# GUIDANCE FOR UNDERSTANDING AND INTERPRETING THE DRAFT 2016 303(d) LIST

October, 2016

## ***What Is the 303(d) List and Why Is It Important?***

Section 303(d) of the federal Clean Water Act requires that states develop a compilation of the streams and lakes that are “water quality limited” or are expected to exceed water quality standards in the next two years and need additional pollution controls (i.e. a Total Maximum Daily Load). Water quality limited streams are those that have one or more properties that violate water quality standards. They are considered impaired by pollution and not fully meeting designated uses.

Additionally, stream considered threatened by pollutants are also appropriate for 303(d) listing, if the trend is likely to lead to a criterion being violated. The 303(d) List prioritizes impacted streams for specialized studies called Total Maximum Daily Load (TMDL). In one waterbody, Barkley Reservoir, a Total Maximum Daily Thermal Load study is needed.

The 2016 303(d) List will update and when finalized, will replace the previous one published 2014.

Once a stream has been placed on the 303(d) List, it is considered a priority for water quality improvement efforts. These efforts include traditional regulatory approaches such as permit issuance and enforcement, but also include efforts to control pollution sources that have historically been exempted from regulations, such as certain agricultural and forestry activities.

If a stream is impaired, regardless of whether or not it appears on the 303(d) List, the Division cannot authorize additional loadings of the same pollutant(s). It may mean that dischargers will not be allowed to expand or locate on 303(d) listed streams

until the sources of pollution have been controlled.

## **WHAT’S NEW FOR 2016**

### **Reassessment of Group 2 and Group 3 Watersheds**

Consistent with the watershed approach, the major difference between the 2014 and 2016 versions of the List is the reassessment of the Group 2 and 3 watersheds. It is in these areas of the state that the reviewer will note the most significant assessment changes.

### **More Formalized Use of Evaluated Assessments**

Division policy has always allowed the use of stream information beyond the traditional in-stream biological and chemical data for use in water quality assessments. In 2016, this policy was formalized into a guidance document developed prior to completion of the Group 3 reassessments. Alternative data sources include biological data older than 5 years that either scored very well or very poorly; severely habitat-impaired streams that have not changed such as concrete-lined channels; and highly protected streams within national parks or natural areas. This guidance can be accessed at:

<http://www.tn.gov/environment/article/wr-wq-water-quality-reports-publications> .

### **Use of EPA’s Recovery Potential Tool (RPT) in Planning Watershed Monitoring**

The Department used the RPT to identify high priority monitoring sites for Group 4 watersheds. The RPT works by searching databases and GIS coverages for attributes selected by staff. This methodical approach will help make the most of our monitoring resources and will insure that high priority streams get monitored.

### 303(d) ASSESSMENT CATEGORIES USED IN 2016

The assessment categories suggested by EPA have been incorporated into the development of the 2016 303(d) List. Each stream or lake in Tennessee has been placed into one of the following categories.

- Category 1** Waterbody or waterbody segment meets all designated uses.
- Category 2** Waterbody or waterbody segment meets some designated uses, but data are not available in order to determine whether all uses are being met.
- Category 3** Insufficient data exists to determine whether any uses are being met.
- Category 4a** One or more uses are not being met. However, TMDLs have been completed and approved for the listed pollutants.
- Category 4b** One or more uses are not being met. However, a TMDL is not needed because compliance with water quality standards will be achieved in the short-term by a more traditional approach, such as permitting or enforcement.
- Category 4c** One or more uses are not being met. However, the impairment is not being caused by a pollutant.
- Category 5** One or more uses are not being met. A TMDL is needed for the listed pollutants.

#### Notes concerning the above categories:

1. As with the 2012 and 2014 lists, Tennessee has used Category 4c for segments impacted by flow alteration as that is not a pollutant and a TMDL is not needed. If commenters suggest additional causes as appropriate for Category 4c, these will be considered on a case-by-case basis. Our conclusions will be documented in a *Summary of Public Comments and Departmental Responses* following the end of the comment period.
2. Some streams, were proposed as Category 4b. These are cases where for on specific streams, traditional approaches such as permitting or enforcement are in place and are expected to lead to water quality standards being met in the short-term; therefore a TMDL is not needed. If additional streams are suggested for Category 4b, we will consider them for the final version.
3. Category 4a was only used for those streams where all TMDLs have been completed. If additional TMDLs were needed in a segment, it was identified as Category 5, even if some TMDLs were approved.

### ***How Were the Waters of Tennessee Assessed for this Document?***

The assessment of Tennessee's waters was based on a water quality evaluation that took place during 2015 and 2016. Water quality data collected at hundreds of streams in Tennessee were compared to existing water quality criteria (Chapter 0400-40-03). Data were compared to numeric water quality criteria or narrative criteria which may contain "free from" statements. Often in the case of narrative criteria, data are compared to appropriate ecoregion reference streams.

Details of the monitoring design and assessment process are provided in TDEC's *Quality Assurance Project Plan (QAPP) for 106 Monitoring in the Division of Water Resources*. This document is posted on the department's webpage at <http://www.tn.gov/environment/article/wr-wq-water-quality-reports-publications>

Information concerning monitoring design and sampling procedures from other agencies who supplied additional data used in Tennessee's assessment process can be requested from the specific agencies.

### ***Which Tennessee Streams Are Not On the 303(d) List?***

Streams considered unpolluted (Categories 1 or 2), plus streams that the Division cannot assess due to a lack of water quality information (Category 3), are not found on the List.

Thus, any stream not on the 303(d) List can be assumed to be either unassessed or unpolluted.

### ***On What Basis Can Waterbodies Be Removed From the 303(d) If They Were Listed In a Previous Version?***

The 303(d) List is designed to be a flexible document that can be updated as new information becomes available. EPA must approve revisions to the document and has identified several acceptable reasons for removing or delisting a stream from the 303(d) List:

- **The stream was listed in error originally.** An example of this might be if a water quality standard was improperly applied, such as the wrong hardness was used to calculate metals criteria.
- **The stream's status changes.** A waterbody or a portion of a waterbody might be determined to be a wet weather conveyance rather than a stream. (Different criteria apply to wet weather conveyances.)
- **Water quality standards change.** The 303(d) is a compilation of streams that violate state water quality standards. If standards change through the triennial review process, the list can be adjusted.
- **The stream has improved.** If the quality of the stream improves and no longer violates criteria for the parameter(s) of concern, the stream can be removed from the List. Documentation of the improvement is necessary.

Appendix A contains a list of the streams approved for delisting due to water quality improvement. A rationale for each delisting is provided.

Appendix B contains any streams being approved for delisting on any basis other than water quality improvement.

***Did the Division Use All “Readily Available Data” In the Water Quality Assessment Process?***

The Division utilized its own water quality data, plus that collected by other agencies and entities in Tennessee. EPA’s STORET and WQX databases were utilized as primary sources of water quality data.

Additionally, the Tennessee Valley Authority, the U.S. Army Corps of Engineers, and the U.S Geological Survey were contacted directly as none of these agencies currently use STORET.

A public notice was sent out requesting any additional data the public or other entities might have. In addition to the data, we requested that submissions include detailed location

information, plus QA/QC measures taken to ensure data quality. Data submittals specific to a stream segment will be considered a comment for official departmental response.

***Are There Any Data Sources That the Division Chose To Not Use in the Assessment Process?***

No. We used all the data that were submitted. However, it should be noted that not all data submitted were used to independently list streams as impacted. Where questions about sampling locations, techniques or analysis methodologies could not be easily resolved, submitted data were used to screen streams for future studies.

As stated previously, if during the review process for the draft 303(d), additional water quality data were brought to our attention, these data were factored into our final decision concerning the status of specific streams.

See the *Summary of Public Comments and Departmental Responses* for additional information. This document addresses the comments received regarding the draft version of the list.

### ***What Is the Watershed Cycle?***

In 1996, the then Division of Water Pollution Control restructured monitoring and permitting activities on a rotating watershed basis (Figure 1). Each watershed will be examined on a five-year cycle as illustrated by the map on the next page (Figure 2).

A typical cycle will generally include:

- Year 1** Hold planning meetings with “stakeholders”. Stakeholders include citizens, environmental groups, other governmental agencies, municipalities, industries, and other interested parties. Develop a monitoring plan.
- Year 2** Collect water quality data.
- Year 3** Collect water quality data.
- Year 4** Water quality assessment activities.

