APPENDIX 1 Computer Output of All Human Engineering Deficiencies	
APPENDIX A Checklist of NUREG-0700 Criteria Used For the Turkey Point Units 3 and 4 DCRDR	

## 1.0 METHODOLOGY

### 1.1 Overview

This report has been prepared in response to NUREG-0737 item 1.D.1 and details the means by which a Detailed Control Room Design Review was conducted for the Turkey Point Units 3 & 4 Nuclear Power Plants owned and operated by the Florida Power & Light Company. The review was conducted using NUREGs-0700 and -0801, and spanned the period from July 1981 to July 1983.

The review was conducted in four phases, as follows:

Phase 1 - Project Planning.

- o Preparation of a review planning document which discusses
  - Review methodologies
  - Review documentation
  - Status, personnel qualifications, and project organization
  - Assessment and prioritization of discrepancies
  - Reporting (findings, assessment, and schedules).

Phase 2 - Control Room Review. This represents the period in which data collection, reduction, and analysis was conducted, resulting in Human Engineering Discrepancy reports and draft reports.

Phase 3 - Enhancement & Design Solutions. Human Engineering Discrepancies were collated, alternate enhancements and design solutions were generated, and the results were considered in trade-offs.

Phase 4 - Reporting. Backfit schedules and Detailed Control Room Design Review results will be provided to the Nuclear Regulatory Commission.

Figure 1-1 shows, in general, the phases and task flow for the Detailed Control Room Design Review. A brief discussion of the activities conducted in each phase of the review follows this figure. The Detailed Control Room Design Review was conducted using the NUREG-0700 guidelines. Planning, staffing, technical approach, and prioritization were conducted in accordance with the guidelines as stated in NUREG-0700.

The present Detailed Control Room Design Review report closely follows the outline recommended in Section 5.2 of NUREG-0700. Specifically, this final report discusses:

- o The Detailed Control Room Design Review phases
- o The technical activities
  - review of operating experience
  - assembly of control room documentation
  - system/function/task analysis
  - conduct of control room surveys
  - verification of task performance capability
  - validation of control room functions

1. The first part of the document is a list of names and addresses of the members of the committee. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

2. The second part of the document is a list of the names and addresses of the members of the committee who have been elected to the office of chairman and vice chairman. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

3. The third part of the document is a list of the names and addresses of the members of the committee who have been elected to the office of secretary and treasurer. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

4. The fourth part of the document is a list of the names and addresses of the members of the committee who have been elected to the office of clerk. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

5. The fifth part of the document is a list of the names and addresses of the members of the committee who have been elected to the office of member-at-large. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

6. The sixth part of the document is a list of the names and addresses of the members of the committee who have been elected to the office of member-at-large. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

7. The seventh part of the document is a list of the names and addresses of the members of the committee who have been elected to the office of member-at-large. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

8. The eighth part of the document is a list of the names and addresses of the members of the committee who have been elected to the office of member-at-large. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

9. The ninth part of the document is a list of the names and addresses of the members of the committee who have been elected to the office of member-at-large. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

10. The tenth part of the document is a list of the names and addresses of the members of the committee who have been elected to the office of member-at-large. The names are listed in alphabetical order, and the addresses are given in full, including the street, city, and state.

- o Method of assessment of discrepancies
- o Method of identification and selection of enhancement and design solutions
- o Review results of Human Engineering Discrepancies, Human Engineering Discrepancy Assessment, and the selected enhancement and design solutions will be organized into the following groups:
  - survey findings (annunciator, communications, etc.)
  - task analysis findings (panel/workspace)
  - human factors engineering suitability and validation of functions findings (control room traffic, workload distribution, and man/machine functional allocations)
- o Improvements to be made
  - enhancements/justification/extent of correction
  - design alternative/justification/extent of correction
- o Schedule of implementation.

1. The first part of the document is a list of the names of the persons who were present at the meeting.

2. The second part of the document is a list of the names of the persons who were present at the meeting.

3. The third part of the document is a list of the names of the persons who were present at the meeting.

4. The fourth part of the document is a list of the names of the persons who were present at the meeting.

5. The fifth part of the document is a list of the names of the persons who were present at the meeting.

6. The sixth part of the document is a list of the names of the persons who were present at the meeting.

7. The seventh part of the document is a list of the names of the persons who were present at the meeting.

8. The eighth part of the document is a list of the names of the persons who were present at the meeting.

9. The ninth part of the document is a list of the names of the persons who were present at the meeting.

10. The tenth part of the document is a list of the names of the persons who were present at the meeting.

11. The eleventh part of the document is a list of the names of the persons who were present at the meeting.

12. The twelfth part of the document is a list of the names of the persons who were present at the meeting.

13. The thirteenth part of the document is a list of the names of the persons who were present at the meeting.

14. The fourteenth part of the document is a list of the names of the persons who were present at the meeting.

15. The fifteenth part of the document is a list of the names of the persons who were present at the meeting.

16. The sixteenth part of the document is a list of the names of the persons who were present at the meeting.

17. The seventeenth part of the document is a list of the names of the persons who were present at the meeting.

18. The eighteenth part of the document is a list of the names of the persons who were present at the meeting.

19. The nineteenth part of the document is a list of the names of the persons who were present at the meeting.

20. The twentieth part of the document is a list of the names of the persons who were present at the meeting.

21. The twenty-first part of the document is a list of the names of the persons who were present at the meeting.

22. The twenty-second part of the document is a list of the names of the persons who were present at the meeting.

23. The twenty-third part of the document is a list of the names of the persons who were present at the meeting.

24. The twenty-fourth part of the document is a list of the names of the persons who were present at the meeting.

25. The twenty-fifth part of the document is a list of the names of the persons who were present at the meeting.

26. The twenty-sixth part of the document is a list of the names of the persons who were present at the meeting.

27. The twenty-seventh part of the document is a list of the names of the persons who were present at the meeting.

28. The twenty-eighth part of the document is a list of the names of the persons who were present at the meeting.

29. The twenty-ninth part of the document is a list of the names of the persons who were present at the meeting.

30. The thirtieth part of the document is a list of the names of the persons who were present at the meeting.

## 1.2 Review Procedures

This section presents, in general terms, the review procedures employed. In Section 2.0, Findings, detailed descriptions of the procedures employed, and results of each, are presented.

### 1.2.1 Phase 2 — Control Room Review

The Control Room Review phase was subdivided into six subtasks as follows:

- o Review of Operating Experience
- o Assemble Control Room Documentation
- o Review of System Functions and Task Analysis
- o Control Room Surveys
- o Verify Task Performance Capability
- o Validate Control Room Functions.

1.2.1.1 Review of Operating Experience — This task was composed of two subtasks: 1) conduct of operator interviews, and 2) review of plant operational experience through Licensee Event Reports, technical specification modifications, etc. This review task was conducted in accordance with the guidelines of NUREG-0700 published September 1981.

1.2.1.2 Assemble Control Room Documentation — In this task, a control room data base was established to support subsequent evaluation. A library was established with control room related documentation (technical specifications, drawings, etc.), control room components were photo-documented, and a 1/3 scale photomosaic was constructed. The library and photo-documentation were centrally located to support the effort. In addition to the library and photographic documentation; a control room inventory of components was developed, identifying for each component, its location, system relationships, functions, and characteristics. Inventory data has been filed for subsequent use.

1.2.1.3 Conduct Control Room Surveys — Much of the detailed assessment of the control room was conducted via surveys. Surveys required the collection of data using preconstructed checklists and interview forms, and the taking of direct measurements of control room parameters such as noise levels, light levels, etc. The survey criteria are presented in Appendix A. For each survey, a draft report (summarizing Human Engineering Discrepancies) was prepared for subsequent inclusion into the present final report. The surveys conducted were:

- o Noise — direct measurements of noise levels were taken and compared to individual checklists items.

- o Lighting — measurements were taken under various conditions (e.g., normal and emergency lighting) and compared to individual NUREG-0700 items.
- o Control Room Environment — assessments were made by direct measurement of the parameters listed below and by comparison to the data in the NUREG-0700 guidelines.
  - temperature
  - humidity
  - ventilation
  - workspace arrangement
  - document organization, use, and storage
  - control room access
- o Design Conventions — evaluations by survey for the conventions listed below. The data was subsequently compared to NUREG-0700 guidelines.
  - coding methods (color, shape, pattern, etc.)
  - standardization of abbreviations and acronyms
  - consistency of control use
  - consistency of display movement or indication
- o Controls — checklist evaluation of controls.
- o Displays — checklist evaluation of displays.
- o Computers — checklist evaluation of computer systems.
- o Emergency Garments — data were collected by walk-throughs, use of emergency garments, speech intelligibility analysis, and checklist application.
- o Labeling — checklist evaluation of labels.
- o Annunciators — checklist evaluation of annunciator systems; direct measurement of annunciator fonts, signal intensities, etc.
- o Anthropometrics — analysis of reach and visual access to control room components given physical configuration of boards, panels, layout, etc. The data was subsequently compared to checklist item requirements.
- o Force/Torque — where indicated by operator observation, force/torque information for control types were collected for comparison to checklist items.
- o Communications — checklist evaluation of communications systems; speech intelligibility analysis of communications modes
- o Maintainability — checklist and questionnaire data concerning operator-maintained components (trend recorders, bulbs, etc.).

**1.2.1.4 Review of System Functions and Task Analysis (SFTA) —** System functions and tasks were identified and evaluated in this task. A 4-step procedure was employed:

- o Identification of systems and subsystems by review of plant documentation

Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group and the experimental group. The control group was divided into two subgroups: the control group and the experimental group. The experimental group was divided into two subgroups: the control group and the experimental group. The control group was divided into two subgroups: the control group and the experimental group. The experimental group was divided into two subgroups: the control group and the experimental group.

- o Identification of event sequences to undergo Task Analysis. These were identified using:
  - NUREGs-0737, -0660, and -0700
  - results of Operating Experience Review
- o Identification of system/subsystem functions through document review and operator interviews
- o Identification and analysis of control room operational tasks.

Task Analysis data served as an input to the verification of task performance capability and to the validation of control room functions (see paragraphs 1.2.1.5 and 1.2.1.6). The results/products of this task were:

- o Response Selection Diagrams
- o Task analysis of functional sequences
- o Task analysis of event sequences
- o Spatial-Operational Sequence Diagrams of task sequences
- o Traffic Pattern Diagrams.

**1.2.1.5 Verify Task Performance Capability** — This evaluation task involved two subtasks: 1) verification of instrument/control availability, and 2) verification of human engineering suitability. The first, verification of availability, was conducted using the Task Analysis and Control Room Inventory. In general, tasks associated with control room functions were examined in terms of appropriate instrumentation in the control room (i.e., task equipment demands vs. actual equipment present in the control room). Estimates of the frequency-of-use for all instrumentation were then generated based on the set of procedures examined.

Estimations of nonprocedurally-bound operations (e.g., boration, etc.) were generated via operator interviews. Also task sequences required in selected event sequences were estimated as to frequency of occurrence in the event sequences. Comparing both frequency and requirements data to the inventory, identification was made of: 1) the absence (in the control room) of task-required information or control, 2) the estimated frequency with which the information or control is required, and 3) the conditions (events, procedures, etc.) under which the information or control is required.

The second subtask, verification of human engineering suitability, involved using Spatial-Operational Sequence Diagrams, Traffic Pattern Diagrams, identified functional groups, and checklists to evaluate human engineering suitability in terms of sequence of component use, control/display proximity, and so forth. NUREG-0700 guidelines served as the principal source document for evaluation criteria.

### 1.3 Documentation and Document Control

Three types of documentation were addressed: 1) reference documentation, 2) process and Human Engineering Discrepancy documentation, and 3) Detailed Control Room Design Review output findings and reports.

#### 1.3.1 Reference Documentation

A program library was established with reference documents to support the Detailed Control Room Design Review tasks. It contains:

- o Licensee Event Reports
- o Outage Analysis Reports
- o Final Safety Analysis Reports
- o Technical specifications and system descriptions
- o Piping and Instrumentation Diagrams
- o Floor plans
- o Panel drawings and photographs
- o Software descriptions
- o Procedures
- o Samples of computer printouts
- o Various Nuclear Regulatory Commission and industry documents bearing on control room design (i.e., NUREGs-0700 and -0660, IEEE specifications and standards, human factors engineering texts, etc.).

As required, this documentation was referenced to support specific tasks within the control room evaluations.

#### 1.3.2 Process Documentation

Data collection and reduction methods were documented for reporting purposes. The general flow of information management is presented in Figure 1-2. Task plans served as the basic process documentation.

#### 1.3.3 Guideline Human Engineering Discrepancy Documentation

Data files for each Human Engineering Discrepancy were generated. For each task requiring a report, file space was reserved for that report. Human Engineering Discrepancy information was stored in a computer file which contained the following information:

- o Guideline number

- o Human Engineering Discrepancy description
- o Human Engineering Discrepancy assessment
- o Human Engineering Discrepancy locations (components which are discrepant from the NUREG-0700 guidelines)
- o Action to be taken on the Human Engineering Discrepancy.

Figure 1-3 presents the Human Engineering Discrepancy form used to document and report findings.

#### 1.3.4 Component Human Engineering Discrepancy Reports

A manually maintained file was established which documented, for each component, Human Engineering Discrepancies cited against that component (generic Human Engineering Discrepancies, such as label font, were not recorded on component sheet). In addition, the header for each Component Level Human Engineering Discrepancy contains the following Control Room Inventory information:

- o Panel/workstation
- o Unique location code
- o System relationship
- o Component function and use
- o Component type and characteristics.

The Human Engineering Discrepancies noted against a component are, where appropriate, listed on the bottom of the form by Human Engineering Discrepancy number (which corresponds to a NUREG-0700 guideline number). The Component Level Human Engineering Discrepancy form used is presented in Figure 1-4.

#### 1.3.5 Task Reports

For each survey, a separate report section has been generated detailing:

- o Objectives of the survey
- o Actual data collection and analysis methods employed
- o Criteria used as a baseline or guideline for evaluation
- o Summary of findings.

#### 1.4 Technical Approach

The technical approach (review procedure) employed is briefly introduced in this section. Detailed discussions of review methodologies are presented in Section 2.0, Findings, where text is provided which describes the activities for the following tasks:

- o Review of operating experience
- o Assembly of control room documentation
- o Review of system functions and task analysis
- o Surveys
  - noise
  - lighting
  - control room environment
  - design conventions
  - controls and displays
  - computers
  - emergency garments
  - labeling
  - annunciators
  - anthropometrics
  - force/torque
  - communications
  - maintainability
- o Verification of task performance capability
- o Validation of control room functions
- o Assessment of discrepancies.

Each survey report addresses:

- o Task Objectives — The type of data to be collected or human performance variables under analysis.
- o Review Team — The personnel required to conduct the task.
- o Criteria — Generally, the review guidelines appropriate to the evaluation being conducted.
- o Task Definition — Steps or procedures followed in the conduct of the task.
- o Outputs and Results — Task results. These are Human Engineering Discrepancies which may be drawn upon by subsequent tasks (e.g., Task Analysis).

## 1.5 Assessment and Implementation

Once a Human Engineering Discrepancy was identified, its disposition had to be determined. This section of the summary report: 1) describes the means whereby Human Engineering Discrepancies were assessed for error-inducing potential and system consequences of induced errors, and 2) details the means by which Human Engineering Discrepancies will be disposed of (redesign, additional Job Performance Aids, etc.) The assessment portion, in essence, determines the scheduling of backfits as a function of the potential consequences of the Human Engineering Discrepancy. The disposition portion determines the means by which a Human Engineering Discrepancy will be ameliorated. Assessment is initially divorced from disposition in terms of selection of backfits; however, Human Engineering Discrepancy disposition may, in some instances, drive scheduling of backfits due to availability of materials, extent of engineering redesign, and so forth. Also candidate backfits undergo assessment to ensure that human engineering discrepancies have been adequately addressed.

### 1.5.1 Assessment

The basic assessment process is divided into four steps, as follows:

- o Assess extent of deviation from NUREG-0700 guidelines
- o Assess Human Engineering Discrepancy impact on error occurrence
- o Assess potential consequences of error occurrence
- o Assign Human Engineering Discrepancy scheduling priority.

A Human Engineering Discrepancy Assessment Form and a Logic Diagram are presented in Figure 1-5.

**1.5.1.1 Assess Extent of Deviation from NUREG-0700 Guidelines** — This step required that a subjective assessment of the extent of discrepancy from NUREG-0700 guidelines be made with regard to the control room. For example, symbol/background contrast might be 40 percent rather than 50 percent, or only small amounts of parallax may exist in a display. A judgement was made based on the content of the guideline being applied and the control room component under assessment. Extent of deviation was subjectively scaled from "1" (some deviation) to "5" (complete deviation). There was also a category N/A (not applicable) for Human Engineering Discrepancies which are not described in NUREG-0700 (discrepancies from other documents such as military standards, human factors engineering texts, etc). Extent of deviation judgements are not used directly to assess priority or scheduling of backfits, but relate to assessment of

By the

of

and

Isaiah

of the

of the

of the

of the

of the

of the

operational error potentials. It is possible to have little deviation from the guidelines and high error assessments, and vice versa.

#### **1.5.1.2 Assess Human Engineering Discrepancy Impact on Error Occurrence —**

Given that no control system can be designed to be operationally error-free, the assessment here was to estimate Human Engineering Discrepancy impact on hypothetical (unknown) baseline error rates of control room components; e.g., will additional errors be induced by discrepancies from the guidelines? Estimates of Human Engineering Discrepancy impact on error occurrence were qualitatively arrived at by consideration of the following:

- o Body physiology
  - fatigue/physical stress
  - discomfort
  - injury
  - anthropometry
- o Sensory/perceptual performance
  - vision
  - audition
  - proprioception
  - touch
- o Information processing
  - overload
  - confusion
  - recall
  - pattern matching/recognition
  - data manipulation (comparing, extrapolating, etc.)
- o Learning
  - inhibition
  - habituation
  - response predominance
  - transfer
  - response competition
  - response latency
- o Task demands
  - frequency
  - duration
  - competition
  - sequence
  - speed
  - communication
  - precision
  - information.

**1.5.1.3 Assess Potential Consequences of Error Occurrence —** Review team, technical staff, and operations representatives evaluated system consequences of hypothesized operational errors. Four determinations are required:

- o Does the Human Engineering Discrepancy relate to plant safety functions?
- o Does the Human Engineering Discrepancy relate to plant functions required to mitigate the consequences of an accident?
- o Could an error lead to unsafe operations or plant conditions?
- o Could an error lead to violations of technical specifications?

Each of these requires a yes/no type response. The Logic Diagram on Figure 1-5 (Human Engineering Discrepancy Priority) shows how these data are integrated to assign categories and priorities to Human Engineering Discrepancies.

Category I Human Engineering Discrepancies are those which have been noted from documented operational errors. All Category I Human Engineering Discrepancies are deemed to increase error potential, but consequences must still be assigned to determine ultimate scheduling priority. Category II Human Engineering Discrepancies are those discrepancies noted during field surveys and/or operator interviews which have been determined to be of valid concern and require corrective action, but for which no documented cases of operator error were found during the Review of Operating Experience. Category III Human Engineering Discrepancies are those discrepancies noted by field surveys and/or operator interviews which have been determined to have little or no impact on operator performance, and for which no documented cases of operator error were found during the Review of Operating Experience.

Assessment of error occurrence was estimated for the following:

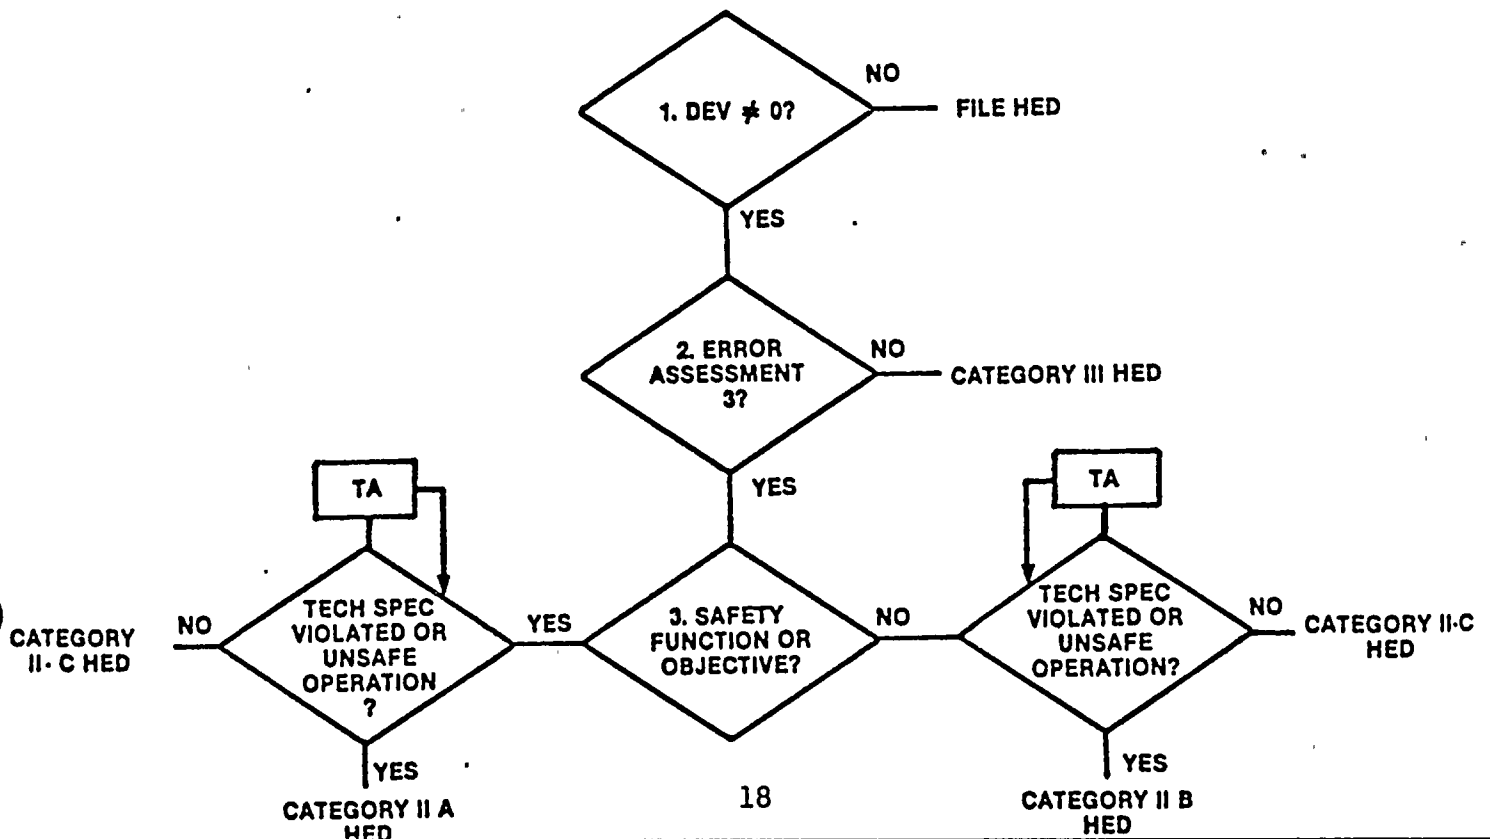

- o Overall operator performance is/is not degraded by the Human Engineering Discrepancy impact on body physiology?
- o The Human Engineering Discrepancy does/does not degrade sensory performance?
- o Information processing capability is/is not exceeded via the Human Engineering Discrepancy?
- o The Human Engineering Discrepancy does/does not induce direct error due to principles of learning?
- o Task difficulty and reliability is/is not affected by the Human Engineering Discrepancy?

Based on the above, a subjective error assessment was generated on a 5-point scale; "1" indicating a low probability of induced errors is expected as a result of the Human Engineering Discrepancy, and "5" indicating a high probability of additional errors being induced.

|    | A. UNSAFE<br>OPERATION  | YES |             |   |   | NO              |
|    | B. VIOLATION<br>OF TECH.<br>SPECS.  | YES |             |   |   | NO              |

**1.5.1.4 Assign Human Engineering Discrepancy Priority Scheduling — Priority for scheduling of backfit was assigned per the following:**

- o Priority A — Prompt - first outage, given availability of materials and engineering lead time.
- o Priority B — Near Term - second refueling outage given availability of parts and engineering lead time.
- o Priority C — Long Term - at any time.

## 2.0 FINDINGS

This section presents results and findings of the Detailed Control Room Design Review. Section 2.1 discusses the Equipment Inventory. Section 2.2 presents findings for the Operating Experience Review. Section 2.3 presents findings and results of the Control Room Surveys. Finally, Section 2.4 discusses the System Functions and Task Analysis findings. Where applicable, all Human Engineering Discrepancies identified via the evaluation processes are presented.

### 2.1 Equipment Inventory

#### 2.1.1 Objective

The objective of the Equipment Inventory was to identify and reference all instrumentation controls and equipment within the control room for: 1) assessment of task equipment demands, 2) Component Level Human Engineering Discrepancy documentation, and 3) priority assessment. The inventory included all components and major assemblies with which operators interface in the control rooms.

#### 2.1.2 Review Team Responsibilities

A human factors specialist with control room operating experience assembled the Equipment Inventory using the form presented in Figure 1-4. (One form was completed for each component or major assembly).

#### 2.1.3 Criteria

Criteria for this task included:

- o The inventory should include all controls, displays and other components on the control boards, peripheral consoles, back panels, etc. - that is, the components with which operators interface at all work stations. (NUREG-0700, p. 3-19).
- o Each component should have a unique identifier (NUREG-0700, p. 3-20).
- o The inventory should identify the system, subsystem, function/sub-function, purpose, and characteristics (range for scaled displays, colors for indicator lights, and position labels for controls) for each component (NUREG-0700, p. 3-19).

#### 2.1.4 Task Definition

A photomosaic of the control room was used as the basis for most of the inventory work. Because the panels are long, they were divided into sections for the purpose of assigning alphanumeric identifiers. The console consisted of the following sections (from left to right facing the console): Coolant Volume Control System, Reactor Control, Steam Flow/Feed Flow, and Electrical. The back panel was divided into the Reactor Coolant System; Reactor, Steam Generator and Reactor Trip; Condensate, Feedwater and Turbine-Generator; and Electrical. The Safeguard Panel was divided into four sections and numbered 1 through 4, from left to right. Each component was assigned a unique alphanumeric code. All components sharing a single label were given the same code.

One Component Level Human Engineering Discrepancy Report (component sheet) was completed for each unique alphanumeric code. Information not available from the photomosaic was collected on-site. Components were divided into subsystems within each panel by a human factors specialist with control room operating experience, and this information was included on the component sheet.

The bottom half of the component sheet includes a list of Human Engineering Discrepancies noted for each component. The Human Engineering Discrepancy number shown refers to the NUREG-0700 guideline which was violated by the component.

Although the control room Equipment Inventory was intended for use in Task Analysis, the references to Human Engineering Discrepancy numbers on the component sheets also provide Florida Power & Light with a list of Human Engineering Discrepancies associated with each component. The component sheets are filed by unit, by panel, by component type within each panel, and finally by location code within component type.

The control room Equipment Inventory was completed July 1983 after the majority of data collection was completed.

#### 2.1.5 Outputs and Results

The output of this task is a filing system containing a data form for each component in the control room. The form contains information describing the component and a list of associated Human Engineering Discrepancies. The Human Engineering Discrepancy number references NUREG-0700 guidelines and the appropriate Human Engineering Discrepancy.

## **2.2 Operator Interviews/Operating Experience Reviews**

### **2.2.1 Objective**

Interviews were conducted with operating personnel in order to obtain information on control room design and operability from users of the system. Questions were intended to gather information on workspace design and panel layout, environmental features, alarm and warning systems, computer systems, communications, procedures, maintenance, and staffing and training. Potential discrepancies as well as positive human factors engineering features were identified.

### **2.2.2 Review Team Responsibilities**

Interviews were conducted by a human factors analyst experienced in interview techniques. The human factors analyst was responsible for briefing each interviewee regarding the purpose and general content of the questionnaire, and for recording responses appropriately on the interview forms. Briefings and interviews both were conducted individually.

Operations personnel participating in the interviews included a majority of the reactor operators, senior reactor operators, watch engineers (shift technical advisors), and shift supervisors.

### **2.2.3 Criteria**

The specific items presented during the interviews are presented in Appendix A.

### **2.2.4 Task Definition/Methodology**

An operations representative was designated to arrange times and places for individual interviews. It was decided that since Unit 3 was off-line it would be most convenient to brief and interview individual operators (one at a time) in an alcove off the control room. The close proximity to the primary operating zone allowed the interviewee rapid return to control room duties if required, allowed demonstrations of incidents or problems on the control board, and provided sufficient privacy to achieve a confidential interview.

Each operator was briefed on the purpose of the interview and its contribution to the overall control room evaluation, as well as about the role of human factors engineering in the design of power plant control systems and interfaces. The interviewees were also assured as to the anonymity of their responses.

Each question was read aloud and then paraphrased to ensure that the intent was clear. The interviewer listened carefully to each response, asking questions when statements were unclear, recorded responses on the questionnaire (Appendix A), and read each recorded response aloud to the interviewee to ensure accuracy.

Prior to each subsequent data collection task, the relevant section of each questionnaire was reviewed to ensure that all of the interviewees' concerns were evaluated and verified.

Questionnaires are retained in comprehensive project files to provide supporting data for this and other aspects of the evaluation.

### 2.2.5 Output and Results

Responses to individual questions were tallied and any clustering of answers noted. A listing of the most frequently noted (clustered) responses is contained in Table 2.2.5-1.

Many insights were identified only once (by one interviewee); yet when verified in the control room (with the three control room operators on shift), the insight was found to be shared. Therefore, all potential human factors engineering problems were reviewed and verified; not simply those problems most frequently identified. An area where this was particularly evident was in panel layout where a variety of potential grouping and arrangement problems were identified.

Each negative observation (noted during interviews) was documented on Human Engineering Discrepancy forms and verified or discredited via subsequent surveys and/or Task Analysis. A number of negative observations were deleted where previously scheduled control room modifications ameliorated the potential discrepancies.

### 2.3 Surveys

This section presents the objectives, review team, evaluation criteria, task definition/methodology, and results/finding of each control room survey. These include:

- o Noise
- o Light
- o Environment/Workspace
- o Controls and Displays
- o Conventions
- o Process Computer
- o Emergency Garments
- o Labels and Location Aids
- o Annunciators
- o Anthropometry
- o Force/Torque
- o Communications
- o Maintainability.

### 2.3.1 Noise Survey

2.3.1.1 Objective — The purpose of the Noise Survey was to ensure that noise levels within the control room do not interfere with aided and unaided voice communications and signal audibility. Noise, signal, and communication levels were measured to determine whether or not they met NUREG-0700 guidelines.

2.3.1.2 Review Team Selection and Responsibilities — The survey was performed by a human factors analyst familiar with the operation of the sound level meter used and fundamental properties of sound.

2.3.1.3 Criteria — The following guidelines were used for data collection, analysis, and discrepancy documentation:

- o Ambient noise levels, under normal operating conditions, do not exceed 65 dB(A) (NUREG-0700, 6.1.5.5.b)
- o To ensure the audibility of signals and alarms, each is at least 10 dB(A) above the ambient noise level (NUREG-0700, 6.3.2.1.a)
- o Acceptable levels for voice communication are as indicated in Figure 2.3.1-1.

#### 2.3.1.4 Task Definitions

Basal Level Reading and Contributing Noise Sources — Noise measurements were taken at a basal level, without contributing conversation, communication, or noise from signals and other oscillating sources. Contributing sources were measured first as individually as possible, then simultaneously. Potential noise sources include:

- o Audible Alarms
- o Printers
- o Communications equipment (ringing telephones, radios, loudspeakers)
- o Emergency or typical environmental control systems (air conditioning, exhaust fans) (since this noise could not be eliminated, it as well as backroom relay clatter was included in all basal measurements)
- o Loud conversation
- o Adjacent control room alarms
- o Open doors leading out of control room (noise from outside sources).

Measurements at Operating Positions and Desks — Measurements were taken at each operator position that requires verbal communication and /or auditory discrimination of a signal or communication. These positions included at a minimum all control room operators' desks and work stations (each panel). A diagram of the control room layout was prepared, and each measurement position was identified by number or code.

**FIGURE 2.3.1-1**  
**VOICE LEVEL AS A FUNCTION OF DISTANCE**  
**BETWEEN SPEAKER AND LISTENER AND AMBIENT**  
**NOISE LEVEL (FROM NUREG 0700)**

**Microphone Positions at Control Panels —** Microphone positions for measurements at control panels were:

- o Toward panel
- o Toward nearest operator desk or station
- o Toward source
- o Straight up without obstruction, for omnipositional measurement.

**Microphone Positions at Operators' Desks —** Microphone positions for measurements at operators' desks were:

- o Straight up
- o Toward nearest operator
- o Toward source of noise.

**Weightings for Measurement —** Readings were taken in dB(flat), dB(A) and dB(C) weightings. Special attention was given to dB(A) readings since these simulate subjective responses to noise. The flat (dB) response is an indiscriminate mode, attributing the sound level to no specific frequency range. To be able to make single figure measurements that take the frequency response of the ear into account, three frequency weighting curves, A, B, and C, based upon the response of the ear, have been devised. The C-weighted mode has, essentially, a uniform response from 30 Hz to 8 kHz. The dB(A) mode is the most commonly used mode for industrial standards, and is the mode upon which the Essex survey recommendations were based. This mode favors the frequencies between 1 and 4 kHz, peaking at 2.5 kHz. Steady-state noise measurement is best made in this mode because it discriminates most sounds which are audible to the average ear over a period of time.

Noise that was difficult to attribute to a specific source, when measured by using general weightings, was measured by using the octave band selector on the sound level meter. All readings were appropriately recorded.

**Ambient Noise Corrections —** Accuracy requires that the background noise be at least 10 dB below the noise level being measured, in each octave band. Even with this 10 dB difference, the background noise will add about 0.4 dB to the measured SPL. The ambient noise corrections given in the table may be used to compensate for the effect of background noise.

## AMBIENT NOISE CORRECTIONS (DB)

---

(From SNI S1.13)

**Data Analysis** — After data collection the measured noise levels were compared to the evaluation criteria.

**Equipment/Facility Requirements** — A certified industrial sound level meter was necessary for executing the noise survey. This meter was capable of measuring in dB, dB(A), and dB(C) weightings as well as in a variable octave band range from 30 to 16,000 Hz. The survey was conducted using a Genrad Model 1982 sound level meter and attachments. The unit was calibrated, per the instructions in the operations manual, prior to the collection of the data.

**Inputs and Data Forms** — All readings were recorded on a floor plan of the Turkey Point Control Rooms. Remarks regarding any acoustical considerations and recommendations were also recorded. Measurement positions were numbered or coded according to the first diagram.

**Outputs** — Data were extracted from the Noise Survey form and diagrams and were analyzed for any anomalies. Readings that proved discrepant, resulting from excessive or inadequate levels, were reported on Human Engineering Discrepancy Report forms.

Recommendations were made for the solution of problems that were found in the course of the survey. Typical recommendations were acoustical absorption backfits and signal attenuation.

2.3.1.5 Findings/Results — Figures 2.3.1-2 through 2.3.1-8 present the noise level data taken in the Turkey Point Control Rooms.

Summarizing these data, Figure 2.3.1-2, basic ambient noise levels are in the acceptable range of 59 to 66 dB(A). Noise sources which were identified and considered as significant contributors to ambient noise were: 1) the instrumentation power transformers located behind the operators panels, 2) the ventilation system, and 3) the overall control room vibration from (apparently) the turbine deck and major machinery. Sources which momentarily contributed to ambient noise (other than audible signals) included:

- o Opening and closing of accesses
- o Normal conversation
- o Habitation noises (paper shuffling, etc.).

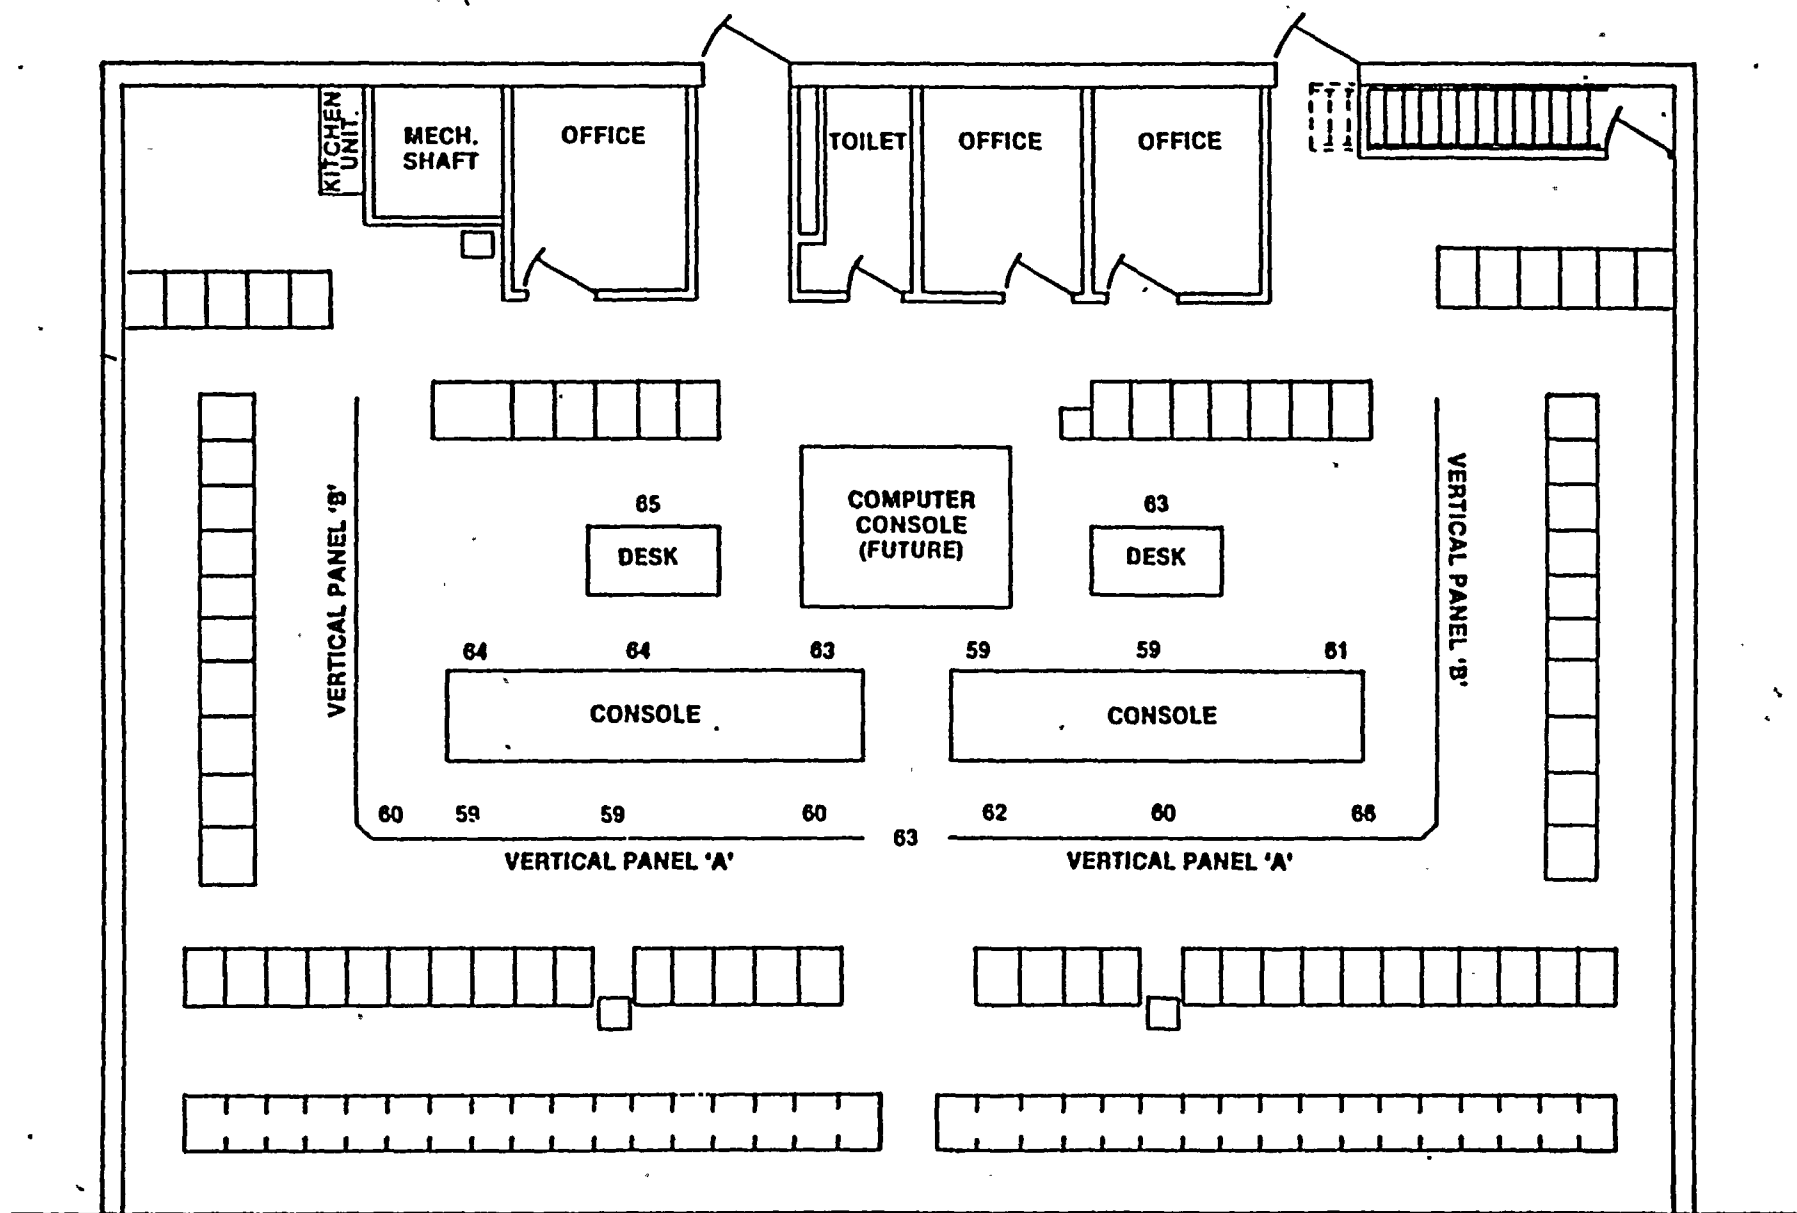

Figure 2.3.1-3 presents ambient noise levels for ten audible frequencies. The data indicate high levels of noise in the lower frequencies (63 to 80 dB in the 31 to 63 Hz frequency range) and moderate levels of noise (51 to 41 dB) in the middle to high frequency ranges, which represent the primary speech frequencies and most audible signal frequencies.

Figures 2.3.1-4 to 2.3.1-8 present sound level data for ambient plus noise contributed from audible alarms. Note that significant auditory masking occurs: 1) when the frequencies of the target and the masking stimuli are about the same, and 2) when the masking stimulus is of a slightly lower frequency than the target stimulus. The point of the above is that audible signal detection is a function of: 1) masker frequency, 2) masker intensity, 3) target frequency, and 4) target intensity.

