

Section 4 of the T&QP details the performance evaluation program consistent with the requirements of 10 CFR Part 73, Appendix B, Sections VI.C.3(a) through (m). Additional details of the performance evaluation program are described in the facility procedures.

The NRC staff has reviewed the applicant's description in T&QP Section 4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in

the T&QP meets the requirements of 10 CFR Part 73, Appendix B, Section VI.C.3 and is, therefore, acceptable.

13.6.4.2.5 Definitions

The provisions of 10 CFR Part 73, Appendix B, Section VI.J state, in part, that terms defined in 10 CFR Part 50, 10 CFR Part 70, "Domestic Licensing of Special Nuclear Material," and 10 CFR Part 73 have the same meaning when used in this appendix. Definitions are found in the PSP, Appendix A, "Glossary of Terms and Acronyms." [On the basis of its review, the NRC staff finds that the definitions sections of the PSP meet the requirements of 10 CFR 73.2, and are, therefore, acceptable.]

Included in this section of the T&QP is the Critical Task Matrix, which is considered SGI and has not been included in this SER.

The NRC staff has reviewed the applicant's description in T&QP of the Critical Task Matrix tasks for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the T&QP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the T&QP meets the requirements of 10 CFR Part 73, Appendix B, and are, therefore, acceptable.

13.6.4.2.6 Conclusion on the Training and Qualification Plan

On the basis of the NRC staff's review described in Sections 13.6.4.2.1 through 13.6.4.2.5 of this SER, the T&QP meets the requirements of 10 CFR Part 73, Appendix B. The target sets, Target Set Analysis and Site Protective Strategy are in the facility implementing procedures, which were not subject to NRC staff review as part of this COL application and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). The NRC staff concludes that complete and procedurally correct implementation will provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

13.6.4.3 Appendix C Safeguards Contingency Plan

13.6.4.3.1 Background Information

This category of information identifies the perceived dangers and incidents that the plan addresses and a general description of how the response is organized.

Purpose of the Safeguards Contingency Plan

The provisions of 10 CFR Part 73, Appendix C, Section II.B.1.b state that the applicant should discuss general goals, objectives and operational concepts underlying the implementation of the SCP.

Section 1.1 of the SCP describes the purpose and goals of the SCP, including guidance to security and management for contingency events.

Scope of the Safeguards Contingency Plan

The provisions of 10 CFR Part 73, Appendix C, Section II.B.1.c delineate the types of incidents that should be covered by the applicant in the SCP, how the onsite response effort is organized and coordinated to effectively respond to a safeguards contingency event and how the onsite response for safeguards contingency events has been integrated into other site emergency response procedures.

Section 1.2 of the SCP details the scope of the SCP to analyze and define decisions and actions of security force personnel, as well as facility operations personnel, for achieving and maintaining safe shutdown.

Perceived Danger

The provisions of 10 CFR Part 73, Appendix C, Section II.B.1 require that, consistent with the DBT specified in 10 CFR 73.1(a)(1), the applicant shall identify and describe the perceived dangers, threats, and incidents against which the SCP is designed to protect.

Section 1.3 of the SCP outlines the threats used to design the physical protection systems.

The applicant adequately addresses perceived danger, provides a purpose of the plan, and describes the scope of the plan.

Definitions

Section 1.4 of the SCP describes that a list of terms and their definitions used in describing operational and technical aspects of the approved SCP as required by 10 CFR Part 73, Appendix C, Section II.B.1.d is found in Appendix A of the PSP.

The NRC staff has reviewed the applicant's description in SCP Sections 1, 1.1, 1.2, 1.3, and 1.4 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR Part 73, Appendix C, Section II.B and are, therefore, acceptable.

13.6.4.3.2 Generic Planning Base

As required in 10 CFR Part 73, Appendix C, Section II.B.2, this section of the plan defines the criteria for initiation and termination of responses to security events, to include the specific decisions, actions, and supporting information needed to respond to each type of incident covered by the approved SCP.

Situations Not Covered by the Contingency Plan

Section 2.1 of the SCP details the general types of conditions that are not covered in the plan.

Situations Covered by the Contingency Plan

The provisions of 10 CFR Part 73, Appendix C, Section II.B.2.a require, in part, that the plan identify those events that will be used for signaling the beginning or aggravation of a safeguards contingency according to how they are perceived initially by the applicant's personnel. Applicants shall ensure detection of unauthorized activities and shall respond to all alarms or other indications signaling a security event, such as penetration of a PA, vital area, or unauthorized barrier penetration (vehicle or personnel); tampering, bomb threats, or other threat warnings—either verbal, such as telephoned threats, or implied, such as escalating civil disturbances.

The provisions of 10 CFR Part 73, Appendix C, Section II.B.2.b require, in part, that the plan define the specific objective to be accomplished relative to each identified safeguards contingency event. The objective may be to obtain a level of awareness about the nature and severity of the safeguards contingency to prepare for further responses; to establish a level of response preparedness; or to successfully nullify or reduce any adverse safeguards consequences arising from the contingency.

The provisions of 10 CFR Part 73, Appendix C, Section II.B.2.c require, in part, that the applicant identify the data, criteria, procedures, mechanisms and logistical support necessary to achieve the objectives identified.

Section 2.2 of the SCP describes in detail the specific situations covered by the SCP, including objectives and information required for each.

The NRC staff has reviewed the applicant's description in SCP Sections 2, 2.1 and 2.2 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR Part 73, Appendix C Section II.B.2 and are, therefore, acceptable.

13.6.4.3.3 Responsibility Matrix

The provisions of 10 CFR Part 73, Appendix C, Section II.B.4, state that this category of information consists of the detailed identification of responsibilities and specific actions to be taken by the applicant's organizations and/or personnel in response to safeguards contingency events. To achieve this result the applicant must address the following.

- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.a, require, in part, that the applicant develop site procedures that consist of matrixes detailing the organization and/or personnel responsible for decisions and actions associated with specific

responses to safeguards contingency events. The responsibility matrix and procedures must be referenced in the applicant's SCP.

- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.b, require, in part, that the responsibility matrix procedures shall be based on the events outlined in the applicant's generic planning base and include specific objectives to be accomplished, description of responsibilities for decisions and actions for each event, and overall description of response actions each responding entity.
- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.c, require, in part, that responsibilities are to be assigned in a manner that precludes conflict of duties and responsibilities that would prevent the execution of the SCP and emergency response plans.
- The provisions of 10 CFR Part 73, Appendix C, Section II.B.4.d, require, in part, that the applicant ensure that predetermined actions can be completed under the postulated conditions.

Section 3 of the SCP includes the responsibility matrix, as required by Appendix C, Section II.B.4a. The responsibility matrix integrates the response capabilities of the security organization (described in Section 4 of the SCP) with the background information relating to decision/actions and organizational structure (described in Section 1 of the SCP), as required by Appendix C, Section II.B.4a. The responsibility matrix provides an overall description of the response actions and their interrelationships, as required by Appendix C, Section II.B.4b. Responsibilities and actions have been predetermined to the maximum extent possible and assigned to specific entities to preclude conflicts that would interfere with or prevent the implementation of the SCP or the ability to protect against the DBT of radiological sabotage as required by Appendix C, Section II.B.4c. The applicant has described how it will ensure that predetermined actions can be completed under the postulated conditions as required by Appendix C, Section II.B.4.d.

The staff has reviewed the applicant's description in SCP Section 3 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR Part 73, Appendix C, Section II.B.4, and is, therefore, acceptable.

13.6.4.3.4 Licensee Planning Base

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3, require, in part, that the applicant planning base include factors affecting the SCP specific for each facility.

Licensee Organization

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.a, require in part, that the SCP describe the organization's chain of command and delegation of authority during safeguards contingency events, to include a general description of how command and control functions will be coordinated and maintained.

Duties/Communication Protocols

Section 4.1.1 of the SCP details the duties and communications protocols of each member of the security organization responsible for implementing any portion of the applicant's protective strategy, which will allow for coordination and maintenance of command and control functions as required by Appendix C, Section II.B.3.a.

Security Chain of Command/Delegation of Authority

Section 4.1.2 of the SCP details the chain of command and delegation of authority during normal operations is discussed in the PSP. The chain of command and delegation of authority during contingency events is also described in the responsibility matrix portions of the SCP. The chain of command and delegation of authority during normal operations is discussed in the PSP. Accordingly, the staff concludes that the applicant has described the chain of command and delegation of authority during contingency events as required by Appendix C, Section II.B.3.a.

Physical Layout

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3(b), require, in part, that the SCP include a site map depicting the physical structures located on the site, including onsite independent spent fuel storage installations, and a description of the structures depicted on the map. Plans must also include a description and map of the site in relation to nearby towns, transportation routes (e.g., rail, water, and roads), pipelines, airports, hazardous material facilities, and pertinent environmental features that may have an effect upon coordination of response activities. Descriptions and maps must indicate main and alternate entry routes for law enforcement or other offsite response and support agencies and the location for marshaling and coordinating response activities.

Section 4.2 of the SCP references Section 1.1 of the PSP for layouts of the OCA, PA, vital areas, site maps, and descriptions of site features. The staff confirmed that these layouts, maps, and descriptions include the detailed information required by Appendix C, Section II.B.3.b, and described above.

Safeguards Systems

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.c, require, in part, that the SCP include a description of the physical security systems that support and influence how the applicant will respond to an event in accordance with the DBT described in 10 CFR 73.1(a). The description must begin with onsite physical protection measures implemented at the outermost perimeter, and must move inward through those measures implemented to protect target set equipment.

Section 4.3 of the SCP describes that safeguards systems are described in PSP Sections 9, 11, 12, 13, 15 and 16, and in facility implementing procedures/documents. Section 8 of the SCP describes how physical security systems will be used to respond to a threat at the site, as required by Appendix C, Section II.B.3.c. As further required by Appendix C, Section II.B.3.c, the SCP description begins with physical protection measures proposed at the outermost facility perimeter, and moves inward through those measures proposed to protect target set equipment..

Law Enforcement Assistance

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.d, require in part, that the applicant provide a listing of available law enforcement agencies and a general description of their response capabilities and their criteria for response and a discussion of working agreements or arrangements for communicating with these agencies.

Section 4.4 of the SCP states in detail the role of LLEA in the site protective strategy. In accordance with Appendix C, Section II.B.3.d, these details include LLEA response capabilities, LLEA criteria for response, and the working agreements or arrangements for communicating with these LLEAs. Additional details regarding LLEA are included in Section 8 of the PSP and Section 5.6 of the SCP.

Policy Constraints and Assumptions

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.e, require in part, that the SCP include a discussion of State laws, local ordinances, and company policies and practices that govern applicant response to incidents and must include, but is not limited to, the following: 1) use of deadly force; 2) recall of off-duty employees; 3) site jurisdictional boundaries; and 4) use of enhanced weapons, if applicable.

Section 4.5 of the SCP details the site security policies, including the use of deadly force and authority to request offsite assistance, as required by Appendix C, Section II.B.3.e.

Administrative and Logistical Considerations

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.f, require in part, that the applicant provide descriptions of applicant practices, which influence how the security organization responds to a safeguards contingency event to include, but is not limited to, a description of the procedures that will be used for ensuring that equipment needed to facilitate response will be readily accessible, in good working order, and in sufficient supply.

Section 4.6 of the SCP outlines administrative duties of the security manager, security shift team leader, facility procedures and administrative forms.

The staff has reviewed the applicant's description in SCP Sections 4, 4.1, 4.1.1, 4.1.2, and 4.2 through 4.6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR Part 73, Appendix C, Section II.B.3 and is, therefore, acceptable.

13.6.4.3.5 Response Capabilities

This section outlines the response by the applicant to threats to the facility. As set forth below, the applicant describes in details how they protect against the DBT with onsite and offsite organizations, in accordance with the regulation of 10 CFR 50.54(p)(1) and (hh)(1), 10 CFR 73.55(k), 10 CFR Part 73, Appendix B, Section VI and 10 CFR Part 73, Appendix C, Section II.B.3. In addition, Appendix C, "Introduction," states, in part, it is important to note that an applicant's SCP is intended to be complementary to any emergency plans developed pursuant to Appendix E "Emergency Planning and Preparedness for Production and Utilization

Facilities,” to 10 CFR Part 50 and 10 CFR 52.79 “Contents of Applications; Technical Information and Final Safety Analysis Report.”

Response to Threats

Section 5.1 of the SCP describes how the protective strategy is designed to defend the facility against all aspects of the DBT. Each organization has defined roles and responsibilities.

Armed Response Team

Section 5.2 of the SCP notes individuals from the Responsibility Matrix and their role in the site protective strategy. This section also notes the minimum number of individuals and their contingency equipment for implementation of the protective strategy. The applicant described the armed response team consistent with 10 CFR 73.55(k)(4), (5), (6), and (7), 10 CFR Part 73, Appendix B, Section VI, and 10 CFR Part 73, Appendix C, Section II.B.3.

Supplemental Security Officer

Section 5.3 of the SCP details the role of supplemental security officers in the site protective strategy. The applicant described the use of supplemental security officers, consistent with the requirements in 10 CFR 73.55(k)(4).

Facility Operations Response

Section 5.4 of the SCP details the role of operations personnel in the site protective strategy, including responsibilities, strategies, and conditions for operator actions as discussed in 10 CFR 50.54(hh)(l).

Emergency Plan Response

Section 5.5 of the SCP notes the integration of the Emergency Plan with the site's protective strategy, and gives some examples of how the Emergency Plan can influence the protective strategy as discussed in 10 CFR 73.55(b)(11).

Local Law Enforcement Agencies (LLEA)

Section 5.6 of the SCP documents the current agreements with applicable LLEA, and therefore meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d, and lists the LLEAs that will respond to the site as a part of the protective strategy. Details on the response of the LLEA are located in Section 8 of the PSP. Furthermore, Section 5.6 provides a general description of the LLEA response capability and meets the corresponding portions of 10 CFR 73.55(k)(9).

State Response Agencies

Section 5.7 of the SCP documents the current agreements with applicable LLEA, and therefore meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d and lists the State response agencies that will respond to the site as a part of the protective strategy. Furthermore, Section 5.7 provides a general description of the LLEA response capability and meets the corresponding portions of 10 CFR 73.55(k)(9).

Federal Response Agencies

Section 5.8 of the SCP documents the current agreements with applicable LLEA, and therefore meets the requirements of 10 CFR 73.55(k)(9) and 10 CFR Part 73, Appendix C, Section II.B.3.d and lists the Federal response agencies that will respond to the site as a part of the protective strategy. Furthermore, Section 5.7 provides a general description of the LLEA response capability and meets the corresponding portions of 10 CFR 73.55(k)(9).

Response to ISFSI Events

Section 5.9 is not applicable for Turkey Point Units 6 and 7 since there is no ISFSI associated with this application.

The staff has reviewed the applicant's description in SCP Sections 5.0 through 5.9 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR 50.54(p)(1) and (hh), 10 CFR 73.55(k), 10 CFR Part 73, Appendix B, Section VI, and 10 CFR Part 73, Appendix C, Section II.B.3, and is, therefore, acceptable. In addition, Appendix C, "Introduction" states, in part, that it is important to note that an applicant's SCP is intended to be complementary to any emergency plans developed pursuant to Appendix E to 10 CFR Part 50 and 10 CFR 52.17.

The following portion of this technical evaluation section is reproduced from Section 13.6.4.3 of the VEGP SER:

13.6.4.3.6 Defense-In-Depth

Section 6 of the SCP lists site physical security characteristics, programs, and the strategy elements that illustrate the defense-in-depth nature of the site protective strategy as required in 10 CFR 73.55(b)(3).

The NRC staff has reviewed the applicant's description in SCP Section 6 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR 73.55(b)(3) and is, therefore, acceptable.