Perform modeling and TMDL generation.

**Year 5** Publish a watershed plan, which includes the proposed actions to be taken to insure that water quality standards will be met. Issue draft NPDES permits and hold public hearings.

**Year 6** Issue final permits after comments have been addressed. Begin cycle again in sixth year.

Stream inventoried on the 303(d) List as violating one or more water quality criteria must be scheduled, on some priority basis, to have TMDLs developed to assist in the identification of control strategies.

**Figure 1: Watershed Cycle**

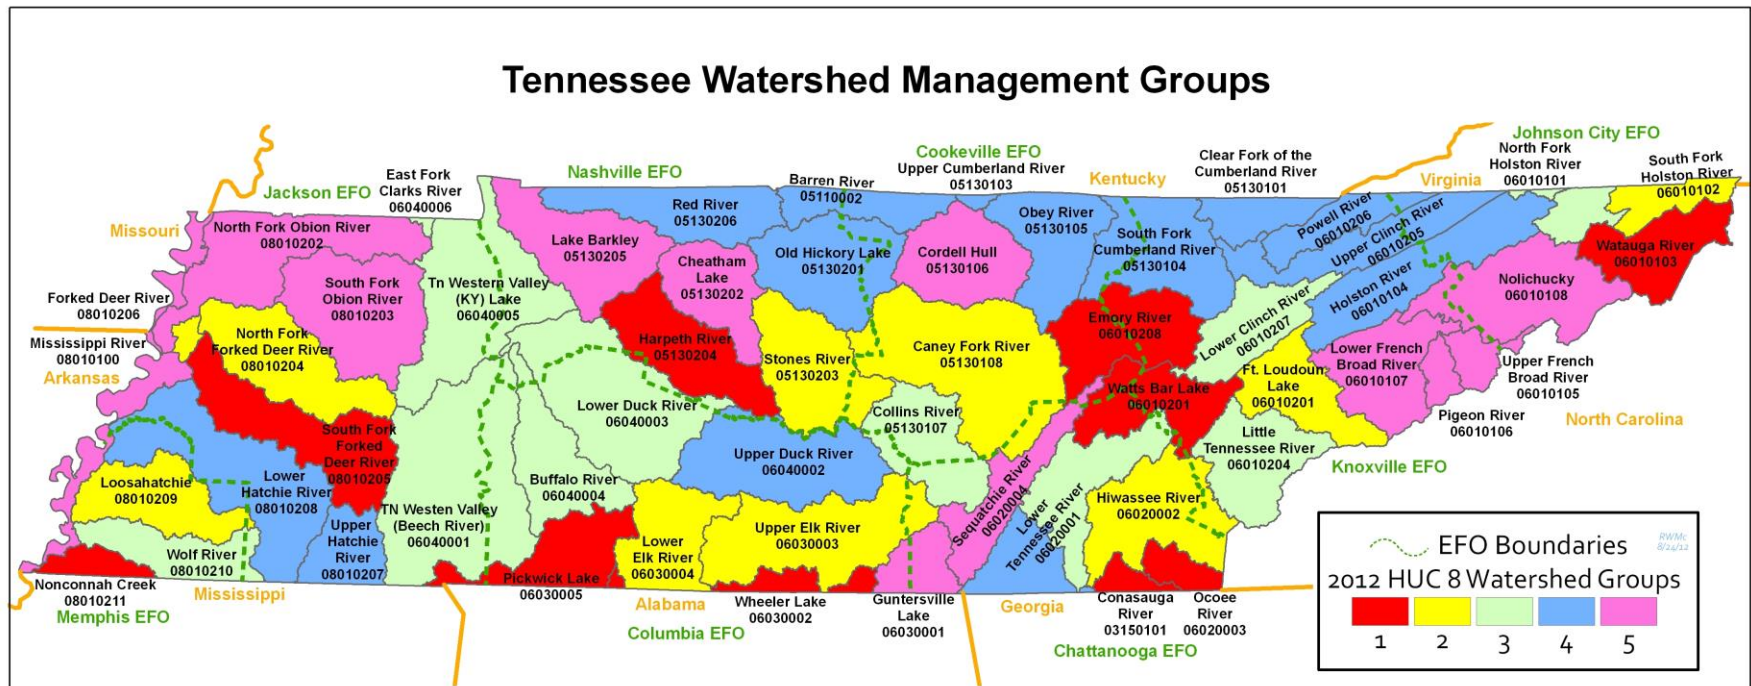

Figure 2: Watershed Monitoring Groups

### ***What Is a TMDL?***

A Total Maximum Daily Load (TMDL) is a study that (1) quantifies the amount of a pollutant in a stream, (2) identifies the sources of the pollutant, (3) and recommends regulatory or other actions that may need to be taken in order for the stream to no longer be polluted. Following are actions that might be recommended:

- Re-allocate limits on the sources of pollutants documented as impacting streams. It might be necessary to lower the amount of pollutants being discharged under NPDES permits or to require the installation of other control measures, if necessary, to insure that standards will be met.
- For sources the Division does not have regulatory authority over, such as ordinary agricultural and forestry activities, provide information and technical assistance to other state and federal agencies that work directly with these groups to install appropriate BMPs.

Even for impacted streams on the 303(d) List, TMDL development is **not** considered appropriate for all bodies of water. Additionally, in cases involving pollution sources in other states, the recommendation may be that another state or EPA develops the TMDL.

### ***How Can Citizens Participate in this Process?***

The Division accepted public comments until September 30, 2016. These comments were sent by letter, fax, or email. Additionally, the division accepted verbal comments at the public meeting the afternoon of August 31, 2016. The meeting was held in Nashville, but citizens were able to videoconference at field office locations. The list of these meetings appeared on the next page.

We specifically requested comments or data the public felt relevant to a listing, or to a stream not currently listed. We requested that data submissions include some basic information such as detailed station locations and the QA/QC procedures used during the sample collection and analysis process.

Additionally, departmental staff were available to meet with groups or individuals to discuss specific listings.

Following the conclusion of the formal comment period, responses were prepared for each comment. These responses have been published in a companion document also posted on the department's website. The responses indicated whether or not a revision was made based on the specific comment received. If a comment did not result in a revision, we explained our rationale for not making a change.

## 2016 303(d) List Public Meeting Schedule

REGION	DATE	LOCATION	LOCAL TIME
<b>Middle Tennessee</b>	August 31, 2016	Nashville Room 3 <sup>rd</sup> Floor, Tennessee Tower 312 Rosa L. Parks Ave, Nashville	1:00 pm
<b>Southern Middle Tennessee</b>	August 31, 2016	Columbia EFO * Main Conference Room 1421 Hampshire Pike, Columbia	1:00 pm
<b>Eastern Middle Tennessee</b>	August 31, 2016	Cookeville EFO Main Conference Room 1221 South Willow Avenue, Cookeville	1:00 pm
<b>West Tennessee</b>	August 31, 2016	Jackson EFO * Main Conference Room 1625 Hollywood Drive, Jackson	1:00 pm
<b>Southwestern Tennessee</b>	August 31, 2016	Memphis EFO * Conference Room 8383 Wolf Lake Drive, Bartlett	1:00 pm
<b>East Tennessee</b>	August 31, 2016	Knoxville EFO * Main Conference Room 3711 Middlebrook Pike, Knoxville	2:00 pm
<b>Southeastern Tennessee</b>	August 31, 2016	Chattanooga EFO * Suite 206, Main Conference Room 1301 Riverfront Pkwy. Chattanooga	2:00 pm
<b>Northeastern Tennessee</b>	August 31, 2016	Johnson City EFO * Main Conference Room 2305 Silverdale Road, Johnson City	2:00 pm

\* At field office locations, the public videoconferenced with the Nashville meeting.