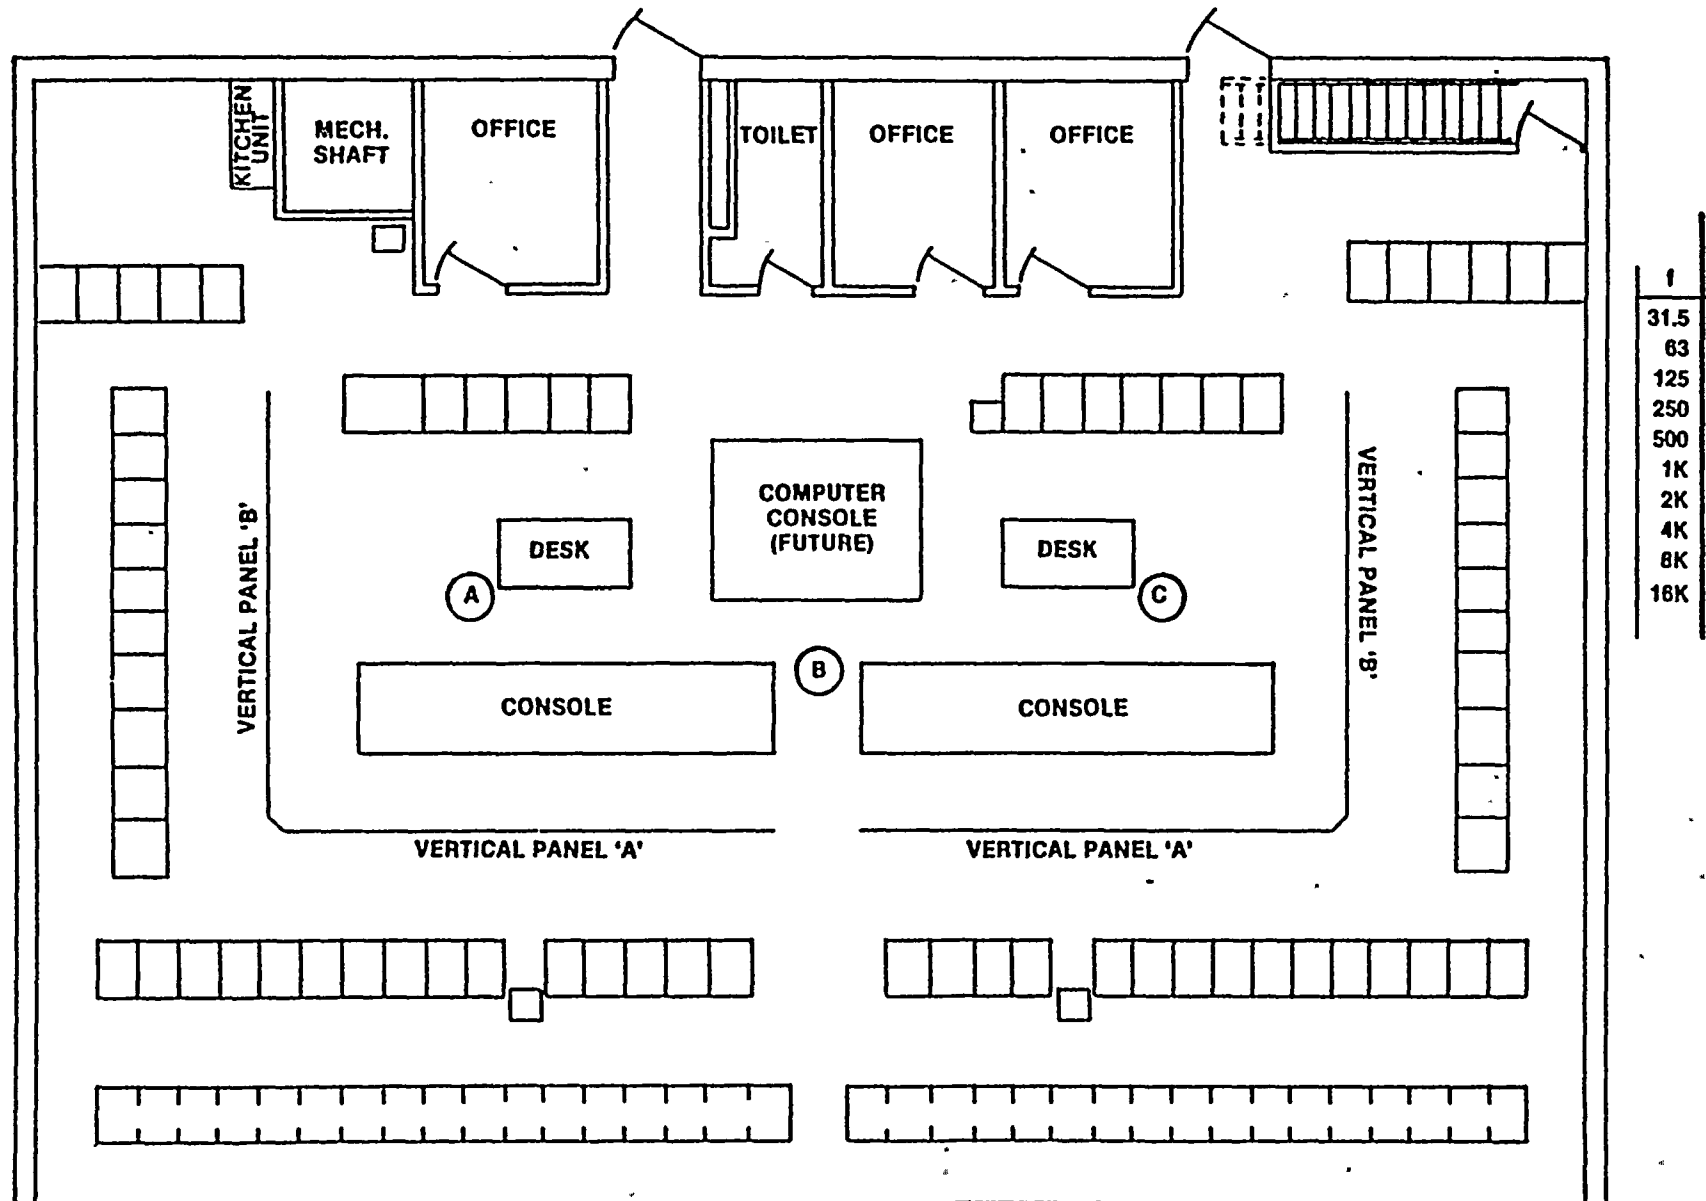

For all measured audible alarms, except the Unit 3 annunciator audible, the alarm signal intensity (for the signal frequency) was greater than potential ambient masking frequencies for the same and adjacent lower ambient frequencies (see table below).

In summary, overall control room noise at the times of data collection was found to be within the NUREG-0700 guidelines of 65 dB(A) with the exception of a reading at 67 dB(A) which is not considered excessively over the limit. All audible signals measured (except Unit 3 annunciator) are considered to have a high probability of signal detection, e.g., ample volume which is not highly subject to auditory masking. The Unit 3 annunciator alarm is, however, subject to masking due to: 1) low signal intensity and 2) high ambient noise in the same octave band as the signal.

The following recommendations are made:

- o Increase both the signal integrity and frequency of the Unit 3 annunciator alarm
- o Provide, if feasible, sound attenuators such as carpeting to reduce ambient control room noise
- o Isolate and attenuate, if possible, the sources of low frequency noise in the control room.

## 2.3.2 Lighting Survey

2.3.2.1 Objective — The objective of the Lighting Survey was to ensure that control room lighting is sufficient to permit the operator to effectively perform all tasks. The lighting test included ambient illumination; display luminance; and reflectance off panel, wall, desk, and floor surfaces. The survey was conducted under both full lighting conditions and emergency lighting conditions.

2.3.2.2 Review Team Responsibilities — A human factors specialist conducted this survey. Responsibilities included developing the test procedure, conducting the test, and recording and reducing the data.

2.3.2.3 Criteria — Criteria for the survey are from NUREG-0700, Section 6.1.5.3 "Illumination" and 6.1.5.4 "Emergency Lighting." The tables and charts on Figure 2.3.2-1 summarize the criteria used for the evaluation (source is NUREG-0700). Additional criteria included assessment of:

- o Glare (6.1.5.3.f)
- o Color recognizability (6.1.5.3.h)
- o Illuminance uniformity (6.1.5.3.b)
- o Shadowing (6.1.5.3.e).

### 2.3.2.4 Task Definition/Methodology

Ambient Illumination — Using the photometer and illuminance probe, measurements (in footcandles) were taken at all operator work stations. Work benches, tables, consoles, panels, floors and walls were measured using an omnidirectional probe and placed directly on horizontal surfaces or at the average male (50 percentile) eye height for vertical panels.

Readings were taken under both normal and emergency lighting conditions. The data were recorded on control room drawings showing the location of each reading. The measurements were then compared with the human factors guidelines in order to identify discrepancies.

Display Brightness — Display brightness was subjectively assessed by walk-throughs of the control room by the human factors engineering analyst. The major backlit component types were sampled and elsewhere where display brightness was deemed a possible discrepancy.

Reflectance — Using the photometer with a spot probe, measurements (in-foot-Lamberts) were taken at all operator work stations. Surfaces were measured in approximately six sections of the board, depending on the surface (for floor and wall

#### Illumination levels

| Surface              | Reflectances |             |
|----------------------|--------------|-------------|
|                      | Preferred    | Permissible |
| * Ceiling            | 80%          | 60-95%      |
| Upper Wall           | 50%          | 40-60%      |
| Lower Wall           | 15-20%       |             |
| Instruments/Displays | 80-100%      |             |
| Cabinet/Consoles     | 20-40%       |             |
| Floor                | 30%          | 15-30%      |
| Furniture            | 35%          | 25-45%      |

\*Recommended reflectances are for finish only. Over-all average reflectance of acoustic materials may be somewhat lower. The upper walls (one to two feet below the ceiling) may be painted with the same paint as is used on the ceiling.

Recommended workplace reflectance levels

FIGURE 2.3.2-1

### Summary of Lighting Evaluation Criteria

measurements a smaller sample was used). It was not necessary to measure the ceiling as the surface was covered exclusively with light diffusing fixtures. Several measurements were taken and compared to identify areas of nonuniform luminance. The distance of the probe from the surface being measured was standardized at one foot from the surface and was oriented at right angles to each sampled surface.

**Contrast** — Contrast was subjectively assessed by a walk-through of the control room with the human factors engineering analyst visually examining the boards.

#### **2.3.2.5 Results/Findings**

Raw data in the form of a control room floor plan drawing and tables of measurements are presented below. Discrepancies were reported on Human Engineering Discrepancy report forms. In general, the lighting system in the Turkey Point Control Rooms meet the NUREG-0700 guidelines. Table 2.3.2-1 summarizes the Human Engineering Discrepancies generated from the Lighting Survey. These were: 1) excessive ambient illumination, 2) glare on the vertical panels, 3) low levels of control room reflectance, and 4) excessively low levels of emergency illumination. Findings for each subtest are presented below.

**Illuminance** — The normal ambient illumination exceeded the levels recommended in the NUREG-0700 guidelines at most work stations (see Figure 2.3.2-2 and Table 2.3.2-2). The emergency illumination was below the minimum guideline values of NUREG-0700 at all operator work stations (see Figure 2.3.2-2 and Table 2.3.2-2).

In response to a preliminary finding regarding illuminance and glare on the vertical boards, Florida Power & Light Company installed blue florescent lights over these panels to reduce both incident lighting levels and glare. The blue florescent lighting was evaluated (the data are summarized on Figure 2.3.2-3) and was found to successfully reduce lighting levels and glare over the vertical panels; however, the blue color had an adverse effect on color coding especially on blue indicator lights (washed out color).

**Display Brightness** — Luminance ratios for display brightness are considered adequate for all back and transilluminated displays and controls.

**Reflectance** — Reflectances of the vertical panels and upper walls was generally found to be below the guideline values, while the percentages were above guideline recommendations off the floor, lower wall, and the blotters on the CRDs' desks. These values, however, were not sufficiently out of tolerance to have a significant effect on human performance. Therefore, a low error assessment was assigned and no backfits recommended in the area of reflectance.

**Contrast —** Contrast reduced by grime on miscellaneous labels, pushbutton legends and mechanical flags were found discrepant as well as the low contrast of printed numerals on impact recorder chart paper.

### 2.3.3 Control Room Environment Workspace Survey

2.3.3.1 Objective — The objective of the Control Room Environment Survey was to evaluate the control room environment to ensure safe, comfortable, and efficient operation. The assessment included furniture and equipment layout; document organization, use, and storage; supervisor access to control room; ambiance and comfort; and temperature, humidity, and ventilation.

2.3.3.2 Review Team Selection — The personnel required to conduct this survey and their responsibilities included:

- o A Human Factors Engineer was responsible for data collection, data analysis, and final report preparation.
- o Various Control Room Operators, familiar with the control room operations and problems, to assist in the assessment of the control room environment. Their input was contributed through informal and formal interview processes.
- o A Technical Assistant to aid in the collection of measurements and data.

2.3.3.3 Criteria — The following are the summarized guidelines from NUREG-0700 used to evaluate the control room environment. Detailed criteria are contained in the attached checklist.

Furniture and Equipment Layout — Work stations, including desks, consoles, and panels, will be placed and spaced to facilitate unobstructed viewing, movement and communications.

- o L-shape, U-shape, concentric, or wing configurations facilitate sight, movement, and communications.
- o Enough space is allowed to enable a single operator to perform required tasks.
  - A minimum of 50 inches is suggested between a single row of equipment/panel and a wall or other opposing surface.
  - A minimum of 50 inches is recommended between two rows of facing equipment.
- o A minimum of 8 feet of space is recommended between opposing rows of equipment where more than one operator must work simultaneously or where kneeling or bending is necessary.

Document Organization, Use, and Storage — A good system for organizing and storing documents is required to enhance their location and use. All documents are easily accessible. Documents are clearly labeled.

Supervisor Access to Control Room — The shift supervisor's office is readily accessible to the control room.

## Temperature, Humidity, and Ventilation

- o Air temperature at floor level and at head level should not differ by more than 10° F.
- o The ventilation system should introduce outdoor air into the control room at a rate of at least 15 cubic feet per minute per occupant.

**Ambiance and Comfort** — Features to consider in creating a pleasant and comfortable atmosphere in the control room are:

- o Color combination
- o Color and lighting
- o Visual relief from instrumentation
- o Comfortable seating
- o Carpeting.

### 2.3.3.4 Task Definition/Methodology

The below procedures were performed for each of the control room environment subcategories.

#### Furniture and Equipment Layout

- o The control room work stations were determined to include the Control Room Operator's desk, the entire bench console, vertical panels A, B, and NIS, and the computer printer table. Also examined were entrance/exits from the primary area, and walkspace/passageway dimensions surrounding work stations.
- o Maintenance and operational requirements were reviewed (to eliminate those criteria not applicable to this control room).
- o Sample components were evaluated using the checklist.

#### Document Organization, Use, and Storage

- o The plant procedures documents were selected for evaluation as these were the only documents stored within the primary area of the control room.
- o The procedures were evaluated on a sample basis, according to the NUREG-0700 guidelines, using the checklist.

**Supervisor Access to Control Room** — Access for the Nuclear Plant Supervisor and Nuclear Watch Engineer were evaluated, using to the NUREG-0700 guidelines and the prepared checklist. Meetings were attended regarding the possible relocation of these offices, to assess operational requirements and possible alternatives to the present design.

## Temperature, Humidity, and Ventilation

- o Temperature and Humidity were measured 24 hours each at head and floor level using a 7-day continuous circular trend recorder.
- o Ventilation was measured using a Davis Ball Bearing Anemometer hand-held six feet above the floor at three equally spaced locations of vertical panel A (A-F on attached drawing) for each unit. Other workspace locations sampled (e.g., G-J) produced no significant readings on the scale. Five 1-minute readings within a 2-foot square matrix (approximate space occupied by one standing operator) were taken at each location, averaged, and the correction factor applied to derive actual air velocity in feet per minute (FPM). A multiplication factor of 2 cubic feet (size of measured matrix) was used to convert feet per minute to cubic feet per minute (CFM) yielding air quantity in each location.
- o Temperature, Humidity and Ventilation measurements were evaluated using NUREG-0700 guidelines and the prepared checklist.

Control Room Decor — Operator interviews were reviewed, and each feature of control room decor was evaluated, according to NUREG-0700 guidelines.

2.3.3.5 Results/Findings — The output for this survey includes the completed checklist for each subcategory of the control room environment, Human Engineering Discrepancy Reports for each parameter conflicting with NUREG-0700 guidelines, and a tabular listing of ventilation measurements. Table 2.3.3-1 summarizes Human Engineering Discrepancies identified during this survey.

In general, the Turkey Point control rooms met the NUREG-0700 guidelines. Two Human Engineering Discrepancies of particular interest were: 1) supervisor visual access to the control room and 2) mirror imaging in the control rooms. Each is discussed below.

Supervisor Visual Access — Figures 2.3.3-1 and 2.3.3.2 show control room visibility from the shift formen's and watch engineer's offices, respectively. Note that a good deal of each control room is obscured by the nuclear instrumentation system (7-foot vertical) panels. A variety of means to ameliorate these discrepancies have been considered, from "bulging" the offices out into the control room between the nuclear instrumentation system panels to elevating the office floors to a point when visibility over the nuclear instrumentation system panels would be afforded. Florida Power & Light elected to extend the Nuclear Plant Supervisor's office into the control room area, which allows complete control room visibility.

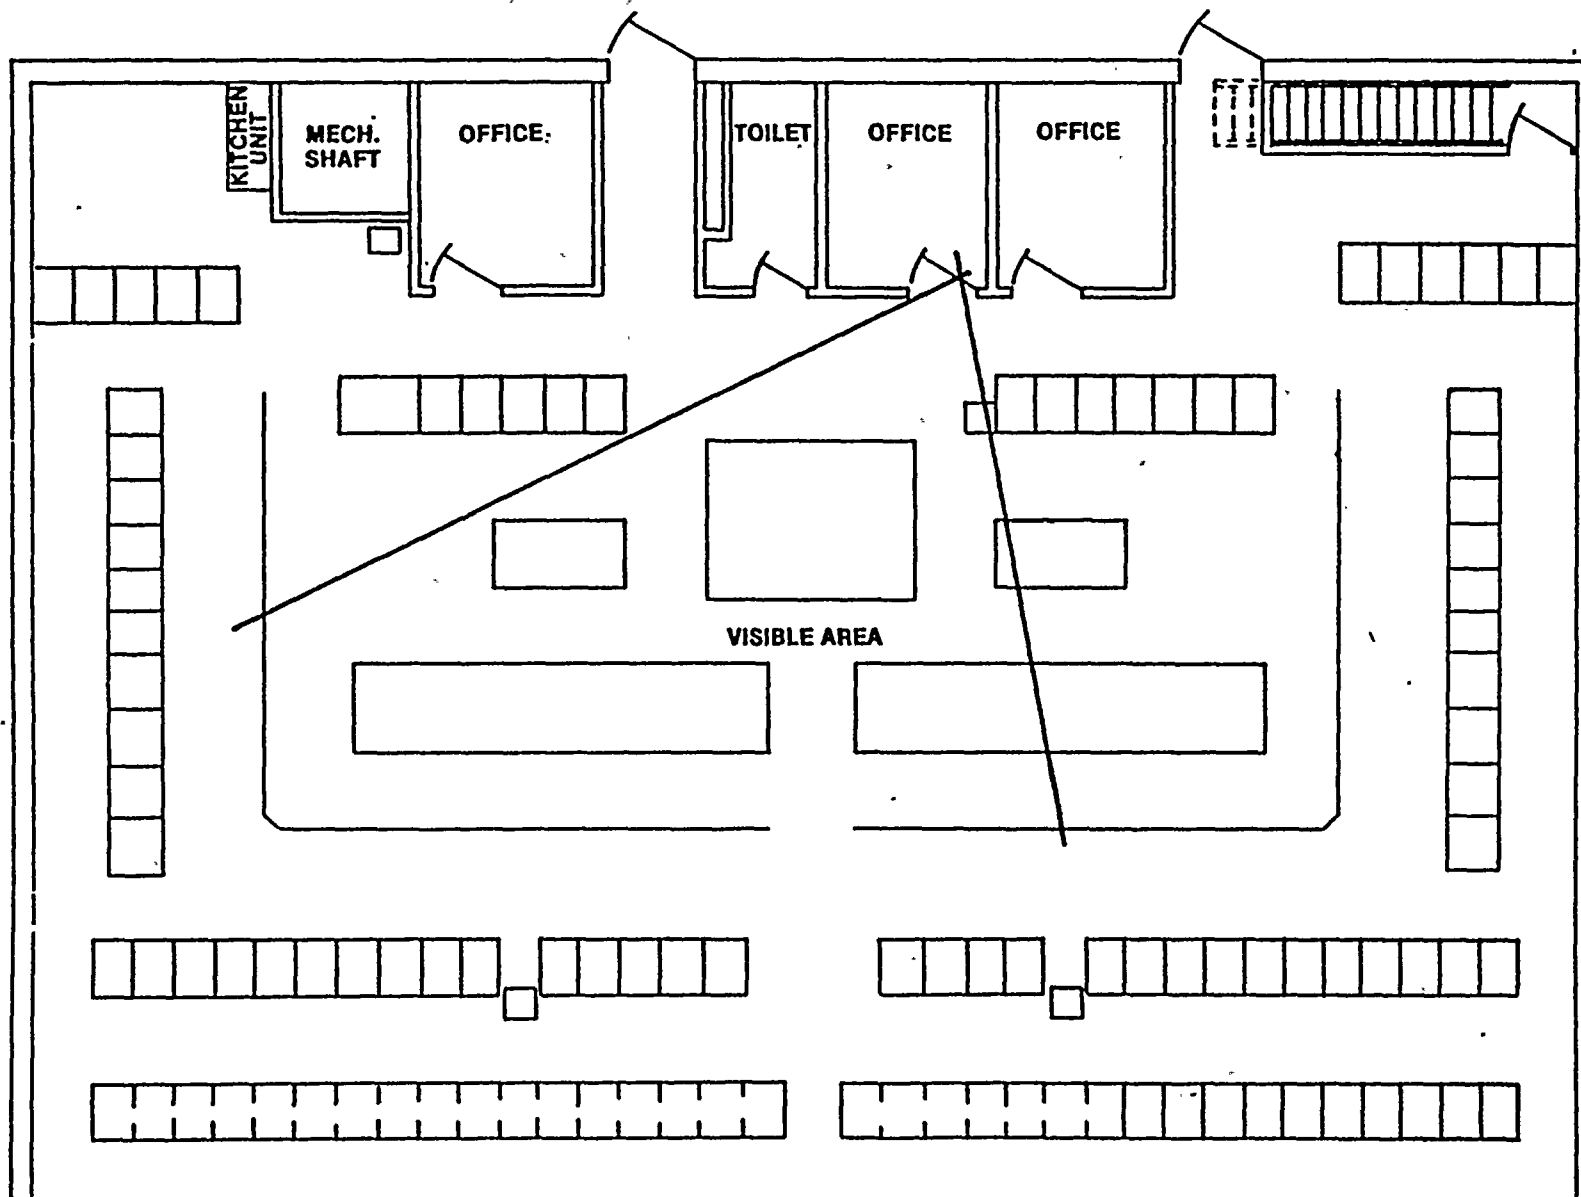

Unit Mirror Imaging — Mirror-imaging in design is considered to potentially present a problem in terms of its impact on human performance in systems operation. The potential impact of this design is represented in plant staffing: if each unit had separate

TABLE 2.3.3-1

## ENVIRONMENT/WORKSPACE SURVEY SUMMARY OF FINDINGS

| File No.   | HED#     | Category |      | Description                            |

**CONTROL ROOM VISIBILITY FROM SHIFT WATCH ENGINEERS OFFICE**

staff the problem would not exist. At the Turkey Point Nuclear Power Plant there are two units each with their central control areas and respective control room operator. Both unit control areas are housed in the same room. In addition, there is a control room operator who is available to work either unit. The inherent issue lies in the monitoring and controlling of the nuclear instrumentation for both units on an alternating basis.

Mirror-imaging of Turkey Point control panels is limited to the Safeguard Panels which are partial mirror images of each other. Mirror-imaging is called "partial" for the purposes of explanation in this study. It is partial because mirror-imaging occurs only on the vertical "B" panels. Figure 2.3.3-3 should help clarify this. In other words, a major group of components located on the right side of a panel for one unit will appear on the left side of the panel for the other unit. For the most part, component sequence and arrangement within the group remains intact and identical between units. The potential impact with this design lies in the change in movement and orientation patterns for the operator who conducts tasks on both Units 3 and 4 Safeguard Panels.

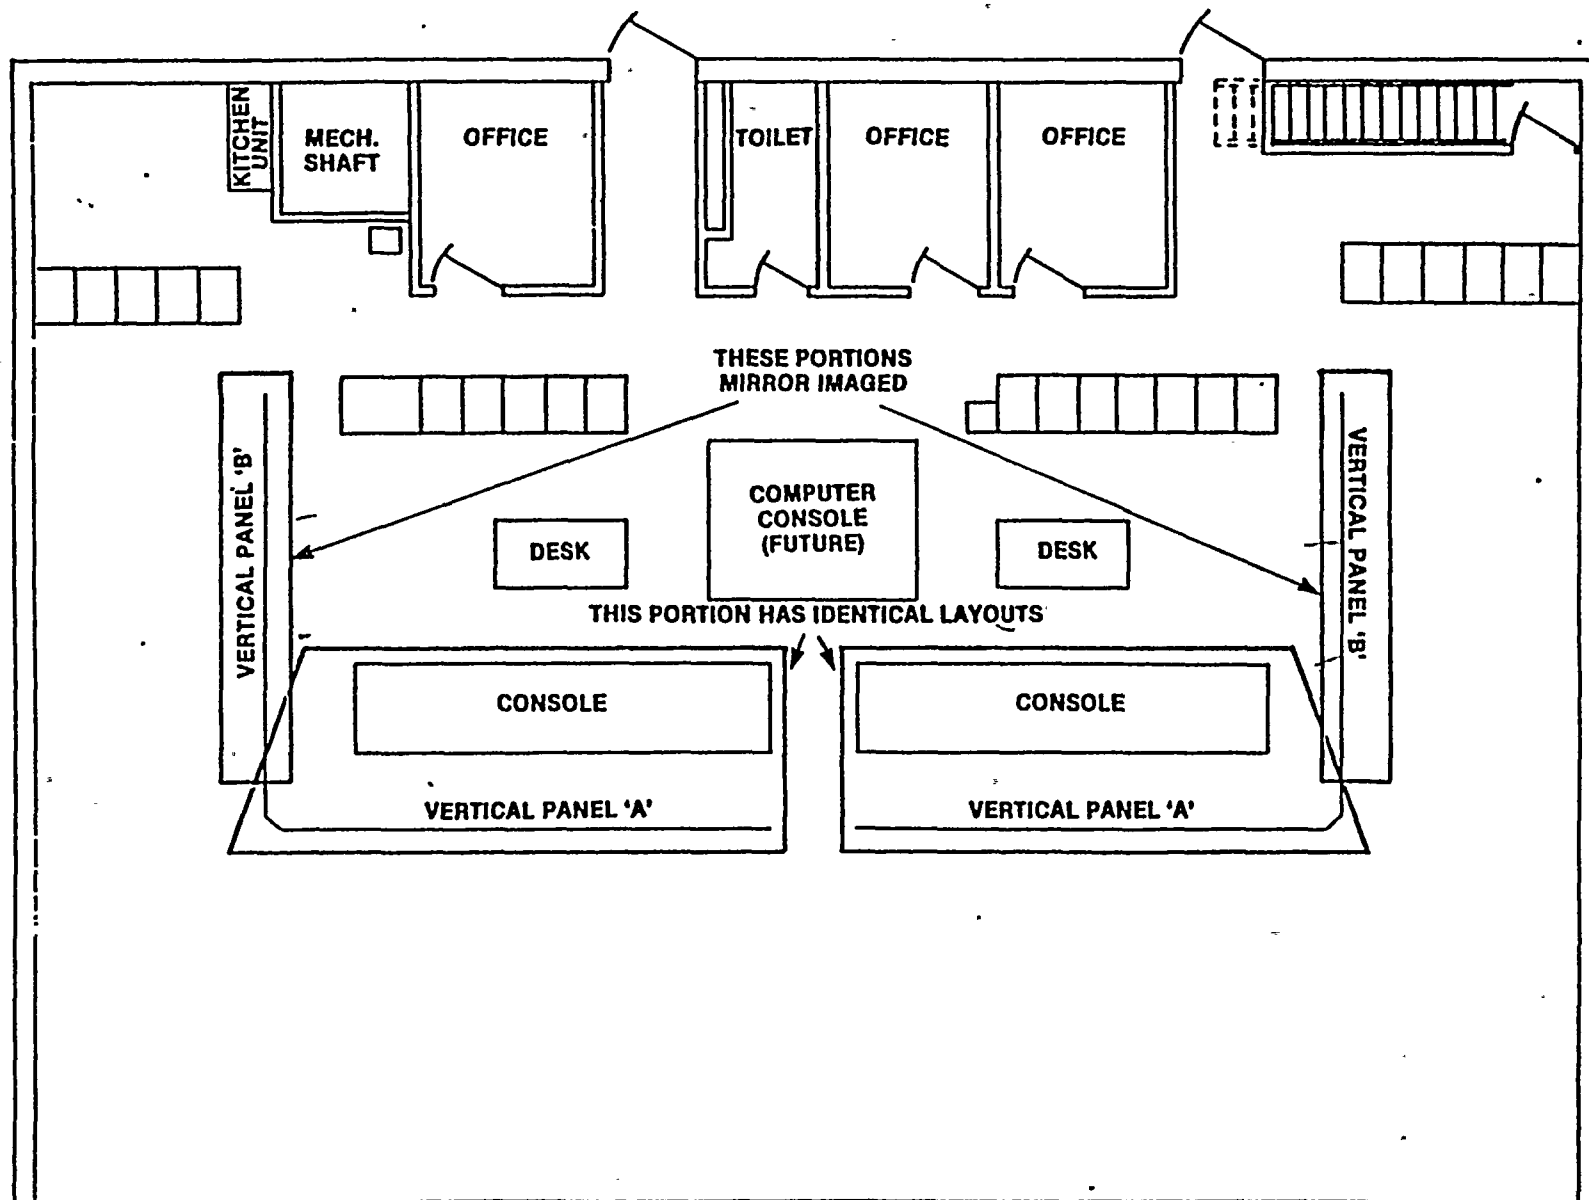

The following describes a study that was conducted to pinpoint some of the task sequences and control room locations where any deleterious effects of mirror-imaging are most likely to occur. The study was based on the findings and data of the Turkey Point system, functions, and task analysis.

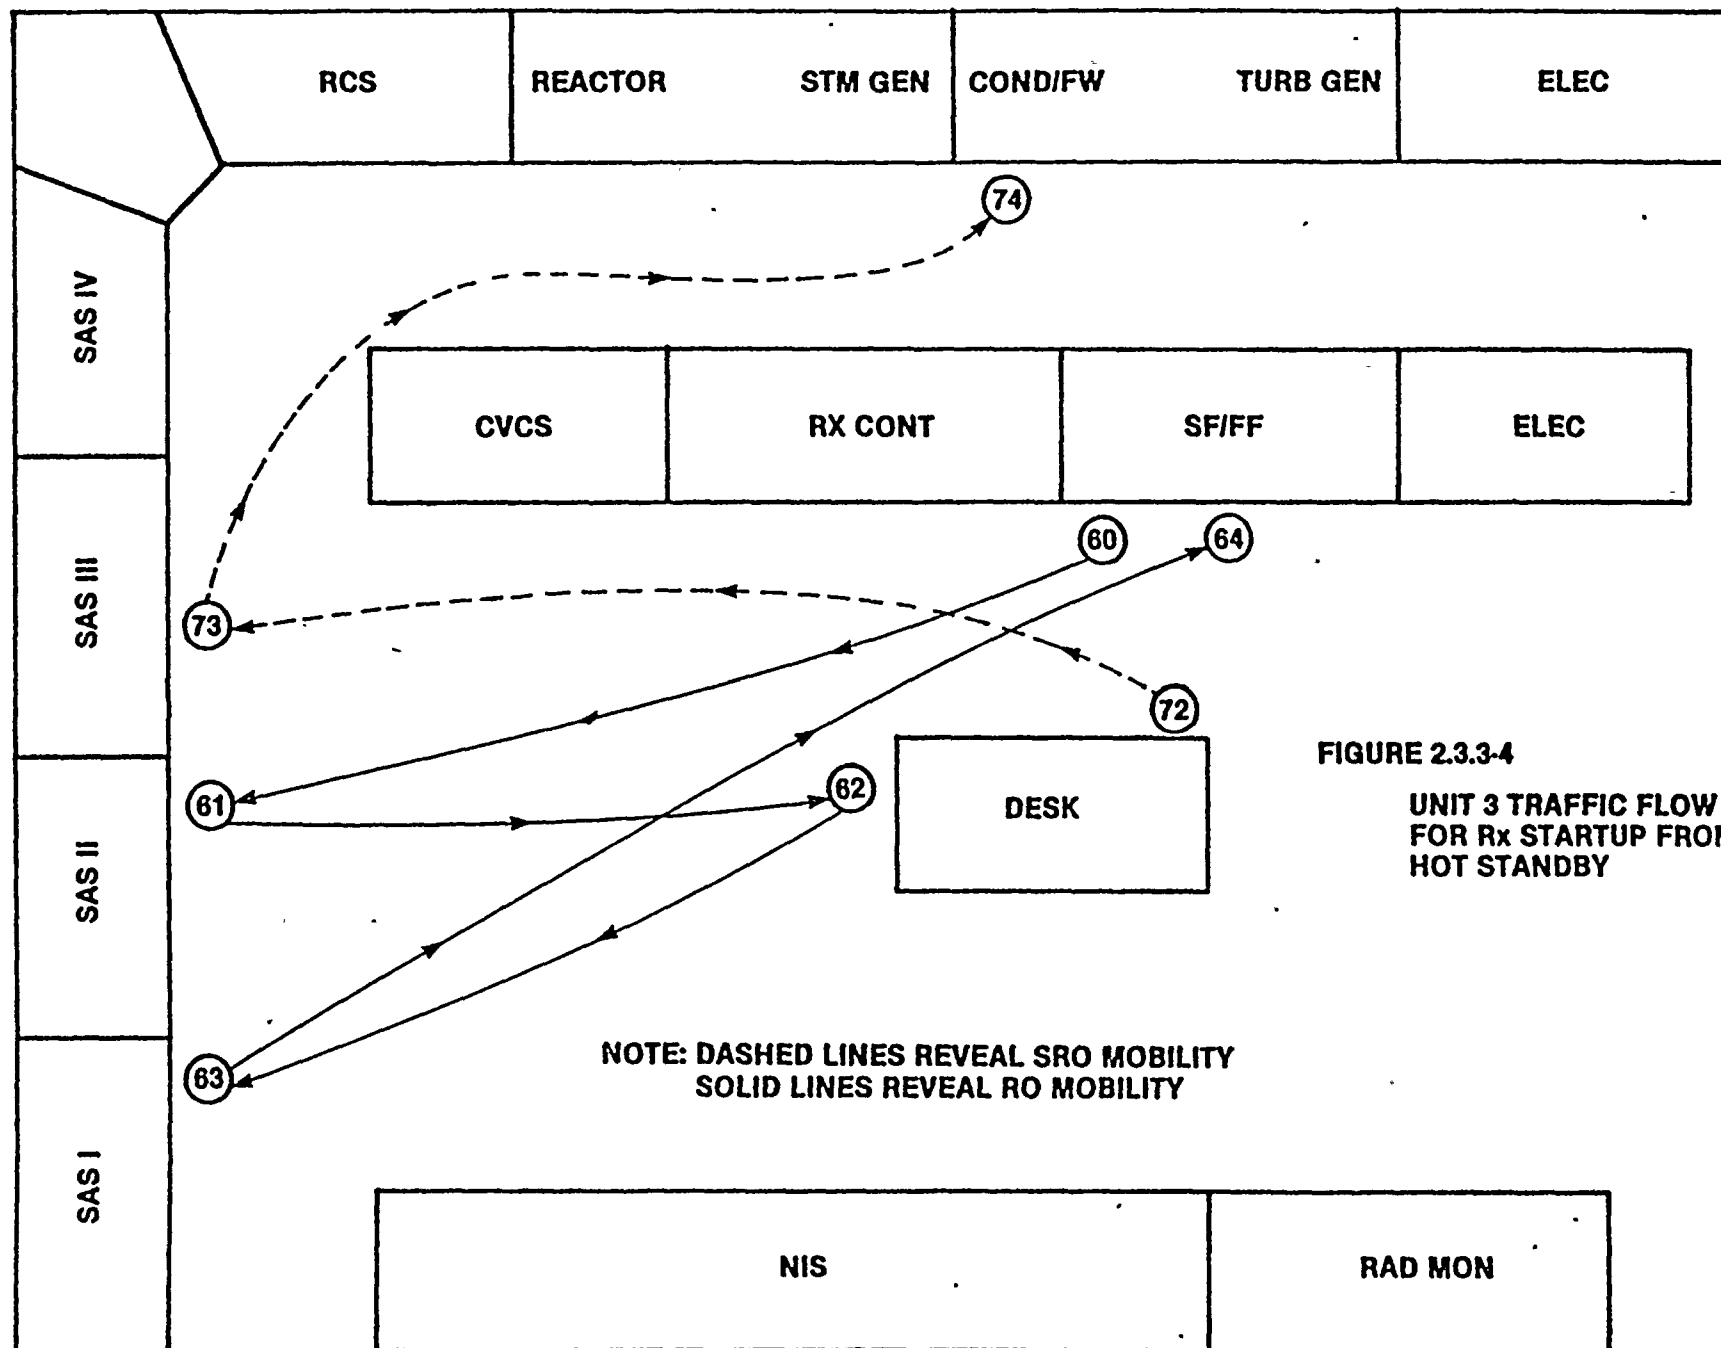

Operator orienting, timing, and search pattern requirements were compared between units for task analyzed sequences. This was conducted using Task Analysis and Spatial-Operational Sequence Diagrams to depict interrelationships between temporal and sequential aspects of the task sequences. In addition, traffic patterns were used to evaluate movement between panels and the effects of mirror-imaging. The results indicate a divergent operational sequence for personnel who operate both units. Figures 2.3.3-4 and 2.3.3-5 show, for the same task sequence (reactor startup from hot standby), the traffic requirements for Units 3 and 4, respectively. Note that circulating patterns are similar, but 1) links differ in length, and 2) directions are revised. Figures 2.3.3-6 and 2.3.3-7 make this point move dramatically. In micro, task sequences conducted on the vertical ("B") panels are mirrored. Figures 2.3.3-8 and 2.3.3-9 show a task sequence for Units 3 and 4, respectively. Note that this is the same task sequence for each unit. The major concern in this example is the visual similarity of the panel layouts, particularly in the area of the recirculation and sectioning values (Task 2). Here a definite possibility of control substitution exists.

From the above, two distinct concerns are apparent: 1) divergent traffic patterns between the two control rooms, and 2) once vertical "B" panel has been accessed, mirrored left/right sequences. Each of these is discussed below.

FIGURE 2.3.3-3

FOR Rx START-UP COLD TO HOT

NOTE: DASHED LINES REVEAL SRO MOBILITY  
SOLID LINES REVEAL RO MOBILITY

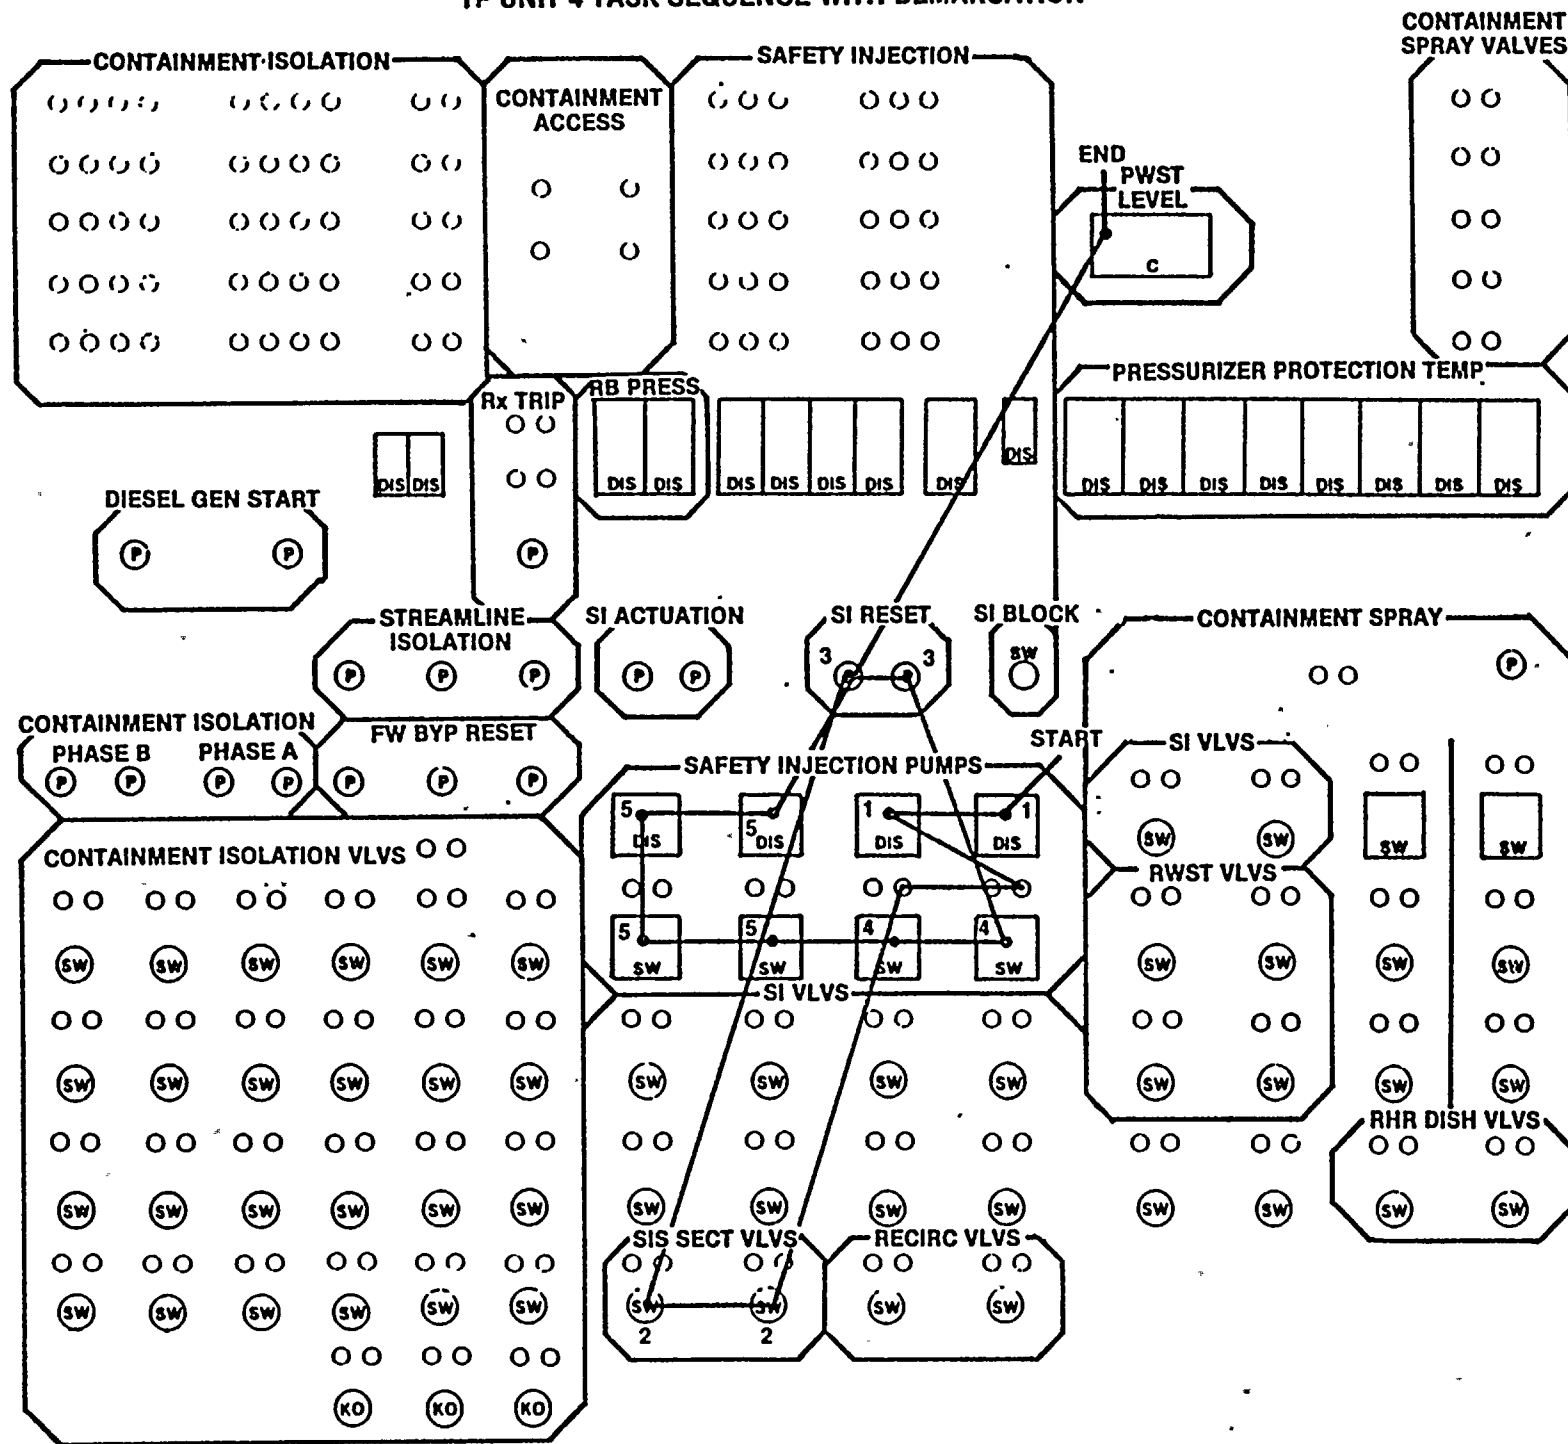

Trafficability — In this case, orienting responses to the "B" vertical patterns may be disrupted. In other words, an operator may initially orient himself to the right, rather than the left, to begin access to the panel. However, there are numerous noncognitive cues to panel location, probably the most significant being the periphery of vision and the acoustical environment. Additionally, the only error type anticipated are those concerning temporal access to controls and displays. Here if a misorientation occurs, it would be readily identified and reorientation would take place. In this case, temporal errors would probably be measured in milliseconds. Given this, essentially no severe adverse operational effects from mirror-imaging of control room overall layout are expected or predicted.

Mirrored Left/Right Sequences — Of greater interest to the issues of operability is the mirroring of the designs of the vertical "B" (Safeguards) panels. As mentioned earlier with regard to the example task sequences of Figures 2.3.3-8 and 2.3.3-9, the principal errors that could be involved are control and display substitution errors. Again, however, the stimuli for orienting to, and accessing, controls and displays are not entirely homogeneous. That is, the visual periphery and acoustic cues are not identical and therefore may not greatly facilitate substitution errors. Indeed many cues exist which may facilitate correct responding. For example, as both units, the safety injection controls/displays are located between the vertical "A" panel and containment isolation on the vertical "B" panels. Panel orientation will probably be towards (or away from) significant stimuli, e.g., vertical panel "A". In humans, left-right discriminations based on interoceptive (or internal, or cognitive) stimuli are at best unreliable. Far more reliable discriminations are exteroceptive cues, e.g., vision and sound. However, different response patterns to similar stimuli do exist, and some cues may be added to help mitigate any deleterious effects of left-right stimulus transfer. That is, additional stimuli can be added to the panels to facilitate correct responding; in this case, demarcation and summary labels. Figures 2.3.3-9 and 2.3.3-10 show the same task sequence for Turkey Point Units 3 and 4 on the vertical "B" panels. The demarcations in these figures clearly break up the panels and provide many additional component localization cues. It is considered to drastically reduce component localization time and increase the probability of correct responding. With demarcations and summary labels as indicated in these figures, minimal negative transfer is anticipated.

Mirror-imaged panels (Safeguard Panels) were compared on a component basis to identify those components which appear out of sequence within a functional group between units. The potential for operator substitution error exists since the mirror-image

FIG 2.3.3-10  
TP UNIT 4 TASK SEQUENCE WITH DEMARCATION

design disturbs the left-to-right or top-to-bottom sequence an operator would expect to find on both units.

Specific controls and displays which violate expectancies and conventions are listed below.