13.6.4.3.7 Primary Security Functions

Section 7 of the SCP details the primary security functions of the site, and their roles in the site protective strategy. It also notes the development of target sets, and their function in the development of the site's protective strategy.

The NRC staff has reviewed the applicant's description in SCP Section 7 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in

NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP meets the requirements of 10 CFR 10 CFR 73.55(b) and is, therefore, acceptable.

13.6.4.3.8 Protective Strategy

The provisions of 10 CFR Part 73, Appendix C, Section II.B.3.c(v), require that applicants develop, implement, and maintain a written protective strategy that shall: (1) be designed to meet the performance objectives of 10 CFR 73.55(a) through (k), (2) identify predetermined actions, areas of responsibilities, and timelines for the deployment of armed personnel, (3) include measures that limit the exposure of security personnel to possible attack, (4) include a description of the physical security systems and measures that provide defense-in-depth, (5) describe the specific structure and responsibilities of the armed response organization, and (6) provide a command and control structure.

Section 8 of the SCP describes the site protective strategy.

The staff has reviewed the applicant's description in SCP Section 8 for the implementation of the site-specific physical protection program in accordance with Commission regulations and NUREG-0800 acceptance criteria. Because the applicant's description in the SCP is consistent with the acceptance criteria in NUREG-0800, Section 13.6.1, the staff finds that the description provided in the SCP provides reasonable assurance that the licensee will meet the requirements of 10 CFR Part 73, Appendix C, Section II.B.3.c(v) and is, therefore, acceptable.

The following portion of this technical evaluation section is reproduced from Section 13.6.4.3 of the VEGP SER:

13.6.4.3.9 Conclusions on the Safeguards Contingency Plan

On the basis of the NRC staff's review described in Sections 13.6.4.3.1 through 13.6.4.3.8 of this SER, the SCP meets the requirements of 10 CFR Part 73, Appendix C, in accordance with the DBT of radiological sabotage as stated in 10 CFR 73.1. The target sets, Target Set Analysis and Site Protective Strategy are in the facility implementing procedures, which were not subject to NRC staff review as part of this COL application and are, therefore, subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). The NRC staff concludes that complete and procedurally correct implementation of the SCP will provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.

13.6.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds the following license condition acceptable:

- License Condition (13-7) - No later than 12 months after issuance of the COL, FPL shall submit to the Director of NRO, or the Director's designee, a schedule for implementation of the operational programs listed in FSAR Table 13.4-201, including the associated estimated date for initial loading of fuel. The schedule shall be updated every 6 months

until 12 months before scheduled fuel loading, and every month thereafter until all the operational programs listed in FSAR Table 13.4-201 have been fully implemented.

13.6.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in the Turkey Point Units 6 and 7 COL FSAR is acceptable based on the applicable regulations specified in Section 13.6.4 of this SER. The staff based its conclusion on the following:

- STD COL 13.6-1, as related to the physical protection program, is acceptable based on the following discussion. The staff's review of the Turkey Point Units 6 and 7 PSP, T&QP, and SCP has focused on ensuring the necessary programmatic elements are included in these plans to provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety.
- As described in this section, the staff has determined that these plans include the necessary programmatic elements that, when effectively implemented, will provide the required high assurance. The burden to effectively implement these plans remains with the applicant. Effective implementation is dependent on the procedures and practices the applicant develops to satisfy the programmatic elements of its PSP, T&QP, and SCP. The target set analysis and site protective strategy are in facility implementing procedures which were not subject to NRC staff review as part of this COLA and are therefore subject to future NRC inspection in accordance with 10 CFR 73.55(c)(7)(iv) and 10 CFR Part 73, Appendix C, Section II.B.5(iii). As provided by Section 3 of the applicant's PSP, a performance evaluation program will be implemented that periodically tests and evaluates the effectiveness of the overall protective strategy. This program provides that deficiencies be corrected. In addition, NRC inspectors will conduct periodic force-on-force exercises that will test the effectiveness of the applicant's protective strategy. Based on the results of the applicant's own testing and evaluation, the NRC's baseline inspections and force-on-force exercises, enhancements to the applicant's PSP, T&QP, and SCP may be required to ensure the overall protective strategy can be effectively implemented. As such, staff approval of the applicant's PSP, T&QP, and SCP is limited to the programmatic elements necessary to provide the required high assurance as stated above. Should deficiencies be identified with the programmatic elements of these plans as a result of the periodic applicant or NRC conducted drills or exercises that test the effectiveness of the overall protective strategy, the applicant shall correct the plans to address these deficiencies in a timely manner and to notify the NRC of these plan changes in accordance with the requirements of 10 CFR 50.54(p) or 10 CFR 50.90, "Application for amendment of license, construction permit, or early site permit."

The COL applicant's security plan information is withheld from public disclosure in accordance with the provisions of 10 CFR 73.21.

13.6.A Site-Specific ITAAC for Physical Security

13.6.A.1 Introduction

Part 10, "Proposed License Conditions and ITAAC," Appendix B, "Inspections, Tests, Analysis, and Acceptance Criteria" of the Turkey Point Units 6 and 7 COLA describes the license conditions for the plant's physical protection systems or features to provide physical protection of the site-specific protective strategy and elements of a site security program. The COLA incorporates by reference Tier 1 Section 2.6.9 of the AP1000 DCD, including plant layout and configurations of barriers, and lists ITAAC related to the site-specific design for achieving detection, assessment, communications, delay, and response for physical protection against potential acts of radiological sabotage and theft of special nuclear material.

The design bases or supporting security analyses and assumptions related to the design descriptions of security-related features incorporated by reference from the AP1000 DCD are in Westinghouse TR-94. Descriptions of site-specific security structures, programs and contingency measures are in the Turkey Point Units 6 and 7 PSP, which includes the site PSP, T&QP and the SCP.

13.6.A.2 Summary of Application

Section 14.3 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8 incorporates by reference Section 14.3 of the AP1000 DCD, Revision 19. Part 10, Revision 8 of the Turkey Point Units 6 and 7 COLA incorporates by reference DCD Tier 1 Section 2.6.9, which includes the physical security-inspections, tests, analyses, and acceptance criteria (PS-ITAC) that are within the scope of the AP1000 standard design. Site-specific PS-ITAC that are outside the scope of AP1000 DCD Tier 1 Section 2.6.9 are provided in Table 2.6.9-2 of Appendix B to Part 10 of the Turkey Point Units 6 and 7 COLA.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 14.3, the applicant provided the following:

Supplemental Information

- STD SUP 14.3-1

The applicant provided supplemental information related to physical security in STD SUP 14.3-1 in PTN COL FSAR Section 14.3.2.3.2.

License Condition

- Part 10, License Condition 1

The applicant provided a license condition in Part 10 of the Turkey Point Units 6 and 7 COLA, Revision 6, which will incorporate the ITAAC identified in the tables in Appendix B. The staff evaluates this license condition in Chapter 1 of this SER.

13.6.A.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

In addition, the acceptance criteria associated with the relevant requirements of the Commission regulations are given in 10 CFR Part 73. The regulation includes specific security and performance requirements that, when adequately implemented, are designed to protect nuclear power reactors against acts of radiological sabotage, prevent the theft or diversion of special nuclear material, and protect safeguards information against unauthorized release.

The provisions of 10 CFR 52.80, Subpart A, require that information submitted for a COL include the proposed ITAAC that the licensee shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the ITAAC are met, the facility has been constructed and will operate in conformity with the COL, the provisions of the Atomic Energy Act, and the NRC's regulations.

The Turkey Point Units 6 and 7 design descriptions, commitments, and acceptance criteria for the security features, including the plant's layout and determination of vital equipment and areas, for a certified design are based on physical protection systems or hardware provided for meeting requirements of the following Commission regulations:

- 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities" 10 CFR Part 52, "Licenses, Certifications, and Approvals for Nuclear Power Plants" 10 CFR 73.1(a)(1), "Radiological Sabotage"
- 10 CFR 73.55, "Requirements for physical protection of licensed activities in nuclear power reactors against radiological sabotage," Appendix B, "General Criteria for Security Personnel"; Appendix C, "Nuclear Power Plant Safeguards Contingency Plans"; Appendix G, "Reportable Safeguards Events"; and Appendix H, "Weapons Qualification Criteria"
- 10 CFR Part 74, "Material control and accounting of special nuclear material"
- 10 CFR 100.21(f), "Non-Seismic Siting Criteria"

Regulatory requirements and acceptance criteria related to physical protection systems or hardware are identified in Section 14.3.12 of NUREG-0800.

Regulatory guidance documents that are applicable to this evaluation are:

- RG 1.91, "Evaluations of Explosions Postulated to Occur at Transportation Routes Near Nuclear Power Plants," Revision 1
- RG 1.206, "Combined License Applications for Nuclear Power Plants"
- RG 4.7, "General Site Suitability Criteria for Nuclear Power Stations," Revision 2
- RG 5.7, "Entry/Exit Control for Protected Areas, Vital Areas, and Material Access Areas," Revision 1
- RG 5.12, "General Use of Locks in the Protection and Control of Facilities and Special Nuclear Materials"
- RG 5.44, "Perimeter Intrusion Alarm Systems," Revision 3

- RG 5.62, "Reporting of Safeguards Events," Revision 1
- RG 5.65, "Vital Area Access Controls, Protection of Physical Protection System Equipment and Key and Lock Controls"
- RG 5.66, "Access Authorization Program for Nuclear Power Plants"
- Information Notice 86-83, "Underground Pathways into Protected Areas, Vital Areas, and Controlled Access Areas," September 19, 1986
- Regulatory Information Summary (RIS) 2005-04, "Guidance on the Protection of Unattended Openings that Intersect a Security Boundary or Area," April 14, 2005. (Exempt from public disclosure in accordance with 10 CFR 2.390, "Public inspections, exemptions, requests for withholding.")

The COL applicant is required to describe commitments for establishing and maintaining a physical protection system (engineered and administrative controls), organization, programs, and procedures for implementing a site-specific strategy that, if adequately implemented, provide high assurance for protection of the plant against the DBT. The site-specific physical protection system described must be reliable and available and implement the concept of defense-in-depth protection in order to provide a high assurance of protection. The security operational programs and the physical protection system are required to meet the specific performance requirements of 10 CFR Part 26; 10 CFR 73.54, "Protection of Digital Computer and Communication Systems and Networks"; 10 CFR 73.55; 10 CFR 73.56, "Personnel access authorization requirements for nuclear power plants"; 10 CFR 73.57, "Requirements for criminal history records checks of individuals granted unescorted access to a nuclear power facility or access to Safeguards Information"; and 10 CFR 73.58. Physical protection hardware within the scope of the AP1000 design is addressed in the AP1000 DCD.

13.6.A.4 Technical Evaluation

The staff reviewed Section 14.3 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COLA represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to ITAAC for physical security. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COLAs. To ensure that the staff's findings on standard content that were documented in the SER for the reference COLA (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COLA, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COLA, as applicable) resulting from RAIs.

- The staff confirmed that all responses to RAIs identified in the corresponding standard content evaluation were endorsed.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and found the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COLA. This standard content material is identified in this SER by use of italicized, double-indented formatting. The staff confirmed that the November 15, 2010, FPL letter L-2010-258 (ADAMS Accession No. ML103210407) contained the same technical information provided in the June 11, 2010, VEGP letter discussed in the standard content material below.

The following portion of this technical evaluation section is reproduced from Section 13.6.A.4 of the VEGP SER:

Supplemental Information

- *STD SUP 14.3-1*

STD SUP 14.3-1 adds the following after DCD Section 14.3.2.2 as new Section 14.3.2.3.2:

Generic PS-ITAAC have been developed in a coordinated effort between the NRC and the Nuclear Energy Institute (NEI) as outlined in Appendix C.II.I-C of Regulatory Guide 1.206. These generic ITAAC have been tailored to the AP1000 design and site-specific security requirements.

In Part 10, Appendix B of the VEGP Units 3 and 4 COL application, SNC describes the ITAAC for the plant's physical protection systems or features to provide physical protection of the site-specific protective strategy and elements of a site security program. The COL application incorporates by reference Tier 1 Section 2.6.9 of the AP1000 DCD, including plant layout and configurations of barriers, and listed ITAAC related to the site-specific design for achieving detection, assessment, communications, delay, and response for physical protection against potential acts of radiological sabotage and theft of special nuclear material. DCD Tier 1 Section 2.6.9 includes the physical security ITAAC that are in the scope of the AP1000 standard design. Site-specific physical security ITAAC that are outside the scope of AP1000 DCD Tier 1 Section 2.6.9 are provided in Table 2.6.9-2 of Appendix B to Part 10 of the VEGP COL application.

The NRC staff's evaluation of the PS-ITAAC (STD SUP 14.2-1) is documented in the Sections 13.6.A.4.1 through 13.6.A.4.3 of this SER.

13.6.A.4.1 Detection and Assessment Hardware

The applicant submitted the following ITAAC for detection and assessment hardware in their letter dated June 11, 2010, "Response to Request for Additional Information Letter No. 047, Supplement 2, Physical Security Inspections, Tests,

Analyses, and Acceptance Criteria,” This letter was used to complete the evaluation below.

1. *The external walls, doors, ceiling, and floors in the location within which the last access control function for access to the protected area is performed are bullet resistant to at least Underwriters Laboratory Ballistic Standard 752, Level 4. (Item 6 in Appendix A to Section 14.3.12 of NUREG-0800.)*
2. *Physical barriers for the protected area perimeter are not part of vital area barriers. (Item 2.a in Appendix A to Section 14.3.12 of NUREG-0800.)*
3.
 - a) *Isolation zones exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area that allows 20 feet of observation on either side of the barrier. (Item 3.a in Appendix A to Section 14.3.12 of NUREG-0800.)*
 - b) *Where permanent buildings do not allow a 20-foot observation distance on the inside of the protected area, the building walls are immediately adjacent to, or an integral part of, the protected area barrier. (Item 3.c in Appendix A to Section 14.3.12 of NUREG-0800.) The isolation zones are monitored with intrusion detection equipment that provides the capability to detect and assess unauthorized persons. (Item 3.b in Appendix A to Section 14.3.12 of NUREG-0800.)*
4. *The intrusion detection and assessment equipment at the protected area perimeter:*
 - a) *Detects penetration or attempted penetration of the protected area barrier and concurrently alarms in both the Central Alarm Station and Secondary Alarm Station. (Item 4.a in Appendix A to Section 14.3.12 of NUREG-0800.)*
 - b) *The intrusion detection and assessment equipment at the protected area perimeter remains operable from an uninterruptible power supply in the event of the loss of normal power. (Item 4.c in Appendix A to Section 14.3.12 of NUREG-0800.)*
6. *An access control system with numbered picture badges is installed for use by individuals who are authorized access to protected areas without escort. (Item 9 in Appendix A to Section 14.3.12 of NUREG-0800.)*
8.
 - a) *Penetrations through the protected area barrier are secured and monitored. (Item 2.b in Appendix A to Section 14.3.12 of NUREG-0800.)*

- b) *Unattended openings (such as underground pathways) that intersect the protected area boundary or vital area boundary will be protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation. (Item 2.c in Appendix A to Section 14.3.12 of NUREG-0800.)*

On the basis of its review the NRC staff determined that the applicant has adequately revised Table 2.6.9-2 for Part 10 to the VEGP COL application PS-ITAAC items 2(a), 2(b), 2 (c), 3(a), 3(b), 3(c), 4(a), 4(c), 6(partially), and 9 identified in Appendix A to Section 14.3.12 of NUREG-0800.

The VEGP COL application references the AP1000 DCD, which addressed NUREG-0800, Section 14.3.12 PS-ITAAC 4(b), 5, 6(partially), 10, 11(a), 11(b), 11(c) and 14. The staff has determined that PS-ITAAC 6, described in NUREG-0800, Section 14.3.12 has been fully addressed between the VEGP submission and the AP1000 DCD.