# Key to 303(d) List

<b>WATERBODY ID</b>	<p>In 1988, the Division divided the state's waters into "waterbodies" and created a database of information about each. Each waterbody has an ID based on EPA's River Reach System. The first eight digits of the ID (after TN) are the USGS HUC Code number. The next three or four digits are the reach number assigned to the stream by EPA. The last four digits is the segment number assigned to each stream section for the Assessment Database (ADB). There is also GIS coverage for listed streams.</p> <p><b>The 303(d) List is sorted in hydrologic order within each major watershed basin.</b> The NRCS watershed number for the segment is available through the ADB.</p>
<b>WATERBODY</b>	The name of the main body of water within the waterbody is provided as <b>NAME</b> .
<b>COUNTY</b>	The county or counties where the waterbody is located.
<b>MILES/ACRES IMPAIRED</b>	The number of impacted miles or acres (according to Reachfile 3) is shown in this column. Lake acres are abbreviated as "ac".
<b>CAUSE</b>	The pollutant or pollutants exceeding water quality standards is identified.
<b>SOURCE</b>	The general source of each pollutant exceeding water quality standards within the waterbody is identified. (For both causes and sources, the Division uses categories provided by EPA in order to be consistent with language used by other states.)
<b>ADVISORY</b>	Segments which have fishing or water contact advisories are identified in the comments. See TDEC's website at <a href="http://www.tn.gov/assets/entities/environment/attachments/water_fish-advisories.pdf">http://www.tn.gov/assets/entities/environment/attachments/water_fish-advisories.pdf</a> for additional information on advisories.

## TMDL Priorities

It should be noted that TMDL priorities are parameter specific and methodologies have not yet been developed for all substances or conditions. Thus a stream that has multiple causes of impairment may be high priority for one cause, but low priority for another.

### **HIGH (H)**

Tools are available to produce the TMDL and the stream is in one of the watersheds being addressed in the next two years. TDEC intends to write the TMDL report in the next two years.

### **MEDIUM (M)**

Tools are available to produce the TMDL, but the stream is not in a watershed being addressed in the next two years. TDEC intends to write the TMDL report in the next five years.

### **LOW (L)**

Tools are not currently available to produce the TMDL or the stream is not in the watershed being addressed in the next five years. TMDLs will be produced in the next 8-13 years. Alternatively, a low priority may indicate that the segment is a TMDL Vision priority and an alternative restoration strategy will be produced in advance of a TMDL. More information about the TMDL Vision is available at <http://www.tn.gov/environment/article/wr-ws-tmdl-new-vision>

### **NOT APPLICABLE (NA)**

4a - A TMDL has already been completed, submitted to EPA, and approved by EPA.

4b - A TMDL is not needed because a different type of control strategy is in place which will bring about compliance with the criterion in a reasonable amount of time.

4c – A TMDL is not needed because the impact to the stream is not being caused by a pollutant.

## Draft Version - YEAR 2016 303(d) LIST FOR THE STATE OF TENNESSEE

### Barren River Watershed watershed.

This small basin is USGS Hydrologic Unit Code 05110002 and flows into Kentucky as part of the Barren River

Waterbody ID	Impacted Waterbody	County	Miles/Acres Impaired	CAUSE / TMDL Priority	Pollutant Source	COMMENTS
TN05110002 008_0550	UNNAMED TRIB TO WEST FORK DRAKES CREEK	Sumner	2.7	Flow Alterations NA	Upstream Impoundment	Category 4c. (Impairment not caused by a pollutant.) Randomly selected for Impounded Streams Survey.

(One or more uses impaired.) TMDLs needed. EPA approved a pathogen TMDL that addresses some of the known pollutants on 6/17/2011.
TN08010211 00720- 3000	NONCONNAH CREEK	Shelby Fayette	6.5	Total Phosphorus L Physical Substrate Habitat Alterations L	Discharges from MS4 area Nonirrigated Crop Production Channelization	Category 5. (One or more uses impaired.) TMDLs needed.
TN08010211 176_1000	JOHN'S CREEK	Shelby	13.7	Total Phosphorus L Loss of biological integrity L due to siltation L Other Anthropogenic Habitat Alterations L Escherichia coli NA	Discharges from MS4 area Channelization Collection System Failure	Category 5. (One or more uses impaired.) TMDLs needed. EPA approved a pathogen TMDL that addresses some of the known pollutants on 6/17/2011.

## APPENDIX A: Streams (or pollutants) on the 2014 303 (d) List Proposed for Delisting in 2016 For Reasons Related to Water Quality