- o Several controls in the grouping for S.G. BLOWDOWN, S.G. SAMPLE and BORON INJECTION are in different arrangements between units.
- o Sequence of displays for HOT LEG and COLD LEG FLOW differs between units.
- o Arrangements of controls for the SAFETY INJECTION group located in the center of the panel are identical between units with the exception of the bottom four controls which are in reversed arrangement between units. Control substitution is highly likely.
- o Sequence of indicator lights for RECIRCULATION SUMPS are reversed on Unit 4 with SUMP B NORTH to the left of SUMP A SOUTH.
- o Arrangement of the display group for RHR INTERLOCK, RHR OUTFLOW, COMPONENT COOLING TEMPERATURES differs in the left-to-right sequence between units.
- o Arrangement of the COMPONENT COOLING WATER controls differs between units. The top-to-bottom sequence of PUMPS A, B, C and adjacent related controls are not identical between units.
- o Group sequence of AUX BUILDING VENTILATION controls differ between units. Arrangement on Unit 3 is as follows (left-to-right): SUPPLY FAN A, B, EXHAUST FAN A, B. Arrangement on Unit 4 is as follows (left-to-right): EXHAUST FAN A, B, SUPPLY FAN A, B. This is potentially confusing because an operator uses adjacent or surrounding components for cues in locating a needed component.
- o Sequence of controls differ between units for PRZR STEAM SAMPLE ISOL, LOOP A&B SAMPLE ISOL, ACCUMULATOR SAMPLE ISOL, RC DRAIN TK GAS ANAL ISOL.
- o Component appearance for RHR LTDN TO CVCS controller differs between units. Unit 3 controller has a black face plate, Unit 4 controller has a silver face plate.
- o Label terminology differs between units for identical components.
  - A and B CONTR ROD DR COOLER DAMPER (controls and displays)
  - RECIRC SUMP A and B (indicator lights)
  - CONTAINMENT SPRAY PUMP DISCHARGE (controls)
  - SI PUMP DISCH HRD ISOL OPEN (controls).

### 2.3.4 Controls and Displays Survey

**2.3.4.1 Objective** — The purpose of the Controls and Displays Survey was to identify and document Human Engineering Discrepancies associated with the detailed design of controls and displays. Details of design include for example: color coding, sizes/shapes (e.g., of switch handles), control/display orientations, and so forth.

**2.3.4.2 Review Team Responsibilities** — The review team consisted of two human factors specialists who collected data and documented the discrepancies. Operations personnel available in the control room at the time of data collection answered plant-specific questions regarding the operator-control board interface. In addition, many guideline items required access to engineering, maintenance, and instrumentation and control personnel for resolution and identification of Human Engineering Discrepancies. These personnel were contacted on an as-needed basis.

**2.3.4.3 Criteria** — Criteria for controls and displays are presented in the control and display checklists which consist of NUREG-0700 recommended guidelines that are applicable to assessment of detailed control and display design. The specific checklists used by the review team are presented in Appendix A.

**2.3.4.4 Task Definition/Methodology** — The Controls and Displays Survey was divided into a number of component-specific checklists (e.g., meters, rotary controls), each of which was designed to be used independent of all other checklists. All checklist items for a particular control or display type were applied to each component in that class. Each component that did not meet a criterion was listed in a Human Engineering Discrepancy discussing the guideline violated. All Human Engineering Discrepancies resulting from this survey are listed on the appropriate control room inventory forms, providing Florida Power & Light with a list of control and display detailed design discrepancies associated with each component.

**2.3.4.5 Results/Findings** — Table 2.3.4-1 lists each Human Engineering Discrepancy identified as a result of the Controls and Displays Survey. The table contains the finding number, category, description, and related comments.

**Control Board Maintenance** — Obsolete components have not been removed, meter scale face coding has not been updated to match expected scale values, and dynatape is used to change scale ranges and position labels rather than modifying or replacing the control or display with an appropriate component.

Other problems with component use are also a product of plant age. Tape used to code operating zones on meter scale faces is peeling off and paint from position labels has chipped, rendering a subset of the labels unreadable.

TABLE 2.3.4-1

## CONTROLS &amp; DISPLAYS SURVEY SUMMARY OF FINDINGS

| File No.  | HED#     | Category |      | Description                                    |

| 22, 23   | 6552a5 | III      | III  | Separation between numerals          |

**Population Stereotypes** — A number of controls and one display in each unit do not operate in conformance with control room conventions. Some controllers have conventional 0-100 scales for valve position, but the "100" indicates that the valve is 100 percent closed. A clockwise rotation of the associated knob, therefore, closes rather than opens the valve. Some rotary controls have "off" or "stop" to the right of the "on" or "start" positions.

**Control Panel Contrast** — No controls are presently color coded. Silver thumb rotaries, keyswitches, and toggle switches on the main control panels and black discrete rotaries on the nuclear instrumentation system channels should not be coded by their present colors, however, because they do not contrast sufficiently with the panel color. All other controls may be coded by their present color.

**Inadvertent Actuation** — Rotaries on the Safeguard Panels are guarded by placing magnetized metal covers over them. The covers have either red or green construction paper taped to them, indicating whether the valve is normally open or closed, and the valve number is written on the construction paper. The guards are inadequate because they may be moved easily and do not always cover the control. They are not desirable from a human factors standpoint because they sometimes obscure the control labels or indicator lights, may be placed somewhere on a panel other than over the intended control, and must be moved when the guarded control is used, possibly interfering with the operation or observation of adjacent controls or displays.

Rotaries on process controllers which should not be manipulated by control room operators are coded with a red dot. These controllers are, however, interspersed in a row of identical controllers and all are guarded in the same way. Similarly, fuses which, when pulled, will result in a reactor trip are not guarded or marked to distinguish them from less important fuses.

**Pushbuttons** — The following discrepancies with pushbuttons were noted:

- o Nonlegend pushbuttons provide no form of positive feedback when activated.
- o Some illuminated pushbuttons on the area radiation monitor are not concave or frictionalized.
- o Legend pushbuttons on the area radiation monitor look like the legend lights on the process radiation monitor. One of the two should be coded in some way so that they are distinguishable.

**Key-Operated Switches** — At the time of the evaluation, key-operated switches were only installed in Unit 3. Analogous controls had not yet been installed in Unit 4. If,

once installed, they are identical to those in Unit 3, the Human Engineering Discrepancies discussed will apply to both units. The following discrepancies with keyswitches were noted:

- o Keys are not inserted with teeth pointing up.
- o Locks are not oriented so that the switch is "off" when the key is in the vertical position.

**Rotary Controls** — The following problems with rotary controls were noted:

- o J-Handle controls are too small and provide more than the recommended clearance when in the "pull-to-lock" position.
- o Both the continuous rotary knobs and the knob skirts on process controllers are too small.
- o Black discrete rotaries on nuclear instrumentation system channels may be positioned between detented points.
- o Rotaries on nuclear instrumentation system channels are not provided with a visible indication of position.

**Information Displayed** — Necessary information is not always displayed to the required degree of specificity, or is not available when necessary. The following are the noted instances:

- o All three condensate storage tank indications are powered by the same supply. If that supply were to fail, none would be available.
- o The RCP VIBRATION RECORDER, the only indication of pump vibration, takes two minutes to provide a trend.
- o CCW Header A and B level meters normally read between 0 and 10 but the scale is 0-140.
- o Some scales must be multiplied by a factor other than ten, making interpretations of these displays more difficult. In addition, scale multipliers are not well labeled.
- o SECONDARY WATER CONDUCTIVITY is displayed in Micromhos/cm rather than ppm, the units of measurement used by operators.

**Scaled Displays** — Discrepancies associated with the design of the instrument generally resulted from poor scale or pointer design. Discrepancies with scale design include the following:

- o Some graduations are missing or too small.
- o Major, intermediate, and minor marks are sometimes used inappropriately.
- o Adjacent meters measuring the same parameter do not always have compatible markings.

- o Meters with curved faces have parallax problems at all but the middle part of the scale.

Discrepancies with pointer design include the following:

- o Pointers on vertical meters are more than 1/16 inch from graduation marks.
- o A single pointer is used with multiple scales.
- o Pointer tips on impact recorders, horizontal meters on process controllers, and semicircular meters associated with rotary controls obscure graduation marks and/or scale numerals.
- o Pointer/background contrast on RWST level meters is insufficient because a temporary black label has been added behind the black pointer.

**Light Indicators** — Discrepancies with indicator lights are of two types: use of lights in inappropriate situations, and misinterpretation of light meaning because of component design. Indicator lights are (but should not be) used to alert operators to unfavorable conditions and to imply equipment status. The OMS legend light has a split window which illuminates completely when either side lights up.

**Trend Recorders** — Trend recorders are of two types: continuous (strip charts) and discrete (impact recorders). The following trend recorder discrepancies were noted during the evaluation:

- o The Tracor Westronics strip charts installed in Unit 4 have pen vibration.
- o Recorder paper scale does not always correspond with the integral recorder scale.
- o No recorders (other than the Tracor Westronic) have variable paper speeds.
- o Impact recorders do not identify the channel being displayed.
- o Impact recorders are often loaded beyond their channel capacity, making it difficult to identify any one trend.
- o It is not possible to select a single impact recorder channel for display before awaiting completion of the sampling cycle.

### 2.3.5 Conventions Survey

**2.3.5.1 Objectives** — The objectives of the Conventions Survey were to identify plant conventions and to determine if these were in compliance with the field survey document. Where discrepancies were identified an assessment was made to determine if there were deviations from acceptable in-place control room conventions, and to determine if a lack of convention was detrimental to efficient plant operation.

**2.3.5.2 Review Team Responsibilities** — Human factors representatives interviewed operators, applied checklists, and identified discrepancies. Operators were requested to identify conventions, sequences, and violations of conventions.

**2.3.5.3 Criteria** — Detailed criteria are contained in the checklists in Appendix A.

#### 2.3.5.4 Task Definitions/Methodology

**Interview** — Control room operations personnel were interviewed to determine what conventions exist in the control room related to arrangement of systems and components, coding, abbreviations and acronyms, and control operation. Questions were presented to determine whether or not confusion existed due to certain conventions, deviations, or lack of conventions.

**Sample** — A sampling of components, systems, labels, and other performance aids were used to verify interview findings. If 50 percent or more of each group were similar in arrangement, coding, and operation, then a convention was assumed to be established. Deviations were reported, as well as lack of convention.

**Checklist** — A checklisting procedure was employed to determine if existing conventions are acceptable by human factors standards. Some items required operator assistance.

**2.3.5.5 Results/Findings** — The data collected is contained on the raw checklist along with interview questions and comments. The identified discrepancies were documented on Human Engineering Discrepancy Report forms. Table 2.3.5-1 summarizes findings (Human Engineering Discrepancies) of the Conventions Survey.

Suggestions or recommendations for the resolution of each discrepancy are documented on the Human Engineering Discrepancy Report forms and were discussed at joint Essex/Florida Power & Light Human Engineering Discrepancy review meetings. In general, very few conventions have been established in the two control rooms; therefore, there are not many discrepancies regarding inconsistent use of conventions. In a complex control room it is recommended that conventions be established (and be adhered to consistently) to reduce operator reliance on memory and reading errors. Definition and implementation of a standard set of control room conventions will aid in overall operations and reduce potential confusion.

### 2.3.6 Process Computer Survey

**2.3.6.1 Objective** — The objective of the Process Computer Survey was to evaluate the design characteristics (system hardware and operational characteristics) of the existing process computer man-machine interface. Those characteristics were observed at the process computer terminal, or were identified through interviews with a plant Digital Data Processing System cognizant engineer and reviews of system design documentation. The system characteristics gathered from the above sources were then compared to human factors engineering design guidelines, and deviations from these guidelines were recorded as Human Engineering Discrepancies.

**2.3.6.2 Review Team Responsibilities** — The review team included a human factors analyst, a computer-cognizant engineer (Florida Power & Light employee) responsible for the Digital Data Processing System modifications, maintenance, etc., and the plant control room operators who utilize the Digital Data Processing System. The computer-cognizant engineer provided information that was not easily accessible to the evaluator from documentation sources, and the control room operators provided system operations information as required.

**2.3.6.3 Criteria** — The guidelines used for evaluating the man-machine interface characteristics of the process computer were the following:

**Detailed Design** — The guidelines checklist in sections 6.7.1, 6.7.2, and 6.7.3 of NUREG-0700 provided the criteria for the survey. The characteristics evaluated by means of these checklists typically address hardware design characteristics. Of equal importance are the operational characteristics of the Digital Data Processing System. For example, while the design guidelines specify the appropriate delay period for system response to keyboard requests for information, no guideline was suggested for evaluating the efficiency of the information access strategy required to reach the necessary level of information detail. Many of the above system operational characteristics were addressed in checklist fashion.

**Task Requirements** — Additionally, the outputs of the function and task analyses (NUREG-0700 recommended studies) where they address the operation of the plant process computers were reviewed by the personnel conducting this survey. The survey evaluators are the evaluation team personnel most familiar with computer operation (from the hardware standpoint) and are the logical candidates to perform an evaluation of system operational characteristics; i.e., be involved in the conduct of an analysis of process computer operational tasks. Issues addressed by the analysis include the following:

- o Have the operational information display functions (e.g., operations monitoring, operations analysis, etc.) been provided for in the display system design?
- o Has the information access structure been organized to facilitate the most frequently used functions and subfunctions, i.e., display system mode and submode organizational efficiency?
- o Does the allocation of functions to either man or machine capitalize on their respective functional capabilities?
- o Are the display formats appropriate to the displayed information type?
- o Does the display system design provide display page formatting flexibility which accommodates individual operator decisionmaking styles? Has too much flexibility been provided resulting in degraded decision-aiding support?

2.3.6.4 Task Definition/Methodology — The two CRTs with corresponding keyboards and the printer that comprise the control room Digital Data Processing System were evaluated according to NUREG-0700 guidelines using the checklist contained in Appendix A.

The checklisting was conducted by an Essex Research Scientist using the avenues of observation, measurement, document review, hands-on demonstration, and interview as data sources. Additional data and confirmation of survey findings were contributed by the review of operator interviews and the Task Analysis. Identified discrepancies were documented on Human Engineering Discrepancy forms.

2.3.6.5 Results/Findings — The results of the Process Computer Survey include the completed checklist and Human Engineering Discrepancy Reports for each parameter not in agreement with guidelines. Table 2.3.6.1 summarizes all Human Engineering Discrepancies identified during the survey.

In general, the discrepancies found related to the limitations of the equipment and programming. For example,

- o The computer printer did not print rapidly enough
- o There is no scroll function or page designation for data contained on multiple pages
- o The dialogue does not contain delay feedback messages

TABLE 2.3.6-1

## PROCESS COMPUTER SURVEY SUMMARY OF FINDINGS

| File No. | HED#     | Category |      | Description                 |

| 21       | 6726K    | IIC      | IIC  | No Delay Feedback Messages  |

TABLE 2.3.6-1

## PROCESS COMPUTER SURVEY SUMMARY OF FINDINGS (CONTD)

| <u>File No.</u> | <u>HED#</u> | <u>Category</u> |             | <u>Description</u>          |
|-----------------|-------------|-----------------|-------------|-----------------------------|
|                 |             | <u>TP-3</u>     | <u>TP-4</u> |                             |
| 22              | 6727A,E,J   | IIC             | IIC         | Highlighting                |
| 23              | 6731E3      | III             | III         | Printer Maintenance         |
| 24              | 6732        | IIC             | IIC         | Alarm Messages              |
| 25              | 6733A,B,D,  | IIC             | IIC         | Computer Graphic Capability |

- o Prompts and feedback messages cannot be requested by the operator
- o Alarm messages cannot be requested by the operator
- o No coding or prioritization of alarm messages exists
- o Graphic capabilities of the system are inadequate.

Other discrepancies involve computer procedures, keyboard dimensions and location, CRT legend readability, and the presence of unused function keys on the keyboard.

### 2.3.7 Emergency Garments Survey

2.3.7.1 Objective — The objective of the Emergency Garments Survey was to identify Human Engineering Discrepancies associated with the use of emergency garments and breathing apparatus. Using checklists drawn from NUREG-0700 and a standard rhyme test, the emergency garments and breathing apparatus were evaluated.

The evaluation consisted of anthropometrics, communications while wearing breathing apparatus, storage and placement of emergency gear in the control room, the ease of access to and donning of emergency gear, and operation of the control boards while wearing emergency clothing.

2.3.7.2 Review Team Responsibilities — The evaluation team was composed of two Essex Corporation staff members, one utility staff member from the Health Physics Department, and one control room operator. The Essex staff, composed of research scientists and associates, served as human factors specialists. Utility Health Physics personnel functioned as operations specialists and evaluation process expeditors. The experience of the control room operator aided in identification of plant-specific discrepancies relevant to the survey.

2.3.7.3 Criteria — The control room emergency garments should comply with the guidelines contained in NUREG-0700.

#### Operator Protective Equipment

- o Types of Equipment — Protective equipment includes protective clothing and breathing apparatus.
- o Anthropometry — Protective clothing and breathing equipment are compatible with operator body size and tasks to provide adequate tactile sensitivity and ability to see, reach, move, communicate, and hear.
- o Periodic Checks — Operator protective equipment is periodically checked to determine if it is in good condition.
- o Quantity — Protective equipment is available in sufficient quantities and sizes for the required number of operators.
- o Marking — Protective clothing sizes are clearly identifiable.
- o Expendables — There is an adequate supply of personal protection equipment expendables, such as filters.
- o Accessibility — All protective equipment is easily and readily accessible.
- o Training — Operators are well practiced in donning protective equipment.
- o Procedures — Instructions for donning, doffing, and controlling personal protective equipment are provided.

#### Emergency Communications - Voice communications with masks survey guidelines:

- o Emergency face masks are equipped with diaphragms that are specially designed to transmit speech.
- o The diaphragms separate voice from exhaust valve action.
- o If not equipped with diaphragms, masks are equipped with electronic speech systems which pick up the voice with an internal microphone and transmit it to a loudspeaker attached outside the mask.

2.3.7.4 Task Definitions/Methodology — A human factors specialist with Health Physics training observed and timed Health Physics personnel dressing out in anti-contamination clothing. Overall time and task times, along with pertinent human factors observations, were recorded.

A touch-and-feel test for the identification of an assortment of hand-held objects was conducted with a subject wearing anti-contamination gloves.

A subject was observed donning the breathing apparatus. Overall time and task times along with pertinent human factors observations were recorded.

A modified rhyme test requires a subject (listener) to identify a set of spoken words from a list of phonetically similar (rhyming) words. A modified rhyme test was conducted with the talker wearing the breathing apparatus mask to test the intelligibility of speech when attenuated by the mask faceplate. The test was then repeated using a mask equipped with an electronic speech system. The talker's instructions used during the test were:

1. Each list was presented by the following statement: "This is test \_\_\_\_\_", where the blank was replaced with the list identification letter found at the bottom left corner of the Talker's List.
2. Each word was embedded in the carrier sentence "Please circle \_\_\_\_\_ in group \_\_\_\_\_", where the first blank was the target word from the Talker's List and the second blank was the word group number from the corresponding Listener's Sheet containing the target word.
3. The presentation rate was approximately 4 seconds between target words.

2.3.7.5 Results/Findings — Several HEDs were identified in the course of this survey. These are presented in Table 2.3.7-1, and address 1) the availability of procedures for donning/controlling inventory of protective equipment and clothing, 2) the storing and packaging of protective clothing, 3) accessibility and labeling of protective clothing, and 4) labeling of fire fighting equipment. Results of the survey subtasks are presented below.

TABLE 2.3.7-1

## EMERGENCY GARMENT SURVEY SUMMARY OF FINDINGS

| <u>File No.</u> | <u>HED#</u> | <u>Category</u> |             | <u>Description</u>  |
|-----------------|-------------|-----------------|-------------|---|
|                 |             | <u>TP-3</u>     | <u>TP-4</u> |   |
| 25              | 6141a,h     | IIA             | IIA         | Protective equipment storage/donning.<br>Procedures for donning/accessing/<br>controlling |
| 26              | 6142        | IIC             | IIC         | Fire equipment  |
| 27              | 6143b       | III             | III         | Labeling of storage locker  |

Emergency Garment Dress-Out — Observed task times and observations are recorded on Table 2.3.7-2. As noted, it took approximately six minutes to dress out (without breathing apparatus), including exiting the control room, accessing the equipment, dressing out, and returning to the control room. An additional 25 seconds were required to don and adjust breathing apparatus (Scott air packs), making total dress out time 390 seconds. This amount of time is considered reasonable, and, therefore, no Human Engineering Discrepancies were generated.

Glove Sensitivity — Common pocket items and/or tools were used to test tactile identification and glove sensitivity. Subjects (human factors analysts) attempt to identify items by feel picking up while wearing the provided anticontamination gloves, the objects identified below:

| <u>Item</u>        | <u>Correctly Identified</u> | <u>Remarks</u>                 |
|--------------------|-----------------------------|--------------------------------|
| Key                | Yes                         |                                |
| Pencil             | Yes                         |                                |
| Pen                | Yes                         |                                |
| Coins:             |                             |                                |
| 25¢ coin           | Yes                         |                                |
| 10¢ coin           | Yes/No                      | Potentially confused for penny |
| Paperclips (Large) | Yes                         |                                |
| Paperclips (Small) | No                          |                                |
| Small clamp        | Yes                         |                                |
| Eraser             | Yes                         |                                |

No Human Engineering Discrepancies were identified during this subtask. It was, however, noted that when using prophylactic gloves with cotton undergloves, freedom of hand movement was somewhat restricted and the muscles controlling hand motion were fatigued rather rapidly. This seems due to the muscles having to overcome the elasticity of the glove materials.

TABLE 2.3.7-2

## ANTI-CONTAMINATION DRESS OUT TIME

| <u>No.</u> | <u>Task Description</u>                                      | <u>Task Time (Sec)</u> | <u>Cumulative Task Time (Sec)</u> | <u>Remarks</u>  |
|------------|--|------------------------|-----------------------------------|---|
| 1          | Start from main control board area and go to dress-out area. | 40                     | 40                                | 1. Get key from NWE<br>2. Go to locker (over 2 rope barriers)<br>3. Open 2 padlocks and a latch<br>4. (Task 8) approx. 15 sec. more to return to CR (inadequate space in front of locker to dress out). |
| 2          | Locate and open garment storage, layout garments.            |                        |                                   |   |
| 3          | Don overalls.  | 19                     | 59                                | Overalls were a little large so extra time was required to tape the waist (take up slack) (see step 5).   |
| 4          | Don boots and hat.   | 33                     | 92                                | No hat was provided.  |
| 5          | Tape seams, prepare tape for gloves.                         | 25                     | 217                               | Tape was hard to handle as the roll was large and unwieldy. Perhaps a tape dispenser would be of assistance.  |
| 6          | Bag and tape badges, TLD, dosimeter.                         | 37                     | 254                               |   |
| 7          | Don and tape gloves.   | 96                     | 350                               |   |
| 8          | Return to control board.                                     | 15                     | 365                               |   |

Total time 365 sec. = 6.1 minutes

**Speech Intelligibility With Breathing Mask** — This test (a modified rhyme test) was run under free-air, low (minimum) ambient noise level conditions. During the initial conduct of the test a distance of approximately six feet was maintained between the listener and speaker. In this test, the speaker, while wearing a Scott air pack and mask, presented 55 words (see Table 2.3.7-3) to the listener (see Table 2.3.7-4), of which 34 words or 62 percent were correctly identified. The test was repeated twice (at 6 and 10 ft.) using a mask equipped with a "Speak Ezee" electronic voice amplification device and new subjects. Intelligibility was significantly improved with use of the "Speak Ezee" advice. With this device attached, 55 words presented to two additional listeners. Listener 1 correctly identified 50 of 55, or 91 percent, of the speaker words. Listener 2 correctly identified 47 of the 55 words, or 85 percent correct identification. Total correct responses were then 97 correct out of 110 words, or 88 percent accuracy, a significant improvement from the unaided speech intelligibility. Given contextual cues to enhance speech intelligibility, use of the "Speak Ezee" device with breathing apparatus should provide good communications.

### 2.3.8 Labels Survey

2.3.8.1 Objective — The objective of the Labels Survey was to determine the appropriateness and clarity of labeling in the control room to enhance operator performance.

2.3.8.2 Review Team Responsibilities — A human factors specialist was responsible for data collection, analysis, and report preparation. A control room operator was required to assist in collecting the necessary information and to advise the human factors specialist of problems that have been encountered.

2.3.8.3 Criteria — The criteria used for the labeling survey are contained in the labels checklist and are presented in Appendix A of this report.

2.3.8.4 Task Description — All components, panels, and systems requiring identification and manipulation were examined to ensure that they were labeled, as were the positions of all discrete controls. In addition, the location and orientation of each label were evaluated for readability and consistency. Panels without hierarchical labeling were identified. Label content was reviewed for clarity, brevity, and spelling. Label readability was evaluated. Measurements included character height, width, width-to-height ratios, and visual angle subtended at the eye; stroke width-to-character height ratios; space between characters, words and lines; and character-to-background contrast. Type style was assessed for consistency, simplicity, and use of all capital letters.

Components with unique labeling requirements (e.g., contrast on electronic counters) were evaluated. Temporary labels, including equipment "tag-outs", were assessed to ensure that they conform with human engineering criteria applied to permanent labels. The procedure for adding a temporary label to the board was evaluated.

2.3.8.5 Results/Findings — A list of all Human Engineering Discrepancies identified during this survey are presented in Table 2.3.8-1. A summary of these findings regarding labels is presented below.

Need for Labeling — Many components lack sufficient descriptive labeling, and some have only temporary dynatape labels. In particular, the Area Radiation Monitor panel and the Hydrogen Recombination panel have inadequate labeling. Labeling criteria requires each component to have a permanent label horizontally oriented above the element. Descriptive labeling for vertical meters is vertically oriented on the display face with the engineering nomenclature on a horizontal label above the component. Many recorders are lacking legend cards to identify pens or channels as well as a descriptive functional label. Most panels lack a hierarchical labeling scheme with letter gradations to

| 64              | 6652           | III             | III         | Lack of procedures and administrative control of temporary labels   |

represent systems, subsystems, components and their parts. The lack of this type of design has resulted in highly similiar and redundant wording of component labels.

**Label Location** — It was found that many functional component labels are not located in accordance with NUREG-0700 guidelines. In general, labels are positioned inconsistently throughout the boards with placement beside, below, and above the described component. For example, display units of measurement appear at the bottom or at the top. Meter labels are vertically oriented on the display face. It is recommended that one arrangement be adopted — placement above the component — and be consistently followed. In many instances component identification may be confusing because labels are not located in close proximity to the associated component and because adjacent labels appear to be continuous. The mounting of some labeling is precarious. Although most labels are screwed onto the panel, some have broken off and have been loosely taped back on. The visibility of portions of recorded matter, figures, or scales is degraded by labels and legend cards located on the display face. A specific rotary control was identified which conceals part of the position label. Control position labels on the Radiation Monitor Panel are partially concealed by the knob skirts.

**Label Content** — It was found that there are instances of labeling in which content was either excessive or inadequate. The primary function of a component should be described in a concise and explicit manner. Some labels are ambiguous, unclear or inaccurate due to improper word selection. In one case a pushbutton which uses an arrow to indicate flow status is reversed showing an inaccurate condition. Clarity of label content is often degraded by the usage of inconsistent abbreviations, acronyms or alphanumeric codes. For instance, some identifiers consist of a three-character alpha code which may be confused with an abbreviated word or acronym. Some control position labels are inconsistently labeled. Breaker control positions are inappropriately labeled as "ON" and "OFF", while pump control positions are labeled as "TRIP" and "CLOSE". Cases of misspelling and the use of Roman numerals were identified.

**Maintenance** — Various function and position labels and legends on pushbuttons have become dirty from the collection of grime and dust thereby reducing letter-to-background contrast and readability. It should also be noted that the use of white letters on a dark background is not recommended due in part to the greater likelihood of loss of readability from dirt. Dark characters on a light background would generally prevent this from occurring. There is widespread use of temporary labels on all panels. Such usage is not limited to conditions of high necessity for a temporary period, and application is not administratively or procedurally controlled to comply with good human engineering

principles. Some "tag-out" labels were in the form of red and white slips hung over the switch handle. They were not secured to the component to prevent control actuation, and often obscure associated and adjacent labels.

Label Format and Readability — Label readability was found to be degraded by the following lettering characteristics.

- o Inconsistent character dimensions
- o Insufficient character height for viewing angle and maximum distance
- o Inadequate width-to-height ratio of counter numerals
- o Use of lowercase letters
- o Letter width-to-height ratios and stroke widths for component and position labels are less than the recommended dimensions
- o Spacing between characters, words and lines is less than the required minimum for legend lights and Electronic displays (LEDs)
- o Legend letter size is too small and has low contrast with background
- o Use of a slanted font and a font with serifs
- o Legends have more than three lines of lettering
- o Counter numerals are not separated by commas, decimals or spaces where appropriate.

### 2.3.9 Annunciator Survey

**2.3.9.1 Objective** — The objective of the Annunciator Survey was to assess the operability and usability of the system using the guidelines outlined in NUREG-0700, and to document and assess all resulting discrepancies.

**2.3.9.2 Review Team Responsibilities** — The members of the review team included a human factors specialist to conduct the annunciator survey; a nuclear operations specialist to supply plant systems information (i.e., interrelationship of various components, the impact of loss of a pump on plant operations); and a plant instrumentation and control engineer to answer questions, provide information, and obtain any necessary documentation for completion of this task.

**2.3.9.3 Criteria** — The criteria used to evaluate the annunciator system are described in the Annunciator Checklist. The specific criteria for each subtask are contained in Appendix A.

**2.3.9.4 Task Definition/Methodology** — This survey was conducted by: 1) application of checklists, and 2) by verification of operator concerns identified during operator interviews. The checklists were separated into two major parts: visual displays and auditory warnings. These checklists addressed maintainability, identification, coding, operation, and arrangements of the annunciator system. The checklisting was designed to be conducted on-site. Operations personnel were interviewed about the system, and were asked to demonstrate the alarm systems operability. Observations and notations were recorded on the checklist sheets. For those items found to be in conflict with checklist criteria, Human Engineering Discrepancy reports were written.

**2.3.9.5 Results/Findings** — Table 2.3.9-1 lists all Human Engineering Discrepancies identified in the course of this survey. Following are the general findings of this survey.

**Annunciator Controls** — Only one set of annunciator controls exists in each control room, and no test or reset functions/controls are provided. Figure 2.3.9-1 shows the location of annunciator controls for each unit. Certain advantages exist for the Turkey Point control rooms having one annunciator control station for each plant. The orienting responses to alarm control stations will be stronger (since only one response station exists), which should tend to reduce response latency. Also given the size and arrangement of the control rooms and the central location of the annunciator response stations, operator responses to anomalies could be facilitated. Several disadvantages also exist, including potential for increased control room traffic, for increased visual distances to annunciator tiles, and for possible crowding of the annunciator control locations during periods of high activity. The distance from the annunciator control location to the

**FIGURE 2.3.9-1  
LOCATION OF ANNUNCIATOR CONTROL STATIONS**

individual windows, and therefore window readability, is of the most concern. Additional control stations would relieve this discrepancy, as would larger, more legible tiles.

**Annunciator Readability** — Annunciator font-size was determined to be too small from the central operating station (at the console) to any annunciator window location. The window size is also very small which prevents a significant increase in legend font size without replacing the entire annunciator system. It is recommended that enhancement (coding) techniques and increasing font size be used to improve readability.

**Coding** — During the survey, no coding (other than first out panel location coding) was being used. A means to prioritize is currently being developed and will be implemented.

**Nuisance Alarms** — Operator interviews identified several nuisance and general alarms as follows:

"Normally in" alarms were identified by operators as being:

- o RCP bypass flow low (2 observations)
- o Source range loss of detection voltage (1 observation)
- o RHR heat exchange to flow (3 observations)
- o CR local-normal control (1 observation)
- o FW HTR levels (1 observation)

Nuisance alarms were identified by operators as being:

- o SG level (2 observations)
- o Steam flow (1 observation)
- o Feed flow (1 observation)
- o FW HTR hi/lo level (1 observation)
- o PRZR cubicle hi/low temp (1 observation)
- o Condensate recovery tank hi level (2 observations)
- o Waste boron panel trouble (3 observations)
- o Ht tracing trouble (2 observations)
- o WTR plant trouble (1 observation)
- o Radwaste (1 observation)

It is recommended that a review of set points on (or the necessity for) the identified nuisance annunciators be conducted; and, an alarm for Reactor Coolant Pump vibration be added to Unit 4.

**Functional Groups** — In general, annunciator tiles are well grouped. Seven tiles were identified by operators as being poorly located as follows:

- o SI pump low suction pressure
- o CCW surge TK level
- o RCP standpipe hi/low level
- o Bypass low flow
- o Breathing air system trouble
- o SG blowdown TK hi pressure
- o SG blowdown TK hi/low level

### 2.3.10 Anthropometry Survey

**2.3.10.1 Objective** — The objective of the Anthropometry Survey was to determine whether controls and displays are located in a manner which makes them highly visible, within reach, and precludes inadvertent actuation.

**2.3.10.2 Review Team Responsibilities** — Two human factors engineers took the measurements necessary for performance of the Anthropometry Survey. With those measurements, a human factors specialist analyzed reach envelopes and visual angles, applied all checklist items, and identified and documented all discrepancies.

**2.3.10.3 Criteria** — The criteria used are from the NUREG-0700 guidelines. These are detailed specifically in Appendix A and generally below:

- a. All controls are within reach of the 5th percentile female (i.e., the person who is smaller than 95 percent of the female population) (6.1.2.2.b.1).
- b. The 95th percentile male can reach all controls without stooping (6.1.2.2.b.2).
- c. All displays are visible from any point at which they must be monitored, based on eye height of both the 5th percentile female and the 95th percentile male. This includes viewing of annunciators from their associated acknowledge controls (6.1.2.2.e).
- d. Controls are placed far enough back on the board to avoid inadvertent actuation (6.1.2.2.d.1).
- e. All controls and displays involved in a single task sequence are located to minimize the requirement for operator movement (6.1.2.2.f).
- f. Consoles are designed to allow sufficient leg and foot room and, if necessary, space for writing (6.1.2.2.g).
- g. Controls and displays which are frequently used or important are located in the most favorable position with regard to viewing or reaching (6.1.2.5.a & 6.1.2.5.b.2).
- h. CRTs are easy to view with a minimal amount of head movement (6.7.2.3).

**2.3.10.4 Task Definition/Methodology** — There were two subtasks in this survey: 1) evaluation of reach envelopes and visual angles, and 2) measurement of distance criteria.

**Reach Envelopes and Visual Angles** — A silhouette drawing of the board was obtained from Florida Power & Light and verified by taking measurements on-site. The required measurements were the distance from floor to benchboard, the distance from benchboard to panel top, and benchboard angle and depth. Using a scale drawing made

from board dimensions, angles from eye height (displays) and functional reach from shoulder height (controls) were drawn in for both 5th percentile female and 95th percentile male. The points at which reach envelop lines cross the board and the points at which the angle from line of sight to display face is less than  $45^{\circ}$  were marked, measured, and converted to full scale dimensions. These points were measured on the board on-site, and then lines were marked on board drawings to indicate the pass/fail area for each checklist item.

Horizontal visual angles were assessed by listing controls and displays used together (identified through the task analysis). For each display to be monitored while activating a control, the viewing angle was measured to ensure that it is less than  $45^{\circ}$  from line of sight.

**Distance Criteria** — In addition to the measurements involved with reach envelopes, a number of board measurements were taken. The distance between controls used in a single task sequence, the distance of controls from the front of the benchboard, control and display height on vertical boards, height of emergency or frequently used controls and displays, and height of consoles which the operator must be able to see over were measured as part of this survey.

Workspace and furniture applications were assessed through measurement of floor-space between furniture, consoles, and walls on-site to ensure that sufficient space has been allocated for the smooth flow of pedestrian traffic.

**2.3.10.5 Results/Findings** — Table 2.3.10-1 summarizes all Human Engineering Discrepancies identified in this survey. In general, no discrepancies deemed significantly debilitating to operations were observed. Most of the Human Engineering Discrepancies deal with the height on the vertical boards for control display mounting, and of these many deal with: 1) low frequency of use components, and/or 2) components deemed insignificant (by operations personnel) to safety issues.

Figures 2.3.10-1 and 2.3.10-2 show, for the 5th percentile female and the 95th percentile male population, functional reach and extended functional reach envelopes on the main operating consoles. Figure 2.3.10-3 shows the vertical reach envelope for the vertical panels "A" and "B" in the control rooms.

### 2.3.11 Force/Torque Survey

2.3.11.1 Objective — The objective of the Force Torque Survey was to identify control room equipment, via operator interview, which require too little or too excessive force for their operation, and to evaluate conformance of any potentially discrepant equipment to applicable human engineering criteria.

2.3.11.2 Review Team Responsibilities — The evaluation team consisted of a human factors engineer qualified to take force/torque measurements and a control room operator. Where control actuation was necessary to subjectively assess the force/resistance of a control, operations personnel directed the activity.

2.3.11.3 Criteria — The force criteria for operation of switch types are contained in the checklists in Appendix A. The source document for the checklist was NUREG-0700.

2.3.11.4 Task Definitions/Methodology — Several control room operators were interviewed using a preconstructed force/torque questionnaire (see Table 2.3.11-1). Individual component types were activated by a control room operator to test conformance with criteria, and were evaluated using the checklist.

2.3.11.5 Results/Findings — Table 2.3.11-2 presents the Human Engineering Discrepancies identified by this survey. As indicated in the table, only two Human Engineering Discrepancies were identified. No additional control resistance problems exist in the control rooms.

TABLE 2.3.11-1  
FORCE/TORQUE QUESTIONNAIRE

1. Do you recall any inadvertent switch actuations as a result of coming in contact with the switch mechanism? If so, do these switches appear to be too easily actuated?

GO TO FIRST PANEL, THEN REPEAT QUESTIONS AT EACH PANEL

2. Are there any controls, pushbuttons, or legend pushbuttons which appear to be too easily actuated or difficult to actuate?
3. Do toggle switches have an elastic resistance that increases as the control is moved and drops as the switch maps into position?
4. Are knobs for spring loaded momentary contact rotary selector controls large enough to be easily held against the spring torque for as long as necessary?
5. Does rocker switch resistance gradually increase then drop to zero when the control snaps into position?
6. Does the resistance for the rocker switch preclude the switch from being placed between positions?
7. Do any control knobs or handles rotate or move loosely on their shafts?
8. Do any controls give the "feeling" that internal wear has occurred or that breakage might occur, or have the "feel" that sensory feedback has altered over the life of the control?

TABLE 2.3.11-2

### 2.3.12 Communications Survey

**2.3.12.1 Objective** — The objective of the Communications Survey was to assess the degree to which various modes of communication transmission and reception used in the control room conform to the human factors guidelines outlined in NUREG-0700. Through the evaluation process generic discrepancies and discrepancies specific to individual communication devices were identified.

**2.3.12.2 Review Team Responsibilities** — The members of the review team and their responsibilities included:

- o A human factors specialist to conduct the checklisting, identify discrepancies, and report the survey findings.
- o A senior human factors scientist to observe the system operation during an emergency drill and identify discrepancies, and to assist in conducting rhyme tests.
- o Communications system operators (Control Room Operator, Nuclear Plant Supervisor, and Nuclear Watch Engineers) to supply operational information and demonstrate system operations.
- o Plant technicians (Instrumentation and Control and Electric Department personnel) to provide and to obtain necessary documentation for completion of this task.

**2.3.12.3 Criteria** — The criteria used to evaluate the various communication systems are based on NUREG-0700 guidelines. Other source books included NUREG/CR-1580 and MIL-STD-1472C. The specific criteria used are contained in Appendix A.

**2.3.12.4 Task Definition/Methodology** — The four procedures used to conduct this survey were: 1) conduct of operator interviews, 2) application of human engineering checklists, 3) observation of emergency drill communications, and 4) conduct of a modified rhyme test. Each is discussed briefly below.

**Interview** — The operator interviews collected in the "Review of Operating Experience" task were reviewed for identification of potential communications discrepancies. The discrepancies were then targeted for verification in the control room and evaluated according to the survey criteria.

**Human Engineering Checklist** — The checklist, applied on-site, was concerned with the following issues: maintainability, identification, coding, operation, audibility, usability, and accessibility.

Operations personnel were asked specific questions about the different communications systems or were asked to demonstrate the system operation and capabilities. Instrumentation and control engineers and plant technicians were consulted concerning specific system capabilities (e.g., frequency ranges, power supplies, and maintenance).

**Emergency Drill** — A human factors specialist and a senior human factors scientist observed most of the communications systems in real-time operation during two of the emergency drills conducted for the Nuclear Regulatory Commission on March 15th and 16th, 1982. Discrepancies, not apparent during normal operations and operator demonstrations of system operations, were noted and Human Engineering Discrepancy reports were written.

**Page System Rhyme Test** — A modified rhyme test of the plant page system was conducted spontaneously, based on operator interview findings. In this subtask, 15 words were spoken over the page system while the plants were in normal operating conditions. The procedure used was, except for talker's list length, the same as described in Section 2.3.7 of this report.

**2.3.12.5 Results and Recommendations** — Table 2.3.12-1 summarizes the Human Engineering Discrepancy findings for this survey. In general, the communications system was found to be discrepant in several areas including emergency use, reliability/maintenance, identification/coding, location, and design.

Interviews suggested intelligibility problems with the page system. Tables 2.3.12-2 and 2.3.12-3 present the target and test words used in a modified rhyme test. The test was presented and 87 percent correct recognition was made of target words. These findings are considered to demonstrate acceptable intelligibility for the page system.

TABLE 2.3.12-1

### **2.3.13 Maintainability Survey**

**2.3.13.1 Objective** — The objective of the Maintainability Survey was to evaluate the adequacy of the control room design to support maintenance activities performed by operations personnel. The survey was organized into three parts:

- o Maintenance of Components with Integral Lighting
- o Recognition of Visual Display Failure
- o Spare Parts, Operating Expendables, and Tools.

**2.3.13.2 Review Team Responsibilities** — The following personnel were required to conduct this survey: a human factors engineer, responsible for data collection and analysis and for report preparation; a control room operator, responsible for providing assistance during data collection and analysis; and an instrumentation and control technician, who was responsible for providing information and assistance during data collection and analysis.

**2.3.13.3 Criteria** — Criteria used in this survey are summarized below.

- o Lamps should be replaceable from the front of the panel (i.e., components should not have to be removed to replace lamp.
- o Components are not susceptible to shorting out or, in the case of switches, to inadvertent activation during the process of lamp removal or replacement.
- o Lamp replacement does not subject the operator to a shock hazard.
- o Covers having legends, color coding, or other component-specific information are physically keyed, or some form of procedural safeguard is provided to prevent interchanging of covers.
- o If lamp replacement requires tile removal, there is a way to ensure that the tile is replaced in the correct location.
- o Dual-bulb or dual-filament light assemblies are used, or bulb-test capability is provided where lamp status cannot be verified.
- o Component design encourages immediate replacement of burned-out bulbs by providing for rapid and convenient bulb replacement with power on and without hazard to personnel or equipment.
- o Operator aids are provided if needed for lamp replacement.
- o When panel instruments such as meters fail or become inoperative, the failure is apparent to the operator (i.e., a failed meter displays an off-scale indication).
- o Spare parts, such as indicator lamps, and any tools required by operating personnel are stored in suitable designated space(s) within the control room.
- o An adequate supply of expendables and spare parts (e.g., fuses, bulbs, ink, recorder charts, printer paper, etc.) are provided.

- o Expendables and spare parts are readily accessible.
- o All tools required to replenish expendables and install spare parts are available.
- o There should be adequate storage space for expendables and spare parts.
- o When different types, sizes, or styles of expendables and spare parts are required, they should be clearly and distinctively marked to avoid confusion or misapplication.
- o Records should be maintained concerning the status of expendables and spare parts.
- o The paper, ink, and other expendables required to maintain graphic recorders should be provided and accessible in the control room.
- o The design of graphic recorders permit quick and easy replenishment of paper and ink.
- o Fresh replacement batteries for walkie-talkies are accessible and well marked.
- o The stock of batteries is sufficient to support continuous emergency operation of walkie-talkies.

**2.3.13.4 Task Definition/Methodology** — The following procedures were followed to conduct this survey.

**Maintenance of Components with Integral Lighting** — All components having integral lighting were identified. Components were organized into generic classes (e.g., legend switches, annunciators, etc.). Next, representative components were selected from each class for evaluation.

Maintenance procedures for lamp replacement for each sample component were reviewed and assessed. Finally, each sample component was evaluated according to the above criteria by using the checklist contained in Appendix A. Whenever necessary, the control room operator or the instrumentation and control technician demonstrated required maintenance activities.

**Recognition of Visual Display Failure** — All visual displays were identified. Visual displays were organized into generic classes (e.g., vertical meters, strip charts etc.). Next, representative displays from each class were selected for evaluation; and display failure modes, indications, etc., were identified by interviewing the control room operators and/or instrumentation and control technician using the interview form contained in Appendix A.

Each sample display was evaluated according to the above criteria using the checklist contained in Appendix A. Whenever necessary, the operator or instrumentation

and control technician simulated display failure either by disrupting the electrical signal to the display, or some other means, as appropriate. Where it was impractical to simulate display failure, display specifications were reviewed to determine display failure response.

**Spare Parts, Operating Expendables, and Tools** — All control room components requiring maintenance by operations personnel in the form of replacing parts or replenishing expendables were identified. The components were organized into generic classes (e.g., transilluminated displays, graphic recorders, printers, etc.). Next, for each class of components the associated spare parts and/or operating expendables required for maintenance by operations personnel were identified and described. Information entered on the data form included:

- o Component — component name or designation (e.g., graphic recorder)
- o Type — type of spare part or operating expendable (e.g., paper)
- o Size — cubic dimensions of spare part or expendable, as stored (approximate)
- o Markings — provisions for labeling or otherwise designating similar items to avoid confusion
- o Replacement frequency — how often the item must be replaced (e.g., once per week)
- o Tools — tools required to replace spare part or replenish expendable
- o Storage location — where in the control room the item is stored.

Storage closets, lockers, etc., were also identified and described. Information entered on this form included:

- o Designation — name assigned to locker, closet, etc. (e.g., Storage Locker #1)
- o Location — where in the control room the container is located
- o Size — internal dimensions of the container
- o Stored items — items stored in the container
- o Labeling — bins, compartments, etc.
- o Frequency of stocking — schedule for restocking container.

The control room design was evaluated with respect to spare parts, operating expendables, and tools by using the checklist contained in Appendix A. In conducting this evaluation it was important to consider the following:

- o Adequacy of supply — to determine if the supply of expendables and spare parts is adequate, one must determine the frequency with

which the spare part or expendable is replaced, as well as the periodicity of stock replacement (i.e., the likelihood that an item will run out before the shelves are restocked).

- o Adequacy of space — to determine the adequacy of storage space, one must compute the volume of all items contained in the storage space when the shelves are fully stocked.

2.3.13.5 Results/Findings — Table 2.3.13-1 presents the findings of this survey. A summary of the discrepancies noted on Human Engineering Discrepancy forms follows:

- o Display failure is not apparent and no lamp test is provided for simple indicator lights, annunciators, and bright is right
- o Some meters and strip charts fail on-scale (failure is not apparent)
- o Illuminated displays
- o Most digital displays have no indication of failure
- o Storage and labeling is inadequate (absent or inaccurate)
- o Stored item accessibility is reduced by location and by locked cabinets
- o Inadequate storage space is provided in, or accessible to, the primary area
- o No inventory is kept for replenishment of spare parts and expendables
- o Tools, when provided, do not fit/work.