In a supplemental response to RAI 14.3.12-1, the applicant stated:

The information contained in SRP ITAAC number 11(d) is redundant to existing ITAAC in the AP1000 Design Certification Document (DCD). AP1000 DCD security ITAAC numbers 1, 4, 5(a), 5(b), 5(c), 13(a), 13(b), 13(c), and 15(b) demonstrate that the central and secondary alarm stations are equal and redundant, by being constructed, located, protected, and equipped to the standards for the central alarm station.

In RAI SRP 14.3.12-NSIR-7, Revision 1, Westinghouse stated:

No corresponding ITAAC has been provided for SRP 14.3.12 ITAAC number 11(d). The information contained in SRP ITAAC number 11(d) is redundant to existing ITAACs. AP1000 security ITAAC numbers 1, 4, 5(a), 5(b), 5(c), 13, and 15(b) demonstrate that the central and secondary alarm stations are constructed, located, protected, and equipped to the standards for the central alarm station.

On the basis of its review, the NRC staff determined that the applicant has adequately shown that NUREG-0800, Section 14.3.12 detection and assessment hardware ITAAC 11(d) is addressed.

13.6.A.4.2 Delay or Barrier Design

The applicant submitted the following ITAAC for Delay or Barrier Design in their "Response to Request for Additional Information Letter No. 047, Supplement 2, Physical Security Inspections, Tests, Analyses, and Acceptance Criteria," Dated June 11, 2010. This letter was used to complete the evaluation below.

5. *Access control points are established to:*

- a) *Control personnel and vehicle access into the protected area. (Item 8.a in Appendix A to Section 14.3.12 of NUREG-0800.)*

- b) Detect firearms, explosives, and incendiary devices at the protected area personnel access points. (Item 8.b in Appendix A to Section 14.3.12 of NUREG-0800.)*
- 7. Access to vital equipment physical barriers requires passage through the protected area perimeter barrier. (Item 1.b in Appendix A to Section 14.3.12 of NUREG-0800.)*

On the basis of its review, the NRC staff determined that the applicant has adequately addressed NUREG-0800, Section 14.3.12 delay or barrier design PS-ITAAC 1(b)(partially), 8(a) and 8(b).

The VEGP COL application references the AP1000 DCD, which addressed NUREG-0800, Section 14.3.12 PS-ITAAC 1(a), 1(b)(partially), 7, 13(a) and 13(b). The staff has determined that PS-ITAAC 1(b) described in NUREG-0800, Section 14.3.12 has been fully addressed between the VEGP submission and the AP1000 DCD.

13.6.A.4.3 Systems, Hardware, or Features Facilitating Security Response and Neutralization

The applicant submitted the following ITAAC for Systems, Hardware, or Features Facilitating Security Response and Neutralization in their "Response to Request for Additional Information Letter No. 047, Supplement 2, Physical Security Inspections, Tests, Analyses, and Acceptance Criteria," Dated June 11, 2010. This letter was used to complete the evaluation below.

- 9. Emergency exits through the protected area perimeter are alarmed and secured with locking devices to allow for emergency egress. (Item 15 in Appendix A to Section 14.3.12 of NUREG-0800.)*

On the basis of its review, the NRC staff determined that the applicant has adequately addressed NUREG-0800, Section 14.3.12 delay or barrier design PS-ITAAC 15(partially).

The VEGP COL application references the AP1000 DCD, which addressed NUREG-0800, Section 14.3.12 PS-ITAAC 12, 15(partially) 16(a), 16(b) and 16(c). The staff has determined that PS-ITAAC 15 described in NUREG-0800, Section 14.3.12 has been fully addressed between the VEGP submission and the AP1000 DCD.

On the basis of its review, the staff finds that since the applicant revised Turkey Point Units 6 and 7 COL FSAR Part 10 to incorporate the requirements for PS-ITAAC, the response to VEGP RAI 14.03.12- 1, 2 and 3 has adequately addressed NUREG-0800, Section 14.3.12, and is therefore, acceptable.

13.6.A.5 Post-Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff proposes to include the following ITAAC for physical security:

- The licensee shall perform and satisfy the ITAAC defined in Table 13.6A-1, "Site Specific Physical Security."

13.6.A.6 Conclusion

The staff reviewed the application and checked the referenced DCD. The staff's review confirmed that the applicant has addressed the relevant information relating to this section, and no outstanding information related to this section remains to be addressed in the Turkey Point Units 6 and 7 COL FSAR. The results of the staff's technical evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

The staff concludes that the relevant information presented in Turkey Point Units 6 and 7 COL FSAR and the additional information received in the November 15, 2010, FPL letter L-2010-258 (ADAMS Accession No. ML103210407) is acceptable based on the applicable regulations specified in Section 13.6.A.4 of this SER. The staff based its conclusion on the following:

- STD SUP 14.3-1, as related to PS-ITAAC, is acceptable based on the following discussion. The staff finds that the applicant adequately describes the physical security systems or provides or facilitates the implementation of the site-specific protective strategy and security programs. The applicant adequately describes the site-specific PS-ITAAC for meeting the requirements of 10 CFR 73.55 and provides the technical bases for establishing a PS-ITAAC for the protection against acts of radiological sabotage and theft of special nuclear material. The applicant includes systems and features as stated in Turkey Point Units 6 and 7 COL FSAR Chapter 13 and referenced TRs. The applicant has provided adequate descriptions of objectives, prerequisites, test methods, data required, and acceptance criteria for security related ITAAC for the approval of the Turkey Point Units 6 and 7 COL.

Table 13.6A-1: Site-Specific Physical Security Inspections, Tests, Analyses and Acceptance Criteria

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
1. The external walls, doors, ceiling, and floors in the location where the last access control function for access to the protected area is performed are bullet- resistant to at least Underwriters Laboratory Ballistic Standard 752, level 4.	Type test, analysis, or a combination of type test and analysis will be performed for the external walls, doors, ceilings, and floors in the location within which the last access control function for access to the protected area is performed.	The external walls, doors, ceilings, and floors in the location where the last access control function for access to the protected area is performed are bullet- resistant to at least Underwriters Laboratory Ballistic Standard 752, level 4.
2. Physical barriers for the protected area perimeter are not part of vital area barriers.	An inspection of the protected area perimeter barrier will be performed.	Physical barriers at the perimeter of the protected area are separated from any other barrier designated as a vital area barrier.

Table 13.6A-1: Site-Specific Physical Security Inspections, Tests, Analyses and Acceptance Criteria

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
<p>3.</p> <p>a) Isolation zones exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area that allows 20 feet of observation on either side of the barrier. Where permanent buildings do not allow a 20-foot observation distance on the inside of the protected area, the building walls are immediately adjacent to, or an integral part of, the protected area barrier.</p> <p>b) The isolation zones are monitored with intrusion detection equipment that provides the capability to detect and assess unauthorized persons.</p>	<p>Inspections will be performed of the isolation zones in outdoor areas adjacent to the physical barrier at the perimeter of the protected area.</p> <p>Inspections will be performed of the intrusion detection equipment within the isolation zones.</p>	<p>Isolation zones exist in outdoor areas adjacent to the physical barrier at the perimeter of the protected area and allow 20 feet of observation and assessment of the activities of people on either side of the barrier. Where permanent buildings do not allow a 20-foot observation and assessment distance on the inside of the protected area, the building walls are immediately adjacent to, or an integral part of, the protected area barrier and the 20-foot observation and assessment distance does not apply.</p> <p>The isolation zones are equipped with intrusion detection equipment that provides the capability to detect and assess unauthorized persons.</p>

Table 13.6A-1: Site-Specific Physical Security Inspections, Tests, Analyses and Acceptance Criteria

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
<p>4. The intrusion detection and assessment equipment at the protected area perimeter:</p> <ul style="list-style-type: none"> a) detects penetration or attempted penetration of the protected area barrier and concurrently alarms in both the central alarm station and secondary alarm station, and b) remains operable from an uninterruptible power supply in the event of the loss of normal power. 	<p>Tests, inspections or a combination of tests and inspections of the intrusion detection and assessment equipment at the protected area perimeter and its uninterruptible power supply will be performed.</p>	<p>The intrusion detection and assessment equipment at the protected area perimeter:</p> <ul style="list-style-type: none"> a) detects penetration or attempted penetration of the protected area barrier and concurrently alarms in the central alarm station and secondary alarm station, and b) remains operable from an uninterruptible power supply in the event of the loss of normal power.
<p>5. Access control points are established to:</p> <ul style="list-style-type: none"> a) control personnel and vehicle access into the protected area. b) detect firearms, explosives, and incendiary devices at the protected area personnel access points. 	<p>Tests, inspections, or combination of tests and inspections of installed systems and equipment at the access control points to the protected area will be performed.</p>	<p>The access control points for the protected area:</p> <ul style="list-style-type: none"> a) are configured to control personnel and vehicle access. b) include detection equipment that is capable of detecting firearms, incendiary devices, and explosives at the protected area personnel access points.

Table 13.6A-1: Site-Specific Physical Security Inspections, Tests, Analyses and Acceptance Criteria

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
6. An access control system with numbered picture badges is installed for use by individuals who are authorized access to protected areas and vital areas without escort.	A test of the access control system with numbered picture badges will be performed.	The access authorization system with numbered picture badges can identify and authorize protected area and vital area access only to those personnel with unescorted access authorization.
7. Access to vital equipment physical barriers requires passage through the protected area perimeter barrier.	Inspection will be performed to confirm that access to vital equipment physical barriers requires passage through the protected area perimeter barrier.	Vital equipment is located within a protected area such that access to vital equipment physical barriers requires passage through the protected area perimeter barrier.
8. a) Penetrations through the protected area barrier are secured and monitored. b) Unattended openings (such as underground pathways) that intersect the protected area boundary or vital area boundary will be protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation.	Inspections will be performed of penetrations through the protected area barrier. Inspections will be performed of unattended openings that intersect the protected area boundary or vital area boundary.	Penetrations and openings through the protected area barrier are secured and monitored. Unattended openings (such as underground pathways) that intersect the protected area boundary or vital area boundary are protected by a physical barrier and monitored by intrusion detection equipment or provided surveillance at a frequency sufficient to detect exploitation.

Table 13.6A-1: Site-Specific Physical Security Inspections, Tests, Analyses and Acceptance Criteria

Design Commitment	Inspections, Tests, and Analyses	Acceptance Criteria
9. Emergency exits through the protected area perimeter are alarmed and secured with locking devices to allow for emergency egress.	Tests, inspections, or a combination of tests and inspections of emergency exits through the protected area perimeter will be performed.	Emergency exits through the protected area perimeter are alarmed and secured by locking devices that allow prompt egress during an emergency.

13.7 Fitness for Duty

13.7.1 Introduction

Pursuant to 10 CFR 52.79(a)(44), COLAs must include a description of the fitness for duty (FFD) program required by 10 CFR Part 26 and its implementation. The FFD program is designed to provide reasonable assurance that: (1) individuals are trustworthy and reliable as demonstrated by the avoidance of substance abuse; (2) individuals are not under the influence of any substance, legal or illegal, or mentally or physically impaired from any cause, which in any way adversely affects their ability to safely and competently perform their duties; (3) measures are established and implemented for the early detection of individuals who are not fit to perform their duties; (4) the construction site is free from the presence and effects of illegal drugs and alcohol; (5) the work places are free from the presence and effects of illegal drugs and alcohol; and, (6) the effects of fatigue and degraded alertness on an individual's ability to safely and competently perform his or her duties are managed commensurate with maintaining public health and safety.

13.7.2 Summary of Application

Turkey Point Units 6 and 7 COL FSAR Section 13.7 is a new section added after Section 13.6 of the AP1000 DCD. The references that are currently in AP1000 DCD Section 13.7 have been redistributed to other Turkey Point Units 6 and 7 COL FSAR sections. There is no information associated with the FFD program incorporated by reference from the AP1000 DCD.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 13.7, Revision 8, the applicant provided the following:

Supplemental Information

- STD SUP 13.7-1

The applicant provided standard supplemental information in Turkey Point Units 6 and 7 COL FSAR Section 13.7 describing the FFD program for both the construction phase and the operating phase of the units. The construction phase program will be consistent with NEI 06-06, "Fitness for Duty Program Guidance for New Nuclear Power Plant Construction Sites," and the

construction phase program will be implemented prior to onsite construction of safety- and security-related SSCs. The operations phase program will be consistent with 10 CFR Part 26.

License Conditions

- Part 10, License Condition 6

The applicant proposed a license condition to provide a schedule to support the NRC's inspection of operational programs included in the Turkey Point Units 6 and 7 COL FSAR Table 13.4-201 including the FFD program.

13.7.3 Regulatory Basis

The applicable regulatory requirements for STD SUP 13.7-1 are as follows:

- 10 CFR Part 26, "Fitness for duty programs"
- 10 CFR 52.79(a)(44)

Regulatory guidance for FFD programs is included in RG 1.206.

13.7.4 Technical Evaluation

The staff reviewed Section 13.7 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, to ensure that the COLA represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application addresses the required information relating to the FFD program.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COLAs. To ensure that the staff's findings on standard content that were documented in the SER for the reference COLA (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7, COLA, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5, to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7, COL FSAR (and other parts of the COLA, as applicable) resulting from RAIs.
- The staff verified that the site-specific differences were not relevant.

The staff has completed its review and has verified that the Turkey Point Units 6 and 7 application incorporates the standard content information included in the Vogtle application. Accordingly, the staff finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COLA. This standard content material is identified in this SER by use of italicized, double-indented formatting. Instead of confirming that all responses to RAIs identified in the corresponding standard content evaluation were endorsed by the Turkey Point Units 6 and 7, applicant (which is a typical step when comparing the two applications), the staff provides its evaluation of similar RAIs issued to Turkey Point Units 6 and 7, following the standard content material. The one confirmatory item in the standard content

material retains the number assigned in the VEGP SER, and is also addressed following the standard content material.

The following portion of this technical evaluation section is reproduced from Section 13.7.4 of the VEGP SER:

Supplemental Information

- STD SUP 13.7-1

The applicant provided a new Section 13.7 in the VEGP COL FSAR describing the FFD program. STD SUP 13.7-1 added the following text to Section 13.7:

The Fitness for Duty (FFD) Program (Program) is implemented and maintained in two phases; the construction phase program and the operating phase program. The construction and operations phase programs are implemented as identified in [FSAR] Table 13.4-201.

The construction phase program is consistent with NEI 06-06 ([FSAR] Reference 201). The workforce population subject to random testing during construction is determined on a weekly basis by averaging the total number of active construction badges over each preceding seven-day period. The random selection from each week's workforce population is identified by a standard computer-generated random number generator using this number of active badges as the range of numbers considered in the weekly random testing selection.

The operations phase program is consistent with 10 CFR Part 26.

The staff notes that Reference 201 in the above text refers to Revision 4 of NEI 06-06.

The NRC staff's review of STD SUP 13.7-1 included the following: (1) the adequacy of the FFD program for the construction phase; (2) the adequacy of the FFD program for the operations phase; and (3) the implementation schedule proposed by the applicant for both the construction phase and operations phase FFD operational programs.

The NRC staff issued three RAIs to obtain further clarification on the applicant's FFD Program. The first two RAIs discussed below are associated with the resolution of STD SUP 13.7-1.

In RAI 13.6-33, the staff asked how the applicant intends to update its FFD program for the construction phase. NEI 06-06 provides examples of the FFD program that is required and, if this guidance is endorsed by the NRC, will provide an acceptable method of complying with the NRC's regulations. If the NRC endorses NEI 06-06, does the applicant intend to update its FFD program for the construction phase to comply with NEI 06-06? If future revisions to NEI 06-06 are endorsed by the NRC, does the applicant intend to update its FFD

program for the construction phase to comply with certain clarifications, additions, and exceptions in these future, endorsed revisions, as necessary?