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN05130107 004 – 0100	HICKORY GROVE BRANCH	Warren	10.99	Riparian Alteration Siltation	Specialty Crop Production Pasture Grazing	Hickory Grove Branch was listed following a biocon in 1997 that only documented 2 EPT families. Cause of the impacts was excessive siltation and riparian alterations. Follow-up biocon in 2002 and 2007 also did not pass, with scores of 7. A 2014 TDEC SQSH at mile 0.8 (Yagar to Short Mountain Road) documented 10 EPT genera and 24 total genera for the very good TMI score of 38. It appears that Hickory Grove Branch has recovered and now meets criteria.
TN05130107 016 – 0740	LAUREL CREEK	Grundy	3.93	Siltation	Specialty Crop Production	Laurel Creek was identified as impaired after it was randomly selected for the Tennessee Wadeable Stream project. When a SQSH was done in 2007, the TMI score was very poor (20). The source of the impacts was an upstream large nursery operation. However the nursery has ceased operation and the stream has improved. In 2013, a biocon documented 10 EPT families, 6 intolerant, and 16 total families for a score of 13.
TN05130107 023 – 0200	DRY CREEK	Warren Sequatchie	24.93	Aluminum Sulfates pH Manganese Iron	Abandoned Mining	In 2014, the entire length of Dry Creek was listed due to historical and current mining activities. Recent data indicate that the lower and upper sections of the stream now meet biocriteria. Thus, we are delisting the upper and lower miles. The middle section of the stream, now segment 0250, will remain listed. It is believed that reclamation of abandoned mines in the upper part of the watershed have helped restore water quality in the headwaters.
TN05130108 001 – 0100	SNOW CREEK	Smith	7.6	Siltation  Riparian Alteration	Pasture Grazing	Snow Creek was listed following a biocon in 1998 that only documented 4 EPT families. Cause of the impacts was excessive siltation. Follow-up biocon in 2002 and 2007 also did not pass, although scores improved. A 2013 TDEC SQSH at mile 1.4 (Horse Bend Road) documented 11 EPT genera and 24 total genera for the very good TMI score of 38. It appears that Snow Creek has recovered and now meets criteria. It is our understanding that NRCS projects have helped fence cattle out of this stream.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN05130108 024 – 4000	ROCKY RIVER	Van Buren Warren	34.09	Manganese	Abandoned Mining	Upper Rocky River has been considered impaired for many years due to manganese and low pH originating from abandoned coal mines in the headwaters. In 2013, a TDEC SQSH at mile 24.5 (u/s Pleasant Hill Cemetery Road) documented 6 EPT genera and 29 total genera for a passing TMI score of 32. (Habitat score = 171.) There was little evidence of accumulated precipitated manganese in the substrate. In a follow-up survey in 2014 at the same location, TDEC documented 6 EPT genera and 20 total genera for the even better TMI score of 34. (Habitat score = 169). According to Mining Section biologists, manganese is no longer evident in the stream due to an Abandoned Mines Reclamation Project. Since adequate pH monitoring has not yet taken place in the stream, Rocky River will need to remain listed for that parameter.
TN05130108 027 – 0300	GARDNER CREEK	Bledsoe	3.1	Manganese	Abandoned mining	Gardner Creek was listed for fish and aquatic life impacts due to manganese discharged from an abandoned surface coal mining facility. A manganese TMDL was developed and implemented. In 2013, a TDEC SQSH at mile 1.5 (Griffith Road) documented 5 EPT genera and 30 total genera for a TMI score of 34. The habitat was excellent (176) with no evidence of the manganese deposits seen previously. Chemical sampling at the same site documented reduced manganese levels. Gardner Creek is now meeting the water quality standard for manganese.
TN05130108 033 – 0200	BEAVERDAM CREEK	Bledsoe	19.9	Riparian Alteration  Siltation	Pasture Grazing	Beaverdam Creek was 303(d) listed due to a failing biorecon that scored 5 in 2002 with only 5 EPT families. Biologists noted excessive silt and a poor riparian area. In 2013, a TDEC biorecon at the same location (mile 1.8 at Highway 101) documented 10 EPT families, 5 intolerant families and 20 total families for the passing biorecon score of 11. Silt levels are lower and habitat is much better than before. Even without a defined riffle for the biorecon, the score still passed.
TN05130108 097 – 2000	MINE LICK CREEK	Putnam	4.23	Escherichia coli	Collection System Failure	Mine Lick Creek was posted against water contact for many years due to chronic overflows from Baxter's sewage treatment plant and collection system. The system has been rehabilitated and the overflows have been controlled and in 2015 the contact advisory was lifted. Although the stream now meets water quality standards for pathogens, it will need to remain listed for total phosphorus and nitrate+nitrite.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN05130203 010 – 0100	ROCKY FORK CREEK	Rutherford	7.4	Siltation  Riparian Alteration	Land Development	This stream was originally listed due to a biorecon that took place in 2007. The biology was poor and excessive amounts of silt were noted due to upstream construction sites which included a school. The stream was dry in 2012, but in 2013 a biorecon was conducted at mile 1.4 (Morton Road) that documented 7 EPT families, 4 intolerant families, and 20 total families for a very good biorecon score of 13. There was much less silt in 2013 due to the stabilization of the construction sites. Rocky Fork Creek now meets biological integrity criteria.
TN05130203 018 - 3000	WEST FORK STONES RIVER	Rutherford	5.1	Siltation	Discharges from MS4 area	In 2000, one of the Division's 71i probabilistic monitoring stations was located at Thompson Lane. Two SQSH surveys scoring 22 and 30 respectively were conducted, both failing scores. As a result, this segment was listed due to excessive amounts of silt. A 2006 biorecon at the slightly downstream Blanton Drive station passed, but a 2009 SQSH survey conducted by Murfreesboro's consultant did not. In 2013, a second biorecon at Blanton Drive passed. In 2014, three out of four SQSH surveys at Blanton Drive and Thompson Lane passed. Finally, in 2015, a TDEC SQSH at Blanton Drive had the almost perfect of 40 and documented 14 EPT genera and 34 total genera. The habitat score was 150. The stream is now considered to meet biointegrity standards.
TN05130203 025 –2000	CRIPPLE CREEK	Rutherford	5.4	Siltation	Pasture Grazing	In 1997, a biorecon was conducted which failed, scoring 5. As a result, this segment was listed due to excessive amounts of silt. In 2000, one of the Division's 71i probabilistic monitoring stations was located at Cranor Road. Two SQSH surveys scored 22 and 34 respectively, one score failing and the other passing. A 2006 biorecon at Cranor Road passed with a score of 13 and documented 7 EPT families, 2 intolerant families, and 21 total families. Habitat score was 142, a very good score for that area. The stream is now considered to meet standards.
TN06010102 012 – 0800	INDIAN CREEK	Sullivan	1.86	Riparian Alteration	Land Development	The lower portion of Indian Creek was listed following a 1998 biorecon which failed, scoring 5. A follow-up SQSH in 2003 also failed, but in 2007 the SQSH result was much improved, scoring 30. A 2012 TDEC SQSH at mile 1.0 (Tate Road) documented 10 EPT genera and 29 total genera for the almost perfect TMI score of 40. The stream now meets standards.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06010102 0231.0_0200	BIRCH BRANCH	Johnson	4.39	Threatened by Low pH	Atmospheric Deposition/Natural	Birch Branch is a high elevation trib to Beaverdam Creek in Cherokee National Forest. Although the biology is good, the pH criterion was violated in multiple observations in 2007. Atmospheric deposition was suspected, although natural rock formations cannot be ruled out. In 2012 chemical sampling, there were no violations of the pH criterion and the biology of the stream scored a 40 TMI. The stream is now being used as a first order reference stream. We consider it no longer threatened by atmospheric deposition, especially since the upwind John Sevier Power Plant has been converted to natural gas.
TN06010102 042 – 0500	CEDAR CREEK	Sullivan	11.8	Nitrate+Nitrite  Siltation  Habitat Alterations	Discharges from MS4 Area Land Development	Cedar Creek was listed following a 1998 biorecon which failed, scoring 7. Follow-up SQSH surveys in 2003 and 2007 also failed, but with scores of 28 and 30. Appeared as if conditions have improved. A 2012, two different SQSH surveys scored 34, one done by TDEC and another by a consultant for Bristol's MS4 program. The TDEC survey at mile 0.3 (Grovedale Road) documented 8 EPT genera and 25 total genera. The stream will need to remain listed for pathogens.
TN06010102 045 – 1000	FALL CREEK	Sullivan	6.25	Riparian Alteration  Siltation	Pasture Grazing	Fall Creek was originally assessed as impacted after it failed SQSH surveys in both 2004 & 2009. The stream was impacted by a large farm that has now been sold. In 2014, a TDEC SQSH station at mile 0.7 (u/s Poteet Farm, Childress Ferry Road) documented 9 EPT genera and 21 total genera for a TMI score of 34. The habitat score was also good (154). The change in landuse has improved the stream.
TN06010102 046 – 0900	TIMBERTREE BRANCH	Sullivan	1.92	Siltation  Riparian Alterations	Pasture Grazing	Timbertree Branch, which is mainly in Virginia, was originally assessed as impacted after it failed SQSH surveys in both 2004 & 2009. In 2013, a TDEC SQSH station at mile 0.1 (Bloomingdale Pike) documented 13 EPT genera and 41 total genera for the excellent TMI score of 40. The change in landuse, most likely in Virginia, has improved the stream.
TN06010107 010 - 0100	GNATTY BRANCH	Sevier	1.8	Escherichia coli	Septic Tanks	Historically, Gnatty Branch was impacted by failing septic tanks. In 2014, following a concentrated effort by Sevier County to require homes to connect to a municipal collection system, E coli levels were reduced to the point that the existing water contact advisory could be lifted. In more recent monitoring in 2015 at mile 0.1 had a geo mean of 94.3 cfu. Geo means from July and August 2014 were 117 and 23 cfu, respectively.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06010201 026 – 0300	HOLLYBROOK BRANCH	Blount	2.78	Ammonia	Pasture Grazing	Hollybrook Branch was originally listed for ammonia due to a couple of elevated levels noted in 2007-2008 TDEC chemical monitoring at mile 0.5 (Martin Mill Pike). In 2012, TDEC monitored again at the same locations and ammonia levels were much lower. Biologists noted that there appears to be fewer livestock in the watershed than in the past. The stream will need to remain listed for nutrients, silt, pathogens and habitat alteration.
TN06010201 026 – 2000	LITTLE RIVER	Blount	17.63	Threatened, not impaired. The specific stressor was undetermined.		This 17.63 mile section of the Little River was previously identified as “threatened” due to a documented decline in diversity at a biological station at miles 9.6. But in 2007 and 2012, TMI scores improved at this station (38 each time), so we no longer consider it threatened.
TN06010201 033 - 2000	ELLEJOY CREEK	Blount	5.37	Nitrate+Nitrite	Pasture Grazing	Ellejoy Creek was listed for NO2+NO3 following 2003 chemical sampling that appeared to show it elevated. In conjunction with SQSH biological surveys in 2007 and 2012, nutrient tolerance scores were not elevated (38.1% & 33.5% respectively). Additionally, chemical sampling at mile 8.0 (d/s Davis Road) did not document elevated nutrient levels. It is now believed that habitat issues are the reason the stream continues to be impaired and it will remain listed.
TN06010201 034 - 0200	WILDWOOD BRANCH	Blount	6.26	Riparian Alteration	Pasture Grazing	In 2000, Wildwood Branch failed a bioecon and was listed as impaired due to riparian alteration. In 2007, the stream failed a SQSH, but with a much better score (28). In 2012, TDEC performed a second SQSH at mile 0.1 (Andy Harris Road) which documented 10 EPT genera and 31 total genera for the almost perfect TMI score of 40. The habitat score was 130. The stream now meets biointegrity criteria, but will need to remain listed for E. coli.
TN06010201 066 – 0200	TWIN CREEK (Twin Branch in previous 303(d) List)	Knox	1.87	Riparian Alteration Siltation	Pasture Grazing Discharges from MS4 area	In 2000, Twin Creek failed a bioecon and was listed as impaired due to riparian alteration and silt. In 2008, TDEC performed a SQSH 2008 TDEC SQSH at mile 2.1 (Virtue Road) which documented 8 EPT genera and 31 total genera for the good TMI score of 34. Twin Creek now meets biological criteria.
TN06010201 066 – 0500	McCALL BRANCH	Knox	1.73	Siltation	Discharges from MS4 area Streambank Modification	In 2004, McCall Branch failed a bioecon and was listed as impaired due to riparian alteration. In 2007, the stream failed a SQSH, but with a better score (24). In 2012, TDEC performed a second SQSH at mile 0.2 (u/s Tipton Station Road) which documented 10 EPT genera and 27 total genera for the passing TMI score of 34. The habitat score was excellent at 141. The stream now meets biointegrity criteria.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06010204 001 - 1000	TELLICO RESERVOIR	Loudon Monroe	16500 ac	Mercury	Atmospheric Deposition	In 2007, mercury found to be over the trigger point of 0.3 ppm in Tellico Reservoir catfish. As a result, mercury was added as a cause to the existing precautionary advisory for catfish. In recent years, levels have been much lower and are well below the 0.3 trigger. Mercury will be removed as a cause for the existing <a href="#">advisory</a> , which will stay in place for PCBs.
TN06010204 042 – 1000	NINEMILE CREEK	Blount	17.1	Siltation	Pasture Grazing Non-irrigated Crop Production	Ninemile Creek was listed for siltation following a 1999 TDEC biocon that scored 7. It also failed a SQWSH in 2007 with a score of 26. In 2013, a TDEC SQSH at mile 4.8 (Trigonia Road) documented 8 EPT genera and 20 total genera for the very good TMI score of 38. Additionally, a 2014 TVA biocon at mile 11.8 (d/s Kyker Road) documented 15 EPT families, 6 intolerant, and 27 total families for a biocon score of 15. The water quality in the stream has clearly improved. There have been a significant number of BMPs installed in this watershed.
TN06010204 043 – 1000	BAKER CREEK	Blount Loudon	9.18	Riparian Alteration	Pasture Grazing	Baker Creek was listed as impacted after it failed a TDEC biocon in 1999. Follow-up surveys had mixed results and in 2008, the stream scored better at mile 8.9 with a TMI score of 30. In 2013, a TDEC SQSH at mile 8.9 (Hwy 95) documented 8 EPT genera and 25 total genera for the good TMI score of 36. As the biology at upstream stations has not improved enough, we split the stream and are only delisting the lower segment. Additionally, both segments will need to remain listed for E. coli. There have been a significant number of BMPs installed in this watershed.
TN06010205 COVELAKE T - 0100	BRUCE CREEK	Campbell	4.8	Manganese	Coal Mining Discharges (Permitted)	Bruce Creek was listed for fish and aquatic life impacts due to manganese being discharged from a surface coal mining facility. TVA, the site operator, installed a passive treatment facility which has effectively lowered manganese levels in the discharge. In June 2014, division staff visited Bruce Creek collected a sample and looked for manganese deposits in the stream. None were found. Bruce Creek will need to remain listed for habitat alteration but is meeting the water quality standard for manganese.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06010207 014 – 0100	WILLIAMS BRANCH	Knox	2.4	Siltation	Industrial Permitted Runoff	Williams Branch was originally listed following non-compliance at a quarry which was losing solids. In 2003, the stream passed a SQSH survey with a passing TMI score of 32, but since the score was borderline, the stream was not delisted. In 2014, a TDEC SQSH at mile 0.5 (Diggs Gap Road) documented 17 EPT genera and 34 total genera for the excellent TMI score of 40. The stream is much better and now meets water quality standards.
TN06010207 016 – 1000	HINDS CREEK	Anderson	6.7	Siltation  Riparian Alteration	Pasture Grazing	Hinds Creek was listed for siltation and riparian alteration following a 1999 biorecon that scored poorly (7). A follow-up SQSH in 2003 also failed with a SQSH score of 28. In 2008, Hinds Creek attained the passing score of 32. Staff biologists wanted to see the stream pass another cycle. In 2010 and 2014, TVA biorecons scored 13. Also in 2014, a TDEC SQSH at mile 0.7 (Brushy Valley Road) documented 11 EPT genera and 33 total genera for a TMI score of 36. Since the stream has passed biological tests since 2008, criteria are being met. The stream will need to remain listed for E. coli. Some NRCS BMP installation in the watershed.
TN06010207 020 – 0400	INDIAN CREEK	Roane	6.8	Siltation  Riparian Alteration	Channelization Pasture Grazing	Indian Creek was listed for siltation and riparian alteration following a 1999 biorecon that scored poorly (7). A follow-up biorecon in 2003 also failed badly with a score of 3. In 2009, a SQSH on Hinds Creek received the score of 28. In 2013, a TDEC SQSH at mile 2.4 (Ford past Archie Raby Bridge) documented 11 EPT genera and 31 total genera for the excellent TMI score of 38. There have been a number of BMPs installed in this watershed.
TN06020001 029 – 1000	SAVANNAH CREEK	Hamilton	15.0	Siltation  Riparian Alteration  Total Phosphorus	Pasture Grazing Nonirrigated Crop Production	Savannah Creek was listed following a failing SQSH score in 2009 (26). In 2013, a TDEC SQSH at mile 5.0 (Mahan Gap Road) documented 8 EPT genera and 24 total genera for a TMI score of 34. A 2014 TVA biorecon at the same spot found 12 EPT families, 4 intolerant, and 25 total families. Because the stream passed biological surveys in both 2013 & 2014, we consider water quality to have improved. Savannah Creek will need to remain listed for E. coli. There have been a number of BMPs installed in this watershed.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06020001 038 – 0210	COLDWATER BRANCH	Meigs	6.8	Siltation  Riparian Alteration  Total Phosphorus	Pasture Grazing	Coldwater Branch was listed following a failing biorecon score in 2008 (5). In 2014, a TDEC SQSH at mile 0.5 (Roberts Road) documented 11 EPT genera and 34 total genera for a TMI score of 38. A biorecon at the same spot scored 15. Because 38 is an excellent SQSH score and 15 is a perfect biorecon score, it appears that the biology of the stream has improved. There have been a number of BMPs installed in this watershed. Coldwater Branch will need to remain listed for E. coli.
TN06020001 041 – 2000	BIG SEWEE CREEK	Meigs McMinn	16.2	Riparian Alteration	Pasture Grazing	Big Sewee Creek was listed following a failing SQSH and biorecon score in 2009 (24 & 7, respectively). In 2013, a TDEC SQSH at mile 4.9 (Womac Hollow Road) documented 9 EPT genera and 34 total genera for a TMI score of 32. A biorecon at the same spot and time scored 13. A 2013 TVA biorecon also scored 13. Water quality appears to have improved, but the stream will need to remain listed for E. coli. There have been a number of BMPs installed in this watershed.
TN06020001 057 – 0200	ROARING CREEK	Rhea	5.3	Substrate Alteration	Channelization	Roaring Creek was listed after it was hydrologically altered in 2005 following a flood event. Additionally, the channel had been altered by the collection of alluvial stones for landscaping materials. The damage to this stream has healed itself. The 2014 biorecon demonstrated that the biological integrity has been restored. (2014 TDEC biorecon at mile 0.1 (Montague Bridge) documented 12 EPT families, 7 intolerant, and 17 total families scored 13 with a habitat score of 146. The SQSH just barely failed (30), but is not the best way to assess this stream due to habitat and riffle limitation. The stream also goes dry frequently.
TN06020001 062 – 1000	POSSUM CREEK	Hamilton Bledsoe	13.19	pH Iron Substrate Habitat Alteration	Abandoned Mining Channelization	Possum Creek was impacted by the construction of Corridor J interstate project which cause the release of pH and iron. Additionally, the stream habitat was altered. Sampling in the most recent cycle did not document elevated iron or depressed pH and habitat scores were good. However, biointegrity scores were still low. It is now believed that the previous identified pollutants from the construction project are no longer problems, but that an unknown pollutant is impacting the stream. It will remain listed, but not for pH, iron and habitat alteration.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06020001 717 - 1000	YELLOW CREEK	Rhea	14.9	Riparian Alteration  Siltation	Pasture Grazing Non-irrigated Row Crops	Yellow Creek was listed as impaired following 2009 biological surveys with failing scores. (The SQSH scored 22 and the biorecon scored 7.) A 2013 TDEC SQSH at mile 2.5 (Old Dixie Hwy) documented 10 EPT genera and 34 total genera for a TMI score of 34. A biorecon also passed with a score of 11. Water quality appears to have improved, but the stream will need to remain listed for E. coli.
TN06020001 889 – 0200	CHESTNUTT CREEK	Hamilton	8.1	Siltation	Discharges from MS4 Area	Chestnutt Creek was listed after it failed both a 2008 biorecon (7) and a 2009 SQSH (28). In 2013, a 2013 TDEC SQSH at mile 0.3 (Apison Pike) documented 11 EPT genera and 35 total genera for a TMI score of 36. A biorecon also passed. The stream appears to have improved.
TN06020002 005 - 1400	UNNAMED TRIB TO CANDIES CREEK	Bradley	1.14	Siltation	Undetermined Source	This stream was listed several years ago due to excessive silt from various sources in the watershed. These sources appear to have been stabilized. Staff biologists decided that due to the lack of riffles in the stream, a biorecon would be a more representative biological survey as a biorecon incorporates multiple habitats while a SQSH only uses riffle habitat. A 2008 TDEC biorecon at mile 0.7 (8735 Eureka Road) documented 12 EPT families, 10 intolerant families, and 28 total families for a perfect biorecon score of 15. The habitat score was 135.
TN06020002 014 – 0100	LITTLE SOUTH CHESTUEE CREEK	Bradley Polk	10.61	Siltation	Pasture Grazing	This stream was listed following a 2007 biorecon that did poorly, scoring 5, with a habitat score of 79. Biologists noted excessive silt. Silt sources appear to have been stabilized in the years since. In 2012 TDEC performed both a SQSH and biorecon at the same location as in 2007 (mile 0.7 Longley Road). Both surveys passed with much better habitat. The SQSH documented 11 EPT genera and 37 total genera for a TMI score of 32. (Habitat score = 150.) The biorecon scored 13. Silt was not seen as a problem in the new survey.
TN06020002 014 – 2000	SOUTH CHESTUEE CREEK	Bradley	9.81	Total Phosphorus	Pasture Grazing	2012-2013 TDEC chemical sampling at a station at mile 13.9 (Old Parksville Road) inducted that phosphorus concentrations are low and no longer appear to be a problem. A SQSH was performed and results in a nutrient tolerant score of 36.4% NRCS has sponsored projects in this watershed; a possible reason water quality has improved for that parameter. South Chestuee Creek will need to remain listed for siltation.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06020002 018 – 0100	HAWKINS BRANCH	Polk	1.86	Escherichia coli	Pasture Grazing	Pathogens were elevated historically in this small stream due to the presence of a large dairy, but this operation has now closed. In 2008, TDEC monitor pathogens at a station at mile 0.3 (USFS Tree Farm). One out of 6 E. coli samples was over 941 cfu. An August-September 2012 geo mean of five E. coli observations was 49.8 cfu, well below the 126 cfu criterion.
TN06020002 087 - 1000	ROGERS CREEK	McMinn	21.6	Riparian Alteration	Pasture Grazing	This stream was originally listed after a 2003 bioecon that did poorly, scoring 7, with a habitat score of 95. It wasn't until 2013 that biologists revisited the stream. A TDEC SQSH at mile 5.1 (Sanford Road) documented 7 EPT genera and 26 total genera for a TMI score of 36. The habitat score was much better at 151. The stream will need to remain listed for pathogens.
TN06030003 044 – 0100	BETSY WILLIS CREEK	Coffee Grundy	22.5	Riparian Alteration  Siltation  Substrate Habitat Alt.	Pasture Grazing Nonirrigated Crop Production	A sand quarry/facility was the original source of the sand that impacted the habitat in this stream. Now that the sand quarry has gone out of business, several significant rain events in the last few years removed the sand and restored the habitat of the stream. Now that the habitat has improved, Betsy Willis Creek no longer violates the narrative standard. The stream will need to remain listed for pathogens.
TN06030003 044 – 0600	DRY CREEK	Grundy	13.8	Substrate Alterations	Channelization	Normally dry, Dry Creek was assessed as habitat impacted due to unpermitted channel alterations performed during a bridge and road construction project. That activity was several years ago and the site has since stabilized. The narrative habitat criterion is no longer being violated at that site.
TN06030003 044 – 0720	GILLIAM CREEK	Grundy	0.76	Ammonia  Sludge Deposits	Municipal Point Source Collection System Failure	The old Monteagle STP is located on Juanita Creek, a tributary to Gilliam Creek. (A new treatment plant has been built.) The old plant still discharges a smaller volume of effluent, but no longer has elevated ammonia concentrations and no longer loses excessive amounts of solids. The old STP continues to be a source of nutrients and the stream will remain listed for those pollutants. It will additionally remain listed for pathogens.
TN06030003 044 – 0721	JUANITA CREEK	Grundy	2.12	Ammonia  Sludge Deposits	Municipal Point Source Collection System Failure	See previous rationale for Gilliam Creek.
TN06030003 044 – 0730	TRUSSEL CREEK	Grundy	4.3	Sludge Deposits	Municipal Point Source	Trussel Creek is the new location of the second Monteagle STP. This facility has had a significant impact on the receiving stream, but one area of improvement is that the facility is no longer losing solids. It can be delisted for sludge deposits, but will need to remain listed for the other parameters.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06030004 017 – 2000	RICHLAND CREEK	Giles	26.7	Siltation  Escherichia coli	Collection System Failure Land Development Urbanized High Density Area Pasture Grazing	Richland Creek was originally listed due to excessive silt from stormwater runoff in the Pulaski area and elevated pathogens from overflows from the sewage collection system. In 2008, Pulaski upgraded their sewage treatment plant and rehabilitated the collection system. As a result, the pathogen criterion was met in 2012 sampling. Additionally, a 2013 TDEC SQSH at mile 18.3 (off Hwy 166 near town of Green Field) documented 12 EPT genera and 26 total genera resulting in the excellent TMI score of 36. These data document that the stream now meets quality standards.
TN06030004 026_0111	UNNAMED TRIB TO ANDERSON CREEK	Giles Lawrence	1.19	Siltation	Off-road Vehicles	Upper Anderson Creek, plus the tributaries Fanny Branch and an Unnamed Trib, were impacted by a commercial off-road vehicle site. Erosion from ATV roads, plus the direct impacts of vehicles driving through streams place a significant amount of silt into the watershed. TDEC required that the site obtain and comply with a stormwater permit. The owner did this and the following remediation of the site caused silt loads to be dramatically reduced. A 2013 TDEC SQSH in Anderson Creek just downstream of the site at mile 4.4 (Schoolhouse Hollow) documented 14 EPT genera and 24 total genera for the very good TMI score of 36 (habitat = 164). It appears that the Unnamed trib and the upper section of Anderson Creek have recovered and now meet water quality standards. Fanny Branch has not yet fully recovered and will need to remain listed for now.
TN06030004 026_0115	ANDERSON CREEK	Giles	0.54	Siltation	Off-road Vehicles	See above rationale for the Unnamed Trib.
TN06030004 029_0410	UNNAMED TRIB TO WET WEAKLEY CREEK	Lawrence	0.75	Siltation	Animal Feeding Operations  Silviculture	This stream was listed as impacted after it was documented that an unpermitted animal feeding operation was impacting the stream with elevated levels of ammonia. Additionally, an upstream logging operation deposited excessive amounts of silt into the stream. 2012-2013 TDEC chemical sampling at mile 0.1 (off Byrd Road d/s of hog waste lagoon) documented that ammonia levels are now lower, but NO <sub>2</sub> +NO <sub>3</sub> levels are higher, indicating that the ammonia in the lagoon is being converted. We will make this change in the listing, but will consider this a pollutant clarification rather than a delisting. However, the upstream logging site has now stabilized and silt is no longer a problem in the stream, so we will delist for this pollutant only, leaving the stream listed for pathogens and NO <sub>2</sub> +NO <sub>3</sub> .

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06040001 060 - 2000	CHAMBERS CREEK	McNairy	4.0	Dissolved Oxygen	Pasture Grazing	Chambers Creek was listed after a 2003 biocon in which the field parameters documented a low DO level. In 2013-2014 TDEC monitored dissolved oxygen levels at mile 17.1 (D/S Berry Bottom Road). There were no violations of water quality criteria.
TN06040001 064 – 2000	HORSE CREEK	Hardin	25.8	Riparian Alteration	Pasture Grazing	Horse Creek was originally listed following a 2008 SQSH that scored a TMI of 30. A 2011 follow-up SQSH also failed. In 2013, a TDEC SQSH at mile 28.9 (u/s Cherry Chapel Road) documented 8 EPT genera and 24 total genera for a TMI score of 36. A biocon found 9 EPT families, 3 intolerants, and 23 total families for a biocon score of 13. Biological integrity has been restored.
TN06040001 809 – 1000	RUSHING CREEK	Decatur	45.3	Escherichia coli	Pasture Grazing	Rushing Creek was originally listed for pathogens following a 2008-2009 monitoring that documented elevated E. coli levels. In 2013, TDEC monitored Rushing Creek at mile 3.3 (Hwy 100) and at mile at mile 5.6 (Largo Road). Only one of 12 E.coli observations were over 941 cfu and the one elevated sample was during a rain event. BMPs have been installed in the watershed and may be the reason pathogen levels are lower.
TN06040003 019 – 2000	BIG BIGBY CREEK	Maury	4.6	Nitrate+Nitrite  Total Phosphorus	Municipal Point Source Pasture Grazing	Nutrients were added as a pollutant to this segment after chemical and biological monitoring at Canaan Road indicated elevated NO2+NO3 & total phosphorus from the Mt. Pleasant were impacting the biology of the stream. The sewage treatment plant is doing better and the nutrients are not impacting as long a distance downstream. A 2013 TDEC SQSH at mile 8.5 (Canaan Road) documented 9 EPT genera and 25 total genera for a TMI score of 38. The NUTOL score was 22.9%, so the biota is not being dominated by invertebrates tolerant to nutrients. The stream will need to remain listed for E. coli.
TN06040003 027 – 1000	LITTLE BIGBY CREEK	Maury	18.77	Siltation	Discharges from MS4 area  Pasture Grazing	Little Bigby Creek was listed after it failed a biocon in 1999. It failed follow-up SQSH surveys in 2004 (22) and 2011 (18). A 2013 TDEC SQSH at mile 2.0 (Old Williamsport Road) documented 10 EPT genera and 25 total genera with a TMI score of 38. The habitat score was 146, so it appears the stream has improved. There have been a significant number of BMPs installed in this watershed.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06040003 034 – 3000	RUTHERFORD CREEK	Maury Williamson	12.5	Siltation Nitrate+Nitrite Total Phosphorus	Pasture Grazing  Discharge from MS4 area	The most upstream segment of Rutherford Creek was listed following biocon surveys conducted prior to 1999. In both 2014 & 2015, a consultant for the city of Spring Hill performed SQSH surveys at mile 20, a station upstream of the Spring Hill sewage treatment plant. In 2014, the consultant documented 11 EPT genera and 30 total genera for a TMI score of 38. In 2015, they documented 8 EPT genera and 33 total genera for the perfect TMI score of 42.
TN06040004 007 – 2000	GREEN RIVER	Wayne	2.65	Solids	Municipal Point Source	This segment of the Green River was found to be impaired due to inadequately treated wastewater discharges. The Waynesboro STP was losing solids and a 2011 TDEC SQSH at mile 11.7 documented 6 EPT genera and 24 total genera for a TMI score of 16. After significant improvements were made at the sewage treatment plant, in 2013, a TDEC SQSH at the same location documented 10 EPT genera and 35 total genera for a TMI score of 36. It appears that with the plant improvements, criteria are now being met in Green River.
TN06040004 025 - 0200	BOOKER HOLLOW	Lewis	1.8	Nitrate+Nitrite T. Phosphorus Low dissolved oxygen Temperature Alterations Escherichia coli	Municipal Point Source  Collection System Failure	Booker Hollow was the receiving stream for the Hohenwald STP for many years and was impacted as the result of inadequately treated wastewater and collection system problems. The discharge has now been removed from the stream. In addition to removing the source of pollutants, the elimination of the discharge has removed a source of flow. During the most recent cycle, the stream was found to be mostly dry. The stream is no longer impaired.
TN06040004 025 - 2000	ROCKHOUSE CREEK	Lewis	5.1	Total Phosphorus  Nitrate+Nitrite	Municipal Point Source	See above. Booker Hollow, the receiving stream for the Hohenwald STP, flowed into Rockhouse Creek and caused nutrient impairment. Now that the discharge has been eliminated, nutrient levels are much lower. The stream will need to remain listed for habitat alterations and pathogens.
TN06040005 050 – 2000	TRACE CREEK	Humphreys	7.33	Siltation  Physical Substrate Habitat Alterations	Land Development	Upper Trace Creek was impacted by an unpermitted channel alteration. TDEC issued an NOV and required corrective action. The stream has now recovered. In 2011, a TDEC SQSH at mile 12.0 (u/s South Clydeton) documented 13 EPT genera and 34 total genera for the almost perfect TMI score of 40. The habitat score was 140.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason For Delisting
TN06040005 075 - 0300	LITTLE TURKEY CREEK	Humphreys	3.3	Riparian Alteration	Pasture Grazing	Little Turkey Creek was listed in the previous cycle after it failed a biocon. When we reassessed it this cycle, it was clear that cattle had been removed and habitat had improved. A 2013 TDEC biocon at mile 0.4 (u/s Turkey Creek Road) documented 14 EPT families, 7 intolerant, and 27 total families for the perfect biocon score of 15. The habitat score was also very good (138). The stream has improved.
TN06040005 032 – 0720	LITTLE BEAVER CREEK	Henderson	5.84	Escherichia coli	Pasture Grazing	Little Beaver Creek was listed for E. coli after monitoring in 1999. Subsequent sampling in 2003, 2009, and 2013 did not indicate that levels were elevated. The only criteria exceedance was due to a rain event. The stream will need remain listed for FAL impacts as the biointegrity criterion is not being met.
TN08010204 014 - 0500	CANE CREEK	Henderson	17.8	Siltation	Land Development Silviculture	Once so clean it was considered as a reference stream, Cane Creek was listed due excessive silt from logging activities in the watershed. The stream went from having 11 EPT families in 1998 to only five in 2002. After the logging site stabilized, the stream rebounded with less silt and 7 EPT families documented in 2012 and an overall biocon score of 13, a passing score that indicates good water quality. While not as good as it once was, it appears that the stream has recovered enough to meet water quality standards.
TN08010209 021_3000	BIG CREEK	Shelby Tipton	27.75	Dissolved Oxygen	Nonirrigated Crop Production  Discharges from MS4 area	This segment of Big Creek was listed after chemical sampling in 2002-2003 and 2007-2008 indicated occasional low dissolved oxygen levels. However, recent sampling by both the Shelby County MS4 program and TDEC did not document any criteria violations. Oxygen levels have improved.
TN08010210 001 – 1000	WOLF RIVER	Shelby	12.8	Lead	RCRA Hazardous Waste Site	Wolf River was listed for lead after levels that exceeded chronic criteria were documented in the 1990s. An upstream Superfund site was identified as one source. The Superfund site has been remediated and levels have been lower. Since 2008, there have been very few exceedances in sampling done by TDEC and the City of Memphis MS4 program. Wolf River will need to remain listed for multiple other pollutants.

## APPENDIX A (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Reason for Delisting
TN08010210 004 – 0400	UNNAMED TRIB TO WOLF RIVER	Fayette	12.0	Total Phosphorus	Pasture Grazing	This stream was listed as impacted by phosphorus following chemical sampling at mile 1.1 (Highway 57) during the last cycle indicated elevated levels. Since 2010, five different SQSH surveys have been done at three different locations. In each case, NUTOL scores were low (28, 10, 8, 30 & 20%, respectively. It is now believed that excessive silt is the reasons for the fish and aquatic life impacts to this stream and enforcement case is ongoing against a large construction site. Additionally, the stream will need to remain listed for E. coli.
TN08010210 023 – 1000	FLETCHER CREEK	Shelby	10.7	Arsenic	Discharges from MS4 area	Fletcher Creek was listed in 2000 after four of ten arsenic observations were over 10 ug/L. In 2008-2009, only one out of 12 arsenic observations were over 10 ug/L. In the most recent cycle, no observations were over 10. It is now believed that whatever the original source, arsenic is no longer a problem in the stream. It will need to remain listed for the other previously assessed parameters.
TN08010210 032 - 1000	CYPRESS CREEK	Shelby	8.6	Lead	Contaminated Sediment  Discharges from MS4 area	Cypress Creek is one of the most impacted streams in Tennessee with a long history of pesticides, habitat alteration, and pathogens, but in the most recent intensive sampling, lead levels no longer exceed chronic criteria. Cypress Creek will need to remain listed for the other pollutants assigned to it.

**APPENDIX B: Streams on the 2014 303(d) List Proposed for Delisting in 2016  
For a Basis Other Than Water Quality Improvement**

<b>Waterbody ID</b>	<b>2014 Impacted Waterbody</b>	<b>County</b>	<b>Miles Impacted</b>	<b>2014 CAUSE (Pollutant)</b>	<b>2014 Pollutant Source</b>	<b>Basis For Delisting</b>
TN05130203 003T – 0100	FINCH BRANCH	Rutherford	5.7	Nutrients  Riparian Alteration	Land Development	This stream was originally listed due to a biological screening survey that took place in 2002. The fact that only a screening survey was done rather than a full bioecon suggests that the stream biology was not good. However, during the next assessment cycle, the stream was observed as dry for extended periods. In 2013, water was present and a bioecon was done, however, in the judgement of the biologist, we could not be confident that the stream had been flowing for very long. It is now believed that the previous appearance of biological impacts in this stream were the results of persistent and prolonged dryness rather than pollution. However, Finch Branch will need to remain listed for pathogens due to overflows from Metro Nashville's collection system.
TN05130203 018_7000	WEST FORK STONES RIVER	Rutherford	7.2	Low Dissolved Oxygen	Pasture Grazing	TDEC made two discoveries about this stream in the most recent monitoring cycle. The first was that the source of the low dissolved oxygen was a failed well that was discharging high sulphur water which is removing the oxygen from the stream. The second discovery was that the stream we identified as the mainstem West Fork Stones was actually a tributary. We have now assessed the tributary as impaired and the mainstem as fully supporting as it scored a 15 on 2013 bioecon.
TN06010102 041 – 0100	PAPERVILLE CREEK	Sullivan	2.54	Siltation	Land Development	This stream has two different names, but historically was assessed as a single waterbody due to its relatively small size. Upstream Sinking Creek (from Trammel Road to Bristol Golf Course) is impaired section. The downstream Paperville Creek is fully supporting and is being delisted. The upstream Sinking Creek will need to remain listed.

## APPENDIX B (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Basis For Delisting
TN06010102 003 – 0200	UNNAMED TRIB TO HORSE CREEK	Sullivan Washington	3.8	Riparian Alteration	Pasture Grazing	This small unnamed trib was originally assessed as impacted after it failed SQSH surveys in both 2004 & 2009. However, on both occasions, habitat scores were good (168 & 153). In 2013, the stream passed a biorecon and again, had the excellent habitat score of 154. It is now believed that in this small stream, the biorecon result was more representative of in-stream conditions than was the previous SQSHs.
TN06010207 028 – 1000	CANEY CREEK	Roane	5.0	Siltation  Riparian Alteration	Pasture Grazing	Caney Creek was listed as the result of a very poorly scoring biorecon in 2003. In 2013, staff feared that the previous poor score may have been due to the effects of the impoundment. The station was moved more upstream and at mile 1.3 (off west end of Antique Lane), a biorecon documented 17 EPT genera, 9 intolerant, and 42 total genera for the good biorecon score of 13. We now think the previous survey score at the downstream site was due to embayment effects rather than pollution.
TN06010207 026 – 0600	BEAR CREEK	Anderson Roane	10.87	Escherichia coli	Undetermined	Bear Creek is within the Department of Energy's Oak Ridge Reservation and drains part of the land around the Y-12 facility. It has received numerous pollutants and is significantly impacted, but there are no known E. coli sources, other than wildlife. We find no historic data indicating pathogens in Bear Creek and the original listing was likely in error.
TN06020001 057 – 0400	HICKMAN BRANCH	Rhea	5.0	Riparian Alteration  Siltation	Pasture Grazing	Hickman Branch was listed after it failed a biorecon in 2009 (scored 7). In 2014, a TDEC biorecon at mile 0.1 (Hickman Road) documented 10 EPT families, 7 intolerant, and 22 total families for the good biorecon score of 13. The habitat score was also good (151). Due to the lack of a traditional riffle area in this stream, the biorecon is better than the SQSH for documenting biointegrity status.

## APPENDIX B (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Basis For Delisting
TN06020001 064 – 0120	MOWBRAY CREEK	Hamilton	1.8	Unknown Toxicity	Upstream Impoundment	Mowbray Creek was listed as impacted following a 2008 biorecon (3) and a 2009 SQSH (28) that failed. The pollutant was unknown. In 2014, a TDEC SQSH at mile 1.0 (Mowbray Pike) documented 12 EPT genera and 27 total genera for a TMI score of 36. A biorecon also passed (13). It is now believed that the small size of the stream and inadequate flows may have contributed to the previous lower scores.
TN06020001 497 - 1000	UNNAMED TRIB. TO CHICKAMAUGA RESERVOIR	Hamilton	3.5	Undetermined Cause	Undetermined Source	This stream was listed as impacted following a TVA biorecon in 1999. Division staff attempted to reassess the stream in later monitoring cycles and it was almost always found to be dry. We now believe that the previous appearance of impacts was likely more as a result of periodic prolonged dryness than pollution.
TN06030003 044 – 0200	PATTON CREEK	Grundy	4.2	Riparian Alteration Siltation	Nonirrigated Crop Production	This stream was observed on multiple occasions in 2013 and was generally dry. The stream was checked again in February 2015 and was again found to not be flowing. As February – April are generally the highest rainfall months in Tennessee, streams found dry at those times are normally considered to be wet weather conveyances unless there is other evidence to the contrary. It is now believed that the previous appearance of biological impacts in this stream were the results of persistent and prolonged dryness rather than pollution.
TN06030003 044 – 0700	CALDWELL CREEK	Grundy	14.1	Riparian Alteration	Nonirrigated Crop Production	This stream was listed following its score of 28 on a SQSH survey in 2009. The stream was revisited in 2013 and staff biologists determined that a SQSH was not appropriate in Caldwell Creek because streams in this area are naturally lacking in riffle habitat, which is required for this type of survey. Thus, staff were in error for comparing the 2009 results to biointegrity criteria. The stream should not have been listed and should now be delisted. Caldwell Creek will need to remain listed for pathogens, which continue to be excessive.

## APPENDIX B (continued)

Waterbody ID	2014 Impacted Waterbody	County	Miles Impacted	2014 CAUSE (Pollutant)	2014 Pollutant Source	Basis For Delisting
TN08010210005 - 0200	STOUT CREEK	Fayette	6.7	Low dissolved oxygen	Pasture Grazing Channelization	Stout Creek was listed for low dissolved oxygen following a 2000 bioecon. During the most recent cycle, the stream was monitored and met criteria. It is now believed that the previous instances of low DO were due to stagnant conditions caused by low flows, a natural condition. The stream will need to remain listed for habitat alterations.
TN08010210020 - 0400	MCKINNIE CREEK	Fayette Hardeman	35.1	Low DO Escherichia coli	Pasture Grazing	This stream was listed as impacted due to sampling that occurred about 15 years ago. TDEC attempted to sample this stream in 2013-2014 and it was found to be dry on most occasions (9 out of 10 observations). Additionally, in aerial photographs from 2012, the streambed was also dry. We now believe that the previous appearance of impacts was due to prolonged dryness and that there is minimal public exposure to pathogens in a dry streambed.

### APPENDIX C: Federally Listed Endangered Aquatic Species in the State of Tennessee

<b>Scientific Name</b>	<b>Common Name</b>	<b>Status</b>	<b>Total Obs.</b>	<b>Pre-1975 obs.</b>	<b>Post-1975 obs.</b>	<b>HUC location of endangered species post-1975</b>	<b>Extirpated since 11/1975</b>	<b>When Listed</b>	<b>Federal Register Citation</b>