TABLE 2.3.13-1

## MAINTAINABILITY SURVEY SUMMARY OF FINDINGS

| File No. | HED#     | Category |         | Description   |
|----------|----------|----------|---------|---|

## **2.4 System Function and Task Analysis**

System Function and Task Analysis was conducted in four basic steps, as follows:

- o Identify/review systems, functions, and tasks
  - identify system functions
  - develop task lists and Response Selection Diagrams
  - identify event sequences to be analyzed
- o Analyze tasks
  - analyze tasks for each function
  - develop Spatial-Operational Sequence Diagrams
- o Verify task performance capability/human engineering suitability
- o Validate control room functions.

Each of these steps is discussed in the following sections.

### **2.4.1 Identify/Review Systems, Functions, and Tasks**

The overall objectives of the System Function and Task Analysis were to identify and organize plant systems, functions, and operator tasks to support subsequent analysis. Subtasks are presented below.

**2.4.1.1 Identify Systems/Subsystems and System Functions** — The objectives of this subtask were to identify and document the plant systems and subsystems which function to operate the reactor plant and generate and distribute power. This included the systems which are represented in the control room. Once the system and subsystem boundaries were identified, the functions which are performed within a subsystem division were identified and documented.

The review team consisted of several senior operations personnel, four human factors specialists, and plant instrumentation and control engineers.

The team members reviewed the Final Safety Analysis Reports, technical specifications, system descriptions, and other available documentation which describe the reactor plant, power generation, and power distribution systems. A preliminary systems and subsystems list was developed. The team interviewed the operations personnel using the control room photomosaic to verify/revise the system and subsystem divisions which were identified by operations personnel as governing:

- o Reactor control and instrumentation systems
- o Safety systems
- o Feedwater systems
- o Radwaste systems
- o Power generation systems
- o Power distribution systems.

The system and subsystem boundaries were identified and verified to reflect the as-built operational status and operating practices. The operations personnel were requested to provide, for each subsystem, the functions (or operations) of (and any operational variations associated with it) the subsystem and its components. Operational variations and the conditions under which they are employed were documented as function alternatives.

This subtask identified the major plant systems, the functions which they govern, and the subsystems of each major system. The list of system functions underwent task Analysis.

**2.4.1.2 Develop Task Lists and Response Selection Diagrams** — The objectives of this subtask were: 1) to identify and describe motor, perceptual, and information processing tasks associated with performance of system and subsystem functions, 2) to identify task sequences and dependencies, and 3) to graphically depict task sequences in Response Selection Diagrams.

Through review of standard, abnormal, and emergency operating procedures and interviews with operations personnel; conditions which initiate operator tasks in relation to performing functions (initiators include alarms, routine monitoring, administrative procedures, etc.) were identified.

Also identified were the prerequisite conditions for the conduct of functions and the possible variations in the conduct of functions based on presence or absence of prerequisite conditions.

By reviewing system operating procedures and interviewing training instructors and operators, individual tasks and decision points involved in function performance were identified. Detailed descriptions of task actions were recorded in the form of Response Selection Diagrams which graphically represent task sequences (see Figure 2.4-1) and identify actions and decisions on the part of the operator.

This subtask provided Response Selection Diagrams for each control room function, depicting:

- o Tasks
- o Task sequences
- o Decision points
- o Task dependencies
- o Detailed task descriptions.

See Figure 2.4.1.-1 for an example of a completed Response Selection Diagram. These Response Selection Diagrams were used as initializing information for detailed analysis of tasks.

**2.4.1.3 Identify Event Sequences** — The objective of this subtask was to identify event sequences (postulated and experienced transients) to be evaluated in the task analysis. The specific list of event sequences selected for analysis were:

- o Plant Startup/Shutdown/Change in Power
- o Loss of Coolant Accident
- o Inadequate Core Cooling
- o Multiple Steam Generator Tube Ruptures
- o Failure of Auxiliary and Main Feedwater
- o Failure of High Pressure Reactor Coolant Make Up
- o Anticipated Transients Without Scrams
  - Loss of offsite power
  - Stuck Power-Operated Relief Valve.

## **2.4.2 Analyze Tasks**

The basic objective of this System Function and Task Analysis activity was to use the data previously generated to analyze, in detail, operator-allocated tasks for each of the functional sequences selected for analysis. Subtasks are discussed below.

**2.4.2.1 Analyze Tasks for Each Function** — The objectives of this subtask were to analyze task requirements to determine information requirements, control requirements, communication requirements, constraints (time, etc.) on task performance, and decisions and skills/knowledge requirements; and to document task requirements in an accessible, usable format for each task and task sequence.

The Response Selection Diagrams were used as a basis to determine detailed task requirements. Detailed task descriptions were analyzed, and for each task the following information was assembled on the Task Analysis/Response Selection Diagram form (See Figure 2.4-1):

- o The required control action, if applicable (i.e., binary, multi-discrete, or continuous)
- o The control panel and the display or control code associated with the task
- o The display requirement, if applicable (i.e., binary, multi-discrete, or continuous scale)
- o Parameter ranges and control features necessary for safe plant operation

- o Skills/knowledge demanded of the operator for task performance
- o Workload assessment.

**2.4.2.2 Develop Spatial-Operational Sequence Diagrams** — The objective of this subtask was to present sequential task accomplishment graphically on line drawings of the board layouts.

Using Task Analysis/Response Selection Diagram data as input, human factors engineering analysts graphically represented task sequences on panel line drawings (i.e, Spatial-Operational Sequence Diagrams). The procedure for generating Spatial-Operational Sequence Diagrams is as follows:

- o Assemble line drawings of control board
- o Code components compatibly with locator codes on Task Analysis/Response Selection Diagram forms
- o Sequentially link control board instrumentation and displays based on Task Analysis/Response Selection Diagram data
- o Numerically identify links with task code numbers from Task Analysis/Response Selection Diagrams
- o Assemble and file Spatial-Operational Sequence Diagrams for subsequent analysis.

The outputs and results of this subtask were Spatial-Operational Sequence Diagrams for each system and subsystem function that identify:

- o Sequence of control/display use for each function
- o Frequency of control/display use for each function
- o Decision and task sequence output failure points.

With the knowledge of the original design considerations and the design and human factors trade-offs that were conducted during the plant design phase, the Operations Department performed an integral role in the determination of task requirements.

The outputs and results of this subtask were verification or identification of: instrumentation and design requirements for performance of tasks, operator skills and knowledge required for task performance, and workload assessment.

### **2.4.3 Verify Task Performance Capability/Human Engineering Suitability**

This task required further analysis and evaluation of operator-allocated tasks. Subtasks for this task are discussed below.

**2.4.3.1 Develop Functional Sequence Diagrams** — The objective of this subtask was to develop event-based Functional Sequence Diagrams for each event sequence listed in Section 2.4.1.3, above.

For each event sequence which underwent evaluation, event evolutions (courses) were identified.

Functional Sequence Diagrams generated from procedures represent the evolving plant and operational status ensuing after an initiating event.

The procedure for developing Functional Sequence Diagrams was as follows:

- o Identify the previously defined functions and tasks as operationally sequenced in the event
- o Identify branch points (e.g., diagnostic decisions, etc.)
- o Timeline operations and tasks to identify event progressions.

As Functional Sequence Diagrams were completed, sequential functions were overlaid on control room floor plans and sequentially numbered to identify and analyze control room traffic patterns. The traffic pattern analysis was conducted as follows:

- o Assemble Functional Sequence Diagrams for each event
- o Obtain control room floor plan drawings
- o Sketch the traffic paths for all operators as required by the event sequence
- o Identify functional (operational) dependencies, as required.

Figure 2.4.3-1 shows a typical Functional Sequence diagram. Figure 2.4.3-2 shows an example of a traffic analysis for the same sequence as presented in Figure 2.4.3-1. Outputs of this subtask are Functional Sequence Diagrams and Traffic Diagram checklists.

**2.4.3.2 Verify Human Engineering Suitability** — The objective of this subtask was to identify man-machine interface problems that may affect task performance, but that may not be evident in component surveys.

There are four major design issues that this subtask addressed: 1) the grouping of components with respect to function, sequence, importance, and frequency-of-use criteria; 2) control and display integration to ensure that associated controls and displays are not dispersed and that their designs are compatible; 3) component discrimination through enhancements such as demarcation and coding techniques; and 4) panel layouts for consistency of conventions across all panels/units. Specific checklist items regarding the above issues were used as compliance standards.

The functional groups were identified in the system and subsystem definition of Task 1. The extent to which functional groups/systems/subsystems define an appropriate functional group with respect to operational requirements was then assessed using the Spatial-Operational Sequence Diagrams. These diagrams identify: 1) the components

which are involved in carrying out the subsystem functions, 2) the sequence of component use, and 3) the associated controls and displays for a particular action. In addition, by identifying corresponding functions between control panels and units, where applicable, location and sequence aspects of the layout consistency were assessed. The checklist criteria items (Appendix A) were applied to each Spatial-Operational Sequence Diagram sheet, and discrepancies were noted. All the Spatial-Operational Sequence Diagrams involving a discrepant component were analyzed with respect to the component's frequency-of-use and importance as determined in Subtask 2.4.4.

#### 2.4.4 Validate Control Room Functions

The objective of this task was to: 1) estimate the importance and frequency-of-use for equipment, and 2) verify the availability of required instrumentation and controls in the control room.

**2.4.4.1 Develop Frequency and Importance Data** — The objective of this subtask was to determine both importance and frequency-of-use data for equipment used in task sequences and selected plant events.

Based on: 1) event sequences, 2) normal operating procedures (e.g., startup), and 3) frequency estimates of nonprocedurally-bound operations (e.g., Boron control, annunciator responses, etc.), frequency data for equipment use is estimated. The procedure for estimating task frequency was as follows:

- o Determine an estimate of the frequency of implementation of normal operating procedures (e.g., start-up, shutdown, change in power) by interviewing senior operations personnel.
- o Similarly, determine estimates of the frequency of nonprocedurally-bound operations (e.g., boration, volume control, etc.) for each function.
- o Assemble data on form.
- o Develop a frequency table for function call-up.
- o Develop frequency estimation for each instrument/control/communication requirement based upon estimated frequency-of-function execution.
- o Sort and store frequency data (see Table 2.4.4.-1).

Using a similar technique, indication of equipment importance was identified by weighting the importance of the events shown on frequency data form and then summing the weighted frequencies of equipment uses in function callups.

The outputs and results of the subtask were estimated frequency-of-use and importance data for control room equipment by event/operation.

TABLE 2.4.4-1  
ESTIMATED FREQUENCY OF FUNCTION CALLUP

| <u>Procedures</u>                      | <u>Frequency Per Week or Frequency Per Month</u> | <u>Total Frequency Per Year</u> | <u>Rated Importance</u> |
|--|--|---------------------------------|-------------------------|
| 1. Startup                             |  |                                 |                         |
| 2. Shutdown                            |  |                                 |                         |
| 3. Change in Power                     |  |                                 |                         |
| .                                      |  |                                 |                         |
| .                                      |  |                                 |                         |
| .                                      |  |                                 |                         |
| n. etc.                                |  |                                 |                         |
| Nonprocedurally                        |  |                                 |                         |
| Bound operations<br>(function callups) |  |                                 |                         |
| 1. Boration                            |  |                                 |                         |
| 2. Dilution                            |  |                                 |                         |
| 3. Cooling Water<br>flow               |  |                                 |                         |
| 4. Maintain SI<br>Tk level             |  |                                 |                         |
| .                                      |  |                                 |                         |
| .                                      |  |                                 |                         |
| .                                      |  |                                 |                         |
| n. PRZR Temp<br>Maintenance            |  |                                 |                         |

**2.4.4.2 Verification of Equipment Availability** — The objectives of this subtask were to identify availability (presence) of required instrumentation and controls in the control room to support performance of system functions, and to identify potentially extraneous control room equipment.

The basic criteria for the subtask were: 1) the control and display designs should match the task needs and operators' capabilities, 2) frequently required or important instrumentation or controls should be located in the control room, and 3) infrequently used or unimportant instrumentation should be excluded from the control room inventory.

The Task Analysis/Response Selection Diagrams were compared with the Functional Sequence Diagrams to identify the equipment requirements. To identify any deficient areas, the results were then compared to the control room inventory list representing the present equipment capabilities and characteristics. All equipment was evaluated for its appropriateness to operating requirements using the checklist (see Appendix A).

The calculated frequency-of-use data was examined to identify equipment with very high or very low frequency of use. Lists were prepared for infrequently used equipment located in the control room and frequently used equipment located outside of the control room. These lists were also annotated with the assessment of the component's importance to operations as previously developed.

The outputs and results of this subtask include: 1) a list of required control room equipment located external to the control room, 2) a list of infrequently used equipment located in the control room, and 3) a list of discrepancies based on Task Analysis of the equipment requirements and the present control room inventory.

### 3.0 IMPLEMENTATION

The objectives of this phase are: 1) preparation of schedules for implementation of selected backfits, and 2) preparation and submittal of the final report.

#### 3.1 Develop Backfit Schedules

Backfit implementation programs were prepared when Human Engineering Discrepancies had been identified, documented, and assessed. Scheduling of Human Engineering Discrepancy backfits will be a function of:

- o Human engineering discrepancy priority
- o Engineering and procurement lead time requirements and constraints
- o Overall plant outage schedules.

Schedules will be reviewed and updated as part of the implementation program.

##### 3.1.1 Phase 3 — Enhancement and Design Solutions

The basic procedure to be employed in identifying and selecting enhancements and design solutions is based on Figure 3-1.

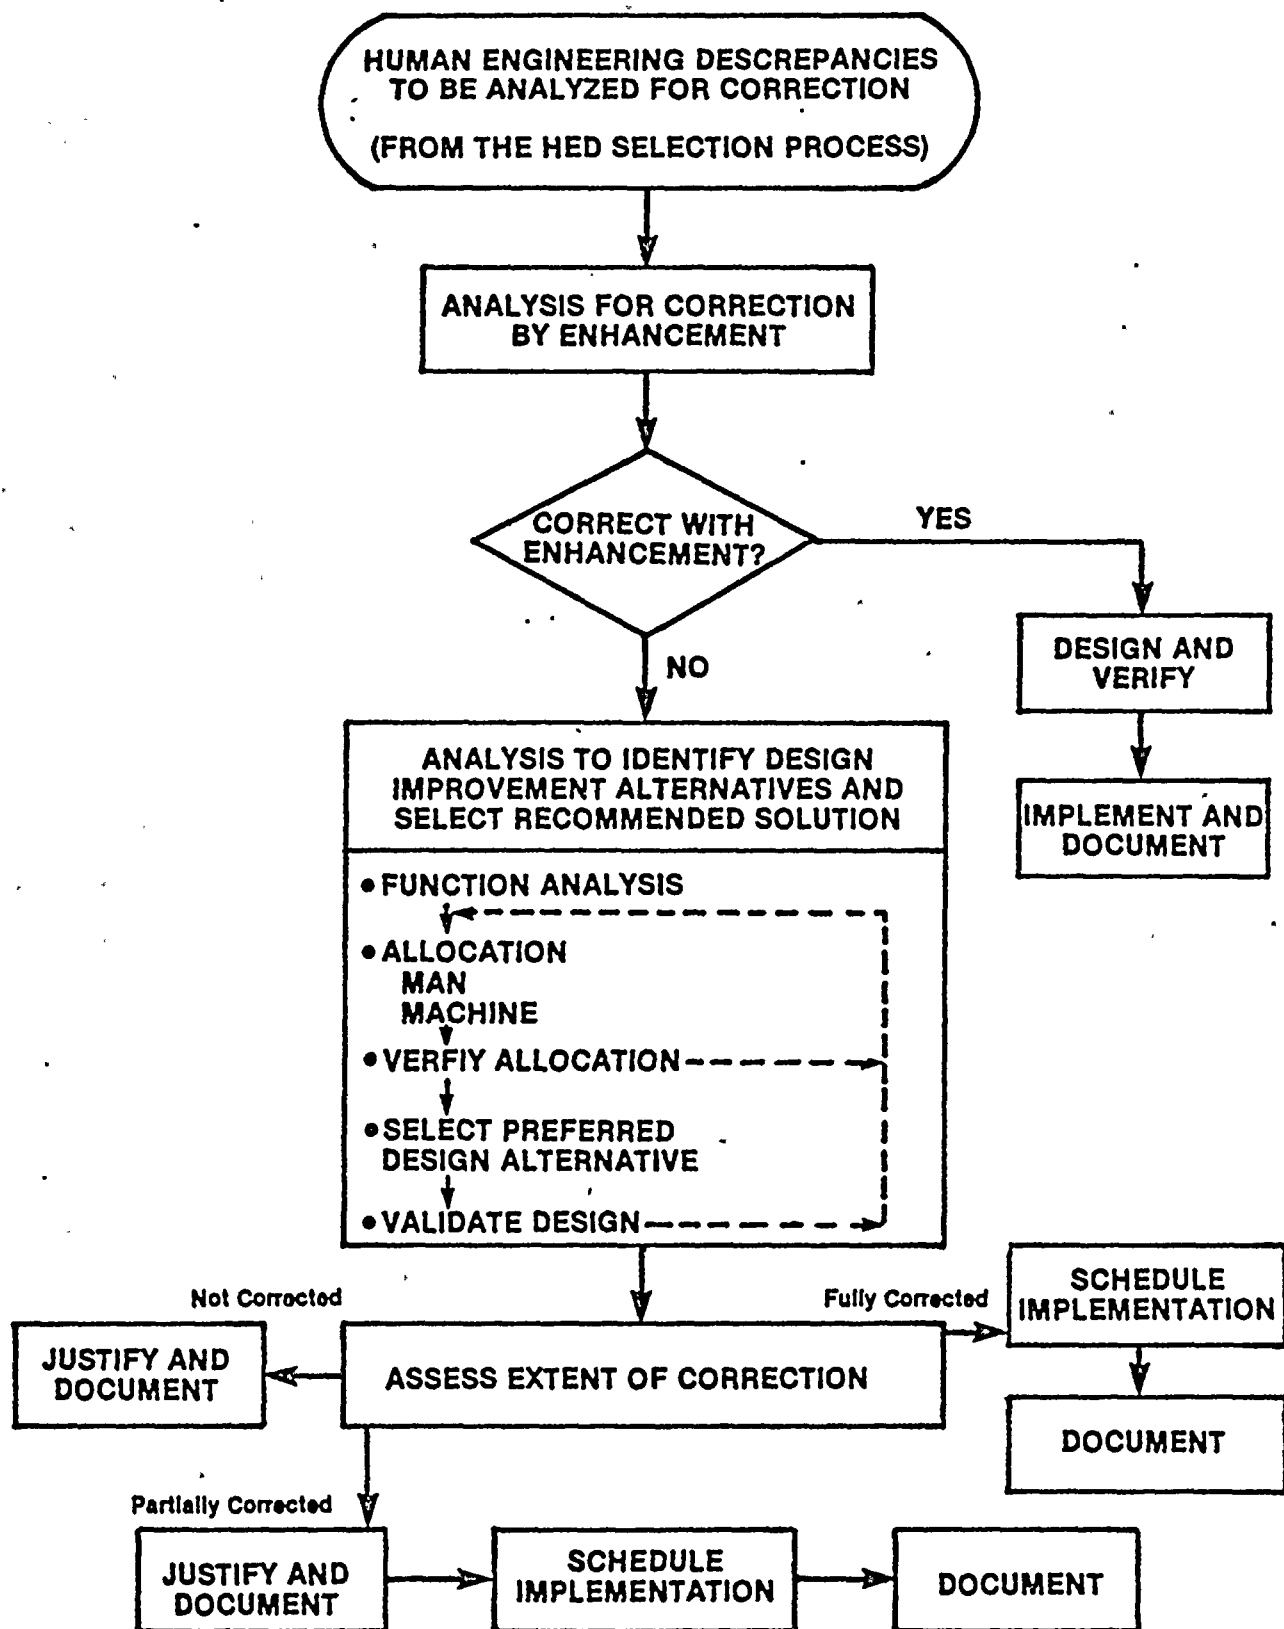

- o Analysis of correction by enhancement
- o Analysis of correction by design alternatives
- o Assess extent of correction.

##### 3.1.2 Analysis of Correction by Enhancement

Discrepancies selected for correction are first examined for possible correction by enhancement (labeling, demarcation, procedure aids, etc.). Each Human Engineering Discrepancy is considered, and, where such correction is possible, the discrepancy is reassessed for its effect on operator performance. Human Engineering Discrepancies are, as appropriate, re-evaluated via checklisting and Task Analysis until human factors engineering suitability is verified. Where it is determined that correction by enhancement is not possible, the Human Engineering Discrepancy is analyzed for correction-by-design alternatives (see Figure 3-2).

##### 3.1.3 Analysis of Correction by Design Alternative

Identification of design alternatives was achieved by the examination of the Human Engineering Discrepancy, reference to task analysis data, and identification of potential

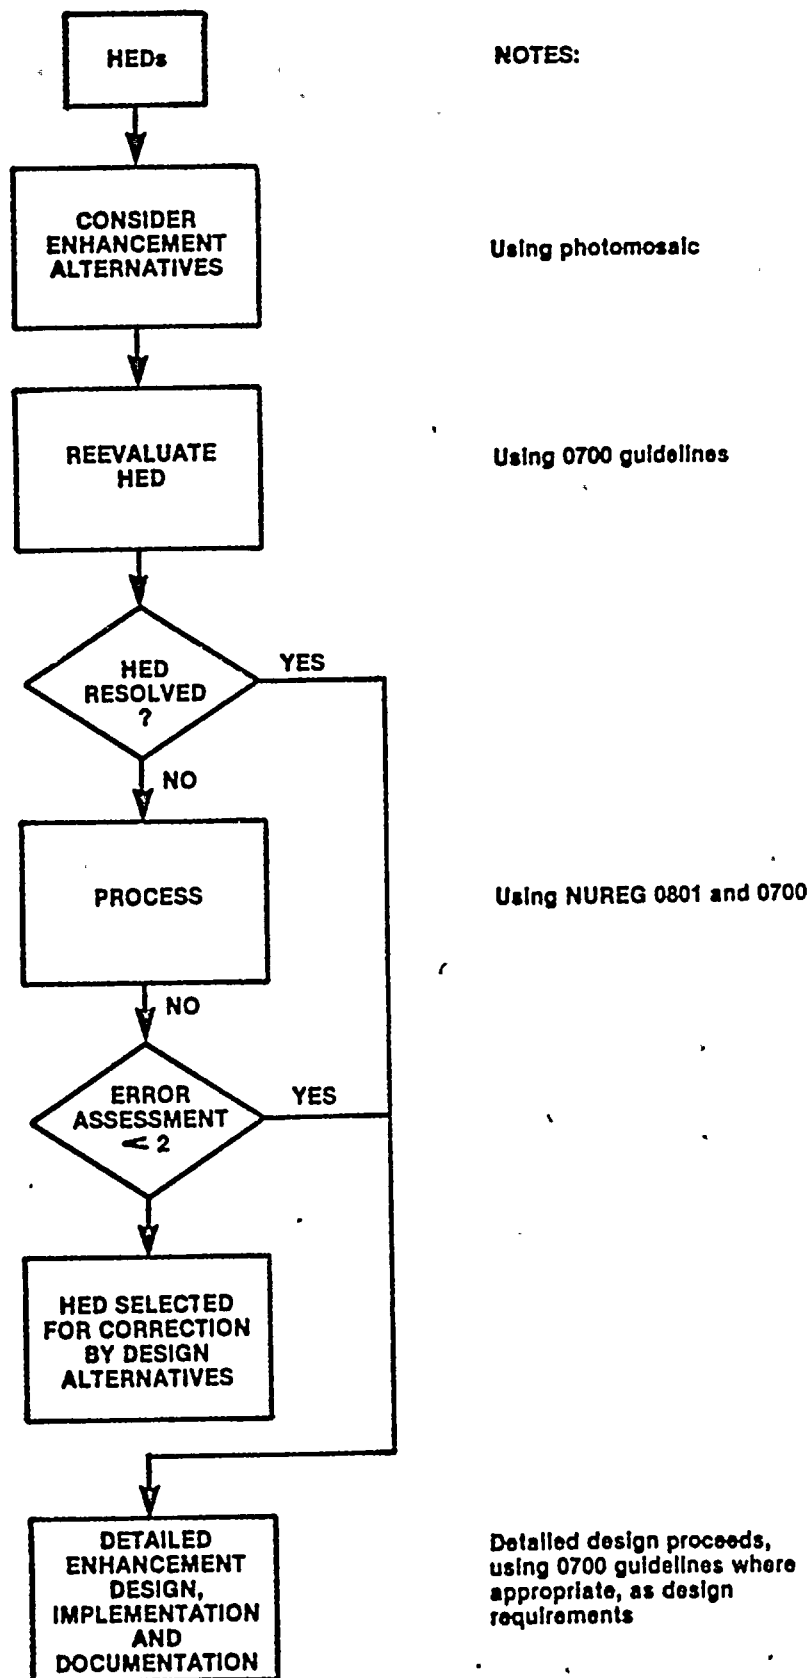

**FIGURE 3-1**  
**ASSESSMENT: SELECTION OF DESIGN IMPROVEMENT**  
**(FROM NUREG-0700)**

**FIGURE 3-2**  
**FLOW FOR CORRECTION OF HEDs BY ENHANCEMENT**

constraints (e.g., availability of equipment, Reg. Guide 1.75, etc.) and was dispositioned by taking into account plant safety, design restrictions, operator performance, and cost effectiveness. The acceptability of design alternatives will be verified by further evaluation using the following:

- o Functional analysis
- o Task analysis
- o Reapplication of appropriate checklists.

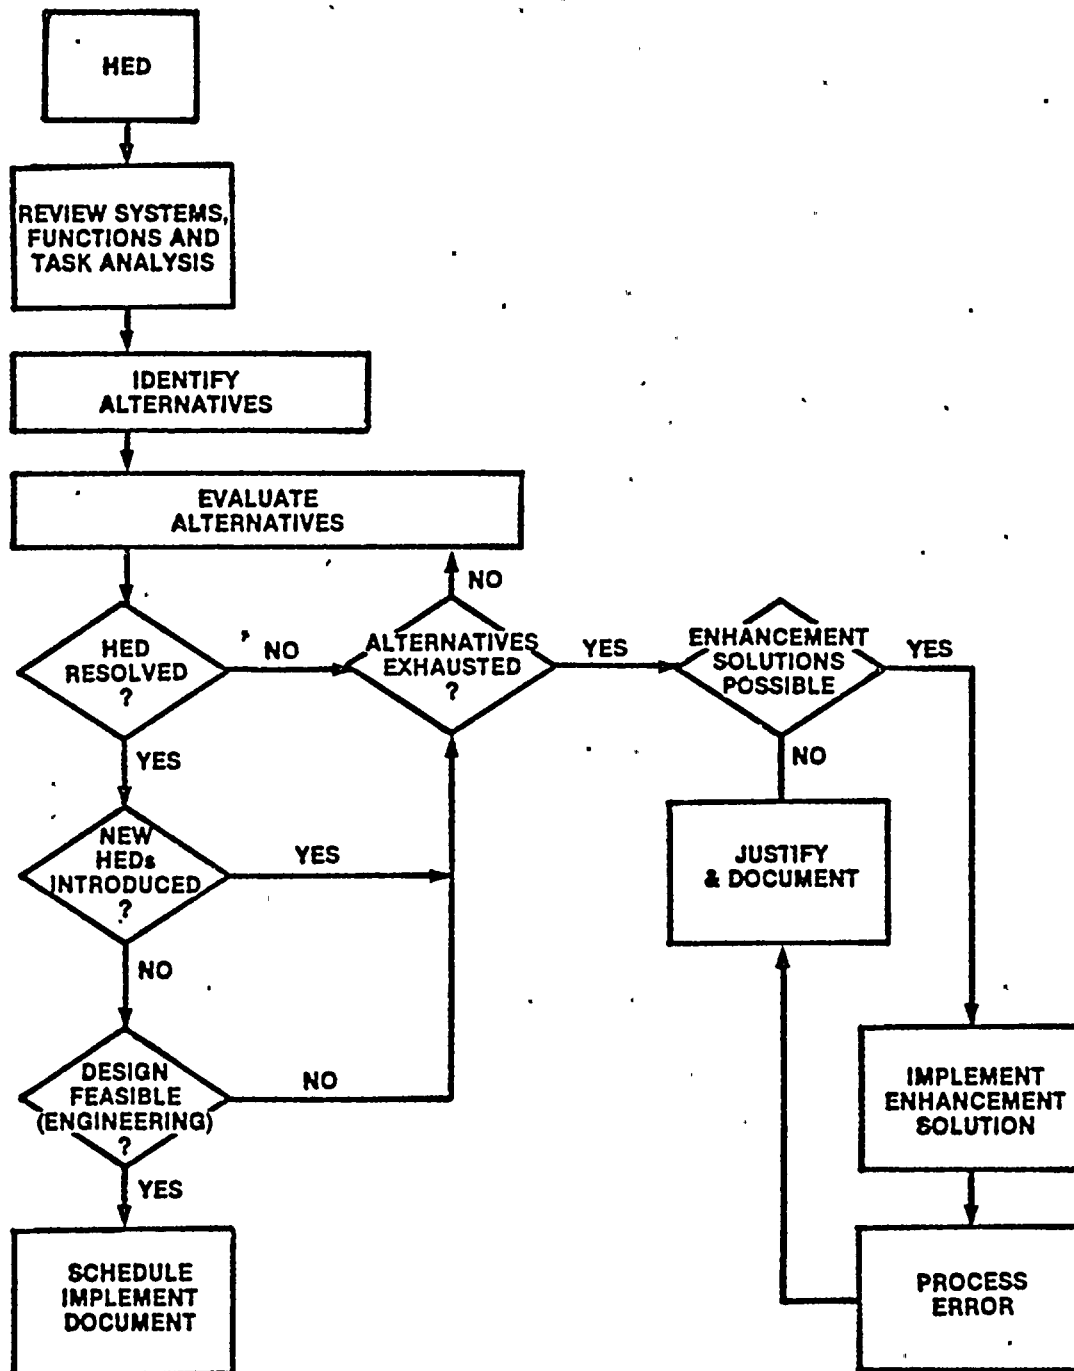

Figure 3-3 presents the general activity involved in the analysis of correction-by-design alternative.

#### 3.1.4 Extent of Correction

For all human engineering programs implemented or Human Engineering Discrepancies selected for correction-by-design alternatives, the extent of correction (by enhancement or redesign) will undergo evaluation. To achieve the assessment, a simple reapplication of program guidelines and verification of human factors engineering suitability will be performed. Figure 3-4 is the form used to document extent of correction assessments. In cases where a generic program is consistently implemented (i.e., labeling, color coding, etc.), only a sample of enhancements will be re-evaluated for extent of correction since the results will be the same in all cases. Correction assessments will occur as part of the implementation program since the full extent of enhancements cannot be evaluated until a sample survey of field implementation is made.

## 3.2 HUMAN ENGINEERING BACKFIT PROGRAM

### 3.2.1 LABELING

As a result of the Detailed Control Room Design Review performed on Turkey Point Unit 3 and 4, 44 of the findings (summarized in Table 3.2-1) identified, remain to be implemented as part of an ongoing labeling effort at the Turkey Point Site.

The labeling effort developed at the Turkey Point Site follows NUREG-0700 as a guideline while taking into account the compact control room design, although compact, Turkey Point 3 and 4 common control room is functionally designed with a consistent pattern of controls and displays. The labeling guideline will standardize the different sections of the control board.

The subject guideline was developed using NUREG-0700 to establish criteria for:

- o Light height
- o Label configuration, i.e., number of lines of print per label
- o Label borders and space between lines
- o Font characteristics

The developed guidelines provides:

- o Guidelines for the preparing, revising, and fabrication of labels for use in the control room and related areas.
- o A dictionary of standard abbreviations and acronyms to be used as a reference in control room labels and procedures.

The following is a list of the remaining findings to be corrected by the ongoing labeling effort. The findings are listed by section number as they relate to NUREG-0700 and file number as they relate to FP&L tracking system. A more detailed listing along with descriptions of each line item presented in Section 3.5 of this report.

### 3.2.2 DEMARCATION

As a result of the Detailed Control Room Design Review performed on Turkey Point 3 and 4 only 3 findings identified, remain to be implemented. (Summarized in Table 3.2-1). Turkey Point 3 and 4 common control room is compact but functionally layed out enjoying vertical grouping of associated controls and displays at this time.

Appendix 2 was developed to provide general guidance for designing and intergrating demarcation along with summary labels and mimic coding. The demarcation guidelines ensure that the final product maintains:

- o Simplicity of design
- o Intergration of summary labels
- o Use of mimics where beneficial to the operators and current panel space permits.

Demarcation will be used to improve functional grouping and/or provide operators with visual keys to improve response time and overall task performance.

Appendix 2 contains: A guidance document which discusses the philosophy of hierarchical labeling and example demarcation scheme. The final demarcation disign selected will be developed using task requirements, system/functional relationship, and operating experience on the Turkey Point control rooms to identify those areas needing enhancement, the demarcation will be coordinated with the relabeling program and completed as part of the units overall control room upgrade effort.

The following is list of the remaining findings to be corrected by the ongoing demarcation/labeling effort. The findings are listed by section number as they relate to FP&L's tracking system. A more detailed listing along with descriptions of each line item are presented in Section 3.5 of this report.

| <u>SECTION NO.</u> | <u>FILE NO.</u> |
|--------------------|-----------------|
| 6.1                | 18,24           |
| 6.8                | 7               |

### 3.2.3 ANNUNCIATOR REVIEW

As a result of the Detailed Control Room Design Review performed on Turkey Point Units 3 and 4, 13 of findings (summarized in Table 3.2-1) identified, remain to be corrected as part of the ongoing Annunciator Review Program.

The Annunciator Review Program address the following points to resolve the subject findings:

- o Re-engraving of alarm windows to alleviate:
  - Congested tiles
  - Incomplete messages
  - Confusing messages
  - Addition of new tiles
  - Standardization of abbreviations
- o Prioritization of alarms by color coding
- o Review of alarm windows to identify those with multiple inputs requiring reflash capability
- o Review of alarm location with regard to associated controls
- o Review of annunciators to identify those common alarms which could be combined into category alarms.

Annunciator engraving specifications, prioritization coding and abbreviation list are contained in the Turkey Point Units 3 and 4 annunciator review report.

The following is a list of the remaining findings to be corrected by the ongoing annunciator program. The findings are listed by section number as they relate to NUREG-0700 and file number as they relate to FP&L's tracking system. A more detailed listing along with descriptions of each line item is presented in Section 3.5 of this report.

| <u>SECTION NO.</u> | <u>FILE NO.</u>            |

| 6.6                | 57                         |

### 3.2.4 CODING CONVENTION

As a result of the Detailed Control Room Design Review performed on Turkey Point Units 3 and 4, 7 of the findings (as summarized in Table 3.2-1) identified remain to be corrected as part of the established coding convention effort.

The coding convention implemented in the Turkey Point Unit 3 and 4 control rooms will be consistent and standardized to reflect the original control room design philosophy.

The subject coding conventions are applied to:

- o Indicator lights
- o Push buttons
- o Mimics
- o Power trains
- o Meter scales
- o Control handles

The following is a list of the remaining findings to be corrected by application of the developed coding conventions. The findings are listed by section number as they relate to NUREG-0700 and file number as they relate to FP&L's tracking system. A more detailed listing along with descriptions of each line item is presented in Section 3.5 of this report.

### 3.2.5 ENGINEERING INTERGRATION REVIEW

As a result of the Detailed Control Room Design Review performed on Turkey Point Unit 3 and 4, there are 19 of the findings (as summarized in Table 3.2-1) identified as requiring design changes remaining to be implemented and/or engineering review completed and final dispositioning assigned.

Of the 18 findings remaining in this category 9 have been dispositioned for design enhancement corrective action and will be implemented during the units refueling outage.

The remaining 10 require engineering review with regard to design alternatives taking into account qualification of equipment, common operational concerns between the Turkey Point Control Rooms, coordination of construction support requirements and availability of equipment/materials. The remaining engineering review items will be dispositioned by Unit 3 outage of 3/85 completion and Unit 4 outage of 10/85 completion.

Turkey Point HED's were written common to both Units 3 and 4 in almost all cases. This was done because of the common/identical control room design. In this section "Engineering Intergration Review" only one of the remaining findings is specifically for Unit 3. Because of the common HED's a redundancy in file number appears in the following lists which appear by unit. Those findings which have already been completed on one unit are noted-complete.

The following is a list of the findings currently scheduled for implementation during Turkey Point Units next refueling outages respectively.

Finding: (Section 6.1, File No. 16)  
(HED No. 6.1.2.5.a(1))

Controls requiring precise operation are mounted outside the recommended 34 to 53 inch zone above the floor. The blowdown controls are outside the reach of the fifth percentile female.

Response: (Section 6.1, File No. 16)

The blowdown controls are being moved as part of control room modifications due to limited panel space. These controls will be lowered as much as board space permits. Florida Power and Light Company feels these changes, in relationship to the frequency of use and limited board space, will enhance the operation of subject controls. These changes are being made on PCM 82-264 Unit 3 and PCM 82-265 Unit 4.

\* Finding: (Section 6.1, File No. 23)  
(HED No. 6.1.3.1.e(2))

There is no local indication for RCP vibration indication on Unit No. 4. The Unit No. 4 display is combined with Unit No. 3 and located on Unit No. 3.

Response: (Section 6.1, File No. 23)

Florida Power and Light Company has completed the engineering review and currently the subject recorder will be replaced with vibration indication on both units during the 1983 outage. This work will be performed under PCM 82-264 on Unit No. 3 and PCM 82-264 on Unit No. 4 which has been complete.

Finding: (Section 6.4, File No. 1)  
(HED No. 6.4.1.1.b(1))

Several controls in the control room are no longer used and some have been disconnected. These controls should be removed.

Response: (Section 6.4, File No. 1)

Non-functional i.e., deactivated controls were removed from Unit No. 4's control boards. The subject controls will be removed on Unit No. 3 during the 1983 refueling outage. Controls which are active but not normally used such as NMC 10 dine particulate monitor will not be removed since they may be used under off normal conditions.

Finding: (Section 6.4, File No. 20)  
(HED No. 6.4.4.1)

Several rotary controls do not move clockwise to increase. Reheater steam stop control MOV-3-1434 and purge control CV-3-2913 (PTP Unit No. 3).

Response: (Section 6.4, File No. 20)

PWO #237503 was issued to have the subject controls rewired to conform to left-close right-open convention. The subject will be corrected during Unit No. 3's 1983 outage.

Finding: (Section 6.4, File No. 21)  
(HED No. 6.4.4.1)

Several rotary controls do not move clockwise to increase. Reheater steam stop; control MOV-4-1434 and purge control CV-4-2913 (PTP Unit No. 4).

Response: (Section 6.4, File No. 21)

PWO's #237504, 237540, 237542 and 237543 have been issued to correct subject control switch convention of operation.

Finding: (Section 6.4, File No. 22)  
(HED No. 6.4.4.1)

The cold reheat steam piping drain control (Unit No. 3) CV-3-3722 and (Unit No. 4) CV-4-3722 move clockwise to close and counter clockwise to open. This is contrary to the normal control room convention.

Response: (Section 6.4, File No. 22)

Presently the subject control switches are scheduled to be rewired to operate consistent with control room convention schedules for implementation are as indicated in Section 3.2.5 of this report.

Finding: (Section 6.5, File No. 2)

Display of extraneous information in the prime operating area is not advised.  
The subject displays are non-functional:

- 1) Containment sump level recorder
- 2) DACA System
- 3) Power range recorder stripcharts

Response: (Section 6.5, File No., 21)

As a result of the Turkey Point review team meeting, the DACA controls were determined to be non-functional and scheduled to be removed in accordance with the schedules presented in Section 3.2.5 of this report.

The subject recorders have been removed and relocated with new models on Unit 4. Unit 3 is being completed presently.

PCM 82-264, Unit 3  
PCM 82-265, Unit 4

Florida Power and Light Company intends no future action on this item.

Finding: (Section 6.8, File No. 1)  
(HED No. 6.8.1.1.c)

The grouping of Tave/Tref, pressurizer pressure, pressurizer level and power range current are not located close enough to their related controls for reading accuracy required.

Response: (Section 6.8, File No. 1)

The subject recorders are scheduled to be rearranged into a more functional arrangement during the scheduled control room modifications. The recorders of high use i.e., Tave/Tref, pressurizer pressure and pressurizer level will be better functionally grouped with their associated controls.

The subject work schedules for Units 3 and 4 are presented in section 3.2.5 of this report.

Finding: (Section 6.8, File No. 6)  
(HED No. 6.8.2.2 and 3)

The displays and controls for main steam flow and feedwater flow are not consistently arranged i.e., the top row of meters is associated with the bottom row of controls and vice-versa. Also the flow selector switch positions are reversed from the display arrangement. This is true on both units.

Response: (Section 6.8, File No. 6)

The display/control and selector switch/display orientation for the main steam flow and feedwater flow display/control arrangement will be corrected to conform to a top bottom-left right ascending order. Schedules for implementation of this work are presented in Section 3.2.5 of this report.

A brief description of the subject findings and proposed design enhancement follows for those human engineering discrepancies which are scheduled to be implemented during the units refueling outages respectively. In addition a detailed listing along with descriptions of each line item is presented in Sec. 3.5 of this report.

### 3.2.6 ADMINISTRATIVE AND TRAINING

As a result of the Detailed Control Room Design Review performed on Turkey Point Units 3 and 4, 4 findings (summarized in Table 3.2-1) identified remain to be incorporated in to site administrative procedures and/or the operator training program.

The following is a list of the remaining findings still to be incorporated. The findings are listed by section number as they relate to NUREG-0700 and file number as they relate to FP&L's tracking system. A more detailed listing along with descriptions of each line item is presented in Section 3.5 of this report.

TABLE 3.2-1

### 3.3 WRITTEN JUSTIFICATION/NO CORRECTIVE ACTION INTENDED

#### 3.3.1 LOW ERROR ASSESSMENT

As a result of the Detailed Control Room Design Review and Human Engineering Discrepancy Review Team meetings on Turkey Point Units 3 and 4 there are 169 findings (summarized in Table 3.2-1) which were identified as requiring no corrective action. These items are presented in detail along with Florida Power and Light Company's justification for taking no corrective action on these items.

The following is a list of findings by section numbers as they relate to NUREG-0700 and file numbers as they relate to FP&L's tracking system. A complete listing of all items along with a brief descriptions of each line item is presented in Section 3.5 of this report. It should be noted that no difference has been made between units since the majority of the items are generic in nature and apply to both control rooms.

Continued on next page.

6.8

2,3,4,5

6.9

2,5,6

Finding:(Section 6.1, File No. 2)  
(HED No. 6.1.1.2a)

During certain transients and when bringing either unit on the line there is inadequate staffing to control both units. Three men are required on the unit having troubles while at least one man is required to be controlling the other unit (more if that unit is having problems) they are only three control room operators for both units. The watch engineer and shift supervisor are required to stand back from the board and supervise.

Response: (Section 6.1, File No. 2)

The third operator is normally scheduled during planned transients and/or evolutions. Florida Power and Light Company feels that the staffing is adequate per the units Technical Specifications. The Watch Engineer and Nuclear Plant Supervisor are also available if their assistance is required.

Essex Corporation believes that the control room staffing is adequate as long as Florida Power and Light Company continues the practice of calling in additional operational support during scheduled startup and shutdown. In addition, increasing the control room staff by one more operator would only add to traffic flow, noise and available space problems during normal operation.

Florida Power and Light Company intends no action on this item.

Findings: (Section 6.1, File No. 3)  
(HED No. 6.1.1.3a)

The partially concentric layout allows full view of the control board except:

1. Operator must turn around to see NIS panel (behind operators desk)
2. Operator must swivel chair to see the end of vertical panel B

Response: (Section 6.1, File No. 3)

The instrumentation located on the nuclear instrumentation panel is easily accessed by control room operators if desired as well as information provided by instrumentation located on vertical panel B.

Due to space limitations Florida Power and Light Company feels the subject displays are functionally placed.

Florida Power and Light Company intends no action on this item.

Findings: (Section 6.1, File No. 5)  
(HED No. 6.1.1.3f(1))

Walkspace between console and vertical panel A (taking guard rail into consideration) is only 36 inches to 38 inches wide instead of the minimum separation of 50 inches recommended, making two person passage difficult.

Response: (Section 6.1, File No. 5)

The handrail located on vertical panel A was provided to prevent accidental operation of the control switches located on vertical panel A. There are no controls or displays located on the back section of the subject control console. The passage and panel area in question is a low traffic area and is normally used only by authorized operating personnel. Florida Power and Light Company believes that there is adequate protection provided to preclude the inadvertent operation of control switches on vertical panel A and that there is ample passage space provided for the intended traffic and operator tasks necessary to be performed in the area.

Florida Power and Light Company intends no action on this item.

Findings: (Section 6.1, File No. 8)  
(HED No. 6.1.1.3a)

The reactor coolant flow and steam flow displays are not visible from the control room operators desk due to obstructions.

Response: (Section 6.1, File No. 8)

Control room modification, especially the new design of the operators desk will maximize the control room visibility, also the incorporation of Safety Assessment System in conjunction with existing redundant indication minimizes the potential for operator error.

Florida Power and Light Company intends no further action on this item.

Findings: (Section 6.1, File No. 9)  
(HED No. 6.1.1.3g)

They are ungarded openings in the panels, where equipment has been removed. Tools or unwanted objects can be placed into the hole causing wires to short.

Response: (Section 6.1, File No. 9)

The subject holes observed were due to control panel rework and modifications. When the subject work is completed the associated equipment will be reinstalled and no ungarded opening will be present on the subject control boards. Florida Power and Light Company intends no further action on this item.

Findings: (Section 6.1, File No. 11)  
(HED No. 6.1.2.2(b,c,e))

Controls associated with the chemical volume control system, reactor containment, electrical distribution and steam flow/feedwater flow are not within the extended reach of the 5<sup>th</sup> percentile female.

Response: (Section 6.1, File No. 11)

The subject controls were verified as being accessible by a 5<sup>th</sup> percentile female during the field survey. The subject female could reach and easily operate the controls in question without excessive bending or stretching.

Florida Power and Light Company intends no action on this item.

Findings: (Section 6.1, File No. 12)  
(HED No. 6.1.2.2e(1))

The NMC Iodine Particulate display located on the hydrogen recombination panel is located outside of the visual field (75° above the horizontal line of sight). It can not be read with any accuracy without the aid of a foot stool.

Response: (Section No. 6.1, File No. 12)

The NMC monitor is an installed spare. In the event the primary and redundant backup iodine particulate monitors are not functional the NMC monitor can be used. A step stool is available in the control room such that operators can read the subject display in the unlikely event it must be used the primary and backup displays are easily accessible and are monitored and maintained by chemistry laboratory personnel.

Florida Power and Light Company intends no action on this item.

Findings: (Section 6.1, File No. 14)  
(HED No. 6.1.2.3g)

The chart table (computer console) located between Unit 3 and 4 has no knee hole for the operator to sit and examine prints.

Response: (Section 6.1, File No. 14)

There are no operations performed at this location which require the operator to be seated. Currently the subject console configuration is being changed, however, due to the size of the control room some compromises will be made with regard to space usage in areas normally intended as leg/knee hole space.

Florida Power and Light Company feels the current panels installed have been best optimized given the design and space constraints and considers this effort satisfactorily completed.

10

11

Findings: (Section 6.1, File No. 15)  
(HED No. 6.1.2.5a(1))

Some controls on vertical panels SAS 4 (T.P.3), SAS 2 (T.P.3), Electrical (T.P.3), SFG 3 (T.P.4), Electrical (T.P.4) and Reactor Coolant System (T.P.3&4) are located below 34 inches causing the operators to stoop to operate them. These controls have a low frequency of use, low importance and also small deviation from guidelines.

Response: (Section 6.1, File No. 15)

A field inspection was performed and the subject controls identified in the above finding are infrequently used, of low importance and only two to three inches outside the guideline limits i.e. 31 inches. Florida Power and Light Company feels the subject controls are functionally grouped and their placement does not present a problem for operator performance since they are clearly labeled and operator use of these controls is infrequent.

Florida Power and Light Company intends no action on this item.

Findings: (Section 6.1, File No. 17)  
(HED No. 6.1.2.5b(1))

There are strip charts located on vertical panels SAS 1 (T.P.3), SFG (T.P.4), Turbine Generator (T.P.3&4) and Reactor (T.P.3&4) which are below 41 inches causing the operator to stoop to read them (also causing possible parallax and readability problems).

Response: (Section 6.1, File No. 17)

The subject displays are located between 41 inches and 35 inches on the panels identified in the above finding. The chart recorders provide the operators with trend information and plant staff with historical records. These trend recorders monitor low priority items and have a low frequency of use. The subject recorders can be scanned by operators in a standing position and if more detailed information is required they may be read with little inconvenience to the operator.

Florida Power and Light Company feels that with the limited space available in the subject control room the recorders in question have been optimally placed based on their importance and frequency of use and intends no further action on this item.

Findings: (Section 6.1, File No. 19)  
(HED No. 6.1.2.8e)

Chair seat depth is 21 inches. The recommended depth is 15 to 17 inches.

Response: (Section 6.1, File No. 19)

Florida Power and Light Company representatives made a field survey of the chairs located in the Turkey Point Control Room. The chairs used by control room personnel are standard office equipment chairs. The subject chairs are not 21 inches deep but 17 to 19 inches deep. No operators questioned had any complaints about back or leg fatigue due to the subject chairs.

Florida Power and Light Company believes the subject chairs are adequate and intends no action on this item.

Findings: (Section 6.1, File No. 25)  
(HED No. 6.1.4.1a,h)

Storage location of protective equipment is partially obscured by relay racks allowing insufficient room to dress. No breathing apparatus is stored there and there is only limited training in its use.

(What is control room habitability requirements? How about chlorine release on site?)

Response:(Section 6.1, File No. 25)

The emergency locker inventory is correct as identified in the site emergency plan. The subject lockers are controlled storage lockers and are not located in an area which is intended for operator dressout. The personnel using the equipment stored in the subject locker will dressout in the control room and office area directly behind it as they are relieved from shift responsibilities to do so.

Personnel required to use breathing apparatus are trained as part of their radiation training and are periodically requalified as required by existing site procedures.

The units' control room meets all habitability requirements and is intended to remain a radioactivity clean area. There are no requirements for storage of breathing apparatus in the control room.

The units control room meets all habitability requirements and is intended to remain a radioactivity clean area. There are no requirements for storage of breathing apparatus in the control room.

Florida Power and Light Company believes the current emergency equipment storage space and existing training program for the use of the subject equipment is adequate and intends no further action on this item.

Findings: (Section 6.1, File No. 28)  
(HED No. 6.1.5.1a)

Ambient temperature is in the range of 65 to 75 degrees F maintaining 70 degrees F most of the time at head level. The criteria recommends a range of 73 to 77 degrees F.

Response: (Section 6.1, File No. 28)

The control room operators have the ability to change the control room thermostat setting if desired. Operators maintain the control room temperature at a temperature which they feel is comfortable and is also within equipment requirements.

Florida Power and Light Company intends no action on this item.

Findings: (Section 6.1, File No. 33)  
(HED No. 6.1.5.3f)

Rod group counter windows reflect light from above lighting causing glare.

Response: (Section 6.1, File No. 33)

The subject counters only provide rod group indication. The operator may position himself over the display while reading it to eliminate the effect of reflected light. The primary rod position indication is provided by the analog indicators located on the vertical panel of the subject bench board which are easily read and also have rod bottom bistable indication.

Florida Power and Light Company feels the subject displays are adequate for their intended function and intends no action on this item.

Findings: (Section 6.1, File No. 34)  
(HED No. 6.1.5.3h)

Reflectance is below guideline values on upper wall and all vertical panels except vertical panel A on Unit No. 4. Reflectance is above guidelines on lower wall, floor and white blotters on control room operators desk.

Response: (Section 6.1, File No. 34)

The error assessment associated with this finding is low. In any environment which is illuminated from overhead, no matter what type of diffuser is used, the incident light levels on the vertical panels will always be lower than the incident light levels on the horizontal sections. Due to the differences in colors i.e. gray panels and white floors and blotters it is only natural that the reflectance will be different. The information presented on the control panels is easily readable and the gray panel provides the operator with a soft background.

Florida Power and Light Company believes the control room lighting conditions and ambience is satisfactory and intends no action on this item.

Findings: (Section 6.1, File No. 39)  
(HED No. 6.1.2,3f)

The Nuclear Plant Supervisor's phone layout is poor. Phones are difficult to reach from seat.

Response: (Section 6.1, File No. 39)

As part of the control room upgrades that were performed to the Turkey Point Unit 3 and 4 control room call directors were added to the Nuclear Plant Supervisors office. Addition of the new telephone hardware has resolved the above finding.

Florida Power and Light Company considers this finding closed and intends no further action.

Findings: (Section 6.1, File No. 40)  
(HED No. 6.1.3.1e)

Bell and Pax phones on each unit have dedicated lines. A call received on Unit 4 for a 3 operator requires the call to be transferred.

Response: (Section 6.1, File No. 40)

The bell extension number and Pax extension number for the units are the same except for the last digit which designates the proper control room i.e. for Unit No. 3 control room the numbers are 233 and 303 respectively and for Unit No. 4 the numbers are 234 and 304 respectively.

Florida Power and Light Company believes the existing phone system and phone number convention is adequate and intends no action on this item.

Findings: (Section 6.2, File No. 4)  
(HED No. 6.2.1.3C(2))

There is no ringing mechanism tied into the sound powered phones. There is no capability for directly switching the sound powered phone to the paging system so that a desired party can be called to the line.

Response: (Section 6.2, File No. 4)

The sound powered phones are provided so that operation and authorized personnel can perform pre-arranged tasks such as core shuffels, plant maintenance etc.

The party/page system is located through out the plant as well as plant utility phones so that plant personnel can page each other and also call specific locations using telephone communciations. Florida Power and Light Company believes the current system is adequate and provide, sufficient flexibility to operating personnel.

Florida Power and Light Company intends no action on this item.

Finding: (Section 6.2, File No. 9)  
(HED No. 6.2.1.8b,c)

No means of clear transmission through face mask or respirators.  
Dial phones are difficult to use with gloves.

Response: (Section 6.2, File No. 9)

There are no requirements for control room operators to wear protective equipment while operating the plant. The control room meets the current habitability requirements for all accident scenarios and is intended to remain a radiologically clean area during an accident with all support personnel stationed at the technical support center and emergency offsite facility.

In the event of a fire or adverse condition the control room would be evacuated and plant shutdown controlled from outside the control room.

Florida Power and Light Company intends no further action on this item.

Findings: (Section 6.2, File No. 11)  
(HED No. 6.2.1.1a)

Telephone conversation is colloquial. Several radio messages were received without recall or apparent confirmation.

Simultaneous use of bell phone and radio was observed. Listener tried to listen to messages simultaneously instead of asking one party to hold the line.

Response: (Section 6.2, File No. 11)

The plant uses accepted terminology. Operation of hand held radios is up to the operator. The portable radios are used by field operators to supplement the installed permanent communication system. Just as with the permanent communications system it is the responsibility of the personnel operating the system to ensure that instructions and conversations are understood.

Florida Power and Light Company believes the existing communication systems are adequate and intends no further action on the above finding.

Finding: (Section 6.2, File No. 12)  
(HED No. 6.2.1.1b)

Control room operator holds finger in left ear to hear conversation on phone. Either the background noise is too high or the signal intensity is too low.

Response: (Section 6.2, File No. 12)

The above finding was observed during a period of high construction activity in the control room. The construction activity in the control room is now significantly reduced as control room work has been completed. The control room operator also has the authority to clear the control room or stop any work activity if necessary.

Florida Power and Light Company believes there are adequate administrative controls and the communication equipment is adequate for the intended use and intends no further action with regard to the above finding.

Finding: (Section 6.2, File No. 13)  
(HED No. 6.2.1.6a)

The security intercom located in the nuclear plant supervisors' office has a high level of background noise and emergency messages were interrupted by non-vital communications on this single channel communications device.

Response: (Section 6.2, File No. 13)

The security intercom system was upgraded and some stations relocated. As a result of the system rework the background static was eliminated. The security intercom system is for the use of security personnel and its use is physically controlled. Contents of communications and priority of messages is controlled by security personnel. In addition to the hard wire intercom system which is designed to be used at specific control points the security personnel have other communication means available such as radios and telephones.

Florida Power and Light Company considers the above finding resolved and intends no further action.

Finding: (Section 6.2, File No. 14)  
(HED No. 6.2.2.2a)

Bell phone and Pax phone have similar rings. No sound coding is used.

Response: (Section 6.2, File No. 14)

As a result of the scheduled control room upgrades indicating lights were added to the control room operators phones to provide them with visual cues to identify the correct phone.

Call directors were added to the Nuclear Plant Supervisors' office to consolidate the number of phones. The call director has illuminated pushbuttons to select the desired phone line.

Florida Power and Light Company believes the existing communication system provides adequate visual cues for personnel to identify the proper instrument with the incoming call. Florida Power and Light Company intends no further action on the subject finding.

Finding: (Section 6.3, File No. 1)  
(HED No. 6.3.1.2a(1))

The radiation monitor located next to the shift supervisors' office and copy machine has an illuminated pushbutton for "power on". When the system is energized the voltage surge causes a control room high radiation alarm concurrent with local high radiation alarms.

When control room operators have to replace the lamp associated with the power pushbutton the power to the radiation monitor system is interrupted and a number of false alarms may be generated depending on the number of times it takes the operator to remove the lamp and replace it.

Response: (Section 6.3, File No. 1)

The testing of alarms and/or maintenance work which will cause false alarms are administratively required to be announced over the public address system to notify plant personnel. Any false alarm which is not announced would cause personnel in that area to follow those plant procedures for egress from a contaminated area. In either event plant personnel safety is maintained.

Florida Power and Light Company believes the administrative controls which currently exist are adequate and intends no further action on the above finding.

Finding: (Section 6.3, File No. 3)  
(HED No. 6.3.1.2a(1))

Fire alarm system false alarms have been reported by plant personnel during periods of rain.

Response: (Section 6.3, File No. 3)

As a result of normal system maintenance the points of water intrusion were identified and sealed. Since the system repairs were complete there have been no false alarms due to water intrusion into the system conduit.

Florida Power and Light Company considers the above finding resolved and intends no further action.

Finding: (Section 6.3, File No. 4)  
(HED No. 6.3.1.2b(1),c(1))

The only way to determine which parameter is out of tolerance on multiple input alarm is verification of board indication or instruct field operation personnel to check equipment and take corrective action where necessary.

There is no alarm printout on the computer to give the operator specific information on multiple input alarms.

Response: (Section 6.3, File No. 4)

The plant supervisory annunciator system provides the operator with a quick means of advisory status. The supervisory annunciators located in the control room are functionally grouped with controls provided for the control room operators' use. The supervisory annunciators are placed and assigned responsibilities consistent with the plant design and Florida Power and Light Company operating philosophy. The control room operator and Nuclear Plant Supervisor direct field personnel, thus centralizing control of equipment and field personnel. The control room personnel determine proper prioritization of field work tasks based on overall plant conditions and requirements.

Florida Power and Light Company believes the existing supervisory annunciator system is sufficient and provides adequate information.

Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.3, File No. 8)  
(HED No. 6.3.1.5a,b)

No dedicated, distinctive audible signal exists for cleared alarms. No special flash rate or color coding denotes a cleared annunciator tile.

Response: (Section 6.3, File No. 8)

It is Florida Power and Light Company operating philosophy that annunciator extinguishment is adequate indication of a clearing alarm since there should be no alarms present during normal operating conditions other than some plant permissives and equipment out of service for maintenance. During transient conditions such as plant trip the ring back feature would introduce excessive visual and auditory noise in the control room environment. Clearing the ring back feature would require an additional operator manual control action to acknowledge each clearing alarm thus taxing the control room operator and increasing the risk of operator error during a potentially critical time due to the shear volume of information which must be processed.

Under normal and steady state conditions operators take deliberate corrective actions to clear alarms and monitor system status via plant process displays to ensure the alarm condition clears. In addition, Florida Power and Light Company is implementing an annunciator prioritization color coding convention. The prioritization coding will aid the operator in assessing the importance of the alarm and thus reduce the response time to implement corrective action and clear the off normal condition.

Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.3, File No. 13)  
(HED No. 6.3.3.2b)

Flash rate for all annunciator tiles under all alarm conditions is 1½ flashes per second instead of the recommended 3-5 flashes per second.

Response: (Section 6.3, File No. 13)

The error assessment associated with the subject finding is very low and Florida Power and Light Company believes that the existing flash rate is adequate for operators to visually identify alarming windows. In addition, operators must identify the alarm prior to acknowledging and locking the subject window in.

Florida Power and Light Company believes the existing system is adequate and intends no corrective action.

Finding: (Section 6.3, File No. 14)  
(HED No. 6.3.3.2.e)

The annunciator windows violate the dark board concept. The annunciators are dim when not in alarm state and bright when in alarm state. Some look bright during normal operation.

Response: (Section 6.3, File No. 14)

The present dim, normally off annunciator scheme provides the control room operator with a constant status of annunciator lamps condition. Annunciator lamp intensity i.e., dimly lit state can be adjusted by use of a slide resistor. Florida Power and Light Company contends that there is sufficient difference in illumination intensity between dimly lit - no alarm and bright - alarmed state for operators to easily differentiate between the two. Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.3, File No. 18)  
(HED No. 6.3.3.4b)

Annunciator windows such as Waste Boron Panel Trouble, Radwaste Trouble, Heat Tracing Trouble and Water Plant Trouble refer the control room operator to another more detailed annunciator panel located outside of the primary operating area.

Response: (Section 6.3, File No. 18)

The subject alarms are supervisory/catagory trouble annunciators. They are provided in the control room because it is the control room operators and Nuclear Plant Supervisors responsibility to direct field personnel. This operating philosophy maintains a centralized control allowing for the proper prioritization of field work tasks based on overall plant conditions and requirements.

Florida Power and Light Company believes the existing system design and administratives responsibilities are adequate and intends no action on the above finding.

Finding: (Section 6.3, File No. 21)  
(HED No. 6.3.4.1b)

Acknowledgement of annunciators is not possible from the vertical panels. There is only one alarm acknowledge pushbutton for each unit, in the center of the bench board/console.

Response: (Section 6.3, File No. 21)

The annunciator tiles will be re-engraved as part of the relabeling/annunciator review effort to improve message readability from the existing control station. The annunciator control station is centrally located on the main control board.

Florida Power and Light Company believes that due to the small size of the control room, the increased annunciator tile letter size, the reduction of annunciator tile verbage and existing functional grouping of associated annunciator tiles that one master annunciator control station in each control room is adequate and intends no further action on the above finding.

Finding: (Section 6.3, File No. 22)  
(HED No. 6.3.4.1d)

With the bright equals alarm and dim equals normal operation, it is not clear whether the window is dim or if one of the two bulbs in the window is burnt out. The dual bulb windows do not provide adequate indication of bulb failure.

Response: (Section 6.3, File No. 22)

Florida Power and Light Company believes that operators experienced in the Turkey Point Plant control room can differentiate a window with a burned out bulb, a normal state dim and an active alarm state bright. The annunciator windows have redundant bulbs, which are both illuminated, installed behind the subject tiles and extinguishment of one or both of the subject bulbs is easily identified by operation personnel and can be diagnosed with the window in either the normal or alarm state.

Florida Power and Light Company believes the system is adequate and intends no action on the above finding.

Finding: (Section 6.3, File No. 23)  
(HED No. 6.3.4.2b(4),c)

The annunciator pushbuttons do not employ shape coding to differentiate between silence and acknowledge. Also the pushbutton design allows operators to defeat the control by placing a quarter in the pushbutton.

Response: (Section 6.3, File No. 23)

The subject pushbuttons are clearly labeled and there are no other control stations requiring the same convention in the control room.

Override of controls are administratively controlled. Florida Power and Light Company believes the subject pushbuttons are correctly arranged and that existing administrative controls preclude any unauthorized defeating of annunciator functions.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 11)  
(HED No. 6.4.2.1)

The controls on the radiation monitor operate clockwise to stop, which is opposite to the population stereotype. The pump controls have indicator lights over them. The off (white) is over the start label and the on light (green) is over the stop label. The second control is spring return from fast to off (although it is not spring return from on to off). An operator reported that the filter has gotten clogged in the past because operators turn it to fast and let it go, assuming the center position is on rather than off.

Response: (Section 6.4, File No. 11)

The subject switching is spring return to center with start on the left and stop on the right. This system is normally on and pump status is displayed immediately above the pump control and is clearly labeled. The subject operate/fast filter switch is only used to advance the filter paper which is also indicated directly above by indicating lights. A category alarm alerts the operator to any abnormal operation. Florida Power and Light Company believes that the subject controls and associated indicating lights are adequately labeled and clearly identified.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 12)  
(HED No. 6.4.2.2f(3),d)

Small silver thumb rotaries do not contrast sufficiently with the panel background.

Response: (Section 6.4, File No. 12)

The error associated with the subject rotaries is extremely low due to the fact that control room operators use deviation meters trend recorders, analog displays, etc. when making adjustments with the subject controls. In no instance is a direct reading from the subject rotary control required to perform an operational function. In some instances the rotaries are adjusted with calibrated test equipment and provide set points: However, these setting are fixed and not intended to be moved.

Florida Power and Light Company believes the subject rotaries adequately perform the intended function and intends no action on the above finding.

Finding: (Section 6.4, File No. 13)  
(HED No. 6.4.2.2f(3))

Controls do not contrast sufficiently with the panel. They are silver and the panel is gray.

Response: (Section 6.4, File No. 13)

The error associated with the subject rotaries is extremely low due to the fact that control room operators use deviation meters, trend recorders, analog displays, etc. when making adjustments the subject controls. In no instance is a direct reading from the subject rotary controls required to perform an operational function. In some instances the rotaries are adjusted with calibrated test equipment and provide setpoints. However, these settings are fixed and not intended to be moved.

Florida Power and Light Company believes the subject rotaries adequately perform the intended function and intends no action on the above finding.

Finding: (Section 6.4, File No. 14)  
(HED No. 6.4.2.2f(3))

Toggle switches are silver and have insufficient contrast with the gray panel.

Response: (Section 6.4, File No. 14)

The error associated with the subject toggle switches is extremely low. The subject toggle switch positions are clearly labeled.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 16)  
(HED No. 6.4.3.1b)

There is no form of positive control activation feedback such as snap feel, audible click or integral light, etc. associated with pushbuttons.

Response: (Section 6.4, File No. 16)

Pressing of a pushbutton is an initiating cue for a given task which has a definite beginning and a definite end i.e., activation of process, acknowledging of an alarm, etc. The end of a task is verified by visual feedback provided by installed instrumentation, indicating lights, computer messages, etc.

Florida Power and Light Company believes that the pushbuttons in the control room do have adequate visual feedback and intends no action on this item.

Finding: (Section 6.4, File No. 17)  
(HED No. 6.4.3.1c)

Check source, power and horn disable pushbuttons on the radiation monitor panel are not concave or frictionalized to increase resistance.

Response: (Section 6.4, File No. 17)

The subject pushbuttons are sufficiently large and activation pressure sufficiently low, as well as adequately separated to preclude the operators finger from slipping off the subject pushbutton and inadvertantly activating the others.

Florida Power and Light Company believes the pushbutton design is adequate and intends no action on the above finding.

Finding: (Section 6.4, File No. 18)  
(HED No. 6.4.3.3a)

Pushbuttons on the radiation monitoring panel next to the supervisors office look like indicator lights on the panel. Design and labelling is the same except that the sides of the pushbuttons are white and the sides of the indicator lights are black, shape and size are the same.

Response: (Section 6.4, File No. 18)

Investigation by Florida Power and Light Company personnel revealed that the subject indicating lights and pushbuttons are sufficiently different and that control room operators can identify them correctly with out any potential for error.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 19)  
(HED No. 6.4.3.3c)

It is not possible to change bulbs in illuminated pushbuttons on the radiation monitoring panel without activating the alarm.

Response: (Section 6.4, File No. 19)

This finding is a duplicate of File No. 1 of Section 6.3 (HED No. 6.3.1.2a(1)). The testing of alarms or maintenance work which will cause false alarms are administratively required to be announced over the public address system to notify plant personnel. Any false alarm which is not announced would cause personnel in that area to follow those plant procedures for egress from a contaminated area. In either event, plant personnel safety is maintained.

Florida Power and Light Company believes that the existing administrative controls are adequate and intends no further action.

Finding: (Section 6.4, File No. 23)  
(HED No. 6.4.4.2a)

"J"-handle rotary controls are 2.25 inches in length, 1.5 inches shorter than the minimum recommended. In addition "J"-handle clearance is 2.33 inches when pulled to lockout instead of the recommended 1 to 2 inches.

Response: (Section 6.4, File No. 23)

Control room operators were questioned on the subject "J"-handle use and performance. Operation personnel indicated that the subject controls were adequate and provided no source of possible human error associated with their tasks.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 24)  
(HED No. 6.4.4.3b)

Keys are inserted with the teeth pointing in either the 4 o'clock or 8 o'clock position. They should all be inserted with teeth pointing up.

Response: (Section 6.4, File No. 24)

Key switches have switch positions properly labeled and keys are consistently oriented with teeth in the upward direction.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 25)  
(HED No. 6.4.4.3d)

Key operated switch locks are not oriented so that the switch is "off" (key removed) when in the vertical position. It is diagonal either to the left or right.

Response: (Section 6.4, File No. 25)

Key operated switches have switch positions properly labeled and keys which are consistantly oriented with teeth in the upward direction.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 26) .  
(HED No. 6.4.4.1e(1))

Continuous rotaries with knob skirts have a knob skirt diameter of one inch rather than the recommended 2 inches.

Response: (Section 6.4, File No. 26)

The error associated with the subject rotary knob skirts is extremely low. The subject control were labeled and installed based on the existing dimensions. The current knob skirt diameters do not impare operator performance and Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 27)  
(HED No. 6.4.4.4e(5))

The knobs on continuous rotaries are less than  $\frac{1}{2}$  inch in diameter rather than the recommended .75 inches.

Response: (Section 6.4, File No. 27)

The error associated with the subject rotary knob diameter is extremely low. The subject control knobs provide adequate gripping surface for operators to perform the desired tasks. The current knob diameters do not impair operator performance and Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 28)  
(HED No. 6.4.4.5b(z))

Black discrete rotaries on the nuclear instrumentation panel and radiation monitor panel may be positioned between detented positions.

Response: (Section 6.4, File No. 28)

Florida Power and Light Company personnel were unable to field verify the above finding. All discrete rotaries have detented positions and are not easily positioned between two detents. Some of the subject rotaries do have rest positions which are used in calibration procedures. The subject positions are detented and are used under administrative control. The subject rotaries are correct and Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 30)  
(HED No. 6.4.3.3b(3))

Legend pushbuttons associated with process controllers have poor contrast due to collected dirt and pushbutton wear.

Response: (Section 6.4, File No. 30)

The subject pushbuttons associated with process controllers are periodically cleaned as part of the operators normal housekeeping routines and worn pushbuttons are replaced as part of normal maintenance. In addition, the subject pushbuttons are also consistently color coded to provide the operators with visual keys as to the subject pushbuttons functions.

Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.4, File No. 31)  
(HED No. 6.4.2.2d)

Rotary controls do not utilize size or shape coding to aid in distinguishing between different function controls. Different shapes are used based on the ability of components not on function.

Response: (Section 6.4, File No. 31)

Presently Florida Power and Light Company has employed shape coding of controls in areas where operator errors have been noted or operators have suggested that the addition of shape coding would improve their performance.

Florida Power and Light Company intends no further action on the subject finding at this time.

Finding: (Section 6.4, File No. 32)  
(HED No. 6.4.3.2d)

Pushbuttons with "deepwell" type raised guards have too much resistance for some operators.

Response: (Section 6.4, File No. 32)

Pressing of a pushbutton is an initiating cue for a given task which has a definite beginning and a definite end i.e., activation of a process acknowledging of an alarm, etc. The end of a task is verified by visual feedback provided by installed instrumentation, indicating lights, computer messages, etc. or a combination there of. Those pushbuttons provided with elevated guards are usually intended to be pressed once to achieve the desired result. The subject pushbuttons are momentary types and are not intended to be maintained in a depressed position for any length of time by operators.

Florida Power and Light Company believes the subject pushbuttons do not provide excessive resistance to operation and do adequately perform their intended function with no operator error associated with their activation.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.4, File No. 33, 36))  
(HED No. 6.4:4.5e(4))

Switch depth on small silver thumb rotaries is less than the minimum suggested depth of 0.625 inches. The subject rotaries are approximately 0.5 inch in depth.

Response: (Section 6.4, File No. 33, 36)

The error associated with the subject rotary knob depth is extremely low. The subject control knobs provide adequate gripping surface for operators to perform the desired tasks. The current knob depth does not impair operator performance and Florida Power and Light Company intends no action on the subject finding.

Finding: (Section 6.4, File No. 34)  
(HED No. 6.4.4.5f)

The spring loaded momentary contact rotary selector controls for:

- 1) Primary water to containment isolation,
- 2) Component cooling make-up MOV-832, and
- 3) R-14 source check (switch)
- 4) Main steam stop bypass motor operated valves

have small handles and require prolonged operator activation. The handle shape is inappropriate for prolonged use..

Response: (Section 6.4, File No. 34)

When questioned about the functional correctness i.e. application of the subject control switch handles operation representatives present stated that the subject control switches and handle shapes were correct for the intended function (inching valves/control). The error assessment associated with the subject finding is extremely low. Operation of the subject control required that the operator verify by visual feedback that the intended task has been complete.

Florida Power and Light Company believes the subject control switch handle types are correct for the intended control function and intends no corrective action on the above finding.

Finding: (Section 6.4, File No. 36)  
(HED No. 6.4.4.5.e(4))

Switch depth on small silver thumb rotaries is less than the minimum suggested depth of 0.625 inches.

Response: (Section 6.4, File No. 36)

Duplicate of File No. 33, Section 6.4.

Finding: (Section 6.5, File No. 3)  
(HED No. 6.5.1.1f)

- 1) There is no lamp test available for illuminated pushbuttons on area radiation monitor panel.
- 2) Counters and digital displays continue to display a numeric value when failed and have no indication of failure.
- 3) Strip chart recorders fail on scale.
- 4) Failure of indicator transmitters causes meters to fail on scale (high or low) and static causes meter needles to stick or read higher or lower than the actual reading.

Response: (Section 6.5, File No. 3)

- 1) The subject illuminated status indicators are backed up with annunciation status and an analog display. Florida Power and Light Company believes the system is adequate, performs its intended design function and intends no action on this item.
- 2) On loss of power LED displays extinguish. All digital displays in the Turkey Point Unit No. 3 and 4 control rooms are provided as operator aids to be used in conjunction with existing analog displays, existing controls, plant process computer and annunciator system. Florida Power and Light Company believes that there is sufficient primary indication and supervisory annunciator support to allow the control room operators to quickly and accurately identify a digital display failure.

Florida Power and Light Company intends no action on this item.

- 3) The strip chart recorders in the control room provide the operator with a historical trend of various parameters. Failure of the input to the trend recorder would also disrupt the analog indicator, supervisory annunciator system and plant computer in various instances. Loss of power to the subject recorders would also be obvious since the paper would not be advancing and the pen would be lying still in one area of the chart causing large blotches.

Florida Power and Light Company believes that there is adequate information available to the control room operators such as analog indicators, supervisory annunciator alarms, plant process computer, to allow the control room operator to quickly identify a failure associated with a strip

chart recorder. In addition, strip chart recorders are time marked and date stamped once per twenty four hours.

Florida Power and Company believes there is adequate primary information available and administrative control to ensure the control room operator can determine a strip chart failure in a timely manner and intends no action on this item.

- 4) Failure of a transmitter output will cause all associated displays associated with it to respond to the high or low output signal by an annunciator alarm signal. In the case of process signals such as level, pressure, temperature and flow, alarm setpoints would be reached or indicators would be outside the normal coded operating bands which would be apparent to the control room operator.

Florida Power and Light Company believes that there is adequate redundant instrumentation, implementation of range coding, supervisory annunciator alarms and normal routine watch log recordings of plant process status to allow control room operators to identify process transmitter failures.

Florida Power and Light Company intends no further action on this item.

In summary Florida Power and Light Company believes the current control room design and normal watch duties provide the control room operator with the necessary information to determine display failure or a process associated transmitter problems. It is then the responsibility of the Instrumentation and Control maintenance personnel to isolate the failure and effect the necessary repairs.

Florida Power and Light Company believes the existing equipment and administrative controls are adequate and intends no action on the above finding.

- Finding: (Section 6.5, File No. 4)  
(HED No. 6.5.1.3b(1),(2))

Labels on displays use font with serifs. In addition, the subject font is not consistant with the font used on all other control room labels.

Response: (Section 6.5, File No. 4)

\ Due to the vintage of the subject control room and equipment, various items have been repaired, replaced and added over the years. In some cases, availability of like kind replacements do not exist, therefore there will be a difference in display label font where manufactures differ. Displays provided are readable. Florida Power and Light Company will make every effort where possible to provide qualified consistent, clearly labeled and readable displays as a result of normal plant maintenance.

Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.5, File No. 5)  
(HED No. 6.5.1.3.b(3))

Many components have manufacturers names on them which are not in all caps.

Response: (Section 6.5, File No. 5)

There is no operational error associated with consistency of manufacturer name plates. Florida Power and Light Company believes the manufacturer name plates are adequate and intends no action on the above finding.

Finding: (Section 6.5, File No. 8)  
(HED No. 6.5.1.5a(1))

Most indicators have more than 9 graduations marks between numbered scales markings.

Response: (Section 6.5, File No. 8)

The subject indicator scales are process specific and due to the required accuracy, space limitations, and need for easily readable scales there are more than 9 graduations between numbered scale markings. However, major and minor mark coding is consistently applied with even multipliers, as well as range coding of normal and off-normal operating bands. Florida Power and Light Company believes that the existing range coding and major/minor marking conventions employed on indicator scale faces are adequate and do not pose an operating problem to control room operators.

Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.5, File NO. 9)  
(HED No. 6.5.1.5c)

Successive values of unit graduations do not conform to the recommended progression of values.

Response: (Section 6.5, File No. 9)

The subject indicators are process specific with scale ranges, increments and multipliers selected based on operating range, accuracy, readability and space limitations. Florida Power and Light Company believes the present indicators which incorporate range coding are adequate and that the scale multipliers are consistent with design and operating requirements.

Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.5, File No. 10)  
(HED No. 6.5.1.5c)

Successive values of unit graduations do not conform to recommendation or multiples of powers of ten.

Response: (Section 6.5, File No. 10)

The subject indicators are process specific with scale ranges, increments and multipliers selected based on operating range, accuracy, readability and space limitations. Florida Power and Light Company believes the present indicators which incorporate range coding are adequate and that the scale multipliers are consistent with design and operating requirements.

Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.5, File No. 11)  
(HED No. 6.5.1.5f)

Recorders have a single pointer with multiple-scales; such a design should be avoided, unless justified as an operational benefit.

Response: (Section 6.5, File No. 11)

The control room operator is aware of the ranges selected and information being presented on the Turbine Vibration Recorder, Turbine Valve Position/Turbine Speed Recorder, Condensate Dissolved Oxygen Recorder and Reactor Coolant Pump Vibration Recorders since all these recorder ranges are dependent on plant status and are manually selected by the control room operator. The subject recorders are clearly labeled and present a very low potential for operators error. Florida Power and Light Company believes the subject recorders do provide the control room operator with clear and easily identifiable trends. The subject recorder display formats are consistent with their intended function and Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.5, File No. 16)  
(HED No. 6.5.2.2b(2))

Pointers on recorders are not mounted close enough to scale to avoid parallax.

Response: (Section 6.5, File No. 16)

Recorders are used for trending and operators read recorders trends off of the scaled chart paper. Recorders also provide a historical source of information to be used by control room operators and plant staff. Scales are provided on recorders as an additional operators aid and are adequate for their intended function.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 17)  
(HED No. 6.5.2.3b)

Green range coding has been placed along the vertical scale of some indicators to represent the normal operating range. Because it is beside the vertical component label on the scale face, it often obscures and reduces the labeling print/background contrast which is black on white.

Response: (Section 6.5, File No. 17)

Engraved component labels are mounted directly below their associated displays. Florida Power and Light Company believes the addition of normal operating bands to selected indicators as an operator aid far outweighs the obscurity of any label such as manufacturer's name or component description located on the indicators scale. Range coding has been installed such that operators may clearly read indicator scale numerals and division mark. The existing component labels contain the components name, identification number and other important information to allow the control room operator to quickly and accurately identify the subject components. Florida Power and Light Company believes the current labeling and range coding program best optimizes control room operator performance and intends no further action on the above finding.

Finding: (Section 6.5, File No. 18)  
(HED No. 6.5.3.1a(3))

- 1) Operator provided tool does not fit hexagon shape indicator lights and suction cup pulls flat top bulbs out correctly, but not round top bulbs. Operators use the metal clip on their identification badges to remove the bulbs which may break the bulb.
- 2) No tool is provided for operators to maintain legend lights and back lit pushbuttons. Operators use a pocket knife to pry off legend tiles and identifications badges to remove bulbs.
- 3) Other bulbs such as those on the pyro alarm panel require a screwdriver to replace them.

Response: (Section 6.5, File No. 18)

Operators are provided with the necessary tools to replace the subject lamps which are their responsibility and have been instructed that any lamps requiring disassembly of equipment and/or controlled access are changed under normal maintenance procedures.

Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.5, File No. 20)  
(HED No. 6.5.5.1a(z))

On drum type counters the numeral width to height ratio is not 1 to 1. In most cases it is approximately 3 to 5.

Response: (Section 6.5, File No. 20)

The subject finding has a very low error assessment associated with it since the subject drum type counter numerals are large enough to be easily read from their respective operator control stations.

Florida Power and Light intends no further action on the above finding.

Finding: (Section 6.5, File No. 21)  
(HED No. 6.5.5.2a(z))

All LED displays have characters which slant to the right instead of being upright.

Response: (Section 6.5, File No. 21)

The subject finding has a very low error assessment associated with it since the LED displays in question are large and easily read by operations personnel from the equipments control station.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 22)  
(HED No. 6.5.5.2a(5))

Horizontal spacing between numerals on LED displays should be between  $\frac{1}{4}$  and  $\frac{1}{2}$  the numeral width. The refueling water storage tank level on Unit No. 3 LED display numeral spacing is about the same width as the numeral size.

Response: (Section 6.5, File No. 22)

The subject finding has a very low error assessment associated with it since the LED display in question is easily read by control room operations personnel and can not be confused as being multiple displays or stand alone single digits.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 23)  
(HED No. 6.5.5.2(a)5)

This is the same finding as File No. 22, Section 6.5 except on Unit No. 4.

Response: (Section 6.5, File No. 23)

The response for this item is the same as that for File No. 22, Section 6.5 (No action intended).

Finding: (Section 6.5, File No. 25)  
(HED No. 6.5.1.1b)

Rotary switches for boron injection valves 4-841 A and B do not have status lights in array at the top of panel SFG3 as do other rotary switches for safety injection.

Response: (Section 6.5, File No. 25)

The subject valves are check valves and do not have status lights since they are automatic. The subject rotary control switches are provided for testing. The subject components are correct for their intended function and no operator error is associated with the above finding.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 28)  
(HED No. 6.5.1.1f)

When there is a loss of a vital instrument bus the magawatt recorder stays where it is (fails on scale rather than off scale). There are backup analog indicators for this parameter.

Response: (Section 6.5, File No. 28)

There is no error assessment associated with the above finding. Failure of a vital instrument bus would cause all the associated indicators, measurement channel instrumentation etc. to fail. A failure of this type would require immediate operator corrective action.

A power failure to any one recorder would cause that recorder to fail, which would be the same as a recorder pen drive failure. The recorders are time checked and date stamped once per twenty-four hour shift as well as normal operator log reading of control panel indicators once per hour. These normal operator watch routines would provide the operator with ample opportunity to identify the subject recorder failure.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 29)  
(HED No. 6.5.1.2.a)

Component cooling header A and B flow indicators normally read between 0-10 (green band). This scale is 0-140 which is not consistent with the degree precision needed by operator.

Response: (Section 6.5, File No. 29)

Component cooling header flow is controlled automatically by the various component temperature control valves. The control room operator needs the display in the control room to verify header flow during normal and off normal plant conditions. The flow indicator scale range is consistent with the intended operating conditions and design criteria. Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 31)  
(HED No. 6.5.1.2e)

The condensate dissolved oxygen is multiplied by a factor. This is not clearly marked on scales or label. The bottom scale on recorder for condensate dissolved oxygen must be multiplied by 5. This is marked on paper only.

Response: (Section 6.5, File No. 31)

The error assessment associated with the above finding is extremely low due to the fact that the recorder is clearly marked as to the multiplier selected on the subject scale during unit startup. The subject recorders are normally used during unit startup along with chemistry reports. The control room operators are aware via logging of the subject reading as to the multiplier selected.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 32)  
(HED No. 6.5.1.3a)

Labels on the hydrogen recombination panel, radiation monitor panel, nuclear instrumentation protection panel and LED displays are too small if viewed from the control room front operating console which is a distance of 8 feet away. The character height is too small. It does not subtend a minimum visual angle of 15 minutes.

Response: (Section 6.5, File No. 32)

For the subject labels to be read from any position in the control room, the letters would have to be  $\frac{1}{2}$  inch in height. The existing labels are engraved to allow operators to read them from the subject equipment control station i.e., approximately two to three feet from the subject panel. The existing labels are adequate for the designed reading distance and Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.5, File No. 33)  
(HED No. 6.5.1.3d)

The legend lights on radiation monitor panel and nuclear instrument protection panel have the following discrepancies:

Space between character is less than the minimum requirement of one stroke width. Space between words is less than the minimum requirement of one character width. Space between lines is less than the required one half character height.

Response: (Section 6.5, File No. 33)

The subject legend lights are back illuminated making the letter to background contrast high and the subject legend easier to read. The legend lights in question are secondary backup information redundant to existing alarms and annunciators. The subject indicating lights are secondary operator aids and the error associated with them low since there are large primary displays which are used by the control room operator. In addition, the legend space limitation will not accomodate any increase in spacing since there would not be enough room for the necessary information.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 34)  
(HED No. 6.5.1.4a)

Indicators for percent flux difference do not tell direction of change (positive/negative). However, this may be inferred by the position of needle on vertical meter.

Response: (Section 6.5, File No. 34)

Flux difference is not identified as positive or negative but rather as being high in the top or bottom of the reactor core i.e. axial offset. The indicators do clearly and correctly present the information being monitored.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 37 thru 40)  
(HED No. 6.5.1.5.a.1)

There are more than nine major, minor and intermediate marks between numbered scale points.

Response: (Section 6.5, file NO. 37 thru 40)

The subject indicator scales are process specific and due to the required accuracy, space limitations, and need for easily readable scales, there are more than nine graduations between numbered scale markings. Major and minor mark coding is consistently applied as well as implementation of operating range coding.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 41 and 42)  
(HED No. 6.5.1.5.a.1)

There are more than nine major, minor and intermediate marks between numbered scale points.

Response: (Section 6.5, file NO. 41 and 42)

The subject indicator scales are process specific and due to the required accuracy, space limitations, and need for easily readable scales, there are more than nine graduations between numbered scale markings. Major and minor mark coding is consistently applied as well as implementation of operating range coding.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 43 thru 45)  
(HED No. 6.5.1.5b)

The height of index marks do not comply with minimum requirements and they are too small and difficult to discriminate.

Response: (Section 6.5, File No. 43 thru 45)

Trend recorders provide operators and plant staff with historical information. Trend recorder paper is scaled and clearly indexed. The subject recorder scale legends are clearly labelled and scale graduations are provided as an operator aid. Florida Power and Light Company believes the subject recorders and their scales do no pose any interpretation for control room personnel and intends no action on this item.

Finding: (Section 6.5, File No. 46)  
(HED No. 6.5.1.5d)

The scales on the adjacent steam header pressure meters are different.

Response: (Section 6.5, File No. 46)

The steam header meter scales are not significantly different to cause reading errors. They all are 0 to 1000 psig in steps of 100 psig. Only the minor increments vary.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 49)  
(HED No. 6.5.2.1a)

The scale value of the condenser vacuum increases with downward movement of the pointer.

Response: (Section 6.5, File No. 49)

The condenser vacuum indicator is a circular meter which depicts a decreasing pressure or conversely an increasing vacuum and is used throughout the industry.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 50)  
(HED No. 6.5.2.2a.2)

The pointer on the condenser and turbine recorders conceals the graduation marks.

Response: (Section 6.5, File No. 50)

The turbine and condenser recorders are trend recorders providing historical data. The operator can easily spot abnormal trends and investigate for precise reading from the chart paper. These recorders serve the function they are intended for.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 51)  
(HED No. 6.5.2.2a.2)

Pointer tip of process control meter overlaps scale graduations marks and index numeral.

Response: (Section 6.5, File No. 51)

These indicators can be accurately read because there is a significant distinction between the pointer tip and graduation mark.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 52 and 53)  
(HED No. 6.5.2.2b.1)

Pointer tips on process indicators are too far from the graduation marks.

Response: (Section 6.5, File No. 52 and 53)

Currently control room process indicators i.e., analog meters are range coded indicating normal operating, off normal and upper and lower limits were necessary. Indicators requiring high accuracy of reading are provided with mirrored scales to allow error free reading.

Florida Power and Light Company contends the present indicators and implemented range coding program provides control room operators with the necessary degree of accuracy required and intends no action on this item.

Finding: (Section 6.5, File No. 54)  
(HED No. 6.5.2.2.b.2)

Due to a convex scale face and height of back panel, meters are subject to reading errors from parallax.

Response: (Section 6.5, File No. 54)

Range coding has been added on selected indicators to help operators when the need to quickly verify a system's operating condition exists. In addition, a re-evaluation by Essex determined that parallax is minimal from the normal operating station.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 56)  
(HED 6.5.2.3.a)

The yellow and lavender color code on vertical meters is difficult to distinguish because lines are very narrow and background has yellowed.

Response: (Section 6.5, File No. 56)

As part of normal maintenance and calibration, indicators are cleaned, range coding updated if necessary, and replaced if faded.

Florida Power and Light Company believes the existing maintenance program is adequate and intends no further action on the above finding.

Finding: (Section 6.5, File No. 57)  
(HED No. 6.5.3.1a.2)

No lamp test capability on the simple indicating lights and legend lights is provided.

Response: (Section 6.5, File No. 57)

The control room operator maintains simple indicating lights as part of their normal routines. Lights, such as safety inject valve indication, are normally lit dimly to present bulk integrity. Safeguards equipment and related values are periodically tested along with their associated indicating lights. Florida Power and Light Company maintains that there is adequate information available to the operator such as analog indicators, trend recorders, and annunciators to verify equipment status as well as adequate surveillance testing and administrative controls to insure indicator lamp integrity.

Florida Power and Light Company intends no action on this item.

Finding: (Section 6.5, File No. 59)  
(HED No. 6.5.3.1c.1)

The simple indicating lights for safety injection indicate valve status by a bright, dim or extinguished lamp. It is difficult to distinguish between bright and dim signals.

Response: (Section 6.5, File No. 59)

The present simple indicating lights provide proper indication for the intended purpose. Other parameters are used by the operator to demonstrate safety injection flow. These lights are also periodically tested to maintain system integrity.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 60)  
(HED No. 6.5.3.1.c(1))

Two lights instead of one should indicate whether access to containment is properly interlocked.

Response: (Section 6.5, File No. 60)

Indication for containment access hatches provide the control room operator with indication of door position not interlock status. The subject inner and outer doors are mechanically interlocked and access to containment is administratively controlled. The purpose of the subject indicator lights is to provide the control room operator with a quick indication of one of the penetrations effecting containment integrity.

Florida Power and Light Company contends the subject indicator lights provide the operator with the necessary information intended. Florida Power and Light Company intends no action on this finding.

Finding: (Section 6.5, File No. 61)  
(HED 6.5.3.1.d)

High hydrogen common alarm indicator light should be accompanied by an audible alarm.

Response: (Section 6.5, File No. 61)

The hydrogen recombiner panel is provided with an audible trouble alarm to alert control room operators of an off normal condition. Florida Power and Light Company contends the system design is adequate and intends no action on the above finding.

Finding: (Section 6.5, File No. 63)  
(HED No. 6.5.3.3)

Status and indicating lights on RCS panel contain legend messages of more than three lines.

Response: (Section 6.5, File No. 63)

The legend messages are written to provide the operator with concise and adequate information and are easily comprehended. Due to the importance of these messages they cannot be shortened without some loss of information necessary to plant operation.

Florida Power and Light Company intends no further action on this item.

Finding (Section 6.5, File No. 65)  
(HED No. 6.5.3.3a.2 and 3)

The legends of various indicators are not legible when bulbs are not lit.

Response: (Section 6.5, File No. 65)

The subject indicators are operators aids by providing early warning signals. They are not intended to replace control room instrumentation for continuous monitoring and need only be acknowledged when lit.

Florida Power and Light Company contends that sufficient process information is available to minimize the effect of the faulty indicator. Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 66)  
(HED No. 6.5.4.1a)

Leeds and Northrup recorders do not have a back plate or support for stamping, causing potential for tears in chart and unclear paper identification.

Response: (Section 6.5, File No. 66)

The charts of the most significant are removed daily and date stamped by the operator. Document control verifies all charts are identified and dated for the purpose of historical recorders.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 68)  
(HED No. 6.5.4.1.i)

Recorders lack capability for paper speed adjustment.

Response: (Section 6.5, File No. 68)

The majority of recorders in the control room have only a single speed setting because there is no need for speed adjustability due to the nature of the process they monitor. In some instances, dual speed recorders are provided for use during unit startup or shutdown. Their purpose is to provide the operator with better resolution of time based processes.

Florida Power and Light Company feels the recorders provided in the control room are adequate and intends no action on this item.

Finding: (Section 6.5, File No. 69)  
(HED No. 6.5.4.1k)

The metal impact recorder is located at the very bottom of the panel making it difficult to read. The scale face has been altered with hand-written scales taped onto scale face making it difficult to interpret scale face.

Response: (Section 6.5, File No. 69)

The metal impact recorder was a temporary instrument used for a special test program. Its function has been replaced by a new impact monitoring system and the recorder has been disconnected and will be removed.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 72)  
(HED No. 6.5.4.2b.2)

Impact recorders are not equipped with a visible wheel to display the channel being plotted.

Response: (Section 6.5, File No. 72)

The impact recorders contain an internal wheel which can be visually monitored with the recorder door open. The recorders are inspected and maintained under the Instrument and Control Department's preventive maintenance program to insure legibility of plotted points.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 73)  
(HED No. 6.5.4.2b.3)

Impact recorders contain too many channels and overlapping of plotted points reduces legibility.

Response: (Section 6.5, File No. 73)

The addition of the Safety Assessment System and Safety Parameter display system will include a data process system which will allow the operator to trend plant information. This will reduce the significance of the impact recorders.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 74)  
(HED No. 6.5.4.2b.4)

There is no provision made to select a single channel for immediate display on the impact recorders.

Response: (Section 6.5, File No. 74)

The addition of the Safety Assessment System, Safety Parameter Display and Inadequate Core Cooling Display System will include a data process system which will allow the operator to obtain trend data of a single channel. This will reduce the significance of the impact recorders.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 75)  
(HED No. 6.5.5.1a.3)

The batch controller display is not separated by appropriate commas, decimal points or spaces.

Response: (Section 6.5, File No. 75)

The batch controller is preset by the operator through the batch integrator. The display is representative of the preset limit and adequate for its intended function.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 77)  
(HED No. 6.5.1.2b)

The transformer and generator temperature recorder scales are in degrees celcius which does not correspond with the standard control room practice of degrees fahrenheit.

Response: (Section 6.5, File No. 77)

The procedurs and documents associated with the subject recorders as well as setpoints are all in degree celcius.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 78)  
(HED No. 6.5.1.1b)

Indicator lights for reheater vent valves consist of only one red light which is off when valve is closed.

Response: (Section 6.5, File No.78)

The subject valves are field verified when closed to insure system integrity. Reliance on the indicating lights is minimal.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 79)  
(HED No. 6.5.1.1f)

If condenser vacuum meter fails it fails low.

Response: (Section 6.5, File No. 79)

Condenser vacuum can be determined from the meter and the mercury column gauge. If the meter should fail the condenser low vacuum annunciator and the mercury column gauge will protect the condenser system, and provide adequate information to the operator.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 83)  
(HED No. 6.5.4.1f)

Tracer Westronics strip chart recorders are difficult to unthread. Slack paper on the take-up reel is the normal result.

Response: (Section 6.5, File No. 83)

A Florida Power and Light field survey team tested the reloading quality of the Tracers Westronics recorder and could not reproduce the results of the finding.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 84)  
(HED No. 6.5.4.2a.2)

Color coding of strip chart recorder pens are not consistent throughout the control room.

Response: (Section 6.5, File No. 84)

Recorders are individually labelled with corresponding pen coding providing the operator with the necessary information and minimizing associated errors.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 85)  
(HED No. 6.5.5.1c)

RPI counter drums rotate downward rather than upward with increasing values.

Response: (Section 6.5, File No. 85)

The RPI counter drum movement is a unique case where rotation downward corresponds with less rod control. This system functions correctly because it corresponds with reactor control analog indication of rod position is also provided and is the operators primary reference point of information.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 87)  
(HED No. 6.5.3.1.b)

Various 24 series bulbs are used to replace burned out indicator lamps. Bulbs in this series vary in shape and some are difficult to grip and are hard to remove.

Response: (Section 6.5, File No. 87)

Currently 24E series bulbs are supplied for lamp replacement. The subject bulbs provide the best performance and are the most easily removed from sockets. Bulbs are ordered from stores; however, depending on manufacturer availability supplies may be depleted and acceptable 24 series bulbs used in place of the 24E type.

Florida Power and Light Company intends no action on this item since the subject replacement lamps are qualified substitutes.

Finding: (Section 6.5, File No. 88)  
(HED No. 6.5.5.2.a(3))

LED displays have characters that are too small to subtend a visual angle of 15 minutes when the operator is standing at his desk.

Response: (Section 6.5, File No. 88)

The control room operator has a CRT located at his desk which displays those plant parameters which are vital to plant operation. Control board displays are designed to be read from their control station not from any location in the control room. Florida Power and Light Company believes the subject displays are correctly sized for their intended reading distance and intends no action on the above finding.

Finding: (Section 6.6, File No. 1)  
(HED No. 6.6)

Three letter codes used for valves is not the recommended - number/alpha/number.

Response: (Section 6.6, File No. 1)

Valves are consistantly labeled throughout the plants. The legend codes agree with plant procedures and drawings.

Florida Power and Light Company feels no further action is intended on this item.

Finding: (Section 6.6, File No. 6)  
(HED No. 6.6.2.1f)

Several rotary controls are labelled in such a way that the component type and the center position label run together. This gives the impression there is only one label. This is especially true with a 3 position switch.

Response: (Section 6.6, File No. 6)

The subject labels do not provide inconsistent or confusing information to the operator. This finding was evaluated as a low error assessment. Switch escutcheon plates are consistently and clearly labelled.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 13)  
(HED No. 6.6.3.2b)

Control and position labels on several rotaries make it unclear whether or not they are breakers. Inconsistent use of the words trip, close and start are confusing.

Response: (Section 6.6, File No. 13)

Convention is such that open-trip-off is on the left and closed is on the right. Error assessment due to misinterpretation of switch operation is very low.

Florida Power and Light Company intends no action on this item.

Finding: (Section 6.6, File No. 14)  
(HED No. 6.6.3.2f)

The word "exhaust" is spelled incorrectly. -Exhause- this occurs on isolation valve indicating lights V2602 and V2603.

Response: (Section 6.6, File No. 14)

Upon reinspection of subject finding it was found that the correct spelling is now used - exhaust -.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 15)  
(HED No. 6.6.3.3.b)

New rotaries are being added that do not use the same valve labelling/number system as existing rotaries. This occurs when there are not enough numbers in a series to include all related components.

Response: (Section 6.6, File No. 15)

Demarcation and labeling will reduce operator error. PTP-PC-82-067 (memo) explains that there were not enough numbers left in a series to completely number a system. Now numbering sequences were established and are being used as necessary.

Florida Power and Light Company feels no further action is required.

Finding: (Section 6.6, File No. 20)  
(HED No. 6.6.3.8a)

Discrete rotary controls do not have all positions labelled. Some have no position labels at all, while others have positions that are marked with lines but not labelled.

Response: (Section 6.6, File No. 20)

The rotary's knob has a pointer and the active points are clearly marked.

Florida Power and Light Company feels these rotarys are marked adequately for

Finding: (Section 6.6, File No. 21)  
(HED No. 6.6.3.8a)

Discrete rotary controls do not have all positions labelled. Some have no positions labelled and some just have lines.

Response: (Section 6.6, File No. 21)

Every switch position that is used is labelled. The rotary's knob has a pointer. The positions that are used are labelled and unused positions are unlabelled, but may be scribed.

Florida Power and Light Company intends no further action on this subject.

Finding: (Section 6.6, File No. 23)  
(NED No. 6.6.3.8c)

Continuous rotaries located at the top of the benchboard have three scales. These scales are difficult to read from the normal operating position, especially for the 5<sup>th</sup> percentile female.

Response: (Section 6.6, File No. 23)

Some of the controllers do not require adjustment. They are preset by instrument and control personnel. The other controllers are adjusted in accordance with other visual aids such as press/level/flow indicators. These rotaries do not represent a setpoint adjustment but rather process control.

Florida Power and Light Company intends no action on this item.

Finding: (Section 6.6, File No. 24)  
(HED No. 6.6.3.8c)

The shape of the rotary control handle blocks the position label on the board.

Response: (Section 6.6, File No. 24)

The position labels can be read by control room operators. In those cases where pointers cover labels only a portion of the position label is obscured. The operator or technician selecting different points on recorders which have obscured position labels can read the adjacent position labels and determine the channel selected for display.

Florida Power and Light Company intends no action on this item.

Finding: (Section 6.6, File No. 25)  
(HED No 6.6.3.8c)

Continuous rotaries have a window on top through which a number can be read. These windows fill up with dust making the number unreadable.

Response: (Section 6.6, File No. 25)

The subject potentiometer readings are not significant since process indicator readings determine the setting not the engraving on the control knob.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 26)  
(HED No. 6.6.3.8c)

Position labels on top draws, for rotaries, of panel are not visible because they are obscured by the rotary handle.

Response: (Section 6.6, File No. 26)

The subject controls are infrequently used. A step stool is available to allow the operator access and visual verification of switch position.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 29)  
(HED No. 6.6.3.9.a)

The access panels are not labelled as to the contents within. None of the accesses leading behind the panels are labelled to identify the functions or items inside said panels.

Response: (Section 6.6, File No. 29)

Access panels are for maintenance personnel. There are no gauges, meters, switches or operational duties for operators in these spaces.

Florida Power and Light Company intends no action on this item.

Finding: (Section 6.6, File No. 33)  
(HED No. 6.6.3.8c)

Large star shaped handle, load limit, obstructs view of position labels.

Response: (Section 6.6, File No. 33)

This is a momentary switch and is not held in position. Operators visual indication is a megawatt output. The subject rotary conform to switch convention increase-clockwise and decrease-counterclockwise.

Florida Power and Light Company intends no action on this item.

Finding: (Section 6.6, File No. 34)  
(HED No. 6.6.3.8c)

The top set of rotary control handles, on the NIS Channel 4 and radiation monitor, block control position labels. This is because of the high location on these panels.

Response: (Section 6.6, File No. 34)

Presently the subject rotarys are infrequently used. When they are used the technician or operator uses a stool to gain better visibility.

Florida Power and Light Company intends no further action at this time.

Finding: (Section 6.6, File No. 35)  
(HED No. 6.6.1.1)

Components on the hydrogen recombiner panel lack functional labeling to identify components. Trend recorders are labeled by legend cards only.

Response: (Section 6.6, File No. 35)

This HED was prepared while the subject panel was still under construction. All applicable labeling has since been complete.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 43)  
(HED No. 6.6.2.3.a)

Discrete rotary position labels are diagonally positioned. Guidelines recommend horizontal positioning to ensure accuracy, speed and ease of readability.

Response: (Section 6.6, File No. 43)

Due to the compactness of Turkey Point Unit 3 and 4 control room some labelling must deviated from recommended guidelines. If guidelines were followed in this case the uniformity of physical size of label and lettering size would be violated. Turkey Point control room is functionally layed out, thus error accessments is extremely low.

Florida Power and Light Company feels no action is necessary on this item.

Finding: (Section 6.6, File No. 44, 56)  
(HED No. 6.6.2.3.a)

Vertical meters are labelled vertically on the scale face. In many cases, this is the only descriptive function labelling for the components. Reading errors, accuracy, time and speed could be affected.

Response: (Section 6.6, File No. 44, 56)

Turkey Point Unit 3 and 4 control rooms are compact but functionally designed. To label vertical components with horizontal labelling, space would be needed that does not exist. Also horizontal labelling in these cases would violate label size and lettering size.

Florida Power and Light Company intends no action and feels the subject labelling does not pose a problem.

Finding: (Section 6.6, File No. 47)  
(HED No. 6.6.2.4d)

There are procedures for periodic cleaning of labels by the operators. These procedures are not being conducted. It is important that horizontal bench boards that are highly prone to collecting dirt and dust be cleaned.

Response: (Section 6.6, File No. 47)

As part of the ongoing labelling effort the labels being replaced are scribed from the back. This eliminates grooved areas on the label fronts where dirt and dust can collect and build up.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 54)  
(HED No. 6.6.4.1)

Component labels that appear on vertical scale faces have extremely small letter sizes and character height. This is inadequate for maximum required viewing distance.

Response: (Section 6.6, File No. 54)

The subject meter faces can be read from 4 to 6 feet. Demarcation and summary labeling will be used to enhance operator performance. Due to the compact design of the control room at Turkey Point the availability of room inhibits strict adherence to some guidelines.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 55)  
(HED No. 6.6.4.1)

Numeral size on scales of verticle meters, on Unit 3, is too small for optimum viewing distance.

Response: (Section 6.6, File No. 55)

Meter range coding is presently used to assist the operator in determining system status from a distance. When detailed information is required the operator reads the scale at close range.

Florida Power and Light Company intends no futher action on this item.

Finding: (Section 6.6, File No. 56)

The above finding is a duplicate of file No. 44, Section 6.6.

Finding: (Section 6.6, File No. 58)  
(HED No. 6.6.4.1a(z))

Process radiation monitor panel component label letter heights for meter are shorter than other component label letter heights. (The same hierarchical level).

Response: (Section 6.6, File No. 58)

The subject labels are readable. The relabelling program will assure that new labels will be consistent in height.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 59)  
(HED No. 6.6.4.1a(z))

Letter height for component labels vary from one component to another. (Within the same hierarchy).

Response: (Section 6.6, File No. 59)

In some cases, labels will be changed as part of the relabelling effort. This will hold true to the major component label preferably below the component. Labels are sized to be readable from associated control stations.

Florida Power and Light Company feels no further action needs to be taken.

Finding: (Section 6.6, File No. 61)  
(HED No. 6.6.5.1d,h)

Tagout labels (tags) are in the form of red and white slips hung over the switch handle. This form of tagout does not physically prevent control actuation. The size of the tag sometimes obscures adjacent labels.

Response: (Section 6.6, File No. 61)

The use of subject tags is an industry standard and is administratively controlled. The amount of information required on these tags mandates the size. Where obscuring might take place folding the tag is recommended.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 64)  
(HED No. 6.6.5.2)

There is no review procedures carried out to determine the use and implementation of temporary labelling. There seems to be no administrative control over this activity.

Response: (Section 6.6, File No. 64)

The use of temporary labels will be limited and used only when needs mandate. This is when construction is being performed and permanent labels are not ready or labels break or have to be changed.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 67)  
(HED No. 6.6.4.1b)

Due to grime and dirt on labels, various functions and position labels have low contrast which degrades readability. The impact recorders on the radiation monitoring panels have degraded readability do to low contrast of printed numerals on chart paper. (Inking problem).

The mechanical red-green flags on various J-handles have low contrast do to grime.

Legends on legend pushbuttons have low contrast due to grime.

Response: (Section 6.6, File No. 67)

The new labels will have flat surfaces so dirt cannot collect. Housekeeping will also help to keep this problem to a minimum.

Normal maintenance should resolve current problems with recorders.

Red/green flags are standard breaker indication and will not be changed.

Florida Power and Light Company intends no further action on these items.

Finding: (Section 6.6, File No. 69)  
(HED No. 6.6.1.1 & 6.6.3.1a)

Rotaries and meters in the DACA system are labeled "DACA" instead of LLLL (Lo Lo Load Limit).

Response: (Section 6.6, File No. 69)

The subject DACA system has been removed. Therefore, no labelling is necessary.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 71)  
(HED No. 6.6.3.2a)

Load limit indicating lights associated with the load limit switch are not correctly labelled. Presently they are labelled in % but should be PSI.

Response: (Section 6.6, File No. 71)

The subject indicating lights are not labelled either % or PSI. Associated controls are labelled PSI.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 2)  
(HED No. 6.7.1.3.a,b)

The computer system does not contain any prompting or structuring features. The present system only gives status information on selected parameters and no other information.

Response: (Section 6.7, File no. 2)

The installation of the Safety Assessment System will replace the current display and expand upon the existing plant computer system capability. The Safety Assessment System does use prompting and structured outputs along with color coding and paging features. The subject finding was determined to be resolved since installation of the Safety Assessment System will correct the above finding.

Finding: (Section 6.7, File No. 3)  
(HED No. 6.7.1.3c)

The computer system only displays the task/file name. Special entries made by the operator are not displayed such as a report to be printed every 15 minutes.

Response: (Section 6.7, File No. 3)

The only special report which the control room operator can request is the poison report. The entry made to request the report is displayed only at the time of entry to allow the control room operator to verify the input. The report is then generated at the requested interval.

As a result of the review team meetings it was determined that the subject finding was invalid due to the fact that the plant computer's design intent is to serve as an outline data display system and provide a summary sequence of events \_\_\_\_\_ selected plant parameters to aid in the review of the events immediately prior to and after a plant trip, and limited data retrieval.

Finding: (Section 6.7, File No. 4)  
(HED No. 6.7.1.4 & 6.7.1.5)

The keyboard contains non-irrelevant/unused keys that add to visual noise, confusion and crowding. Uppercase unused function keys are included on the alpha keyboard.

Response: (Section 6.7, File No. 4)

New keyboards are part of the computer system upgrade. The subject keyboards are standard Ramtee Keyboards and will have unused functions.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 5) .  
(HED No. 6.7.1.4d,g)

The CRT keyboard key separation of 0.19" is less than the recommended 0.25". The keyboard slope 5°-10° is less than the recommended 15°-20° from horizontal.

Response: (Section 6.7, File No. 5)

This item will be changed as part of the computer system upgrade. A standard Ramtee Keyboard will be installed as part of the upgrade.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 6)  
(HED No. 6.7.1.6b,c)

The printer speed is too slow for the update on Steam Generator Level and flow of once per minute. The printer speed is 60 lines per minute instead of the recommended 300 lines per minute.

Response: (Section 6.7, File No. 6)

The finding is invalid because the printer is not intended to trend Steam Generator level or flow. These are trended by strip chart recorders on the console. The system, however, will be replaced by a high speed line printer during the SAS/SPDS/ICC upgrade.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 8)  
(HED No. 6.7.1.8a2,a4)

The computer procedures seem to be written for a programmer, not an operator. These procedures do not describe the overall computer system or system components so the operator can interface.

Response: (Section 6.7, File No. 8)

Incorporated as part of the computer system upgrade will be training and functional descriptions.

Florida Power and Light Company intends no further action.

Finding: (Section 6.7, File No. 9)  
(HED No. 6.7.1.8b)

The computer system does not provide cross reference indices for computer programs. The programs are indexed numerically, only by entry code number.

Response: (Section 6.7, File No. 9)

This finding is invalid because special programs such as "Flux" include the analog channels which are related to the output on the output screen or printout. Therefore, cross references are not necessary because all pertinent information is displayed in the output.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 10)  
(HED No. 6.7.2.1c)

The CRT is light print on dark background in high ambient lighting.  
(Approximately 80 FT. candles).

Response: (Section 6.7, File No. 10)

A joint review team agreed that the CRT's are oriented so there is a minimum of reflected glare and contrast i.e., character to background is sufficient.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 11)  
(HED No. 6.7.2.1f & 6.7.2.2g(2))

The CRT resolution is poor. The numbers zero and eight are hard to distinguish. The font is a 5 x 7 dot-matrix rather than the recommended 7 x 9.

Response: (Section 6.7, File No. 11)

The system upgrade will include a new 19" CRT with a 7 x 9 matrix.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 12)  
(HED No. 6.7.2.1g)

The CRT screen flickers making it difficult to read.

Response: (Section 6.7, File No. 12)

This was a maintenance problem A PWO was issued and the problem was repaired as part of normal plant maintenance.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 13)  
(HED No. 6.7.2.3f)

The keyboard and CRT locations are such that the operator can not operate them from the main control board. The operator must go around the desk to use the keyboard and see the CRT screen.

Response: (Section 6.7, File No. 13)

The system upgrade will include the following:

- 1) SPDS keyboard will be at operators panel in view of the CRT.
- 2) SAS has a keyboard with associated utility screen.
- 3) ICC and associated keyboard located together.

Florida Power and Light Company intends no further action on these items.

Finding: (Section 6.7, File No. 14)  
(HED No. 6.7.2.4a,c)

Post Trip Review (PTR) readouts consist of a seven place decimal followed by "E + On". This notation requires a conversion into a usable number.

Response: (Section 6.7, File No. 14)

Operators are aware of the difference between natural logarithms and common logarithms. "E" indicates common log base 10 and is universal in control room computers.

Florida Power and Light Company intends no action on this item.

Finding: (Sectin 6.7, File No. 15)  
(HED No. 6.7.2.5f)

Paragraphs on the CRT screen are layed out in continuous text without only separation.

Response: (Section 6.7, File No. 15)

The system upgrade will incorporate this feature with a programable keyboard and set by the menu format.

Florida Power and Light Company intends no futher action on this item.

Finding: (Section 6.7, File No. 16)  
(HED No. 6.7.2.5h,i)

Displays that are continued on multiple pages are not numbered and the total number of pages are not indicated. The present system does not have scrolling capability. When a hard copy is requested only 18 of the lines displayed on the CRT is printed.

Response: (Section 6.7, File No. 16)

The upgraded computer system will have paging and screen scroll capability. The CRT only displays 18 lines.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 17)  
(HED No. 6.7.2.5m)

The amount of information, bearing activated screen area should not exceed 25% of the total screen area. Presently this area is 75%.

Response: (Section 6.7, File No. 17)

Only 18 lines of the text can be displayed at one time. It was determined by a joint team review that 18 lines are legible and not difficult to read.

Florida Power and Light Company intends no action on this item.

Finding: (Section 6.7, File No. 18)  
(HED No. 6.7.2.6a)

- 1) The computer source range setpoints are too high and not low enough.
- 2) Rod position indication is set too low and not high enough.

NOTE: This data was collected during operator interviews.

Response: (Section 6.7, File No. 18)

A review of all the setpoints was made. The results of this review will be implemented in the new upgraded computer system. Also any problems concerning setpoints can be corrected through proper channels in the future.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 19)  
(HED No. 6.7.2.6i & 6.7.2.7a)

The computer dialogue does not contain any feedback messages indicating changes in status of parameters that have been selected.

Response: (Section 6.7, File NO. 19)

The upgraded computer system will contain dialogue that shows continuous updating of parameters selected.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 20)  
(HED No. 6.7.2.6k)

The present computer system does not contain any delay feedback messages that inform the operator to standby. The computer is searching for data or there is a normal delay.

Response: (Section 6.7, File No. 20)

The computer system is being upgraded. The new system will have a feedback function that enables the operator to know the status of the computer when searching for information.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 21)  
(HED No. 6.7.2.7a,e,j)

Only one urgent message is highlighted on the computer CRT with flash coding. Any other messages are not coded or highlighted.

Response: (Section 6.7, File No. 21)

The computer system upgrade will have color coding and highlighting features for all urgent and important messages.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 22)  
(HED No. 6.7.3.1e(3))

The computer printer does not have a plate of instructions for reloading paper, ribbon, ink, etc. attached to the printer.

Response: (Section 6.7, File No. 22)

Paper is reloaded similar to a typewriter and is \_\_\_\_\_ i.e., no special instructions required. The printer ribbon is a maintenance item which is replaced by instrumentation and control maintenance personnel when control room operators observe printer print becoming light. Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.7, File No. 23)  
(HED No. 6.7.3.2)

There is no dedicated printer to record annunciator alarms. The sequence of events recorder is available only on command and prints information other than alarms. Alarms are not recorded in sequence of occurrence. The operator can not request printouts by alarm groups. There is no coding used to distinguish alarms from other messages. Alarm messages are not specific enough for rapid identification of the nature messages.

Response: (Section 6.7, File No. 23)

The contact points monitored by the sequence of events recorder were selected by operation and engineering personnel. The contacts selected to be monitored were those identified as being necessary to analyze abnormal transients and plant trips. It was necessary to exclude contact points which provide no information with regard to plant operating status or key functions since this information would only serve to add bulk to the output and provide no directly usable information to staff personnel.

Florida Power and Light Company contends that the sequence of events recorder is not an alarm printer and is adequate for its intended function.

Coding does exist in the left hand margin and a vertical line separates the code from the alarm or messages. Abbreviations are used as a space and time saving feature. Personnel are familiarized in training and refreshed on the job.

Florida Power and Light Company intends no further action on these items.

Finding: (Section 6.7, File No. 24)  
(HED No. 6.7.3.3a,b & d)

The computer printer does not contain graphic illustration capability. Groups of 5 are not separated by a space in tables with long columns of numbers.

Response: (Section 6.7, File No. 24)

The computer system is being upgraded and will incorporate trends and mimics. A plotter will also be included as part of the upgrade thus a copy of graphic displays can be printed. The spacing between long columns of numbers will be keyboard programable.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.8, File No. 2)  
(HED No. 6.8.1.1c)

Important displays are located locally throughout the plant. There may be inadequate time to prevent possible hazards.

Response: (Section 6.8, File No. 2)

The criticality of all plant components was reviewed by Florida Power and Light. Florida Power and Light Company contends that the items of the highest significance are presently displayed in the control room. Some items, however, will be added to the control room during the SAS/SPDS/ICC upgrade.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.8, File No. 3)  
(HED No. 6.8.1.2 & 6.8.1.2c)

. Displays located on the verticle panels must be monitored while manipulating controls on the front console.

Response: (Section 6.8, File No. 3)

The console carries the most pertinent information corresponding to the subject controls. Often the operator will confirm the console indication by checking an alternate source on the verticle panel, but items such as valve control are in direct relation to console indicators such as the steam generator level recorders. The addition of SAS/SPDS/ICC monitors will increase the console information.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.8, File No. 4)  
(HED No. 6.8.1.2 & 6.8.2.1c)

The arrangement of related controls and displays of the boric acid and steam dump systems do not permit efficient operation.

Response: (Section 6.8, File No. 4)

Emergency boration and natural circulation are the key safety functions of the boric acid and steam dump systems. The parameters which are pertinent to emergency boration and natural circulation are located on the console within the areas of the boric acid and steam dump controls.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.8, File No. 5)  
(HED No. 6.8.1.3b)

Panel lacks demarcation lines to facilitate control/display integration for search and identification tasks.

Response: (Section 6.8, File No. 5)

Limited demarcation will be implemented after painting of control panels. Due to the compact design of the control room and close placement of controls meters, etc.

Florida Power and Light feels extensive demarcation would only crowd the control board and hinder operators. Although compact the common control room is functionally designed with a consistent pattern of controls and displays.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.9, File No. 2)  
(HED No. 6.9.1.2c.3)

Control position indicator scale and display scale do not correspond.

Response: (Section 6.9, File No. 2)

Operators are trained to recognize and interpret the display scales utilized throughout the control room.

Displays are process dependent units of measurement, function, process, etc., are clearly labelled on displays and component labels.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.9, File No. 5)  
(HED No. 6.9.2.1b)

The simple indicating lights for the safety injection system do not correspond with their associated valve controllers.

Response: (Section 6.9, File No. 5)

A modification to this system is currently planned as part of the units control room upgrade modifications and proper labeling utilized to associate valve controllers with their respective indicating lights will be implemented. Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.9, File No. 6)  
(HED No. 6.9.3.2a)

Inappropriate control to display ratio of process controllers, i.e. excessive rotation of controllers is required to acquire desired display response.

Response: (Section 6.9, File No. 6)

Process controller, rotation is a function of plant parameters such as flow, pressure, and temperature which change with power level and desired accuracy as well as desired rate of change. Florida Power and Light Company contends that the subject controls provide adequate signal output to turn ratio for the design functions intended.

Florida Power and Light Company intends no further action on this item.

### 3.3.2 DELETED/INVALID FINDING

#### (NO FURTHER ACTION REQUIRED)

As a result of the Detailed Control Room Design Review and Human Engineering Descrepancy Review Team meetings on Turkey Point 3 and 4 there were 23 findings (Summarized on Table 3.2-1) which were deleted either because they were duplicate else where or because they were invalid. These findings were dispositioned as requiring no further action as identified in the following text.

The following is a list of those findings which were deleted. The subject findings are listed by section number as they relate to NUREG-0700 and file number as they relate to FP&L's tracking system. A more detailed listing along with a brief description of each line item is presented in Section 3.5 of this report.

| <u>SECTION NO.</u> | <u>FILE NOS.</u>             |
|--------------------|------------------------------|
| 6.1                | 13,37,38                     |
| 6.4                | 2,4,9                        |
| 6.5                | 7,13,24,27,35,36,47,58,62,71 |
| 6.6                | 10,27,31,32,65               |
| 6.7                | 1,7                          |

Findings: (Section 6.1, File No. 13)  
(HED No. 6.1.2.2g)

The console (bench board) kick space is three inches by 3.75 inches rather than the recommended four inches by four inches.

The guard rail extends the edge of the console out another three inches increasing the kick space to six inches there for this is not a problem.

Response: (Section 6.1, File No. 13)

As a result of review team meeting the subject finding was deleted.

The subject finding was reviewed and determined to require no corrective action since the subject bench board provides the operator with a standing work station and if seated at this station the operator would be using a draftsman type stool. The panel design is adequate for the intended use.

Florida Power and Light Company intends no action on this item.

Findings: (Section 6.1, File No. 25)  
(HED No. 6.1.4.1a,h)

Storage location of protective equipment is partially obscured by relay racks allowing insufficient room to dress. No breathing apparatus is stored there and there is only limited training in its use.

Response:(Section 6.1, File No. 25)

The emergency locker inventory is correct as identified in the site emergency plan. The subject lockers are controlled storage lockers and are not located in an area which is intended for operator dressout. The personnel using the equipment stored in the subject locker, will dressout in the control room and office area directly behind it as they are relieved from shift responsibilities to do so.

Personel required to use breathing apparatus are trained as part of their radiation training and are periodically requalified as required by existing site procedures.

The units' control room meets all habitability requirements and is intended to remain a radioactivity clean area. There are no requirements for storage of breathing apparatus in the control room.

The units control room meets all habitability requirements and is intended to remain a radioactivity clean area. There are no requirements for storage of breathing apparatus in the control room.

Florida Power and Light Company believes the current emergency equipment storage space and existing training program for the use of the subject equipment is adequate and intends no further action on this item.

Finding: (Section 6.1, File No. 37)

This finding had two HED numbers associated with it, HED No. 6.1.1.5.e and 6.5.3.1.b. The subject finding was correctly filed and dispositioned under Section 6.5, File No. 86. File No. 37 of Section 6.1 was deleted. Florida Power and Light Company intends no action on this item.

Finding: (Section 6.1, File no. 38)

This finding had two HED numbers associated with it, HED No. 6.1.1.5.e and 6.5.3.1.b. The subject finding was correctly filed and dispositioned under Section 6.5, File No. 86. File No. 38 of Section 6.1 was deleted. Florida Power and Light Company intends no action on this item.

Finding: (Section 6.4, File 2)  
(HED No. 6.4.1.1c(2))

There is a fuse holder which has been placed in a hole on the electrical console. It serves no function although it appears to be a rotary control.

Response: (Section 6.4, File No. 2)

The subject fuse holder was inserted in the hole in the electrical panel to prevent debris from being introduced into the subject panel until a suitable plug can be inserted.

The subject finding was determined to be a duplicate of File No. 1, Section 6.4 and was deleted.

Finding: (Section 6.4, File No. 4)  
(HED No. 6.4.1.1c(2))

The main steam stop bypass motor operated valves and component cooling water make up motor operated valves are inching valves. The rotary control associated with these valves is spring return to center and must be held in the open position until the valve opens completely. These controls are not marked in any way to indicate that they are different from all the other spring return rotaries.

Response: (Section 6.4, File No. 4)

The subject valves are used to perform process control tasks which require the subject valves to be throttled. Florida Power and Light Company believes that the present valve labeling, operator training and procedural controls properly identify the subject valve operation and function. The subject finding is a duplicate of File No. 34, Section 6.4, and was deleted.

Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.4, File No. 9)  
(HED No. 6.4.2.1)

Breakers are not consistently labelled. Position labels are labelled on-off and some are trip-close.

Response: (Section 6.4, File No. 9)

A field survey was performed and no control breakers were identified as operating opposite to normal breaker control switch convention. The subject finding was deleted as being a duplicate of File No. 13 of Section 6.6. Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 7)  
(HED No. 6.5.1.3b(5))

Spacing between words is less than one character width on status legend lights, words and abbreviations are cramped together, making the legend difficult to read quickly.

Response: (Section 6.5, File No. 7)

Presently component labels are being re-engraved and replaced under File No. 6 of Section 6.5. The above finding is a duplicate of File No. 6 Section 6.5 and was deleted.

Florida Power and Light Company intends no further action on the above finding since it is being corrected via File No. 6 of Section 6.5.

Finding: (Section 6.5, File No. 13)  
(HED No. 6.5.1.6d(1))

Status lights on safeguards panel use the following color code: Channel I-red, Channel II-white, Channel III-blue and Channel IV-yellow. These colors are also applied to controls and displays on SF/FF panel, COND and SG/RX panels but are not used consistently.

Response: (Section 6.5, File No. 13)

The color codes for safeguards measurement Channels I-red, II-white, III-blue, IV-yellow are correctly and consistently applied through out the control room. Florida Power and Light Company field, personel were unable to find any incorrect application of the subject coding convention.

The subject finding was deleted based on proper application of existing color conventions. Florida Power and Light Company intends no further action on the above finding.

Finding: (Section 6.5, File No. 24)  
(HED No. 6.5.1.1c)

Condensate storage tank level has three meters provided for system function - 1 vertical and 2 horizontal, but all are on the same circuit. If one fails they all fail. A redundant display should have separate circuitry.

Response: (Section 6.5, File No. 24)

Two additional Condensate Storage Tank Level indicators were added. Each indicator signal originates from it's own transmitter. These additional indicators were added so if one failed the other would be a backup. The new indicators are also more accurate. Florida Power and Light Company feels this finding was in error and subsequently deleted. Florida Power and Light Company intends no action on this item.

Finding: (Section 6.5, File No. 27)  
(HED No. 6.5.1.1.b)

Reactor coolant pump vibration recorder is located only on Unit No. 3.  
No local indication for point status on Unit No. 4.

Response: (Section 6.5, File No. 27)

The subject finding is a duplicate of File No. 23, Section 6.1. The subject finding was deleted as a result of the Turkey Point joint review.

Work is being performed under File No. 23, Section 6.1. Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 35)  
(HED No. 6.5.1.4.f)

Secondary water conductivity recorder displays units of \_\_\_\_\_/CM which operators cannot use directly. Parts per million is a more usable unit.

Response: (Section 6.5, File No. 35)

The subject recorder valves are correct. As a result of review team meeting it was agreed that operators view the subject recorder for trend i.e., any change in conductivity level and that acceptable ranges are clearly identified in consistent units. The subject finding was determined to be invalid. Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 36)  
(HED No. 6.5.1.5a)

The power range detector current meters have three scales. The bottom two scales 0-500 and 0-100 have no minor index markings. However, meter scale does incorporate mirror back for elimination of parallax and meter pointer does extend to top scale which does have index marks.

Response: (Section 6.5, File No. 36)

The subject meters are used for calibration of the associated instrumentation. The minor graduations are located on the top scale to allow for easier readability and accuracy. The subject indicators are correctly designed for their application and use and no operator error is expected. As a result of review team meetings the subject finding was dispositioned as invalid.

Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 47)  
(HED No. 6.5.1.5f)

Power range detector current meters have a single pointer with multiply scales. A rotary selector is provided to select between four different scales.

Response: (Section 6.5, File No. 47)

The rotary selector is used strictly for calibration of the detector. Once calibration is completed, the rotary selector is positioned on the normal operating scale. The subject finding was dispositioned as invalid during review team meetings.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 58)  
(HED No. 6.5.3.1.c.(1))

Power available to auxiliary feedwater pump is indicated by an illuminated status light. Extinguished light may mean bulb is burned out or loss of power to pump.

Response: (Section 6.5, File No. 58)

As a result of review team meetings it was determined that the subject illuminated status indication was consistent with plant convention and review guidelines. Extinguishment of the subject lamp requires immediate operator action to determine cause and take corrective action.

The subject finding was dispositioned as invalid. Florida Power and Light Company intends no action on the above finding.

Finding: (Section 6.5, File No. 62)  
(HED No. 6.5.3.2a.1)

Each pushbutton for the 4KV Bus A and B lockout relays have a pair of indicator lights. Each light should be labelled A or B to identify appropriate bus.

Response: (Section 6.5, File No. 62)

The pair of indicating lights are simple redundant indication for their corresponding pushbutton. The subject finding was dispositioned as invalid as a result of review team meetings.

Florida Power and Light Company intends no action on this item

Finding: (Section 6.5, File No. 71)  
(HED No. 6.5.4.2b.1)

Three scales have been added (handwritten) to the scale face of recorders 441 making difficult to read.

Response: (Section 6.5, File No. 71)

A field inspection performed by Florida Power and Light personnel could not verify this finding. No new scales had been added and the recorders were functioning properly. The finding was dispositioned as invalid.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 10)  
(HED No. 6.6.3.1a)

All units on each panel have either two lights or two pushbuttons which are labelled "High" and "Low". The high light shows when the high radiation setpoint has been reached. The low light shows when the area sensor has failed. The low light should be labelled fail.

Response: (Section 6.6, File No. 10)

The label is consistent with the function displayed - low threshold voltage. As a result of review team meeting the subject finding was dispositioned as invalid since the subject labels did correctly identify type of equipment failure.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 27)  
(HED No. 6.6.3.8a)

All rotary controls on the hydrogen recombiner panel are missing position labels.

Response: (Section 6.6, File No. 27)

Duplicate to File No. 35, Section 6.6.

This HED was written prior to completion of the subject system which requires permanent labels to be installed and was deleted.

Finding: (Section 6.6, File No. 31)  
(HED No. 6.6)

Record was incorrectly located in this section and has been  
relocated in Section 6.4, File No. 0036.

Finding: (Section 6.6, File No. 32)  
(HED No. 6.6)

Record was incorrectly located in this section and has been  
relocated in Section 6.5, File No. 0088.

Finding: (Section 6.6, File No. 65)  
(HED No. 6.6.3.3.b)

New 6000 series valve numbers are being used as new equipment is installed. This numbering system does not conform to existing valve numbering conventions.

Response: (Section 6.6, File No. 65)

The subject finding was determined to be a duplicate of File No. '15, Section 6.6, and was deleted.

Finding: (Section 6.7, File No. 1)  
(HED No. 6.7.1.2a4)

Computer dialogue "PTR lock pending" means reactor trip when stated in vocabulary and syntax of the control room operator. This does not reflect vocabulary of the user population.

Response: (Section 6.7, File No. 1)

As a result of the joint review team it was identified that "PTR locked pending" meant the digital data process system post trip review log was available for access by plant personnel not reactor trip. The message is consistent with associated plant conditions and operator required response. The subject finding was determined to be invalid since the only time the log is available is after a reactor trip. If an operator attempts to access the post trip review file after it has been reset the screen message will be "PTR busy".

Finding: (Section 6.7, File No. 7)  
(HED No. 6.7.1.6b,c)

The computer printout of the rod position is programmed to update and print once every minute. The operators would prefer and think it is necessary once every 5 minutes due to the distracting noise.

Response: (Section 6.7, File NO. 7)

The finding was determined to be invalid because the computer will not print any position unless requested by the operator through the CRT. Rod position is also included on the hourly report and is indicated on the console.

Florida Power and Light Company intends no further action on this item.

### 3.4 COMPLETED BACKFITS

#### 3.4.1 COMPLETED ENHANCEMENT/DESIGN SOLUTIONS

As a result of the construction work effort and Turkey Point Steam Generator outage on Unit 3, there are 28 findings (summarized in Table 3.2-1) which were closed or completed. The following is a list of those findings by section number as they relate to NUREG-0700 and file numbers as they relate to FP&L's tracking system. Presently the documentation for the closed findings along with descriptions of each line is controlled by FP&L's Power Plant Engr. Group and a brief description presented in Section 3.5 of this report.

Turkey Point Units 3 and 4  
SECTION NO.

FILE NO.

|     |  |
|-----|--|
| 6.1 | 1,6,7,20,21,22,26,27,29,31,32,<br>35,36,41 |
| 6.2 | 2,10                                       |
| 6.3 | 2,9,10                                     |
| 6.4 | 3,6,15                                     |
| 6.5 | 1,15,81                                    |
| 6.6 | 9 (Unit 3 only)<br>52, 68 (Unit 4 only)    |

Finding: (Section 6.1, File No. 1)  
(HED No. 6.1.1.2b)

The utilization of additional personnel to augment staffing under emergency conditions did not satisfy NRC requirements. During the last NRC test transient personnel did not report to site until after event was over.

Response: (Section 6.1, File No. 1)

Based on test results, current procedures and planning were reviewed than revised. Call out test "L-82-303" was initiated. Additional personnel in aloted amount of time arrived on site.

Florida Power and Light Company feels that procedures to augment the normal staff during an emergency is adequate.

Finding: (Section 6.1, File No. 6)  
(HED No. 6.1.1.6a)

The shift supervisor and watch engineer do not have adequate visual and audible contact with the primary area of the control room. NIS panel obscures their view into the primary area. Rope barriers obstruct access. When yelling, communications are not heard or incorrectly heard.

Response: (Section 6.1, File No. 6)

Control room modifications have minimized subject problems. Included as part of the modification effort was to extend the observation area into the control room and the incorporation of a intercom system. The changes were implemented in PCM 82-114.

Florida Power and Light Company feels this will enhance control room operation.

Finding: (Section 6.1, File No. 7)  
(HED No. 6.1.2.1)

The control room main entrance/exit door handle is only 28 inches above the floor. This requires operator to stoop over to reach the handle.

Response: (Section 6.1, File No. 7)

As part of the control room modifications the door was changed. Now the handle is at a normal level. This was part of the PCM 82-114 control room modification.

Florida Power and Light Company feels no further action is necessary.

Finding: (Section 6.1, File No. 20)  
(HED No. 6.1.3.1e 2)

The area radiation monitor is located at the end of Unit 3. The status of this equipment should be in both control rooms capable of controlling that equipment.

Response: (Section 6.1, File No. 20)

This item is being supplemented by the new Safety Assessment System. Information will be available on utility screens in both control rooms.

Florida Power and Light Company feels no further action is necessary.

Finding: (Section 6.1, File No. 21)  
(HED No. 6.1.5.1a)

There are only 3 A/C units to cool the control room. If one A/C unit fails the 2 remaining are not adequate enough to cool the equipment and personnel. Equipment has had a history of overheating.

Response: (Section 6.1, File No. 21)

The control room upgrade and control room habitability is being taken care of under PCM 82-60.

Florida Power and Light Company feels this should satisfy the needs of equipment and personnel.

Finding: (Section 6.1, File No. 22)  
(HED No. 6.1.1.4b.1)

FSAR, emergency and normal operating procedures are in poor condition. There is only one set and it is stored on Unit 4. The use of color coding to distinguish between the different procedures is non-existent. Indexing is by number not by name. Binders are so full they will not stay closed and pages are falling out.

Response: (Section 6.1, File No. 22)

As part of the control room upgrade the subject procedures were color coded. New binders purchased and a central location was provided for a second set of procedures. -P.O. #202278- Florida Power and Light Company feels no further action needs to be taken on this item.

Finding: (Section 6.1, File NO. 26)  
(HED No. 6.1.4.2)

Fire extinguishers are not hung in relation to the label of type of extinguisher. Accessibility to fire extinguisher is difficult do to location, behind relay racks out of primary area. Not all operator are instructed in the operation of fire extinguishers, only the fire team.

Response: (Section 6.1, File No. 26)

The subject items were evaluated. Operations will be given fire training. Fire extinguishers will be placed in their proper places. Additional equipment will be added as necessary. PWO #156302 will document corrective action.

Florida Power and Light Company feels no further action is necessary.

Finding: (Section 6.1, File No. 27)  
(HED No. 6.1.4.3b)

Labelling of storage locker, whose contents are test and communciation equipment for refueling, does not adequately describe the contents.

Response: (Section 6.1, File No. 27)

The storage locker was relabelled identifying said contents.

Florida Power and Light Company feels no further action is necessary in regard to this item.

Finding: (Section 6.1, File No. 29)  
(HED No. 6.1.5.2b)

The ventilation system is producing drafts of 50 to 150 FPM. These measurements were taken at head level. Air velocities should not exceed 45 FPM.

Response: (Section 6.1, File No. 29)

Site engineers evaluated the ventilation system. The subject problem has been corrected and is documented thru PWO @237534.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.1, File No. 31)  
(HED No. 6.1.5.7c)

There is no quiet area for control room operators to take a break. Due to understaffing operators are not allowed to leave the control room and have to wait to use rest room facilities by transference of responsibility duty. There is always control room noise throughout the shift to add to operator fatigue.

Response: (Section 6.1, File No. 31)

Control room modifications have added additional toilet facilities. These modifications have reduced traffic in the control room and allowed operator better access to existing facilities. PCM #82-114 documents changes to the control room.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.1, File No. 32)  
(HED No. 6.1.5.7a.35)

The control room decor and asthetics are fatiguing to the operators. Relay noise and turbine vibration tend to make operators sleepy on the night shift. Floor, ceiling, wall and control boards colors do not give eyes any relief. Tile floors create a dust problem besides fatigue for the standing operator.

Response: (Section 6.1, File No. 32)

A review of the subject finding resulted in several changes to the control room atmosphere. Color changes have been made to walls, control panel, and ceiling. The control room is virtually air tight from the outside world. Carpet has been installed. PCM #82-114 is the control room document for control room upgrade.

Finding: (Section 6.1, File No. 35)  
(HED No. 6.1.1.4a & 6.1.1.5d)

Inadequate and improper storage space in the control for books, procedures, logs, coffee supplies and spare parts. Empty book shelves are outside control room, near the kitchen. Unnecessary amounts of coffee supplies are stored in the control room prime space. Spare parts are in a back room.

Response: (Section 6.1, File No. 35)

Control room modifications incorporated a new design that utilizes available storage space more efficiently. These changes are covered in PCM #82-114.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.1, File NO. 36)  
(HED No. 6.1.1.5 & 6.5.4.1e)

Computer printer paper is stored on the floor in a box. The printer paper is restocked so infrequently that the control room operators do not know where to get spares thus the paper is turned over and reused.

Response: (Section 6.1, File No. 36)

The subject finding was addressed and taken into consideration as part of the control room redesign effort PCM #82-114.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.1, File No. 41)  
(HED No. 6.1.1.3c & d)

The rope barriers throughout the control room tend to be a tripping hazard/obstacle for the operators.

Response: (Section 6.1, File No. 41)

Due to the control room modifications rope barriers were essential to control personnel during the upgrade effort. Upon completion of control room modifications rope barriers that are needed and do not cause a hazard will be left. PCM #82-114.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.2, File No. 2)  
(HED No. 6.2.1.2b.6)

The design and location of the NRC and fire phones is not satisfactory. They can be knocked out of their respected cradles by passing traffics.

Response: (Section 6.2, File No. 2)

As part of the communications upgrade this finding was corrected. The operators desk was redesigned and the phones were vertically mounted with in an enclosure to protect them from accidental bumping. PCM #82-114 covered this task.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.2, File No. 10)  
(HED No. 6.2.2.1b)

The different phones at the operators desk lack individual audible coding. When a phone rings it is hard to distinguish which phone it is that is ringing. The operator must touch each phone to determine which is the right one.

Response: (Section 6.2, File NO. 10)

This item was addressed as part of the control room modification and upgrade of communications system. PCM #82-114 the phones now have a light that goes on when that particular phone rings enabling the operator to respond without difficulty.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.3, File No. 2)  
(HED No. 6.3.1.2a.1)

Several annunciator alarms occur so frequently that they are considered a nuisance. A few of these nuisance alarms only come in during certain procedures. The others are alarming frequently all the time. Operators are defeating the alarms when they become a nuisance.

Response: (Section 6.3, File NO. 2)

A review of the alarm situation was made. The cause, frequency and necessity was surveyed to minimize the effort of nuisance alarms and correct the cause and/or eliminate same. A.P. 0103.2 Pg. 10 8.1.4 will also help with the disabling of alarms.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.3, File No. 9)  
(HED No. 6.3.2.1f)

There is no audible alarm location coding except between Units 3 and 4. The different panels within each unit have the same audible alarm code.

Response: (Section 6.3, File No. 9)

New alarm systems were installed to better enhance the coding between Unit 3 and 4. Alarm coding between panels was reviewed by Florida Power and Light Company. It was determined that, due to the compactness of the control rooms and functional grouping of the annunciator, additional coding alarms would not enhance operator reaction.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.3, File No. 10)  
(HED No. 6.3.2.1a)

Unit 3 annunciator audible alarm is not distinguishable over the construction noise in the control room or over Unit 4 alarms. The shared alarm panel is also responsible for the same condition.

Response: (Section 6.3, File No. 10)

During the control room modifications PCM 82-264 for Unit 3, a new alarm that can be heard over background noise was installed. This new alarm is consistent with NUREG-0700.

Florida Power and Light Company intends no further action on this subject.

Finding: (Section 6.4, File No. 3)  
(HED No. 6.4.1.1.cl)

The same type of controller is used for several different functions. The rotary in some cases is used to set the setpoint, thus the actual value on the rotary is important. On others the rotary scale is irrelevant, the operator watches another display while working the rotary. Controllers are not identified as the which ones serve which type function.

Response: (Section 6.4, File No. 3)

The instrumentation department has reviewed this finding. Subsequently the controllers which have stationary setpoints have been identified and labeled as such.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.4, File No. 6)  
(HED No. 6.4.1.2)

The control power fuses for the NI channels are not properly guarded or provided with interlocks to keep them from being pulled. This action will trip the plant.

Response: (Section 6.4, File No. 6)

The subject fuses have had guards installed. PWO #237529 initiated this activity.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.4, File No. 15)  
(HED No. 6.4.2.2.f(3))

NI black rotaries are mounted on a black label engraved with the component and position labels. There is insufficient contrast between the control and the background.

Response: (Section 6.4, File No. 15)

The ongoing labelling program has replaced the labels for the subject rotaries on the NI panel. The new labels are consistent with NUREG-0700.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 1)  
(HED No. 6.5.1.1e)

On Hagan Process Controller the meters displays demand rather than status information. The controllers are not labelled to indicate this fact.

Response: (Section 6.5, File No. 1)

The Hagan Displays are labelled demand signal. This item is addressed during operator training. Title - "Logic Systems with Hagan Controllers".

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.5, File No. 15)  
(HED No. 6.5.1.6d(1))

The radiation monitor color code scheme is different than that used on the main control panels.

Response: (Section 6.5, File No. 15)

Operators are informed of the radiation monitor color coding being used. This information is given during training titled "Requal Cycles 82-83".

Florida Power and Light Company feels no further action is intended on this item.

Finding: (Section 6.5, File No. 81)  
(HED No. 6.5.4.1)

Steam generator feedwater flow recorders fail frequently. The pens stick. These recorders are used during start-up and shutdown operations.

Response: (Section 6.5, File No. 81)

The subject recorders were replaced with improved units during the planned control room modifications program.

Finding: (Section 6.6, File No. 9)  
(HED No. 6.6.3.1a)

Each auto process controller has a pushbutton which puts it in auto and then displays whether the controlled function is increasing or decreasing. The arrows and controller FCV-3-1114 are both pointing in the same direction.

Response: (Section 6.6, File No. 9)

The labelling effort has corrected this item. The left arrow is now pointing down and the right arrow up. This signifies increase and decrease.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 52)  
(HED No. 6.6.3.8a)

Hydrogen monitor scales on Unit 4 have two different ranges and one unit of measurement. There is a dual selector switch with no position labels.

Response: (Section 6.6, File No. 52)

The ongoing labelling program has corrected this find. The range selector switch has been properly labelled.

Florida Power and Light Company intends no further action on this item.

Finding: (Section 6.6, File No. 68)  
(HED No. 6.6.1.a)

The label on meter (TI-4-443A) for Unit 4 pressurizer is incorrect.

Response: (Section 6.6, File No. 68)

The pressurizer instrumentation is being upgraded. The subject indicator was removed and new instrumentation added to replace the mislabelled meter under PCM 82-265. Florida Power and Light Company intends no further action on this item.

### 3.4.2 SCHEDULED COMPLETION DATES FOR STANDARDIZED BACKFIT SOLUTIONS

This section provides the currently scheduled completion dates for the Turkey Point Standardized Backfit Program.

| <u>PROGRAM</u>                       | <u>COMPLETION DATE</u>           |
|--------------------------------------|----------------------------------|
| 1. Labeling                          | July, 1985                       |
| 2. Demarcation                       | July, 1986                       |
| 3. Annunciator Review                | July, 1985                       |
| a) Hardware Installation             | 1 <sup>st</sup> Refueling Outage |
| 4. Coding Convention                 | July, 1985                       |
| 5. Engineering Intergration Review * | May, 1984                        |
| a) Dispositioned                     |                                  |
| 1) Unit 3 Complete                   | December, 1984                   |
| 2) Unit 4 Complete                   | June, 1984                       |
| b) Disposition Pending               |                                  |
| 1) Unit 3 Outage of Completion       | March, 1985                      |
| 2) Unit 4 Outage of Completion       | October, 1985                    |
| 6. Administrative and Training       | July, 1984                       |

\*NOTE: Refer to Section 3.2.5 of this report for a list of those engineering intergration review items scheduled for installation during the units next refueling outage and those items remaining to be reviewed, dispositioned and reported on by March 1, 1986.

### **3.5 IMPLEMENTATION PROGRAM TRACKING SYSTEM AND SUMMARY REPORT**

The Human Factors Implementation Program Tracking System data base has been developed for the purposes fo maintainng a:

- o Inventory Control
- o Status Update
- o Open Items List
- o Project History

#### **3.5.1 INVENTORY CONTROL**

The implementation Program Tracking System will account for a file of records, which are documented Human Engineering Discrepancies complied from an audit performed by Essex Corp. in collaboration with Florida Power and Light Company. These records are a brief synopsis of each Human Engineering Discrepancy containing:

1. A unique FP&L control file numbering system.
2. Human Engineering Discrepancy number based on a "as found" descerepancy with reference to the NUREG-0700 'indexing format.
3. Identity of the general area or location in the plant were the problem exists.
4. Responsible lead for work being done.
5. A brief description of descerepancy.

#### **3.5.2 STATUS UPDATE**

The Implementation Program Tracking System will maintain status of each Human Engineering Discrepancies which will be within a status block designated for status (or progress) information, and will provide a current work history (or synopsis) of each controlled item.

#### **3.5.3 OPEN ITEM LIST DEVELOPMENT**

When inventory control and status updates are made, the Implementation Program Tracking System provides project management with a current "Open Items List", and will enable effective and systematic "closing" of each item.

Continued on next page.

The items that were completed have the associated Plant Change Modification number listed where applicable, and are included in the Implementation Program Tracking System for accountability and historical reasons.

#### **3.5.4 PROJECT HISTORY**

Upon completion of the task, this document will provide a project work history for reference purposes, and can be used at any point in time as an index for resolutions and applications for the work done during Human Factors Implementation Program.

The intent of the Implementation Program Tracking System is to provide project management and support work organization groups with an effective means of coordinating and facilitating the Human Factors work effort. The up-date of the Implementation Program Tracking System will be done on a "as needed" basis.

#### **3.5.5 PROGRAM INDEX AND LISTING**

The following computerized listing is the index and listing of Florida Power and Light Company Turkey Point Units 3 and 4 detailed control room design review implementation program tracking system. (See Appendix 1).

## OPERATOR INTERVIEW

| EVALUATION GUIDELINE   | REF.          | EVALUATION GUIDELINE  | REF.          |
|--|---------------|---|---------------|
| 1. Senior operators who supervise or assist operations of more than one unit need to be stationed so that they can communicate effectively with operators in each unit and have an unobstructed visual path to each units' control boards. | 6.1.3.1<br>b. | 9. Emergency equipment will be stored in an orderly fashion.                            | 6.1.4.3<br>a. |
| 2. Operational crews will be committed to one or the other unit and will not be allowed to alternate between the two mirrored units.   | 6.1.3.2<br>a. | 10. Storage location(s) will be accessible, clearly marked, and known to all personnel. | 6.1.4.3<br>b. |
| 3. The distinction between the mirrored units will be heightened as much as possible.  | 6.1.3.2<br>b. |   |               |
| 4. All equipment such as fire, radiation and rescue equipment, will be checked periodically for its condition.   | 6.1.4.2<br>a. |   |               |
| 5. All equipment will be easily and readily accessible.  | 6.1.4.2<br>b. |   |               |
| 6. Operators will be trained in the use of all emergency equipment.  | 6.1.4.2<br>c. |   |               |
| 7. An administratively approved procedure for each type of emergency will be written.  | 6.1.4.2<br>d. |   |               |
| 8. There will be an automatic fire warning system for control room fires.  | 6.1.4.2<br>e. |   |               |

# HUMAN ENGINEERING CHECKLIST

## NOISE

\*Criteria are different.

| EVALUATION GUIDELINE   | REF.              | EVALUATION GUIDELINE  | REF.              |
|--|-------------------|---|-------------------|
| <p><b>Speech Intelligibility</b></p> <p>1. Verbal communications between points are intelligible under slightly raised voice levels for ambient noise levels.</p>  | 6.1.5.5 a.        | <p>7. Auditory signal intensity does not cause auditory discomfort.</p>   | 6.2.2.6 b.        |
| <p><b>Noise</b></p> <p>2. Background noise levels do not exceed 65dB(A).</p>   | 6.1.5.5 b. CRE-11 | <p>8. Auditory signal intensities do not exceed 90dB(A) with the exception of 115dB(A) for evacuation alarms.</p> | 6.2.2.6 c.        |
| <p>3. When voice transmission systems are not provided between the primary operating area and other control room locations, background noise is further reduced.</p>   | 6.1.5.5 c.        | <p>9. Auditory signal frequencies are between 200 and 5000 Hz with the maximum range of 500 to 3000 Hz.</p>       | 6.2.2.5 a. AD-12  |
| <p>4. Noise distractions are minimized.</p>  | 6.1.5.5 d.        | <p>10. Wide-band auditory signals of approximately 200 Hz are used.</p>   | 6.2.2.5 b.        |
| <p><b>Acoustical Treatment</b></p> <p>5. Acoustical treatment limits reverberation time to one second or less.</p>   | 6.1.5.5 e.        | <p>11. The signal intensity is discernible above ambient CR noise.</p>  | 6.3.2.1 a.* AD-23 |
| <p><b>Auditory Signals</b></p> <p>6. To assure gaining the operator's attention, a normal signal-to-noise (S/N) ratio of 10dB(A) is maintained in the control room with a S/N or 20dB in one octave band between 200 and 5000 Hz being adequate.</p> | 6.2.2.6 a. AD-15  |   |                   |

## LIGHTING

\*Criteria are different.

| EVALUATION GUIDELINE  | REF.   |
|---|--|
| 1. Illuminated indicators are at least 10% greater in illumination than surrounding panel.                                    | 6.5.3.2<br>b. and<br>6.5.3.3<br>a.(1)<br>VD-90 |
| 2. Ambient lighting avoid reflection or refraction that cause light indicators to appear to be glowing when they are not.     | 6.5.3.1<br>b.<br>VD-91                         |
| 3. Changes in ambient lighting do not affect discrimination of color coding.  | 6.5.1.6<br>e.(3)<br>VD-65                      |
| 4. The emergency illumination system provides a minimum of 10 footcandles at all work stations in the primary operating area. | 6.1.5.4<br>c.                                  |
| 5. Failure of the normal lighting system does not degrade the emergency lighting system.                                      | 6.1.5.4<br>b.                                  |
| 6. An automatically activated emergency lighting system that is independent of any other lighting system is provided.         | 6.1.5.4<br>a.                                  |
| 7. Surface colors are recognizable under both normal and emergency conditions.  | 6.1.5.3<br>h.<br>CRE-7                         |
| 8. Reflectance conforms to guidelines.  | 6.1.5.3<br>g.<br>CRE-6                         |
| 9. Glare does not interfere with readability of displays, labels, or indicators.  | 6.1.5.3<br>f.<br>CRE-3                         |

| EVALUATION GUIDELINE   | REF.                       |
|--|----------------------------|
| 10. Labels, instructions and other written information are not in a shadowed position.   | 6.1.5.3<br>e.(2)           |
| 11. Ambient illumination is provided via direct or diffuse lighting.   | 6.1.5.3<br>e.(1)<br>CRE-5  |
| 12. To reduce operator fatigue and eyestrain, shadows are avoided.   | 6.1.5.3<br>e.              |
| 13. Luminance ratios for task areas conform to guidelines.   | 6.1.5.3<br>d.<br>CRE-8     |
| 14. Supplemental lighting provides for specialized visual tasks in areas where fixed illumination is not adequate.   | 6.1.5.3<br>c.<br>CRE-10    |
| 15. Illumination levels do not vary greatly within work stations.  | 6.1.5.3<br>b.              |
| 16. Illumination levels conform to guideline.  | 6.1.5.3<br>a.*<br>CRE-10   |
| 17. The illuminated condition is recognizable under the highest predicted ambient light condition and is at least 10% brighter than the surrounding panel. | 6.4.3.3<br>b.(2)           |
| 18. When the CRT uses light characters on a dark background, character luminance is 23 ft-L minimum and 46 ft-L preferred.                                 | 6.7.2.1<br>c.(4)*<br>VD-47 |
| 19. When the CRT uses dark characters on a light background, screen background luminance is 23 ft-L minimum and 46 ft-L preferred.                         |                            |

# HUMAN ENGINEERING CHECKLIST

LIGHTING

| EVALUATION GUIDELINE   | REF.                      | EVALUATION GUIDELINE | REF. |
|--|---------------------------|----------------------|------|
| 20. When ambient illumination in the vicinity of the CRT is in the medium to high range, the CRT uses dark characters and symbols on a light background. | 6.7.2.1<br>c.(2)<br>VD-47 |                      |      |
| 21. Ambient illumination contributes no more than 25% to screen luminance through diffuse reflection and phosphor excitation.                            | 6.7.2.1<br>c.(1)<br>VD-47 |                      |      |
| 22. CRT screens are installed to minimize or eliminate reflected glare at normal operator viewing angles.  | 6.7.2.1<br>b.<br>VD-47    |                      |      |
| 23. Alphanumeric and graphic characters are easy to read under all control room lighting conditions.   | 6.7.2.1<br>a.<br>VD-47    |                      |      |
| 24. Proper lighting of at least 8 ft.C is provided in work access areas.   | CRE-17                    |                      |      |
| COUNTERS   |                           |                      |      |
| Visibility   |                           |                      |      |
| 25. Counters are self-illuminated when used in areas which provide display luminance below 1 ft.-L.  | VD-83                     |                      |      |

# HUMAN ENGINEERING CHECKLIST

## CR ENVIRONMENT

| EVALUATION GUIDELINE   | REF.                | EVALUATION GUIDELINE  | REF.          |
|--|---------------------|---|---------------|
| <b>Workspace Arrangement</b>   |                     |   |               |
| 1. Control room arrangement facilitates efficient unobstructed movement and communication.                                       | 6.1.1.3 d.(1)       | 9. Shelves are located so that contents can be seen and reached. Under no circumstances is the top shelf higher than 76 inches.   | WA-8          |
| 2. Equipment is arranged with movement and communications patterns in mind.  | 6.1.3.1 a.          | 10. The CRT screen data and messages are within unobstructed view of the operator at normal work station.   | 6.7.2.3 f.    |
| 3. Visual relief from arrays of instrumentation is provided.   | 6.1.5.7 a.(3)       | 11. If writing space is on the console, it does not interfere with viewing and operation of controls and displays.  | 6.1.2.3 h.(2) |
| 4. Controls are located so that simultaneous operation of 2 controls does not require a crossing or interchanging of hands.      | WA-4                | 12. If writing space is not provided on the console, it is located at a nearby desk or table.   | 6.1.2.3 h.(3) |
| <b>Workspace Location</b>  |                     | 13. Controls are placed close to the display they affect and with an equal distribution of work between right and left hands (finest adjustment reserved for the right hand).   | WA-3          |
| 5. The shift supervisor's office is readily accessible to the control room.  | 6.1.1.6 a.          | 14. Controls on a vertical surface are located in an area no greater than 8 inches above the head and no further than 18 inches from the center line. Controls frequently operated or critical are located between shoulder level and waist height. | WA-6          |
| 6. Operators at desks and consoles have full view of all control and display panels in the primary operating areas.              | 6.1.1.3 a.<br>WA-28 |   |               |
| 7. Desk and console placement facilitates voice communications from seated operators to any point in the primary operating area. | 6.1.1.3 b.          |   |               |
| 8. Out-of-the-way storage is provided for operators' coats and personal belongings.  | 6.1.5.6 a.          |   |               |

# HUMAN ENGINEERING CHECKLIST

6

## CR ENVIRONMENT

| EVALUATION GUIDELINE   | REF.             | EVALUATION GUIDELINE   | REF.          |
|--|------------------|--|---------------|
| 15. Finger-operated controls are located with 29 inches from operator's shoulder.<br>#   | WA-3             | 24. Lockers are large enough for storage of personal items.<br>#   | 6.1.5.6<br>b. |
| 16. Controls operated with the whole hand are located within approximately 27 inches of the operator's shoulder.<br>#                                      | WA-3             | 25. The minimum lateral work-space for racks with drawers:<br>a) racks with drawers weighing less than 45 lbs., 18 inches clearance on one side and 4 inches clearance on the other; and b) racks having drawers weighing over 45 lbs., 18 inches clearance on each side.<br># | WA-15         |
| <b>Workspace Size, Shape, Design</b>   |                  | 26. Segmented, wraparound consoles are used when the panel space for a single seated operator exceeds 44 inches of flat surface.<br>#  | WA-28         |
| 17. Operators are able to perform tasks at any work station.<br>@  | 6.1.1.3<br>c.(2) |  |               |
| 18. A means for voice communications is provided in rest-rooms and eating areas.   | 6.1.5.7<br>b.(3) | 27. If vision over top is required, the width of central segment does not exceed 44 inches and the left and right segments do not exceed 24 inches.<br>#   | WA-28         |
| 19. Desks provide enough space for all materials required during task performance.<br>@  | 6.1.2.7<br>a.    |  |               |
| 20. Desks have adequate knee space.<br>#   | 6.1.2.7<br>c.    | 28. Controls used for performing the same function on different items or equipment are the same size.<br>#   | CON-17        |
| 21. Workspace Coding/Identification work @ operators is identifiable work @ comfortably at desks as permitted by desk dimensions.                          | 6.1.2.7<br>b.    |  |               |
| 22. Adequate space is allowed between the chair and desk/console so the operator can easily get in and out of the chair or can view equipment behind.<br>@ | 6.1.1.3<br>e.    | 29. Labels are located on main chassis of the equipment.<br>#  | PA-44         |
| 23. Panels and equipment enclosures are designed so that no unwanted objects can be introduced.<br>#   | 6.1.1.3<br>g.    | 30. When instructions applying to a covered item are labeled on a hinged door, the lettering is properly oriented so that it can be read when door is open.<br>#   | PA-29         |

## CR ENVIRONMENT

| EVALUATION GUIDELINE   | REF.          |
|--|---------------|
| <b>Workspace Visibility</b>  |               |
| 1. Total left-to-right viewing angle does not exceed 190°.   | WA-29         |
| 32. Where functional groups are outlined with contrasting lines, a 1/16 inch border designates secondary or non-critical groups.                     | CDI-13        |
| 33. Where functional groups are outlined with contrasting lines, a 3/16 inch border designates primary, emergency, or extremely critical operations. | CDI-13        |
| <b>Workspace Safety</b>  |               |
| 34. Operators are able to get to any work station without encountering any obstacles.  | 6.1.1.3 c.(1) |
| 35. Handset cords are positioned to avoid entangling critical controls or endangering passing traffic.   | 6.2.1.2 b.(5) |
| 36. Vertically mounted handset cradles are located out of the way of traffic.  | 6.2.1.2 b.(6) |
| 37. Handrails are provided for platforms, stairs, and floor openings or wherever personnel may fall from an elevation.                               | CRE-17        |
| 38. Skid-proof flooring on stair or step-tread coverings are used.   | WA-39         |

| EVALUATION GUIDELINE   | REF.              |
|--|-------------------|
| 39. Stairs, stair-ladders, ramps, etc., are equipped with handrails on each side. Where one or both sides are open, guardrails are provided.   | WA-36             |
| 40. Stair-ladders are made of metal; handrails have non-slip surface.  | WA-39             |
| 41. Emergency doors/exits are accessible and easily opened. The doors are designed to be opened by a single motion of hand or foot. There are emergency exits from secure or classified areas. | CRE-17            |
| 42. Exposed edges are rounded to a minimum radius of .4 inch and corners to a minimum of .5 inch.  | VD-6              |
| <b>Workspace Climate</b>   |                   |
| 43. The climate control system is capable of maintaining temperature and humidity.   | 6.1.5.1 a. CRE-1  |
| 44. Air temperature at floor and head levels do not differ by more than 10°F.  | 6.1.5.1 b. CRE-1  |
| 45. Capacity of ventilation system is at least 15 cubic feet per minute per occupant.  | 6.1.5.2 a. CRE-15 |
| 46. Air velocity in the primary operating area does not exceed 45 feet per minute measured at operator head level and does not produce a noticeable draft.                                     | 6.1.5.2 b. CRE-15 |

# HUMAN ENGINEERING CHECKLIST

## CR ENVIRONMENT

| EVALUATION GUIDELINE   | REF.                   | EVALUATION GUIDELINE   | REF.   |
|--|------------------------|--|--------|
| <b>Workspace Comfort</b>   |                        |  |        |
| 47. Control room colors are coordinated.   | 6.1.5.7<br>a.(1)       | 58. The backrest reclines between 103° and 115°. The backrest engages the lumbar and thoracic regions of the back, and supports the torso so that the operator's eyes can be brought to "eye line" with no more than 3 inches of forward body movement. If only lumbar support is given, lateral curvature does not exceed 7.3 inches in radius. | WA-17  |
| 48. Color and lighting creates a cheerful atmosphere.  | 6.1.5.7<br>a.(2)       |  |        |
| 49. Comfortable seating is provided.   | 6.1.5.7<br>a.(4)       |  |        |
| 50. Carpeting is provided.   | 6.1.5.7<br>a.(5)       |  |        |
| Chairs pivot so that operators can readily adjust position.  | 6.1.2.8<br>a.          | <b>Workspace Accessory Hardware</b>  |        |
| 51. A restroom and kitchen or eating area are located within or near control room.   | 6.1.5.7<br>b.(1)       | 59. Lighting systems use light baffles or diffused indirect lighting.  | CRE-3  |
| 52. Restroom and eating facilities are easily accessible.  | 6.1.5.7<br>b.(2)       | 60. Trademarks, company names, or other markings are not displayed on the panel face.  | CRE-6  |
| 53. A rest area is provided.   | 6.1.5.7<br>c.          | <b>Workspace Acoustics</b>   |        |
| 54. Chairs pivot so that operators can readily adjust position.  | 6.1.2.8<br>a.          | 61. The average room sound absorption coefficient is at least .20.   | CRE-14 |
| 55. Chairs support the lower back; the angle between the back and seat is about 100° for office tasks and greater for reading and resting. | 6.1.2.8<br>b.<br>WA-17 | 62. Acoustical treatment in accordance with the figure on back is used to reduce reverberation time.   | CRE-12 |
| 56. Chairs with armrests are preferred for personnel who remain seated for long periods of time.   | 6.1.2.8<br>c.          | <b>Workspace Illumination</b>  |        |
| 57. Seats and backrests are padded with at least 1" of compressible material.  | 6.1.2.8<br>d.<br>WA-17 | 63. Luminaires are placed at least 60° from the viewer's line of sight.  | CRE-3  |

## PROCESS COMPUTER

| EVALUATION GUIDELINE  | REF.                      |
|---|---------------------------|
| 71. A positive identification is provided at the individual CRT to indicate if it is under local or master control.                             | 6.7.1.5<br>c.(2)          |
| 72. Dedicated keys that initiate/activate functions are grouped together.   | 6.7.1.5<br>d.(1)<br>CON-9 |
| 73. Function controls are easily distinguishable from other types of console keys.  | 6.7.1.5<br>d.(2)          |
| 74. Function controls are clearly labeled to indicate function.   | 6.7.1.5<br>d.(3)<br>CON-1 |
| 75. Design and layout of function controls are consistent for all consoles in control room.   | 6.7.1.5<br>d(4)<br>CON-77 |
| 76. Function keys are physically separated from alphanumeric keys on the console.   | 6.7.1.5<br>d.(5)          |
| <b>OTHER CONTROLS</b>   |                           |
| 77. Control devices (such as light pens, selector pens, RAND tablets, etc.) are operable from most favorable position for computer interaction. | 6.7.1.6<br>a.             |
| 78. Control devices provide rapid positioning of cursors or selection of choices.   | 6.7.1.6<br>b.             |

| EVALUATION GUIDELINE   | REF.                   |
|--|------------------------|
| 79. The accuracy of control method or device is commensurate with the functions to be served.  | 6.7.1.6<br>c.          |
| 80. Control design allows the operator freedom of movement to perform other duties.  | 6.7.1.6<br>d.          |
| <b>COMPUTER-OPERATOR RELATIONSHIP</b>  |                        |
| 81. Correct response is provided within response times listed in Exhibit 6.7-6 for each type of query.   | 6.7.1.7<br>a.          |
| 82. When response time exceeds 3 seconds, a delay message is presented in order to maintain the operator's attention and to confirm normal computer operation. | 6.7.1.7<br>b.          |
| 83. Procedures are in hard copy form at a minimum.   | 6.7.1.8<br>a.(3)       |
| 84. A complete set of operations and contingency procedures is available in control room.  | 6.7.1.8<br>a.(1)       |
| 85. Procedures are prepared from control room operator's point of view.  | 6.7.1.8<br>a.(2)       |
| 86. Viewing distance on CRT is greater than 18 inches.   | 6.7.2.3<br>a.<br>VD-46 |

### EVALUATION GUIDELINE

### REF.

105. Corrections of individual errors are made without requiring re-entry of correct data.

6.7.1.3  
d.  
OCI-24

106. The computer system contains a sequential file of operator entries, available upon operator request.

6.7.1.2  
e.  
OCI-24

107. When many subsystems require monitoring, information is filtered by software or machine function.

VD-9

108. Operator is provided instructions for correcting computer diagnosed errors.

OCI-19

109. System recognizes and reports detectable errors.

OCI-19

### COMPUTER ACCESS

110. Only properly authorized personnel are allowed to make changes by entry, deletion of alteration of data.

6.7.1.1  
a.

111. At least one copy of current operating software is securely and remotely stored.

6.7.1.1  
b.

112. When characters, words, or phrases are to be inserted, such items are first collected and displayed on a buffer area of screen, and then inserted by one operator command.

6.7.1.1  
c.  
OCI-26

### EVALUATION GUIDELINE

### REF.

113. Before the operator requests that result in permanent changes are processed, the computer system requires operator acknowledgement.

6.7.1.1  
d.  
OCI-24,  
25

### ACCESS AIDS

114. Operating procedures describe:

- o The overall computer system,
- o The computer system components with which the operator can interface,
- o The specific procedures necessary to accomplish all operator-computer interface functions.

6.7.1.8  
a.(4)  
(a,b,c)

115. Contingency procedures describe indications which identify failure or malfunctioning of computer system and necessary actions to be performed by the operator in case of malfunction.

6.7.1.8  
a.(5)  
(a,b)

116. Specific codes or addresses that the operator may request are cross-indexed by alphanumeric or numeric code program name, system/subsystem identification, and functional group identification.

6.7.1.8  
b.(1)  
(a,b,c,  
&d)

117. Cross-indices of data displays are available in at least hard-copy form in control room.

6.7.1.8  
b.(2).

|---|---------------------------|--|---------------------------|
| 203. When directions to the operator accompany an options list, the directions precede the list.  | 6.7.2.5<br>j.<br>OCI-5    | 211. Alphanumeric characters (if used) are grouped into words, sentences, or text in a meaningful way.   | VD-38                     |
| 204. Urgent messages are highlighted on the CRT screen.   | 6.7.2.5<br>k.(1)<br>OCI-7 | <b>GRAPHIC CODING AND HIGHLIGHTING</b>   |                           |
| 205. Urgent messages are displayed in the same location on the CRT screen.  | 6.7.2.5<br>k.(2)          | 212. Highlighting of important messages is used on CRT.  | 6.7.2.7<br>a.<br>OCI-7    |
| 206. In systems in which selection is made by use of a cursor formats are organized to minimize positioning movements of the cursor.  | 6.7.2.5<br>l.             | 213. Highlight coding methods are consistent.  | 6.7.2.7<br>b.(1)          |
| 207. The amount of information-bearing activated screen area does not exceed 25% of the total screen area. This does not include demarcation lines used to separate groups of data. | 6.7.2.5<br>m.             | 214. Highlighting methods for emergency conditions are not used in association with normal conditions.   | 6.7.2.7<br>b.(2)          |
| 208. CRT displayed trend plot scales are consistent with the intended functional use of the data.   | 6.7.2.5<br>n.             | 215. If contrast enhancement is used for highlighting, no more than three brightness levels are used in a single presentation. (Two is preferred.) | 6.7.2.7<br>c.             |
| 209. CRT screen lines are composed of at least 20 points per cm (50 points per inch).   | VD-50                     | 216. Blinking for purposes of highlighting is not used except for emergency conditions.  | 6.7.2.7<br>d.<br>OCI-7    |
| 210. Data, text, formats, etc., essential to system performance are under system control.   | OCI-17                    | 217. If blinking is used for highlighting, no more than two blink rates are used.  | 6.7.2.7<br>e.(1)          |
|   |                           | 218. For single blink rate, 2-3 blinks per second with a minimum of 50 msec "on" time between blinks is used.                                      | 6.7.2.7<br>e.(2)<br>OCI-7 |

# HUMAN ENGINEERING CHECKLIST

## PROCESS COMPUTER

| EVALUATION GUIDELINE  | REF.          |
|---|---------------|
| 219. If two blank rates are used for highlighting, the rates are about 4 per second and 1 per second.   | 6.7.2.7 e.(3) |
| 220. If 2 blink rates are used, the on-off ratio is about 50%.  | 6.7.2.7 e.(4) |
| 221. If 2 blink rates are used, the higher rate is used for the most critical information.  | 6.7.2.7 e.(5) |
| 222. Where blinking is used for highlighting, the blinking rate is between 2-3 Hz with a minimum flash duration of 50 msec.   | OCI-7         |
| 223. If inverse video or image reversal is used for highlighting, it is used to highlight in dense data field, such as a word or phrase in a paragraph of text or a set of characters in a table of data. | 6.7.2.7 f.    |
| 224. If graphic coding is used, it is used to present standard qualitative information or to draw attention to a portion of the display.  | 6.7.2.7 g.    |
| 225. Graphic codes are consistently used.   | 6.7.2.7 h.    |
| 226. If symbols are used for coding, they vary widely in shape.   | 6.7.2.7 i.    |
| 227. The number of symbols used for coding is kept small.   | 6.7.2.7 j.(1) |

| EVALUATION GUIDELINE   | REF.                    |
|--|-------------------------|
| 228. The number of coding symbols under optimum conditions does not exceed 20.   | 6.7.2.7 j.(2)           |
| 229. The number of coding symbols under adverse display conditions is six.   | 6.7.2.7 j.(3)           |
| 230. Other techniques (i.e., color, filled versus unfilled) to display different states or qualities of a basic symbol are used if needed. | 6.7.2.7 j.(4)           |
| MULTI-PAGE CONSIDERATIONS  |                         |
| 231. Page design and content minimize operator memory requirements.  | 6.7.2.8 a.(1)           |
| 232. All data relevant to a specific entry is displayed on a single page.  | 6.7.2.8 a.(2)           |
| 233. When pages are organized in hierarchical fashion, a visual audit trail of choices is provided upon operator request.                  | 6.7.2.8 b.              |
| 234. Location references within a scrolling frame are provided in viewable portion of frame.   | 6.7.2.8 c.(1)<br>OCI-16 |
| 235. Sectional coordinates are used for panning large schematics.  | 6.7.2.8 c.(2)           |
| 236. Means are provided for operator to control the amount, format, and complexity of information being displayed.                         | 6.7.2.8 d.<br>OCI-16    |

## EMERGENCY GARMENTS

| EVALUATION GUIDELINE  | REF.       |
|---|------------|
| 1. Protective equipment includes protective clothing and breathing apparatus.   | 6.1.4.1 a. |
| 2. Protective equipment will be compatible with body sizes and will allow adequate tactile sensitivity and ability to see, move, communicate, reach and hear. | 6.1.4.1 b. |
| 3. Protective equipment will be checked periodically to make sure it is in good condition.  | 6.1.4.1 c. |
| 4. Protective equipment will be available in sufficient number and sizes to accommodate all operators.  | 6.1.4.1 d. |
| 5. Sizes will be marked clearly.  | 6.1.4.1 e. |
| 6. An adequate supply of personal protection equipment expendables will be provided.  | 6.1.4.1 f. |
| 7. Protective equipment will be easily and readily accessible.  | 6.1.4.1 g. |
| 8. Operators will be well practiced in donning equipment.   | 6.1.4.1 h. |
| 9. Instructions for donning, doffing, and controlling protective equipment will be provided.  | 6.1.4.1 i. |

| EVALUATION GUIDELINE   | REF.                    |
|--|-------------------------|
| 10. Personnel wearing protective equipment will be able to operate communications equipment. | 6.2.1.8 b.              |
| 11. Emergency face masks will be equipped with diaphragms for transmitting speech.           | 6.2.1.8 c.(1)<br>COM-13 |
| 12. Diaphragms are capable of separating voice from exhaust valve action.                    | 6.2.1.8 c.(2)<br>COM-13 |
| 13. An electronic speech system will be used if face mask is not equipped with diaphragms.   | 6.2.1.8 c.(3)           |
| 14. Controls will be easily identified while wearing emergency gear.                         | 6.4.1.1 d.(1)           |
| 15. Controls will be easy to activate while wearing protective equipment.                    | 6.4.1.1 d.(2)<br>CON-4  |

# HUMAN ENGINEERING CHECKLIST

## LABELING

\*Criteria are different.

\*\*0700 is more specific.

\*\*\*1580 is more specific.

| EVALUATION GUIDELINE   | REF.                        |
|--|-----------------------------|
| <b>LABEL CONTENT</b>   |                             |
| 1. Labels describe the equipment functions and, if needed for clarity, engineering characteristics or nomenclature are also described. | 6.6.3.1<br>a. & b.<br>PA-56 |
| 2. Label wording expresses the exact intended action.  | 6.6.3.2<br>a.<br>PA-55      |
| 3. Instructions are clear and direct.  | 6.6.3.2<br>b. & c.<br>PA-55 |
| 4. Words that have a commonly accepted meaning for all intended users are used in labels.  | 6.6.3.2<br>d.<br>PA-55      |
| 5. Unusual technical terms are avoided.  | 6.6.3.2<br>e.<br>PA-55      |
| 6. Words are spelled correctly.  | 6.6.3.2<br>f.               |
| 7. Use of Roman numerals is avoided.   | 6.6.3.4<br>e.               |
| 8. Words on labels are concise and convey the intended meaning.  | 6.6.3.5<br>PA-55            |
| 9. Words and abbreviations of similar appearance are avoided.  | 6.6.3.6<br>PA-56            |

| EVALUATION GUIDELINE  | REF.  |
|---|---|
| 10. Labels are used to identify functionally grouped controls or displays.  | 6.6.3.7<br>a.<br>PA-32  |
| 11. This warning notice is clear, direct, and attention getting and of 25% larger letter size than any detailed instructions (e.g., "Danger! Deadly Shock Hazard" rather than "Warning —High Voltage"). | PA-29   |
| 12. This label uses no periods, except to preclude misinterpretation.   | PA-46   |
| 13. Categories of information not needed in using a display are avoided.  | 6.5.1.4<br>b.<br>VD-7<br>PA-47  |
| <b>LABEL LOCATION</b>   |   |
| 14. Labels are located above the functional groups and components and the panel elements they identify.   | 6.6.3.7<br>b.<br>PA-45<br>and<br>6.6.2.1<br>a. & b.<br>PA-45<br>PA-49 |
| 15. Component labels located above eye level are positioned to ensure visibility.   | 6.6.2.1<br>c.<br>PA-45  |
| 16. Labels are placed close to the components they describe.  | 6.6.2.1<br>d.<br>PA-46  |

1. The first part of the document is a list of references. The references are listed in a standard format, with the author's name, the title of the work, and the publisher. The references are as follows:

1. J. H. Van Veen, *The History of the Netherlands*, 1910, 1911, 1912, 1913, 1914, 1915, 1916, 1917, 1918, 1919, 1920, 1921, 1922, 1923, 1924, 1925, 1926, 1927, 1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, 1937, 1938, 1939, 1940, 1941, 1942, 1943, 1944, 1945, 1946, 1947, 1948, 1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967, 1968, 1969, 1970, 1971, 1972, 1973, 1974, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578,

# HUMAN ENGINEERING CHECKLIST

68

## LABELING

### EVALUATION GUIDELINE

### REF.

17. Labels are placed where they are not obscured for an extended time period during operation.

6.6.2.1  
e.\*  
PA-44  
and  
6.6.2.4  
b. & c.  
PA-44  
PA-45  
PA-47

18. Adjacent labels are separated by sufficient space so they are not read as one continuous label.

6.6.2.1  
f.  
PA-46

19. Labels are mounted to preclude accidental removal.

6.6.2.2  
a.  
PA-44

20. Labels are mounted on a flat surface.

6.6.2.2  
b.  
PA-44

21. Labels are positioned horizontally.

6.6.2.3  
a.(1)  
PA-43

22. This label is not a manufacturer's label placed directly on an instrument face.

PA-47

23. Vertical orientation of labels is used only when space is limited.

6.6.2.3  
a.(2)  
PA-43

24. Curved labels are avoided.

6.6.2.3  
b.  
PA-43

25. Labels do not obscure figures or scales which must be read.

6.6.2.4  
a.  
PA-47

### EVALUATION GUIDELINE

### REF.

26. Administrative procedures are in place for the periodic cleaning of labels.

6.6.2.4  
d.

27. Control position indicators will correspond with display labels.

6.9.1.2  
c.(3)

28. Printing is on the display face.

6.5.1.4  
a.(1)

### GENERAL LABELING PRINCIPLES

29. Controls, displays, and other equipment that will be located, identified, or manipulated are appropriately and clearly labeled.

6.6.1.1  
PA-28

30. Major labels are used to identify major systems on panel sections.

6.6.1.2  
a.(1)  
PA-29

31. Subordinate labels are used to identify subsystems or functional groups.

6.6.1.2  
a.(2)  
PA-49

32. Component labels are used to identify each component.

6.6.1.2  
a.(3)  
PA-49

33. Labels do not repeat information contained in higher-level labels.

6.6.1.2  
a.(4)

# HUMAN ENGINEERING CHECKLIST

## LABELING

| EVALUATION GUIDELINE  | REF.   | EVALUATION GUIDELINE  | REF.  |
|---|--|---|---|
| <p>34. Labels will be graduated in letter size as follows:</p> <ul style="list-style-type: none"> <li>o Major labels are 25% larger than subsystem/functional group labels.</li> <li>o Subsystem/functional group labels are 25% larger than component labels.</li> <li>o Component labels will be 25% larger than control position identifiers.</li> </ul> | <p>6.6.1.2<br/>b.(1)<br/>PA-50<br/>PA-31</p> <p>6.6.1.2<br/>b.(2)<br/>PA-50<br/>PA-31</p> <p>6.6.1.2<br/>b.(3)<br/>PA-50<br/>PA-31</p> | <p>39. Tag-out labels clearly identify out-of-service components and equipment, are securely affixed, do not obscure the label associated with the non-operable component and any adjacent devices, and are designed to physically prevent actuation of a control.</p> <p>40. The use of temporary labels is administratively controlled.</p> <p>41. A review procedure is used to determine if temporary labels will be used: (1) when needed; (2) how used; (3) content; (4) installation; (5) impact on other system equipment; (6) documentation requirements; (7) retraining requirements; (8) periodic review; and (9) removal.</p> | <p>6.6.5.1<br/>d. - h.</p> <p>6.6.5.2<br/>a.</p> <p>6.6.5.2<br/>b.(1-9)</p> |
| <p>35. Displays are identified as to whether they reflect demand or actual status.</p> <p>36. Display markings are black on a white background to provide high contrast.</p>  | <p>6.5.1.1<br/>e.(1)<br/>VD-89</p> <p>6.5.1.3<br/>c.(1)<br/>PA-59</p>  | <p>LOCATION AIDS</p> <p>42. Demarcation lines are visually distinctive from the panel background.</p> <p>43. Lines of demarcation are attached permanently.</p>   | <p>6.6.6.2<br/>b.<br/>CDI-13</p> <p>6.6.6.2<br/>c.</p>                      |
| <p>TEMPORARY LABELS</p> <p>37. Temporary labels are used only when necessary and conform to good human engineering principles.</p> <p>38. Temporary labels do not obscure prior permanent labels unless the old label is to be replaced.</p>  | <p>6.6.5.1<br/>a. &amp; b.</p> <p>6.6.5.1<br/>c.</p>   | <p>GENERAL LABELING READABILITY</p> <p>44. Character height subtends a minimum visual angle of 15 minutes or 0.004 X viewing distance.</p>  | <p>6.6.5.1<br/>a. and*<br/>6.6.4.1<br/>a.(1)<br/>PA-34</p>                  |

1. The first part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

2. The second part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

3. The third part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

4. The fourth part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

5. The fifth part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

6. The sixth part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

7. The seventh part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

8. The eighth part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

9. The ninth part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

10. The tenth part of the document is a list of names and their corresponding addresses. The names are listed in the left column, and the addresses are listed in the right column. The names are: John Doe, Jane Smith, and Bob Johnson. The addresses are: 123 Main St, 456 Elm St, and 789 Oak St.

| <b>LEGEND LIGHTS</b>   |  |
| 66. The legend is readable under ambient light conditions, with or without internal illumination.                                    | 6.4.3.3<br>b.(1)<br>and<br>6.5.3.3<br>a.(2)<br>CON-57        |
| 67. Legend lettering and contrast and use of color is consistent throughout the control room.  | 6.4.3.3<br>b.(3)   |
| 68. The legend messages are specific, unambiguous, and concise.  | 6.4.3.3<br>b.(4)<br>PA-35<br>and<br>6.5.3.3<br>b.(4)<br>VD-6 |
| 69. The legend messages contain no more than three lines of lettering.   | 6.4.3.3<br>b.(5)<br>and<br>6.5.3.3<br>b.(5)<br>CON-58        |
| 70. Where meaning of the light is not apparent, labeling is provided close to a legend light indicator.                              | 6.5.3.2<br>a.(1)**<br>VD-96                                  |
| 71. Legend lettering contrasts well with background when light is both on and off, under both ambient and transilluminated lighting. | 6.5.3.3<br>a.(3)<br>PA-59                                    |
| 72. Legends are worded to indicate status indicated by glowing light.  | 6.5.3.3<br>b.(7)   |

*[The page contains extremely faint, illegible markings and noise.]*

# HUMAN ENGINEERING CHECKLIST

## LABELING

| EVALUATION GUIDELINE  | REF.   | EVALUATION GUIDELINE   | REF.                                   |
|---|--|--|--|
| <p><b>MISCELLANEOUS</b></p> <p><b>Access Openings</b></p> <p>73. Each access opening is labeled # to identify the function of items accessible through it.</p> <p><b>Danger Safety Instructions</b></p> <p>74. All danger, warning, and safety instruction labels are in accordance with appropriate safety standards.</p> <p><b>Trend Recorders</b></p> <p>75. Labeling for trend recorders identifies the parameters recorded. If multi-pen, parameters are listed in order of associated scales or recorders.</p> <p><b>CONTROLS</b></p> <p>76. This switch must be used with the cover panel off and duplicate switch position labels are placed on the internal unit.</p> <p>77. See illustration on back. This label for concentric controls uses the following hierarchy: small solid dot, larger solid line, and larger broken circle. Nomenclature is adjacent to controls and identifies the function of each knob. Color coding is used to increase code-symbol reliability.</p> | <p>6.6.3.9<br/>a.<br/>PA-29</p> <p>6.6.3.9<br/>b.<br/>PA-29</p> <p>6.5.4.2<br/>a.(1)</p> <p>PA-51</p> <p>PA-52</p> | <p><b>LABELS — ORIENTATION</b></p> <p>78. The angle for viewing this # label is as shown in the figure on the back.</p> <p><b>LABELS — COLOR</b></p> <p>79. White alphanumeric characters on black background have thinner stroke widths than black characters on white background.</p> <p><b>LABELS — PANELS</b></p> <p>80. This panel is illuminated by ambient or individual illumination, and the stroke width on its label conforms with the following guidelines:</p> <p>a. Dark characters on light background have a stroke width 1/16 of the letter height.</p> <p>b. Light characters on dark background have a stroke width 1/8 of the letter height.</p> | <p>VD-21</p> <p>VD-38</p> <p>PA-38</p> |

1. The first part of the document is a list of the names of the persons who were present at the meeting.

## ANNUNCIATORS

\*Criteria are different.

\*\*0700 criteria are more specific.

\*\*\*1580 is more specific.

| EVALUATION GUIDELINE  | REF.             |
|---|------------------|
| <b>VISUAL DISPLAYS</b>  |                  |
| <b>Maintainability</b>  |                  |
| 1. Lamps may be replaced rapidly and conveniently from the front of the display panel.  | 6.3.3.1 c. VD-92 |
| 2. If necessary, operator aids are provided for lamp replacement.   | 6.3.3.1 c.       |
| 3. Bulbs may be removed and replaced while power is on without causing circuit component failure or personnel safety hazards.                                       | 6.3.3.1 c. VD-92 |
| 4. Legend screen or indicator covers are designed to prevent inadvertent interchange or to provide a check of proper installation.                                  | 6.3.3.1 c. VD-92 |
| 5. Incandescent display lamps have dual bulbs or filament redundancy to indicate need for replacement of a bulb or filament without degrading operator performance. | VD-91            |
| 6. Annunciators are designed so that failure of the circuits or bulbs is immediately apparent.  | VD-2             |
| 7. Failure of the annunciator circuit will not cause failure in the equipment associated with the display.  | VD-7             |

| EVALUATION GUIDELINE   | REF.                       |
|--|----------------------------|
| 8. Master light test control exists for each control panel using incandescent bulbs.                                     | VD-91                      |
| <b>Identification/Coding</b>   |                            |
| 9. High-priority or safety-related annunciators flash red, while all other lights do not flash or are a different color. | VD-95                      |
| 10. Annunciators or warning lights are separate from and clearly distinguishable from status indicators.                 | VD-96                      |
| 11. This annunciator is discriminably larger and brighter than other less critical legend lights.                        | VD-110                     |
| 12. This warning device attracts the attention of a busy or bored operator.  | 6.3.3.2 a. VD-112          |
| 13. The specific tile(s) on an annunciator panel use flashing illumination to indicate an alarm condition.               | 6.3.3.2 a. VD-109 VD-99*** |
| 14. This warning device specifies what is wrong or what action to take.  | VD-112                     |
| 15. This warning device allows continued attention to other duties.  | VD-112                     |
| 16. This warning device is not likely to fail or give false warnings.  | VD-112                     |

| DATE | DESCRIPTION | AMOUNT | CHECK NO. | BANK |
|------|-------------|--------|-----------|------|

# HUMAN ENGINEERING CHECKLIST

74

## ANNUNCIATORS

| EVALUATION GUIDELINE   | REF.                |
|--|---------------------|
| 17. Each matrix is labeled with alphanumeric codes for identification of individual tiles. The number of alarm tiles and the matrix density are kept low.  | 6.3.3.3<br>d.(1)    |
| 18. Appropriate alphanumeric codes appear on matrix axes for ready coordinate designation of a particular visual tile; coordinate designation is preferred on the left and top sides of the annunciator panel. | 6.3.3.3<br>c.(1)(2) |
| 19. Summary labels identify major alarm groups.  | 6.3.3.3             |
| 20. If used, brightness coding uses only two levels (bright and dim).  | VD-111              |
| 21. If brightness coding is used, bright represents primary items and dim represents background or supplementary information.  | VD-111              |
| 22. The maximum number of chromatic colors used on annunciators is five (total of seven, including black and white).   | VD-108              |
| C/D Relationships  |                     |
| 23. Flashing lights have a flash   | 6.3.3.2             |
| 31. Status lights indicating the   | VD-89               |
| flashless operation of a component with  | VD-100              |
| system off cycles from those of equal  | VD-109              |
| duration (e.g., 15 sec. for 15 sec.)   |                     |
| components.  |                     |

| EVALUATION GUIDELINE   | REF.   |
|--|--------|
| 24. Size-coded annunciators use a maximum of three sizes/steps.  | VD-111 |
| 25. Compound coding is usually less satisfactory than single coding if the single code used is the best available.                                   | VD-106 |
| 26. Coding in this annunciator system is consistent throughout the control room.   | VD-106 |
| 27. No color combinations which can be easily confused (e.g., red and orange; blue and purple) are used for coding annunciators in the control room. | VD-97  |
| 28. If used, symbols are clearly associated with the objects/conditions they represent.  | VD-110 |
| 29. Symbology codes use only simple, symmetrical symbols with enclosed areas, sharp angles, and/or smooth curves.                                    | VD-110 |
| 30. Symbolic codes avoid using variations of a single geometric form.  | VD-110 |

## ANNUNCIATORS

| EVALUATION GUIDELINE  | REF.                                | EVALUATION GUIDELINE   | REF.                                 |
|---|-------------------------------------|--|--------------------------------------|
| 32. Control devices associated with this annunciator are within readily reachable distances.                  | 6.3.4.1<br>VD-88                    | 41. Numeral width-to-height ratio is 3:5.  | 6.3.3.5<br>d.(3)*<br>VD-103<br>VD-40 |
| 33. Critical function indicators are located within 15° of the operator's normal line of sight.               | VD-90                               | 42. Letter height is identical for all tiles.  | 6.3.3.5<br>a.(2)                     |
| Readability   |                                     | 43. Type styles are consistent on all visual tiles.  | 6.3.3.5<br>b.(2)                     |
| 34. Annunciator visual tile legends are specific and unambiguous.   | 6.3.3.4<br>a.*<br>PA-55<br>VD-6     | 44. Stroke-width-to-character-height ratio is between 1:6 and 1:8.   | 6.3.3.5<br>d.(1)*<br>VD-105          |
| 35. Tile legends address specific conditions.   | 6.3.3.4<br>c.*<br>VD-6              | 45. Minimum space between characters is one stroke width.  | 6.3.3.5<br>d.(4)<br>PA-60            |
| 36. Legends are engraved.   | 6.3.3.5<br>c.(1)*<br>VD-103         | 46. Minimum space between words is the width of one character.   | 6.3.3.5<br>d.(5)<br>PA-61            |
| 37. Only upper-case type is used on visual tiles.   | 6.3.3.5<br>b.(3)<br>VD-103          | 47. Minimum space between lines is one-half the character height.  | 6.3.3.5<br>d.(6)<br>PA-62            |
| 38. Type styles are simple (no flourishes or serifs).   | 6.3.3.5<br>b.(1)<br>VD-103<br>VD-41 | 48. The operator is able to read all the annunciator tiles from the position at the work station where annunciator acknowledge control is located. | 6.3.3.5<br>a.<br>VD-90<br>VD-35      |
| 39. Numerals and letters do not vary in engraving depth.  | VD-103                              | 49. Legends provide high contrast with the tile background.  | 6.3.3.5<br>c.*<br>PA-59              |
| 40. Letter width-to-height ratio is between 1:1 and 3:5 or 100% to 60% for black letters on white background. | 6.3.3.5<br>d.(2)<br>VD-105<br>VD-40 | 50. Legends are dark lettering on light background.  | 6.3.3.5<br>c.(2)<br>VD-93            |

1. The first part of the document is a list of names and addresses of the members of the committee. The names are listed in alphabetical order, and the addresses are given in full. The list is as follows:

| Name         | Address                                    |
|--------------|--|
| Mr. A. B. C. | 123 Main St., New York, N.Y.               |
| Mr. D. E. F. | 456 Elm St., Boston, Mass.                 |
| Mr. G. H. I. | 789 Oak St., Chicago, Ill.                 |
| Mr. J. K. L. | 101 Pine St., Philadelphia, Pa.            |
| Mr. M. N. O. | 202 Cedar St., St. Louis, Mo.              |
| Mr. P. Q. R. | 303 Birch St., San Francisco, Cal.         |
| Mr. S. T. U. | 404 Maple St., Portland, Me.               |
| Mr. V. W. X. | 505 Spruce St., Seattle, Wash.             |
| Mr. Y. Z. A. | 606 Fir St., Denver, Colo.                 |
| Mr. B. C. D. | 707 Ash St., Minneapolis, Minn.            |
| Mr. E. F. G. | 808 Hickory St., Kansas City, Mo.          |
| Mr. H. I. J. | 909 Walnut St., Cincinnati, Ohio.          |
| Mr. K. L. M. | 1010 Chestnut St., Pittsburgh, Pa.         |
| Mr. N. O. P. | 1111 Sycamore St., Indianapolis, Ind.      |
| Mr. Q. R. S. | 1212 Poplar St., Louisville, Ky.           |
| Mr. T. U. V. | 1313 Magnolia St., Memphis, Tenn.          |
| Mr. W. X. Y. | 1414 Dogwood St., Savannah, Ga.            |
| Mr. Z. A. B. | 1515 Peach St., Atlanta, Ga.               |
| Mr. C. D. E. | 1616 Apple St., New Orleans, La.           |
| Mr. F. G. H. | 1717 Orange St., Miami, Fla.               |
| Mr. I. J. K. | 1818 Lemon St., Tampa, Fla.                |
| Mr. L. M. N. | 1919 Lime St., Jacksonville, Fla.          |
| Mr. O. P. Q. | 2020 Grape St., Orlando, Fla.              |
| Mr. R. S. T. | 2121 Strawberry St., Fort Lauderdale, Fla. |
| Mr. U. V. W. | 2222 Raspberry St., West Palm Beach, Fla.  |
| Mr. X. Y. Z. | 2323 Blueberry St., Boca Raton, Fla.       |
| Mr. A. B. C. | 2424 Blackberry St., Fort Myers, Fla.      |
| Mr. D. E. F. | 2525 Elderberry St., Naples, Fla.          |
| Mr. G. H. I. | 2626 Fig St., Sarasota, Fla.               |
| Mr. J. K. L. | 2727 Guava St., Venice, Fla.               |
| Mr. M. N. O. | 2828 Huckleberry St., Clearwater, Fla.     |
| Mr. P. Q. R. | 2929 Jamun St., Dunedin, Fla.              |
| Mr. S. T. U. | 3030 Kiwifruit St., Palm Bay, Fla.         |
| Mr. V. W. X. | 3131 Lychee St., Melbourne, Fla.           |
| Mr. Y. Z. A. | 3232 Mango St., Ft. Pierce, Fla.           |
| Mr. B. C. D. | 3333 Nectarine St., Sebring, Fla.          |
| Mr. E. F. G. | 3434 Olive St., Winter Haven, Fla.         |
| Mr. H. I. J. | 3535 Papaya St., Vero Beach, Fla.          |
| Mr. K. L. M. | 3636 Plum St., Ft. St. John, Fla.          |
| Mr. N. O. P. | 3737 Quince St., Palm Bay, Fla.            |
| Mr. Q. R. S. | 3838 Raisin St., Melbourne, Fla.           |
| Mr. T. U. V. | 3939 Strawberry St., Ft. Pierce, Fla.      |
| Mr. W. X. Y. | 4040 Tangerine St., Sebring, Fla.          |
| Mr. Z. A. B. | 4141 Ugli Fruit St., Winter Haven, Fla.    |
| Mr. C. D. E. | 4242 Watermelon St., Vero Beach, Fla.      |
| Mr. F. G. H. | 4343 Xigua St., Ft. St. John, Fla.         |
| Mr. I. J. K. | 4444 Yuzu St., Palm Bay, Fla.              |
| Mr. L. M. N. | 4545 Zucchini St., Melbourne, Fla.         |

## ANNUNCIATORS

| EVALUATION GUIDELINE   | REF.                  | EVALUATION GUIDELINE  | REF.       |
|--|-----------------------|---|------------|
| 65. The maximum number of audible signal codes by sound duration at any given time does not exceed three.          | AD-19                 | Operations  |            |
| 66. Changes in signal intensity are used as a spatial coding cue. Frequency is not used for spatial coding.        | AD-20                 | 74. Caution signals are distinguishable from warning signals.   | AD-31      |
| 67. The maximum number of spatially coded signals (via intensity changes) does not exceed four.                    | AD-20                 | 75. Similar audible signals are not contradictory in meaning.   | AD-18      |
| 68. Differences in sound intensity are distinct.   | AD-21                 | 76. Signals that increase progressively in level are not used where manual silencing is required.           | AD-7       |
| 69. The same signal should designate the same information at all times.  | 6.3.3.2 c.(2)<br>AD-1 | 77. Communication systems for warnings, such as loudspeakers, horns, etc., are not used for other purposes. | AD-12      |
| 70. More critical auditory signals are clearly distinguishable from those of lesser importance.                    | AD-3                  | 78. Auditory signals capture operator's attention without causing irritation or a startled reaction.        | 6.3.2.1 c. |
| 71. No more than seven different frequencies are used for coding all auditory displays, including warning systems. | AD-15                 | 79. Auditory alert mechanisms automatically reset after activation.   | 6.3.2.1 e. |
| 72. Auditory signals direct operator to location requiring action (localization).                                  | 6.3.2.1 f.<br>AD-3    | 80. Audible alarms are used in conjunction with warning lights, unless alarm is for evacuation.             | AD-23      |
| 73. Coded signals are used to alert operator to an alarm that is not within primary operating areas.               | 6.3.2.2 a.            | 81. Alarm system can be silenced.   | AD-8       |
|  |                       | 82. Auditory signals are not presented simultaneously.  | AD-3       |
|  |                       | 83. Alarm audibles are shut off only after initiation of the signals.                                       | AD-8       |

# HUMAN ENGINEERING CHECKLIST

## ANNUNCIATORS

| EVALUATION GUIDELINE   | REF.       | EVALUATION GUIDELINE   | REF.       |
|--|------------|--|------------|
| 84. System is equipped with manual initiation as a supplement to automatic initiation (e.g., evacuation, testing, etc.). | AD-30      | 92. Failure of audible alarm circuitry does not adversely affect equipment.                        | AD-11      |
| 85. An audible alarm is provided to indicate malfunctions in unmonitored equipment.                                      | CRE-21     | 93. Where signal intensity is adjustable, such adjustment is governed by administrative procedure. | 6.3.2.1 b. |
| 86. Cleared alarms have a dedicated distinctive audible signal of finite duration.                                       | 6.3.1.5 a. |  |            |
| 87. Audible alarms are discernible over ambient control room noise (level approx. 10 dB over ambient).                   | 6.3.2.1 a. |  |            |
| Arrangement  |            |  |            |
| 88. Sound sources are directed towards the operator.   | AD-6       |  |            |
| 89. Sound sources are placed at or above the head of the operator.   | AD-10      |  |            |
| Maintenance  |            |  |            |
| 90. Audio displays are equipped with circuitry test devices or other means of operability testing.                       | AD-10      |  |            |
| 91. Systems failures do not affect operability of audible alarm systems.   | AD-11      |  |            |

## ANTHROPOMETRIC

\*Criteria are different.

\*\*0700 is more specific.

### EVALUATION GUIDELINE

### REF.

#### WORKSPACE ARRANGEMENT

1. Minimum separation from the back of any desk to any opposing surface is 36 inches. 6.1.1.3\* e.(1) WA-21
2. Minimum lateral space for a seated operator is 30 inches. 6.1.1.3\* e.(2) WA-21
3. Minimum separation between a single row of equipment/panel and a wall is 50 inches. 6.1.1.3 f.(1) WA-20
4. Minimum separation between two rows of facing equipment if operated by one person is 50 inches. 6.1.1.3 f.(2) WA-20
5. Minimum separation between opposing rows of equipment where more than one person works simultaneously will be 8 feet. 6.1.1.3 f.(3) WA-20

#### STANDING OPERATIONS

6. Console height will not exceed 58 inches when a standing operator must see over it. 6.1.2.2 a.
7. The highest controls on a stand-up console allows a 5th percentile female to reach without stretching or using a stool, ladder, etc. 6.1.2.2 b.(1)\*\* VD-22

### EVALUATION GUIDELINE

### REF.

8. The lowest controls on a stand-up console allows a 95th percentile male to reach without bending or stooping. 6.1.2.2 b.(2)\*\* VD-22
9. Benchboard slope permits a 5th percentile female to reach all controls. 6.1.2.2 c.
10. Controls are set back a minimum of 3 inches from the front edge to protect against accidental activation. 6.1.2.2 d.(1)
11. No control is more than 25 inches from the front edge of the console. 6.1.2.2 d.(2)
12. All displays, including annunciators, are mounted so that they are within the upper limit of the visual field of the standing 5th percentile female. 6.1.2.2 e.(1)(a)
13. All displays and annunciators are mounted so that the angle from the line of sight to the face plane is 45° or greater. 6.1.2.2 e.(1)(b) VD-22
14. The oblique angle from the line of sight to a display located to either side of the working position from which the display must be read is at least 45°. 6.1.2.2 e.(2)
15. The maximum lateral spread of controls and displays at a single-operator work station does not exceed 72 inches. 6.1.2.2 f.

## ANTHROPOMETRIC

| EVALUATION GUIDELINE  | REF.                   | EVALUATION GUIDELINE  | REF.                        |
|---|------------------------|---|-----------------------------|
| 16. A clearance of 4 inches vertical and 4 inches horizontal is provided for foot room at the control board.  | 6.1.2.2<br>g.<br>WA-25 | 24. Displays are mounted so that the angle from the line-of-sight to the display face plane is 45° or greater.  | 6.1.2.3<br>e.(2)**<br>VD-22 |
| SEATED OPERATIONS   |                        | 25. Controls and displays for a seated operating sequence will be within maximum extended reach and viewing range of the seated operator specified on Figure 6.1-11.      | 6.1.2.3<br>f.(1)            |
| 17. Console height for seated operators is no higher than 45 inches above the floor if the operator must see over the console.  | 6.1.2.3<br>a.(1)       | 26. The operator will not have to bend/stretch significantly for operating sequences and sustained or precise control action.   | 6.1.2.3<br>f.(2)            |
| 18. When the seated operator need only monitor (not read) status lights and annunciators beyond the console, see-over console heights above 45 inches are acceptable. | 6.1.2.3<br>a.(2)       | 27. Sufficient foot and leg room will be provided under all tables, consoles, etc.  | 6.1.2.3*<br>g.<br>WA-27     |
| 19. All controls on a sit-down console are within the reach of the 5th percentile female.   | 6.1.2.3<br>b.          | 28. A surface at least 16 inches deep and 24 inches wide is provided for writing; for other kinds of seated tasks, the surface will be 16 inches deep and 30 inches wide. | 6.1.2.3*<br>h.(1)<br>WA-27  |
| 20. The benchboard slope is within the functional reach of the 5th percentile female.   | 6.1.2.3<br>c.          | SIT-STAND WORK STATIONS   |                             |
| 21. Controls are set back a minimum of 3 inches from the front edge to protect against accidental activation.   | 6.1.2.3<br>d.(1)       | 29. Height and lateral limits for controls and displays conforms to 6.1.2.2 (see attached).   | 6.1.2.4<br>(a)              |
| 22. Controls are not mounted farther than 25 inches from the console edge.  | 6.1.2.3<br>d.(2)       | 30. A high chair is available so that seated eye level is the same as standing eye level.   | 6.1.2.4<br>(b)              |
| 23. All displays and annunciators are mounted so that they are less than 75° above the horizontal line-of-sight of the seated 5th percentile female.                  | 6.1.2.3<br>e.(1)       |   |                             |

# HUMAN ENGINEERING CHECKLIST

## FORCE/TORQUE

| EVALUATION GUIDELINE   | REF.                          |
|--|-------------------------------|
| 1. Toggle switches have an elastic resistance that increases as the control is moved and drops as the switch snaps into position.                            | 6.4.5.3<br>a.<br>CON-65       |
| 2. Knobs for spring-loaded momentary contact rotary selector controls are large enough to be easily held against the spring torque for as long as necessary. | 6.4.4.5<br>f.                 |
| 3. The resistance for rocker switches is a minimum of 10 ounces and a maximum of 40 ounces.  | 6.4.5.4<br>e.(2)<br>CON-70    |
| 4. Rocker switch resistance gradually increases, then drops to zero when the control snaps into position.  | 6.4.5.4<br>c.(1)<br>CON-71    |
| 5. This resistance precludes the switch being placed between positions.  | 6.4.5.4<br>c.(2)<br>CON-71    |
| 6. Resistance of a large toggle switch is 10 ounces minimum and 40 ounces maximum.   | 6.4.5.3<br>c.(4)<br>CON-64    |
| 7. Resistance of a small toggle switch is a minimum of 10 ounces and a maximum of 16 ounces.   | 6.4.5.3<br>c.(3)<br>CON-64    |
| 8. Resistance of thumbwheel controls is a minimum of 6 ounces and a maximum of 20 ounces.  | 6.4.5.1<br>d.(2)(e)<br>CON-92 |

| EVALUATION GUIDELINE  | REF.                       |
|---|----------------------------|
| 9. Resistance of continuous adjustment thumbwheels is between 3 and 6 ounces.   | 6.4.5.1<br>c.(2)<br>CON-97 |
| 10. Resistance of rotary selector controls is a minimum of 1.0 inch/lb. and a maximum of 6.0 inch/lbs.  | 6.4.4.5<br>e.(5)<br>CON-32 |
| 11. Knob torque for continuous adjustment rotaries is within the range of 4.5 to 6.0 inch/ounces.   | 6.4.4.4<br>d.<br>CON-39    |
| 12. Resistance of key-operated controls is 1.0 inch/lb. minimum and 6.0 inch/lbs. maximum.  | 6.4.4.3<br>g.(3)<br>CON-46 |
| 13. Resistance for legend push-buttons is a minimum of 10 ounces and a maximum of 40 ounces.  | 6.4.3.3<br>e.(5)<br>CON-56 |
| 14. Resistance for round push-buttons is a minimum of 10 ounces and a maximum of 40 ounces.   | 6.4.3.2<br>d.<br>CON-50    |
| 15. Control knobs or handles do not rotate, slip, or move loosely on their shafts so as to retain full characteristics during its service life. | 6.4.1.1<br>e.(2)           |
| 16. No internal wear or breakage occurs to alter the "feel" or other sensory feedback of the control.   | 6.4.1.1<br>e.(3)           |

# HUMAN ENGINEERING CHECKLIST

## COMMUNICATIONS

\*Criteria are different.

\*\*0700 is more specific.

| EVALUATION GUIDELINE  | REF.                       |
|---|----------------------------|
| 1. Fixed-base UHF transceivers provide a frequency response of at least 200-3300 Hz and sufficient dynamic range for handling speech characteristics. | 6.2.1.5<br>a.<br>COM-1     |
| 2. Gain is adjustable, with the lowest setting allowing audibility.   | 6.2.1.5<br>b.<br>COM-4     |
| 3. Procedures are established and posted for the use of the UHF system.   | 6.2.1.5<br>c.              |
| 4. The announcing system provides a good frequency response of 200-3300 Hz, to achieve intelligibility.   | 6.2.1.6<br>a.(1)<br>COM-1  |
| 5. Loudspeakers are placed to adequately cover all necessary areas without "Dead Spots".  | 6.2.1.6<br>a.(2)<br>COM-9  |
| 6. Microphone frequency response is compatible with the system.   | 6.2.1.6<br>b.(1)<br>COM-15 |
| 7. Powered telephones, used with the system, have microphones compatible with the announcing system.  | 6.2.1.6<br>b.(2)           |
| 8. Microphones are highly sensitive to speech signals.  | 6.2.1.6<br>b.(3)           |
| 9. Microphone dynamic range permit 50dB variations in signal input.   | 6.2.1.6<br>b.(4)<br>COM-15 |

| EVALUATION GUIDELINE  | REF.                       |
|---|----------------------------|
| 10. Microphone input is provided within the control room.                                       | 6.2.1.6<br>b.(5)           |
| 11. Speakers are provided in all areas where control room personnel might be.                   | 6.2.1.6<br>c.(1)<br>COM-26 |
| 12. Speakers are placed to yield an intelligible level of signal throughout the area.           | 6.2.1.6<br>c.(2)           |
| 13. Procedures are outlined for the proper manner of speaking on the announcing system.         | 6.2.1.6<br>d.              |
| 14. Speaker volume is adjustable to allow detection of auditory alarms.                         | 6.2.1.6<br>e.(1)<br>COM-4  |
| 15. Lowest gain control setting allows audibility of communication.                             | 6.2.1.6<br>e.(2)<br>COM-4  |
| 16. Control room inputs have priority to interrupt or bypass messages on the announcing system. | 6.2.1.6<br>f.              |
| 17. Point-to-point intercoms connect the control room with important plant areas.               | 6.2.1.7                    |
| 18. The system provides adequate frequency response from 200-3300 Hz.                           | 6.2.1.7<br>a.              |
| 19. Gain is adjustable at each intercom unit, with lowest setting allowing audibility.          | 6.2.1.7<br>b.              |

| EVALUATION GUIDELINE   | REF.                        | EVALUATION GUIDELINE   | REF.                      |
|--|-----------------------------|--|---------------------------|
| 54. Headsets provide hands-free operation, except where push-to-talk switches become necessary in areas of high ambient noise.                                     | 6.2.1.3<br>b.(4)<br>COM-20* | 63. Patch panels are marked conspicuously and located in accessible areas, especially in back-panel areas.   | 6.2.1.3<br>e.(2)          |
| 55. Binaural headsets are used in areas with high ambient noise, remote from the control room.   | 6.2.1.3<br>b.(5)            | 64. A complete set of patch cords are provided at each panel.  | 6.2.1.3<br>e.(3)          |
| 56. Headset storage area is well-marked and accessible.  | 6.2.1.3<br>b.(6)            | 65. Walkie-talkies have a good frequency response between 200 and 3300 Hz.   | 6.2.1.4<br>a.(1)          |
| 57. Need for ringing is determined by the plant depending on sound-powered phone procedures.   | 6.2.1.3<br>c.(1)            | 66. There is sufficient dynamic range and gain to handle instantaneous speech pressures and to develop necessary signal level at headphone or loudspeaker of walkie-talkies. | 6.2.1.4<br>a.(2)<br>COM-1 |
| 58. If ringing is not installed, the user is provided the capability for switching the sound-powered transmitter to the paging system to call a party to the line. | 6.2.1.3<br>c.(2)            | 67. Walkie-talkie radio frequency is broad enough for uninterrupted communication with control room.   | 6.2.1.4<br>b.(1)          |
| 59. Plug-in jacks for the sound-powered system are provided in the control room.   | 6.2.1.3<br>d.(1)            | 68. Use of walkie-talkies is restricted in areas where low-level analog or digital equipment are affected by frequency bands.  | 6.2.1.4<br>b.(2)          |
| 60. Jacks are located close to the work stations to prevent the need for unduly long cords.  | 6.2.1.3<br>d.(2)            | 69. Walkie-talkies are light and portable.   | 6.2.1.4<br>c.(1)          |
| 61. Jacks accommodate only the sound-powered phone system (not conventionally powered phone systems).  | 6.2.1.3<br>d.(3)            | 70. Walkie-talkie portability allows one hand, and preferably both, free for other tasks.  | 6.2.1.4<br>c.(2)          |
| 62. Requirements for switching with sound-powered phones are assessed for the plant based on procedures for use of sound-powered phones.                           | 6.2.1.3<br>e.(1)            | 71. Microphones are integrated into the transceiver package of the walkie-talkie.  | 6.2.1.4<br>c.(3)          |

## COMMUNICATIONS

| EVALUATION GUIDELINE  | REF.                | EVALUATION GUIDELINE   | REF.   |
|---|---------------------|--|--------|
| 72. Party identification is required and provided for when more than two parties are using the same channel on the walkie-talkie at separate locations. | 6.2.1.4 d.          | 80. Communication devices are labeled and color-coded (emergency, normal, etc.).                                       | COM-19 |
| 73. Adjustable signal detection for warning systems is controlled by administrative procedure.  | 6.3.2.1 b.          | 81. Emergency and most frequently used communication devices are immediately accessible.                               | COM-19 |
| 74. The warning signal captures the operator's attention but does not cause irritation or startled reaction.  | 6.3.2.1 c.          | 82. Communication devices are easily reached.  |        |
| 75. Each auditory signal is adjusted to result in approximately equal detection levels at normal operator work stations in the primary operating area.  | 6.3.2.1 d.          | 83. Microphones for this equipment are protected against breath blast and moisture condensation.                       | COM-16 |
| 76. The annunciator auditory alert mechanism automatically resets when it is silenced.  | 6.3.2.1 e.<br>AD-9  | 84. Receiver control layout for this device is "station-select" by the right hand and volume control by the left hand. | COM-23 |
| 77. The operator is able to identify the work station or the system where the auditory alert signal originated.   | 6.3.2.1 f.*<br>AD-5 | 85. This communications system allows emergency messages top priority.   | AD-3   |
| 78. This communications system uses auditory signals only for a few of the most urgent warnings.  | VD-4                | 86. This communications device has individual visual signals for each channel to show which channel is in use.         | COM-10 |
| 79. Reach to communication devices and controls is unobstructed.  |                     | 87. This device does not use channel sharing.  | COM-10 |
|   |                     | 88. For this infrequently used device, instructions are provided.  |        |
|   |                     | 89. This microphone does not overload with signals as high as 125-130 dB.  | COM-15 |

## COMMUNICATIONS

| EVALUATION GUIDELINE   | REF.   |
|--|--------|
| 90. This is a directional microphone if feedback "squeal" is a problem.  | COM-16 |
| 91. This communications system has loudspeakers of different communication channels separated at least 10° from the operator's position.                                     | COM-12 |
| 92. This headset has a frequency response as broad as that of the remainder of the system.   | COM-21 |
| 93. These headphones and loudspeakers can reproduce sound from 100 to 4000 Hz.   | COM-5  |
| 94. This headset receiver has a uniform frequency response between 300 and 4000 Hz.  | COM-23 |
| 95. This device transmits sounds from 250 to 4000 Hz.  | COM-1  |
| 96. This headset has 2 speech channels, and one channel is fed into one ear and the other channel into the other ear <u>or</u> both signals are "picket-fenced" at 30-40 Hz. | COM-10 |
| 97. This headset receiver has enough electrical power to drive peak sound-pressure level to 131 dB when using two earphones.   | COM-23 |
| 98. This headset/handset allows speaker to hear own voice in phase with speech.  | COM-8  |

| EVALUATION GUIDELINE   | REF.            |
|--|-----------------|
| 99. This emergency communication device is permanently installed.  |                 |
| 100. Where speaker reverberation is a problem, many low powered loudspeakers are present, rather than a few powerful loudspeakers.               | COM-9           |
| 101. High-quality communications have a dynamic range of 60 dB; commercial broadcast 40-45 dB.   | COM-1           |
| 102. This microphone has high pass filters to reduce frequency noises, and frequency-selective filters to give characteristic timbre to signals. | COM-3<br>COM-10 |
| 103. This device has controls capable of controlling sound pressure levels to 110 dB.  | COM-4           |
| 104. This carbon microphone has no "packing" of the carbon granules.   | COM-15          |
| 105. Carbon microphone is avoided if quality criteria demand a truly linear response characteristic of very low background noise.                | COM-15          |
| 106. A ribbon microphone is not used for close talking unless specifically designed for this use.  | COM-15          |

TOP SECRET "GOLDEN BIRD"

2. 2000年12月15日，在“2000年中国城市竞争力”会议上，中国城市竞争力研究会发布了《2000年中国城市竞争力报告》。

## COMMUNICATIONS

|      |   |        |  |
|------|---|--------|--|
| 107. | Audio signals provided over operator headsets are coded the same as their respective annunciators.                  |        |  |
| 108. | This microphone has a high sensitivity to acoustic speech signals.  | COM-7  |  |
| 109. | This microphone rejects distracting acoustic signals and noises at the speaker's location.                          | COM-6  |  |
| 110. | This headset receiver has gain control with dynamic range to make the signal 15 dB more intense than ambient noise. | COM-23 |  |

# HUMAN ENGINEERING CHECKLIST

## MAINTAINABILITY

\*Criteria are different.

\*\*0700 is more specific.

| EVALUATION GUIDELINE   | REF.                 | EVALUATION GUIDELINE   | REF.                 |
|--|----------------------|--|----------------------|
| 1. There is an adequate supply of expendables and spare parts — fuses, bulbs, ink, inking pens, recorder charts, printer paper, etc. | 6.1.1.5 a.           | 10. Legend lights which provide a @ "maintenance or adjustment" status are uncovered or non-visible during normal operation, but are readily accessible. | VD-90                |
| 2. Expendables and spare parts are readily accessible.   | 6.1.1.5 b.           | 11. Legend covers are keyed to prevent interchanging.  | 6.4.3.3 c.(4) CON-57 |
| 3. All necessary tools to install expendables and spare parts are available.   | 6.1.1.5 c.           | 12. Display failure is apparent to the operator.   | 6.5.1.1 f. VD-7 VD-2 |
| 4. There is adequate storage space for expendables and spare parts.  | 6.1.1.5 d.** WA-33   | 13. Dual-bulbs or dual-filaments are used.   | 6.5.3.1 a.(1) VD-91  |
| 5. The variety of expendables is clearly and distinctively marked to avoid misapplication.   | 6.1.1.5 e.           | 14. Bulb test capability is provided.  | 6.5.3.1 a.(2) VD-91  |
| 6. Records of the status of expendables and spare parts are kept.  | 6.1.1.5 f.           | 15. Bulb replacement while power is on is provided without being hazardous to personnel.   | 6.5.3.1 a.(3) VD-92  |
| 7. For lighted displays, a lamp test capability is provided.   | 6.4.3.3 c.(1) CON-57 | 16. For lighted displays, all light covers are keyed to prevent interchangeability.  | 6.5.3.1 c.(2) VD-92  |
| 8. Pushbutton lamps are replaceable from front of panel.   | 6.4.3.3 c.(2) CON-57 | 17. Paper, ink, and other expendables are provided and accessible in the control room.   | 6.5.4.1 e.           |
| 9. Legend pushbuttons do not malfunction or activate inadvertently during lamp removal or replacement.                               | 6.4.3.3 c.(3)        | 18. Recorder design permits quick and easy replenishment of paper and ink.   | 6.5.4.1 f. VD-78     |

# HUMAN ENGINEERING CHECKLIST

## TASK ANALYSIS

| EVALUATION GUIDELINE   | REF.          | EVALUATION GUIDELINE  | REF.                  |
|--|---------------|---|-----------------------|
| <b>UNIT INTEGRATION</b>  |               | <b>GENERAL PRINCIPLES</b>   |                       |
| 1. All controls and displays needed for (1) detection of abnormal conditions and (2) bringing the plant to a safe shutdown condition are included in the control room. | 6.1.1.1 a.    | 7. Each control provides a sufficient range of control.   | 6.4.1.1 a.(1)         |
| 2. Control of plant equipment from one control room does not affect the ability of operators of other control rooms to maintain control of their units.                | 6.1.3.1 e.(1) | 8. There is a good reason to require a control for the function concerned.  | 6.4.1.1 b.(1)         |
| 3. The status of plant equipment under the control of one control room is displayed in all control rooms capable of controlling that equipment.                        | 6.1.3.1 e.(2) | 9. The precision and range of a control does not exceed the need.   | 6.4.1.1 b.(3)         |
| 4. Availability status indications are displayed in all control rooms if control of plant renders that equipment unavailable to other control rooms.                   | 6.1.3.1 e.(3) | 10. Controls are functionally grouped and are in the same location from panel to panel.   | 6.4.2.2 b.<br>CON-8/9 |
| 5. A single, centrally located control panel/console is used for dual-unit control rooms.  | 6.1.3.1 e.(4) | 11. Pushbuttons in a row or matrix are positioned in a logical order, or in an order related to the procedural sequence.                      | 6.4.3.1 a.            |
| 6. Administrative procedures are in place which assign responsibility for allocation of use of controls of shared plant equipment to a single control room.            | 6.1.3.1 e.(5) | 12. Analysis of operator tasks is recommended to establish operator information requirements.   | 6.5.1.1 a.            |
|  |               | 13. Visual displays provide all information about the system status and parameter values that is needed in all situations of plant operation. | 6.5.1.1 b.**<br>VD-6  |
|  |               | 14. Only needed information is displayed in the operating area.   | 6.5.1.1 c.**<br>VD-7  |
|  |               | 15. Visual display of actual system/equipment status is displayed for all important parameters.   | 6.5.1.1 e.(2)         |

# HUMAN ENGINEERING CHECKLIST

## TASK ANALYSIS

| EVALUATION GUIDELINE  | REF.                |
|---|---------------------|
| 16. Scale units is consistent with the degree of precision and accuracy needed by the operator.                           | 6.5.1.2 a.          |
| 17. Percentage indication is used when the parameter is meaningfully reflected by percentage.                             | 6.5.1.2 c.<br>VD-6  |
| 18. Scales span the expected range of operational parameters.   | 6.5.1.2 d.(1)       |
| 19. Scales employ the appropriate scale ranging techniques.   | 6.5.1.2 d.(2)       |
| 20. Scales are supported by auxiliary wide-range instruments.   | 6.5.1.2 d.(3)       |
| 21. Display dynamic sensitivity is selected to minimize the display of normal random variations in equipment performance. | 6.5.1.2 f.          |
| 22. Scales are compatible in numerical progression and scale organization.  | 6.5.1.5 d.<br>VD-71 |
| 23. Recorders are used to record trend information and material which may be needed for later reference.                  | 6.5.4.1 g.<br>VD-78 |
| 24. Recorders are located within primary operating areas.   | 6.5.4.1 h.          |
| 25. There will be no mismatch between nomenclature used in procedures and that printed on the labels.                     | 6.6.3.3 c.<br>PA-63 |

| EVALUATION GUIDELINE   | REF.                      |
|--|---------------------------|
| 26. Controls and displays are functionally grouped within the constraints of grouping by task sequence.                                    | 6.8.1.1 b.<br>CDI-8       |
| 27. Controls and displays are grouped according to importance and frequency of use within the constraints of grouping by task sequence.    | 6.8.1.1 c.<br>CDI-9       |
| 28. The location of controls and displays within a single panel makes the most effective use of the viewing and manual manipulative areas. | 6.8.1.2                   |
| 29. Groups of components on a panel are physically spaced so that the boundaries of each group are obvious.                                | 6.8.1.3 a.**<br>CDI-14    |
| 30. Demarcation lines circumscribe functional or selected groups of controls and displays with a contrasting line.                         | 6.8.1.3 b.**<br>CDI-13    |
| 31. Displays observed in a specified sequence are grouped together, preferably in a left-to-right, top-to-bottom, or natural sequence.     | 6.8.2.1 a.(1)<br>VD-18    |
| 32. Controls operated sequentially are grouped together, preferably in a left-to-right, top-to-bottom, or natural sequence.                | 6.8.2.1 a.(2)**<br>CON-10 |
| 33. Layout of related controls and displays is symmetrical.  | 6.8.2.1 a.(3)<br>CDI-8    |

# HUMAN ENGINEERING CHECKLIST

## TASK ANALYSIS

| EVALUATION GUIDELINE   | REF.                       | EVALUATION GUIDELINE  | REF.                       |
|--|----------------------------|---|----------------------------|
| 51. If not feasible to mount controls directly below the display, controls are mounted to the right of the display.                      | 6.9.1.2<br>a.(4)           | 59. When techniques (50) and (51) do not apply or a c/d relationship is not apparent, layout enhancement techniques are employed (see 6.8.1.3). | 6.9.1.2<br>b.(6)<br>CDI-13 |
| 52. Where there is a normal order of use, controls are arranged for use in left-to-right, top-to-bottom, or other natural sequence.      | 6.9.1.2<br>a.(5)<br>CDI-10 | <b>DISPLAY SELECTORS</b>  |                            |
| 53. When techniques in (50) or (51) cannot be employed, layout enhancement techniques are employed — spacing, demarcation, color coding. | 6.9.1.2<br>a.(6)<br>CDI-13 | 60. The control moves clockwise from OFF through settings 1, 2, 3... n.   | 6.9.1.2<br>c.(1)           |
| <b>SINGLE CONTROL, MULTIPLE DISPLAYS</b>   |                            | 61. The control position sequence conforms to the display sequence.   | 6.9.1.2<br>c.(2)<br>CDI-8  |
| 54. Displays are located above the control.  | 6.9.1.2<br>b.(1)<br>CDI-11 | 62. Multiple controls or displays related to the same function are grouped together.  | 6.9.2.1<br>a.<br>CDI-8     |
| 55. Controls are placed near the display and preferably under the center of the display array.   | 6.9.1.2<br>b.(2)<br>CON-11 | 63. Sequence of use is left-to-right, top-to-bottom.  | 6.9.2.1<br>b.<br>CDI-8     |
| 56. Displays are arranged horizontally or in a matrix.   | 6.9.1.2<br>b.(3)<br>CON-11 | <b>SINGLE PANEL ARRANGEMENTS</b>  |                            |
| 57. If not feasible to mount displays above the control, they are mounted to the left of the control.                                    | 6.9.1.2<br>b.(4)           | 64. Each display is located directly above its associated control.  | 6.9.2.2<br>a.(1)<br>CDI-10 |
| Where there is a normal order of use, displays will read from left-to-right, top-to-bottom, or in other natural sequence.                | 6.9.1.2<br>b.(5)<br>CDI-10 | 65. Display/control pairs are arranged in rows.   | 6.9.2.2<br>a.(2)<br>CDI-11 |
|  |                            | 66. Each control occupies the same relative position as the display to which it is associated.  | 6.9.2.2<br>b.(1)           |

# HUMAN ENGINEERING CHECKLIST

## TASK ANALYSIS

| EVALUATION GUIDELINE  | REF.                       |
|---|----------------------------|
| 67. Controls and displays have corresponding labels.  | 6.9.2.2<br>b.(2)<br>PA-32  |
| <b>MULTI-ROW DISPLAYS WITH SINGLE-ROW CONTROLS</b>  |                            |
| 68. Displays are ordered left-to-right, top-to-bottom, and matched to controls ordered left to right.                       | 6.9.2.2<br>c.(1)<br>CDI-11 |
| 69. Controls and displays have corresponding labels.  | 6.9.2.2<br>c.(2)<br>PA-32  |
| <b>CONSISTENCY</b>  |                            |
| 70. Arrangement of functionally similar controls and displays conform throughout the control room.                          | 6.9.2.2<br>d.              |
| 71. Modular control/display packages are selected and arranged to achieve maximum conformity to 6.9.2.2 (a-d).              | 6.9.2.2<br>e.              |
| 72. Where displays are on separated panels, they are preferably on the adjacent upper panel from their associated controls. | 6.9.2.3<br>a.              |
| 73. Related controls and displays are not located on separate panels that face each other.                                  | 6.9.2.3<br>b.              |

| EVALUATION GUIDELINE  | REF.                      |
|---|---------------------------|
| <b>GENERAL MOVEMENT RELATIONSHIPS</b>   |                           |
| 74. A clockwise turn of a rotary control results in its associated linear scales moving up or to the right.                                     | 6.9.3.1<br>a.(1)<br>CDI-1 |
| 75. A clockwise turn of a rotary control results in its associated digital display to increase in value.  | 6.9.3.1<br>a.(2)          |
| 76. A clockwise turn of a rotary control results in its associated strings of indicator lights moving from bottom to top or from left to right. | 6.9.3.1<br>a.(3)          |
| 77. A clockwise turn of a rotary control results in its associated circular meters moving clockwise.  | 6.9.3.1<br>a.(4)<br>CDI-1 |
| 78. Movement of a linear control up or to the right causes associated linear scales to move up to the right.                                    | 6.9.3.1<br>b.(1)          |
| 79. Movement of a linear control up to the right causes associated digital display to increase in value.  | 6.9.3.1<br>b.(2)          |
| 80. Movement of a linear control up to the right causes associated strings of indicator lights, to move from bottom to top or left to right.    | 6.9.3.1<br>b.(3)          |

## WALK-THROUGH

| EVALUATION GUIDELINE  | REF.             | EVALUATION GUIDELINE  | REF.                       |
|---|------------------|---|----------------------------|
| 1. When continuous monitoring or the timing of control actions are critical, operators do not have to leave the primary operating area.             | 6.1.1.1<br>b.    | 9. Controls and displays are assigned to work stations so as to minimize operator movement.   | 6.8.1.1<br>a.<br>CDI-8     |
| 2. Control room manning and task assignments ensure complete and timely coverage of controls, displays, and other equipment during plant operation. | 6.1.1.2<br>a.    | 10. Control actuation does not result in inadvertent actuation of an adjacent control.  | 6.8.3.1<br>b.<br>CON-13    |
| 3. Activities and task assignments are planned to ensure proper coordination of additional personnel who augment the normal crew.                   | 6.1.1.2<br>b.    | 11. A visual display that is monitored during control manipulation is located sufficiently close so an operator can read it clearly and without parallax from a normal operating posture. | 6.9.1.1<br>a.<br>CDI-8     |
| 4. Control room arrangement minimizes interference between members of the operational crew.   | 6.1.1.3<br>d.(2) | 12. Controls and displays are located so that displays are not obscured during control operation.   | 6.9.1.1<br>b.<br>CDI-10    |
| 5. Potential task loading is evaluated to ensure that every unit can be covered adequately in all situations.                                       | 6.1.3.1<br>c.    | 13. Displays are not obscured by manipulation.  | 6.9.1.2<br>b.(7)<br>CDI-11 |
| 6. Controls are easily adjusted with the required level of precision.   | 6.4.1.1<br>a.(2) | 14. There is no lag time between system condition change and display indication.  | 6.9.3.1<br>c.(1)           |
| 7. Duplication of controls not occur, except for a specific reason.   | 6.4.1.1<br>b.(2) | 15. When there is a time lag between control actuation and ultimate system state, there is an immediate feedback indication of the process and direction or parameter change.             | 6.9.3.1<br>c.(2)           |
| 8. Each control is the type normally anticipated for the operation concerned.   | 6.4.1.1<br>c.(2) | 16. Feedback from the display is apparent for any deliberate movement of a control.   | 6.9.3.2<br>d.              |