The applicant replied that it submitted an FFD Program for NRC approval as part of the Limited Work Authorization (LWA) request, and that the program is now being implemented as part of the construction activities. If NEI 06-06 is endorsed by the NRC, SNC plans to transition to a program that follows the guidance in NEI 06-06. The COL application currently commits to NEI 06-06, Revision 4, and will be changed in a future revision to commit to NEI 06-06, Revision 5. The applicant will evaluate substantial changes in subsequent revisions to NEI 06-06 and modify the construction phase FFD program to incorporate those substantial changes determined to be appropriate.

The applicant's response to RAI 13.6-33, as well as its supplemental response, revises Section 13.7 to address the issues discussed above. The relevant portion of the proposed revised text, to be included in a future revision of the VEGP COL FSAR, is included below:

The Fitness for Duty Program (FFD) is implemented and maintained in multiple and progressive phases dependent on the activities, duties, or access afforded to certain individuals at the construction site. In general, two different FFD programs will be implemented: a construction FFD program and an operations FFD program. The construction and operations phase programs are illustrated in [FSAR] Table 13.4-201.

The construction FFD program is consistent with NEI 06-06 ([FSAR] Reference 201). NEI 06-06 applies to persons constructing or directing the construction of safety- and security-related structures, systems, or components performed onsite where the new reactor will be installed and operated. Management and oversight personnel, as further described in NEI 06-06, and security personnel prior to the receipt of special nuclear material in the form of fuel assemblies (with certain exceptions) will be subject to the operations FFD program that meets the requirements of 10 CFR Part 26, Subparts A through H, N, and O. At the establishment of a protected area, all persons who are granted unescorted access will meet the requirements of an operations FFD program. Prior to issuance of a Combined License, the construction FFD program at a new reactor construction site for those subject to Subpart K will be reviewed and revised as necessary should substantial revisions occur to either NEI 06-06 following NRC endorsement or the requirements of 10 CFR Part 26.

The staff notes that Reference 201 in the above text refers to Revision 5 of NEI 06-06.

In RAI 13.6-34, the staff asked the applicant to: (1) describe how FSAR Table 13.4-201, Item 15, related to the security operational program, comports with 10 CFR 26.3, "Scope," and 10 CFR 26.4, and the guidance provided in the

NRC's letter to NEI dated December 2, 2009, entitled "Status of U.S. Nuclear Regulatory Commission Review and Endorsement of NEI 06-06, 'Fitness for Duty Program Guidance for New Nuclear Power Plant Construction Sites,'" and (2) provide site-specific information to clearly and sufficiently describe the applicant's FFD program. This information would include, but is not limited to, any deviations or exceptions to the requirements of 10 CFR Part 26 as further described in NEI 06-06.

The applicant stated that the response to RAI 13.6-33 provided the changes to the COL application that will describe the FFD program required by 10 CFR Part 26. Site-specific information is also provided in that response to clarify which program will be used to cover the various classifications of workers that must be covered in accordance with 10 CFR Part 26. The applicant's response to RAI 13.6-35 (below) revises FSAR Table 13.4-201, Item 20 to address the guidance provided in the NRC's December 2, 2009 letter. The proposed revision to Item 20 of FSAR Table 13.4-201, to be included in a future revision of the VEGP COL FSAR, is included below:

Item	Program Title	Program Source (required by)	FSAR Section	Implementation Milestone	Requirements
20.	Fitness for Duty (FFD) Program for Construction (workers and first-line supervisors)	10 CFR 26.4(f)	13.7	Prior to initiating 10 CFR Part 26 construction activities	10 CFR Part 26, Subpart K
	FFD Program for Construction (management and oversight personnel)	10 CFR 26.4(e)	13.7	Prior to initiating 10 CFR Part 26 construction activities	10 CFR Part 26, Subparts A - H, N, and O
	FFD Program for Security Personnel	10 CFR 26.4(e)(1)	13.7	Prior to initiating 10 CFR Part 26 construction activities	10 CFR Part 26, Subparts A - H, N, and O
		10 CFR 26.4(a)(5) or 26.4(e)(1)		Prior to the earlier of: A. Licensee's receipt of SNM in the form of fuel assemblies, or B. Establishment of a protected area, or C. The 10 CFR 52.103(g) finding	10 CFR Part 26, Subparts A - I, N, and O
	FFD Program for FFD Program personnel	10 CFR 26.4(g)	13.7	Prior to initiating 10 CFR Part 26 construction activities	10 CFR Part 26, Subparts A, B, D - H, N, O, and C per licensee's discretion

Item	Program Title	Program Source (required by)	FSAR Section	Implementation Milestone	Requirements
	FFD Program for persons required to physically report to the Technical Support Center (TSC) or Emergency Operations Facility (EOF)	10 CFR 26.4(c)	13.7	Prior to the conduct of the first full-participation emergency preparedness exercise under 10 CFR Part 50, App. E, Section F.2.a	10 CFR Part 26, Subparts A - I, N, and O, except for §§ 26.205 – 209
	FFD Program for Operation	10 CFR 26.4(a) and (b)	13.7	Prior to the earlier of: A. Establishment of a protected area, or B. The 10 CFR 52.103(g) finding	10 CFR Part 26, Subparts A - I, N, and O, except for individuals listed in § 26.4(b), who are not subject to §§ 26.205 – 209

In its December 2, 2009, letter to NEI, the NRC stated that during the review and approval process for NEI 06-06, the applicant should provide the following statements in its application:

- *NEI 06-06, Revision 5 was used in the development of the construction site FFD program.*
- *The applicant will review and revise its construction site FFD program as necessary to ensure that it comports with the NRC-endorsed version of NEI 06-06.*
- *If the NRC staff's review of NEI 06-06 results in substantive changes to the most recent, docketed FFD program description provided by the applicant, the applicant must amend its application to reflect the changes.*

The applicant's proposed revisions to FSAR Section 13.7 satisfactorily address the three items described above. The December 2, 2009, letter also provided implementation milestones for consideration by applicants. The staff confirmed that the proposed revisions to FSAR Table 13.4-201, Item 20, include all of the implementation milestones in the December 2, 2009, letter.

*Therefore, based on the staff's acceptance of the proposed revisions to FSAR Section 13.7 and to FSAR Table 13.4-201, Item 20, as noted above, the NRC staff concludes that the applicant has satisfactorily addressed STD SUP 13.7-1 by providing sufficient information on the FFD program for both the construction phase and the operating phase of the units. The inclusion of this information in a future revision of the VEGP COL FSAR is **Confirmatory Item 13.7-1**.*

Resolution of VEGP Site-Specific Confirmatory Item 13.7-1

Confirmatory Item 13.7-1 is an applicant commitment to revise its FSAR Section 13.7 and Table 13.4-201 regarding the FFD program for the construction phase and the operating phase of the units. The staff verified that the VEGP

COL FSAR was appropriately revised. As a result, Confirmatory Item 13.7-1 is now closed.

License Conditions

In RAI 13.6-35, the staff asked the applicant if proposed License Condition 3, A.1, and G.7, described in Part 10 of the COL application comports with FSAR Table 13.4-201, Item 15, which itemizes the aspects of the security operational program.

The staff further evaluated the need for License Condition 3, A.1 and G.7, for the VEGP COL application and determined it was not needed because the implementation milestones for FFD are governed by 10 CFR Part 26. The staff communicated this information to SNC, which then submitted Supplement 1 to its response to this RAI, removing this license condition for FFD.

- Part 10, License Condition 6

The applicant proposed a license condition in Part 10 of the VEGP COL application to provide a schedule to support the NRC's inspection of operational programs, including the FFD program.

The proposed license condition is consistent with the policy established in SECY 05-0197, "Review of Operational Programs in a Combined License Application and Generic Emergency Planning Inspections, Tests, Analyses, and Acceptance Criteria," for operational programs and is acceptable.

Evaluation of Turkey Point Units 6 and 7 RAIs

The staff issued RAI 6279, Question 13.07-1 to the applicant.

The staff evaluation of the applicant's response provided in letter dated February 21, 2012, related to the FFD program (ADAMS Accession No. ML12053A347) is as follows:

NRC RAI Number: 6279, Question 13.07-1

Under 10 CFR 52.79(a)(44), the applicant's FSAR must contain a description of the fitness for duty (FFD) program and its implementation required by 10 CFR Part 26. Provide site-specific information to clearly and sufficiently describe your FFD program in terms of the scope and level of detail in order for the staff to evaluate and determine a reasonable assurance finding of acceptability. This information may include, but is not limited to any condition in which the applicant intends to deviate from or take exception to the requirements of 10 CFR Part 26 as further described in NEI 06-06, "Fitness for Duty Program Guidance for New Nuclear Power Plant Construction Sites" or as endorsed by the NRC. Regulatory Basis: 10 CFR 52.79(a)(44).

FPL RESPONSE:

COLA Part 2, Section 13.7 will be revised to provide site-specific fitness for duty information.

ASSOCIATED COLA REVISIONS:

COLA Part 2, Section 13.7, Fitness for Duty, will be revised in a future COLA revision by adding the following text (with an LMA [left margin annotation] of PTN SUP 13.7-1):

“The FFD program for the construction site, as defined in NEI 06-06, will be administered under an FPL-approved EPC contractor program. The 10 CFR Part 26, requirements are implemented for the construction site area based on the descriptions provided in Table 13.4-201.

- Construction Workers & First Line Supervisors (EPC contractor employees and subcontractors) are covered by the FPL-approved EPC contractor FFD Program (elements Subpart K).
- FPL employees and FPL subcontractor's construction management and oversight personnel are covered by the Turkey Point Units 3 & 4 Operations FFD Program and the EPC contractor's employees and subcontractor construction management and oversight personnel are covered by the FPL-approved EPC contractor FFD Program (elements Subpart A - H, N, and O).
- FPL security personnel are covered by the Turkey Point Units 3 & 4 Operations FFD Program and the EPC contractor's security personnel are covered by the FPL approved EPC contractor FFD Program (elements Subpart A - H, N, and O). This coverage is applicable from the start of construction activities to the earlier of (1) the receipt of SNM in the form of fuel assemblies, (2) the establishment of a protected area, or (3) the 10 CFR 52.103(g) finding.
- FPL FFD Program personnel are covered by the Turkey Point Units 3 & 4 Operations FFD Program and the EPC contractor's FFD Program personnel are covered by the FPL-approved EPC contractor FFD Program (elements Subpart A, B, D - H, N, O, and C per licensee's discretion).
- FPL security personnel protecting fuel assemblies, or the established protected area, or the facility following the 10 CFR 52.103(g) finding are covered by the Turkey Point Units 3 & 4 Operations FFD Program (elements Subpart A - I, N, and O).
- Personnel required to physically report to the Technical Support Center (TSC) or Emergency Operations Facility (EOF) when that requirement is in effect are covered by the Turkey Point Units 3 & 4 FFD Program (elements Subpart A - I, N, and O, except for § 26.205 - 209).”

In response to RAI 6279, Question 13.07-1, FPL stated that FSAR Table 13.4-201 will be revised to provide site-specific fitness for duty information. The inclusion of the information provided in the RAI responses in a future revision of the FPL COL FSAR was identified as part

of **Confirmatory Item 13.7-1**, which is discussed in the standard content portion of this safety evaluation above.

Resolution of Turkey Point Site-Specific Confirmatory Item 13.7-1

Confirmatory Item 13.7-1 is an applicant commitment to revise its FSAR Section 13.7 and Table 13.4-201 regarding the FFD program for the construction phase and the operating phase of the units. The staff verified that the Turkey Point Units 6 and 7 COL FSAR, Revision 5 was appropriately revised. As a result, Confirmatory Item 13.7-1 is now closed.

13.7.5 Post Combined License Activities

For the reasons discussed in the technical evaluation section above, the staff finds substance of the requirements of License Condition (13-7) acceptable, and the substance of those requirements will be included in the license in a more general condition that covers the implementation of all programs:

- License Condition (13-7) - No later than 12 months after issuance of the COL, FPL shall submit to the Director of NRO, or the Director's designee, a schedule for implementation of the operational programs listed in FSAR Table 13.4-201, including the associated estimated date for initial loading of fuel. The schedule shall be updated every 6 months until 12 months before scheduled fuel loading, and every month thereafter until all the operational programs listed in FSAR Table 13.4-201 have been fully implemented.

13.7.6 Conclusion

The staff reviewed FSAR Section 13.7 along with the applicant's proposed revision of this section. The staff's review confirmed that the applicant's proposed revision to Section 13.7 has adequately addressed the required information relating to the FFD, and for the reasons set forth above, the staff finds it acceptable. The FFD portion of the FSAR, Section 13.7, is consistent with the requirements of 10 CFR Part 26 and 10 CFR 52.79(a)(44).

13.8 Cyber Security

Section 13.8 does not exist in either the AP-1000 DCD or the Turkey Point Units 6 and 7 COL FSAR. The NRC staff has added this section to the SER in order to address specific issues regarding the Turkey Point Units 6 and 7 cyber security. General description of the cyber security program, including combined license information item associated with cyber security, is part of the discussion in Section 13.6, "Physical Security," of the Turkey Point Units 6 and 7 FSAR and the AP1000 DCD.

13.8.1 Introduction

In Revision 3 of the Turkey Point Units 6 and 7 application dated December 16, 2011 (ADAMS Accession No. ML11361A102), Florida Power & Light Company provided Revision 1 of the Cyber Security Plan (CSP) for Turkey Point Units 6 and 7 in Part 9 of the application. The CSP applies to all critical digital assets (CDAs) used for Turkey Point Units 6 and 7 operation. In the submittal, the applicant describes how the requirements of 10 CFR 73.54 will be implemented to protect digital computer and communications systems and networks associated with the

following functions from those cyber attacks, up to and including the design-basis threat (DBT) described in 10 CFR 73.1. The scope of 10 CFR 73.54 includes CDAs associated with the following:

- safety-related and important-to-safety functions
- security functions
- emergency preparedness functions, including offsite communications
- support systems and equipment which, if compromised, would adversely impact safety, security, or emergency preparedness functions

13.8.2 Summary of Application

The applicant addresses cyber security in Section 13.6 of the Turkey Point Units 6 and 7 COL FSAR. Section 13.6 of the Turkey Point Units 6 and 7 COL FSAR, Revision 8, incorporates by reference Section 13.6 of the AP1000 DCD, Revision 19. The applicant's CSP includes deviations from RG 5.71, "Cyber Security Programs for Nuclear Facilities." As set forth below, the staff has evaluated these deviations.

In addition, in Turkey Point Units 6 and 7 COL FSAR Section 13.6, the applicant provides the following:

AP1000 COL Information Item

- STD COL 13.6-5

The applicant provided additional information in STD COL 13.6-5 to address COL Information Item 13.6-5, which provides information related to the cyber security program.

License Conditions

- Part 10, License Condition 3, Item G.10

The applicant proposed a license condition in Part 10 of the Turkey Point Units 6 and 7 COL application requiring the applicant to implement the cyber security program prior to initial fuel load.

- Part 10, License Condition 6

The applicant proposed a license condition in Part 10 of the Turkey Point Units 6 and 7 COL application to require implementation of operational programs included in Turkey Point Units 6 and 7 COL FSAR Table 13.4-201 including the cyber security program, in accordance with designated milestones, which would provide a schedule to support the NRC's inspection of these programs.

13.8.3 Regulatory Basis

The regulatory basis of the information incorporated by reference is addressed in NUREG-1793 and its supplements.

The applicable regulatory requirements for cyber security are as follows:

- 10 CFR 73.1, "Purpose and scope"
- 10 CFR 73.54, "Protection of digital computer and communication systems and networks"
- 10 CFR 73.55, "Requirements for physical protection of licensed activities in nuclear power reactors against radiological sabotage," paragraphs (a)(1), (b)(8), and (m)
- 10 CFR 73.58, "Safety/security interface requirements for nuclear power reactors"
- 10 CFR Part 73, "Physical protection of plants and materials," Appendix G, "Reportable Safeguards Events"

The applicable regulatory guidance for cyber security is RG 5.71.

13.8.4 Technical Evaluation

The staff reviewed Section 13.6 of the Turkey Point Units 6 and 7 COL FSAR and checked the referenced DCD to ensure that the combination of the DCD and the COLA represents the complete scope of information relating to this review topic.¹ The staff's review confirmed that the information in the application and incorporated by reference addresses the required information relating to cyber security. The results of the staff's evaluation of the information incorporated by reference in the Turkey Point Units 6 and 7 COLA are documented in NUREG-1793 and its supplements.

The staff's review of the Turkey Point Units 6 and 7 CSP has focused on ensuring that the necessary programmatic elements are included in this plan to provide high assurance that activities involving special nuclear material are not inimical to the common defense and security and do not constitute an unreasonable risk to the public health and safety. The staff reviewed the Turkey Point Units 6 and 7 CSP to assure the necessary programmatic elements that, when effectively implemented, will provide the required high assurance of adequate protection of the common defense and security and public health and safety. Effective implementation is dependent on the procedures and practices the applicant develops to satisfy the programmatic elements of its CSP. The facility implementing procedures are subject to future NRC inspection.

Section 1.2.3 of this SER provides a discussion of the strategy used by the NRC to perform one technical review for each standard issue outside the scope of the DC and use this review in evaluating subsequent COLAs. To ensure that the staff's findings on standard content that were documented in the SER for the reference COLA (VEGP Units 3 and 4) were equally applicable to the Turkey Point Units 6 and 7 COLA, the staff undertook the following reviews:

- The staff compared the VEGP COL FSAR, Revision 5 to the Turkey Point Units 6 and 7 COL FSAR. In performing this comparison, the staff considered changes made to the Turkey Point Units 6 and 7 COL FSAR (and other parts of the COLA, as applicable) resulting from RAIs.
- The staff confirmed that the Turkey Point Units 6 and 7 CSP provided in Part 9, Revision 3 of the application on December 16, 2011, was identical to the June 14, 2010, VEGP submittal transmitting its CSP, with the only exceptions being to the title of the units and the identification of the position charged with oversight of the program.

- The staff verified that the site-specific differences were not relevant.

Accordingly, the staff has completed its review and finds the evaluation performed for the standard content to be directly applicable to the Turkey Point Units 6 and 7 COLA. This finding included verifying that the difference in the position charged with oversight of the program (the Vice President Fleet Support at Turkey Point and Vice President of Nuclear Operations Support at VEGP) does not affect the staff's conclusions regarding the applicant's CSP. This standard content material is identified in this SER by use of italicized, double-indented formatting. The one confirmatory item in the standard content material retains the number assigned in the VEGP SER.

The following portion of this technical evaluation section is reproduced from Section 13.8.4 of the VEGP SER:

AP1000 COL Information Item

- *STD COL 13.6-5*

The NRC staff reviewed STD COL 13.6-5 related to COL Information Item 13.6-5, which identifies the need for a COL applicant to address cyber security. STD COL 13.6-5 supplemented Section 13.6 of the VEGP COL FSAR by stating the following text is to be added after Section 13.6 of the VEGP ESP SSAR:

The Cyber Security Plan is submitted to the Nuclear Regulatory Commission as a separate licensing document to fulfill the requirements contained in 10 CFR 52.79(a)(36) and 10 CFR 73.54. The Cyber Security Plan will be maintained in accordance with the requirements of 10 CFR 52.98. The Plan is withheld from public disclosure pursuant to 10 CFR 2.390.

Section 13.6 of the VEGP COL FSAR also refers to FSAR Table 13.4-201, "Operational Programs Required by NRC Regulations," as providing the milestone for implementing the cyber security program.

The VEGP applicant submitted Revision 0 of its CSP in a letter dated June 14, 2010, to demonstrate that the cyber security program will provide high assurance that digital computer and communication systems and networks are adequately protected against cyber attacks, up to and including the DBT as described in 10 CFR 73.1. The CSP has been withheld from public disclosure pursuant to 10 CFR 2.390(d) (1). In its review of this plan, the NRC staff used the guidance in RG 5.71 to determine if the regulatory requirements described in Section 13.8.3 of this SER are satisfied.

The applicant described the cyber security program based on 10 CFR 73.54, including the audit of the effectiveness of the cyber security program as required by 10 CFR 73.55(m), submittal of CSPs and the establishment, maintenance and implementation of a cyber security program required by 10 CFR 73.55(a) (1) and 10 CFR 73.55(b)(8) and reporting requirements in 10 CFR Part 73, Appendix G. The implementation milestones for this program are included in VEGP COL FSAR Table 13.4-201.

As detailed in the remainder of this SER section, the CSP has been reviewed by the NRC staff for format and content utilizing the NRC CSP template in RG 5.71, and found to include all features considered essential for such a program, and is acceptable. In particular, it has been found to comply with the Commission's regulations including 10 CFR 73.54, 10 CFR 73.55(a)(1), 10 CFR 73.55(b)(8), 10 CFR 73.55(m), and 10 CFR Part 73, Appendix G and conforms to the NRC CSP template set forth in RG 5.71.

*The applicant has committed to incorporate this CSP into a future revision of the VEGP COL application to address NRC requirements in 10 CFR 73.54. This action will be tracked as **Confirmatory Item 13.8-1**.*

Resolution of VEGP Site-specific Confirmatory Item 13.8-1

Confirmatory Item 13.8-1 is an applicant commitment to include the CSP into a future revision of the VEGP COL application. The staff verified that the VEGP COL application was appropriately revised. As a result, Confirmatory Item 13.8-1 is now closed.

13.8.4.1 Establishment of Cyber Security Program

The VEGP CSP describes how SNC will establish a cyber security program to achieve high assurance that the VEGP digital computer and communication systems and networks associated with safety, security, and emergency preparedness, including offsite communications and support systems and equipment which if compromised would adversely impact safety, security and/or emergency preparedness (SSEP) functions, and their digital assets, hereafter defined as CDAs, are adequately protected against cyber attacks up to and including the DBT. RG 5.71 provides a method that the staff considers acceptable for complying with this regulation. SNC complies with the requirements of 10 CFR 73.54 by providing a CSP that follows the template in Appendix A of RG 5.71, except as noted in Attachment A, "Vogtle Electric Generating Plant Units 3 and 4 Cyber Security Plan Deviations from Regulatory Guide RG 5.71." The VEGP CSP included:

Within the scope of the NRC's cyber security rule at 10 CFR 73.54, systems or equipment that perform important to safety functions include structures, systems, and components (SSCs) in the balance of plant (BOP) that could directly or indirectly affect reactivity at a nuclear power plant and could result in an unplanned reactor shutdown or transient. Additionally, these SSCs are under the licensee's control and include electrical distribution equipment out to the first inter-tie with the offsite distribution system.

The VEGP CSP included a deviation from the guidance to clarify that systems or equipment that perform important-to-safety functions include SSCs in the balance of plant (BOP) that could directly or indirectly affect reactivity and could result in an unplanned reactor shutdown or transient. This deviation is consistent with Commission policy.

The NRC staff reviewed the VEGP CSP against the template in RG 5.71 and the staff requirements memorandum (SRM), CMWCO-10-0001, "Regulation of Cyber Security at Nuclear Power Plants," dated October 21, 2010.

The applicant states in the VEGP CSP that its security program complies with 10 CFR 73.54 by:

- (1) establishing and implementing defensive strategies consistent with the defensive model, described in Section 3.1.5, including the security controls described in Sections 3.1, 3.2, and 3.3.*
- (2) Maintaining the program, as described in Section 4.*

Based on the above review, the NRC staff finds that establishment of a cyber security program described in Section 1 of the VEGP CSP is acceptable.

The following SER Sections 13.8.4.2 through 13.8.4.23 correlate to specific sections in Appendix A to RG 5.71. These SER sections use the same headings as the corresponding Appendix A sections, and include the Appendix A numbering system in the titles. SER Section 13.8.4.24 addresses each of the deviations identified in the applicant's CSP.

13.8.4.2 Security Assessment and Authorization (Section A.3.1.1 of Appendix A to RG 5.71)

Section 3.1.1 of the VEGP CSP states that the following will be reviewed every 24 months:

- A formal documented security planning, assessment, and authorization policy that describes the purpose, scope, roles, responsibilities, management commitments, and coordination among departments and the implementation of the security program and the controls applied in accordance with Section 3.1.6*
- A formal documented procedure to facilitate the implementation of the cyber security program and the security assessment*

The NRC staff reviewed the above and found that evaluation of the program elements every 24 months is not consistent with Section C.3.1.1 of RG 5.71. The time period between evaluations is 12 months longer than the time period provided in brackets in RG 5.71. However, this 24-month time period conforms to 10 CFR 73.54(g), requiring the applicant to review the cyber security program as a component of the physical security program in accordance with the requirements of 10 CFR 73.55(m), including the periodicity requirements. The requirement of 10 CFR 73.55(m) is that at minimum the applicant review each element of the physical protection program at least every 24 months.

Based on the above review, the NRC staff finds that the security assessment and authorization described in Section 3.1.1 of the VEGP CSP is acceptable.

13.8.4.3 Cyber Security Team (Section A.3.1.2 of Appendix A to RG 5.71)

Section 3.1.2 of the VEGP CSP states that a cyber security team, composed of individuals with broad knowledge, will be established and maintained and that the broad knowledge of the team will include the following areas:

- Information and digital system technology; this includes cyber security, software development, offsite communications, computer system administration, computer engineering, and computer networking.*
- Nuclear facility operations, engineering, and safety; this includes overall facility operations and plant technical specification compliance.*
- Physical security and emergency preparedness; this includes the site's physical security and emergency preparedness systems and programs.*

This section of the VEGP CSP also enumerates the roles and responsibilities of the cyber security team. Aside from the deviations discussed below, this section of the VEGP CSP conforms to the CSP template wording provided in Section A.3.1.2 of RG 5.71.

The VEGP CSP includes several deviations from the text of RG 5.71:

- 1) The first deviation clarifies that the cyber security team (CST) will be responsible for “overseeing” preparation of documentation of cyber security controls and that, in fact, non-team members (such as vendor personnel) may perform some of these actions, under the supervision of the CST. This clarification is acceptable to the staff since the responsibility to ensure compliance with 10 CFR 73.54 remains with the CST.*
- 2) The second deviation changes the CST responsibility from “assuring the retention” of assessment documentation to “establishing the retention policy” for assessment documentation. Again, the deviation is acceptable to the staff since the responsibility to ensure compliance with 10 CFR 73.54 remains with the CST.*
- 3) The third and final deviation seeks to change the basis for CST determinations being made in a free and objective manner. The RG 5.71 wording states that the CST should be free to make determinations that are not constrained by “operational goals.” The deviation changes the respective sentence to say “...by business goals.” Again, the deviation is acceptable to the staff since it maintains the same objective of keeping financial considerations out of decision making regarding cyber security.*

Based on the above review, the NRC staff finds that the CST described in Section 3.1.2 of the VEGP CSP is acceptable.

13.8.4.4 Identification of Critical Digital Assets (Section A.3.1.3 of Appendix A to RG 5.71)

Section 3.1.3 of the VEGP CSP states that to identify the critical systems (CSs) at VEGP, the CST identified and documented plant systems, equipment, communication systems, and networks that are associated with the SSEP functions described in 10 CFR 73.54(a)(1), as well as the support systems associated with these SSEP functions in accordance with the approved plant licensing basis.

The VEGP CSP also states that the CST identified and documented CDAs that have a direct, supporting, or indirect role in the proper functioning of CSs.

The steps outlined in the VEGP CSP essentially match the corresponding steps described in RG 5.71 for this same activity. The only difference between the corresponding section in RG 5.71 and the VEGP CSP is the addition of the modifying phrase: "...and defined in the approved plant licensing basis."

10 CFR 73.54(a)(1) requires that the licensee protect digital computer and communication systems and networks associated with: (i) safety-related and important-to-safety functions; (ii) security functions; (iii) emergency preparedness functions, including offsite communications; and (iv) support systems and equipment which, if compromised, would adversely impact SSEP functions.

This deviation is acceptable because SNC proposes to use its licensing basis to identify CSs that are associated with SSEP functions, as 10 CFR 73.54 requires. This statement includes the first step in RG 5.71 to analyze digital computer and communication systems and networks to determine if they include CDAs.

Based on the above review, the NRC staff finds the applicant's proposal, described in Section 3.1.3 of the VEGP CSP, to use 10 CFR 73.54(a) (1) and its licensing basis to identify CDAs to be acceptable.

13.8.4.5 Reviews and Validation Testing (Section A.3.1.4 of Appendix A to RG 5.71)

Section 3.1.4 of the VEGP CSP states that the VEGP CST will be responsible for conducting a review, performing validation activities, and for each CDA, the CST determined:

- its direct and indirect connectivity pathways*
- infrastructure interdependencies*
- the application of defensive strategies, including defensive models, security controls, and other defensive measures*

The CSP also requires that the CST validate the above activities through comprehensive walkdowns, which include a range of activities that conform to those activities specified in RG 5.71 for this purpose.

The requirements, processes and procedures described in this section of the VEGP CSP conform to, and encompass all of the same specifications, outlined in the comparable section of RG 5.71.

Based on the above review, the NRC staff finds that reviews and validation testing described in Section 3.1.4 of the VEGP CSP is acceptable.

13.8.4.6 Defense-In-Depth Protective Strategies (Section A.3.1.5 of Appendix A to RG 5.71)

Section 3.1.5 of the VEGP CSP states that the defensive strategy consists of the defensive model described in Section C.3.2 of RG 5.71, and the detailed defensive architecture of Appendix C, Section 6, defense-in-depth controls in Appendix C, Section 7, and security controls applied in accordance with Section 3.1.6 of the VEGP CSP with one deviation to its defensive architecture. The VEGP defensive architecture, including the deviation is consistent with the security model described in RG 5.71, which provides for isolation of safety-related and security CDAs.

Based on the above review, the NRC staff finds that the defense-in-depth protective strategies described in Section 3.1.5 of the VEGP CSP are acceptable.

13.8.4.7 Application of Security Controls (Section A.3.1.6 of Appendix A to RG 5.71)

Section 3.1.6 of the VEGP CSP states that VEGP Units 3 and 4 established defense-in-depth protective strategies by applying and documenting the following:

- the defensive model described in Section 3.2 of RG 5.71 (discussed in SER Section 13.8.4.6)*
- the physical and administrative security controls established by the VEGP Units 3 and 4 Physical Security Program and physical barriers, such as locked doors, locked cabinets, and locating CDAs in the VEGP Units 3 and 4 protected area or vital areas, which are part of the overall security controls used to protect CDAs from attacks*
- verification of the effectiveness of the implemented operational and management controls described in Appendix C to RG 5.71 and implemented alternatives to the Appendix C controls for each CDA*
- the technical controls described in Appendix B to RG 5.71 and the operational and management controls described in Appendix C to RG 5.71, consistent with the process described below*

The VEGP CSP deviates from RG 5.71, Section C.3.3 Security Controls and Appendix A.3.1.6, by stating that when a control from Appendices B and C of RG 5.71 is not implemented, the licensee will implement alternate control(s) that “do not provide less protection than the corresponding” control in the appendix.

This deviation is consistent with the method used in RG 5.71, which states that controls should provide equal or better protection.

The VEGP CSP also deviates from RG 5.71 by stating that when a control can be proved to be unnecessary, the applicant will perform an analysis demonstrating that the control is not necessary, and will provide a documented justification. Although RG 5.71 specifically calls for an attack vector analysis, and the VEGP CSP does not specifically commit to performing an attack vector analysis, the VEGP CSP does commit to justifying the non-applicability of a control by demonstrating that the attack vector does not exist. This provides for the same outcome as RG 5.71.

Based on the above review, the NRC staff finds that the application of security controls described in Section 3.1.6 of the VEGP CSP is acceptable.

13.8.4.8 Incorporating the Cyber Security Program into the Physical Protection Program (Section A.3.2 of Appendix A to RG 5.71)

Section 3.2 of the VEGP CSP states that the licensee will provide the management interfaces necessary to appropriately coordinate physical and cyber security activities, as follows:

- establish an organization that is responsible for cyber security and is independent from operations*
- document physical and cyber security interdependencies*
- develop policies and procedures to coordinate management of physical and cyber security controls*
- incorporate unified policies and procedures to secure CDAs from attacks up to and including the DBT*
- coordinate acquisition of physical or cyber security services, training, devices, and equipment*
- coordinate interdependent physical and cyber security activities and training with physical and cyber security personnel*
- integrate and coordinate incident response capabilities with physical and cyber incident response personnel*
- train senior management regarding the needs of both disciplines*
- periodically exercise the entire security organization using realistic scenarios combining both physical and cyber simulated attacks*

The VEGP CSP deviates from RG 5.71 by not creating a unified security organization. The commitment to provide for appropriate management interfaces to coordinate the physical and cyber security organizations provides for a level of integration equivalent to a unified organization.

Based on the above review, the NRC staff finds that the incorporation of the cyber security program into the physical protection program described in Section 3.2 of the VEGP CSP is acceptable.

13.8.4.9 Policies and Implementing Procedures (Section A.3.3 of Appendix A to RG 5.71)

Section 3.3 of the VEGP CSP states that the licensee will develop policies and procedures to address the security controls in Appendices B and C to RG 5.71 and review and approve issues and uses, and revise the same according to Section 4 of the CSP. The CSP will also establish specific responsibilities for the positions described in Section 10.10 of Appendix C to RG 5.71, with the following deviation.

The CSP states that this will occur “in accordance with the security control application process in Section 3.1.6 of this Plan.” This process requires the applicant to justify and demonstrate that any deviation from the controls in RG 5.71 provide no less protection than the corresponding control in Appendices B and C; therefore, the VEGP CSP will require the same level of protection as the corresponding commitment in RG 5.71.

Based on the above review, the NRC staff finds that the policies and implementing procedures described in Section 3.3 of the VEGP CSP are acceptable.

13.8.4.10 Maintaining the Cyber Security Program (Section A.4 of Appendix A to RG 5.71)

Section 4 of the VEGP CSP states that the applicant will establish the programmatic elements necessary to maintain security throughout the life cycle of the CDAs, and that the applicant has implemented these elements. For new assets, SNC commits to follow the process described in Section 4.2.

Section 4 of the VEGP CSP is nearly identical to Section C.4 of RG 5.71, with the deviation of replacing the bracketed text [Licensee/Applicant] with VEGP Units 3 and 4, and by including the caveat that the operational and management controls are applied following the process described in Section 3.1.6. The process described in Section 3.1.6 allows the licensee/applicant to not apply a control if it can demonstrate that the control is not necessary by justifying that the attack vector associated with the control does not exist. This approach is consistent with the method used in RG 5.71, and does not reduce the protection to the plant.

Based on the above review, the NRC staff finds that the maintenance of the cyber security program described in Section 4 of the VEGP CSP is acceptable.

13.8.4.11 Continuous Monitoring and Assessment (Section A.4.1 of Appendix A to RG 5.71)

Section 4.1 of the VEGP CSP states that the licensee will continue to monitor security controls for effectiveness; will ensure that they remain in place

throughout the life cycle of the CDA; and will verify that rogue assets are not connected to the infrastructure.

The VEGP CSP includes a single deviation from Section A.4.1 of RG 5.71. The RG states that “[Licensee/Applicant] continuously monitors security controls consistent with Appendix C to RG 5.71,” whereas the VEGP CSP states that “VEGP Units 3 and 4 continues to monitor security controls consistent with Appendix C to RG 5.71.”

This deviation is consistent with the method in RG 5.71, which calls for periodic assessments, which is consistent with the statement “continues to monitor.”

Based on the above review, the NRC staff finds that the ongoing monitoring and assessment described in Section 4.1 of the VEGP CSP is acceptable.

13.8.4.12 Periodic Assessment of Security Controls (Section A.4.1.1 of Appendix A to RG 5.71)

Section 4.1.1 of the VEGP CSP states that the licensee will periodically assess that security controls implemented for each CDA remain robust, resilient, and effective in place throughout the life cycle, at least every 24 months.

The NRC staff reviewed the above and found that this period of assessment is not consistent with RG 5.71. The time period between evaluations is 12 months longer than the time period provided in RG 5.71. However, this 24-month time period conforms to 10 CFR 73.54(g) requiring the licensee/applicant to review the cyber security program as a component of the physical security program in accordance with the requirements of 10 CFR 73.55(m), including the periodicity requirements. The requirements of 10 CFR 73.55(m) are that, at a minimum, the licensee/applicant review each element of the physical protection program, which includes the cyber security program, at least every 24 months.

Furthermore, the VEGP CSP states that controls will be reviewed according to the requirements of the security controls if that period of review occurs more often. This is also consistent with the method provided in RG 5.71.

Based on the above review, the NRC staff finds that the periodic assessment of security controls described in Section 4.1.1 of the VEGP CSP is acceptable.

13.8.4.13 Effectiveness Analysis (Section A.4.1.2 of Appendix A to RG 5.71)

Section 4.1.2 of the VEGP CSP states that the licensee will monitor and measure the effectiveness of the cyber security program and its security controls to ensure that both are implemented correctly, operating as intended, and continuing to provide high assurance that CDAs are protected against cyber attacks. The licensee commits to verifying the effectiveness of the security controls every 24 months, or in accordance with the specific requirements of the implemented security controls, whichever is more frequent.

The NRC staff reviewed the above and found that this period of verification is inconsistent with RG 5.71. The time period between evaluations is 12 months

longer than the time period provided in RG 5.71. However, this 24-month time period conforms to 10 CFR 73.54(g) requiring the applicant to review the cyber security program as a component of the physical security program in accordance with the requirements of 10 CFR 73.55(m), including the periodicity requirements. The requirements of 10 CFR 73.55(m) are that, at a minimum, the applicant review each element of the physical protection program, which includes the cyber security program, at least every 24 months.

Furthermore, the VEGP CSP states that verification will also occur according to the requirements of the security controls if that period of verification occurs more often. This is also consistent with the method provided in RG 5.71.

Based on the above review, the NRC staff finds that the effectiveness analysis described in Section 4.1.2 of the VEGP CSP is acceptable.

13.8.4.14 Vulnerability Assessments and Scans (Section A.4.1.3 of Appendix A to RG 5.71)

Section 4.1.3 of the VEGP CSP states vulnerability assessments will be performed as specified in the security controls in Appendices B and C of RG 5.71 to identify new vulnerabilities that have the potential to impact the effectiveness of the cyber security program and the security of the CDAs. The applicant also commits to address vulnerabilities that could cause CDAs to become compromised or could have an adverse impact on SSEP functions. Section 13.1 of Appendix C of RG 5.71 provides that vulnerability assessments should occur no less frequently than once a quarter, at random intervals, and when new potential vulnerabilities are reported and identified.

Section A.4.1.3 of RG 5.71 states that vulnerability assessments will occur no less frequently than quarterly, whereas the VEGP CSP states that this will occur, “as specified in the implemented security controls in Appendices B and C to RG 5.71 and implemented alternatives to the Appendices B and C controls.” The process SNC has committed to in Section 3.1.6 of the VEGP CSP requires SNC, if it does not implement the controls in Appendices B and C, to demonstrate that an alternate control does not provide less protection than the corresponding control in Appendices B and C.

Therefore, if SNC does not implement the security control in Section 13.1, or deviates from the requirement for a quarterly vulnerability assessment, it will ensure that this deviation does not provide less protection than performing quarterly vulnerability assessments, and will provide an analysis that demonstrates that the attack vector does not exist and will document this justification for inspection.

Based on the above review, the NRC staff finds that the vulnerability assessments and scans described in Section 4.1.3 of the VEGP CSP are acceptable.

13.8.4.15 Change Control (Section A.4.2 of Appendix A to RG 5.71)

Section 4.2 of the VEGP CSP states that the licensee will systematically plan, approve, test, and document changes to the environment of the CDAs, the addition of CDAs to the environment, and changes to existing CDAs in a manner that provides a high level of assurance that the SSEP functions are protected from cyber attacks. The CSP also commits that the program establish that changes made to CDAs use the design control and configuration management procedures or other procedural processes to ensure that the existing security controls are effective and that any pathway that can be exploited to compromise a CDA is protected from cyber attacks.

The VEGP CSP does not deviate from Section A.4.2 of RG 5.71.

Based on the above review, the NRC staff finds that the change control process described in Section 4.2 of the VEGP CSP is acceptable.

13.8.4.16 Configuration Management (Section A.4.2.1 of Appendix A to RG 5.71)

Section 4.2.1 of the VEGP CSP states that the licensee will implement and document a change management process as described in Section 4.2 of the VEGP CSP. Further, it commits to implement and document the applied configuration management controls described in Appendix C, Section 11 to RG 5.71 following the process described in Section 3.1.6 of the CSP.

The VEGP CSP does not specifically commit to apply the security controls in Section 11 of Appendix C of RG 5.71; however, it does commit to apply the process in Section 3.1.6 of the CSP. The commitment in Section 4.2.1 is consistent with Section A.4.2.2 of RG 5.71 as the applicant has committed, if it does not implement the security controls in Section 11 of RG 5.71, either to implement alternative controls that do not provide less protection than what is in Section 11, or to demonstrate that this control is unnecessary by demonstrating that the attack vectors associated with Section 11 to Appendix C of RG 5.71 do not exist for VEGP.

Based on the above review, the NRC staff finds that the configuration management process described in Section 4.2.1 of the VEGP CSP is acceptable.

13.8.4.17 Security Impact Analysis of Changes and Environment (Section A.4.2.2 of Appendix A to RG 5.71)

Section 4.2.2 of the VEGP CSP states that the applicant will perform a security impact analysis in accordance with Section 4.1.2 before implementing a design or configuration change to a CDA or, when changes to the environment occur, to manage potential risks introduced by the changes. The CSP also commits to evaluate, document, and incorporate into the security impact analysis safety and security interdependencies of other CDAs or systems, as well as updates, and documents the following:

- *the location of the CDA and connected assets*

- connectivity pathways (direct and indirect)
- infrastructure interdependencies
- application of defensive strategies, including defensive models, security controls, and others
- defensive strategy measures
- plant-wide physical and cyber security policies and procedures that secure CDAs from a cyber attack, including attack mitigation and incident response and recovery

The VEGP CSP commits to perform these impact analyses as part of the change approval process to assess the impacts of the changes on the security posture of CDAs and security controls, as described in Section 4.1.2 of the VEGP CSP, and to address any identified gaps to protect CDAs from cyber attack, up to and including the DBT as described in Section 4.2.6.

Finally, Section 4.2.2 states that the licensee will manage CDAs for the cyber security of SSEP functions through an ongoing evaluation of threats and vulnerabilities and implementation of each of the applied security controls provided in Appendix B or C of RG 5.71 and implement alternatives to the Appendices B and C controls during all phases of the life cycle. Additionally, SNC has established and documented procedures for screening, evaluating, mitigating, and dispositioning threat and vulnerability notifications received from credible sources. Dispositioning includes implementation of security controls to mitigate newly reported or discovered threats and vulnerabilities.

The language in Section 4.2.2 of the VEGP CSP is identical to that in Section A.4.2.2 of RG 5.71 and includes no deviations.

Based on the above review, the NRC staff finds that the security impact analysis of changes and environment described in Section 4.2.2 of the VEGP CSP is acceptable.

13.8.4.18 Security Reassessment and Authorization (Section A.4.2.3 of Appendix A to RG 5.71)

Section 4.2.3 of the VEGP CSP states that the licensee will have implemented, documented, and maintained a process that ensures that modifications to CDAs are evaluated before implementation so that security controls remain effective and that any pathway that can be exploited to compromise the modified CDA is addressed to protect CDAs and SSEP functions from cyber attacks. This section further states that the VEGP cyber security program establishes that additions and modifications are evaluated, using a proven and accepted method, before implementation to provide high assurance of adequate protection against cyber attacks, up to and including DBTs, using the process described in Section 4.1.2 of the VEGP CSP.

The licensee also commits to disseminate, review, and update the following when a CDA modification is conducted:

- *a formal, documented security assessment and authorization policy, which addresses the purpose, scope, roles, responsibilities, management commitment, coordination among entities, and compliance to reflect all modifications or additions*
- *a formal, documented procedure to facilitate the implementation of the security reassessment and authorization policy and associated controls*

The VEGP CSP does not deviate from Section A.4.2.3 of RG 5.71.

Based on the above review, the NRC staff finds that the security reassessment and authorization described in Section 4.2.3 of the VEGP CSP is acceptable.

13.8.4.19 Updating Cyber Security Practices (Section A.4.2.4 of Appendix A to RG 5.71)

Section 4.2.4 of the VEGP CSP states that the licensee reviews, updates and modifies cyber security policies, procedures, practices, existing cyber security controls, detailed descriptions of network architecture (including logical and physical diagrams), information on security devices, and any other information associated with the state of the cyber security program or the applied security controls provided in Appendices B and C to RG 5.71 and implemented alternatives to the Appendices B and C controls when changes occur to CDAs or the environment.

This information includes the following:

- *plant- and corporate-wide information on the policies, procedures, and current practices related to cyber security*
- *detailed network architectures and diagrams*
- *configuration information on security devices or CDAs*
- *new plant- or corporate-wide cyber security defensive strategies or security controls being developed and policies, procedures, practices, and technologies related to their deployment*
- *the site's physical and operational security program*
- *cyber security requirements for vendors and contractors*
- *identified potential pathways for attacks*
- *recent cyber security studies or audits (to gain insight into areas of potential vulnerabilities); and identified infrastructure support systems (e.g., electrical power; heating, ventilation, and air conditioning;*

communications; fire suppression) whose failure or manipulation could impact the proper functioning of CSs

The VEGP CSP does not deviate from Section A.4.2.4 of RG 5.71.

Based on the above review, the NRC staff finds that updating of cyber security practices described in Section 4.2.4 of the VEGP CSP is acceptable.

13.8.4.20 Review and Validation Testing of a Modification or Addition of a Critical Digital Asset (Section A.4.2.5 of Appendix A to RG 5.71)

The VEGP CSP Section 4.2.5 states the licensee will conduct and document the results of reviews and validation tests of each CDA modification and addition using the process described in Section 3.1.4 of the VEGP CSP.

The VEGP CSP does not deviate from Section A.4.2.5 of RG 5.71.

Based on the above review, the NRC staff finds that the Review and Validation Testing of Modifications or Additions of a Critical Digital Asset described in Section 4.2.5 of VEGP CSP is acceptable.

13.8.4.21 Application of Security Controls Associated with a Modification or Addition (Section A.4.2.6 of Appendix A to RG 5.71)

Section 4.2.6 of the VEGP CSP states that when new CDAs are introduced into the environment of VEGP, the licensee:

- deploys the CDA into the appropriate level of the defensive model described in Section 3.1.5 of this plan;*
- applies the technical controls identified in Appendix B to RG 5.71 and the operational and management controls described in Appendix C to RG 5.71 in a manner consistent with the process described in Section 3.1.6 of this plan*
- confirms that the implemented operational and management controls described in Appendix C to RG 5.71, and implemented alternatives to the Appendix C controls, are effective for the CDA*

The plan also commits that when CDAs are modified, the licensee:

- verifies that the CDA is deployed into the proper level of the defensive model described in Section 3.1.5 of this plan*
- performs a security impact analysis, as described in Section 4.2.2 of this plan*
- verifies that the technical controls identified in Appendix B to RG 5.71 and the operational and management controls described in Appendix C to RG 5.71 are addressed in a manner consistent with the process described in Section 3.1.6 of this plan*

- *verifies that the applied security controls discussed above are implemented effectively, consistent with the process described in Section 4.1.2 of this plan*
- *confirms that the implemented operational and management controls discussed in Appendix C to RG 5.71 and implemented alternatives to the Appendix C controls are effective for the CDA*

The VEGP CSP deviates from Section 4.2.6 of RG 5.71 by modifying the phrase “applies the technical controls identified in Appendix B to RG 5.71 in a manner consistent with the process described in Section 3.2 of RG 5.71,” to read “applies the technical controls identified in Appendix B to RG 5.71 and the operational and management controls described in Appendix C to RG 5.71 in a manner consistent with the process described in Section 3.1.6 of this plan.” This is consistent with RG 5.71 as the VEGP CSP commits to following the process in Section 3.1.6 of the VEGP CSP, which requires that controls are applied, an alternative that provides equivalent protection is provided, or the licensee demonstrates that the control is not necessary.

The VEGP CSP also deviates from Section A.4.2.6 of RG 5.71 with the modification of this phrase, “verifies that the security controls discussed above are implemented effectively, consistent with the process described in Section 4.1.2 of this plan” to read “verifies that the applied security controls discussed above are implemented effectively, consistent with the process described in Section 4.1.2 of this plan.”

This deviation is consistent with the method used in RG 5.71. RG 5.71 assumes that all the controls in Appendices B and C will be applied; whereas, the VEGP CSP commits that if a control is not applied, there will be no reduction in protection as compared to the corresponding control. This method is also captured in RG 5.71 and, therefore, the VEGP CSP is consistent with RG 5.71.

Based on the above review, the NRC staff finds that the application of security controls associated with a modification or addition described in Section 4.2.6 of the VEGP CSP is acceptable.

13.8.4.22 Cyber Security Program Review (Section A.4.3 of Appendix A to RG 5.71)

Section 4.3 of the VEGP CSP states that the applicant has established the necessary measures and governing procedures to implement periodic reviews of applicable program elements, in accordance with the requirements of 10 CFR 73.55(m). Specifically, the VEGP CSP calls for a review of the program’s effectiveness at least every 24 months. In addition, reviews are to be conducted as follows:

- *within 12 months following initial implementation of the program*
- *as necessary, based upon site-specific analyses, assessments, or other performance indicators*

- *as soon as reasonably practical, but no longer than 12 months after changes occur in personnel, procedures, equipment, or facilities that potentially could adversely affect cyber security*
- *by individuals independent of those personnel responsible for program management, and any individual who has direct responsibility for implementing the program*

This deviates from RG 5.71 in the specific wording, but includes the same commitments. Specifically, RG 5.71 states that the licensee reviews the program's effectiveness at least every 24 months. In addition, reviews are conducted as follows:

- *within 12 months of the initial implementation of the program*
- *within 12 months of a change to personnel, procedures, equipment, or facilities that potentially could adversely affect security*
- *as necessary based upon site-specific analyses, assessments, or other performance indicators*
- *by individuals independent of those personnel responsible for program implementation and management*

Based on the above review, the NRC staff finds that the cyber security program review described in Section 4.3 of the VEGP CSP is acceptable.

13.8.4.23 Document Control and Records Retention and Handling (Section A.5 of Appendix A to RG 5.71)

Section 5 of the VEGP CSP states the necessary measures and governing procedures to ensure that sufficient records of items and activities affecting cyber security are developed, reviewed, approved, issued, used, and revised to reflect completed work. VEGP will retain records and supporting technical documentation required to satisfy the requirements of 10 CFR 73.54 and 10 CFR 73.55, "Requirements for Physical Protection of Licensed Activities in Nuclear Power Reactors against Radiological Sabotage," until the NRC terminates the facility's operating license. Records are retained to document access history, as well as to discover the source of cyber attacks or other security-related incidents affecting CDAs or SSEP functions, or both. VEGP Units 3 and 4 will retain superseded portions of these records for at least three years after the record is superseded, unless otherwise specified by the NRC.

This deviates from RG 5.71 by not specifically detailing the types of records, but instead describes that records will be retained to document access history and information needed to discover the source of cyber attacks and incidents. This is consistent with what is included in RG 5.71, Section 5, and includes all the performance-based characteristics and commitments of that section.

Based on the above review, the NRC staff finds that the document control and records retention handling described in Section 5 of the VEGP CSP is acceptable.

13.8.4.24 Deviations Taken to RG 5.71, Sections C.1 Through C.5

The VEGP CSP states that the plan deviates from Regulatory Positions C.1 through C.5 of RG 5.71, as noted in Attachment A to the CSP. It also deviates from Section A.1 of Appendix A of RG 5.71. For that reason, the staff considers that the full evaluation of the CSP must include a review of the deviations taken to those sections of RG 5.71 as listed in the VEGP CSP. This section of the SER lists those 69 specific deviations and their evaluated security impact. The following deviations were provided in a table, as part of Attachment A to the CSP.

13.8.4.24.1 RG 5.71, Section C.2, fourth paragraph, first sentence (page 8)

SNC added the term “adequately” to the phrase “...systems and equipment are protected from cyber attack.” Since 10 CFR 73.54 specifically makes that same statement, the staff found no reason to object to that clarification. The objective is to provide adequate protection to the identified CDAs.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.2 RG 5.71, Section C.2, fourth paragraph, twelfth bullet, third sub-bullet (page 8)

SNC clarifies that its overall design is based on the Westinghouse AP1000 design and states that the AP1000 DCD commits to Revision 1 of RG 1.152, “Criteria for Digital Computers in Safety Systems of Nuclear Power Plants.” Since the applicant is required to have a cyber security program that meets the performance objectives outlined in 10 CFR 73.54 and is not obliged to achieve that requirement exclusively through the example provided by RG 5.71, this clarification, in and of itself, was not considered by the staff as deviating from the requirements established by the rule.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.3 RG 5.71, Section C.2, fifteenth bullet (page 8)

The deviation states that the required policies and procedures have not yet been written, reviewed, and approved, and, thus, are not currently available for inspection and review.

The NRC requires that these policies and procedures be completed and available for review by the completion of the CSP implementation schedule proposed by the applicant, since CSP inspections would not occur until that time. The requirements of 10 CFR 73.55(a)(4) and proposed License Condition 6 provide the necessary controls associated with developing the required policies and procedures of the CSP.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.4 RG 5.71, Section C.3, Figure 1 (Page 10)

The deviation changes the arrows on the left side of Figure 1 from “Continuous Monitoring” to “Ongoing Monitoring.”

The NRC intended monitoring to occur periodically, and when required, based on certain inputs into the process. SNC states that “continuous” might imply that monitoring was perpetual and not event driven. This was not the staff’s intent with the term “continuous.” The staff accepts the use of the term “ongoing” to better reflect the intent of this diagram.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.5 RG 5.71, Section C.3, third paragraph, first sentence (Page 10)

The VEGP CSP changes the statement, “An acceptable method to establish a cyber security program at a facility is by performing the following, (1) analyze the digital computer and communication systems and networks, ...” to “An acceptable method to establish a cyber security program at a facility is by performing the following: (1) identify critical systems and critical digital assets as described in Section C.3.1.3, (2) analyze the digital computer and communication systems and networks...”

This deviation is acceptable because SNC proposes to use its licensing basis to identify CSs that are associated with SSEP functions, as 10 CFR 73.54 requires. This statement includes the first step in RG 5.71 to analyze digital computer and communication systems and networks to determine if they include CDAs.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.6 RG 5.71, Section C.3.1, first paragraph, first sentence (page 11)

The VEGP CSP changes the statement, “Consistent with the requirements of 10 CFR 73.54(b)(1), a licensee must conduct a site-specific analysis of digital computer and communication systems and networks to identify CDAs, which are those assets that, if compromised, could adversely impact the SSEP functions of nuclear facilities.” to “Consistent with the requirements of 10 CFR 73.54(b)(1), a licensee must conduct a site-specific analysis of digital computer and communication systems and networks to identify CDAs, which are those assets that, if compromised, could adversely impact the CSs of nuclear facilities.”

SNC defines a CS as:

An analog or digital technology-based system in or outside of the plant that performs or is associated with a safety-related, important-to-safety, security, or emergency preparedness

function. These critical systems include, but are not limited to, plant systems, equipment, communication systems, networks, offsite communications, or support systems or equipment, that perform or are associated with a safety-related, important-to-safety, security, or emergency preparedness function as defined by the approved plant licensing basis.

This definition ties CSs to SSEP functions; therefore, the change is consistent with the method used in RG 5.71, as this means that CSs are all those assets associated with SSEP functions, and, therefore, could adversely impact those SSEP functions.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.7 RG 5.71, Section C.3.1, first paragraph, second bullet (page 11)

The VEGP CSP includes a deviation to correct an editorial omission in RG 5.71. Page 11 of RG 5.71 states that:

An acceptable method for identifying and documenting CDAs is as follows:

- *obtain authorization for security assessment*
- *define roles and responsibilities cyber personnel and form the cyber security team*
- *identify and document CDAs at the facility*
- *review and validate configurations of CDAs*

The VEGP CSP corrects the second bullet to read:

- *define roles and responsibilities of cyber personnel and form the cyber security team*

This deviation which supplies the omitted “of” is consistent with the intent of the referenced bullet.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.8 RG 5.71, Section C.3.1.2, third paragraph, second bullet (page 13)

The VEGP CSP changes the second bullet on Page 13 of RG 5.71 from:

documenting all key observations, analyses, and findings during the assessment process so that this information can be used as a basis for applying security controls;

to:

documenting all key observations, analyses, and findings during the assessment process so that this information can be used as a basis for addressing security controls;

This deviation is acceptable because RG 5.71 allows a licensee to address, as opposed to apply, security controls if it follows the process in Appendix A, Section 3.1.6 of RG 5.71, which is to apply the control, apply an alternative that provides no less protection than the corresponding security control, or to demonstrate that the control is not necessary because the attack vector, root cause, or vulnerability associated with the control does not exist.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.9 RG 5.71, Section C.3.1.2, third paragraph, sixth bullet (page 13)

The VEGP CSP changes the sixth bullet on Page 13 from:

- preparing documentation and overseeing implementation of the cyber security controls provided in Appendices B and C to this guide, documenting the basis for not implementing certain cyber security controls provided in Appendix B, or documenting the basis for the implementation of alternate or compensating measures in lieu of any cyber security controls provided in Appendix B; and*

to:

- overseeing documentation and implementation of the cyber security controls provided in Appendices B and C to this guide, documenting the basis for not implementing certain cyber security controls provided in Appendix B and C, or documenting the basis for the implementation of alternate or compensating measures in lieu of any cyber security controls provided in Appendix B and C; and*

This deviation is acceptable because overseeing the documentation and implementation of security controls by qualified personnel is an approved method. Further, the extension of this method in Appendix C is also acceptable as the licensee has committed to follow the process in Appendix A, Section 3.1.6 of RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.10 RG 5.71, Section C.3.1.2, third paragraph, seventh bullet (page 13)

The VEGP CSP includes a deviation from RG 5.71 that changes bullet 7 from:

assuring the retention of all assessment documentation, including notes and supporting information, in accordance with 10 CFR 73.54(h) and the record retention and handling requirements specified in Section C.5 of this guide.

to:

establishing the retention policy of all assessment documentation, including notes and supporting information, in accordance with 10 CFR 73.54(h) and the record retention and handling requirements specified in Section C.5 of this guide.

This deviation is acceptable as the licensee has committed to establish the retention policy. Although this may be done by a different team, and not the CST, it is consistent with the intent of RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.11 RG 5.71, Section C.3.1.2, fourth paragraph, first sentence (page 13)

The VEGP CSP deviates from RG 5.71 by changing this sentence:

The licensee's CST needs to have the authority to conduct an objective assessment, make determinations that are not constrained by operational goals (e.g., cost),

to:

The licensee's CST needs to have the authority to conduct an objective assessment, make determinations that are not constrained by business goals (e.g., cost),

This deviation is acceptable because the intent of this statement in RG 5.71 is to ensure that cost is not used as a factor in making determinations about the adequacy of security controls, vulnerabilities, identifying CSs and CDAs, and carrying out other assessment functions of the CST.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.12 RG 5.71, Section C.3.1.3, second paragraph (page 14)

The VEGP CSP deviates from RG 5.71 by changing the identification process from CDAs to CSs. This deviation is acceptable because the VEGP CSP commits to continue identifying CSs by identifying digital computers, networks, communication systems and support systems that perform and are associated with SSEP functions, as well as support systems and equipment that, if compromised, would adversely impact the plant's SSEP functions.

This is consistent with the process in RG 5.71, which identifies CDAs through the same process. The licensee further describes CDAs as a CS or part of a CS; therefore, the use of the term CS as opposed to CDA is also consistent with the method used in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.13 RG 5.71, Section C.3.1.3, fifth paragraph, first sentence (page 15)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing:

With the identification of the all the CSs ...

to:

With the identification of all the CSs ...

This change is acceptable because it accomplishes the intent of this phrase in RG 5.71 eliminating the unnecessary “the.”

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.14 RG 5.71, Section C.3.1.3, fifth paragraph, second sentence (page 15)

The VEGP CSP deviates from RG 5.71 by changing the following statement from:

A CDA may be a component of a CS ...

to:

A CDA may be a complete CS or component of a CS, ...

This deviation is acceptable because this statement is true. A CDA may be a complete CS and the deviation does not change the level of protection provided by the method outlined in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.15 RG 5.71, Section C.3.1.3, fifth paragraph, fifth sentence (page 15)

The VEGP CSP deviates from RG 5.71 by including additional documentation to help identify CSs and CDAs. Specifically VEGP includes “other licensing basis” documents to identify CSs and CDAs.

This deviation is in line with the intent of using existing documentation to identify CSs and CDAs. This section of RG 5.71 describes “helpful information sources for identifying CSs and CDAs” and is not an exhaustive list, nor is it the only method SNC has committed to use to identify CSs and CDAs. Specifically, SNC has committed to identify all digital computers, networks and communication systems associated with SSEP functions, which is what 10 CFR 73.54 requires.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.16 RG 5.71, Section C.3.1.3, eighth paragraph, first bullet
(page 16)**

The VEGP CSP deviates from RG 5.71 by stating that CDAs may be an entire CS. As previously discussed in Section 13.8.4.24.14 of this SER, it is true that a CDA may be an entire CS; therefore, this definition does not adversely impact either the method used in RG 5.71 or the protection that RG 5.71 provides.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.17 RG 5.71, Section C.3.1.3, eighth paragraph, second bullet
(page 16)**

The VEGP CSP deviates from RG 5.71 by stating that CDAs may be an entire CS. As previously discussed in Sections 13.8.4.24.14 and 13.8.4.24.16 of this SER, it is true that a CDA may be an entire CS; therefore, this definition does not adversely impact either the method used in RG 5.71 or the protection that RG 5.71 provides.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.18 RG 5.71, Section C.3.2, first paragraph, first sentence
(page 18)**

The VEGP CSP deviates from RG 5.71 by providing an editorial correction to RG 5.71. Specifically, the VEGP CSP changes the following sentence from:

As stated in 10 CFR 73.54(c)(2), the licensee must design its cyber security program to apply and maintain integrate defense-in-depth protective strategies to ensure the capability to detect, prevent, respond to, mitigate, and recover from cyber attacks.

to:

As stated in 10 CFR 73.54(c)(2), the licensee must design its cyber security program to apply and maintain integrated defense-in-depth protective strategies to ensure the capability to

detect, prevent, respond to, mitigate, and recover from cyber attacks.

This deviation captures the intent of this sentence in RG 5.71 by correcting “integrate” to “integrated.”

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.19 RG 5.71, Section C.3.2, second paragraph, fourth sentence (page 18)

The VEGP CSP deviates from RG 5.71 by pointing to an editorial error in RG 5.71. Specifically, the VEGP CSP changes the following sentence from:

Therefore, defense-in-depth is achieved not only by implementing multiple security boundaries, but also by instituting and maintaining a robust program of security controls that assess, protect, respond, prevent, detect, and mitigates an attack on a CDA and with recovery.

to:

Therefore, defense-in-depth is achieved not only by implementing multiple security boundaries, but also by instituting and maintaining a robust program of security controls that assess, protect, respond, prevent, detect, and mitigate an attack on a CDA and with recovery.

This deviation captures the intent of this sentence in RG 5.71 by correcting “mitigates” to “mitigate.” Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.20 RG 5.71, Section C.3.2, third paragraph, first sentence (page 18)

The VEGP CSP deviates from RG 5.71 by pointing to an editorial error in RG 5.71. Specifically, the VEGP CSP changes the following sentence from:

For example, if a failure in prevention were to occur (e.g., a violation of policy) or if protection mechanisms were to be bypassed (e.g., by a new virus that is not yet identified as a cyber attack), mechanisms would still in place to detect and respond to an unauthorized alteration in an impacted CDA, mitigate the impacts of this alteration, and recover normal operations of the impacted CDA before an adverse impact.

to:

For example, if a failure in prevention were to occur (e.g., a violation of policy) or if protection mechanisms were to be

bypassed (e.g., by a new virus that is not yet identified as a cyber attack), mechanisms would still be in place to detect and respond to an unauthorized alteration in an impacted CDA, mitigate the impacts of this alteration, and recover normal operations of the impacted CDA before an adverse impact.

This is acceptable because the change to add the word “be” to the phrase “would still be in place to detect” captures the intent of this sentence by supplying the “be” omitted from RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.21 RG 5.71, Section C.3.2.1, Figure 5 (Page 19)

The VEGP CSP includes a defensive architecture, which deviates from the example provided in RG 5.71. The proposed architecture is acceptable because it provides defense-in-depth, communication isolation for safety and security systems, and multiple nondeterministic boundaries for nonsafety/nonsecurity CDAs. This provides adequate protection for CDAs and ensures that appropriate isolation and boundary protection exists for all CDAs where appropriate.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.22 RG 5.71, Section C.3.2.1, third paragraph (page 19)

The VEGP CSP deviates from RG 5.71 by modifying the characteristics of an acceptable defensive architecture by stating that the architecture includes CSs and CDAs configured in accordance with Section 5 of Appendix B, and Sections 6 and 7 of Appendix C in accordance with the security control application process described in Section 3.3. As previously discussed in Section 13.8.4.24.9 of this SER, the use of the security control application process to address controls is consistent with RG 5.71.

SNC has committed to apply the security control, demonstrate that alternative controls provide no less protection than the corresponding control, or demonstrate through analysis that the attack vector the control addresses does not exist; therefore, the control is not necessary.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.23 RG 5.71, Section C.3.2.1, third paragraph, first bullet (page 19)

The VEGP CSP deviates from RG 5.71 by modifying the example defensive architecture to match the architecture to be used in the AP1000. This deviation is acceptable because it provides the appropriate isolation of safety and security CDAs, and adequate boundaries for nonsafety/nonsecurity CDAs.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.24 RG 5.71, Section C.3.2.1, third paragraph, second bullet (page 19)

The VEGP CSP deviates from RG 5.71 by modifying the example defensive architecture to match the architecture to be used in the AP1000. As previously discussed in Section 13.8.4.6, this deviation is acceptable because it provides the appropriate isolation of safety and security CDAs, and adequate boundaries for nonsafety/nonsecurity CDAs. This is consistent with the defensive model in RG 5.71, as the VEGP defensive architecture provides boundaries for safety systems that are deterministic.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.25 RG 5.71, Section C.3.2.1, third paragraph, third bullet (page 19)

The VEGP CSP deviates from RG 5.71 regarding communications from digital assets at lower security levels to digital assets at higher security levels. This deviation is acceptable because the defensive architecture prevents specific communication from lower security levels to specific higher security levels. This is consistent with the defensive model in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.26 RG 5.71, Section C.3.2.1, third paragraph, new second bullet (page 19)

The VEGP CSP deviates from RG 5.71 regarding remote access. This is consistent with the guidance in Section C.7 of RG 5.71, which also states that remote access to CDAs at the highest level be prevented.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.27 RG 5.71, Section C.3.2.1, third paragraph, new sixth bullet (page 19)

The VEGP CSP deviates from RG 5.71 by including in its defensive architecture a statement from Section C.7 of RG 5.71 for validating data (software updates, new firmware, etc.) using a method at or above the level of security the CDA that will have data transferred to it. This concept is already acceptable in RG 5.71 and is also included in the defensive architecture, although in a different section of the document. This is consistent with the method used in RG 5.71 and does not adversely impact the protection provided.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.28 RG 5.71, Section C.3.2.1, third paragraph, seventh bullet
(page 19)**

The VEGP CSP deviates from RG 5.71 by changing the commitment to eliminate applications, services and protocols not necessary to support the design-basis function of the CDAs to eliminate, disable, or render these inoperable. This is consistent with the method in RG 5.71, because in some cases these elements cannot be eliminated, but rather may have to be disabled or otherwise rendered inoperable. In each case, the result is the same. The asset is only configured to perform its design-based function and nothing more, which produces no less protection than the method in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.29 RG 5.71, Section C.3.2.1, third paragraph, eighth bullet
(page 19)**

The VEGP CSP deviates from RG 5.71 by eliminating the requirement to configure CDAs and boundary protection systems in accordance with Section 5 of Appendix B and Sections 6 and 7 of Appendix C. However, the VEGP CSP does commit to this in the preamble statement as described in Section 13.8.4.24.22 of this SER. Therefore, the VEGP CSP provides the same commitment to perform this as does RG 5.71, albeit in a different part of the same section.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.30 RG 5.71, Section C.3.2.1, fourth paragraph (page 19)

The VEGP CSP deviates from RG 5.71 by deleting the paragraph that commits to applying the security controls. However, the VEGP security plan commits, in Section 3.1.6, to address these controls and is, therefore, consistent with the method used in RG 5.71. The deleted paragraph is, therefore, unnecessary in the VEGP CSP to achieve the same commitment.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.31 RG 5.71, Section C.3.2.1, Prior to fifth paragraph (page 19)

The VEGP CSP deviates from the RG 5.71 defensive architecture. The VEGP architecture is described in Section 13.8.4.6 of this SER.

Based on the review and assessment in Section 13.8.4.6, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.32 RG 5.71, Section C.3.3, first paragraph, second sentence
(page 20)**

The VEGP CSP deviates from RG 5.71 by changing the following sentence:

A cyber compromise of CDAs would adversely impact nuclear facilities' SSEP functions that are necessary for protecting public health and safety.

to:

A cyber compromise of CDAs could adversely impact nuclear facilities' SSEP functions that are necessary for protecting public health and safety.

This deviation is consistent with the intent of RG 5.71, which implies that a compromise could lead to adverse impact and possible radiological sabotage. The intent of the paragraph is to establish the impact that could occur if a CDA were compromised. The security controls are designed around worst case scenarios, and the change in the VEGP CSP from "would" to "could" maintains this logic.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.33 RG 5.71, Section C.3.3, third paragraph, fourth sentence
(page 20)**

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing the statement:

Thus to provide high assurance that CDAs are protected from cyber attacks, potential cyber risks of these CDAs must be addressed known potential cyber risks.

to:

Thus to provide high assurance that CDAs are protected from cyber attacks, potential cyber risks of these CDAs must be addressed for known potential cyber risks.

This is acceptable because the change captures the intent of this sentence by supplying the "for" omitted from RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.34 RG 5.71, Section C.3.3, third paragraph, first sentence
(page 20)**

The VEGP CSP deviates from RG 5.71 by adding Appendix C to the list of controls that may be addressed using the method in Section 3.1.6 of Appendix A. This is consistent with the intent of RG 5.71, which assumes that all the controls in Appendix C can be implemented as written. However, if the controls can be addressed to demonstrate that an alternative control provides no less protection than the comparable control in Appendix C, or that the control is not necessary by demonstrating that the attack vector does not exist, this would meet the intent of RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.35 RG 5.71, Section C.3.3, third paragraph, first bullet (page 20)

The VEGP CSP deviates from RG 5.71 by adding Appendix C to the list of controls that may be addressed using the method in Section 3.1.6 of Appendix A. This is consistent with the intent of RG 5.71, which assumes that all the controls in Appendix C can be implemented as written. However, if the controls can be addressed to demonstrate that an alternative control provides no less protection than the comparable control in Appendix C, or that the control is not necessary by demonstrating that the attack vector does not exist, this would meet the intent of RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.36 RG 5.71, Section C.3.3, third paragraph, second bullet
(page 20)**

The VEGP CSP deviates from RG 5.71 by stating that alternative controls will not provide equal or better protection to the corresponding control, but rather that they will not provide less protection than the corresponding control. This is consistent with the method used in RG 5.71; providing an alternative that does not provide less protection, and does not adversely impact the security program. Therefore, this change in commitment will provide an adequate level of protection and is consistent with the method used in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

**13.8.4.24.37 RG 5.71, Section C.3.3, third paragraph, second bullet, second
sub-bullet (page 20)**

The VEGP CSP deviates from RG 5.71 by changing the statement:

*performing and documenting the attack vector and attack tree
analyses of the CDA and alternative countermeasures to confirm*

that the countermeasures provide the same or greater protection as the corresponding security control in Appendix B.

to:

performing and documenting an attack vector and attack tree analysis of the CDA and alternative countermeasures to confirm countermeasures provide no decrease in the effectiveness of protection as compared to the corresponding security control identified in Appendix B or C.

This deviation is acceptable because whether the licensee performs a single analysis or multiple analyses, the method is comparable provided that it will demonstrate that there is no decrease in protection. Further, the modification of the second part of the sentence is also acceptable because the intent of this method in RG 5.71 is to ensure that alternative controls do not provide less protection than the corresponding control. Therefore, a commitment to ensure that alternatives do not provide less protection produces a comparable level of protection as stating that the alternatives provide equal or better protection. Finally, the addition of the Appendix C controls to this method is acceptable because the licensee has committed to apply the control, apply an alternative that provides no less protection than the comparable control or not to apply the control and demonstrate that the attack vector does not exist.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.38 RG 5.71, Section C.3.3, third paragraph, second bullet, third sub-bullet (page 20)

The VEGP CSP deviates from RG 5.71 in a similar manner to deviations in Section 13.8.4.24.37 of this SER by changing the commitment to implement alternative countermeasures that provide at least the same degree of protection as the corresponding security control in Appendix B, to implementing alternative controls to provide no decrease in the effectiveness of protection as compared to the corresponding security control identified in Appendices B and C of RG 5.71.

This method is consistent with the method in RG 5.71 as it also meets the criteria for the performance based characteristics of 10 CFR 73.54. As long as the implemented alternative control does not provide less protection than the corresponding control in RG 5.71, the intent of this section of RG 5.71 has been met. Alternative controls are considered to be adequate only if they provide equivalent protection, and the VEGP CSP commits to that minimum standard.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.39 RG 5.71, Section C.3.3, third paragraph, third bullet (page 20)

The VEGP CSP deviates from RG 5.71 by not stating that SNC will specifically perform an attack vector and attack tree analysis to demonstrate that one of the

specific security controls is not necessary. SNC does commit to performing an analysis to demonstrate that the attack vector does not exist (i.e., is not applicable), thereby obviating the need for a specific security control.

This method is consistent with the method in RG 5.71 as it commits to demonstrating a conclusion, specifically, that the attack vector does not exist. If the licensee can demonstrate this, and not use an attack vector or attack tree analysis, the results are still the same and, therefore, the method would produce a result that does not provide less protection than the method in RG 5.71.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.40 RG 5.71, Section C.3.3, fourth paragraph, second sentence (page 20)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing the statement:

When a security control is determined to have an adverse affect, alternate controls should be used by the licensee to protect the CDA from cyber attack up to and including the DBT consistent with the process described above.

to:

When a security control is determined to have an adverse effect, alternate controls should be used by the licensee to protect the CDA from cyber attack up to and including the DBT consistent with the process described above.

This is acceptable because the change captures the intent of this sentence in RG 5.71, by correcting “affect” to “effect.”

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.41 RG 5.71, Section C.3.3, fifth paragraph, second sentence (page 21)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing the statement:

If these effectiveness or vulnerability analyses identify a gap in the cyber security program, the licensee may need to implement additional security measures and controls not provided in Appendixes B and C.

to:

If these effectiveness or vulnerability analyses identify a gap in the cyber security program, the licensee may need to implement additional security measures and controls not provided in Appendices B and C.

This change is acceptable because it captures the intent of this sentence in RG 5.71, by correcting “Appendixes” to “Appendices.”

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.42 RG 5.71, Sections C.3.3.1.1 through C.3.3.1.5, first paragraph and last bullet (pages 21 and 22)

The VEGP CSP deviates from RG 5.71 by stating that it will not apply all of the security controls in RG 5.71, but rather will address them. The VEGP CSP already commits to the RG 5.71 process, which is:

- 1) applying controls;*
- 2) applying an alternative control that does not provide less protection than the corresponding control; or*
- 3) not applying a control, but demonstrating that the corresponding attack vector does not exist.*

The intent of RG 5.71 is to address the controls in Appendices B and C. This can be accomplished in accordance with Section 3.1.6 of Appendix A, to which SNC has committed.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.43 RG 5.71, Section C.3.3.1.1, first paragraph, second bullet, fourth sub-bullet (page 21)

The VEGP CSP deviates from RG 5.71 by committing to audit CDAs at an interval defined for the CDA, or within 5 days following revocation of an individual’s unescorted access, due to a lack of trustworthiness or reliability, or as soon as reasonably practical upon changes in personnel. Although this method uses a different frequency than the method in RG 5.71, which calls for annual assessments, or assessments immediately upon changes in personnel, this frequency does meet the requirements of 10 CFR 73.55(m), which allows the licensee to define these intervals based on its own assessments of need.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.44 RG 5.71, Sections C.3.3.2.1 through C.3.3.2.5, first paragraph and last bullet (pages 23 and 24)

The VEGP CSP deviates from RG 5.71 in a fashion similar to the deviation cited in Section 13.8.4.24.42 of this SER by committing not to apply the controls, but rather to address them. As previously stated, this deviation is consistent with the method in RG 5.71, and also meets the intent of the RG, provided that the licensee follows the process in Section 3.1.6 of Appendix A, to which SNC has committed.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.45 RG 5.71, Sections C.3.3.2.6 through C.3.3.2.9, first paragraph and last bullet (pages 24-26)

The VEGP CSP deviates from RG 5.71 in a fashion similar to the deviation cited in Sections 13.8.4.24.42 and 13.8.4.24.44 of this SER by committing to apply the controls, but rather to address them. As previously stated, this deviation is consistent with the method in RG 5.71, and also meets the intent of the RG, provided that the licensee follows the process in Section 3.1.6 of Appendix A, to which SNC has committed.

Based on the above review and assessment, the NRC staff finds that this deviation is acceptable.

13.8.4.24.46 RG 5.71, Section C.3.3.2.9, first paragraph, first bullet (page 25)

The VEGP CSP deviates from RG 5.71 by making an editorial correction to RG 5.71. This involves changing the first bullet:
