Colonel WARREN. I feel that Major de Seversky probably had a little difficulty in getting oriented when he first went around in those two cities. I say that because that was my first impression when I first went in to those two cities. It was very difficult to analyze what had actually happened.

Of course, our parties had landed at Yokohama, and had gone around in Yokohama and Tokyo for several days. A comparison was rather difficult. In the first place, there were no standing brick walls or ordinary chimneys in the two atomic-bombed cities. So you have, essentially, a wide area which is completely flat and covered by rubble. Your impression is that maybe nothing much happened but fire, and it is true that the majority of the wooden buildings did burn.

But the burning was under somewhat different circumstances than has been indicated. As a result of the atomic bomb explosion, the majority of these buildings within half a mile were probably reduced

to splinters, because we were able to find, in the large open spaces of the stadium tract which was near to zero, pieces of four by fours, six by sixes, and eight by eights, which were from a foot to 2 feet long. Those pieces apparently had been carried by the winds into that area where they could not be burned. Elsewhere, throughout the flattened area were large timbers, partly from the roofs of houses which had been splintered. So, when the fires did start, they consumed essentially what was kindling, and the fires consumed that at a very high rate.

We took a great deal of care to look for the demolition bombing which had occurred in Nagasaki. We were only able to find three direct hits on the Mitsubishi plant and in the midget-submarine area in the southern parts of the bay area. Out of 12 bomb hits and craters that we were able to locate and recognize, there were also three which made direct hits on the medical school. These were 500-pound demolition bombs, and they had caused extensive local destruction. However, the loss of life and the volume of buildings and equipment demolished were quite small, although these bombs, particularly the three which had struck the medical school, had caused a great impression on the Japanese.

Each of two bombs that hit the medical school happened to land inside of a surgery. Major Youngs and I had quite an argument for a few days as to whether these were ether explosions or explosions of some anesthetic, because the extent of the damage to the building was out of proportion, at least in my mind; it was too minor in extent, when surrounded by the rest of the destruction which was present. They totally demolished the insides, for about 20 feet on a side, and they bared the reinforcing of the concrete. If the city had not been touched by anything else but these, they would have been considered serious.

In the medical school, the remembered loss of life from these two direct hits was very small, probably four or five people only. Of course, these were small bombs, not 10-tonners, and I appreciate that fact. But, when you looked outside of the school building, or looked inside elsewhere, the amount of over-all damage produced was ridiculously small in comparison to the rest.

One very great source of confusion was the fact that the Japanese themselves had no information, no precise data. They did not know what the population of either city was beforehand. They had very little way of telling how many people had survived or had returned to the city.

I am embarrassed by the fact that even though I led a medical party which was supposed to get figures on the mortality, and so on, that we could not come back with any definitive figures that I would be able to say were more than a guess.

The only actual fact that we could get at the end of the second month of study, at the beginning of October, was that at Nagasaki they had recorded the burning and cremation of 40,000 bodies. It is my belief that there must have been 20,000 or 30,000 more in the ruins, buried or consumed by the fire.

The data in Hiroshima was likewise inadequate and I see no way of putting a precise figure on the mortality or how a precise figure can ever be put on the total casualties.

A good deal has been said about the radiation effect. We spent a great deal of time trying to evaluate the number of people who were killed by the gamma radiation or other radiation at the time of the explosion or subsequently.

Our best guess is that if there had been no gamma radiation, the total casualties would have been 5 to 7 percent less. In other words, the gamma radiation and allied radiation effects did not add a great deal to what would have happened if the same amount of energy had been released by TNT.

A great many people were injured by fire; that is, by flames from the burning buildings, in exactly the same way that they were injured in the fire bombings. This is a burn in the ordinary sense.

When we left Nagasaki, the cases in the hospitals averaged 20 cases of fire burns to one of gamma-ray injury. There will continue to be fire-burn cases in these hospitals probably for months yet, but I believe most of the gamma-ray effects, or most of the cases affected by gamma rays are no longer much in evidence, although the symptoms of such injury can still be detected by careful investigation in some ambulatory cases.

The mortality from the gamma-radiation injury had ceased pretty well before the eighth week after the explosion, but the deaths from fire burns, those slowly healing subacute and chronic cases were still very numerous.

There was no crater. The amount of radioactive material found was of great scientific interest, but of no biological significance; that is, it was never there in amounts dangerous to any living thing.

As General Farrell has said, the ball of fire did not come to the ground and we have good evidence of that in the wooden structures, the poles, particularly. The fires which did occur were, in the main, of secondary origin. There are Japanese reports of fields of wheat that were ripe catching fire about a half a mile to three-fourths of a mile away on the hillside. There were certain individuals with black clothing who had the clothing catch on fire. Clothing with black stripes and other dark figures on the cloth was scorched and the pattern was often seen from a superficial burn on the skin from the infrared radiation. This healed promptly.

This effect was also well illustrated on the telephone poles, which were scorched on the side toward the demolition and on other objects which were combustible or whose texture and appearance could be changed by an increase of temperature.

We have a great deal of evidence to indicate that the concrete buildings were gutted by the blast waves and the burning of the contents of the buildings was caused, in a great number of cases, by short circuits and fires of other secondary origin.

However, in each case, the personnel in those buildings was subject to injury and death by the secondary missiles, the main one of which was the steel window framing, which was torn out of its socket by the blast force; these window frames were thrown into the room, through the room, knocking down the personnel and not infrequently knocking down also the partitions and going on into the halls or even through both hall walls.

The impression is gained that a great many of the concrete or heavily built buildings were not damaged. You gained that impres-

sion if you looked at them from the street. Our party had two engineers, whose duty it was to specifically inspect buildings and determine what were construction failures that caused death. As a result, we have a good deal of rather precise information in pictures to indicate that relatively few of these buildings escaped major damage of some sort from the blast.

The medical school buildings in Nagasaki were built to withstand earthquakes and were exceedingly heavy. The window frames in the majority of the buildings were steel frames which were poured with the building. In most cases, these frames were ripped out. The wooden false ceiling, the wainscoting, the laboratory equipment—everything in these rooms—the books in the library, and so on, looked as if an earthquake or a hurricane of extremely high velocity had disrupted the contents.

Not infrequently, bodies were still present two months after the explosion, underneath such debris. They were killed by the fall of the false ceilings. These false ceilings were heavy and when they fell on the individuals in the room they added to the mortality, in addition to that caused by the window frames.

It took us a long time to get any information from the Japanese, and almost day to day the data which they gave to us changed. As I remember, in these two cities—I am speaking particularly of Nagasaki where I remained the longer—the stories of the Japanese changed. They frequently told us what they thought we wanted to hear and we had great trouble in getting the true facts.

A great many of them cannot remember where they were. We got a great deal of information from the three doctors in the medical school who survived and who were able to help us in our survey of cases. Five doctors survived altogether, but the other two were unable to participate; they were badly injured. The rest of the staff of 50 died; 200 of the medical students survived, but they were not of much use to us, because a great many of them were still weak and unable to carry out any duties. The rest of the 600 either died or could not be accounted for. The number of nurses and patients who died is unknown.

At the Red Cross Hospital in Hiroshima, the chief of staff was very badly injured; he had fractures of his clavicle and scapule, and a great many cuts from glass. He was not sure of what happened to the rest of his staff, but he told us that a great part of his staff had not survived, and probably 15 or 20 of the nurses were dead. He could not say how many patients were dead. In fact, he had no very clear memory of that day.

We tried to get information from the Japanese survivors as to where they were at the time, so that we could set down precise figures as to the survival rates and mortalities and injuries, and so on. It was almost impossible to get this information with any accuracy. We not infrequently found that the Japanese could not tell us where they were at the time within 1,000 meters. It took often an hour of careful questioning of a patient, even an intelligent one, like a doctor or a nurse, to find out precisely what happened on that day.

The three doctors in the Nagasaki medical school remembered nothing for 2 or 3 hours afterward and the two who could not help us because they were badly injured remembered nothing until the next day.

Our conclusion was that we could trust very little of the factual information that came to us through interpreters, from these Japanese, these patients.

When you realize that all the records and all the facilities and all the organizations of both towns were wiped out, literally, in one instant, you can see that a survey party trying to get information about individuals has very little hope or chance of success.

I could go on at great length, but I think I have said enough for your purpose.

The CHAIRMAN. Thank you.

Major DE SEVERSKY. I would like to say that in general I agree with the observations of the colonel here, I agree that there was a very terrific fire; the rest remains for the experts to find out about.

We must realize that buildings in Hiroshima and Nagasaki were in the midst of a fire of terrifically high degree of temperature. Within the concrete, metal structures were expanding, breaking concrete walls and ceilings. There was a great deal of that sort of damage. I could not easily determine whether the damage was due to the original blast or to the heat and expansion of the internal structures. Generally, both looked alike.

Now, those chimneys—I am going to show you the pictures I have. Among these pictures that I will show you, there are pictures of chimneys still standing. I hope you don't mind that.

Colonel WARREN. Not a bit.

Major DE SEVERSKY. Your statement about the wood puzzles me. I conceive that the wood might have been thrown or moved around by the wind, but what puzzles me are the trees. There were tree trunks in abundance at zero point. While I admit an atomic bomb can do a lot, I do not think that an atomic bomb can move and transplant trees.

So far as the chaotic condition of the interior of the buildings is concerned, it must be realized that during the fire there was a great panic among the Japanese. The Japs were upsetting things; there was some looting going on, because there were no troops present.

In this connection, I remember an incident. When I went through the Vulkanrod laboratory in Germany, I thought the place was struck by a hurricane, but it wasn't a hurricane. It was struck by our GI's who went through and made sure the place wasn't going to be usable.

So, while I agreed with Colonel Warren about the interior destruction—well, so many things had taken place there that I imagine it is very difficult, with any degree of accuracy, to discern the cause of damages and really know exactly what happened in each particular case.

Colonel WARREN. May I reply?

The CHAIRMAN. Yes.

Colonel WARREN. The only chimneys, though; that were actually standing were reinforced concrete chimneys which were built to withstand earthquakes; and almost all of those had the reinforcing rods snapped on the side toward the blast or where the blast had exercised compression on the downward side. That would mean that the chimneys would have to come down in the majority of cases.

I think it was quite easy, in some places where there was no fire, to show that the damage to the concrete building was due to the blast forces alone.

Insofar as the trees are concerned, they also are streamlined, and the infrared radiation which they received was not sufficient to kill them.

Also, there was not enough heat on the ground or radiation heat on the ground to kill the seeds so that the plants sprung up right away.

In fact, the Japanese planted beans and corn, and, at our urging, they raised vegetables such as sweetpotatoes, and so on, because we thought that there was no danger from doing so and we wanted them to feel—and we wanted our troops to feel—that the area was safe. We had measured it and it was safe.

Another thing around the area below zero, for a distance of 300 or 400 yards, the forces were almost straight down, so that the telephone poles and trees were relatively untouched. They were not moved from their position at all. Branches were stripped off, but not much more damage than that.

On the other hand, when you go out a quarter of a mile or more, the trees and poles were pushed down—the majority, not all—so that their base was toward the center of the blast. That was one way by which it was easy to define where zero was.

However, as you pointed out before and as has been brought out, each explosion has a lot of vagaries in it. I think it was a common experience in London and elsewhere, where there were people killed in one room and none in the next room in the same building. So, we can explain a lot of things from that. I feel that we shouldn't haggle too much over what escaped or what was damaged.

The facts are that a tremendous amount of destruction occurred in these cities; it did the job it was intended to do. The forces involved are tremendous, they are greater than anything we have had to deal with before. I would hate to see any kind of a weapon like this used.

I have been involved in the New Mexico test and investigation of these two cities. I view the future use of them with a dim light. I would fervently hope that they are never used again as a bomb or as a weapon in the future. It is not a plaything, by any stretch of the imagination, and it does a tremendous amount of damage.

I think that the radiation has been exaggerated, because the small added percentage of the people killed from that, in addition to the expected effects of TNT bomb equivalent, was small. Also, the protection which would have to be built against the blast would probably be adequate to protect against the radiation.

That is all, thank you.

Senator JOHNSON. Colonel Warren, did I understand you to say that in Nagasaki the city had been previously bombed by conventional bombs of 500-pound size?

Colonel WARREN. Yes, Senator. A raid was made, so we were told, on the 1st of August, and a string of about 10 bombs was dropped on the east side. As a result, three of them made direct hits on the medical school, and something like 15 or 16 dropped on the south side of the harbors—they were aimed at the midget-submarine plant and the lower part of the Mitsubishi steel plant.

Senator JOHNSON. Were the hits in the medical school accidental?

Colonel WARREN. I think that both were accidental, except that they tried to get the midget-submarine plant at the south end of the harbor and they ran over too far to the north under the cloudy

conditions which prevailed. Or a man may have dropped his bombs to get rid of his load on the way home. I do not know the details. There were craters, though.

Senator MILLIKIN. That is, there were three hits that you found?

Colonel WARREN. There were three in the Mitsubishi steel plant and submarine area which actually struck buildings or the foreground of buildings. The rest of them hit the bank, they went into part of the bay and missed the buildings otherwise.

The CHAIRMAN. Are there any further questions?

(No response.)

Thank you very much, Colonel.

We will convene again at 2 o'clock to finish this line of testimony and also to hear a very important witness who will talk to us on the definition of basic scientific information.

The hearing will recess until 2 o'clock.

(Whereupon, at 1 p. m., a recess was taken until 2 p. m. of the same day.)

AFTERNOON SESSION

The CHAIRMAN. Mr. Nitze, you are vice chairman of the United States Strategic Bombing Survey made at Nagasaki and Hiroshima?

Mr. NITZE. That is correct, sir.

The CHAIRMAN. Have you some comments to make upon the testimony of this morning?

Mr. NITZE. Yes, we would like to make a few comments on that.

STATEMENT OF PAUL H. NITZE, VICE CHAIRMAN, UNITED STATES STRATEGIC BOMBING SURVEY, ACCOMPANIED BY PROF. H. L. BOWMAN, DIRECTOR, PHYSICAL DAMAGE DIVISION, USSBS, AND PROFESSOR OF CIVIL ENGINEERING, DREXEL INSTITUTE OF TECHNOLOGY, PHILADELPHIA, PA.; AND DR. LUTHER L. TERRY, MEDICAL DIVISION, UNITED STATES STRATEGIC BOMBING SURVEY (U. S. PUBLIC HEALTH SERVICE)

Mr. NITZE. I think first I would like to describe the United States Strategic Bombing Survey. It was set up in the fall of 1944 at the request of President Roosevelt to make an impartial survey of the effects of the strategic air attack on Germany. The Army supplied us with a large number of trained personnel, but the main direction of the survey was civilian in order to assure impartiality.

We made an investigation in Germany not only of the physical effects of the various weapons that were used, but also industry by industry to see how the damage to a given factory related to the over-all production of the industry and to Germany's war potential. We made a survey city by city to see what the effect of urban area attack was, investigated what happened to the morale of Germany, what happened from the medical standpoint, and also what happened from the over-all economic and military point of view. We tried to cover the subject matter from the broadest possible point of view.

The CHAIRMAN. What is your background? Will you state it briefly for the record?

Mr. NITZE. Prior to joining the survey I was in the Foreign Economic Administration handling the procurement of strategic mate-

rials from abroad and the preclusive buying operations against the Axis, an economic background. Prior to the war I was a vice president of Dillon, Read & Co.

The group included specialists in all different fields. The groups, at maximum strength, was as large as 1,400 in Europe.

After completing the European survey, we were requested to make a similar survey in Japan, not only of the physical damage, but also the entire relationship between the physical damage and these other effects, the economic, military, and political effects.

Obviously the atomic bomb was a new element in Japan which warranted a great deal of attention, so we sent into Hiroshima and Nagasaki quite large groups. I think we had 114 people in each place for periods of up to 2 months; not all of them that long, but very extended periods of time, and those included structural engineers, ordnance people, medical people, experts in the electrical field, the railroad experts, and so on.

As Major de Seversky said, the problem of really defining what the effects were is a job which cannot be done hastily. Our first impressions were sometimes totally different from our final impressions. It is only after you have made a detailed examination structure by structure and have correlated all the data that you can come up with sufficiently basic and accurate conclusions to evaluate and compare atomic weapons with other weapons.

I think we might go to some of the major points which have been raised, taking first the question as to the blast effect which was caused by the atomic bomb in relation to the blast effect which might have been caused by a 10-ton blockbuster. We have computed the distances from ground zero point at which structures of all various types were destroyed. I think Professor Bowman could give some summary as to the range at which blast effects occurred.

Professor BOWMAN. The figures for Hiroshima are as follows:

We found that one-story brick buildings were destroyed pretty generally up to about 7,700 feet.

Senator TYDINGS. A mile and a half?

Professor BOWMAN. That is right. Brick multistory buildings were destroyed rather generally up to about 5,700 feet. Up to about 2,000 feet, reinforced concrete buildings would have about one-third of the area rendered useless.

Senator MILLIKIN. Up to about how many feet?

Professor BOWMAN. 2,000 feet.

Senator TYDINGS. Is this Nagasaki or Hiroshima?

Professor BOWMAN. Hiroshima.

Senator TYDINGS. That is the first bomb?

Professor BOWMAN. That is the first bomb. I don't have in exactly that same form the figures for Nagasaki, but as an example of reinforced concrete construction at Nagasaki, there were 21 reinforced concrete buildings located between 1,000 and 2,000 feet from ground zero. Of that 21, 4 were destroyed; 10 had what we have designated as "structural damage," which means that some of the main members would have to be rebuilt; and the remaining 7, which accounts for all 21, suffered what we called superficial damage—that is, they had walls knocked out or minor damage of considerable extent, and by minor damage I mean more than windows broken and partitions knocked out.

Senator MILLIKIN. Can you distinguish for us the destruction or injury caused by blast and by fire?

Professor BOWMAN. The damage that I have given here is all blast damage.

Senator JOHNSON. Was there very much apparent difference in the types of buildings of those that were completely destroyed and those partially destroyed and those that were superficially destroyed?

Professor BOWMAN. There are two factors that enter in. One, of course, is distance. The other is that in dealing with reinforced concrete buildings, as an example, there is a wide difference in construction. Because of the Japanese laws regarding earthquake construction, and also because of laws which required a much heavier roof than we use in many cases, some of those buildings were even stronger than ours would have been. On the contrary, some of them were of poor construction; the design may have been made all right, but the workmanship was poor. The concrete was poor in some of them, so that some of the differences that you get, the spread in distances, would be accounted for by the difference in construction of the various buildings.

Senator TYDINGS. Do you have a ready reference for quick comparison as to the damage and the extent of the damage from point zero of the biggest blockbuster beside the atomic bomb?

Professor BOWMAN. I don't have those figures, sir; I would have to guess.

Senator TYDINGS. Could you get it?

Professor BOWMAN. There would be a big difference, but I would have to guess.

Senator TYDINGS. Give me a guess now, and then correct it in the record permanently after you have time to verify your guess. How many times greater is the damage of the atomic bomb used over Hiroshima as compared with the damage that would have been done in the same spot by the biggest blockbuster?

Professor BOWMAN. You are talking about Hiroshima?

Senator TYDINGS. Yes—5, 10, 15, 25—how many times greater?

Professor BOWMAN. I would say the number is certainly not less than 100, and probably 200 would be a better guess.

Senator TYDINGS. So your answer is somewhere between 100 and 200 times as much damage was done by one atomic bomb as would have been done by the greatest blockbuster that was used in World War II. Is that right?

Professor BOWMAN. I think that is correct.

(Professor Bowman subsequently submitted the following, which was made part of the record:)

WAR DEPARTMENT,
UNITED STATES STRATEGIC BOMBING SURVEY,
PHYSICAL DAMAGE DIVISION,
Gravelly Point, Va., February 27, 1946.

HON. BRIEN McMAHON,
Chairman, Special Committee on Atomic Energy,
Senate Office Building, Washington 25, D. C.

DEAR SENATOR McMAHON: Inclosed are the statements on the relation between a 10-ton "blockbuster" and the atomic bomb which Senator Tydings requested me to submit for record when I appeared before your committee on February 15.

Sincerely yours,

H. L. BOWMAN,
Director, Physical Damage Division.

In appearing before the Senate's Special Committee on Atomic Energy on February 15, 1945, I was asked by Senator Tydings to guess the number of 10-ton "blockbusters" which would cause destruction equal to that of one atomic bomb of the type used in Japan, and to later correct the guess for the record.

My guess was that the number would be not less than 100 and might be as high as 200, assuming that each type detonated at the optimum altitude. On further thought I see no reason for changing these figures.

Theoretical considerations suggest that a 10-ton bomb (i. e., one containing a charge of perhaps 8 tons of TNT) would demolish multistory brick buildings with load-bearing walls located at distances of 400 feet from the point of detonation, would do serious structural damage (i. e., damage demolishing, or at least requiring the replacement of, main supporting members) to multistory buildings with frames of structural steel or reinforced concrete located at distances of 150 feet. Corresponding distances for the atomic bomb are 5,000 feet and 2,000 feet. Therefore, the relative areas of destruction are—

$$\text{Multistory brick} \quad \left(\frac{5000}{400}\right)^2 = 156$$

$$\text{Multistory steel or concrete} \quad \left(\frac{2000}{150}\right)^2 = 178$$

It is seen that these figures lie in the range 100-200 mentioned above.

These theoretical figures for the atomic bomb may be compared with figures obtained by actual survey at Hiroshima (corresponding distances at Nagasaki would be at least 15 percent greater). To multistory reinforced-concrete buildings at a distance of 2,000 feet from air zero (i. e., the point in the air at which the bomb detonated) the atomic bomb caused structural damage which rendered about one-third of the floor space of the buildings unusable. Also, multistory brick buildings were destroyed at distances (average) of 5,750 feet from AZ; single-story brick, at distances of 7,700 feet.

H. L. BOWMAN,
*Director, Physical Damage Division,
United States Strategic Bombing Survey.*

Mr. NITZE. On that point, wouldn't it be also fair to say that, irrespective of the target used, that ratio would not change greatly? In other words, both weapons used against flimsy construction or both weapons used against heavy construction, the ratio would still be relatively constant.

Senator TYDINGS. I will ask my question in another form. Does your proportion hold true as to lives as well as to buildings? Is it more or less in the case of lives in that area?

Professor BOWMAN. I don't think there would be any wide difference.

Senator TYDINGS. In other words, the life casualty would run along with the building casualties?

Professor BOWMAN. I think that is right.

Senator TYDINGS. Would you give me your best considered thought on that when you have a little time to reflect on it, and state what figure you actually think on sober second thought would be the one you suggest?

Professor BOWMAN. Yes.

Mr. NITZE. I think, Senator, that Dr. Terry could testify as to the relationship between casualties caused by incendiary bombs in other Japanese cities and the casualties in Hiroshima equated as to areas of equal physical destruction.

Dr. TERRY. Could you testify on that?

Senator TYDINGS. Let me ask you whether it is your intention later to give us similar figures on Nagasaki?

Professor BOWMAN. These figures apply generally.

Senator TYDINGS. Of course, there was more area destroyed at Hiroshima than at Nagasaki.

Dr. TERRY. In attempting to compare, of course, there are many variables, but we tried to make the equation as simple as we could.

Insofar as human lives were concerned, the number of deaths and injuries produced by an atomic bomb and produced by incendiary bombing in Japan, the simplest manner in which we could make an equation where there would be only one variable was to compare the number of deaths, rather the percentage of deaths produced in Hiroshima and Nagasaki to the percentage of deaths produced in other cities where a comparable percentage of the cities' area was destroyed by incendiary bombing. In other words, one would have to suppose—in applying that, for instance, to Tokyo, a much larger city—that a sufficient number of atomic bombs would be dropped to produce the same percentage of damage to the built-up area as was achieved in Hiroshima and Nagasaki.

On that basis, and comparing mortality and morbidity figures we found that the figure for injuries would be 15.2 times as great by atomic bombing as by incendiary bombing.

Senator TYDINGS. What do you mean? One incendiary bomb?

Dr. TERRY. I said incendiary bombing.

Mr. NITZE. To produce comparable physical damage.

Senator TYDINGS. Would it take 15 times the number?

Dr. TERRY. No, this represents the number of injuries produced by the atomic bomb in comparison to incendiary bombing. If one produced the same amount of damage in two comparable cities, in one by incendiary bombing, in the other by atomic bombing, there would be 15 times as many people injured in the second as in the first. There would be 18 times as many people killed. The exact figures are 15.2 and 18.6.

Senator TYDINGS. You mean the atomic bomb would injure 15 times as many?

Mr. NITZE. If one destroyed three square miles of Tokyo by incendiary bombs, and if one also destroyed three square miles by atomic bombing, the casualties in the first instance would be one-fifteenth of the casualties in the second instance.

Senator TYDINGS. So that if a city were 3 miles square, for example, and was completely devastated by either method, the amount of casualties as a result of atomic bombing would be 15 times as great as by incendiary bombing?

Mr. NITZE. Right, on the basis of Japanese experience.

Senator TYDINGS. Now I understand you.

Major DE SEVERSKY. May I ask a question?

The CHAIRMAN. Yes, go ahead.

Major DE SEVERSKY. Your comparison is one Japanese city as against the other Japanese city, one Japanese city attacked by atomic bombs against another Japanese city attacked by incendiaries. Are you convinced that the same ratio will apply exactly to a steel and concrete city where there are no wooden structures?

Dr. TERRY. I was not talking about concrete cities. I was talking about comparative mortality and morbidity figures for Japanese cities. For incendiary bombing, five of the largest cities in Japan were taken; for the atomic bombing, the two cities were taken.

Senator TYDINGS. Could you right there give us the number of planes and the number of incendiary bombs that would be used in the comparable area for your statistics for incendiary bombing as

against the one plane and the one bomb used in an atomic bombing, and the length of time?

Dr. TERRY. I don't know.

Senator TYDINGS. Would it be possible for you to construct a reasonably accurate table in answer to that question?

Dr. TERRY. Oh, yes; I think so.

Senator TYDINGS. Will you do it and put it in the record?

Dr. TERRY. Certainly.

Senator TYDINGS. I would like to know the number of planes and the amount of time.

Dr. TERRY. What do you mean by time, sir?

Senator TYDINGS. Well, whether you could take 100 planes in 2 days, or 50 planes in 4 days, or whatever it would take.

Dr. TERRY. If you will pardon my interruption, I don't believe the time element would be of any importance, because actually we will presume that one plane could fly there as quickly and drop its bombs as quickly as a thousand planes.

Senator TYDINGS. If 100 planes came over, they would be a better target than if one plane came over. One plane would be the worst target of all.

You can shoot into a flock of ducks and hope to kill one without aiming very well; but you cannot shoot one duck without having a pretty good aim. That has been my experience with duck shooting, anyway.

Major de SEVERSKY. May I inject something here?

I feel that it is quite to the contrary. Of course, if you are attacking a defenseless city, that is one question; but, if one plane approaches a city that has adequate air defenses, it probably will never get there. In that case, you would probably have to send quite a number of planes to guarantee that one of them would actually deliver the atomic bomb to the right place.

Senator TYDINGS. But with 200 planes you lose the element of surprise. With one plane, you keep the element of surprise.

Major de SEVERSKY. Only for the first time or two times.

Senator TYDINGS. All you want is one time with an atomic bomb.

Senator JOHNSON. One hunter and 200 ducks, or 200 hunters and one duck—that is your comparison. If you have one duck among 200 hunters, as in the case of one plane, he doesn't have much chance of getting away.

Senator TYDINGS. I would like to know how many planes it would take to effect the same amount of devastation with incendiary bombs as it would take with one atomic bomb, and we can figure out the time element almost automatically.

Mr. NITZE. There was some testimony this morning with respect to the number of planes which would have been necessary to produce comparable damage at Hiroshima. I think General Farrell testified that it would be somewhere in the order of 400 to 750 planes, and our testimony was that taking into account the fact that in other cities there was some repeat raiding where you went over some already-burned-out area, while these were virgin cities from the standpoint of fire, about 300 planes would be the equivalent figure.

We also made the point, however, that that would only be fire damage which would result therefrom, that there would be no blast damage and far fewer casualties.

Senator TYDINGS. You can flee from a fire, to some extent, but you cannot flee from an atomic bomb very well.

Mr. NITZE. That is correct, and the casualties would presumably be one-fifteenth what they were from this particular bomb.

The second point we wanted to make was that as you increase the strength of your structures, the relationship does not necessarily go down; the stronger weapon is relatively just as effective against strong structures as it is against weak structures.

Senator TYDINGS. That is sensible.

Mr. NITZE. Granted that there are protective measures which you could take to reduce the loss of life, and Major de Seversky's point was very well taken this morning that this was a surprise attack, that people did not find themselves in shelters. They were all out in in the open, and if there had been warning the casualties would have been measurably less.

Senator TYDINGS. You would, however, say that Major de Seversky's point was not well taken when he maintained that one atomic bomb is only 10 times as great as one blockbuster?

Mr. NITZE. That we think is completely out of the realm of any reasonable relationship.

Senator TYDINGS. Your opinion is based on actual examination of the facts, isn't it?

Mr. NITZE. Yes; but one does have to make some hypothetical calculations in order to translate it.

Senator TYDINGS. Not completely hypothetical?

Mr. NITZE. Not completely hypothetical.

The CHAIRMAN. Senator Tydings, Major de Seversky's statement in the Reader's Digest was that one atomic bomb delivered as it was over Nagasaki would do no more damage than one blockbuster dropped in the traditional blockbuster-dropping style over lower New York, not 10.

Senator TYDINGS. I don't think Major de Seversky would maintain that position now, would you, Major?

Major DE SEVERSKY. I still consider that the atomic bomb exploded over concrete and steel cities in the same manner as it exploded in Hiroshima would cause damage to the structure which would be on the order of the damage caused by one 10-ton blockbuster.

Senator TYDINGS. What is that again?

Major DE SEVERSKY. I said it would be approximately the same as the result of a direct hit by one 10-ton blockbuster, but I do not say they will be equal if both of them score direct hits. That is another story. We went through that this morning and it is all in the record, sir.

Senator TYDINGS. Well, I don't want to take issue with you, because I am here to listen and not to argue; but I would say that some 25 men who have preceded you on the stand, who have worked on the atomic bomb and experimented with it and have viewed the damage, all take issue with you, and none of them support you.

Major DE SEVERSKY. I still have to maintain my own opinion based on my observations, and if I find I am mistaken I will have enough moral courage to admit I was wrong.

Senator TYDINGS. All I was trying to do was to see if you could agree that the atomic bomb, as testified here, was 100 or 200 times

greater in its material destructiveness than is the blockbuster. You don't agree to that? You think they are equal?

Major DE SEVERSKY. It depends on the target. I went through that this morning.

Senator TYDINGS. I hope if I am in New York and they have a selection of weapons the next time they are going to bomb that city in the next war, the fellow who selects them will take a blockbuster instead of an atomic bomb, and I am sure you will agree with me.

Major DE SEVERSKY. It all depends on the means of defense you are going to work out.

Mr. NITZE. Perhaps the reason there is disagreement is that you might not get what is called structural damage, as defined by the weapons-analysis experts, which means main structural members have given way, to the heavy steel structures of New York from a bomb exploding at the height that the atom bomb was actually exploded at Nagasaki, but you would certainly get an enormous amount of the type of damage which is important to the citizens of the United States, which is to have the walls blown in, to have people killed in large numbers, to have the buildings made completely useless as any place where you can live or do any business.

Senator TYDINGS. I would like also to have put in the record, if it hasn't been put in, by whoever can put it in, that we have the scope of the 10-ton blockbuster put in the record at about this point so that we may have the actual limitations.

Mr. NITZE. As it happens, I don't believe there is a 10-ton blockbuster. None was ever built.

Senator TYDINGS. Well, whatever one there was, the largest. I would like to get that in so we not only would have what we know about the atomic bomb, but what we actually know about the 5- or 6- or 7-ton blockbuster.

Mr. NITZE. We might go through some of these paragraphs, paragraph by paragraph.

Major de Seversky says that the appearance of Nagasaki and Hiroshima was comparable to the appearance of any other city that was burned, which is quite right, because the result of the secondary conflagration is the thing which you first see when you go there, the remains of a big fire. But as one looks more deeply into the thing, the effects are different.

I don't believe an incendiary raid would produce evidences of flash effect such as one finds in Hiroshima and Nagasaki. I have here a piece of tile from the tile roofs that Major de Seversky refers to, which shows the bubbling effect one gets on the tile roofs.

Major DE SEVERSKY. Why is it caused by flash and not by fire? It is heat, isn't it? But why flash and not fire?

Mr. NITZE. I believe experience shows that that type of effect would not result from a secondary fire, that that could only be produced by the radiation and flash effect of an atomic bomb.

Professor BOWMAN. That only occurred near zero point. It didn't occur throughout the area where the buildings were burned.

Major DE SEVERSKY. I am going to show you a picture at zero point where the paint is beautiful, nothing was scorched. Unless the explosion hits like lightning bolts and sizzles this spot and that spot and not the entire area, I am completely flabbergasted.

Professor BOWMAN. There were acres of this bubbled roof tile.

Mr. NITZE. Out to considerable distances it was bubbled.

Professor BOWMAN. 600 to 1,000 feet from zero this effect took place.

Major DE SEVERSKY. How would you explain to me that on the top of those buildings, practically at zero point, the paint on the railings and wooden doors survived?

Colonel WARREN. There are a lot of things we cannot explain, but you can see plenty of evidence on telephone poles where this infrared radiation, without any flame at all, affected the side of the pole toward zero and not the side in the shadow, and that is exactly the same thing.

Major DE SEVERSKY. There is nothing to prove to me that this is necessarily a flash burn.

Senator TYDINGS. This goes horizontally through the air, as I understand it, and hits whatever it comes in contact with.

Colonel WARREN. It is like light, subject to screening which produces shadows.

Mr. NITZE. I think with respect to this point we can supply photographs of the gas tank which was some four or five thousand feet from zero point in Hiroshima where the paint is clearly glazed wherever it was exposed, and where you can see the shadows of an intervening building which was blown down by the subsequent blast as clearly as though it were brilliant sunlight. Even out at that distance there was that type of effect.

Major DE SEVERSKY. I can remember, for example, burns on a white concrete bridge at one place where one of the men I talked to told me people were knocked down and were lying on the bridge for some time during the raging fires. The whole bridge was smoked up, but when the bodies were removed they left a white imprint on the bridge.

Professor BOWMAN. But there are places where the railing of a bridge cast its shadow and the rail was still standing, so that wasn't lying on the bridge during the fire.

Major DE SEVERSKY. Behind the pole there were white spots.

Colonel WARREN. Not very far out.

Mr. NITZE. With respect, for instance, to such things as telegraph poles still standing, and with respect to chimneys still standing, those are certainly structures where the pressure equalizes very rapidly. The pressure hits on one side, and almost instantly the pressure is equal on the other side, so it is to be expected that that type of thing would survive and did survive even though some of the chimneys, as Colonel Warren stated, were structurally injured at the base. I think on analysis that is not a difficult phenomenon to explain.

If one wants to give protection to people close in to an atomic explosion, it can be done with adequate shelters; but you cannot have openings because the blast would blow in, and flying debris was one of the largest causes of casualty in Hiroshima and Nagasaki. If you don't have openings, then you don't have an equalization of pressure and the shelters would have to be strongly constructed.

One of the reasons why structural damage was probably not greater than it was from blast was due to this equalization of pressure as the windows blew in and the blast equalized. But if you try to protect the people inside, then you have to have a structure which will maintain itself even though the pressure does not equalize.

Major DE SEVERSKY. What do you think would be the effect if they used the kind of shelter that we saw at Essen and IG Farben in Germany?

Mr. NITZE. I think it was our opinion that shelters of that type would stand against a bomb exploded at this altitude, and that the people therein would have survived. In other words, it is possible to build shelters which would protect people from this explosion at this altitude. I think Major de Seversky's point is well taken that if you lower the altitude you shrink the area exposed to the effect of the bomb, even though you increase its effective power within the smaller area.

General Farrell's point that it probably is impossible to construct any structure which would give total defense against a direct hit is also well taken. All that can be done is to reduce the area of vulnerability by improved types of structures.

There are a number of minor factual errors in the article, in addition to these mentioned. It does seem, moreover, as though Major de Seversky had been trying to make a point and had not presented factual data impartially from the scientific point of view or from the impartial standpoint which he recommends at the end of his article. It seems the phraseology in the article is misleading where it is not wrong and is not necessarily a fair phraseology.

Senator TYDINGS. Of course, you are talking all the time about the old atomic bomb.

Mr. NITZE. Yes, our investigation of course was limited to the bombs that were dropped at Hiroshima and Nagasaki.

Senator TYDINGS. To the first two. Unfortunately, much of the testimony before this committee has been in secret with FBI men standing at the door, so we are in no position to talk about the future atomic bomb. It is only fair to say that these conclusions are based on the first two that were used.

Mr. NITZE. I think we might make a few comments with respect to the relative effectiveness of the bomb dropped over Hiroshima and the one dropped over Nagasaki. It is quite true that the area which was destroyed at Nagasaki was less than the area at Hiroshima, but that is solely due to the nature of the target. The intervening hills did protect a portion of the downtown area of Nagasaki, but not all of it by any means. I think we have got some photographs here which will show the degree to which that downtown area was injured.

I think Dr. Bowman's figures conclusively demonstrate that the radius from zero point, at which structures of comparable types were damaged, was appreciably greater at Nagasaki than at Hiroshima. That is correct; is it not?

Professor BOWMAN. That is correct.

Senator JOHNSON. The Nagasaki bomb, then, was the more potent of the two?

Mr. NITZE. Yes, measured from ground effects irrespective of the scientific computations as to the energy released.

Senator JOHNSON. Is that true in all departments—the blast, the radioactivity, the heat, and all?

Mr. NITZE. I think in all effects.

Professor BOWMAN. We have no figures on radioactivity.

Senator TYDINGS. Could I ask you whether the maximum point of blast effect was measured at Nagasaki, and if so what was it?

Mr. NITZE. The distance from ground zero?

Senator TYDINGS. You gave some figures starting with 7,000, 6,500, and 2,000 feet, and so on. Have you any comparable figures where the hills did not intervene showing the scope of the Nagasaki bomb?

Mr. NITZE. Yes, I think Dr. Bowman has those figures here.

Professor BOWMAN. I don't have exactly comparable figures.

Senator TYDINGS. Give us an approximation.

Professor BOWMAN. The relative effectiveness of the two bombs?

Senator TYDINGS. Well, as I recall you stated, I think, 7,800 feet.

Professor BOWMAN. I would say that the given effects at Hiroshima were repeated probably 25 percent further away at Nagasaki.

Senator TYDINGS. So that it would be a fair average conclusion to take the limitations you have mentioned on the effect of the bomb at Hiroshima and add 25 percent to each category in estimating the increased scope, and so forth, of the Nagasaki bomb?

Mr. NITZE. Yes.

Major DE SEVERSKY. Senator, I don't think it is exactly fair to use it as an inescapable conclusion, because while intervening hills limited the spread of the blast in one direction, they also might have assisted the propagation of the blast in another direction, forming a sort of channel, like the phenomenon that takes place in a wind tunnel or a gun barrel. In Nagasaki, I can show you a great many wooden buildings still standing up at a distance nearer to the zero point than in Hiroshima, and you can measure it yourself on the map.

Dr. MORRISON. But shielded by hills?

Major DE SEVERSKY. Not at all; I can show it to you.

Senator TYDINGS. I am in no position to argue the merits of this, but with a limited knowledge of it I don't think it got much force from from the echo of the hills.

Major DE SEVERSKY. This section here [indicating photograph], I have pictures of it; it all consists of ordinary Japanese wooden buildings. That distance from here to zero is shorter than the distance in Hiroshima in a similar case, yet here it isn't protected by the hills. There are no obstructions in this direction, and that is a fact.

Senator TYDINGS. What have you gentlemen to say to that observation?

Professor BOWMAN. There are freak effects in all bombings, but I am comparing comparable concrete buildings, and I would like to revise the 25-percent figure I gave a minute ago and make it 15 percent. I have looked at some figures, and I think that the results in the two cities were of such magnitude that you can say that equal damage occurred 15 percent farther out in Nagasaki than in Hiroshima.

Dr. MORRISON. If I may, I would like to add one more statement on the USSBS people's statement.

We made measurements simultaneously with the blast which were not measurements of damage, but simply measurements of the excess pressure, which I think would quite well agree with the damage estimates that these gentlemen have made. These are instrumental measurements, not measurements of the damage on the ground, but certain instrumental effects we observed which confirmed our belief that

the Nagasaki bomb was a more powerful weapon, and which agree in magnitude with the damage estimates.

The CHAIRMAN. All right, Dr. Nitze. I don't want to hurry you, but I do wish to get through with this.

Mr. NITZE. I think we have touched on the major points. I think the most important point is that on heavier structures, if we were using the bomb against a city which was built not as the Japanese cities were built but with much heavier structures, you would still have approximately the same relationship between the effectiveness of a blockbuster and an atom bomb as one does have against the flimsy structures.

I think that is the major point of this argument.

Major DE SEVERSKY. If it exploded in the same manner?

Mr. NITZE. That is right.

Major DE SEVERSKY. We have no disagreement.

Mr. NITZE. I might discuss your computation here. You said:

It seems to me completely misleading to say that the atomic bomb used on Japan was "20,000 times more powerful" than a TNT blockbuster.

In the first place, there is an error in the mathematics there, because in the first paragraph you have talked about a 10-ton blockbuster, and such a bomb would contain 5 to 7 tons of TNT, and as I remember it the statement was made that the force released by the Nagasaki bomb was 20,000 tons of TNT, so the figure would go right down to 3,000 to 4,000 and not 20,000 such blockbusters.

To continue to quote from your article:

From the view of total energy generated, this may be correct. But we are not concerned with the energy released into space. What concerns us is the portion which achieves effective demolition. From that point of view, the 20,000 figure is reduced immediately to 200 for a target like Hiroshima.

We feel that that figure is wrong; that it would be in the order of 100 to 200 ten-ton blockbusters, which brings us up to a 1,000 or 2,000 tons of bombs and 500 to 1,000 tons of TNT in any case.

Major DE SEVERSKY. I have an explanation to make there. In that particular case, I considered the ratio between the two tactical efforts to destroy the target. In other words, I feel that 200 planes loaded with ordinary bombs could do the same destruction to Hiroshima that one plane could do dropping one atom bomb.

Mr. NITZE. But if we are talking about that, a plane carries up to 5 to 10 tons of bombs; it doesn't carry just 1 ton of bombs.

Senator TYDINGS. Are we talking about 200 planes—carrying what?

Major DE SEVERSKY. A full load, roughly 10 tons.

Mr. NITZE. Then, it is 2,000 planes.

Major DE SEVERSKY. No, 200 planes.

Mr. NITZE. Two hundred planes you are figuring for incendiaries, which we think ought to be 300 planes.

Senator TYDINGS. Read that paragraph to me, again, will you, please?

Mr. NITZE (reading):

It seems to me completely misleading to say that the atom bomb used on Japan was "20,000 times more powerful" than a TNT blockbuster. From the view of total energy generated, this may be correct, but we are not concerned with the energy released into space. What concerns us is the portion which achieves effective demolition. From that point of view, the 20,000 figure is reduced immediately to 200 for a target like Hiroshima.

Senator TYDINGS. That should have been 2,000, then, according to the calculations you just made here.

Mr. NITZE. That is correct.

Senator TYDINGS. So it is 1,000 percent out of line?

Mr. NITZE. That is correct. [Continuing to read:]

For a target like New York, the figure of 20,000 drops to one or less.

We don't think it drops at all.

Senator TYDINGS. All right.

Major DE SEVERSKY. I still want to defend the figure of 200 for the simple reason that what I was trying to point out to the people was that the Hiroshima bomb was not 20,000 times more powerful than a TNT blockbuster. I was also answering the Chicago scientists, who accused me of wrong arithmetic. I was proving to them that I was right when I figured that Hiroshima might have been put out of commission or destroyed by 200 Superfortresses. They said that if one Superfortress destroyed one city, 200 Superfortresses ought to be able to destroy 200 cities. I said to them they forgot one little detail, that all such cities ought to be of the same flimsy nature of Hiroshima.

Senator TYDINGS. What would happen if 100 Superfortresses carried 100 atomic bombs over Hiroshima?

Major DE SEVERSKY. I think that would be a waste of material. My answer was directed particularly to this group of scientists in Chicago. I thought that they should have qualified that all the 200 cities should be of the same nature as Hiroshima; in that case, they would be right. If the 200 cities were like Chicago and New York, it will be an entirely different matter. Two hundred bombs of the type that were dropped on Hiroshima will not destroy 200 Chicagos, and I stand by that statement.

Senator TYDINGS. I think I see what you mean, but the article conveys another impression. That is my point. I see what you are saying now, but I think your article conveys another impression; and in any case, it is 1,000 percent in error even on your own explanation.

Major DE SEVERSKY. Are you talking about destruction, yes? I am talking about the number of planes. That paragraph is tied up with the previous paragraph. You cannot read the two paragraphs separately. You have to read both of them, and the entire content of the article; and I have no question that anybody who reads it will understand what I mean.

Senator MILLIKIN. Mr. Chairman, could I ask a question of any of the witnesses here, whether it would be feasible or practicable to conduct a model test, a heavy structure model test, and extrapolate the results?

Mr. NITZE. I think Dr. Morrison could testify best on that.

Dr. MORRISON. I think we had very good tests at Nagasaki and Hiroshima which were very expensive, and I think the British people and our own people have analyzed the results.

As to the conditions of the first atomic tests, we made very careful tests of measuring impulses and all the effects of damage as a result of distance.

Now, experience with explosions has given us a way to correct these figures as to damage to all sorts of structures. European and otherwise, and I think it is on this experience that the USSB surveys have worked. I don't think we need any more information on that, and it would be

expensive. I think we can predict within a factor of two or thereabouts just what would happen to any particular building.

The CHAIRMAN. Taking it into New York, now, with his example of one blockbuster doing as much damage as one atomic bomb, what comments have you got to make on that?

Dr. MORRISON. That it is not true, because it does not agree with the facts. It is a technical question.

The CHAIRMAN. What is true?

Dr. MORRISON. I don't know. I think the USSBS people might be better to estimate than I. It is evident that the damage is not proportionate to the energy released, and that is perfectly clear. The damage is done more or less in proportion to the area of damage which goes up not directly with the distance away for a given effect but the square of that distance. If you double the distance of effects, you multiply by four times the amount of damage, other things being equal.

Major DE SEVERSKY. How about interfering structures between?

Dr. MORRISON. If you double the radius—

Major DE SEVERSKY. You cannot talk about radius without first giving the nature of the target.

Dr. MORRISON. I say if the radius were double. Now, to double the radius requires much more than a two-fold increase in energy, very much more—I would say in the order of 8 to 10 times more; allowing for intervening structures, I would say 10. Without that, I would say something like 8, and that is why we made a bomb of this size, a 20,000-ton equivalent, as the President has said.

One could make bigger bombs to do more damage, but it soon doesn't pay because you have to increase the energy so much.

Senator MILLIKIN. You say from the experience and knowledge we already have you can make a fair approximation of what will happen if an atomic bomb of the kind that we have now, or of any other kind, might be dropped in lower Manhattan?

Dr. MORRISON. Yes, sir.

Senator MILLIKIN. Are you ready to speculate on how many blockbusters it would take to produce the same effect at the same place?

Dr. MORRISON. Well, I don't like to make an off-hand statement. Major de Seversky has had a long time to talk to the committee. He has printed articles, and I have to try to answer in an off-hand sentence, so I hope you will understand that what I am saying is not very sound, and I will give a large region for error. I will be conservative and say at least 100, perhaps 300 or a thousand, depending on the nature of the targets. I cannot imagine any target in which the bomb used in the appropriate way against the blockbuster used in the appropriate way for it would not do something like 100 times as much damage.

Senator TYDINGS. Considering the opposition of a great deal of the country to certain parts of New York City, I think the committee might take under advisement an actual demonstration.

Major DE SEVERSKY. Senator, I think it is very difficult to prove these contentions, because I do not think the New Yorkers are likely to be bombed within the next year. But we are going to have some tests in the near future, and I would like to ask Dr. Morrison what he thinks the atom bomb is going to do to the Navy, and then probably within 6 months or so we will be able to find out which assumption is closer

to the facts, because then we will be able to see the results with our own eyes.

Would you tell me roughly your idea as to what you think is going to happen to the ships?

Dr. MORRISON. I do not want to talk about the Navy, but since you direct me to do it, and if the committee is perfectly willing, I am willing to talk about it, but I shouldn't. I do not know the precise ships or their placements, and, therefore, what I have to say is rather speculative.

I would tend to agree with the statement you made earlier that the air shot will not damage more than a handful, if that many, ships. That is all I can say.

If you want to drop the bomb within a couple of ship-lengths of any ship to make a pretty broadside target, either 500, 800, or 1,000 feet, you would smash any capital ship, in my opinion. But I think the test as actually done with a high-level air shot will not damage but the closest ships. The next will be slightly damaged, and the ships any distance away will not be damaged at all.

Major DE SEVERSKY. The only difference between you and me is this: I feel that if the air shot is going to be dropped like at Hiroshima, the battleship is not going to be damaged very badly.

Dr. MORRISON. I would advise you not to stand on the deck of that battleship.

Major DE SEVERSKY. I don't think I would like to, either, but I think I wouldn't mind—except for the radioactivity, after what I saw in Hiroshima—I wouldn't mind being below the deck.

Senator TYDINGS. You may be my proxy, Major.

The CHAIRMAN. Are there any other comments, Mr. Nitze?

Mr. NITZE. I would like to make one more comment.

I think the measurement of the physical destruction is not the appropriate measure of the true effectiveness of the bomb, for the impact this bomb had on Japan, or any other country presumably, is far greater than that. For instance, one can take this general hospital in Hiroshima which the major referred to and said that no one was seriously damaged in the building and the building was not structurally injured. It is true that no structural member was damaged in that building, but it is also true that as a useful instrument as a hospital it was completely useless to the Japanese for 3 weeks or longer thereafter.

Major DE SEVERSKY. And I added that the damage was exactly the same as the damage that would be done by a blast of TNT bomb. In other words, glass was blown out, the plaster fell down. It probably knocked a lot of patients down too.

Mr. NITZE. 90 percent of the people in it were injured.

Major DE SEVERSKY. Not by direct action of the atomic bomb, but by falling plaster, which would happen with a TNT bomb.

Dr. MORRISON. How far away would a TNT bomb have to be to do the same damage to the hospital?

Major DE SEVERSKY. I would say about two or three hundred feet.

Dr. MORRISON. This was exactly 1 mile away.

Major DE SEVERSKY. About 10 times.

Colonel WARREN. And it tore up X-ray equipment bolted to the floor, moved partitions and dental chairs that are very heavy.

Major DE SEVERSKY. But the building itself was structurally intact.

Dr. TERRY. It injured 90 percent of the people in it, the patients and personnel, and the hospital was not able to continue as a hospital.

Major DE SEVERSKY. That is what I say in this article. The loss of life was tremendous from the atomic bomb—far more than from any other source.

Dr. TERRY. You said the people inside were not seriously affected, which is not true when 90 percent of the people were injured and when the personnel was not adequate to carry on the hospital functions. It is not exactly a complete misstatement, but it is said in such a way that no one could interpret it correctly.

Senator TYDINGS. What would be the cost to repair that building, as compared with its original cost?

Dr. MORRISON. I think one of the people from the USSBS might be able to help. Anybody who has built buildings has some notion. I have not built buildings and do not know what would be the cost of rebuilding the Red Cross Hospital in Hiroshima from the condition in which it was left after the bomb as compared with the cost to build the complete building. My impression is that most of the value of that building was destroyed by the bomb because such a terrible job was done to the internal building.

Major DE SEVERSKY. I don't think the hospital was destroyed to that extent. I think it was primarily superficial damage—windows and plaster. I went through it very thoroughly, and, as a matter of fact, my statement is based on the report of doctors and nurses who had been working there. I simply repeated what three doctors told me and what six nurses told me. Naturally people were injured by falling plaster like in an ordinary TNT explosion but there were not any 1,000-mile hurricanes blowing through there. There were some people injured by glass. In England, during the bombing, the major injuries were sustained from flying glass. Those are not supernatural phenomena.

Dr. TERRY. From a practical standpoint, it doesn't make any difference how a man is killed, whether by hitting him over the head or by flying glass—he still is dead, and that is the important thing I think one has to consider in talking about injury produced regardless of how it was produced. The one outstanding feature, I think, about the atomic bomb from all other types of bombs is the abnormally large number of human casualties that were produced. They were produced in all manners, but that is relatively unimportant. The fact is they were produced.

Major DE SEVERSKY. Due to the element of surprise. I could guarantee to produce more injuries in the same city by using poison gas if no one knew I was going to use it. It is a question, in that case, of attacking an unprepared and defenseless city where there was no adequate air-raid precaution measures. They were not prepared for the ordeal, and you cannot credit the bomb with the unusual loss of life on that basis. Through the whole history of military science, when you have an element of surprise you cannot properly judge the true value of your weapon, because, under those circumstances, its efficacy is enormously enhanced. We cannot take for granted that similar losses will occur in the future, because in Hiroshima and Nagasaki the element of surprise was the major contributing factor.

The CHAIRMAN. Any other observations?

Mr. NITZE. I think there are a great many detailed observations we could make. There is one further point I would like to refer to, and that is that Major de Seversky this morning referred to the fact that Japan was already defeated by air power, and that the major influence of the atomic bomb was that it made an invasion unnecessary.

On that point I think we would more than agree with the major. It is our opinion that Japan probably would have surrendered prior to November 1 in any case; the atomic bomb merely accelerated the date at which Japan surrendered.

We have got some photographs in case anybody would like to look at them, but I do not think they are necessary.

The CHAIRMAN. Dr. Morrison, have you any salient points you wish to make?

Dr. MORRISON. Perhaps I would like to make a couple of remarks.

STATEMENT OF DR. PHILIP MORRISON

Dr. MORRISON. As I see it, Mr. Nitze has expressed the real point in issue here, which is whether the atomic bomb will do a great and overwhelming amount of damage to American or European industrial cities since it has only been observed to do damage over rather lightly constructed cities, like the cities of Japan.

The nature of Major de Seversky's comment is that it will only do damage comparable to that of a very large TNT bomb carriable by one plane. Against this one has to look into the technical features of the situation, which I do not believe Mr. de Seversky has had an opportunity to do; at least he doesn't seem to have had access to the published figures and all the standard general information on damage, some of which is very relevant.

It is true that we do not have any experience with the atomic bomb over a city of western construction. We have, however, some experience with large explosions in these cities. I think the most famous explosion was that in the harbor in the city of Halifax caused by the detonation of picric acid, which is similar to TNT, corresponding to 4,000 tons. That was out in the harbor some distance from the shore. It was outside the city of Halifax, and although I have only been in Halifax once, I would say that if you should pick out a city at random in the United States you would find a city similar to Halifax. It is not like lower Manhattan, but there is not much in the United States that is like lower Manhattan. This city was damaged pretty badly by this accidental explosion equivalent to 4,000 tons of TNT. I think the number of casualties is not well known, but it was estimated to be about 30,000. This is the best sort of experience we have in this direction.

In one German city there was a 5,000-ton explosion of ammonium nitrate, and there again the casualties—this was rather remote, out from the center of the city in a chemical plant—were only a few thousand. I think you have to think of these things to see that a 20,000-ton explosion, that of the atomic bomb, will do much the same sort of damage.

The scale factors in going from a 10-ton to a 20,000-ton bomb are known. It is not correct to say that there is 2,000 times as much dam-

age. There is 2,000 times as much energy, but not 2,000 times as much area of damage.

However, one can look at some of the scale factors, and I think you will see the sort of thing we have in mind. For example, the standard British figures learned by experiment and also by actual observation in damaged regions show that for a 2-ton blockbuster. Let me give you a few figures. We have not, of course, exposed people to this, but from actual measurements made in the same way with the same instruments on 2-ton bombs and on the atomic bomb, and from actual observations of what 2-ton bombs do in European cities, we have some standards to go on. It is a question of measuring, not a question of opinion, as far as I can see. It is a technique one has studied and knows something about.

One distance, for example, is the distance at which lung damage from blast becomes important. This is surprisingly close to a bomb. That is, people are rather resistant to blast, so if a man is not hit by debris or pushed against a wall, or burned, but simply hit by a blast wave, it must be close to him. The figure given is something like 50 feet from a 2-ton blockbuster, and the man has a fair chance of surviving against this damage, against lung damage. That figure would go up to something like 1,200 feet for the atomic bomb.

In the same way, a 9-inch wall, which is a good example of grade B damage, would be expected to be pushed over most of the time at 200 feet from a 2-ton blockbuster, and I would say that the equivalent scale factor from our experience with this bomb would be about 4,000 feet.

Pressures due to a tornado produce only partial structural damage—a tornado would not have fazed the medical school or the Red Cross Hospital at Nagasaki. It would have done about the same thing the bomb did, smashed the insides. But the aerial photos would still look pretty good. That is what we call roof and ceiling damage—skylights, casements, interior partitions, and so forth.

The tornado scale of damage was produced 450 feet away from a 2-ton blockbuster, and about seven or eight thousand feet away from an atomic bomb, I would say.

Now, if you get 650 feet away from a 2-ton bomb, you have the effect of a wind gale as of a severe storm which will knock over billboards, light roofs, and probably knock over many Japanese houses, but not very serious. That same effect would be produced at about 14,000 feet as against 650 feet. All one has to do is to look at these scale factors, and it becomes hard to see how you can conclude that against any kind of a target, the two will not have qualitatively a different kind of damage—100 times as much—maybe 300, I wouldn't argue about that, and I think that is all that any responsible person has ever claimed.

It is perfectly true that the total area of damage in lower Manhattan would be much less than the total area of damage at Hiroshima; no one can doubt that. I think the total casualty damage would be comparable, because the thing that protects Manhattan is that it is strong and densely populated. It was made to have a lot of people in it. I think in the same way, roughly, you would do about the same dollar damage in lower Manhattan as you do in

Hiroshima. The building costs more to build and is stronger when you get it done.

I don't think the military effect would be much less than the military effect of a bomb dropped at the right time of day over Hiroshima. If you dropped one at random on Manhattan, not Wall Street, you would produce an effect of much the same qualitative and quantitative damage as at Hiroshima. There would not be so much burning, but the buildings would still be broken down. There would be extensive class B damage, buildings made unusable, capable of repair but not totally destroyed, extending over several miles. You will have casualties running from 30,000 to 100,000.

If the hit were lucky, in the middle of the day while people were on the streets, it might be 200,000.

I cannot see how a conceivably lucky hit with a 10-ton blockbuster could do anything like this. The whole point of what people have been saying about the atomic bomb is not that somehow it magically kills people. It does not vaporize them. It does not make them into glass. It doesn't do any of these things. No one who was responsible said that. But it does produce extensive damage, damage which cannot be produced by less than 100 superbombers of a sort we don't have many of now. One has to remember also that to talk about raids of a hundred or a few hundred bombers measured against one atomic bomb does not give you the right factor. What one must think of in determining what this will do in the future conduct of war and solving the problems you have before you is not the question of what happens when one atomic bomb comes, but what happens when a thousand come, because we are told, and I can assert that it is true, that we can manufacture atomic bombs without appreciably increasing our plants. I think that to correspond with this sort of bomb production, Mr. de Seversky's figure as to the necessary airplanes—which I think he would find great difficulty getting off the ground—would be 200,000 bombers, with 2,000,000 trained crew and another 10,000,000 ground crew. I don't think you can load these people and send them off in a day or 2 days.

Senator TYDINGS. I followed all these figures you have made about the 2-ton blockbuster at 50 feet and a 2-ton blockbuster on a 9-inch wall, and so on, and I see that through all these figures the factor runs about 15 percent, or rather 15 times, and that applies even to area. Would that be a correct summation of your testimony?

Dr. MORRISON. I think that the scale figure I used for distance was about 20, to be very conservative.

Senator TYDINGS. In some cases they are 20, as I followed the figure, and in others they go down to 12, so I arbitrarily figured it at 15. Probably it is closer to 17 or 18.

Dr. MORRISON. It depends on the kind of damage you are talking about.

Senator TYDINGS. But the general examples you gave have a ratio of 20 to 1?

Dr. MORRISON. Yes, sir; that is quite right for distance—not for area, sir. You see, if I did damage over a distance of five blocks, I would damage then a square 10 blocks on an edge, which would be 100 blocks.

Senator TYDINGS. I multiplied that and took diameters instead of radius.

Dr. MORRISON. But I think you have to multiply again by the same figure to get the right ratio for area, because the diameter is in two directions.

Senator TYDINGS. That is the way I took it.

Dr. MORRISON. Well, I think we have some disagreement then in our figures.

Senator TYDINGS. Let me understand. You said, for example, that a person from a blast 50 feet away might live, and it would have to be 1,200 feet away with an atomic bomb. Therefore the figure of radius there is 24 times.

Dr. MORRISON. Yes.

Senator TYDINGS. Now we take that radius and make a diameter out of it, and make a circle or an area out of it from zero point. That is what I did in each one of these equations, so it runs out around 20 percent—that is, 20 times.

Dr. MORRISON. I think in order to get the area you have to square the ratio. Suppose we consider the case of lung damage. Let me take 1,000 feet as against 50 feet for round numbers.

Senator TYDINGS. Let's take the area of a 1,200-foot radius and a 50-foot, and multiply them both and compare them—and that is what I did.

Dr. MORRISON. That is what you did?

Senator TYDINGS. Yes.

Dr. MORRISON. Maybe we should do it together.

Senator TYDINGS. You would square the diameter and multiply by 0.7854, wouldn't you, to get the area of a circle?

Dr. MORRISON. Did you square 1,000? Let me put it a little more simply. Instead of a circle, use a square.

Senator TYDINGS. You are right; I see your point. I did everything except square it, and you have squared me.

Senator JOHNSON. Dr. Morrison, is it an exaggeration to say that one atomic bomb equals 20,000 tons of TNT?

Dr. MORRISON. No, sir; that is a correct statement.

Senator JOHNSON. That is a correct statement?

Dr. MORRISON. That is a correct statement. It is not a correct statement to say that it does the damage which 20,000 individual 1-ton bombs would do. That is no longer a correct statement.

Senator JOHNSON. What is the basis of comparison, then?

Dr. MORRISON. The basis of comparison is on energy released, and what we are saying is that the atomic bomb does the same damage that would occur if you had an arsenal containing 20,000 tons of TNT all in one piece, and simultaneously blew it up. Then you would have very comparable damage.

There are some additional factors, but for the purposes of argument they are not important; so I would say it is a sound statement to say it is like an explosion of 20,000 tons of TNT. It does not do as much military or tactical damage, as Mr. de Seversky has pointed out, as 20,000 individual planes each dropping 1 ton.

I might perhaps give a rough explanation of why this is. The point is that you blow up the center of this region very thoroughly. You blow it up into tiny, little pieces; whereas if you have 1-ton bombs, you blow up many more regions into medium-sized pieces. As far as the military effect goes, it doesn't matter if a man is blown into a thousand or five thousand pieces, or into two, as Colonel War-

ren reminds me. It is more efficient to kill a man by blowing him into two pieces than to waste your energy in tearing his building or him up into shreds. The building is useless and the man is dead.

All you have done is spread energy violently in this area. As you go farther out, the energy goes down. It is not true that 20,000 tons of TNT does 20,000 times the area damage as one blockbuster of one ton achieves, but it does do several hundred times as much area damage, and that is the point we are trying to make.

Senator JOHNSON. Thank you.

The CHAIRMAN. Is there anything further that any of you gentlemen wish to add?

Senator MILLIKIN. I would like to put a clincher on the thing I have already put to the witness.

If you made the New York Stock Exchange the zero point, could you by your calculations and by your existing knowledge of this energy figure out how many atomic bombs of given power would have to be put down there on zero to accomplish a desirable area of destruction?

Dr. MORRISON. Well, I think that if one had photos of the area, some information from the structural people about the strength of the buildings, one could plot out roughly the A and B damage circles around this zero point for one bomb, and one could decide where to drop the next nearest bomb to get the desired damage.

Senator MILLIKIN. You might miss it, but it wouldn't be grotesquely wrong?

Dr. MORRISON. That is right, sir. It doesn't mean that everybody within the damage circle would be dead, 100 percent damage. There would be some cases of people who would walk out, some cases of bannisters not knocked down, and so on, because of the very complex geometry of a city wherein nobody can go and look at the ruins and say, "There was a telephone pole just up here that shaded that particular piece of railing."

That is a thing you cannot find out afterward, but the military can predict results with good accuracy. This was done for the Eighth Air Force and the Twentieth, as well, during the war, with considerable success, and it was done, I may say, for the Hiroshima and Nagasaki areas. We have tried to make an estimate of what the military effect would be, and we found it to be about right.

We did underestimate—and this was an error—the terrible effect on casualties, and the great morale and psychological effect that came from the saturation nature of the bomb. Mr. Penney, of the British Mission, pointed out in advance that we were tending to underestimate the saturation. He correctly said, 3 days after the test shot in New Mexico, that one of these bombs would destroy the military value of a city of 300,000 population. The city of Hiroshima is 308,000.

Senator MILLIKIN. I think I can put my question in an entirely different form. Are you able to estimate with reasonable accuracy the masking effect of heavy structures, assuming you know all about those structures and their relation one to another?

Dr. MORRISON. That is a little hard to do. I think with fair accuracy one could do that, but that is a rather serious problem.

Senator MILLIKIN. That is why I asked awhile ago if there was a practical way to do it in model form.

Dr. MORRISON. I am afraid it is hard to do it. This is a question I cannot give an answer to offhand, but I don't think the masking effect would seriously affect the military nature of the problem. The buildings would have to go somewhere. They fall in the streets; people are killed by the blast leaking through the alleyways and so on. You might not correctly estimate the air cover, but you would not, I think, incorrectly estimate the effect of damage.

Now, it is certainly possible to build buildings that will withstand anything but a very close hit from an atomic bomb. It is easier to build buildings that will withstand anything but a direct hit from a 10-ton bomb, but I don't think any sizable fraction of our population live in such structures.

I think the structures, as Colonel Warren pointed out, that the Japanese had in Nagasaki, and some of the structures in Hiroshima were stronger than any comparable buildings we have in this country. I don't think you can find anything equal, except in Los Angeles and Berkeley, Calif., where special earthquake building has been done. This was not uniformly true, but there were some buildings of that kind.

If you take a train coming through New York or Chicago, as I have done, you look over the rooftops of the city from the elevated structure, you don't see many buildings that would last within a few thousand feet of an atomic bomb.

The CHAIRMAN. Thank you very much, Doctor.

Dr. Ridenour, you are here specifically to talk about basic scientific information and technical know-how and what you conceive to be the necessary secrecy restrictions, I believe.

Dr. RIDENOUR. Yes, sir.

The CHAIRMAN. Will you proceed, Doctor?

STATEMENT OF DR. LOUIS N. RIDENOUR, REPRESENTING THE FEDERATION OF AMERICAN SCIENTISTS

Dr. RIDENOUR. My name is Louis N. Ridenour. I am on leave from the physics department of the University of Pennsylvania, and now at the Radiation Laboratory, Massachusetts Institute of Technology. Although I was a prewar nuclear physicist, since the beginning of 1941 I have been concerned with the design of military and naval radar equipment, and with the steps necessary to insure that effective use is made of this equipment in actual warfare.

The hearings so far held by this committee are impressive in their completeness and impartiality. I wish to discuss one tremendously important aspect of atomic legislation: its provisions for maintaining secrecy with regard to the fundamental scientific content of what has been called the secret of the atomic bomb.

This question has been touched on in testimony before this committee. There is universal agreement that it is wise and useful to permit and even encourage full and free publication of all the results and findings of basic scientific work, provided only that this is not done on a unilateral basis—provided, in effect, that other nations will trade their scientific results for ours. However, some of the individuals who have appeared before you—for example, General Groves—have either implied or stated explicitly that it would not be wise

for us to maintain such a policy of free publication of basic scientific work if other nations refuse to do likewise. I feel that this is entirely wrong. I shall try to show you that the interests of our nation will be better served by complete freedom of publication of the results of scientific work than by attempting to restrict the circulation of such information to a certain group in this country, in order to prevent its leakage to foreign nations who might be our enemies in a future war. In my opinion, this is true even if no other nation in the world has a policy of free publication of scientific results. It is true whether we think that we have entered on an era of international peace, or believe reluctantly that we must prepare ourselves for inevitable war.

It is easy to make an idealistic argument for freedom of scientific publication: to say that the publication of results is the lifeblood of science, to assert that only by demonstrating our international good faith by a policy of free publication can we hope to set the stage for international trust and understanding. I shall not make such arguments, because I do not believe that they cover the present case. Our nation is clearly committed to an atomic armament race at least as an interim national policy; the fact that we are still manufacturing and storing up atomic bombs admits of no other interpretation. There are evidences that other great nations are ready to enter into this race with us. Under these conditions, we must make plans in the light of the possible failure of the measures now being taken for securing international agreement on inspection and control of atomic energy. I shall therefore confine my remarks to the desirability of freedom of scientific publication in an era of international suspicion, during an armaments race, and even in the midst of a war.

C. F. Kettering has said: "When you lock the laboratory door, you lock out more than you lock in." In the radar field, we started with the same atmosphere of secrecy, the same precautions about compartmentation of information and clearance of individuals, which characterized the atomic bomb project right to the end, and still characterize it today. However, we did away with most secrecy before the end of the war. At the end of the war, the Army was publishing a magazine on radar with a circulation of over 12,000. It had become by that time apparent that secrecy cost us in efficiency far more than it gained us by keeping the enemy in ignorance. We found it a lot harder to inform the enemy than readers of spy stories may think. In the spring and summer of 1943, Allied aircraft were finding and killing German submarines at a rate not far from one a day, by the use of a new type of radar. There was literally no more important problem to the German high command than to find out the nature of the device our aircraft were using. Exactly the same radar was then in use by Allied bombers attacking Germany; and the inevitable losses of such aircraft scattered this radar—about which the German Navy was so eager to learn—all over Germany and the occupied countries. Despite all this, 6 months elapsed between the loss of the first complete equipment to the Germans and their realization that this was the radar their submarines had to combat.

The use of the word "secret" for the results of scientific investigation or the findings of engineering is genuinely misleading. Let me illus-

trate what I mean. If I say, "I am thinking of a number, but I shall keep it a secret," I have used the word "secret" in its usual sense. Apart from the possibility of my telling you the number, you have no way of knowing it or of finding out what it is. On the other hand, if I say, "I know the critical mass of U-235 necessary to make a bomb, and I intend to keep it secret," I am using the word "secret" in an entirely different sense. I am saying to you, not that you cannot find out what I know, but that you must find it out for yourself, without my help. This may cause you to become annoyed with me, but it cannot keep you in ignorance.

In order to be sure that I am keeping such knowledge from you, I must also keep it from some of my own people. Since it is never known, in science, which man will have a new idea, or what each man must know in order to have the ideas and do the work of which he is capable, I am hobbling my own work by my misguided belief in the usefulness of scientific "secrecy." Arbitrary exclusion of a certain number of my own scientists from full knowledge of my progress removes entirely the usefulness of these men.

This is really the crux of the argument. If we can hide nothing permanently by scientific secrecy, then it is clearly undesirable, for it slows our own progress. Scientific history is full of coincidences—of cases in which two or more men, in different parts of the world, have reached the same result and independently of one another's work and at the same time. Dr. A. H. Compton, an outstanding figure in the work on the atomic bomb, was awarded the 1927 Nobel prize in physics for his discovery of what is now called the Compton effect—the inelastic scattering of light quanta by free electrons. In Holland, this is called the Debye effect, because Compton's explanation of his experiments was given independently by Debye at the very same time.

The Russian physicist, Gamow, and Gurney and Condon—the same Dr. Condon who is scientific adviser to this committee—gave independently and at the same time an explanation of the phenomenon of alpha-particle disintegration of the radioactive elements. The very phenomenon of nuclear fission itself, the basis for the atomic bomb, was only foreshadowed by the work of Hahn and Strassmann in Germany. The hypothesis of a violent splitting of the uranium nucleus was independently proposed and verified by Frisch in Copenhagen and by Joliot in Paris. The suggestion that plutonium would be a suitable explosive for an atomic bomb was made in this country by Prof. L. A. Turner. The Smyth report points out that the same idea occurred independently to the British physicist Cookcroft, and Turner has told me that Von Halban, working in France, had the same idea at the same time.

Two promising new devices for the acceleration of electrons and atomic nuclei to high energies were invented last fall by two young American scientists. One, called the synchrotron, was invented by McMillan, at Berkeley; another, the microtron, by Schwinger, at Harvard. In the summer, 1945, issue of the *Journal of Physics* of the U. S. S. R., a Russian physicist named Veksler published a paper describing these two devices. Though the scientific shades had been down between Russia and the United States during the war, after 5 years we find Russians and Americans doing the same things, in the same way, at the same time. The synchrotron involves a magnet,

whose design is straightforward but complicated. McMillan is presently building a synchrotron, on funds supplied by the Manhattan district. When a physicist at MIT, who is also planning the construction of a machine of this type asked McMillan for his magnet design, he was told that the Army would not permit the release of information on the magnet. Who are we attempting to handicap by such restrictions? Surely not the Russians; they not only invented the synchrotron, they did it earlier than we did.

In my own wartime field of radar there were many examples of the same kind. Radar itself was independently invented by the Germans, the French, the British, the Japanese, and ourselves. Each of these nations kept it secret from all of the others, not knowing to what little point this was done. Microwave radar, which has played such a great role in the Allied victory, was made possible by a single invention, the cavity magnetron. This is a transmitting tube which give previously unimaginable amounts of power on wavelengths far shorter than those available to radio engineers before the war. It was invented by the British. When the British sent a scientific mission over to this country in the late summer of 1940, one of the most impressive of the secrets they had to show us was the cavity magnetron. When the radiation laboratory was first set up, an attempt was actually made to keep knowledge of the magnetron localized in one group of the laboratory, not even letting the men who were working on a modulator to energize this tube know of the tube's design. Yet, all this time there was in the Russian literature a paper which exactly described the cavity magnetron, and gave the results of experiments with it.

In the light of all this evidence, and more of the same kind which I could quote for hours, you must forgive scientists for being impatient with talk of "the secret of the atomic bomb." The Army's policy respecting the release even of the most peripheral information obtained by the Manhattan project has been much too restrictive. Today, for example, more than 8 months after the explosion over Hiroshima, the entire nonsecret literature covering the immense amount of medical work on the effects of radiation and of radioactive poisons on living tissue is to be found in section 8.70 of the Smyth report. Quoted in its entirety, it is: "Extensive and valuable results were obtained." Even in an armaments race such as that we are in today, even in the war to which such an armaments race is likely to lead us, how do we benefit by withholding the results of such investigations in medical fields?

Some of my friends who have had no contact with the bomb project have been interested in speculating on the problems which surround the atomic bomb. Only a law providing for thought control on the Japanese pattern would make it an illegal breach of security to tell you the results of this speculation. It may be interesting for you to compare some of the results of this speculation with the things you have been told as "secrets" in executive sessions of your committee. Such results can be equally well deduced by the physicists of any second-rate world power on the basis of the completely available published information on nuclear physics. If you feel it is proper, I shall be glad to tell you of some of these speculations.

I cannot presume to advise this committee of the detailed way in which a bill for atomic energy control should provide for peacetime secrecy restrictions on the publication of scientific work. It is my opinion that all of the bills so far presented go much too far in the direction of imposing such restriction. There would be little purpose served by full publication of instructions for the manufacture of an atomic bomb, and I believe that it is wise to restrict the publication of information concerning finished military devices.

On the other hand, there is no benefit to us, and there can be very serious harm, in restricting the performance of experiments or the publication of results in any field of basic science, nuclear physics included. The definition of "basic scientific information" in S. 1717 in my opinion is not valid. It is important to publish not only the end results of scientific work, but a detailed description of how they were obtained. It is only this practice which distinguishes modern science from medieval alchemy.

We can make an analogy with the way other weapons are handled. The design of guns is kept confidential; yet the metallurgy of steel is dealt with in the usual way. Military aircraft are designed in secret; yet the aerodynamic principles on which they are based, and even techniques such as flush riveting, are freely published and available to all. It is thus that scientific and engineering progress is made.

Advocates of secrecy in science feel that it will advance our national security and strengthen our national defense, else they would not advocate it. All of the evidence available to me shows that scientific discovery and engineering development cannot flourish fully except under conditions which allow all competent men to be fully informed, and thus able to contribute to progress. We shall weaken, not strengthen, our national defense by any restrictive measures on performance or on publication in scientific fields.

That concludes my prepared statement.

The CHAIRMAN. Any questions?

Senator HART. Doctor, may I ask one question, in your own field of radar? It is true, is it not, that we were way ahead of our enemies in this last war in our adaptation of microwaves?

Dr. RIDENOUR. Yes, sir, that is true; and my belief, based on 5 years of observation, is that our leadership in this field was entirely due to the fact that the barriers of secrecy were broken down entirely between our Army and our Navy and among all three armed services of the British and between the British and ourselves, so that there was an enormous team of perhaps 10,000 scientists and engineers working together with full knowledge of the progress of the whole group. They advanced the art so fast that our enemies, who were still interested in engineering secrecy in this field, could never keep up.

Senator HART. Yes, but carrying your argument to its logical conclusion and making the assumption that your enemies could have obtained the information at the same time we did would have meant that we would not have weapons superior to them.

Dr. RIDENOUR. Well, sir, I question that, if I may, because we must distinguish between knowledge and performance. That is to say, it is not enough to be informed of the results of a scientific experiment or of the design of a particular device. It is still necessary to make

use of this information in the performance of another experiment, or in the manufacture and employment of the device. It is my contention that one must not make a small advance in a certain field and say "Now, I must keep this secret so no one catches up with me." He, must say, "I must tell this to everyone, to the competent scientists and engineers, and I will keep ahead of everyone."

Senator AUSTIN. I have a question that is probably curiosity and not founded on any real premise, and that is whether you think it is scientifically possible for the phenomenon of absorption of a neutron by a uranium nucleus relating this division into parts with release of energy—whether it is scientifically possible for that phenomenon to occur without the use of the devices or similar ones that you have referred to?

Dr. RIDENOUR. I am sorry, sir; I do not understand what devices you mean.

Senator AUSTIN. Literally, it gets down to the question of whether it is possible for an accident to occur which results in fission releasing great energy.

Dr. RIDENOUR. Oh, almost certainly such accidents are occurring all the while in nature.

Senator AUSTIN. That is just my question.

Now, will you explain that?

Dr. RIDENOUR. Yes, sir. As you know, cosmic radiation bombards the earth all the while and at sea level here the radiation consists of various types of energetic particles, and in particular contains some neutrons. These neutrons, striking uranium atoms up at Great Bear Lake or in the stone of this building, or anywhere in the world, will, on occasion, produce nuclear fission.

Now, this does not happen at a very great rate, else in the lifetime of the earth all of the uranium would have been used up by such a process; but it certainly is occurring all the while.

Senator JOHNSON. Is that the discovery that the Russians announced that was announced in the press as having come from Russia a few months ago, the discovery that you are mentioning now?

Dr. RIDENOUR. I don't think so, sir. This is not really a discovery at all. If one finds there are neutrons in cosmic radiation and uranium in the earth, this is a foregone conclusion.

Senator JOHNSON. The announcement of their discovery, so-called, seems to be similar to your theory.

Dr. RIDENOUR. I have seen only newspaper accounts of this announcement, and I infer from those accounts that what was discovered by the Russians was so-called spontaneous fission of the uranium nucleus. Just as a nucleus will sometimes shoot out an alpha particle, so also the fission into more or less equal halves with the release of energy may happen spontaneously. This is a rather infrequent event.

Senator TYDINGS. As I recall the newspaper accounts of that, it was the Russians who had discovered the process by which spontaneous nuclear fission took place.

Dr. RIDENOUR. Yes, sir; that would make sense.

Senator TYDINGS. That would make sense?

Dr. RIDENOUR. Yes; it would in the sense that the nuclear fission in which the atomic bomb people were interested was encouraged to happen.

Senator TYDINGS. If they had discovered that, I would assume that would be quite a worth-while discovery.

Dr. RIDENOUR. Well, I am not competent to say. I think it tells you some useful things.

The CHAIRMAN. Doctor, the term "basic scientific information" has been defined in S. 1717 as including, in addition to theoretical knowledge of nuclear and other physics, chemistry, biology, and therapy, all results capable of accomplishment as distinguished from the processes or techniques of accomplishing them.

Now, I take it you quarrel with that definition.

Dr. RIDENOUR. Yes, sir; I feel it is too restrictive.

The CHAIRMAN. Why?

Dr. RIDENOUR. Because it is not sufficient to say merely "I have done an experiment, believe me, and I find that the likelihood that a uranium nucleus will undergo fission if I bombard it with neutrons of a certain energy is thus and so."

It is not enough to give this result without saying how you attained it, because the main purpose of scientific publication in our modern age, let us say since Galileo, has been to make it clear to others how they can repeat and check the experiment that another man has done, and that is what I meant to imply when I said that our science differed only from medieval alchemy in that way. You know, the alchemist had recipes for turning silver into gold and lead into gold, and so on, and these recipes were secret. They didn't tell them to anyone.

The CHAIRMAN. Now, translating that into the Smyth report, you would say that the Smyth report deals exclusively in basic scientific information, would you?

Dr. RIDENOUR. Well, sir, there is a good deal of engineering information in it, and there is a good deal of basic scientific information which is left out. For example, it has almost no numerical results on the various nuclear processes, and the likelihood of their occurrence under various circumstances, and so on. It has almost no results of experiments, let alone the means of accomplishing the experiment.

The CHAIRMAN. Don't you feel that if the way these things were accomplished were to be made known and published in the world, it might bring very much closer the achievement of the same result, namely, the Nagasaki bomb in other countries?

Dr. RIDENOUR. I have heard varying estimates on that from people who were actually in the project. I think you should get a comment from someone who was in the project.

The CHAIRMAN. I am talking from your own knowledge and your own conscience. If we publish not only the results, but how they were achieved, to the world, then it certainly would bring that much closer the accomplishment of the perfected bomb in other countries, would it not?

Dr. RIDENOUR. I don't feel that it would make a very substantial difference, and the reason I don't is the one that I gave a little earlier, namely, that we must not only know things, we must also do things.

Some friends of mine who have worked in the atomic bomb project have said that the real time-consuming part of the work was the construction of the plants, and the lack of availability of scientific information scarcely held up the progress of the work at all. The scientific work was done concomitantly with the construction.

Therefore, if I were a scientist of Shangri-La, and the Sultan of the place asked me to make him an atomic bomb, I would call in today not only the scientists but also the contractors, and I would say to the contractors, "Now, I know roughly what I want." I would have the contractors start to build the sort of establishment that I gathered, from my general knowledge that everyone has of the project, would be necessary, and I would put my scientists to work filling in the gaps in what I need to know in order to make these plants run. I think the whole thing would fit together pretty well, and it would make very little difference whether this nation were publishing scientific papers on the subject of nuclear fission or not.

Senator TYDINGS. I understand your viewpoint on secrecy from this end down, but at what point do you think secrecy could be justified and under what circumstances, if at all?

Dr. RIDENOUR. Well, sir, I feel that it is justified with respect to the detailed design of military weapons. I do not want to have anybody, including me, told how we make an atomic bomb and how you make it go off. This is a very difficult thing to do, we are assured by all the published literature; and I am ready to believe it. I don't think that is any of the scientist's business, and I don't think it advances science any to publish it.

However, the design of McMillan's synchrotron magnet has nothing to do with it.

Senator TYDINGS. Let me see if I can generalize, which isn't fair, so as to get your viewpoint without consuming a lot of time. You would make available all the information that might be termed "scientific progress," but you would not make available that information whenever it took the characteristic of a weapon, or something closely related to a weapon—that is, the technique of the application of the discovery to the weapon itself?

Dr. RIDENOUR. Yes, that is right.

Senator TYDINGS. Is that a rough line of demarcation?

Dr. RIDENOUR. It is, and the reason I advocate this—I hope you will all understand—is not that I think it is a good idea from any idealistic or high-minded point of view, but that it gets you farther ahead. We see this in radar. There is one field of radar in which the assertion I made to you, sir, is not true. The compartmentalization was not entirely broken down. I refer to the identification equipment which was carried by Allied aircraft and ships in order to give a specific signal on Allied radar when a friendly vessel or aircraft was involved. This was kept much more secret than anything else in the whole field of radar, and operationally it was the biggest flop in the whole field of radar. After D-day in Normandy, IFF equipment was never used, and it was never used because it didn't work properly under conditions of high traffic density. It didn't work properly under conditions of high traffic density because it wasn't designed right, and it wasn't designed right, I think, because not enough work had gone into its design and not enough work could go into it so long as the secrecy requirements were maintained the way the people thought they should be.

Senator TYDINGS. You are not advocating the disclosure of anything in the nature of a weapon or what might be called indispensable to the weapon. You are talking about scientific discoveries removed from what might be called the weapons of war.

Dr. RIDENOUR. Yes, sir. I am parenthetically in this IFF discussion recommending that you make your compartments of secret knowledge rather big and roomy, even within the Army or Navy, or you will get into trouble; but that is another matter.

The CHAIRMAN. Going back to the atomic bomb again, if I understand your principle correctly, applied to the atomic bomb, you would open up entirely the processes by which fissionable material is made?

Dr. RIDENOUR. Yes, I would.

The CHAIRMAN. But you would stop at the point where the fissionable material was compressed into the bomb or bomb process?

Dr. RIDENOUR. Yes, sir.

The CHAIRMAN. Now, does that mean that you would open the doors of Oak Ridge and invite scientists from all over the world to come in there and see how we turn out that fissionable material?

Dr. RIDENOUR. I think it does, Senator. I am not supposed to know what is at Oak Ridge.

The CHAIRMAN. Well, having in mind that it has been testified here that when you have fissionable material you are 75 percent on the way toward making a bomb—and take my word for it that fissionable material is processed and produced at Oak Ridge; just assume that—do I understand your point to be that you would invite everybody in to look at that that had any curiosity on the subject?

Dr. RIDENOUR. I would see no harm in it, Senator, because, while you may be 75 percent on the way toward making a bomb when you have fissionable material, I don't think you are very far down the road toward having fissionable material after having the 25-cent conducted tour of Oak Ridge.

The CHAIRMAN. I agree with you on that.

Senator TYDINGS. I have been misled a little right here in your answer to Senator McMahon. I understood that you wanted a wide measure of exchange of information between people working on the same project without compartmentalization.

Dr. RIDENOUR. That is if there are any secrecy requirements maintained on the project by the other principle we were discussing, Senator.

Senator TYDINGS. But when you have permitted that freedom of exchange between people who are interested in the common venture, why should you take somebody from a foreign country and show them the application of those principles by actual mechanisms?

Dr. RIDENOUR. Well, sir, there are a couple of reasons for that.

Senator TYDINGS. Doesn't that violate pretty much your general line of demarcation which you cut out here a short while ago?

Dr. RIDENOUR. I don't feel it does, and I would like to enlarge a little on it, if I may.

Senator TYDINGS. Perhaps I misunderstood you.

Dr. RIDENOUR. Let me state again that I feel there should be full and free publication, and I really mean publication in the regular scientific journals.

Senator TYDINGS. Assume we agree with you on that.

Dr. RIDENOUR. I mean publication of things which do not directly have to do with the manufacture of military weapons, just as the metallurgy of steel is well known, and all that; but exactly how a particular gun is made is quite often kept dark. This being so, I think it is wise to do it even unilaterally. Supposing no other nation in the world

did it. We should go ahead and do it and let these fellows subscribe to the Physical Review, and everything like that.

Senator TYDINGS. I am not talking about publications now. Let's assume that we all agreed with you, just for the sake of assumption. What I am talking about is why, after we have told them how to do it, should we take someone in who is a foreigner, for example, through our plants and let him see how we apply the principles? What would be the advantage to us in that procedure, or to science?

Dr. RIDENOUR. Well, it would be a nuisance to us, of course; we would have to spend a lot of time doing this.

Senator TYDINGS. First of all, they would all come or would want to come, wouldn't they?

Dr. RIDENOUR. Quite a lot of them, probably.

Senator TYDINGS. Would you be in favor of letting them come if they didn't let you come?

Dr. RIDENOUR. Yes, sir; I would. The most direct and immediate way by which you would benefit is that a number of these people would never go home. You saw that happen before the war.

Senator TYDINGS. I don't know whether that would be an advantage or not.

Dr. RIDENOUR. It certainly was on the atomic bomb, as I am sure you will agree.

Senator TYDINGS. Anyhow, what I am getting at is this: I can see, thinking it through or reaching a conclusion, a great deal of logic in the exchange of scientific information and all of that. But I don't see the logic of taking a man into what might be called a plant devoted exclusively to national defense and showing him everything about it.

Dr. RIDENOUR. Well, sir, I hope that it won't be devoted exclusively to national defense. Fissionable material has to do with a great many other things.

Senator TYDINGS. But at the time it does. I am dealing with it as of this year, and my question is directed as to now, for example. Would you advocate taking foreign scientists through Oak Ridge now?

Dr. RIDENOUR. I certainly think it would do no harm.

Senator TYDINGS. Well, they would learn a lot that they could go back and save a lot of time on, wouldn't they?

Dr. RIDENOUR. I don't think they would save much time.

Senator TYDINGS. What would be the advantage of their coming, then? Certainly, if they are not going to profit by anything they would see, there would be no advantage in showing them through and no reason for following the logic you have expounded here.

Dr. RIDENOUR. There is the sort of peripheral advantage that on the one hand you encourage that they do this in your favor, and if this is done all over the world it is a good thing. In the second place, you make it perfectly clear that this is one oasis in a suspicious world where there is really freedom of science, and if you think it wouldn't fill full of scientists from all over the world—

Senator TYDINGS. Let us assume we agree with you, and we open the doors of Oak Ridge. Would you throw open the doors in plants of the other parts of the country that are engaged in other phases of the atomic bomb situation?

Dr. RIDENOUR. Well, as I understand the layout at Hanford, I would see no harm in selling tickets for that.

Senator TYDINGS. Where would you say, "Now, we have been very glad to have you over here, but this is the one place we cannot take you into"? Where would that be?

Dr. RIDENOUR. As I understand the arrangement, that would certainly be at Los Alamos, despite the fact that there is a very great deal of work which has gone on there in the past and is still going on which is pure science and has nothing to do with the weapon, for nevertheless there are departments there charged with the design and manufacture of bombs.

Senator TYDINGS. In other words, you would show them all phases of making the weapon and the parts of the weapon, but you would not show them the assembly of the weapon?

Dr. RIDENOUR. Yes, sir.

Senator TYDINGS. So if they knew all the parts that went into it, they could assemble it pretty fast, couldn't they?

Dr. RIDENOUR. That has been asserted. I don't particularly believe it. I think there is a difference between knowing how to do a thing and getting it done, and, as I have said before, my friends have told me that getting it done accounted for most of the time in our work on the project.

Senator TYDINGS. Of course I am not a scientist, and my observation may seem out of place; but I would like, as far as we can, to remove all barriers on the exchange of scientific information. As a layman in the scientific field, I don't believe I could go as far as your testimony here indicates without feeling that I had done my country a disservice, possibly, and I would rather err on the side of not hazarding that chance than to be too generous and find that I would be sorry for it afterward. That is a decision we have to make.

Dr. RIDENOUR. That is correct, sir, and I have been very anxious to come here simply because my observations of the war have made me believe that the country is better served by the rapid progress which can be maintained with full exchange of information.

Senator TYDINGS. Isn't there some intermediate point where the irritable phases of this could be relaxed or eliminated without going the whole way? It is a good bit like prohibition, you know. We either go all wet or all dry. Isn't there some temperance in it where you scientists could be reasonably satisfied and we wouldn't help our possible enemies of the future, and if so, what do you believe, notwithstanding your testimony, we might do even now without going the whole distance that you have indicated you thought we should go?

Dr. RIDENOUR. There are various degrees of publication in this field, as you indicate. One thing which could certainly be done tomorrow with no harm to anyone is to publish all of the medical information from the project. I cannot see how anyone could possibly feel the national defense was concerned in that in any way.

Senator TYDINGS. Would this be a feasible approach: that your body, which is organized into a scientific organization in this country, would have a committee, so to speak, on grievances, and that when you felt that the restrictions were unnecessary you could present those, say, to the Atomic Commission and have a hearing either in secret or in the open, and out of common exchange of ideas reach some more moderate point rather than be dependent on the Army and Navy men completely? Would that do it?

Dr. RIDENOUR. Well, sir, that would certainly be a very great help in the presence of restrictions which I hope it is possible to avoid.

Senator TYDINGS. In that way you would see their point of view, or hear their point of view; and they would hear your point of view; and perhaps through some committee of that sort you might get some more elasticity which would achieve more of what you want to accomplish.

Dr. RIDENOUR. I have read the testimony before this committee rather completely, and the estimates of the length of time it takes for another country to get to the stage at which we are now vary; but they are all in a rather modest range, 5 to 10 years, let us say. Now, the effect on this period of completely full publication of the kind that I have been recommending has been testified to be between 6 months and 2 years.

I think that this is such a small fraction of an already short period—

Senator TYDINGS. Let me put it to you this way, sort of anticipating you, but I want to get it in this form if without the exchange of any scientific information other countries working on the atomic bomb could not master it, let us say, within a period of 5 years, and if by the fullest exchange of scientific information and the tour through Oak Ridge and Hanford, and so forth, they could master it in 2 years, would you still be in favor of exchanging the information?

Dr. RIDENOUR. Yes, sir. I would feel that our national defense is better served for two reasons: In the first place, we have not conducted our negotiations which are intended to reach an international agreement in an atmosphere of at least, implied hostility; in the second place, our own progress shall have been so thoroughly expedited by doing this that our position relative to this other nation will be more favorable than a policy of secrecy would have brought it to be.

Senator TYDINGS. All I would like to say, in a humorous way and not to take issue with you, is that if you ever run for a public office never tell your opponents all the support you have got if you want to keep it.

Senator JOHNSON. Going back to your own field in radar, I am quite puzzled by some of your statements here, beginning in the bottom of page 2 [referring to Dr. Ridenour's prepared statement]. You stated:

In the radar field, we started with the same atmosphere of secrecy, the same precautions about compartmentation of information and clearance of individuals, which characterized the atomic bomb project right to the end, and still characterize it today.

Then you go on down a sentence or two, and say:

It had become by that time apparent that secrecy cost us in efficiency far more than it gained us by keeping the enemy in ignorance.

And then this sentence—I don't know whether it is facetious or what your meaning is:

We found it a lot harder to inform the enemy than readers of the spy stories may think.

Was there to be an advantage in telling the Germans about radar?

Dr. RIDENOUR. No, sir; that is a wry joke and not a very good one, I am afraid.

Senator JOHNSON. I am glad it is a joke, because I call to mind the proximity fuze, for instance, somewhat related to radar. If the Germans had discovered the proximity fuze and had applied the knowl-

edge of radar in that direction, it would have cost many, many American lives.

Dr. RIDENOUR. Yes, sir; and the astonishing thing to me and the thing I mean by this sentence, about how hard it is to inform the enemy is that we shot off so many hundreds of thousands of shells with proximity fuzes in them without the enemy apparently catching on. It is really very surprising how difficult it is to give secret information away. You can go to all sorts of lengths, such as scattering all these radar sets all over Germany, without doing it.

Senator HART. My prediction, Doctor, is that before you are as old as most of us here are you will have changed your views in that respect, and you will have many disagreeable surprises as to how easily others do learn our secrets.

Dr. RIDENOUR. That may be so, and I suspect it is particularly so in the operational field where the secrets are easy to understand, compact and easily carried around, and easily given away.

Technical secrets are rather another matter. In radar, for example, our people learned about enemy radar mostly by capturing it. I know this because I was privy all the information that we were getting, and this is how we got it. It was necessary to go run a raid against Bruneval in order to find out about the Germans' work on radar, and so on.

Our establishment up at MIT was spraying 10-centimeter and 3-centimeter radio wave lengths in all directions from the fall of 1940 on. It would have been necessary to do no more than live across the Charles River in an apartment house with a very simple kind of crystal receiver and wave meter to gain some very valuable information about wave lengths, of forthcoming radar to be used by our services, plus repetition rates, and a lot of other things people think they would like to know.

Senator HART. But not, Doctor, to learn how to make the proximity fuze Senator Johnson just spoke of?

Dr. RIDENOUR. Sir, I don't believe you learn this by reading a paper. I really don't. It took the people who made the tubes, which is the heart of the fuze, quite a long time to learn to make them despite the fact that they knew exactly what they were trying to do and worked very hard at it.

There is a big difference between knowledge and accomplishment.

Senator HART. Doctor, you state in your statement as a fact one thing that I don't know that any of the members of this committee know. You have asserted as a fact that we are still manufacturing and storing up atomic bombs. You must be very closely informed, Doctor, if you can state that as a fact.

Dr. RIDENOUR. No, sir; I may be mistaken about that. I drew it from General Groves' testimony before this committee and his estimate of the amount of money necessary to carry on the establishment, and so on. I might be quite wrong in that and if so, I shall be glad to withdraw it. I should withdraw the statement as a fact, that is quite true.

Senator HART. I don't call upon you to withdraw it. I thought you knew something that I don't know.

Dr. RIDENOUR. No; I do not. I was overguessing from my reading of the testimony here.

Senator TYDINGS. Don't you think the grievance committee might accomplish a great deal of liberty for you, so to speak, that would be wholesome? That is, the Army perhaps would be in a position to hear you if you had some organization where you could get at least a large part of what you want where they feel it wouldn't impair the safety of the country.

Dr. RIDENOUR. I do, indeed. I think it would be a very good idea if there must be restrictive legislation.

Senator TYDINGS. Assuming there must be some, even any amount of it, you certainly ought to have a place where you can be heard, in the secret or in the open, and can give them your reasons why and can tell them what you think is so, and out of that may come some progress.

Dr. RIDENOUR. That may be true. I myself would take care to work in a field where there are no restrictions, as many scientists would.

Senator TYDINGS. Even if you are right, a great majority of the American people, whether right or wrong, and certainly an overwhelming majority of Congress would be reluctant to throw the doors of Oak Ridge and places like that wide open.

Dr. RIDENOUR. I realize that entirely. I think this is a crusade.

Senator TYDINGS. But what we would do is be willing to put you in touch with the people who had charge of Oak Ridge, and if you could show them where the interest of the Nation would be served by throwing them open, we would want you to have that opportunity which you don't have now.

You would probably get the old buck passing all the way up, but what you want is a committee you can deal with directly, and they can take your request under advisement and give you a yes or no answer about. That would seem to me to be one way you would at least accomplish some of the things you have in mind, and which would be feasible of accomplishment in the Congress.

Dr. RIDENOUR. Well, that must always be borne in mind, I am sure.

Senator TYDINGS. We haven't got over 531 nuclear physicists in Congress, and it is a little hard for them to understand.

Senator MILLIKIN. I think the distinctive feature of your testimony is that you would share to some degree know-how even in time of war.

Dr. RIDENOUR. Yes, sir.

Senator MILLIKIN. That is a distinct novelty from the type of testimony we have been having, and I think you properly styled it as a crusade.

Let me ask you, if we had this bomb plant on December 7, 1941, would you then have invited the Germans into it, carrying out your theory?

Dr. RIDENOUR. No, Senator; I certainly shouldn't have done that.

Senator TYDINGS. Or the Japanese?

Dr. RIDENOUR. No, indeed. I think we must really put two interpretations on my remarks, and I have put two on them tacitly. During time of actual war, what you certainly want to strive for is the fullest possible circulation of information within our own allied group of people who are concerned with a particular thing. That is what we had in radar. We didn't publish the stuff in the newspapers, but

we did circulate it entirely among all the people who were working on radar.

Senator MILLIKIN. Could you qualify the bulk of your testimony in that way?

Dr. RIDENOUR. Yes, sir. During a war, this is my feeling what it is desirable to do.

Senator MILLIKIN. Do you think it is desirable to make free general exchange during the period of what you call international suspicion?

Dr. RIDENOUR. Yes, sir; I do, because it is precisely then that we wish our national accomplishment to be the greatest, our rate of national accomplishment to be the greatest. And the greatest rate of national accomplishment in any given field is that when the largest number of people are working on it on the basis of the most thoroughly diffused information possible.

Senator MILLIKIN. Would you give the same answer as applying to the period you describe as "during an armament race"?

Dr. RIDENOUR. Yes, sir.

Senator MILLIKIN. So that the one place where you go back a little bit is during time of actual war, and you qualify that by free circulation among your allies, but not beyond that?

Dr. RIDENOUR. Yes. You see, if we were a second-rate nation this would not be wise, but if our rate of achievement and that of nation A which is not ours were different in our favor, then we want everybody to progress at the maximum rate.

Senator JOHNSON. Isn't that a good way to become a second-rate nation?

Dr. RIDENOUR. I do not feel so. The purpose in my testimony is to attempt to demonstrate how you maintain your position as a first-rate nation. You see this thing that is called a secret in connection with the atomic bomb is not a secret in the sense of something permanent and durable.

Senator JOHNSON. If it isn't a secret it isn't a secret and we need not waste time on that. But it is the things that are secret, and certainly there is knowledge that is secret?

Dr. RIDENOUR. There is knowledge that is classified secret in this field. I think there is very little knowledge that cannot be found out by looking for it.

Senator TYDINGS. Doctor, if you are buying a horse, isn't it pretty good psychology on the part of the seller to tell you only about the good points of the horse and not disclose the fact that the horse is blind and has stringhalters in his left hind leg; and, on the other hand, isn't it pretty good psychology on your part to point those things out to the seller in order to arrive at an understanding. Or do you think these individual equations can completely be thrown aside when you are dealing with a nation?

Dr. RIDENOUR. I am afraid, Senator, that all of you men, and perhaps rightly, make the tacit assumption that we shall be better off with respect to our own progress, if we maintain this secrecy. The whole burden of my testimony is that I feel we shall not be better off with respect to our own progress in a world of suspicion and trouble and everything else.

Senator TYDINGS. Let me qualify it by saying if this was an ideal world, of course I would agree with you completely but there are some forces arise in this world of ours from time to time that almost threaten us with extinction, and knowing that there are evil men who frequently come to power, even the son of a good king may be a very cruel and intolerant fellow, we have to take into consideration not only the situation that exists today but what may happen tomorrow or next year. We have had so many lessons throughout the 2,500 years of recorded history that it isn't wise to disarm, for example, unless the other fellow does. Why does Russia, the United States, Britain, France, and China maintain armies today when they have already disarmed Germany and Japan? Obviously they maintain them against each other. That is a simple piece of logic, isn't it?

Dr. RIDENOUR. Right.

Senator TYDINGS. If they are not willing to disarm, why should we tell them how to get stronger than they are now, when we are keeping up our Army not because of Germany or Japan, but because of Russia, Britain, France, and China, and each of them is in the same position?

Dr. RIDENOUR. My argument is entirely that we will improve our relative position by so doing.

Senator TYDINGS. I am telling you that you have got a lot of trust in human nature.

Dr. RIDENOUR. No, sir; I have a lot of trust in our scientific and engineering talent.

Senator TYDINGS. I agree with you that up to a point we ought to make science as free to operate as it can, but I don't think we ought to take them through Oak Ridge, for example, or Hanford or any of those places.

Dr. RIDENOUR. Well, I was asked about Oak Ridge and Hanford. I certainly do not insist on this. If I were dictator, I wouldn't object to it. But what I am trying to speak of mostly is a policy of scientific publication in this field, which is no different from our policy in any other field.

Senator TYDINGS. You know, some of these countries in the world haven't sent us any special invitations to visit their scientific laboratories so far. There are few who urge that we come over to see what they are doing. They are not anxious to invite us, and I think that speaks pretty strongly for the fact that we may be going down a one-way street.

The CHAIRMAN. Although I think it should be said that Russia did send an invitation to our scientists here to come over, did they not, last summer?

Dr. RIDENOUR. Yes, sir.

The CHAIRMAN. And Dr. Langmuir headed that mission?

Dr. RIDENOUR. He was certainly a member.

The CHAIRMAN. You read his testimony, did you?

Dr. RIDENOUR. Yes, I did.

Senator TYDINGS. I think that was awfully nice of Russia, and I hope they will keep it up.

Dr. RIDENOUR. I hope we will do things like that, too; but I think they are very much less important than the policy of maintaining scientific research, engineering developments, and scientific publica-

tion on the same basis in this field as it has been maintained in every other, because this is what has put our Nation where it is today.

I made a crack about our IFF not being any good, our radar identification equipment. In fact, the compartmentalization with respect to the information on Japanese identification equipment was much more severe than ours. The Japanese Army and Navy had different frequencies, and a Japanese Army plane would not look friendly to a Japanese battleship, which seems to me the high point in absurdity.

Senator TYDINGS. I hope that is one piece of information you didn't send over to Japan.

Dr. RIDENOUR. Oh, they knew it. Toward the end, the Army didn't seem to be much worried about this, because the Navy didn't have many ships left.

Senator JOHNSON. Have you read Dr. Jewett's testimony before this committee, which appeared yesterday?

Dr. RIDENOUR. No, sir.

Senator JOHNSON. He made a distinction between basic scientific knowledge and technological knowledge. You don't seem to make as much of a distinction as he did.

Dr. RIDENOUR. Well, sir, I think this is an extremely hard distinction to draw; a sensible distinction can usually be drawn.

Senator JOHNSON. I would be very glad, for one, to have you read Dr. Jewett's testimony and give this committee, or at least give me, your analysis or views on what he had to say.

Dr. RIDENOUR. Yes, sir; I would be very glad to do so.

Senator JOHNSON. I was very much in hopes that you were in complete accord with him, but I am afraid you are not. I am disappointed that you are not.

The CHAIRMAN. Will you send a letter to us commenting on Dr. Jewett's testimony?

Dr. RIDENOUR. Yes; I will. I have a high regard for Dr. Jewett, and if we are out of line, maybe I am out of step.

Senator JOHNSON. I may be the mistaken person; I hope that I am.

The CHAIRMAN. Are there any further questions?

Thank you very much, Doctor.

Now, Major de Seversky, you have some pictures that you have waited quite a while to show. We will see them now.

(Whereupon, at 4:20 p. m., the committee recessed.)

APPENDIX

(Dr. Alexander Sachs, who appeared before the Special Committee on Atomic Energy on November 27, 1945, subsequently requested that he be permitted to revise and amplify his statement, so as to give a more complete report of the early history of the atomic bomb project. The chairman of the committee, Senator Brien McMahon, complied with that request. The revised statement, which follows the question-and-answer form of the original—see pt. 1 of the hearings on atomic energy, pp. 1-29—was made part of the record and appears below.)

REVISED STATEMENT OF DR. ALEXANDER SACHS

DR. SACHS. I am by profession, gentleman, a practical economist, economic adviser, and industrial consultant. I was previously economist and vice-president of the Lehman Corp., of which I am still a director and a special economic adviser in my new capacity. Throughout the decade prior to the war I was associated with them.

I have also been interested in the problems of our national economy and national welfare as affected by international conditions and problems. From its advent phase on, the Great Depression of 1929-33 struck me as fraught with greater gravity and deeper portent than prior depressions in our business cycle history. For I felt that its roots lay in the untenability of the whole postwar reconstruction of the twenties that was effected on a world scale, and furthermore, I felt with growing concern that the financial and economic collapse would engulf the political order that was established by the peace treaties. Thus imbued, I came to be known or nicknamed as the "Economic Jeremiah." In the course of that depression I had gone to Europe to observe on the spot the financial crisis of 1931 and my advice came to be sought by leading figures. In particular I was a special adviser in an informal capacity to Lord Reading and Lord Lothian, who as members of the new National Government formed in the summer of 1931, were concerned with the impact of the world depression on England.

From that trip I came back with a sense of foreboding as to the further repercussions of that depression upon the United States, holding that the break-down of the postwar monetary and economic reconstructions was bound to aggravate the spiraling depression in the United States as it was undermining the political and economic order of the world. The fulfillment of successive analyses and forecasts regarding the depression led to my being introduced in 1932 to Mr. Roosevelt. Thus began an association which continued from then through this war as an informal adviser without any special label. In that work I tried to live up to a concept that President Roosevelt had formulated in his message of January 1937 on Government reorganization. He described therein that men who are to serve a President as assistants and advisers should not only command personal confidence but: "They should be possessed of high competence, physical vitality, and a passion for anonymity." In particular I tried to live up to the last requirement, a passion for anonymity, and throughout have avoided any public self-referentialness, feeling that my job was to be on tap to and for the President without trying to influence the course of events beyond trying to point out advance implications and consequences to those who were shaping the course of events.

As to the interaction between the economic and political forces that produced the world crisis, I had in 1932 submitted to the President-elect this summary: "The statesmen of the world have continued to be overtaken by a sort of high-tension paralysis—like the trivial oscillations of the trench war battlefronts up to America's entrance in the great war—only to find that the imperious and

menacing march of events swept aside the half-willed and half-thought schemes, and even attacked improvised defenses that were resorted to too late, as in the German case to save Germany for democracy. The outstanding feature of this great depression is that the economic order developed since the Reformation and the great society developed since the fall of the Roman Empire have come to be threatened not by the destructive impact of external or natural forces, but by a disintegration from within because of an incipient failure of concerted will and political wisdom."

Thus imbued, I came to suggest early in 1933 in connection with the formulation of the National Recovery Act—for which I was called in in my capacity as an economist—that an important use for public-works funds to be provided was the reconditioning of the Navy, the mechanization of the Army, and the improvement of national defense. General Hugh Johnson, who during the depression was an assistant in an economic capacity to Mr. Baruch and had thus become interested in my interpretations and forecasts of economic developments, was given by the President a leading role in the NRA and he and the President asked me to serve as organizer and first head of NRA's Division of Economic Research. In the drafting phase of the act, I at first urged upon them the inclusion of those national defense provisions.

Senator AUSTIN. What year was that?

Dr. SACHS. That was in 1933, in the legislation of April and May. Hugh Johnson in the Blue Eag'le, pages 197-198, credits me with having suggested that this provision about making available funds for naval construction and other defense be written into the NRA bill. Hugh Johnson was a little bit too generous in thinking that I had sole responsibility for the idea. The fact was that in a patient argument with the President the conclusion was reached that the advent of Hitler to power boded ill for all democracies, and that it was necessary that we take time by the forelock.

I have always been of the view that the real warmongering, combined with defeatism, is done by the pacifists, and that one who is concerned about the protection of national interests without aggressive aims is the real practical pursuer of peace.

Later on—and I had been in the habit of reporting to the President regarding the progress of international developments—in 1936 he called me in to help in working out a solution for the problem of public utilities and electric power. I had proposed the idea of a power pool, and even then we discussed that in the event of war danger we would want to have a mechanism for the coordination of private and public power. The distinguished figures representing the public at that White House Conference in September 1936 were Mr. Owen D. Young and Mr. Lamont, and I had been another one that was selected alongside those representing the public-utility interests and the governmental authorities concerned with power. The international situation was a subject of discussion a year later with the renewed outbreak of Japanese aggression on China.

After Munich I had begun to send the President a series of memoranda. It was at the turn of the year in January 1939, that I had sent in a very long study on the international situation. In the preface to it I described the attitude underlying that memorandum and the predecessors on problems that had been discussed with him in 1936, and also in 1937 prior to the quarantine speech. My role was, if you will, to be a resonator for ideas that he had and also as a humble submitter of ideas of my own. In that preface I wrote:

"The orientation towards the world crisis that has been developed in prior reports and needs to be borne in mind continually is that we are already in what Thomas Hobbes, who lived through the British civil war 300 years ago, justly called 'war time tract' and 'war weather.' 'For war consisteth not in battle only but in a tract of time wherein the will to contend by battle is sufficiently known * * *. For as the nature of foul weather lieth not in a shower of rain but in an inclination thereto of many days together; so the nature of war consisteth not in actual fighting but in the known disposition thereto during all the time there is no assurance to the contrary.'"

The thesis then was that the aggressor powers, the Nazis and their allies as well, for Japan had begun its aggressions in 1931 and expanded them in 1937, were passing from the state of "white war" and limited war to totalitarian war.

On March 10, 1939, when I had been asked by St. John's College to deliver a talk on the world situation, I prepared certain notes of which I had sent the President a copy. These were entitled "Notes on Imminence World War in

Perspective 'Accrued Errors and Cultural Crisis of the Inter-War Decades.' That memorandum dated March 10, 1939, had this opening sentence: "This interwar generation has been living on the edge of a smoldering volcano; and the predominant attitudes among both what is called the 'right' and what is called the 'left' have been variants of escapism, very much like peasants situated on the edge of a volcano who go on cultivating the slopes in the hope that the eruptions will not take place in their lifetime."

Then I reviewed the errors of the interwar period. Toward the end I said: "The present period is too late for that reversal of error which prevents the consequences of error. The real 'Munich' took place in 1936, in connection with the Rhineland. Then was the last opportunity missed for preventing that cumulative German aggression that was bound to culminate in a new and more terrible war by Germany. But what can and must be done for our salvation and safety is self-clarification and self-reorientation toward the onrushing dangers."

Then in the concluding sentence—and you must pardon the length, for I thought it was my business to try to think things out instead of trying to be popular—I urged preparedness:

"There is still time for western civilization, and especially for the exceptionally and fortunately situated United States, to use the time drafts that can still be made on the 'Bank of History' for the preparedness that has and will become more and more urgent and inevitable for all members of western civilization as a result of the past errors committed and in the course of the prospective unfolding aggressions of Nazi Germany."

It was in the following month, on April 15, 1939, that there was published in the *Physical Review* a note by Dr. Leo Szilard entitled "Instantaneous Emission of Fast Neutrons in the Interaction of Slow Neutrons with Uranium."

In keeping with the custom in scientific research, the date of its original sending was included, dated March 16, 1939. So it coincided with the time when Hitler seized Prague, and by seizing Prague became the controller of the crossways of the Continent.

The background of that article in the *Physical Review* was that at the turn of the year 1938 certain experiments had been concluded in Germany. These became known rather fully, thanks to Dr. Niels Bohr, of Denmark, who came to this country and reviewed them with his colleagues, for scientists are an international community. The word "international" in that connection is not as precise as it ought to be. Science rather is "trans-national"—moving across boundaries of nations—and progresses in terms of evolving common ideas. After all, our heritages of common moral, political, and intellectual ideas in their institutional forms date for our world from the Reformation and the Renaissance. That crystallization of Hebraic-Christian ideals, and that recovery of the Hellenic pursuit of science has functioned as a sort of spiritual and intellectual atmosphere for all nations of our civilization. The men of science depend upon the free flow of knowledge and ideas through that atmosphere. Through such personal communication as was provided by Dr. Bohr the refugee scientists working in this country were made aware more thoroughly than through the publications of the experiments by Drs. Hahn, Strassmann, and Meitner that had resulted in the fission of uranium.

What was subsequently done in this country represented a distinct advance. The work was by Dr. Szilard and, as independent confirmation, by Prof. Enrico Fermi, a Nobel Prize physicist from Italy. The Nazi contamination had advanced so far that return became difficult for him, as well as for all others who did not conform to the tribalistic notions of nazism. The mutual confirmatory work of Dr. Szilard and Dr. Fermi amounted to the suggestion that a chain reaction could be established in the process of atomic fission. Such a chain reaction had implications for war by reason of the kind of power that would be concentrated in and released by the process of atomic disintegration.

Because I had been imbued with the ideas already noted about the nature of the world crisis, I was concerned with what was happening to the victims of nazism and fascism, and I tried in my own small way to be helpful during the period when the scientists had to leave.

I gave you at first some high lights of the "Book of Genesis" of my concern, and after that came, if you will, the "Book of Exodus," the exodus of scientists who came to this country as a haven of refuge. Prior to that Dr. Szilard had worked in England at Oxford and Cambridge—at Oxford with F. A. Lindemann,

who played toward Mr. Churchill a role analogous to the one concerning this project played by me toward Mr. Roosevelt.

In the wake of this phase of the exodus, the scientists settled in democratic countries like ours were concerned not only with the progression of a technical problem, but with its political and moral implications. Dr. Einstein was pre-eminent among them. Professor Einstein's theoretical work, while it antedated the First World War, received practical confirmation in the astronomical tests that, interestingly enough, came just in the closing phase of World War I, as Prof. A. S. Eddington, of Cambridge, showed in his early books on relativity and space, time and gravitation. There was another great physicist, who was a friend of Dr. Szilard and part of that group, Prof. E. P. Wigner, professor of theoretical physics at Princeton.

Einstein, Wigner, and Szilard discussed the problem. I want to impress upon you gentlemen—if a member of the cognate older faith may refer to the Gospel of St. John—that “in the beginning was the word,” and the idea. In the beginning was a moral idea and a political concern on the part of the physical scientists and this social scientist whom they brought in. They brought me in because they had known of my interests and had heard that I was in a position to talk to the President and talk to him in terms of broad and fundamental concepts. The idea was, How can this be brought to the attention of the President?

The Germans were organized to carry on experimentation without limit. The Nazis were not at all concerned about the magnitude of expenditures. Ironically, despite all the beblinkered concern on the part of members of my own expertise, economics, as to the postwar problem of reparations, the fact was Germany was spending on armament in any and every year once it got going, more than was involved in the total amount of its remittances on reparations. Money was no object. They had the scientific governmental institutions. Many of the scientists who later led here and in England in this work had been carrying on such work at the Kaiser Wilhelm Institutes of Physics and Chemistry.

Our idea was that if they should be able to discover a concentrated power that could be used as an explosive, then the real safety of the United States and the rest of civilization would be gravely imperiled. For bear in mind that the essence of this period of foul weather internationally, to use Thomas Hobbes' expression for this wartime weather, was that the Nazis were rushing to conquer and not permitting others time for the organization of defense.

Therefore, these physical scientists and myself—I was brought into the picture in the summer of 1939 and was conditioned for what was taking place because I had for a long time been interested in theoretical physics and had followed the scientific publications—then felt that it was important to bring these matters to the attention of the President. In turn I felt that it was essential that an opinion should be written by the one man whom the world recognized as the preeminent scientist of our day, and not only the preeminent scientist, but, as the Senator this morning remarked, one of the greatest humanitarians because he had left nazism before expulsion orders were given to him. He had anticipated the trend of events. He did have the political foresight and did see what it implied. So after discussion Dr. Einstein wrote a letter regarding this, dated August 2, 1939. I had also asked Dr. Szilard to write a memorandum describing the significance of the current and evolving scientific research, which was written on August 15, 1939.

Then I sought and waited for a proper opportunity to see the President. I had been in touch with him through the summer, but I felt at the time that the mere delivery of memoranda was insufficient. Our system is such that national public figures—you gentlemen know it from your work as legislators, and it applies to the executive and the administrative in government—are, so to speak, punch-drunk with printer's ink. So I thought there was no point in transmitting material which would be passed on to someone lower down. This was a matter that the Commander in Chief and the head of the Nation had to know and act on. I could do it only if I could see him for a long stretch and read and discuss the material, so that it would come in by way of the ear and not as a sort of mascara on the eye.

Then, of course, with the outbreak of the war on September 1, 1939, the President had the problem of the existing neutrality legislation, as you recall. So only when that was solved did I accept an appointment, because it meant that then I could see him at leisure and present all the relevant material. I brought over the material to him, and met with him on October 11, 1939. I wrote the letter in anticipation of my seeing him so that I would be able to read it. The opening sentence was:

"With approaching fulfillment of your plans in connection with revision of the Neutrality Act, I trust that you may now be able to accord me the opportunity to present a communication from Dr. Albert Einstein to you, and other relevant material bearing on experimental work by physicists with far-reaching significance for national defense."

"Briefly, the experimentation that has been going on for half a dozen years on atomic disintegration has culminated this year (a) in the discovery by Dr. Leo Szilard and Professor Fermi that the element uranium could be split by neutrons and (b) in the opening up of the probability of chain reactions—that is, that in this nuclear process uranium itself may emit neutrons. This new development in physics holds out the following prospects:

"1. The creation of a new source of energy which might be utilized for purposes of power production.

"2. The liberation from such chain reaction of new radioactive elements, so that tons rather than grams of radium could be made available in the medical field.

"3. The construction, as an eventual probability, of bombs of hitherto unenvisioned potency and scope: As Dr. Einstein observes, in the letter which I will leave with you, 'a single bomb of this type carried by boat and exploded in a port might well destroy the whole port together with some of the surrounding territory.'

"In connection, then, with the practical importance of this work—for power, healing, and national defense purposes—it needs to be borne in mind that our supplies of uranium are limited and poor in quality as compared with the large sources of excellent uranium in the Belgian Congo, and, next in line, Canada and former Czechoslovakia. * * *

I also informed him we had learned that in the wake of the successful experiments of Drs. Hahn, Strassmann, and Meitner, the last of whom afterward also joined the exodus, the Germans upon capturing Czechoslovakia and seizing Prague, had embargoed the export of uranium from Czechoslovakia.

I also mentioned the people who had been at work on this and who had been consulted.

"* * * Mindful of the implications of all this for democracy and civilization in the historic struggle against the totalitarianism that has exploited the inventions of the free human spirit, Dr. Szilard, in consultation with Prof. E. P. Wigner, head of the physics department at Princeton; and Prof. E. Teller, of George Washington University; sought to aid this work in the United States through the formation of an association for scientific collaboration, to intensify the cooperation of physicists in the democratic countries—such as Professor Joliot in Paris, Professor Lindemann, of Oxford, and Dr. Dirac, of Cambridge—and to withhold publication of the progress in the work on chain reactions."

The CHAIRMAN. Doctor, what was the date of the embargo on uranium?

Dr. SACHS. Right in April, right after the seizure of Prague on March 15, 1939. Bear in mind that the scientific world community was already astir and included Professor Joliot, married to a daughter of Madame Curie; Professor Lindemann, of Oxford, afterward Lord Charwell, who played this corresponding role to Winston Churchill.

"As the international crisis developed this summer, these refugee scholars and the rest of us in consultation with them unanimously agreed that it was their duty as well as desire to apprise you at the earliest moment of their work and to enlist your cooperation. * * *

"In the light of the foregoing, I desire to be able to convey in person, in behalf of these refugee scholars, a sense of their eagerness to serve the Nation that has afforded them hospitality, and to present Dr. Einstein's letter, together with a memorandum which Dr. Szilard prepared after some discussion with me and copies of some of the articles that have appeared in scientific journals. In addition, I would request in their behalf a conference with you in order to lay down the lines of policy with respect to the Belgian source of supply and to arrange for a continuous liaison with the administration and the Army and Navy Departments, as well as to solve the immediate problems of necessary materials and funds."

There are two more documents that are pertinent to the enlistment of the President's interest at the time. One of the things that I submitted to the President, in addition to the scientific material was, of course, this review of mine of the whole world situation on the imminence of war and the nature of this war, which is really a Thirty Years War from 1914 on, with only a brief interlude, a brief armistice, in the twenties. From 1931 on there was a resumption

of war first by Japan in the seizure of Manchuria, and then came the succession of wars, the Italian war against Abyssinia, the interventionism by the Axis Powers in Spain, the war against Austria, and finally the seizure of Czechoslovakia.

In 1936 there were lectures delivered on the history of science, reviewing the progress since the turn of the century in the physical sciences. The book was published by Cambridge University Press after Munich in 1938. Due to the work that I had done in England and my relationship to leading figures, I used to get publications in a variety of fields, including science. This book published in 1938 contained two lectures on the history of recent developments in physics, and the development of the theory of atomic structure by Lord Rutherford, whose work initiated the technical side of the physical research since the turn of the century. Some of the greatest work of Lord Rutherford was done right nearby when he was professor of physics at McGill University, and it was for this work that he got the Nobel Prize.

There were these two lectures by the subsequently deceased Lord Rutherford which were revised by an assistant of his, and then there was a separate lecture in addition on Forty Years of Atomic Theory, by F. W. Aston, of Cambridge, who died only a few days ago, as you may have seen the notice. F. W. Aston, reviewing the work that had been done by 1936 and describing what was being done in England and elsewhere, ended up his lecture with a warning and a prophecy. I showed this book to the President with a view to high lighting that, as with other fruits of the tree of knowledge, there is an ambivalence to atomic power with poles of good and evil. The concluding paragraph is as follows:

"There are those about us who say that such research should be stopped by law, alleging that man's destructive powers are already large enough. So, no doubt, the more elderly and ape-like of our prehistoric ancestors objected to the innovation of cooked food and pointed out the grave dangers attending the use of the newly discovered agency, fire. Personally, I think there is no doubt that subatomic energy is available all around us, and that one day man will release and control its almost infinite power. We cannot prevent him from doing so and can only hope that he will not use it exclusively in blowing up his next door neighbor."

The President remarked, "Alex, what you are after is to see that the Nazis don't blow us up." I said, "Precisely." He then called in General Watson, lovable "Pa" Watson, another one of that period who has gone from us, and said, "This requires action." General Watson then went out with me, and the informal group was established.

Senator VANDENBERG. What was the date of this?

Dr. SACHS. October 11, 1939, sir.

He selected, with the approval of the President, one man representing the Army concerned with science, and one representing the Navy: Colonel Adamson for the Army and Commander (since Admiral) Hoover for the Navy.

Holding that as an expert I ought not to be injecting political views, I have throughout my work remained an associate regardless of party and other affiliations. I have the honor to know ex-President Hoover, and I was very pleased to find a namesake of his concerned with these scientific problems, as President Hoover during his incumbency as Secretary of Commerce did a great deal for the advancement of science and scientific research.

As the central figure, the President named a Government individual who was concerned with problems of science, the Director of the Bureau of Standards, Dr. Lyman J. Briggs, who rendered great service during the critical period.

I got in touch with Dr. Briggs that very night, before having to go again to the White House to report progress to the President. For the potentialities of this were very much in the mind of the President, and he had remarked, "Don't let Alex go without seeing me again."

I saw him later that night, and the resultant idea was to hold a meeting in the near future. A meeting was scheduled after this October 11 conference at the White House, for October 21.

I reported to Professor Wigner, who throughout this period occupied a pivotal role because he is highly esteemed and was perceptive on what you might call the political problems. I reported to him in a letter of October 17, and I sought throughout the interval to broaden the group of scientists who were to attend that conference.

Senator VANDENBERG. How about the Einstein letter you referred to?

Dr. SACHS. The Einstein letter of August 2, from which I quoted in part in my own letter, was left with the President, along with my letter.

The CHAIRMAN. Have you a copy of it?

Dr. SACHS. That is part of a record which I will leave with you gentlemen, which was a report I prepared immediately after the announcement about the use of the atomic bomb in August for the White House, for the Department of Commerce—Mr. Wallace as the successor in charge of the Department that had such an important role through the Bureau of Standards—and for the War Department.

The CHAIRMAN. Does that contain your letter?

Dr. SACHS. It contains all the documents, sir. It contains Einstein's letter, and it contains other memoranda.

I had throughout this period sought to be a historian, because the President said to me, "Pa Watson is going to be too busy to be a historian; you had better do that."

I made contemporaneous reviews, and would submit them as galvanizers of action.

I have a copy of Einstein's letter, a duplicate, which has his signature, and I will leave that copy with you.

Senator VANDENBERG. Could you state in a sentence or two the import of Einstein's letter?

Dr. SACHS. Yes, sir. [Reading:]

"Some recent work by E. Fermi and L. Szilard, which has been communicated to me in manuscript, leads me to expect that the element uranium may be turned into a new and important source of energy in the immediate future. Certain aspects of the situation which have arisen seem to call for watchfulness and, if necessary, quick action on the part of the administration. I believe therefore that it is my duty to bring to your attention the following facts and recommendation."

He then describes the new phenomenon, and states that the sources of practical supply are outside the United States; that the United States has only very poor ores of uranium in moderate quantities, and that there is some good ore in Canada, and the former Czechoslovakia. As to that, he reports:

"I understand that Germany has actually stopped the sale of uranium from the Czechoslovakian mines which she has taken over. That she should have taken such early action might perhaps be understood on the ground that the son of the German Under Secretary of State, von Weizsaecker, is attached to the Kaiser Wilhelm Institute in Berlin, where some of the American work on uranium is now being repeated."

In other words, there was political interest being taken in the work. So Dr. Einstein said that one of the ways in which the administration could be helpful was to entrust this task to a person "who has your confidence and who could perhaps serve in an unofficial capacity." His task might comprise the following:

"(a) To approach Government departments, keep them informed of the further development, and put forward recommendations for Government action, giving particular attention to the problem of securing a supply of uranium ore for the United States.

"(b) To speed up the experimental work, which is at present being carried on within the limits of the budgets of university laboratories, by providing funds, if such funds be required, through his contacts with private persons who are willing to make contributions for this cause, and perhaps also by obtaining the cooperation of industrial laboratories which have the necessary equipment."

These scientists, as you see, gentlemen, were no doctrinaires, but indicated a practical perceptiveness—ready to use whatever means were available so that the Government and the Nation secured a supply and funds for going ahead with this thing.

The next meeting that was held was on October 21 in Washington under the chairmanship of Dr. Briggs of the Bureau of Standards, and there was a survey made of the whole situation. Many scientists were there who were not as concerned as these refugee scientists, for, as I tried to explain, gentlemen, the latter, in addition to their interest in the advancement of science, were interested in the imperiled position of the United States and civilization. They were infused with a concern in the Quaker sense of the word of devoted interest and responsibility. Many of the other scientists said: "This is very remote; we have got to wait and see; there are other lines of progress rather than the chain reaction that may be more attractive." The discussion wandered all over attractive side issues.

The one who occupied the intermediary and catalytic role in behalf of the President had then to ask these American men of science and the Government officials, including the Army and Navy representatives, to indulge—and I re-

member using the phrase of the Irish poet Yeats, echoing Coleridge—in a “willing suspension of disbelief.”

The issue was too important to wait, because if there was something to it there was danger of our being blown up. We had to take time by the forelock, and we had to be ahead of the Germans.

One great advantage that we had was that these refugees, these scientists themselves, responded to that very spirit of freedom that brought the Pilgrim Fathers over here, the search for the freedom of speech and religion and, if you will, free science and free thought. They were saturated by ideas and motives which the regimented scientists could not have, and so the transplanted and the American scientists, if given the means, would make advances much faster.

In the wake of that conference, a subcommittee was appointed, notwithstanding those expressions of doubt. The subcommittee was presided over by Dr. Briggs, and on behalf of the services, Keith F. Adamson, lieutenant colonel, United States Army, and Gilbert C. Hoover, commander, United States Navy. A report was written to the President dated November 1, 1939, on the stationery of the National Bureau of Standards of the Department of Commerce, which reviewed the situation technically and culminated with this observation:

“3. The energy released by the splitting of a mass of uranium atoms would develop a great amount of heat. If the chain reaction could be controlled so as to proceed gradually, it might conceivably be used as a continuous source of power in submarines, thus avoiding the use of large storage batteries for under-water power.”

(I would not have wanted to limit it to this form, but a continuous source of power was the fundamental idea.)

“4. If the reaction turned out to be explosive in character it would provide a possible source of bombs with a destructiveness vastly greater than anything now known.

“The military and naval applications suggested in paragraphs 3 and 4”—in this case he was expressing the not quite suspended disbelief of the representatives of the Services; voicing their greater skepticism, Dr. Briggs said that the military and naval applications “must at present be regarded only as possibilities because it has not yet been demonstrated that a chain reaction in a mass of uranium is possible. Nevertheless”—and in this respect these representatives were willing to go ahead—“in view of the fundamental importance of these uranium reactions and their potential military value, we believe that adequate support for a thorough investigation of the subject should be provided.”

There had been a previous adverse report that I had known about, which was given by a technical adviser of one of the Services in the summer, and it was because of that adverse report that they didn't see any reason for being interested, although they wanted to be kept informed, that I was brought in to go directly to the Commander in Chief.

So they concluded:

“We believe that this investigation is worthy of direct financial support by the Government.”

But, alas, we had no money.

“The Lea bill now before Congress if enacted would provide for carrying out important investigations of this kind in cooperation with the universities.

“We recommend the enlargement of the committee to provide for the support and coordination of these investigations in different universities. We suggest the following be invited: President Karl Compton, Massachusetts Institute of Technology; Dr. Alexander Sachs, 1 William Street, New York” (that was my address at Lehman Bros., who were very kind to let me devote time, and did not ask me to tell them what it was about. Mr. Robert Lehman is particularly to be thanked for this, and a man who afterward became an adviser of the War Production Board, and later Deputy Chairman, Mr. Arthur H. Bunker, who was then executive vice president of the Lehman Corp.)

The people who were asked to be added were Prof. Karl Compton, myself, Prof. Albert Einstein—I am reading this in the order given there; I belong very much at the foot of any such list—Prof. Albert Einstein of the Institute for Advanced Study, and Dean George B. Pegram, Columbia University.

As a sequel to the major finding and recommendation, the committee proposed that initial support take the form of:

(a) Supplying for immediate and experimental work four metric tons of pure-grade graphite; and

(b) If later justified, supplying 50 tons of uranium oxide.

Later on there were all kinds of difficulties about getting the supply, to which I referred. Late that year and in the following year there was another newcomer, an industrialist-engineer by the name of Boris Pregel, who made available his very valuable supplies and experience to Columbia University for the experiments of Dr. Szilard and Professor Fermi, for which he was thanked by Dean Pegram.

The first phase was to coordinate the group of physical scientists for the purpose of presenting the idea to the President. The second phase was the securing of action by the Government, and that was climaxed by the report, which was a go-ahead signal, that Dr. Briggs wrote on November 1, 1939.

If you bear in mind how narrow has been the time, how correct was the concept of the memorandum from which I read of March 10, 1939, that the job was "time-borrowing, the issuance of drafts on the 'Bank of History,'" it becomes plain that if the work had not been thought through before the advent of the war, and if the President had not taken action immediately after, and if the report of the Bureau of Standards and its technical head had not come forth on November 1—the bomb could not have come when it did toward the end of the war to abbreviate the war in 1945. From all this you will realize that the time-borrowing was very essential, and along with it the finding and improvement of the organization media for the successive tasks of the year 1939 and the year 1940 and beyond. In the ensuing period I was an adviser of the President also on problems of strategy. I was also a special consultant to General Donovan, Director of the Office of Strategic Services, for whom I had written in 1941 the first report on the intellectual work that was being done in outside institutions on problems of totalitarian war economics, as well as strategy, before the organization of the Office of Coordinator of Information, that afterward became the Office of Strategic Services.

Through these connections I was able to keep in touch, and I was in turn kept in touch, on the basis of great confidence, with the White House on what was going on, so I knew what was happening even to the very last. I discussed the problem of the form of the use of the bomb with the President early in November 1944, when I submitted a memorandum on the Final Phase of the European War and Emerging Phases of Far Eastern War Liquidation—which contained a forecast that the war would end in April or May, and that there would be no last-ditch stand, but the whole German system would collapse.

Though I have kept in touch, my official role as the representative of the President continued up to the time when, as you will see, I submitted to him the idea that it must be given over to an organization in charge of all scientific development, and suggested Dr. Bush, of whose keen interest and ready aid I had learned in the course of the difficult months of 1940.

Many of the pivotal figures are not now alive; the President is dead. General Watson, who rendered very great service, is dead. I well remember his report that in talking to military and naval men who had said, "Well, this is still so remote; what is this thing?—let's wait and see," "Pa" Watson would say, "But the Boss wants it, boys." That was the theme song of "Pa" Watson. He is dead, and the secretary who used to call me up and pass on White House messages is also dead.

These documents that fortunately were written represent the main available records of the flux of events, apart from scraps, and the scraps that are available in the files are insufficient to give a correct picture. One gets a picture from some of the things that have been published that there was a linear progression. Like all human undertakings, it was full of set-backs, difficulties, conflicts between perceptiveness and willingness on the one hand, and doubts and negations on the other, and it required continuous prodding. Such work as I was able to do, I was able to perform because everyone knew I was not concerned about anything but the progress of the work and had made myself anonymous. If I may again quote the New Testament, there is a verse in First Peter, "Be ready always to give answer to anyone that asketh of you the reason of the hope that is in you, with meekness and fear." I felt that I and the others had to go on with this work, and that it must go on, and so I sacrificed my time and concentrated on that. Later on, as a matter of fact, when the war broke out, I resigned from my administrative post and became a private economic adviser and was the better able to devote myself to war work to a considerable extent.

Prior to that, in the summer of 1941, I had given to the Navy a plan that was worked out with the aid of a great engineer, Dr. Emil Mayer, for the use of detector radiosonic buoys for the establishment of an Atlantic security lane originally for the lend-lease shipments. This substantially was afterward

adopted by the Navy through technical work under Professor Hunsacker of MIT and the fostering concern from 1942 on of Mr. Lewis Douglas, then Deputy Administrator of the WSA.

Thus with regard to the adoption of all such technical devices I want to etch in this consideration: that in the beginning there had to be a political concept and a moral concern, and that later it was necessary to provide proper vehicles for action and also to induce acceleration of action.

The third stage in the atomic project was the coordination phase of the university researches with limited governmental aid and pressure—by Einstein and the speaker—for a new framework and an accelerated tempo for the project.

While a number of the university representatives were encouraged by the governmental interest, the fundamental tenor and the tempo of the work remained, on the whole, continuous with the past—that is, they were regarded as mere laboratory researches.

The time of this phase was approximately coincident with what was called then the "phony" war. This was the time of the war which embraced the period between the fall of Poland and the Nazi invasion of the Lowlands.

You can well realize that the President during this period was pressed by and preoccupied with numerous internal and international problems. Our liaison for the project, General Watson, orally conveyed the general tenor to the President of Dr. Briggs' report. While he had done that, he thought when, after an interval, he transmitted it to me on February 8, 1940, that a more pointed conclusion was still necessary. He added that he had asked for a special recommendation from Dr. Briggs.

Meanwhile, some progress was made in the coordination of the university researches by the Coordinating Committee mentioned in the concluding point 8 of Dr. Briggs' report. The appointment of Dean Pegram served to focalize activities in Columbia on this project and frequent conferences were held there by the speaker with Drs. Pegram, Fermi, and Szilard.

In mid-November of 1939, our group had projected an octet of experimental projects in the hope that the subsidiary questions could be cleared within a period of 6 months. In notes that were made at the time, I listed the nature and scope of these subsidiary problems and the recommended leading figures from nearby educational institutions working on these problems. Of the new men brought in the most important was Prof. Harold C. Urey, who had won the Nobel Prize for his work on heavy water.

After the turn of the year, the Columbia project became the recipient of governmental aid in the form of limited funds intended for the purchase of materials, as is borne out by the reply that Dr. Briggs made on February 20, 1940, to General Watson's note of February 8, 1940.

But Dr. Einstein and myself were dissatisfied with the scope and the pace of the work and its progress. The speaker conferred with Dr. Einstein at Princeton in February. I went out to see him there and developed an inquiry as to the importance of the work that was being carried on at the time in Paris, work that had been described in a contemporaneous issue of *Science*. While we felt that it was very important that this free trade in ideas—to use an expression of Justice Holmes in one of his great and discerning decisions—that this exchange of ideas among free scientists should be carried on because they served as links and as stimuli to future work, their accessibility through publications to Germany constituted an important problem. Nonetheless, it was advisable to secure comparative evaluations and in response to my question about the work of the French, Dr. Einstein said that he thought the work at Columbia was the more important. He further said that conditions should be created for its extension and acceleration.

Accordingly, I sent, on February 15, 1940, to General Watson a plea for larger aid and an intimation that presently Dr. Einstein would give a favorable evaluation of the work which had been completed at Columbia.

(The letter referred to is as follows:)

FEBRUARY 15, 1940.

Gen. EDWIN M. WATSON,
Secretary to the President,
The White House, Washington, D. C.

DEAR GENERAL WATSON: Thank you very much for your letter of the 8th and the accompanying report of Dr. Briggs to the President, both of which will be treated as confidential. Had the recommendations from the second part of point

5 through points 6 and 8 been placed ahead of the more technical points 1-4, the practical meaning of the letter would have been clearer and more forceful; namely, that in the opinion of Dr. Briggs and his colleagues it was distinctly worth while to go ahead. Due to too academic a presentation, I feel that that practical point was lost.

As the last issue of Science contained a quotation from Science Letters bearing on work in Paris, and as, since our meeting, there has been even more searching and significant work in this country, I shall take the occasion to submit within the next month an up-to-date appraisal of the situation which, according to Dr. Einstein in a recent conversation, holds forth even greater promise than we had thought.

With kind regards and appreciation,
Yours sincerely,

ALEXANDER SACHS.

Dr. SACHS. Ensuing conferences which I had with Dr. Einstein prompted the suggestion that he prepare another review of the situation for submission to the President. I had felt that Dr. Einstein's authority was such that, combined with his insight and concern, it would affect the tempo of the work. His review, which was dated March 7, was written as a letter to me. I will read the opening and closing paragraphs of this letter, addressed to me at my office at the Lehman Corp.

"In view of our common concern in the bearings of certain experimental work on problems connected with national defense, I wish to draw your attention to the development which has taken place since the conference that was arranged through your good offices in October last year between scientists engaged in this work and governmental representatives."

He also reported that he had learned of the further work that was going on in Germany since the outbreak of the war, the work on uranium. He pointed out that this work was being intensified in Germany. I shall quote a portion here:

"I have now learned the research there is being carried out in great secrecy and that it has been extended to another of the Kaiser Wilhelm Institutes, the Institute of Physics."

The sources of such information are not only personal communications but also scattered references in technical publications that can be made to throw light on what goes on. By this process even under the totalitarian system secrets come out. Similarly, under our freer system things can come out in an impersonal way. They did come out even while we were taking terrific measures, and very rightly so. Yet by inadequate attention to technical sources those measures proved in one not unimportant instance rather ineffective. I refer specifically to the unwitting disclosure by the Minerals Yearbook of 1943. On page 828 of that book, in the course of a very technical statement about uranium, there is such a reference to the use of uranium for potential war purposes in 1943.

Senator TYDINGS. Was that our book, or was it a German book?

Dr. SACHS. It was our book, the Minerals Yearbook for 1943, on page 828. At the very time that newspapers and editors were not even to breathe the word "atom," the Minerals Yearbook of 1943, page 828, said, with reference to uranium, "Uranium production in 1943 was greatly stimulated by a Government program having materials priority over all other mineral procurements, but most of the facts were buried in War Department secrecy." Then it goes on to say, "Most of the 1943 uranium supply was used by physics laboratories for research on uranium isotopes as a source of energy." These technical books went everywhere, they were available by the ordinary routine to the technicians who would not have to read between the lines.

Thus secrets leaked out. To a different degree this sort of thing obtained even in the hermetically sealed German system. It is inherent in the situation.

As I said, Dr. Einstein wrote me on March 7, 1940. He stated that research on uranium had intensified in Germany.

"Since the outbreak of the war, interest in uranium has intensified in Germany. I have now learned that research there is being carried out in great secrecy and that it has been extended to another of the Kaiser Wilhelm Institutes, the Institute of Physics. The latter has been taken over by the Government and a group of physicists, under the leadership of C. F. von Weizsaecker, who is now working there on uranium in collaboration with the Institute of Chemistry. The former director was sent away on a leave of absence apparently for the duration of the war."

"Should you think it advisable to relay this information to the President, please consider yourself free to do so. Will you be kind enough to let me know if you are taking any action in this direction?"

I shall skip the next paragraph. Then he wrote:

"I have discussed with Professor Wigner of Princeton University, and Dr. Szilard the situation in the light of the information that is available. Dr. Szilard will let you have a memorandum informing you of the progress made since October last year so that you will be able to take such action as you think in the circumstances advisable. You will see that the line he has pursued is different and apparently more promising than the line pursued by Monsieur Joliot in France about whose work you may have seen reports in the papers."

I had, throughout, followed the policy not only of being an expert on tap, but of going to other people's experts to see what they were doing. When it came to scientific work, I left that to the scientists. I did not presume, when I forwarded these memoranda written by Dr. Einstein, Dr. Szilard, and the others, to act other than as a synthesizer for them.

I passed on Dr. Einstein's review of the situation to the President on March 14, 1940, asking for an opportunity to confer with him on the latest phases of the experimental work.

(The letter referred to was entered in the record of the committee and appears below:)

MARCH 15, 1940.

The PRESIDENT,

The White House, Washington, D. C.

DEAR MR. PRESIDENT: As a sequel to the communication which I had the honor to submit to you on October 12, Prof. Albert Einstein sent me another regarding the latest developments touching on the significance of research on uranium for problems of national defense. In that letter he suggests that I convey to you the information that has reached me that since the outbreak of the war, research at the Berlin Institute of Physics, which has been taken over by the Government, was placed under the leadership of C. F. von Weizsaecker, son of the German Secretary of State.

In the realization that these further views of Dr. Einstein have a definite bearing on the favorable report submitted to you by Dr. Briggs as chairman of the committee which conferred with experimental scientists concerned and myself, I am enclosing his communication for your kind perusal. May I also ask whether and when it would be convenient for you to confer on certain practical issues brought to a focus by the very progress of the experimental work as indicated in the concluding paragraph of Dr. Einstein's letter?

In view of your original designation of General Watson in this matter, I am transmitting it through his good offices.

Yours sincerely,

ALEXANDER SACHS.

Dr. SACHS. The reply of General Watson on March 27, 1940, was to the effect that the governmental committee was awaiting "a report of the investigations being conducted at Columbia University" and hence "the matter should rest in abeyance." I did not feel that I could rest.

Senator TYDINGS. "In abeyance"?

Dr. SACHS. Yes. For the sense of foreboding about Nazi aggression that had been voiced before the outbreak of the war—as I disclosed previously—impelled me to relate the expectations of new invasions in the wake of spring to the instant project.

At the beginning of April, opportunity was afforded the speaker in the course of a visit to the White House to unfold views on the probable course of German aggression as encompassing in this war—as distinguished from the last war—the elimination of neutrals so as to secure complete control of the coast from Norway to France. It had this bearing on the uranium project: It was suggested that diplomatic arrangements be made for the shipment of uranium supplies from Belgium to the United States, instead of shipment on the eve of invasion to France, to avoid their probable capture by the Germans in their military onrush through France.

Taking the project as a whole, it was urged that instead of delimited aid in the form of specific material purchases or reimbursements for expenditures by universities, a fund be made available from governmental sources or by persuading foundations to allocate a fund in order that research could be planned on an adequate scale and on a long-term basis.

I had also another thought in mind in making that suggestion that the late spring months were not too early for the planning of the enlargement of the research personnel; to wit, around April and May the scientists were being booked up for the next year's work in the universities, and if we did not take them then, we were not going to have them later on. So, our job was to divert academic talent from teaching to research, to public research. Otherwise, the right kind of people, the people we wanted, would have completed their negotiations with faculties for the next academic year.

The tenor of these considerations and recommendations was embodied in an aide-memoire which I prepared in Washington and left with the President as a review of the situation: "Import of War Developments for and Application to Natural Defense of Uranium Atomic Disintegration," April 20, 1940.

The fourth phase was the phase which I have called in this report written immediately after the events, in the role of contemporaneous historian which the President assigned to me—"efforts by the originators of the project to gain the adherence of the governmental and advisory group to organizational changes needed to attune the research to the urgencies of unfolding World War events."

The representations made to the President at the end of March and early April, as just summarized, led him within a few days to revert to and act upon my preceding correspondence that had been pitched in the same key.

Accordingly, on April 5, 1940, he acknowledged what had been conveyed to him and proposed that a new conference be held in Washington between Dr. Einstein and the speaker on the one hand, and Dr. Briggs and the special representatives of the Army and Navy on the other hand.

The closing paragraph of that letter indicated that the President wanted the research continued: That is, the preliminary questions about which a few in the coordinating group still retained tints of doubt were in his mind disposed of.

To General Watson was delegated the making of arrangements for the conference, but the President wanted to be advised directly of the results of the conference.

Under even date, General Watson asked the speaker for a list of scientists to be invited, inclusive of suggestions by Dr. Einstein. The inquiries made by the speaker of Dr. Einstein and other members of the coordinating group led to the submission to General Watson of the requested list.

Throughout my work I was in touch with Dr. Wigner of Princeton, Dr. Szilard and Dean Pegrum of Columbia and, later on, also Urey.

Following the receipt on April 13 of the two letters from the White House of April 5, Dr. Einstein was written to on April 15. My letter opened with a statement regarding the transmission to the President of Dr. Einstein's communication of March 7 to me. It referred to favorable action taken by the President upon his return from the Canal Zone trip where he had been on vacation. I had gotten in touch with him in the course of that trip, as he had given to this anonymous adviser the privilege of getting through with his messages, and the message so conveyed had contributed to the decision by the President "to adopt the procedure suggested" in the speaker's original communication.

Cognizant of the resistances in the group to the proposed enlargement of the organizational framework, the speaker urged Dr. Einstein to participate in person in the forthcoming conference. However, after a conference which the speaker had with Dr. Einstein at Princeton, it became clear that indisposition on account of a cold and the great shyness and humility of that really saintly scientist would make Dr. Einstein recoil from participating in large groups and would prevent his attendance. So, he delegated me to report for him, too.

As a substitute, I had asked him to enable me to record the consensus of our views in the form of a written communication to Dr. Briggs. That communication, dated April 25, 1940, to Dr. Briggs, which Dr. Einstein signed, referred to the discussions he had had with Dr. Wigner and myself on the progress of the work of Dr. Fermi and Dr. Szilard.

The purport and purpose of the letter was to impart a new impetus and to suggest an appropriate adjustment of the organization side of the research to the interlinked necessities of the emergent phase of the research and of the international situations.

I should like to quote from that letter.

"I am convinced as to the wisdom"—

The CHAIRMAN. Whose letter was that?

Dr. SACHS. This is Dr. Einstein's letter, which I brought with me, to Dr. Briggs.

"I am convinced as to the wisdom and urgency of creating the conditions under

which that and related work can be carried out with greater speed and on a larger scale than hitherto.

"I was interested in a suggestion made by Dr. Sachs that the Special Advisory Committee supply names of persons to serve as a board of trustees for a nonprofit organization which, with the approval of the governmental committee, could secure from governmental or private sources, or both, the necessary funds for carrying out the work.

"Given such a framework and the necessary funds, it (the large-scale experiments and exploration of practical applications) could be carried out much faster than through a loose cooperation of university laboratories and Government departments."

You must bear in mind that this was before the fall of France and the Government executives had no money.

We were trying to take this thing out of where it was. This was the viewpoint of those who, having made their venture of faith, sought assistance adequate to the need, as distinguished from other scientists who were content with what I called, in the memorandum to the President, a bit-by-bit procedure. Since we realized the import and pressure of international events, we wanted the thing lifted out of the somewhat monastic type of research that goes on in universities, a slow-motion process on very limited scale. We wanted both larger scale and much faster tempo.

Originally, the April meeting was scheduled by Dr. Briggs for April 22, and so far as nongovernmental people were concerned, was to be limited to Dr. Einstein, Dean Pegrum of Columbia, and myself. Then by telegram of April 20, the meeting was postponed to the 27th. In the interim I sought to enlarge the group and I requested that an invitation be sent to scientists and executives in universities involved in the current uranium research.

That request was granted, as appears from my letter to the President of May 11, 1940.

(The letter referred to was entered in the record of the committee and appears below:)

MAY 11, 1940.

THE PRESIDENT,

The White House, Washington, D. C.

DEAR MR. PRESIDENT: In furtherance of your kind letter to me of April 5, the conference suggested by you was arranged and held under Dr. Briggs' chairmanship on April 27, between the governmental and nongovernmental groups concerned with the bearing of uranium experiments on national defense. With the conclusion of the first experiment, which was conducted at Columbia University by Drs. Szilard and Fermi, with governmental aid, the whole project is now entering upon a new stage. Assuming that the governmental committee will now, upon your inquiry, report in favor of further and larger governmental action, may I, in accordance with your own gracious expression of a desire to be advised of developments, submit the following considerations and suggestions:

1. With the invasion of Belgium by the very power which has organized the residue of its scientists for uranium work, the danger—alluded to in my original letter to you of October 11, 1939—that America may be cut off from uranium supplies of the Belgian Congo has increased. In addition, the successful completion of the above-mentioned preliminary experiment renders it practicable and advisable that the action to be taken shall be adequate and comprehensive.

2. Such action inherently involves not only larger financial support to be accorded by the Government but also the formation of an organizational framework under which the work can proceed with the flexibility required for a going enterprise. Interestingly enough, the latter practical aspect has been emphasized by Dr. Einstein in conversations with myself and was communicated by him in a letter to Dr. Briggs, of which I am enclosing a copy for your kind perusal and attention. In this connection you might find of interest the enclosed copies of two communications which I have received from Dr. Szilard, the first of which contains a synoptic statement of the implication of the work for national defense that was made orally at the above-mentioned conference of April 27, and the second an outline of the next tasks to be undertaken.

3. The resultant requirement for forming an organization for directing the work outside of governmental institutions and for assuring that work by scientists in the universities is carried out with due secrecy has to be dovetailed with the designation of persons to serve as trustees of a nonprofit organization that is to supervise the allocation of funds and to coordinate the various branches of the work.

4. These interlinked needs suggest to me that it would be desirable to bring one of your legal aides into the circle of discussion, along with General Watson, who is now serving so efficiently as a liaison for the representatives of the service departments and the Bureau of Standards.

In view of the urgency of a decision on these points, I should greatly appreciate conferring with you in the course of next week, at your convenience.

Yours sincerely,

ALEXANDER SACHS.

Dr. SACHS. That, then, is the background against which the conference was held, a background which was lit up by portentous international events. The second week of the month opened with the German invasion of Norway and Denmark on April 9; the third week witnessed counter operations by the British, the landings in Norway on April 16 and April 18.

Since the concern for national defense and the survival of civilization motivated my mediation of the project between the scattered scientists and the President, it is understandable that in the flux of erupting international forces I should seek to transpose the laboratory questions to the larger theater of international policy and military operations.

Two contemporaneous crystallizations of that preoccupation are available. The first is a memorandum letter prepared at my request by Dr. Szilard under date of April 22. The second is the already referred to memorandum for use with the President, dated April 20, 1940, and bearing the title "Import of War Developments for and Application to National Defense of Uranium Atomic Disintegration."

Skipping the very technical side, I want to mention the—

The CHAIRMAN. Doctor, I am sorry, but we have to recess at 12 o'clock. So, if you will, we would like to have you bear that in mind.

Dr. SACHS. All right, sir. I will pick an appropriate place.

The memorandum-letter by Dr. Szilard aimed to describe the next phase of the research and its dual alternatives and their respective applications to national defense. The first case deals with chain reactions in which the neutrons are slowed down so only a small fraction of uranium can be utilized. In the second case, the neutrons are not slowed down and so the bulk of the ordinary uranium can be utilized. It is the latter case which has the greatest significance for national defense and particularly for the production of atomic bombs. The former significance would appear to lie in power production. Both would also present the complication that personnel handling such atomic engines would be exposed to the radiations.

The second alternative also presented a dual utility for concentrated power and concentrated explosives. As to the second use, the concluding paragraph of that memorandum constitutes a most illuminating formulation:

"A chain reaction of this second type would make it possible to bring about explosions of extraordinary intensity. If, for purposes of aggression, a bomb based on such a chain reaction were set off at sea near the coast, tidal waves brought about by the explosions might lead to the destruction of coastal cities."

The coincident memorandum of the speaker was concerned with high lighting the bearing of the war developments on the organizational aspects of the uranium research, and evoking applications for naval warfare with a view to throwing into sharper relief the urgencies of providing more central direction and greater adequacy of scope and speed in the prosecution of the project.

I had previously been called in to discuss what would be the results if control of the Mediterranean was achieved by the aggressor. In that connection there was a coincident idea advanced by a person who had been in the Army and who was concerned about this problem, a very great authority and friend of mine, General Donovan. General Donovan and myself had independently perceived that the Mediterranean would for war prosecution against Germany be significant north-south, as distinguished from east-west. We saw that the democracies would be pushed out from the Continent, that the next war phase would push France out as a major belligerent power.

This conclusion did not require so much foresight, as it required a memory with which I happen to be endowed. For the French military people engaged in the last Peace Conference had seen that and stated it. Furthermore, in the book on the Peace by André Tardieu to which Clemenceau wrote an introduction, there is a prevision of the 1940 plight and defeat of France. Clemenceau was a layman who had his own views about military strategy: You will remember he was the man who had remarked that war is too serious a thing to leave it

solely to the military—Clemenceau had seen that development and he expressed himself on it as an insightful layman, who while entertaining complete respect for the performance of the military, can synthesize the military considerations with the political considerations.

Clemenceau had insisted at the Peace Conference, "If you do not give the French the protection at the Rhine, then the other democracies will have no base of operations, no base of support, no jumping-off place for operations by the overseas democracies." Thus mindful of the last war, we agreed we would not even have a base on the Continent. Therefore, the significance of the Mediterranean was going to be north-south and not east-west.

In the light of and following such discussions on the fate of our access by sea to the Continent, I broached the problem of the supply of uranium for the United States. I pointed out that the biggest supply of uranium was in the hands of the Belgians. I pointed out that even if in anticipation of invasion they were to send it to France, it would not come to us. Hence we ought to open, ahead of invasion, diplomatic negotiations.

Incidentally, that industrialist-scientist I mentioned, Boris Pregel, who at the outbreak of the war was in France and was a French citizen, had, it later appeared, asked the French Government in 1939 to make arrangements with the Belgians.

That prescience on the part of these newcomers and refugees, gentlemen, was operative in our cause because they were united by a political sensitivity along with their specific expertise as scientists and technologists.

Now, the memorandum which I submitted to the President opened with a description of the meetings and the work that was being done by other scientists; by the scientists in England, men like Drs. Chadwick and Lindemann, and so on. That work would be available for coordination with research in America. In other words, there was suggested at that time the idea of Anglo-American collaboration. In that already alluded to Cambridge lecture in 1936, it was foreseen that there would eventually be developed a new source of energy; and that lecturer was also aware, profoundly and humanly aware, of the dualism, the good and evil, in such development.

The memorandum then dealt with the tendency to reservations and understatement of the results of research and their implications, the effect of which on governmental representatives was to cause them to recoil from the very suggestions that were being pressed by Dr. Einstein and myself for providing a larger and more resourceful organizational framework for adequate and faster prosecution of the task.

In the effort to overcome the tempo dampening and scale dampening that the other attitude entails—the attitude of conservative hesitation, proper enough in an ordinary task but not for this kind of thing, which required the already designated "willing suspension of disbelief"—in that effort, the speaker submitted the following observations and considerations which in a later presentation to the President appeared to be contributive toward a resolution of the organizational difficulties:

"The present writer, as a nonphysicist"—this is a quotation from my memorandum—"would not of course venture an opinion alongside those cited. But as an economic historian and as a practical economist versed in the conduct of technological research, he has ventured to convey to the scientists mentioned and to the governmental authorities his hypothesis that the difficulties which loom so large now might well arise from the characteristic physical limitations of the pre-prepilot plant operations that are carried on in the typical university laboratories. If the project is fraught with promise and importance for national defense, then it seems to him worth while to approximate very soon the conditions of industrial pilot-plant operations. This might entail the building of equipment, machinery, and even the construction of adequately scaled and adequately protected physical plant.

"Once we relate the uranium research to national defense, it should be regeared in type and tempo to the most advanced technological research that has been carried out by the American chemical and electrical companies."

I need hardly insert parenthetically that it was this scale of operation which was carried out with such distinction later on by General Groves. Returning to the memorandum:

"What has taken place in Poland, Denmark, and Norway, and will doubtless go on through other European countries that will be invaded, is that the pacific-minded countries have not brought their national defense up to the quantity and"

quality required for technological warfare. When the import of the European war is assimilated by the American people and national defense is undertaken as a national enterprise, then we may be confident that we will match in war with the progressiveness of our civilian technology and come to surpass it, which means surpassing the German military technology."

In the conviction, then, that "an adequate organizational framework is itself the precondition for the ascertainment and effectuation of the value of nuclear research for national defense," the speaker proceeded to sharpen the possible applications of that research for naval operations—

Senator RUSSELL. What was the date of that?

Dr. SACHS. April 20, 1940, before the invasion of France.

As I say, I proceeded to point out the possible applications for naval operations, on the assumption that the war would in time become global on the part of the Axis, inclusive of Japan, against the democracies, inclusive of the United States.

In that event, the applications in the dual form of telescoped power drive and magnified explosives should aid the United States to overcome "the disadvantage under which we labor due to the enormous distances between continental United States and our possessions, and between our possessions and the Japanese homeland."

This was not warmongering; this was adjustment to the import of events as I saw them, as I followed the phenomenal developments.

If I may quote again from the Bible, from the Twenty-fifth Jeremiah: the nations were successively "taking the winecup of this fury at the Lord's hands and drinking it." I could see that we would all be engulfed; that on the Continent, only Great Britain would be left; and that we would be the only major continental-insular power left in the universe and that then we would have to take action. I saw that we must not let Germany get ahead with atomic research on the kind of weapon they were working on, a weapon whose essence is the elimination of time for the defense, the elimination of that borrowed time that we all needed so badly in this war.

Inasmuch as the attempt to relate the applications to strategic and logistic configurations presupposed naval data, Dr. Briggs' good offices with Admiral Bowen and Commander Hoover brought answers to questions I submitted in a letter. I did not have a copy of that letter for inclusion in my report.

As the sequel to my April 1940 activities was to place the atomic project on a new plane, this new stage of the work in progress provides the occasion for drawing attention to a needed revision in the fast-crystallizing misconceptions of the project's history. The historical review I have given from the contemporaneous record that I kept for the President as a guide to his decisions and actions shows that the development of the atomic bomb was not the linear progression from a single decision that people have spoken and written about. You will remember the story in Alice in Wonderland about the Queen and Bill Lizard: how the Queen started with the end, or the sentence to be imposed, and then worked back. So there is a tendency when it comes to writing history for people to say in the instant case: We have got the bomb and we used it; therefore, the order of development must have been present throughout. Actually there was no such straight line, but rather a zigzag of lines. Moreover, every bit of effort that was applied to evolve and effectuate the eventual right policy was indeed indispensable. Every right effort, however apparently infinitesimal, becomes in retrospect infinitely important for what gave us not only the weapon but the timely use for shortening the war.

As to the role played by the bomb, while it assuredly shortened the war, it must also be recognized that Japan had already been, on normal military calculations, beaten. The timing was so right because of what had been done toward beating Japan by the Navy, the Air and other military power, and also by the economic and other factors. We must not in our concern with the new weapon tend to eliminate all the other elements that constitute the whole organization of our national defense and offense. Thus we needed those bases protected by the Navy and the Air Forces to use for the bombing and so the application of the bomb was conditioned by the success of the other war operations with the other war technologies.

All the same, the bomb presents a new factor—a most vital factor. But I cannot now go into those questions and instead I must return to the history in the crucial phase.

The conference of April 27, 1940 on organization framework and the inadequacy of what we had then, resulted in new submissions to the President for a resolution of the difficulties.

The conference that was held on April 27 at the Bureau of Standards under Dr. Briggs' able and conciliatory chairmanship did serve to dispel doubts that had been entertained by some members. It also marked further progress in evoking a willingness to entertain consideration of large-scale expenditures that might run up to six figures. That was fantastic, alongside the cost theretofore—the thousands that were being spent and the money that was being furnished by those who were on the margin, who were spending out of their own pockets in connection with this work in corresponding amounts. Yet the majority, accustomed to the small scale of physical laboratories at the universities and the correspondingly reduced scales of the budgets of governmental scientific laboratories, did not appear ready to design a large-scale and comprehensive program, and instead insisted on "bit-a-bit" procedures with ranked preferences and time deferments.

By the beginning of May the uranium research at Columbia, which was the pathfinding research, had reached the point where expansion was deemed advisable and desirable by the whole quartet of scientists concerned—that is, by the direct experimenters, Drs. Fermi and Szilard, and by Dean George Pegram and Prof. Harold Urey.

After a number of conferences by the speaker with the Columbia group, a sort of minute was drafted as of May 10 embodying the consensus as to the successive stages. In this case, I myself did the secretarial work.

The first point in this minute was:

"The first large-scale experiment would have as its aim to demonstrate beyond any doubt whatever that a nuclear chain reaction could be maintained in a system composed of carbon and uranium. This would require about 100 tons of graphite and some 10 to 20 tons of uranium metal. It would also be necessary to design a rather elaborate mechanism to stabilize the chain reaction and to safeguard against overheating as well as the possibility of an explosion."

The second point was:

"The next stage is to carry out a general survey of all nuclear constants in order to confirm the values previously obtained and to narrow down the limits of experimental error beyond observed values of the constants. This would strengthen the assurance of the group in the ultimate success of the experiment."

"Then as preparatory ground for that experiment would come the advancing of structural details and the carrying out of technological tests on samples of materials which have to be used in large quantities in the ultimate experiment. This in turn would require getting bids for the manufacturing of the material in needed quality and quantity."

As to quality, the problem of refinement was throughout a very grave one: it was the industrial know-how which had to be acquired, as well as the fundamental scientific research.

In financial terms, the first stage would require expenditures of \$30,000 to \$50,000; the second stage would require from \$250,000 to upward of \$500,000.

It was the speaker's view that in the interest of time-efficiency and even of economy, the second could be prepared for while the first was going on, providing that adequate funds were made available to begin with. The proposal which had been submitted for a nonprofit organization directed by a mixed board of trustees seemed, under the conditions antedating the prospect of large defense appropriations, particularly suited to methodical and economical direction of the work.

The lack of resolution of the organizational difficulties led the speaker to submit an analysis of the situation and resultant recommendations in a communication to the President dated May 11, 1940, together with a note of transmittal to General Watson of even date.

The point of departure was—I am coming to the end of this section, that may serve as a terminal point.

The CHAIRMAN. Very well, Doctor.

Dr. SACHS. The point of departure was that, according to the advices given to the speaker by Dean Pegram, the graphite experiment, which had been partly financed by the Government, was a success. As the communication was coincident with the German march through Belgium, the invasion having begun on May 10, the situation adumbrated in the initial presentation of October 11, 1939, had come to pass. I mean the situation I had presented when I stated that we should acquire uranium supplies from all Belgian sources had come to pass. A problem of access to uranium supplies that would be needed on a larger and larger scale had been thrust forward. This in turn threw into sharper relief

the previously described need for that change in the organizational framework "under which the work could proceed with the flexibility required for a going enterprise."

The President was therefore requested to designate a legal aide to facilitate the establishment of a nonprofit body which would secure the resources for carrying on the work under conditions where the tenure of the research posts would be secure and their equipment and material be amply provided for. I had in mind that large group of scientists that would have to be brought in at that period when they were looking for other university posts. Along with that there should be provision for the necessary secrecy as distinguished from the normal eagerness and competitiveness in early publication of indicated results.

You must see that the job was to transform the conditions and to anticipate the time-order in normal use. Even for getting the scientists, you had to take into account the fact that we were preventing them from having what is the biggest asset to the scientist—the knowledge that the results of their research will get published when they do important things. So you have to give them adjustments in salaries. There was no time to delay. If we delayed, then we would be losing the scientists. Additionally, at that time—this was before the invasion of France—you would have to see to it that all this work, in view of its potential value and its potential danger, was not made known to the potential enemy through the scientific magazines, such as *Science* and the *Physical Review*, and related foreign publications.

Is this a good stopping point, Mr. Chairman? I could go on. What do you say, sir?

The CHAIRMAN. Doctor, the Senate meets at 12 o'clock.

Dr. SACHS. All right, let me go on, then. This is a very short section.

The CHAIRMAN. All right.

Dr. SACHS. This is part 6 of my history, assembled at the end, in August, from the notes and reviews that were made contemporaneously with the developments. The heading is: Resolution of the Difficulties and Resetting of the Uranium Project into the New Organization Established by the President on June 15, 1940, for the Direction of All Scientific Developments Related to National Defense.

The CHAIRMAN. What was the date that the small-scale stage ended and that you were to go forward on the large scale?

Dr. SACHS. Between May and June it was decided that we needed to go forward on the larger scale. The appointment of a new organization, the Office of Scientific Research and Development, came, I think, on June 15, having been preceded by suggestions of such a scheme that I transmitted to General Watson.

Senator AUSTIN. This was 1940?

Dr. SACHS. This was in 1940.

In keeping with the practice of full knowledge and cooperativeness with the Presidential representatives from the Government services to direct the joint committee on the uranium project, the letter to the President of May 11 was given a counterpart in the communication to Dr. Briggs of May 13, 1940. That is, I did not do anything with the President without sending a copy or speaking about it to Dr. Briggs, as the administrator-scientist, or to General Watson, as aide to the President.

My letter to Dr. Briggs drew attention to Dean Pegram's favorable report on the graphite experiment and inferred that the governmental committee would report favorably to the President on the project. That would be reported directly to the President and I was convinced enough that it would be certain to be recommended.

Recognizing that university research is inherently characterized by what I called a "traditional discursive attitude and leisurely tempo," the contemporaneous facts of the invasion of Belgium threw into sharper relief the requirements of national defense. Applied to this project, those requirements were for a resourcefulness of operation and an acceleration of pace, and also a secrecy that could not be had in the university projects, generally carried on with limited means and in an atmosphere of mutual interchange. And I want to say here that the scientists, Dr. Szilard, Dr. Wigner and Dr. Einstein, were all of the same view, that there had to be secrecy against leaks to the enemy.

In furtherance of the foregoing, another letter was written to General Watson on May 15, the second and revised version of which is included here.

(The letter referred to was entered in the committee's record and appears below:)

MAY 15, 1940

Gen. EDWIN M. WATSON,
Secretary to the President,
The White House, Washington, D. C.

DEAR GENERAL WATSON: Confirming the intimation that I had the honor to convey in my letter to the President and in my covering note to you, I have just received a letter from Dean Pegram, of the department of physics of Columbia University, stating that the initial experiment "has now been concluded with satisfactory result," and that "the absorption cross-section of carbon was found to be encouragingly small * * * only about one-third of the upper limit previously reported in the literature." The detailed meaning of that has been set forth in the letters of Dr. Szilard of May 10 and of April 22, which I forwarded to the President; a copy of the latter was also sent to you. Please advise me before any conference on this is arranged.

In connection with an independent matter having to do with economic and fiscal policies for effectuating national reconstruction and defense, I should appreciate your expressing to the President my readiness to submit certain social-minded economic ideas that had interested him in 1936 and 1934, as to incentive devices for evoking large-scale plant investment for national defense and the training and reconditioning of the requisite skilled labor. To the original proposals drafted in 1932, there was added in early 1933—when submitted for the National Recovery Act—a provision authorizing public-works expenditures for national defense, in view of the altered international situation. The ideas and proposals in connection with the original FHA plan submitted in 1933 were later expanded in the second FHA plan that, at the President's behest, was worked out for Governor Eccles' advisers. In keeping with the pattern of these earlier plans, the role of government can be adjusted to specific requirements.

For the instant purpose, the organizational instrumentality proposed is the establishment of a Scientific Council of National Defense, composed of executives, engineers, and economists, acting in behalf of the Government, who should be invested with administrative powers for the testing and execution of technical projects of utility for national defense.

Yours sincerely,

ALEXANDER SACHS.

Dr. SACHS. The main communication of the speaker contains the first adumbration of a plan similar to that later developed by the President for the direction of the scientific work related to national defense. The new suggestion was made in the settling of proposals which the speaker was evolving for submission to the President with respect to amortization and other incentive-tax devices for national defense plant construction. It was my belief that industry had to be related to and integrated for national defense and I had been asked to submit some suggestions. I made many suggestions in my professional capacity as an economist with reference to these problems, apart from my interest in this uranium research.

In respect to the specific problem of an organizational framework that would carry forward uranium research on a bigger scale and at a faster tempo, the new conclusion and recommendation of the writer was as follows, against the background that the Government was then thinking of going to the Congress with a request for bigger appropriations:

"For the instant purpose, the organizational instrumentality proposed is the establishment of a Scientific Council of National Defense, composed of executives, engineers, and economists, acting with administrative powers for the testing and execution of technical projects of utility for national defense."

In acknowledging that letter, General Watson on May 16 added an observation regarding the broader suggestion for a mixed executive and administrative group for scientific phases of national defense.

The CHAIRMAN. Was that group formed?

Dr. SACHS. That group was formed on June 15. There was an intervening communication and I had received an authorization after an O. K. and an encouraging word from the President to represent the Government in negotiations with the Belgian company representatives here for the acquisition of uranium.

The CHAIRMAN. Doctor, there has just been a quorum call from the Senate and I think we will have to stop at this point.

Dr. SACHS. May I complete that phase of the story?

The culmination of the foregoing phases of the uranium project came on the day following the Germany Army's entry into Paris. On June 15, the President

established a new committee for the correlation of the scientific efforts of the country concerned with problems of national defense and placed that committee under the chairmanship of Dr. Vannevar Bush, President of the Carnegie Institution of Washington, whose name I have mentioned in the course of my discussion here. This committee included representatives of the Army and Navy and distinguished scientists and, initially, was to be attached to the Council of National Defense, in keeping with the suggestions I had made.

Accordingly, the President advised Dr. Briggs on June 15 that "since the problem on which you are engaged is part of this larger picture," Dr. Bush was requested by him to take over the uranium project and to reconstitute the committee.

Now, I make my summary: Thus was found a larger framework in accordance with the tenor of the speaker's recommendations. Dr. Bush's committee after our entry into the war became the Office of Scientific Research and Development. Associated with him and with Dr. James B. Conant, of Harvard, was the General Policy Committee, which included the then Vice President, Henry A. Wallace, Secretary of War Stimson, Gen. George C. Marshall, and Army and Navy representatives. The other group of the Army came in 1942.

The uranium project as initially presented by Dr. Einstein and the speaker in October 1939, having by the spring of the next year been reported on favorably by the testing and coordinating committee that the President had appointed under Dr. Briggs' chairmanship, was thus launched on a permanent and progressive career in the wake of our decision after the fall of France to embark on expanding defense.

From then on it became invested with the importance, the resources and the secrecy available to the Government of the United States in defense and later in war for the translation of an idea into a reality and into an instrument of national policy in war and peace.

The CHAIRMAN. Thank you very much, Doctor.

INDEX

XIII.

Subject	Part	Page
International collaboration among scientists (<i>see also</i> Freedom of exchange).	1	5, 113, 133
	2	225
International control of atomic energy (<i>see also</i> Discard of atomic energy; Freedom of exchange; International inspection of atomic energy production; Stock piles).	1	83-85, 87-88, 97, 123-129, 142, 151
	2	317-318, 340-342
	3	378-379
Elimination of causes of war-----	2	354-357
Enforcement-----	1	51, 53, 123, 131, 170
	2	199-200, 204-206, 278, 333-334, 345-346, 360-361
	3	379
International disarmament (<i>see also</i> Outlaw of other weapons).	2	342-344
Political problems involved-----	2	186
Relation to domestic control-----	1	32, 88, 103, 112, 148
	2	339, 359
United Nations Organization-----	1	127, 345
Urgency of-----	1	107, 109, 112, 140, 146-147, 160, 181, 187, 193, 242, 285, 305, 310, 330
International inspection of atomic energy production (<i>see also</i> Conversion of peacetime atomic energy plants to war use; Detection of atomic bomb production; Outlaw of other weapons; Violations).	1	84, 97, 117, 151, 157, 195
	2	286-287, 306-309, 324-325, 340, 342-343
Basis-----	1	122
	2	189-190
Chances for success-----	1	53, 57-58, 60, 104, 123-124
	2	309-310, 333
Circumvention-----	1	77
	2	209, 214
Constitutional aspects-----	2	316-317
Effect on private enterprise economy-----	1	52, 58, 87
Feasibility:		
Political-----	1	76, 125
	2	305, 330
Scientific or technical-----	1	75, 125, 182-183
	2	200, 305, 306, 330-333
	3	379
Methods (<i>see also</i> Detection, methods of)-----	1	51, 130, 151
	2	189, 200, 209, 229-230, 331-333
Personnel required-----	1	51
	2	188, 331
Prerequisites for success:		
Freedom of movement-----	1	51, 57
	2	211, 218
Free press and speech-----	1	87, 138-139
Violations. (<i>See</i> International control, enforcement of.)

ATOMIC ENERGY ACT OF 1946

TUESDAY, JANUARY 22, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to call, at 10 a. m., in room 424B, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Johnson, Austin, Millikin, Hickenlooper, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will come to order.

We have under consideration this morning S. 1717, and I will ask the reporter to insert the bill in the record at this point.

(S. 1717 is as follows:)

A BILL For the development and control of atomic energy

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

DECLARATION OF POLICY

SECTION 1. (a) FINDINGS AND DECLARATION.—Research and experimentation in the field of nuclear fission have attained the stage at which the release of atomic energy on a large scale is practical. The significance of the atomic bomb for military purposes is evident. The effect of the use of atomic energy for civilian purposes upon the social, economic, and political structures of today cannot now be determined. It is reasonable to anticipate, however, that tapping this new source of energy will cause profound changes in our present way of life. Accordingly, it is hereby declared to be the policy of the people of the United States that the development and utilization of atomic energy shall be directed toward improving the public welfare, increasing the standard of living, strengthening free competition among private enterprises so far as practicable, and cementing world peace.

(b) PURPOSE OF ACT.—It is the purpose of this Act to effectuate these policies by providing, among others, for the following major programs;

(1) A program of assisting and fostering private research and development on a truly independent basis to encourage maximum scientific progress;

(2) A program for the free dissemination of basic scientific information and for maximum liberality in dissemination of related technical information;

(3) A program of federally conducted research to assure the Government of adequate scientific and technical accomplishment;

(4) A program for Government control of the production, ownership, and use of fissionable materials to protect the national security and to insure the broadest possible exploitation of the field;

(5) A program for simultaneous study of the social, political, and economic effects of the utilization of atomic energy; and

(6) A program of administration which will be consistent with international agreements made by the United States, and which will enable the Congress to be currently informed so as to take further legislative action as may hereafter be appropriate.

ATOMIC ENERGY COMMISSION

SEC. 2. (a) There is hereby established an Atomic Energy Commission (herein called the Commission), which shall be composed of five members. Three members shall constitute a quorum of the Commission. The President shall designate one member as Chairman of the Commission.

(b) Members of the Commission shall be appointed by the President, by and with the advice and consent of the Senate, and shall serve at the pleasure of the President. In submitting nominations to the Senate, the President shall set forth the experience and qualifications of each person so nominated. Each member, except the Chairman, shall receive compensation at the rate of \$15,000 per annum; the Chairman shall receive compensation at the rate of \$20,000 per annum. No member of the Commission shall engage in any other business, vocation, or employment than that of serving as a member of the Commission.

(c) The principal office of the Commission shall be in the District of Columbia, but the Commission may exercise any or all of its powers in any place. The Commission shall hold such meetings, conduct such hearings, and receive such reports as will enable it to meet its responsibilities for carrying out the purposes of this Act.

RESEARCH

SEC. 3. (a) RESEARCH ASSISTANCE.—The Commission is directed to exercise its powers in such manner as to insure the continued conduct of research and developmental activities in the fields specified below by private or public institutions or persons and to assist in the acquisition of an ever-expanding fund of theoretical and practical knowledge in such fields. To this end the Commission is authorized and directed to make contracts, agreements, arrangements, grants-in-aid, and loans—

(1) for the conduct of research and developmental activities relating to (a) nuclear processes; (b) the theory and production of atomic energy, including processes and devices related to such production; (c) utilization of fissionable and radioactive materials for medical or health purposes; (d) utilization of fissionable and radioactive materials for all other purposes, including industrial uses; and (e) the protection of health during research and production activities; and

(2) for studies of the social, political, and economic effects of the availability and utilization of atomic energy.

The Commission may make partial advance payments on such contracts and arrangements. Such contracts or other arrangements may contain provisions to protect health, to minimize danger from explosion, and for reporting and inspection of work performed thereunder as the Commission may determine, but shall not contain any provisions or conditions which prevent the dissemination of scientific or technical information, except to the extent already required by the Espionage Act.

(b) FEDERAL ATOMIC RESEARCH.—The Commission is authorized and directed to conduct research and developmental activities through its own facilities in the fields specified in (a) above.

PRODUCTION OF FISSIONABLE MATERIALS

SEC. 4. (a) DEFINITION.—The term "production of fissionable materials" shall include all methods of manufacturing, producing, refining, or processing fissionable materials, including the process of separating fissionable material from other substances in which such material may be contained, whether by thermal diffusion, electromagnetic separation, or other processes.

(b) AUTHORITY TO PRODUCE.—The Commission shall be the exclusive producer of fissionable materials, except production incident to research or developmental activities subject to the restrictions provided in subparagraph (d) below. The quantities of fissionable material to be produced in any quarter shall be determined by the President.

(c) PROHIBITION.—It shall be unlawful for any person to produce any fissionable material except as may be incident to the conduct of research or developmental activities.

(d) RESEARCH AND DEVELOPMENT ON PRODUCTION PROCESSES.—(1) The Commission shall establish by regulation such requirements for the reporting of research and developmental activities on the production of fissionable materials as will assure the Commission of full knowledge of all such activities, rates of production, and quantities produced.

(2) The Commission shall provide for the frequent inspection of all such activities by employees of the Commission.

(3) No person may in the course of such research or developmental activities possess or operate facilities for the production of fissionable materials in quantities or at a rate sufficient to construct a bomb or other military weapon unless all such facilities are the property of and subject to the control of the Commission. The Commission is authorized, to the extent that it deems such action consistent with the purposes of this Act, to enter into contracts for the conduct of such research or developmental activities involving the use of the Commission's facilities.

(c) EXISTING CONTRACTS.—The Commission is authorized to continue in effect and modify such contracts for the production of fissionable materials as may have been made prior to the effective date of this Act, except that, as rapidly as practicable, and in any event not more than one year after the effective date of this Act, the Commission shall arrange for the exclusive operation of facilities employed in the manufacture of fissionable materials by employees of the Commission.

CONTROL OF MATERIALS

SEC. 5. (a) FISSIONABLE MATERIALS.—

(1) DEFINITION.—The term "fissionable materials" shall include plutonium, uranium 235, and such other materials as the Commission may from time to time determine to be capable of releasing substantial quantities of energy through nuclear fission of the material.

(2) PRIVATELY OWNED FISSIONABLE MATERIALS.—Any person owning any right, title, or interest in or to any fissionable material shall forthwith transfer all such right, title, or interest to the Commission.

(3) PROHIBITION.—It shall be unlawful for any person to (a) own any fissionable material; or (b) after sixty days after the effective date of this Act and except as authorized by the Commission possess any fissionable material; or (c) export from or import into the United States any fissionable material, or directly or indirectly be a party to or in any way a beneficiary of, any contract, arrangement, or other activity pertaining to the production, refining, or processing of any fissionable material outside of the United States.

(4) DISTRIBUTION OF FISSIONABLE MATERIALS.—The Commission is authorized and directed to distribute fissionable materials to all applicants requesting such materials for the conduct of research or developmental activities either independently or under contract or other arrangement with the Commission. If sufficient materials are not available to meet all such requests, and applications for licenses under section 7, the Commission shall allocate fissionable materials among all such applicants in the manner best calculated to encourage independent research and development by making adequate fissionable materials available for such purposes. The Commission shall refuse to distribute or allocate any materials to any applicant, or shall recall any materials after distribution or allocation from any applicant, who is not equipped or who fails to observe such safety standards to protect health and to minimize danger from explosion as may be established by the Commission.

(b) SOURCE MATERIALS.—

(1) DEFINITION.—The term "source materials" shall include any ore containing uranium, thorium, or beryllium, and such other materials peculiarly essential to the production of fissionable materials as may be determined by the Commission with the approval of the President.

(2) LICENSE FOR TRANSFERS REQUIRED.—No person may transfer possession or title to any source material after mining, extraction, or removal from its place of origin, and no person may receive any source material, without a license from the Commission.

(3) ISSUANCE OF LICENSES.—Any person desiring to transfer or receive possession of any source material shall apply for a license therefor in accordance with such procedures as the Commission may by regulation establish. The Commission shall establish such standards for the issuance or refusal of licenses as it may deem necessary to assure adequate source materials for production, research, or developmental activities pursuant to this Act or to prevent the use of such materials in a manner inconsistent with the national welfare.

(4) REPORTING.—The Commission is authorized to issue such regulations or orders requiring reports of ownership, possession, extraction, refining, shipment, or other handling of source materials as it may deem necessary.

(c) BYPRODUCT MATERIALS.—

(1) DEFINITION.—The term "byproduct material" shall be deemed to refer to all materials (except fissionable material) yielded in the processes of producing fissionable material.

(2) DISTRIBUTION.—The Commission is authorized and directed to distribute, with or without charge, byproduct materials to all applicants seeking such materials for research or developmental work, medical therapy, industrial uses, or such other useful applications as may be developed. If sufficient materials to meet all such requests are not available, the Commission shall allocate such materials among applicants therefor, giving preference to the use of such materials in the conduct of research and developmental activity and medical therapy. The Commission shall refuse to distribute or allocate any byproduct materials to any applicant, or recall any materials after distribution or allocation from any applicant, who is not equipped or who fails to observe such safety standards to protect health as may be established by the Commission.

(d) GENERAL PROVISIONS.—(1) The Commission is authorized to—

(i) acquire or purchase fissionable or source materials within the United States or elsewhere;

(ii) take, requisition, or condemn within the United States any fissionable or source material and make just compensation therefor. The Commission shall determine such compensation. In the exercise of such rights of eminent domain and condemnation, proceedings may be instituted under the Act of August 1, 1888 (U. S. C. 1940, title 40, sec. 257), or any other applicable Federal statute. Upon or after the filing of the condemnation petition, immediate possession may be taken and the property may be treated by the Commission in the same manner as other similar property owned by it;

(iii) conduct exploratory operations, investigations, inspections to determine the location, extent, mode of occurrence, use, or condition of source materials with or without the consent of the owner of any interest therein, making just compensation for any damage or injury occasioned thereby.

(2) The Commission shall establish by regulation a procedure by which any person who is dissatisfied with its action in allocating, refusing to allocate, or in rescinding any allocation of fissionable, source, or byproduct materials to him may obtain a review of such determination by a board of appeal consisting of two or more members appointed by the Commission and at least one member of the Commission.

MILITARY APPLICATIONS OF ATOMIC POWER

SEC. 6. (a) The Commission is authorized and directed to—

(1) conduct experiments and do research and developmental work in the military application of atomic power; and

(2) have custody of all assembled or unassembled atomic bombs, bomb parts, or other atomic military weapons, presently or hereafter produced, except that upon the express finding of the President that such action is required in the interests of national defense, the Commission shall deliver such quantities of weapons to the armed forces as the President may specify.

(b) The Commission shall not conduct any research or developmental work in the military application of atomic power if such research or developmental work is contrary to any international agreement of the United States.

(c) The Commission is authorized to engage in the production of atomic bombs, bomb parts, or other applications of atomic power as military weapons, only to the extent that the express consent and direction of the President of the United States has been obtained, which consent and direction shall be obtained for each quarter.

(d) It shall be unlawful for any person to manufacture, produce, or process any device or equipment designed to utilize fissionable materials as a military weapon, except as authorized by the Commission.

ATOMIC ENERGY DEVICES

SEC. 7. (a) LICENSE REQUIRED.—It shall be unlawful for any person to operate any equipment or device utilizing fissionable materials without a license issued by the Commission authorizing such operation.

(b) ISSUANCE OF LICENSES.—Any person desiring to utilize fissionable materials in any such device or equipment shall apply for a license therefor in accordance with such procedures as the Commission may by regulation establish. The

Commission is authorized and directed to issue such a license on a nonexclusive basis and to supply appropriate quantities of fissionable materials to the extent available to any applicant (1) who is equipped to observe such safety standards to protect health and to minimize danger from explosion as the Commission may establish; and (2) who agrees to make available to the Commission such technical information and data concerning the operation of such device as the Commission may determine necessary to encourage the use of such devices by as many licensees as possible. Where any license might serve to maintain or foster the growth of monopoly, restraint of trade, unlawful competition, or other trade position inimical to the entry of new, freely competitive enterprises, the Commission is authorized and directed to refuse to issue such license or to establish such conditions to prevent these results as the Commission, in consultation with the Attorney General, may determine. The Commission shall report promptly to the Attorney General any information it may have of the use of such devices which appears to have these results. No license may be given to a foreign government or to any person who is not under and within the jurisdiction of the United States.

(c) **BYPRODUCT POWER.**—If in the production of fissionable materials the production processes yield energy capable of utilization, such energy may be used by the Commission, transferred to other Government agencies, sold to public or private utilities under contract providing for reasonable resale prices, or sold to private consumers at reasonable rates and on as broad a basis of eligibility as the Commission may determine to be possible.

(d) **REPORTS TO CONGRESS.**—Whenever in its opinion industrial, commercial, or other uses of fissionable materials have been sufficiently developed to be of practical value, the Commission shall prepare a report to the Congress stating all the facts, the Commission's estimate of the social, political, and economic effects of such utilization, and the Commission's recommendations for necessary or desirable supplemental legislation. Until such a report has been filed with the Commission and the period of ninety days has elapsed after such filing, within which period the Commission may adopt supplemental legislation, no license for the use of atomic energy devices shall be issued by the Commission.

PROPERTY OF THE COMMISSION

SEC. 8. (a) The President shall direct the transfer to the Commission of the following property owned by the United States or any of its agencies, or any interest in such property held in trust for or on behalf of the United States:

(1) All fissionable materials; all bombs and bomb parts; all plants, facilities, equipment, and materials for the processing or production of fissionable materials, bombs, and bomb parts; all processes and technical information of any kind, and the source thereof (including data, drawings, specifications, patents, patent applications, and other sources, relating to the refining or production of fissionable materials); and all contracts, agreements, leases, patents, applications for patents, inventions and discoveries (whether patented or unpatented), and other rights of any kind concerning any such items;

(2) All facilities and equipment, and materials therein, devoted primarily to atomic energy research and development; and

(3) All property in the custody and control of the Manhattan engineer district.

(b) In order to render financial assistance to those States and local governments in which the activities of the Commission are carried on and in which the Commission, or its agents, have acquired properties previously subject to State and local taxation, the Commission is authorized to make payments to State and local governments in lieu of such taxes. Such payments may be in the amounts, at the times, and upon the terms the Commission deems appropriate, but the Commission shall be guided by the policy of not exceeding the taxes which would have been payable for such property in the condition in which it was acquired, except where special burdens have been cast upon the State or local government by activities of the Commission, the Manhattan engineer district, or their agents, and in such cases any benefits accruing to the States and local governments by reason of these activities shall be considered in the determination of such payments. The Commission and any corporation created by it, and the property and income of the Commission or of such corporation, are hereby expressly exempted from taxation in any manner or form by any State, county, municipality, or any subdivision thereof.

DISSEMINATION OF INFORMATION

SEC. 9. (a) BASIC SCIENTIFIC INFORMATION.—Basic scientific information in the fields specified in section 3 may be freely disseminated. The term "basic scientific information" shall include, in addition to theoretical knowledge of nuclear and other physics, chemistry, biology, and therapy, all results capable of accomplishment, as distinguished from the processes or techniques of accomplishing them.

(b) RELATED TECHNICAL INFORMATION.—The Commission shall establish a Board of Atomic Information consisting of one or more employees and at least one member of the Commission. The Board shall, under the direction and supervision of the Commission, provide for the dissemination of related technical information with the utmost liberality as freely as may be consistent with the foreign and domestic policies established by the President and shall have authority to—

(1) establish such information services, publications, libraries, and other registers of available information as may be helpful in effectuating this policy;

(2) designate by regulation the types of related technical information the dissemination of which will effectuate the foregoing policy. Such designations shall constitute an administrative determination that such information is not of value to the national defense and that any person is entitled to receive such information, within the meaning of the Espionage Act. Failure to make any such designation shall not, however, be deemed a determination that such undesignated information is subject to the provisions of said Act;

(3) by regulation or order, require reports of the conduct of independent research or development activities in the fields specified in section 3 and of the operation of atomic energy devices under licenses issued pursuant to section 7;

(4) provide for such inspections of independent research and development activities of the types specified in section 3 and of the operation of atomic energy devices as the Commission or the Board may determine; and

(5) whenever it will facilitate the carrying out of the purposes of the Act, adopt by regulation administrative interpretations of the Espionage Act except that any such interpretation shall, before adoption, receive the express approval of the President.

PATENTS

SEC. 10. (a) Whenever any person invents a device or method for the production, refining, or other processing of fissionable material: (i) he may file a patent application to cover such invention, sending a copy thereof to the Commission; (ii) if the Commissioner of Patents determines that the invention is patentable, he shall issue a patent in the name of the Commission; and (iii) the Commission shall make just compensation to such person. The Commission shall appoint a Patent Royalty Board consisting of one or more employees and at least one member of the Commission, and the Commissioner of Patents. The Patent Royalty Board shall determine what constitutes just compensation in each such case and whether such compensation is to be paid in periodic payments rather than in a lump sum. Any person to whom any such patent has heretofore been issued shall forthwith transfer all right, title, and interest in and to such patent to the Commission and shall receive therefor just compensation as provided above.

(b) (1) Any patent now or hereafter issued covering any process or device utilizing or peculiarly necessary to the utilization of fissionable materials, or peculiarly necessary to the conduct of research or developmental activities in the fields specified in section 3, is hereby declared to be affected with the public interest and its general availability for such uses is declared to be necessary to effectuate the purposes of this Act.

(2) Any person to whom any such patent has been issued, or any person desiring to use any device or process covered by such patent for such uses, may apply to the Patent Royalty Board, for determination by such Board of a reasonable royalty fee for such use of the patented process or device intended to be used under the Commission's license.

(3) In determining such reasonable royalty fee, the Patent Royalty Board shall take into consideration any defense, general or special, that might be pleaded by a defendant in an action for infringement, the extent to which, if any, such patent

was developed through federally financed research, the degree of utility, novelty, and importance of the patent, the cost to the patentee of developing such process or device, and a reasonable rate of return on such research investment by the patentee.

(4) No court, Federal, State, or Territorial, shall have jurisdiction or power to stay, restrain, or otherwise enjoin any such use of any such patented device or process by any person on the ground of infringement of such patent. In any action for infringement of any such patent filed in any such court, the court shall have authority only to order the payment of reasonable royalty fees and attorney's fees and court costs as damages for any such infringement. If the Patent Royalty Board has not previously determined the reasonable royalty fee for the use of the patented device or process involved in any case, the court in such case shall, before entering judgment, obtain from the Patent Royalty Board a report containing its recommendation as to the reasonable royalty fee it would have established had application been made to it as provided in subparagraphs 2 and 3 above.

ORGANIZATION AND GENERAL AUTHORITY

SEC. 11. (a) ORGANIZATION.—There are hereby established within the Commission a Division of Research, a Division of Production, a Division of Materials, and a Division of Military Application. Each division shall be under the direction of a Director who shall be appointed by the President, by and with the advice and consent of the Senate, and shall receive compensation at the rate of \$15,000 per annum. The Commission shall delegate to each such division such of its powers under this Act as in its opinion from time to time will promote the effectuation of the purposes of this Act in an efficient manner. Nothing in this paragraph shall prevent the Commission from establishing such additional divisions or other subordinate organizations as it may deem desirable.

(b) GENERAL AUTHORITY.—In the performance of its functions the Commission is authorized to—

(1) establish advisory boards to advise with and make recommendations to the Commission on legislation, policies, administration, and research;

(2) establish by regulation or order such standards and instructions to govern the possession and use of fissionable and byproduct materials as the Commission may deem necessary or desirable to protect health or to minimize danger from explosion;

(3) make such studies and investigations, obtain such information, and hold such hearings as the Commission may deem necessary or proper to assist it in exercising any authority provided in this Act, or in the administration or enforcement of this Act, or any regulations or orders issued thereunder. For such purposes the Commission is authorized to require any person to permit the inspection and copying of any records or other documents, to administer oaths and affirmations, and by subpoena to require any person to appear and testify, or to appear and produce documents, or both, at any designated place. Witnesses subpoenaed under this subsection shall be paid the same fees and mileage as are paid witnesses in the district courts of the United States;

(4) create or organize corporations, the stock of which shall be wholly owned by the United States and controlled by the Commission, to carry out the provisions of this Act;

(5) appoint and fix the compensation of such officers and employees as may be necessary to carry out the functions of the Commission. All such officers and employees shall be appointed in accordance with the civil-service laws and their compensation fixed in accordance with the Classification Act of 1923, as amended, except that expert administrative, technical, and professional personnel may be employed and their compensation fixed without regard to such laws. The Commission shall make adequate provision for administrative review by a board consisting of one or more employees and at least one member of the Commission of any determination to dismiss any scientific or professional employee; and

(6) acquire such materials, property, equipment, and facilities, establish or construct such buildings and facilities, modify such building and facilities from time to time, and construct, acquire, provide, or arrange for such facilities and services for the housing, health, safety, welfare, and recreation of personnel employed by the Commission as it may deem necessary.

ENFORCEMENT

SEC. 12. (a) Any person who willfully violates, attempts to violate, or conspires to violate, any of the provisions of this Act or any regulations or orders issued thereunder shall, upon conviction thereof, be punishable by a fine of not more than \$10,000, or by imprisonment for a term of not exceeding five years, or both.

(b) Whenever in the judgment of the Commission any person has engaged or is about to engage in any acts or practices which constitute or will constitute a violation of any provision of this Act, it may make application to the appropriate court for an order enjoining such acts or practices, or for an order enforcing compliance with such provision, and upon a showing by the Commission that such person has engaged or is about to engage in any such acts or practices a permanent or temporary injunction, restraining order, or other order shall be granted without bond.

(c) In case of contumacy by, or refusal to obey a subpoena served upon, any person pursuant to section 11 (b) (3), the district court for any district in which such person is found or resides or transacts business, upon application by the Commission, shall have jurisdiction to issue an order requiring such person to appear and give testimony or to appear and produce documents, or both; and any failure to obey such order of the court may be punished by such court as a contempt thereof.

REPORTS

SEC. 13. The Commission shall, on the first days of January, April, July, and October, submit reports to the President, to the Senate and to the House of Representatives. Such reports shall summarize and appraise the activities of the Commission and of each division and board thereof, and specifically shall contain financial statements; lists of licenses issued, of property acquired, of research contracts and arrangements entered into, and of the amounts of fissionable material and the persons to whom allocated; the Commission's program for the following quarter including lists of research contracts and arrangement proposed to be entered into; conclusions drawn from studies of the social, political, and economic effects of the release of atomic energy; and such recommendations for additional legislation as the Commission may deem necessary or desirable.

DEFINITIONS

SEC. 14. As used in this Act—

(a) The term "atomic energy" shall include all forms of energy liberated in the artificial transmutation of atomic species.

(b) The term "Government agency" means any executive department, board, bureau, commission, or other agency in the executive branch of the Federal Government, or any corporation wholly owned (either directly or through one or more corporations) by the United States.

(c) The term "person" means any individual, corporation, partnership, firm, association, trust, estate, public or private institution, group, any government other than the United States, any political subdivision of any such government, and any legal successor, representative, agent, or agency of the foregoing, or other entity.

(d) The term "United States" includes all Territories and possessions of the United States.

APPROPRIATIONS

SEC. 15. There are hereby authorized to be appropriated such sums as may be necessary and appropriate to carry out the provisions and purposes of this Act. Funds appropriated to the Commission shall, if obligated during the fiscal year for which appropriated, remain available for expenditure for four years following the expiration of the fiscal year for which appropriated. After such four-year period, the unexpended balances of appropriations shall be carried to the surplus fund and covered into the Treasury.

SEPARABILITY OF PROVISIONS

SEC. 16. If any provision of this Act, or the application of such provision to any person or circumstances, is held invalid, the remainder of this Act or the application of such provision to persons or circumstances other than those to which it is held invalid, shall not be affected thereby.

SHORT TITLE

SEC. 17. This Act may be cited as the "Atomic Energy Act of 1946".

The CHAIRMAN. Senator Austin, I believe, has something that he wishes to insert in the record.

Senator AUSTIN. Mr. Chairman, I ask unanimous consent to have printed in the record that part of the official report of the House of Commons Debates, Dominion of Canada, held at Ottawa, Canada, on Monday, December 17, 1945, which relates to the passage of a resolution by the House of Commons relating to the agreement made by the President of the United States, Prime Minister Attlee, and Prime Minister Mackenzie King. I offer this for the record because it does confirm the opinion of this committee with respect to the proper interpretation of that agreement, and I call attention to just one sentence for the purpose of making it clear on the record that that is so, but I want the whole matter within pages 3697 to 3718 published in our hearings. The matter I call attention to appears on page 3701, Mackenzie King speaking. He is discussing the subject of the exchange of scientific information, and he says, among other things:

However, we stated our readiness to share, on a reciprocal basis, with others of the United Nations, detailed information concerning the practical industrial application of atomic energy, just as soon as effective and enforceable safeguards against its use for destructive purposes could be devised.

The CHAIRMAN. Without objection, it will be printed in the record as requested by Senator Austin, and I am sure it will be helpful to us.

(The excerpt from the Canadian House of Commons Debates referred to above is as follows:)

ATOMIC ENERGY

APPROVAL OF AGREED DECLARATION SIGNED AT WASHINGTON, NOVEMBER 15, 1945

Right Hon. W. L. MACKENZIE KING (Prime Minister) moved:

"That it is expedient that the houses of parliament do approve the agreed declaration on atomic energy signed by the President of the United States, the Prime Minister of the United Kingdom, and the Prime Minister of Canada, at Washington on November 15, 1945, and that this house do approve the same."

He said: Mr. Speaker, the House of Commons is being asked by the motion now before it to approve the agreed declaration on atomic energy which was signed at the White House, Washington, on the 15th of November of this year, by the President of the United States, the Prime Minister of the United Kingdom and the Prime Minister of Canada.

The statement which embodies the declaration was read to honorable members of this house by my colleague, the Minister of Justice, on the afternoon of the day on which the declaration was made. Copies of the declaration in English and in French were tabled in pamphlet form on December 1. The declaration has received the widest publicity. I think it may be truly said that it has met with general approval.

As the declaration is one of far-reaching significance and historic interest, it is desirable that it should be formally approved by both houses of our parliament. Apart from other positive advantages, such approval should serve effectively to meet the criticism that the Prime Minister of Canada in joining with the Prime Minister of the United Kingdom and the President of the United States in the discussions at Washington and in signing the declaration "either assumed that parliament and the Canadian people had no views on the atomic bomb question or that their views didn't matter; that it was within his sole right and power to determine what should be done." I am happy to say that this uncalled for criticism seems to have met only with the rebuke it so obviously deserves.

Research into atomic energy: No discovery, in all time, has equaled in interest that of the release of atomic energy. No discovery has been fraught with possibilities which may prove to be either so baneful or so beneficial to mankind.

It may serve as a helpful introduction to an understanding of the problems which the discovery of atomic energy has created, if I say a word or two concerning the discovery itself, and the circumstances which led to the part the release of atomic energy came to have in military warfare. My introductory words may also help to give some idea of Canada's contribution to atomic research and processes, and to explain the strategic position which Canada, along with the United Kingdom and the United States, has come to hold in working towards a solution of problems to which the use of atomic energy has given rise.

All the world now knows that the sudden termination of the war against Japan was due to the appalling destruction of life and property wrought, in August of the present year, by the use of the atomic bomb against the cities of Hiroshima and Nagasaki.

Until recently the world believed that the atom was the ultimate indivisible particle of matter; a particle of matter so minute as to admit of no division. When the war began in 1939, scientists of many nations had come to recognize that the release of energy by the "splitting" of the atom, or what is scientifically referred to as "atomic fission" was a possibility. The war gave impetus to research into the means of releasing atomic energy and later to the production of atomic bombs.

At the outset, research was carried on mainly in the universities of the United Kingdom. During 1940 there was an interchange of information on war research between Britain, the United States and Canada. By the summer of 1941 such progress had been made in research in the application of atomic energy that it was felt that full use should be made of university and industrial laboratories in seeking to find, just as rapidly as possible, the means of producing atomic bombs. In October of 1941, upon the suggestion of President Roosevelt, there began a coordination and joint conduct of British and American efforts. In 1942 the United Kingdom authorities proposed that an important section of research into atomic energy should be carried on in Canada as a joint enterprise. The special Montreal laboratory of the national research council was thereafter organized, and staffed by over 300 workers. It was by far the largest organization ever created in Canada to carry out a single research project. Other research projects were undertaken at McMaster, Toronto and McGill universities, and at the national research laboratories in Ottawa.

Developments in the United States and Canada: By the summer of 1942, the expanded program of research seemed to justify a decision to proceed with the construction of large-scale production plants in the United States. The Americans alone were active in large-scale work.

At Quebec, in September 1943, an agreement was signed between Mr. Churchill and Mr. Roosevelt which bound their two countries to collaborate with the object of producing, as quickly as possible, a military weapon for use in the war. Under this agreement a combined policy committee was set up. Upon the invitation of Mr. Roosevelt and Mr. Churchill, in which I had concurred, Mr. Howe, the Minister of Munitions and Supply, was made a member of the combined policy committee as the representative of Canada.

Up to the present, uranium is the mineral that has been used as basic material for the atomic bomb process. Thorium is a probable second basic material for that purpose, although it is not as yet a proven material. The largest proved deposit of uranium ore is in the Belgian Congo, and the next largest is in Canada. As soon as the significant use of uranium in the atomic bomb process was disclosed to Mr. Howe and myself, we secured the approval of the cabinet of the purchase of the Eldorado uranium properties in the Great Bear lake area, and reserved for the government control of all such minerals as might be discovered in Canada in the future. This was a strategic factor of high importance, since this second largest known source of raw material thereby became accessible to the large manufacturing plants already built in the United States.

The work of the several research projects has been closely coordinated with the development of a pilot plant at Chalk River for the investigation of atomic energy processes. This work is of considerable importance. It includes the study of the utilization of thorium as a starting point for the production of "active material". This pilot plant is unique in character and is suitable for a field of research that has not been explored elsewhere.

Three governments in partnership: Here may I quote from a statement prepared by Mr. Churchill while he was at the head of the coalition government. It was made public by his successor after Mr. Attlee's assumption of office.

Mr. Churchill's statement is as follows:

"In the United States the erection of the immense plants was placed under the responsibility of Mr. Stimson, United States Secretary of War, and the American army administration whose wonderful work and marvellous secrecy cannot be sufficiently admired. The main practical effort and virtually the whole of its prodigious cost now fell upon the United States authorities who were assisted by a number of British scientists.

"The relationship of the British and the American contribution was regulated by discussion between me and President Roosevelt, and a combined policy committee was set up. The Canadian government whose contribution was most valuable provided both indispensable raw material for the project as a whole, and also necessary facilities for the work of one section of the project which has been carried out in Canada by the three governments in partnership."

Elsewhere in his statement Mr. Churchill said:

"By God's mercy, British and American science outpaced all German efforts. These were on a considerable scale but far behind. The possession of these powers by the Germans, at any time, might have altered the result of the war."

It is worthy of notice that the determination to embark on large-scale undertakings for production of atomic bombs was agreed upon while some details of the project were still in the laboratory stage. The outcome was a most impressive demonstration of the collaboration of scientific skill and technical capacity conducted under conditions of the highest secrecy.

This aspect of the production of the atomic bomb was referred to by Mr. Churchill in the following words:

"The whole burden of execution including the setting up of the plants and many technical processes connected therewith in the practical sphere constitutes one of the greatest triumphs of American—or indeed human—genius of which there is record. Moreover, the decision to make these enormous expenditures upon a project which however hopefully established by American and British research remained nevertheless an awful uncertainty stands to the everlasting honour of President Roosevelt and his advisers."

The two uses of atomic energy: What was aimed at in the combined efforts of the scientists was the development of methods for the release of atomic energy, either to produce an explosion, or as a source of power. The immediate purpose of the construction of large-scale production plants, and the work of the combined policy committee, was the use of atomic energy for military purposes.

It is now known that the release of atomic energy can be effected so rapidly that a few pounds of "active material" will produce an explosion equivalent to that of the setting off of several thousands of tons of TNT. On the other hand, the energy released can, it is believed, be so controlled as to produce a steady flow of heat obtainable at a temperature high enough to operate steam-driven electrical generating plants. One ton of "active material" used in this way would generate as much power as about three million tons of coal.

In a passage which will carry its appeal to every human heart, Mr. Churchill has vividly expressed the sentiments to which these amazing facts give rise:

"This revelation of the secrets of nature long mercifully withheld from man should," he said, "arouse the most solemn reflections in the mind and conscience of every being capable of comprehension. We must indeed pray that these awful agencies will be made to conduce to peace among the nations and that, instead of wreaking measureless havoc upon the entire globe, they may become a perennial fountain of world prosperity."

This is the problem presented by the discovery of the release of atomic energy. Here is the challenge to our day and generation.

Sharing of information: Up to a certain point the processes for releasing atomic energy are the same whether the purpose is an industrial, commercial, or humanitarian use, or whether it is that of mass destruction. Up to this point of departure the processes are already quite widely known. The scientific knowledge upon which these processes are based has been shared by a number of nations.

Beyond this point of common development, the construction of atomic bombs consists of a series of highly technical manufacturing processes which are still very secret. Knowledge of these technical manufacturing processes is popularly referred to as the "know-how." It is this know-how which is possessed in whole or in part by Britain, the United States, and Canada, and which has not been made known to other nations. The reason for not imparting to other nations, without certain guarantees and controls, the know-how in the production of atomic bombs is because of the potentialities of vast destruction involved.

It should not be supposed that the control of the raw materials presently enjoyed by Canada, the United Kingdom, and the United States will, for any length of time, prevent developments in other countries. Neither should it be imagined that the processes in manufacturing atomic bombs—now secret—will prevent, indefinitely, similar developments in other countries. Even with international measures of supervision and control, it will be but a matter of time before all processes are known to practically all nations. Hence the need for immediate action to seek every available means to end all possibility of war itself.

Preliminary discussions on atomic energy: I come now to the declaration on atomic energy signed at Washington, on November 15th last.

As hon. members are aware, I visited President Truman at the White House on September 30th, the day before I sailed from New York for England. During this visit, matters related to the atomic bomb were referred to in conversation between the President and myself. Mr. Truman invited me to visit him again on my return from abroad. He also told me that he was looking forward to a visit from Mr. Attlee, the Prime Minister of the United Kingdom.

Upon arrival in London, I learned from Mr. Attlee that, toward the end of September last, he had made known to the President his view on the vital importance to the world of the discovery of atomic energy. He had expressed the opinion that the application of atomic energy to warfare made it essential that those in responsible positions in the countries under whose auspices the development had taken place should consider the problems to which it had given rise. In conveying to the President the tentative conclusions at which the British government had arrived, Mr. Attlee had suggested that personal discussion might follow.

On October 3, in a message to Congress, President Truman said:

"I therefore propose to initiate discussions, first with our associates in this discovery, Great Britain and Canada, and then with other nations in an effort to effect agreement on the conditions under which cooperation might replace rivalry in the field of atomic power."

While I was in London, communications were received from President Truman inviting Mr. Attlee and myself to come to Washington at as early a date as could be arranged to discuss with him the problems related to atomic energy.

In his Navy day speech on United States foreign policy, on October 27, President Truman, referring to his message to Congress, added that discussion of the atomic bomb with Great Britain and Canada, and later with other nations, could not wait upon the formal organization of the United Nations.

The conference at Washington: Mr. Attlee and I arrived in Washington on the morning of Saturday, November 10th. Mr. Attlee had left London by plane on the afternoon of the previous day. I had left London on Saturday of the previous week to cross by ship. We arrived in Washington at the same hour. During our stay in Washington, every courtesy was extended to Mr. Attlee and myself by the President and the Secretary of State, Mr. Byrnes. From the hour of our arrival to the day of the signing of the declaration, meetings and conversations were held continuously.

In our consideration of the problems discussed, the President and Mr. Byrnes had the assistance of Dr. Vannevar Bush, director of the office of scientific research and development, and scientific adviser to the President's committee on atomic energy. Prime Minister Attlee was accompanied by Sir John Anderson, chairman of the advisory committee in the United Kingdom on atomic energy. Sir John Anderson is perhaps the best informed of anyone in the United Kingdom on the whole subject, and on the circumstances attending the work with the Americans and ourselves in the researches on atomic energy. Mr. Attlee was also assisted by Lord Halifax, the British ambassador. I was joined in Washington by Mr. Howe, the Canadian member of the combined policy committee, and Dr. C. J. Mackenzie, president of our national research council. I was also assisted while in Washington, by the Canadian Ambassador, Mr. L. B. Pearson; by Mr. Norman Robertson, the Under-Secretary of State for External Affairs, who had accompanied me to England, and by Mr. Hume Wrong, Associate Under-Secretary of State for External Affairs, who joined Mr. Robertson and myself on our arrival in Washington.

I should like to acknowledge the invaluable assistance given me by all these gentlemen and by members of our embassy staff in Washington.

The agreed declaration: In asking hon. members to support the motion which is now before the house, approving the Washington declaration on atomic energy, I feel I cannot do better than to set forth essential features of the declaration itself and, in so doing, indicate governing considerations which were constantly in the minds of all who participated in the discussions.

There was recognition at the outset that the vast significance of the discovery of the release of atomic energy was not yet fully comprehended; that very few realized the far-reaching effect of the discovery upon the future of the world. It was agreed that the discovery had placed at the disposal of mankind means of destruction hitherto unknown, and against which there could be no adequate military defence, and in the employment of which no single nation could, in fact, have a monopoly. In a word, it was agreed that civilization could not survive an atomic war. It was also recognized that it was impossible to isolate the problem of the atomic bomb from the problem of the use of other weapons of destruction. The atomic bomb was seen as the latest word in destructiveness, but not necessarily the last.

The truth is that no system of safeguards that can be devised will of itself provide an effective guarantee against production of atomic weapons by a nation bent on aggression. Nor can we overlook the probability of the development of other major weapons of mass destruction, or of new methods of warfare which may constitute an ever greater threat to civilization than the military use of atomic energy. At Washington, we were therefore called upon to consider not merely the elimination of the atomic bomb as a weapon of war, but also the kind of world order which is necessary in an atomic age, if civilization is to survive.

In our deliberations we were seeking to take the first step in an effort to rescue the world from a desperate race in weapons of mass destruction. We were prepared to concede that the progress our three countries had made in the development and use of atomic energy demanded that our countries take the initiative in an international effort to prevent the further use of atomic energy for destructive purposes. We felt an equal obligation on the part of our countries to promote the use of recent and future exchanges of scientific knowledge, particularly in the utilization of atomic energy for peaceful and humanitarian ends. At the same time we sought to make very clear that the responsibility for devising means to ensure that the new discovery should be used for the benefit of mankind, instead of as a means of destruction, rested not on our nations alone, but on the whole civilized world.

The exchange of scientific information: In the agreed declaration we felt obliged to draw a distinction between the information essential for the development of atomic energy for peaceful purposes and the information concerning the practical industrial application of atomic energy.

Representing, as we did, the three countries which possess the knowledge essential to the use of atomic energy, we declared our willingness, as a first contribution, to proceed with the exchange of fundamental scientific information, and with the interchange of scientists, and scientific literature for peaceful ends, with any nation that would fully reciprocate. We stated our belief that the fruits of scientific research should be made available to all nations, and that freedom of investigation and the free interchange of ideas were essential to the progress of knowledge. The basic scientific processes essential to the development of atomic energy for peaceful purposes have already been made available to the world. We declared that all further information of this character that might become available from time to time should be similarly treated.

As I have already explained, the use of atomic energy for industrial, commercial and humanitarian purposes is dependent upon the same methods and processes as, up to a certain point, are required for the military exploitation of atomic energy. While we were prepared to share the information essential to the development of atomic energy for peaceful purposes, we were not convinced that the spread of the specialized information regarding the practical application of atomic energy in the manufacture of bombs, before it was possible to devise reciprocal and enforceable safeguards acceptable to all nations, would contribute to a constructive solution of the problem of the atomic bomb. On the contrary, we thought it might have the opposite effect. However, we stated our readiness to share, on a reciprocal basis, with others of the united nations, detailed information concerning the practical industrial application of atomic energy, just as soon as effective and enforceable safeguards against its use for destructive purposes could be devised.

Atomic energy and the arts of peace: The attention which has so far been directed to the strictly war aspects of atomic energy—that is, to the atomic bomb—should not be allowed to obscure the immense possibilities of development of atomic energy for the arts of peace. The atomic bomb is a weapon of destruction unsurpassed in human experience. But the energy locked up inside the atom, controlled and directed to useful and constructive ends, may make it possible to provide goods and services for people throughout the world on a scale which we

cannot now envisage. It may be the means of raising the standard of living; of providing physical comfort against hazards of weather and extremes of heat and cold. It may revolutionize some present-day means of transport and communication, making all countries of the world near neighbours in a more immediate sense than has been made possible even by the development of air transport.

It must never be forgotten, however, that the use of atomic energy for peaceful purposes cannot be developed without at the same time producing the very material which is used in a bomb.

Commission on atomic energy proposed at Washington: In order to attain the most effective available means of entirely eliminating the use of atomic energy for destructive purposes, and for promoting its widest use for industrial, commercial, and humanitarian purposes, we gave it as our opinion in the Washington declaration that at the earliest practicable date a commission should be set up under the united nations organization, to prepare recommendations for submission to the organization. We expressed the view that the commission should be instructed to proceed with the utmost despatch; and that, in particular, it should make specific proposals (a) for extending, between all nations, the exchange of basic scientific information for peaceful ends; (b) for the control of atomic energy to the extent necessary to ensure its use only for peaceful purposes; (c) for the elimination from national armaments of atomic weapons and of other major weapons adaptable to mass destruction; and (d) for effective safeguards by way of inspection and other means, to protect complying states against the hazards of violations and evasions. These tasks may well have to move forward by separate stages, building upon the confidence which the progressive exchange of information will provide.

Under the charter of the united nations the signatory powers have pledged themselves not to use force except in support of the purposes and principles of the charter. At Washington we expressed the view that by whole-hearted support of the united nations organization, and by consolidating and extending its authority, thereby creating conditions of mutual trust in which all peoples will be free to devote themselves to the arts of peace, there would be found the most immediately available means of maintaining the rule of law among nations and of banishing the scourge of war from the earth. We declared it to be the firm resolve of our three countries to work without reservation to achieve these ends.

Nothing can be truer than that without unremitting cooperation and the united effort of nations there will be no enduring and effective protection against the atomic bomb. Nor without this cooperation and united effort can there be protection against the indiscriminate use of poison or against the latest refinements in gas warfare, or protection against bacteriological warfare, all of which are even more frightful methods of human destruction than the atomic bomb. To ensure civilization from destruction it is not enough to banish atomic or gas or bacteriological warfare; we must banish war itself.

It is intended that the proposals of the Washington declaration for the establishment of a commission to prepare recommendations on the means of dealing with the problems raised by the development of atomic energy should be submitted to the first general assembly of the united nations. It is expected that the general assembly will open its first session in London on January 10. On the exact procedure to be followed in bringing up this vital matter for consideration by the united nations organization, I am unable to say anything at present.

Before leaving Washington on Thursday last December 13, to take part in the meeting in Moscow of the foreign ministers of the United States, the United Kingdom and the Soviet Union, the Secretary of State of the United States announced that he wished to discuss with the Soviet government its views on how they would be prepared to cooperate in the establishment of the commission and on the procedure which should be followed. On these questions we are in constant consultation with the governments of the United States and the United Kingdom, the other parties to the Washington declaration on atomic energy.

President Roosevelt's vision: While I do not wish at the moment to attempt to look too far into the future with respect to proceedings of the united nations organization, I am pleased to have this opportunity to speak of the past in reference to the creation of the united nations organization itself. I recall very well that while the war against Germany and Japan was still in progress, there were many who felt that President Roosevelt was pressing, with undue haste, the establishment of a united nations organization. Echoes of this criticism were heard at San Francisco last spring at the time of the united nations conference on international organization. It was not until after the conference was over, and the charter of the united nations organization had been brought into existence,

that the world learned of the discovery of the release of atomic energy and of its practical application against Japan. The use of the atomic bomb as a major weapon of military warfare presented, in an instant, to all nations wholly new problems of security. Against the use of the atomic bomb in war, nothing has thus far been suggested which could be regarded as a means of defence.

President Roosevelt's prophetic vision had once more come to the aid of humanity at a time of its greatest need. Had President Roosevelt waited until the war was over to call a united nations conference to bring the charter into being, we should not have had the united nations organization at hand today to assist in the solution of the problems which the atomic bomb has brought so conspicuously to the fore. Instead, the countries seeking a solution of its problems would have been more bewildered and baffled than they are. The world is but slowly recognizing what it owes to the late President.

Problems of the atomic era: If I have made myself clear with respect to the problems of the atomic era with which we are now faced, it will be apparent that they are primarily political problems affecting the relations between men and governments. Fundamentally they are a part of the age-old conflict between good and evil. As such their ultimate solution will be found only in the realm of philosophy and morals. One thing is certain: they admit of no mechanistic solution. By themselves, devices for the control of atomic energy are at best but temporary expedients. For this reason, I believe, it is an error to contemplate the control of the use of atomic energy in commodity and police terms, as if atomic energy were some new and dangerous drug. Technical scientific controls of production, processing and final disposition are indispensable, but they are obviously inadequate. It would, I believe, be criminal folly to allow ourselves to imagine that the peace and security of mankind can be attained by any scheme of commodity control.

As political problems affecting the relations of governments, the solution of the problems presented by atomic energy must be sought in the realm of world politics. The more deeply one ponders the problems with which our world is confronted in the light—"the terrible light," as Mr. Attlee said—of the implications of the development of atomic energy, the harder it is to see a solution in anything short of some surrender of national sovereignty. With a limited surrender of national sovereignty, there must be instituted some form of world government restricted, at least at the outset, to matters pertaining to the prevention of war, and the maintenance of international security.

The united nations organization is not a sufficient answer to the problems of peace and security which the world is now seeking. It is a first step, and an all-important step, in the direction of that cooperation between nations which is essential to the survival of civilization. It is not, however, the only, much less the final, step. The united nations organization is an indispensable medium and channel and forum through which the peoples of the world can work out new institutions and arrangements which their peace and security now require.

We do well to recall that the united nations charter had been signed before the world knew of the existence of the atomic bomb, much less anything about its ghastly military potentialities for mass destruction. The coming of the atomic bomb has opened our eyes to the appalling possibilities which will face the world if the united nations should fail to achieve effective international cooperation. It is to be hoped that such a prospect may be sufficient to cause every country, in the interests of its own citizens, to recognize that "over all nations is humanity." It is devoutly to be hoped that the nations will not delay too long in welcoming, albeit in the form of some self-denying ordinance upon individual national sovereignties, a measure of world sovereignty sufficiently effective to maintain international security and to end all possibility of war.

If we are agreed on the ultimate necessity of some measure of world government to maintain world security, we should, by every means in our power, support and strengthen every agency of international cooperation and understanding which can help to make the world community a reality. The peoples of all nations must address themselves to the task of helping to devise and shape institutions and relationships which will enable mankind to ensure, if not its salvation, at least its survival. We must work with all our might for a world order under the rule of law. This seems to be our only hope. Humanity is one. We must act in the belief that no nation and no individual liveth to himself alone, and that all are members one of another.

Mr. JOHN BRACKEN (Leader of the Opposition). Mr. Speaker, I am sure we have all listened with very great interest to the remarks of the Prime Minister as he outlined Canada's part in achieving the release of atomic energy and the various steps

leading up to the agreed declaration which is now before us, and his elaboration of the various clauses in the declaration.

At the outset I wish to compliment the Prime Minister, and all those associated with him, and particularly the scientists of Canada, on their respective parts in bringing about the results of that great discovery. With much of what the Prime Minister has said I am in entire agreement, and I should like to think that in that respect I speak for members in every section of the house.

The question of atomic energy, its production, its control and its use, everyone will agree, is of great importance at this time. The immediate question before this house is the declaration recently issued and signed by the President of the United States, the Prime Minister of Great Britain, and the Prime Minister of Canada. The resolution before us makes a statement and asks a question. It declares that it is expedient at this time that we approve the statement that has been presented to us. This statement, I am sure the Prime Minister will agree, is one which will have no effect in law at the moment, but is one which may be a guide to public opinion throughout wide areas of the world.

The Prime Minister has dealt with the history and the development of this recent gain in science. My remarks will deal more particularly with the political consequences of that development. The declaration before us contains nine clauses. I propose to analyse these very briefly and to make a brief comment on each as I proceed.

The first clause indicates the recognition of an important fact, perhaps the most important fact of the age in which we live, the fact that the modern developments in physical science are so far in advance of the modern developments in social science as to constitute a grave danger to the human race.

I believe it was Wells who, in one of his books, said that civilization is a race between education and catastrophe. If that were true twenty years ago, it is much more true today in the light of the new knowledge that science has given to the world. The question now is whether our growing control over the physical forces around us is to be used for the progress of mankind or for the destruction of mankind. That is the problem that has been dropped into the lap of this generation, and that is what makes this particular time the most interesting and perhaps the most challenging in which any generation of man has ever lived.

The second paragraph sets out that the responsibility arising from this discovery rests upon this generation. It rests upon us to see that all these discoveries are used for the benefit of mankind and not for its destruction. That paragraph indicates one other fact, that the initiative rests with those nations who happen to have been the first to discover the truth of the atomic bomb. But it indicates also, that the responsibility for ultimate success in controlling this new discovery rests with all the nations of the world.

The third paragraph is a statement of fundamental truth. It is in these words: that the only complete protection for the civilized world against the destructive use of scientific knowledge lies in the prevention of war.

I believe, Mr. Speaker, that with the statements contained in these three clauses of the declaration no one in this house will be in disagreement.

The fourth paragraph is a statement of proposed policy. In it we are asked to declare our willingness to proceed with the exchange of fundamental scientific information, and the interchange of scientists and scientific literature for peaceful ends, with any nation that will fully reciprocate. Here we face, an immediate question: Are the scientific data and the technological knowledge so far developed to be entrusted by those who have them to those who do not have them?

This is a question to which an answer must be given reasonably soon. If the present attitude of exclusion prevails for an indefinite period, suspicions and distrust will be engendered in those who do not have this knowledge. At the same time there are few who would favour the distribution of the data and the technical processes indiscriminately, without taking every reasonable precaution to preserve world peace. It would seem reasonable that any nation which is to be permitted to have the knowledge we possess, and from it to develop atomic energy on a commercial scale, ought first to be prepared to submit its mines and laboratories to regular inspection. It is difficult to see how this secret can be shared without serious risk until every one of the great powers of the world is prepared to permit the free dissemination of news and the free admittance for observation of representatives of our great news services. I think it is not going too far to say that to our newspaper men and women we owe our survival in the last half dozen years of war. Had they not been able to find out what our enemies were planning for us and report, as they did, we would have been conquered before waking up to what was going on in the world.

The fifth paragraph contains four statements; one a statement of belief, one a statement of fact, one a statement of intention, and one a statement of hope. The statement of belief is this:

"We believe that the fruits of scientific research should be made available to all nations, and that freedom of investigation and free interchange of ideas are essential to the progress of knowledge."

I think everyone will agree with that statement of belief. The statement of fact is:

"* * * the basic scientific information essential to the development of atomic energy for peaceful purposes has already been made available to the world."

That is, the "basic" scientific information is widely known. The statement of intention is this:

"It is our intention that all further information of this character that may become available from time to time shall be similarly treated."

But that it is to be made available under conditions mentioned later on. The statement of hope is this:

"We trust that other nations will adopt the same policy, thereby creating an atmosphere of reciprocal confidence in which political agreement and cooperation will flourish."

All will approve, I am sure, of the general attitude expressed in this paragraph. The human race has never yet been denied the fruits of invention by conscious public policy, and denying them now would be unnecessarily holding back material progress. This new knowledge has potentialities for both good and ill. We cannot prevent its development. We must therefore control its use. We must make ourselves capable of turning this and other secrets of nature to constructive use.

Paragraph 6 contains a statement of opinion and an offer to share the scientific knowledge. The opinion is that the spreading of specialized information before it is possible to devise effective safeguards would not contribute to a constructive solution of the problem of the atomic bomb. The second part of the paragraph is an offer, as I have said, to share scientific knowledge on a reciprocal basis. It states:

"We are, however, prepared to share on a reciprocal basis with others of the united nations, detailed information concerning the practical industrial application of atomic energy just as soon as effective enforceable safeguards against its use for destructive purpose can be devised."

This brings us nearer to the nub of the problem we have to face. Is it possible or practical to develop the use of atomic energy for peaceful purposes and prevent its use for war purposes? We cannot now be certain that explosives produced for one purpose will not be used for the other. The problem of policing the use of this process is a complicated one, much more complicated than any political problem ever undertaken in the past. Can society draw a line of demarcation—and see that the line is observed—between developing atomic energy for peaceful purposes and outlawing it for the purposes of war? That is the challenge. It is a challenge we must accept, and as the lines suggest, we accept it by tying our faith to reciprocal agreements to banish its use in time of war.

The seventh paragraph is another statement of opinion. In effect it says, "We state it as our opinion that a commission should be set up to prepare recommendations aimed at the elimination of the use of atomic energy for destructive purposes, and to make possible its use for humanitarian purposes." If any member of parliament has any criticism of this clause I suppose it would be in order for those subscribing to the agreement to ask what better solution could have been proposed. Its authors at best see through the glass but darkly. They are only groping their way, with care and hesitation. I hope this clause does not reveal a disposition to try to escape from the responsibilities incumbent upon those who possess the secret. It is practically certain that the bomb will be used if another war breaks out. Unless we are visionaries this must soon be realized. If there is to be war, any nation wanting to live cannot afford to be without a means of defence or retaliation if it is attacked. The secret is ours today. Others will have it tomorrow, and many will have more dangerous ones later on.

Paragraph 8 suggests a procedure. It suggests that the proposed commission should proceed by separate stages, and more specifically that it should undertake first a wide exchange of scientists and scientific information; and second, to develop a full knowledge concerning natural resources and raw materials. This clause adds a note of realism to which I think most of us will subscribe. We are dealing with a secret process, at least a process that is now secret. If the secret

were no secret at all there would be little use in this elaboration of machinery. If it is still a vital secret in the hands of three nations a terrible responsibility rests upon these nations to devise the best safeguards possible for its use. There is no reason not to believe that some nations will relapse into a passive state, believing that entrusting the task to some international body will settle everything. The danger is that while the innocent will keep their promises, the aggressors will prepare to break their promises and war will be more likely than if no promises were made at all. A half-baked plan will mean that once more this generation will go to sleep on an inactive but still live volcano. That is what happened prior to the recent war.

Paragraph 9, as I interpret it, is an appeal to rationalism in a world made up of nation states. In that paragraph the necessity of three things is pointed out: the necessity of the rule of law among nations as well as among people within nations; the necessity of active and generous support to the united nations organization as the best means now known to humanity of achieving a world of peace; and the necessity of doing everything that humanity can devise to banish war. The paragraph concludes with this brief but strong resolve:

"It is our firm resolve to work without reservation to achieve these ends."

This clause sets before us a goal, but it does not guarantee that we shall attain it. It states the challenge that faces us. The united nations charter was founded on an agreement of the Big Three. That charter has been elaborated on the foundation of certain basic understandings. But the discovery of how to release atomic energy has shattered our faith in that foundation as it is now laid. The most vital problem, therefore, faces us still. Can the world, organized as it is today or as it may be organized in the future, so conduct itself as to save itself from destruction? Are man's own inventions to be the cause of his own destruction? Is the world to remain an age of unreason; or is man, with his new gadgets, to revert to times we thought were passed—times without the controls civilization could provide?

I am not one who feels that we must close this debate on a note of pessimism. I feel that many discussions outside this house have been characterized by too much alarm and despair and by too little hope and optimism. If man is to be destroyed by his own inventions, why weep about it beforehand? Rather, knowing the danger, let us set about with determination to avoid that end. Let us set out to find and to provide the most practical political solution that the collective mind of man is capable of making.

Some say: Let the problem be entrusted to the security council of the united nations organization. That would mean entrusting it to eleven sovereign states, leaving some forty others out of consideration. Let us not forget that warfare has experienced a great transformation in recent years. In the first great war, a country like Belgium could defend itself for weeks or months—this time, only for a matter of days. In future, days will not be allowed us to get ready—only hours, perhaps only minutes, possibly not even that. It is possible that non-aggressors will be less helpless than they have been in the recent past. Aggressors will at least know that if they make war there is every risk that an instrument is in being that may abolish their largest cities in a matter of seconds. That will surely be a restraining influence upon aggressors.

The choice for us seems to be between an association of powers in which it becomes the necessity of nearly all to prevent any one from dominating the scene—either that or a renunciation of some part of our sovereignty, some abridgement of our national sovereignty. If the latter is to be the solution, it ushers in the beginnings of a world state.

The nations of today were not built in a day. The national state as we know it has been a thousand years and more in the building. And a new international order will not be built in a day. But it can be started in a day—in fact, it has already been started; and while it is in the building, we must move with caution and with awareness. We are fortunate in being a member of the British commonwealth of nations and in being a neighbour of the United States. We all rejoice that the agreement before us today is one made between Britain, the United States, and Canada. Thus we in Canada must all feel, as a member of this triumvirate, that while we are in good company we share a terrible responsibility.

What does it all add up to? If my sixty years tell me anything, they tell me that humanity will neither be satisfied nor safe till there is world security against aggressors. Any realist must know that this security will come in one or other of two ways—the way of war, followed by slavery to a dominating state, or the way of understanding, followed by a cooperative world; by force of arms that will result in a world state, in which one part will be dominant, or by force of reason.

in which nations will live together, each contributing its proper share of the price of discipline, and each bearing the fruits of the consequent peace and progress of mankind.

Our path as Canadians is clear. Collective security for humanity is possible only in international collective agreement. We must pay the price of international collective agreement. That price is the sacrifice of some degree of national sovereignty. That price the nations will only grudgingly and slowly be willing to pay; but that price we have already commenced to pay. A world state we now living may never see, but the various peace pacts of the past, the international labour organization, the United Nations organization, the food and agriculture organization, the Bretton Woods agreement, the proposed international trade conference—all these are steps toward international security. All these give up something, even though it be little, of national sovereignty. What we are enduring today is the labour pains of better world understanding, the beginnings of a world of peace and of potential progress such as man has never before witnessed.

We have two things to do, both of which require conscious effort and a degree of international tolerance and understanding never before demonstrated in the world. We must determine to have international peace, and we must determine to be relieved of the shackles that have tied us to war and hunger and disease in the past. We must go forward in faith, conscious that, while we may not reach the goal in our day, we are going at least in the right direction and knowing that we are doing our part in bringing the world nearer to the time when peace and prosperity rather than war will be the inheritance of mankind.

Mr. ANGUS MACINNIS (Vancouver East). Mr. Speaker, I regret that owing to a slight indisposition the leader of this group is not here this morning, and I regret it particularly because I know that he had prepared something on this subject. He has given a great deal of thought to it, and while I, or anyone else who may speak from this group, would express the same views, I am sure we cannot do it as well as he would have done it.

The question before us today has to do with approval of the agreement arrived at in Washington by the President of the United States, the Prime Minister of the United Kingdom, and the Prime Minister of Canada, in regard to the control and use of atomic energy. I approve, and I believe this group approves, the agreement. It makes provision for passing on information to the other nations as quickly as an understanding can be arrived at as to the proper use of atomic energy.

I believe the proper organization to control this matter is that of the United Nations. However, I am sure, and I agree with the Prime Minister (Mr. Mackenzie King) when he says that what must be done is not only to prohibit the use of atomic energy in war, but rather to abolish war altogether. So long as we have wars, those who make them will use every means they can find to win them. The question which we should put our minds to, then, is not the prevention of the use of atomic energy for war purposes, but the prevention of war itself.

One thing that is disturbing at the present time in connection with atomic energy is the fact that research seems to be in the control of private organizations such as the Duponts in the United States, the Imperial Chemical Industries in the United Kingdom and Canadian Industries Limited in Canada. I believe it is quite improper to leave research of this kind in the hands of private organizations, particularly when those organizations have demonstrated in the past that they are not much concerned with the social uses to which the results of research may be put. These organizations have tremendous vested interests and large aggregations of capital which might easily be rendered obsolete by the development of a new power of this kind. I had hoped that one of the things that would be done would be to bring research in this matter under the full control of the United Nations organization, following what has been done by the three nations which at present seem to have the knowledge of this power.

The leader of the opposition (Mr. Bracken) says we have come to the stage in world affairs where cooperation is not only necessary but imperative. Indeed, in my humble opinion the atomic bomb has brought us to the stage where world government at the international level is not only a desirable thing, but a necessity. The choice before us is either world government or world destruction.

Mr. SOLOMON E. LOW (Peace River). Mr. Speaker, the problem of securing peace on a world scale seems presently to be the responsibility of the United States, Great Britain, and Canada. In my consideration of the declaration made by the Prime Minister of Canada, the Prime Minister of the United Kingdom, and the President of the United States, and in my study of the whole problem of the atomic

bomb and of the world situation, I have come to several conclusions which I wish to outline briefly to the house.

The first of these is this: If the United States and Canada and Great Britain were to remain in exclusive possession of the secret of the technical production of the atomic bomb for some long period of time, I am satisfied that for that period of time the world would have peace. Of course we must admit that eventually the other countries of the world will discover the technique of manufacturing these terrible weapons, and at that time the supremacy of the Anglo-American people will disappear and the problem of securing peace for the world will no longer be their exclusive responsibility.

The second conclusion which I have reached from my studies is this: If all the governments of the world and the nations, large and small, were truly democratic, then I am convinced that an international agreement on the production and application of atomic energy and the organization of effective international control for the production of atomic energy in all countries of the world could be made effective. I am satisfied that that would then be possible, because democratic governments are amenable to the influence of public opinion and of parliaments like our own. It would be possible, because in democratic countries secret arming would be out of the question, mainly because in countries like our own and in those having democratic governments money cannot be spent without the approval of parliament.

Let us examine in a realistic way the situation in which one of the parties to an international agreement—particularly an international agreement concerning the atomic bomb—is a dictatorship. In a dictatorship you would find no free press, you would find no opposition to the government, either in the so-called parliament or throughout the country, such as we have in this country; you would find no regard for parliament. There are such totalitarian countries in this world, and I may say that Russia is not the only one. However, I am convinced that Russia is perhaps the most closed and most totalitarian country of all the major powers.

Under such circumstances I ask in all seriousness, of what value would be any international agreement on the atomic bomb? Of what value would be an international control committee? Who would discover and bring to light, let us say, secret armaments plants that might be established in a totalitarian country? Who would uncover preparations for a new war and bring them to light so that the world would know? Lastly, who would uncover the secret production of this outlawed atomic bomb? Those are questions to which we must give serious thought. Those are questions to which answers are not easily found.

On the other hand, if Canada becomes a party to an international agreement on the atomic bomb and obligates herself not to produce the bomb or to use it in case of war, there are a number of important things which it seems to me we ought to be ready to look squarely in the face. Under such circumstances, in the first place we must ask: Would the united nations organization be able to ensure the complete fulfilment of Canada's pact?

In the first place we have a comparatively free press in Canada. This free press certainly would publish the facts and the whole facts of what was going on. Sometimes we are irked at the actions of the press, but thank God in these days the press can say what it wishes to say. I uphold them in saying it, even though it may be criticism of me or of my actions or of those of the party that I represent.

We have here a free parliament. My first experience down here has assured me that this is a parliament in which men can and do speak their minds. The members of parliament will find out, or at any rate make a great effort at finding out, just what is going on. The government will daily be confronted with resolutions to place on the table copies of all documents relating to any of the processes concerning the atom bomb that might be going on. Somebody, because of that free parliament, will find out what is going on. In this house we have an opposition to the government, constantly watching to see that the government does not do anything of which the opposition disapproves, and ready always to divulge to the world the things that the government is doing. I have known oppositions to take great glee in divulging such things. I cannot understand how a government in a democratic country could keep very long any secret such as that of the manufacture of the atomic bomb.

We have also throughout the country political parties in opposition to the government, constantly on the watch to find out and divulge what the government is doing. If Canada were signatory to an international pact on the atomic bomb I am satisfied that an international commission could come into our country freely and as often as it wished; and could investigate thoroughly over as wide-

spread a territory as it wished, every plant, every arsenal, every laboratory. This would be in compliance with our solemn pact, and it is what would happen in a country such as ours, and in any other democratic country that can truly be said to be democratic. The commission could talk freely with people anywhere in Canada, and the people would give information to the commission freely because we do preserve in Canada, as in other democratic countries, a good measure at least, of personal freedom. People need not be afraid to talk. There is certainly no such fear in Canada—I have noticed that. No person in our country would be afraid to discuss almost any matter with an international commission, because we have guarantees of personal freedom—and we have no secret police, no death penalties for political offenses, or what is often referred to as military espionage.

One must conclude therefore that the united nations organization would come into Canada and other democratic countries and find them fulfilling to the letter the pact and pledges given with respect to the atomic bomb.

Now the question I must face and all of us must face is this, What about Russia or any other totalitarian power? Would it be possible for the united nations organization to secure fulfillment of Russia's pact on the atomic bomb, or that of any other totalitarian country? We must know that in such countries there is no guarantee of personal freedom, and therefore the people cannot talk freely. Every remnant of personal freedom has gone. There is no free press. The press is wholly controlled and muzzled by the government and cannot divulge what is going on. There is no free parliament; there is no opposition to the government either in the so-called parliament or throughout the whole land. They liquidate oppositions in such countries. They do not allow oppositions to work, and no commission for controlling the atomic bomb could possibly have free access to such a country. They would allow the commission to come in, perhaps, but the commission would be allowed to see only what the government wanted them to see. They would be accompanied and guarded. They would be allowed to go into this and that innocent-looking place, but they would have no freedom at all to look into the arsenals and laboratories or to visit the plants and factories. I would point out also that in Russia, as in some other countries, there are vast areas about which foreigners know little or nothing, which have been developing over many years but which are completely fenced around so far as getting information in or out is concerned. Do you suppose for one moment that an international control commission would be allowed to go into such an area? Would it not be possible for plants, any number of them, to be established in such an area for the manufacture of the atomic bomb? Why, of course. It is unthinkable to suppose that an international commission could possibly find out what was being done there, especially in the light of the fact that an international commission for control would be up against the secret police and the threat of death for any who give information and speak their minds freely. There are death penalties in Russia and in all totalitarian countries for "military espionage," a term which is often loosely used to include most innocent observation and discussion. The prohibitions in such countries do not end with death. They often result in deportation of friends and families. These things are a constant threat to the people.

Under all these circumstances I am forced to the conclusion that a country like Russia simply cannot be controlled by an international organization. I am convinced that so long as there are dictatorships amongst the great powers, an effective international solution of the atomic bomb problem is utterly impossible. Now, if the secret technical methods of the manufacture of the atomic bomb are turned over to the united nations organization, it seems inevitable that the secret of this most dangerous weapon in the world's history will be conveyed to the dictatorships without attaining in return, any real and effective guarantees in return that the bomb will not be made and used in a war of aggression. Remember that only a dictatorship—and this I must impress upon hon. members with all the vehemence at my command—could possibly prepare secretly an atomic Pearl Harbour. It could not be done in democracy. Therefore it is absurd to talk of international control so long as Russia and some other totalitarian countries remain as they are.

I have reached another conclusion, of which I must speak briefly. I think it is absurd to talk of government at an international level so long as Russia remains as she is. I should like to hear those who advocate government at the international level tell us exactly what it means. Just what does it mean to Canada, and what does it mean to the other nations of the world? "Government at the international level" has been bandied around freely and loosely. Taking the situation in Canada right now, I wonder if anybody would advocate Canada become

ing a party to an international government with representation on a basis of population? I wonder where would Canada's twelve million people stand in relation to the 130 million people in the United States? Suppose we should become party to an international government in which the United States might be the dominant nation, and come in on a basis of population, would Canada be prepared to become the northern share-cropper area for the United States? Has anybody ever taken the pains to study what happened in the southern United States, and how they became the southern share-cropper area for the industrial north of the United States? I say that the people of Canada, if they knew the truth, would not support for one moment any such thought; and if they would not accept such an attitude towards our friends of the United States, to whom would they subordinate themselves as a nation? Would it be Russia? I am not prepared to grant that, not for one moment. So far as I am concerned, I can see only one end to such a complex as has been developed on this "government on the international level," and that is the destruction of the British commonwealth of nations of which we form a part—the only real security, the only guarantee of international security we have under the present circumstances. The situation may look black, but situations have looked black at various times in the past.

Mr. Speaker, there is a man not far from me, the hon. member for Yorkton, who speaks of my being "the worst bloody imperialist"—I do not know what he was going to say further, but I should just like to have him know that I am not going to lend a hand to selling my country down the river for any association with a doubtful international organization which rests upon the balance of a strong totalitarian country.

Mr. CASTLEDEN. There was no reference to the hon. member. He just imagined that.

Mr. Low. Of course the hon. member for Yorkton is very smooth in getting out of situations of a kind where his tongue runs away from him. I have seen him in those situations before.

Mr. ARCHIBALD. Anybody stirring up hatred in the world the way the hon. member for Peace River does deserves what he gets.

Mr. Low. I am talking straight to the communists, Mr. Speaker like the one who just cut in. I say to you that God has come to the aid of the United Kingdom and the commonwealth of nations times without number. The only way we can ever explain some of the interesting, important and almost supernatural events which have happened in the past through our history is to recognize that God's hand was in it. There have been times when it looked as though all was lost; times when great men such as Wellington and Pitt have been led to exclaim that all was lost and that there was no hope for the empire or the commonwealth; that we were bound to be defeated and destroyed. Well, Mr. Speaker, men have commonly said such things; they have said them in all ages.

Mr. REID. But it will last a long while yet.

Mr. Low. Yes; it will last a long while yet if we do our duty and do not sell ourselves and our birthright into slavery.

I say that the spirit of unity which was placed amongst us was put there for the purpose of rallying the various parts of the commonwealth to the aid of each other in times of stress. That spirit has rallied us all many times in the past, and it will do it again if we give it a chance. I should not like to see that spirit destroyed. It can easily be destroyed by such loose talk on "government at the international level" as we hear so often in this house.

Mr. ROSE. It came first from England, did it not?

Mr. Low. I am convinced that the Prime Minister has set his hand to a fairly wise declaration. I believe history will record that in its main clauses it was wise.

Now, having set its hand to this declaration, the government should, it seems to me, take under serious and earnest advisement the reform of its whole external policy somewhat along the lines which I shall now give and which, I may say, the Social Credit Association of Canada will endorse most heartily.

There have been numerous occasions, Mr. Speaker, on which people in and out of this house have declared that the Social Credit people are narrow nationalists. That is not so; I deny it most vigorously. Just because we are not ready to accede to every request and every suggestion to sell our birthright, to yield our sovereignty completely and become subject to the domination of tremendous forces outside Canada, does not mean to say that we are in any way narrowly nationalistic.

In the first place, the government should be determined to preserve within Canada, the spirit and the practice of true political and economic democracy. I claim that that is the best guarantee of the intentions of any country not to

become a dictator or to tolerate anything like a dictatorship. I repeat that we should be careful to preserve all the elements of true democracy, with all that that means, and we shall then have done our best to assure the nations of our peaceful intentions.

The second thing I suggest is that we give every assurance of the fullest international cooperation on the part of Canada, as a sovereign nation, for the achievement of an era of peaceful prosperity throughout the world.

Third, we should be prepared to extend as a nation to all other nations the hand of good will and brotherhood and justice.

Fourth, we should be prepared to send economic aid to all needy nations, if necessary without even expecting repayment. Give them every opportunity to balance their payments with us and I am satisfied we shall thereby convincingly demonstrate our peaceful intentions.

In the fifth place, I plead with the government not to yield to this diabolical doctrine of surrendering our sovereignty to any supranational government. We must be in a position in the next few years to act quickly and unfettered. The speedy action of Canada alone might be a means at some time in the future of saving the world.

Sixth, because it is not possible to devise a foreign policy which will be acceptable to the great majority of Canadians so long as they have no real knowledge and are torn between opposing opinions which are spread through the country, mainly through the propaganda of legions of foreign agents, the government must now provide the people with really accurate information. That is the only way the people can possibly make up their minds—on the basis of facts, conveyed by sound and accurate information about what is going on abroad.

Canada can never have a successful and sound external policy until the people of Canada are informed, and through their possession of accurate information are ready to instruct and to support their government.

Seventh, Canada should meticulously keep the peace, praying God that the Anglo-American people will be true to their great trust. At the same time they should be ready instantly, if necessary—and I emphasize this very particularly—to rain fire on those nations who disregard their solemn pledges and wantonly wage war.

I know that some hon. members, particularly in the group to my right, will declare that in saying this I am a warmonger. That is not so. I am a lover of peace. But the only way to guarantee nonaggression in such a world as we now have is to be strong, and just, and ready to act on a moment's notice if necessary.

Last but not least, I say to the government that their foreign policy as well as their domestic policy should be one of absolute trust in God and keeping our powder dry.

I support the resolution.

Mr. CASTLEDEN. And the brotherhood of man?

Mr. Low. Yes, sir.

Mr. FRED ROSE (Cartier). We have just heard from the leader of the Social Credit party what is practically a war declaration—in my opinion a very irresponsible way of talking in this atomic period. If he were concerned with his own province of Alberta—because we know against whom he made the war declaration—he would realize that parts of that province would be very much in the area of the war which he was advocating this morning.

Mr. Low. I was not advocating war. That is just the hon. member's own microbes interpretation.

Mr. ROSE. It is most regrettable that only a few months after the war we should have here a discussion of so serious a problem as the prevention of another war. People throughout the world, and that includes Canada, are disturbed by present events. I have here a letter from a woman in Ottawa, Mrs. Sheila Woodsworth, who writes to me as follows:

"I am afraid of the atomic bomb. Alone I can do nothing about it. I am writing to you in the hope that you will do all in your power to see that this great discovery is not left in the hands of a few countries but is controlled by a world organization. This seems to me the only hope for us and our children."

An hon. MEMBER: Who wrote it?

Mr. ROSE. I gave the name—Mrs. Sheila Woodsworth, of Ottawa. I do not know her. As I said before, it is most disturbing that a few months after the war, people feel impelled to write such letters as this to members of parliament, asking them to do something so that this atomic bomb shall not be used among peoples. The Washington declaration does not reassure me any more than it reassures that person; I do not think it reassures any member of this house. The fact is that

the declaration leaves in the hands of those who have it the power to use the atomic bomb at their discretion, and leaves the door open to an atomic armament race. It may sound very harsh, but it is a fact that it has left in the hands of the United States, Great Britain, and Canada not only a dangerous weapon of war, but a dangerous weapon of diplomacy.

War simply does not come by itself; someone once said that war is a continuation of politics in a different way. Politics goes on before war, and politics today is becoming an atomic diplomacy. We see it going on right now in Washington, more perhaps than anywhere else. And recently, we had the example when Ambassador Hurley practically demanded that the United States should use the advantage of the atomic bomb in her diplomatic dealings. Such voices are heard more and more in the United States. Pressure is being exerted on Washington for the United States government to use the atomic bomb as a diplomatic weapon to club everybody.

I follow closely the United States press. I spoke in Boston a week ago Sunday, and there you get the feeling that a new diplomacy is being advocated in the United States. There is the intervention in China, and Washington practically says: "We will keep those marines there until the situation fits into our pattern." One hon. member spoke about Anglo-American democracy. I would say that this is far from a democratic action. We read daily about the wiping out of Indonesian villages, of people poorly armed fighting for their freedom against British forces, and again we hear about Anglo-American democracy. This is not the type of pattern we had hoped for in the postwar period. It is not the type of pattern that will produce lasting security.

The Prime Minister praised the great work of President Roosevelt, and we all had the greatest respect for the late president, but I would remind hon. members of something that he said in March 1945. He knew that collaboration cannot be Anglo-American but must be collaboration among those powers that made victory possible, the powers that can preserve the peace together. Speaking about the trouble at the time he said:

"It is fruitless to try to place the blame for the situation on one particular nation or another. It is the kind of development which is almost inevitable unless the major powers of the world continue without interruption to work together and assume joint responsibility for the solution of problems which may arise to endanger the peace of the world."

The other day President Truman seemingly forgot these words when he said: "No more conferences of the big three; we don't have to get together any more."

There is no solution but in the continued unity of the big three. Only a few weeks ago when Cordell Hull, that great old statesman, accepted the Nobel prize, he said:

"We must never forget that to achieve the great goal of lasting peace it is imperative that there be continued unity, friendly understanding, and common effort among the people and statesmen of the major united nations who bore the principal burden in the war against the axis."

Unity and understanding among those who bore the burden in the war! But this declaration of Washington has been made by powers outside one great power that bore one of the greatest burdens, and this can only tend to create suspicion and bring about a situation that is not the best at the present time. Some people are always suggesting that the Russians are close-mouthed, that they do not say what they want to say, that they do not say what they mean, that they just keep everything to themselves, and so on. Hon. members who are interested have the same opportunities as I have for acquiring information. They can resort to the New York Times, as I do. If they will look at that newspaper in its issue of Wednesday, November 7, 1945, they will find reported therein a speech made by foreign commissar Molotov in which he referred to atomic diplomacy. What he says reflects the feeling of the Soviet people over the fact that they are being kept out, and are being given reason for suspicion. He said:

"A word must be said about the discovery of atomic energy and about the atomic bomb, the colossal destructive force of which was displayed in the war against Japan. Atomic energy has not yet been tried, however, for averting aggression or safeguarding peace, but it is not possible at the present time for a technical secret of any great size to remain the exclusive possession of some one country or some narrow circle of countries. This being so, the discovery of atomic energy should not encourage either a propensity to exploit the discovery and the play of forces in international policy, or an attitude of complacency as regards the future of peace-loving nations."

Plainly and simply, Mr. Molotov says that there are some nations who believe that they have an advantage because they have the bomb, but that it cannot be kept a secret. It shows that there is a good deal of suspicion in his mind. He ends his speech by saying, "We will have atomic energy and many other things." I would say that as a result of the great contribution which the Russians made to victory, it should have been possible for the three nations to get together, making the atomic bomb the possession of all, because we would then know that it would not be used by any one nation.

It has been disclosed that the Germans had some very dangerous type of poison gas but they did not use it because they knew that everyone had it. From the point of view of equilibrium in diplomatic and political relations, it would have been better if the atomic bomb had been placed in the hands of all rather than in the hands of the Anglo-American nations. It is true there is a conference of foreign ministers where the matter is being discussed, but this is taking place after the Washington understanding and agreement. It could have taken place before, and it should have occurred before.

One United States newspaper man, Leland Stowe, referring to the atomic bomb as a diplomatic weapon, gives the following picture, writing in the Montreal Standard on November 24, 1945. He is a newspaperman of great repute who has travelled throughout the world and has seen the various countries at war. He knows of their sufferings. He says:

"If the Soviets had the bomb and had followed Washington's precise course since August 6, how would the average American feel? I think the newspapers would be full of explosive condemnation of the 'imperialistic power-seeking' Russians—and an awful lot of us would be plenty scared.

"We would say: If the Russians don't intend to use the bomb, actually or for blackmail purposes, why didn't they invite President Truman and Prime Minister Attlee to a conference right away?

"We would say: Why is Moscow treating the Americans and British as if they were second-class allies? Military men would be derelict in their duty if they didn't say: We've got to build a bomb of our own in the shortest possible time. Don't trust the Russians. The very fact that they only talk about sharing, after they've had time to make many more bombs themselves shows they can't be trusted."

If I were a Russian I think I should feel exactly like that. But I am not worried about being a Russian. As one member of this house and as a Canadian interested in the peace of Canada and the world, I am afraid that the damage which has been done already will be hard to heal in the coming months, though I hope it may be healed. Scientists who have worked on the bomb have spoken publicly for the first time, and this is all to the good. Scientists who know exactly what is involved in this atomic energy, much better than at least many of us in the house can know, have advised that we hand over the secret to an international committee, not at some future date but right away. A number of scientists were engaged in this work. One very prominent man, Doctor J. R. Oppenheimer, who directed atomic bomb research at Los Alamos, New Mexico, said:

"It has momentarily strengthened us—"

Meaning the United States.

"—but not in the long run. Some people apparently have been reluctant to draw this to the attention of the world."

Then he recommends that it be placed in the hands of an international organization. Doctor Curtis, who was one of the leading scientists working on atomic energy at Oak Ridge, Tennessee, said that atomic energy should be turned over to an international organization to control all aspects of atomic power. There are many more. Only the other day Professor Szilard, appearing before the senate committee on atomic energy, said it would appear that we were producing bombs against the soviet union. One of the senators interjected, "No, no; we are friends." Professor Szilard replied, "Well, I assume we are producing them against the Soviet Union," and he was one of those who first thought of the possibility of the bomb. He went on to say: "Well, if we are, we are going to be at a disadvantage." He pointed out that it would take the United States twenty years to decentralize her industries, which would have to be done in the event of atomic war, but he said it would take Russia only two years, and therefore the advantage of having the bomb now would be completely lost. One of the most ridiculous arguments against passing on the "know-how" to other countries was presented by Major General Leslie G. Groves, who was in charge of the whole project of producing the atomic bomb. He gave some reasons why it should not be placed in the hands of an international organization; and do you

know what he said: He said it would erase national boundaries, end the sanctity of the home and destroy private commercial enterprise. That was the reason for his opposition to an international organization; that it would destroy the sanctity of the home and destroy private free enterprise. If these are the reasons then I would say that those who oppose handing this over to an international organization are relying on pretty weak arguments. After all, the atomic bomb would definitely destroy the sanctity of the home; everyone will agree with that.

I was not going to speak on this at all, but before I conclude I must say a few words about one group in this house who have been carrying on a most vicious agitation against a country which has been a loyal ally and which has been carrying out all the decisions reached at various conferences. People say you cannot trust the Soviet Union, that they are going to bolshevize the world. Well, right next door to Russia is Finland. We were told that was a country Russia was going to swallow. They had elections in that country. The communists did not come into power. A majority of those elected were neither communists nor socialists. They said Russia would swallow Hungary. Well, Hungary has not been swallowed. They had elections there and the small holders' party came out with the largest group. Then people said, "Aha! now there has been a free election, because the communists did not come out in the majority." In France, of course, the communists came through the election as the largest party and the Red Army is not there. Again, something was said about Austria, but in Austria the Russians actually placed their cards on the table. They recognized the free government at the head of which was Renner, a socialist. They had elections there, and what happened? We all know the results. Then the Soviet Union said they would withdraw from Manchuria, and they are allowing Chinese troops to go into that country. I should like to see the other countries living up to their promises and responsibilities as the Soviet people have been living up to theirs. Let the other countries prove their good faith. Let them prove it in Indonesia, in French Indo-China, in China, and everywhere else. They have not done so. The Social Credit group in this house, and particularly the leader of that group, assisted you ably by the hon. member for Wetaskiwin, have been carrying on a vicious agitation here.

Mr. HANSELL. What about me?

Mr. ROSE. I am sorry; I did not mean to overlook the hon. member for Macleod. They have been carrying on a most vicious agitation against the Soviet Union, actually speaking as though the Soviet people have been our enemies, carrying on the type of agitation which I have said before does not help bring about unity, does not help us when we try to build peace in the world, which will not solve anything but in my opinion will only help create more and more suspicion.

Some hon. MEMBERS. Carried.

Mr. ROSE. No, it is not going to be carried so quickly; this is one time I am going through with it. I will say that those who have been speaking against the Soviet Union are using the language of the Hitlerites. That is a sharp statement, isn't it? One day they will speak about the Soviet Union. The next day they will speak about bankers, international bankers, and they will mention any Jewish name they can think of in the banking world, forgetting the Mellons, the Chase National Bank, the Royal Bank, the Bank of Montreal—on the board of which there is not a single Jew—and all the rest of them. They are carrying on an agitation anti-soviet, anti-Jewish, anti-Socialist. Why, they even charged the Liberal party with becoming a socialist party. In every sense the sort of agitation they are conducting to-day resembles the agitation of the Hitlerites in the good old days. I have before me their attitude toward foreign affairs. Here in this house, of course, they have to polish it up a bit, but down in the province of Quebec they believe they can sell the people anything they wish. Here is their attitude, for instance, toward San Francisco, from their own paper, Vers demain, dated April 15, 1944:

"Nous pouvons être sûrs qu'à San-Francisco, il y aura d'autres délégués que les représentants officiels des nations invitées. Ils n'auront pas le droit de vote, mais ils seront là pour inspirer ceux qui auront le droit de vote. Les financiers y seront. Les Juifs y seront. Les socialistes y seront. Toute la bande infernale essayera de canaliser ce concil œcuménique de la matière."

I should like to translate that, because it is too good to be missed by some hon. members:

"We can be certain that at San Francisco there will be other delegates than those officially representing the various nations. They will not have the right to vote but they will be there to inspire those who have the right to vote. The

financiers will be there, the Jews will be there, the socialists will be there. All that infernal gang will be there to canalize this conference into their own channels."

And, speaking about the peace we want to have, in another edition of the same paper, under date of May 1, 1945, they say:

"La dernière paix, au traité de Versailles, fut façonnée par les Juifs internationaux, Schiff, Warburg et consorts: on sait ce qui en est sorti. Le monde chrétien, chrétien mais paganisé, de 1945 est-il en train de passer sous la même coupe?"

Then, speaking about the peace after the last war, they say that the last treaty, the treaty of Versailles, was fashioned by international Jews, Schiff, Warburg and Company, and that we know what has come out of it. Then they ask if the Christian world, Christian but paganized in 1945, is to pass through the same status.

Let me say that that was Hitler's argument. I have one extract here which actually uses material I saw in a nazi paper, and which states that the Jews, the Jewish financiers, such as Kuhn, Loeb and Company, had helped the Russians to carry out their revolution. Those are the stories, printed in that paper, which appeared in the nazi press. According to one of these papers the hon. member for Wetaskiwin (Mr. Jaques) was to speak over the air about Shylock and Marx.

Listen to that language. That is language we have not yet forgotten, language that is not yet dead. Here they come to the House of Commons and, while they do not use the same language, that is what they mean. It is language which can only create trouble. If we proceed on the basis of it we can have no peace, no stability.

It is the good fortune, however, of the people of Canada that those people are limited to one province. We understand that we must have peace, and Canada as a neighbour of the Soviet Union and the United States and as a member of the British commonwealth holds great responsibility. We must do everything in our power to cement that degree of unity needed throughout the world, and especially among those who have carried most of the burden in the ear. Otherwise we shall have chaos and disaster.

Mr. E. G. HANSELL (Macleod). Mr. Speaker, I shall not take much time this afternoon. I had not intended speaking at all until, as the hon. member for Peace River (Mr. Low) was speaking, I heard certain mumblings in this section of the house. I did not have to strain my ears to hear the last speaker, the hon. member for Cartier (Mr. Rose), and I am not going to answer him.

Mr. ROSE. It is just a debt repaid.

Mr. HANSELL. However, he has attacked some of our supporters in the province of Quebec. All I wish to say is that whether they are our supporters or not, the people of Quebec have the happy faculty of speaking their minds. And they use the freedom Canada gives them as citizens. That is all.

There is no semblance of hatred whatsoever in the minds of hon. members of the Social Credit party; no hatred toward any people or any nation. We disagree with totalitarian dictatorship, and we have been outspoken in our disagreement. We wish no ill, and will fight against anything that will bring ill to any people or any nation anywhere.

May I compliment the Prime Minister (Mr. Mackenzie King) and the other signatories of the declaration now before us for consideration. I have read it with considerable care and, after reading it, it was my view that it is a magnanimous document, Great Britain, the United States, and Canada, represented by the heads of those nations, in that document have offered to the world all the benefits of atomic energy which they have discovered. I repeat that those benefits are offered to the entire world.

For a period of time, for economic reasons those countries could have retained this development of science. They could have brought to the western democracies the greatest standard of living yet dreamed of. But they have shown themselves willing to share this development with the world. The only place they have stopped in extending their gift is when it comes to destruction. And even in that respect, the declaration goes so far as to say that they will let the world have the benefit of their knowledge, when they are sure it is safe to do so.

Surely no nations could be more generous or more magnanimous to the rest of the world than have these three, when dealing with this matter.

Right Hon. W. L. MACKENZIE KING (Prime Minister). Mr. Speaker, I gather from the debate that the house is all but unanimous in support of the resolution, and that at most there is but one member, the hon. member for Cartier (Mr. Rose), who is opposed to it. It will be, I know a source of great satisfaction to all members of parliament—members of all parties—that both in the Senate and in

the House of Commons of Canada there has been unanimity in support of the resolution. That will help in all parts of the world.

May I convey to my hon. friend the Leader of the Opposition (Mr. Bracken) my congratulations upon the splendid address he delivered this morning. Clearly, it was one to which much thought had been given, and which will be helpful I am sure to all who are interested in this all-important question.

There was one reference my hon. friend made—I believe it was to paragraph 7 in the declaration—where it seemed to me, if I heard his words aright, that either he had not in mind the true interpretation of the language of the motion, or that he was expressing something that was not wholly what was in his mind. If I heard his words correctly, he said we were relying upon reciprocal agreements to see that the atomic bomb would not be used in future wars. Hansard will show whether I have understood my hon. friend correctly.

I noticed the hon. member for Vancouver East (Mr. MacInnis) took up the point and I thought quite rightly, said that the whole purpose of my remarks in interpreting the declaration had been to make clear that we cannot afford to rely upon any agreement anywhere; and that the only security against the use of the atomic bomb is the abolition of war itself. That was the point I wished to make very clear, namely, that so far as a major weapon of warfare of this kind is concerned, agreements amount to nothing at all, unless there can be some way in which apart from agreements an unscrupulous people may be prevented from violating an agreement into which they may enter or from using weapons of mass destruction. I repeat, the only safeguard for the preservation of civilization, now that the world is possessed of a weapon of war so devastating as the atomic bomb, is that matters be so worked out in the course of time, and in the near time, that nations will realize that those who take up weapons of this kind to destroy other nations are going to destroy themselves as well. In this last war, the use of the bomb by one country was replied to by the use of the bomb by others, but it was not the atomic bomb. In an atomic age, that same kind of conflict can only bring disaster to all mankind.

I am quite sure that my hon. friend on looking over his notes or Hansard will find that while expressing what was in his mind he was in agreement with myself on that particular point.

Mr. BRACKEN. I was not conscious that I was in disagreement; I am trying to find the reference to which my hon. friend alludes but I have not been able to find it as yet.

Mr. MACKENZIE KING. It may not be there, and I hope it is not, but if it is there I am quite sure my hon. friend did not mean in any way to disagree with what had been said by myself.

May I express also to the hon. member for Vancouver East my appreciation of the manner in which he spoke this morning, and, with one exception, of what he said; I shall allude to the exception in a moment. I should like to say that we all regret that the leader of the C. C. F. party (Mr. Coldwell) has been prevented from taking part in this debate, particularly for the reason which has prevented him from being here this morning. Fortunately, he has already spoken elsewhere on this question, and a good deal of publicity has been given to what he has said. I think his remarks have made it clear that he would strongly support of this resolution.

The one remark, if I caught it aright, of my hon. friend the member for Vancouver East to which I wish to take exception was his statement that research into atomic energy for use in war had been in the hands of the Duponts in the United States, Imperial Chemical Industries in Britain, and Canadian Industries Limited in Canada. That statement is absolutely untrue, and I want to make the strongest possible denial I can make of the statement. This particular field of research was a matter of the most complete cooperation between the universities and government departments; it was not in the hands of these industrial concerns to which my hon. friend has referred. It is quite true that in the building of some of the plants firms which were possessed of special skills and had been associated with one or other of the industries to which my hon. friend referred were employed to help on the work of construction, but so far as the research work is concerned that was a matter which was kept entirely under the control of Government departments of our three countries and the industries mentioned were not parties to the research work.

Mr. MACINNIS. Have they access to the research and the use of it?

Mr. MACKENZIE KING. No; and I wish to make that very clear. Will my hon. friend give the House his reason for believing that they have had such access?

Mr. MACINNIS. If I did not think that I had fairly good reason for saying that, I certainly would not have made the statement. I am very glad to accept the Prime Minister's statement that it is not true, although I do not think that is the best way of saying it.

Mr. MACKENZIE KING. May I say to my hon. friend that a thing is either true or untrue. If it is not true, then there is only one way of stating the fact.

Mr. MACINNIS. If I had said that about my right hon. friend, I am sure he would have objected.

Mr. MACKENZIE KING. I would never have made the statement that my hon. friend made.

Mr. MACINNIS. I would not agree with the right hon. gentleman.

Mr. MACKENZIE KING. That is a very serious statement to make, particularly by an hon. member who is leading his party. Unless the hon. member was prepared to give the grounds on which he based a statement of that kind, he should not have made it at all. I must thank my hon. friend and congratulate him upon having accepted unreservedly the correction which I have made in the particular I have.

I also want to thank the leader of the Social Credit party (Mr. Low) for so strongly supporting this resolution. I do not think it is necessary for me at this time to enter into a discussion as to the points of difference between the hon. member and the hon. member for Cartier (Mr. Rose). There is a time and a place for all things. I think a debate on the principles of democracy versus dictatorship might well have been left over for another occasion.

May I say to the hon. member for Cartier, who appears to have felt it necessary for him to speak on behalf of one particular country, that I think it is unfortunate for that country that he has taken the attitude which he has today, particularly when at the moment there happens to be in the capital of that country the foreign secretaries of both the United Kingdom and the United States. They have gone there to seek to dismiss altogether any ground of suspicion, and to do their utmost to secure, as respects the course to be taken to prevent the atomic bomb from being used for purposes of destruction, complete accord between the three countries which are represented at that conference.

In conclusion may I say this one word which I feel I should like to say at this time. I do not believe we can survey the past years without realizing that the most dangerous of all things that can happen to any country is that evil men should get control of its affairs. No one can look at what is being brought out at the trial at Nuernberg without realizing that the reason the German people are in the position they are in today, the reason we have had this terrible war, is that the government of Germany got into the hands of wicked men. If democracy is to save itself, I do not care what the country is, if any form of government is to save itself, the people must make it their first endeavour to see that the men whom they entrust with the responsibility of power are men who believe in what is right who are honest men, not men, as this group in Germany have been, a lot of gangsters at heart.

Speaking of science, I believe the world has reason to be thankful that men of science have made the great discoveries they have. The progress of the world has come in large part from scientific discoveries. Most things, through the measures in which they are used, have inherent in themselves their opposites something that may be made of great benefit to the world may also be used for diabolical purposes in other ways. It all depends upon who possess the control and what the motive is that lies behind their actions. The greatest of all scientists, so far as being a benefactor of mankind is concerned, was, I believe, that great man, Louis Pasteur. I have before quoted in this house a certain passage from Pasteur, I should like before we conclude this debate to quote it again because it seems to me to go to the very heart of the whole situation we have been discussing today. This statement was made by Pasteur over half a century ago. It will be seen to have a much wider application than could never have been dreamt of at the time it was made:

"Two contrary laws seem to be wrestling with each other nowadays: The one, a law of blood and of death, ever imagining new means of destruction, and forcing nations to be constantly ready for the battlefield—the other, a law of peace, work and health, ever evolving new means of delivering man from the scourges which beset him. The one seeks violent conquests, the other the relief of humanity. The latter places one human life above any victory; while the former would sacrifice hundreds of thousands of lives to the ambition of one. Which of these two laws shall ultimately prevail, God alone knows."

Mr. MACNICOL. Would the Prime Minister add the name of Doctor Banting?

Mr. MACKENZIE KING. I am very happy to add Doctor Banting's name to the list of scientists who will ever be remembered as among the great benefactors of mankind. In referring to Louis Pasteur, I was quoting from one who so far as the world's record is concerned stands, I believe, preeminent as a scientist and benefactor of mankind.

I believe that by enabling us to make prevail among nations the law of peace, work, and health, science will have given us the key to the solution of our world problems. The great scientists are known to be men of wide vision and of large heart. I am sure the motive that actuates them is in most cases, at least, that of service to their fellowmen. Again, in the words of Pasteur, I believe the final verdict upon their researches will be: "Science will have tried by obeying the laws of Humanity extend the frontiers of Life."

Mr. JOHN BRACKEN (Leader of the Opposition). Mr. Speaker, I am not sure that I caught the full significance of the Prime Minister's comments with respect to one of my observations. I am sure there is no difference of any consequence between us, but lest there should be I should like to refer to the matter. I think it was not paragraph 7 but paragraph 6 to which the Prime Minister must have been referring. The last sentence in paragraph 6 of the declaration reads as follows:

"We are, however, prepared to share, on a reciprocal basis with others of the united nations, detailed information concerning the practical industrial application of atomic energy just as soon as effective enforceable safeguards against its use for destructive purposes can be devised."

My comment on that was as follows: I said that it was an offer to share scientific knowledge on a reciprocal basis, and I added:

"The problem of policing the use of this process is a complicated one, much more complicated than any political problem ever undertaken in the past. Can society draw a line of demarcation and see that the line is observed—between developing atomic energy for peaceful purposes and outlawing it for the purposes of war? That is the challenge. It is a challenge we must accept, and as the lines suggest, we accept it by tying our faith to reciprocal agreements to banish its use in time of war."

Mr. MACKENZIE KING. That was the phrase I meant—tying our faith to reciprocal agreements to banish its use in time of war. I do not think we are tying our faith to anything but the abolition of war itself. That is my point.

Mr. BRACKEN. I think the Prime Minister will agree that I was dealing with the clauses as I came to them, and that what I said was not meant to be an all-inclusive statement, but rather an interpretation of the clause itself.

Mr. MACKENZIE KING. I quite agree.

Mr. BRACKEN. I might have made it more inclusive and said, banish its use in time of war and to banish war itself. But I went on to say that it must be our main effort to banish war itself. Since the Prime Minister has referred to it, and in order that there may be no doubt as to the record, perhaps I might be permitted to repeat what I said with respect to war itself. I said:

"What does it all add up to? If my sixty years tell me anything, they tell me that humanity will neither be satisfied nor safe till there is world security against aggressors. Any realist must know that this security will come in one or other of two ways—"

And so forth; I need not repeat it all, but I ended by saying:

"What we are enduring today is the labour pains of better world understanding, the beginnings of a world of peace and of potential progress such as man has never before witnessed.

"We have two things to do, both of which require conscious effort and a degree of international tolerance and understanding never before demonstrated in the world. We must determine to have international peace and we must determine to be relieved of the shackles that have tied us to war and hunger and disease in the past. We must go forward in faith, conscious that, while we may not reach the goal in our day, we are going at least in the right direction, and knowing that we are doing our part in bringing the world nearer to the time when peace and prosperity rather than war will be the inheritance of mankind."

Motion agreed to.

The CHAIRMAN. We have with us this morning our friend, Mr. Harold D. Smith, Director of the Bureau of the Budget, who will be the first witness on the domestic legislation.

Mr. Smith, will you proceed?

STATEMENT OF HAROLD D. SMITH, DIRECTOR, BUREAU OF THE BUDGET

Mr. SMITH. Mr. Chairman, and members of the committee, most of the previous witnesses before this special committee have discussed the scientific and technical aspects of the development and control of atomic energy. A knowledge of nuclear physics and engineering alone, however, cannot solve this problem that faces the Nation and the world. At the moment, our national safety and welfare depend more immediately on our legislative and administrative knowledge. It is the administrative aspects of this problem that I, as an administrator, would like to discuss today.

Modern science has put at the disposal of society forces which may determine the future of civilization. At the moment the greatest of these forces is atomic energy. We must now consider, as your committee is considering, how we may organize the Government in order to control such a force through democratic processes. Only by such control can we protect our safety and enhance our welfare without destroying the freedom of thought and speech which is the foundation of our constitutional system.

In dealing with a question of this scope and this novelty, it seems to me that the most important questions are of a rather general and even philosophical nature, and I would like, in the course of my remarks, to deal with the general background as well as the specific types of questions that are usually considered administrative in character.

I will not discuss the international aspects of this problem, except to say that I agree with those who have already expressed to your committee the hope that steps may be taken in accordance with the declaration of President Truman, Prime Minister Attlee, and Prime Minister King, to bring into being a system of international control through the United Nations Organization.

On the domestic side, I believe that we know enough about the general problem to conclude that we should set up a special civilian agency to take over from the War Department, as the President has recommended, the development and control of atomic energy.

From expert testimony before you and before the House Military Affairs Committee, there seems to be little disagreement on several points. Atomic energy is now the greatest destructive force known to man. It could already be used, rather uneconomically, for industrial heat and power purposes. Whether or not its future power uses are important, its indirect effects on scientific progress, including progress in medicine, will certainly be tremendous. Moreover, the same fissionable materials, which can be preserved indefinitely, can be used either for peaceful purposes or to make atomic bombs.

These facts lead me to believe that we must have a single agency to control the use of atomic energy for both military and civilian purposes. I believe that Secretary Patterson was correct in saying that the War Department should be relieved of such control, since the problems involved go far beyond the military sphere.

If we set up a special agency for this purpose, what should be (1) its functions, (2) its powers, (3) its relationship with the President and the Congress, and (4) its internal organization? I would like to

comment on each of these points in turn, and occasionally illustrate my comments by reference to S. 1717, the bill introduced by your chairman for the development and control of atomic energy.

FUNCTIONS

Most of the proposals on this subject have been in fairly close agreement regarding the functions of the suggested agency. For this reason may I note briefly what seems the general consensus. This agency should conduct research in nuclear physics and other subjects related to atomic energy. It should see to the manufacture of materials from which atomic energy may be derived. It should administer the system of regulation and controls to protect the public from the physical dangers involved in the use of these materials, and to make sure that the total supply is conserved and directed to furthering the public welfare in the most effective way.

There have been, of course, certain differences in emphasis with regard to the functions of the proposed agency. I believe those functions should include not only the development of atomic energy for the national defense but its development and control to promote the general welfare, further scientific progress, strengthen competitive enterprise, and safeguard world peace. For this reason I was glad to see that the bill introduced by your chairman included a statement of these purposes and provided that the agency's research program should include studies of the social, political, and economic effects of atomic energy and its use.

POWERS

To carry out these extensive functions, what powers should be vested in the agency itself, and how much should it be required to work through other agencies or through private enterprise?

The unusual character of the problem of controlling atomic energy, I am sure, justifies the granting of broad powers to the proposed agency. It seems to me, however, that S. 1717 wisely distinguishes between the type of individual freedom that ought to be protected against Government interference, and the type of freedom from control that may lead to the waste of our national resources or the concentration of irresponsible private power.

I agree with other witnesses that the Federal Government must control atomic energy, and that the normal system of private control of materials and patents ought not to operate in this field. At the same time, I believe that the Federal Government should not take on functions that can be accomplished equally well by private business.

Senator MILLIKIN. Mr. Chairman, may I interrupt? Do we have any knowledge of what patents have been allowed in this field?

The CHAIRMAN. Senator, I believe the company called the Kellogg Co. has some patents that have been developed in this field.

Mr. NEWMAN. It may be that they have patents on some of the byproduct technical developments which came into the making of the atomic bomb as such. As to the basic patents and the assembly of the bomb, I would suspect that most of those patents are in the hands of the Government and have either been taken out by the War Department or someone else.

Senator MILLIKIN. Do we know whether there are any private patents or private applications for patents where the knowledge has been secured through our Government's effort?

The CHAIRMAN. I don't think so, Senator. I think it is a very apt subject for investigation and testimony.

Senator MILLIKIN. What is the Kellex Co.?

The CHAIRMAN. The Kellex Co. was an engineering company that did a great engineering job on the K-25 project that we saw down at Oak Ridge.

I wish Mr. Newman would look into the patent situation before we get through with these hearings.

Mr. NEWMAN. I think we should hear the Commissioner of Patents, for one thing, who knows more about what patents the Army has taken out than anybody else—they have been deposited with the Commissioner of Patents—and then a few of the private corporations which appear to have some of the patents on technical developments incidental to the research.

Senator MILLIKIN. It might be well also, Mr. Chairman, to have a survey of the foreign field on the subject.

The CHAIRMAN. Will you arrange to get that, too, Mr. Newman?

Mr. NEWMAN. Yes.

The CHAIRMAN. All right.

Senator MILLIKIN. Pardon me for interrupting.

Mr. SMITH. It therefore seems to me that the bill introduced by your chairman is correct in granting the Federal Government a complete monopoly over the production and ownership of fissionable materials (including patents on methods of production) while permitting, under its license, private ownership of source materials, by-products, or devices for the application of atomic energy. Thus the Government will have ownership of the strategic material, and may control related materials and their uses.

I am equally in agreement with the provisions of this bill which distinguish between basic scientific data, which scientists generally agree should not be restricted, and the technical data, which must be controlled by the proposed agency if they are related to the national defense or come within the terms of the Espionage Act. The emphasis of this bill on the greatest possible dissemination of even technical data is a step in the direction of the free exchange of information that must some day be achieved throughout the world.

Similarly, I believe the bill is justified in requiring that patents on atomic energy devices be subject to what amounts to a compulsory licensing system. If atomic energy is important enough to justify complete governmental control, no aspect of its use should be determined by private monopoly.

RELATION TO PRESIDENT AND CONGRESS

While I would like to see legislation on this subject limit the authority of the Government over private citizens, I do not think that it should restrict the normal executive control of the President over the proposed agency or its subordinate divisions. Congress must define the powers of the executive branch in order to keep our political system free and democratic. With respect to the authority of the President to direct

the executive agencies within the limits of statutory policy, however, the case is quite different. If such authority is restricted, there is no positive means for enforcing the wishes of the people and the Congress.

I have heard it argued that the extraordinary importance of this subject, the terrifying possibilities that it involves, are reasons for giving the proposed Atomic Energy Commission a status somewhat different from that of the other executive agencies of the Government, and for restricting in some respects the authority that the President should exercise over it. It seems to me that the contrary is true. When we adopted our Constitution, the executive agencies commanding the greatest concentration of power and requiring the highest degree of technical skill were the armed forces. Just as it has always been a fundamental principle of our constitutional and political system that the military power of the Nation should be directly subordinate to the civil power—that our President should be commander in chief of the armed forces—I believe that this agency, like the executive departments, should be fully under the direction of the President.

For this reason, I endorse the provision that the members of the Atomic Energy Commission serve at the pleasure of the President. While they will be subject to his general executive direction, the bill properly provides that for several types of actions they must obtain his express approval. Thus the President must approve the manufacture of atomic weapons or their transfer to the armed forces, and he must approve regulations relating to the Espionage Act.

Each of these actions is related to the national defense aspects of atomic energy.

Senator AUSTIN. May I interrupt the witness for a question?

The CHAIRMAN. Surely.

Senator AUSTIN. I am not anticipating anything or making any prophecy in this question, but if it should develop that in the reorganization of the military department of the Government there should be, under the President, a Secretary of Common Defense, do you mean to have your policy applied through such a Secretary in the beginning where you say in your testimony that the President by this bill is properly given the authority over certain matters there? Do you contemplate that authority being exercised through such a reorganized system as we may have?

Mr. SMITH. Yes; I would think so; that is, with any of these matters that have military implications, the President would receive advice through the Secretary of National Defense, or whatever his title would be.

Senator AUSTIN. Thank you.

Senator JOHNSON. Well, Mr. Smith, I don't find any difference of opinion with respect to the defense measures or the defense implications, rather, of atomic energy resting under the authority of the President, but Congress has created the Federal Power Commission, the Federal Trade Commission, the Interstate Commerce Commission, the Federal Communications Commission, and other commissions, which have legislative functions and are supposed to be legislative agencies as being different from executive agencies, and it seems to me that the functions of the Commission that we are to create will have much in common with the Interstate Commerce Commission and these other legislative agencies, and that Congress, therefore, should have a peculiar control and a special control and a very defi-

nite control over the operations of this new commission in keeping with the age-old policy of having legislative agencies and executive agencies. What is your reaction to that?

Mr. SMITH. Well, Senator Johnson, while in general I would agree with you, the problem that I think we get down to is what we mean by control, and who really has it. I think, if I might develop this point here a little bit further along, you will see what I am driving at. If it is all right I would like to come back to a discussion of your question.

Senator JOHNSON. Certainly. I think that is one of the fundamental questions that is before this committee, and one that we will have to face, and face squarely.

Mr. SMITH. Yes, sir.

On the other hand, we do not know what types of problems will come up in the development of atomic energy for civilian purposes that will vitally affect the activities of other Federal departments. It therefore seems clear to me that, in order that the President may coordinate the work of this agency with that of the rest of the executive branch, he should have full authority to direct its activities whenever he needs to do so.

Like other executive agencies, the proposed Commission will be accountable to the Congress through the regular procedure for the review of its appropriations as well as by virtue of the fact that its only powers are derived from a statute of the Congress. In view of the great effect the use of atomic energy may have on our whole economic system, S. 1717 wisely requires that the licensing of any device for this purpose be reported to the Congress 90 days in advance. The Congress will then have an opportunity to enact emergency legislation if it wishes. The most important means by which the Congress may hold the agency accountable, however, is by dealing with it as a part of the general program of the President. The Commission's relations with other departments of the Government—the State Department, the armed services, the proposed National Science Foundation, the Departments of Justice and Interior and Commerce, and many others—will be equally as important as its internal operations.

INTERNAL ORGANIZATION

As I have already remarked, I believe that S. 1717 is generally sound with respect to the functions and powers of the proposed Commission, and its relationship to the President and the Congress. At the same time, I would like to question the provisions of this bill which establish the internal organization of the Commission.

We must admit that at this time we know very little about all the uses to which atomic energy can be put. In approaching the problem, however, we ought to make it clear that we know something about administrative organization. We certainly ought not to assume that we can ignore everything we have learned about the science of administration from the history of our Government, and from the practical experience of administrators.

In the light of such lessons, it seems to me that this measure should be amended in a number of respects.

First, this bill sets up four divisions within the proposed agency. I do not believe that the internal divisions of the Commission should be set up by statute at this time.

S. 1717 recognizes the need for flexibility by giving the Commission the power to assign functions to its divisions, or to create additional divisions. Nevertheless, the titles of the four statutory divisions suggest a definite pattern of organization. I do not feel sure that anyone can foresee at this time the pattern of organization the Commission should have several years hence. I would therefore recommend that the Commission have power to set up and abolish divisions as it sees fit, in order to enable it to adjust itself gradually to new problems as they arise.

Similarly, there will be a great many points at which the work of the proposed Commission will touch on the work of other Federal agencies. At such points it may be desirable from time to time to adjust the relationship between departments and agencies, or to shift functions or units from one to the other. For this reason, I would suggest that the bill contain a provision bringing the proposed Commission within the scope of the Reorganization Act of 1945. That act now contains a provision exempting agencies created subsequent to January 1, 1945.

The CHAIRMAN. Mr. Smith, do you mind an interruption at this time?

Mr. SMITH. No.

The CHAIRMAN. Do you feel that the divisions that are created under the bill are logical at this time as we know the problem?

Mr. SMITH. I feel that you are on much safer ground—this is my point—if you do not specify in your bill what the divisions should be. It seems to me that the Congress ought not to go so far as to define the internal organization of the agency at this time. I would rather leave the Commission and the administrative people flexibility, and I believe that you will be in a better position if you allow for such flexibility in view of the fact that there are uncertainties as to what the problems are. I think that is my point.

The CHAIRMAN. I understand your point, but I want to make it clear that you do not quarrel per se with the divisions that are suggested in the bill at this time, as they are suggested; it is only the philosophical concept or political concept of setting them forth by statute—

Mr. SMITH (interposing). Yes; I think my answer is that I couldn't do any better, if the divisions are to be defined, as near as I can see.

The CHAIRMAN. Then of course the bill does provide for the creation of additional divisions as they may become necessary.

Mr. SMITH. Yes.

The CHAIRMAN. Well, now, in the Department of Justice, the work of the Department is carried on in 6 different divisions. Are they set out by statute?

Mr. SMITH. I assume they are; I am not sure.

The CHAIRMAN. That works satisfactorily there.

Thank you for permitting the interruption.

Mr. SMITH. Second, I would recommend that the Commission be provided with a general executive or administrative officer. If an executive agency is headed by a board or commission, I cannot imagine how it may operate effectively without using some single person as a channel of direction and coordination, both in carrying out the plans it has determined, and in bringing up new ideas for consideration.

The CHAIRMAN. Now I am not disposed to quarrel with you about that statement, except that I would ask you, does the Federal Power Commission have such an officer?

Senator JOHNSON. That is the question I wanted to ask him, whether the Interstate Commerce Commission has such an officer. That is the fundamental question implied in my general observation a moment ago.

Mr. SMITH. My answer is that I know that the Federal Power Commission either has or has been trying to get such an officer.

The CHAIRMAN. I don't think they have now. The Civil Aeronautics—well, of course that was split, wasn't it, a few years ago? The Interstate Commerce Commission, Senator, I don't think has.

Senator JOHNSON. No. One of the Commissioners acts as Chairman, and of course that is very proper; someone would have to act as chairman of any commission.

The CHAIRMAN. The Federal Trade Commission functions as a commission, I think.

Mr. SMITH. I am willing to develop this any way you like, but if I could make the point, then I would like to come back to your question, because I would like to take on that question with you, as I think it is a very important one.

If the proposed Commission does not transmit its instructions to its divisions through a single person, the division heads will deal with individual members of the Commission themselves. They will naturally choose to deal with the member or members who they think will give them the answers they want, and to play one member off against another. When they start doing so, they almost inevitably establish a set of personal relationships that are likely to destroy the harmony that should exist among the Commission members.

I would urge, therefore, that S. 1717 be revised to provide that the President appoint an executive director who, under the Commission's supervision, shall direct and supervise all other officers and employees of the Commission. Since members of the Commission, which will be the policy-making body for the agency, will be confirmed by the Senate after appointment by the President, I propose that the executive director not be made subject to senatorial confirmation.

The CHAIRMAN. That is a very poor suggestion to make to a bunch of Senators. [Laughter.]

Mr. SMITH. Well, the Director of the Budget has a very bad reputation, I take it, for bad suggestions.

Senator MILLIKIN. I don't follow the reason—the suggestion may be good—that because the members of the Commission are subject to the confirmation of the Senate, it should follow from that that the chief executive officer should be exempted. In fact, I think you could argue that that is an additional reason why he should be confirmed.

Mr. SMITH. I wouldn't so argue. But if I could complete my points, Mr. Chairman, I will come back to these other questions.

The CHAIRMAN. Well, Mr. Smith, we are making notes of all these contested points, so we will be back.

Senator MILLIKIN. I would rather allow the members of the Commission to escape and confirm the executive director.

Senator JOHNSON. The trouble, Mr. Smith, is that the further you go the worse it gets.

Mr. SMITH. That is all right, Senator.

Third, I would recommend against the appointment of division heads by the President. I think this method of selecting them unwise partly because it would lessen the freedom with which the Commission may make changes in its pattern of organization. More important, experience has shown that Presidential appointment of subordinates within departments or agencies does not strengthen the President's direction of those agencies, but weakens it. Such appointments will destroy the unity of an organization and make it impossible for the President to hold responsible the man at its head.

Fourth, I recommend that you strike out of the bill the provisions requiring individual members of the Commission to sit on four statutory boards, and giving such boards final reviewing authority on certain subjects. I believe that the Commission should be given authority, in its discretion, to hear appeals for any purpose from any subordinate officers or boards. The Commission will, of course, wish to delegate enough responsibility to subordinate officers or boards to be able itself to deal effectively with the most important questions. If you wish to require the Commission to set up boards for certain specialized types of hearings, I strongly recommend that individual members of the Commission not be required to sit as members of such boards. Such specialized individual duties could only distract them from their more important collective responsibilities.

Fifth, the bill in question provides for a Commission of five full-time members. I agree wholeheartedly that the functions of this agency are too important to be entrusted to any persons who are not full-time officials of the Federal Government. At the same time, I believe that a board of three members will be more effective than a board of five. The smaller the number of members on the board the more attractive the positions will be to men of the highest ability.

The CHAIRMAN. Mr. Smith, the thought was advanced that it would be impossible to get the proper type of men to serve full time on a commission of this kind. Do you share that apprehension?

Mr. SMITH. No, I do not, Mr. Chairman; I do not.

The CHAIRMAN. Membership on this Commission, it seems to me, if it is finally created, might well be regarded as important a responsibility as any officer, including membership on the Supreme Court; would you not think so?

Mr. SMITH. I heartily agree with you; yes.

Sixth, the bill gives the proposed Commission the power to create corporations. I do not believe that it can accomplish anything by the creation of a corporation that it could not accomplish by setting up a division of its own organization. If exceptional powers, or exemptions from burdensome procedures, are needed, they can be granted to a division of the Commission as well as to a corporation. The act of December 6, 1945, both reduced the privileges of such corporations and made clear the intent of the Congress to restrict the number of corporations in the future. I therefore recommend that you strike out of S. 1717 the grant of power to create corporations.

While recommending certain deletions, I would like to say that I agree with your chairman with regard to one important provision that he left out of his bill. The purpose of this legislation is to put the development of atomic energy under civilian control. I therefore consider it sound not to include a provision exempting the agency from the laws which prevent officers of the armed services from accepting

civil offices without giving up their commissions. This bill, by remaining silent on this subject, does not discriminate against members of the armed forces. It merely requires them to choose between two types of careers which have different obligations, different rewards, and different conditions of tenure. The Congress may see fit to make individual exceptions to this rule from time to time. But it is a general rule that should be maintained, especially when the purpose is to transfer an agency from military to civilian administration.

Atomic energy is a new material force. Scientists tell us it has ushered in a new era. It is likely to have great effects, of course, on many aspects of our life. But while it is going to change a great many of the problems which face our political and administrative system, I do not think it changes the principles of that system. To develop and control atomic energy, we must take steps that are consistent with our basic concepts of democratic and representative government.

S. 1717 would deal with the problem within our constitutional framework. It makes the proposed Atomic Energy Commission, like other executive agencies, directly responsible to the President and the Congress. It grants the Commission enough power to do its job without endangering freedom of thought and speech. At the same time, it would give the Commission an awkward internal structure, which would lack the unity and simplicity that mark an effective and responsible organization.

As the bill is revised, I hope that it loses none of its present merits and gains by improvements in the organization that it proposes to establish.

Senator JOHNSON. Mr. Chairman, I have to leave at 11 o'clock, as I have a conflicting engagement at that hour, and I hope that Mr. Smith can now go into the question that I raised a moment ago: Congressional authority versus Executive authority over this Commission. I am very anxious that the Congress control this Commission with a tighter hand than it has controlled any agency of our Government heretofore, and it seems to me that Mr. Smith's recommendations go in the opposite direction to that.

The CHAIRMAN. You understand, Senator, that the bill provides for quarterly reports to the Congress of everything that is done, and also requires that before any atomic energy devices may be used, that the Congress must pass on that policy. I think if you will examine the bill you will find that the Congress not only must be kept fully informed, but has a right of veto power in many essential respects.

Senator JOHNSON. Yes; I have noted that with a great deal of satisfaction, but I want to hear the witness' arguments, and I want to hear his conclusions on those points; and it seems to me that his argument all the way is traveling in the opposite direction and looking toward Executive control instead of congressional control.

I would go far beyond the present language of the bill in establishing congressional control if I had my way about it. But the witness appears to have a different idea. I would like to have something on that, as he has suggested he would give us.

Mr. SMITH. Mr. Chairman, I think you are naturally aware that you are hearing from an administrator or an alleged administrator, whichever term you wish to use, and that I, naturally, in contrast to the position each of you hold, must speak from my own background of experience on a subject of this sort; and I think you will doubtless

gather from my testimony that I am greatly concerned about the organization you propose, because I frankly think that it has some serious defects.

Now coming to the problem that is raised here concerning congressional versus Executive control, I don't think they are two separate types of control but a single problem. And I will argue that unless you have adequate Executive control, you do not have adequate congressional control; and that unless you can get a responsible Executive set-up—because after all, you pass the law, you provide the framework, and then it is the President who is responsible for the faithful execution of the laws—your hands are pretty much tied unless you can get back from the administration the results that you should have from thoroughly responsible Executive action.

Now that is the thesis on which, not only in theory but in practice, I approach this subject. And I maintain that, in fields such as this, the Congress, unless it provides a sound administrative organization, has very few recourses; and that, on the other hand, the administration's hands are tied. That is my thesis, and I think there is an awful lot of fiction about this whole area of congressional control. I think it is a two-way proposition in which you lay down the rules and regulations, and then you have to see that somebody else lives up to the rules and regulations; and the rules and regulations, it seems to me, on the administrative side, have to be such that they have a considerable support in administrative experience.

The CHAIRMAN. Mr. Smith, the bill provides for the setting of a quota of production of fissionable materials for each quarter by the President, and the President, of course, must report that to Congress. Now do you think it would be practicable to have the Congress set the amount of fissionable materials that would be produced in each quarter?

Mr. SMITH. I would not think so, although I have not studied that particular phase of this bill. I thought you wanted my views on the administrative side of it, and I have pretty much confined myself to that.

The CHAIRMAN. Of course, this goes to the heart of Senator Johnson's objection, or at least his comment, that he would put more emphasis on congressional power and less on the Executive, and it certainly occurred to me that this is one of the most vital decisions that can be made in relation to atomic energy domestically, as to how much fissionable material shall be produced in any one quarter. I was trying to figure out how in the world Congress could do that with any degree of speed, with any degree of success.

I am frank to say that the more congressional supervision, the more congressional opportunity to correct mistakes in this situation, the more I am in sympathy with it, but I don't see, taking that for an example, how the Congress could fix a quota such as is proposed under the bill.

Mr. SMITH. I do not see how Congress can do that, either, and I know of no similar situation where Congress takes such an action. There are, I think, some situations where congressional committees make something related to administrative determinations, but that I wouldn't think of as being solely a congressional action.

The CHAIRMAN. I notice that you cut down or propose to cut down the Commission, as proposed in the bill, from five to three, the reason

being given that the smaller the number on the board the more attractive the position would be to men of the highest ability.

Well, of course, I have already expressed my feeling as to how important membership on the Commission would be. There are nine on the Supreme Court, and just about every lawyer I know of in the United States would like to get on there. I am wondering whether that is a good objection to the provision.

Mr. SMITH. Well, frankly, I don't think that it is one about which you should be too much concerned. Out of some experience, I feel that a Commission of three for this sort of thing is better than a Commission of five, and perhaps I would even argue that it is better than a Commission of five because I might believe in a Commission of one, and if you get more than five it is a question that you might go up to a hundred, and the first thing you know you would have a town meeting. Somewhere you have to draw an arbitrary line. My arbitrary line would be at three, and it seems to me that you might put those three at a rather high salary status, for example, where you might not feel like doing that for five.

There is some question as to what would be contributed by two additional members of a Commission. It is usually the case that either one or two men, actually strong men, run a show of that sort.

The CHAIRMAN. I notice that you recommend the creation of an administrator. I have no strong feelings on that. It might be that for administrative efficiency that might be necessary.

What other agencies are there in the Government that have that kind of a set-up now?

I might say that I do not see how the power to appoint an administrator and the provision for an administrator would have anything to do with the congressional control of the man except through the confirmation of him, which I think ought to be, because they confirm the members of the Commission. But laying that aside, what other agencies of the Government are there that do have that kind of set-up?

Mr. SMITH. Well, I don't think you can make comparisons here. I think the comparison with the Federal Power Commission, for example, is not a good one, and that there are dangers in that kind of comparison. It just happens that we made a very thorough study some time ago of the operation of the Federal Power Commission, and I think that it should have an executive; that you cannot do business even in a quasi-judicial agency without an executive. But here it seems to me that you have got something very much more important than that, if I see this problem, and I don't pretend to see it at all in any complete way. But it seems to me that here you have got a Commission which is performing a multitude of functions, that you might argue very well, by analogy with some other commissions in the Government about whose operations I am fairly familiar, both their good points and bad points; you might argue very well that if this Commission had only quasi-judicial or quasi-legislative functions, that you didn't need an executive. On the other hand, it seems to me that this Commission has vast administrative functions dealing with the operation of plants, and all of that sort of thing, and why should we deny, then, the administrative experience we have had in the Government—whether you wish to turn to Surplus Property, for example, or elsewhere where we are in trouble because we do not have executive responsibility thoroughly

quasi-judicial
leg.

operation
(adm)

fixed? And in my book it is inconceivable to me how any Commission—and we know the experience, for example, in commission forms of city government—can possibly operate without a central executive.

The CHAIRMAN. I can see the point. There are a great many manufacturing plants here which would have to be operated by this Commission, and it might be well if they had a general manager. Now, we could write that into the bill. Would you attempt to write in any statutory authority for the general manager, or would you leave that to the Commission to set his duties?

Mr. SMITH. Well, I think that just offhand I would be inclined to argue that there is much more need for some at least general statutory provision with respect to an executive than there is with respect to the heads of the divisions under him. I think the two things would be inconsistent, that you have to go one way or another. In the main, however, I would lean in the direction of having the Commission, depending upon the functions that were laid out for it, pretty much define the duties of the director.

Your committee has given much more study to this than I have, although I am pretty clear about the administrative side of it in terms of my own experience, but it seems to me that if you conceive of this Commission as performing quasi-judicial functions, then you have one kind of problem, while if you conceive of the Commission performing those and many managerial functions, such as the operation of these plants, your problem is entirely different. I think it is something probably pretty vast. Rather than bring something that in time contracts, it is very likely to expand. Then it seems to me that the need for an executive is a very important need.

The CHAIRMAN. Sort of general manager?

Mr. SMITH. Yes. One might think, in this connection, of something like the TVA experience, which is fairly well known, at least parts of it. I would lay down no particular pattern, but it does seem to me inevitable that you would have to come to some central executive.

The CHAIRMAN. Are there any further questions, gentlemen?

Senator AUSTIN. I have a query.

Do you not advocate the laying down, in the legislation, of general policies in any event? Whatever form this administrative set-up may take, must we not, as a Congress, give it in legislation the general, over-all objectives of this legislation to work toward?

Mr. SMITH. Yes, I certainly believe so, and I don't know quite how far you might go there. It seems to me you have laid down the functions. I think that question is pertinent to this matter of congressional control, about which I do not want to be misunderstood. I believe very sincerely in congressional control. In short, I believe in our form of government. The question, then, is, How do you get that? Well, it seems to me here in a new subject, that the Congress is better off if it lays down the general groundwork and the general rules and regulations, and prescribes the general policies within this field; then lays out a general framework, too, for the administration or carrying out of those policies. However, since on the side of the administration the Chief Executive is responsible, I would propose to give him considerable leeway in adjusting that organization, because there are so many unknowns here, always keeping in mind that the Congress then can come back and tighten up the reins here and there and make the necessary adjustments.

It seems to me—to take a very important, I think, analogy out of recent experience with respect to surplus property—that there we were going too far in connection with detailed specifications. It is a little difficult, I think, for an objective person, looking at that, to say, “Well, was the Congress to blame; was the administration to blame; or was everybody to blame?”

So it seems to me that in a field that is unknown and where experimentation is necessary, it is better strategy all around to provide in the beginning for some flexibility so that adjustments can be made, and thereafter, as the Congress watches the operation and develops notions as to reservations that ought to be applied here and there, then come in and make those adjustments as this new field begins to grow. It seems to me that that is a very practical approach to it, both from the standpoint of the Congress and the problems that will be faced on the side of the administration, and actually gives the Congress much more control than the more rigid approach that would tie administrative hands in the beginning so that there could be a kick-back, “Well, if the Congress hadn’t done this, we would have been able to do such-and-such kind of thing.” Those arguments, of course, get us nowhere. It is essentially a joint enterprise, as I see it.

Senator AUSTIN. Well, is it proper to interpret your view as envisaging the sort of work that an institute does in developing, in a new field, the new policies as experience suggests them, so that Congress gets from this institute that special service in research and experience that Congress cannot itself do or have?

Mr. SMITH. I think that is a very excellent analogy, a very excellent analogy, and I would think that the Congress might perhaps through a special committee such as this keep very close watch on what was going on and get regular reports, and then adjust the harness, so to speak, here and there as occasion demanded.

Senator AUSTIN. That is all.

The CHAIRMAN. Thank you very much, Mr. Smith.

Senator HICKENLOOPER. I have a question, Mr. Chairman.

The CHAIRMAN. Pardon me, Senator Hickenlooper.

Senator HICKENLOOPER. I am quite interested in your statement, Mr. Smith, with respect to the arbitrary selection of the numbers of this Commission. I would like to discuss that with you a minute.

It doesn’t occur to me that there is any arbitrary figure, as such. It seems to me there are certain categories that are essential to be represented on this Commission, and that the representation of those categories will automatically fix the number of the Commissioners if that policy is followed. In other words, we have science, which must or should be represented, in my opinion, on this Commission. We have the technique of production—you might say the engineers—which should be represented in a controlling position on this Commission. We certainly have the public and foreign disposition of this material that, in my opinion, should be represented on this Commission by either one or two members, certain foreign and certain domestic public uses of this material. Then, while this is controversial, I would say that as long as this bill is being set up, or any legislation is being set up, admittedly as temporary legislation because we don’t know where we are going, and as long as we don’t have satisfactory international agreements for the control of this thing,

and as long as it still is a weapon and only a weapon, that it is vital that the armed forces, those charged with the national defense of this country, be at least temporarily represented on this Commission. It would seem to me that you could classify the membership or the representation of this Commission into the categories that we might agree upon are outstanding.

Now, I notice your comment on the fact that no military representation is set up on the Commission. I happen to disagree thoroughly with that. You may be right, but it would seem to me that until we have some reasonable assurance of where we are going with this thing, that any domestic control of this must of necessity take in the military phase of it during this temporary or at least emergency period.

Now, if we begin to pick the numbers of this Commission just arbitrarily, we may leave out of representation some very vital category. That is my thought or comment on your suggestions there on the membership of the committee.

Mr. SMITH. Well, it seems to me that it depends a little on how you start. If you start with the thesis that this Commission is to represent various groups, as you evidently do from what you say, then you are quite right that it might be 7 or it might be 9 or it might be 5 or it might be 11. But I would not start that way. In my own experience—and I have served on quite a few boards and commissions—I should say the worst of them are those chosen to represent special groups and special interests.

Senator HICKENLOOPER. I agree with you thoroughly as a general social and civic set-up. I think that has been one of the frailties of our commissions and boards we have appointed, that we have special advocates on there for special pressure groups. I conceive this to be a totally different problem. We are pioneering in a field that none of us, not even the scientists nor the engineers, can accurately predict for very far in the future. They can project theory but not predict with any accuracy.

It would seem to me that if it is a temporary situation, then the great fields of this thing should have their experts on there rather than an arbitrary group of laymen who would have the authority.

Senator MILLIKIN. Could that not be accomplished by a technical advisory committee expanded to whatever the number may be to get the particular type of advice that the Commission needs?

Mr. SMITH. That would be my solution of it. I think what you want here are broad-gage people on this Commission, chosen because of their stature and general knowledge rather than because of any technical competence they have. I think the engineers and scientists ought to be advising on the technical side, and not become involved in major policy. I would say the technical people, in the main, are the worst people to deal with large policy issues.

Now, that isn't always so, but just saying that as a class. I happen to have a background in engineering myself, so I can be critical of engineers. I would get that kind of talent by organization approaches.

The CHAIRMAN. I would like to call your attention, Senator Millikin and Senator Hickenlooper, to this. The bill provides that—

Members of the Commission shall be appointed by the President, by and with the advice and consent of the Senate, and shall serve at the pleasure of the President. In submitting nominations to the Senate, the President shall set forth the experience and qualifications of each person so nominated.

He is not required to do that even with members of his Cabinet. In fact, I know of no such provision; it is a unique provision in our legislative history.

Senator HICKENLOOPER. I think it is a unique provision, Mr. Chairman, but I have read that, and it doesn't mean anything. I mean, it is useless in the bill as it is written.

The CHAIRMAN. It is a requirement on the President to fully acquaint the Senate with the qualifications that the members have.

I am not particularly wedded to it. It seemed to me to be a good thing to do in this specific case. But I merely call attention to it because I want to point out that at least there is some implied restriction on the President to send up those men who would be broad gage, as Mr. Smith suggested they should be.

Senator MILLIKIN. Mr. Smith, I assume that you prefer to limit your testimony more or less to the administrative features of the bill which is being considered.

Mr. SMITH. Yes; that is correct.

Senator MILLIKIN. In other words, you wouldn't care to go into whether there should be such a Commission, or the basic philosophy involved in it?

Mr. SMITH. No, I think not. Within just what general knowledge I have, and it is only general, of the other phases of the bills, and what you are attempting to accomplish, I can't very well either pick flaws or make suggestions.

With respect to the administrative side of it, I think we have accumulated some experience that leads me to be a little concerned. The experience is enough of a guide for me to predict that if you started a certain way you would come out eventually in a certain way, and whatever the trials and errors and tribulations would be in the meantime might not be too helpful from the standpoint of the total program, and I think that is my sole contribution, if any, Mr. Chairman, to your discussion.

Senator HICKENLOOPER. Mr. Smith, pursuing this matter I raised a moment ago a little further, my thought about the categories into which this field falls and the representation on the Commission probably is prompted, at least now, by the fact that I think we have had examples of where so-called broad-gage men have been appointed to office but have then wholly failed or refused to take the advice of the technical or trained people in the field in which they are supposed to administer, and the people who are trained or who have the background for the solution of problems, have, in some instances, been completely disregarded, and the so-called broad-gage people have followed another tack that diverges from that advice. There is no authority there to do what these people feel is right or proper under the circumstances.

That is not always true, I realize, but I think that examples could be produced of that, although they are immaterial here. It is for that reason that I feel that there must be some assurance that the technical knowledge of these people in their special fields can be brought into some position of authority or some position of control in the disposition of this thing, and it is to protect against people who are not specialists, listening to evidence or listening to recommendations and then liter-

ally brushing them aside because of their own particular attitudes, that I make that suggestion.

Mr. SMITH. Well, I would think anybody who literally brushed aside technical information in this field would certainly be a very irresponsible person, and I would hope that you would get, at least out of the membership of this Commission, a good many safeguards against that.

Senator HICKENLOOPER. Let me call your attention to something that has already happened. I don't know what the fact is about this, I am not attempting to state the fact, I mean, but there was some considerable apprehension just 2 or 3 weeks ago that many of the very carefully guarded secrets of this thing were going to be divulged before any agreements were had internationally. Now, I say that that feeling was prevalent in many places here. It would seem to me that that, had it happened, might have been literally brushing aside a very vital part of this great field.

Senator MILLIKIN. Well, that would not be brushing aside any technical testimony; that would be brushing aside the United States of America. You can vaccinate a judge with technical information but you can't always make it take, and sometimes he is very wise in disregarding technical information.

Senator HICKENLOOPER. Well, I always think he is a little incompetent when he holds against me, anyway. [Laughter.]

The CHAIRMAN. Do you have anything further to add, Mr. Smith?

Mr. SMITH. I think not.

The CHAIRMAN. Thank you very much. Would you be willing, Mr. Smith, to submit by way of amendments, that which you have put in your statement, on the administrative phases of this matter?

Mr. SMITH. I would be glad to do so.

The CHAIRMAN. We would appreciate it very much if you would.

Mr. DAVIS. Mr. Davis has come here to testify on the subject we are interested in; and I guess you can go right ahead, Mr. Davis.

**STATEMENT OF WILLIAM H. DAVIS, FORMER DIRECTOR OF THE
OFFICE OF ECONOMIC STABILIZATION, AND FORMER CHAIR-
MAN OF THE WAR LABOR BOARD**

Mr. DAVIS. Thank you, Mr. Chairman and Senators.

I come here with some temerity, almost. I suppose that the committee wants to hear from me perhaps because of what administrative experience I have had in the Government, which included to some extent a sort of multiple-person board, and also, I think, because of my familiarity with the patent system and the fact that I am now serving as chairman of a committee appointed by the President to advise him, through the Secretary of Commerce, as to the policy of the Government with respect to the patent laws. And those questions do come into this discussion because the McMahon bill does make provisions with respect to patents in this field of atomic energy.

From the general study that I have made of the situation and the proposed bills, I have felt that there were a few basic things that are quite necessary.

The first is that the National Government should promptly gain control of the production and of the use of all material and all proc-

esses readily capable of or directly connected with the release of atomic energy by chain reaction.

Second, that the development of atomic energy for the peaceful pursuits of mankind, and for military purposes, subject to all international agreements to which the United States adheres, and subject to the exigencies of active military operations, should be directed and controlled by the Federal Government through a single permanent commission whose members, in my judgment, should be wholly devoted to that single duty and no other.

Third, that scientific and technical information about the production of atomic energy should be fostered, accumulated, and recorded by our Government, and made universally available just as soon as adequately safeguarded exchange of such information can be internationally agreed on.

Senator AUSTIN. May I interrupt for a minute?

Mr. DAVIS. Surely.

Senator AUSTIN. I put in the record this morning a quotation from Mackenzie King, Prime Minister of Canada, taken out of his statement in the Parliament of the Dominion of Canada, House of Commons, on December 17, 1945, at a time when that great body was about to act upon the agreement which he, on behalf of Canada, had entered into with the United States and Great Britain. I ask you if this statement by him corresponds with what you have just stated as a postulate in your third recommendation:

However, we stated our readiness to share, on a reciprocal basis, with others of the united nations, detailed information concerning the practical industrial application of atomic energy, just as soon as effective and enforceable safeguards against its use for destructive purposes could be devised.

Mr. DAVIS. Senator Austin, that expresses exactly my views. It seems to me so plain, knowing what we do know now about the lethal powers of this energy, and having our attention unfortunately almost exclusively diverted to that aspect of it, it seems to me clear that you can't run a government, I don't think you can run a family, 2 or 3 years from now, unless the whole world believes, the peoples of the world believe, that they know all that anybody knows about this material. It is the unknown that terrifies, and there is terror in this thing. So that you just couldn't run a government unless you were satisfied that you knew and had available all the knowledge that is anywhere available.

It is like the bubonic plague. Now, we are not afraid of communicating with Chicago for fear that we will spread the bubonic plague to New York or Washington, because we are accustomed to feel complete assurance that if the bubonic plague was in Chicago we would know about it. And when you bring things into that common knowledge of mankind the terror of them disappears. If there is any secret about this thing, and if that secrecy is not dispelled, you just can't live. And above all things you are not going to be able to stop the present concentration upon the destructive aspects of it to the certain neglect of the tremendous constructive values of this new source of energy.

Senator HICKENLOOPER. Does your conception of this go to the point of disclosing everything we know about the destructive composition of this thing, that is the destruction of a bomb?

Mr. DAVIS. Oh, yes; and I don't think the world can live with this thing until everybody in it is ready to tell all they know about the subject. Of course I agree with the quotation that Senator Austin read. In fact I put into my own statement the same idea, that you must have an assurance of safeguards. But that those safeguards should stop short at any point of technical information—whether it is practical industrial know-how or basic scientific theory—seems to me impossible. It must extend to a complete disclosure of everything that is known about it.

The fourth item that seemed to me essential was that in the meantime, under the control of the proposed Commission, all knowledge on the subject should be made as freely available for peaceful pursuits as in any wise is consistent with national safety, because there is no doubt that at the moment the emphasis is on the destructive value.

Gentlemen, these scientists, on the 2d day of December 1942, succeeded in setting up this chain reaction at Chicago. They all knew what it meant; every scientist there knew the tremendous significance of that achievement. They didn't tell anybody, not at all. It was put under the most tremendous injunction of secrecy, and the material was produced and sent down to Dr. Oppenheimer and the others in New Mexico to make bombs out of. I often wonder, and I like to visualize, and I would like the committee to visualize, what would have been the result if that discovery had been made on the 2d day of December 1932. We weren't interested in bombs in 1932, we were interested in energy for peaceful purposes. We were at the bottom of a depression. If those fellows had made that discovery on the 2d of December 1932, it would have been in the newspapers the next morning, it would have thrown an entirely different color on the whole psychology of the country. The depression would have been over, I think, because of the hope and promise that is inherent in this thing, and nobody would have ever thought about bombs. They would have eventually, of course, but it would have been entirely different.

Now, we must capture that same attitude of mind about it. I think, if I may be so bold, that if this committee could have scientists calculate and come here and tell the committee what could be done with the amount of energy that was released at Hiroshima and Nagasaki or even down in New Mexico in that first experiment, just calculate that amount of energy and figure up what you could do with it for useful purposes, that would be very enlightening. Some such evidence, it seems to me, ought to be before the committee, at least before the country. If you want the Colorado River to flow over the Sierra Nevada Mountains, all right, we have got plenty of energy to do that in any one of these explosions, I should judge, although I never measured it. But certainly we have now available to us an almost inconceivable, a truly inconceivable, amount of energy, and enough energy to do anything we please with the face of the earth, when we please to do it, and I think that the sooner attention is directed to that aspect of it, the better.

Now finally, my fifth suggestion is that the essential control of the means of production of atomic energy should be so administered as to interfere as little as possible with the fullest and freest utilization of atomic energy for peaceful purposes. Military uses should, of course, be and remain wholly under Government control.

I am emphasizing there that the control of production and distribution of the materials from which atomic energy can be released I think it absolutely essential to be in the hands of the Government, and I think it should be done in such a way as to avoid, as far as possible, any interference with the development of the uses for peaceful purposes of the atomic energy.

Senator MILLIKIN. We have had a lot of testimony, Mr. Davis, that the use of the energy for peaceful purposes takes you three-fourths of the way along to the use of the energy for war purposes. Does that not suggest that at least until the world is postured for peace, that we have got to exercise the same degree of control over its peaceful development as over its war development?

Mr. DAVIS. I think so, Senator, but I make the distinction there—and I am glad you asked the question because it will help me make the distinction which I have in mind—between the production of the energy and the materials from which atomic energy is released by chain reaction; I make the distinction between that production and the development of the use of the energy after it is released.

Now, I believe, as the McMahon bill proposes—you can't go too far to suit me—in absolute governmental control of every speck of material and every speck of invention and discovery in the field of the production of atomic energy, and control of the licensing of the material for use. I think that should be absolutely controlled by the Government, at least for the present, until we know where we are. But I have in mind that the McMahon bill—in fact all the bills, I think—reflect the idea that that being so, the license to use this material should be as free as possible and without, certainly, discrimination, and without monopoly and so forth. That is expressed. But I am emphasizing here—and I will come back to it when I come to the patent section—that it takes some thinking to do that.

You may unconsciously or through ignorance put in hampering provisions which are unnecessary to the control of production.

Now, I was asked to go over the three bills—S. 1717, introduced by Senator McMahon; S. 1463, introduced by Senator Johnson; and S. 1557, introduced by Senator Ball—and I have done so. I think the mere statement of what I regard as the essentials is enough to indicate that I would find the McMahon bill much more to my liking than any of the others.

Senator McMahon, I don't know just how I should approach this subject. I have some matters really almost of draftsmanship, that I could touch on, and then on the patent section I would like to express my thoughts rather fully. If I may, I will just run over S. 1717 page by page and indicate the draftsmanship changes, for whatever they may be worth, and I assure the committee that this is without any desire to butt in where my advice is not wanted.

On page 4 of the McMahon bill, in line 19, in the sentence under (b) which reads—

the theory and production of atomic energy, including processes and devices related to such production—

it seemed to me that the word "materials" should be inserted so that it would read—

including processes, materials, and devices related to such production—

because, as you know, at least two of the important discoveries were of materials useful in the production of atomic energy.

Now, in the next line, line 20, and throughout the bill, we find the word "fissionable," and as a matter of semantics that seems to me a shocking word, but I don't know how interested the committee is in that.

The CHAIRMAN. What would you suggest?

Mr. DAVIS. I will make this suggestion, Senator, prefacing it by saying this, that I am not making the suggestion merely as a matter of semantics. I think as a matter of definition it is important. I realize that the bill, and very wisely I think, defines fissionable material in an almost arbitrary way, that is in the sense that the Commission is to make its own dictionary. The words are used in the bill to define that material which the Commission has decided that it ought to control, for the purposes of the act. That is what it practically amounts to. You see almost any material may be fissionable. As I understand it, they are working now on carbon and silicon, two elements which make up the overwhelming part of this terrestrial planet, and they don't know how to fission them so as to produce atomic energy. Did I hear Senator Hickenlooper say that he hopes they never will find out? If so, I would be inclined to join with him. But still they may be fissionable in that broader sense.

I took occasion to look at Webster's Dictionary and I find no such word as "fissionable" in the dictionary. The word is derived from a Latin irregular verb, and the word "fissure" is the English verb, as well as noun. There is a word "fissile" which is a good dictionary word, and is defined as meaning "capable of being split, cleft, or divided in the direction of the grain, like wood, or along natural planes of cleavage, like crystals." And there is, down at the bottom of the page under unapproved words, so to speak, the words "fissibility" or "fissible."

But the key to the thing, gentlemen, is that what you are shooting at is not all material which releases atomic energy, because after all, radium, which is the preeminent material in its natural state which radiates energy, does not need to be controlled. What you are shooting at, it seems to me, is material which releases atomic energy by chain reaction, that is a conflagration, like a fire. It starts and feeds on itself. That is the thing that characterizes this new discovery.

The CHAIRMAN. Do you know, Mr. Davis, that for a couple of weeks we had nothing but doctors before us, and not honorary at that, and they kept using that word, and I thought it must be in the dictionary.

Mr. DAVIS. Well, if you knew much about scientists, Senator, you would know that they are the worst makers of words in the world. The last person to let write a dictionary is a scientist.

Senator HICKENLOOPER. Perhaps they are creating a new word. Doesn't "jitterbug" now appear in the dictionary?

Mr. DAVIS. Oh, this word will appear in the dictionaries all right. It has been used enough. It is the business of a dictionary writer to put a word in the dictionary if it is in the language.

Senator HICKENLOOPER. At this point, isn't there another field of atomic investigation at least that the scientists have talked about for a long time, the possibility of creating some reaction by combination as well as fission?

Mr. DAVIS. I don't know about that but I should think there would be; they are interested in other explosive fields, of course.

Senator HICKENLOOPER. I don't know whether they think it feasible or not but I think they have been investigating that source as well as fission, or whatever this other word is.

Mr. DAVIS. That is an idea that I didn't think of, in which case you wouldn't use the word "fissionable" at all.

Senator HICKENLOOPER. It occurs to me that it is worth inquiry as to whether or not reference should be made to material that will undergo fission alone, because there may be other combinations and other methods to which that word would not apply.

Mr. DAVIS. There certainly might. I was thinking of what we have in plutonium and uranium-235, which is that upon bombardment with neutrons they release more neutrons than it takes to start them bombarding, and that is the conflagration.

Senator AUSTIN. The trouble there is that you haven't got an exclusive definition by such a word or by such conduct because in fact it is not always bombardment that is necessary to release this energy; it may be by absorption.

Mr. DAVIS. Well, my suggestion—not to dwell upon it too much—for what it is worth, is that the best thing, or the best two words, rather, that I could think of to replace "fissionable," would be "reactive fissile" material, and then define "reactive fissile material" as the bill now does, to include plutonium, uranium-235, and such other materials as the Commission may, from time to time, determine to be capable of releasing, or directly connected with the release of, atomic energy through chain reaction. That is my suggestion and it doesn't cover what Senator Hickenlooper had in mind.

I may say in passing, Mr. Chairman, that it seems to me that if the definition—and this is pretty finicky, you can forget it if you want to—that if the definition were of the words "fissionable material" in the singular, or "reactive fissile material," and then throughout the bill pains were taken to always use it in the singular, you would avoid quite a number of confusions in the bill. In the bill as it is presently written, sometimes you say "fissionable material" and at other times "fissionable materials," and I think if you used the singular it might help.

On page 7 of the bill, in line 10, where it provides that—

the Commission shall arrange for the exclusive operation of facilities employed in the manufacture of fissionable materials by employees of the Commission—

it would seem to me wise to change the word "manufacture" to "production" because then you will have the benefit of the definition of "production of fissionable materials" which is found in section 4 (a).

Senator AUSTIN. Mr. Chairman, may I ask whether it was intended to have some different phase of process represented by the word "manufacture"? You have used the words "production of fissionable materials" in line 5, page 7, and, when you use the words "in the manufacture of fissionable materials" in line 10, do you mean to represent that subsequent transaction which puts the material, the product, into use? It is a question of what you mean.

The CHAIRMAN. Well, Senator, I think that Mr. Davis is correct. I don't think that the word "manufacture" is necessary to convey my meaning.

Senator AUSTIN. You don't?

The CHAIRMAN. No.

Senator HICKENLOOPER. It would seem to me, Mr. Davis—I was just talking to Dr. Condon about it—that as the word “fission” has a limited definition, and while I haven’t the exact wording at the moment, that some definition such as this might be helpful:

any material which is capable of an explosion for the production of power through the alteration of the structure of the atom.

That would take in your atomic theory, it wouldn’t limit it to fission or any other method, and Dr. Condon suggested that I might mention “capable of maintaining a self-creating force.” But really what we are after here is the power or explosion or something else created from the alteration of the structure of the atom, and there are several methods as to that.

Mr. DAVIS. That is right.

In the Johnson bill, on page 12, on line 17, you will find a definition of the material or substance as—

substances determined by the Commission to be readily capable of or directly connected with the transmutation of atomic species, the production of nuclear fission, or the release of atomic energy.

Now, I take it that that definition, which contains such words as you have in mind, was probably modified by Senator McMahon—I am guessing at this—in the definition in section 5 of his bill, because it was too broad; it includes radium, for instance. And the definition in the McMahon bill was “capable of releasing substantial quantities of energy,” which I take to be an effort to get away from radium. Perhaps the two, however, could be combined. As I say, all we know about now, or all I know that we know about, is the chain reaction, the self-perpetuating release of energy.

The CHAIRMAN. Don’t you think that that is a good definition of “fissionable materials,” waiving for the moment your objection to the use of the word “fissionable”?

Mr. DAVIS. Yes.

The CHAIRMAN. Don’t you think that that is a definition that would work satisfactorily?

Mr. DAVIS. What definition?

The CHAIRMAN. The definition of “fissionable materials” under section 5. I just want to get clear your view on that. You have no quarrel with the definition of “fissionable materials,” I take it?

Mr. DAVIS. No; I haven’t any really, Senator, if I am correct in thinking that what you were shooting at was to let the Commission determine what goes in this dictionary—

The CHAIRMAN (interposing). I think you have got to, because it may be a constantly changing situation.

Mr. DAVIS. I do too, and very much so. When it comes to the patent end of it, you use that expression in the patent section and people who make inventions and own patent rights must not be under any doubt as to what is a fissionable material, they must be able to say, “Well, the Commission has said this is so,” and until the Commission says it is, their patent rights are not affected by the bill. I think that is tremendously important. As I say, my objection to the word was perhaps a little finicky, that it is not very good English and does contain this other content of what you are really driving at.

Now, on page 15, line 21, the last word of that line, “therein,” I couldn’t understand. I thought it had gotten in by mistake. As far as I can see it has no predicate.

The CHAIRMAN. I think it is a misprint.

Mr. DAVIS. Then on page 17 where you are dealing with the dissemination of information, which I think is so important, you say:

The term "basic scientific information" shall include, in addition to theoretical knowledge of nuclear and other physics, chemistry, biology, and therapy, all results capable of accomplishment, as distinguished from the processes or techniques of accomplishing them.

Now, it really seems to me that the words "information as to" should be put in there before the words "all results" in line 4. You say:

all results capable of accomplishment, as distinguished from the processes or techniques of accomplishing them.

The CHAIRMAN. Where do you want to make the insertion?

Mr. DAVIS. At the beginning of line 4 insert the words "information as to," before the words "all results."

That brings me, Mr. Chairman, to the patent section—

The CHAIRMAN (interposing). What do you think of this section on dissemination of information? That is one of the most difficult, and must be one of the most carefully studied of the provisions of the bill, and in my consideration of it it gave me the most trouble, because you have, of course, two distinct objectives: One, to give out just as much knowledge and information as you can, consistent with national security and safety. That is what I tried to do in this section. Have you really studied this section?

Mr. DAVIS. I gave this much thought to it, for whatever it is worth, Senator. You see in some of the other bills there was a much greater attempt to rely on the difference between basic scientific knowledge and practical know-how. My experience is that they run into one another in indescribable confusion, and it would be very difficult to separate them.

The CHAIRMAN. The Smythe report illustrates that.

Mr. DAVIS. Yes, and we have it in the patent business all the time, because you can't patent a discovery in basic physics, but only its useful application. And it is very difficult. But here you are trying to say, as I read it—and I read it a number of times—you are trying to go as far as possible now in saying now what may be freely disseminated.

The CHAIRMAN. That was the intent.

Mr. DAVIS. And you say "basic scientific information" and information as to the results capable of accomplishment by this basic scientific information, but not the means of accomplishing it.

The CHAIRMAN. Well, the Smythe report after all reported the end result of accomplishment by different processes which it described, not in detail as to exactly how it was done, but the fact that it had been done. Now that was the philosophy behind giving out the Smythe report, don't you think so?

Mr. DAVIS. I do, indeed, and I think the Smythe report did a great deal of good, and that we are much better off to have that much released than to have had all that kept secret. I don't think it did any harm. Of course if we could now step to a point where we had this Commission set up and where we had our international agreement as to exchange of information, then this section would no longer be necessary.

The CHAIRMAN. Well, you know that the bill carries a proposal to suspend any section that should be in conflict with later developed international agreements.

Mr. DAVIS. Yes; that is right. As I read this section I thought, well, the Commission is going to have to exercise some discretion there. I tried to imagine, Suppose they discover how to release atomic energy from carbon, not by chain reaction but by some other phenomenon? Under this section the Commission would be in duty bound, I take it, to disseminate the information that they had discovered how to release atomic energy from carbon.

Senator HICKENLOOPER. At that point, Mr. Davis, and Mr. Chairman, as I read section 3 and section 9, it seems to me that those two sections taken together make mandatory the divulgence of all information, including information as to atomic bombs as weapons, and make mandatory the research in that field, the way the language of the bill reads here.

Mr. DAVIS. You mean basic scientific information as to the making of bombs?

Senator HICKENLOOPER. It says: "Basic scientific information in the fields specified in section 3 may be freely disseminated." And then it states what the term "basic scientific information" shall include.

Section 3 starts out:

The Commission is directed to exercise its powers in such manner as to insure the continued conduct of research and developmental activities in the fields specified below by private or public institutions or persons and to assist in the acquisition of an ever-expanding fund of theoretical and practical knowledge in such fields.

Now here is the important thing:

To this end the Commission is authorized and directed to make contracts, agreements, arrangements, grants-in-aid, and loans—

it is a mandate, the Commission is "directed"—

(1) for the conduct of research and developmental activities relating to (a) nuclear processes; (b) the theory and production of atomic energy, including processes and devices related to such production; (c) utilization of fissionable and radioactive materials for medical or health purposes; (d) utilization of fissionable and radioactive materials for all other purposes, including industrial uses.

Now, that word "all," I take it, means all, that there is no limitation.

Then in section 9 it says that this basic information "may be freely disseminated," having set up a mandate that the Commission shall thoroughly explore the use of atomic energy in these materials for all purposes.

Mr. DAVIS. Now, I take section 9 to exclude the processes or techniques of accomplishing these results. The way I feel about it—I don't know how good my advice about it is, Senators—but as I read it I felt—

Senator HICKENLOOPER. I would be interested if you would read it at your leisure, if you would examine it with that idea in mind.

Mr. DAVIS. As to how far section 3 is carried into section 9?

Senator HICKENLOOPER. Yes. My impression is that section 3 is carried in completely, because it says, "basic scientific information in the fields specified in section 3 may be freely disseminated." Then it defines "basic scientific information" as not only research but—

Mr. DAVIS (interposing). I take it that the intended meaning of section 9, or when I read it I took it to amount to this—

Senator HICKENLOOPER (interposing). It does exclude techniques.

Mr. DAVIS (continuing). To mean that in the fields specified in section 3, basic scientific information acquired under the provisions of section 3—basic scientific information as distinguished from this know-how—may be freely disseminated.

The CHAIRMAN. Senator Hickenlooper, is your objection that if, for instance, some great superbomb was to be developed that you would, under the bill, have to report the fact that it was in existence, but would not have to say how it had been done?

Senator HICKENLOOPER. No, I don't think you would have to report it. This says, however, that the Commission is directed to make contracts in all these fields, and explore all of the fields of atomic production, and then it says that that information "may be freely disseminated," and that goes right up to the point of the technique. The technique is excluded in this particular section. But you also find another section in this bill defining "foreign governments" as "persons," and the Commission is directed to issue, upon demand, to all "persons," under certain restrictions and limitations, this fissionable material.

The CHAIRMAN. Wait a minute, Senator. You will also find in the bill a provision against the export or import of any fissionable materials. Now I think that—

Senator HICKENLOOPER (interposing). I think that is under the Commission—

The CHAIRMAN (interposing). No foreign government could export any fissionable materials under this bill. I think it might be well to tighten that up.

Senator HICKENLOOPER. I am merely calling attention to the rather radical conflict of language in a couple of places which I think will cause some confusion.

The CHAIRMAN. We want to correct such things; that is what we are here for.

Senator HICKENLOOPER. I think that section 3, in connection with section 9, would bear some rather careful analysis as to what it does say, and I value your opinion on that, Mr. Davis, very highly.

Mr. DAVIS. Thank you, Senator, I don't know as that would be worth half as much as your own.

Senator HICKENLOOPER. That is very nice of you, but I would still like very much to have your opinion.

Mr. DAVIS. I know what you have in mind, I am sure, and I will be glad to think it over. I might throw in, parenthetically, that I can't imagine anything that would be better for the world than if the Army should now announce that the fissionable material which we now have embodied in bombs has a capacity of releasing an amount of energy which would be "sufficient to do the following things." It would probably be sufficient, as I say, to make the Colorado River run over the Sierra Nevada Mountains, and perhaps remove the Sierra Nevada Mountains, for all I know, if anybody wanted to. I think they have got enough energy in bombs today to irrigate every square mile of arid land in America.

Senator HICKENLOOPER. It would have a very fine effect also, if this should be true—I don't know whether it is or not—if they also announced, when the time came, that we have enough bombs to blow anybody off the map. That might speed up some agreements and negotiations.

Senator AUSTIN. We might call on Paul Bunyan and his blue ox.

Mr. DAVIS. This has Paul backed off the map, Senator.

Now, to come to the patent section, Mr. Chairman and gentlemen, I have prepared a proposed substitute. This is a subject on which I have some special knowledge. That begins on page 18.

Paragraph, or rather section 10 (a), proposes really the exercise of eminent domain with respect to any inventions or discoveries that lie in the field of the production of fissionable material. It proposes—and I think soundly so—that any such invention or discovery becomes, ab initio, the property of the United States, and the inventor or discoverer will be compensated by this Patent Royalty Board.

The CHAIRMAN. Let me ask you at this point, this question. Because of your particular interest in the patent field have you looked into the patent situation in the Manhattan project; have you any information on that?

Mr. DAVIS. No direct information, Senator. I know only a little about it through Mr. Kenyon and Mr. Lister. Kenyon was the head of the War Department's patent work, and Lister was out there at the Manhattan project, but I haven't discussed it in detail with them.

The CHAIRMAN. They are the gentlemen that would know about how many patents arose in this project, that is, the occasion for the patents? Will you make a note of those two names and let's have them for the committee?

Mr. DAVIS. Yes; can I put that in the record right now?

The CHAIRMAN. Surely.

Mr. DAVIS. The first one is Mr. W. Houston Kenyon, Jr., whose address is 165 Broadway, New York City. Mr. Kenyon was the patent adviser to the Secretary of War during the war, and is now the head of the staff which is working under this committee of which I am the chairman, on a revision of the patent laws.

Mr. Lister's name is Gordon K. Lister, and his address is 60 East Forty-second Street, New York City. He is a young patent lawyer, and I don't know the extent of his knowledge of this particular thing but I know he was out there on the Manhattan project. In fact I have a letter from him about this bill. I attended a meeting of the patent bar in New York a week ago and they knew that I had been asked to testify about this bill, so some of them offered some objections.

Now, as to section 10 (a), as I say, I am in accord with the basic idea that the Government should have the ownership of all inventions or discoveries in the production of fissionable material. The section, as it is written, starts out:

Whenever any person invents a device or method for the production, refining, or other processing of fissionable material.

There were two suggestions I had on that which I embodied in the proposed redraft. The first of them is that the words "a device or method" are not sufficiently comprehensive because you may be interested in materials, as I said before, and I see no reason why the language of the patent statute would not be better here so that there would be no question about it. It is somewhat artificial language, but it has been explained and interpreted by the courts, and it would read as follows:

Whenever any person invents or discovers any new and useful art, machine, manufacture, or composition of matter for the production of fissionable material—using those words—

for the production of fissionable material—

to carry in the definition of section 4 (a).

The CHAIRMAN. Those words have been construed by the courts.

Mr. DAVIS. Yes.

The CHAIRMAN. I see no reason why we shouldn't adopt that suggestion.

Mr. DAVIS. Then in line 24 it is provided that the Commissioner of Patents "shall issue a patent in the name of the Commission." I propose to change that to "shall issue a patent to the Commission." It seems a slight change, but the patent statute provides that patents shall be issued in the name of the United States of America to the inventor or his assignee. So that it is really more proper to say that the patent will issue "to the Commission."

Then I did suggest in this redraft that instead of referring to this Patent Royalty Board as such, that you should use the expression, perhaps, Patent Compensation Board, for this reason: That I foresee that especially in these basic inventions, in the field of production, that a royalty compensation—in fact you foresaw that in the draft here—would not be an appropriate one, and that a lump-sum payment would be more appropriate; that somebody might invent or discover a very important improvement in the production of fissionable material and it might be the policy of the Commission not to use that at all at that time. So the Government would be saying, "I am going to take this from you and not use it," and you couldn't compensate him then by a royalty. I would like to get away from that. I would like to see it perfectly clear in the bill that this Board which fixes compensation is not limited to royalty payments. In fact the bill says that—

The Patent Royalty Board shall determine what constitutes just compensation in each such case and whether such compensation is to be paid in periodic payments rather than in a lump sum.

Senator HICKENLOOPER. Mr. Davis, I would like to ask you about this, on that particular provision. This sets up a board. That is, the Commission itself takes this patent by this process, eminent domain or whatever you want to call it—it is not that exactly—and then the Commission itself sets up a compensation board.

Mr. DAVIS. Yes.

Senator HICKENLOOPER. It is just as if I wanted to sell you a horse, and I turn the title of the horse, or to the horse, over to you, and then say, "How much will you give me for the horse?" I am against a procedure where the group that makes the rules sits in judgment on the compensation to be paid. It seems to me that if the Commission is going to take the invention of an individual under a theory of compensation, that is, if we go on the theory of compensation, we have two ways to go, either the Government will just preempt it with no compensation, or fair compensation will be paid.

The CHAIRMAN. We couldn't take it without compensation and stay within the Constitution.

Senator HICKENLOOPER. Well, the bill hasn't gone on that theory, it has gone on the theory of compensation. Therefore, it would seem to me that if a patent is issued to the Commission, then the Commission should present this matter, along with the man who invented it, to a court of claims, or to some other body removed from the parties in interest.

Mr. DAVIS. Senator, I am halfway between the two on that, and I thought a great deal about it. If I may develop what I did think about it—

Senator HICKENLOOPER (interposing). That is why I raised the question, I would like to get your opinion on that.

Mr. DAVIS. The Commission is certainly going to need a permanent institution, set up for the purpose of measuring the value of these inventions, and this Board not only has the functions, in the bill, of fixing compensation for rights taken by eminent domain, but also for fixing a reasonable royalty in the other field of the use of atomic material where there will be occasion to grant licenses through the action of the Commission, and to compensate for them.

Now, you will certainly need there a body of men who devote themselves to that job, because there is a great interrelation of values as you can imagine, in such a field. They become knowing of what values are in that field. I think the initial determination should be made by such an administrative body. I don't think that the final determination should be. My suggestion was to be that you go back to page 11, under "General Provisions" beginning at the bottom of page 10 and running over to page 11, where it is provided that—

In the exercise of such rights of eminent domain and condemnation, proceedings may be instituted under the act of August 1, 1888, or any other applicable Federal statute.

Now, the Johnson bill went a little further than that—

Senator HICKENLOOPER (interposing). But when you exercise eminent domain the authority, as a rule, exercising eminent domain, does not have the final say on the compensation. An owner, if dissatisfied, has a remedy in adequate review.

Mr. DAVIS. Well, precisely, and if I may finish here, because I didn't quite finish, I will bring that out. In the Johnson bill it is proposed, in section 8, page 16, under the heading "Compensation for Private Property Acquired," that—

The United States shall make just compensation for personal property acquired, taken, or requisitioned pursuant to section 6 (d) or section 7. The Commission shall determine such compensation. If the compensation so determined be unsatisfactory to the person entitled thereto, such person shall be paid 50 percent of the amount so determined, and shall be entitled to sue the United States to recover such further sum as added to said 50 percent will make up such amount as will be just compensation.

Now, some such arrangement of preliminary determination by the Commission, with review by the courts under the act of 1888, it seems to me should apply here, not only to all personal property condemned but including the patent rights, which are personal property.

Senator HICKENLOOPER. I agree with that.

The CHAIRMAN. That 50-percent provision is the same provision that was contained in the War Contracts Disputes Act. Fifty percent of any disputed contract was paid and the rest was litigated.

Mr. DAVIS. Well, whether 50 percent is the right division or not I hadn't thought much about it. I do think, though, that there should be an initial fixing of the compensation by the Commission, through this special board, but that that should be subject to review in the courts. I suppose it would be anyway.

The CHAIRMAN. Yes; it would be.

Mr. DAVIS. That is my suggestion on that.

Senator AUSTIN. Have you taken care of that in your substitute?

Mr. DAVIS. No; I have not; it doesn't come directly into that portion.

The CHAIRMAN. Might I interrupt, Mr. Davis, and request Mr. Newman to follow that portion of Mr. Davis' testimony and let us have an amendment in accordance with that provision of the Johnson bill?

Mr. NEWMAN. Yes, sir.

Mr. DAVIS. Now to get to the next step which I think is of tremendous importance to everybody concerned, and I would like to try to express this as clearly as I can because it is rather specialized knowledge. That has to do with the provisions of subsection (b) of section 10, under "Patents." The proposal there is that "Any patent now or hereafter issued"—I have got to interrupt myself, Mr. Chairman, and go back to section 10 (a) first, I am sorry, because I neglected to point out—and I have taken care of it in the proposed redraft—that the last sentence of section 10 (a) which provides, "Any person to whom any such patent has heretofore been issued shall forthwith transfer" and so forth, omits to cover inventions that have already been made before the passage of the act, patent applications that are now on file. In my redraft I have enlarged it to say—

Any person who has heretofore made any such invention or discovery, or who has heretofore filed an application for any such patent, or to whom any such patent has heretofore been issued, shall forthwith transfer all right, title, and interest in and to such invention, discovery, patent application, or patent—

and so forth. That is just completing the coverage.

Now back to subsection (b). The purpose there was to say that now we turn to this field of use of atomic energy, and having, I think, two thoughts in mind: One is the possible lethal use of atomic energy which must be guarded against, and the other is the great desirability of promoting the widest possible use of atomic energy in peaceful pursuits—

The CHAIRMAN (interposing). Do you mind if I interrupt you for just one moment?

Mr. DAVIS. Not at all.

The CHAIRMAN. Under 10 (a) you have said that you wanted to insert a provision that took care of a patent that had already been issued?

Mr. DAVIS. The thing that was left out was inventions that have been made and have not issued yet as patents, Senator. Your first provision covers any inventions hereafter made. The last sentence covers any patents heretofore issued. The thing that was omitted was any inventions heretofore made and any patent applications now pending.

The CHAIRMAN. I am sorry to have interrupted you; I misunderstood you.

Mr. DAVIS. Now, in subsection (b) the proposal, then, is to say that with respect to all patents taken out by private citizens, which relate to the utilization of atomic energy, the language being—

covering any process or device utilizing or peculiarly necessary to the utilization of fissionable materials, or peculiarly necessary to the conduct of research or developmental activities—

that as to all those patents they become subject to compulsory license on terms and conditions as to royalty, to be fixed by this Royalty Board. I think that that is a great mistake, and I can illustrate it by making two inventions for you.

First I will assume—this is not my invention—but suppose I invent a little device the size of a water bucket that has got pipes in it, and you can connect it to the faucet in your house and it has a receptacle and you drop a little pill of uranium-235 or plutonium into this receptacle and you have got a house hot-water heater that will run a week or a month or whatever it is—and these things are sold over the counter in the department store or hardware store. I see no reason in the world why the inventor of such a device as that should be treated any differently from the inventor of something that uses the energy of the sun, or electrical energy, for a useful device of that kind. I will develop that a little further later on.

Now let's go to the other extreme. Suppose some of these big laboratories, or I or you, discover tomorrow that by throwing some kind of an electromagnetic field, we will say, around an active pile of plutonium, that they could not only absorb the neutrons that now have to be absorbed in these huge metallic shields, thereby doing away with all that mess, but that in so absorbing the neutrons they became immediately converted into electrical current, electrical energy, that could be transmitted. So you could set a pile on this table and throw your electric field around it and have a power plant sufficient to light a city. Well, with so basic a thing as that I can see how the Commission might feel, and the country might feel, that it should not be left in the monopolistic control of a single company.

So what I suggest in my redraft, Senators—and I do it with the greatest earnestness—is that you leave it to the Commission to say with respect to this type of patent right—

The CHAIRMAN (interposing). You mean the pill in the pail?

Mr. DAVIS. Yes, or any invention or discovery relating to the utilization of atomic energy, that it be left discretionary with the Commission to go out into that field and say, "In this case you must issue license," using that discretion from time to time as the policy of the act would dictate. What I propose in my redraft is that when the Commission finds that it is appropriate to the policy of the act, and suitable to accompany the license to use which it is to issue under section 7, then have the power to say to the patent owner, "You must issue a license for use on terms to be fixed by this Commission, and not do it in a blanket way."

Now, let me tell you why, Senators, and this goes to the heart of a very important subject. There are three activating effects of the patent system. I, of course, may be suspected of prejudice in that field, I have devoted my life to it, but I certainly know from experience that what I say is true.

There are these three different motivating things. The first one is that you reward the inventor, thereby inducing him to disclose his

discovery instead of keeping it secret. Now mind you, the nature of the discovery is that it comes to the mind of an individual—it may not come for a long while to the mind of anybody else—but if this individual wants to keep it secret he can. And the primary function of the patent system is to induce him to disclose it. Now, the last thing we want in this atomic energy thing is to have people feeling that they have been done out of the benefits of the patent system and therefore be inclined to try to keep the secret.

Of course the inventor is induced to disclose it by two very fundamental human motives. One of them is the honor, the dignity—he likes to be recognized as the inventor, and that has a tremendous effect, I know from experience. The second is that he needs to live like the rest of us, and he gets money that way.

Now, I will state the other two functions of the system before I come back to the effect of this bill.

The second is to protect risk capital. After all, it takes a lot of money nowadays, and in this field maybe tremendous amounts of money. It cost \$2,000,000,000 to complete this little job of getting the thing on the market, so to speak. But if a group of investors, a corporation or an individual, puts in this risk capital in developing a naked idea to a commercial product or process, and then if his competitor can come along the next day and copy his commercial process or product, he not only hasn't been rewarded but he is definitely in the red on the transaction because he has to carry this investment and amortize it, and the other fellow has none. So that protection of risk capital is the second function.

Now, the third effect of the patent system which every patent lawyer has had many illustrations of in his experience, is not so well understood, and I refer to it as the "enforced diversity of innovation"—and I will put it this way.

Suppose you had an area of land and you know that there is "gold in them thar hills," and you wanted to explore them as rapidly and thoroughly as possible. The best way to do it would be to take, say, as many explorers as you had, say 100 men, skilled in the business, who knew their way, and say to them, "Now, you fellows know your business; you go ahead on your own hook, each in his own direction, and I will lay upon you only one injunction, and that is that you must not follow in anybody else's footsteps; wherever you see footsteps turn aside and go somewhere else"—because the natural tendency of mankind is partly "sheepish," there is no doubt about that, that they like to follow other people's footsteps.

The effect of the patent system in what we might call the lower levels of invention, is to force diversity. A is a manufacturer of can openers; B is a competitor. B comes along with a new type of can opener. He gets a patent on it. A can't copy it, but he still has to stay in the can-opener business, so he gets busy and gets himself up some new type of can opener, and it is usually a little better than B's.

Now, that is a humble example of what I have seen occur throughout American industry for the last 45 years, over and over again, and in the great industries. I could give you numerous instances. For instance, in the separation of copper from its ores, and in the refining of copper, or in the chemical field where the fact that A is shut off by a patent from one new line leads him to develop another.

That is what I refer to as the "enforced diversity of innovation," which is a fundamental effect of the patent system.

Now, let's look at this proposal of the present section 10 (b) in the light of those three things, and subsection (a), too. Now, in (a), where you are dealing with the basic production of this material, you propose to reward the inventor and you propose, really, that the Government should put in the risk capital. Now, let me put it this way, Senators, never open up a patent right to compulsory licensing unless you are ready to have the Government supply the risk capital, because nobody else will supply it if you once take away that monopoly right. But in this basic material you want to control the production of it, and the Government will, as it has done, supply the risk capital. Now, you lose the diversity of innovation when you take everything into the hands of the Government. It is probably replaced, in this field of basic research and tremendous interest, by another motive of mankind, the creative instinct which I often say is such that you don't need to encourage an inventor to invent, any more than you need to encourage a man to love; it is a basic human instinct. You have to support him——

The CHAIRMAN (interposing). In other words, Columbia would get a grant-in-aid and so would Chicago, and the competition is between the two universities, for instance?

Mr. DAVIS. Sure. These boys get in there and they are motivated by the love of creation, so much so that I, in the scientific research bill, was opposed to the idea of giving any reward at all in the laboratories of nonprofit institutions because it just gets these boys worrying about money when, if you leave them alone, they are really rather devoted, I think—Dr. Condon may agree with me or not; I don't know—to their research.

But at any rate, when you step into the second field, the field of use, if you set up, as this bill proposes, automatically this compulsory license, you destroy the protection to risk capital and you destroy the compulsory diversification of effort. And I think it would be quite unwise and unnecessary to do it, because, in preference to that, you should leave it, I think, to the Commission to have really the power of modified eminent domain, to go in there and say "In this case we find that this monopoly is standing in the way of the basic purpose of the act, specifically today, now, standing in the way, and we therefore decide to throw out of the window this risk capital advantage and the diversity of innovation advantage, for the sake of the higher good." But I don't think you can do that in general.

Now, I will just add this much to that, that you also have, and reflected in the language of the bill, a field of invention and that is in the devices that have already been invented, tremendous advances in devices. The advances were made because there was plenty of money around, and this really tremendous purpose had to be accomplished, and they made improvements in filters and pumps and endless things that probably would not have come about in 20 years in the ordinary processes of advancement.

Well, if those things are necessary or essential to the production of atomic energy, or even to its utilization, then the Commission should have discretion to take them. But there is no reason why the inventor of those things should have to give a license to his competitor to make those pumps for general purposes, and all of

them have uses outside of the field of atomic energy which I don't think the Commission should have any right to interfere with.

Senator AUSTIN. Have you the phrase or paragraph before you that you suggest as a substitute?

Mr. DAVIS. Yes; I have some copies of it here.

Senator HICKENLOOPER. I wonder if we can have that printed, Mr. Chairman.

The CHAIRMAN. Yes; we shall, Senator, and it will appear in the record at this point.

(The proposed substitute section 10 is as follows:)

PATENTS

SEC. 10. (a) Whenever any person invents or discovers any new and useful art, machine, manufacture or composition of matter for the production of fissile material: (I) he may file a patent application to cover such invention or discovery, sending a copy thereof to the Commission; (II) if the Commissioner of Patents determines that the invention or discovery is patentable, he shall issue a patent to the Commission; and (III) the Commission shall make just compensation to such person. The Commission shall appoint a Patent Compensation Board consisting of one or more employees and at least one member of the Commission, and the Commissioner of Patents. The Patent Compensation Board shall determine what constitutes just compensation in each such case and whether such compensation is to be paid in periodic payments rather than in a lump sum. Any person who has heretofore made any such invention or discovery, or who has heretofore filed an application for any such patent, or to whom any such patent has heretofore been issued shall forthwith transfer all right, title, and interest in and to such invention, discovery, patent application or patent to the Commission and shall receive therefor just compensation as provided above.

(b) (1) The Commission shall have power, on its own motion or upon application of any interested party, and upon first finding that such grant would be in furtherance of the policy declared in section 1 and is required in connection with the issuance of any license under section 7 of this Act, to grant (by right of eminent domain) to any person a license under any patent heretofore or hereafter issued of such scope, and containing such terms for the protection of the public interest, as the Commission deems necessary to effectuate the purposes of this Act and containing such reasonable royalty and related provisions for the benefit of the patent owner as the Patent Compensation Board shall determine.

(2) In determining such reasonable compensation, the Patent Compensation Board shall take into consideration any defense, general or special, that might be pleaded by a defendant in an action for infringement, the extent to which, if any, such patented invention or discovery was developed through federally financed research, the degree of utility, novelty, and importance of the invention or discovery, the cost to the patentee of developing such invention or discovery and a reasonable rate of return on such research investment by the patentee.

(3) If complaint be made to any court, Federal, State or Territorial, alleging that a defendant has, in course of the production or utilization of fissile material or by-product material, made, used or vended the invention of any patent heretofore or hereafter granted, and seeking relief for infringement thereof according to law or equity, the said court shall not have jurisdiction or power to stay, restrain or otherwise enjoin (i) any acts so complained of which are within the scope of any license previously granted by the Commission as provided in section 10 (b) (1) hereof; nor (ii), if not so licensed, any acts so complained of until sixty (60) days from and after service of the complaint, unless the Commission has previously refused to license the same. If, during said sixty (60) day period, the defendant shall apply to the Commission for a license as hereinabove provided and shall diligently prosecute such application, the court shall not thereafter have jurisdiction or power to stay, restrain or otherwise enjoin the acts so complained of unless and until the Commission has determined to refuse a license or, the Commission having granted a license, the defendant makes, uses or vends the said invention in a manner not within the scope of said license or, having done so in a manner within the scope of said license, fails to abide by those terms thereof which are for the benefit of the plaintiff. Nothing herein contained shall be deemed to lessen or curtail the existing jurisdiction and authority of any court

to enter judgment for damages or costs or to increase such damages, for infringement of any patent, but the provisions as to reasonable compensation contained in any license granted by the Commission, and a written recommendation of the Patent Compensation Board as to the reasonable compensation it would have established in the particular case had application for a license been duly made, shall be admissible in evidence upon the issue of damages.

Mr. DAVIS. Now, there is one question that I myself raise at the bottom of page 1 of this draft. I have put in parentheses the words "by right of eminent domain," so that the sentence reads:

The Commission shall have power * * * to grant (by right of eminent domain) to any person a license—

and so forth. I marked that that way for the very reason that I wanted to discuss at that point the question that we have discussed, of review of the Commission's compensation acts, and whether it is necessary to put in "by right of eminent domain" I would like to leave to the lawyers of the committee, or the committee itself, I don't know. The words are not used in the earlier part of the bill and probably needn't be used here.

The CHAIRMAN. They usually "take" under the right of eminent domain. I have never heard of "granting" under it.

Mr. DAVIS. That is right. The wording of the general provisions on page 10 is "take, requisition, or condemn."

Senator HICKENLOOPER. Eminent domain is generally considered to be an inherent authority of government. I am like the chairman, I never heard of it being used in this particular way before.

Mr. DAVIS. The way it gets connected with the word "grant" is that the Commission now shall have power to take from the inventor and grant to others.

The CHAIRMAN. Having taken, and taken under a legal power, that of eminent domain, they would have it legally, to do as they would with it. I don't think it is necessary.

Mr. DAVIS. I don't either.

Now, there is one other point I make here. In the bill as drawn, in section 10 (b) (2) on page 19, it says, "Any person to whom any such patent has been issued, or any person desiring to use any device or process," and so forth, may apply for a license and apply to the Board to fix an appropriate license fee. I foresee a great deal of trouble, unnecessary trouble, for the Board, if you say that any patentee who has a patent in this tremendous field can go to the Board, because you will find a lot of gadget makers who will be coming to this Commission and saying, "I would like to have you now fix an appropriate fee for the grant of a license under my patent," and he would be doing it just to get publicity, recognition. I don't think the Commission or the Board should undertake to fix a license fee until there is some reasonable prospect, at any rate, that the Commission is going to order the issuance of a license, or until there is an application at least from somebody who wants a license. What I have done in my redraft is this. In my section 10 (b) (1) I say: "The Commission shall have power, on its own motion or upon application of any interested party," and so forth. That is partly side-stepping the issue by leaving it to the discretion really of the Commission to say whether this fellow is an interested party or not.

Senator HICKENLOOPER. One more step there. It might be well, and would still leave open negotiation between individuals and take

the patent compensation board off the spot, if the inventor of the device that hadn't been turned over to the Government, or was considered to be under the supervision of this Commission, if he made a bona fide deal with some fellow that wanted to use it at a certain fee, and then submitted it to the Commission as to whether that would be approved.

Mr. DAVIS. That might be helpful. There is another helpful thing that might be done, following the lead of the present Commissioner of Patents, who has now set up a register in the Patent Office in which people are beginning to register a very large number of patents available for license. I believe the Radio Corporation has recorded all their patents there. Now the Commission might well maintain such a list too. Maybe it is unnecessary to duplicate it, but people could come and say, "I hereby offer to license my invention in this field to anyone who wants a license, on terms to be fixed by this Board," and maintain a register of such patents.

Senator AUSTIN. I would go one step farther than your suggestion and make that "any person having a justiciable interest."

Mr. DAVIS. Well, maybe so, Senator Austin. You have my point?

Senator AUSTIN. Yes.

Mr. DAVIS. I would be very glad, Mr. Chairman, if the staff wants to talk with me about this section, and finds any bugs in it, or doesn't know what I am shooting at, or anything like that, rather than take the time of the full committee, to go over it with the staff.

The CHAIRMAN. If you could, Mr. Davis, get together with the staff and see if the views can be reconciled, that would be very helpful, although I recognize that there is a basic difference of opinion.

Mr. DAVIS. Yes.

Senator HICKENLOOPER. You have a very different situation there. I mean what you have been talking about now is about a patent that I might secure and retain, not about a patent that would be taken under eminent domain or turned over to the Commission under this bill.

Mr. DAVIS. That is right.

Senator HICKENLOOPER. And yet it would have such an effect or an interest in this atomic energy field that it would still be subject to the control—that is, the end result would be subject to the control—of the Commission.

Mr. DAVIS. Yes.

Senator HICKENLOOPER. That would be the only way the Commission would have anything to say about what I licensed Senator Austin if I controlled the patent?

Mr. DAVIS. That is right. Suppose you had invented a pump for liquids or gases, as they did in this development. Now you want to go into the manufacture of that and you license somebody to manufacture that pump for pumping beer in a brewery. The Commission wouldn't have any interest in that and there is no reason in the world why your patent rights should be interfered with in that field at all. It is only if they want to use it in the production or use of atomic energy.

And I will say this to you: There is an idea abroad, gentlemen—if I could impress this on this committee as I have tried to do on other committees of the Senate—there is a very natural idea that runs like

this: "We want to have this thing freely and widely used to the maximum extent. A patent is a monopoly and therefore an impediment to extensive use. Therefore, let's break down the impediment and let everybody use it." It is a very natural idea but if it were a sound idea the whole patent system would be unsound, and it is not just a theoretical matter, it is a practical matter of actual experience. People will say to you, "Look at what a wonderful country the United States is"—we all like to say that—"and what a wonderful job we have done in invention and promotion of industrial things, gadgets, if you please—"

Senator HICKENLOOPER (interposing). I take it Lorenzo Jones has contributed to that.

Mr. DAVIS. Yes. But I don't know what we would have done without the patent system. I do know from practical experience, over and over again, that to get risk capital I had to have the patent, I never could have gotten it without the patent; and that over and over again a man has been forced into a new line because he was shut off in some path by a patent. Those are real values, and it is those values that make it unsound to think that by doing away with the patent in a field you are going to increase the public use in that field. It is quite the contrary. The most effective method of getting at invention, which is a naked idea—it is like a child at birth, it has to be brought up, fed, developed, and kept for an average of, probably 7 years might be a good average, before you get the thing on the market, it has got to be taken care of all that time—and if you open it to compulsory license, even on a reasonable royalty basis, you just leave it out on the doorstep, you know, in the cold. That is what I have tried to work into this proposal.

The CHAIRMAN. This objection occurs to me and I would like to get your observation on it: I can see the strength of your point as far as concerns inventions hereafter made. In other words, let's assume that a new type of pump is invented next year and it has two applications, one in the production of atomic energy, and another in pumping beer in the brewery. Now, I can see a very good reason for at least the beer-pumping function being protected by a patent. How about, though, the situation that might confront us if, for example, the Kellogg Co. had invented, as I am sure they have, certain pumps, certain apparatus, which was necessary while it was working under the Government contract, and they now find that it has a beer-pumping purpose. What is your observation on whether or not they should be protected by the patent for the beer-pumping purpose, having invented it under Government contract to do this job and having been reimbursed?

Mr. DAVIS. Well, that is a very difficult question to answer because it depends on the contractual relationships, express or implied, at the time the invention was made. In connection with the Kilgore bill I was asked to confer with those people, and I have taken the position that any invention or discovery for which the United States paid with its money, they paid for the research, should belong to the United States. Secondly, that when an invention or discovery belongs to the United States, it becomes senseless to talk about a patent at all because the patent right is merely an emanation of the power of government as an umbrella over the private citizen who owns the patent, and when the invention vests in the Government, that emana-

tion must be absorbed in the body politic and the practical aspect of it is, the pragmatic aspect is, that you can't administer and you can't politically visualize the Government granting a monopolistic right to its citizens discriminately.

The CHAIRMAN. In this redraft have you provided any way to take care of the contingency which you have suggested?

Mr. DAVIS. Only to this extent, Senator: The bill as it was originally drawn omitted to provide for this compulsory license with respect to devices peculiarly useful in the production of atomic energy, or of fissionable materials, and that has been corrected in here. So that the Commission in any case would be able to say, "Well, you must give the Kellogg crowd, or somebody else, a license to manufacture some of these things for use in the production of atomic energy." That is only a part of it. Your problem is one about which Mr. Kenyon would know much more than I, because during the war every contract of research they made involved this problem, and every agency of Government had a different policy as near as I can find out. The Navy did one thing, the Army did another, and so on. In general the Army—and this is a generalization with a good many exceptions to it—but as near as I can generalize the Army would make a contract which assured to the Government in perpetuity the right to use the invention for governmental purposes, without cost, but left to the originator, like the Kellogg people, the right for private use. I think you will find the bulk of them like that.

But I was talking with Dr. Bush about a case in which they made a contract in some medicinal field, as I recall, for special research, and the results of the research were, by contract, assigned to Dr. Bush, as Director, or to the Government, but under a deed of trust, really. That is, they agreed to assign them to the Government for specified purposes. You will find instances like that.

Now, the Kilgore bill provides, as it is now drawn, that any invention paid for by a Government appropriation for research will belong to the Government, with certain exceptions, and those exceptions amount to this—that the procurement agency can make a special contract where the contractor is putting in his own money, or where the research is in a field in which the contractor has already put in a lot of money. That is left to the discretion of the agency, the agencies being enjoined, however, to observe the general policy of the Government that anything paid for by the Government, by Government money, should belong to it. That is the present form of the proposed Kilgore bill.

Senator AUSTIN. May I ask you if there is any difference in your mind between the relationship of the Government as a contractor to the inventor, and that of the private enterprise to the inventor? Doesn't it all turn upon what the inventor's contract was?

Mr. DAVIS. Yes, it does, Senator, but the law, as you probably know, on that subject, is very trying. The law has always said that a man employed by you to make an invention, which is a little indefinite to start with, but employed for the purpose of developing a certain field, if he makes an invention in that field, then it doesn't belong to you but all you have is a shop right in it, and that really lies back of what the Army did during the war so largely.

In the last war I was in a position, in passing on Government forms—I got in pretty late like everything in the last war, and didn't

begin to regulate anything until the middle of 1918—but I found patent sections that just unbelievably differed. I found, for instance, in many of the departments of the Army, that the contracting officer required the contractor to hold the Government harmless against patent infringement suits. In other departments of the Army the practice was exactly reversed, and the Government guaranteed to hold the contractor harmless.

Then, as you know, they passed an act putting the thing in the Court of Claims, so that you can't sue a Government contractor on a patent now except in the Court of Claims. But it is a very complicated, unnecessarily obscure law, and I think I would answer Senator McMahon's question by saying that this section that I drew up does not deal with that, but if the Kilgore bill does not in itself cover this field, then it seems to me that a similar provision as to Government research, expenditures and patents, should perhaps be brought into this bill. Indeed it is hinted at in this bill, as you know, where you say that in fixing the compensation, the royalty board shall take into account the extent to which Government money has been involved.

The CHAIRMAN. Mr. Davis, going back to your pill-in-the-pail-of-water idea, for the purposes of illustration, I want to see if I understand you correctly, and if I do, a couple of the implications of it. We will assume that John Jones comes along and is successful in dropping the pill in the pail of water and he produces a small gadget which conceivably might take the place of all local power installations in homes and factories and shops. For a period of 17 years he would have America in his back pocket, wouldn't he?

Mr. DAVIS. Yes; that is what I tried to picture on a somewhat larger scale in my electrical field idea. That is a situation where, if it were announced today that the General Electric Co.'s laboratories had discovered something like that, it would blow the roof off the stock market, because every public-service corporation in the country wouldn't know where they were coming out.

Senator HICKENLOOPER. Isn't that pretty well taken care of in this bill, though? In other words, under this bill the Commission would have charge of anything that has the use of atomic energy involved.

Mr. DAVIS. That is right, Senator. Under the bill the General Electric Co., having made that invention, couldn't use it until they got a license from the Commission to get the material. That is the first step.

The CHAIRMAN. And the Commission couldn't grant the license until it had made a study of the social implications and the political implications of the invention and reported them to Congress.

Mr. DAVIS. Yes.

Senator HICKENLOOPER. Traditionally that would probably take a very long time.

The CHAIRMAN. Well, assuming that that would be the result of the General Electric Co. dropping the pill in the pail of water, it might very well take a long time, because otherwise, if you were to spring it on our economy overnight, not only the stock market would go "blooey" but everything else.

Senator AUSTIN. What have you done here, Mr. Davis?

Mr. DAVIS. What I have done here is to say that the Commission, at the time it considers whether to issue a license for use of atomic

material and to allocate the material to the General Electric Co. or whoever it is, shall also have the opportunity to consider whether they should impose upon the patent rights in that case this right to extend licenses to others.

The CHAIRMAN. Now, in this particular case of your pill in the pail of water, if you were running the Commission what would you do?

Mr. DAVIS. Well, my pail of water, Senator, was not something that I thought of as replacing present installations, power installations. The other one was, the power plant. But my pail of water was just something like you would sell to homes that didn't have adequate hot-water systems, just as you now have a little burner that you put on the edge of the bathtub, or what-not. I was trying to imagine something that was not necessary to anybody's happiness, but for which there would be a reasonably good market, and in that case I would say, "Well, let him have his patent," if it was only a patent on the gadget.

The CHAIRMAN. In other words, as you have it written out you leave it within the jurisdiction of the Commission as to whether or not it is important enough for it to be widely disseminated, taking the risk of the loss of—what did you call it, Mr. Davis?

Mr. DAVIS. Enforced diversity of innovation—that is rather a mouthful.

The CHAIRMAN. Leaving that decision to the Commission?

Mr. DAVIS. Yes.

The CHAIRMAN. I take it that you are going to work with the staff on this?

Mr. DAVIS. Yes, sir.

The CHAIRMAN. Thank you very much, Mr. Davis.

The committee will recess until 10 o'clock tomorrow morning.

(Whereupon, at 1:10 p. m., the committee recessed until Wednesday morning, January 23, 1946, at 10 a. m.)

ATOMIC ENERGY ACT OF 1946

WEDNESDAY, JANUARY 23, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to call, at 10 a. m., in room 424-B, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Johnson, Austin, Byrd, Millikin, Hickenlooper, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will come to order.

Mr. Secretary, we invited you here this morning to testify on S. 1717, and any comments that you care to make will be welcomed regarding the domestic legislation which is pending before the committee.

Would you proceed in your own way?

STATEMENT OF HON. JAMES FORRESTAL, SECRETARY OF THE NAVY

Secretary FORRESTAL. I am very glad to respond to your invitation to testify before the Special Committee on Atomic Energy of the Senate, limiting, however, what I have to say to the military considerations that grow out of the bill.

I don't believe I am qualified to express views on the other implications of the discovery of atomic energy.

I have considered the provisions of Senate bill 1717 as it relates to the Navy. I concur in the over-all purpose of the bill, but respectfully suggest that certain changes may properly be made.

In its present form, the Navy thinks the bill is not satisfactory in the following respects:

Prestige of the Commission is established by the caliber of its membership. We think that members serving, to quote the language of the bill, "at the pleasure of the President," would carry a connotation of impermanence which would not be desirable and would also limit the dependence of the membership.

The CHAIRMAN. That is the way you serve yourself.

Secretary FORRESTAL. Well, sir; maybe I haven't got prestige.

The CHAIRMAN. I think you have got a lot of it.

Secretary FORRESTAL. We think the outstanding scientific and industrial leaders might be unwilling to serve on these terms. We think that the lack of an executive officer or administrator could profitably be corrected.

We think that while the organization of the so-called Manhattan district into functional groups is logical, that those groups could profitably be coordinated by a single—I don't like the word "coordinator" in that sense.

The CHAIRMAN. A general manager?

Secretary FORRESTAL. Yes; an executive, in other words, who will bring together the functions, the actual working of your functional committees or groups. In fact, we think the fact that there is no mandatory liaison or exchange provided between the State, War, and Navy Departments is a gap. It seems to me, as far as I am concerned personally, that this is so related, just as our military power is inextricably related, to diplomatic policy; that certainly this whole subject is one that is tied very closely to the question of military policy and our national policy in the field of foreign affairs.

We think that the fact that the Commission has no specific responsibility for the national defense, while at the same time it is charged with the development of atomic weapons, is not logical. We think that responsibility and the authority for development must go together.

Fissionable materials are required, by section 5, subparagraph (a) (4) of the bill to be distributed to any applicant equipped to observe safety standards and who does so observe them regardless of national interest.

Section 9 (b) (2) of the bill gives the Commission the sole right to determine what information is of value to the national defense. The Commission has no responsibility in matters relating to national defense, and we think that that right and authority are therefore not properly vested in that body.

Senator BYRD. What section is that?

Secretary FORRESTAL. Section 9 (b) (2) of the bill.

The CHAIRMAN. That is on page 17, Senator Byrd.

Secretary FORRESTAL. The positive recommendations we have are as follows:

That there be included as an object, and a provision made for the organization along the lines that were so successful in the Manhattan district during the war;

That a mixed Commission be established of ex officio and full-time members as follows: Vice President of the United States as chairman, the Secretary of State, Secretary of War, and Secretary of the Navy, all acting ex officio;

That four full-time members be appointed for specified terms—6 years in our judgment—by the President.

The CHAIRMAN. Pardon me. You have the Vice President, the Secretary of War, the Secretary of Navy?

Secretary FORRESTAL. And the Secretary of State.

That four full-time members be appointed by the President, with the advice and approval of the Senate, and subject to recall only by impeachment, and that they be eligible for reappointment with a salary substantial enough to enable the man to take such a position to be attracted by it, something in the order of what was provided for the Justice of the Supreme Court.

We believe that the prestige of the Commission would be insured by the fact that members of the Government were included in it, men who are also responsible for the national security and for our

international relationships. The full-time members would provide continuous surveillance of actual administration.

We think, in addition, that that Commission should have an executive director or secretary, or call them what you will, or administrator similarly appointed by the President with the approval of the Senate, to receive a substantial salary and to be charged with the execution—to be specific about it, the preparation of agenda, with distribution of the information to the membership, and with the responsibility of doing the dustpan job at the conclusion of meetings, to see that the decisions made are carried out.

I might add that I think that is essential throughout our entire Government.

The CHAIRMAN. That is the general manager?

Secretary FORRESTAL. Yes; that is correct. There should be provision for continuous transmission of experimental results through Government and industrial agencies which have legitimate claim on that kind of information. The Commission should have the authority to establish safeguards, the authority and duty to establish safeguards against the use of fissionable material in a manner that endangers health. That, of course, is obvious. He should have the responsibility of seeing to it that experiments take place in a properly protected area, or sufficiently remote so that there can be no undue danger of damage to the population.

From 1946 to 1950, in that period, unless the use of atomic weapons is either abolished or controlled by international agreement of a very firm and definitive character, we think that military application of the weapon should be a joint responsibility of the Commission and of the War and Navy Departments, again on the thesis that the responsibility for the national security lies with the military departments, and that this subject cannot be divorced from the general question of national security.

The CHAIRMAN. Now, Mr. Secretary, let me try to understand just what you mean by that. You stated that during the period from 1946 to 1950—I wish you would restate it, because I am getting a little fogged up there.

Secretary FORRESTAL. I might read the entire paragraph. I think what I read subsequently might possibly clarify that statement.

We think that from 1946 to 1950, unless the use of atomic weapons is abolished by international agreement, that the military application of those weapons should be the joint responsibility of the Commission and of the War and Navy Departments. During that period the Commission and the Joint Chiefs of Staff should determine the broad lines along which atomic weapon development is to proceed. In the implementation of those decisions, the Commission should have cognizance of the atomic war-head design and development. By that I mean that part of the weapon which particularly is concerned with the atomic energy application. It is, you might say, like the war head of a torpedo. It should be that particular area of development and design which should be under the charge of the Commission, while the War and Navy Departments should have the duty of the design, the development and the combat use of the vehicle, and the weapon as a whole.

In 1950 that provision should be reexamined in the light of international agreements and the current strategic and technical requirements.

Admiral Blandy, I think, might expand in somewhat more precise language what I mean by that allocation of responsibility.

Senator JOHNSON. Mr. Chairman, will we have an opportunity to interrogate the Secretary?

The CHAIRMAN. I am sure we will.

Senator JOHNSON. He is not leaving?

The CHAIRMAN. No. The admiral will go ahead here, and then we will go back to the Secretary; or would you prefer, Senator, to talk with the Secretary before we start? I am sure either way it is agreeable with the Secretary.

Senator JOHNSON. However it may fit in. I have no preference, but I do have a question or two that I would like to address to the Secretary.

I notice that he says if the atomic bomb shall be abolished by the United Nations. I want to ask him if he thinks it is possible for the atomic bomb to be abolished by anybody unless they are also able to abolish war and all other weapons. The atomic bomb is only one weapon, and I should also like to ask him if he thinks there will ever be another world war in which atomic bombs will not be used, basing that on the fact that the atomic bomb is the most efficient and the least expensive of all war weapons.

Secretary FORRESTAL. It is obvious you cannot abolish either dynamite or gunpowder, and if you have war they will be used. My own view is that it is quite likely that this weapon would be used. In other words, I doubt very much—unless you can cure the fundamental evil of war—whether you can sort of delimit an area for the kind of weapons you will use in war.

Senator JOHNSON. That is also my opinion, and I think it is very harmful to hold out the hope to the people that by some hocus-pocus or resolution, or something of that kind, the atomic bomb can be simply wiped out and forgotten and marked off.

Secretary FORRESTAL. I certainly wouldn't want to give that impression, Senator, either to you or anybody else. I think your point is well taken, but I am speaking for a military department, and I think it would be a disservice to the military establishments to have the impression created that we think there is no hope of ever stopping war. I think there is.

Senator JOHNSON. I think there is a hope for stopping war; at least I hope there is a hope, because of the atomic bomb, among other things.

Secretary FORRESTAL. All we are trying to do here, Senator, is to say that since this country has suffered in the past from the over-optimism about the possibilities of stopping war, all we are trying to say is that you should have protection against the very thing you have in mind. That is what we are really after, not to reach a wishful state of mind where we think that our desires will control human action.

Senator JOHNSON. I am very glad to have that point in your testimony clarified, Mr. Secretary.

That is all, Mr. Chairman.

The CHAIRMAN. I have a few questions, but I think I will wait until after the admiral concludes his statement, unless Senator Byrd or Senator Hart has any questions.

**STATEMENT OF VICE ADM. W. H. P. BLANDY, DEPUTY CHIEF
OF NAVAL OPERATIONS FOR SPECIAL WEAPONS**

Admiral BLANDY. I believe the best way to express what I think about the Commission having the sole responsibility for development of the entire weapon, in case any weapons beyond the atomic bomb should be developed and used, would be to draw a parallel with the torpedo. I don't believe we would want somebody who merely had to do with explosives at the present time to be responsible for and have full authority over the design and construction and production of the entire torpedo, when the Navy had to use that torpedo and had no authority over its design.

There is general agreement, I believe, among military and naval people concerned that there must be a centralized control of the production of fissionable materials so far as the Government is concerned, and the research and development in connection therewith.

When it comes to the applications, the military applications of atomic energy, I believe that the War and Navy Departments should have a greater share in that phase of the matter.

The CHAIRMAN. How would you set it up, Admiral?

Admiral BLANDY. In the first place, a great deal will be accomplished by having the Secretaries of War and Navy as members of the Commission, and then I would have the same type of liaison with the Commission on the part of the War and Navy Departments as was had with the Office of Scientific Research and Development. That worked very well.

In the case of the Navy Department, my own experience was that of Chief of the Bureau of Ordnance during the first part of the war. I had officers definitely told off as liaison officers with sections of the Office of Scientific Research and Development, and they belonged almost as much to the OSRD as to my Bureau. They worked intimately with the scientists who were doing the research and development end of the work.

The CHAIRMAN. Of course there is nothing in the bill as it is now written to prevent the closest liaison between the Army, Navy, and the Commission.

Admiral BLANDY. There is nothing to prevent it, but nothing to require it, either.

The CHAIRMAN. Was it a requirement by law in the Office of Research and Development?

Admiral BLANDY. No, sir; but, on the other hand, they were not given the sole responsibility of developing weapons. That responsibility still lay with the War and Navy Departments. The OSRD was to help, and that is what I think should be the case here, with the proposed Atomic Energy Commission.

But the War and Navy Departments, I believe—I probably should leave out the War Department, because I am speaking only for the Navy Department—should have the final word on the approval of a weapon, as to whether or not it is adequate for its purpose, because

after all they do have the over-all duty of providing for the national defense from initial conception to final use in battle.

The CHAIRMAN. Now, as I understand it, Mr. Secretary, you advocated an eight-man commission: Vice President, Secretary of War, Secretary of the Navy, and Secretary of State, and four full-time members.

STATEMENT OF SECRETARY FORRESTAL—Resumed

Secretary FORRESTAL. Yes.

The CHAIRMAN. To be for a definite term and without confirmation. That would make a commission of eight, I take it.

Secretary FORRESTAL. Yes.

The CHAIRMAN. Well, as I gathered, your objections to the bill can be summarized as follows:

- (a) That the Commission should be broadened;
- (b) It should be given a full term;
- (c) The membership should be made up partly of Cabinet officers and partly of other full-time appointees.

Of course, the Secretary of War, the Secretary of the Navy, and the Secretary of State would be limited in their period of time to the tenure of the President who appoints them.

Secretary FORRESTAL. Or to his pleasure.

The CHAIRMAN. But you say that the four full-time members would have continuity, and you advocate that. You also advocate the appointment of a general manager, for want of a better term. I think I agree with you, personally, on that.

You also would like to have a specific mandatory liaison between the State, War, and Navy Departments and the Commission working under the bill.

Now, as I get it, those are your objections. Outside of that, you approve of it, do you not?

Secretary FORRESTAL. Well, as I say, I have limited my testimony to the military aspects of the bill. I did not think it was my province, nor do I have the background of knowledge that I think one should have to go into the broader aspects of it, as regards the use of the atomic energy for industrial purposes.

Senator JOHNSON. Mr. Chairman, I would like to ask the Secretary what the philosophy back of making the Vice President a member of this board is?

Secretary FORRESTAL. Simply to identify it somewhat more closely with Government and to raise, if you will, the prestige. I think the Vice President's office still has prestige.

The CHAIRMAN. They have a vacancy now.

Senator JOHNSON. Prestige is all right enough, but you are changing the function of it. The office has no function except to act as a spare tire in case of an emergency, and now you are bringing the Vice President into the most important function, as I see it, of government.

Secretary FORRESTAL. Isn't that a good thing, possibly to increase the scope of the activity of the office of Vice President? After all, he becomes President.

Senator JOHNSON. Well, I doubt that we should by law try to change an office that is set up by the Constitution. That is entirely another question, however.

I just wondered why you bring him into this picture.

Secretary FORRESTAL. Well, we have no pride of authorship about the suggestion. What we are trying to do is be sure that this Commission does not get set up on an academic and remote basis where it is operating without relation to the other parts of the Government. The membership of this Commission could be the occupants of other Federal offices, who could be suitably suggested, I dare say; but certainly the War and Navy Departments definitely should be on. As to the Vice President, I don't have a deep conviction about it. It is a suggestion rather than a deep conviction. The other three are more than a suggestion. I think very strongly they should be on.

Senator JOHNSON. I think there would be very good reason for putting a Public Health representative on there to see that nothing was done that would injure the public health.

Secretary FORRESTAL. I wouldn't quarrel with that, but I would not want to see a commission which could say to the War and Navy Departments, "This is as far as you can go in the development or use of these weapons."

Senator JOHNSON. Your point is, and I think it is very well taken, that it is hard at the moment to separate the peacetime uses of atomic energy from its wartime potentialities?

Secretary FORRESTAL. That is right.

Senator JOHNSON. I think that point is well taken.

Senator HART. Mr. Chairman.

The CHAIRMAN. Senator Hart.

Senator HART. Mr. Secretary, you of course are cognizant of the bill with Senator Johnson's name on it, where the feature, as far as organization and composition of the Commission is concerned, lies in part-time men. The philosophy behind that, as I understand it, is that only in that way can we get certain of the best brains and judgment of the country to work on this problem, because they will not leave their other fields of employment.

My question is, do you think that it would be advisable and practicable to include in this Commission a certain number—probably a minority—of men on a part-time basis along the lines of the whole Commission as it would be constituted by the Johnson bill?

Secretary FORRESTAL. I think that is practicable. I always think in terms of individuals, and I think that your point is well taken. Undoubtedly it would be questionable whether you could get Dr. Vannevar Bush to give full time to this, and yet it would be highly desirable to have men like him and Dr. Conant as part-time consultants or full members of the Commission.

I think there has to be some nexus of permanence that gives this the character, if the implications of this are as serious as the scientists tell us.

Senator HART. I don't think it is out of your field, Mr. Secretary, to ask you also if you think the employment of men of those capabilities and experiences in an advisory capacity as members of an advisory board would be good enough?

Secretary FORRESTAL. It would be very desirable.

Senator HART. Would it be good enough?

Secretary FORRESTAL. I would doubt it. I am impressed all through Government by the constant interruptions, not in policy but

in the mechanics of government. This, after all, is going to be a pretty important part, whether you like it or not, of government. I think there has to be some continuity of organization that will provide, if you will, the factual background for the men who make policies, because I doubt if any man who gives his part-time attention to this can follow it with the closeness that I think it will probably have to be followed.

Senator HART. Do I understand you to say, Mr. Secretary, that you think the inclusion of the men on that basis, meeting a few times a year with the Commission, with expenses and a fee of \$50 a year, would not be an advisable or practicable means of organizing the Commission, in part?

Secretary FORRESTAL. I doubt if it is possible to lay out a chart now that will tell you how you are going to engage the attention and interest of such people. They may have interest, but whether they have time to give to this problem in the detail it will have to receive, is questionable. I doubt whether you could get either Dr. Conant or Dr. Bush. I doubt whether the limitations that are imposed automatically upon them by the nature of their present jobs would give them a great deal of time or allow a great deal of time to be devoted to this project. I think it practicable to have them; I don't see how you would escape having them. They are two of the few people in the country that can speak with informed background.

I think no matter what form your Commission takes, or what body is organized to deal with it, you will have to have recourse to the advice and help of those people.

Now, the tenure or character of their employment and how you work it out, I would be reluctant to try to be precise about. I don't think I have thought deeply enough about it.

Senator HART. That is, you would rather not give your opinion right now as to whether those men employed in advisory boards versus actual members of the committee would be better?

Secretary FORRESTAL. I am inclined to think that I would say you would have to have both.

Senator HART. I have nothing further on that line, Mr. Chairman, except that I wouldn't like the Secretary to be misunderstood. He has mentioned Dr. Bush and Dr. Conant, but of course there have been employed under the Manhattan district leading industrialists, also.

Secretary FORRESTAL. That is another element which I am glad you mentioned, because it is obvious that the complex which produced the atomic weapons that the Army and Navy used is a complex of abstract research and applied research and industrial know-how.

The CHAIRMAN. Mr. Secretary, what we are really doing here is trying to set up what may be a new department of the Government. You wouldn't suggest that the Navy be run with any absentee, part-time, come-lately advisers—"I'll see you a month from Tuesday" stuff. You would want them on the job, and you are on the job; this is your only job and you gave up your private business because you thought you needed to do it to run the Navy; isn't that true?

Secretary FORRESTAL. Yes; that is correct, sir.

The CHAIRMAN. Now, in that capacity as Secretary of the Navy, and overseeing the organization, you reach out and pull in such scientific advice as you need?

Secretary FORRESTAL. Scientific and other; business and educational.

The CHAIRMAN. And that has been what has made the Navy the success that it was in this war. Therefore, I assume that if we set up a commission to run the domestic problem of atomic energy, it would be operated in a good deal the same fashion and the same style, generally speaking. We would reach out for the best advice we could get on the problems they would be charged with. They would do it better, don't you think, if they were on the job and were full-time members?

Secretary FORRESTAL. That is my view. It is my view, provided you have the representation, as I said earlier, of those agencies of Government that have responsibility for our diplomacy and our defense. I would want to qualify it. I would agree with your statement with that qualification.

The CHAIRMAN. This argument that you cannot get men of the proper caliber to take a job of responsibility doesn't strike a very sympathetic chord with me.

Secretary FORRESTAL. Most able men, Senator, have many demands on their time. I have certainly found, as I think you have, that the men you want are always in demand in many fields.

The CHAIRMAN. That is true of the secondary positions, but not with the top positions. There is still, I think, enough honor left in top positions in our Government to get good men. Otherwise we would be in a bad way with the next Supreme Court vacancy; we just couldn't fill it.

Senator BYRD. Mr. Chairman.

The CHAIRMAN. Senator Byrd.

Senator BYRD. Secretary, I was called out for a few minutes. Did you deal with section 6 on page 12, the military application of atomic power? Does that section meet with your approval?

Secretary FORRESTAL. Well, it has, provided that the nature or constitution of the Commission includes the people in Government who are responsible for the use of weapons and the national security.

Senator BYRD. They will be in the minority, won't they, even by the suggestion that you made in changing the Commission? In other words, is the Army and Navy willing to turn this over to what we might term "a civilian commission" to decide whether or not the atomic bomb shall be manufactured or used?

Secretary FORRESTAL. It is not.

Senator BYRD. Even with your suggestion, doesn't this bill do that?

Secretary FORRESTAL. Well, we were trying to suggest modifications.

Senator BYRD. You only suggest how many military members.

Secretary FORRESTAL. Four, the Vice President and Secretaries of War, State, and Navy.

Senator BYRD. The Vice President isn't a military man, and we have no Vice President now, anyway, and cannot have one for 3 years.

Secretary FORRESTAL. As I said, our suggestions were directed mainly to getting into this Commission members of the responsible Government departments.

Senator BYRD. Don't you think one of the vital questions involved in this legislation is to what extent the military will be subordinated to any civilian commission in the manufacture and use of atomic bombs?

Secretary FORRESTAL. Well, we certainly have great reservations on that.

Senator BYRD. This section takes it completely out of the hands of the Army and Navy, as I read it, and leaves it to the Commission.

Secretary FORRESTAL. Our suggested modification maybe does not meet your point. It certainly is an improvement.

Senator BYRD. You suggest three military men; the Secretary of the Navy, Army, and who else?

Secretary FORRESTAL. The State, because this has a diplomatic implication.

Senator BYRD. Three out of five. That still does not answer the question whether this power of decision should rest or should be taken away from the Army and the Navy who are primarily responsible.

Secretary FORRESTAL. Possibly I am counting on the fact that the authority and prestige of the people who speak for those responsible departments of government could not be ignored.

Senator BYRD. Well, is the text of this satisfactory to you with these other changes that you mention in regard to the appointment of the Commission? That goes pretty far, as I read it.

Secretary FORRESTAL. I have sufficient confidence that if this were broadened to include those individuals, I would be; after all, we are trying to make suggestions to a bill to bring it into conformity with the protection we think is necessary. I wouldn't want to appear here just in a state of flat negation. We are trying to make suggestions which we think will modify it sufficiently to give protection.

Senator BYRD. To my mind, that is a very vital question that must be decided.

Secretary FORRESTAL. I agree with you, Senator; there is no question about it.

Senator MILLIKIN. May I ask, Mr. Secretary, would the Navy object to keeping this under the exclusive control of the military for a further temporary period?

Secretary FORRESTAL. Of course not. It wouldn't.

Senator JOHNSON. Mr. Secretary, I notice that you have an equally divided situation here through your recommendations, an eight-man board. What is the reason for an eight-man board instead of an odd-number board where you would have a majority vote? Perhaps I haven't understood your proposal, but that is the way I understand it.

Secretary FORRESTAL. All we are addressing ourselves to is the desirability of getting military and other governmental representation on this Commission. As to its numerical composition, I wouldn't stand on eight, seven, or nine, but I do feel most strongly, as I say, that the military departments of the Government should have a voice in this Commission.

Now, as to the character of that voice, its extent, it is for your committee to determine; but I submit that it would be, in the present state of the development of this weapon, unthinkable that the users of that weapon shall not be represented.

Senator JOHNSON. Well, in view of all the testimony of scientists, mostly, of course, your position is absolutely correct. Up to the present moment there has been no plan advanced here, even by the scientists, where the military aspects of atomic energy can be separated from

its peacetime uses, except the very vague hope that maybe something can be worked out to change human behavior, and all that sort of thing, and make it safe to close their eyes to its military uses, and launch a domestic and peacetime use.

Secretary FORRESTAL. Along the same line of your thoughts, it is obvious that we have laws against murder, but people still have revolvers, and sometimes use them.

Senator MILLIKIN. Mr. Secretary, would you advise that in our own consideration of what to do about this thing we give very careful consideration to the state of world affairs to determine in our own minds whether we have reached a point where the important nations can cooperate with each other peacefully?

Secretary FORRESTAL. Well, that is fundamental, Senator.

Senator MILLIKIN. I had hoped that you would say that.

Secretary FORRESTAL. Well, I speak for a military department, and I would not want to give the public the impression that we think only in terms of the use of military force as the only means of securing peace for the world. I agree with your implied statement.

Senator MILLIKIN. I put my questions very carefully so as not to embarrass you in that particular.

Secretary FORRESTAL. My hopes are the same as yours and everybody around this table; but we cannot, as I say, wish ourselves into Paradise.

Senator AUSTIN. Mr. Chairman, I have just one question.

The CHAIRMAN. Senator Austin.

Senator AUSTIN. Mr. Secretary, don't you think that this committee ought to keep a little something in reserve here so that if the Congress should set up a military department in which there would be a munitions board, that the control of the military aspect of this energy could be fitted into that munitions board?

Secretary FORRESTAL. For the reasons that Senator Hart advanced, the industrial aspects of this development, I think your thought is an excellent one.

Senator AUSTIN. That is all.

The CHAIRMAN. Mr. Secretary, and Admiral Blandy, too, if you wish to answer this, on page 12 under the "Military applications of atomic power," do you approve of section (c) of the proposed bill, which provides that the President must give his consent and direction each quarter for the amount not only of fissionable materials that may be produced, but the amount of atomic bombs, bomb parts, and other applications of atomic power?

Secretary FORRESTAL. I would like to respond to that first, Senator, and then I would like Admiral Blandy to comment.

I think it is dangerous to assign responsibility of that character to the President, which must necessarily be exercised vicariously. I mean by that that it seems to me it would be quite difficult for him to act under that clause intelligently except on the advice of some other agency. Now, shall that agency be this Commission, or the War and Navy Departments?

If it is this Commission, that strengthens my statement that that Commission should have representation from the security departments of the Government.

The CHAIRMAN. No, Mr. Secretary. I presume the President, being directed to exercise an independent pact, would make that

decision from advice that he might receive from a dozen different sources. My point is that the decision to make atomic bombs and bomb parts is not a decision which any person is going to exercise vicariously. It is going to be one of the most, if not the most, important decision that he as President makes. I wanted to find out what you thought of putting the responsibility on the President of the United States as to just how much we are going to do in the way of making destructive devices.

Secretary FORRESTAL. I think it puts a burden on them which is too great for them to discharge. I go back to one President who once discharged, I think, his Chief of Staff over war plans, and within a very short time afterward we had to have war plans in the most explicit form. That was some years ago, so it is not recent history.

I just wouldn't want to take a violent position for or against, but now that you call my attention to it, I must confess I have misgivings on it.

I would like Admiral Blandy to expand on that.

Admiral BLANDY. I don't think that is a very workable provision from the standpoint of smooth operation. It is a sort of staccato piece of music to have this recurrent consent every quarter. I don't think you could have much of a continuing policy on development in that way, but I do recognize that if the President is to have this veto power, he could exercise it at any time—for instance, in response to a ratification of an international agreement either abolishing atomic weapons or limiting them.

Senator HART. Admiral Blandy, do you not think that it would be necessary to divide that problem into two categories, one, the production of fissionable material, which as we all know is a continuing process and not something that can be turned on and off at a moment's notice, whereas the actual construction of a bomb possibly could be turned on and off as we like. We cannot do that with the fissionable material itself, can we?

Admiral BLANDY. No, sir. As I say, it would be very unsatisfactory both for a development program and a production program to have this stop-and-go sign reversing every quarter.

Senator HART. Can you not separate in this problem the construction of the bomb itself from the production of fissionable material, which is a different kind of a process?

Admiral BLANDY. If I understand you correctly, Senator, you mean that this might not apply to the construction of the bomb, but only what we might call the atomic part of the bomb?

Senator HART. Well, we can turn the spigot on and off in the bomb assembly lines.

Admiral BLANDY. You can do it, but it isn't a satisfactory way of manufacturing, of course.

Senator HART. Can you do it at all in the production of fissionable materials at 3-month intervals?

Admiral BLANDY. I am not qualified to answer that, sir. I would rather leave that to someone in the Manhattan district.

Senator MILLIKIN. I think other testimony has indicated it is not practicable.

Admiral BLANDY. I believe so, but I did not want to put myself on record as being an expert in the production of fissionable materials.

Senator BYRD. It was also testified, as I recall it, that if you manufactured the plutonium, or whatever was necessary to operate a great power plant, that that could be converted into a bomb in 3 months' time. You could take that same mass of material and convert it into a bomb. That was 70 or 80 percent of the actual completion of the bomb.

That is correct, isn't it, that the same material can be used?

Admiral BLANDY. I understand so, yes.

Senator BYRD. If you operated a power plant on a large scale, for instance.

Senator HICKENLOOPER. Mr. Chairman, may I ask Admiral Blandy a question?

I will put this question a little more concretely, Admiral. I would like to ask your opinion on this.

Would it be more practical and feasible if the bill provided, for instance, that either the President or some other proper agency would designate the amount of fissionable materials or the activity of this Commission for production for a whole year at a time, giving notice, say, 6 months prior to the beginning of the production period?

In other words, lengthening the time of notice and then giving a much greater period for production than snubbing it right down to a quarter, each 3 months.

Admiral BLANDY. I think that would be a much more practicable scheme.

Senator HICKENLOOPER. It is my understanding, from testimony here, that it is completely unworkable to have quotas, at least if they are varying quotas prescribed each 3 months, that the whole operation and production program is just not suited to that kind of operation. I don't know, but we have had some testimony along that line. I merely wanted to get your personal opinion on the matter, if you care to give it.

Admiral BLANDY. I think that would be, as I said, a much more practicable scheme. As a matter of fact, through appropriations, the Congress could exercise a good deal of authority in the actual production, also. That is handled on an annual basis—at least it is in the War and Navy Departments.

Senator MILLIKIN. The Congress traditionally exercises complete control over the supply and maintenance of our ordnance.

Admiral BLANDY. Yes, sir.

Senator MILLIKIN. Yes, and we do it under the Constitution. There is no reason that has been developed why the Congress cannot determine whether we are going to make bombs or not make bombs in the same way it determines whether you are going to build a battleship or not build a battleship.

Admiral BLANDY. If it were placed on an annual basis, I believe that would be the preferable method; to leave it to the Congress.

Senator MILLIKIN. It certainly would be unprecedented to give the President authority to determine a battleship program. It never has been given. There may be some limitations or some delegations of a certain amount of discretion in the matter, but the Congress lays out the military program, at least in its broad outlines.

Senator HICKENLOOPER. Mr. Chairman, it is my understanding that in 1934 the Congress authorized the building of the Navy up

to treaty strength, 5-5-3 strength, and put the procedure and method in the hands of the President; but that was a specific proposition.

Senator MILLIKIN. That was direct authority to the Navy to accomplish a certain objective by a certain time. That is precisely what I am talking about. By the same token we could, if we wanted to, prescribe the same sort of directive and the same sort of limitations on the atomic bomb.

Admiral BLANDY. I think it would be preferable.

Secretary FORRESTAL. I will say, Mr. Chairman—if I might boil my view down to this—that with a thing that is charged with such tremendous fantastic implications as this atomic energy, it is too important a subject to be left only to the military; but I think it is equally fantastic to conceive that it be left solely to an agency in which the military had no voice.

Senator HICKENLOOPER. Mr. Chairman, I am sorry I was late, but I would like to ask the Secretary a question which I believe he touched on in his statement.

Yesterday I suggested that at the present time, at least, it was my view that any commission that is set up should have representations in authoritative positions of several categories. I might not limit them to any particular ones, but to me science should be represented by a capable man. The technical end of production, such as engineering, should be represented. Certainly, I believe, someone who knows something about foreign situations should be represented. I think the public should be represented, and above all, at least in this temporary bill, most everyone admits that our legislation now is bound to be temporary because we don't know what the future holds; I think that for at least that time until we are assured that the bomb will be outlawed among nations, that those charged with the national defense—which means the armed forces—should have an equal representation among others.

There might be one or two other categories.

Secretary FORRESTAL. You have expressed, Senator, much better than I have, what I have been trying to suggest.

Senator HICKENLOOPER. I thought I saw a statement on that here, but I didn't have time to go over it.

Secretary FORRESTAL. We suggest that the State, War, and Navy be members of this commission.

Senator HICKENLOOPER. My suggestion of yesterday didn't quite go to designating the State, War, and Navy, but at least that those two fields of national responsibility be represented equally on this commission.

Secretary FORRESTAL. Well, our feeling is precisely as you have expressed it.

Senator HICKENLOOPER. Thank you.

Senator BYRD. Mr. Secretary, at the top of page 12—

The Commission is authorized and directed to—(1) conduct experiments and do research and developmental work in the military application of atomic power * * *

Is it your understanding that that would be done by the military authorities, or would be done by some agency that this commission would set up?

Secretary FORRESTAL. I would think it would have to be done under the guidance and direction of the military authorities using, as they had to use during this last war, all the elements of technical abstracts.

Senator BYRD. It seems to me a mistake to leave any loophole here whereby another vast organization can be set up to do this experiment and research work.

Secretary FORRESTAL. We wouldn't want an agency to develop submarines for the Navy. I should think the Navy must have the right to select its weapons.

Senator BYRD. And subsection (b):

The Commission shall not conduct any research or developmental work in the military application of atomic power if such research or developmental work is contrary to any international agreement of the United States.

Do you construe that to mean that agreement would be such an agreement as would have to be confirmed by the Senate?

Secretary FORRESTAL. I should think that language would have to be examined and written very carefully.

Senator BYRD. I certainly think that should be clarified. An agreement with regard to the use of the atomic bomb is one of the most vital questions.

Secretary FORRESTAL. There again, who makes the determination as to whether it is contrary to international agreement? Where does that power reside?

Senator BYRD. I think it should be written in there, "Such agreement confirmed by the Senate." There are a lot of international agreements, a great many that don't come before the Senate.

Secretary FORRESTAL. To reinforce your thought on it, I do not know that there was ever a specific agreement about the way in which submarines were to be used, but there was certainly an agreement that was not kept in two wars.

Senator BYRD. I, for one, would not be willing to set vast power which may mean the future destruction of this country in any department of the Government. I think there ought to be such an agreement that would be, in its language, confirmed by the Senate. Is that your opinion about it?

Secretary FORRESTAL. I think it is a very well taken point. I would like to think on it.

Senator BYRD. We ought to have such safeguards as we can around such an agreement.

Secretary FORRESTAL. I will say this: You must not limit the development until the world has got the pattern we are hoping it will achieve. You must not limit or put hampering strings around the military responsible people for the development of weapons.

Senator BYRD. Does the chairman regard the words "international agreement" to mean such an agreement as would be confirmed by the Senate, or some agreement made by one of the agencies of the Government?

The CHAIRMAN. I would think, and have taken the position all along in my thinking on this and in the former bill, the first bill ever introduced on this subject, that it would have to be agreed upon by the Congress of the United States.

Senator BYRD. You mean both branches?

The CHAIRMAN. Both branches.

Senator BYRD. And not be in the nature of a treaty, then?

The CHAIRMAN. I don't see the necessity for it, personally. I, however, am one of those who believe I would like to have inter-

national agreements ratified by a majority vote of both Houses rather than a two-thirds vote of the Senate.

Senator BYRD. I imagine you would make this to clarify that in one way or another?

The CHAIRMAN. Yes; I would be glad to clarify it.

As far as I am concerned, it could read, "Any international agreement of the United States which has been approved by the Congress of the United States."

Senator JOHNSON. Mr. Chairman, if the Secretary will permit me, I should like to go back to the difficulty of dividing the wartime uses from the peacetime uses of uranium or atomic power. The scientists told us that when you used uranium for power, you were 75 percent on the way to its use as a bomb. In other words, when we use coal for power, the ashes are practically worthless; but when we use uranium for power, the residue is the very thing that we need to create bombs. That makes all the difference in the world, and so the two are tied together so closely that we ought to recognize that fact in any legislation which we propose, which we handle.

Secretary FORRESTAL. There is no question about that.

Senator JOHNSON. 75 percent means the assembling of the uranium, the mining of it, the assembling of it, the processing of it right up to the point where all it requires is the chemical action, and then you have your bomb.

Secretary FORRESTAL. I don't know what you mean, Senator, that at this time it is inseparable. Certainly it hasn't reached any stage yet where you can separate it.

Senator JOHNSON. That is correct. We all hope there will be some way of separating them, although nothing appears any place to base that hope on at the moment.

Secretary FORRESTAL. My own very sketchy knowledge on the subject certainly conforms to your impression.

Senator JOHNSON. I think that is such a fundamental point that I hope the chairman and the committee will pardon me for bringing it up so often here.

Secretary FORRESTAL. That is why I said that the complex that makes the bomb is the composite of abstract research and implied research and the industrial complex that produces it, and it is not divisible at the moment.

Senator HART. Has the Secretary finished his statement?

Secretary FORRESTAL. I have, sir.

Senator HART. Mr. Chairman, I would like to ask him something in a different and somewhat less important field.

A moot question in anything that we do concerns the spread or the nonspread of information on atomic energy and secrets vital to the country, and their various solutions.

The bill which my colleague introduced mentioned on page 5, in the first paragraph, the—

dissemination of scientific or technical information, except to the extent already required by the Espionage Act.

I am certain, Mr. Secretary, the Navy Department has had experience with the workings of the Espionage Act, and my question is whether or not you think that that act is sufficient, as of now, for your purposes?

Secretary FORRESTAL. I would doubt it. I would want to refresh my reading of the Espionage Act, but I think it is too elastic to give protection under that wording.

Senator HART. Can you go any further in that, Mr. Secretary, as regards experiences of the last war?

Secretary FORRESTAL. You mean the war just finished?

Senator HART. Yes.

Secretary FORRESTAL. Well, we know that there has been dissemination, all right; that has occurred. But I think I would like to respond to that in writing, Senator, because it is a question I should not answer lightly.

The CHAIRMAN. I think, Mr. Secretary, it might be well when you do that, if you don't think the Espionage Act as it is now written will cover the subject, to suggest what amendment to the Espionage Act would cover the subject, because we have got to have, it seems to me, some definite tying post, some place to start from, some base.

Senator AUSTIN. Mr. Chairman, let me recall to your memory that this Espionage Act has been before the Congress many times during the past few years, and very good causes for amendment of it have been presented.

I have not been a member of the Judiciary Committee for about a year, but before that for many years I had to do with that problem as a subcommittee man of the Committee on the Judiciary. I should think it would be a very troublesome thing to attach to this bill the burden of amendment of the Espionage Act, basing my opinion on that experience. I would advise against it, and think, rather, that the suggestion of the Secretary of the Navy should be some specific exceptions rather than amendments to the Espionage Act.

Secretary FORRESTAL. I am inclined to agree with you, Senator. I wouldn't feel qualified to rewrite or suggest the rewriting of the Espionage Act, in the light of this legislation. I wouldn't want to have that assignment.

Senator AUSTIN. It would be very difficult.

The CHAIRMAN. Of course, under the bill, Mr. Secretary, the Commission has the power to write regulations imposing further restrictions on dissemination in addition to those provided for, or that might be provided for, by the Espionage Act. The only restriction on that is that the President must approve those regulations and restrictions.

Secretary FORRESTAL. I must confess that I am a prejudiced witness because I have in mind the difficulties we had in operating prior to the beginning of this war in dealing with Japanese observation. I am all for the minimum amount of espionage in this country. We pay a high price for a thing I think we should preserve, but it lends force to your observation. Senator Hart, I know, believes more than I that we could not enforce any of the normal precautionary measures that you would take for the security of our fleet in the Pacific.

The CHAIRMAN. I want to call your attention to subparagraph (5) on page 18, which provides:

(5) whenever it will facilitate the carrying out of the purposes of the Act, adopt by regulation administrative interpretations of the Espionage Act except that any such interpretation shall, before adoption, receive the express approval of the President.

Of course, it is for a lawyer to determine how much that permissive authority would extend as against the Espionage Act itself. I wouldn't know. The Navy and Army have worked during the war on the powers to make regulations, and there are plenty of people in the hoosegow now because of your regulations.

Secretary FORRESTAL. During the war, Senator—not before the war.

Senator HICKENLOOPER. Mr. Chairman, I might observe from my reading of that it would seem to me that that section is not desirable, because you are putting into the hands of the Commission the interpretation of a criminal statute and making that interpretation in turn a criminal statute. It would seem to me that that is the province of the court. The Espionage Act is a criminal statute, and this says that the Commission can interpret the Espionage Act, and that then becomes the final statute.

The CHAIRMAN. The difficulty in the Espionage Act is the classification of material that is subject to it, and by regulation you could classify the material with which, if there was any interference, immediately a violation of the act could be had.

Senator HICKENLOOPER. That is true, but this is a very broad provision indeed. It says:

(5) whenever it will facilitate the carrying out of the purposes of the Act, adopt by regulation administrative interpretations of the Espionage Act except that any such interpretation shall, before adoption, receive the express approval of the President.

That to me, at least, is revolting against a fundamental of criminal procedure and our concept of criminal law.

The CHAIRMAN. That is what the Army and Navy have done under the war power, and that is how they maintained their secrecy requirements that the exigencies of wartime have demanded. That is how they operated, and that is how they are operating now.

Senator HICKENLOOPER. Morally, I might approve of their action; as a fundamental American policy of jurisprudence, I would condemn it in peacetime.

The mere fact that they have done it during wartime as a matter of necessity, as I say, might in the emergency meet with approval, yet I think we are on dangerous ground in writing that into a permanent statute, a permanent peacetime policy of the American legal structure.

Secretary FORRESTAL. I think, Mr. Chairman, that, after all, laws and their enforcement do react to the climate of opinion during which they are enforced, and the atmosphere of opinion during the war was very far remote from what it is normally in the American public minds, thank God, in peacetime.

Senator HICKENLOOPER. I might say this as further explanation of what I mean: The Attorney General has been given the right to examine—and we assume that he examines carefully—various statutes for interpretation. Without exception, so far as I know, when he interprets the statute he gives an exhaustive opinion of that statute and what it means. That, however, is in turn subject to review and determination by our courts.

This is an administrative interpretation of a criminal statute that is not subject to the review and determination of any court system.

The CHAIRMAN. Oh, yes.

Senator HICKENLOOPER. Just the President.

The CHAIRMAN. Oh, no. After all, you have got to charge him with this, and then he is going to come to court. That is for the courts to determine.

Senator AUSTIN. Mr. Chairman, if we should have such a set-up as I gather the Secretary of the Navy has advocated here, which is a sort of council of common defense, that includes State, War, and Navy, what would be the difficulty of describing the things proscribed in some such way as this?—reading at line 8, page 5:

but shall not contain any provisions or conditions which prevent the dissemination of scientific or technical information, except that proscribed by the Council of Common Defense.

Then it wouldn't be in a box of trying to interpret the Espionage Act, and would not be left to the limitations of the Espionage Act, and you would be in a position to adapt yourself to the changing scene. That is, what might be dangerous at one time would not be dangerous at another time.

Secretary FORRESTAL. In other words, you would make a positive affirmation of what you could give out, rather than saying what you couldn't?

Senator AUSTIN. Yes; it seems to me so. However, that is just a thought to work with.

The CHAIRMAN. Of course, the whole effort, Senator, I think you agree, should be to get out as much scientific information as we can without hurting the country's security, and I personally do not like to put within the hands of the military the sole determination.

Senator AUSTIN. It wouldn't be if you follow the thought of the Secretary of the Navy, namely, you have got the combination of State, War, and Navy in his picture here.

The CHAIRMAN. Oh, you mean the board?

Senator AUSTIN. Yes; exactly.

The CHAIRMAN. Not the Board of National Defense as you call it, but you mean the Commission as made up?

Senator AUSTIN. I am not undertaking to crystallize this into a definite term. I made an illustration of a council of common defense, that is all.

The CHAIRMAN. It has other applications than the thing we are talking about?

Senator AUSTIN. Yes.

The CHAIRMAN. Are there any further questions of the Secretary?

If not, Mr. Secretary, thank you very much for coming. I don't know whether we are going to see you tomorrow morning or not, but I understand that we have room 312, which is the Finance Committee room, for our meeting tomorrow morning, and I understand that Admiral Blandy is going to testify about the tests that will be made.

Secretary FORRESTAL. That is correct, sir. Thank you, Mr. Chairman and members of the committee.

The CHAIRMAN. Admiral, do you have any more to add?

Admiral BLANDY. I have nothing further to add.

The CHAIRMAN. I think the committee is through with you for the time being. We will be glad to see you tomorrow.

Admiral BLANDY. Thank you, sir.

The CHAIRMAN. Mr. Secretary Ickes.

Mr. Secretary, you have a prepared statement, and I believe each member of the committee has been given one. You can proceed, sir.

STATEMENT OF HON. HAROLD L. ICKES, SECRETARY OF THE
INTERIOR

Secretary ICKES. Mr. Chairman and gentlemen, I am very glad to pay my tribute to the important public service that this committee is rendering. It is easy to become hysterical over the real dangers that are inherent in our conquest of the atom. A few months ago it looked as if the urge to do something, no matter what, might saddle us with short-sighted legislation drafted under emotional stress. At that point this committee wisely insisted that just because this problem had such breath-taking dimensions, it required the most thorough and painstaking analysis that the legislative organs of our democracy could give it. As the result of that wisdom, we are able today to consider a bill which is carefully designed to safeguard the progress and the freedom of science while maintaining the integrity and supremacy of civilian government.

These objectives of S. 1717 are close to my heart. I am entirely in accord with their major implications.

I quite agree that our national safety and our industrial progress depend upon our doing the biggest job of scientific research that has ever been done in the world; that we cannot leave that research to private initiative and industry; that the Federal Government, with all of the aid that it can get from the colleges and private laboratories, must shoulder the main burden of that task, while leaving free and untrammelled the road of private scientific research; that the Government must be empowered to maintain full access to all private scientific developments in this field, to own all patents and materials, and to control all military and industrial applications of atomic energy in such a way as to protect the public safety; that at the same time the Government must give increased attention to the social and economic possibilities, as well as to the physical and medical implications of atomic fission; that any control agency set up in this field should be responsible to the President of the United States and not to an irresponsible supergovernment; and that whatever is done by such a control agency must be open to the broadest scrutiny and congressional supervision based upon the regular and detailed reporting of agency activities. A democracy cannot afford to keep secrets from itself.

If I disagree on some of the detailed aspects of this proposed legislation I know that you will take such disagreement as a part of the democratic process to which the efforts of this committee are directed and out of which can come something better than any one of us alone could have devised.

Scientific progress and scientific freedom are indivisible. That, I take it, is the underlying theme of S. 1717. We cannot advance the cause of science and civilization by making research a crime. Under this bill it would not be necessary for a student of physics to secure permission from an Army officer if he wished to discuss with his colleagues, let us say, the effects of nuclear bombardment on the neptunium atom. That cannot be said of some other bills which have been introduced in this field.

We have often been told that the price of liberty is eternal vigilance. We have not been told often enough what the returns on that investment amount to. I think that it is only timely to observe that we in the United States today have the highest standard of living in the

world and our people today enjoy the greatest measure of security possessed by any people in the world, largely because of the freedom with which scientists, explorers, engineers, and technicians of many races, creeds, and national origins have been able to meet on our soil, to think unpopular thoughts, to try out unorthodox ideas, to explore with imagination and develop with ingenuity our natural and human resources. From the days when the refugee du Ponts first settled here, at the invitation of Thomas Jefferson, to the arrival of those great refugee scientists who played so preeminent a role in the conquest of the atom, Einstein and Fermi and their many distinguished collaborators, we have been not only safeguarding liberty but enjoying its rich fruits. I hope that the day will never come when the thinking of scientists is so hedged about with petty restrictions that, as happened in Germany and Italy, foreign scientists will not want to come here and our own scientists will not want to stay here. And so I am grateful to this committee for its efforts to maintain the freedom and the progress of American science.

Let me add that I think that the distinction is wisely drawn in S. 1717 between the realm of discussion and experimentation, where freedom is the only safe rule, and the realm of applied technology, where, in a matter that involves the national safety and welfare so vitally, social control is essential. The control that S. 1717 would impose upon the commercial production of fissionable materials and their utilization in industrial channels seems to me to be entirely justified. If the push of a button can destroy a city, no nation can afford to leave the button in private hands. That would amount to an abdication of sovereignty.

I said a moment ago that this bill is designed to maintain the integrity and supremacy of civilian government. That seems to me to be a matter of very great importance. The scientists who have worked on atomic fission tell us that there is no specific military defense against atomic bombs, and that within 2 to 5 years other nations will probably be in a position to make them. I am impressed with that prediction because I recall that in November 1941, shortly before Pearl Harbor, when most of the scientific and technological problems of atomic bomb manufacture and even of plutonium production and U-235 enrichment were still unsolved, some of these same scientists predicted that the first atomic bombs would be produced between November 1944 and November 1945. They were right. So I assume that they may be equally right now, when they predict that other countries will have such bombs in less than 5 years.

We have, then, only a little time in which to negotiate with other nations for a security which cannot be achieved by a monopoly of knowledge or by specific military defenses, a security which must be based upon the international sharing of knowledge and adequate international inspection and policing. That kind of agreement can better be achieved if the control of atomic energy is in civilian rather than military hands. I do not blame the military for suspecting and preparing for the worst from all other nations. That is its job. But you cannot successfully negotiate an international agreement unless you start with the assumption that it will be advantageous to all of the parties concerned.

If you look at this problem of atomic energy only through military binoculars all that you can see is the threat of future wreckage, to

which the only answer is more wreckage. Even the destruction of enemy cities at the outbreak of a war would not provide an adequate defense. Presumably enemy storage and transmitting areas may be located in uninhabited sections of desert or ice or water, deep underground and relatively immune from attack. If we want security for our homes and our children—not just the uncertain satisfaction of hoping that in an atomic war we might kill sooner more of the enemy than they could of us, we are going to have to gain that security by working out arrangements of mutual advantage with other nations. Nor will that job be facilitated if we make atomic energy control a function of the military.

I suppose that there was a time when electricity was almost as terrifying as atomic energy is today, and I am pretty sure that if we had proceeded to treat electricity as a military secret we would have succeeded only in retarding our development as a nation. We need to have civilian control of atomic energy in the interest of the development of our Nation and of industrial and medical progress, as well as in the cause of world peace and true national security.

According to an old Chinese proverb, the first result of a war is that the adversaries exchange vices. I hope that the first result of our victory is not going to be an imitation of the Japanese system in which the military controlled industry, government, and science. As I see it, that arrangement had disastrous results for Japanese industry, government, and science, as well as for the Japanese military. Some of the bills that have been introduced on the subject of atomic energy would take us a long way along the road to Tokyo.

So much for the general objectives of S. 1717, with which I am in complete sympathy. On the proposed machinery for achieving those objectives, I have some doubts and suggestions to present to this committee.

In the first place, I think that the idea of setting up an independent board, unconnected with existing departments of the Government, to handle the problem of atomic energy is unsound. Atomic fission is too big a matter to be set off in a field by itself with a fence around it and separated from the problems with which the regular departments of the Government have to deal. Atomic energy is part of the larger problem of energy, and its development vitally affects what we are to do with our oil, coal, and water power. Atomic energy puts new values upon our public lands and our mineral resources. It profoundly affects our industrial potential, our standards of living, our international relations. If the departments of our Government are to leave all of these implications of atomic energy to an independent board of atomic experts, the established departments of Government—including the Departments of State, War, Navy, and Interior—through which the Nation has from its beginning accomplished its important business, will be shunted aside and our major national responsibility committed to a new and untried board. This board would undoubtedly be or become expert on atomic energy but I believe that it would take years, if not decades, for the board and its staff to acquire a feeling for the duties and responsibilities of government.

In the years that I have spent in Washington, I have seen a good many problems arise that looked on their face as if they were brand new. The natural impulse in such a situation is always to set up a

new kind of organization to deal with the assumed new problem. But in the end it generally has developed that the problem was not quite so new as was supposed, and that established agencies of Government had been working in the same field. In such a situation it has become necessary to set up a coordinating agency to coordinate the new agency with the old agencies and perhaps a few liaison officers to coordinate the coordinators, and then maybe a few top-level "super-dupers" to get the whole thing straightened out.

Now, the development of atomic fission is a great scientific advance which is bound to change the fabric of our daily lives. But it is neither the first nor the last such advance. In the space of our national existence the jump from manpower and animal power to steam power and electricity, in the fields of production, communication, and transportation, was wholly revolutionary, yet we did not find it necessary to set up a special Federal department of steam or electricity or to alter the essential form of our Government to meet the problems thus created. After all, the form of our Government was set to meet and conquer new problems arising from all directions, many of them unforeseeable. The matter of opening the country to railroads and telegraph lines in the last century, a task never envisioned by the founding fathers, was largely handled by the Department of the Interior. Other essential problems created by the conquest of steam and electricity were handled by various of the departments of the Federal Government.

It is easy to forget that the progress of the sciences and the useful arts was one of the objectives to which our form of government was expressly dedicated by the founding fathers. I shall not take the time of this committee to rehearse the many great scientific and engineering advances that have been sponsored and aided by the Federal Government. I content myself with saying that if the existing governmental departments that are properly concerned with international relations, military defense, natural resources, power, and technology, are not qualified to carry on with the problems of an atomic age, they ought to be abolished; otherwise they ought to participate, within their appropriate fields, in the control of atomic energy. I therefore believe it important to orderly government that there be a single administrator responsible to a committee of Cabinet officers, appointed by the President, carrying out those responsibilities set by S. 1717 that do not fall within the jurisdiction of any single existing department.

If, however, in the judgment of your committee, it be essential that the public interests have other representation, I would then urge that consideration be given to the establishment of a board of nine members, including five or six heads of departments and four or three independent members. I have already made such a suggestion to the Kilgore committee in connection with the proposed national science research foundation bills, and your committee may wish to consider the application of that recommendation to your own special problem. I note that one of the bills before your committee, S. 1557, provides for a membership of five Cabinet officers, the Secretaries of State, War, Navy, Interior, and Commerce, and of four members at large employed on a per diem basis. That seems to me to be a mistake. If there are public members, they should be full-time public members without outside personal business interests. The United States is entitled to undivided loyalty.

I think, too, that whatever the membership of the control agency may be, it is essential that the board's executive authority be centralized in a single administrator. Multiheaded boards are fine for discussion, and they may be well suited for judicial or quasi-judicial jobs that require no initiative on the governmental side. But they just won't do the work where you have a task that requires drive, initiative, and direction emanating from a central authority while coordinating the efforts of a great staff. A control agency cannot possibly coordinate its staff if it is moving in two or three different directions itself at the same time.

Other suggestions that I have to offer with reference to the provisions of S. 1717 go to matters of detail. There are several points at which the bill seems to me to need clarification or strengthening, if it is to achieve the objectives to which it is directed.

For one thing, I am troubled by the provisions of section 5 which make it a crime for me or for anyone else to own any fissionable material. I do not know whether there is any fissionable material in my farm in Maryland. The geologists tell me that uranium exists in small quantities in practically all parts of the earth and that about one part in 140 of natural uranium is U-235, which is fissionable. The lawyers tell me that my property goes down to the center of the earth. It isn't very easy for me to figure out whether that many cubic yards of earth contain any fissionable material, especially when you take account of the fact that I would not recognize fissionable material if I stumbled over it in the street. At any rate, I do not think that I should be fined and imprisoned just because I may innocently and unknowingly be an owner of fissionable material.

The CHAIRMAN. I think you are right about that, Mr. Secretary. Secretary ICKES. Thank you.

I suppose that the provisions of the bill outlawing private ownership of such material are intended to refer to packages of stuff refined in laboratories and properly labeled. And I have no objection to the provisions of section 5 so far as they apply to that, but I do think that the language of S. 1717 is unduly broad and somewhat terrifying.

Another point at which I think the language of this draft may be overdrastic is raised by section 7 (b) which seems to require the Atomic Energy Commission to give out fissionable materials and to license the use of such materials to just about any and every applicant. I think that is all to the good, where materials are wanted for scientific purposes. But where such materials are wanted for purposes of private profit, I am not prepared to say that anybody who steps up to the counter should be entitled to a pound of fresh plutonium. Quite apart from the military and international aspects, on which others can speak with more authority, I think that such a provision might have unfortunate consequences from the standpoint of our domestic economy. At any rate, if I were a Senator I would want to know more than I do know about the cost of plutonium production and the economics of its utilization before I promised to hand it out to all comers.

If I am correct in believing that commercial use of fissionable materials is not an immediate possibility, I think that there might be some advantage in leaving for future congressional consideration the terms that should govern the disposition of fissionable materials. After all, we can't solve at once all of the problems that atomic

fission puts before us. Whatever legislation is enacted this year must be considered interim legislation, to be amended when our knowledge of the subject is greater than it is today. This matter of the disposition of the sources of atomic energy might very well be left for some other time when we are better informed than we are today on the economic ramifications of the problem. True, that would leave our legislation incomplete. But completeness may be a false goal in interim legislation. I think, for instance, that it would be a serious mistake to postpone the consideration of domestic legislation such as is before your committee until the completion of pending international negotiations. There are some phases of this problem on which prompt legislative action is necessary.

One such phase, I may say, which is in no way covered by S. 1717, is legislation amending the laws relating to the disposal of the public lands so as to reserve to the United States all fissionable materials. This would obviate the necessity for the Government's buying back such material at a later time. I may say parenthetically that a suggestion for legislation of this kind has been prepared by my staff and will shortly be submitted to the Congress for its consideration, and I hope it will have speedy congressional attention because of the urgency of this special aspect of the atomic energy problem.

Another phase of the problem that seems to me to require further consideration is the question of byproduct power, such as is given forth incidentally in the production of plutonium. Thus far such byproduct power has been used only for such unworthy purposes as raising the temperature of the Columbia River. I am not anxious to raise the temperature of any river, and I am not satisfied with the provisions of section 7 (c) dealing with the disposition of byproduct power. I think that whatever power is produced incidentally in the production of fissionable materials should be disposed of under the same standards that now govern the Federal disposition of power produced incidentally in various water-control projects, such as those constructed by the Bureau of Reclamation and the Corps of Engineers. That is to say, there should be a definite preference given to public agencies and nonprofit cooperatives in the disposition of power produced at public expense.

Necessary transmission outlets must be authorized in order to effectuate this preference, and the Congress should reiterate its sound traditional policy of fostering the widespread use of power in the interest of the ultimate consumer and of avoiding its monopoly by limited groups. Language such as that adopted in section 5 of the Flood Control Act of 1944 would accomplish this end. Public expenditures in this field should not become a disguised subsidy to a few utility companies.

One final point on which the language of S. 1717 seems to me to need some modification is in connection with the provisions for condemnation in section 5 (d) (1) of the bill (at pages 10 and 11). This section as it stands is open to question. Some of my legal advisers tell me that there are certain forms of property which are ordinarily not subject to condemnation unless expressly specified in the condemnation act. I think, therefore, that section 5 (d) (1) should be amended so as to cover expressly all forms of real and personal property, however held, including patents, as well as properties already

devoted to other public uses by States, municipalities, territories, Indian tribes, or other legal entities.

Senator AUSTIN. May I ask you a question?

Secretary ICKES. Yes.

Senator AUSTIN. You say all forms of real and personal property. Do you mean whether they contain any of the elements?

Secretary ICKES. No, relating to fissionable materials.

Senator AUSTIN. That is what I wanted to find out.

Secretary ICKES. More important than any of the foregoing suggestions as to the terms of S. 1717 are those which may be directed to what the bill as a whole fails to provide.

In the first place I do not find anywhere within this bill any prohibition against the peddling of confidential material by employees of the Commission. As I have already suggested, I think that one of the good points of S. 1717 is that it leaves independent scientists entirely free to experiment and discuss as they see fit. That is all to the good. But somewhere in the Government there must be power to control the way in which the products of Government research and experimentation are to be made available to the public and to other nations. This is a matter that cannot be left to the decision of individual employees. I think, therefore, that the bill might very well prohibit the unauthorized disclosure of confidential material by employees of the Commission or by persons or agencies working for the Commission on a contract basis.

There is a second point upon which the powers vested in the Commission seem to me inadequate to accomplish the purposes of the proposed legislation. The members of the committee are fully aware of the extent to which our conquest of the atom was made possible by the work of scientists who did not have the foresight to be born in the United States. Einstein, Fermi, Bohr, Oliphant, and Szilard came from Germany, Italy, Denmark, England, and Hungary, and a host of other great scientists came to us from these and other countries. Their help was asked and eagerly accepted, in wartime, without much reference to the red tape and technicalities of our exclusionary immigration laws and regulations or the citizenship requirements of our civil-service laws. It may be that on future occasions when we need help from abroad we will not have a war emergency to justify detours around the morass of immigration laws and regulations. I suggest, therefore, that the proposed Atomic Energy Commission ought to have the power to employ noncitizens wherever necessary, whether they reside here or in any other part of the world, without regard to existing citizenship requirements for Federal employment.

Senator AUSTIN. That would probably be subject to such international arrangements as we get into?

Secretary ICKES. It would have to be that.

The Commission ought to have the further power to bring into this country any persons whose services may be required, together with the dependent members of their families, without regard to race, or national origin, or any other of the grounds upon which we now exclude would-be immigrants.

Under the present immigration laws we decide whether a man can come into this country by looking, primarily, not to what he might bring us for the future, but to his national origin. Under our gerrymandered quota laws we take the position that a German immigrant

is twice as valuable as a Pole. We assume that he is 4 times as precious as a Hungarian, 30 times more worth while than a Rumanian, and 100 times worthier than a Filipino. We have, therefore, since 1924, made it very difficult for scientists and technicians to come to this country if they had the bad fortune to be born on the wrong side of the boundary line. Unless we are willing to sacrifice our national future, as the Germans did, to a racial myth, we ought to include in S. 1717 some provision by which the Atomic Energy Commission may be relieved, in its own work, of the incubus of citizenship and immigration restrictions and set free to hire the best talents in the world, wherever they may be found, to carry out its great task.

There is a related point that raises somewhat similar considerations. We have been repeatedly told that scientific talent is one of the precious elements in our national economy that ought not to be wasted. Yet one of the distressing features of our war mobilization was the extent to which we put talented physicists, chemists, economists, and other technical experts to work peeling potatoes in the Army and doing various other chores, some even less edifying than that of KP. I recall one incident of a college graduate known to me personally. He was born in this country of Chinese parents, and he volunteered for service in the Army. He spoke Cantonese and several other languages. He was put to work cleaning latrines. In my own Department it made me heartsick to see talented map draftsmen, engineers, and geologists, who were doing vital war jobs, taken out of important war work and put into uniform to perform tasks that others could do better, or at least as well. If such situations should be repeated in the future they might very well constitute a serious impediment to the scientific work of civilian departments and agencies. I suggest, therefore, that the Atomic Energy Commission ought to have the power in appropriate cases to co-opt employees of other agencies, including the military, with the consent of the persons affected, and to put such men to work on the profoundly important activities that would come within the jurisdiction of the Atomic Energy Commission.

There is another point on which I think that the specified powers of this Commission are inadequate to the efficient accomplishment of the tasks for which it is made responsible. Under section 1 (b) of S. 1717, a major responsibility of the Commission is the dissemination of information to industry and to the public concerning atomic energy. Now, the dissemination of information by a Government agency is an activity that has traditionally been regarded in certain quarters with grave suspicion. Accordingly, we have a considerable number of laws which make it difficult or impossible for any Government agency to disseminate information in an effective and economical way. Take, for instance, the law which prohibits the sale of more than one copy of any public document to a single customer unless the customer is a Member of Congress (act of January 12, 1895, sec. 61, 28 Stat. 610, 44 U. S. C. sec. 71); or take the law which prohibits the use in Government publications of any illustration "unless it relates entirely to the transaction of public business" (act of March 3, 1905, sec. 1, 33 Stat. 1213, 44 U. S. C. sec. 118); or consider the general legislative prohibition against Government publications "not having to do with the ordinary public transactions of the executive departments" (act of March 3, 1905, sec. 1, 33 Stat. 1249, 44 U. S. C. sec. 219 (a)), or the law that requires all Government printing to be

submitted to the Government Printing Office (act of January 12, 1895, sec. 87, 28 Stat. 601, 622; 44 U. S. C., sec. 111).

These are but a few of the many statutes which encumber the path of a Government agency that tries to disseminate information.

During the war it was possible to find detours around many of these statutes. For instance, The Official Report on the Development of the Atomic Bomb Under the Auspices of the United States Government, written by Professor Smyth, at the request of Major General Groves, appeared shortly after the dropping of the first atomic bomb. That, I suppose, is because it was published by the Princeton University Press and not by the Government Printing Office. What the Comptroller General is going to say about that, I don't know, but in any event the report is out, and for some months it has been high on the list of nonfiction best sellers.

The CHAIRMAN. I can back you up on that, because we have yet to get copies of hearings that were held 5 weeks ago, completed copies, from the Government Printing Office.

Secretary ICKES. It is illustrated and a book dealer is permitted to buy more than one copy—even if he isn't a Congressman. My suggestion, then, is that specific language be included in S. 1717 which would free the Atomic Energy Commission from all restraints imposed by existing law on the dissemination of information by Government agencies.

Indeed I might go further and suggest that there are a number of other outworn laws which might very well be dispensed with if we want an Atomic Energy Commission that will operate with reasonable efficiency. Take, for instance, the law which prevents Government employees from attending scientific conferences, unless express provision in that behalf was made in the appropriation bill drafted a year or two before (act of June 26, 1912, sec. 8, 37 Stat. 184, 5 U. S. C. sec. 83). As I read the Smyth report, the process of developing the atomic bomb consisted very largely of conferences, at which fragmentary ideas of different people were brought together, and these conferences were generally arranged at a week's or a month's notice. It was wartime, and I suppose that the Comptroller General was not even told about these conferences. Or consider section 102 of title 5 of the United States Code, which declares that no Government department shall spend more than \$100 in any year for the purchase of needed periodical publications. I suppose that some Government official bought too many magazines or newspapers in 1842, when that law was passed, but must all Government agencies suffer forever for that indiscretion?

The woods are full of statutes like that, and, so far as I can tell, the general theory of these statutes, as construed by that watchdog of the Treasury, the Comptroller General, is that the use of airplanes, motor-propelled vehicles, typewriters, bottled water, and anything else not used by George Washington's Cabinet is, *prima facie*, illegal unless expressly mentioned in the latest departmental appropriation acts. You can readily appreciate, gentlemen, that an Atomic Energy Commission might not find its work facilitated by these statutes. I think it would be a good idea to exempt such a commission from all laws governing public purchases, contracts, and expenditures, whenever the Commission determines that compliance with such laws would be incompatible with the public interest.

I have emphasized what I conceive to be mistakes of commission and omission. These are for the most part relatively minor. I cannot conclude without saying that, in my opinion, the accomplishment of the basic objectives which you have set out in S. 1717 is essential to the maintenance of our democracy and to our future well-being and security as a nation.

Senator HART. Mr. Secretary, referring to the early part of your statement, there is one thing I would like to understand.

Do you personally believe that we should now disclose all of the secrets which remain to us in connection with the atomic bomb?

Secretary ICKES. Should disclose them?

Senator HART. Yes; to everyone.

Secretary ICKES. Well, I wouldn't say to everyone. If it means should we disclose them to the nations that fought with us to win the war, I would say "Yes."

Senator HART. That is, you would disclose every last remaining secret which we now have?

Secretary ICKES. I would.

Senator HART. In your statement, at the bottom of page 5, you say:

Nor will that job be facilitated if we make atomic energy control a function of the military.

Secretary ICKES. That is right..

Senator HART. Who has proposed that we do?

Secretary ICKES. Well, I have seen various suggestions to that effect. I may be misinformed, but even if it isn't proposed, I would like to put in the negative anyhow, Senator.

Senator HART. There is no such proposal before this committee.

Secretary ICKES. Then that is all to the good.

Senator HART. I have nothing further.

Secretary ICKES. Perhaps I cried before I was hurt, but I don't want to be hurt.

The CHAIRMAN. Any further questions of the Secretary?

Senator HICKENLOOPER. Clearing up the Secretary's statement a moment ago that he would disclose the secrets of atomic energy, is that all the secrets we have including the making of the bomb to the nations that fought on our side during the war, and would that be prior to the arrival of any agreements for the outlawing of the weapon?

Secretary ICKES. That is a matter of international negotiation that I am not competent, and certainly not disposed, to discuss. That is a matter of international agreement.

Senator HICKENLOOPER. I was merely attempting to get straight in my mind as to when you would make this disclosure. Frankly, I feel that there are some disclosures which should not be made until we get satisfactory agreements.

Secretary ICKES. I might agree with you, Senator.

Senator HICKENLOOPER. I wouldn't want to go out now and just bare our bosom to the world.

Secretary ICKES. I am the last man in Washington to attempt to invade the jurisdiction of the State Department. A Member of Congress may do so, but I may not.

Senator HICKENLOOPER. On page 9 of your statement I have a little difficulty in reconciling the recommendation of the Secretaries of State,

War, Navy, Interior, and Commerce as members, where you refer to the provision in one of the bills——

Secretary ICKES (interposing). I don't recommend that provision.

Senator HICKENLOOPER (continuing) ——that those officers, together with four members at large, be employed. Then you criticize the employment of the per diem members on the basis that they would not be devoting their full time and energy to the commission.

To me, that doesn't quite square with the fact that the Secretaries of State, War, Navy, and Interior apparently are approved on that Commission, but they certainly have other duties besides the atomic energy, and would be devoting only a small percent of their time.

Secretary ICKES. But they have no duties outside of duties to the Government, which I think is a very valid distinction; and your per diem members, if they should be appointed, would have only that specified duty to the Government intermingled with personal and private business duties of their own.

The CHAIRMAN. Mr. Secretary, in this statement that you made here today, you stress the necessity for civilian control, which you believe is exemplified in S. 1717.

Now, the War Department prepared a bill which was the subject of hearings over in the House. It was introduced by Mr. May on request, and Senator Johnson was acting as Chairman of the Military Affairs hearing by request. That bill required that there be part-time directors, and provided for full-time general managers, with a specific exemption from the statute which requires that no military men may at the same time hold civilian jobs. In other words, it was claimed by some—and I want to find out if you agree with that thought—that the purpose was to have absentee directors and full-time military operators.

Now, that bill is before the committee at this time. Is that the bill that you had reference to, or the suggestion that you had reference to, for military emphasis rather than civilian emphasis in the control of this matter?

Secretary ICKES. Yes; I would oppose that provision in any bill. I think we would be taking a long step away from the road of civilian control of our Government that we have traveled since the Constitution was adopted.

The CHAIRMAN. Thank you very much, Mr. Secretary, for being here.

The committee will meet at 10 tomorrow morning, on the Navy test.

(Thereupon, at 12:05 p. m. the committee adjourned until 10 a. m., Thursday, January 24, 1945.¹)

¹ For Admiral Blandy's statement on January 24, see pt. 4 of the hearings on atomic energy. The hearing on that day was not part of the series of hearings on S. 1717.

ATOMIC ENERGY ACT OF 1946

FRIDAY, JANUARY 25, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met at 10 a. m., pursuant to adjournment, in room 312, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Johnson, Austin, Millikin, Hickenlooper, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will please come to order.

It is my understanding that Dr. Hutchins, Dr. Gustavson, Dr. Redfield, and Professor Levi of Chicago are going to give us an hour's presentation—that was the agreement that was made with them—of their point of view on domestic legislation.

I understand that they would prefer not to be interrupted by questions until they have finished, if that is agreeable to the committee.

Maybe an hour is too much. As I understand it, you gentlemen will take about 40 minutes, the members of the staff tell me. So, gentlemen, you may proceed.

STATEMENT OF DR. ROBERT M. HUTCHINS, CHANCELOER OF THE UNIVERSITY OF CHICAGO

Dr. HUTCHINS. Mr. Chairman and members of the committee, my associates whom I present today are Robert Redfield, professor of anthropology and dean of the division of the social sciences; R. G. Gustavson, professor of chemistry and vice president and dean of faculties; and Edward H. Levi, professor of law, for 5 years special assistant to the Attorney General.

The university with which we are connected was a major center of the research leading to the atomic bomb. The university has organized three new institutes to continue atomic research on a large scale. All of us have been for some time concerned with the problems before this committee. In my own case I have been involved in these problems since the beginning of the research on the atomic bomb, even before the inception of the Manhattan project.

The issue before the committee is the most important before the Congress. It is far more important than the Pearl Harbor investigation, important as that is; for this committee is concerned with the future of civilization and not merely with incidents, however lurid, in the past.

101

The issue before this committee is more important than the labor disputes that are now going on, important as they are. Nobody supposes that these disputes can wreck the United States, no matter how much they may retard its progress. The policy adopted by this committee may determine the fate of our country, and even of the world.

Compared with the issue before this committee, such questions as balancing the Budget, adopting peacetime conscription, or even the rate of demobilization of the armed forces pale into insignificance.

We know that civilization cannot outlive an atomic war. We know that the decisions of this committee will go far toward deciding whether we are to have an atomic war. It is not too much to say, therefore, that the deliberations of this committee may determine whether or not civilization shall survive.

Any legislation in the field of atomic energy must be based on the assumption that war will in some way or other be averted. We cannot assume that there is going to be a war and then try to frame domestic legislation on that assumption. The assumption that there is going to be a war would lead to the conclusion that we had better start the war this morning, because only this morning can we be sure of having supremacy in atomic bombs.

No plans for atomic energy, and no plans for anything else, for that matter, can be made on the supposition that we are going to have war. Any war we have will be so destructive that no plans can be carried out. We must plan in the conviction that we can defeat war and develop atomic energy in a world at peace.

It is therefore apparent that in this field there can be no solely domestic legislation. Any legislation must subordinate domestic use to international agreements. We must assume that such agreements can be reached and that they will be kept. Any legislation must be such as to reassure other nations as to the peaceful intentions of the United States. For this country to announce by way of domestic legislation, for example, that it regards atomic energy as a weapon would justify the fears of other countries and lead them to suppose that the United States intends to dominate the world by force. Any domestic legislation about atomic energy must fit into the general plans which this country adopts to promote peace.

These considerations lead to the conclusion that any legislation in the field of atomic energy must contemplate an unusual degree of governmental control. The Government must know all about all developments at all times, because of the international ramifications of any development at any time. This discovery is the most important since the discovery of fire. Its social, economic, military, and political consequences cannot now be foreseen. We know that we cannot play with fire, even after 5,000 years of experimentation with it. This discovery is infinitely more dangerous than fire. The people of the United States must plan to develop this discovery for the benefit of the world; they must plan to protect the world against it. This matter is too serious to be left to the casual activities of individual enterprisers.

Consideration of the international aspects of the problem also leads to the conclusion that this discovery should be developed under the auspices of civilian rather than military representatives of the Government. The surest and clearest way to prove to the world that we

regard atomic power as a weapon is to place control of it in the hands of the armed forces.

Here I do not enter upon the fitness of the armed forces to promote scientific research or to deal with scientific workers or to develop the peacetime uses, such as the medical uses, of atomic energy. I wish to emphasize the general alarm that would spread through the world if we proclaimed that the military were in charge of atomic energy in the United States.

Although we have to accept an unusual kind of governmental interference in developing atomic energy, the limitations imposed by such interference need not be seriously restrictive, not nearly so restrictive as those imposed by the Army during the war. The secrecy requirements of the Manhattan engineer district were excessive even in wartime and were, I believe, detrimental to the project.

A country like ours will profit by the freest exchange of scientific information, for we have the technical skill and the resources to make the most of any ideas that appear anywhere in the world. Even from the standpoint of future military security, therefore, secrecy requirements should be reduced to the minimum. Certainly all basic scientific information should be free.

There are already on the statute books enough laws to prevent the treasonable revelation of military secrets.

We must agree, however, that this discovery is so important and so dangerous that the people through their elected representatives must supervise its development. This discovery cannot be allowed to get out of hand. Since we have here an unprecedented force, we must reconcile ourselves to unprecedented methods of dealing with it.

Mr. Redfield, Mr. Chairman.

**STATEMENT OF DR. ROBERT REDFIELD, DEAN, SOCIAL SCIENCES
DIVISION, UNIVERSITY OF CHICAGO**

Dr. REDFIELD. Mr. Chairman and members of the committee, in legislating about atomic energy the paramount consideration is peace. Whatever else a bill may accomplish, it must provide conditions that make war less probable. One test it must meet before it is measured by any other: Does it increase the chances of enduring peace?

The effectiveness of the bill in connection with production of energy and with development and research is to be tested within the framework of the bill as a measure for the peace of the world, and subordinate to this first consideration. This is because today we face an absolute necessity to prevent another war.

For the first time in history the necessity to prevent another war is absolute because we can no longer look forward to both war and the preservation of our civilization. Before atomic energy a nation could plan to advance human progress with or without a great war. Then one could say, let us try to avert a war, but if war cannot be averted, let us fight the war and also go forward with the work of civilization.

We have just fought a great war, and in spite of the immense cost of victory we feel that victory was worth the cost.

That war was the last such major war. Now a great war will not leave even the victorious nation with enough to enable it to go forward with the work of civilization.

The committee has heard convincing testimony as to the immense increase in destructiveness made possible by the new weapons. A major war with atomic weapons would destroy both combatants as leaders of civilization. It is this fact which makes the prevention of another war the paramount consideration in the control of atomic energy.

The bill that will command our support is not a bill which makes for both war and peace, for peace maybe, but if not, then war. It is a bill which makes for peace.

In legislating about atomic energy, domestic and international issues are inseparable. Any bill that can be drawn will affect the chances of war or peace. What this Nation does with regard to atomic energy will be looked to by every nation in the world as a guide post to the future. If it appears that this Nation plans for war, other nations will plan for war. If it appears that this Nation puts peace first, beyond other considerations, then other nations will be disposed to join us in making that peace.

Any bill in this Congress about atomic energy is a major act in international affairs. It may be a decisive act in the choices that lead to war or to peace.

Peace is made through confidence between peoples and through agreement between nations. It is threatened by secrecy, endangered by suspicion, and put in grave peril in a race of armaments. Therefore, that bill about atomic energy makes for peace which promotes candor and confidence and which checks a race of armaments.

What are the features of a bill about atomic energy that will have these effects?

In the first place, such a bill will treat atomic energy as an instrument for the advancement of human welfare. It will encourage in every way development and research for medical and industrial uses. On the other hand, it will provide means whereby the use of atomic energy in the manufacture of bombs may be quickly brought to a halt. To encourage the peaceful uses of atomic energy it will provide for the utmost freedom in the exchange of scientific knowledge. It will offer scientists in all parts of the world opportunity to join with scientists of the country in the extension of knowledge in this field with the least possible secrecy regulation. It will take control of atomic energy from military authorities and put such control, and the bombs themselves, into the hands of civilian authorities.

In the second place, a good bill will provide for such governmental control of both development and production as will demonstrate the readiness of this country to enter into international agreements for the reduction of armaments and the control of war and which will make it possible for this country quickly to meet such agreements. It will do this by providing governmental control over the source materials of atomic energy, and over the manufacture of all products at all closely connected with atomic weapons.

It will provide a system of inspection of plants, facilities, and laboratories which will maintain this control and will show determination to explore the possibilities of world-wide inspection as a part of atomic energy control through international agreements.

It will maintain these controls for the further reason that there must be no suspicion that private interests are concerned in the manufacture of atomic weapons. The bill must be a statement to

the people of the world that this country is determined that atomic bombs shall never be used again.

To realize this determination may require a degree of interference with industrial development of atomic energy beyond that which has been called for in connection with previous discoveries. No private interest deserves consideration if it stands in the way of a peaceful utilization of the new energy. If, to bar military uses, it is necessary to modify the special patterns of commercial development or regulation of development that have prevailed in metals, electricity, fuels, and plastics, we must modify them. For atomic energy is a new beginning, or it is an ending, and to make it a new beginning we dare not be bound by the past.

To realize the determination that atomic energy shall be only a benefit it is further necessary that the bill provide the people with understanding of the consequences of its use. Its social, economic and political implications are so vast and far-reaching that we cannot allow the impact of the changes it will bring to fall upon society as they may happen to fall. This is a change in technology that can destroy civilization or make it over, and therefore the effects of its development on industry, on prices, on leisure and its uses, on government and community life, must be studied as they occur and even before they occur. Social science recognizes in this physical event the initiator of changes in human living perhaps greater than have occurred before, and swifter.

We must have, therefore, the foresight which social science adds to the guesses of common sense, and therefore the bill must provide for study and report of the implications of atomic energy for society. Of these implications the most immediate are those political consequences which make for an ultimately destructive war, or for peace. To prevent war and to promote peace the bill must, in first instance, be shaped.

Dr. HUTCHINS. Mr. Gustavson, Mr. Chairman.

Senator MILLIKIN. Dr. Gustavson is from my own university. He is a man highly esteemed in Colorado. We all loved him very much and hated to see him leave, but are glad to see him in such appropriate surroundings.

The CHAIRMAN. It becomes incumbent upon me to say that the first time I saw Dr. Hutchins he was dean of the Yale Law School and had me on the carpet. He, as you can see, wasn't much older than I was at the time. I submitted gracefully to his kind attention.

Senator HICKENLOOPER. I believe the only credit we can take is that we join Illinois across the Mississippi River.

Senator JOHNSON. Senator, I want to congratulate Illinois on getting Dr. Gustavson. I recall that when I was Governor of Colorado I tried very hard to have Dr. Gustavson made the president of the agricultural college at Fort Collins, and I concur in everything that my colleague, Senator Millikin, said about him. We have suffered a very great loss in losing Dr. Gustavson, and our loss is Illinois' gain.

Dr. GUSTAVSON. You are very kind, Senator Johnson.

The CHAIRMAN. I don't know what you are going to say, but I certainly am deeply interested now.

Dr. GUSTAVSON. The proper thing for me to do is bow out, I think.

STATEMENT OF DR. REUBEN G. GUSTAVSON, VICE PRESIDENT
AND DEAN OF THE FACULTIES, UNIVERSITY OF CHICAGO

Dr. GUSTAVSON. It is difficult to throw off the psychology of war when thinking about atomic energy. If we succeed in developing an international organization which will decrease to a very great extent the possibility of a war with atomic bombs, then it is indeed possible to contemplate marvelous developments in the fields of science and industry as a result of the discoveries in the field of nuclear physics and nuclear chemistry. If we fail to establish such an organization internationally and an atomic bomb armament race is the result, then it is hard for me to believe that the kind of life it will be possible to live, namely, one of constant fear, is worth being concerned about.

Naturally we first think of atomic energy in terms of useful power. Atomic power is a reality. Energy can be liberated in the form of heat at any temperature we desire. It is now possible to liberate this energy under conditions that can be carefully controlled. It is possible to regulate the rate at which energy is liberated by nuclear reactions just as accurately, indeed, as it is possible to control the temperature of this room.

Science had to develop methods for the liberation of atomic energy under controlled conditions before an atomic bomb could be produced. This controlled release of atomic energy was first accomplished in December 1942.

We ask ourselves, "What are the possibilities for the development of power that will compete in price with coal, oil, or natural gas?" The question is difficult to answer. A few calculations may be of interest. One pound of uranium will produce something like 11,000,000 kilowatt-hours of energy. If we should be able to prepare concentrates of uranium-235 for \$9,000 a pound, then that would mean, as far as fuel is concerned, that energy could be produced at the rate of one-tenth of a cent per kilowatt-hour.

How does this compare with coal? Suppose we assume that coal costs \$5 per ton and that we are dealing with a coal which contains about 14,000 British thermal units per pound. Then we find that, as far as fuel is concerned, electrical energy, not taking into consideration the equipment necessary, would cost about six-hundredths of a cent per kilowatt-hour.

These figures are of interest because they indicate that these calculations, which are only rough approximations, mean that commercial atomic energy is a possibility. As far as the physical factors are concerned, if materials were made available, a dynamo could be generating electricity from atomic energy in 6 months. When we remember that we have only started to learn how to separate the uranium atoms which have a weight of 235 from those which have a weight of 238, that, in fact, the whole field of producing energy from nuclear reactions is in its infancy, even a conservative would be inclined to say that the probabilities are strong that atomic energy will be a commercial success.

Progress will undoubtedly take place as we work in this field as far as efficiency of the processes are made better. This means, of course, that the possibility of driving submarines, ocean-going vessels, and possibly even trains with atomic power is real. Smokeless cities may be a reality.

But even though we should never be able to use atomic energy economically, there are still many great advances in human welfare that are possible through these discoveries.

In the first place, we now have neutrons, some of which are moving very rapidly, so-called fast neutrons, other neutrons which are moving relatively slowly, available for study. We can use these neutron rays in much the same way as we use X-rays. And, in fact, a number of experiments which have been carried out using X-rays will undoubtedly be repeated using neutron rays.

We know that certain types of cancer yield to X-rays. Will there be other types of cancer that will yield to neutron rays? Research alone is the answer.

We know that you can bring about certain mutations in plants with X-rays. What will we be able to do with neutron rays? Research, again, is the answer.

We know that we can bombard the common stable elements such as iron, phosphorus, and sulfur with neutron rays and render them radioactive. It is possible, for example, to convert the element manganese into a form of iron which has the properties of radium by bombarding that manganese with neutrons.

This man-made radioactive iron can be followed by means of delicate instruments which will detect the radiations that are thrown off by the radioactive iron. Using material of that kind, for example, we can follow the rate at which blood corpuscles are destroyed in the body. That is, we can put this radioactive iron into a form in which it can be assimilated and put into the blood corpuscles, and then you can follow the blood corpuscle because it contains a tagged form of iron. We can study the value of different kinds of preservatives on red blood corpuscles. In fact, this was done in work carried out by the Army and Navy during the war.

We can use these same radioactive elements, which are called tracers, to follow chemical reactions. We can use them to follow chemical reactions not only in the laboratory but even on a very large scale, and if I had the time available for example, I could point out how you could even study the reactions of a blast furnace with these tracer materials. Just as we can take pictures of bony structures within living organisms by means of X-rays, so we can take probably pictures of atoms in molecules by using neutron rays.

So we have an opportunity today to learn what the atomic architecture of various kinds of substances really is by actually photographing them after a fashion with neutron rays. These techniques will undoubtedly be of tremendous significance in industries such as the organic chemical industry, the medicinal industry, the synthetic rubber industry, et cetera.

While the fundamental discoveries in producing atomic energy, about which we have been talking, came out of the world of physics, we must not think by any means that this represents a finished story. We have broken atoms up into a nucleus and electrons. We have broken this nucleus up into particles which we speak of as protons and neutrons.

We have evidence from studies that have been made with cosmic rays that there are particles larger than the electron and yet smaller than the neutron. One such particle is called the mesotron. Is it possible to break the neutron up into these smaller structures? If we

are able to break up the neutron into mesotrons, for example, will such reactions take place with a liberation of energy, just as the breaking up of the nucleus takes place with a liberation of energy? Research again is the answer to these questions.

So I would say that we have opened up a whole new frontier, a frontier which offers real intellectual excitement for the investigator and which, in all probability, promises a higher standard of living and a better life for the common man. The exploration of this frontier calls for fundamental research. This means that the Federal Government must make grants to universities and other research organizations to get this work done. A great deal of this work in the past has been done in European universities. In the future we must depend upon great American universities, private and public, to do this research. Some of the great research institutions connected with industry will carry their share of the responsibility.

These workers must be free to exchange information not only with workers in our own country but with workers all over the world. In this way a cross-fertilization of minds takes place, and new ideas are born. In this way mistakes are corrected, and incomplete observations are finished.

The Italian investigator, Enrico Fermi, for example, set up the experiment for nuclear fission in 1935. The full significance of the experiment was not realized until 1939, and then the work was finished by a German, Otto Hahn.

Given the means for research and freedom to investigate, new frontiers will be opened up in pure science. Applied science will follow. Two conditions are necessary: Science must have adequate support, and, equally important, science must be free.

Dr. HUTCHINS. Mr. Levi, Mr. Chairman.

STATEMENT OF PROF. EDWARD H. LEVI, UNIVERSITY OF CHICAGO LAW SCHOOL

Professor LEVI. Mr. Chairman and members of the committee, everyone will agree that atomic energy is too important to the future of this country to permit any cartel, domestic or foreign, to control its use or development. If there is any danger of a private monopoly in any of the stages of the development of atomic power, such as control over uranium or plutonium, or over any important process or application, the American people would want to prevent it.

As to many other industrial fields, we may have a split personality, condemning cartels as contrary to free enterprise, and yet tolerating them, because that is what a part of the rest of the world seems to want.

But it seems clear that the American people will not want to tolerate any private cartel controlling the development of atomic power in this country. In fact, the idea of such control seems fantastic.

But the idea is not fantastic, and any legislation in this field must take this possibility into account. After all, there is a cartel controlling radium, and radium is found in ores which also contain uranium. One company already has a dominant position over vanadium, and vanadium is found in ores which also contain uranium.

It may seem unthinkable that a cartel might be permitted to retard the development of a field important to national security. But the

production of synthetic rubber was almost prevented in this country because of the control of patents by I. G. Farben and the various restrictive arrangements it had made. We are told that radioactive byproducts can play an important part in the development of medical research. Again we must be warned by the fact that the field of medicine and drugs is most highly cartelized and controlled. No American company wants to see these things happen in the field of atomic power.

In order to prevent these things from happening in the field of atomic power, legislation must guard against certain common practices or accidental results. For example, it is a common practice for an American company to make an exclusive cross-licensing arrangement with some foreign company under which patents and know-how are exchanged. A basic part of such an arrangement is an understanding between the parties that each party is to have a monopoly in the particular field in its own country.

Whatever we may think of such arrangements, whether they be considered legal or illegal under our present patent system, we cannot permit such agreements to restrict the development of atomic power. In fact when we are trying our utmost to encourage the development and beneficial use of atomic power, it would be anomalous to permit any company, large or small, or even an inventor to own any basic patent with the right to refuse to license anyone else to use the invented process or machine in the field of atomic energy.

In other fields it is perhaps possible that we may permit companies to acquire, accidentally or otherwise, key natural resources, such as bauxite, radium, or vanadium. But we cannot permit such a development for uranium. In other fields we permit companies to keep secret unique processes which they have developed, but in the field of atomic power, there at least should be no trade secrets against the Government.

This means that legislation must give to the Government special powers to prevent any monopolistic ownership of uranium or fissionable materials. It means that, as to atomic energy, our regular patent system must be modified. We can't afford to have blocking or fencing patents in this field. No company would want to assume the responsibility for preventing the widest possible development and application of atomic energy devices.

Legislation must make sure that, unlike the normal foreign business agreement between an American and a foreign company, the general public interest will override any exclusive arrangements. It must provide that our own country's foreign policy will have to control the development by American capital of foreign factories which might produce atomic bombs. And any commission set up by the legislation must have the right of access to all American plants and full information as to the state of the art.

This is the antimonopoly, the anticartel side of the picture. A part of the same picture, however, is that we want to discourage control by monopolies in order to make it possible for all American business to take part in this new development on the widest possible basis.

We want business to engage in research and developmental work in this field. We do not want research to be only governmental or the work of nonprofit institutions. Thus it is important that the Government have the right to give grants in aid and contracts for research

and developmental work to private business enterprises. It is also important that some incentives be provided for private enterprise so that it will be anxious and willing to engage in research and developmental work.

What kind of incentives can legislation in the atomic energy field provide?

We may as well admit the fact that there are some incentives which good legislation in this field cannot provide at the present time. We cannot permit private enterprise in this country to begin the manufacture of fissionable material for the purpose of creating power.

There are two reasons why we cannot permit this. In the first place, the production of fissionable material by private companies for their own purposes and for the commercial sale of power will complicate the international situation enormously. It will make much more difficult the setting up of an inspection system. It would tend also to foreclose the possibilities of an international authority under the UNO which would not only have the right to inspect but the exclusive right to license the manufacture of fissionable materials throughout the world.

In the second place, we do not know enough about the commercial possibilities of atomic power to have intelligent legislation on that subject. And this is a matter which is so important that Congress must decide the issues.

While commercial and developmental work are going on in the industrial field, we will learn more about the industrial possibilities. When we learn more, then the Congress will have the information on which it can determine what the standards for industrial control should be.

And there is another incentive which good legislation cannot give to industry. This is the incentive of the exclusive right to control. In other words, whatever the right to refuse to issue a license under a patent may be worth, no company in the atomic energy field should have this right.

If legislation in this field should deny to private industry for the present the right to manufacture fissionable materials for the production of power and should deny the right to industry to possess patents which it can refuse to license, will there be sufficient incentive so that industry will take part in the development of this new source of power? This is, of course, a crucial question which any legislation in this field must face.

The answer seems to be this: It is unthinkable that American business, given complete freedom to go ahead in research and development in this all-important field, will not do so. Industry can be given the fissionable material for its research and developmental work. The wide exchange of information should facilitate research. Industry can be given rewards for inventions not only through governmental contracts and grants in aid, but by receiving a royalty for the use of the inventions it develops.

Further, during the waiting period it can develop equipment or parts to be sold to the Government. And industry will know that as soon as an international agreement has been reached and the Congress has the social and economic facts before it, additional legislation governing further commercial use will be passed. Industry undoubtedly will wish to take part in such studies as will be necessary before good legislation covering industrial use can be enacted.

I think that if industry is given the choice between intelligent legislation enacted after the social and economic facts concerning the industrial use of atomic power are known in greater detail, or legislation which perforce can provide no standards but which gives all-embracing and uncontrolled authority to a commission, industry will be on the side of intelligent legislation, and it will be willing to wait for such legislation while at the same time engaging in research and developmental work.

It is important that this should be so. This is the only way we can encourage peace in the world and at the same time begin to get the peaceful benefits of atomic power.

Dr. HUTCHINS: Mr. Chairman, in these statements we have emphasized the importance of the issues before the committee. We have insisted that any legislation in regard to atomic energy must subordinate domestic use to international agreements and must be such as to assure other nations of the peaceful intentions of the United States.

We believe that the importance and danger of the discovery justify an unusual measure of governmental control. We think that such control can be so provided as to interfere very little with research and development. We believe that the social, economic, and political effects of atomic energy must be continuously investigated.

We have called attention to the tremendous benefits which will flow from this discovery if war can be prevented and research can be free. Medical care and biological investigation are already being revolutionized. The use of atomic energy for heat, power, and light presents no scientific or engineering problems; the only question is that of the economics of distribution.

We have pointed out that research in these fields is in its infancy and that the Government should conduct research and support research on a liberal scale. The applications of a discovery as important as that of fire cannot now be foreseen; but they will undoubtedly mean a higher standard of living for the world.

We think that legislation must provide that no cartel, domestic or foreign, can interfere with these developments. This means, among other things, that we must be prepared to modify our patent laws in this field.

We believe that no satisfactory bill can be drawn now to regulate industry in this field; and we favor a period of study, the formulation of a program, and the clarification of the international issues before industrial development begins. We turn now to the question whether the bill before the committee meets the requirements which we have been attempting to state.

This bill, Mr. Chairman, S. 1717, known as the McMahon bill, raises the issues we have been discussing. The first of those issues is the international problem.

Redfield, what do you think about the McMahon bill as to the international issue?

Dr. REDFIELD: While the bill does not declare the paramount importance of the international considerations as clearly or as early in the bill as I should like it to do, the general effect of its provisions, it seems to me, is to make it relatively easy for this country to enter into and fulfill international agreements for control, and there are two paragraphs in the bill in which the international agreement and its possibilities are explicitly referred to.

Paragraph 6 (b) provides that no military research shall be carried on if contrary to international agreement, and paragraph 9 (b) provides that knowledge may be disseminated if consistent with international agreement.

Dr. HUTCHINS. Well, there is also, isn't there, Levi, a provision in the McMahon bill requiring the express consent of the President for the manufacture of bomb parts?

Professor LEVI. There is that, and I think it is also important to mention that the basic idea of the bill that basic scientific information should be freely available is completely in harmony with what we think is necessary in the international system.

Dr. GUSTAVSON. At the same time, of course, it makes provision for the control of distribution of technical material depending upon what the national security is, and also makes provision for this very wide exchange of material of a basic nature. It is important to know that the bill distinguishes that.

Professor LEVI. It also prohibits private arrangements between American and foreign companies which might get in the way of international agreement if you can get one, and it does provide an inspection system which ought to help facilitate the international agreement.

Dr. HUTCHINS. This inspection system that is provided in the bill facilitates international agreements in two ways. In the first place, it provides that the Government shall be at all times informed as to what is going on in this field, and, in the second place, if there is to be an international inspection system, we have under this bill an opportunity to provide a model inspection system in this country.

Dr. REDFIELD. I observed also, Dr. Hutchins, that the bill, with regard to international considerations, would be one which clearly gave authority over this matter to civilians rather than the military.

If I read correctly the relevant provisions of this bill, it does give that assurance.

Professor LEVI. I think that it is terribly important that at the same time the President should control the manufacture of bombs and bomb parts.

Dr. HUTCHINS. I don't think you gentlemen could have read Secretary Forrestal's recommendations to this committee the other day, who seemed to feel that complete military control of this new power would be highly desirable. I thought the quaintest suggestion which Secretary Forrestal was reported to have made was that the Vice President of the United States should automatically become chairman of the proposed commission. I think that is a good suggestion now when we have no Vice President.

Our suggestion on the international aspects of this bill, Mr. Chairman, would, I think, be that it might be strengthened in two ways: First, there might be, as Mr. Redfield proposes, a clearer, earlier, and more explicit statement that the development of atomic energy in this country must be subordinate to our foreign policy. A comparatively minor change might also be advanced, and that is that the by-products might be made available to foreign countries for medical research. There would be no danger in that, and there would be great benefit to the world.

Professor LEVI. Great benefit to us.

Dr. HUTCHINS. And to us. The second issue that we have attempted to discuss is the issue of governmental control. The pro-

visions in the McMahon bill for governmental control are very broad, and yet it would appear no broader than the situation demands.

The Government becomes the exclusive producer and the exclusive owner of all fissionable material, and controls facilities when they can be used at a rate sufficient to produce a bomb. It provides that no one else can produce power until there is a 90-day wait, and no one else can produce fissionable materials unless there is further legislation.

Professor LEVI. They can for research and developmental work.

Dr. HUTCHINS. Do you regard these provisions as excessive, Levi?

Professor LEVI. No I don't. I think they are fairly strict, but I think they are the kind of provisions you have to have if the Government is going to have control over fissionable material, and I think they are drawn up so as to deprive the Commission of undue control.

As I understand it, the distinction between source material and fissionable material in the bill is intended to keep the Government from automatically owning the source material, and to permit it to own only those things it has to own, unless there should be a change, in which case it does have the right of eminent domain and does take over; but there is no automatic ownership.

Dr. REDFIELD. In short, the provisions with reference to Government control seem to provide a nice adjustment between two interests which are not wholly in conflict: the interest to provide such a situation as would make it possible for the United States rapidly and effectively to join any international control, and the interest of our country to favor the development of this new invention for peaceful reasons.

This seems to be a judicious adjustment of these two considerations to one another.

Professor LEVI. Of course, I think we have to recognize that the bill does permit the Government to go into the power business in the sense that it can sell the power it produces incident to the production of fissionable materials.

Dr. REDFIELD. We recognize that is only with regard to this interim period, and presumably it refers to the power which will be produced incident to the development and research.

Professor LEVI. I don't know. The Government is allowed to produce fissionable material, and while it is producing fissionable material, if it does produce power, it can sell it under this bill.

Dr. HUTCHINS. In any event, the industrial legislation is postponed on that subject.

Professor LEVI. That is right.

Dr. HUTCHINS. There is nothing in this bill that seems to suggest that the Government should in perpetuity be the producer and seller of atomic power.

Professor LEVI. That is perfectly correct.

Dr. HUTCHINS. The third question, then, is the question of the McMahon bill in relation to research and development.

What is your view on this subject, Gustavson?

Dr. GUSTAVSON. This is a phase of the bill that scientists have been tremendously interested in, for the simple reason that all of our experience indicates that it is only when you have a free interchange of information that progress in science can be realized.

If you want to know something about the air we breathe, you have got to get acquainted with Lavoisier, the Frenchman, Avogadro, the Italian, and Mr. Black, the Scotchman. You have got to go around

the world, and so it is with practically every piece of fundamental research that has been carried out.

Mistakes are made, observations are incomplete, and it is only when the work of one man is subjected to the critical analysis by another man that these mistakes are corrected, or incomplete observations are completed. This basic freedom in basic research is provided for in the bill.

At the same time, as far as technical development is concerned, or technical matters, the know-how of doing this and that, there is adequate protection for the national welfare as far as the bill is concerned, and a good deal of that legislation, of course, will depend upon what is done in the international field.

I think it is important to recognize, too, that while there would seem to be an emphasis on fundamental research, there is a great deal of industrial research that can go on, even though the industrial applications are held back. For example, in developing the atomic bomb, we saw different kinds of atoms separated by a diffusion process. This is something relatively new in industry, and the fact that that has been successful will undoubtedly mean that people who are making oxygen from the air will probably experiment with the possibility of producing oxygen from the air, using the basic ideas that were used in separating the uranium atoms; or the separation of helium from natural gas falls in the same category.

A tremendous amount of research can go on in industry previous to large-scale industrial uses.

Dr. HUTCHINS. Well, this bill in the first place makes research about as free as it can be in a field as dangerous and important as this, with such limitations as the Espionage Act, with the administrative interpretations of the Espionage Act made by the Commission.

In the second place, the bill does everything it can conceivably be called upon or expected to do in the promotion of research, which calls for grants in aid and calls for Government research, emphasizes medical uses, safety standards, and provides for preferences to research development and medical uses.

There is a point that I am sure one of you gentlemen will want to comment on, and that is that this bill authorizes the Commission to engage in research itself, so the Government here goes into research.

Professor LEVI. Some people think that cuts down private research and will certainly cut down the grants in aid for private research; the Government will want to do the whole thing itself.

Dr. GUSTAVSON. We must remember that we are breaking into a field that is very, very wide. The only comparable situation I can think of is agriculture, where the welfare of the peoples of the world, in fact, is involved, and over the years the Government has engaged in agricultural research through the land-grant colleges; work has been carried on by industry with respect to fertilizers, and so on. There hasn't been any competition that hasn't been good for both parties, and I feel that with atomic energy you have something that is equally broad. It is hard to believe that there will not be more than enough work to go around.

Professor LEVI. I think we should mention that under this bill, of course, the Government has control over fissionable material, and if it should refuse to give the fissionable material out, then it would be controlling the research that other people could do.

Dr. HUTCHINS. We would take the view that the Commission should allocate fissionable materials among research workers in terms of their capacity to adhere to proper standards of health and safety. We would be strongly opposed to any authority in the Commission to allocate materials among investigators in terms of the Commission's estimate of their competence.

Professor LEVI. The way the bill is now written, the Commission has to give it out.

Dr. HUTCHINS. That is the way it should be, isn't it?

Professor LEVI. Not only that, but if it were changed in that regard, I should think the whole spirit of the bill would be changed.

Dr. GUSTAVSON. Of course there is a safeguard there that may not be obvious to the layman, and that is the provision that anyone seeking the use of the fissionable material for research purposes must be able to show that they can adequately protect the health of the people concerned, and also take care of safety precautions.

The field of atomic energy isn't a field in which some boy can go upstairs in his barn and start experimenting. It isn't that kind of a project.

As we know at the University of Chicago, the guarding of the health of employees was a major factor, and so also anyone who engages in this field, if he has the capacity to protect the research workers, to take safety precautions, almost ipso facto is going to be somebody qualified to work in the field.

Dr. HUTCHINS. Let us turn to the social, economic, and political aspects of this bill, Redfield.

Dr. REDFIELD. In these aspects it seems to me the bill is good and its provisions are impressively bold and original as compared with some of the actions of the Federal Government in the field of research in which the necessity of combining investigation of social and economic consequences with the technical and physical matters has been neglected.

It is perhaps not remarkable that during the war the development of atomic energy for military purposes was carried on without the participation of students of society; but in the long run it was unfortunate that it could not be so combined.

There has been some hesitation in considering the general question of Federal support to research, as to whether support for the social sciences should also be included. This bill, however, quite clearly, as I read it, provides that support for research in the social and political and economic implications is to be carried on equally with the investigation of the physical and chemical aspects both by the Government and through grants in aid to other groups.

Furthermore, it is provided that the Commission becomes responsible for a study of what is going to happen to our society when the utilization of this invention really gets under way.

Dr. GUSTAVSON. That is something new, isn't it?

Dr. REDFIELD. That seems to be something completely new. In the past we have let invention fall where it might, and we have had industrial revolutions without being able to do anything about them until they happened. Now we know we may have a superindustrial revolution, and we hope we are going to be wise enough, if this bill is enacted and carried out, to take as much scientific forethought as can be accomplished.

Professor LEVI. I think this bill poses a different problem than the Kilgore or Magnuson bill for general social research, because you do need additional legislation on the industrial use, and you have to get the social and economic facts before you can get good legislation on that.

Dr. HUTCHINS. But the bill provides for studies by the Commission, studies by contracts made by the Commission, studies through grants in aid sponsored by the Commission, so that you have provision for continuous investigation of this subject as the invention develops, and this is unprecedented, unique, and highly desirable.

Now, as to industry, Levi.

Professor LEVI. I think the bill takes a middle-of-the-road, common-sense position as to the industrial problem. It does provide for these preliminary studies, and does provide that the Commission, as soon as it can, must make recommendations to the Congress for further legislation.

It does modify the patent system by not permitting any exclusive control, any refusal of a license; but the effect of the bill is to permit inventors to receive royalties or get paid for their inventions, so that it very clearly tries to preserve that incentive.

It also tries to encourage competition.

Really one of the very few restrictions placed in the bill is the authority given to the Commission to place restrictions on the use of atomic energy devices; the Commission may impose certain conditions in order to encourage competition.

Dr. HUTCHINS. The question is whether adequate incentives are provided for industry.

Professor LEVI. I think as adequate incentives are provided as you can possibly have without saying that we will permit industry at the present time to go ahead and manufacture power and produce fissionable material, which would raise a whole set of social and economic problems in the international scene, which I don't see how you can get legislation on now.

Dr. HUTCHINS. Industry has, of course, a two-billion-dollar backlog of investigation which the Government has carried on during the past 4 or 5 years.

Professor LEVI. And it is getting full use of that, because it has free access to all of that information, all of the patents, and everything. There are no blockings or fencing on patents now.

Dr. HUTCHINS. Mr. Chairman, our conclusion is that the McMahon bill is a good bill. It subordinates the domestic development and use of atomic energy to international agreements, as any good bill must do. It places atomic energy under civilian control. It does not treat atomic energy as a weapon.

Although it provides the necessary measure of governmental control, it at the same time frees research. It calls for both Government research and private research. It provides for research into the social, economic, and political aspects of the problem. It devotes special attention to medicine and biological research. Here we believe the bill could go further, and allow the distribution of byproducts for medical research in other countries. No program for industry can be drawn until the international situation is clearer and the social, economic, and political ramifications of atomic energy have been studied. The McMahon bill recognizes this fact and provides for the necessary study.

What is needed now is the freest possible research and development. The McMahon bill makes all basic scientific knowledge free and provides for the publication, under proper safeguards, of technical knowledge. The whole spirit and policy of the bill is that the most active research and development in this field must be encouraged by every possible means. Hence the bill modifies the patent system and prohibits the development of any monopoly or cartel.

The bill is in the best tradition of democratic legislation. It provides that Congress must be kept informed constantly. It calls for further legislation in the light of greater knowledge. It keeps this great development in the hands of the people, and puts its management in the hands of the civilian representatives of the people. It insists on the widest possible understanding of the problem. It promotes the widest and most rapid development of the discovery.

This is one of the rare moments in history at which it is possible for any man to see in simple dramatic form the issue before the world. We are on the brink of the precipice and one false step may take us over. The issue is no longer the issue of peace or war. The issue is peace or suicide. The people of the United States have recognized that this is the issue. They have declared that they will regard themselves as trustees for this discovery, which is freighted with incalculable good or incalculable evil for the world. The McMahon bill carries out the principle of trusteeship and gives us hope that we may plan with some confidence to obtain for mankind the peaceful benefits of our scientific knowledge and technical skill.

The CHAIRMAN. Now, Doctor, as I understand it, you are open to question?

Dr. HUTCHINS. Yes, sir.

Senator JOHNSON. Mr. Chairman, it seems to me that Professor Levi in his paper put his finger on a very important matter that applies to our job of setting up political controls.

He pointed out, as I understood it from his reading, that we were in no position at the present time to develop a long-range policy, the international situation being what it is and the domestic situation being what it is; that we are in no position to set up a long-range policy.

Perhaps I misunderstood him, but that is what I gathered from his paper. I couldn't agree with his conclusions altogether. If we are not in a position to legislate wisely, to set up the proper controls, then isn't the answer to find some way of setting them up where they can be changed as the changing picture comes into better view, rather than a stab in the dark at this particular time?

What I am driving at is this: Ever since this whole question of controlling atomic energy was dumped in the lap of the Congress, I have been trying to figure out some way of setting up congressional controls, having in view the same objectives that you men have, of providing against private monopoly and all of those things in this new field. But, unfortunately, I haven't been able to figure out in my mind, and no one has been able to help me, how we can set up congressional controls.

It does seem to me that one approach might be a sort of temporary procedure, maybe to last a year, 2 years, or 3 years, and then force it to come back for a further conclusion.

I noticed all through this round-table discussion the term "governmental controls." I would like to reduce that to "congressional

controls," rather than just "governmental controls," and that is the thing that I have been struggling with—and you have not been very helpful to me in your discussion along that line this morning.

Professor LEVI. Mr. Chairman, I don't disagree with that statement. As I understand the statement, it is that congressional control should be preferred over Commission control, and I certainly agree with that. It is also true that any legislation that is passed now, certainly as to the industrial use, must be regarded as temporary or interim legislation. That is the way I regard the McMahon bill.

You could perhaps have an additional statement to that effect in the bill, but the Commission is directed to make recommendations to the Congress as soon as it can as to changes or additional legislation.

Now, you could perhaps put aside the industrial power now entirely, and not have any legislation on it at all; but I think that would be unwise, because you do want industry to take part in the research and developmental work, and you do want to give them some incentives now. Therefore I think it is very important to be able to tell them now, "If you make an invention, you can either sell it to the Government or license it to other people and get a royalty."

I think it is quite important to tell them that now, so you don't have a stalemate until the other facts develop.

Without research and developmental work, I don't think you can get the other facts. As I understand it, that is the direction that this legislation takes. I agree that it is better to have the Congress do it.

Senator JOHNSON. It may take that direction, but it seems to me, if Congress enacts the McMahon bill, outside of receiving reports, it loses complete control. It occurs to me that perhaps there should be a time limit when this bill would completely expire. The trouble is that when Congress enacts a law, and then Congress attempts to amend that law, it runs up against a Presidential veto or the possibility of a Presidential veto and the requirement that you have a two-thirds majority to override that veto.

Changes in laws, amendments to laws, are not quite so easy in practice as they may appear in theory.

This committee had many noted physicists and scientists before it, and they gave us very helpful advice in their testimony; but I don't recall a single one who appeared before us, a single one of these noted men who appeared before us, who did not say in almost these words that unless we can set up international controls over atomic energy, the whole thing ought to be set aside, for two reasons: first, that it is impossible to separate the military uses of atomic energy from peacetime uses, that there is great difficulty in that; and, second, that the peacetime usage is a step toward military usage. You gather your uranium; you process it to a certain extent; you make plutonium out of it in the process of using it for power, and then it is only one small step—which they describe as being 75 percent along the way to a weapon—when you use uranium for peacetime power.

Since you have that great difficulty in front of you, and while steps are being taken—yesterday a very important step was taken—yet it seems to me that we are quite far removed from a satisfactory international disposal of atomic energy as a war weapon right at this moment when we are trying to write this bill.

Professor LEVI. I think anything that would require legislation on the subject again would be within the spirit of our discussion.

Dr. HUTCHINS. Mr. Chairman, isn't it possible to ask just what the McMahon bill does? It seems to me that what the McMahon bill does is to establish first the principle of civilian control. If you don't want civilian control, you don't want this bill.

The second thing the McMahon bill does it to promote research and development in every possible way. If you don't want research and development at this time, then you don't want this bill.

But the McMahon bill specifically does not authorize industrial use, which is 75 percent of the way toward military use. The McMahon bill explicitly postpones that issue, and thus postpones the only issue that is seriously involved with the international situation.

Senator JOHNSON. Well, that is your interpretation of the McMahon bill, and you have a right to that viewpoint. I am not quarreling with that viewpoint, and I am not quarreling with the McMahon bill. I hope that it does all the good things that you say, and still protects us against what might possibly happen to us.

I noticed in your statement a moment ago, Doctor, that you complain about Forrestal's position. I didn't understand Forrestal's position to be out-and-out military control. He did say that at the moment atomic energy is such an efficient weapon of war that the military does have a keen interest in it, that that has been the only use to which it has been put up to the moment, and therefore the military should have some little say-so in the control and handling of this new power.

As a matter of fact—and I don't think anyone can deny that the discovery of atomic energy, or the practical use of it, has completely revolutionized all of the military tactics that we have had in the past, completely changed them—the whole aspect of warfare has been changed by this new discovery. Since that is true, I think we would be very purblind to tell our military agencies, "That door is closed to you."

Dr. HUTCHINS. I should agree with that, Senator.

Senator JOHNSON. I think that is all that Secretary Forrestal was pleading for. That was my understanding.

Dr. HUTCHINS. Then he was misquoted in the press, and I apologize. It was stated in the press in Chicago that, in response to a question, the Secretary stated he would be satisfied with complete military control. If he did not say that, I apologize in behalf of the press and myself.

Senator JOHNSON. I didn't know about that statement.

The CHAIRMAN. No, he didn't; and I had occasion to talk with him again yesterday about it.

I think it is fair to quote him as he talked the day before yesterday and as he talked with me again, as saying that he believes that there should be a civilian—I don't want to say "domination"—control, but there should be more military representation than provided for in the bill as it is now written; and I think that is a better statement. In fact, it is a true statement of his position as he gave it to us.

Senator MILLIKIN. Mr. Chairman, I asked, I think, the question to which Dr. Hutchins refers in a glancing or negative way. That is, I asked him if he would object to a bill that for the time being kept control exclusively in military hands, and I think he said from a military standpoint there would be no objection to that. It was

not a question designed to test the merits or demerits of the McMahon bill; it was a question which I asked to test his own mind so far as a further temporary control might be involved.

Senator HICKENLOOPER. Dr. Hutchins, I want to call attention to the second paragraph of your first statement, not to criticize but to discuss it with you just a moment, in which you say that this overshadows Pearl Harbor, overshadows strikes, overshadows the internal affairs of the country.

My personal belief is that the stronger and more orderly our social and economical affairs in this country are maintained, therefore the more strength we have to use whatever this atomic energy gives us for world good, and that therefore, hand in hand with the importance of the atomic energy business, must go a sound solution of our domestic problems to give us internal strength ourselves and to prevent disruption.

I didn't know whether your statement was making those relatively unimportant.

Dr. HUTCHINS. No; all these matters are important, as I think the statement indicates. The issue of atomic energy is the issue of survival, really, and if you aren't expecting to survive, there is not much sense in worrying about what you are going to do with your life.

For example, you may expect a person in my position to suppose that the virtue and intelligence of the people are more important than anything else; I think they are; but if those people are about to commit suicide, there is not much use in discussing their virtue or intelligence if they are not going to be there tomorrow. That is all I mean.

Senator MILLIKIN. My thought is that domestic and social virtue internally in this country give us an added strength in order to accomplish things with it.

Dr. HUTCHINS. Absolutely.

Senator MILLIKIN. There is another statement here I would just like you to amplify for a moment, if you care to, a statement on page 2, where you say—

For this country to announce by way of domestic legislation that it regards atomic energy as a weapon would justify the fears of other countries and lead them to suppose that the United States intends to dominate the world by force.

Doesn't it also follow—or does it?—I didn't mean to put my question in a cross-examining manner—that the failure of any other countries of substance or power to agree readily to outlaw and to go along sincerely with the outlawing of atomic energy as a weapon might not also be an indication on their part that we might have something to fear from them, or something at least to suspect of them in the future?

In other words, the responsibility is not all ours.

Dr. HUTCHINS. Certainly, Senator, if any country which is in a position to exploit atomic energy on a large scale turns it over exclusively to the military in that country, or declines to cooperate in international agreements on this subject, there will be justifiable suspicions throughout the world of the intentions of that country.

Senator MILLIKIN. There is one question I would like to ask Mr. Levi.

As a lawyer, Mr. Levi, I take it you have given some considerable thought to this whole field of legislation on this subject. Have you heretofore prepared proposed legislation along this line?

Professor LEVI. Oh, I have read the legislation, and at times I have wished I knew how it could be done better. I have thought about it for a long time.

Senator HICKENLOOPER. I take it that perhaps, either in the preparation of this particular bill, or prior thereto, you were consulted about your ideas on this matter, weren't you?

Professor LEVI. Yes, but what I was trying to say, which I perhaps did not make clear, is that the consultation was by way of criticism of other people's language. I put it that way because there are things in this bill which I am not satisfied with, but I can do no better.

Senator HICKENLOOPER. There are many fine features about this bill. I am not objecting to it, but I am refreshed this morning, for it is the first time in a good many years in legislative history that I have seen a measure as comprehensive as this get such united approval in all of its particulars. I thought perhaps you had been consulted, Mr. Levi, and had given some aid and suggestions in the various categories of the provisions.

Professor LEVI. I will give you an example of what I mean. I think what we have been talking about are the major problems of the bill, as, for example, the patent problem. In discussing that problem we have said that we think the effect is to reward the inventor and to have a kind of compulsory licensing. Of course, that isn't quite what the bill says. The bill gives the title of the patent to the Government. I don't think that is necessary, but I also think it is less important, and I didn't think that was the kind of thing we ought to raise here.

Senator HICKENLOOPER. I am in thorough agreement with the general objectives. I think this has been a fine presentation and a unique method of presentation. I congratulate the Chicago round-table technique, because I think it is highly constructive, and certainly I have obtained a lot out of the discussion.

My own personal feeling is that any commission that is set up to handle this thing must, as has been suggested here, be considered a temporary approach to this problem. I think, 10 years from now, our views may change, but I also have the feeling that until satisfactory international agreements for the preservation of peace which we can rely upon have been reached, I do believe any control of this should take into consideration the military aspects of it until our safety and the safety of the world is established.

At this moment I cannot go along with completely divorcing it from all military implications, and I think military representation should be had until those agreements are reliable and until they have been put into effect. We might well announce now that the moment they are, we will abandon military participation, if it is necessary to do that.

Senator AUSTIN. Mr. Chairman.

The CHAIRMAN. Senator Austin.

Senator AUSTIN. There is one question I would like to ask about your conclusion, Dr. Hutchins.

Is it correct to construe your conclusion to mean that, before effective control of the destructive use of atomic energy is established, we ought to exchange reciprocally with another nation scientific knowledge regarding the constructive use of atomic energy?

Dr. HUTCHINS. Well, Senator, we take it as almost axiomatic in this field that basic scientific knowledge is already very well distributed, that there is nothing that can be gained by any attempt to conceal such knowledge as we already possess.

Second, we take it that the united effort of the world—or perhaps not the united effort, but the scattered efforts throughout the world—to advance basic scientific knowledge will be more valuable to us than limiting it to this country because of the technical skill and the resources of the people of the United States. Therefore, we see nothing to be gained by delaying any longer the distribution of basic technical knowledge and the basic scientific knowledge and exchange of such knowledge.

The bill provides for the control of the distribution of technical knowledge in such a way as to safeguard the interests of the United States. Now, what is needed at this stage is a statement of whether we are going to have civilian or military or mixed control, and a statement that we are going to support or not support the widest possible research and development in this field. That is essentially what the McMahon bill attempts to do.

We do not see any dangers in the military point of view in anything that the McMahon bill advances.

Senator AUSTIN. Then I understand your answer to be yes as to the basic knowledge but no as to the technical knowledge?

Dr. HUTCHINS. No; our answer as to the technical knowledge is the answer given in the McMahon bill, that such technical knowledge may be distributed to the extent that duly authorized representatives of the Government think it is safe to distribute.

Senator AUSTIN. Then is this true, that your answer is yes as to both basic and technical knowledge?

Dr. HUTCHINS. No. We do not favor the unrestricted exchange of technical information. We favor such exchange of technical information as will not endanger the security of the United States.

We rely on the governmental authorities created by the McMahon bill to determine what information may be distributed.

Senator AUSTIN. Then isn't it fair to construe your position to be that you do favor the prior effective control of destructive use of atomic energy, before the exchange of knowledge?

Dr. HUTCHINS. Not before the exchange of basic scientific knowledge, because we see no danger in such exchange. We feel that the representatives of the Government should be authorized to control the exchange of technical knowledge, but perhaps I am exceeding my authority in attempting to speak for my colleagues on this point.

Dr. GUSTAVSON. I think that is important to keep in mind, as I am sure that this committee does, that the atomic bomb as the end product of a great military enterprise was primarily an engineering project. The basic science, the discovery of fission, and a great deal of the basic knowledge connected with it, was all known before the war; the great task which science and industry carried out with the help of military organizations during the war was taking these basic principles and applying them for a definite end. It is important, I think, to remember that Dr. Compton, speaking in Chicago, made the statement that at no time were the engineers slowed down in their efforts to arrive at a point where they could manufacture a bomb by a lack of information that would come to them from research

work, all of which means that the basic knowledge that was available to the whole world was available obviously to any other nation. And they can, if they put the time in on it, gather the same information of a technical character that we gained.

Technical information is very important, and it takes time to get it; but technical information can always be gathered by any group of efficient technical people. Given basic principles and asked to arrive at a definite end, any good engineering concern would usually say, "Yes, that can be done."

Basic information, however, is of a different character. You cannot make any guaranties there, and that information is already available.

The other phase of that is that if we were to maintain secrecy on the basic science involved in this field, and other countries would do the same thing, we would very definitely hinder progress, because it is only as you get this interplay of mind upon mind that you make progress. That is a difficult thing, I think, for the layman to see; but in science it is just a first principle.

For example, Fermi's experiment in Italy on the bombardment of uranium by neutrons. He carries out the experiment, he sees a certain result, he gives it an interpretation. Then, for a matter of 5 years, the whole scientific world was in confusion. In fact, we could say the world was saved by confusion, because work was carried on, attempting to make so-called transuranic elements, and one was reported after the other.

Finally, after about 5 years, an individual in Germany sees the correct interpretation of what happened; and we run that same chance. We do something, we observe incompletely or we make the wrong interpretation. As far as the structure of science is concerned, it depends upon somebody else, maybe in our country or out of our own country, correcting us.

Senator AUSTIN. I think this question will be all I need to ask. I gather that the balance lies between the weight given to security and scientific progress, and you put emphasis on speedy scientific progress, whereas, as a committee of the Congress, it seems to me we have to put weight on security first—No. 1. Is that correct?

Dr. HUTCHINS. That is not the sole prerogative, Mr. Chairman, of a committee of Congress. Every American citizen must put security first. The question is, How do you get it?

Our position is that you will get the greatest security by the greatest scientific freedom, because this country, with its resources and its technological ability, can make the most of any scientific ideas that appear anywhere in the world.

Take a great electrical concern in this country. Its attitude toward trade secrets is likely to be less and less restrictive as it gets bigger and stronger, because it feels that the fewer trade secrets there are in the field, the greater its own progress will be, because it is sure of its own technical preeminence.

We can be sure at the present moment of the scientific and technical preeminence of the United States. It is in our interest, therefore, to provide for the widest exchange of scientific ideas on which we shall be able to capitalize for our own military security to a far greater extent than any other country in the world.

Dr. GUSTAVSON. In fact, the atomic bomb is an example of that. We were the only country that could and did take advantage of the

basic information developed in other parts of the world for the production of a bomb.

Dr. HUTCHINS. Nobody can say that the scientific ideas and knowledge underlying the atomic bomb were American ideas; they weren't. Our contribution on that score was probably less than that of six other countries you can name.

Senator AUSTIN. That is all, Mr. Chairman.

Senator JOHNSON. Dr. Gustavson, a moment ago you indicated that confusion was a great virtue and saved the world between 1935 and 1939. These dates are my own.

What leads you to think that confusion might not be a blessing from 1946 on for a few years, the world being in a chaotic state such as it is in? Might not a little confusion be very helpful for the time being until we get better stabilized politically?

Dr. GUSTAVSON. I think that is an interesting question. Of course, with respect to the first part of it, what I had in mind was, if you had a correct interpretation in 1934 and 1935, after the Fermi experiment, Germany with her preeminence as a nation of scientists or high technical skills in science and technological skills in industry would have had the bomb. There is no doubt about it.

Now, then, a great deal of the confusion on one of the most important discoveries has disappeared. There might be some confusion grow out of future experiments if some country should do an experiment which ultimately would give us atomic energy, but which result we didn't see at the moment; it might be again true that confusion would save us, but at the moment we have got a firecracker in our hands, and that is a reality, not the firecracker of the future, as I see it.

Senator JOHNSON. Then the political situation in the world is far from ideal at the moment.

Dr. GUSTAVSON. That is right.

Senator MILLIKIN. Mr. Chairman.

The CHAIRMAN. Senator Millikin.

Senator MILLIKIN. I gather from what you said, Dr. Hutchins, that no matter what you may think of the field of political science, you do not favor cloture on the other sciences. Is that correct?

Dr. HUTCHINS. Yes, sir.

Senator MILLIKIN. I believe that the work of this committee will more or less turn on how it accepts certain assumptions that you set out at the beginning of page 2 of your remarks. I would like to read those remarks again and bring them forward.

Any legislation in the field of atomic energy must be based on the assumption that war will in some way or another be averted. We cannot assume that there is going to be a war and then try to frame domestic legislation on that assumption. The assumption that there is going to be a war would lead to the conclusion that we had better start the war this morning, because only this morning can we be sure of having supremacy in atomic bombs.

No plans for atomic energy, and no plans for anything else, for that matter can be made on the supposition that we are going to have war. Any war we have will be so destructive that no plans can be carried out. We must plan in the conviction that we can defeat war and develop atomic energy in a world at peace.

As far as I am concerned, Doctor, if I could accept your assumptions there, the rest of the problems before this committee would be very simple. I should like to explore a little with you the basis for that theory and the basis for your assumptions.

What valid reason is there at the present time for assuming that war will be averted, beyond our hope that it will be averted?

Dr. HUTCHINS. Well, the question is not, Senator Millikin, whether war is going to be averted. The question is rather, What are the assumptions on which any legislation at the present time in regard to atomic energy can be based?

Senator MILLIKIN. But if we cannot accept a durable, valid assumption that war will be averted, we then have the job of assuming that it may not be averted, and the two lines of procedure as against one hypothesis or the other would be much different.

Dr. HUTCHINS. Well, would they be so different? Let us consider what the results of one assumption or the other would be. Let us assume that there is going to be a war. In that case, the thing to do is to start one, because at the present time we have the power to win.

Senator MILLIKIN. Let us look that right square in the face. I think that you have posed something there that we are all ducking, but let's look it right squarely in the face.

Suppose that we were to reach the conclusion that war is inevitable. Would you say that we would be warranted in using the bomb to destroy the nation that we figured would inevitably involve the world in war?

Dr. HUTCHINS. I decline, Senator, to be brought into that hypothesis as a participant. If you say that in your opinion war is inevitable, then it seems to me—and if you say that your first duty is to protect or defend your own country—you would be warranted in exerting all your efforts to getting the war under way at once, because we are in a better position to win now than we may be in the future.

Senator MILLIKIN. Let us assume that you reached the conclusion that war is inevitable.

Dr. HUTCHINS. You have my recommendation.

Senator MILLIKIN. I am delighted that you look that in the face and give that answer to it. It might come to that.

As you look around over the world, Doctor, what are the cheering prospects that will enable us to indulge in the assumption, so far as law making is concerned, that we have seen the end of wars?

Dr. HUTCHINS. Perhaps, Senator Millikin, we ought to make clear that we think that there are two issues here: One is the issue of the foreign policy of the United States, which is not, as such, before this committee; the other is the issue of what you are going to do with atomic energy.

Now, we have assumed that it is the foreign policy of the United States to maintain and promote peace in every possible way. We believe that atomic energy must be considered in the light of that policy, and that that is the only way really in which it is useful to consider it, because if that is not the policy of the United States, and if we are not going to find the ways to implement that policy, then the thing to do is not merely to sit on the atomic bomb, because sitting on the atomic bomb will not protect us from the atomic bombs that other nations will shortly be able to produce.

The answer, if you assume it is not the policy of the United States to promote peace and that we cannot obtain peace, is to start a war.

Senator MILLIKIN. There you have a divided subject. I think it is the policy of the United States to promote peace; of course it is.

I think that in the main that has always been our policy, and I am sure that it is our policy at the present moment.

But war is made, as is obvious, between several nations; and our policy does not necessarily control the war-making potentials in this troubled world.

Dr. HUTCHINS. I would like to point out, Senator, that this bill is subordinate at every point to the foreign policy of the United States. If the foreign policy of the United States changes, either because of a change in the Congress or the administration, or because of a change in the national situation, then the policy of the Commission and the policy of the Government in regard to atomic energy can change. So it seems to us that the bill provides for these fluctuations in the world situation to which you were referring.

Senator MILLIKIN. But that would raise the basic question, then, whether we would want to turn over—whether Congress, which has the job of supplying and maintaining our military forces and has the responsibility for the declaration of war, and so forth, would want to turn over to a commission the power to determine questions that are that vital.

Dr. HUTCHINS. I do not believe that the power is in the Commission to determine the foreign policy of the United States. The Commission is subject to the direction of the President in regard to the foreign policy of the United States and the utilization of atomic energy in the light of that policy.

Senator MILLIKIN. Let us suppose that the President of the United States, under that theory, conceived the notion that the world is about to come out of the present armistice and go into war, and let us suppose then that he instructed the Commission to govern itself accordingly.

Do you not think that the Congress ought to have something to say about that?

Dr. HUTCHINS. I should think it would. Congress does not abdicate by passing a single measure of this kind.

Senator MILLIKIN. Well, it abdicates if one bad decision were made and executed before Congress could act. I think that is what Senator Johnson was driving at a while ago.

Senator JOHNSON. That is exactly what I was driving at.

Senator MILLIKIN. We haven't had an answer to that. One bad decision, either to withhold the use of the bomb or to use the bomb, might shape the whole face of the earth for all time to come, and it might change the whole complexion of this country.

Dr. HUTCHINS. I don't see anything in this bill that changes the war powers of Congress. The use of the bomb is an act of war, isn't it?

Senator MILLIKIN. I say we give the preliminary power to a commission to accept the instructions of the President on the foreign policy of the country, and to govern itself accordingly. If that Commission acted, and acted promptly, it might then present the Congress with nothing more than a very unfortunate fait accompli, or it might be a fortunate one.

The CHAIRMAN. The President of the United States is the Commander in Chief of the Army and Navy, isn't he?

Dr. HUTCHINS. Yes.

The CHAIRMAN. As such, he is over the Army and Navy, and in the same way in charge of this establishment and this Commission, is he not?

Dr. HUTCHINS. I believe so, but the situation which Senator Millikin forecasts is one I find inconceivable.

What would happen as a result of it? There would be, let us say, some increase in the rate of production of atomic bombs, reports of which are required to be filed quarterly with the Congress. There is nothing in this act that would give the Commission the power to drop an atomic bomb. That would be an act of war on which Congress would have to take its own position.

Senator MILLIKIN. Let us turn it around, and let us suppose that the Commission, in response to the President's views on the state of our foreign affairs, had opened the way to the peacetime use of atomic energy, and had authorized the freest exchange to the ultimate extent of all the information available to us and that abroad, but that the President's estimate of the situation was wrong in that under the exact posture of the world we were not quite ready for that.

Would not the Commission have that power, and would not the President have the power to suggest that the state of world affairs is such that you can now make this free exchange?

Dr. HUTCHINS. The first question is the exchange of what? As we have indicated, in our judgment the exchange of basic scientific knowledge is not a danger to this country.

The second question is the exchange of technical information. Since the Congress would receive quarterly reports to amend its legislation, and since it would take considerable time for any nation to avail itself of the technical information that would be released by the Commission, even assuming that the Commission and the President were all entirely wrong, it would seem that there is sufficient congressional control provided.

Senator MILLIKIN. Well, it just depends on whether you want to give the Commission the power, then, to start on what might turn out to be a very bad policy for the United States, on the theory that we could recall the start if we didn't like it.

You are dealing here, I will remind you, Doctor, with a cataclysmic force. I said once before that when you talk about this thing in stages, it is like going over Niagara Falls in stages.

Dr. HUTCHINS. What would be your estimate, Gustavson, of the amount of time that it would take other nations with adequate industrial facilities to build an atomic bomb if they had all the scientific and technical information which the United States possesses?

A very large amount of the technical information that the United States possesses has already been published in the Smyth report by the War Department, and all the basic scientific knowledge is well known.

Suppose a nation now starts from scratch to build an atomic bomb.

Dr. GUSTAVSON. I think most people have estimated that it would take from 2 to 5 years. I think we can see that situation if we pick an analogy. Suppose that in this war we did not have the internal-combustion engine, but suppose that at the beginning of the war we knew that gasoline-air mixtures would explode, that you could explode them with the electric spark, that if the explosion took place in a piston, the piston would be driven out, and you could turn a wheel. That is basic information. How long would it take to build a tractor or a jeep, tank, or automobile, with that information?

Well, we know that with that scientific information, basic information, it would take us years to do it. The speed with which we

were able to build the atomic bomb in a matter of something like 3 or 4 years is a pretty good estimate of how long it would take somebody else to do it.

Senator MILLIKIN. Would that not be qualified by the fact that with this exchange of information there undoubtedly would be short-cut processes? Would it take us 2, 3, 4, or 5 years to repeat what we have done, in the light of our present knowledge?

Dr. GUSTAVSON. If you started with the basic knowledge we now have, I think it would take us just about as long to build an atomic bomb if we started from scratch again, to develop the plants and all that go with it.

Senator MILLIKIN. Then the question comes to what we are exchanging. If we are proposing to exchange that which everyone knows, then the bill is futile and there is no point in the exchange.

Dr. HUTCHINS. I beg your pardon, Senator. The regulations of the Manhattan district during the war were based on the assumption that nothing should be exchanged, nobody should talk to anybody, even scientists in different sections of the project shouldn't talk to anybody; and it is important to get the principle established by legislation that in the further development of atomic energy that restrictive process shall not go on.

Senator MILLIKIN. Let us assume that is correct. I am talking about exchange now with foreign nations. They either exchange something they haven't got or want, or we are just passing the Smyth report back and forth; or if you take that assumption, that we are just passing the Smyth report back and forth, then we are not really dealing with anything of importance, because they know about the Smyth report, and they have the facilities for making a compendium of known information the same as we have.

We must necessarily direct our attention, I suggest, to the exchange of something that they haven't got that they would like to have. Now, if we give them that—and let us say that it took them 2 years to use it—if we have misjudged the international situation, if we have misjudged the party to whom we give the information, 2 more years of life in the whole cycle of time is not very important.

Dr. GUSTAVSON. I see the point that you are making. Let me put it this way. I am sorry, for psychological purposes, that we started talking about the secret of the atomic bomb and implied that we had secrets of a fundamental nature with respect to the bomb.

Senator MILLIKIN. I am in entire agreement with you, Doctor.

Dr. GUSTAVSON. May I say just one thing more? I would have been delighted if, when we issued the Smyth report, the Federal Government would have said: "We were successful in building an atomic bomb. The world knows that. It has seen the demonstration. We are now giving you the basic principles on which the atomic bomb was built."

That would have resulted in a world feeling, it seems to me, that the American Government, the United States Government, developed a bomb and used it under a pressure of great necessity of national survival, but is not interested in atomic bomb warfare.

When we started talking about secrets, which we do not possess—because as far as basic information is concerned, they are open—then we started to indicate that we do have a military advantage in terms of fundamental basic knowledge, which we do not have, and we are lulling ourselves into a false sense of security.

Senator MILLIKIN. Doctor, I suggest that that comes down again to the fact that we are exchanging that which has no value of currency. We either have something that is worth keeping to ourselves, or we do not.

Now, if we are going on the assumption that the other fellow knows as much about it as we do, what is the point in all of this exchange talk? That can go on anyhow.

If, on the other hand, we have something that is of value which they want and haven't got, then we have an entirely different problem.

Dr. REDFIELD. Senator, if I may interpose, does not the bill provide for the greatest circulation of basic scientific knowledge yet to be learned?

Senator MILLIKIN. Yes.

Dr. REDFIELD. A provision of the bill which we here at this table seem to admire is that it prevents the interposition of such regulations as attended the Manhattan project with regard to future basic science, and therefore there will be something that other countries can use, but that we can use better than any other country.

Senator MILLIKIN. Suppose someone in the laboratory evolves a novel conception of a further step in this thing which will magnify its power 10,000 times. Now, that is a laboratory conception. Should that laboratory conception be circulated around over the world prior to the time we are convinced that the world is in for peace rather than war?

Dr. REDFIELD. As you put the case, Senator, it would seem to fall under the head of technical knowledge rather than scientific.

Senator MILLIKIN. I do not put it in the case of scientific. I put it in the case of laboratory conception.

Dr. HUTCHINS. Wouldn't we be interested in where that idea originated?

Let's look at the international situation with regard to the construction of the atomic bomb. Fermi was in Italy. Hahn was in Germany. Niels Bohr was in Denmark. Five or six of the most important men on the Manhattan project are Hungarians who had worked in Hungary in this field. The basic work of Chadwick in England was fundamental to the development.

Now, we grabbed them all—not the men, but we grabbed some of the men, as many as Hitler and Mussolini honored us by sending here; but we grabbed their ideas, and we made the bomb. I think it can be shown that there is some Japanese scientific influence behind the bomb as well.

Now, let us take the case that you suppose, and let us imagine that it is a basic scientific idea. If it arises here, you may wish to monopolize it; but suppose that it arises somewhere else in the world. We are not talking about a one-way street; we are talking about exchange, and when we say "exchange" we mean exchange. We are assuming a situation in which all scientific workers all over the world in the field of nuclear energy are busily engaged in laboratories and busily putting out their results. Our contention is that the United States will be able to get further with its own military security with the freest system of exchange, because we can capitalize better than any other nation on any other ideas that arise anywhere.

Senator MILLIKIN. Now would you mind giving me an answer to my question? Assuming that we have a laboratory conception of the

kind that I have mentioned—I am not talking about a technological development, but a laboratory conception—would you say that we should circulate it?

Dr. HUTCHINS. I should say that it would be in the long-term interest of the United States to have the freest circulation of such basic ideas.

The CHAIRMAN. Doctor, there seems to be apparently some impression that there is a provision in this bill which makes it automatic that blueprints of bombs shall be sent, upon the enactment of the legislation into law, posthaste all over the world. You have no such understanding, have you?

Dr. HUTCHINS. No, sir.

The CHAIRMAN. Now, there has also been some discussion about congressional control. I am one who is very sympathetic to having the most congressional control that can possibly be had within the traditional framework of our form of government. We have the executive, the judicial, and the legislative; and the legislative, as I see it, may only lay down a plan or program which the executive has to execute.

Now, in this bill I think you will find, will you not, several things that the Congress must do in the field of atomic energy that it does in no other field? For instance, it prohibits the Commission from introducing into our industrial life any application of atomic energy without reporting to the Congress and getting Congress' approval. Isn't that true?

Dr. HUTCHINS. Yes.

The CHAIRMAN. It also calls upon the Congress for its appropriations. Of course, that is the same as any other commission or activity of our Government. Congress has the blood stream which goes into it, keeping it alive or not.

It must report quarterly—the Commission must report quarterly—to the Congress for everything that it has done and everything that it plans to do; so it does have congressional control written into the bill.

Senator JOHNSON. I would say, if you permit me to, Mr. Chairman, that reports are very unsatisfactory controls.

The CHAIRMAN. If you can figure out some way, Mr. Senator, whereby the Congress can go down and operate the Manhattan district—we might just as well try to operate the Postal System, the TVA, run the Army and Navy, and have every Senator out with his own army on a battlefield.

Senator JOHNSON. I wouldn't go quite that far, but I am certain of this, Mr. Chairman: If Congress were controlling the Manhattan district, the Manhattan district wouldn't be working feverishly, day by day and month by month, creating atomic bombs until atomic bombs are under some sort of control. That is one thing that I have got to say.

I haven't been able to understand our good friend from Chicago who is very jealous of giving the military any power whatsoever, and yet in the bill which they have so completely approved we give the Commander in Chief of the Army and Navy complete control. But at the lower levels, when you get down to the Secretary of the Navy or the Secretary of War, they say, "No, no, that should not be done."

Dr. HUTCHINS. I don't think so, Mr. Senator. Speaking only for myself, I should have no objection to adding the Secretaries of War,

State, and the Navy to this Commission. What we are attempting to suggest is that the Commission must be predominantly a civilian commission.

The CHAIRMAN. That is exactly what Forrestal suggested the day before yesterday, that the Secretaries of War, State, and Navy be added to the Commission.

Senator AUSTIN. I was very anxious to have him put on the record—and he did so—his assent to the proposition that if Congress so reorganizes the military department that there should be a munitions board in it, he agreed with the theory that any commission or committee that is created by such a bill as this should be articulated with it, and, if so, that would accentuate the civilian control.

Senator MILLIKIN. I would like to explore another angle of the thing, Doctor. I assume that you accept the thesis of most of the scientists that inspection in any event is necessary to the control of the use of atomic energy.

Dr. HUTCHINS. I think that is a very interesting point.

Senator MILLIKIN. Proclamations, in and of themselves, are not sufficient, but have to be implemented with inspection.

Dr. HUTCHINS. There has to be some way to be sure agreements are kept.

Senator MILLIKIN. How can you assure a dependable system of inspection of any country that does not permit freedom of the press or general free exchange of news, or that operates—as Senator Vandenberg describes it—“behind an iron curtain”?

Dr. HUTCHINS. This bill, I think, Senator, does not attempt to deal with the question of international legislation in this field, nor does it attempt to determine international policy in this field.

It says that on the assumption that international agreements can be worked out and will be kept, this bill is subject to those agreements. If they are not worked out, or you think they cannot be kept, then some other legislation will have to be adopted. There is nothing in this bill that in any way imperils the security of the United States. This bill merely provides for the most rapid development of research and technology in this country, in this area.

Senator MILLIKIN. You would not contend, would you, Doctor, that in framing the bill we should frame it on a strictly domestic basis without any thought in our minds of international implications?

Dr. HUTCHINS. Our position is the opposite, that any bill must be subordinate to international agreements.

Senator MILLIKIN. So we must, of course, look at the situation over the world and let our minds play over questions such as states that operate behind an iron curtain, and as to whether inspection systems in those states will be worth the agreement that might be entered into respecting those systems.

Dr. HUTCHINS. May I put it this way, Senator? Some legislation in this field should be passed as soon as possible. General Groves has announced that he is reluctant to continue, that the Manhattan district is disintegrating, yet we know that work in this field should continue. Therefore, some arrangement for the continuation of the work, presumably not under the direction of the Army or of the Manhattan district, must be made.

Now, what arrangement can be made now that will provide for the continuation of the work, relieving the Army and the Manhattan

Engineering District, without imperiling the security of the United States? What can you do in advance of international agreements?

We see nothing in this bill that prevents the United States from entering into appropriate international agreements. We see nothing in this bill that endangers the United States if such agreements are not entered to.

The CHAIRMAN. I want you to stress that. In other words, it goes both ways. If we enter into agreements, there is nothing in the bill that prevents it. If we don't enter into agreements, and go into an armament race, we could undoubtedly of course go into it under this bill.

Dr. REDFIELD. You can put it stronger than that, can't you. This bill makes it as easy to enter into international agreements as any legislation which would meet the other considerations.

Dr. HUTCHINS. And meanwhile you advance research and development.

Senator MILLIKIN. One phase of the problem—and we might as well face that also—is what would be the objection to keeping the matter bottled up under military control for a reasonable period of time until we can see, for example, how the UNO is going to work out, until we can make a better estimate of the prospects of peace in this world? What would be the objection to that from a scientific standpoint?

Dr. HUTCHINS. I think there would be objection from the scientific standpoint, because the scientists, although they were willing to submit to restrictions which in some cases amounted almost to those of a concentration camp during the war, would not do their best work, and some of them I feel sure could not work at all if the regulations and program of the Manhattan district were carried out during peace.

Senator MILLIKIN. But if for security reasons it were thought wise—I don't ask you to accept the assumption—to continue the matter under military control, keeping in mind that at the present time we do not have the commercial use of atomic energy, and that we do have a weapon for a limited period of time, say 6 months or a year, science would not suffer irremediably, would it?

Dr. HUTCHINS. Of course, as you state the question, the answer must be "No." How could I say that science would suffer irremediably from anything, even, say, from the assassination of all the existing generation of scientists? There might be another generation.

Senator MILLIKIN. Science would suffer irremediably if you bottled it up forever?

Dr. HUTCHINS. Even then I suppose there might be a black market in scientific knowledge.

Senator MILLIKIN. I would not suggest that, even in trying to get a viewpoint on one phase of our problem, so my proposition goes to a limited, and I hope temporary, extension of the existing arrangement.

Dr. HUTCHINS. I would say, only as a retired professor of evidence, that the burden of proof is upon anybody who wishes that policy followed, because we do know that it will restrict scientific advance. We do know that it is not in the long-term interest of our country, even looked at from the security point of view, because the long-term security interests of our country are involved with the most scientific work in this field. Therefore, it is in the interest of science to remove restrictions.

Now, to the extent to which you insist on continued military control, to that extent science will be hampered, and anybody who proposes—in peacetime, at least—to hamper science, has the burden of proof.

Senator MILLIKIN. Yes, that is quite a burden, too; I agree with you entirely on that. But we are not, strictly speaking, in peacetime, Doctor.

Senator AUSTIN. It is usually stated the other way, is it not, that the burden of proof falls on him who takes the risk?

Senator MILLIKIN. Yes; I agree with that.

Dr. HUTCHINS. The question is, Where is the risk?

Senator MILLIKIN. We are not, I suggest, Doctor, in a state of peace. We are not even in a technical state of peace.

We still have all of our war controls set up under laws of Congress, unrepealed, and all you have to do is take a look around the world and you are convinced by what you see that we are not in a real state of peace.

Senator JOHNSON. We have an Army of 4 million men.

Senator MILLIKIN. Yes, and we propose to keep an Army of perhaps a million and a half.

Senator JOHNSON. And a Navy of more than a million.

Senator MILLIKIN. We will have a total Military Establishment of how many people?

Senator JOHNSON. On July 1 we will have an establishment in the Army and Navy of 2,100,000. As of January 1, we have an establishment of 4 million in the Army and nearly 2 million in the Navy.

Senator MILLIKIN. That suggests, Senator Johnson, that while we worry ourselves so much as to what we do as a threat of something, those who are much persuaded by that line of argument should give thought to whether a Military Establishment of that size is a threat.

Senator JOHNSON. I have one more question I should like to ask. I know it is very late and that all of us are anxious to get away, but I would like to ask Dr. Hutchins if he believes that there will ever be another world war in which the atomic bomb will not either be used to start it or to finish it, unless we develop some more terrible weapon than the atomic bomb.

Dr. HUTCHINS. Well, I should certainly say that if there is another war within the next 5 years, the atomic bomb will be used either in starting it or finishing it.

My unfortunate acquaintance with the university laboratories leads me to suppose that there are other weapons equally terrible, or even more terrible, that will be produced either before or during the next war, which may make the atomic bomb obsolete.

Senator JOHNSON. But you do think that that is a very important and fundamental question, nevertheless?

Dr. HUTCHINS. Yes, sir.

Senator JOHNSON. In dealing with this whole problem, I am optimistic enough to believe that the atomic bomb is the greatest instrument for peace that has ever been discovered, and these more terrible weapons that are to follow it and are following it will make world wars absolutely unthinkable, and, therefore, that we are headed for peace. I think that these weapons will bring about that peace, will force us to peace.

As you put it a moment ago, peace or suicide. No sane man, individually or collectively, is going to accept suicide when he can have peace.

Dr. HUTCHINS. The issue is certainly peace or suicide.

Senator MILLIKIN. Do you mind, Senator Johnson, if I carry that one step further?

Senator JOHNSON. No.

Senator MILLIKIN. Doesn't the logic of your whole thesis carry you to this, that if the bomb must be used, we should use it first?

Dr. HUTCHINS. If you believe that the bomb is going to be used, then you had better use it first.

Senator MILLIKIN. That is one place where we cannot be mushy-minded. If the authority should conclude that there is going to be atomic warfare, of course, we ought to be the first to use it. That assumes that conclusion.

Dr. Gustafson—and I think his estimate coincides with the other estimates we have had here—believes that, so far as the atomic bomb as we know it now is concerned, we have a period of grace of from 2 to 5 years, not because of any inherent secret in it, but because it would take that long to develop the know-how and to build the plants and to actually make bombs.

So the underlying question, Dr. Hutchins, I suggest—or one of them—is, What shall we do with that bomb in the period of grace to try to bring about a situation in the world where a bomb will never have to be used?

Dr. HUTCHINS. That depends on the foreign policy of the country.

Senator MILLIKIN. Exactly.

The CHAIRMAN. Certainly it would be unthinkable that we should drop them first, wouldn't it, Doctor, and maintain ourselves as a democracy?

Dr. HUTCHINS. I think the theory of the preventive war would be extremely unpopular in this country.

Senator MILLIKIN. Suicide is unthinkable, too. Between the two, Mr. Chairman, I shudder less at the thought of dropping the bomb than of having the country destroyed.

The CHAIRMAN. If there are no further questions, we will recess until Monday.

(Whereupon, at 12:15 p. m., the hearing was recessed until Monday, January 28, 1946, at 10 a. m.)

ATOMIC ENERGY ACT OF 1946

MONDAY, JANUARY 28, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met at 10 a. m., pursuant to adjournment, in room 312, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Johnson, Tydings, Austin, Millikin, Hickenlooper, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will come to order.

Dr. DAVIES, as I understand it, you represent the Federation of Atomic Scientists, and I believe that they wrote the committee and asked to have you represent them, and you were assigned to testify this morning.

Dr. DAVIES. Yes; I shall represent them insofar as anyone may represent the opinions of a large group.

The CHAIRMAN. But you were selected to represent them. Who selected you?

Dr. DAVIES. Members of the executive committees of these separate associations.

The CHAIRMAN. How many on the executive committee?

Dr. DAVIES. I think we have about seven or eight, and that is probably a typical number.

The CHAIRMAN. And that is composed of one from each site?

Dr. DAVIES. No; each site has an executive committee, and the executive committees exchange recommendations and then settle on a single candidate.

The CHAIRMAN. All right. Go ahead.

STATEMENT OF DR. HARRISON DAVIES, REPRESENTING THE FEDERATION OF ATOMIC SCIENTISTS

Dr. DAVIES. My name is Harrison Davies. Professionally speaking, I began life as a biochemist. During the war manpower crisis I was converted to a radiochemist. I have been an employee of the metallurgical project in Chicago and of the Clinton Laboratories at Oak Ridge. I have been engaged in chemical studies in the plutonium project since the summer of 1943.

Senator MILLIKIN. May I ask for something of your preliminary professional training before you became a radiochemist?

Dr. DAVIES. Yes, sir.

I received a bachelor's degree in chemistry at Johns Hopkins University in 1935 and a Ph. D. in physiological chemistry from the Johns Hopkins Medical School in 1938.

Following that I was a research fellow in the natural sciences from 1938 to 1940 at California Institute of Technology at Pasadena, Calif.

Following that I was in industry for 3 years in the Lederle Laboratories outside of New York City.

Senator MILLIKIN. Whom were you with in the industry?

Dr. DAVIES. American Cyanamid, a subsidiary of the Lederle Laboratories. That is a biological house, making antisera, vaccines, and so forth.

Senator MILLIKIN. I am curious about what was involved in your conversion from a biochemist to a radiochemist. Can you tell us in untechnical language what that involved?

Dr. DAVIES. Yes, sir. A great deal of midnight oil.

Senator MILLIKIN. Can a man that is trained generally in chemistry and, let us say, expertly in chemistry, generally speaking, make a conversion rather rapidly from a biochemist to a radiochemist?

Dr. DAVIES. It is important that he have a good theoretical training.

Senator MILLIKIN. Let me tell you why I am asking the question. During the course of the hearings here, the question has come up frequently as to how quickly a foreign country could assemble or train the technical skill necessary to make bombs. The impression that I gained out of the testimony heretofore is that it is quite a long and arduous process, involving much experience and training, to convert a man who has been in one branch of physics or chemistry into the branch that has to do with this energy. What would you say about that?

Dr. DAVIES. I think it is very important there be at least a nucleus in the new group to start the training program. If there is such a nucleus—let us say one specialty man per dozen ordinarily trained chemists or physicists—then it will go pretty fast.

If such a nucleus is not present, I imagine the difficulties would be very much greater.

Senator MILLIKIN. If there were not a nucleus of that kind present, you would almost have to start your original research from the beginning, wouldn't you?

Dr. DAVIES. It would be much more arduous.

I am here this morning to present the views of the Federation of Atomic Scientists, composed of scientists and engineers who have worked on the Manhattan project. For several months we have studied the various proposals for domestic legislation on atomic energy. As scientists, we desire legislation which will foster research and development in the field of atomic energy and will preserve the freedom necessary for the further advance of science. As citizens, we fear unwise laws on atomic energy for the same reason other citizens fear them: We, too, value our lives.

Long before the atomic bomb fell on Hiroshima we realized that it would affect political and economic ideas all over the world. While the rest of the world was preoccupied with war, we came to the view that our work might well have more far-reaching results than the winning of the war itself.

While we debated the issues and strove for a plan which might secure safety for the world and yet realize the full benefits of atomic

energy, we lacked advice from other quarters. With the release of the bomb and the introduction of atomic energy legislation into the Congress, it became possible to form organizations, seek expert opinion in other fields, and publicize our views. We have done our best to add to our technical knowledge of atomic energy some understanding of the complex political, legal, and economic features of the problem.

The Federation of Atomic Scientists has developed a set of policies which our members believe should be embodied in atomic energy legislation. We now have the opportunity to compare our aims with the provisions of a specific bill. The McMahon bill satisfies these aims in great detail. The men who made the bomb are for the bill. I wish to report to the committee that S. 1717 has the strong support not only of more than fifteen hundred Manhattan project scientists and engineers, but of thousands of other scientists.

I appear here today empowered by the groups which make up the Federation of Atomic Scientists to tell you why we like the McMahon bill; why we think that, with a few minor changes designed to strengthen the obvious intent of the bill, it will be the best practical solution of the problems of domestic legislation.

Any bill should include two aims: security for the country and exploitation of the peaceful benefits of atomic energy. With these in mind, we have examined S. 1717 in terms of—

- (1) Contribution to the hope of peace;
- (2) Stimulation of research and development;
- (3) Provisions for studies and reports by the Commission; and
- (4) Administrative structure.

INTERNATIONAL CONTROL AND THE NATIONAL SECURITY

There can be no real national security in a world in which many nations possess atomic weapons. There can be no solution of the problem of security short of an effective international control of atomic and other weapons of offense and of the elimination of war as a method of settling international disputes. Any domestic legislation must therefore encourage the international control of atomic energy. We believe that S. 1717 fulfills this requirement. The problem of the production of atomic bombs is treated specifically; responsibility is so fixed that international regulation must take precedence. In this respect, we feel that the addition of a general section stating explicitly that international agreements will supplant the provisions of the bill will enhance the prospects for obtaining effective agreements.

The CHAIRMAN. I thought that language was pretty definite, Doctor.

In the bill it states that any provision that is in conflict with any agreement that is hereinafter made shall cease to be valid. Let's see if I have the correct wording on that.

Dr. DAVIES. This quotation appears under "Military Applications of Atomic Power" does it not, page 12, section 6?

Senator AUSTIN. Of course, you have no idea that such a statement is necessary in order to give effect to the international agreements, do you?

Dr. DAVIES. No; it is not necessary, but possibly it is helpful.

Senator AUSTIN. It is solely to have the bill express an attitude of the United States?

Dr. DAVIES. Exactly, sir.

Senator AUSTIN. And you think that that attitude might promote agreement among nations?

Dr. DAVIES. I do.

The CHAIRMAN (reading from S. 1717):

The Commission shall not conduct any research or developmental work in the military application of atomic power if such research or developmental work is contrary to any international agreement of the United States.

Mr. DAVIES. Yes; I think the feeling of the group was that that might well be given more prominence in an earlier portion of the bill.

The CHAIRMAN. Just a matter of emphasis?

Dr. DAVIES. Yes, sir.

Senator TYDINGS. You are in favor of the purport and intent of it, but you simply want it made more clear?

Dr. DAVIES. High-lighted.

The CHAIRMAN. Of course, you realize, as Senator Austin says, even if that clause were not in there it would still have the effect. If an international agreement were properly ratified by the Senate or Congress, our domestic legislation would, then, under the Congress, be superseded.

Dr. DAVIES. Yes; but I wonder if all of our foreign readers are aware of that.

Furthermore, the provisions of the bill for the domestic development of atomic energy are such that international control can be introduced without serious domestic dislocation. A commission, responsible to the President and to the Congress, controls the production and the distribution of fissionable materials; the Commission has full powers of inspection and can require reports on all work in the field; private monopolies are not permitted; premature industrial development which might prejudice international agreements, by the creation of vested interests and by complicating the inspection problem, is not allowed.

Senator MILLIKIN. I notice especially the sentence that you have read under your subhead I, as follows:

There can be no solution of the problem of security short of an effective international control of atomic and other weapons of offense and of the elimination of war as a method of settling international disputes.

Suppose that you should reach the conclusion that a dependable international agreement among the principal powers of that kind is not possible. Would that modify your attitude toward the bill in any way?

Dr. DAVIES. No. I think that in that eventuality the precise provisions of the bill will not be of much importance; that we shall have to change entirely our legislative structure and our plans for the future.

Senator MILLIKIN. And there would have to be another approach to it?

Dr. DAVIES. Yes; I suspect so.

Senator MILLIKIN. In that event, can you visualize perhaps a tighter military control of the subject than is provided for in the bill?

Dr. DAVIES. Well, I believe the proper steps to take will have to depend on the precise circumstances of this hypothetical eventuality, and I don't believe we can possibly specify it now in sufficient detail.

Senator MILLIKIN. Does that indicate to your mind that perhaps we are, for a brief period of time, premature in this matter?

Dr. DAVIES. No; because I believe that our very best chance of not getting into this precarious eventuality that you mentioned is to proceed with this kind of legislation as rapidly as possible.

Senator MILLIKIN. Do you believe this kind of legislation would eliminate the causes of war?

Dr. DAVIES. It will at least leave room for the first step in the elimination of the causes of war.

Senator MILLIKIN. What would you say the first step is?

Dr. DAVIES. I believe the first step is to indicate to the world that we do not mean to use this phenomenon in a destructive manner.

Senator MILLIKIN. Do you think that if we took that step that it would, for example, have influence on the problems in Iran, the problems of the Bosphorus and the Dardanelles, the problems in the Pacific, the problems of Poland; the problems of Lithuania, Esthonia, and Finland, the problems in the Balkan countries, Czechoslovakia and Yugoslavia—do you believe that this bill would make an important contribution toward the solution of those problems?

Dr. DAVIES. I feel it may be a contribution, because many of those problems have behind them a feeling of military insecurity, and this bill at least sets out on the road of eliminating this fear.

Senator MILLIKIN. That again comes down to the basic thing we discussed awhile ago as to whether the other important nations will accept the intent of the bill in good faith, doesn't it?

Dr. DAVIES. Yes, sir.

Senator MILLIKIN. It involves the complete exchange of information, not only scientific information but other information, among, let us say, the principal nations of the world.

Dr. DAVIES. Yes.

Senator MILLIKIN. And involves the elimination, you might say, of police powers, does it not?

Dr. DAVIES. It would help a great deal.

Senator MILLIKIN. Certainly we cannot achieve this basis that you emphasize—and I think quite properly—until things of the character I have mentioned are corrected or solved in some way or other. Is that not correct?

Dr. DAVIES. Yes. Perhaps it is a question of in what order to do things; and our feeling, I am pretty sure, is that we must undertake them concomitantly.

Senator MILLIKIN. Well, we do have a weapon. Insofar as we know, we are the only Nation that has that kind of weapon for the present for a period of grace estimated from 2 to 6 years. The question, therefore, is: What shall we do with this weapon prior to the time that we have the assurance of a dependable world peace? Is that not the question?

Dr. DAVIES. Yes, sir.

Senator MILLIKIN. So you would suggest to the committee that the committee give careful attention to that in relation to this or any other bill that may come before it?

Dr. DAVIES. Yes, sir.

The CHAIRMAN. Doctor, is there anything in this bill as it is proposed that would in any way jeopardize this country's security, as you see it, providing the world turns away from the UNO and goes down the path to war. Assuming that horrible state of affairs, is there anything in this bill that makes America less ready in that eventuality, as you see it?

Dr. DAVIES. The bill will not hurt us nor harm us in such a situation, in my opinion.

The CHAIRMAN. So I presume that Senator Millikin's point is based on the fact that our security might be lessened if these horrible things came about. Did you understand that that was the thesis of his questions to you?

Dr. DAVIES. No; I don't understand the last remark.

The CHAIRMAN. As I understood Senator Millikin—Senator, it is your view that if these things came about you certainly would not want any legislation that would prejudice the security of this country, naturally.

Senator MILLIKIN. That is entirely correct, of course.

The CHAIRMAN. Now, you say, Dr. Davies, as I understand it, that there is nothing in this bill, as you see it, if that does eventuate, that prejudices the security of this country in your opinion.

Dr. DAVIES. That represents my opinion.

The CHAIRMAN. I want to make sure, for that is mine, too.

Senator TYDINGS. Let me ask a question there, and make a short statement beforehand.

You recall the Washington Naval Disarmament Conference in 1922, when we scaled our Navy down to that of other countries. We took no account in that conference of land armies, but simply took the branch in which we were strongest and reduced it to the parallel of other nations without an over-all account of the relative strength of our country with that of the other great powers.

Now, if we do something with the atomic bomb in itself, even though it meets our approval and we do succeed in getting the nations to adopt your idea of what should be done, without any comprehension of their air forces and their armed might, 5 or 6 or 10 years from now, so that we will be inferior to them, would you still hold to that view that the atomic bomb, which is our main weapon, should be put on a parity with that of other countries?

Dr. DAVIES. Well, that is an eventuality a little like Senator Millikin's, is it not?

Senator TYDINGS. Let me put it to you this way with some concrete figures.

The history of our country is that we turn pretty rapidly from war to peace. Five years from now, if we follow the old pattern, we will have an army of a couple of thousand men. Much of our Navy will be tied up and not fit to go to sea. Our military air force will be reduced.

Now, let's suppose that nations X, Y, and Z do not follow that pattern. Let's suppose that nation X keeps an army of 5,000,000, and nation Y keeps an army of 10,000,000, and nation Z keeps an army of 2,000,000, plus 3,000,000 reserves. They have air forces that integrate into such an army, and we don't have those things. The one field in which we are dominant is the atomic bomb.

Now, would your idea be to let them share on a plane of parity, so to speak, in the atomic bomb field with us while nothing is done in these other respects?

Dr. DAVIES. Well, the great point is to avoid the beginning of the war, and we cannot put very much faith in the ability of these bombs to prevent the war beginning.

Senator TYDINGS. I agree with you, but the point is, is it fair for our country to reduce its strength without a comparable reduction of

strength not only in the atomic bomb field but in all other fields at one and the same time? Must not that action be simultaneous?

Dr. DAVIES. I believe that all weapons must be reduced on a parity basis.

Senator TYDINGS. I am trying to get an answer to it, and I want to make sure you understand me.

Dr. DAVIES. I understand your question, but I do not know the answer.

Senator TYDINGS. You see, we let the Navy down in 1922 and made ourselves relatively weaker. We made every other nation correspondingly stronger by the action we took in 1922 when we destroyed the strongest Navy we had.

Now, would it be your opinion, that, assuming we can reach an agreement for the control of the atomic bomb, we ought to reach that agreement without a corresponding diminution in the other arms of all other countries so that the relative picture is the same?

Dr. DAVIES. I feel that I am for such a proposal.

Senator TYDINGS. Which one now?

Dr. DAVIES. The proposal that other arms must be similarly reduced, particularly offensive arms.

Senator TYDINGS. In other words, you are willing to give as much as any other nation will give, but you want to make sure that we all give in the mutual undertaking for peace and the settlement of disputes by peaceful processes rather than war, and that you are not in favor of the reduction of the relative strength of the United States to that of some other country in one category unless that other country reduces the things in which it is strong so that we are on a parity with them in all respects.

Dr. DAVIES. That seems a proper approach.

Senator TYDINGS. Then I take it that you would be opposed to atomic bomb control alone?

Dr. DAVIES. If we began with the control of atomic bombs only, and did not in a reasonable time go on to the control of other offensive weapons of war, I should like very seriously to reconsider my position.

Senator TYDINGS. Then even if you start and secure the control of the atomic bomb only, you would make that as a lasting agreement contingent upon the happening of other events that would accomplish the things we had under discussion; that is, other disarmament?

Dr. DAVIES. Yes.

Senator TYDINGS. You would not, then, be in favor, as a lasting policy, of control of the atomic bomb only in a world that was armed in all other respects, and in many cases armed far superior to that of our own country?

Dr. DAVIES. The difficulty of going on to that last logical conclusion is that the alternative, in which we keep the atomic bomb and other people proceed to develop the atomic bomb, does not give us, in our opinion, any more security than we would have if we eliminated the atomic bomb and did not require a concomitant reduction of other kinds of armament.

Senator TYDINGS. It has to be an over-all overhauling?

Dr. DAVIES. I think the Chinese saying "No choice between evils" applies here.

Senator TYDINGS. I am going to adhere to the opinions that you are advocating, that any control of the atomic bomb as a separate undertaking should not be had as a permanent solution unless it is

accompanied by the control of other weapons which make other countries stronger than us.

Dr. DAVIES. If the possession of such weapons does endanger us, then I agree with you.

Senator TYDINGS. You know we had the last war in Germany without any atomic bombs over there, and it was a pretty good war. What I am getting at is this: Can we, as responsible legislators, in your opinion, reduce our atomic bomb potential unless other countries reduce their potential in other respects in which they are superior at one and the same time?

Dr. DAVIES. Not over the long view.

Senator TYDINGS. That is what I mean. Therefore, the efficacy of your atomic bomb control, a control that is understandable because the atomic bomb is a dangerous weapon, is predicated upon the contingency that immediately following, or simultaneously therewith, there be a scaling down of the defenses of other countries in whichever respects they are superior to us just as we are superior to them in the atomic bomb field.

Dr. DAVIES. Yes; if, as I have stated, that superiority really menaces us.

Senator TYDINGS. Well, certainly an army of 10,000,000 would menace us, wouldn't it?

Dr. DAVIES. Not necessarily. The British Navy has not been a menace to us for a century, although it was highly superior to our own at one time.

Senator TYDINGS. There was a time when the British Navy was a menace to us, and that time may come again. I don't think it will, luckily, but the point is that we have to legislate in the face of all possible contingencies.

Dr. DAVIES. Yes, sir.

Senator TYDINGS. And, therefore, your testimony is that you favor atomic bomb control between nations, but only if those nations which agree to it—and we will assume that they are all the nations—immediately make contingent upon its ultimate adoption as a lasting solution a corresponding reduction of other arms in the categories in which other nations are superior to us so that we will not have weakened our position and strengthened theirs?

Dr. DAVIES. Since I cannot get my qualification in—that is, I am not too sure of it myself—I will agree with that statement of yours.

Senator TYDINGS. Then would you be in favor of atomic bomb control alone without any consideration at all of the relative land or air strength of our countries in other fields outside the atomic bomb field?

Dr. DAVIES. For the present time; yes.

Senator TYDINGS. How long would you adhere to that?

Dr. DAVIES. Until those who were competent to advise me felt that we were beginning to be in danger.

Senator TYDINGS. Now, keep in mind as you answer me, the Washington Naval Disarmament Conference; when we had, then, what might be called the atomic bomb of 1922, which was the most powerful fleet in the world. We reduced our strength in that field to that of other countries, Japan and Britain. We took no account of their armies or air forces, their tanks or buzz bombs, or any disease germs or poison gases or any of those things. We just said, "There is one

thing we are stronger in than anybody else in the world. We don't want to be any stronger in that field than anybody else, so we will come down on a parity."

We said nothing, and let them go ahead in all other categories, so the net result was we weakened our ability to defend ourselves while correspondingly increasing their ability to attack us.

Do we want to do that again with the atomic bomb?

Dr. DAVIES. I wish to comment on the scuttling of the ships. The error in that seems to me not that they were scuttled but that, when disarmament was not achieved later throughout the world, we did not build it back again.

Senator TYDINGS. Would you want to go through the Washington Naval Disarmament program with the atomic bomb without a simultaneous consideration of the mutual ability to make war of other countries in other categories?

Dr. DAVIES. I think we should consider that.

Senator TYDINGS. You mean, you would start with it?

Dr. DAVIES. Start with it; yes.

Senator TYDINGS. But you wouldn't allow it to remain as a permanent solution unless there was this corresponding reduction of armament by other countries in fields in which they are superior to us just as we are superior to them in the atomic bomb field?

Dr. DAVIES. I agree with that.

Senator TYDINGS. I thought you would, but I wanted to be sure.

Senator HART. Mr. Chairman, may I ask a question?

The CHAIRMAN. Surely.

Senator HART. May I follow up the answer you gave Senator McMahon just now, that you see nothing in the bill which would endanger our security as of today? Inasmuch as the War Department and the Navy Department are the organizations upon which the security of the country rests, they are the ones who are responsible for that, do you think that at this moment, as of now, the War and Navy Departments should be divorced of all authority and influence as regards this weapon?

Dr. DAVIES. Of the power to set the policy of the Commission by vote, I think yes. Of the right to have contact with those who do set the policies, with that right I am in complete agreement.

Senator HART. Well, it is scarcely a matter of policy; it is a matter of fact and present-day condition where there is a weapon in existence in our possession and in the hands of the military.

Do you think the time has arrived for the Congress to say they must divorce themselves of all authority as well as responsibility?

Dr. DAVIES. This weapon is a policy, a political weapon. It has political significance, and for that reason it should not be in the hands of the military.

Senator HART. Inasmuch as the President and the Congress are in direct control of the military, what is the difference?

Dr. DAVIES. They are in direct control, but is that control directly exercised?

Senator HART. Well, can't you conceive that it would be just as directly exercised as any control over the Commission would be?

Dr. DAVIES. It could be, but it will not necessarily be.

Senator HART. It won't necessarily be in either case, will it?

Dr. DAVIES. No, sir. I merely see the likelihood of the policies in the field of atomic energy being more subject to the Government if it is in the hands of a civilian commission.

Senator HART. Thank you, Doctor.

Now, just one other small point. In response to the questions of Senator Millikin, you said something about making everything known. To be specific, do you think that, as of now, we should publish to the rest of the world the remaining secrets that we possess as regards this weapon, that we should inform everybody in the world exactly what the weapon is and how to make it?

Dr. DAVIES. I think publication of the knowledge of the Manhattan project should fall short of the method of detonating the atomic bomb. There is no reason that I can see why anyone should demand that information.

Senator HART. That is, you do not see that we should, as of now, publish to the rest of the world, or our allies, our few remaining secrets?

Dr. DAVIES. I feel that the information in other portions of the project other than that dealing with the detonation of the bomb is not important to our security.

Senator HART. But most of that has already been published, has it not?

Dr. DAVIES. The details, no. The general lines have been indicated.

Senator HART. Do you think that further details should be published?

Dr. DAVIES. I don't think it particularly important as far as our security goes. As regards a program for setting up international agreements in this field, it might help, it might create a very good spirit to do so.

The CHAIRMAN. Doctor, is there anything in this legislation that you think provides for any disarmament?

Dr. DAVIES. No.

The CHAIRMAN. Senator Hart suggested that since the military was under the control of the President and Congress, that it therefore follows that the President and Congress would have complete control while leaving it under War Department control, we might say, instead of under a civilian commission.

Of course, I suppose that, basically, electricity furnishes more of the sinews of war than any other component, does it not?

Dr. DAVIES. Or oil, perhaps.

The CHAIRMAN. I don't know that there has ever been any suggestion that we leave our national policy for either electricity or oil directly to the military, have we?

Dr. DAVIES. I have never heard it.

The CHAIRMAN. Now, on the peacetime application of this force, the peacetime use of it, do you see any precedent in all of our history for putting this under the War Department?

Dr. DAVIES. I can think of none.

Senator HICKENLOOPER. At the present time, Dr. Davies, atomic energy is a weapon only, isn't it? The only practical application of atomic energy that we have today is as a weapon.

The CHAIRMAN. No; that isn't so, Senator. How about medicinal uses?

Senator HICKENLOOPER. Let me find out what the Doctor says about that.

Dr. DAVIES. The only important application of atomic energy that has actually been made is the bomb.

Senator HICKENLOOPER. And there are collateral fields at the present time, considering the fact that the bomb was the objective and that we attained that objective, and we, at least temporarily, discarded the examination of the other fields, such as medicine, power, and all those things, in attaining this objective.

There are other fields for future exploration, such as its use in public health and its use for power, and the civil uses of atomic energy.

Inasmuch as today its only proven practical field of use is the weapon, and as we here in Congress must set up a temporary statute, I think most everyone admits that we cannot see too far into the crystal ball of the future and know just how we are to outline a complete program of legislation for further generations to come; and, therefore, the legislation must be approached, I believe, from a temporary basis.

Dr. DAVIES. Yes, sir.

Senator HICKENLOOPER. What do you think about not having full control of atomic energy lodged in the military, that is, the full control and direction, but to have military representation temporarily in any group that undertakes to go into this atomic field in the immediate future, until such time as international agreement for its outline or taking it out of the field of weapons is reached?

Dr. DAVIES. I would feel that the Commission should have among its members men of military experience, but that members of the Commission should be full-time members of the Commission, and not members of any other governmental group.

Senator HICKENLOOPER. But you do feel, as I understand it, that at the present moment, and for at least a period of time until matters are settled with respect to the weapon, the Commission should have the benefit of important military considerations, and that factor should be an important consideration during this period, so long as it is only a weapon?

Dr. DAVIES. It should be kept in mind that, if we are not in danger in this period of grace that Senator Millikin has mentioned, I do not believe it too important that those considerations enter our program.

Senator HICKENLOOPER. Well, you believe in keeping the battleships under the control of the Navy, don't you? They have scrap-iron possibilities, and various other uses that they could be put to in the industrial activity of the country, and yet the battleship is a weapon, and we consider that under complete military control, or at least as long as the battleship is a weapon it should have careful attention by the military whose duty it is to defend the country?

Dr. DAVIES. I feel somewhat more kindly toward the battleship than I do the bomb.

Senator HICKENLOOPER. You are just as dead when killed by a battleship as when killed by a bomb.

Dr. DAVIES. That is true; but my battleships, I feel, will protect me, while I do not feel my bombs will protect me.

Senator HICKENLOOPER. There is a difference in the conception of strategy of war, but in order to make my basis clear, I don't believe

this thing should be kept under the unlimited control of the military at all. I believe that until we can get satisfactory guaranties of the peaceful use of atomic energy—

Dr. DAVIES. Are you speaking technologically?

Senator HICKENLOOPER. No; I mean international agreements between nations for the peaceful use and the elimination of the military use of atomic energy. I feel that we should have some pretty strong and intimate representation by the military on any group; that is, by those who are expert in the military use of the weapon, whether they be civilians or whether they be out of the Department. That factor should be in there until we feel reasonably certain that the bomb has been eliminated as a weapon. After that, then I would say put it completely under civilian control.

Dr. DAVIES. I will agree that military experience should be present on the Commission.

Senator HICKENLOOPER. And the question of the possibility of national defense in the future, so long as the bomb is a potential weapon in the world, it should be a factor, shouldn't it?

Dr. DAVIES. I don't understand.

Senator HICKENLOOPER. By that I mean unless we can assure ourselves that it has been taken out of use as a weapon, we always have to consider the fact that somebody may use it against us, or we may have to use it in our national defense against somebody else, barring those guaranties of peace.

Dr. DAVIES. I would rather wait until we had real concern that it would be used or might be used against us to decide those questions.

Senator HICKENLOOPER. A bomb goes off awfully fast.

Dr. DAVIES. It takes time to make it, though.

The CHAIRMAN. I want to make one brief observation.

Do you know Admiral Land of the Maritime Commission?

Dr. DAVIES. Yes, sir.

The CHAIRMAN. He was a civilian when he served on the Maritime Commission, which is a civilian commission. Gen. George Marshall is now the Ambassador to China, not in his capacity as a general but in his capacity as George Marshall, citizen. That is true, isn't it? That is true; I can tell you it is true.

It just occurs to me that in the appointment to this Commission there is nothing in the world to prohibit somebody with former Army or Navy experience. For instance, Senator Hart has served as an Admiral in the Navy. There would be nothing in the bill to prevent his appointment, and yet Admiral Hart would go on the Commission as a civilian, would he not?

Dr. DAVIES. Yes, sir.

Senator HICKENLOOPER. I am not concerned whether "brass" sits around the table or not, as official uniformed people. I am concerned with the principle; whether he is a man of present capability along this line, or whether he is actually an official in some other branch of the Government makes little difference to me. I am concerned as to whether or not, so long as this is a weapon, we have the benefit of expert military knowledge and appreciation not only of what has gone on in the past but of our potential needs in the future so long as it is a weapon and so long as that is the conception in the world.

Is that a reasonable assumption?

Dr. DAVIES. I am not quite clear as to the sort of experience in the use of the atomic bomb that you have in mind.

Senator HICKENLOOPER. I am speaking about the experience in the responsibility for the defense of the United States. That is what the military is charged with, that is what it is trying for, and that is what we hold them responsible to. So long as this thing is a weapon, there is that potential possible need, and I am merely trying to explore the fact as to whether or not during this transition period from getting it completely out of the secrecy of military wartime control and into the hands of the public we should probably have the benefit of military experience, because it still continues to be a bomb, and will be for some time.

Senator JOHNSON. I want to ask the chairman if he favors placing Gen. George Marshall and Admiral Land on the Commission to be set up?

The CHAIRMAN. Oh, no. I was only using that as an example.

Senator JOHNSON. Are you opposed to them going on?

The CHAIRMAN. I don't think I have to answer that, or suggest who should go on the Commission, Senator.

I was merely pointing out that there had been plenty of precedent for men who had had military experience in taking civilian jobs, who became civilians. I do not, I will tell you frankly, believe in the military having control of atomic energy.

Senator JOHNSON. I join you in that, but you advanced a very interesting proposal here, and I was anxious to find out just how far you would go in that direction, whether you favored Gen. George Marshall and Admiral Land going on the Commission that is to be set up.

The CHAIRMAN. Well, of course, as you know, it is provided that the President makes the nominations.

But I will say this: If I were President and were called upon to make the Commission, and George Marshall had finished his work in China, and I could induce him to serve on the Commission, I think he is not only a grand officer, but he is a great statesman, and my answer to you would be that I would certainly give serious consideration to naming George Marshall on that Commission. I am not so intimately acquainted with Admiral Land.

Senator JOHNSON. I concur in your analysis and in your conclusion. I would join you in that wish.

I would like to ask the witness if he does not deem it advisable to place this new proposed Commission, insofar as it is possible, under the control of the Congress rather than under the control of the Commander in Chief of the Army and Navy, and the other departments under the Commander in Chief of the Army and Navy—Congress versus the administration?

Dr. DAVIES. Your point of view being that the bill, as it now stands, places the Commission more under the control of the Commander in Chief of the Army and Navy than it does under Congress?

Senator JOHNSON. That is correct, and that is something I am trying to correct in the bill. I want to find out if you have an opinion on that question, whether you think there should be tighter congressional control over this Commission than is now provided in the McMahon approach to the problem?

Dr. DAVIES. Congress has a voice in this undertaking.

Senator JOHNSON. Yes, of course, but that is about all they have, and I want them to have something more than a voice.

Dr. DAVIES. They have the opportunity to approve the nominations for the Commission; they hold the purse strings; they get the reports and an opportunity to legislate further on the committee's recommendations.

Senator JOHNSON. And you think that is sufficient? You are perfectly satisfied?

Dr. DAVIES. I think so; I really don't know what further provisions could be added.

Senator JOHNSON. You are perfectly satisfied with that condition, then?

Dr. DAVIES. Without further examination; yes.

Senator JOHNSON. There is another point, following Senator Tydings' exploration of your viewpoint.

It has always been difficult for me, and I am wondering how it is so easy for some of you, to segregate the atomic bomb weapon from all other weapons of war. You just seem to think that you can write off the atomic bomb and then go on with a nice little polite war that has everything in it of destructive nature except the atomic bomb.

I cannot do that in my own thinking, and I wonder how you folks are able to do it without more concern.

Dr. DAVIES. Why, I don't think we do separate them, Senator Johnson. We regard the bomb menace as the most severe of the menaces in the world, and therefore it is the logical one to attempt to remove first.

Senator JOHNSON. Well, war is a menace; war itself is a menace.

Dr. DAVIES. Yes, but we must have a way of going about its removal. One of the ways is the removal of the weapons of war.

Senator JOHNSON. By removing the weapons, you say?

Dr. DAVIES. Yes.

Senator JOHNSON. Well, that may be so, if it were possible to do. When Senator Tydings was interrogating you, it kept coming to my mind that while we were destroying our battleships Germany was building up her industries, and in modern war every heavy-duty industry is a war potential. Germany, instead of building battleships, was building her war potential by building up her peacetime industries to be converted to wartime industries, and in that way she was making herself strong.

Now, it seems to me you have to approach war not piecemeal, by segregating atomic energy and atomic bombs over here and letting other developments go forward. I was interested in your approach to this problem by saying that you thought we ought to begin with the atomic bomb. As I followed you, it seemed to me that you were very much opposed to permitting that to be the end. You wanted it to be the beginning, but not the end?

Mr. DAVIES. That is correct, sir.

Senator JOHNSON. In that, I agree. I think that that is being very realistic. But to dismiss all of these other potentials of war and single out atomic energy, which is the most efficient war weapon, the most effective war weapon ever created, it just occurs to me that that is making it too simple and too easy. There are many war weapons, and some of them are just as devastating, perhaps, or more so, as the atomic bomb. So instead of directing our efforts toward the elimina-

tion of the atomic bomb, why not direct our efforts toward the elimination of war?

I heard you say a moment ago that there is no defense against the atomic bomb. Well, while it isn't a satisfactory defense in any way, it is a defense nevertheless, and the only one we have, and that is the atomic bomb itself.

My hope is to make war such a certain suicidal adventure that by atomic bombs, and other potential weapons of that character, a war would be unthinkable, and therefore war itself will go out the window instead of specific weapons going out the window. That is the approach that I am trying to make to this problem, and I am rather distressed to find so many able and thinking people assume that we can segregate atomic bombs from war, and at the same time that we are accomplishing something.

We have asked a great many witnesses in this chamber whether they think that there ever will be another world war without the use of atomic bombs, or some of the later developments, and the answer has been invariably no.

Do you think there will ever be a world war in which atomic bombs, or something following that line of weapon, will not be used?

Dr. DAVIES. Not if the war goes on for any length of time.

Senator JOHNSON. Well, it will go on for some time unless the atomic bomb is used in the beginning to stop it.

Dr. DAVIES. Well, I suppose it would depend upon the particular military situation. In any long war, certainly a nation will have an opportunity to develop the bomb if it has not got it at the beginning.

Senator JOHNSON. I spoke of world wars, and world wars are long wars; so your answer is that in any long war, as you class it, or any world war, as I will call it, atomic bombs will be used?

Dr. DAVIES. Certainly.

Senator MILLIKIN. Many people think that the next 5 or 6 months will give us an opportunity to form a very good judgment on whether we can have real cooperation for peace among the present nations of the earth. There are several tests of that before UNO and several will develop within the next 5 or 6 months.

Having that in mind, let me ask you whether there would be an irremedial harm to science if the matter were kept bottled up, the way it is right now, over a short period—let us say 6 months to a year—until we can have a clearer view of whether or not the world is postured for peace?

Dr. DAVIES. If it is bottled up the way it is now, it will be a practically inactive field, I believe, in another 6 months or a year. It could be reconstituted if a real emergency arose and there seemed to be nothing else to do but return it, but, during the interim period during which you wish to keep it bottled up, the field would be deserted by most of the workers.

Senator MILLIKIN. Don't you think, if that were the policy of Congress, that enough scientists could be kept on the job, at least to keep things in stand-by condition?

Dr. DAVIES. What is the advantage of having it remain in its present position?

Senator MILLIKIN. I am not setting out to argue the case, but I will say that it seems to me that in any logical thinking when you propose a change you should answer the question "Why change?"

Now, this bill and other bills propose a change. I think we should ask ourselves, "Is the situation of the world such that we are warranted in making a change? If not, not at the moment, when can we foresee a period of time when we can redetermine our problem and reach a decision?"

Now, I have postulated that within the next 5 or 6 months, or maybe a year, we can reach a pretty fair conclusion as to whether or not this world is postured for peace. If it isn't postured for peace, clearly our policies are going to be much different than if the contrary be true. Therefore, I say—I am merely exploring this; this is not a theory of mine or a position of mine—I think we are duly bound to explore it. Why make any change? Why not keep the thing bottled up just as it is for, say, 6 months or a year?

You say, "We will lose scientists." I believe we will. We will lose scientists under any of the contingencies, because I assume that the scientists are not in favor of going on and making bombs.

Dr. DAVIES. That is correct.

Senator MILLIKIN. So from the scientific standpoint, except as to the peacetime use of power, a delay of 6 months or a year in the development of the peacetime use of power, what is the harm in keeping it bottled up as it is?

Dr. DAVIES. Well, we feel that shifting the responsibility for activity in this field to a civilian commission will further the probability of a peaceful world, and that this question of whether we shall have a peaceful or war filled world, which will be decided within the next 6 months, or a year, as you say, is partly determined by what we do now. This is one of those things which can help to bring us to the peaceful decision.

Senator MILLIKIN. Just how would that help to bring us to a peaceful decision? There is always a certain amount of vagueness when we get to that proposition.

Now, I would appreciate it very much if you could state specifically how this bill will help to improve the prospects for peace?

Dr. DAVIES. By giving the signal to the rest of the world that if it is humanly possible we will not employ this phenomenon in an aggressive way, but, rather, that we stand ready to come to agreement with them to prevent the beginning of an atomic armament race.

Senator MILLIKIN. Pursuing a little further the line of inquiry I am on, would we not serve precisely the same effect; and, in fact, stimulate it, if we were to say that once we are convinced that the world is postured for peace, and we are looking for positive signs and not words, not programs, not agreements, but looking for positive signs—once we are assured of that—then we propose that this thing be known to the world?

Dr. DAVIES. Senator, we are always waiting for the other fellow to make the first sign.

Senator MILLIKIN. What do you make out of that?

Dr. DAVIES. I mean, let us, by such a bill as this, make the first sign ourselves.

Senator MILLIKIN. I am trying to find out why. What is the virtue of it? Don't we make a sign when we say at the present time the prospects for peace—let us put it very conservatively—are not as good as they might be. We have a weapon. In view of the present state of the world, we do not feel that we should let go of this weapon,

but the moment that we have a sign that is a durable sign and a dependable sign, something on which we can shape our national policy, then we will make this thing known to the world.

Now, what is the matter with that sign?

Dr. DAVIES. I would argue that such a sign from the rest of the world is less likely to come if we continue the field of atomic energy under the present circumstances.

Senator MILLIKIN. All of these things that disturb the world—there is no use rehashing all of them; you know what they are as well as I know what they are—have been brought into being regardless of the bomb. There isn't the faintest assurance that they will be eliminated regardless of what happens to the bomb at this moment. If you wish me to make it more specific, I am willing to do so.

Dr. DAVIES. I believe I understand you, Senator.

Senator MILLIKIN. The ambition of some nations for warm-water ports is an age-old ambition, and it will never be forsaken. It cannot be forsaken in the national interest of those nations. Now, that ambition arose independent of the atomic bomb. Is there any demonstrable evidence that it will be forsaken by anything we do about the atomic bomb?

Since the atomic bomb has been in existence and has been used, there have been new developments in the international situation, despite our possession of the bomb, that greatly threaten the peace of the world. Perhaps my end point is that you are putting too much emphasis on what will happen to make the world a more peaceful place by what we do with the bomb.

I repeat, since the bomb was exploded, I could mention a half-dozen things that have been injected into the world picture that are war breeding, and that there is no reason to believe that there will be any retraction of them despite the bomb, or what we do about it.

If these things go on when we keep the bomb in our possession, is there less likelihood that they will go on if we share the bomb?

Dr. DAVIES. The atomic bomb legislation will certainly not of itself solve the sort of difficulties that you have described.

Senator MILLIKIN. Now I come back to this proposition: If a period of 6 months or a year will give us a durable hope that these conditions can be remedied by this new world organization which we have set up, and which is perhaps our last and best hope for peace, if 6 months or a year's experience with that organization will give us the sign that we are going to live in a world of peace or a world of war, what irremedial harm is done by just keeping it bottled up as it is?

The CHAIRMAN. Do you mind if I help him out?

Senator MILLIKIN. I should be delighted. I should like to have the answer.

The CHAIRMAN. Well, the only thing that Maj. Gen. Leslie Groves and I agree on with relation to atomic energy is when he says we had better set a domestic policy on it. The necessity is immediate, because it is important that we continue, as I see it, Senator, with all the resources at our command to improve and to accelerate our technological process in the art.

There is no question in the world but that all other peoples are busy at the matter. I think that we ought to keep ahead in our development of the business.

Now, General Groves stated in San Francisco that the project was disintegrating and called upon Congress for legislation. He said he was tired, that he was making decisions that he wished he didn't have to make, and I agree with him that we should get ahead with it.

Senator MILLIKIN. You have transferred the discussion from the witness to General Groves, and General Groves isn't here so I cannot pursue the matter with the general. My impression of the general's over-all reaction is that he wants an expression of congressional policy rather than a particular kind.

The CHAIRMAN. He has got a particular kind, Senator. He would like it to end up in his lap.

Senator HICKENLOOPER. It is my impression that his position is diametrically opposite to that. I think he expressed clearly here the fact that he thought it should not remain in the exclusive and secret control of the military, but that Congress should set up a body to take it over and take it out from under their dominion. That has been my impression of his attitude. I never got the impression that he wanted to keep control of this.

The CHAIRMAN. Well, it certainly has been my opinion.

Senator MILLIKIN. Perhaps the witness has benefited from this colloquy and could give me his reaction to the question I put.

Dr. DAVIES. Well, I felt that I had answered the question a little bit back by saying that this continuation of this field under the present circumstances has, to a certain extent, the effect of making more difficult a settlement of the bomb question, and, if we could not settle the bomb question now, we should have the greatest difficulty settling it later.

If we do not settle it later, it will be the most severe problem we have in the world.

Senator HICKENLOOPER. Mr. Chairman, may I suggest to Senator Millikin one possibility about a suggestion that has been made here concerning an indication to the world of our intentions.

I wonder if these new conditions that have come up in the world, mentioned by Senator Millikin, and new demands and new complications in the international situation may not be stimulated somewhat by a basic feeling on the part of other nations that we are not going to use the bomb as a weapon, and that therefore the real conviction on the part of the nations that we don't want to use the bomb as a weapon is already basically established in their mind. Therefore, added demonstration might not contribute anything to their already formed conviction on that point.

Dr. DAVIES. Well, this requires a considered judgment on the psychology under which they are operating. I am sure I cannot give it.

Senator HICKENLOOPER. That is based on the fact that if they were afraid of us they wouldn't have made these demands.

Senator MILLIKIN. The fact remains that many disturbing things have been injected into the international situation since we used the bomb.

Now, those who do those things do them in a calculated way. They may be taking a calculated risk. We don't know what their precise calculations are, but the end point is, I believe, as I have stated it, that despite our development of the bomb, and our use of the bomb, these troublesome things continue to pop up in our face every time we pick up the paper.

Senator AUSTIN. You have already in a brief reference to your prepared statement made a fundamental point that any legislation should high-light the subordination of our statute, whatever it may be, to the international agreements to be entered into. That being so, let us assume that already three great powers who possess the knowledge have agreed and let the world know that there won't be any exchange on a reciprocal basis of knowledge of the basic facts with respect to constructive use of this energy until security has been effectively established against the destructive use of this energy.

Now, we have two assumptions, you see. Let us assume also that our own Government has appointed a committee to advise it with reference to its position in the commission already provided for by the UNO. That is our third assumption.

Now, then, is it not wise for us to postpone a decision upon this matter of the organization of our atomic commission until we do know what the effect of these facts are that I have called attention to, and they are great facts because they are international?

Dr. DAVIES. Room is left in the bill for the results of these facts. I doubt if the decision of the international body will affect in great measure the day-to-day working of the domestic structure.

Senator JOHNSON. I don't want to be tiresome, but I would like to go back to the question I was asking, because I think I stopped short of a conclusion which I am very anxious to make.

I asked the witness, and my understanding is that he answered "Yes" to the question as to whether, if there is another war, the atomic bomb will be used.

Now, since he answered that question, I would like to ask the witness if under those conditions he does not think that any commission set up to control the atomic bomb or atomic energy should have military representation, since if there is another war the atomic bomb is certain to be used. Must not we approach it, then, from the point of view that the military part of it is inseparable and must always be considered, and that there should be military representation on whatever commission is set up?

Dr. DAVIES. No; we feel that it is not necessary now in any case.

Senator JOHNSON. Yet you say if there ever is another war, the atomic bombs are going to be used. If that is the correct answer, and I believe it is, then why not accept the fact and say, "Well, that being so, the atomic bomb is a potential military weapon, and since it is a potential military weapon we must keep the military in any commission that is set up for its control"?

Dr. DAVIES. I believe military experience should be present there, but policy making by the Army or Navy should not be permitted.

Senator JOHNSON. Well, I asked Senator McMahon a moment ago a question that I would like to ask you now. What would you think of General Marshall and Admiral Land as members of the proposed commission?

Dr. DAVIES. I am not too well acquainted with the admiral, but I should be delighted with General Marshall as a civilian member of the Commission.

The CHAIRMAN. You wouldn't want three General Marshalls, would you, assuming there were five?

Dr. DAVIES. Well, if it has to be three, then the Commission would have to call in expert testimony on a great many subjects which could better be obtained by broader representation on the Commission.

The CHAIRMAN. Doctor, we want to get to the floor at 12 o'clock, and you are only on page 3 of a nine-page statement, so I suggest that you proceed.

Senator MILLIKIN. Mr. Chairman, may I make a comment?

The CHAIRMAN. Yes, Senator Millikin.

Senator MILLIKIN. A number of people have commented to me on an article by Maj. Alexander P. de Seversky which has appeared in the Reader's Digest. They are interpreting his article as watering down the importance of the atomic bomb.

Seversky is a man of sufficient standing so that I would like to suggest that we call him before the committee and sift him on the statement that he has made. It might be well also to have Dr. Morrison and others who have been to Hiroshima and Nagasaki and have seen the effects of the bomb there, because there is some conflict in the testimony.

The CHAIRMAN. I think that is a good suggestion, Senator, and I might say that if any other Senator has any witness he wishes to question—we are taking them as they come and as they request to appear—if you wish us to contact someone and ask them to come here, we would be glad to have your suggestions.

Senator MILLIKIN. During the course of other testimony you repeatedly asked what would be the effect of the bomb, for example, on heavy structures such as in lower Manhattan. I get the impression from Seversky that he thinks perhaps that could be duplicated by bombs of the type that have been used in this war. The thing is so fundamental that I believe when any responsible person gets up and has a view on it, especially of the standing of a man like Seversky, we ought to have him in here and hear from him.

The CHAIRMAN. We will see that that is done.

I might say, Senator, that I wish to talk with the committee as quickly as possible about having afternoon sessions. I think we ought to get on with the hearings as quickly as we can.

You may proceed, Doctor.

STIMULATION OF RESEARCH AND DEVELOPMENT

Dr. DAVIES. Vigorous research and development in nuclear science must be maintained. The use of the fission phenomenon and its byproducts in physical, chemical, biological, medical, and industrial research, as well as in power development, should greatly enrich our country and indeed all mankind.

Bill S. 1717 will foster such research and development through equitable distribution of fissionable material and of byproduct materials to all research workers, by granting funds to independent research organizations, such as universities, private and industrial laboratories, through the widest possible dissemination of information, and by creating a division of governmental research to insure a complete program.

The provisions of the bill for allocation of fissionable and byproduct materials are the best guaranty for rapid development in the field of atomic energy. No requirement other than the capacity to satisfy health and safety standards is set forth. We consider this requirement sufficient.

Independent research is encouraged by the bill. Government research is not preferred above private research in the allocation of

funds. We regard this as a highly desirable feature of legislation in the atomic energy field or for that matter in any other scientific field. The full development of science rests upon independent research by many individuals in many laboratories throughout the world. The direction which scientific research will take at any time cannot be predicted nor can research be completely guided by even the most intelligent administrator or scientist. Ideas come from the most unexpected sources. Scientists in a well-staffed, well-equipped laboratory may work on a problem for many years and yet those new and revolutionary ideas which may completely change the complexion of their work can come from a single scientist or from a small group working in a poorly equipped laboratory in a small country. It is, therefore, of the utmost importance that problems be studied by many independent groups and individuals. All competent scientists should be allowed to study the problems of atomic energy and to obtain the materials and such funds as are necessary for their work.

The bill provides for the wide distribution of byproducts, such as the radioactive products. The use of these materials as tracers or "tagged atoms" in the study of biological, chemical, medical, and industrial processes will, we believe, lead to the first peacetime applications of fission. Study of the byproducts themselves will advance our knowledge of the fundamental properties of matter.

The dissemination of basic scientific information and, when possible, related technical information, is made mandatory. The bill, in fact, attempts to provide the freest possible exchange of scientific information. We strongly approve of such provisions, and feel they should not be abridged. Science cannot prosper in secrecy. Science cannot develop when workers in a particular field may not discuss problems with those in similar fields. The wide publication given to fundamental scientific discoveries in the last 40 years is largely responsible for rapid scientific development. The fact that S. 1717 encourages this point of view is applauded by the atomic scientists. For similar reasons we would like to see the force of the patent section maintained in guaranteeing freedom for use in this field of all discoveries and inventions.

We approve the security regulations of the bill. During the war most scientists not in the armed forces worked on secret war projects. Secrecy regulations were based on the Espionage Act and successfully denied important information to the enemy. We feel the Espionage Act will provide as much national security as can be found in a policy of secrecy. We are pleased that the McMahon bill bases its security regulations upon this act and does not set up any further power to make arbitrary secrecy regulations.

STUDIES AND REPORTS BY THE COMMISSION

The American people have a large interest in the development of atomic energy. Progress and policy in this field should be subject to public scrutiny. The bill provides that the Commission shall submit quarterly reports to the President and to the Congress. These reports must detail the activities of the Commission and must include the Commission's program for the following quarter. Thus the work of the Commission is constantly in the public view and a means is provided for insuring that the Commission will act in the public interest. The atomic scientists look to the continuing interest of Congress to insure the development of atomic energy for the maximum public benefit.

Senator JOHNSON. I should like to call the attention of the witness to the fact that there are virtually tons and tons of reports made to the President and to the Congress by the different agencies, and I want to emphasize the fact that that safeguard which he deems important is, in my opinion, of little or no importance.

Dr. DAVIES. I might remark, however, that this is a subject that might be of special interest to the Congressmen deluged with reports.

The CHAIRMAN. In other words, the state of wildlife in Arkansas might be overlooked but, as to what we are going to do with this thing, people might read it?

Dr. DAVIS. Exactly.

Further, the bill provides for studies of the social, political, and economic implications of atomic energy and that these studies shall be reported as a basis for new legislation, particularly with regard to future industrial uses. New developments in atomic energy will be studied from the point of view of their effect on our national economy and a sound basis will be provided for future developments. In addition, international agreements will be facilitated since premature or unformed legislation on such questions as the future large-scale use of atomic energy will be avoided.

Bill S. 1717 encourages research and development in the field of industrial application of atomic energy. The policy of postponing large-scale industrial applications is, in our opinion, a wise policy. Industrial processes should certainly be developed, and the bill provides adequately for their development. Widespread industrial application, on the other hand, may present us with new difficulties. The economics of atomic power development are too uncertain to permit a decision at this time. Furthermore, premature development of special interests in this field may prejudice the possibility of international control. The possession by individuals or private groups of the facilities for producing fissionable material—the production of power may be accompanied by the production of fissionable materials—would greatly complicate the problems of international inspection and control.

It is worth emphasizing once again that strong Government control, based upon a Government monopoly of the production of fissionable materials, protects us from the misuse of these materials and prepares us for the possibility of an effective international control system.

ADMINISTRATIVE STRUCTURE

The composition of the Commission has been discussed by the committee. Two hostile viewpoints have been presented. The Commission should be small for the sake of efficiency. On the other hand, the Commission, it is said, should be large in order to permit representation of the many groups whose affairs touch upon the Commission's activities. It occurs to us that a third and more desirable choice exists. We believe the Commission should be large enough to permit physically the discharge of its duties, but no larger. It should include among its members persons with pertinent specialized information. The Commission should include men with training and experience in, say, pure science and industry, not that the special interests of scientists and industrialists shall have voice but rather that the indicated experience shall be available. Commission members

should have but one interest, the public welfare. If the Commission is composed of men each of whom is clearly instructed to safeguard the interest of a special group, its policies will often be unsatisfactory compromises. A need for further coordination among Government agencies and the Commission can perhaps be achieved through the presence of representatives of such agencies at the Commission's deliberations. In our judgment, the number of commissioners should not be decreased. It is essential that their appointment be full time.

We wish to go on record most strongly as favoring complete exclusion of the military from any policy-making function on the Commission. By this we do not mean to exclude efficient liaison between the Commission and the armed forces. Provisions making this liaison mandatory as suggested by Secretary Forrester would not be opposed by the atomic scientists. However, it is in best tradition of American Government that policy be made by civilians. A subject fraught with such tremendous significance to our foreign policy as the development of atomic energy in this country must certainly be freed from every vestige of military control.

The administrative structure of S. 1717 seems very satisfactory. Some of the functions of a future commission have now been recognized and the bill provides for them. Thus, divisions for production, allocation, research, and military application are established and their directors charged with the day-to-day supervision of these activities. This arrangement should leave commissioners free to formulate policy.

The system of Presidential appointment and removal eliminates the possibility of insulation against review and against change. The policy-making function of the Commission, together with the delegation of administrative duties to the divisions, makes real the functions of the appeal boards provided for by the bill. Were the commissioners also the administrative officers, we feel appeals would have little meaning, since they would be directed against those people who had already formulated the policies and made the decisions.

There are a number of minor changes, designed to clarify the bill's intent that we could suggest. We should be glad to submit those to this committee, if it so desires. We have not brought them forward in this testimony, since we do not wish to divert attention from the important points. The major questions we have discussed and the treatment by the bill of these questions lead us to regard S. 1717 as a very good bill. The atomic bomb project scientists strongly urge its rapid enactment into law.

Senator HART. Doctor, you have repeatedly made statements about the policy-making function, and recommended the complete divorce of the military function.

Dr. DAVIES. Yes, sir.

Senator HART. I am curious to know how far in your own mind you intend that policy-making function to carry. Is it your thought that this Commission shall settle all policies whatever in connection with atomic energy?

Dr. DAVIES. As far as the domestic policies go, yes, sir. Do you mean our domestic national commission?

Senator HART. Yes; what you are talking about, where the policy-making function should rest.

Dr. DAVIES. Well, one might for analogy compare it with the TVA authority, which is specifically instructed in its acts to cooperate in very specific ways with very specific governmental bodies.

Senator HICKENLOOPER. On page 7 you use this language:

We believe the Commission should be large enough to permit physically the discharge of its duties, but no larger. It should include—

and this is the pertinent sentence—

among its members persons with pertinent specialized information.

Now, apparently in that paragraph, or in this statement, you say that it is pertinent to have scientists on there, pertinent to have industrialists on there. So long as this is solely a weapon, why isn't it pertinent to have specialists in the military on there?

Dr. DAVIES. I think it is very pertinent.

Senator HICKENLOOPER. Well, I understood that in the last part of your statement you said the Commission itself should be completely divorced, so far as the membership is concerned, from the military.

Dr. DAVIES. That is right. I don't think those two are inconsistent. I don't think we should discriminate against those with military training, but they should not be members of the armed forces at the time they are serving on the Commission.

Senator HICKENLOOPER. Let me ask you this with reference to the question raised by Senator Millikin a while ago, and discussed by you, which I think is quite pertinent.

With reference to the suggestion that we turn this Commission into a civilian agency at this time, divorcing the military as a gesture of our willingness or our desire for peace, what is your opinion as to the effect on other nations of the world, for instance, if we would divorce atomic energy at this moment entirely from the military and set up a purely civilian commission, but at the same time if we set up a universal training program in this country and prepared the oncoming generations for military service? How would that balance up in the minds of the world as to our intentions toward peace?

Dr. DAVIES. One would certainly partially vitiate the other as far as getting the right psychological reaction.

Senator AUSTIN. The logical effect of your position is that the weaker we make ourselves the more powerful is our voice in international negotiations for security and peace. That is the logic. If that is true, we would not be able to carry out our foreign policies if we carried out your proposals here. Isn't that so?

Dr. DAVIES. No; I cannot agree with your assumption, your logical conclusion. We wish to be rid of the atomic bomb in order that the rest of the world shall be rid of it also.

Senator AUSTIN. But you are so honest in your mentality that I have refrained from suggesting this, which has occurred time and time again in my mind, and which I think I will suggest:

There was a great statesman here by the name of Bob Toombs from the South, before the Civil War, and in his campaign for election he declared, "We can lick the damn Yankees with cornstalks."

But after the war was over, he came up for reelection, and somebody in the crowd was unkind enough to pipe up and say, "Bob, didn't you tell us you could lick the Yankees with cornstalks?"

"Well, yes," he said, "I did; but the damn Yankees wouldn't fight with cornstalks."

Senator JOHNSON. Mr. Chairman, I should like to go back to the sentence on page 7 [of Mr. Davies' prepared statement] which Senator Hickenlooper read. It should include among its members persons

with "pertinent specialized information." Now, we are talking about the Commission. I have heard it said that scientists should always be kept on tap but never on top. Do you agree with that?

Dr. DAVIES. No, sir.

The CHAIRMAN. Doctor, I do not wish to lose sight of the fact that the bill does provide—and I don't believe you have emphasized it, or any witness so far has emphasized it—on page 21, section 11, that—

There are hereby established within the Commission a Division of Research, a Division of Production, a Division of Materials, and a Division of Military Application. Each Division shall be under the direction of a Director who shall be appointed by the President, by and with the advice and consent of the Senate, and shall receive compensation at the rate of \$15,000 per annum. The Commission shall delegate to each such Division such of its powers under this Act as in its opinion from time to time will promote the effectuation of the purposes of this Act in an efficient manner.

Then it goes on to say:

Nothing in this paragraph shall prevent the Commission from establishing such additional divisions or other subordinate organizations as it may deem desirable.

Now, apparently it has been lost sight of that the military applications are to have a place within the Commission if this bill is adopted. I would assume that the Director of the Division of Military Application would be, or in your opinion should be, a military man; wouldn't you say so?

Dr. DAVIES. Yes; and there is no objection that he shall be in the military service at that time.

The CHAIRMAN. And he could be on active duty, could he not?

Dr. DAVIES. Yes, sir.

Senator HART. But he must have nothing to do with setting policies.

The CHAIRMAN. That would be set by the Commission; that is true.

Senator JOHNSON. He would take orders, but not give them.

The CHAIRMAN. That is right, and that is where I want to keep them, Senator.

Are there any more questions?

We will meet tomorrow, I understand, in the Agriculture room, room 324, the witnesses to be Dr. Shapley, of Harvard, and Dr. Rabi, of Columbia.

(Whereupon, at 11:50 a. m. the committee recessed until 10 a. m., Tuesday, January 29, 1946.)

ATOMIC ENERGY ACT OF 1946

TUESDAY, JANUARY 29, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to adjournment, at 10 a. m., in room 324, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Tydings, Johnson, Millikin, and Hickenlooper.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will come to order.

We are fortunate to have with us this morning Prof. Harlow Shapley, who is director of the Harvard Observatory, and probably the country's outstanding astronomer.

Doctor, you have a prepared statement, I see.

Dr. SHAPLEY. I have, Senator.

The CHAIRMAN. Will you proceed, please?

STATEMENT OF DR. HARLOW SHAPLEY, DIRECTOR OF HARVARD OBSERVATORY

Dr. SHAPLEY. For the record, my name is Harlow Shapley; I am director of the Harvard Observatory, and a member of the faculty of Harvard University. Also I am president of Science Service and of the Scientific Research Society of America (Sigma Xi), and in preparing the following statement I have had some assistance from my colleagues in all of these organizations.

The Special Committee on Atomic Energy has heard much important testimony on the problems involved in legislation on the development and control of atomic energy. Recognizing my inexperience, I should like to spare you my views on many of the technical questions concerned and confine my remarks to the following topics, which I believe are all relevant to the problems before this committee:

1. The universality of atomic energy liberation;
2. Urgency of atomic energy legislation;
3. International aspects of science in the atomic age;
4. Coordination of the proposed Atomic Energy Commission with UNESCO and the National Science Foundation;
5. Comments on specific points in S. 1717.

With regard to these topics I have either some professional knowledge or some recent personal experience that may be useful. Probably

161

7041.31-46-pt 2-5

others have presented arguments on some of these points already, and therefore I shall handle each subject briefly.

I should like to preface my specific testimony with the statement that in general I find S. 1717 highly satisfactory. I can report that this is also the reaction I have obtained through direct solicitation of the views of my colleagues referred to above. In addition to them, I have the comments of many members of an informal temporary National Committee on Atomic Energy which I have formed for the specific purpose of obtaining a wide consideration of the many problems created by the current impact of science on society. A large majority agree with me that those who prepared S. 1717 have done an excellent service for the scientists as well as for the public.

UNIVERSALITY OF ATOMIC ENERGY LIBERATION

It is not at all farfetched, I believe, to remind this committee that the release of atomic energy, through methods comparable with the fission of uranium and plutonium, is the most basic operational fact of the universe, except perhaps for its creation. In announcing the fall of the first atomic bomb in Japan, President Truman referred to this fact that the atomic energy that produces sunshine is essentially the same as the energy of the bomb.

A generation ago the astronomers were forced to hypothecate the release of atomic energy in the hot interior of the sun—forced to it by the fossils in the old rocks of the earth. The fossil plants of the carboniferous age were discovered to be some 300,000,000 years old. This was demonstrated, incidentally, through the normal radioactive transmutation of this same uranium atom, the artificial splitting of which has produced an international headache and a crisis for humanity.

The great age of the fossils which lived by grace of the same kind of sunshine and the same amount of sunshine as works today in preparing us to be the fossils of the future, makes necessary a long-continued constant source of sunlight.

The CHAIRMAN. What are we going to be in the future—"fossils of the future"?

Dr. SHAPLEY. I said that advisedly. I say there is no escape from the fact that we ourselves are going to be the remnants of a past age. Perhaps I have said it a little lightly.

The CHAIRMAN. No; I just got quite a reaction out of it.

Dr. SHAPLEY. No other source is considered possible than that which arises from the energy of the atoms. The sun has been a steady producer for hundreds of millions of years, and to perform so steadily it has used natural atomic engines.

I should interpolate here that other sources of solar energy have been considered, like the infall of meteors, like the contraction of the sun, like the simple burning of the sun. They all can produce energy for a certain amount of time, but not sufficient energy to keep the earth heated long enough for the geological ages that we now recognize. The sun apparently is not depending on the splitting of uraniumlike atoms. It works at the other end of the periodic table, as Dr. Bethe has already explained to this committee. It gets its enormous energy sources from the synthesis of light elements out of the lightest of all elements—hydrogen. By far the most colossal source of atomic energy in the

universe is this transmutation in the stars of this most common of the elements. The stars can do it. We think we know how they do it. And we cannot follow their method because the maintenance of the necessarily high temperature, about 20,000,000, would be difficult if not impossible, and would be impractically expensive. The artificial transmutations of the lighter elements so far accomplished by man require much more energy than is produced. Our methods are not efficient.

Although in S. 1717 atomic energy is broadly enough defined in section 14 (a), throughout this Atomic Energy Act of 1946, as it is officially called, the emphasis and provisions are almost wholly confined to "fissionable materials" as defined in section 5 (a) (1). The helium synthesis is not included. I do not recommend the change at this time, but I want to point out that if we should find a way to sidestep the requirement of high temperature, we might soon need amended legislation. We might need an Atomic Energy Act of 1947, or of 1948, or 1950.

The CHAIRMAN. Doctor, just so that I make sure that I understand. In other words, the bill covers "fissionable materials," the splitting materials, of course.

Dr. SHAPLEY. That is right.

The CHAIRMAN. What you are talking about is the combining of certain elements in the periodic table to bring about, as you say, the synthesis process?

Dr. SHAPLEY. Yes.

The CHAIRMAN. Helium is one element, isn't it, and hydrogen and helium might be brought together?

Dr. SHAPLEY. Hydrogen into helium, thus releasing atomic energy.

The CHAIRMAN. So if we had that process come about, the definition would not be sufficiently broad, would it?

Dr. SHAPLEY. That is definite; and that is my thought.

The CHAIRMAN. Do you think that the immediacy of that is sufficient to cause us to change the definition now?

Dr. SHAPLEY. I would hardly think so at the present time. It may come, of course, at almost any time, and it may not come at all. It is a very difficult business, because the stars have the great advantage of enormous mass, and therefore the possibility of maintaining very high temperatures. We would have to find some very tricky way to sidestep that present basic requirement.

The CHAIRMAN. All right, Doctor.

URGENCY OF THE LEGISLATION

Dr. SHAPLEY. This leads to the observation that in revising S. 1717 it is to be hoped that this committee will recognize that prompt passage of a bill appears to be important. American scientists and technologists, as well as the Army and Navy, are anxious to know what the national policy is to be. The scientists of Europe, and the governments of Europe, need to know our plans in order that they can better shape their policies and help shape the urgent international policy with respect to atomic energy. Is it not, therefore, important, if you may permit me this suggestion, that the controvertible points, which might delay passage of the bill, be avoided as much as possible? We can keep in mind that on the basis of riper experience this legislation can be quickly amended. We need at the moment as good interim legislation as is possible.

In the spirit of expediency, therefore, I suggest that section 9, entitled "Dissemination of Information," might be greatly simplified. A statement to the effect that "for a period of one year, and until this bill is amended, no information about atomic bomb assembly and use can be released" would probably allay the fears of many and still not seem too crippling to scientific research and development, or contradictory to our widely approved plan of world-wide exchange of scientific knowledge and scientific personnel.

But if it were not for the widespread worry in many circles throughout America, and the need for prompt legislation, I would personally approve section 9 as it stands.

Senator MILLIKIN. Do you mind, Doctor, if I ask an interrupting question that bears on a somewhat different subject although related in a way?

Do you believe that the general exchange of scientific information between the nations and the exchange of scientists is feasible unless you have at the same time a general exchange of all kinds of information and the permission for all kinds of people to cross borders? Do you think it can be confined to scientists?

Dr. SHAPLEY. I believe, Senator, that the effective interchange of scientific information must be accompanied by the interchange of personnel. There is no check in published materials, or occasional papers at scientific meetings, that you are getting the whole story, and I believe that perhaps more important than increasing the already considerable exchange of scientific literature is the widespread travel of the scientists of all countries.

Senator MILLIKIN. Do you think that could be brought about unless at the same time you permitted general exchange of information of all kinds, scientific and otherwise? Do you think it can be limited to that in a practical way?

Dr. SHAPLEY. I had not thought of that, but I hope it couldn't be limited. That is, you are asking could we perhaps get information that is relevant to the atomic energy bill and not at the same time have all the information on agriculture, social development, literature, and history, and so forth.

Senator MILLIKIN. I mean, can you isolate just one department of human knowledge and say, "Now, after this we will exchange information and personnel but we will not exchange anything else." Is it practical to do that?

Dr. SHAPLEY. It might be practical, but it would be inadvisable, I think, and a very incomplete picture of the international amity toward which we must approach for the future security and future advance of human culture.

Senator MILLIKIN. I am sorry to have interrupted you.

Dr. SHAPLEY. Dr. P. W. Bridgman of Harvard University writes that he believes that the weakest part of the bill is section 9 (a) on basic scientific information. Instead of the abbreviation I have suggested, he proposes that the details might be more specifically stated. I should like to introduce his comment into the record for consideration in any further revision of the bill:

PREPARED STATEMENT OF DR. P. W. BRIDGMAN OF HARVARD UNIVERSITY

This [dissemination of information] is obviously a matter of very great difficulty to formulate adequately, and I believe that the sponsors of the bill have already spent much effort on it. The difficulty is added to by the fact, which I have

obtained from the best-informed sources, that there is now in the possession of the Manhattan district certain basic scientific information which the scientists closest to the project consider should not be published at present. In the face of this situation I believe that the full matter of basic scientific information can be dealt with only in much more specific terms. I would suggest that section 9 (a) be expanded into four sections, as follows:

(1) The Commission shall have no jurisdiction or control over any purely theoretical scientific activity which is based only on published material, nor jurisdiction or control over the free publication of the results of such activity.

(2) The Commission shall have no jurisdiction or control over any experimental or technical activity in the performance of which no materials are used the control of which is specifically allocated to the Commission and which utilizes only published results, nor jurisdiction and control over the free publication of the results of such activity.

(3) Basic scientific information obtained as the results of experiments performed with the aid of materials in the control of the Commission shall be freely publishable. In case of dispute as to whether certain information is of basic scientific character the decision shall be made by three scientists appointed by the President of National Academy of Sciences.

(4) Classified material at present in the control of the Manhattan Engineers' District or similar classified material relating to atomic fission resulting from activities sponsored by the Government during the war shall be declassified and published as rapidly as the Commission may decide is consistent with the public interest.

The CHAIRMAN. Do you subscribe to that definition, that revision by Dr. Bridgman, Doctor?

Dr. SHAPLEY. Not completely.

The CHAIRMAN. Will you tell us what criticism you have of it?

Dr. SHAPLEY. I would have left out the reference to the National Academy of Sciences. I would not have been quite so concerned about the freedom of publication as Professor Bridgman is. In general, I would prefer, as I stated before, that section 9, or at least 9 (a), be simplified in order not to alarm people into believing that we are injudiciously telling secrets that we should not tell, or giving away information—an act that for the time being is not consistent with the public interest.

The CHAIRMAN. Now, the Smyth report of course was authorized and given out by the War Department, and I presume that the Smyth report is a good example of what is termed "basic scientific information." That is true, is it not?

Dr. SHAPLEY. Yes; that is true.

The CHAIRMAN. Now, there has been some controversy over whether it was wise to publish the Smyth report. Have you had any criticism of that?

Dr. SHAPLEY. No; but I was startled to see it when it came out. I thought publication was perhaps a little hasty, but I was enthusiastic that our Government took the attitude that we are not concealing information of genuine scientific value.

The CHAIRMAN. In other words, do you feel that there was anything released in the Smyth report which prejudiced our security?

Dr. SHAPLEY. No.

The CHAIRMAN. Now, the War Department made the determination to release that. Under the terms of this bill, a civilian commission would have to come to the same determination to release information, basic scientific information, as the War Department released without consultation with the Congress, or with the President for all I know, or anybody else; isn't that true?

Dr. SHAPLEY. Yes.

The CHAIRMAN. Well, what I am trying to find out, Doctor, is why you have the feeling that the delegation by the Congress to a commission as it is finally set up in the bill, should arouse such a focal point of controversy as to delay passage of the bill. That is what I take it you are afraid of.

Dr. SHAPLEY. I am afraid of it, Senator. Frankly, I think it is rather silly that there is this worry and opposition. As I have said, I think section 9 is well written, and I agree to it completely as it stands, except as a matter of expediency at a time when I do think it important that we get our atomic energy bill passed. That is all.

The CHAIRMAN. Well, let's put it this way: I would like you to be the devil's advocate for a moment and to tell me what you think will be the argument made by persons who believe that this section would permit the giving away of secrets that should be kept—and I always say "secrets" in this field, Doctor, quote-unquote.

Dr. SHAPLEY. I believe that cannot be answered very rationally. We have in this country, as you know, a considerable, shall we say, journalistic worry that we are telling to various countries things that we had better delay for diplomatic reasons for some time. To me, it is a type of jingoism; to me it is perhaps tied up with the political struggle for an issue. I don't take it very seriously, and I am afraid I would not be a very good devil's advocate. I don't believe I could quite justify that attitude that we should not be free with our information and not proceed as you have described and planned in section 9.

The CHAIRMAN. Of course, I think it is important under the bill that basic scientific information must be given out.

Is that true?

Dr. SHAPLEY. That is right; and it should be, of course.

The CHAIRMAN. And in your opinion, it should be?

Dr. SHAPLEY. Very definitely should.

The CHAIRMAN. Can science prosper, Doctor, in an atmosphere of secrecy and restraint?

Dr. SHAPLEY. No; I think there is very little possibility that it can, and science has many times been hindered by selfish concealment of information over an interval of time. I think that will be even more true in the future, because the scientists are so interlinked, and it is so impossible for any one given investigator to control his whole field.

Therefore, we must have literature, we must have bibliographies; we must have collaborators in our big researches. I saw a paper published a few days ago which had 10 authors, indicating that no single man felt competent to issue that particular job on his own authority. It showed the need of collaboration. I think science has no chance at all of prospering in the way we would like to have it prosper unless we have very wide collaboration, very extensive cooperation in distributing information, and therefore any restraint on science or technology must be justified on the basis of procedural arrangements. It cannot be a good long-range policy.

The CHAIRMAN. Now, the Commission, as it is created, has to make the determination of what is basic scientific information, does it not?

Mr. SHAPLEY. That is right.

The CHAIRMAN. And it might be that they would not classify immediately something as basic scientific information if at that time its release at that particular moment might be highly prejudicial.

Now, the discretion is within the Commission, is it not, under the bill?

Dr. SHAPLEY. Yes; and a very high responsibility is within the Commission.

The CHAIRMAN. A very great responsibility. Do you know of any other way administratively to handle it than to give that discretion to a Commission? Congress cannot do it, can it?

Dr. SHAPLEY. I would think it would take high expertness in the Commission.

The CHAIRMAN. You cannot imagine the Congress debating each release of information, and just exactly how much we could release or couldn't; can you?

Dr. SHAPLEY. No.

The CHAIRMAN. I don't want to labor the point, Doctor.

Senator MILLIKIN. Mr. Chairman.

The CHAIRMAN. Senator Millikin.

Senator MILLIKIN. I quite agree that over the long term you do not help science by having to move in an atmosphere of secrecy and restraint, but, paradoxically, we had the biggest advance in this atomic fission business under secrecy and under the impetus of war that we have had in this country, which means exactly nothing, because, as I say, over the long term that would be a very bad policy, I think.

Senator McMahon, Senator Johnson, and I have been neglecting the Senate Military Affairs Committee for a long time. Will you excuse us so that we may be there for a few minutes now?

The CHAIRMAN. All right.

Dr. SHAPLEY. Section 6 (b) contains an important provision, namely:

The Commission shall not conduct any research or developmental work in the military application of atomic power if such research or developmental work is contrary to any international agreement of the United States.

The proposed legislation thus recognizes the internationality of scientific research. The build-up to the practical release of atomic energy came from many countries. Our legislation must be prepared to recognize that both the good of science and the potential evils that must be restrained are international. We must be prepared to encourage the exchange of scientific information and to aid in the foreign travels and foreign studies of our scientists, including graduate students and specialized technicians.

COORDINATION WITH UNESCO AND THE NATIONAL SCIENCE FOUNDATION

In this connection the Atomic Energy Commission could well make use of the facilities of the newly formed United Nations Educational, Scientific, and Cultural Organization. The charter of the subsidiary organization of UNO was signed in London in November 1945 by the representatives of 44 countries. A joint resolution, I believe, has just been introduced into Congress to provide for the adherence of the United States to this organization. An important function of UNESCO will be the world-wide dissemination of scientific knowledge; the sponsoring of special international conferences; and the breaking down, in the fields of science, education and culture, of unnecessary national boundaries and sectional restrictions. When it is in full

operation, UNESCO should prove to be an important instrument for assisting in various operations of the new Atomic Energy Commissions, both for the United States and for the United Nations.

There will also be need to coordinate the activities and responsibilities provided for in this Atomic Energy Act of 1946 with the activities and responsibilities of the National Science Foundation, which is under consideration by other committees of the Senate. The Commission and the Foundation both expect to sponsor research in nuclear physics; in the use of radioactive materials in medical research; and in the interests of the national defense. In both bills there is a consideration of the problems of the patents that might arise from the discoveries and developments that occur in the course of investigations subsidized by the Government. It would seem advisable to seek a common and consistent policy with regard to patent provision—and here I am speaking for a number of correspondents—and to consider the various other consequences of the overlapping coverage of these two highly important legislative acts.

I should like to make a number of comments on specific points in S. 1717, remembering that of course a number of them have been discussed before.

In sections 2 (a) and 2 (b) provision is made for an Atomic Energy Commission of five members, all of whom are full-time employees of the Government and are forbidden to have other business, vocation, or employment. This is a difficult point, I admit, but I would prefer the single full-time administrator, with full-time divisional directors, as provided in section 11 (a), and an unpaid advisory committee, that arrangement being made in order to get the services of the better men. But I shall not comment further on this point since it will be discussed in some detail, I believe, in a later session of this committee by President Karl T. Compton, of the Massachusetts Institute of Technology, with whom I have conferred. I may add that President J. B. Conant, of Harvard University, tells me that he also definitely prefers the single administrator with advisory board.

In section 5 (a) (4) on the Distribution of Fissionable Materials it is prescribed that—

The Commission is authorized and directed to distribute fissionable materials to all applicants requesting such materials * * *.

The word "directed" will make it possible for any crank to obtain fissionable material so long as he is equipped to observe such safety standards as may be established by the Commission. I grant that the Commission may find it hard to distinguish between the various orders of cranks in the fields of scientific research, and therefore I suggest no substitution for the word "directed." You may decide it is profitable to gamble on these unorthodox explorers who in turn probably believe that the "authentic" scientists are the cranks. So I pass that point.

Section 5 (a) (3), entitled "Prohibition" will make a great many innocent landowners into lawbreakers. This production of common criminals seems to be the usual experience when prohibition is put into the law.

I have in my pocket, Senator, a common piece of rock which I picked up on my way to this hearing. It is not my custom to come armed to a senatorial hearing, but I bring this to illustrate a weakness

in the phraseology. This piece of rock contains approximately 10,000 trillion atoms of uranium-235.

Uranium, as you know, is a very common, well-distributed element; It appears in minute quantities all over the earth, and where there is ordinary uranium, there is uranium-235, which is fissionable material.

My suggestion is a change in the phraseology, which probably has been pointed out by others.

My objection is to the phraseology, "It shall be unlawful for any person to own any fissionable material."

Incidentally, I have computed there are about 10 tons of uranium-235 within 5 miles from where we are sitting. It is a common element in the rocks, although not very easily obtained therefrom, as we have found. Uranium is, of course, also a constituent of the dust on the floor. This prohibition which I have mentioned naturally affects all mineralogical museums, and certainly the provisions of section 5 (a) will confuse the problems of ownership and provide endless bookkeeping. I believe the situation can be largely corrected by changing the phrase just quoted, which was, "It shall be unlawful for any person to own any fissionable material."

The CHAIRMAN. Doctor, that can be easily remedied by distinguishing between source materials and the finished product, can't it?

Dr. SHAPLEY. Yes. Or my suggestion is: "It shall be unlawful for any person to own any fissionable material except as permitted and authorized by the Commission." That exception already appears in the next provision of the prohibition clause.

The CHAIRMAN. I might interrupt you, Doctor, to say that of course it wasn't the intention when we drew the bill to make any unaware owner of source materials responsible criminally. I don't get them out of a reading of it, but I think that we ought to be careful that that point is cleared up. I just wanted you to know that wasn't the intention, of course.

Dr. SHAPLEY. Obviously, it wasn't the intention. It is merely a matter of phraseology.

In section 12 (a) on Enforcement, is a phrase that may cause considerable anxiety. It is the stipulation that any willful violation, attempt to violate, or conspiracy to violate "any regulations or orders issued" under this act is punishable. Throughout the bill there is much left to the power and judgment of the Commission. An arbitrary Commission could make rules that would ruin scientific research. In this bill, which no doubt will be amended as time goes on and experience accumulates, it would be possible, without danger, to leave out the phrase "or any regulations or orders issued thereunder," in line 19 on page 23.

My only concern is the worry that might be caused in nervous quarters by the phrase "any regulations or orders."

In conclusion I should like to record a protest which is perhaps not appropriate here, against the loose phraseology of the Atomic Energy Resolution adopted by the General Assembly of the United Nations Organization in London last week. The protest is relevant because our domestic policy must be coordinated sooner or later with this United Nations resolution, and with the international activities created thereby. The first sentence of the resolution provides for the establishment of a commission "to deal with the problems raised by the discovery of atomic energy and other related matters." Instead

of "the discovery of atomic energy" we should use the more correct statement "the discovery of large-scale artificial liberation of atomic energy" or "the discovery of the fission of the uranium atom." The discovery of atomic energy occurred 50 years ago at the dawn of our knowledge of radioactivity, and that discovery is not the problem which incited the resolution adopted by the General Assembly of the United Nations Organization last week.

The CHAIRMAN. I guess they will know what they have to deal with over there, regardless of how the regulation is written.

Dr. SHAPLEY. It is a loose phrase, that is all.

The CHAIRMAN. Doctor, do you believe the Government should own all fissionable materials?

Dr. SHAPLEY. Yes.

The CHAIRMAN. And that private ownership of fissionable materials should not be permitted.

Now, private ownership of fissionable materials was permitted in S. 1463, which was the first bill introduced on this subject, the May-Johnson bill. You agree that was in error, and that was corrected in this bill, if I understand you?

Dr. SHAPLEY. Yes.

Senator MILLIKIN. Would you mind stating, Doctor, why the fissionable materials should be owned, as distinguished from controlled? Let me preface my question with this: These materials in my State occur in the regular incidents. They are found in connection with other mining operations. It would be somewhat impracticable for the Government to own all of the deposits that might have that kind of material associated with other commonly mined materials.

Dr. SHAPLEY. I can see that point, Senator, and I have thought about it, although to comment on this subject is, of course, outside of my field of competence.

At the beginning of the arrangement for the control and production of atomic energy we must do a great many things that heretofore did not seem reasonable. It is not a time in which the older system of operation can be followed clearly.

I would like to see the Government owning—and that word "own" might be in quotation marks, because it may take a special kind of ownership or right—all the fissionable material at the present time. After some years of experience, that plan might be modified, but I would sooner start from the total Government control and ownership, rather than do a part-way job and have to work then, perhaps, toward further Government control.

The CHAIRMAN. Doctor, I think you were talking about source materials rather than the finished product.

Senator MILLIKIN. Then my question was misdirected.

The CHAIRMAN. Of course, Senator, as you know, as far as source materials are concerned, the Commission has the authority to buy or condemn any source materials. There might be an objection raised that the byproduct, that is, the byproduct of mining vanadium, we will say, would lie there dormant and the Government, which would be the only purchaser since it would be the owner of the end product, fissionable material, could set a very unfair price, it seems to me. But after all, your miner wouldn't have to accept it. He could say, "Condemn it," so he could have access to the courts to get a fair value for his product.

Senator MILLIKIN. I was striking only at the point of the ownership of the raw material. I see no point in it at all. It seems to me it could be controlled just as well as it could be owned. In fact, I think if you want to develop uranium ores, for the Government to own them unless it is going into general mining operations, general exploratory operations, would be a restrictive thing rather than a helpful thing. I have no doubt in my own mind that raw material can be controlled at the source, but a general program of ownership in view of the way the ore occurs, at least in my State, would involve the practice of the whole State of Colorado and would probably end all mining operations in the whole State of Colorado. Of course, I am "agin" that.

The CHAIRMAN. Of course, that isn't provided for in the bill. The Commission licenses the movement of ingredients essential for the production of fissionable materials so that it can assure an adequate supply and prevent a diversion of those materials. They have authority to condemn or buy, but certainly there is no intention or authority in this bill to go out and buy up the State of Colorado for the purpose of getting any monopoly of such material.

Senator Millikin, have you any further questions?

Senator MILLIKIN. No.

The CHAIRMAN. Senator Hickenlooper, you just came in. Dr. Shapley is a noted astronomer from Harvard and has given us the benefit of his testimony.

Senator HICKENLOOPER. You haven't located any uranium on any of the other planets, have you, Doctor?

Dr. SHAPLEY. No; we haven't. We haven't the slightest doubt that it is there, but it is difficult to detect. We have detected some 50 of the earth's elements on other stars, but not uranium.

The CHAIRMAN. Doctor, I notice on page 5 of your statement that you say you would prefer a single full-time administrator with full-time divisional directors. In other words, I take it that you approve of the divisional set-up that is erected in the bill?

Dr. SHAPLEY. That is right.

The CHAIRMAN. Each having at the head of that particular section a most competent man in that particular field.

Dr. SHAPLEY. Full-time and employed in this only.

The CHAIRMAN. Now, what objection have you got to the Commission approach? I notice that you say that you would rather have a sort of advisory committee, an unpaid advisory committee.

Isn't it your experience, Doctor, that unpaid advisory committees give just about as much as they are paid for?

Dr. SHAPLEY. Yes; and when I said "unpaid," perhaps I should have modified that a bit. I meant they were not full-time employees but were employed in the way one hires special consultants. But I think there is something in that point you make.

If we have a full-time advisory or managing commission, I think we cannot get the best men; our commission is likely to be made up either of heroes, or emeriti, or men whose interests are in part elsewhere.

It has been suggested that one could get men on such a full-time commission for a period of only 2 or 3 years. But men who are working for 2, 3, or even 5 years and then returning to some other interest—university or industry—cannot be entirely free of pondering the future.

The CHAIRMAN. Doctor, you know there is something contradictory in what you have just said to an observation you made to Senator Millikin a few moments ago, when you said we could not think in the usual terms in several facets of this situation. It has occurred to me that when we talk about staffing this Commission with competent high-class men there is one place at least in which the imagination isn't let to roam, to the extent that the highest-class men would be attracted to this because of the importance of it both to our future prosperity, perhaps, and even our existence as a nation.

Don't you find that a little inconsistent in your own mind?

Dr. SHAPLEY. I grant your point, and, recognizing it, I used the word "heroes." I mean by "heroes" men who do see that this is an unusual situation and who are willing to sacrifice their past and future, if it is a sacrifice for them, to take positions and responsibilities on the Commission. But suppose we were constructing a Commission at the present moment: I can think of a dozen men whom I think would be competent to be on that Commission, approximately a dozen men. All of them have either industrial or university affiliations at the present time, and to ask them to give them up would be requesting the unusual service that you suggest. So, I grant your point. I was inconsistent if we are applying to industrial and mining enterprises the same principles that we apply to principles of social service.

The CHAIRMAN. Well, suppose we made the salary—we couldn't compete with private industry, for Government just doesn't do that with \$100,000 salaries, but suppose we paid the Supreme Court salary; don't you think that that would be sufficient to attract the type of men that we would need who would serve because they recognize the vital importance of this?

Dr. SHAPLEY. I don't believe the salary is a thing that will take care of that.

The CHAIRMAN. Not exclusively, of course.

Dr. SHAPLEY. I don't believe it is a very essential point.

I think the request that these individuals on the Commission abandon their former connections, their former associations and the way they have built up their lives—because they wouldn't be competent on this Commission unless they did have a record of great service and of great accomplishment—and divorce themselves entirely from these associations may be successful, but I would worry that such men could not be found. I think that we could do a good deal of damage to this Commission if we select men who look at it either as a political plum or as something that is worth their doing only because they haven't much else of importance to do.

Also there is one other point that may come up in further discussions, especially if Dr. Compton testifies on this matter, and that is what would be the activity of these five men? There are division administrators to look after the divisions. The topman, the chairman, would have plenty to do, but unless there were some partition of the work, could you get these highly competent administrative or scientific individuals to find profitable employment for themselves commensurate with the responsibilities that they have given up?

That is a question and not an assertion.

The CHAIRMAN. It would strike me that a person who is on this Commission would have the advantage that we Senators do not have,

a little time for reflection for the vital problems that they would have to pass on. We don't make much provision for that in Government. I think probably we lose thereby.

Dr. SHAPLEY. Nearly all of us work too much, think too little.

Senator MILLIKIN. Because I wasn't able to hear your entire address, Doctor, I know I have missed your position as to whether the commission should be composed of scientific personnel.

Dr. SHAPLEY. No; that matter wasn't brought up.

Senator MILLIKIN. Do you think it should be?

Dr. SHAPLEY. I don't think it should be exclusively scientific personnel, if by scientific personnel we are thinking of nuclear physicists or even natural scientists.

Senator MILLIKIN. It seems to me that what you have just said is consistent with your statement a while ago that in some phases of these problems it may take 10 men to work up a proper symposium, and of course if you attempted to put a physicist or a scientific man to represent every problem in this whole field, you would have a congress of scientists rather than an effective administrative commission.

I put that also not as an assertion but as a question.

Dr. SHAPLEY. The bill, of course, provided for all the necessary machinery in the way of special committees and advisory boards and subcommittees. On the advisory board, it would seem to me that one must have representation of the social scientist and of Government as well as of the technical scientists associated with atomic energy release, and that would be true whether it was strictly an advisory committee or a full-time committee. The problems cover so many fields.

Senator MILLIKIN. This is a routine question of mine, so I will ask you: Do you think science would be irremediably injured if this whole subject continued to be bottled up for, let us say, 6 months or a year?

Dr. SHAPLEY. No.

Senator HICKENLOOPER. With reference to this—I don't remember how you referred to it, Doctor—general full-time administrator with an advisory board, would you recommend that this administrator be appointed by the President and his power defined by law, or would his powers be limited and directed and his policies controlled by the advisory commission that you suggest?

Dr. SHAPLEY. At least the advisory commission should be consulted if it is a well-chosen commission on the problems that would be written into the bill.

Senator HICKENLOOPER. I assumed under any circumstances, that being the case, that the advisory commission would be consulted by the very nature of their set-up as an advisory commission. As to the ultimate authority for decisions, what would you suggest concerning that? Who would be the final authority on definition of policy and administrative activities?

Dr. SHAPLEY. The President of the United States.

Senator HICKENLOOPER. Well, what authority would that administrator have?

In other words, if he were in direct conflict with the suggestion of his advisers, would he say, "Well, I have your advice; thank you. It will be this way." Or would he be controlled in his policy by the advisers' determination in this thing? Or would the administrator and

the advisory commission both have to take their quarrel to the President and say, "Here, we don't get along; you decide who gets the apple."

Dr. SHAPLEY. That matter has been discussed a good deal in our National Science Foundation organization, and I have felt that the people who know how to administer bureaus and departments in Washington are much more competent to speak on that subject than are the scientists who have not had experience. Therefore, in a way, I am quoting what I have heard from competent and trustworthy administrators when I say that I believe that the administrator should be a person of authority in those matters, that the advice that he would get from his committee should be not mandatory but useful. That, of course, would have the result, then, that he is alone responsible for the outcome and responsible to the people and to the President.

Senator HICKENLOOPER. Thank you. I was merely trying to at least pursue this proposal down to where the final authority would rest. I think you have answered the question.

The CHAIRMAN. Thank you, Dr. Shapley.

Dr. Rabi, suppose you give your name for the record, and tell us of your qualifications to come and advise us here today.

**STATEMENT OF DR. ISIDOR I. RABI, PROFESSOR OF PHYSICS,
COLUMBIA UNIVERSITY**

Dr. RABI. I am not sure of my qualifications, but in any event I am a physicist and a professor of physics at Columbia University in New York.

For the period from late 1940 to late 1945, I was at the Radiation Laboratory in Cambridge with the position of associate director. This laboratory was, I believe, the largest laboratory under the auspices of OSRD and was devoted to research and development in the field of radar. From early 1943 to the end of the war, I was also a consultant for the project at Los Alamos, N. Mex.

The first thing I would like to say is that I am in general agreement with the intent and provisions of S. 1717. The provision of a commission is a very wise one, in my opinion. As I understand the bill, the Commission is essentially a policy-making body in the vast and complicated field of nuclear energy. It seems to me very desirable to have a body of men who can devote themselves to the planning, coordination, and general direction of policy.

The establishment under section 11 (a) of the four divisions of research, production, materials, and military application is also in line with the best experience, both in private industry and in the war effort. For the protection of research, it is very important to separate it from the field of definite application and production. This has been the experience of large organizations, of which the American Telephone & Telegraph Co. and the General Electric Co. are two outstanding examples. In a new and active field like nuclear physics, which at the present moment rests on the very inadequate theoretical basis, it is vital that research be as unhampered as possible and that the scientist be encouraged to explore this field with the freest use of his imagination. Because of this, it is particularly important to separate research from the activities of the practical production of nuclear energy or implements of war. The exploration of this field

with the broad objective of obtaining a clear understanding of the fundamental basis of such phenomena as nuclear forces, the production of energy in the stars, cosmic rays and the associated new particles such as the mesotron, will find a basis for the new technology of atomic energy. One will then be able to proceed with further developments with the assurance that no vital avenues of approach to the problem have been neglected.

I would also like to say that I like in this bill the idea of a civilian commission, and I think that is directly in line with our war experience, that the most effective connection the military have with such activity is in the form of liaison.

I want to add to my own statement a statement of Dean Pegram.

Senator MILLIKIN. May I ask a question, Doctor?

If the war had not come along and made the development of this energy a matter of extreme urgency, how long do you think it might have been before we would have acquired the same amount of knowledge?

Dr. RABl. I don't know whether you mean we or the whole world, or some other country. It was quite clear that beginning in about the middle of 1939 this sort of this thing was possible, and it was merely a question of who would decide to go for it in a big way. We did because of the pressure of war.

Some other country, poor in natural resources like coal and oil, might have gone for it for other reasons. One cannot predict at all, I think.

Senator MILLIKIN. Would it have gotten out of the laboratories without having behind it the profligacy of war expenditure?

Who, for example, or what nation in peacetime would have started to translate the laboratory knowledge into results?

Dr. RABl. Well, many nations, with many reasons for doing so. For example, an empire like Great Britain has many areas in which coal is scarce and where energy is desired, and they could have set it up.

Senator MILLIKIN. Well, we spent two and one-half billion. Let us assume that a large part of that would not have to be respent if someone were approaching it fresh. Let us say that it took \$500,000,000 to do the job. Merely mentioning a sum of that kind and then correlating it with the peacetime activities of Government is, I believe, expressive of very serious doubt as to whether there would have been this sort of translation from the laboratory into results for a very long time.

Dr. RABl. Do you mean, Senator, that the war would simplify the overhead cost, and that the capital expenditure for peacetime use would not have been made, so that we would get atomic energy now for peacetime use possibly merely as a byproduct of the war and that there is no other human activity which would give such support to the scientific research?

Senator MILLIKIN. That is the general effect of what I was driving at, but I would like to exclude from the inference that I have given you that I mean that it would never have come about. I am speaking in terms of the foreseeable future.

Dr. RABl. I think it would depend upon the temper of the particular country. If they were in the mood for great expansion, such as our drive out to the West, they would go for this sort of thing. If they were in a conservative mood and said, "We have other things to do," they wouldn't.

Senator MILLIKIN. It is highly speculative, isn't it?

Dr. RABI. Yes; it is a big world, and all sorts of things could happen.

Senator MILLIKIN. It is entirely speculative as to when we would have gotten to the point we are now, had it not been for the urgency of war.

Dr. RABI. I don't think we would have gotten far with it unless we had this immediate urgent application.

Perhaps some of the Senators from the Southwest or other regions where coal might be difficult to get at, say California, might say, "Here is a source of energy which would be very important for irrigation and other purposes," and get the Government to go in for it at a reasonable rate of \$25,000,000 a year, and they would have it in about the same time we are going to have it anyway, I guess.

Senator MILLIKIN. Again, that is entirely speculative?

Dr. RABI. Yes.

Senator MILLIKIN. Now, the point I am coming to is that this acceleration in the development of the science, this bringing it to at least the beginning of a fruition, came about under military direction.

Dr. RABI. It is a difficult and complicated question. I mean that military direction has various shades of meaning. I would say "military connection"; the military were more the people who could get the money from the Government. They held the pursestrings, and a few were willing to take the responsibility for spending such sums, to the military already spending such very great sums that this was something additional.

Senator MILLIKIN. I think it is incontestable that there was an over-all military direction and under that—let us call it regimentation, a very obnoxious regimentation of the scientists. I would not for a moment have you draw the conclusion that I would favor a permanent military control of the subject. I was just putting a little counter into your thought that only science can achieve anything and can head this way in an adequate way, my point being that the greatest development of the subject has come under top military control.

Dr. RABI. I see what you mean, Senator, and there has been no quarrel between us.

You drew an inference, not from any remark I made. What I said was that our experience in the war has been that for scientific development the best position of the military is the form of liaison. I was referring not to the Manhattan district which was a very special sort of thing, or made very special, but to the vastly more complicated operations, I think, of the OSRD, of which our laboratory was one of the chief elements, the Radiation Laboratory. I was simply talking from experience. Also let us say from the form of organization of laboratories, like the Naval Research Laboratory, where the civilians run the thing and the military there are there for liaison and for providing basic administration. They take care of the buildings and do the paper work, and then otherwise are there for observation, for transmission to their different military branches.

Senator MILLIKIN. I have gotten a very distinct impression from the testimony that the over-all direction of the matter was in the military. Of course, the military availed itself of a wealth of science and perhaps without science the military would have been entirely futile in the thing, but somebody headed it. It is my understanding it was the military.

Dr. RABI. Well, sir, you can go back step by step. General Groves was, in essence, the head of this thing for a time. Behind him was another committee; and behind him stood another group, which was civilian; and behind them all stood the President of the United States, who was a natural-born civilian, so I don't know where you are going to draw the line. At some point, somebody had to be given some money, had to spend it and had to have some organization for spending this money. You would have an organization with people in brown suits or people in ordinary costume. There was nothing in the previous history of the organization, the United States engineers, which made it anything special for them. They never ran much in the way of laboratory, certainly no such vast research approach. It was a job which was given to them during the course of the war, and such things happen all the time.

I don't think we can draw a proper inference from it, until we have the detailed history of the activities of the Manhattan district, and all the important decisions, how they were made and what the reasons were, and a careful examination of whether those were or were not good decisions.

What we have here is, to begin with, somebody gave somebody else some money, and then after a few years, as an end result, a bomb materialized. Now, the end result of the bomb does not prove that the administration was good throughout or bad throughout. I think the whole thing will await further study.

I am speaking, however, more from my own experience in another field which the general public knows more than any of the other operations of the OSRD, our particular laboratory, the Radiation Laboratory. The costs of the products of the Radiation Laboratory, the things which were developed there and then went into production, and which were produced as a result of the Radiation Laboratory were just about as great as what the Manhattan district spent. I think it amounted to about a billion and a half, and the Manhattan district was two billion; so the Manhattan district isn't our only example of the initiation of an important scientific project and its development and use against the enemy.

Senator MILLIKIN. I wasn't making any point, Doctor, as to whether the administration was efficient or inefficient. If it was inefficient, then under your theory the parties made accountable in a major way are the scientists. Starting at the top, the decision to go ahead was made by President Roosevelt, who was, as you say, a civilian, and also Commander in Chief of the Army and Navy. Below that, the time came when there was an over-all direction or coordination or liaison, or whatever you want to call it, by the military, and the record here is full of the resentment and not resistance—because they cooperated splendidly—the uncomfortable cooperation of scientists who felt they were being regimented. That is all I was trying to develop, and that is why they want to get out from under it now. That is why they want a civilian commission.

I don't believe those things are contestable, Doctor.

The CHAIRMAN. Doctor, I don't think that we should hold you up very long to comment further on the Manhattan district and the way it was operated. I thought about it a good deal. We had the scientists with the ideas and the basic scientific knowledge, and then we had some of the most prominent engineering organizations in the

country who were called in. Then, we had the Army with an unlimited amount of money and without any regard for priorities, which got what the other two groups said they needed to do this job. Isn't that true?

Dr. RABI. As far as I know.

The CHAIRMAN. And they did act as procurement agents for this project, and they did set up security rules for this project. Is that right?

Dr. RABI. Yes; as far as I know.

The CHAIRMAN. Now, do you know or have you heard of any engineering accomplishments per se that were contributed by the Army other than the three or four private industrial and engineering organizations that were brought in under contract to do the job?

Dr. RABI. Well, sir, my connection with the project was only through the Los Alamos Laboratory, which was charged with making the bomb and they required a minimum of outside engineering, so I cannot really say. I had no connection with the other branches that approach it.

The CHAIRMAN. I think it is a subject we can well delay in view of the more important and immediate things we have got to do. When the final history of the thing is written, we will be able to decide those things.

I don't want to be understood as playing down the Army's contribution, which was undoubtedly a great one, but I just want to keep it in proper focus if we can, inasmuch as it might have some influence upon who should operate it in the future. The amount of credit that the Army is entitled to might indicate its essentiality in running this for the benefit of the country.

Senator MILLIKIN. Mr. Chairman, may I make one brief remark? The chairman has defined, with one exception, the attributes of a top executive. He has said he got the money; he said he did the procurement. It has been admitted he did the liaison. There is one thing the chairman has omitted, and I think they will admit that is true: The Army defined the objective.

When you have those things, you have every element of top direction.

The CHAIRMAN. I think President Roosevelt defined that, Senator.

Senator MILLIKIN. Wasn't he Commander in Chief and weren't we told how good he was as a Commander in Chief?

The CHAIRMAN. And that is one of the evidences that proves it. I say, "Touché."

Go ahead, Doctor.

Dr. RABI. I have discussed this bill with Dean Pegram, of Columbia, from two points of view; one is the general declaration of policy and the other is the point of view of a sharper definition of some of the provisions of the bill, particularly as they relate to specific scientific matters.

Now, the following portion of my statement was written by Dean Pegram who has been associated with the problem of atomic energy since its inception, and I subscribe most heartily to the point of view which he expresses. I would like to read that into the record.

This is Dean Pegram's statement, which resulted from our discussions:

A bill for the Government control of atomic energy is very necessary and the general intent and plan of such control as set up in the bill merits approval and

support. The following remarks on features of the bill and suggestions for revisions, while critical, are offered with the hope that they may be helpful in clarifying the bill.

These remarks are limited to:

1. The basis of a bill for the control of atomic energy.
2. The need in such a bill of exactness of terminology and of clear limitations of the scope of the bill with respect to the materials to be controlled.

REMARKS ON THE DECLARATION OF POLICY, SECTION I (A)

Presumably this introductory section should give a forthright statement of a sound basis for the bill. As it stands this section fails to base the bill on the real and valid reason for the proposed unprecedented governmental control of certain materials and their uses, which good and sufficient reason is that if these materials are not strictly controlled by the strongest agency possible, they present an unprecedented menace to the public welfare and to national security. Instead of making this direct and obvious approach, this section rather artificially or disingenuously bases the bill on the probability that the use of atomic energy for civilian purposes can improve the public welfare. This is obviously a most debatable reason. If this were a sufficient reason for the seizure and control of uranium, it would be applicable also to any useful material—tungsten, tin, copper, iron, sulphur—anything.

The argument offered here is not against the Government ownership and control of certain potentially dangerous materials in their benign uses for civilian purposes. The argument is first that the Government must guard the public safety, next that in its strict control of certain materials for the public safety the Government should not interfere with, but should rather aid, proper uses of atomic energy for the public good.

More fully developed, a natural and logical statement of the reasons for such a drastic bill as this would cover the following points:

1. Atomic explosives present so great a hazard to the public welfare and the national safety that only through the strictest control by the Federal Government of certain fissionable materials and any use of them can the people be assured of protection. State or local government would obviously be unable to handle this problem.
2. These materials, of which the misuse could be so disastrous, can when properly used provide a new source of energy for the benefit of the public.
3. The necessary Government control to remove the hazard of the misuse of these materials ought not to prevent the useful developments that can come from this new source of energy. Therefore to insure this, an adequate policy should be declared and put into effect.
4. "Accordingly it is * * *" (lines 3 to 8, page 2 of this bill).

REMARKS ON SECTION 5 AND ON THE USE OF "FISSIONABLE" THROUGHOUT THE BILL

A conspicuous fault in the bill is the unwarranted use of the word "fissionable." It is hardly to be conceived that the bill intends to give the Commission power to assume ownership of all lithium or boron compounds, yet both lithium and boron are fissionable. It is well known that if a proton is shot into the nucleus of Li-7 fission results, giving two equal parts each a helium-4 nucleus. This is no negligible fission from the energy standpoint; 17.6 million electron volts is released from the fission of one atom, more per pound of Li-7 than comes per pound from the fission of U-235. No one conceives of lithium or boron being dangerous materials, but U-235 is certainly dangerous. The all important difference is of course, that with U-235 a chain reaction can occur, with lithium it cannot. The potentiality of a cumulative fission by a chain reaction is necessary in any explosive material, be it gunpowder, TNT or U-235. Hence in this bill, as much stress should be put on the potentiality of a chain reaction in a material as upon the material being fissionable.

To do so will require a few more words in the bill but should make the bill more palatable to those who wish to know just what is intended by the bill.

Senator MILLIKIN. May I ask, Doctor, would it be disturbing to industry, for example, if it were concluded that lithium were one of the objectives of this bill? Who would be disturbed by it?

Dr. RAB. It is so widely used, is so widely present, it is certainly not in accord with the spirit and intent of this thing.

The CHAIRMAN. In other words, Doctor, you would like it to be defined as "fissionable material in which it is possible to have a chain reaction"?

Dr. RABI. Yes; and this statement goes on to make a large number of specific recommendations for changes throughout the bill.

If you prefer, I will read just one or two more short paragraphs, and then introduce the letter, rather than go through the thing line by line.

The CHAIRMAN. It is criticism on definitions?

Dr. RABI. Yes, and changes here and there throughout the bill.

Senator MILLIKIN. Will you give us what you think are the more important of them, Doctor.

Dr. RABI (reading):

The same definiteness could be secured if the bill should give a new definition to "fissionable material" by stating that a "fissionable material" shall mean a material containing atoms of which the nuclei are capable of being split into fragments in such a way that a cumulative chain reaction can occur resulting in the release of energy. If this new and more specialized meaning could be given to "fissionable," the nuclear physicists could perhaps use "splitable" as they have hitherto used "fissionable." If such redefining were to be done for the purposes of this bill, it would be desirable to add further to the definition given above the following words "in amounts of one hundred or more electron volts per fission."

It may be remarked that it is not unlikely that means will be found to cause nuclear fission in many kinds of atoms—fissions without the possibility of cumulative fission by a chain reaction, and these should certainly not be included under the control of the proposed commission.

Senator MILLIKIN. Is cumulative fission the thing that happens when you have a chain reaction?

Dr. RABI. That is what is meant here.

Senator MILLIKIN. And when you have a chain reaction, you have cumulative fission?

Dr. RABI. Yes.

Senator MILLIKIN. Why the word "cumulative," if we are going to get cranky about the words?

Dr. RABI. One sends off another, or more than one, so the number of fissions accumulates.

Senator MILLIKIN. But isn't it sufficient to say a chain reaction, if that is what happens?

Dr. RABI. I think it would be sufficient. On the other hand, you might have a chain reaction which goes along in a chain and then breaks off before it accumulates, you see, and that would not be a dangerous thing.

Senator MILLIKIN. You mean it is not completely synonymous with chain reaction?

Dr. RABI. Not completely. It would mean a chain reaction which goes faster. You might mean a chain reaction which is breaking down.

Senator TYDINGS. Doctor, why do you fix the figure of 100?

Dr. RABI. It is a nice figure. Anything below that would not result in an explosive which would be very much more dangerous than TNT and doesn't need such an extraordinary measure.

Senator TYDINGS. How high above that could we go without being much more dangerous than TNT? In other words, to stay out of the atomic field, to stay out of the cumulative fission as you have defined it, how much higher than 100 could you go?

I am assuming in my question that 100 has a reasonable factor of safety in it. Now, when you get to the point of what might be called equality factors, rather than having three times the necessary safety provision, how much higher could you go than a hundred before you would tread on dangerous ground?

Dr. RABI. I doubt whether you could go more than 10 times as high.

Senator TYDINGS. You mean 10 more points as high?

Dr. RABI. Let us say 1,000. I don't think you would want to go as high as 1,000, because 100 already is several times, 10 times or so, what you would get from ordinary explosives, but 1,000 would be 100 times as great.

Senator TYDINGS. How about 110, for example?

Dr. RABI. I would not cut it as fine as that. One hundred was simply taken arbitrarily.

Senator TYDINGS. How about 150?

Dr. RABI. I would buy that, too, if you insisted.

Senator TYDINGS. What point do you generally meet as an over-all place where you equalize your factor of safety with that of the danger involved?

Dr. RABI. That is an indefinite thing. We are trying to make a principle there. I would rather set a limit by actual further study.

Senator TYDINGS. That has a factor of safety of several times what probably is needed, your 100 figure?

Dr. RABI. That is right.

Senator TYDINGS. And you feel that that factor could not be further reduced?

Dr. RABI. It certainly adds clarity to this to bring it in.

Senator TYDINGS. You pulled it down far enough, in other words, to make your factor of safety waterproof?

Dr. RABI. That is right.

Senator HICKENLOOPER. Still I understand, Doctor, that the factor of safety you have named would in your opinion not interfere with the reasonable use and experimentation with this material?

Dr. RABI. Yes, sir.

Senator HICKENLOOPER. That is other material that would not produce any more than this.

Dr. RABI (continuing to read):

The present wording of section 5 is puzzling. Is pure metallic uranium, with the isotopes present in the natural ratios a "fissionable material"? or is it a "source material"? Would the pure isotope U-238 be a "fissionable material"? Is uranium nitrate a "fissionable material"?

Senator TYDINGS. Doctor, I don't want to bore you with that 100 figure, but how did you arrive at that?

Dr. RABI. Simply that 100 gives you about 10 times the energy per item that you would get from TNT.

Senator TYDINGS. How would you rate TNT in that scale?

Dr. RABI. About from 5 to 10.

Senator TYDINGS. What would be the next intermediate explosive force between TNT and the fission of the atom?

Dr. RABI. I don't know of any.

Senator TYDINGS. Then, you are jumping from 10 to 100?

Dr. RABI. I don't know the details of some of the new explosives, but I doubt if they have a factor of 2.

Senator TYDINGS. Let us put it this way. For the purposes of your testimony, you are excluding practically everything from the scope of this control that now exists except nuclear fission?

Dr. RABI. That is right.

Senator TYDINGS. Is that correct?

Dr. RABI. That is right.

The CHAIRMAN. Go ahead, Doctor.

Dr. RABI (reading):

Section 5 (a) (3) (a). Shall it be unlawful for a man to own 10 grams of metallic uranium? One-tenth of a milligram? One microgram?

Certainly the Commission will consist of reasonable men, but so far as practicable we should be governed by law and not by men.

In section 5 (b) (1) why beryllium? why not copper, iron, carbon and other things that can be used effectively in, or in preparation of, an atomic bomb?

This was the general statement, and now I have here a series of suggested revisions in line with the foregoing remarks, going through the thing page by page and section by section.

The CHAIRMAN. If there is no objection, we will turn those over to the staff and let them work on them and include them in the record.

Senator MILLIKIN. I assume in due course we will have a tabulation of all suggestions for amendments.

The CHAIRMAN. That is right. We are having them drawn up now as each one comes in. They are being tabulated. When the testimony finishes, Senator, what we plan to do is to have the original bill and the suggested changes side by side so that we can see what they are.

Now, Doctor, have you anything else of your own to add?

Dr. RABI. No, sir.

The CHAIRMAN. The suggested revisions will be included in the record at this point.

(The suggested revisions read as follows:)

COLUMBIA UNIVERSITY,
January 28, 1946.

Suggested revisions in line with the foregoing remarks:

S. 1717

Section 1 (a), p. 1, line 8. After "evident", insert "and the necessity of unusual governmental controls and safeguards is equally evident. The destructive power of atomic explosives is so great that their misuse with criminal intent or by accident, might suddenly destroy cities, even the seat of government, hence for the protection of the nation and the safeguarding of the public welfare, it is imperative that strict control by the government of such super explosives be established and continued."

Page 2, line 2. After "life" insert "Such strict governmental control as is necessary for safety should be exercised in such a way as not to deprive the people of the advantages of this new source of energy, and to this end a policy is needed."

Page 2, line 22. Before "fissionable materials" insert "certain".

Section 4. Title, page 4, line 16, change title to "Production of Materials Capable of Releasing Energy Through Nuclear Fission by Cumulative Chain Reaction".

Section 4 (a), page 5, line 18. Change "fissionable materials" to "materials capable of fission by chain reaction".

Page 5, lines 19, 20, and 25. Insert "such" before "fissionable".

Page 6. Insert "such" before "fissionable" each time the word is used.

Page 7, line 5. Change "fissionable materials" to "materials fissionable by chain reaction".

Section 5 (a), page 7, line 13. Change title to "Materials Fissionable by Chain Reaction".

Page 7, line 14. Change "fissionable materials" to "materials fissionable by chain reaction".

Page 7, line 18. After "material" insert "sustained by a chain reaction".
Page 7, line 19. Title. Change "fissionable materials" to "materials fissionable by chain reaction".
Page 7, line 21. Insert "such" before "fissionable".
Page 7, line 24. Change "fissionable material" to "material fissionable by chain reaction".
Page 8, lines 1, 3, and 6. Insert "such" before "fissionable".
Page 8, line 8. Change "fissionable materials" to "materials fissionable by chain reaction".
Page 8, lines 10 and 15. Insert "such" before "fissionable".
Page 8, line 18. Insert "amounts of such" before "fissionable".
Page 9, line 2. Omit "beryllium" and put the "or" before "thorium".
Page 9, line 4. Change "fissionable materials" to "materials fissionable by chain reaction".
Page 10, lines 3, 4, and 5. In the two places where "fissionable material" occurs, change to "material fissionable by chain reaction".
Page 10, line 23, change "fissionable" to "materials fissionable by chain reaction".
Page 11, line 1. Change "fissionable" to "materials fissionable by chain reaction".
Page 11, line 21. Change "fissionable" to "materials fissionable by chain reaction".
Page 13, line 6. Change "fissionable materials" to "materials fissionable by chain reaction".
Page 13, lines 9 and 14. Insert "such" before "fissionable".
Page 14, lines 19 and 20. Change "fissionable materials" to "materials fissionable by chain reaction".
Page 15, line 11. Change "fissionable materials" to "materials fissionable by chain reaction". P. 15.
Page 15, lines 13 and 17. Insert "such" before "fissionable".
Page 18, line 21. Change "fissionable material" to "material fissionable by chain reaction".
Page 19, line 14. Change "fissionable materials" to "materials fissionable by chain reaction".
Page 21, line 25. Change "fissionable" to "materials fissionable by chain reaction".
Page 25, line 1. Change "fissionable material" to "material fissionable by chain reaction".
(The foregoing suggested revisions would introduce 112 new words in section 1 (a). The proposed changes relating to the word "fissionable" throughout the bill would add about 100 words.)

The CHAIRMAN. Are there any questions from the committee?

Thank you very much, Doctor.

That ends the testimony for today.

Since we have 20 minutes of the session, I would like to have a short executive session on procedure.

(Whereupon, at 11:40 a. m., the committee retired into executive session.)

ATOMIC ENERGY ACT OF 1946

WEDNESDAY, JANUARY 30, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to adjournment, at 10 a. m., in room 312, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Johnson, Austin, Millikin, and Hickenlooper.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will come to order.

Mr. Davis, I believe you are the director of Science Service. Will you further qualify yourself, Mr. Davis, and tell us about your organization?

STATEMENT OF WATSON DAVIS, DIRECTOR, SCIENCE SERVICE

Mr. DAVIS. Science Service is a rather unique institution in that it serves as a newspaper syndicate and a liaison organization between the scientists of the Nation and the public in various ways.

One of our principal functions is to report day by day the scientific news and interpret it to the public. We have been doing that for 25 years, so that while I am no expert in the sense that I have never split an atom knowingly, at least I have been an observer of many things that have happened.

The CHAIRMAN. Do you suppose unconsciously you may have split an atom?

Mr. DAVIS. I think maybe yes.

Senator AUSTIN. You might have split an infinitive anyway?

Mr. DAVIS. Yes, Senator; probably quite frequently.

The CHAIRMAN. You say this organization has been in existence for 25 years?

Mr. DAVIS. Yes, sir.

The CHAIRMAN. Do you run a subscribed service organization?

Mr. DAVIS. No; it is a nonprofit business operation; that is, the newspapers pay a fee, but it isn't a stock concern in any sense of the word.

Our trustees are operated by the National Academy of Sciences, and the National Research Council, the American Association for the Advancement of Science, the newspaper profession as such, and the E. W. Scripps estate, from which the original endowment came.

The CHAIRMAN. Will you mind submitting later, of necessary, a list of the directors of your organization?

Mr. DAVIS. I will be glad to do so.

The CHAIRMAN. You say it is a nonprofit organization?

Mr. DAVIS. Yes; and its job has been, during those 25 years, to get science before the public in an accurate and understandable way.

Senator AUSTIN. Who was the founder of your institution?

Mr. DAVIS. Two men really conceived the idea: E. W. Scripps, a newspaperman, and William E. Ritter, the California biologist. They said, "If we want to have an intelligent world and intelligent people, we have got to tell them about science."

They persuaded the scientists of the country to undertake this work.

The CHAIRMAN. And each scientist sends in his findings to you. Is that it?

Mr. DAVIS. We have an expert staff of about 10 people that correspond with professors in universities. They process this material and make it understandable.

The CHAIRMAN. You popularize it?

Mr. DAVIS. Yes; and we operate as a newspaper press association in the field of science exclusively.

We have a lot of other functions, too, Senator, that are extremely interesting, such as science clubs. There are 9,200 science clubs in the high schools of the Nation which we service or aid in the study of science.

That is a very important function in connection with this whole understanding by the people of such problems as the atomic bomb.

The CHAIRMAN. Have you a prepared statement?

Mr. DAVIS. I have; yes.

The CHAIRMAN. You may proceed.

Mr. DAVIS. The problems, Senator, before the committee, as I understand it, are essentially to provide for the reconversion of atomic energy, and to set up means of protecting the welfare of the world and nations from the misuse of atomic energy.

The committee has heard in previous sessions much about the dangers of the atomic bomb and the necessity for international control. It seems to me that there should be discussion and consideration not alone about the fears of the destruction of the world by the atomic bomb, but the essential usefulness to mankind of atomic research and its many byproducts.

One of the primary objectives should be to get atomic science reconverted. Valuable months are being lost. We must go on making the world a better place to live in regardless of our fears that, if we cannot control atomic energy, it will wipe out what the war left of civilization. There is so much yet to be done.

As a result of atomic bomb research, new elements have been discovered—elements 95 and 96—which are yet unnamed. We have new tools for research, such as carbon-14, that can be used as the means of discovering perhaps the secrets of the cause of cancer, the way the green leaf utilizes sunlight, what happens in some of the most fundamental processes in the body, and hundreds of other things.

There is no reason why researches in these fields should be delayed, and I imagine they are not in large measure, and there is no reason why they should be kept secret.

There is no military necessity that they be concealed, as far as I can see. There is a human necessity that they be done as fast as possible and with full announcement of results.

It seems to me that the control and research upon atomic energy are essentially scientific and administrative jobs.

I don't think it is too much to ask that no military men or ex-military men be on the Commission, if a commission is established.

It is quite possible that an administrator, with an advisory committee might be a more satisfactory arrangement.

One of the most useful of the provisions in the bills before the committee is the accent in the McMahon bill on the continuance of research and the dissemination of information.

Senator AUSTIN. Would you mind a question before you leave the subject of the composition of a commission, if we have one?

Are you familiar with the major divisions of the enterprise up to date?

Mr. DAVIS. Yes; roughly so, Senator.

Senator AUSTIN. That is, here you have already had a successful commission of industry, government, and science. Have you any comment to make on the theory of having your permanent organization combine all three elements of our economy?

Mr. DAVIS. I think that the control of atomic energy and research in the field is essentially an administrative problem, and can be approached in the same way that other administrative problems are.

I think it is relatively unimportant as to whether you have a good commission or a good administrator. Both of them work, in our scheme of things. For instance, in science we have had a prime example of administration by an administrator under the OSRD, Dr. Bush, and that was set up in connection with the Government bureaus. We also have a very splendid example of a successful operation of a commission, the National Advisory Commission for Aeronautics. I don't think it is a very critical point.

Senator AUSTIN. I don't think I made my question clear.

Assuming that we are to have a commission, my question was, what guides should we follow in the composition of the Commission? Should we follow the experience which we have had thus far in the development of atomic energy, and combine in this Commission representatives of Government, of industry, and of science?

Mr. DAVIS. Well, it would be hopeless to put upon the Commission all of the experience and knowledge that we have that will be needed to be called upon. The Commission in a sense is a policy-making body, a determining body, rather than an information-gathering body. I think that, from the standpoint of world confidence, there might be a great deal to be gained by actually taking the control of the Commission out of the hands of the military and putting it into scientific hands, rather than doing the reverse.

That does not mean, Senator, that it wouldn't be necessary to have all of the advice that we can possibly get from the military, from the industrialists, and from all others who have been concerned with this magnificent achievement. But I think that can be had through the Commission itself, through service aid to the Commission by advisers.

Senator AUSTIN. That is all.

The CHAIRMAN. You know, Senator, I thought about that when we were writing the bill, and there are so many classifications in our society that demand representation—small business, big business, farmers, scientists, and the labor organizations—that it is quite a problem. That is why I left it open.

Mr. DAVIS. I believe Mussolini tried that method of government.

The CHAIRMAN. I don't know about that.

Mr. DAVIS. I know very little about it.

Mutual confidence between nations is necessary to prevent a disastrous atomic bomb race. The mere control of fissionable material by various nations is not enough. We can control atomic energy within our own borders, just as we control the manufacture and use of narcotics, explosives, firearms, or poisons.

We can do this because there are laws made by the Congress whose enforcement is desired by the vast majority of the population, and there is a sufficient degree of confidence among our people to make such control and regulation effective.

Other nations can, and undoubtedly will, control atomic energy within their own borders. There must be developed the same degree of world control that is considered normal and accepted on a national scale.

The world, in effect, must become one nation, with government X just as confident that government Y will not engage in atomic-bomb warfare as Florida is that Maine won't bombard it with subzero weather.

In connection with the establishment of world confidence, there should be an information offensive. We should distribute to the peoples of the world, the facts and information that will convince them of the stake that all of them have in the unification of the world, that will convince them that we will not use the atomic bomb which we possess in an offensive defense.

Understanding that must be arrived at to allow the free interchange of information is not alone on the political or diplomatic level, but goes deeper than that.

In convincing the rest of the world that we are no menace to them, and in convincing the American people that we can cooperate with peoples of other nations, it will be valuable to have as many people of the different nations as possible visit with other peoples.

This will be particularly effective in the case of scientists and professional men. Resumption of the interchange of visits of scientists and of the free interchange of scientific information should be encouraged, and this would be aided and not hindered by the McMahon bill in atomic physics and related fields.

Secrecy in scientific research is a short-sighted and dangerous policy, not only for those from whom the information is kept, but for those who try to keep the secrets.

The progress of science and of our civilization based on it is dependent upon an advance made here, and another there, synthesized by time and ingenuity into some real step forward.

A rigorous and complete scientific intelligence service is a necessary part of our atomic energy program. Scientific intelligence is needed in all fields of science and technology, but it is supremely urgent in the explosive realm of the atomic nucleus. We must never forget that atomic fission was discovered in a nation that was on the verge of starting a world war. Only the world's traditional freedom of scientific publication caused that key experimental result to be announced to the world.

The CHAIRMAN. Which one do you refer to?

Mr. DAVIS. The Hahn-Strasser paper, which appeared in January 1939.

The CHAIRMAN. In January '39—that was in Nazi Germany, wasn't it?

Mr. DAVIS. Yes.

Senator MILLIKIN. Mr. Chairman.

The CHAIRMAN. Senator Millikin.

Senator MILLIKIN. It is an ironical thing that that announcement which came to our attention precipitated us into making the bomb on the theory that we were in a race with Germany.

After the war was over we found that there was no race at all, that Germany had not gotten out of the laboratories, had no bomb-making plans, and hadn't even commenced.

I don't urge that as a reason for not having exchange of information; I urge it as a very bloody and ironical fact connected with this whole subject.

Mr. DAVIS. Well, Senator, perhaps we didn't realize how inefficient in that particular respect the Germans were. They weren't inefficient in some other ways. I don't know the facts in connection with their development of atomic research.

Senator MILLIKIN. Let me make it very clear that if I had had to make the decision as to whether we should go ahead and perfect a bomb under the information that we had, I should have made the same decision that was made by those who did decide to go ahead. I merely mention it as an interesting irony in the picture.

Once you reflect on that, you can see that had the whole subject been left to peacetime impetus, we might never have had a bomb, or certainly a bomb might have been long delayed and the commercial uses of the thing, involving as they do such a large capital expenditure, might not have been considered practical in peacetime, and that, too, might have been long deferred.

Mr. DAVIS. What might have happened, Senator, is that if the Germans had taken their time they would have launched a sudden offensive. If they had delayed the start of the war, they could have perfected the bomb, and we certainly would not be here talking about it today.

Senator MILLIKIN. But the irony of it is that they did not, and we did.

The CHAIRMAN. Mr. Davis, you opened up an interesting thought, at least to me.

In Germany, as it was run under the Nazis, were there any restrictions on the dissemination of scientific information?

Mr. DAVIS. I am not very competent to answer that question, because I don't know what has been discovered by our scientific intelligence people since the close of the war. But there was a surprising amount of publication of scientific results under the Nazis.

Now, I don't know whether or not that was due to the lack of realization of their leaders that this material was really useful; it probably was. I don't think that is ever mentioned.

The CHAIRMAN. All right, sir.

Mr. DAVIS. If an equivalent experimental finding, such as the one I referred to, were discovered in one of our Manhattan project laboratories, it probably would not be announced now.

One of the needs in the present situation, is to assume that such new knowledge, wherever disclosed, will be announced, and that it will be available to us. Our scientific intelligence service must be

inclusive, alert, highly qualified, and closely integrated with the research.

Our traditional industrial research set-up, based on a system highly competitive in some aspects, may cause the loss to the Nation of some important advances that might be synthesized out of dovetailing facts discovered in different laboratories. Unnecessary secrecy in the name of military security sets up such a situation artificially with equally dangerous results.

There is, of course, a certain amount of material, such as the actual making of the bomb itself, and things that are equivalent in the atomic field to the design of artillery that would, of necessity, under present conditions and until the world control is achieved, have to be kept secret.

But the fundamental material of research, results of research, can in a large measure be freely announced, and we can get better results in that way, even if you wish to look at it for the moment from a purely selfish standpoint.

The CHAIRMAN. Why?

Mr. DAVIS. Because research is a rather peculiar process in that you have got to have the play of a large number of minds. I suppose research is something like the development of legislation. While certain facts are discovered by one person, the way in which those facts hinge upon the whole situation is determined by the interplay of a large number of minds, and the bringing in of new facts. I think that is a rather common human experience.

The connection of control and use of atomic energy with the proposed establishment of the National Science Foundation is intimate and important. There should be a high degree of coordination. Action upon S. 1720 is important, because it would implement a broad scope of research which may bring results as fruitful and as far-reaching as nuclear research.

I think it is important to realize that unless nations and those who lead them are peace-loving in the real or psychiatric sense, there will be no peace.

Peoples, like persons, suffer from manias, and one of these is national sovereignty.

Germany and the Nazis were a Napoleon among nations.

We should be alert, as we were not before both world wars, to the danger signs which are so plain and unmistakable. I am going to be bold enough to suggest that the committee should call in psychologists and psychiatrists to give them information on these aspects.

The key factor in the peaceful solution of utilization of atomic energy is human behavior, which is based on understanding and the capacity to understand.

Then, of course, atomic energy is only one aspect of development to the world scene. We are faced with other possibilities for warfare, essentially untried, which, while not so sudden or extensive, are of the same order of the atomic bomb. I refer to biological warfare.

Senator MILLIKIN. Under principles of human behavior, has any aggressor nation ever put aside its aggressive designs because some other nation practiced self-immolation as far as war power is concerned?

Mr. DAVIS. That is a good question for a historian, Senator.

Senator MILLIKIN. It also rests on human behavior?

Mr. DAVIS. Yes. A mad nation may be only restrained in the same way that we restrain an individual who is mentally ill; that is, by putting him where he cannot do harm. There certainly are, and have been at times, nations in that state.

Before the war which has just ended, there was a time when if the people had had a real understanding of the nature of the national psychosis that Germany was suffering from, for instance, something could have been done about it.

Senator MILLIKIN. Would you say that it would be a national psychosis if we were to strike down our own war power so long as there is any indication that powerful nations have aggressive designs?

Mr. DAVIS. That again is something you ought to ask a psychiatrist. I am getting into terminologies in which I am not expert, but I should think that would certainly be bad judgment. Whether you would make it a matter of mental illness on the part of the nation, if you want to use that analogy—and of course it is an analogy.

Senator MILLIKIN. It could rest upon emotionalism that would approach psychosis. Not applying those labels to what I shall now mention, I will remind you that we had a disarmament conference in this country, and we immediately started to disarm and did disarm to the extent we agreed to. Nations that were aggressors at heart, did not keep their agreements, and did not in fact disarm.

In fact, when we disarm, we of course give that much encouragement to a nation that has aggressive designs.

We and other nations signed the Kellogg Pact in which we thought we could talk war out of existence; but instead of serving that purpose, it simply furnished a mask behind which aggressor nations could perfect their war-making ability, while the rest of the world thought it had talked war out of existence.

Mr. DAVIS. That is exactly why we need the best scientific advice in all fields, to be able to tell us when a dangerous situation exists, either in our own country or in other nations.

Now, it is obviously much more difficult to see our own difficulties within our own country in most cases than it will be to see the difficulties in other nations.

The record of psychological warfare, what Captain Zacharias did in connection with Japan, is so impressive, that it seems to me that all that body of knowledge is of the same order of importance as the physical and chemical research that has done so much to give us these magnificent answers in atomic and nuclear research.

The CHAIRMAN. If I gather what Senator Millikin is saying, he certainly would not walk down the street of a town where every man in the town had a gun, and throw his away. You wouldn't do that either, would you?

Mr. DAVIS. No, sir. I think the Senator had a very good point. If you are going into a civilization that carries six-shooters, you have to carry one, obviously. Otherwise, you won't exist very long.

The CHAIRMAN. It might be better if we had a seven-shooter in a town like that.

Mr. DAVIS. Yes; or an atomic bomb.

The CHAIRMAN. If you have got one and somebody else has got one in that town, both of you had better put it away, don't you think.

Mr. DAVIS. That is what the committee is trying to work out.

Senator MILLIKIN. I notice in the Orphan Annie strip they now have the atom bomb down to hand size, and you can tote your private demolition.

But, as a scientific man, you wouldn't know about the Little Orphan Annie strip.

Mr. DAVIS. Oh, yes; I follow all of those important matters, too, sir.

The CHAIRMAN. Are there any further questions of Mr. Davis?

If not, Mr. Davis, thank you very much indeed.

Mr. DAVIS. Thank you, Senator.

The CHAIRMAN. The next witness is Mr. Raymond Swing, a radio commentator.

Will you come forward, Mr. Swing.

I know that Mr. Swing is interested in this subject, as all of us know who have heard his broadcasts, and I am pleased that he wants to contribute to the record.

STATEMENT OF RAYMOND SWING, RADIO NEWS COMMENTATOR

Mr. SWING. Mr. Chairman, I have a prepared statement. May I read it?

Senator AUSTIN. I want to say before Mr. Swing starts that I have to leave here for an appointment at 11:15, so I want him to understand I am not disgusted with his statement if I step out in the middle of it.

The CHAIRMAN. When he is broadcasting and you do that, he doesn't know anything about it.

All right, Mr. Swing.

Mr. SWING. I have two chief points I consider it a privilege to register before this committee as worth its attention in framing legislation for atomic control. One is the tremendous importance of our atomic establishment in our international relations. One is the need of keeping atomic energy clearly under the control of the American people to whom it belongs.

The release of atomic energy was the result of a military enterprise, undertaken in the time of war for purposes of war. It was carried out through the exercise of war powers. And it has no legal status at this moment other than as a part of the war arsenal of the United States armed forces. Being possessed exclusively by the United States, in that no other nation has atomic bombs, and being the most powerful weapon ever devised by men, the atomic bomb is a powerful factor in American relations.

If I may repeat before this committee what I have said on another occasion, at this moment the United States is manufacturing atomic bombs. It will be manufacturing them next week, next month, or unless the President puts a stop to it, or the War Department does so, or Congress does so; it will be manufacturing them next year, and the year after, and as far ahead as can be seen. And by making them, the United States increases its arsenal of weapons, just as though its built battleships or tanks or rockets. For the present there is only one use for the great installations erected with the money of the American people to make the atomic bombs. It is a military use. It is under the strictest and exclusive control of the Army. And though we are at peace, the \$2,000,000,000 investment

is still functioning, and part of the installations are working on a 24-hour basis.

At the recent Moscow Conference, agreement with the Soviet Union was reached to set up an atomic commission under the UNO Security Council. It will study the possibilities of the international control of atomic energy, and when it perfects a system of inspection and control, the secret of the bomb can be shared. This is a good start toward good relations, but only a start. It does not preclude development of the bomb by other countries. It does not halt the armament race in which we now have a handsome head start. It is an affirmation of the intent to provide international control, and to outlaw the use of the bomb as an instrument of warfare. But the intent is hedged about by the necessity of perfecting a system of inspection and control.

While we wait for the atomic commission to set up and go to work, the United States continues to manufacture the bomb. And if that is not something that worries people in this country, we can be sure that it worries people in other countries. Of all the specific elements of relative power, our exclusive possession of, and continued manufacture of, the atomic bomb are an outstanding cause of worry to people abroad. We already are the strongest military nation, thanks to our Navy, our existing aircraft and our capacity to make them, and our all-around industrial productivity. We do not need to make the atomic bomb to pull our weight in the world. But we continue to manufacture it. And we manufacture it under secrecy which must be called sinister, because of the stress put on secrecy in this country, and the effect that it has on our international relations.

We should make it clear that we are not exploiting the bomb as a military factor. We should stop making it, and we should take the control of the installations for making it out of the hands of the military just as quickly as possible. That is the least we can do in furthering the work of the atomic commission of the UNO. It would demonstrate to other nations that we are back on a democratic basis. Then we should not have to be feared as a nation needs to be if its destiny is too much committed to the operations of army men working in secret.

We have made a beginning in reducing fear by accepting the policy of putting atomic energy ultimately under UNO control. But we can reduce the fear still more by taking the great atomic project altogether out of the hands of the Army. That is something for which no delay is advisable. It will do good right away. It is good that needs to be done. And it is good that will be of as great value to us domestically as it is in our foreign relations. For the Army is making only atomic bombs, and as long as the Army runs the atomic project, that is all that it will make. There can be little development of atomic energy for nonmilitary purposes as a result of the two-billion-dollar investment of the American people. That needs a new and permanent change in control.

Since the elimination of fear from international relations is essential if there is to be peace, it rarely can fall to the Congress of the United States and its organs, to do so important a task as now waits to be done in removing the atomic bomb from military control. So long as we manufacture atomic bombs, and we alone know how to do it, we issue a challenge to the rest of the world to learn the secret and to draw even with us in strength, and we serve notice that we deserve to be

feared. Whatever the justification of the use of atomic bomb in World War II, there can be no justification for continuing its manufacture now that the war is over, unless anyone is so foolish as to believe that we can serve the peace by inspiring dread and fear of the American people among our neighbors. To leave the control of the atomic bomb with the Army is to permit the continuous flow of fear from this country to all corners of the earth. But, similarly, to take the control of the atomic bomb and the atomic projects from the Army is to remove this cause of fear and to serve the interests of the American people in peace. Here is an unprecedented opportunity to aid peace quickly, and aid it basically; to do it without giving up any national asset or interest.

For the time being, the military importance of atomic energy must be considered as outweighing its use in a civilian economy, but in drafting legislation for the control of atomic energy a longer view may wisely be taken. For the moment there is no known way for the use of small quantities of fissionable materials, and there is no unlimited source of such materials, which would make it possible for the release of atomic energy to revolutionize the world's social economy. But there is far more likelihood that atomic energy will become generally available in small quantities than there was likelihood, say, 10 years ago, that atomic energy would become available in the large quantities used in the atomic bomb. And it is not undue exercise of the imagination to be drafting legislation with that possibility in mind. If atomic energy is conceivably to become the source of power of the future which will do a great part of the work of the world, we face what is perhaps one of the greatest tests of wise government that ever has confronted a democracy: For the control of the power resources of the Nation and the world means the political control of the Nation and perhaps of the world. And the possibilities at stake require the recognition of certain principles in setting up the future development of atomic energy. One is to safeguard, as one would safeguard the Nation itself, the people's sole ownership of atomic energy and control over it. It must not be delegated to individuals in any way by which individuals might use it to exploit the people or diminish their control over their destiny. Hence, there must be no private manufacture of fissionable material. And if there is private use of fissionable material it must be under the closest public safeguards.

Whatever the Congress decides as to the size and constitution of the board which controls atomic energy on behalf of the people, it must devise the most immediate responsibility of that board to the people. For that reason it appears desirable that the members of that board should serve, as proposed in the McMahon bill, at the pleasure of the President. That would make it possible for public criticism of the policy of the board to become both immediately and continually effective. To set up a board whose members serve long terms with removal only for cause, might be to establish a board not responsive to the public.

It is important, too, that the members of this board should devote their entire time to the service of controlling atomic energy, and that they be adequately remunerated so as to give the public the choice of the ablest men available.

A special word should be said on the importance of this board being composed exclusively of civilians, and the executive administrators

of the atomic project being civilians. I have stressed the importance of this provision from the standpoint of international policy. It is of equal importance that the future of atomic energy should not be committed to officers of the armed forces. If, as appears possible, atomic energy is ever to become the source of the future power of much of our economy, and control over it is to be tantamount to control over the welfare of the Nation, it is axiomatic that this power should not be vested in peacetime in a soldier. It is a characteristic of our democracy that the things that affect the people should be kept as closely as possible under the control of the people. In atomic energy we have what may become the richest heritage of our Nation. It must be kept for the people, in their capacity as citizens of a peaceful world.

In drafting the legislation for the control of atomic energy, the Congress may be tempted to slur over the necessity of maintaining social control in the interest of serving private enterprise and a competitive economy. Now, it may be that atomic energy is not going to be revolutionary in our economy. If it is not, if it is to be only a limited source of heat, and is not to grow to be much more than another public-utility industry, the danger from careless legislation would not be great. But it may be that atomic energy is going to revolutionize our economy. And in that event it becomes of the very greatest importance who is to decide what is done with atomic energy, who makes it, who uses it, and on what terms it is used. It must not be licensed in a way to give power over the people to industrialists or to corporations. We might find ourselves falling into a Fascist pattern, with industry holding the country in the palm of its hand.

Senator MILLIKIN. May I interrupt?

Mr. SWING. Yes, sir.

Senator MILLIKIN. May it not also follow a Fascist pattern if the total control of the energy were left in the Government?

Mr. SWING. It would follow a totalitarian pattern, sir, but by a Fascist pattern, I understand a pattern in which industry as such exercises the political control. I go on to say, on the other hand, we should avoid a totalitarian solution, with the control of atomic energy before the reach of the people.

There is really little reason to be thinking about competitive society and private enterprise in drawing up the basic legislation about atomic energy. What must be safeguarded is the treasure of the people. Atomic energy was released by their government, spending their money, serving their interests. It was not done by or through private enterprise, though the contribution toward success by men in private enterprise has been very great. But this was not a creative contribution which private enterprise alone could have fostered. It was a social enterprise. It had no other origin and could not well have begun otherwise. Atomic energy does not in any sense belong to anybody but to the people of the United States. It does not belong to private enterprise. And to let it slip carelessly into private control without due thought as to adequate popular controls may be to lose the public treasure, and indeed to give power over the American people to private individuals in defiance of the democratic principles of our national life. We already know that atomic energy has surpassed imagination in creating a destructive force. That being quite as possible, the legislation should be drafted with special dedication

to the public interest and to the public interest being supreme over private interest.

The CHAIRMAN. Senator Hickenlooper.

Senator HICKENLOOPER. I would like to discuss a part of this philosophy with Mr. Swing, if I may.

You have emphasized, and I think very properly, the proprietary interest of the people as a whole as differentiated from private interests in this atomic field.

I don't know whether I fully understand whether you mean that we as a people, as a whole and as a nation, should keep the whole field of atomic energy to ourselves as against the rest of the world, or whether we should give it to the rest of the world.

Mr. SWING. I wasn't discussing that phase of it. I assume that the rest of the world also will develop atomic energy, and in each of the other countries they will face then the same problem as to what is made of this power.

Senator HICKENLOOPER. I raised that question because of your special emphasis throughout this discussion that it is the property of the people and should be kept completely in the control of the people. You were not discussing the international phases of the matter?

Mr. SWING. In this regard, no.

Senator HICKENLOOPER. Would you care to express yourself as to your opinion on how far we should go at this moment in disclosing to the rest of the world the secrets, if any, that we have about the whole atomic energy field?

Mr. SWING. I have very strong views on this subject.

Senator HICKENLOOPER. We are glad to have them.

Mr. SWING. I think that we should make it very clear to the world that we do not intend to dominate it through our possession of the atomic bomb. I think we must make it very clear to the world that we wish to serve world peace.

Personally, I believe that the only safeguard of world peace will be a form of international relationship which goes beyond the present United Nations Organization, and I would advocate that we make a start on world government in a limited field with the control over all aggressive weapons vested in a central authority, a statement which is, I believe, not so far removed from one you yourself have made.

Senator HICKENLOOPER. But that situation would presuppose reliable agreements regarding the use of atomic energy, would it not?

Mr. SWING. Not until I had the organization that I believed in would I share any knowledge of atomic energy.

I would come back to your original question. I would not, at this time, for example, share the secret of the atomic bomb, but I would make it known to the world that we, as a nation, are ready to share that secret once we have reliable instrumentalities.

Senator HICKENLOOPER. Thank you. That answers the question. I think perhaps we all agree that we have a tremendous obligation in this country to do everything we can to remove the causes of fear in the rest of the world, but by the same token I wonder if you don't agree that there is an equal responsibility on other nations of the world to take equal steps to remove on their part the cause of any fear that we might have of their intentions? Isn't the obligation mutual in the world rather than resting solely upon us? I don't say that you said it rests solely upon us.

Mr. SWING. Oh, I so thoroughly agree with you that it has to be mutual. I don't see, however, that we are capable of making a contribution to the world order in changing the policies of our neighbors. Our contribution consists in making our own policy.

Senator HICKENLOOPER. We must make our position clear.

Mr. SWING. We must make those policies which do not create fear. We may well say to others, "Your policies are creating fear and we hope you will change them," but it doesn't lie within our power to make or change the policies of other countries.

Senator HICKENLOOPER. Now, Mr. Swing, assuming that we have done everything we can, leaving that aside, haven't we, as a matter of fact, made many overtures all pointing to our desire for peace and cooperation in the world?

Hasn't our Government and our people, in many ways, made overtures that should perhaps not give full guarantees in the minds of other nations but that we think ought to be indicators of our desire for peace?

Mr. SWING. I think in many ways we have. I think in many ways we have conducted a foreign policy that is in the right direction, but I think there are serious lapses in it.

I think the continued manufacture of the atomic bomb is one of those lapses.

Senator HICKENLOOPER. Well, on the broad statement I might tend to agree with you. I think there are some very practical reasons up to this moment why it would be most difficult indeed to discontinue manufacture of the atomic bomb until we know where we are going. I think we must pass a bill here and get this thing under control before we are warranted in letting the fires go out.

Mr. SWING. Well, I am interested in the bill, as you are.

The CHAIRMAN. Senator Austin.

Senator AUSTIN. I am very interested in your statement and am glad I could stay through to hear it all.

May I be excused now?

The CHAIRMAN. Certainly. I thought, Senator Austin, you might like to know that we are going to have Mr. Henry Wallace and Dr. Von Neumann, of Princeton University, who is doing the mathematics, as I understand it, on these Navy tests, to testify here tomorrow.

Senator HICKENLOOPER. May I say, Mr. Chairman, that I am especially happy that Mr. Swing is here, and I hope that others, in greater numbers, in the same situation he is, may be heard. We have had a number of special pleaders before this committee, either scientists, engineers, or construction or military people. I think generally speaking they are special pleaders for a particular line that they have been following in the active pursuit of this thing.

I think we can well listen to a great many people that have neither made the bomb nor fired it, and who have approached this from a public attitude as members of the public with opportunity to evaluate the situation.

I think from that standpoint, your testimony is very welcome indeed.

Senator MILLIKIN. Mr. Swing, don't you think that any of your key decisions—I am speaking of the decisions of the committee—must turn on this judgment as to whether the world as of today is postured for peace?

Mr. SWING. That is, in formulating your legislation, you must act on the assumption that we are going to have peace?

Senator MILLIKIN. One way or the other.

Mr. SWING. Certainly, if you don't assume that we are going to have peace, you must be assuming that we are going to have war. What you decide would then certainly not deter us from having that war.

Senator MILLIKIN. That situation would affect, in a most vital way, what we recommend to the Senate.

That brings me to this question: Would you say that we should turn this subject over to an exclusively civilian commission if we should determine also that the world as of today, is not postured for peace?

Mr. SWING. The hypothesis is one that I shrink from accepting. I cannot believe that as civilized persons we should get out at this stage, a few months after the making of peace, to prepare for another war.

Senator MILLIKIN. But it is a hypothesis that is a very unpleasant one, and I don't believe that the committee can shrink from what it may consider to be the realities of the situation. I am not suggesting for a moment that the committee thinks that the world is not postured for peace. If the committee should conclude as of this time—not 6 months from now or a year from now, and I believe you agree that we will have some interesting tests come up within the 6 months or a year—that the world is not postured for peace, won't the committee be warranted in turning the control of this energy over to an exclusively civilian commission?

Mr. SWING. Well, I should answer that question, sir, by saying that, if you are going to start on that assumption, the question of civilian control or military control is a very minor one really, and that it would be your duty as a committee to go to the American people to say that we have to take the imminence of a war into consideration and that we require therefore an entire reconstruction of our economic life so that we can survive an atomic war.

Senator MILLIKIN. Well, it might very well be that if you had reached the conclusion—I don't think the committee needs to reach the conclusion that war is imminent, for I think there are many gradations in the whole field of speculation—that the world is not postured for peace, and if therefore the committee should conclude that this subject should not be turned over at this time to a commission composed exclusively of civilians, of course the committee would have to make its position known to the public, and it would be highly desirable and essential to have public support. So let me ask you, Mr. Swing, do you think that the world of today is postured for peace?

Mr. SWING. It is a very confused world, sir, in which there are many factors working for peace and many factors working for war. It is a world in which we still have not lost the power of our own initiative and the command over our future and our destiny.

What we do now, and particularly in countries like the United States where the people have power, in creating the international structure of the next few years will go very far to determine whether peace or war will eventuate.

Senator MILLIKIN. I quite agree that there are many factors working for peace, but can we say that there are not also many factors working for war?

Mr. SWING. Oh, indeed, there are. There always have been, and assumedly there always will be.

I would say, sir, that the appointments of giving the control over atomic energy in this country in any way to the military would be creating a factor for war.

Senator MILLIKIN. Let me probe that just a little bit with you. I asked the witness who preceded you whether there was any example in history whereby a strong nation that gave up its strength as a gesture for peace thereby caused a nation with aggressive designs to put down its arms; the witness did not cite any examples, and I wonder if you can cite any examples.

Mr. SWING. I say this not irreverently. I think it is a trick question. Senator MILLIKIN. I did not so intend it.

Mr. SWING. I don't think you mean it to be, but I think it is a trick question, because obviously we have lived in a world of war and we have failed in every way to get disarmaments. Consequently, no one can cite such a case.

But one could also say, putting it another way, is there any case in history where the accumulation of power of defense has of itself provided a long interim of peace in the world?

Senator MILLIKIN. I do not like to make the argument. I shrink from that argument just as you shrank from an argument a while ago. Up to date, I believe you will agree that the only thing that has kept peace in the world is an overwhelming power residing some place, residing in Rome for a long period of time, residing in Great Britain for a long period of time. Nothing else has produced peace, measuring the period of peace.

Mr. SWING. Well, the problem of producing peace in the time of Rome obviously was somewhat different from the problem as it is today, and I would say quite frankly that I do not believe that peace is to be maintained by the single national power of any great nation any longer in the world today, that you will have to have power, but the maintenance of peace is going to rest with the use of that power on behalf of law.

Senator MILLIKIN. Let me now take my questions out of the category that you feared I was putting them in, by making it more practical.

The desire for peace after the last war, I believe, was just as vocal as it is now. You recall that. We called it a war to end wars, and to show our sincerity in the thing, you recall, we had a naval disarmament conference. We genuinely disarmed a very substantial part of our Navy but that gesture did not do any real good. It was an encouragement, in effect, to nations with aggressive designs to go ahead and build themselves and to redraft the former balance that we had had and that we probably would have used better than they did.

Then, we came along to the Kellogg Pact, and we solemnly outlawed war. We thought, as I expressed it to the previous witness, that we could talk war out of existence and could wish war out of existence. But that was just meat for a hungry lion. That again was a facade behind which aggressive nations could continue to pile up the instruments of aggression.

Now, at what point can we safely again make the gesture?

May I suggest that we cannot make it until we have reasonably satisfied ourselves that the world is postured for peace, and may I

suggest further that perhaps this is not the moment to reach that decision because from listening to you, Mr. Swing, I know that there are many war-breeding factors in the world today.

Mr. SWING. Well, I come back to my statement that it is very much up to us what kind of a world we bring into existence. To come to your analysis, I agree with your analysis that the Disarmament Conference in Washington did not produce the results wanted, but we got World War II after World War I not because the Disarmament Conference failed but because we did not make proper use of our collective power. We had collective power and we didn't make use of it.

We could have stopped the aggression in Manchuria in 1932—I mean the human race could have. The Ethiopian attack could have been stopped, and we didn't care to make proper use of our collective power.

We have got to have power to have peace, sir, and I agree with you that the question about peace is whether we are going to have just power nationally in the hands of one nation which will then dominate other nations or whether we are to have the power of the world used in the support of law. That is the basis of our domestic peace, and it must be the basis of our international peace.

Senator MILLIKIN. After the last war we didn't enter, but the major aggressive nations entered, the League of Nations, but they did not mean what they said. One of the pledges was a pledge for disarmament. They didn't mean what they said. They said it, but they did not mean it.

So, Germany quite rightly said, "One of the conditions on which we put down our arms was that there would be disarmament, and you are not disarming; so, unless you do disarm, we are going to rearm."

And what happened? One of the signatories of the League of Nations said, "Why, your position is sound. We will allow you to build up your navy to half of our strength."

Now, that was not the League of Nations. That was a notion of a participant in the League of Nations, the most powerful participant of the League of Nations, of how to disarm. So, they didn't mean what they said.

Must not we have some attention to realism and analyze by the actions of the principal powers whether they meant what they said when they went into the United Nations Organization?

Mr. SWING. Well, sir, I think the United Nations Organization is inadequate in its present form in the same way the League of Nations was inadequate in its form. It must be strengthened and perfected if we are to have peace. I agree with you there.

Senator MILLIKIN. Mr. Swing, so far as the profession is concerned, the professions of intent in the United Nations Charter are just as noble as those of the League of Nations and just as noble as any of the gestures—the verbal gestures—toward peace that have been made in the world's history, unless it is the Congress of Vienna Charter, which tied itself to God.

The CHAIRMAN. Any answer?

Mr. SWING. I think not.

The CHAIRMAN. Senator Johnson, have you anything you would like to ask Mr. Swing?

Senator JOHNSON. No; I think not. I got here a little too late to hear his prepared statement, but I am reading it, trying to catch up on it. I find several statements that he has made in which I am in complete and even enthusiastic agreement. You go ahead and perhaps I will run into something.

The CHAIRMAN. Mr. Swing, I, of course, as you know from the bill, agree with you so thoroughly in your underlying philosophy that it is contrary to our American system of government to permit the military to have control of a power that could be so tremendous as to dominate our society.

At the same time, until some international concord on the matter is reached, I presume that some attention has to be paid to military applications of the matter. Even if the actual production of the bomb itself should cease, and I agree that it should cease, experimentation and research, I presume, should go on until some agreement is had.

I want to call your attention to the fact that there is nothing in this bill—and if you have found anything, I would like to have it pointed out to me—which prevents or in any way retards that program.

In the provision of section 11 on page 21 of the bill it is provided, and I have pointed it out before, that there is a Division of Military Application. I would assume that the head of that division would be a military man. That is, not on the Commission itself, but the head of one of the divisions underneath it.

You would not have any objection to the head of that division being a military man, of course?

Mr. SWING. Certainly not. It would have to be.

The CHAIRMAN. I just wanted to get that straightened out so that neither you nor I would be held to be divorcing this matter at this particular time, if this bill is enacted into law, divorcing the military from any participation in the necessary place for them to participate.

As I take it, it is your view, as it is mine, that on the policy end of the matter—that is, where the policy is determined—you would prefer that the soldiers, the generals, and the admirals, did not serve?

Mr. SWING. Not only do I prefer that they shouldn't; I call attention to the fact that it is contrary to our system of government that they should, and the very special considerations make it important that our system of government prevail in the future control of atomic energy.

The CHAIRMAN. I believe you had some criticism to make of the bill that was introduced early in the fall because it did make possible an entire military control of this whole subject of atomic energy.

Mr. SWING. I did. It would make that possible, and in the first place it also make possible that industrialists should be put in charge of the bill without what I considered adequate public control over the manufacture and use of atomic energy.

The CHAIRMAN. I want to thank you, Mr. Swing, on behalf of the committee.

I do want to give Senator Johnson an opportunity to direct any questions that he wishes.

Senator JOHNSON. I don't find very much in the testimony with which I am in disagreement, except the common approach that we have had here in this committee to the lack of apparent desire of wit-

nesses who seem to want the people to fully control it to express the possibility that Congress might have a more direct hand in the control of both atomic energy and the military uses of atomic energy.

I will admit, as the chairman knows, I have been struggling with this problem for some time, trying to work out some way or other where the Congress, the direct representatives of the people, might have a firmer control during this interim period. I think we all must realize that whatever legislation we are providing for the present is an interim legislation. We cannot very well take the long viewpoint until we know what the international situation is to be and the extent to which atomic energy is going to be used as a military weapon.

When those two problems are settled for ourselves and for the world, then we can enact permanent legislation. Until such a time, I have been in hopes that a way would be found to keep the control of atomic energy in the hands of Congress. I will admit I haven't been able to work it out yet, but I am still trying. I think it is a worthwhile thing to try to do. I don't know that I will ever be able to work it out, because there are some very great difficulties, tradition being one and perhaps the Constitution being another.

Just the same, it does seem to me that here we have a new power, a new factor that completely revolutionizes all military tactics and perhaps completely revolutionizes all industrial processes. Until we know which way the cat is going to jump, it does seem to me that Congress should retain a firm hold. I have been disappointed that the witnesses appearing here have not stressed that point more. They are not at all satisfied to let the military agencies of the Government continue their controls, but they are perfectly willing for the President to set up a commission, and that, it seems to me, might very well be the same old military control under another approach.

That is one of the reasons why I am trying so hard to find a way out where we can keep this in complete control of the people, because after all this is the people's discovery. It is like air, and it is like fire, and we do not want anyone to get a monopoly on it.

I do appreciate your statement with respect to that, and I do appreciate your very caustic criticism of the so-called May-Johnson bill in that respect. I think that that bill was weak in its control of the peacetime uses and application.

Perhaps Senator Millikin has exhausted this phase of the subject, but it does seem to me that many of you folks who are kind enough to give us advice and help in the control of this very difficult substance are brushing aside too lightly the military aspects.

One of the questions that has been given to many of the witnesses—and unless you covered that with Senator Millikin, one that I should like to ask you—is, do you think that there ever will be another world war in which the atomic bomb is not to be used?

Mr. SWING. I cannot make a prophecy, sir, but I can say that it is up to us, to the members of this generation, to decide that. We still are free agents in making our future.

Senator JOHNSON. Well, I don't know whether we are free agents or not, when we get into war. If we get into a world war, men become very desperate and our Nation becomes very desperate.

Perhaps the atomic bomb will be outlawed to begin the war, but as soon as we get into the war our scientists will gather, our industrialists will gather, and we will produce the most efficient weapon

that has ever been devised by man up to the present time and attempt to use it.

Mr. SWING. If we have national wars, sir, I am convinced that the atomic bomb will be used. If we have the use of police power on behalf of a central world authority, I do not believe that the atomic bomb will be used.

Senator JOHNSON. Well, that brings up one other point that I have been interested in, and that is it has seemed to me that the atomic bomb might be used as a power for peace, that it might be the policeman's billy club. You seem to dismiss that idea completely.

Mr. SWING. If I may be permitted to be so rude, I think it is a dreadful idea.

Senator JOHNSON. It is a dreadful idea. War is a dreadful idea.

Mr. SWING. I don't think it is a policeman's billy club; it is the arming of a traffic officer with tear gas and machine guns to do something, giving him weapons that are not necessary for the performance of his duties. If we have a central authority in which there is adequate power to maintain order in the world, you don't need to conduct war against civilians on a mass basis.

Senator JOHNSON. No; of course; but if war should break out you are not going to be able to quell it with firecrackers or bows and arrows. You have got to use something potent, and the most potent thing that you can use is going to be the most effective thing.

Of course, it is a dreadful thing to contemplate using atomic bombs for any purpose, but modern wars are indescribably bad.

Mr. SWING. I think we agree, Senator, that if we are going to have wars, they are going to be atomic wars, whether or not you and I like it. I am merely taking the stand that if we should have a central world authority which has adequate power to perform police functions, the atomic bomb does not belong in the arsenal of that organization, and I can foresee a future.

You asked me at the outset could I foresee the possibility of the atomic bomb not being used in future conflicts. That possibility I see. If we have national wars, I believe that the atomic bomb will be used.

Senator JOHNSON. That is all, Mr. Chairman.

The CHAIRMAN. You know, Mr. Swing, I forget who it was that said that men find zest in living forever on the brink of disaster.

Now, it strikes me that the idea that men will keep peaceful, because one country, namely ours, has the power to blow them to smithereens, is without foundation; men just won't react that way. They never have in all the course of history, no matter what the overhanging danger. Do you agree with that?

Mr. SWING. I do not believe we, the American people, can frighten the world into being good.

The CHAIRMAN. We might frighten them into making more bombs themselves?

Mr. SWING. Yes, sir.

The CHAIRMAN. If there are no other questions, thank you very much, indeed, Mr. Swing. It is nice to see you.

We will meet again at 10 o'clock tomorrow morning in this room.

(Whereupon, at 11:40 a. m., a recess was taken until 10 a. m., Thursday, January 31, 1946.)

ATOMIC ENERGY ACT OF 1946

THURSDAY, JANUARY 31, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to adjournment, at 10 a. m., in room 312, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Austin, Millikin, Hickenlooper, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will come to order.

Dr. von Neumann, your name was suggested to the committee by Senator Ball, and he said that he would like to have your testimony in the record. You were therefore invited to appear. You may go right ahead.

STATEMENT OF DR. JOHN VON NEUMANN, PROFESSOR, INSTITUTE FOR ADVANCED STUDY, PRINCETON, N. J.

Dr. VON NEUMANN. Senator McMahon, gentlemen, I suppose that you will wish to know my qualifications. I am a mathematician and mathematical physicist. I am a member of the Institute for Advanced Study in Princeton, N. J. I have been connected with government work on military matters for nearly 10 years: as a consultant of the Ballistic Research Laboratory of the Army Ordnance Department since 1937; as a member of its Scientific Advisory Committee since 1940. I have been a member of various divisions of the National Defense Research Committee since 1941 and a consultant of the Navy Bureau of Ordnance since 1942. I have been connected with the Manhattan District, beginning in 1943 as a consultant of the Los Alamos Laboratory, and I spent a considerable part of 1943-45 there.

I greatly appreciate the distinction of appearing before you. I realize the exceptional importance of the subject which you are considering. The developments in the field of subatomic energy release which took place in the last decades, and which culminated in 1939-45, and even more those developments which are likely to follow in the decade ahead of us, have implications in the international field which are widely appreciated. Since they have been discussed by many others, and since I do not possess any special qualifications with respect to them, I do not think that it would be useful for me to dwell upon them. I would like to emphasize instead another aspect, which is

205

also of very great importance, and which is of a domestic nature—although our present efforts to handle it may well set an example of universal significance.

It is for the first time that science has produced results which require an immediate intervention of the Government. Of course, science has produced many results before which were of great importance to society, directly or indirectly. And there have been before scientific processes which required some minor policing measures by the Government. But it is for the first time that a vast area of research, right in the central part of the physical sciences, impinges on a broad front on the vital zone of society, and clearly requires rapid and general regulation. It is now that physical science has become "important" in that painful and dangerous sense which causes the State to intervene.

Considering the vastness of the ultimate objectives of science, it has been clear for a long time to thoughtful persons that this moment must come sooner or later. We now know that it has come.

The legislation on atomic energy represents the first attempt in history to regulate science in this sense. In past wartime and peacetime emergencies, governments did influence various phases of the social effort, including science, in order to promote military or economic ends. However, such efforts were always limited in time and in scope, and directed toward some ulterior, independent purpose. It is only now that science as such and for its own sake has to be regulated, that science has outgrown the age of independence from society.

Many scientists regret this, and I am one of them. Atomic physics in particular is now losing a good deal of its detachment and abstractness, and will probably never again be the same as before 1939. I repeat: From the scientists' special viewpoint, this evolution is probably not a desirable one—but nobody can change it, and we must admit that it is taking place. There is clearly a need for the Government's intervention here and now.

The problem is, then, how to effect this regulation without falling into either extreme. Regulation is needed, because nuclear physics, in combination with irresponsible or clumsy politics, could at this moment inflict terrible wounds on society. And with some more development, which could be effected—and probably will be effected by some country or other—in a moderate number of years, and the main outlines of which are perfectly discernible now to the expert, the same combination of physics and politics could render the surface of the earth uninhabitable. Regulation is therefore needed, both in politics and in science, but I will only talk of the latter, for the reasons given earlier. Regulation of science, on the other hand, must not go too far. Indeed, it should not go very far in any event, even though the risks are very great. This is the subject about which I would like to speak.

In regulating science, it is important to realize that the legislator is touching at a matter of extreme delicacy. Strict regulation, and even the threat or the anticipation of strict regulation, is perfectly able to stop the progress of science in the country where it occurs.

The CHAIRMAN. What was the last sentence?

Dr. VON NEUMANN. Strict regulation, and even just the threat or anticipation of strict regulation, can perfectly well stop the progress of science even before a very strict regulation has actually taken place.

The CHAIRMAN. Do you say why?

Dr. VON NEUMANN. No; I am asserting that.

The CHAIRMAN. Do you explain why you assert that?

Dr. VON NEUMANN. I am going to.

The CHAIRMAN. I beg your pardon.

Dr. VON NEUMANN. The fact that strict or unreasonable regulations may deter mature scientists from pursuing their vocation, or from pursuing it with that degree of enthusiasm which is necessary for success, is in itself important; but even it is not the most important fact involved. What is more fundamental is this: The numbers of new talent, which accede in any one year to a given field of science are subject to considerable oscillations. They decrease or increase in response to the emergence of new interests, to changing social valuations, to new developments in the field in question, or in neighboring scientific or applied fields. It is perfectly possible that more interest in one field which is near the one involved will scare talented men away from that field. These things have happened many times before. I am convinced that seemingly small mistakes in "regulating" science may affect the "reproduction" of scientists quite catastrophically.

Erroneous legislation on this subject may harm science in this country seriously, even irretrievably. Very great intellectual values may be lost in this manner. Apart from this, damage to fundamental science would, at the present stage of industrial development, soon cause comparable damage in the technological and then in the economic sphere. Finally, since other countries may not be similarly affected, it would seriously impair the national defense.

For all these reasons I am completely convinced that it is necessary to maintain and to protect the natural *modus operandi* of fundamental research, and specifically two of its cornerstones: freedom in selecting the subject of fundamental research and freedom in publishing its results. Any attempt to subdivide nuclear physics is futile from the start. For instance, to make work on the fission of heavy nuclei—uranium, thorium, or similar substances—a preserve for special rules or for secrecy would be vain since the reactions of light nuclei might later assume an even greater importance. To police all work on transmutations of all atomic species would still prove inadequate. There may be still other sources of primary energy which exist in processes yet to be discovered. Science, and particularly physics, forms an indivisible unity; no attempt to compartmentalize it will produce anything but disappointment, and to put all of atomic physics, or all of physics, on the restricted or classified list would clearly kill the physical sciences.

The CHAIRMAN. Doctor, do you mind being interrupted?

Dr. VON NEUMANN. No; please do.

The CHAIRMAN. You just said that to compartmentalize it would be to destroy it?

Dr. VON NEUMANN. No; not quite. What I meant was that any attempt to regulate one part of physics—because we have recognized that that particular part can produce dangerous consequences—and to leave another part free is an uncertain affair, because I don't think anybody can judge at this moment which part of physics will be relevant in this field next year or 5 years from now.

On the other hand, to regulate everything to do with physics would certainly kill physics.

Senator HART. You gave as an example the fact that the lighter nuclei may be just as important a source in the future as the heavy nuclei are now.

Dr. VON NEUMANN. I think Dr. Bethe has talked about this subject before the committee. I can merely repeat things which he has probably said.

We have reason to think that the main source of energy in the stars are light nuclei. We think, or we suspect what conditions exist in the stars, but we don't think we can reproduce them on earth. But there may be other ways to produce such conversions.

The CHAIRMAN. We have had it pointed out to us that it would be well to change the definition which we have in the bill from "fissionable" to "reactive fissile" material—capable of producing a chain reaction to take care of the gaseous synthesized products at the top of the periodic table.

Go ahead, Doctor.

Dr. VON NEUMANN. There is the further point that of course we know still very little about nuclear physics, which is still in a state of rapid evolution and great changes. I am sure you know that the war, if anything, has held up the development of nuclear physics and the chances are that the development will be more rapid in the next 5 years than in the last 5 years.

It is entirely unpredictable what sources of energy will appear in the next 5 or 10 years. It is probably true that fission is only characteristic of the level on which we are doing business, for the order of magnitude of the energy involved, but I don't think there is any serious reason to believe that this is the only access to the very great subatomic energies. I think that it is premature to believe that we hold the key to those energies, that this is the only way in which one can get at them.

To put it another way: To make it quite universal and make rigid legislation not only for fission but all forms of physics would certainly be completely disastrous for physics. It is difficult to foresee how work in physics could go on then.

It is plausible that potential nuclear explosives and actual or potential radio poisons should be subject to safety and health regulations, and to the Government's police power. This has always been so for dangerous substances produced by the chemical industry, and it should be done even more strictly for those originating in the coming nuclear industry. This can certainly be done, and both the Ball bill and the McMahon bill indicate certain guiding principles. I assume the details will have to be worked out in the administrative practice, as usual. There must, however, be no restrictions in principle on research in any part of science, and none in nuclear physics in particular, and absolutely no secrecy or possibility of classification of the results of fundamental research.

To come to a different part of the subject, I think that any special legislation against military developments in the atomic field would not be justified at this moment, and would be exceedingly harmful. It is generally admitted that we should have an Army and a Navy and that they should be maintained at a high level of efficiency. It would therefore be inconsistent to forbid them to work on the development

of a class of weapons that is likely to be of the greatest importance—the atomic weapons—and to monopolize all atomic weapon development in the Commission. Our wartime experience produced a system for military technological development which worked. It had its shortcomings, but it worked at least as well as that of any belligerent, as far as we know, and definitely better than that of some important belligerents. It was based on the coexistence of a large civilian organization, the OSRD, and of the Army and Navy research and development establishments, plus adequate liaison. Just one of these two components, plus any amount of advisers or observers from the other party, would have been inadequate.

Besides, I do not believe that a nation would be wise in attempting to forbid to itself to do certain things. I think that the military uses of atomic energy should be in the province of each—the Commission, the Army and the Navy; that each of these three should have a right to do work in that field.

Senator MILLIKIN. Mr. Chairman, may we have that statement repeated, please?

The CHAIRMAN. Will you repeat that last statement?

Dr. von NEUMANN. I think that the military uses of atomic energy should lie in the province of each one of the three, the Commission, the Army, and the Navy.

Regarding the makeup of the Commission, I feel somewhat inexperienced and uncertain, but I feel satisfied as to these points:

If there is to be an Administrator, he should be elected by and serve at the pleasure of the Commission.

Since the Commission is to be policy making, the Cabinet should be directly represented on it, and its character should be civilian.

I do not think that the time is now mature to connect this piece of domestic legislation with anticipated and desirable future developments in international politics. This should be done by additional legislation, I think, when and as the circumstances justify it.

The idea that the Commission should make periodic reports to the President and to Congress seems to me to be a sound one. I would like to add that I would expect that the most important modifications in what is to be done will probably emerge in such reports; in other words, that it is very difficult to predict now in every detail how the Commission should regulate.

I doubt, however, that quarterly reports are necessary or desirable. It seems unlikely that every 3 months will produce enough progress to make such reporting really valuable, and besides a certain distance from the events to be reported is essential. There is ample experience to support this. I think that yearly reporting would be more nearly right.

The CHAIRMAN. They might report that they didn't make any progress, and that might be important to know, too.

Dr. von NEUMANN. Yes. This may be a solution. On the other hand, it is a little awkward. Experience shows that if you have to report, you report something; and it may actually be an opinion of a matter which is not yet finished, and an opinion which may change very soon. However, I admit that they could report zero.

The CHAIRMAN. Do you have some questions, Senator Austin?

Senator AUSTIN. I gather that the central point of your paper is that there should be absolute control of the science of production and

development of the theory of production of atomic energy, with absolute control of it in the Government.

Dr. von NEUMANN. I think there should be absolute control of the materials which are produced and of the industrial aspects of it.

Senator AUSTIN. That is not my question. My question is, Do you advocate the control of the theory, of the science, the physics and the chemistry?

Dr. von NEUMANN. No; I think it would be exceedingly difficult. I have tried to point out that it may not even be effective, even if one attempted it. One may direct it at the wrong object. One may think that one part of physics is particularly important from this point of view and one may discover afterward that one has focused one's attention to the wrong part.

Furthermore, I think that a very strict control of these subjects would probably ruin them anyway.

Senator AUSTIN. Then, on that basis your thought is that control be limited to that possession of the properties of science, the products of science, that will assure constructive rather than destructive use of those products. That is your idea?

Dr. von NEUMANN. Yes.

Senator AUSTIN. Thank you.

Senator HART. Doctor, am I correct in assuming that you believe that there should be practically as free interchange of fundamental developments in science with scientists abroad as there is within our own country?

Dr. von NEUMANN. I think so, because it is impossible to maintain the normal functioning of research as soon as you limit free interchange of information. In the first place, it will be very difficult to limit interchange of information with scientists abroad, without limiting it also between scientists in this country. I mean it is impossible to keep a secret if it is known to thousands of people.

The CHAIRMAN. Why do you say thousands, Doctor?

Dr. von NEUMANN. Well, the number of members of the Physical Science Society are 2,000, or something of that order.

Dr. CONDON. Five thousand five hundred.

Mr. NEWMAN. I might point out, Senator, that Dr. Condon is president of the society.

Senator HART. I would like your opinion on one point. I assume you are remarkably closely in touch, and have been so all your life, with the upper-level scientists abroad. Do you think we have more to gain from that free interchange, or would you think that the scientists of Europe, for instance, would have more to gain in such free interchange?

Dr. von NEUMANN. It is exceedingly difficult to tell. It is exceedingly difficult to guess ahead. However, I think the gains and losses are probably of the same order of magnitude. There is always enough of a risk that we stand to lose more in one particular case than to gain. It would be very difficult to take the responsibility for that.

Furthermore, what I would like to emphasize is this: First of all, if we try to prevent interchange of information with foreign scientists, we must also regulate it at home, and by doing this we would handicap ourselves enormously. In other words, the whole machinery which is necessary to avoid information from getting out of the country would certainly lead to compartmentalization at home, and the loss

of scientific morale at home; so, we would lose considerably beyond the loss just due to our not getting information from abroad.

There is also this: Interchange with foreign scientists is important because you get the viewpoint of people who have a somewhat different approach to your problems. You see, in one country there is always a certain inbreeding of ideas.

It is true in both directions, if two countries are interchanging information, that each gets a fresher viewpoint.

Senator HART. Thank you.

Senator MILLIKIN. Do you believe that it is practical, Doctor, to have a free interchange of scientific information between the nations of the earth without at the same time having a free interchange of all kinds of information?

Dr. VON NEUMANN. Certainly.

Senator MILLIKIN. You think it is practical or isn't practical?

Dr. VON NEUMANN. I think it is practical.

Senator MILLIKIN. This subject of nuclear energy has become one of great significance. That is why you are here, Doctor. That is why this committee is sitting.

Can you consider the subject in a vacuum of its own, or must it be related to political developments over the face of the earth?

Dr. VON NEUMANN. I think it must be related to political developments.

Senator MILLIKIN. If it must be related to political developments of the earth, we must have, then, a free exchange of political information, must we not?

Dr. VON NEUMANN. I think that is a separate matter.

Senator MILLIKIN. Well, you have made it, by your previous answers, an intermingled matter.

Dr. VON NEUMANN. Yes; but what do you exactly mean, Senator, by the interchange of political information?

Senator MILLIKIN. Well, we now have a situation where the world is ignorant of political and other developments in many spots on this earth where there is neither exchange of scientific information nor of any other kind of information, including information which might have political significance under any definition of political that you wish to make.

How, then, can they be separated?

Dr. VON NEUMANN. I think the free interchange of scientific information is necessary. The country which attempts to prevent it would probably lose more because it has to change its internal scientific machinery.

Senator MILLIKIN. I agree with you that far, but since we have agreed that this part of science has now entered the realm of politics, how can we say consistently that we will have free exchange of information on a strictly one-sided part of the subject and not have free exchange of information on the other side, which is necessary to evaluate the whole thing?

Dr. VON NEUMANN. I have no doubt it would be very desirable to have free interchange of information politically. I have no feeling, I have no intuition as to how difficult or how easy it is to achieve it.

In science, I would say the state of affairs has always existed in the past, so we know what it looks like, and we know that this is the normal way of working.

Senator MILLIKIN. But you do not have free exchange of scientific information so far as nuclear energy is concerned?

Dr. VON NEUMANN. We had it up to 1939.

Senator MILLIKIN. But at the present time you do not have it, and science itself has assumed a weapon significance. It now becomes important for us to establish policies either to exchange or not to exchange.

But for the political end of the thing, to reach proper evaluations, since the political end and the scientific end are intermingled, must we not have free exchange of political information at the same time that we have free exchange of information on nuclear energy?

Dr. VON NEUMANN. What I mean is this: I think it would be very desirable to have a free exchange of political information. However, if for any reason we cannot have it immediately or cannot have it, I don't think we would gain anything by preventing the exchange of scientific information. Of course, an important thing would be lacking, but we would harm ourselves by preventing an exchange of scientific information.

Senator MILLIKIN. I agree with you that there are perhaps greater difficulties in securing a free exchange of political information than there would be of scientific information, but is the scientific information that would be exchanged under your theory entirely dependable and can it be properly evaluated prior to the time that you have a general free exchange of information?

Dr. von NEUMANN. From the point of the fate of the world, it is, of course, not complete and cannot be completely evaluated. From the point of view of carrying on scientific work, it is complete and suffices.

Senator MILLIKIN. But you agree that the two bear on each other and therefore have an intermingled significance?

Dr. VON NEUMANN. Oh, yes.

Senator MILLIKIN. Thank you.

The CHAIRMAN. Doctor, you are a citizen of the United States?

Dr. VON NEUMANN. Yes.

The CHAIRMAN. And where were you born?

Dr. VON NEUMANN. In Budapest, Hungary.

The CHAIRMAN. When did you come to this country?

Dr. VON NEUMANN. 1930.

The CHAIRMAN. Had you engaged in your professional career in Hungary?

Dr. VON NEUMANN. Very little in Hungary, but a good deal in Germany and in Switzerland.

The CHAIRMAN. Are you now associated at Princeton, did you say?

Dr. VON NEUMANN. Yes; I was professor of mathematical physics at Princeton University from 1930 to 1933, and I have been a professor of mathematics at the Institute for Advanced Study, which is also in Princeton but which is a pure research institution, since 1933.

The CHAIRMAN. You are associated with Dr. Einstein there?

Dr. VON NEUMANN. Yes; that is the organization.

The CHAIRMAN. Are you consulting with the Navy about the tests that are proposed?

Dr. VON NEUMANN. Yes.

The CHAIRMAN. You are in consultation with the Navy on that?

Dr. VON NEUMANN. Yes.

The CHAIRMAN. I think that we will want to talk to some more, Doctor, maybe, in executive session.

Senator MILLIKIN. I should like to ask one more question, Mr. Chairman.

Do you believe that as of today, Doctor, the prospects for world peace are dependable?

Dr. VON NEUMANN. I don't know. I think the situation has its dangers.

Senator MILLIKIN. Do you think that prior to the time that we can get a better analysis of those dangers we are warranted in turning this subject over to an exclusively civilian Commission?

Dr. VON NEUMANN. Essentially; yes. I think the Cabinet should have control of the Commission; I think it would be a good thing if the Cabinet were directly represented on it.

On the other hand, it is not clear to me how long it will take before we can be reassured about the general situation of the world, whereas I think it is very urgent to have a regulation of work in nuclear physics, or those phases of it which have to be regulated. It is unquestionable that work in nuclear physics is already suffering from the absence of a final settlement.

Senator MILLIKIN. I gathered from your testimony that you do not take out of the picture a place for a military voice in the matter.

Dr. VON NEUMANN. My personal feeling is that the best thing would be to have the policy-making authority of the Commission in civilian hands, if the Army and Navy were left free to develop their own weapons.

Senator MILLIKIN. At the present time, the significance of the thing is military, isn't it?

Dr. VON NEUMANN. Of nuclear energy?

Senator MILLIKIN. You have no practical use for the energy outside of the military sphere as of this moment.

Dr. VON NEUMANN. We have been very negligent in developing the peaceful uses of atomic energy, manifestly because all of this happened under the danger of wartime.

Senator MILLIKIN. As of this moment, we have no other use for nuclear energy.

Dr. VON NEUMANN. I wouldn't go that far.

Senator MILLIKIN. Sir?

Dr. VON NEUMANN. I wouldn't go quite so far. We are producing right now radioactive substances which are exceedingly important from the medical point of view. I am not a medical man, and I don't know to how much of a medical use they are being put at this moment, but I am sure they are being used.

Senator MILLIKIN. But it is a byproduct of the military use that is being made of the energy at this time.

Dr. VON NEUMANN. It is a byproduct of running a fission pile; a fission pile is a plant to produce plutonium.

Senator MILLIKIN. And the production of plutonium at the present time is for a military purpose.

Dr. VON NEUMANN. True, but we have a byproduct which is very important from other points of view. It will certainly take a few years before nuclear energy can be used for peaceful purposes because it takes a certain amount of development. It will also take a few years before we have trained the minimum number of nuclear engineers.

Senator MILLIKIN. It would take an enormous amount of capital also, would it not?

Dr. VON NEUMANN. Considerable, but I would not say enormous. It is probably less than what is absorbed now by several major industries. It would be an important industry, but I assume that at this moment it is smaller than the automobile industry.

Senator MILLIKIN. By the same token that the automobile industry did not spring up overnight, the use of nuclear energy for peacetime purposes would not spring up overnight.

Dr. VON NEUMANN. No; I think it will take a few years, except for the radioactive aspects.

Senator MILLIKIN. And the initial plants for peaceful purposes would take very substantial money. This is not something you can do in a barn or in a bathtub.

Dr. VON NEUMANN. No; but may I mention two things: One is that a plant for military purposes and a plant for peaceful purposes—and I mean in particular plants to make plutonium—do not differ very seriously. If you want to make plutonium, you make it in the same way. A plant for peaceful purposes would have to have provisions for utilizing the energy which you produce, whereas in the military plants it was wasted; here an additional development is needed.

Senator MILLIKIN. We spent two and one-half billion to reach our present plants, and let us assume that three-fourths of it is wasted. We had to move fast.

Dr. VON NEUMANN. Surely.

Senator MILLIKIN. We had to experiment with three or four methods all at the same time, so obviously there was a waste in there. But assume that three-fourths of it was wasted, you are still talking in terms of \$500,000,000. Who is ready to put up \$500,000,000 to produce nuclear energy for peacetime purposes?

Dr. VON NEUMANN. Well, it depends on how the Government is regulating this, but I would expect that the Government would be doing well in spending sums of this magnitude on this subject. If it is to be developed by private enterprise, I would expect that there would be private entrepreneurs who would be willing to do it. This is clearly a thing which has the importance, and is likely to assume the dimensions, of the entire chemical industry, so I think it ought to be looked at on that basis.

Half a billion is an enormous capital investment, but it is not an unusual sum if you talk in terms of major industries.

Senator MILLIKIN. Well, it is a very unusual sum, I suggest, for a peacetime outlay in a field which is already covered to some extent. I am speaking of the power field. I am even speaking of the medical field.

In the case of the power that we have and can develop by normal means and in a slow evolutionary way, if you wish to call it slow—I am speaking of “politically” now—I believe that, first, there are very few nations that could put up \$500,000,000, unless we loaned it to them, and, second, I doubt whether politically you could get an appropriation for \$500,000,000 for nuclear energy from our own Government—I mean the peacetime use of nuclear energy.

Dr. VON NEUMANN. I think its importance in the power field is not that it produces cheaper power than the power you produce now.

I think coal is actually very cheap, and it is very difficult to compete with coal just as a source of calories. But in this manner you could produce power under conditions under which you cannot use coal. I am sure that you are familiar with the many possibilities of this type. It is more in the qualitative than in the quantitative sense that this is a very important new development in power. We certainly have enough tons of coal available.

Senator MILLIKIN. I do not disparage the future possibilities of the subject. I am trying to arrive at some timing factors in my own mind and what to do in the meantime.

Dr. VON NEUMANN. May I add that it is by no means clear that the processes of producing nuclear energy will always be as large and expensive as they are today. It is a general experience with industrial processes that when they are first developed they are vastly more expensive than they become later, and you don't even get a correct idea of the order of magnitude involved if you judge only these early stages.

Senator MILLIKIN. I agree completely with that. I imagine it cost \$25,000 to build the first model T Ford.

Senator AUSTIN. Isn't it true, Doctor, that we have to recognize that private capital is just as much restricted by Government monopoly as the ideas of science are restricted by it when put upon the production and absolute control by Government?

Dr. VON NEUMANN. Well, to be honest, I am less familiar with the workings of private enterprise than with the workings of scientific research; so I would not dare to make an absolute statement there.

Senator MILLIKIN. Let us do a little day-dreaming for a moment and assume a condition in the world where we have dependable assurance of continued peace so that we can put our whole mind on the development of this energy for peacetime purposes.

The suggestion that it be completely controlled by the Government under that hypothesis forms a totalitarian pattern, does it not?

Dr. VON NEUMANN. Surely. All I mean is that it should be controlled to this extent: The Government would probably interfere in some way, for instance, if somebody accumulated 10 tons of TNT in his cellar, or accumulated great amounts of poison. The fission substances are similarly dangerous and ought to be similarly under ordinary police supervision.

Senator MILLIKIN. They are dangerous from the standpoint even of protecting the people in peacetime?

Dr. VON NEUMANN. Yes, they can cause accidents.

Senator MILLIKIN. Radiation and stupid experiments with the subject might result in explosions and other forms of danger.

Dr. VON NEUMANN. Yes; but this is just the ordinary police power of the Government.

Senator MILLIKIN. That is as far as you intend to go, that the Government should exercise a sensible police power over the subject?

Dr. VON NEUMANN. Yes.

Senator MILLIKIN. Would that preclude ownership?

Dr. VON NEUMANN. That is a little difficult to tell, and I am sure it is much more for the lawyer to decide.

Whether you want to abolish ownership in a field, or maintain ownership but regulate it in such a manner that the owner is not free to use his property, is a question of legal and political convenience rather than of scientific technique.

Senator MILLIKIN. There is a serious question there, isn't there, on the assumptions that we have been dealing with?

Dr. VON NEUMANN. It is not technical in the physics sense.

Senator HICKENLOOPER. Perhaps you touched on this before I came in, Doctor, in your statement, but I would like to have your opinion as of a scientist on the matter of the tenure of any commission or board set up to control atomic energy; in other words, whether a commission should hold office at the pleasure of the President, which would be in a broad sense a political appointment subject to the changes of political ideas, or whether a board of the capability that we would hope any such board would have should be given the assurance of a definite tenure of office for a substantial period of time within which it could have some security to work out its programs.

Now, have you commented on that before?

Dr. VON NEUMANN. Just to a limited extent. I have expressed the view, sir, that I thought the Cabinet should be directly represented and the other members should be technical. I think the Cabinet members on the Commission would represent automatically the political element which can express the changes in national politics, and I think the other members should be definitely technical and should have a reasonable tenure.

I don't say they should be life positions, but something tenuous, like 5 years, 6 years, or possibly have the members come in in alternate years.

Senator HICKENLOOPER. In other words, it is your opinion that this board should at least have a security in some of its elements, anyway, of a definite tenure of office rather than to be entirely subjected, that is, all of the members entirely subjected, to holding office at the pleasure of the President or any other group that might be set up?

Dr. VON NEUMANN. I think it should be about 50 percent technical, and the technical members should have tenure.

The CHAIRMAN. Doctor, bearing upon the ability of our country to keep secrets in the scientific field and upon, as you phrase it, very bad effects of such secrecy, when Edison invented the incandescent bulb—the first bulb that he invented—do you think that there would have been the progress in the development of electricity to the point we have it today, if at that time it had been closed up and sealed off so that no one could have known about Edison's performance?

Dr. VON NEUMANN. I think that if Edison's laboratory alone had been secretive, then it probably would have only meant a loss of time. I am convinced that a few years later somebody else would have invented it.

If, however, the entire scientific community had been secretive, that I think would have been very bad for science. It just would have produced a bad group morale.

American scientists were very good about keeping secrets during the war. In fact, in the field of nuclear physics they regulated themselves to keep things secret, before the Government intervened, but everybody clearly understood that this was a transient wartime measure, and everybody did it in the absolute expectation that it would end with the war. I think it would have a bad effect on the general morale of scientists if it should turn out that the system is to be continued.

The CHAIRMAN. Why did you say the war had held back nuclear physics?

Dr. VON NEUMANN. Oh, because if you had wanted to get the maximum progress in nuclear physics—in other words, if you had wanted to produce a state of affairs 20 years from now which is as advanced as possible, then one would certainly never have concentrated as much of the best scientific talent into the few fields which had immediate military applications as one did.

Evidently much more scientific talent was concentrated on radar and short wave than the subject justified from a general scientific point of view, although these fields are important industrially and absolutely vital militarily.

Regarding the developments in nuclear physics, in atomic fission, I think one has to say that the development of the chain reaction and of the fission bomb were enormous engineering tours de force. They were enormous engineering projects carried out by scientists, because the necessary engineers did not exist.

But if nuclear physics had been left to itself, it would not have concentrated on the upper end of the periodic system to this extent. Many scientists who were working in this field claimed that they were stranded at the wrong end of the periodic system.

It is probable that lighter elements will give more important results in the coming years, so we should concentrate on them.

The CHAIRMAN. Senator Millikin pointed out that \$500,000,000 was a tremendous sum of money, with which we can all agree, and it is hard to comprehend \$500,000,000.

He also voiced to you the opinion that it would be rather difficult to get any such appropriation through the Congress for the peacetime development of this Pandora's box that we have opened.

Do you know how many days of war that represents—the cost of the war?

Dr. VON NEUMANN. Very few; \$500,000,000, I think, is about 1 day and a half.

The CHAIRMAN. I thought it was a little more than that, maybe two and a half, but you may be entirely right.

Dr. VON NEUMANN. I figure one hundred billion a year.

The CHAIRMAN. It is rather typical of us in thinking in that way.

Dr. VON NEUMANN. May I add that it was really more expensive than money expresses, because, of course, it diverted not only money—which was a relatively free commodity, but it also diverted strategic raw materials and scientific talent and a few other things which are exceedingly limited and which are much harder to produce in extraordinary quantities in wartime than any other economic services. It was actually probably even more expensive than the half billion or the two billion number indicates.

The CHAIRMAN. Do you think, Doctor, we would be warranted as a Government in going ahead and spending money on a large scale for peacetime experimentation and research in this field?

Dr. VON NEUMANN. Well, I think there are only two alternatives—either turn it over completely to private enterprise or to support it by the Government. I would think the subject is so new and the implications or the possibilities so enormous, that it would justify continued Government interest or support. It is a thing which is really on a larger scale than industrial developments usually are, and the effects on our lives are much more direct.

Senator MILLIKIN. The very challenging thought of the chairman that if we were to spend but a fraction of our money for peacetime

benefits that we do for wartime benefits has always been a challenge for a more constructive use of our peacetime money and energy, while I think there is a distinction that should be observed.

When you pour your wealth for war, you are pouring it out to save your very existence; whereas, at the present time at least, so far as the development of nuclear energy is concerned, we might in the long term have cheaper power, but we have power at the present time. Our existence is not threatened by the lack of power.

I have no doubt that the medical therapeutic value of this energy will be enormous, but as of the present moment I believe that most of those uses are covered by other available things which are most costly perhaps, or hard to get; but our very existence is not threatened.

There is another consideration. Once you go through a war and spend all of your sums—we have spent more in this war, twice over, than the value of the accumulated tangible property gathered together since the landing of the Pilgrim Fathers.

Now, there must be a stop sometime; otherwise, you get into the theory of the embezzler who says, "Well, I have stolen \$100,000; they can only put me in jail once, so I might as well steal another \$10,000," or the theory of the drunkard who goes for the hair of the dog that bit him.

Dr. VON NEUMANN. I see the point, but I would like to add this: Of course, in wartime this thing was done and had to be done very wastefully. As you have pointed out, three avenues were tried simultaneously. It was very plausible after a short time that at least one of them would work, only it wasn't clear how long it would take.

Furthermore, it was forced at a maximum tempo, and if you try to do a thing twice as fast as industry would do it normally, then you probably pay for it much more than twice as much.

However, if, as you suggested, one might double the present performance by spending another half billion, which would seem to be in the reasonable order of magnitude, I would still say that society will get more out of this than a half a billion, just on the peaceful uses if the thing is further developed.

I think it is not continuing reckless spending because one has indulged it for a while, but it is a very wise investment. This is the nucleus of a very important industry which will probably become to be worth much more than half a billion.

Senator MILLIKIN. I suggest without prolonging this, Doctor, that it is wise investment if it is wise in the light of the financial condition of the country.

The CHAIRMAN. Doctor, I am going to retain you to argue for me with Senator Millikin, because I think you have pretty well presented my viewpoint.

There is a question, Doctor, as to whether we can afford not to develop that which we have. Don't you agree with that?

Dr. VON NEUMANN. Yes. I would think that we can afford it. In other words, the things which are needed exist, and they could be used without seriously affecting the standard of living.

The CHAIRMAN. You believe, of course, that research in this field is going forward throughout the world.

Dr. VON NEUMANN. Certainly. Research has probably been slowed down throughout the world by the war, but it is probably recovering now.

The CHAIRMAN. Would you, as a citizen of this country, forgetting all military applications, want this country to be second in the matter of atomic energy?

Dr. VON NEUMANN. No; one should certainly make every effort to do one's best, and to do it just in the ordinary peaceful competitive spirit.

The CHAIRMAN. You, I take it, would not welcome the thought of country A, country B, or country C proceeding well along the road toward peacetime industrial use of atomic energy, would you?

Dr. VON NEUMANN. You mean without the United States progressing? No, I think it would be very deplorable, and I think it would not be desirable from any point of view.

The CHAIRMAN. It is conceivable that it might ruin our economy, isn't it?

Dr. VON NEUMANN. In peacetime, if you are assuming that there is no danger of war anywhere in the world, then all these things are not quite as dramatic as otherwise. In other words, if you are behind in your research and others are ahead of you, you will gradually become a second-rate industrial nation.

On the other hand, you can still buy other people's licenses and continue after a fashion. But it would be deplorable; it would be as bad as letting down in any other field of human endeavor, and we shouldn't do it.

I think it is important that the country should be first in industry and research from a purely peaceful point of view.

Senator MILLIKIN. Mr. Chairman, I believe the witness will agree with me that it is bad to become a second-rate nation in the ways outlined by our very able chairman. It is also bad to become a second-rate nation through insolvency.

Dr. VON NEUMANN. I would think the question is whether insolvency threatens or not.

Senator MILLIKIN. Yesterday we had a message from the President of the United States that shows the predicament that a nation can get into when it considers itself busted. I don't want the United States to have to pass a tin cup to other nations of the world.

The CHAIRMAN. Any further questions? Thank you very much, Doctor.

Mr. Secretary it is nice to see you here. You may proceed.

STATEMENT OF HON. HENRY A. WALLACE, SECRETARY OF COMMERCE

Secretary WALLACE. Mr. Chairman and members of the committee, you have invited me here today to discuss the several bills before your committee for the domestic control and development of atomic energy. In my judgment there is no more important problem before the Congress. The satisfactory solution of the problems created by atomic energy will have an important bearing on the future standard of living of the American people and of all the peoples of the world. It may determine whether our civilization and whether the human race itself will continue to exist.

As Secretary of Commerce, I have a particular interest in the parts of these bills which relate to the potential economic uses of atomic power and of byproduct materials. However the several aspects of

atomic energy—domestic and international, economic and military—are very closely related. Each aspect affects the others to such an extent that the whole problem has to be considered before a satisfactory policy can be worked out with respect to any particular phase. This close relationship was brought out very clearly in the testimony of the scientists who appeared before your committee last month. I shall therefore first discuss some of the general aspects of the problem as background for my specific comments on economic, industrial, and other nonmilitary applications of atomic fission.

In thinking about these several bills, we must first determine the reasons why legislation is needed on the domestic aspects of atomic fission. What are the things that need to be done now in the domestic field, and how do they relate to the question of international control to prevent the use of atomic power as a military weapon? In his message to the Congress on October 3, 1945, President Truman clearly summarized the reasons for domestic legislation which were important at that time. Those reasons were:

1. To establish a peacetime organization to take over the plants and facilities developed during the war for the production of fissionable materials and bombs.
2. To develop and direct a policy of further research on atomic fission and byproduct materials.
3. To secure control over the basic raw materials in this country.

In that message to the Congress, the President also stated that he would soon initiate international discussions for the control of atomic energy and for outlawing the use of atomic weapons. He pointed out that international arrangements for these purposes would be difficult to achieve, but that the alternative was a "desperate armament race which might well end in disaster."

Very important progress has been made in the direction of effective international cooperation since the President's message was delivered some 3 months ago. A preliminary meeting with Great Britain and Canada took place in November. A further meeting was held in December in which Russia participated; and Russia, Great Britain, and the United States agreed to sponsor the establishment of an Atomic Commission of the United Nations to make recommendations to the Security Council on the following points:

1. For extending between all nations the exchange of basic scientific information for peaceful ends;
2. For control of atomic energy to the extent necessary to ensure its use only for peaceful purposes;
3. For the elimination from national armaments of atomic weapons and of all other major weapons adaptable to mass destruction;
4. For effective safeguards by way of inspection and other means to protect complying states against the hazards of violations and evasions.

The proposal for the establishment of an Atomic Commission was approved a few days ago at the first meeting of the Assembly of the United Nations in London.

Since the President's message of October 3, it is clear that a further very important consideration has developed with respect to domestic legislation on atomic fission—the need for consistency between our domestic policy as established in such legislation and the international policy which the United States has sponsored and which the other members of the United Nations have accepted in principle. That international policy is to bring about as soon as possible agreements

among all nations not to develop or use atomic weapons; and to insure that such agreements are effective by backing them up with an international inspection system. We do not yet have such international agreements nor an inspection system, but our domestic legislation must be designed to fit into such arrangements and must not give other nations any reason to doubt that international control is our policy and that we would support that policy wholeheartedly. For example, we would undoubtedly give the other nations of the world reason to distrust our motives if on the international front we advocate a policy designed to prevent war and to prevent the use of atomic energy for military purposes, while we simultaneously place the scientific and technological development of atomic energy in the hands of the military at home. So long as we continue without legislation on this subject, we are doing just that. In the eyes of the world, we are entrusting all of the Nation's activities in the field of atomic energy to the military.

I now turn to an examination of the bills before your committee, and especially the McMahon bill (S. 1717), the Johnson bill (S. 1463), and the Ball bill (S. 1557), in relation to the requirements for domestic legislation which I have listed. The requirement that domestic legislation conform to, and serve to carry out, the international policy to which we are committed is obviously the most important single consideration. Unless we can insure that atomic energy will not be used as a weapon, utilization of the power in the atom for peaceful purposes and for the welfare of mankind is only an academic consideration. If atomic weapons are ever again used in war, civilization as we know it will be destroyed. Those, if there are any, who survive the destruction will be concerned with the elemental problems of getting enough to eat and improvising some sort of crude shelter, and not with atomic power plants or medical applications of byproduct materials.

In order to be consistent with the international policy which we have proposed and which offers the only possible alternative to an atomic arms race and ultimate chaos, domestic legislation must be based upon the following principles:

First, it must provide for civilian control in complete harmony with our international policy.

Second, it must provide the basis for a free international exchange of basic scientific information, and for the exchange of technical information when international arrangements make that possible.

Third, it must provide for the early development of the best possible techniques for inspection, which this country can then offer and propose to the United Nations.

Perhaps some further discussion of the third point may be in order. As several scientists who appeared before your committee have testified, the United States knows so much more about the technical problems of inspection—because we are the only nation which has produced fissionable material in quantity—that we must take the lead in devising and proposing effective inspection techniques. The development of such techniques has not yet been possible because of the wartime secrecy rules which are still in force—the compartmentalization of information imposed by the military upon the scientists associated with the Manhattan project. Therefore the formulation of such techniques may need to wait upon the establishment of the Commission.

I shall now take up in turn each of the three principal bills concerned with domestic control and development and consider them in relation to the three standards of conformity with our international policy which have just been enumerated.

First, let us consider the McMahon bill (S. 1717). This bill was introduced after our policy of striving for international control of atomic energy had been formulated by the President and after the initial meeting of the President with the Prime Ministers of Canada and Great Britain. The possibility thus existed of making policy on the so-called domestic aspects of this problem conform to our international policy, and full advantage was taken of this opportunity. This bill places control of developments within the United States in a full-time, five-member civilian commission responsible to the President. Members of the Commission will be appointed with the advice and consent of the Senate, and will be removable at the discretion of the President.

These provisions are consistent with our traditions of democracy and would place control of development of this new tremendous force in the hands of agents directly responsible to representatives of the people. Such democratic control and responsibility are essential not only to prevent undesirable forms of authoritarianism or military dictatorship on the domestic front, but also to assure a domestic program consistent with our international policy. Moreover, the bill specifically provides in section 6 that—

The Commission shall not conduct any research or developmental work in the military application of atomic power if such research or developmental work is contrary to any international agreement of the United States.

The Commission is given custody of all atomic bombs, and is directed not to produce bombs nor to turn any over to the armed forces of the United States except at the express direction of the President. This is a fundamentally important provision which will assure the continuation of our traditional policy of civilian control of military matters. At no time in the history of the United States, in fact, has it been more important to follow the constitutional pattern of subordinating the armed services to civilian representatives of the people.

Secondly, S. 1717 places great emphasis on complete freedom for fundamental scientific research and on the free international exchange of basic scientific information. It provides further, in section 9, that related technical information shall be distributed—

with the utmost liberality as freely as may be consistent with the foreign and domestic policies established by the President * * *.

Furthermore, the Commission is not only authorized but is directed to foster and develop economic, medical, and other peaceful uses of the process of atomic fission and byproduct materials resulting therefrom.

Finally, under the complete civilian control and with the close coordination with international policy which the bill provides, it is clear that the Atomic Energy Commission could quickly arrange for the development of the best possible techniques for use in an international inspection system by the scientists, engineers, and technicians acquainted with all phases of the Manhattan project.

The Johnson bill (S. 1463) is defective with respect to all three criteria of consistency with our international program. Since the bill was drafted and introduced before our international policy was

clearly formulated in the form of the declaration of the President and the Prime Ministers of Great Britain and Canada, it was almost inevitable that this should be the case.

The Johnson bill is essentially a bill for promoting further military developments of atomic power. It turns the entire question of domestic development and use of atomic energy, including military developments and uses, over to a nine-man, part-time Commission and to an Administrator appointed by the Commission. The Commission and the Administrator are given powers which make them largely independent of the President and of the Congress. The Commission members are appointed for 9-year terms, and cannot be removed by the President except on specific limited charges.

Under the Johnson bill, the Administrator, who is appointed by the Commission, is in fact the real power. Not only is he the top full-time official, but the bill gives directly to the Administrator practically all of the sweeping powers over persons and property which are given to the Commission itself. The Administrator cannot be removed by the President. Therefore, in any basic disagreement with the Administrator over policy the President might first have to show cause to remove a majority, or five members, of the Commission. This peculiar wording of the bill would set up the most undemocratic, dictatorial arrangements that have ever to my knowledge been proposed to the Congress in a major legislative measure. It would give to the Administrator the greatest powers that have ever been given to one man in time of peace, and yet the bill does not even provide for Senate confirmation nor for any direct means of removal by the President.

The Johnson bill is equally deficient in other respects. The entire emphasis in the bill is on the military application of atomic energy. Little positive encouragement is given to the Commission to sponsor and develop economic, medical and other peaceful uses of atomic power or its byproduct materials. The Commission is left perfectly free to manufacture, or have manufactured by private contractors as many bombs as it may see fit, and there is no specific limitation on the disposition to be made of such bombs. A yearly inventory of property, which presumably would include bombs, is required to be made to the President, but only such parts of that inventory need to be made available to the Congress as the Commission believes to be desirable.

The general statute which prohibits commissioned officers from holding civilian positions is set aside to permit military men on active duty to serve on the Commission, or as Administrator or Deputy Administrator. There is also a strange provision in section 3 of the bill which seems to indicate that the draftsman may have contemplated that the Administrator would be an Army officer and the Deputy Administrator a Navy officer. That provision reads as follows:

the Deputy Administrator shall at all times be kept fully informed by the Administrator.

These provisions potentially place the people of this Nation and even of the world at the complete mercy of a small group of men, perhaps a military clique, who could use this fearful new power to impose new and more terrible forms of authoritarianism and imperialism.

With respect to the second criterion, the bill does not provide for the free dissemination of basic scientific data, nor for the international

exchange of technical data, if and when the President finds that international arrangements have progressed to the point where such exchange would be desirable. On the contrary, there is great emphasis on security regulations—which need not even be made public. There are drastic penalties provided for even unintentional violations of the statute or of security regulations. These provisions indicate again that military applications are the prime consideration of this bill, and under it that wartime security regulation would be carried over into peacetime.

This again is a place to mention, as so many of the eminent scientists who have been associated with the development of atomic fission have pointed out, that to carry security regulations and secrecy to extremes will soon place the United States at the bottom of the scientific world in nuclear physics instead of at the top. Such regulations stifle scientific progress. They are completely counter to the teachings of the history of science. Scientific endeavor requires an atmosphere of freedom conducive to pursuing the path of truth wherever it may lead. Under conditions of military secrecy, restriction and regimentation, the best-qualified scientists would not continue to work on atomic energy. They would leave the field of atomic fission and pursue research in other fields of scientific investigation.

Lastly, under this bill I doubt whether we shall get the scientific and technical collaboration which is necessary to develop, without further delay, the inspection techniques required for effective international control of atomic energy under the United Nations.

It seems to me clear that if S. 1463 or anything like it were enacted by the Congress, it would tremendously increase the difficulties of achieving and successfully administering an international control and inspection system. We would be proposing control and peaceful uses of atomic fission to the world on the one hand, and on the other, we would be turning our domestic development and use over to a virtually independent commission. The commission provided could be dominated and controlled by the armed forces under a statute that emphasizes military developments of atomic energy. This is certainly not the way to encourage international cooperation. It is clear that this bill was not drafted to fit into a policy of international control of atomic energy. In order to conform to such a policy this bill will have to be discarded.

I now turn briefly to Senator Ball's bill, S. 1557. This bill seems to me to fall somewhere between the McMahon bill and the Johnson bill. It is clearly the intent of the bill to provide for civilian control of domestic developments and for coordination with our international policies. The nine-man Commission would consist of five Cabinet officers and four part-time public members. There is no restriction on the President's power of removal. Military officers on active duty are specifically barred from membership on the Commission or from serving as Administrator or Deputy Administrator. On the other hand, being less detailed than the other two bills, it does not provide much guidance to the Commission on many specific points of policy. It seems to me very desirable that the Congress spell out the policies to be followed by the Commission as far as that can be done at the present time, and not give to the Commission what amounts to a blank check on many questions.

I should now like to turn to the second major aspect of these so-called domestic bills—the economic, medical, and other nonmilitary applications of atomic energy. As your committee has already brought out in its hearing in December, this phase of the subject must also be considered in relation to the question of international control and inspection system. It was argued that with large-scale production of fissionable materials for economic purposes, inspection would become more difficult, and there might be more opportunity for clandestine diversion of fissionable materials to the production of bombs and other atomic weapons by a nation or groups determined to violate international controls. To my mind it would be most unfortunate if international suspicions, and the frailties and weaknesses of mankind, should force the world to forego even for a short time the benefits of the energy of the atom.

This is a matter which will have to be worked out and determined by all the nations concerned and will depend at least in part on the effectiveness of the inspection techniques which qualified scientists, engineers, and other technicians have proposed after they have had an opportunity to study all of the technical problems involved. In any event, it will probably take several years to develop practical large atomic power plants, so that the question is not immediately before us. On the other hand, qualified scientists have pointed out that some of the materials produced as byproducts of atomic fission have important and immediate medical applications, which should be put into use by the medical profession without delay. Perhaps all that is needed in the domestic legislation is a provision that no development or utilization of atomic energy for economic purposes shall be undertaken which is contrary to any international agreement or policy of the United States. We should strive in every possible way, however, to find international solutions to permit the prompt harnessing of this new source of energy for the benefit of mankind.

With such a provision, I think the domestic legislation should properly provide every possible encouragement to research and development on economic, medical, and other nonmilitary uses of the process of atomic fission and its byproduct materials. The provisions of the McMahon bill on economic uses seem to me well conceived. This bill provides positive encouragement to research on nonmilitary uses of atomic fission and directs the Commission freely to distribute fissionable material in small quantities for this purpose.

The Johnson bill seems to imply that all sources of fissionable material—the raw ores—shall be owned by the Government, and that mining extraction shall be carried on by the Government. The McMahon bill seems to me to be preferable to the Johnson bill on this point, in that it provides for private ownership and extraction of ores, but requires that the sale and distribution of ores be carried out under Government license.

With respect to patents, only the McMahon bill has any detailed provisions; the Johnson and Ball bills do not deal with this question at any length and presumably would permit private patents both on processes relating to the production of fissionable material and on devices for the use of fissionable material. Since atomic fission may ultimately form the basis of a large part of our economic activity, it is clear that private patent monopolies on critical and key processes

should not be permitted. The McMahon bill would eliminate private patent monopolies by requiring sale to the Government of patents on all production processes, and the compulsory licensing with fair royalties to the inventor, of all patents on devices for the utilization of atomic energy. I should like to suggest that with respect to devices essential to the production of fissionable materials, which will be a Government monopoly or at least carried on only under Government license and control, that another method may be preferable. It might be desirable to shortcut lengthy patent proceedings by forbidding private patents in this field and authorizing the Commission to purchase inventions directly from the inventor.

With respect to patents on devices for the utilization of atomic energy, the compulsory licensing provisions of S. 1717 seem to me to be essentially sound. However, it might be desirable for the bill to provide some definition of the devices which should be subject to compulsory licensing. As the bill is now worded, even trivial and unessential devices—such as a special stepladder or a pair of overshoes used in an atomic energy plant—would fall within the compulsory licensing provision. This seems to be unnecessary and may create a possible hardship for the inventors of such minor devices. Perhaps a criterion of broad public interest or the specification of antimonopolistic policy could be used to define and restrict the area of compulsory licensing.

Finally, on the question of patents, there is no provision in any of the three bills requiring that patents on inventions and discoveries resulting from Government-financed research on atomic fission and related subjects be dictated to the public or turned over to the Government. Such inventions may be extremely important, not only in the field of atomic fission itself, but in many ordinary industrial operations. For example, one of the Government contractors at the Oak Ridge plant of the Manhattan district has issued a memorandum, with the approval of the War Department, stating that some 5,000 such new devices and improvements capable of ordinary industrial application were developed by this one company alone. A copy of this memorandum is being submitted for the committee record.

The CHAIRMAN. What is the name of that company?

Secretary WALLACE. Dr. Condon, do you know the name of the company?

Mr. CONDON. It is the Kellogg Corp., a subsidiary of M. W. Kellogg.

Senator MILLIKIN. Does that company claim ownership of these patents?

Secretary WALLACE. No; I don't think it claims ownership of the patents.

Senator MILLIKIN. I mean is it holding them as a sort of trustee for the Government?

Secretary WALLACE. The matter is raised in this document, if you care to look at it.

(The memorandum referred to reads as follows:)

[From: J. M. Mathes, Inc., 122 East Forty-second Street, New York 17, N. Y., John Black, Public Relations and Publicity Department, for release at 2 p. m., Monday, September 17, 1945]

5,000 NEW PRODUCTS, RESULTING FROM ATOMIC BOMB PROJECT, ARE WAR'S GIFT TO PEACE

The immediate benefits to American industry in new inventions, new and improved products and procedures of manufacture, resulting from the atomic

bomb project were analyzed today at a luncheon meeting of business-paper editors representing the principal processing industries, held at the Biltmore Hotel, New York, under the auspices of the M. W. Kellogg Co., chemical engineers of Jersey City, N. J., and New York N. Y. The Kellogg Co. arranged the meeting on behalf of its wartime subsidiary, the Kellex Corp., a noncommercial industry-wide unit which engineered through to construction and operation one of the major plants of the atomic bomb project at Oak Ridge, Tenn.

The keynote of the meeting was the premise based, on current estimates, that, as a result of the vast development work underlying the project, more than 5,000 new products and procedures affecting all phases of American life are available to industry. These products and procedures now await only Government release for commercial application.

Arranged on authorization of the War Department, the meeting included addresses by H. R. Austin, executive vice president of the Kellogg Co. and A. L. Baker, general manager of the Kellex Corp.

The Kellex Corp., which included in its personnel a cross-section of the Nation's scientific and engineering talent loaned for the war emergency by many companies, was formed for the purpose of developing procedure and designing equipment for volume production of uranium-235, an essential ingredient in the atomic bomb project. In this capacity the company had charge of the designing and engineering, and supervised construction of, the diffusion-process plant at Oak Ridge.

According to a memorandum distributed at the luncheon, this \$2,000,000,000 project has resulted in many scientific developments wholly apart from the fundamental factor of atomic power itself, which can be utilized immediately by a wide range of major American industries. These industries include petroleum refining, chemical processing, gas processing, manufacture of pressure and vacuum vessels, electrical, refrigeration, high vacuum, and industries employing corrosive chemicals. In petroleum refining are listed such advances as improved pumping; new type, more efficient heat exchangers; mass spectroscopy (continuous analytical control); possible new methods for separating gas mixtures and improved automatic control. Parallel advantages were specified for the other industries. In further analysis of technical progress made at Oak Ridge, the memorandum tells of "a development, aptly and simply called the leak detector, which is more sensitive than any other existing device previously utilized for the same purpose." Benefits accruing to the medical profession and public health include: (1) A low cost, more abundant source of radioactivity; (2) improved protective methods for combating toxicity in industry; and (3) extension of cancer therapy.

The history of the Kellex Corp. and the significance to industry of its work at Oak Ridge were reviewed by Mr. Baker, who disclosed many facts about this company which had lived under a strict seal of secrecy for 3 years. Two major tangible assets accruing to industry from the record of Kellex were cited by the speaker as: (1) The experience gained in handling hitherto obscure products and the development of new ways of doing business "which cannot help but result in substantial cost-savings and increased quality throughout industry"; and (2) the prestige value of the accomplishment both internationally and in making for "closer integration of our own scientific world."

Mr. Baker said that most of the advantages are still necessarily under Government ban of secrecy and he emphasized that the new developments totalled "not one or two, or an occasional isolated improvement, but literally thousands."

Himself a career veteran of the Oak Ridge project, having served on the diffusion-plant program since the Kellex Corp. was formed, Mr. Baker added:

"What really happened was that here American skill created almost overnight a new industry. A totally new type of plant was built to employ totally new processes for the production of a totally new product. The principal building of the diffusion plant, six stories high and shaped like a U of U's, houses the largest chemico-physical continuous process in the world: A single process employing more pumps, more barriers, more power, more people, more instruments, more of every process-essential than had ever been even thought of before."

Mr. Austin in his address described the character of the Kellex Corp., terming it "an all-American team of highly skilled men, drawn for the emergency from many industries, companies and professions whose patriotic motive combined to achieve the goal they had set for themselves."

Increased interest was attached to the meeting by two current developments—award of the Army-Navy E to Kellex for its excellence in war production, and the news that for the immediate future the diffusion plant is the only one of the three plants at Oak Ridge which will be continued in operation. On the latter point, it was stated that this decision was the result of a new postwar policy by

the Government in which emphasis is shifted from all-out war production at any cost to concentration on a single process which would yield maximum peacetime production consistent with efficiency and economy of operation. Wartime performance of the diffusion plant was such that the authorities selected this process for the continued separation of U-235 in the postwar period.

Approved by the War Department for general press distribution.

PRESS MEMORANDUM

WAR'S GIFT TO PEACE

(As a result of the inventive, scientific, industrial, and engineering advances incident to work on the atomic bomb project, it is estimated that more than 5,000 new and improved products and procedures are now available to American industry awaiting only Government release for volume production.)

A large amount of space in our daily papers and periodicals has been devoted to glowing accounts of the painstaking, involved research by world famous nuclear physicists culminating in the splitting of the uranium atom. Interesting speculations on the possibilities and availability of atomic power have been indulged in but all too little has been said about the benefits which industry, as it is today, might expect, not from the use of atomic power, but from engineering principles, new equipment and new methods developed as a necessary prerequisite of the atomic bomb.

It is therefore the purpose of this memorandum to make available to the press some tangible assets accruing to American industry right now from knowledge gained in the successful solution of the problems faced in separating U-235 from natural uranium by gaseous diffusion methods. And incidentally, the success of that process has been underlined in two current developments: (a) The Kellogg Corp. shares with others serving at Oak Ridge, the honor—so well deserved by all of them—of the Army-Navy E award, which tribute has just been announced by the Government; and (b) even more important, from an engineering viewpoint, the technical soundness of the diffusion plant's processes and equipment are strikingly demonstrated in the current announcement that, of the three methods in use at Oak Ridge, this is the only plant which will be continued on normal operation. This decision it is stated was the result of a new postwar policy in which emphasis is shifted from all-out war production at any cost to concentration on a single process which would yield maximum peacetime production consistent with efficiency and economy of operation. Wartime performance of the diffusion plant was such that the authorities selected this process alone for the separation of U-235 in postwar use.

The development work for this method had to be transformed from a highly theoretical concept without even a laboratory process upon which to base design and performance data into an efficient, multistage, commercial, gas recycling process. And it all had to be done in a hurry. So vast was the undertaking and so enormous the cost that it is quite safe to state that no single corporation or group of corporations would even consider industrial research on this subject with such little prospect of success. The saying "necessity is the mother of invention" was never so true as in the new developments, both in apparatus and process, conceived, developed and applied under the emergency of war to bring the project to a successful conclusion.

It is doubtful if such concentrated research was ever before brought to bear on any one problem. That it was solved quickly is a tribute to the ingenuity and resourcefulness of American science and engineering and bodes well for future developments in this field. The total cost of just separating the U-235 isotope by the diffusion process in important volume reached a substantial portion of the over-all figure of \$2,000,000,000. Mistakes were made of course because decisions had to be made quickly, but progress is not achieved without mistakes. The important point is that these mistakes were capitalized on, and now that it is all over, the vast sum of money spent can be considered not only as a necessary war expenditure or as a preliminary to developing super power resources in the future, but also as our Government's contribution toward the betterment of industry as a whole.

For there is no doubt about it, industry does not have to wait for atomic power to utilize the experience of the project. Many lessons have been learned which can and will be applied to more efficient processing immediately. It can not all

be revealed in print at present but it is in the minds of engineers and firms participating in the project and will be inextricably bound up with their future thinking, engineering design, construction and processing. Some items in these fields can be mentioned and are considered below. It is hoped that they will afford to the serious thinker some idea of the enormity of the problem and the scope of its application toward the betterment of our industries.

Following are some of the industries with indications of how they will benefit from knowledge gained in the U-235 problem:

1. Petroleum refining:
 - (a) Improved pumping.
 - (b) New type, more efficient heat exchangers.
 - (c) Mass spectroscopy (continuous analytical control).
 - (d) Possible new methods of separating gasoline fractions.
 - (e) Improved automatic control.
2. General chemical and processing industries: Same as in petroleum refining.
3. Manufacture of pressure and vacuum vessels:
 - (a) Checking welds.
 - (b) Pretesting vessels for leaks before operation.
 - (c) Improved vacuum techniques.
4. High vacuum industries:
 - (a) Improved vacuum methods for vitamin distillation.
 - (b) New methods of detecting high vacua in electronic tube manufacture.
 - (c) Low-pressure, low-temperature dehydration of foodstuffs.
5. Gas processing industries:
 - (a) Diffusional separation of helium from natural gas.
 - (b) Efficient separation of hydrogen from process gases.
 - (c) Diffusional separation of oxygen and rare gases from air.
 - (d) New techniques in gas recycling.
6. Electrical industry.
 - (a) New electronic techniques in high vacua.
 - (b) Improved micro-sensitive instrumentation.
7. Medical profession:
 - (a) A low cost, more abundant source of radioactivity.
 - (b) Improved protective methods for combatting toxicity in industry.
 - (c) Extension of cancer therapy.
8. Refrigeration industry:
 - (a) Increased safety in equipment.
 - (b) Improved handling of fluorides for refrigerants.
9. Industries employing corrosive chemicals.
 - (a) New pump and valve lubricants and packing methods.
 - (b) New treatment of metal surfaces to prevent corrosion.
 - (c) Improved safety practices.
 - (d) Completely enclosed pumps operated from exterior by induction.

Corrosion factors.—Right from the start of the project staggering obstacles loomed. Uranium, being a solid, had first to be transformed into a gas for utility in the selected gas diffusion process. This meant selecting a compound of uranium with some other element which would be gaseous at nominal temperatures and from which elemental uranium could be readily regained after diffusion. After much experimentation, which included uranium hexafluoride, UF_6 , and also other gases, suitable process gases were selected. One of the big advantages of UF_6 , which brought it into special consideration was that fluorine, having only one isotope, would not complicate the separation by adding new combinations which would diffuse at varying speeds. Uranium hexafluoride is a solid at room temperature but fortunately turns into a gas at $56^\circ C$. Unfortunately, however, like most fluorine compounds, it was highly reactive, physiologically poisonous, and introduced problems of corrosion which pointed toward difficulties in production and handling. In the words of one Kellogg spokesman "uranium hexafluoride is one of the hardest things to handle in the history of mankind."

It was found that practically all the techniques and developments gained in the successful study of the problem could be carried over into a number of industries plagued by corrosion factors through improvement in equipment and processing. The results indicated a saving of millions of dollars annually in the conservation of critical equipment and materials, minimum break-down of moving parts, and also increased safety for workers.

In the process it was imperative that no material in contact with the process gas react with it since such corrosion would lead not only to plugging of the microscopic pores of the diffusion barrier and various mechanical failures but also to absorption (i. e., virtual disappearance) of enriched U-235 isotope. Obviously,

therefore, standard type valves and piping could not be used; instead, new methods of pretreating metal surfaces against corrosion were worked out, new coolants, piping, new type heat exchangers, lubricants, pumps, and packing were developed to satisfy the stringent requirements.

Application of new corrosion knowledge to industry.—Hydrogen fluoride is an important isomerization and alkylation catalyst in petroleum refining as well as an important raw material in the production of aluminum and refrigerants. It is, however, so highly active and dangerous that industry has not yet capitalized on many of its potentialities. Its handling may now be made safer and simpler without excessive maintenance costs and as a result its increased use in industry may be realized.

Other important starting materials for a host of industrial products such as sulfur dioxide, hydrogen chloride and the mineral acids (sulfuric, nitric, and phosphoric) have all presented severe problems of transfer and corrosion with particular emphasis on valve lubricants and pump packings. These difficulties can be greatly simplified by application of the knowledge gained through the extensive experimentation with UF_6 and the other related gases.

Pumps.—The story on pumps, the heart of the process and one of its most difficult problems, is particularly interesting and applicable to modern industry. Thousands of pumps operating under reduced pressure at Oak Ridge created problems in vacuum technique on an unheard-of scale. Other thousands operated at nominal pressures. But regardless of the type or service none could leak or corrode and all had to have as small a volume as possible. Many different types of centrifugal blower pumps and syphon-sealed reciprocating pumps were tried out and new types developed. For example, in one of the pumps for the larger stages the impeller was driven through a coupling containing a very novel and ingenious new seal. Another type of pump was completely enclosed, its centrifugal impeller and rotor being run from the outside by induction.

Top-flight pump designers from leading manufacturers in this country collaborated in research at the central Kellogg laboratories in Jersey City and succeeded to a remarkable degree in increasing industry's knowledge of this all-important phase of processing. For security reasons the practical applications of the new types of pumps developed cannot yet be revealed publicly. However, the engineers who participated in this phase of the project have brought to their parent companies a vastly increased lore of new techniques which cannot help but be reflected in increased service to their customers.

Perhaps the most significant advance in pump design which has been most successfully accomplished is the utilization of supersonic velocities of a very high order (Mach numbers of over 1.0).

Barrier requirements.—Literally acres of porous barriers were required for the gas diffusion plant with billions of holes smaller than 0.01 micron (about two millionths of an inch). Despite the high degree of porosity required such barriers had to be able to withstand a pressure head of one atmosphere. The pores had to be of uniform size and spacing, must not become enlarged or plugged up as the result of direct corrosion or dust coming from corrosion elsewhere in the system, and the barriers had to be amenable to manufacture in large quantities and with uniform quality.

One of the major reasons for the lack of diffusion techniques in industry today has been the barrier problem. Few, if any, corporations cared to expend the prohibitive time and money in the necessary research on this problem, until it was made necessary by the exigency of the situation. Almost at the last minute an excellent barrier was developed and today these operate successfully throughout the more than several thousand stages.

APPLICATION OF DIFFUSION PRINCIPLES TO INDUSTRY

Now that a large part of the basic research on diffusion barriers and their application to full-scale industrial separations has been completed, particularly with reference to gas recycling and instrumentation, it seems almost certain that helium will be separated from natural gas by diffusion techniques rather than by the present refrigeration method. Helium is so light in comparison to other components of natural gas that its diffusion velocity through a porous barrier is over twice as great as the next lightest compound present in the same source.

It may be even easier to isolate hydrogen by these new methods from a number of process gases now used merely as fuel because the diffusion velocity of hydrogen, the lightest of our elements, is over four times that of any compound associated with it.

The isolation of ethylene from cracked gas oil by incorporating diffusion barriers as an integral part of cracking units could conceivably supply an abundant source of this versatile chemical used for the manufacture of synthetic rubber, plastics, antifreeze, alcohol and many other products.

The preparation of oxygen and rare gases from air without resorting to refrigeration and fractional distillation is another possible application, when economic methods are developed.

The direct isolation of natural gasoline fractions from crude petroleum without resorting to distillation, and new types of fractionating columns for the petroleum-refining industry also appear feasible.

Instrumentation.—If pumping is the heart of processing, then instrumentation is the brain. No continuous process could function efficiently without adequate automatic control. In the gaseous-diffusion plant the problems of instrumentation were far greater than in any other industry because the theory involved the assumption that diffusion took place through an infinite number of stages whereas practicability dictated that such stages be limited in number.

Even so, several thousand stages were required, necessitating an intricate system of gas recycling involving abnormally large volumes of gases in relation to the finished product and continuous high precision analytical control. About half of the gas processed in each stage diffused through the porous barrier as enriched U-235 product, and after repressuring was sent on to the next higher stage for further concentration; the impoverished half was also repressed and recycled through the next lower stage. The recycling involved was enormous, over 100,000 times the volume of the final enriched gas.

There were developed to meet these needs the most precise, continuous, automatic, analytical control instruments ever produced by man. This refinement is one of the outstanding features of the gas diffusion plant and constitutes one of its most important applications to industry today. Instruments which before had existed only in research laboratories were improved upon and adapted to commercial use; completely new prototypes were conceived, developed, and put into mass production. The result is that now as never before there is available to industry a more nearly perfect system of continuous automatic control than has ever existed.

APPLICATIONS OF NEW INSTRUMENTATION TO INDUSTRY

Mass Spectroscopy.—One of the developments employed is a new type of mass spectroscopy which every petroleum refiner will welcome for control of cracking operations and transfer line analysis. The mass spectroscopy has been employed for several years in research laboratories and even within the last 2 years in certain phases of the refining industry but never on the perfected scale developed at Oak Ridge. The foremost instrument engineers and physicists in this country and England devoted their full time not only toward gearing this instrument to continuous control but also to expanding this country's capacity for its quantity output. In no other country has electronic research been applied on so grand a scale. Security considerations are not violated in revealing that the mass spectroscopy is an electronic device for analyzing gases both qualitatively and quantitatively from a mass standpoint by separating a beam of dissimilar gas molecules into separate beams according to their formula weight. Determinations are very fast, require only a thimbleful of gas and make obsolete the formerly used Orsat and chemical analyses particularly for the purposes of continuous control where instantaneous changes must be effected the moment a process swings "off the line."

Its potential uses in industry include the accurate analysis of natural gas or any process gas, the continuous automatic control of any gaseous process such as alkylation, dehydrogenation, vapor phase cracking, etc., the checking of inert gases such as nitrogen used to provide a protective atmosphere in furnaces, etc., the checking of the completeness of any evacuation process as in the manufacture of radio tubes, the detection of impurities, and many others. Industry will not have to wait for benefits from this versatile tool because production facilities have been enormously increased since the new type was created.

Leak detector.—A second development, aptly and simply called the leak detector, is more sensitive than any other existing device previously utilized for the same purpose. It played an important part in ensuring that all parts of the gaseous diffusion plant were vacuum tight. Any leaks out of or into the system would be damaging both from the standpoint of loss and contamination of an exceedingly valuable material. The leak detector is well adapted for locating annoying leaks

in industrial high-vacuum processing industries such as vitamin manufacture where even microscopic leaks undetectable by the familiar ammonia-hydrogen chloride method or Tesla coil method are still potent enough to prevent drawing the necessary high vacuum on the equipment. Other potential uses include the pretesting of pressure and vacuum apparatus before putting it in service, checking equipment in operation to ensure no wasteful loss or contamination, the testing of welds for minute pores which would otherwise escape detection and ensuring the physiological safety of refrigeration equipment employing toxic coolants.

Heat exchangers.—Of great interest to the petroleum refining industry is the development of a new type heat exchanger. Since an unavoidable concomitant to pumping gas is heating it and since enormous volumes of gas were processed, individual cooling units for each stage had to be developed. A brand new type of heat exchanger was conceived for this purpose and developed up to the production stage. A manufacturer was then selected, shown how to make it even to the extent of redesigning his equipment so that thousands of units could be turned out quickly. They were installed and functioned very well.

Possible medical and physiological benefits.—Thanks to the variety and multiplicity of radioactive products which can be produced by means of U-235, we face the prospect of soon having available for therapeutic medicine radioactive materials possessing a wide variety of properties. It is logical to expect, therefore, that these new materials will be suitable for products offering a greater range of usefulness and at lower cost than radium.

The possibility exists of incorporating a micro quantity of a radioactive isotope in food to observe its metabolism in the body of experimental animals. Such "tagged" material could be readily traced in its passage through the organs of the body.

Money not wasted.—It should be borne in mind that the benefits mentioned above accruing to American industries as a result of knowledge gained in the development of the gas-diffusion plant represent only a small part of what is permitted to be revealed at this time. The total cost of the project, \$2,000,000,000, actually only represented 8 days of war cost to the United States.

If it be estimated that the war would have lasted another 6 months, the actual saving could be estimated at \$45,000,000,000.

Senator MILLIKIN. I certainly would agree with your intimation, if that is the intimation, that there should be no private ownership of patents developed at Government expense.

Secretary WALLACE. That is the point which I am making, Senator. I am not acquainted with the patent situation with respect to these 5,000 developments, whether patent rights were reserved to the Government or whether the company retained patent rights. Although the Department of Commerce is interested in making these developments available to American business, we have been unable to get any information on this subject. Apparently even this matter is still shrouded in military secrecy.

The CHAIRMAN. What do you mean "unable to get any information"? Have you asked for it?

Secretary WALLACE. That is my understanding—Dr. Condon?—that we have made some inquiry.

Dr. CONDON. I think that was done by Mr. Green, not myself. He said he had been unable to get any direct answer, and after making this release that they had changed their policy on the matter and decided not to say anything further on it. This document was released in September or October, I believe.

The CHAIRMAN. It bears the date of September 17, 1945.

Has the War Department been asked whether this company owned these patents or whether it didn't?

Dr. CONDON. I would have to ask Mr. Green about that.

Mr. NEWMAN. I can answer that, Senator.

The War Department was asked, I believe by Mr. Bordon, of the Publications Board under the Secretary, as to these patents. Bordon

informed Mr. Green, of the Publications Board, that he had asked General Groves for the information with respect to the patents, and Groves had instructed him that this was a closed matter on which no information could be given at this time.

The CHAIRMAN. Thank you.

Senator HART. Mr. Secretary, or anyone else who knows, is it likely that many of those 5,000 are in the class of the 15 percent of secrets which have not been disclosed by Dr. Smyth's report, and refer to the know-how?

Secretary WALLACE. My understanding is that the vast bulk of these are not in that category. As they are described in this document, the vast bulk of them are of a sort that would be used in ordinary civilian processes.

Senator HART. Are there any of them in that category?

Secretary WALLACE. I suspect there may possibly be some in that category.

Senator MILLIKIN. Mr. Chairman, I should like to suggest that we get the head of the Kellogg Corp. and that we get General Groves before the committee, in executive session if necessary, and get this thing cleared up with the utmost expedition.

The CHAIRMAN. I think that is a wise suggestion, Senator.

Secretary WALLACE. In any event, this question deserves consideration. If the patent provisions of the Kilgore bill for a National Science Foundation are adopted by the Congress, no specific provision will need to be made in the atomic energy bills because the Kilgore bill provides for public dedication of all discoveries arising in the course of Government-financed research and development. However, if that particular provision of the Kilgore bill is not enacted, I strongly urge that a similar provision be incorporated into the statute on atomic energy.

The CHAIRMAN. Mr. Secretary, do you mind if I interrupt you at this point?

Secretary WALLACE. Go ahead, sir.

The CHAIRMAN. Do you know of any other company that engaged in the Manhattan project that did take out patents or claim patents?

Secretary WALLACE. I would not care to name any company. It is my understanding that there are a number of them that did take out patents on various devices, but I know nothing of the details of that.

The CHAIRMAN. I was told that Union Carbide Co., which developed the diffusion plant at Oak Ridge, although they considered that they had invented many patentable features, did not file any patent claims.

Senator HICKENLOOPER. Didn't the du Pont Co. specifically have that as a part of their original agreement, that they would under no circumstances claim any patents or any patent rights in any devices developed in this project by them?

The CHAIRMAN. I think that was one of the statements in their contract.

Secretary WALLACE. I think there were a number of companies that did the same thing.

Senator HART. I think that was allied with the statement that they accepted \$1 as the total payment for their services under the Manhattan district.

Senator MILLIKIN. I should like to suggest, in addition, that it would be well to have somebody make a survey of these employment contracts to see what is in the contracts so far as this subject is concerned.

Secretary WALLACE. There is one further provision in the McMahon bill on economic uses of atomic energy which requires special consideration. Section 7 (d) provides that the Atomic Energy Commission shall not license any practical industrial or commercial use of fissionable materials until after a report on each such use has been prepared and submitted to the Congress by the Commission and after a 90-day waiting period has elapsed following the submission of the report. During this period the Congress would have an opportunity to enact supplementary legislation regulating such use. This provision clearly extends an invitation to vested economic interests to bring pressure upon the Congress to prohibit or delay economic progress. To take a hypothetical example, let us assume that some future Edison will invent an application of atomic power that will make all present electrical power plants obsolete. It is clear that such a development might seriously threaten many vested interests—the interests of stockholders, bondholders, workers, and others. It may well be necessary for the Congress to take cognizance of such a situation and enact such legislation as may be required to minimize transitional hardships. It would be highly undesirable, and might well place this country at the bottom of the international scale in progress toward peacetime developments of atomic energy, if we were to prevent the introduction of such a new power plant in order to protect vested interests.

The CHAIRMAN. After all, it would be the Congress of the United States that would be making that determination, wouldn't it?

Secretary WALLACE. That is undoubtedly true, but it would be making a determination in response to determined pressure groups, and the way you have it phrased is an invitation for such pressure groups to form promptly.

The CHAIRMAN. In other words, do you think that the Congress should divorce itself from the responsibility for a reviewal at least, of any determination of what might be an almost overnight transition in our economy?

Secretary WALLACE. If this section is left out of the bill Congress would not divorce itself. Congress' hands would in no way be tied.

The CHAIRMAN. Let us assume that your future peacetime Edison comes up with this proposal and a five-man Commission that we propose would say, "All right; go ahead," and immediately the market for 50,000,000 tons of coal would be gone overnight.

Do you think that Congress should not be given an invitation to review that determination?

Secretary WALLACE. Congress has the privilege, and would not in any way be prevented from stepping in, even though this section 7 (d) is eliminated.

The CHAIRMAN. I suppose it could abolish the Commission and set up another one. That would be rather a Draconian step to take.

Secretary WALLACE. You could go direct to the particular situation, if Congress so desired.

Senator MILLIKIN. Mr. Chairman, may I suggest that there are congressional precedents for keeping it in Congress.

When the air brake came along, Mr. Secretary, it of course was a very revolutionary and useful device, and Congress provided by law a certain period of time in which the transition should be made from the old-type hand brake, and so forth, to air brakes. The same thing happened in the case of couplers. I think that the same thing happened in the transition from wooden coaches to all steel coaches.

I believe we can find laws on all of those subjects which in their day were very revolutionary, imposing some congressional control over the rate of speed with which these things would come into being so as to protect the type of interest to which you refer.

Secretary WALLACE. It seems to me very important, if this country is not to fall behind certain other countries in the adoption of this power to peacetime uses, that the diminution of the hardship involved in the transition be arrived at in some other way than slowing the rate of speed of the transition.

However, that could well be discussed by Congress.

I want to urge most vigorously that we not put ourselves in the position of being forced to fall behind other nations in an economic way.

The CHAIRMAN. Mr. Secretary, Senator Johnson couldn't be here today, but at each session, practically, he is trying to work out more congressional control of this subject.

I am sure that I could speak for him that when you want to take one out it would meet with his very great disfavor.

Secretary WALLACE. With section 7 (d) in force, the Congress will have invited a campaign to restrain the introduction of such a development, a campaign which would undoubtedly magnify the immediate difficulties of present owners and workers and minimize the long-run benefits to the entire Nation which would result from the new processes. With such a provision in effect during the last 150 years, can it be doubted that our technological progress and the rise in our standard of living would have been seriously retarded? We would have had strong pressures to slow up the introduction of all major technological developments—the steam engine, the power loom, the reaper, the automobile, the telephone, and the airplane. We dare not take the responsibility in history for a slowdown in the utilization of this greatest achievement of science.

In summary, I have attempted in this statement to discuss the major principles involved in the proposed "domestic legislation." There are additional questions of technical detail and exact language which I have not mentioned, but which are covered in the formal reports on the bills which your committee requested some time ago. These reports will be submitted to the committee as soon as they have been cleared by the Bureau of the Budget.

In closing, let me summarize my views on the question of "domestic legislation":

1. Domestic legislation cannot be considered apart from our international policy on the control of atomic energy. Since international control to prevent the use of atomic weapons is by far the most important aspect of atomic energy, domestic legislation should be consistent with such control.

2. Domestic legislation should emphasize the development of peaceful uses of atomic energy.

3. Economic uses of atomic energy should to the maximum extent possible with safety and security be carried out by private enterprise rather than by Government monopoly.

The McMahon bill meets the first two of these criteria, and would require only minor modification with respect to the third. The other two bills would require complete revision to conform to these standards.

Senator AUSTIN. Does the Secretary intend to make a suggestion as to such modification in the report to be cleared by the Bureau of the Budget?

Secretary WALLACE. With regard to the third point?

Senator AUSTIN. Yes.

Secretary WALLACE. I don't remember whether that specific recommendation is there or not.

If the Senator wishes, I will endeavor to prepare such a thing.

Senator AUSTIN. I would be glad to have the Secretary's suggestion as to that.

Secretary WALLACE. I therefore wholeheartedly endorse the McMahon bill, subject to the revisions I have mentioned, in preference to any of the other bills which are now before this committee.

In coping with the problems, both international and domestic, created by the advent of atomic energy, this committee has the most awesome responsibility ever placed on a committee of Congress. In the hands of this committee, in the determinations of the Congress, rest the destinies not only of the people of the United States, but of the world. This committee has an opportunity for the exercise of vision, courage, and statesmanship which occurs only rarely in history.

No man can with clarity foresee the future developments which will stem from the harnessing of atomic energy. We are probably standing on the threshold of a new and more far-reaching economic revolution than we have ever experienced in the past. The decisions which must be made are decisions which will determine whether mankind destroys itself or whether it finds the road to new and undreamed-of mastery of the secrets of the universe in the interest of a better life for all.

We must be prepared to deal with the human as well as with the physical problems which atomic energy will create. We must anticipate social and economic changes which may be effected by this new force, a need which the McMahon bill in its provisions requiring social and economic study foresees.

We can best deal with the great problems which face us by closely adhering to the fundamental principles of freedom and democracy so firmly rooted in our Constitution and in our traditions. We must insist on maintenance of the principle of Government responsibility to the people—and avoid an atomic energy commission which is not responsible to the electorate or to its chosen representatives. We must insist on adherence to the traditional principle of civilian control over military matters—and avoid any possibility of military domination or dictatorship. We must insist on stimulating the development of peacetime uses of atomic energy through the channels of free private enterprise—and, as far as is compatible with public safety and welfare, avoid stifling and restrictive governmental operation, regulation, or control. We must assure the widespread use of atomic energy devices—and avoid the restrictive practices of monopoly. We must insist on following the fundamental precepts of scientific freedom—

and avoid secrecy, suppression, or compartmentalization of knowledge. We must insist on the most rapid peacetime development possible of atomic energy—and avoid retarding such development because of any vested interest. Most important of all, we must insist on the utilization of atomic energy for the betterment of the human race—and avoid the pitfalls which would lead to the destruction of our civilization and international suicide.

These are the principles which should be incorporated into any bill designed to cope with the development and control of atomic energy. For the sake of the peoples of these United States and of the world may you do your job wisely and well.

Senator HART. Mr. Secretary, at various points in your statement, you have mentioned inspection techniques, and you have said that it was impossible to develop those techniques for the use of the international commission so long as the present compartmentalization of scientists is concerned, and in fact as long as it is in the hands of the Manhattan district.

Now, various scientists have been before the committee and have rather played down the idea of any techniques of that sort. In fact, one said that he thought that if he were given the job of inspecting another country, the most useful tool that he could be provided with would be a screw-driver in order to open boxes.

In view of that testimony which we have received, would you care to elaborate further on your statement in order to prove your point?

Secretary WALLACE. Well, I happened to read that particular segment of Dr. Oppenheimer's testimony and couldn't help feeling that to some degree he must have been a little facetious at the moment.

I think that particular reply was made with regard to the detection of bombs that might be secreted and later set off.

Senator HART. Yes; I think that is right. But, Mr. Secretary, there were other scientists who were not facetious at all.

Secretary WALLACE. I feel the problem would best be handled by other means than the use of screw drivers. They might play a part, but if there were certain quantities of material loose in the world, the desirable method of inspection would be first to be so familiar with all of the scientists working on these problems in the world that you could know just what they were up to.

Second, to be so familiar with all the types of processes used in building plants, so familiar with the plants of the world that would produce certain key and bottleneck parts that you could trace them with certainty—and so on.

It would take someone much more familiar with all the various devices used than I am to sketch out a method of inspection, but I would be quite willing to say this:

If these scientists could emerge from their various compartments, and confer together, exchange information, they could, in my belief, quite rapidly work out effective inspection systems.

Senator HART. We have had considerable testimony, Mr. Secretary, to the effect that the technique is not at all difficult, and, as the problem appears to this committee, the difficulties are political and not technical.

I have just one further question, Mr. Secretary.

You have expressed great admiration for that part of S. 1717 which takes all bombs and bomb parts wholly out of the custody of the

military and puts them entirely under the control of the civilian commission.

Now, I call your attention to the fact that in the communique which came after the Moscow Conference, the conferees called for the elimination from national armaments of atomic weapons and of all other major weapons adaptable to mass destruction.

Now, following your thought and following the philosophy of S. 1717, would it not also be necessary to take from the military all bombing planes, and bombs of lower power which can achieve mass destruction, and have achieved it?

Secretary WALLACE. In my testimony I only intended to speak about the military use of atomic energy, and not about any of these other matters.

Until the United Nations arrives at some agreement with regard to these other matters, I certainly would not advocate any such procedure.

Senator HICKENLOOPER. Mr. Secretary, following up that answer, until the United Nations or the respective nations individually give satisfactory assurances of the outlawing of the atomic power as a weapon, wouldn't it follow that at least our military responsibility should still exercise control over atomic energy as a weapon just as it should in battleships or bombs of lesser power?

Secretary WALLACE. Yes and no. I would advocate very strongly that at the earliest possible moment, the military, for its own sake, place the control of the atomic bomb, or the material out of which the atomic bomb is made, directly under the supervision of the President.

Unless that is done, the United States inevitably will be looked on as potentially the greatest aggressor nation in the world.

Senator HICKENLOOPER. Will we be looked on as a greater aggressor nation and still maintain the greatest Navy in the world, the greatest air fleet in the world?

Secretary WALLACE. Senator Hickenlooper, these other traditional methods of armament do not have the altogether extraordinary potentialities for destruction of the race that atomic energy has, and I wouldn't put them in the same category at all.

Senator HICKENLOOPER. If I may say, and not be misunderstood, I think I am as zealous to outlaw these things, to keep from killing people, as anybody, so I am not advocating the continuance any longer than necessary.

I admit that atomic energy is spectacular, but it would seem to me that atomic energy is a method of killing, causing death and destruction. It would seem that a 10-ton bomb is a method of causing death and destruction in mass degrees.

Now, I am wondering whether or not the military should not have a substantial, not a controlling but a substantial, voice in this field, which is now entirely devoted to national defense.

True, we have medical possibilities. We have civilian possibilities, but at the moment it is entirely a weapon for national defense, or offense is perhaps a better term.

Until we can be reasonably certain of reliable agreements, or understandings that its use will be outlawed as a weapon, doesn't possibility of its use as a weapon rather demand that we don't just discard it?

Secretary WALLACE. I feel that what you advocate, Senator, inevitably leads to the atomic armaments race which President Truman so vigorously deplored, and that it is absolutely vital to take steps to get it out of the hands of the military.

I think we ought to get it out of the hands of the military at the earliest possible moment, and that we should also press with the greatest possible vigor through the United Nations for the international control and inspection system. Otherwise, there will be suspicions in this country that certain other nations are holding out on the quantity of material which they may have been able to produce.

Undoubtedly they will not have produced more than a small fraction of what we have already produced. The ultimate result of such suspicions is the disaster of an atomic bomb race.

That stand which you advocate seems to me to lead in that direction.

Senator HICKENLOOPER. Does it lead any more in that direction than the maintenance of the greatest Navy in the World, the maintenance of a proposed substantial armed force, such as universal training, the maintenance of the greatest air fleet in the world?

Secretary WALLACE. Very much so, in my opinion; that is, I think the potentialities of atomic energy in this field are enormously greater than any of the means which you have mentioned.

Senator HICKENLOOPER. An article by Alexander de Seversky was mentioned a couple of days ago, in which he tended to depreciate the over-all net effect of atomic energy, saying that it is just another big bomb, a little bigger perhaps and more effective on certain types of targets.

I don't know whether he is wrong, for I haven't enough information on that, but that leads me to another question, if you would care to express yourself on this:

At this moment, without considering what we may or may not be able to do by way of future agreements, would you care to say how far you would go in disclosure of knowledge, both scientific and technical, in the whole field of atomic energy so far as we know up to and including the discharge of the bomb as a weapon to other nations of the world?

Secretary WALLACE. At this moment, it is obvious that we are not in a position to go very far.

Senator HICKENLOOPER. May I ask why?

Secretary WALLACE. Simply because we have pending action on the agreement proposed at Moscow between the four powers—Canada, United States, Britain, and Russia.

Senator HICKENLOOPER. Well, in other words, we haven't yet received or been able to arrive at a satisfactory mutual assurance in connection with the Atomic Energy Commission.

Secretary WALLACE. I am completely in accord with the provisions of the McMahon bill.

I think they fit in admirably with the agreement proposed at Moscow between the four powers. Of course, action hasn't yet been taken; specific action has not yet been taken on those recommendations.

Senator HICKENLOOPER. There must be some fundamental reason underlying the righteousness of the agreement. In other words, I

might assume that we are not in a position to disclose at this moment, because we haven't arrived at reliable or satisfactory understandings, and therefore we should keep this matter somewhat in abeyance and not make full disclosures.

Secretary WALLACE. Of course, what I hope is that a sufficiently satisfactory understanding and inspection system will be developed through the United Nations Organization so that there never will be disclosed any information about the making of bombs; that that will be completely out of the picture; and that there will be free scientific disclosure of the facts that lead to its peacetime use.

Senator HICKENLOOPER. I am in complete accord with that, but I also believe that that presupposes satisfactory and reliable agreements among nations.

Secretary WALLACE. I think certain other nations will want to have just as much assurance, and the same kind of assurance, we would want in their place that there is no danger of our having any of the material in a position to make atomic bombs once the agreement is arrived at.

Senator HICKENLOOPER. Here is the thing that troubles me. Let us suppose we get to the point.

It is our desire or our hope that we don't disclose the technique of the final stages of the bomb, its detonation, or any of those things. I am wondering if any other nation of this size in the world is going to be satisfied to hear us say, "We will just lock this seventh door here and we alone will have the key; the rest of the nations will stay out of there."

I wonder if they will be satisfied to let us keep and lock up, or attempt to forget the secret of the bomb, yet disclosing at least a substantial portion of the thing.

Secretary WALLACE. I think the answer to your question will be obvious if you will imagine some other nation as having done what we have done, and what we would want under those circumstances.

Senator HICKENLOOPER. I think it is a troublesome problem as to when, and the extent to which, these things should be retained or given away.

It has been testified, as you probably have read, numerous times that when we make power and go through this fission process and obtain fissionable material, we are, roughly, 75 percent down the road toward making a bomb. We have another step out of four before we can blow things up.

Secretary WALLACE. All of which gets around to an adequate inspection process.

Senator HICKENLOOPER. Of course, I think there has to be inspection. Probably the detail would have to be worked out.

My question is based on this: that we must, as you have pointed out here, acknowledge that the responsibility, at least as far as Senate legislation is concerned, is going to be upon this committee to write legislation that we at least hope has some judgment and some vision into the immediate future, anyway, and those problems are very troublesome.

That covers the point which you have in mind, and at the same time opens up the door to fruitful use of the energy for peacetime purposes with the greatest possible speed.

Senator MILLIKIN. I would like to ask you, Mr. Secretary, whether inspection as a durable and dependable measure of protection does

not in a large measure turn on whether the important nations of the earth really mean it when they say they want peace. In other words, if a nation makes pious proclamations and says it wants peace, while at the same time harbors aggressive designs, is there any inspection system that will give us complete protection?

Secretary WALLACE. I think that is a scientific problem. Obviously, there must be complete accessibility for inspection committees.

Senator MILLIKIN. But the world is a mighty large place and the aggressor nations have always found means for avoiding the restrictions that have been put upon them. I am just wondering whether we can rely on inspection unless we first have a dependable assurance that we are going to have a world at peace.

Secretary WALLACE. I think you have to have that inspection system in order to have that dependable assurance. I don't think you can have it in any other way.

Senator MILLIKIN. If you had a world in which the nations really mean what they say when they say they want peace, you would not need an inspection system.

Secretary WALLACE. I don't think there is any question about the desire of the various nations for peace. Neither do I think there is any question about the types of fears that exist in the various nations which make for war. The nations do want peace, every one of them.

Senator MILLIKIN. You believe that we are now off on a dependable course toward peace?

Secretary WALLACE. That depends in considerable measure on the action this committee takes.

Senator MILLIKIN. Would you make it "exclusively" or just as you said "in considerable measure"?

Secretary WALLACE. In considerable measure.

Senator MILLIKIN. Since we have dropped or actually used these bombs, there are symptoms around the world, Mr. Secretary, that indicate that aggression has not lost its popularity.

Secretary WALLACE. You can find symptoms of aggression everywhere, Senator. No nation has an exclusive right to harbor certain types of aggression.

Senator MILLIKIN. And no one has related those aggressions to the fact that we have the atomic bomb. They went on before, and they have been going on since.

Basic to that, does not the whole job of this committee and of the Congress swing more or less on its judgment—no matter what its judgment may be one way or the other—as to whether we have now entered a period of peace on which we can rely?

Secretary WALLACE. Well, every nation asks concerning every other nation's intention at the present time.

Senator MILLIKIN. We did that before World War I. We did that at the Disarmament Conference. We did that in connection with the Kellogg Pact, and that inquiry has not produced peace.

Secretary WALLACE. But you have now introduced into the world something altogether new, something altogether frightening, something altogether fearful that is not just another type of big bomb.

The possibilities of invention in this field are so great, and the first bombs in this field are so tiny compared with their potentialities. The leading scientists of the leading nations of the world know this

and have communicated these truths to the heads of these nations. All thoughtful people of any scientific knowledge whatsoever in positions of authority know that this is not merely a repetition of ancient history, but that we are confronting something altogether new, out of which we can make, if we use our heads and imagination, a durable peace or out of which we can make an atomic-bomb race, fear, hatred, and the destruction of humanity.

Senator MILLIKIN. I agree with the latter part of your statement, but I invite your attention to the fact that, despite our development of this new magnitude of power, some of the nations have gone on planting seeds of war in this earth.

Secretary WALLACE. Well, let him that hath complete virtue throw the first stone on that front.

Senator MILLIKIN. We have already thrown the stone; we threw the stone at Hiroshima and Nagasaki.

Senator HICKENLOOPER. Mr. Secretary, may I suggest this: We have this bomb, which is a great weapon. We may propose to demonstrate our good faith and our desire for peace with the rest of the world by even perhaps abandoning its manufacture as a weapon and placing the control of atomic energy in a civilian group.

It certainly has its arguments and its support. We would do that; we would abandon the bomb as a weapon, I take it, at this time as a gesture toward peace and as a demonstration to other nations of the world that we do not desire to go on a program of aggression or to go on a theory of enlarged war in the future.

Secretary WALLACE. That doesn't follow from the McMahon bill.

Senator HICKENLOOPER. No. I am not necessarily talking about the McMahon bill; I am talking about the philosophy of ridding ourselves, if possible, either upon agreement or otherwise, from the use of that weapon in the hope that the rest of the world will dispense with it.

Secretary WALLACE. That will depend upon the discussions in the international field.

Senator HICKENLOOPER. But it would be desirable, as I understand it, and would be a demonstration to the world if, as, and when we can adopt that philosophy of outlawing it as a weapon. That seems to have run all through the testimony of the various witnesses here. I am wondering what effect it would have on the world if today we arrived at some agreements that were satisfactory, at least satisfied us to the point where we could say we would stop making the bomb and no other nation is going to make it, and yet turn around a day or two later and establish a program of universal military training in this country which is certainly not traditional with this Nation.

What kind of a demonstration to the world would that be of our peaceful intentions?

Secretary WALLACE. I am as much concerned as the Senator with the conflict in attitude when that day comes.

Senator HICKENLOOPER. Well, it seems to me we would be putting a knife away with one hand and pulling a pistol out with the other, perhaps, if we are trying to demonstrate our peaceful intentions and our desire for a peaceful world. It would seem to me the retention or abandonment of either of those might be well argued by other nations as a demonstration either for or against a policy of war in the future as contrasted to a policy of peace.

Secretary WALLACE. It would seem to me, Senator, we should examine each of those matters on its own level according to the situation that may exist internationally at the time.

Senator HICKENLOOPER. Does it make much difference in your intention whether you shake your left fist or your right fist under a fellow's nose?

Secretary WALLACE. I say that there is a difference in the levels, and that it is not two fists.

Senator HICKENLOOPER. Well, a fellow might be able to hit harder with his right fist or his left one, but could probably still produce a bloody nose with either. It would seem to me that we are going to have to think a little bit about what our intentions really are.

Secretary WALLACE. That field is altogether minor compared with this one, it seems to me. Let us determine the priorities in our approaches; this is No. 1.

Senator HICKENLOOPER. It might be minor in the power developed. It might be minor in comparison. That is, the training of youth every year might be minor in the aggressive power that that alone could develop as compared with what you could do with 100 atomic bombs; but I am wondering if the principle is any different.

Secretary WALLACE. Principles always have to be accompanied by an examination of the facts.

Senator MILLIKIN. By inspection.

Senator HICKENLOOPER. Well, somebody said here the other day, "Are there any degrees of evil?"

The CHAIRMAN. Senator Austin.

Senator AUSTIN. I have just one question, I think, and I gather the question from your entire thesis, because you stated a postulate at the beginning which was that whatever civilian control we establish must be in complete harmony with our international policy.

Several times in state papers, and finally in a communication from our Secretary of State, our international policy has been stated to be that not until after establishment of effective security measures against the destructive use of atomic energy will the United States permit reciprocal exchange by us of knowledge relating to the constructive use.

Therefore, doesn't it follow that until that event—whether the time may be long or short between now and then—we must retain our own security measures?

Secretary WALLACE. That is true, Senator, but I would advocate even before then that the custody of the bomb be placed in some wider place than just one department of government. I would agree precisely with the Senator in his statement, with that amendment of a broader custody.

Senator AUSTIN. That is all.

The CHAIRMAN. Mr. Secretary, Senator Millikin just stated or assumed a hypothesis that there were nations in the world that might be moving toward aggression.

As I get the exchange between you and the Senator, the Senator's viewpoint was that inspection might not even be worth trying if that was the condition—that is, inspection under an international agreement.

Do you or do you not believe that even assuming that hypothesis there would not be a net gain to the United States and to other peace-

loving nations of the world if we had an inspection system, granting that hypothesis?

Secretary WALLACE. I am afraid I don't understand your hypothesis.

The CHAIRMAN. I was taking Senator Millikin's hypothesis that assuming there were nations in the world which had aggression in their national heart, my question is, would it not be to the benefit of peace-loving nations, even assuming that was true, if we could impose by international agreement an inspection system?

Secretary WALLACE. Yes; I think there would be a net gain for the United States and the world even under that assumption, provided we had a truly effective inspection system.

We would have to keep in mind, of course, that that nation would have one or several of its scientists and engineers on the inspection committee which would be visiting the United States and examining all of our plants, just as we would have several scientists and engineers on the committee which would be going to that particular country or countries, inspecting all of their plants.

The CHAIRMAN. Yes; but they would know that we had it and we would not know—in the absence of an inspection system—whether they had it or not, would we?

Secretary WALLACE. That is correct. It would seem to me that we would tend to be the net gainer under the situation you envision.

The CHAIRMAN. Even under that hypothesis?

Secretary WALLACE. Even under that hypothesis.

The CHAIRMAN. In the absence of any system for gathering information as to the state of development in the world, it would be entirely possible in the absence of the inspection system for us to be blitzed without any advance notice or knowledge, wouldn't it?

Secretary WALLACE. That is correct, sir; I agree. It seems to me the all-important thing is getting the various scientists out of their compartments in which they have been placed in the Manhattan project to work on the details of this inspection system.

The CHAIRMAN. That is now going on.

Secretary WALLACE. I am glad to know that. I didn't know it.

The CHAIRMAN. That is going on. It was developed in testimony before this committee that there was no coordinating committee that had been appointed to coordinate the various plans for inspection, and at the instance of this committee such a coordinating committee has been established and is now at work.

Secretary WALLACE. It seems to me the very fact that there are certain suspicions abroad in the world today as to motives makes it essential that the scientists of the various countries work out an inspection system that would be a real one.

The CHAIRMAN. We hope so.

Senator MILLIKIN. Mr. Chairman, I was not disparaging the usefulness of a successful inspection system. My point was that even if you have that and if at the same time there is an intent to wage war, we cannot rely for our protection on the inspection system, because I am postulating that under the most rigorous inspection there would still be opportunity for evasion.

We have a rigorous inspection system against counterfeiting, but we have counterfeiters. The point is that under this power which you have described as an extraordinary thing, which cannot be related entirely to other weapons—I have heard it described as a new

magnitude, and I think that is a very good expression—you cannot take any chances, because the fellow that shoots first wins the war. Of course, that indicates in itself inspection, but my point is that you have got to go beyond that and have at the bottom a genuine intent, by action, to have a peaceful world. If you don't have that, we cannot rely upon inspection for our protection.

Secretary WALLACE. The Senator is getting into the religious field now.

Senator MILLIKIN. I am totally unqualified to go into that field, Mr. Secretary. If I am in that field, then I quickly withdraw.

Secretary WALLACE. I think it has been said in olden times that hatred doesn't cease by hating but by love. That is an old, old saying among religious teachers.

The CHAIRMAN. If there are no further questions, I want to thank you very much, Mr. Secretary, for your appearance here today.

Tomorrow we will meet at 10 o'clock to hear Dr. Edward Teller, a very noted physicist, and Dr. Karl Compton, president of the Massachusetts Institute of Technology.

(Whereupon, at 12:20 p. m., the committee recessed until 10 a. m., Friday, February 1, 1946.)

ATOMIC ENERGY ACT OF 1946

FRIDAY, FEBRUARY 1, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to adjournment, at 10 a. m., in room 312, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Johnson, Austin, Millikin, Hickenlooper, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will come to order.

Gentlemen, we are privileged to have with us Dr. Karl T. Compton, president of the Massachusetts Institute of Technology.

STATEMENT OF DR. KARL T. COMPTON, PRESIDENT, MASSACHUSETTS INSTITUTE OF TECHNOLOGY

Dr. COMPTON. Senator McMahon and members of the special committee, I have a prepared statement from which I shall read certain parts and try to paraphrase the rest, if that is agreeable.

The CHAIRMAN. That is agreeable.

Dr. COMPTON. I believe that first I should qualify as a witness, and I do that on three points.

Senator HART. Mr. Chairman, I think we all know the doctor's qualifications.

The CHAIRMAN. Senator, I think we do, but they ought to be in the record.

Dr. COMPTON. The points that I think may be of possible significance in this testimony are, first, the fact that during the 15 years or so during which I have been president of the Massachusetts Institute of Technology, I have spent, as far as I can estimate, about one-third of the time on governmental boards or committees. That included, from 1933 to 1934, the chairmanship of the Science Advisory Board, which was appointed by the President to study the operations of scientific departments of the Government and to make recommendations regarding organization and the scientific programs of those departments.

In 1939 I was appointed a member of Mr. Stettinius' War Resources Board, which didn't operate very long. I guess it was premature.

In 1940 I was appointed to the National Defense Research Committee under the chairmanship of Dr. Bush, and I have served on that since June 1940, in that connection being primarily responsible

on the committee for the developments in the field of physics and most importantly radar.

In the last couple of years of the war I was in charge of the Office of Field Service of OSRD, which involved efforts to assist the armed forces in the theaters in getting new weapons into use in the theaters.

I am a physicist by profession and have been at one time or another president of the American Physical Society, chairman of the American Institute of Physics, president of the American Association for the Advancement of Science.

In the field of atomic energy I had some contact with that during the time in which it had been put by the President under the jurisdiction of the National Defense Research Committee and later the Office of Scientific Research and Development. Then I dropped out of the picture until last spring, when I was appointed to the advisory committee that was set up by the Secretary of War in connection with use of the atomic bomb. I wasn't of very much service to that committee, because in the summer I went out to the far Pacific, and was in the Philippines and Japan until about the first of October. So much for the qualifications.

Senator AUSTIN. May I ask a question of you, Doctor?

Dr. COMPTON. Yes, sir.

Senator AUSTIN. Is there any systematic method of educating young men in that subject of atomic energy? That is, up to this time has there been any organization of the study so as to professionalize it in any way?

Dr. COMPTON. Well, before the war the subject of nuclear physics was the most active field of research in physics in our universities and in some of the companies, but principally in the universities. That has been the source of personnel.

During the war a great many more young men have become educated in very specialized lines as they have worked on some of these atomic energy projects, and at the present time I think perhaps the most important single thing for getting ahead in this country is to get the educational programs in the universities started and get equipment and activities going so that we can get some men trained to meet this situation.

Senator AUSTIN. The time has already arrived when young men are writing to me for information as to how to join up with some institution for some course in which they can take this specialized study. Nothing really has been organized yet, has it?

Dr. COMPTON. A large number of the universities and engineering schools are working very vigorously in trying to get the program set up. They are pretty much stymied at the present time, because I think until Congress acts and clears the air so that the institutions know what they can do and can get equipment to work with, things are more or less at a standstill; and that is one point I wanted to bring out in my testimony. I think it is very urgent that action should be just as prompt as can be taken with adequate wisdom.

Senator AUSTIN. Thank you; I shall be very interested in that aspect of your statement.

Dr. COMPTON. The first point that I bring out would be to re-emphasize this last statement, because the institutions and the groups that can work on this field are really marking time for lack of authority to exchange information, to secure the materials neces-

sary for research and development or to secure financial backing and make commitments necessary to active developments in this field.

I might interpolate just as one example from my own institution, the Massachusetts Institute of Technology. We have set up a group; we have recruited an excellent staff. Our corporation is ready to make available approximately half of all the unrestricted funds that we have in our portfolio to get started a program on atomic energy, because we think that that is the biggest thing in sight for the future, and it will need the education of men. Connected with that, it will need research and development. We are prepared to put in somewhere between one or two million dollars into a building that will be designed especially for this purpose, but we cannot very well move with these things until we know what program will be permitted and what possible types of support for carrying on that work will be available, and what the order of magnitude will be.

In the meantime the Manhattan district, of course, has this program under its jurisdiction, and I think it is doing everything that it properly can under the circumstances to carry this thing through in the interval. Obviously, there are some things that it cannot properly do. There must be some major questions of policy decided for the peacetime and civilian operations in this field. I know from talking with General Groves that he and his colleagues do not feel that they should make these policy decisions at this time and therefore set a pattern which might not be the pattern that the Atomic Energy Commission would later wish to follow.

I think the Manhattan district is doing everything it can to keep the thing going, but it is subject to that definite limitation, and that is one great reason why I hope that Congress can act as promptly as possible.

Another important reason, of course, is that in comparison with any other nations that may be throwing everything they have into getting ahead with this program, we will be losing our lead to the extent to which we delay in getting started.

I have been very much impressed, gentlemen of the committee, with the very intelligent way in which the committee has gone about the study of this question, getting a basic understanding of the technical aspects and getting competent technical advice.

I think the bill S. 1717, except in one respect which I will refer to later, is a very good bill. It is clear-cut in its definitions and in its objectives.

I have had the privilege of hearing Senator McMahon explain something of the background which your committee has had in mind, and I realize that you have been thinking far deeper than the merely superficial aspects of this program.

I should say that in general I heartily approve of this bill, S. 1717, with the exception of one point which I think is very important and with the suggestion of two or three minor details.

Taking up those minor points first, in section 5 (c), paragraph No. 1, which is on page 10 of the bill, there is a definition of byproduct materials, and then a paragraph that has to do with the consideration of those byproduct materials. I think that is excellently conceived and excellently drawn, and I have no criticism except this: I think there might be some confusion in carrying out this bill, confusion

between the types of byproduct materials that you have in mind here, and another type of byproduct material.

I think you have in mind those byproduct materials that the physicists or engineers would call "hot," hot materials that are produced in these uranium piles or in the separation, and possibly later in the industrial use of some of these fissionable materials. But there is another type of byproduct material that will be involved in the program and which should be handled differently and ought not to be confused with this type. I refer to materials that will be the byproducts of the metallurgical extraction of the basic uranium or thorium from the ores, the materials that you define in the bill as "source materials."

There is a wide variety of ores from which uranium can be extracted, and commercially it will probably be possible economically to extract ores that contain a fraction of a percent—maybe rather a small fraction of a percent of uranium, and the uranium may be associated with other materials, such as copper, and so forth.

In the process of extraction, those other materials are byproduct materials of the metallurgical process or the mining and metallurgical operation, and those, I take it, are not the byproduct materials to which your bill refers. Presumably, they could come into the atomic energy picture only to the extent that their commercial disposition would reduce the net cost of getting the uranium out of the ore.

The CHAIRMAN. What would be the names of some of those materials?

Dr. COMPTON. I am not enough of a metallurgist to know. Copper would certainly be one. There might be some nonmetallic products. I don't know what they are, but in any ore that contains, for example, two-tenths of 1 percent of uranium it means there are 99.8 percent other things, and to whatever extent those can be usefully disposed of, they are byproduct materials in the mining of uranium.

To handle that, I would make a specific suggestion that on page 10, just following the word "material," the last word in the definition of "byproduct material," there be inserted, perhaps in parentheses, this clause:

It shall not be deemed to refer to the nonradioactive substances which may be byproducts of the metallurgical processes involved in separating ordinary uranium, thorium, or similar materials from their ores.

The definition then would read:

The term "byproduct material" shall be deemed to refer to all materials (except fissionable material) yielded in the processes of producing fissionable material. It shall not be deemed to refer to the nonradioactive substances which may be byproducts of the metallurgical processes involved in separating ordinary uranium, thorium, or similar materials from their ores.

Now, the next minor point is on the preceding page, page 9, line 1, in the definition of "source materials." The definition reads:

The term "source materials" shall include any ore containing uranium, thorium, or beryllium, and such other materials peculiarly essential to the production of fissionable materials as may be determined by the Commission with the approval of the President.

Now, either fortunately or unfortunately, depending upon how we look at it, these source materials are very widely distributed, and traces of uranium or thorium are found almost everywhere. I have been told by one of the men who held one of the key positions in this

atomic energy project that, for example, if you take the average over the surface of the earth and take up a good shovelful of dirt anywhere, you will find an amount of fissionable material in that way which, if it could be got out by proper chemical methods, would yield an energy equivalent to the burning of about 3 tons of coal—any place in your backyard or any place, on the average you have got about that much fissionable material. It means in the order of 1 part in 5,000, or 1 part in 10,000.

Obviously, it would not be desirable to have under the jurisdiction of this Commission the responsibility for licensing the transfer, possession, or title to any source material after mining, extraction, or removal, if it were taken to the absurd limit of dealing with these exceedingly small traces that are not economically recoverable.

It seems to me that in the definition of "source material" it would be advantageous to insert, after the word "containing," the words "quantities deemed by the Commission to be economically recoverable of," so that that definition would read:

The term "source materials" shall include any ore containing quantities deemed by the Commission to be economically recoverable of uranium, thorium, or beryllium, and such other materials peculiarly essential to the production of fissionable materials as may be determined by the Commission with the approval of the President.

The CHAIRMAN. That would seem to be a very sensible modification.

Dr. COMPTON. Then, there is a third one to which I would just call attention, because I am not close enough to the subject to be certain of my ground on this, but I have a doubt.

That is on page 7, lines 7 to 11, which deal with the handling of existing contracts.

That paragraph reads:

The Commission is authorized to continue in effect and modify such contracts for the production of fissionable materials as may have been made prior to the effective date of this Act, except that, as rapidly as practicable, and in any event not more than one year after the effective date of this Act, the Commission shall arrange for the exclusive operation of facilities employed in the manufacture of fissionable materials by employees of the Commission.

I am not at all certain that the Commission could actually carry out that directive in a period of 1 year. I notice in the May bill, H. R. 4566, there is leeway given which makes this permissive but not directive; that is, the Commission may take over the production operations by Government agency under its own control, or may handle them by contract.

I know that in setting up these operations and getting them under way it was figured that the very great manufacturing production experience of a few of our greatest companies was the only thing that made this operation possible, and whether the Government could recruit within a period of 1 year a staff that could take over those operations, I don't know. I think I would feel happier if that were more flexible and made permissive rather than a directive.

Turning now to the point that I do feel is quite important, that is the whole of section 2 of this bill which specifies the organization of the Commission. In brief, it provides for a commission of five members with quite substantial compensation who are prohibited from engaging in any other business, vocation, or employment, and for whom there is no specified term of office. The Commission is responsible both for the determination of policies within the limit of directives

established by the Congress, and also for the administration and execution of these policies.

In my judgment, this is an inferior type of organization and is subject to serious objection. I would like to point out some of those that seem to me to be important.

In the first place, it is not good administrative practice to have the administrative and executive functions in the same hands as the policy-making function. This is illustrated in every type of significant organization in our country. Starting at the top, in our Federal Government, the policy-making function is vested in the Congress, and the executive function is vested in the President. In business corporations you have the policy-making function in the hands of a board of directors, and the president and executive staff carry out those policies.

The same thing is true in educational institutions where you have a board of trustees, and you have a president and faculty that carry out those policies. The same thing is true of the great foundations and hospitals.

I believe that there is a logical reason for that separation, and also it seems proved by the fact that it has survived, because it is the universal type of organization.

I think it would be much wiser to have a policy-making commission or board which would be subject in over-all matters to the President and the Congress, but which, within their directives, would be in a position to make the subordinate policies and to evaluate the way in which those policies were carried out by an administrator.

The second point is that while the Commission, as set up in section 2, could command the services of good men, I don't believe it could command the services of the best men, and that is in spite of the fact that the compensation is a generous compensation for Government officials. I believe that in a thing as important as this atomic energy is going to be, there ought not to be serious limitations on the type of men that could be brought in on the policy-making side. To speak of men that are not living, I would think of men of the caliber, for example, of Newton Baker and Elihu Root as men of a type that it would be important to have represented on this Commission.

Furthermore, it might be advantageous to have the heads of certain of the most concerned Government departments represented on this Commission. I think it should be possible to have one or two of the top scientists represented on this Commission; but as the bill is now drafted, none of those men would be available.

The CHAIRMAN. Doctor, if you applied the same test that you are now speaking about, I wonder what the Senate of the United States would be composed of.

Dr. COMPTON. Sir, I am going to come to that in my next point. I can justify the Senate.

Senator HICKENLOOPER. May I ask the doctor a question, Mr. Chairman?

The CHAIRMAN. Yes, sir.

Senator HICKENLOOPER. I presume, Doctor, that there might be underlying your comment on this No. 1, the fact that the best men undoubtedly will have and demand to have some other interests or some other field of interest in addition to this; that it would be difficult to get the best men who could confine their energies and their entire

abilities to the particular field of administration or handling of this atomic energy.

Dr. COMPTON. That is the point exactly. The thing is so important and so interesting that I think you could probably get anybody you would want to put in a very considerable amount of time. But if you say that he would have to resign as Secretary of War or have to resign as head of a great law firm or have to give up his job as a director of research of some great laboratory or something of that sort, to put in full time on this, then I don't think he would be available.

Senator HICKENLOOPER. May I ask you this: Do you believe that the policy-making group composed of such men would be amply able, giving part-time attention, to properly formulate the policies and properly evaluate this field and get the proper perspective in the entire field so that the Administrator could carry out the policy and keep a sufficient check on it to know that it was done?

Dr. COMPTON. I think it would be possible.

Of course, it would mean that the Administrator would have to have a good strong administrative staff, and as in every such organization the Administrator would probably in most cases take a great deal of initiative.

But any of these groups that I have known about take their jobs very conscientiously and very seriously, and I think the combined wisdom that you could get would be worth having.

Senator HICKENLOOPER. Thank you.

Senator MILLIKIN. I should like to suggest, Doctor, that one way you can get these top men to disassociate themselves from all other interests in life, and perhaps the only way, is life tenure; but that would probably be too inflexible for this sort of organization.

Dr. COMPTON. Yes; sir, I believe so; and that was the third point I was going to bring up. The implication of indefinite tenure for membership on the Commission, I think is unwise. For one thing, it is a new and very active developing field and it should be possible from time to time to bring in fresh blood and fresh ideas. I would be afraid that without a term of appointment, and with the great power that this Commission will have, there will be the danger of its falling into a bureaucratic rut, and I don't think—for a thing as new and proceeding as rapidly as this is—that risk ought to be taken.

The CHAIRMAN. Doctor, you haven't overlooked, I am sure, the provision in section 11 on page 21 of the bill which provides that in the performance of its function the Commission is authorized to—

(1) establish advisory boards to advise with and make recommendations to the Commission on legislation, policies, administration, and research.

Dr. COMPTON. Yes, sir.

The CHAIRMAN. Do you not envisage, assuming that this was the type of commission that was set up, the setting up of the kind of part-time advisory board that you have been talking about?

Dr. COMPTON. Yes, Senator McMahon. I think that is a wise provision. I think there should be advisory boards probably in various fields—in the geological field, for example, or the engineering or production field, and so forth.

The CHAIRMAN. In other words, the full-time five-man Commission, composed of men who had no other interests of any kind, would be able to set up an advisory board composed of the type of men that you

suggest, who could be quarterly, or as the necessity demanded, in the position to consult with the board and advise the board on policies.

Now, this board would be a public board. It would have access to media for the dissemination of its views, and it would seem to me to exercise a great influence in the matter without at the same time being able to control the workings of the project.

I just wanted to make sure you had not overlooked that provision.

Dr. COMPTON. I haven't overlooked that, and I think it is a good provision. I think there should be advisory boards in any case. However, as the Commission is established, I think the Commission will need special technical expert advice in various fields, and it can get that in the manner that you suggested. I have not overlooked that.

My only point is that I think the other method of defining membership in the Commission is the better method, independently of this other point.

The CHAIRMAN. In other words, instead of having the advisory board advise the Commission, you would want the advisory board to be advising the Administrator?

Dr. COMPTON. Well, it could be either way; but I should think the Commission might want to have the advisory board advising it or the Administrator. I don't see that this provision for these advisory committees would not be applicable however the Commission is constituted; I think in any case there should be the possibility of advisory boards.

Senator MILLIKIN. I should like to suggest, Doctor, it couldn't be any other way unless the Commission itself, within itself, had a personnel that embraced all of the sciences and all of the human knowledges.

Dr. COMPTON. Right.

Now, I don't believe it is necessary to provide this substantial compensation for the members of the policy-making commission, as distinct from the administrative staff. The salaries proposed in this bill of \$20,000 and \$15,000 are generous for governmental employees, but for the type of individual that seems to me to be called for, that monetary reward would not be the principal inducement, or even a major inducement.

If it were the inducement to the job, then I don't think he is the man that ought to be on the commission. The right type of person, I think, would be the man that took the job as a public duty because of its interest and importance. I would much rather see this amount of money go into providing as strong as possible a staff for the Administrator.

The CHAIRMAN. I read in the paper where Louis Mayer's salary was \$960,000, and the President of the United States gets \$75,000. I doubt whether the average American citizen today, if given his choice, would hesitate long about which job he would prefer to get.

Dr. COMPTON. I think that is right, but the incentive should be the interest and importance of the job.

Senator HART. Doctor, may I ask you what you think of this: Throwing back to what you have said about the control of large industrial organizations, and also of educational institutions being in the hands of a board of directors or trustees, have you given any thought to the idea of having the Commission composed of men in

both categories, some full time chosen by the President at the best salaries that can be supplied to get the best men, but which, as you say, will not attract all the men of the caliber which this committee should represent in certain respects.

How would it be, then, to have the board of directors of the Commission composed of men in both categories, some part time and some full time?

Dr. COMPTON. If that didn't make any difficulties within the group, I should think that might be workable. That would be equivalent to having, we will say, some professional members and some public members, or however you want to call them. I think that would be feasible.

Senator HART. It would be somewhat akin to a board of directors in which the president of the company and certain of the vice presidents also sit as directors.

Dr. COMPTON. Or ex officio members.

Senator HART. And they are at the same time the executives of the concern.

Dr. COMPTON. Yes; I think that would be workable.

Senator HART. Would you think that that thought is serious enough for us to pay a good bit of attention to?

Dr. COMPTON. Well, if you ask my preference as to this sort of thing, I would recommend a commission in which the members were appointed without salary to serve part time, but any administrator and probably a deputy administrator ex officio also members of the board.

Senator HART. Well, to carry it a little further, one very excellent feature of Senator McMahon's bill is setting up certain compartments. We may not have them just right, but presently there are four, and the heads of those departments would be, reverting to the industrial, parallel to the vice presidents of the concern. There would be several of them. Would their inclusion in the Commission look to be a good thing to you?

Dr. COMPTON. Yes, sir; I should think that would be a good solution. That might make a fairly large Commission with the Administrator and the heads of the four divisions. You would have five men there who are full time. Then I should think there should be at least an equal number of public members serving part time.

Senator HART. Thank you, Doctor.

Dr. COMPTON. I don't have any one pattern that seems to me the best thing, but the thing I want to argue for is that the bill not be passed in its present form, in which it would exclude from membership on the board some types of persons that I think would be very helpful; it is that, as presently drawn, it would exclude some people that I think would be very helpful on the board.

Senator HICKENLOOPER. Let me ask you this, Doctor: It is probably of little consequence at the moment, but these part-time members—would it be desirable to provide that as to part-time members they should get the equivalent of the same per diem pay that the full-time members got when they were performing the duties?

Dr. COMPTON. I should think so; yes; as far as the meeting of expenses is concerned. I believe any man serving on a voluntary basis should have a fairly generous expense account, and should not be required to itemize down to the last cent in an expense account;

that is, a per diem, as we did, for example, in our OSRD organization throughout the war. All of us who served without compensation received a \$10 per diem. I am a member of one or two other boards in which there is a \$25 per diem, and in which I confess I make money, which I am a bit ashamed of. But \$10 is a little skimpy if you are too busy to try to save money on taxicabs, and so forth.

Senator HICKENLOOPER. If you live for \$10, you have to look around a little as to where to eat.

Dr. COMPTON. There is one point that was raised in regard to membership on the Senate, and I promised to try to defend the Senate. In some quarters I think there is a feeling that the affairs of government can only be safely entrusted to men that are on the Government pay roll. I think in many cases this is necessary and inevitable because of the nature of the job and its responsibilities, and I would say certainly the Senate, knowing the full time has to be put in on the Senate, is one of those. There is just no other possible way of handling its business. But in other cases it is not necessary or, in my judgment, even desirable to have paid career men in the office, and I think that this is one of those cases.

Now, one of the best illustrations I think of in the Government of an organization that is somewhat similar to this atomic energy, although less important, and that has worked very well by the type of commission that I would advocate, is the National Advisory Committee for Aeronautics. It is similar in this sense: It has to do with a pretty highly technical subject, and it was created at a time when that subject was pretty much in its infancy. The Government recognized that it was important for the national interest to get ahead in the development of that field. This National Advisory Committee for Aeronautics has been operating since the time of the first World War, and has done a most excellent job. The chairmen—present and past chairmen—of that commission have been extraordinarily able men, devoted to the job. Those men were President Ames, of Johns Hopkins, then Dr. Bush before he went on to the OSRD, and presently Dr. Hunsaker. I am certain that none of those three men could have been secured to serve on the National Advisory Committee for Aeronautics if there had been the specification that he had to give up all other employment and interests. But I know all those three men personally, and I know that they did their jobs well and very devotedly, and put in from time to time pretty close to full time on that job when it was needed. That is true of their other colleagues. That Commission has some ex officio members, representatives of various Government positions, and then it also has the public members that are appointed by the President, I believe, with the consent of the Senate.

Those are some of the reasons why I believe that this section 2 of S. 1717 is inferior to the alternative type of organization that is proposed in the May-Johnson bills which provide for an unpaid, part-time policy-making commission, with members serving a definite term, a 9-year term, and with a paid, full-time administrative organization under an Administrator appointed by the Commission, or it might alternatively be nominated by the Commission and appointed by the President with the approval of the Senate.

Senator HICKENLOOPER. Doctor, may I ask you about this 9-year term? Would it be wise, under a part-time proposal such as you make, to make the original appointments for that substantial length

of time, or would it be better to start a part-time service on this board for perhaps a shorter period until we know a little more about where we are going with this atomic energy?

In other words, my point is that 9 years freezes it for quite a long time in its inception. Five years from now we might be willing to make it 15 years, or might want to make it 2.

Dr. COMPTON. There is a balance of advantages and disadvantages that has to be weighed. In the May-Johnson bills there are three appointed each year for a 9-year term, so there is some turnover. The danger of a long-term appointment is that if you get the wrong man in there, he may not be so bad that you can impeach him or throw him off, but he may not be helpful and it may be desirable to make a substitution.

Senator HICKENLOOPER. I think history has shown that practically without exception there are ways and means of securing the resignation of an undesirable person.

Dr. COMPTON. But history has also shown that those ways are not always followed out when they should be. I should think a shorter term, with the possibility of reappointment on a second term, but not more than a second term, perhaps would be a safe provision. There is the advantage in not making it too short, because it takes a little while to learn the job.

Senator HICKENLOOPER. Of course any term appointment must be an arbitrary term. We must center on 5 years, 4 years, 9 years, or some other term.

Dr. COMPTON. If I had just the power to draft a thing of this sort, I wouldn't make the term as long as 9 years; I would make it a shorter term—3, 5, or something of that sort, with the possibility of reappointment. I would probably choose the longer term, say 5 years, with the possibility of reappointment.

Senator MILLIKIN. Don't you think, Doctor, that all turns on whether you adopt the theory of a tenure which carries with it the exclusion of all other business interests?

Dr. COMPTON. Yes, sir; if it excludes all other business interests, then I think it has got to be a long term, preferably life. It should be so that the man can think he holds that job as long as he is competent.

Senator MILLIKIN. That is the turning point one way or the other?

Dr. COMPTON. Yes, sir. If there is the exclusion of all other business, then I don't see anything other than letting this be a career job, because the man would be "out on his ear" otherwise.

The CHAIRMAN. Doctor, Cabinet officers hold at the pleasure of the President, do they not?

Dr. COMPTON. I think so.

The CHAIRMAN. I can tell you they do. The difficulty many times, particularly in a change of administration, is to keep them out instead of getting them in.

Dr. COMPTON. If I might go on, gentlemen, to a conclusion, I am not sure whether I am supposed, Senator McMahon, to comment on any of the other bills or just this S. 1717.

The CHAIRMAN. We want any comment you wish to make.

Dr. COMPTON. I have a couple of comments on the May bill and the Johnson bill—that is, H. R. 4566 and S. 1463.

I understand that these in their original forms were identical, or essentially identical. The May bill has been revised and very much

improved. So far as I know, the Johnson bill was not correspondingly revised because, I believe, that thing was then turned into the hands of your committee, as far as the Senate was concerned.

I believe that H. R. 4566 is a good and acceptable bill as it now stands except for one feature, and this criticism applies also to a somewhat greater extent to the corresponding portion of the Johnson bill. In the Johnson bill on page 12, lines 14 to 20, there occurs this statement:

The Commission is authorized to extend the provision of this subsection (b) to any deposits from which there can be refined or produced other metals or substances determined by the Commission to be readily capable of or directly connected with the transmutation of atomic species, the production of nuclear fission, or the release of atomic energy.

Now, when you come to the transmutation of atomic species, you have got a very big program. My scientific friends, who have been closer to this in the laboratory in recent years than I have, tell me there is only 1 of the 92 chemical elements of which the earth is composed that has not in one way or another, with the cyclotron or otherwise, been involved in the transmutation of atomic species, and that one probably will soon come into the picture.

Just literally, as this bill is drafted, it gives the Commission authorization over all of the elements of which the earth is composed, and as I said one time facetiously, that would leave only contemplation and religion outside the jurisdiction of this Commission; that obviously is not intended.

The point there is that scientifically in the laboratory ways have been found of transmuting a very large majority of the chemical elements, transforming them from one element to some different element, and probably ultimately all of them. There are very few of these transmutations that have anything except a purely scientific interest, and it is only a very few—at the present time only the fission of uranium-235 and plutonium and their attendant processes—which involve atomic energy in a foreseeably useful or dangerous form.

Senator HICKENLOOPER. May I interrupt at that point and say that the matter of definition has been discussed by the committee, and it has been suggested by some of those who know a lot about it that some restriction on the definition along this line be made: Products that are capable of releasing atomic energy and a self-sustaining chain reaction.

Dr. COMPTON. That would make it all right as far as I am concerned.

Senator HICKENLOOPER. That verbiage is not perhaps scientifically accurate, but that was the sense of the suggestion.

The CHAIRMAN. Would that definition cover synthesis as well as fission?

Dr. COMPTON. No; that wouldn't. I think that would cover only the fission. You are thinking of the synthesis of producing plutonium, for example?

The CHAIRMAN. I am thinking of the gaseous elements at the high point of the periodic table inasmuch as there is, as I understand it, a prospect of development of atomic energy through a combination of lighter elements.

Dr. COMPTON. Yes; there may be possibilities there.

Senator HICKENLOOPER. I didn't intend to be technically accurate on the statement; I was merely suggesting the idea that it had been

suggested as "products capable of releasing atomic energy or quantities of atomic energy in an explosive manner in a self-sustaining chain reaction."

Now, I presume that synthesis may, although I don't know, involve a chain reaction.

Dr. COMPTON. Well, I think something along that line would cover what Senator McMahon has in mind, because the synthesis in this case is a process that is carried out as part of the program for getting this self-sustaining chain reaction.

I had suggested something here which is along the same line; that is, in the May bill, H. R. 4566, which makes an attempt to meet this, but a pretty weak attempt, I am afraid, by introducing the words "peculiarly related to," which limits the broader statement of the original May-Johnson bill to "substances readily capable of or peculiarly related to the transmutation of atomic species, the production of nuclear fission, or the release of atomic energy."

But "peculiarly related to" is still pretty indefinite, and it seemed to me there might be introduced in the May bill, H. R. 4566, on page 30 an additional definition under that list of definitions, as follows:

The term "peculiarly related to" means essentially involved in the production of fissionable material or release of atomic energy in processes capable of producing materials or energies in such appreciable quantities as to be commercially or militarily significant, or to constitute a national hazard.

That is perhaps a little clumsy but you had essentially the same idea. I think something of that sort should go in if a bill of the type of the May bill is passed.

I think in S. 1717 that is satisfactorily taken care of.

The CHAIRMAN. Doctor, in the May bill it is provided, of course, that there shall be an advisory commission. Now, you have a representative from MIT on the Aeronautical Commission, have you not?

Dr. COMPTON. Well, at the present time Dr. Hunsaker is the Chairman of it.

The CHAIRMAN. What department does he head?

Dr. COMPTON. He heads our aeronautical engineering department, and also our mechanical engineering department.

The CHAIRMAN. Would it be a violation of good faith to tell us what his salary is?

Dr. COMPTON. Off the record.

The CHAIRMAN. Do you think that the type of men, such as the good doctor is, might not be perhaps eager to take a place at \$20,000 on this Commission?

Dr. COMPTON. Off the record.

The CHAIRMAN. Doctor, in ordinary peacetime, how many hours a month do you think you could get from part-time Commissioners?

Dr. COMPTON. I think that depends very largely on the importance of the job. Now, I have told you a little bit about my circumstances. I have put in, in 15 years, as far as I can estimate, the equivalent of 5 full years of time on these Government commissions.

The CHAIRMAN. Most of that has been in wartime, has it not?

Dr. COMPTON. Either war or prewar. It has been in an emergency, that is true.

The CHAIRMAN. And of course the same considerations would not apply in times of peace?

Dr. COMPTON. They would not, sir, completely. The National Advisory Committee for Aeronautics is the best example I know, be-

cause it is most nearly along the line I am thinking of, and I know there in peacetime that the men I have known on that Commission who have been either chairmen or on the executive committees, have put in very considerable amounts of time, at times putting in weeks or months continuously on the job.

The CHAIRMAN. Off the record.

Dr. COMPTON. On the other hand, you might want to interest people such as Donald Douglas, Glenn Martin, Lindbergh, Orville Wright, or people of that sort.

The CHAIRMAN. But they would still be available as members of the advisory committee to the full-time workers, as you might call them.

Dr. COMPTON. That advisory committee could be an exceedingly useful committee if its advice were taken.

Now, I have had a little experience on governmental advisory boards when it was pretty clear that those advisory boards were window dressing, and that is not a satisfactory situation to be in. It all depends on whether the agency that you are trying to advise really wants your advice and is willing to take it or not, and there is danger in that.

The CHAIRMAN. On the other hand, Doctor, you of course have this consideration, haven't you: On this we can agree, it is going to be a very powerful Commission, extremely powerful?

Dr. COMPTON. Yes, sir.

The CHAIRMAN. Don't you think it is of some importance that the people of the country believe that they have people serving but one interest, not open to the charge that they have other conflicting interests in their private lives which might subconsciously guide them in their decisions?

Dr. COMPTON. I think that is important, and for that reason I, for example, would immediately write myself off if anybody were to think of me for this sort of job. For fear anybody might get the idea I might be on such a commission, I would write myself off, because I have too much conflict of interest. We have too much of a group at MIT that wants to get into this thing.

The CHAIRMAN. That is the point. Here you are, one of the leading men in the field; and so acknowledged all over the country, and you write yourself off an advisory committee. Now, it is men of your type—you wouldn't phrase it that way, but I will, because you are too modest—that you are urging for appointment to this Commission. The very reasons that you give as to why you would feel disqualified, or would not accept appointment to an advisory committee, would be applicable to many others who perhaps would not be as sensitive to the situation so as to decline to serve.

Dr. COMPTON. I have tried to think of a good many individuals that I think would be good for this job, and I can think of some very good men who would not have this handicap and whom I don't believe would be available on a full-time basis.

Senator HICKENLOOPER. Doctor, isn't it reasonable to think that men or women, people of the type and ability that you have been referring to as possible appointees on this part-time Commission, would be of the type that if they undertook the responsibility of this part time job would not only undertake it with the intention to devote all the necessary time to it that the situation demanded, but

they would also have sufficient grasp of their other responsibilities and be able to evaluate them, and when they accepted the job it would be a well considered acceptance of a highly important job, and it would receive the attention of their abilities?

Dr. COMPTON. I believe so; yes. Perhaps this thing we are talking about can be broken down into two: One is how the Commission should be appointed, and the other is the point that I brought out in my testimony, the question as to whether it is advisable to have the same body charged with the administration as is charged with the determination of policies and the criticism of the administration.

Now, if there were provided in S. 1717 a provision for an administrator and an administrative staff which you now have provided in your four divisions—an over-all administrative staff—and the Commission became primarily a policy-making commission and did not also themselves head those divisions, then I think it would be a sounder organization.

The CHAIRMAN. If I were in the Department of Justice—as I was for some years—in charge of the Criminal Division, it would strike me that my usefulness might be decidedly impaired if in setting policies, as I was called upon to do, in criminal prosecution, I also ran a law office on the side. You run into that conflict at every turn of government.

The Interstate Commerce Commission members would hardly be thought to be appropriate if one of them was a railroad president.

Dr. COMPTON. You run into that, of course, in every place, and if you ruled out everybody that had a conflict of interest, you never could get anything done, if you carry it to the limit.

Take, for example, operations on some of these foundations—the Rockefeller Foundation, for example. I happen to be a member of their board of trustees. I raised the question when I was asked to become a member—I said, “I don’t want to get into a situation in which I cannot bring before this foundation any fine project that the Massachusetts Institute of Technology may want to have considered.”

They said, “That is fine; we will take care of that. You need have no embarrassment at all.” And they did take care of it in this way. At any time, under that foundation, when any grant is under consideration or any project under consideration that concerns an institution of which a man is either a member or a trustee, or anything of that sort, he leaves the room and he hears nothing whatsoever of the decision. All members are honor-bound to give him no information of what went on in the discussion. All he learns about is the final action that they take.

That is universally followed. This conflict of interest is a thing that comes in very generally, and has to be handled. The difficulty is that unless you can find some way of working so as to permit people that might have a conflict of interest to participate in the program, you immediately cut out a lot of the most effective people you could have.

The problem seems to me to be to set the thing up in such a way that the man who has the conflict of interest is on the one hand never personally embarrassed, and, on the other hand, is never in a position where he can exert influence on his own show. I think that is a policy scheme that has to be set up within the organization, but I would hate to see a thing like atomic energy, as important as that,

set up in such a way that you would say that everybody who was concerned in the field of atomic energy in his other affairs was automatically ruled out.

The CHAIRMAN. Of course, they would be eligible for the advisory board that is provided for under the bill.

Dr. COMPTON. Well, I have given my best judgment. I may not be right on this.

The CHAIRMAN. It is just a disagreement as to the philosophy of the thing between you and myself.

Senator MILLIKIN. May I suggest in that connection that this conflict of interest is a matter of degree. In the Senate, for example, we have many farmers, men who own farms, who do not consider that there is any conflict of interest when they legislate on farm problems, and legislate in a way that may affect them importantly so far as their own farms are concerned.

It is a common practice in the Supreme Court of the United States for a man to disqualify himself if he has had some conflicting interest in the litigation before him.

I respectfully suggest that unless you can find a man from Mars or the moon, or some place, he has had some connection with the rest of the world and is found to run into conflict of interest in remote degree. When he comes into conflict of interest in close degree, then as any other honorable man would do, he disqualifies himself. Isn't that correct?

Dr. COMPTON. Yes, sir; it is.

Senator MILLIKIN. If you assume, Doctor, that you are going to have a top commission with the benefit of instruction from specialists, it doesn't particularly matter who is on that, what profession the men on the top commission may belong to, if they are honorable men to start with, if they are intelligent men, if they have a sensitivity to progress in science, if they have a sensitivity to our economic situation and to the problems of industry, if they have a sensitivity to our national defense. You might find that any place, if those are good qualifications for membership on that sort of commission. Would you disagree?

Dr. COMPTON. No; I agree with that, sir.

The CHAIRMAN. Doctor, Senator Millikin used the example of the Supreme Court Justice disqualifying himself. It is my hope that membership on this Commission, if set up as proposed in the bill, would be considered of equal dignity, on account of the life-and-death potentialities of the decisions of such a commission, to be on a par with justiceship on the Supreme Court.

Certainly I am sure that neither you nor I would want Justice Burton or Justice Stone or any other justice to be operating a private law office in Washington, New York or any place else, would we?

Dr. COMPTON. No, sir; we would not.

Senator MILLIKIN. I want to say that I quite agree, Mr. Chairman. For example, there certainly would be a red lantern on the appointment of the head of a great power concern, let us say, to this Commission; for obviously he would be exercising judgment in his job that might very easily bring up a very clear conflict between his private interests as the head of a great power concern and his public interest in relation to this energy.

Dr. COMPTON. I think my testimony on this, of course, is colored by my own experience; my own experience has been that those jobs

that have been handled by the method that I advocate have been handled in a manner that has been both efficient and honorable.

I would also say this: In the experience of this Science Advisory Board in 1933 and 1934, it was not a very romantic job that was done. That was at a time when the scientific budget had been cut to the bone, and the question was how to carry on. Our job was at the request of the Secretaries of the Departments, or the Director of the Budget, to go into some of these scientific bureaus to see how they could be salvaged and what best could be done. We had a board, and quite a number of subcommittees, and we never asked a single man to serve on that board or one of the subcommittees who turned it down. I think there must have been 50 or 75 men engaged in those studies, and everyone dropped everything he did or was doing for a period of a year or 2 years.

Senator MILLIKIN. Were they scientific men?

Dr. COMPTON. They were, sir.

Senator MILLIKIN. Do you believe this is a correct statement: that probably of all of the professions in the world, the scientist is less interested in monetary gain—I am speaking of the pure scientist?

Dr. COMPTON. I don't know of any other group that has less interest in monetary gain, and I have had enough experience in seeing scientists get jobs one place or another to know that the interest and importance of the job far outweigh a differential of 25 or 50 percent in the salary they get from it. That is always true.

Senator MILLIKIN. I think you will agree that we all have egotistical motivations. The motivation of some is to have the biggest car in town or the most money in town.

Is not one of the egotistic motivations of scientists to have his name on a sound paper to receive the kudos of his fellow scientists, and to build up his reputation with papers and contributions, and to be known among his fellow scientists as a good man in the field? Is that not the main ego satisfaction that the scientist gets?

Dr. COMPTON. Yes, sir.

The CHAIRMAN. Wouldn't the same considerations, Doctor, that Senator Millikin has just graphically expressed be present in the drawing power of a full-time, well-paid commissionership on this Commission?

Dr. COMPTON. It would have a drawing power; I don't deny that at all. But there are some people that it would not draw who would be very useful. As you say, you can get help from them on the advisory commission.

Senator HICKENLOOPER. I wish to explore one thought for just a moment on the question of the executive and administrative set-up of this Commission. I think it is a difficult problem and a most important problem as to how it is constituted, but I have in mind, Doctor, a particular board at this moment which is very important—and I won't say where it is—which has tremendous authority in a technical field.

I am quite sure that the membership of that board that exercises final authority is very mediocre. The capacity of the members to evaluate recommendations that are given to them by experts is not great. That board consequently has been buffeted from one side to another on decisions due to the lack of the ability of those who control the policy to evaluate the expert advice on one side or the other that is given them.

I think we have sometimes run that danger on arbitrary appointments in controlling positions, and then rely upon really highly technical advice at the lower levels to keep the board straight.

In other words, it would seem to me that in a matter as important as this, and with the implications and ramifications as great as we think this is, those who control the policy or the last word on it should have at least as great a mental capacity for analyzing and arriving at conclusions—whether they are expert in a particular field of advice or not—as the experts who advise them. If they are a shade below that capacity, then we are apt to get an uncertain course, and we are apt to get into a position where the policies of that board, because of the very conflicting advice they may get and their lack of ability to evaluate, may be not what it should be.

Dr. COMPTON. You have expressed very well, I think, better than I have expressed, one part of the concern I have here; because it seems to me that the advisory boards primarily should be experts, advising as experts, and not advising as national policy makers. The commission itself has got to be the one that makes the policy, subject to Congress.

As you say, it has got to have a caliber that will command the respect of the public and the respect of these advisory groups.

Furthermore, I think that one very important safeguard in a position of this sort is that the man should not be under influence in his decision by the fact that his \$20,000 or \$50,000 a year may depend on the decision that he makes. When you get in as high a position as that, I think that is pretty important, and you cannot always get it. There are some types of situations where that cannot be done; for example, the Supreme Court is one of those.

The CHAIRMAN. And the Senate, Doctor.

Dr. COMPTON. And the Senate; yes.

The CHAIRMAN. And the House.

Dr. COMPTON. But I believe that the thing can be done here—not as far as the work of the administration is concerned, but as to the decision on the major policies and the evaluation—as one stage between the administrator and the Senate, for example, as to how the thing is going on, and there should be a group there that is more independent than a group would be set up under this bill.

Senator HART. Mr. Chairman, if you have finished that particular angle of it, I would like to ask President Compton to turn back to what he said about the 1-year termination of all contracts, and so forth, after which, as the words of the bill now provide, the Commission shall arrange for the exclusive operation of facilities employed in the manufacture of fissionable materials.

My question is, viewing the possible magnitude of such production for peacetime purposes, do you think that the Government can ever arrive at a point where they can as efficiently operate those plants as they have very likely been able to do under private management, under contracts, or for gain?

Dr. COMPTON. I don't believe so. How big the differential would be, I wouldn't know, or whether the differential is worth paying; but I don't believe they can be handled as efficiently, and I think at the present stage where the thing is in so much flux—as, for example, will these production methods be rendered obsolete within a limited period of time by a method of enriching the piles, or some other material, or

something of that sort?—the matter might become a problem that would take the finest engineering talent that could be found to handle the modifications. I don't know any place inside the Government where that is found.

I suppose the Army engineers come closest to it, and they have done a magnificent job; but they have had to get the outside help to do this type of construction, because there is no background of experience for that. To make that shift by law—say that that shift has to be made within a period of 1 year—it seems to me is running a big risk.

Senator HART. I was attempting to carry you a little further than that, Doctor. There are arguments on both sides, and very good arguments for confining this absolutely to the Government; and there are other considerations. Now, if this does grow into a really big business for the production of power or other peacetime purposes, as it may, I just wonder if you think that the Congress should at this time lay down a law that private business never can engage in it except under very tight licenses which would allow not too much private industry?

Dr. COMPTON. I think one thing we all agree on is that this is so important for national safety and international relations, that the control has got to be a tight control anyway you work it so far as the control goes. It seems to me there is no question but that the Government has to retain tight control over this thing because of its nature and significance. When it comes to how that control is maintained, whether it is by actually doing all the work itself or by allowing it to be done under contracts or under license, I think it is too early at the present stage to say what ought to be done. I think the thing should be left flexible, and I can quite easily see that it might be desirable that the Government operate at least some of these plants and sell the byproduct power, or something of that sort.

I think it may be a big enough thing so that in the long run it has got to be Government-operated, but I would hate to make the decision in the legislation right now. I would rather see that left flexible, and see how that thing develops. The legislation could be made later after we find out how it goes.

Senator MILLIKIN. I believe you have answered a question I wanted to ask you, Doctor, pursuing Senator Hart's theme. What we can do with this energy and how we are going to do it depends largely on the state of the world. If we were to reach a period where we have dependable assurance of world peace—and I mean dependable assurance of world peace—we could have an entirely different viewpoint toward the controls the field require at the present time. Is that not correct?

Dr. COMPTON. Oh, yes.

Senator MILLIKIN. Is it not also correct that at the present time this is a field that requires some Government subsidy if we are going to go ahead with it? To put it another way, do you know of any private industry that is willing to spend the money necessary to carry on from where we are now?

Dr. COMPTON. No, sir.

Senator MILLIKIN. And there is precedent for that. I think we have appropriated \$30,000,000 for research on the use of coal and oil, because private industry would not interest itself in the subject. I think an argument could be made that this is something that, if you want to go ahead with it, has to have some Government subsidy.

Dr. COMPTON. I agree with that, sir.

Senator HART. But you still do agree that we should not be too inflexible in that respect in any law we put on the books at this time?

Dr. COMPTON. Yes, sir.

Senator MILLIKIN. But you do visualize that the time might come when the public safety factors were no longer predominant, and at that time it might be advisable to turn the whole thing loose into private enterprise?

Dr. COMPTON. Perhaps, under adequate control. I think the thing is inherently so dangerous, there are so many dangerous things that can happen if it is not properly handled, that it will always have to be a thing that is under very close Government supervision. I think the time might come when there would be large industrial use.

Of course, I think this bill is well drawn on that point as regards industrial use of the product, because, if I understand it correctly, the bill is drafted in such a way that a license can be given, a nonexclusive license for industrial use on appropriate terms; so that as far as using the product is concerned, I think the bill is all right.

The only place where this question arose was on the actual job of manufacturing the fissionable materials in the first place.

Senator MILLIKIN. Mr. Chairman, I would like to ask one more question, and then I promise to desist.

Do you feel that an inspection system is feasible which, at the same time, will not violate the necessary secrets in laboratories of private industry that are not engaged in producing atomic energy?

Dr. COMPTON. I think so; yes. We have had some minor experience to back that. We know that the fire-insurance companies have inspection of plants, and they go into the plants of one company and its competitors, and so forth. I have never heard of any scandal in that connection.

Senator MILLIKIN. Of course, you could stand a fire. The whole theory of a fire-insurance company is to be able to stand the fire; whereas, we cannot stand an attack of atomic bombs.

Dr. COMPTON. But the inspection you are thinking of is the inspection to find out the conditions under which this material is being used—first, whether it is being worked with at all, and second, the conditions under which it is being handled.

Senator MILLIKIN. And whether there is a clandestine development of the energy for an improper purpose.

Dr. COMPTON. It will be a difficult problem, but I think the difficulties of not doing it are so much greater than the difficulties of doing it that there can be only one answer to that.

The CHAIRMAN. Doctor, you said that you were in Japan at the time the interim committee was functioning?

Dr. COMPTON. Yes, sir.

The CHAIRMAN. Did you view those Japanese cyclotrons while you were there?

Dr. COMPTON. I saw the two of them that were in Tokyo. I think there were three others in Japan that were completed, and one other in the course of construction; but I saw only the two that were in Tokyo.

The CHAIRMAN. Did you approve of their destruction?

Dr. COMPTON. No, sir; I did not.

The CHAIRMAN. Were you consulted about that?

Dr. COMPTON. I was consulted in Japan with reference to the conditions under which they should be allowed to operate, and the scientific mission of which I was a member drafted the regulations which were put into effect under MacArthur's order, under which they were operating at the time when I left.

That is, conditions were that in the first place we recognized that the cyclotron is not a military tool. I think Dr. Langmuir, before your committee, said "It produces knowledge; it doesn't produce bombs," and we recognize that. We set up the regulations wherein all Japanese nuclear scientists should be required—who were doing any laboratory work—to report the objectives and nature of their work at such periodic intervals as the commanding general might order. Second, of course, they should be open for inspection at any time; and third, they should engage in no work that could conceivably produce quantities of uranium-235, plutonium, or similar elements which would be capable of being weighed with the most sensitive chemical balance. Finally a later order went in that limited their work to production of tracer materials for use in biological and medical research.

The CHAIRMAN. Did the commanding general approve of that report that the scientific mission made?

Dr. COMPTON. Yes, sir; it was the official order, the official ruling under which that work was going on at the time when I left Japan at the end of September.

The CHAIRMAN. Were you surprised to see that they had been destroyed?

Dr. COMPTON. I was.

The CHAIRMAN. Do you know who caused their destruction?

Dr. COMPTON. Nothing except what I have read in the papers, no. I know the Secretary of War, to whom I wrote a letter of protest, accepted full responsibility. He said the order had gone out over his name. He said that he personally had known nothing about it, and I can well understand that.

The CHAIRMAN. Did he tell you who was responsible in the War Department for this reversal of the scientific mission's advice?

Dr. COMPTON. No, sir; I don't know that, and the War Department here may have known nothing about the scientific mission's advice, and probably didn't. I don't know that, and I have not tried to find out.

The CHAIRMAN. It might be well for this committee to find out.

Dr. COMPTON. Well, I think it was unfortunate. It is a dead issue; the thing won't happen again. I think it was unfortunate and it disturbed a good many people.

Senator MILLIKIN. Was it a good cyclotron?

Dr. COMPTON. It was a good cyclotron. It was operated by a Japanese scientist named Nishina who was a personal friend of Ernest Lawrence, and when Lawrence built his next-to-the-largest cyclotron—or perhaps one just before that—he ordered duplicate parts, magnets, and coils, for his friend Nishina. That was the basis of Nishina's cyclotron. As far as the major construction parts were concerned, it was identical with one of these at the University of California.

Senator HICKENLOOPER. Are there other cyclotrons operating in Japan now?

Dr. COMPTON. I believe not.

Senator HICKENLOOPER. Were all the cyclotrons destroyed in Japan, or just one?

Dr. COMPTON. I cannot answer that question; I don't know. I have just seen the pictures of this big one of Nishina's being destroyed, and I have had no report from Japan. If I recall the newspaper reports, it was that they had all been destroyed.

Now, Nishina had two cyclotrons. There was one smaller one, and it was completely destroyed in one of our incendiary bombing raids. I never would have believed that an incendiary raid could do what was done to that mass of iron and copper, but it certainly was completely wrecked. The big one that was later destroyed by the Army was not damaged in the raid.

Senator AUSTIN. Was it melted?

Dr. COMPTON. The iron was not melted; the copper was melted down. The iron warped, but not melted.

Senator MILLIKIN. What is the size of one of those big ones, how many tons?

Dr. COMPTON. I can not remember the tonnage. The instrument was one that would have pretty well filled this section of the room here, giving space enough to get around it. I forget the tonnage.

Senator HART. I have one question which the Doctor may not wish to answer.

I don't know, Doctor, whether or not you have touched upon security of secrets very much in these manifold duties you have been carrying on for the Government; but if you have, I would like to ask if you think the provisions of S. 1717 for security as of now are sufficient. They fall back upon the Espionage Act, with the possibility of administrative softening or hardening, but nothing else. The question is whether you think that as of now that would be sufficient?

Dr. COMPTON. Yes, sir; I thoroughly approve of those provisions here. I think they are sufficient, and I think they are very wise, because as I see the situation, we are not worried about what happens in the next 2 or 3 years; we are worried about what may happen over a longer period than that. The most important single thing for us to be in a strong position is to develop this field of atomic energy and all the scientific and engineering background just as fast as we can. That cannot be done under security restrictions.

It seems to me that from a standpoint—speaking solely now of national defense—the wisest thing we can do is throw these restrictions to the winds as regards the scientific facts, the facts of nature. I am not referring now to the industrial technique and know-how.

As far as the scientific facts are concerned, I think security restrictions should be completely removed and we should go ahead just as fast as we can possibly get ahead in the development in that field.

If at any time the country gets under the storm clouds, or something of that sort, then things can be tightened up as they would in time of emergency. If war should break out, then of course the restrictions would be put on again.

I have used this illustration, I think, once before. I think our national security factor in this thing is analogous to something like this: Suppose that back when most of you were children and I was a young man, about the time the automobile came in, the War and Navy Departments had said, "Well, this internal-combustion engine

looks as if it ought to have a very great military significance, and we will classify that information and develop it for our military purposes in trucks, tanks, and maybe airplanes"—if they were envisaged at that time.

I think it is clear to everybody that under those conditions our great automotive industry never could have been developed to anything like the strength that it is now. Then, when we got into this war, we might have had some secrets on our shelves, but we would have had an absolutely inferior product and wouldn't have had the productive capacity which was far more important than any secrets we had in winning the war.

I think we should look at this atomic energy thing in the same way at this stage.

Senator HART. Just one other thing, Doctor. I don't think that you mean that such production secrets as we still retain should be disclosed any further than they have been?

Dr. COMPTON. Yes; I agree. I think they should not be disclosed and I think we should keep that industrial know-how at least until such time as our country, our Congress, is convinced that an international arrangement has been arrived at which we can go along with.

When that time has come then I think our country should take the lead in its generosity in cooperating with that organization; but until that time, I think we should keep this know-how.

Senator HART. Would there ever be any good in our telling the rest of the world how to make a bomb?

Dr. COMPTON. I cannot see any good in the world in that; no.

The CHAIRMAN. Doctor, if, at the time Rutherford split the nitrogen atom back in 1919, restrictions such as now are exercised by the War Department on the whole field of nuclear energy were imposed, do you think there would have been the advance that occurred between 1919 and 1939?

Dr. COMPTON. Certainly not; no, sir. As you gentlemen know perfectly well, this knowledge of nuclear physics just advanced by leaps and bounds in the late 1920's and 1930's. This fission idea came in, in about 1939. I think it will go ahead by leaps and bounds again if the thing can be set free to go. It will go much faster in the future than it has in the past, if conditions are right.

Senator HICKENLOOPER. Our intensive activity in the investigation in this field in the last 4 or 5 years has been in the presence of war to develop exclusively a weapon of war.

Dr. COMPTON. That is right.

Senator HICKENLOOPER. And that was the sole and only immediate object that we had in mind.

Dr. COMPTON. That is right.

Senator HICKENLOOPER. Therefore, do you think—whether compartmentalization was the answer, or some other matter—we should have retained strict secrecy so far as the military activity, objectives, and methods were concerned during that period?

Dr. COMPTON. During the war period, I think the thing has been handled just right. I think we can regret that out of all the work these scientists were doing there wasn't more work done in science to develop the art; but that was inevitable. It was cast aside.

Senator HICKENLOOPER. Our object wasn't to advance the art but to produce a weapon of war as quickly as possible, I believe.

Dr. COMPTON. I have no criticism at all of the way it was handled during the war. My comment is only as to what we do next, throwing the scientific side of the thing open.

Senator HICKENLOOPER. So far as I have been able to observe, Doctor, it seems universal that the intention of everyone that I know, including the Army, is that scientific information should be given when, as, and if Congress sets up a civil body to take charge of this. I think the secrecy at the present moment which is being maintained is merely a carry-over from the military responsibility which probably they would like to divest themselves of.

Dr. COMPTON. I am sure they would. I have heard various ones say they would.

The point is, as I mentioned earlier, knowing that this Federal Atomic Energy Commission is going to be appointed, the War Department doesn't feel free, as I gather it, to make decisions on security, on availability of materials, on setting up or making facilities available to universities, for example, or to industry, or things of that sort, because that would be doing something that the Congress intends this Commission to supervise.

Senator HICKENLOOPER. They accepted the responsibility under the military secrecy and the military objective, as I understand it.

Dr. COMPTON. Yes. Incidentally, I would like to say this: It is going to take some time to get this Atomic Energy Commission set up and educated and operating, and I have already made a plea for as prompt action as can be taken. In fact, I would go further in my plea and say that most of these minor details of definitions and things of that sort I wouldn't waste time on at this stage, if it is going to delay the passage of the Act. I would wait for those things to be corrected in supplementary legislation if they cause a delay.

In the meantime, I think it is most important that the Manhattan district retains the authority and the support necessary to do what it can in the interim until the Atomic Energy Commission is ready to take over.

Otherwise, everything stops.

Senator HICKENLOOPER. It is the only authority we have now.

Dr. COMPTON. Yes, sir.

The CHAIRMAN. Thank you very much, indeed, Doctor.

(The prepared statement submitted by Dr. Compton is as follows:)

PREPARED STATEMENT OF DR. KARL T. COMPTON

Senator McMahon, members of the Special Committee of the Senate on Atomic Energy, I appreciate the privilege of submitting to you my views on the proposed legislation for the development and control of atomic energy. I scarcely need to say that I consider this subject to be one of very great national importance. It is also a subject on which it is highly desirable to reach wise decisions and to pass legislation as promptly as possible because, until such legislation is passed, the scientists and engineers who should be pushing forward to secure more complete scientific knowledge of nuclear processes and to develop useful peacetime applications are to a considerable degree "marking time" for lack of authority to exchange information, to secure the materials necessary for research and development, or to secure the financial backing and make the commitments necessary to active development of this field. The Manhattan district engineers are doing what they properly can to bridge the gap until authoritative legislation is passed, but for obvious reasons the program cannot go ahead at anything like full speed until the Congress acts. If such action is very long delayed the United States will lose much of its head start in comparison to such other nations as may already be throwing their full resources into the project.

I have noted with interest and approval the very intelligent manner in which your committee has tackled this problem by informing itself as fully as possible regarding the technical aspects of atomic energy and securing competent technical advice. Benefiting by this approach and by the previous studies and legislative drafts, you have drawn, in S. 1717, a bill which is clear-cut in its definitions and objectives, all of which I approve. In view of the long study which you have made and the extensive testimony which you have already heard, there would seem to be no reason for my further amplification of this statement of approval.

I would, therefore, confine my discussion of S. 1717 to just three points, the first two of which are of rather minor importance and are simply the suggestion of further definitions to avoid possible later confusion. The third point, however, which has to do with the constitution of the Commission, I believe to be of very great importance.

My first point is a technical one, having to do with the definition of byproduct materials in section 5 (c), paragraph (1), on page 10. From the context of (c) I believe that you have in mind by "byproduct materials" those materials mostly "hot" in the sense of being radioactive isotopes, which are produced in the action of a pile or other device in the process of producing or separating such desired end products as uranium-235 and plutonium. As to such byproduct materials I believe that their handling as provided for in (c) is wise and adequate.

However, there is another type of byproduct material which will be involved in the atomic energy program which should be handled differently and which should not be confused with the type of byproducts which I have just mentioned. I refer to the materials which will be byproducts in the process of metallurgical extraction of the basic uranium or thorium from the ores which you define as "source materials" in section 5 (b) paragraph (1).

For example, there is a wide variety of ores from which uranium may be extracted. In some of these the uranium content may be only a few percent or even a few tenths of a percent, but it may be technically and economically feasible to get uranium even from low-grade ores. In the process of extracting the uranium, many other materials will also come out as byproducts, as, for example, copper. Such byproducts would of course be commercially disposable and should be handled in the usual commercial manner, and would come into the atomic-energy picture only insofar as their commercial disposition should reduce the cost of the uranium or similar metal of interest for atomic energy.

I suggest, therefore, that any confusion between the byproduct material which the committee has in mind in this section and the type of byproduct occurring in the extraction of the metal from the original ore could be taken care of by introducing a sentence in parenthesis immediately following the word "material" in line 5, page 10, as follows: "(It shall not be deemed to refer to the non-radioactive substances which may be byproducts of the metallurgical processes involved in separating ordinary uranium, thorium, or similar materials from their ores.)"

My second point refers to the definition of "source materials" in section 5 (b), page 9, line 1. Fortunately or unfortunately, depending on how we look at it, these source materials are very widely distributed and traces of them can be found almost anywhere. I understand, for example, that on the average over the surface of the earth if you take up a good shovelful of dirt it will on the average contain sufficient traces of fissionable materials so that, if they were extracted, purified and properly used, they could supply an amount of energy equivalent to the burning of about 3 tons of coal. Literally speaking, therefore, the definition of "source materials" as now written would require a license from the commission in almost every mining operation. This absurd extreme is of course not the intention of the bill, but it would seem to me desirable to modify the definition of "source materials" to make it conform more accurately to what your committee has in mind.

I would therefore suggest the insertion, after the word "containing" on page 9, line 2, the words "quantities deemed by the commission to be economically recoverable of." Thus this definition would read:

"The term 'source materials' shall include any ore containing quantities deemed by the Commission to be economically recoverable of uranium, thorium, or beryllium, and such other materials peculiarly essential to the production of fissionable materials as may be determined by the Commission with the approval of the President."

Turn now to my third point which I consider to be a very serious objection to S. 1717 in comparison to the corresponding provisions in the May-Johnson bills. I refer to the constitution of the Atomic Energy Commission as provided in section 2 on pages 3 and 4.

This section provides for a commission of five members with quite substantial compensation, who are prohibited from engaging in any other business, vocation, or employment, and for whom there is no specified term of office. This Commission is responsible both for the determination of policies, within the limits and directives established by the Congress, and also for the administration and execution of these policies. In my judgment this is an inferior type of organization and subject to serious objections, of which the following are important.

1. It is not good administrative practice to have the administrative and executive functions in the same hands as the policy-making function. This is illustrated in every type of significant organization in our country. Starting at the top, in our Federal Government the policy-making function is vested in the Congress and the executive function is vested in the President. In every business organization the policies are ultimately set by the board of directors and carried out by the president and his subordinate officers. In every university the ultimate policy decisions are made by a board of trustees and executed by the president and his faculty. The same organizational pattern is found in the great altruistic foundations, like the Rockefeller Foundation, the Carnegie Corp., the Brookings Institution, and the larger hospitals. It is not an accident or mere tradition that the policy-making and executive functions have been so universally separated. It is a result of experience and of the survival of the form which in the long run has proven most advantageous. It is therefore running contrary to all the background of experience to entrust so important an enterprise as the development of atomic energy to one small body of men responsible for their administrative acts and executive efficiency to themselves as policy makers, subject only to the ultimate control of the Congress. It would be much wiser I believe to have a policy-making commission or board subject in over-all matters to the President and the Congress, but, within their directives, determining the policies and in a position to evaluate the carrying out of these policies by an administrator.

2. While the Commission as set up in section 2 could command the services of good men it could not command the services of the best men, and certainly the best wisdom and competence anywhere available will be required to direct and develop the potentialities of a program of such importance to our nation and to civilization. I believe it should be made possible to bring in the policy-making function men of such wisdom and statesmanship, for example, as Elihu Root and Newton D. Baker, if they were now alive. It should be possible to draw on the services of some of the most expert and mature scientists and engineers. It should be possible to bring into the Commission the heads of some of the most important departments of the Federal Government intimately concerned with atomic energy. If the Atomic Energy Commission were established in accordance with section 2, it would immediately rule out from membership all men of this type, yet I feel sure that it is most important that men of such qualifications should be eligible for appointment to the policy-making commission.

3. I believe that the implication of indefinite tenure of membership on the commission is unwise because, in such a new and actively developing field as atomic energy it should be possible from time to time to bring in new blood and new ideas, and for this reason I believe that there should be a term of appointment long enough to insure experience and full competence but not so long as to permit the Commission to fall into a bureaucratic rut.

4. I do not believe that the policy-making function of the Commission should require full time, although it certainly would require very substantial time; in fact I do not believe that the policy-making function could long be very effectively carried out by men who are restricted, as in this bill, from participating in other business, vocation or employment. This objection of course does not carry over to the administrative and executive functions because here certainly there must be a full-time staff for whom this job becomes a career.

5. I believe it undesirable and also unnecessary to provide substantial compensation for the members of a policy-making commission, as distinct from the administrative staff. The salaries proposed in this bill of \$20,000 or \$15,000 per year are generous for governmental employees. However, for the type of individual who seems to me to be called for in establishing our national policies on atomic energy, this monetary reward would not be an inducement. If it were the inducement he would not be the right type of person for the job. This right type of person should be one who took the job as a public duty because of its interest and importance, and there is plenty of past experience to indicate that such men will be available. I would furthermore point out that these proposed salaries are sufficiently attractive to create strong pressures for appointment by men seeking good governmental berths. This is not the type of man to whom

the policies in so important an enterprise should be entrusted. I should interpolate here by saying that I would have very considerable faith in the President and the Congress in their desire to make the best possible appointments to such an important post, but I simply point out that in my judgment the set-up described in section 2 would be a severe handicap.

6. I realize that in some quarters there appears to be a feeling that the affairs of government can only be safely entrusted to men on the Government pay roll. In a great many cases this is necessary and inevitable in view of the nature of the job and its responsibilities. In other cases, however, it is not necessary, or in my judgment even desirable, and I think that this is one of such cases.

The fact that voluntary services to the Nation can be secured and efficiently rendered is amply demonstrated by the performance of the Office of Scientific Research and Development during the past war. Perhaps the best long-term example is that of the National Advisory Committee for Aeronautics, which has operated for over 25 years in a very distinguished and fruitful manner under the direction of a committee serving part-time and without salary, yet devoting a combination of time, energy, and talent because of the interest and importance of the job. No full-time paid commission, for example, could have commanded the services of the three past chairmen of the NACA, President Ames, Dr. Bush, or Professor Hunsaker. At the time of the last war, recognizing the great importance and technical character of aviation, the Congress established the National Advisory Committee for Aeronautics in a manner to command the services of the most competent personnel in the country, and to operate in a manner as fully as possible free from political pressures. It is the same kind of action which I believe is now called for to make the best progress in this similar situation of atomic energy, namely, a situation of great national importance and of highly technical character.

For reasons such as the above, therefore, I believe that section 2 of S. 1717 is unwise and is inferior to the alternative type of organization proposed in the May-Johnson bills which provide for an unpaid, part-time policy-making commission, with members serving a definite (9-year) term, and with a paid, full-time administrative organization under an administrator appointed by the Commission (or it might alternatively be nominated by the Commission and appointed by the President with the approval of the Senate).

I believe that this issue is so important that, if I had to express a preference between the two bills as now written, I should state my preference for the May bill, in spite of the fact that I like the clarity and emphasis of S. 1717 in other respects.

Permit me to conclude this statement with brief comments on the May bill, H. R. 4566, and the Johnson bill, S. 1463. I believe that in their original forms these two bills were essentially identical. The revised May bill, H. R. 4566, is a decided improvement over the original May bill and in my judgment is preferable to S. 1463 in those portions in which they now differ.

I believe that H. R. 4566 is a good and acceptable bill as it now stands, except for one feature, the criticism of which also applies to a slightly greater extent to the corresponding portion of the Johnson bill.

In the Johnson bill, S. 1463, page 12, lines 14 to 20, there occurs this statement:

"The Commission is authorized to extend the provision of this subsection (b) to any deposits from which there can be refined or produced other metals or substances determined by the Commission to be readily capable of or directly connected with the transmutation of atomic species, the production of nuclear fission, or the release of atomic energy."

I suspect that in drafting this bill it was not realized that this phraseology would give the Commission jurisdiction over probably every material of which the earth is composed. My physicist friends who are closer to the new developments than I am, tell me that there is probably only one of the entire group of 92 chemical elements of which the earth is composed which has not been proven in one way or another to be "directly connected with the transmutation of atomic species, the production of nuclear fission, or the release of atomic energy." It was certainly not the intent, nor would it be the desire of the Congress, to place under the Atomic Energy Commission jurisdiction over all the materials of which the earth is composed. As I once remarked, this would leave very few human activities except contemplation and religion outside the jurisdiction of the Commission.

The point is that modern science has found ways of transmuting a very large majority of the chemical elements, transforming them from one element to some different element, and in the process of nuclear fission quite a variety of common

chemical elements are produced as uranium-235 or plutonium (explode) by fission. However, all but a very few of these transmutations are of only scientific interest. It is only a very few, notably the fission of uranium-235 and of plutonium and their attendant processes which involve atomic energy in foreseeable useful or dangerous form. Consequently the above wording in this bill should be redrafted so as to include only those aspects of nuclear processes which are significant from the standpoint of usefulness or hazard.

The May bill, H. R. 4566, attempts to specify more exactly the desired objective by inserting the word "peculiarly," as for example on page 14, line 9, and page 15, line 10, and specifies the substances with which the bill is concerned as those which the Commission determines to be "readily capable of or peculiarly related to the transmutation of atomic species, the production of nuclear fission, or the release of atomic energy." This would leave it to the Commission to interpret the significance of the word "peculiarly."

While this is an improvement over the original phraseology, I believe that it would be still further improved by the insertion of an additional definition in H. R. 4566, page 30, immediately following paragraph (g), somewhat along the following lines:

"(b) The term 'peculiarly related to' means essentially involved in the production of fissionable material or release of atomic energy in processes capable of producing materials or energies in such appreciable quantities as to be commercially or militarily significant, or to constitute a national hazard."

In conclusion, therefore, I would summarize my testimony on these bills as follows. As they now stand I believe that the interests of the Nation would be better served by the May bill, H. R. 4566, than by the McMahon bill, S. 1717. If section 2 of S. 1717 should be modified to adopt essentially the type of Commission and Administrator provided in H. R. 4566, I then believe that S. 1717 would be the more advantageous of the two bills. If a bill like the Johnson bill, S. 1463, is to be followed by the Senate, I believe that it should be revised to conform with the May bill, H. R. 4566, and that both bills should define what is meant by "peculiarly related to" along the lines suggested above. Finally I would again emphasize, as I did in the beginning, the importance of prompt action. I deem prompt action so important that I would advocate passage of the May bill without changes, or of the McMahon bill with only the change in the constitution of the Commission, if by so doing a month or more of delay could be avoided. The desirable minor improvements could be made later in supplementary legislation.

Until the legislation is passed, and no time allowed to organize and educate the Atomic Energy Commission, it is essential that the Manhattan district be authorized and financed to continue its work vigorously.

The CHAIRMAN. Mr. Edward Teller.

STATEMENT OF EDWARD TELLER, PROFESSOR OF PHYSICS, UNIVERSITY OF CHICAGO

Professor TELLER. Mr. Chairman, members of the committee, my name is Edward Teller. I am professor of physics at the University of Chicago. During the last 7 years I have been working on the problem of atomic power. In the period leading up to Hiroshima and Nagasaki, I witnessed a strikingly fast and successful development. The main fact which I want to call to the attention of the Senate Special Committee on Atomic Energy is this: Since the surrender of Japan the scientific and technical development of atomic energy has practically come to a standstill.

Many feel that with the successful conclusion of the war there is no further need to develop atomic bombs. Development of bombs must depend on the international situation. As a scientist I do not think that I am in a better position than the average citizen to make a recommendation on the desirability of production of weapons. But many people will agree that peacetime work should proceed.

In the following, I shall attempt to give a crude outline of possible future developments of atomic power. I shall then discuss the

reasons which have been responsible for the lack of progress in the past months and which threaten to frustrate any vigorous development in the future. Finally, I shall outline the conditions which, in my opinion, must be established if successful work on atomic power is to be resumed.

Among the fields of future work, I should like to mention first the defense against the atomic bomb. Such defense may not utilize atomic power. Yet in connection with the atomic bomb the feasibility of defense must be uppermost in our minds.

It has been stated repeatedly that a satisfactory defense is impossible. I share this belief. Nevertheless, the difference between an unsatisfactory defense and no defense may be decisive.

Devices may be constructed which destroy a considerable fraction of atomic missiles directed against us. It is extremely difficult but not impossible to develop fast-moving defense missiles which are automatically steered toward approaching projectiles. To accomplish this end, scientific and technical developments similar in magnitude and success to recent work in radar and jet propulsion would be necessary.

In recent years development of aggressive weapons has outstripped the development of defense. The V-2 rocket and the atomic bomb are two instances of weapons against which, at present, no defense exists. The atomic bomb is in its earliest infancy and even a moderate amount of work may improve it considerably. Future bombs may become less expensive, may be easier to handle, and they may have a much greater destructive power. I am convinced that it will not be very difficult to construct atomic bombs which will dwarf the Hiroshima bomb in the same way that that bomb has dwarfed high explosives. In the near future, we can hardly expect that defensive measures will catch up with the means of aggression. Our present military advantage seems great. But the events of the last years show how quickly this situation may change. Only 3½ years of intensive effort were needed to make an atomic bomb. Unless the possibility of a future war can be eliminated, we are going to live in a world in which safety no longer exists.

I do not know whether international developments will make further work on atomic bombs necessary. I share the hope that the atomic bomb, together with other weapons of aggression, will be eliminated. But if it should be decided that we renew work on the development of the atomic bomb, it must be pointed out that, under present conditions, we are not prepared to do so.

Among the peacetime applications, extraction of useful power from chain reacting structures is first in economic significance. One must not expect any profound effects on our economic life in the near future, but specific applications may soon become important. One is production of energy in places which at present lack cheap power. Another is construction of smaller energy-producing units which will function for a very long period of time. It must be stated, however, that even these smaller units cannot be installed without a considerable weight of shielding, and they therefore cannot be used in cars or airplanes but only in fairly large-sized vessels. Progress toward all these ends has been, in the recent past, slow.

Use of radio elements which are byproducts of atomic power plants will have an extremely great influence in science, particularly in

medical science. Work with these byproducts will lead to a better understanding of living organisms, and the knowledge so gained will, in the end, help to save human lives. Progress in this direction has been practically negligible so far. In the past this was due to necessary wartime secrecy which made it impossible to distribute the radio elements among the men who could have made use of them. The publication of the Smyth report has changed this situation. The distribution of many radio elements would disclose now no important secret and would result in no real danger since, in appropriately small quantities, these byproducts are harmless. That the byproducts have not been distributed and used in the last months is due, to a considerable extent, to the inertia of the administrative apparatus required for the distribution. I believe that these materials should be made available not only to scientists in this country but to scientists throughout the world. This would be a gesture which would cost us little and would bring us great returns in good will as well as in the advancement of scientific knowledge.

Scientific use of byproducts will probably not be long delayed. All other phases of work on atomic power present a much more serious problem. This is so because scientists are returning to their academic work and the great majority of them have stopped being actively interested in work on war projects. There are several reasons for this.

Scientists are men who have chosen as their work the free investigation of nature. For this freedom they have sacrificed the expectation of a greater income which industrial or commercial jobs offer. They will not give up this freedom except for the most compelling reasons.

In times of peace many feel an understandable reluctance to work on weapons of destruction.

The present interim arrangements do not permit any long-range planning. No long-term contracts can be offered since the authorities are reluctant to make commitments prior to the passage of legislation.

Even if a person does decide to continue work on atomic power, he is hampered by the fact that long-range planning is ruled out. He feels, therefore, that his efforts are wasted.

With the success of the atomic bomb, a number of routine operations have become part of the program. In Los Alamos, N. Mex., which was, up to the present date, my place of residence, these routine operations threaten to crowd out research and development. Under such conditions it is extremely difficult to secure the cooperation of scientific personnel.

All of the security regulations are irksome. Some seem to be unnecessary, particularly since hostilities have ended, and some rules of secrecy are a serious hindrance to progress.

The development of atomic power and the construction of the atomic bomb were possible only because individual scientists working on these problems were willing to take the initiative and to assume responsibility. According to the nature of the organization in which we were working, and which continues to be in force, such individual actions were not encouraged and often met with resistance. Since the emergency has passed, few scientists are willing to act with such vigor unless they are both asked and encouraged to do so.

What can be done to induce a reasonable number of scientists to work on the further development of atomic power?

First, it is important that legislation should be passed to make long-term planning possible and thus remove some of the present handicaps. But the wrong kind of legislation will merely cause the present stagnant conditions to continue.

It must be clear that no pressure can bring about real progress in science or development. It is impossible to force a person to be inventive and resourceful.

More financial inducements will not suffice either, and Congress cannot insure progress by simply appropriating great sums of money. One of my young friends has recently accepted a stipend of \$150 per month because this stipend permits him to continue his studies and his research. In doing so he turned down a job with a salary almost six times greater. A certain amount of money will, of course, be necessary to give scientific workers enough leisure to go ahead with their task. But other conditions are not less important.

One of these is the removal of certain parts of secrecy regulations. Purely scientific data—that is, facts concerning natural phenomena—must not be kept secret. If such secrecy is continued, it will warp the entire research activity of any man who is involved in work on atomic power. He either has to sever relations with the scientific world not involved in the development of atomic power or he has to acquire a split personality, remembering in certain parts of his work only certain parts of the information available to him.

Furthermore, scientific facts cannot be kept secret for any length of time. They are readily re-discovered. If we attempt to keep scientific facts secret, it will certainly hinder us, but will hardly interfere with the work of a potential competitor.

The only secrets which can remain effective for a reasonable length of time are technical details of construction and industrial know-how. Indeed, these things cannot be easily communicated except by actual collaboration. As an example, I may mention the construction of cyclotrons. In spite of the fact that full details have been published, everyone had the greatest difficulties in reproducing these instruments except those men who had a chance to learn directly from the original inventors.

Another part of security which will impede progress is compartmentalization. During the work on the atomic bomb, an attempt was made to give each person only so much information as he needed to perform his specific task. Thus the field of vision of each individual was artificially narrowed down. He could not use his full imagination. He could not be fully useful. One great drawback in this system is that in scientific work no person can judge what information another man will need. Scientific progress results from a continued search for surprise. It cannot be planned or directed. Compartmentalization is the principle that your right hand must not know what your left hand is doing. In the long run this principle makes effective research impossible.

I believe that even if some secrecy must be maintained, it should be restricted to a few subjects on technical details. Secrecy regulations should be in a large measure entrusted to the people who themselves engage in the work.

Perhaps the most important requirement for successful scientific work is the encouragement of individual initiative. In organizing work on atomic power there exists the grave danger of too much

planning, of too great centralization. Thus a mistaken idea, a single scientific prejudice in the minds of the planners, may render the whole program barren. Such rigorous planning will, furthermore, repel the best scientific talent.

This danger cannot be avoided by good legislation but only by a reasonable administration of the law. But legislation may counteract overcentralization by earmarking a yearly sum for small projects, carried out at universities. These projects should not be under the direction of the central administration of atomic power. They should be responsible to the faculties of the respective universities. Their success should be judged after 3 or 5 years. If even 1 percent of the money spent on atomic power would be set aside for such long-range investments, we could be assured of valuable returns.

To obtain a systematic picture of the desirable relations of scientists to future work on atomic power, I shall consider the problem under five headings.

(1) WORK ON GENERAL SCIENTIFIC BACKGROUND AND ON EDUCATION

Scientists are most eager to engage in this work. If the traditional freedom of research is preserved and if some financial aid is given, this type of work will flourish.

(2) WORK ON TECHNICAL PEACETIME DEVELOPMENTS

One should attempt to carry out a considerable part of such work at universities but only under the condition that the work need not be kept secret. In the few cases where secrecy is necessary, the work should be carried out in special laboratories. In this way universities will remain institutions of free learning and enquiry. The special laboratories will have to employ some scientists and will use additional scientific workers as consultants.

The two fields of activity just mentioned contribute most in building up the technical and scientific potential of the country. Therefore, in the long run, these endeavors are the most important for national defense. If, however, short-range preparedness is necessary, other types of development become important.

(3) DEVELOPMENT OF WEAPONS

If this activity is judged necessary, it should be carried out in the most effective way. This means that secrecy should be reduced to a minimum. As much as possible of the work not subject to secrecy should also be carried out at universities. The rest must be done at special civilian laboratories with full-time and part-time participation of scientists. To secure the necessary scientific personnel for this work in peacetime will be difficult. The special laboratories must have, therefore, an exceptionally wise and liberal leadership. In my opinion, one need not, and should not, exclude participation by the armed forces.

(4) PRODUCTION OF WEAPONS

This work will never attract scientists and in the long run scientists are not needed in this work. The work should be transferred to the

armed forces or to a Government-controlled corporation, and, in either case, placed under the direct authority of the President of the United States.

(5) TESTING OF WEAPONS

This activity is of great interest to the armed forces and for the scientists as well. An atomic bomb may be regarded as a scientific tool. It allows us to find out facts of nature which cannot be found out in any other way. These tests cannot be effectively performed either by the scientists alone, who lack manpower, nor by the armed forces alone, who lack detailed information. Therefore, tests should be planned mainly by scientists, but, in the actual execution, the armed forces should participate to the greatest possible extent.

In my testimony I have repeatedly spoken of the further development of atomic bombs. I should like to say, in conclusion, that such development may lead to war, that a future war will be horrible beyond imagination, that none of the combatants will be spared, and, what is worst, that such a war may destroy the decency of those who survive it.

But I do not know by what measures the danger of war may be reduced. I have therefore restricted my testimony to the discussion of the one question: If any aspect of atomic power is to be developed, by what means can the necessary cooperation of scientists be obtained?

The CHAIRMAN. Thank you very much indeed, Doctor. There will be a future announcement as to the next session.

(Whereupon, at 12:20 p m. the committee adjourned.)

ATOMIC ENERGY ACT OF 1946

THURSDAY, FEBRUARY 7, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to adjournment, at 10 a. m., in room 457, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Tydings, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. Mr. Rafferty, I believe you are vice president of the Union Carbide & Carbon Corp.

Mr. RAFFERTY. I am a vice president and director of the Union Carbide & Carbon Corp.

The CHAIRMAN. We have asked you to come here this morning primarily to give us any views that you may have on the domestic legislation that is pending, that is, for the domestic problem.

However, I imagine we would like to have for the record a description of your company's part in this project as far as you can go with it within the requirements of secrecy. So would you give us a description of your company's part in this project?

STATEMENT OF J. A. RAFFERTY, VICE PRESIDENT, UNION CARBIDE & CARBON CORP.

Mr. RAFFERTY. Senator, I am glad to be here in response to your request to appear before this committee and to outline the activities of the Union Carbide & Carbon Corp. in this Manhattan project.

There were about six of the units of the Union Carbide & Carbon Corp. that participated actively in this work. There were the United States Vanadium Corp., the Linde Air Products Co., the National Carbon Co., the Electro Metallurgical Co., the Bakelite Co., and the Carbide & Carbon Chemicals Corp.

Over the last 20 years the United States Vanadium Co. has been occupied in the prospecting, mining, and milling of carnotite ores. These carnotite ores contain vanadium oxide to the extent of about 40 pounds per ton of ore, and these same ores contain about 5 pounds of uranium oxide, or a quarter of 1 percent of uranium oxide in the ore.

The region of production of these carnotite ores lies mostly in Colorado, Utah, New Mexico, and Arizona.

The extraction of vanadium oxide is a readily accomplished process, and the gang or tailings after the extraction of vanadium oxide contain the uranium oxide, which we piled up in our plant.

281

I don't know how much you want to go into now, Senator, the different activities of the company.

The Linde Air Products Co. did its work mostly in Tonawanda, N. Y. The Electro Metallurgical Co. did its work in Niagara Falls. The Bakelite Corp. did its work in Bound Brook, N. J. The Carbide & Carbon Chemicals Corp. operated the Oak Ridge plant. That plant in Oak Ridge has been operating, as you know, and is operating today. I don't suppose I could go into any of the details, for security reasons, of the operation of that plant. I don't know what has been declassified particularly, and I would be rather reluctant to speak much about that.

Senator HART. I suggest, Mr. Chairman, that Mr. Rafferty give us some most useful information as to the use of the company's engineers, physicists, and chemists in the developmental work, with a view to indicating the magnitude of the company's work in the entire project.

Mr. RAFFERTY. Due to the experience that we had in all these different activities—for instance, the know-how of which I spoke in the prospecting, mining, and milling of ore—we had everything pretty much ready for the use of the Government when this project was launched, and we built and enlarged our facilities for supplying the project with the increased demands that the project required.

We dealt a great deal, of course, in a research way, and placed the facilities of our research laboratories, construction crews, and operating crews entirely in the hands of the Government.

If I were to go into the activities of the research laboratories, I am afraid I would again get into regions where I don't know whether I am at liberty to speak or not.

In the Oak Ridge plant, we not only cooperated in its design and construction, but we had to man that whole plant, which is probably the largest continuous operation in the world. Its operations were very similar to those of a large chemical operation, and we took plentifully from the operating personnel of the Carbide & Carbon Chemicals Corp. The Linde Co. likewise, in running their big plant up at Tonawanda, took several hundred of their personnel to operate it. That goes pretty much for the Electro Metallurgical Co. in Niagara Falls, who prepared the pure uranium metal for use by the Hanford plant in Washington.

We had to work out those processes in great detail, which we did by our technical forces, both the engineers and the research scientists that the Senator speaks of.

The Bakelite Corp. had to supplement all the work that had been done by the Columbia University in the researching of some of the most critical parts of the Oak Ridge plant.

The CHAIRMAN. You feel somewhat bound by security restrictions from giving a more complete description of the detail of the work, Mr. Rafferty?

Mr. RAFFERTY. In all this work, of course, we have participated in a very major way, but our company has pretty much shunned the limelight that has gone with this whole thing, very much because we took seriously the injunctions of the Government in connection with the security regulations.

The CHAIRMAN. Do you recollect how many men you had on your payroll in carrying out this over-all activity?

Mr. RAFFERTY. Oh, Senator, I would say perhaps a rough guess of 20,000 men. In the Oak Ridge plant alone, we have 10,000 men. I would imagine we had another 10,000 in all the other activities of our corporation.

The CHAIRMAN. When we were down there, Mr. Rafferty, we did not see so many men. That was one of the minor secrets of the occasion, the fact that there didn't seem to be such a large personnel in evidence as we went through the gas-diffusion plant which your company operates.

Mr. RAFFERTY. Of course the operations themselves in the gas-diffusion plant are very highly instrumented, and it doesn't require very many operators right at the scene of operations. But there are a great deal of auxiliary operations for conditioning and maintaining the equipment. We have a power plant down there alone, I think, that generates about 300,000 kilowatts to run that plant.

The CHAIRMAN. Did you erect that power plant?

Mr. RAFFERTY. We helped in the whole project. The power plant itself was built by the Jones Construction Co. The Oak Ridge plant was designed by the Kellex Corp., but we collaborated all the way through in the design and engineering of the job. The operation of the plant itself is entirely in our jurisdiction.

The CHAIRMAN. That is the entire gas-diffusion plant, as well as the electromagnetic process?

Mr. RAFFERTY. No; the electromagnetic process is operated by the Tennessee Eastman Co. We produce up to a certain purity of material, and then they take it on. The Tennessee Eastman plant, our plant—the gas-diffusion plant, plus the electromagnetic plant are pretty much classified as the Oak Ridge development.

The CHAIRMAN. During your work, I presume that you developed some new processes?

Mr. RAFFERTY. Yes, sir.

The CHAIRMAN. Did you develop any new gadgets or new inventions?

Mr. RAFFERTY. Yes, Senator, we would in that capacity in which we were serving—yes; quite a few.

The CHAIRMAN. Do you think that anything that your company or personnel has developed has any peacetime prospects for use?

Mr. RAFFERTY. Yes, sir.

The CHAIRMAN. Are there any of them that you could tell us about without, in your opinion, violating the security regulations? I leave that entirely to you.

Mr. RAFFERTY. I would say that, for instance, in our mining operations we have effected improvements that might be applicable in some degree to the mining industry in general in this country. In the Tonawanda plant, we have done some quite good work in effecting separating methods that we have developed which could be applied generally to industry. I wish I could expand more on that.

The Bakelite Corp. has done a very good job in some of their work. Carbide & Carbon Chemicals Corp., of course, has done quite an outstanding job in the operation of that plant. When you get several hundred outstanding chemical operators, the best improvements, I have found in my experience are after the project leaves the research laboratory and gets into the hands of the operators. There is a lot,

I think, that will develop to bring about industrial improvements in this country when this whole thing can be released.

The CHAIRMAN. Now, in the contract that you have with the Manhattan district or with the War Department—I believe it was with the War Department that you have your contracts?

Mr. RAFFERTY. Yes, sir.

The CHAIRMAN. Do you have any provision in there for treatment of patents of new inventions made during the course of this work?

Mr. RAFFERTY. Well, just what was specified in those contracts, Senator, I cannot state definitely. I think I might sum up that whole thing by saying that we assumed that all this work that was financed by the Government was certainly not our property, and I don't think we made any effort at all to cover the thing by patents. We even threw in our own know-how in these different operations, and we weren't specific as to how much publicity might be given by the Manhattan district to those patents of our own.

We were under such strain and stress in this whole work that the question of where the proprietary ownership lay was a purely academic one with us. I assumed that the Government would keep control of those improvements or patents that were effected by the Government money.

The CHAIRMAN. Was that your belief as to what should be done on all patents or all inventions that were made, and improvements that were made in the course of this project?

Mr. RAFFERTY. Well, my general conclusion in that direction would be that if the Government has financed this work, they employed private industry to go ahead and carry out the job. Now, I don't think that industry has got any proprietary interest in that sort of thing. There will be, of course, disputed zones wherein the previous know-how of industry probably has made the major contribution to certain improvements that were effected in the course of the work, and I think in that disputatious zone it certainly could be compromised in some fair-minded manner.

The CHAIRMAN. As far as you know, your company has filed no claims for patents on anything developed by your company in the project?

Mr. RAFFERTY. And financed by the Government?

The CHAIRMAN. That is right.

Mr. RAFFERTY. I don't recall any, and I would be surprised if there are any, Senator.

The CHAIRMAN. Do you know anything about the patent situation of other companies that had to do with the project, whether they have filed or not?

Mr. RAFFERTY. Only by roundabout hearsay, and I don't know whether there is anything to it or not. I understand some of the companies did file patents, but I didn't get that from the principals of the companies themselves; I got it more or less by hearsay.

The CHAIRMAN. Have you, Mr. Rafferty, given any consideration to S. 1717, or any of the other legislation?

Senator HART. May I ask him one question to clear up before you begin that?

The CHAIRMAN. Surely.

Senator HART. Mr. Rafferty, this zone of dispute as to whether the inception of an idea which would be patentable and was carried

on incident to the development work of the Manhattan district—in the case of your company, is that a zone of considerable area?

And also, as another part of my question, what is the position of the individual who was an employee of your company, who had an idea before he began to be paid by the Government indirectly that he may have developed incident to his work with the project?

Mr. RAFFERTY. Well, the zone of possible dispute between ourselves and the Government is so slim, Senator Hart, that we would not give it much heavy thinking at all. I don't imagine that anything in this disputed zone would be momentous enough for us to do any more than give it to the Government, if they made much of an issue about it.

Now, in the case of employees who may have developed some previous know-how, that would be a company matter, and I think that ought also to lie in the same limitations of my first statement.

Senator HART. The individual who was one of your employees would not acquire patent rights in his own right?

Mr. RAFFERTY. No, that would be a company right, Senator.

The CHAIRMAN. Mr. Rafferty, I presume you have given some consideration, because of your deep interest in the project and the extent to which you have been engaged in it, to our present proposal for handling the Manhattan district.

Do you believe that there should be a Government monopoly of the making of fissionable materials, or do you think it permissible to farm it out to private contractors?

Mr. RAFFERTY. Senator, I have read the McMahon bill. I think in the main it is a very good bill. I have a deep appreciation of the fact that the success of this effort up to now has been due to a group effort of Government, industry, and science, and I think it was the best way to effect that success in the emergency in which we were working.

But I do think now that the McMahon bill outlines very well a system of carrying on that we should work under. I have only had one thing in mind to debate about, which was the question as to whether three or five men could carry on the tremendous ramifications that their duties are going to involve. I noticed the other day that the Commission was suggested to be cut down from five to three.

The CHAIRMAN. The President suggested that.

Mr. RAFFERTY. I think the people should have pretty much control of it. I think that considerable farming out might well be followed. I am at a loss to see that the Commission can have 100 percent success in this thing unless we tap and utilize the tremendous knowledge that industry has in this thing.

There is no doubt in my mind—and I suppose I speak clumsily—that industry did the heavy part of this job, and I think it would be a great loss to the country and to this Commission, who is acting for the country, if they are not in a position to, and do, utilize that information. I would hope that industry's contribution would be pretty much eleemosynary as far as the Commission goes.

The CHAIRMAN. Well, of course, there is nothing in the bill that would prevent the Commission from drawing upon industry for anything it could possibly get. You realize that?

Mr. RAFFERTY. Yes, I realize that, Senator.

I suppose the composition of the Commission will be the determining factor as to how much of that tapping of industry's know-how will

be effected. After all, the success of anything depends upon the personnel and the management of it.

At one time I thought that a commission of that kind could have representation from industry, science, and Government, the Government being represented by Congressmen and Senators, a representative of the Chief Executive, and a representative from the Supreme Court. I don't know whether it could be done or not, but I do feel this, too: Naturally the military, I suppose, is more or less in bad with everybody because they have necessarily been shoving everybody around because they had to in the war, but I do realize that the military always has utilized the achievements of research in industry in the possible applications of improvements for military uses, and I do think that the military should have access to the progress that is effected in atomic energy over the years—although I certainly don't think they should be in control of it.

If it looks as though, in order to effect civilian control, we should just have this three- or five-man Commission, it is perfectly all right with me. I have made the point that that Commission should have ready access to and be welcomed by industry to help them out wherever they could, and farm out this work, farm out jobs to the industrial research laboratories, as well as the university laboratories.

The CHAIRMAN. There is a provision for that.

Mr. RAFFERTY. I realize that.

The CHAIRMAN. And there is also a provision in the bill providing for a Division of Military Application set up under the Commission.

Mr. RAFFERTY. Yes.

The CHAIRMAN. You stated that you believed we ought to have civilian control in the matter?

Mr. RAFFERTY. Oh, yes; I think it should be in civilian control. I suppose industrialists are civilians, and university scientists are civilians. I just would hope that the composition of that Commission would be such that men who have been through the whole project could be on that Commission. Otherwise, it is going to take them a great deal of time to learn it.

The CHAIRMAN. You will recollect that in the bill there is a provision permitting the Commission to appoint an advisory board, or boards, as it may see fit. I presume on any advisory board that was set up that industry, science, and Government might well be liberally represented.

Senator HART. Following up the chairman's last question, what is your conception of the status of an advisory board under those conditions, in case their advice is not accepted, or there is too much disagreement? Would you have any fears that the ability to advise of such a board would not be fully utilized under those conditions?

Mr. RAFFERTY. Yes, that would be my fear, Senator Hart. I would rather reverse it and have the advisory board put over the Commission. I suppose that is not practical.

Senator HART. You said in response to the chairman, as I understood you, that you rather preferred the board of director over the management system which obtains in industry; is that correct?

Mr. RAFFERTY. That is correct, sir.

Senator HART. Now, would you carry that a little further and give us your ideas, just off the cuff, of how you would today constitute that board of directors?

*Atomic Energy
+ Commission*

MR. RAFFERTY. Well, I would have science represented on that board of directors, and by science I mean perhaps some university scientists, someone in academic circles, one or two. I would have one or two industrialists. I would have, if possible, somebody in Government—maybe a member from the House and a member from the Senate. You might take the representatives from the Military Affairs Committees from those two bodies, if you would, and could combine some military flavor with the governmental end. I would hope to get somebody from the State Department, and if we could get one of the busy Justices of the Supreme Court, I would imagine that kind of a board would appeal to the people as one which would not be in the control of the military, and would be represented a lot by the branches of the Government itself.

My whole thought in this thing, Senator, is to instill confidence in the people that this atomic energy program would be carried out in the hands of the people. I am afraid sometimes that a commission—whether you call them civilians or not—might turn into a sort of bureaucratic body, and wouldn't have the vision necessary to carry this thing on. I am just wondering whether you can get the personnel on a commission like that that would carry this thing on in the all-embracing way it ought to be done.

I guess that is about all I could say.

SENATOR HART. The chairman of a board of directors in industry is a very important person who actually works full time, is he not?

MR. RAFFERTY. The chairman of the board of directors, yes; he is generally a full-time employee.

SENATOR HART. Would you use that same idea if you were setting up the Commission, and make the chairman a full-time man highly paid—that is, as highly paid as the Government could pay?

MR. RAFFERTY. Well, I had visualized this advisory board, Senator Hart, as not a full-time body. I had visualized that board as a board that would meet at appropriate periods.

SENATOR HART. I was not talking about the advisory board, but the board of directors idea and the chairman of the board.

MR. RAFFERTY. Well, if that board was going to meet—you are emphasizing now the question of the chairman of the board being full time?

SENATOR HART. Yes; I am speaking of the chairman only.

MR. RAFFERTY. Well, of course, I would imagine that the chairman of that board would not have to be a full-time employee, Senator. He would preside over the board meetings, but that board, as I see it, would supervise as directors do, the workings of this Commission, and they would see that the programs that were outlined perhaps by the Commission and concurred in by the advisory board, or amplified by the advisory board, would be carried out.

Now, I would imagine those meetings could be carried on by men who are not putting in full time. If you were to get industrialists and men of science on that board, I think there are men that probably wouldn't want to give their full time to this thing. It was merely to carry out my thought of the short-comings, maybe, of the personnel that you will have on the Commission, that you could put on maybe men of a little larger viewpoint and more broad experience. It will be very difficult to get qualified industrialists to spend their whole time on a Commission like this. The industrialists I know of that

have been occupied on this project would be difficult, if not impossible, to get full time; but you could get them on a part-time basis where they would be serving maybe 1 or 2 days a month, or something of that length of time.

Senator HART. Then, Mr. Rafferty, you would not in this instance think that the chairman of the board—call him that for the present—would be so highly important and would find so much to do that he at least would have to devote his full time to it?

Mr. RAFFERTY. No, sir; I do not.

Senator HART. One other thing. It is usual to have management—that is, the president and certain vice presidents—members of the board of directors, is it not?

Mr. RAFFERTY. Yes.

Senator HART. Would you follow that idea if you were setting up this Commission, or board of directors, whichever you call it for the present?

Mr. RAFFERTY. I think, Senator, that I wouldn't have anybody in the Commission on the board. Is that what you meant?

Senator HART. No; I am rather drawing an analogy between the board of directors to become really the Commission, with management being full time and separate from that.

Perhaps you can talk straighter on this if I throw you back to the bill that is in the House. Now, are you familiar with the May bill?

Mr. RAFFERTY. Not very, Senator; no.

Senator HART. That has a different approach, a different solution to the problem of the top-line management. You have not studied that bill?

Mr. RAFFERTY. No; I was out of the city on a protracted visit to our plants in the West when that bill came out, and I did not have a chance to go over it thoroughly. I didn't study it as I have the McMahon bill.

Senator HART. I have no further questions.

The CHAIRMAN. In that May-Johnson bill, which Senator Hart has referred to, the provision is for a board of directors—not by that name, but that is the idea—and then the board appoints the Administrator, who is not subject to Senate confirmation. All of the very wide powers that are given to the part-time Commission are also given to the Administrator. The Administrator is not removable by the President, and in order to get rid of him you would have to remove, I think, five of the nine commissioners in order to get at him. He also has the power to determine—true enough, in consultation with the part-time Commission which would meet one or two days a month—how much fissionable material was made and how many bombs could be made.

There is also a provision in the bill which waives the prohibition against a member of the Military Establishment serving in a civilian job, so obviously the intention was to have the Administrator a military man.

Secretary Wallace, when he was up the other day, suggested that perhaps the intention was to make the Assistant Administrator a Navy man, inasmuch as there was a requirement that the Administrator must tell the Assistant Administrator everything.

Now, what would you think of that set-up?

Mr. RAFFERTY. Well, the future I visualize for atomic energy is an entirely peacetime one to make people's lives better and better all the time. I am not looking at this thing from a military standpoint at all. I am praying that the efforts of the world to maintain permanent peace are going to win out, and I wouldn't want to be in favor of a set-up like that.

I believe that the appointees of this Commission should be under the jurisdiction of Congress and the President.

Senator HART. Of the Commission?

Mr. RAFFERTY. Of the Commission. At the same time, as I say, we expect our military to defend us in time of crisis, and I would expect the military to have their eye on the developments that are to come out in atomic energy, and utilize them to the limit, if conditions warrant.

I presume that there is going to be a strong liaison between this Commission and any commission that the UNO sets up, and that is why I thought that on this board of directors the State Department might be represented. I would perhaps be in favor of the Secretary of State to be the chairman of the board of this body I speak of, so that the people engaged in this country will be closer in touch with the advice of a man in his position. He is the man that is going to have to take care of the foreign affairs.

That is why I also outlined a board that would, by no stretch of the imagination, be under the control of the military. I assumed that the congressional representatives, if they were the heads of the Military Affairs Committees, would still be Congressmen.

From what I hear you say about this set-up, I wouldn't be in favor of that; no.

The CHAIRMAN. This project, it has been estimated to us, may cost the people of the United States as much as a half a billion dollars a year. I am hopeful myself that it can be done much more reasonably than that.

Do you know of any business or private business of a comparable size that would operate with an administrative staff which would only meet around 1 or 2 days a month?

Mr. RAFFERTY. That would cost —

The CHAIRMAN. That much money. We have this tremendous cost, you see. Now, as I understand your thought, you are proposing more or less an absentee board of directors that would set the policies for this half-billion dollar expenditure of Government funds.

Does it strike you that that is a control a little too far away from the source of the power to make you a little wary of a proposition like that?

Mr. RAFFERTY. You are not speaking now of the May bill, Senator?

The CHAIRMAN. No; I am talking about your suggestion.

Mr. RAFFERTY. About my suggestion—if I may say "my," for I think perhaps some others have thought of it, and maybe I was not the first one to think of it.

Of course, a half billion dollars you speak of involves also the expenses entailed in running these plants?

The CHAIRMAN. That is right.

Mr. RAFFERTY. Oak Ridge, Hanford, and Los Alamos, and wherever else they operate.

The board of directors that I am visualizing would to be a working board of directors. I am familiar with working boards of directors, and I have heard a lot about those that deal more or less in absentee attendance.

These men that I would suggest on this board, however, would be workingmen and would stay in close touch with the program that the Commission outlines, and which the board would approve.

The CHAIRMAN. In other words, you are for a full-time commission?

Mr. RAFFERTY. A full-time commission.

The CHAIRMAN. To operate the plants?

Mr. RAFFERTY. That is right.

The CHAIRMAN. Your thought is that over and above them, and subject to their approval or rejection, there ought to be a part-time advisory board of directors?

Mr. RAFFERTY. That is right.

The CHAIRMAN. That is your thought?

Mr. RAFFERTY. That is right.

The CHAIRMAN. Rather than having the board of directors of outside men who would give 1 or 2 days underneath the Commission advising the Commission, but not binding upon them?

Mr. RAFFERTY. I think that the advisory committee ought to have some—whether it is confirmation, at least concurrence with the Commission. The Commission ought to concur. I think that if you just have an advisory board whose advice might be pretty much not concurred in by the Commission, after a while you wouldn't get very ready response and ideas from this board.

Senator HART. Then, Mr. Rafferty, in which—either the Commission or the board of directors—would you place, under the direction of Congress, the final power of decision?

Mr. RAFFERTY. Of the Commission and the board?

Senator HART. I am confused now as to which you mean, whether you would have the board of directors have the final power of decision, or the Commission, which the chairman has just mentioned, of three or five members. Which would it be?

Mr. RAFFERTY. Well, I believe that at least we ought to go so far as to say that the Commission's recommendations would have to be concurred in by the advisory board, and if there is any stalemate arrived at in that sort of a set-up, maybe Congress ought to decide it.

I wouldn't be loath to put the Commission under the board of directors as far as confirmation of their findings is concerned, because I think that board will have broader experience, and I would imagine that the scientific and industrial men there would be fortified with an awful lot of background in their own spheres of influence, and could probably take a broader aspect than the caliber of men of that Commission. If you knew what the caliber of that Commission was, I could say probably what the final say of the advisory board would be.

Senator HART. Under any salary which the Federal Government can pay, what is your estimate of the caliber that we would get for men who would devote full time to the work? Federal salaries are relatively low. Would we be able to get men who were sufficiently high grade to have the full power of decision under Congress and the President?

Mr. RAFFERTY. As to the type of men I have in mind, I question, Senator Hart, whether you could get them for that money. At the

same time, I think that the provision for the salary is not niggardly; but the men of industry that might help to back up that Commission on an advisory board are men who would probably not want to leave industry at the present time either because they might be getting more than that salary today, or because they see the future holding out for them higher rewards than that.

Senator HART. Whereas, with an advisory board you would rather apprehend that their status might become not too good?

Mr. RAFFERTY. I had in mind perhaps a different caliber of men on the advisory board than you would get on the Commission and, as I say, these men, on the advisory board then would fortify that Commission with judgment and experience which the Commission hasn't got.

I would imagine that these men on the advisory board would be the type of men who would only want their carfare paid, their transportation, if the Government saw fit and wanted them to take it. I am not looking forward to any salaried men on that board strictly from Government money.

Senator HART. You are speaking now of the advisory board as provided for in Senator McMahon's bill, for which you have, quite properly, expressed an admiration. That is what you are speaking of now, and not the board of directors idea which would really control?

Mr. RAFFERTY. Well, I first was talking about the advisory board and I think the Senator had pointed out that a provision was made in the bill for an advisory board to be selected under the Commission. I think I did say to the Senator that I would prefer, if I had my way, to make the advisory board over the Commission, and I still think so.

The CHAIRMAN. That is, your basic thought in that is your doubt as to the caliber of men who would be appointed on a five-man commission, or whatever number Congress finally decides; and underlying that is, of course, a belief that you cannot get the best men to serve on a full-time commission of this kind.

I might say to you, Mr. Rafferty, that I envisage membership on this Commission as being on a comparable basis, a comparable position of honor, with membership on the Supreme Court.

I think you, who are so imbued with the importance of this after working on it, and I, knowing much less about it, realize the tremendous force expended and let loose on the world, and the great power any body of administrators will have in administering a bill for its control.

Do you not feel that there would be a considerable appeal on the basis of honor, on the basis of public service, to bring the proper men to the Commission to operate this on a full-time basis, the same inducement that goes out to a Senator of the United States who might make \$150,000 a year but who is willing to come to the Senate and devote 14-hour days to his work, or to the Supreme Court Justice who gives up \$150,000 a year in private practice, as Charles Evans Hughes did, as Owen Roberts did, as Chief Justice Stone and Robert Jackson did, or to men of the caliber of Stimson and Forrestal? Have you given any thought to those considerations?

Mr. RAFFERTY. Yes, I have, Senator; and, as I said, if that Commission of the type of men you speak of is bulwarked with understudies who can talk to industry and to the scientists and who can see that the deals that are made with the scientists are understandable to all these

people. I agree with you that you can get that type of man. But this thing is so involved; every day there is some new development in connection with this atomic energy, and I question whether civilians can stay with it. Heaven knows it is giving a lot of us who have a little smattering of the thing a difficult time to stay in touch with it. But if you take three or five of the men you are talking about, men of the caliber in Government work today, and they have a host of scientists, industrialists, and engineers around them to advise them, that will aid them in making the proper steps to develop this thing to its utmost so that we will not be behind the flag in comparison with other nations—and that is very important—then I think that is all right.

The CHAIRMAN. A commission composed of men of the caliber that I have suggested, with an advisory board composed of some of the best minds of the country in the field would certainly be, in your opinion, conducive to fair operation and a good and progressive operation of this project, would it not?

Mr. RAFFERTY. Yes, sir.

The CHAIRMAN. So it comes right down to this basic fact: Are we so morally bankrupt in this country that we cannot get five citizens to come and serve their country, and to serve the future of the world and the future of their country with honor and dignity, at a \$15,000 salary? That is really what it comes down to, isn't it?

Mr. RAFFERTY. That is correct, Senator. I don't doubt you can get five men of that kind, and that is why I supplemented my first remarks by saying I hoped they had a good advisory board, because the type of men you outline are the type of men who should make this Commission very successful.

But if you don't get that type of men, again going back to my remark that the composition of the personnel of the Commission is going to have a lot to do with its success, I cannot see where an inferior type of personnel is going to get the type of men I have in mind for an advisory board.

Senator HART. Mr. Rafferty, this parallel to the Supreme Court—and I don't wish to embarrass you in any way with this question—but does that weigh so heavily with you in view of some appointments which have actually been made to the Supreme Court?

Are you so fully satisfied with all the appointments that have been made to the Supreme Court over the last 50 years, let us say, that you feel that is an apt parallel to draw?

Mr. RAFFERTY. You mean to appoint one man from the Supreme Court on this board?

Senator HART. No; the composition of the Commission, the caliber of the men.

Mr. RAFFERTY. Oh, I would say that that would be a pretty marvelous commission if it approached the caliber of the Supreme Court appointees.

Senator HART. That is, you in your own experience and your present status as a citizen of broad experience, would have no particular fears as to the composition of that Commission under the terms of the McMahon bill as it now stands?

Mr. RAFFERTY. That is right, Senator. I would have no fears whatsoever.

Senator HART. You think that adequate men would be chosen and would accept?

Mr. RAFFERTY. I had not conceived, frankly, of that type of man accepting this job because it is so completely out of his former lines. I conceive that perhaps an outstanding physicist, and outstanding fellow who knew engineering, and maybe some outstanding fellow in the mining fraternity would have to be on this Commission. Now, if you are going ahead and selecting men of that kind, and have these men fortified with the technical fellows, I think that is fine.

Perhaps not enough emphasis in the bill, Senator McMahon, has been placed upon the type of men who would be on this advisory committee.

The CHAIRMAN. Except that they are confirmable by the Senate, and the framers of our Constitution wisely put that provision in there.

I have a little difficulty in following your thought that it would be impossible to get the proper caliber of men. I just don't agree with you on that. After all, it would be a pretty poor way if we had to weight our own Army and Navy with a board of directors vetoing the action of the Secretary of War or the Secretary of the Navy.

Mr. RAFFERTY. Well, perhaps the reason why I was anxious to suggest this board of directors or advisory committee is because we will be dealing with foreign nations, for one thing, and I visualize the Secretary of State or one of his assistants on this Commission. I visualize plenty of congressional action on appropriations, and what not, and I thought perhaps that could be more intelligibly put before Congress if the Senate and House had representatives thereon.

Senator TYDINGS. Let me ask you a question here, if I don't interrupt the chairman.

You want the advisory committee because you assume in your statement that the membership of the advisory committee—all things considered—will have a superior and more detached point of view for the welfare of this enterprise than the Commission itself?

Mr. RAFFERTY. That is right.

Senator TYDINGS. And you want the advisory committee to be a policy-making committee, and the Commission to be in the position of executing and carrying out that policy; and your feeling is that if you have this detachment that is based primarily not on salary, but on knowledge, that the better policy will prevail than if that is put under the Commission?

Mr. RAFFERTY. That is right.

Senator TYDINGS. So that the compensation of the advisory committee is secondary.

Mr. RAFFERTY. It is immaterial, sir.

Senator TYDINGS. Now, wouldn't you accomplish the same thing if you made the advisory committee the Commission, and put under it the executives to carry out the policies of the advisory Commission?

Mr. RAFFERTY. That is right.

Senator TYDINGS. In other words, let's assume that we name the advisory Commission with no salary except a modicum to take care of expenses, travel, and what not?

Mr. RAFFERTY. That is right.

Senator TYDINGS. And then under that there was a permanent staff carrying out those policies.

In that contingency, how many meetings do you visualize the advisory committee—I am going to keep that old nomenclature—

would have to have a year in order to direct the executives who would carry out its policy?

Mr. RAFFERTY. Oh, I would say, perhaps as a suggestion, 1 day a month.

Senator TYDINGS. One day a month?

Mr. RAFFERTY. Yes.

Senator TYDINGS. It is only fair to assume that at the beginning they would probably have to meet more frequently?

Mr. RAFFERTY. That is right.

Senator TYDINGS. So I am assuming you are looking at it after it has been in operation for 6 months.

Mr. RAFFERTY. Yes.

Senator TYDINGS. Then you visualize that after that, if they would come once a month to a meeting, how long would they stay in session?

Mr. RAFFERTY. I would say all day.

Senator TYDINGS. Do you think they could do it 1 day a month?

Mr. RAFFERTY. I think if they attack the thing early enough in the morning, and stay a little late in the afternoon, they could do it.

Senator TYDINGS. A great deal of the thinking would be done, I suppose, prior to their convening?

Mr. RAFFERTY. That is right.

Senator TYDINGS. Do you visualize that there would be such a meeting of the minds on general policy that they could transact business in a single day?

Mr. RAFFERTY. Well, as I visualize this advisory board, they would have an opportunity between meetings to discuss the weighty problems with their associates in these different companies that have been occupied in this enterprise, and I should think every organization would lay itself ready to co-operate.

~~Senator TYDINGS. Let me pursue that just one step further. Do you estimate that it would be possible to attract the caliber of men to the advisory Commission which you have described here if it were necessary for them to come 1 or 2 days a month with no salary except expenses for the high honor involved therein?~~

~~Mr. RAFFERTY. I certainly do.~~

~~Senator TYDINGS. You do?~~

~~Mr. RAFFERTY. Yes, sir.~~

Senator TYDINGS. And you are somewhat fearful that if that policy of honor, you might say, or service without compensation is discarded, that the job may become a political one wherein some people may be put on there without that high degree of approach which your testimony seems to imply, and so you are fearful that the regular commissioners, whom you have heretofore described, will be of an inferior type to the advisory Commission.

Mr. RAFFERTY. When Senator McMahon puts up men of the caliber of the Supreme Court appointees, or Senators of the United States, he is changing my viewpoint as to what I had visualized as the composition of this committee.

Senator TYDINGS. How about making the salary larger than \$15,000 a year? Do you think that would attract these exceptionally fine men who are well qualified in their line?

Mr. RAFFERTY. It wasn't perhaps so much the salary that I had in mind as the fact that industry today, which has had these men in this job, has a lot of men which I know would serve on this advisory

committee for nothing, because they are making more than \$15,000 or \$20,000, and they have no ambition to leave their company and industry. There are a lot of men that don't get as much as \$15,000 or \$20,000, but who hope some day to get beyond that and have cast their lots with industry.

Senator TYDINGS. If there was a conflict between the policy laid down by the advisory committee and the permanent Commission, to differentiate between the two, you would want the bill so drawn that the advisory committee was the directing force and the subsidiary permanent Commission couldn't overrule its proclaimed policy, or deviate from it?

Mr. RAFFERTY. Yes, I would say that there ought to be at least a concurrence between the two bodies.

Senator TYDINGS. And if there is a disagreement, the advisory committee's decision would be paramount?

Mr. RAFFERTY. I would say that would be a good way to leave it; yes, sir.

Senator TYDINGS. So what it comes down to is that you make the advisory committee the Commission, and make the permanent staff—which we designate as the Commission—really executives under the advisory Commission?

Mr. RAFFERTY. That is right.

Senator TYDINGS. What you are arguing is that instead of having a commission which sits all the time, you would have a commission that was assembled from time to time, at least once a month, to proclaim policies; then you would have a chief executive under it and other assistants who would carry out that policy?

Mr. RAFFERTY. That is right.

Senator TYDINGS. So you are really arguing for a nonpaid commission of the highest type?

Mr. RAFFERTY. That is right.

Senator TYDINGS. With executives under it?

Mr. RAFFERTY. That is right.

Senator TYDINGS. As preferable to a permanent commission that would meet all the time?

Mr. RAFFERTY. That is right.

The CHAIRMAN. Mr. Rafferty, it is of course one of the principles of the law, in recognition of the Biblical injunction, that a man cannot serve two masters. It is embodied in our law that one who has an official position with the Government must not enter into contractual relations with the Government when he passes on the amount of compensation for the Government. It is a very wise provision.

Now, it is envisaged that industry will be called upon in an advisory way for advice. Naturally the men on the advisory Commission would be drawn from that portion of industry which knows most about this problem.

Do you see any conflict that might well develop between a member of the advisory Commission on the one hand advising the Government, and on the other hand taking contracts from the Government?

Mr. RAFFERTY. Well, I would say that that man would have to be very particular. I naturally, being associated in industry as I am, have always wondered how industry became so severely criticized in the past; in the press at any rate, in certain public circles. I don't think there is a higher-minded lot of men than the men in industry, and I think they have showed that in this war.

I would say that any member of the advisory Commission who was employed by a concern with which the Commission or the Government, as a result of the Commission's recommendation, might enter into a contract, could and should disqualify himself from taking any action pertaining to such a contract.

I would rather trust an industrialist to seek out the proper schools or proper personnel to make these contracts with in behalf of the Government, because industry is using that type of man all the time, and industry reinforces its research laboratories from all these schools. That is the kind of thing I am making a plea for, that the Government would get the best value for any money it spends in these things.

The outstanding things done in science are done in industrial laboratories, outside of the fundamental things that the university laboratories are organized for. But, as I said before, the outstanding things that were brought out in this bomb project were brought out by the type of men that industry has—the technical engineers plus the research men they employ.

That is the thing I am urging. I would like to see that placed at the service of the Government. I think, as to the thing you were talking about, that these industrialists would be watched pretty closely, and I would say that proper action could be taken by Congress to provide punitive measures in case a member of the advisory Commission should show partiality to some particular company or some particular group.

The thing I am hoping for is that an adequately qualified commission will be set up that can handle this almost overwhelming task.

The CHAIRMAN. Really what it comes down to is the type of men that we appoint on the Commission.

Mr. RAFFERTY. That is right.

The CHAIRMAN. If we appointed a commission that was of low grade, your belief is that the best interests of the country would better be protected by having an advisory commission that could veto the acts of such a low-grade commission?

Mr. RAFFERTY. Yes.

The CHAIRMAN. On the other hand, I take it if a high-type commission was appointed, of the caliber of the men that I have indicated, you would be perfectly content to leave the final determination of policy with a commission of that kind, composed of that kind of men, to be advised, but not to be run, by an advisory board?

Mr. RAFFERTY. That is right.

The CHAIRMAN. So the basis of your fear is the caliber of men who would be appointed on the full-time Commission. Speaking only for myself, and assuming that the confirmatory powers are kept in the bill, as I assume they will be, I can assure you that I would examine, as a Senator, the qualities and credentials of any candidate who was proposed for appointment most carefully with those standards in mind. I hope that that is the kind of commission we would get.

Mr. RAFFERTY. Well, I will be very happy if you get that kind of commission. I was visualizing maybe a commission of less experienced and qualified men than what you have just outlined, Senator.

The CHAIRMAN. Thank you very much, Mr. Rafferty.

Mr. RAFFERTY. Thank you, Senator. I enjoyed it very much.

The CHAIRMAN. The committee will meet tomorrow at 10 o'clock in room 324.

(Thereupon, at 11:30 a. m. an adjournment was taken by the committee until Friday, February 8, 1946, at 10 a. m. in room 324.)

ATOMIC ENERGY ACT OF 1946

FRIDAY, FEBRUARY 8, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to adjournment, at 10 a. m., in room 324, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Millikin, Hickenlooper, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will come to order.
Mr. Folk.

STATEMENT OF GEORGE E. FOLK, PATENT ADVISER TO THE NATIONAL ASSOCIATION OF MANUFACTURERS

Mr. FOLK. Mr. Chairman, my name is George E. Folk. Since my retirement from the practice of patent law, I have for the past 7 years acted as patent adviser to the National Association of Manufacturers. Its committee on patents and research has given careful consideration to proposals for the establishment of an Atomic Energy Commission as outlined in the Senate bill, S. 1717, and other similar bills introduced in Congress. The patent and research committee's recommendations, as later set forth, have been approved by the board of directors of the National Association of Manufacturers. I am speaking today for the National Association of Manufacturers, a voluntary organization of about 13,000 manufacturers, 70 percent of whose members have less than 500 employees each.

The CHAIRMAN. Are you restricting your comments to the patent sections of the bill, Mr. Folk?

Mr. FOLK. No; because they are tied up so that one necessarily involves the other.

The National Association of Manufacturers is alive to the fact that, in order "to protect the national security and to insure the broadest possible exploitation of the field" of atomic energy (p. 2, lines 22 to 24, of the McMahon bill, S. 1717), it is necessary and desirable that the Government regulate and police the production and use of fissionable materials. We believe, however, that it is not necessary or advantageous to institute a "program for Government control of the production, ownership, and use of fissionable materials" (p. 2, lines 21 to 22).

297

In short, we are in full accord with the statement in the President's message to Congress of October 3, 1945, that—

our science and industry owe their strength to the spirit of free inquiry and the spirit of free enterprise that characterized our country. * * * The observance of this policy is our best guaranty of maintaining the preeminence in science and industry upon which our national well-being depends.

It is important, however, to keep in mind what "free enterprise" really is. The American idea of free enterprise is not that a person should be free to disregard the property rights of others. It is obvious that the right of one person in any form of private property limits the freedom of others to exploit that property. "Free enterprise" merely means that so long as a person respects the property rights of others, whether it be in physical property or in patent property, he shall be as free as is consistent with public interest to conduct his own business enterprise, and especially that he shall be as free as possible from Government control. Accepting this interpretation, the American interpretation, of free enterprise, we wholeheartedly endorse the maintenance of free enterprise in the development and exploitation of atomic energy for industrial purposes.

We therefore take the position that the Commission should be given only such authority as is, or may become, conducive to public safety and public health, with the least possible Government interference.

We, therefore, venture to criticize certain features of the McMahon bill, S. 1717, trusting that such criticisms may be deemed to be constructive and helpful to the committee in its difficult task of formulating a bill that will protect the national security and insure the broadest possible exploitation of the field of atomic energy—the declared purpose of the act—and at the same time will not run contrary to the American system of free enterprise.

GENERAL AUTHORITY OF THE COMMISSION

Assuming that the Commission be given, as it should be, authority to establish regulations adequate for the public safety, it would then seem wholly unnecessary that the Commission shall be the exclusive producer of fissionable materials for industrial purposes (p. 5, line 24); and that it shall be "unlawful for any person to produce any fissionable material except as may be incident to the conduct of research or development activities" (p. 6, line 5).

It would seem unduly harsh to give authority to the Commission by which it may "require any person to permit the inspection and copying of any records or other documents" (p. 22, line 9). This would seem, furthermore, to violate the constitutional provision guaranteeing the—

right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures—

The CHAIRMAN. Now, let us examine that, Mr. Folk. I presume that you have more or less followed the discussions about inspection that have been proposed for international application.

Mr. FOLK. Yes, I have followed that rather closely in the newspapers.

The CHAIRMAN. And you realize that any effective inspection system that is evolved will necessarily have to be applied with equal force and effect in our own country, as well as in the other countries of the world?

Mr. FOLK. That will undoubtedly have to be the case.

The CHAIRMAN. You, of course, are acquainted with the terrible potential destructive possibilities of atomic energy.

Mr. FOLK. Such as we get from the newspapers and talks with some who have some scientific knowledge of it.

The CHAIRMAN. I don't know that I have any scientific knowledge, but from what I know of it I think I can assure you that is accurate.

Mr. FOLK. Yes; it is potentially a dangerous matter.

The CHAIRMAN. Now, of course we have to weigh the potential dangers of its use and we must, in the light of that, judge what we are going to do to prevent it from being used as a weapon of war. You would say that that was a highly desirable objective, would you not?

Mr. FOLK. Oh, yes.

The CHAIRMAN. Might it not be, therefore, that we would have to suffer certain restrictions that perhaps we would not even think of suffering if it were not for this terrible danger that we might be under?

Mr. FOLK. That is undoubtedly true.

The CHAIRMAN. So that assuming that an inspection system is developed which could only be effective providing there was free inspection, and assuming that as the hypothesis, would you still object to the provision that requires a person to submit to inspection?

Mr. FOLK. There would be a great deal that would be required under this inspection that would have no real relation to the danger from use of the material, I should think. It should be carefully safeguarded, but I think the language is too broad here. If that language should be changed, I think it would be all right, and it could be changed.

The CHAIRMAN. How do you suggest changing it?

Mr. FOLK. I haven't given any particular thought to that. I cannot think for the moment of how to change that language, but I would be glad to think it over, if you wish me to, and let you know my views on it.

I object to papers being subject to examination which may not have any direct bearing on the use of fissionable material. The bill is broader than the uses of fissionable materials, as I will point out later.

The CHAIRMAN. I wish that you would give that further consideration and submit a suggestion for a change that you think will accomplish the objectives that we must accomplish, it seems so me, in view of what we are dealing with, and still not unwarrantedly harass our people, because that is not the intent of the bill.

Mr. FOLK. I know it is not, and that is the reason I called attention to the broad language here.

The CHAIRMAN. The intent of the bill is to protect our people, and it perhaps is some indication of what might be necessary in our inspection system.

Mr. FOLK. I want you to understand that we are entirely in accord with the objectives of this bill, to protect the public against danger. We think the bill is drawn somewhat broader than is necessary.

As to materials under control of the Commission, the bill is designed to give unlimited control to the Commission over "source materials," "fissionable materials," the "production of fissionable materials," "byproduct materials," and "atomic energy." It is also designed to control the use of fissionable materials (1) in research and development

activities, (2) in industrial uses of fissionable materials, and (3) in military application of fissionable materials. Even for regulatory powers, it is, of course, important that the definitions of the above terms shall not be broader than are necessary to give the Commission authority to regulate for public safety.

DEFINITION OF TERMS USED

The definition of "source materials" (p. 9, line 1) is such as to "include any ore containing uranium, thorium, or beryllium." This definition is so broad it would include ores in which only minute quantities of such elements are found. Undoubtedly ores abound which contain little radioactive material but are nevertheless now used and are useful for other industrial purposes. Such industrial uses should not be under the control of the Commission. The latter part of the definition also includes—

such other materials peculiarly essential to the production of fissionable materials
* * *

This is broad enough to include many devices and substances which now have varied industrial applications entirely apart from the production of fissionable materials. For example, it would include electrical apparatus, electromagnetic devices, blowers, turbines for generating power, fuels, etc. I doubt that it was intended that the definition should be so broad, but it is capable of that construction. Surely it is not intended, as the definition would seem to imply, that the Commission shall have control over all industries employing for any purposes such devices or substances. Attention is also called to the fact that there are now in existence many industries utilizing uranium, thorium, and beryllium. These industries, not in any sense a public menace, would under this bill as drawn come under the dominance and control of the Commission even though such industries are not now engaged nor likely to become engaged in the production of fissionable materials.

The definition of "fissionable materials" (p. 7, line 14), in addition to including plutonium and uranium-235, includes—

such other materials as the Commission may from time to time determine to be capable of releasing substantial quantities of energy through nuclear fission, of the material.

It is quite probable that additional fissionable materials may be discovered in the future in which the release of substantial quantities of energy through nuclear fission may be so sluggish as not to endanger the public safety. The definition should be changed to include only such other materials as the Commission from time to time may determine to be likely by their fission to endanger the public safety.

The CHAIRMAN. I take it, Mr. Folk, that the point you make and your underlying philosophy here is that the public safety is the sole criterion of the Government's authority in the field?

Mr. FOLK. I have gone a little further than that later and I may have said here—"or the misuse of such materials." That is, if the material is very scarce, we don't want it squandered; I recognize that.

The CHAIRMAN. But you take the position that fissionable material should be permitted to be manufactured by any industrialists?

Mr. FOLK. Provided it is under police regulation, so that it will not endanger the public.

The CHAIRMAN. What compensation do you envisage, or do you suggest any, from private industry to the Government for the use of the process?

Mr. FOLK. I see no reason why they should be any different from any new enterprise. For example, the beryllium enterprise is a very important new industry that has arisen in the last 9 or 10 years, and that would come, it seems to me, under the control of this Commission.

The CHAIRMAN. But that wasn't developed from Government funds, was it?

Mr. FOLK. So far as Government funds are concerned, I should say definitely any invention made by an employee of the Government should be owned by the Government, and should be open to license by anyone.

The CHAIRMAN. The Government has spent \$2,250,000,000 on the Manhattan project and has brought this to mass production—loosely speaking—of the material.

Of course, that was the taxpayers' money and added to the debt. Do you advocate that the result be turned over to private industry, that the processes be turned over to private industry, without compensation?

Mr. FOLK. I don't know the terms under which the people are working for the Government, what the contract provided. Of course, something would depend on that.

If it is Government property—and it could be Government property by reason of the contractual relations, in that the Government employed these people and paid them for the time to do this work—of course the results belong to the Government.

Now, insofar as it is safe to let the public have the advantage of that, the taxpayers who paid for that development should have the free use of it; that is, a nonexclusive license.

It is very difficult to answer your question without knowing the details.

The CHAIRMAN. In other words, under the contracts, as I understand them, certainly the basic processes that produce fissionable material are the property of the Government and have been paid for by the people. Now, if I understand you correctly, what the Government would get would be a shop right, and everybody else would be allowed to produce the fissionable material based upon the Government processes without any royalty or payment of any kind to the Government.

Mr. FOLK. Well, the Government would get more than a shop right; it would get ownership of the patents under the conditions you have mentioned.

Now, what should they do with them? We have various theories regarding what should be done with Government patents, some taking the view that, since the Government would be acquiring the patent for the public, the public should be allowed to use it freely without further payment, having already paid for it; others have the view that it should be sold for compensation, and others exclusive license given.

We haven't attempted to deal with it in this statement, but in my personal view I think when the Government owns a patent it should be free for use by anybody that is capable of using it without any compensation.

The CHAIRMAN. Therefore, the Jones or Smith Manufacturing Co. of New Jersey or New York should be permitted, under that theory, to start up a uranium-producing plant?

Mr. FOLK. Provided it is safe to do so, because we should have competition in dealing with uranium. You will get it that way, if everybody is given a chance.

The CHAIRMAN. Do you see any possibility of adding difficulty to the international control of fissionable materials through the dissemination of it on a private basis all over the country?

Mr. FOLK. I haven't thought of any. I don't see any. Of course, we don't know what the international situation will be. What I am very much afraid of is that, if we put severe restrictions on it that are not put on in other countries, the other countries will undoubtedly have the advantage in that case, and I would dislike very much to see that happen.

There should, of course, be some provision by which the authority of the Commission is not so limited that it couldn't act sensibly. I agree with that.

Whether it is the material we are talking about now, or any other patents owned by the Government, there should be free use by the public because they have paid for it ultimately by taxes or otherwise, and why should they have to pay for it again?

I am glad you ask me these questions, because it gives me an opportunity to discuss them.

The definition of "production of fissionable materials" (p. 5, line 17) is likewise too broad in view of the definition given to "fissionable materials" and in view of the reasons above set forth.

The term "atomic energy" is defined as including "all forms of energy liberated in the artificial transmutation of atomic species." This, of course, does not include spontaneous transmutation, such, for example, as occurs in radium and other radioactive materials. But it is probable that even in the artificial transmutation of atomic species, such transmutation can also occur with many elements without any danger to the public in general. I should be disappointed if that does not prove to be the case. Therefore, the definition of atomic energy, in view of the control given to the Commission, is much too broad, broader than is necessary or desirable.

As the art develops, it is almost certain that harmless fissionable materials may be discovered, not now known to be capable of fission, but which can be extensively utilized for industrial purposes without creating a public hazard, and for the use of which there will be no need even for regulation.

Thus the bill, in providing, as we shall presently point out, Government control of source materials, the production and use of fissionable materials, byproduct materials, and atomic energy, would give to the Government enormous and increasing economic control of private enterprise not only as it exists today but as it will probably develop in the contemplated atomic age. It would increasingly wipe out our boasted American system of free enterprise.

The CHAIRMAN. Has it occurred to you, Mr. Folk, that if sudden and widespread industrial use—call it peacetime use—of atomic energy were made, that it might have some impact upon our economic system?

Mr. FOLK. I should think it would, definitely; of course, I don't know. We have had guesses, and I have listened to a lot of guesses

from people who know, some who figure that in 5 or 10 years we will be using it extensively, and others think possibly never. But I am not sufficiently informed on the scientific aspect of it.

The CHAIRMAN. If it came indiscriminately and more rapidly than we think, which is quite possible, it might have some impact upon our economic system, might it not?

Mr. FOLK. Absolutely, it would, and that is the reason I don't want to change it from free enterprise to Government-controlled enterprise.

The CHAIRMAN. Let us assume that Westinghouse and General Electric, du Pont, or any one of the great concerns which made such great contributions to this project, were to develop very quickly an atomic furnace. Do you see any difficulty in putting that into our economy over night?

Mr. FOLK. No more than in any new development. My experience is that new developments take years before they get into commercial use.

The CHAIRMAN. Well, let us assume, though, that they do, through a combination of fortunate circumstances, develop an atomic furnace which would overnight displace 500,000 coal miners from work. Do you see any threat to our free-enterprise system in such an immediate transmutation?

Mr. FOLK. No; no more than has been threatened in the past with new developments, like the railroads driving the cabs out of existence, and so forth, in various other industries. There is always a displacement for the time being, but always to the advantage of the public in a very short time.

The CHAIRMAN. You see no difference in the situation as it might develop with atomic energy?

Mr. FOLK. No; I do not.

The CHAIRMAN. Even though it displaced all other forms of energy?

Mr. FOLK. I think it is very unlikely that that problem would arise, but if it does arise, it is just like any other new invention that came in to displace something that had gone before. Of course, there have been people who advocated not allowing labor-saving machines to be patented on the theory that it displaced labor. We now know it was a blessing to have labor-saving machines when we needed them.

CONTROL OF SOURCE MATERIALS

Now we get to the control of source materials. In view of the broad definition of source materials, it is unjustifiable to provide that no person "may transfer possession or title to any source material after mining, extraction, or removal from its place of origin," and no person may receive such material without a license from the Commission (p. 9, line 6). This provision would not be nearly so objectionable, though apparently unnecessary and harmful, if the definition of source material is restricted, as above suggested, so as to include only dangerous-to-process ores, and not to include such material, for example, as ores which it may be found can be processed and used without any danger to the public. The search for undiscovered ores should not be discouraged, as the above prohibition would undoubtedly tend to do. Regulation is all that is necessary. Further control would be harmful.

CONTROL OF THE PRODUCTION OF FISSIONABLE MATERIALS

We believe that it is unnecessary and undesirable to have the Commission be the exclusive producer of fissionable materials, except where such production is incident to research or developmental activities by those licensed by the Commission to do so (p. 5, line 24); or for the Commission to "arrange for the exclusive operation of facilities employed in the manufacture of fissionable materials by employees of the Commission" (p. 7, line 9). It would be sufficient that the Commission shall have the authority to regulate and police the production of fissionable materials in such way as to guard the public safety.

CONTROL OF FISSIONABLE MATERIALS

The provision by which any person owning any right in fissionable material shall forthwith transfer the same to the Commission is an unnecessary interference with free enterprise (p. 7, line 19). It would be sufficient that only such fissionable materials, the possession of which by an individual may endanger the public safety, should be under the regulation of the Commission. Ownership of the material by the Commission is not necessary for regulation of its possession and use.

The CHAIRMAN. You, of course, realize that after the Government produced the fissionable materials, assuming that they could be used industrially, there is no provision in the bill which would bar the Commission from permitting this to be used by private industry under a suitable payment to the Government.

Mr. FOLK. That is true, and yet there are one or two objectionable phases of that which I will come to in just a moment, and which I think should be corrected.

The CHAIRMAN. In other words, there is no intention under this bill for the Government to operate atomic-energy furnaces in every house in the country.

Mr. FOLK. No, it is to produce material which would be used in such furnaces.

The CHAIRMAN. That is right.

Mr. FOLK. I think that is wholly unnecessary and is undesirable.

The CHAIRMAN. But I wanted to make certain that you understood that it ended with the production of fissionable materials themselves.

Mr. FOLK. I understand perfectly.

The CHAIRMAN. And did not contemplate that the Government would go in the business of heating every house in the country, or of taking any of the fissionable materials and running locomotives or steamships with them.

Mr. FOLK. I understand that at present the bill does not contemplate that. The bill does contemplate, however, licenses required for research or for industrial pursuits. In making it unlawful for any person to operate any equipment or devices utilizing fissionable materials without a license from the Commission, such provision would undoubtedly deter the development of harmless fissionable materials.

The CHAIRMAN. What do you mean by "harmless fissionable materials"?

Mr. FOLK. We have radioactive materials now, like radium, which have a spontaneous splitting of the atom; that is what gives

radium its effect. Yet it isn't harmful to anybody exercising proper precautions in using it. I anticipate in the future that we are going to discover a number of substances that can be used where the action is not so violent that it cannot be used safely as a substitute for other things.

The CHAIRMAN. Any material that is fissionable, that releases any amount of energy, is potentially a source of destruction, is it not?

Mr. FOLK. I don't believe it is necessarily. Would you say that radium is?

The CHAIRMAN. No.

Mr. FOLK. Radium releases energy; radium is split up.

The CHAIRMAN. Granted, but is it a scientific fact that radium produces energy in any appreciable amount necessary to do the work of industry?

Mr. FOLK. No, but I can conceive of there being discovered other elements, perhaps some of much less atomic weight than uranium and thorium and the like, which would nevertheless release fissionable energy.

The CHAIRMAN. It seems to me just as soon as it releases enough energy to be worth while, to do the work of industry, to do the work of so many kilowatt-hours, if you please, it would then be capable of being used explosively.

Mr. FOLK. Well, the suggestion that I have made, or that NAM has made, is that if such is found to be the case, the Commission should regulate it and police it, but I am confident myself that there will be fissionable materials discovered that don't need regulation, that will produce sufficient energy to be used commercially or industrially, and still not be a public danger. If it proves to be a public danger, or is likely to be, this Commission should have authority to know what is going on, and if they find there is such danger, then it immediately comes within their province under the suggestion I have made. Have I made myself clear?

The CHAIRMAN. Oh, yes; I understand your point; I don't agree with you, but I understand it.

Mr. FOLK. Just so I make it clear; I was in hope you would at least agree with something we had to say.

It should suffice if the authority of the Commission be limited to the regulation of such use thereof as might endanger the public safety.

Provision is made that—

Where any license might serve to maintain or foster the growth of monopoly, restraint of trade, unlawful competition, or other trade position inimical to the entry of new, freely competitive enterprises, the Commission is authorized and directed to refuse to issue such license or to establish such conditions to prevent these results as the Commission, in consultation with the Attorney General, may determine.

This provision is too broad and very objectionable. It opens the way to possible unjust discrimination against applicants for a license. Any private ownership of property is a monopoly of that property. Any refusal of a property owner to allow others free use of his property is to that extent a restraint of trade. In any event, the word "unlawful" should be inserted before "monopoly" and also before "restraint of trade," just as it is with respect to "competition," referred to in the foregoing as "unlawful competition." The antitrust laws could then provide adequate safeguards.

I might say that also where you say "or other trade position inimical to the entry of new competitors," you might say "inimical to the lawful entry of new competitors."

Have I made myself clear?

The CHAIRMAN. Yes, sir.

PATENTS

Mr. POLK. Now we come to the patents. Section 10 (p. 18, line 19), under which patents covering inventions for the production, refining, and other processing of fissionable materials shall be issued to the Commission and not to the inventor, of course nullifies those provisions of the law, in accordance with the Constitution, by which the inventor is given the exclusive right to his invention for a limited term. Believing as we do, and as is generally accepted to be the fact, that our patent laws have been to a very great extent responsible for the development of new industries, increased employment, and a high standard of living, such overthrow of the fundamentals of our patent system should not be undertaken. It should suffice if the Government merely takes over a non-exclusive license for governmental purposes with provision for just compensation for the rights so taken, as is now provided by law.

Section 10 (b) (p. 19, line 12) provides that any patent already issued to private individuals covering any process or device utilizing or peculiarly necessary to the utilization of fissionable materials is subject to compulsory licensing. This, of course, amounts to confiscation of private property. It is not the taking of private property by due process of law or for public use with the safeguard provided in article V of the Amendments to the Constitution. It should suffice that the Government take, for governmental uses only, a nonexclusive license with just compensation therefor. Compulsory licensing of patents already issued has generally been regarded as unconstitutional confiscation of vested private property.

You see, I make a distinction between patents already issued and those issued in the future. There is a distinction.

The CHAIRMAN. Is it your conception of the law that the Government cannot use its condemnation powers and take private property with due compensation?

Mr. POLK. Only where the public use is involved, and that doesn't mean use for Tom, Dick, and Harry or anybody that wants it. The Government doesn't condemn real estate and divide it up among its citizens.

The CHAIRMAN. Well, of course I grant you that, but there would be the thought—granted the tremendous effect that these things might have on our economy—that the Government might have the right under the Constitution to take that property upon the payment of due compensation. However, that raises a legal question.

Mr. POLK. I have paid attention to that especially. Since the very beginning of time, the Supreme Court has invariably held that the patent property was just like real estate, not to be subject to confiscation by the Government, nor for use of governmental purposes even without just compensation. I want to bring that point up. I have never heard any good authority contrary to this, and the bills that have heretofore been introduced in Congress on compulsory

licensing have generally been amended to make it include future patents only.

Senator HICKENLOOPER. What was that last statement?

Mr. FOLK. I can say it again, probably in different language. I say the general interpretation of the law is that taking patent property is a confiscation of that property, and the Supreme Court has held—as recently as in the Glass Industry case—that the Government has no more right to take that property than it has any private property.

Senator HICKENLOOPER. You are dealing only with future patents?

Mr. FOLK. That is right.

The CHAIRMAN. Do you know of any patents in the field now?

Mr. FOLK. Unfortunately, I don't. You could get that, Mr. Chairman, I should think, by asking the Commissioner of Patents to give you a list of those patents relating to fissionable materials. It would be rather an interesting study. Of course, you are not going to get a list of the patent applications. I should think those would be preserved for secrecy reasons during the war and not released.

The CHAIRMAN. I imagine they are available to us.

Mr. FOLK. They should be.

The CHAIRMAN. Now, of course we haven't, but we intend next week to get into that situation in some detail. You know that all the contractors working under the Manhattan district have been working for the Government and have been paid for their work.

Mr. FOLK. Then, in general, it would belong to the Government.

The CHAIRMAN. So the difficulty that you anticipate about patents already applied for would probably not raise too many difficulties.

Mr. FOLK. No; I don't believe it would, but I haven't even got to "applied for"; I have so far considered issued patents, because "applied for" refers to future patents, those that have not been issued. I deal with that in the next paragraph.

The CHAIRMAN. I rather think that the Commissioner of Patents has not issued any patents upon atomic energy devices or upon the production of fissionable materials. If he has done so, we want to know about it.

Mr. FOLK. There may have been some issued before the war. Generally there is, long before a thing goes into commercial use, a patent issued on it.

The CHAIRMAN. I rather think we are dealing with a virgin field here.

Mr. FOLK. Probably so.

Senator HICKENLOOPER. I expect they took out patents on these cyclotrons, and things of that sort—much of the apparatus.

Mr. FOLK. Yes; and they have taken patents out on the processing of beryllium and uranium. I think the next witness will deal with that and knows much more about that than I do. I do know uranium, as a metal, was isolated more than 100 years ago. Naturally, many industrial uses have come of it.

Now, my position is that your bill—unintentionally, no doubt—is drawn so broad that you would have control of those industries. I really raise the point that I think should be given some attention.

While there may be some difference of opinion regarding compulsory licensing of future patents, even in such case it is questionable whether Congress has the authority to grant other than an exclusive right.

The granting of a patent subject to compulsory license is the negation of an exclusive right. In any event it is contrary to the spirit and intent of the constitutional provision for promoting the progress of science and useful arts, by the grant to the inventor of an exclusive right for a limited time, a provision which for more than 150 years has proven its merit.

The National Association of Manufacturers is therefore opposed to the confiscation of patent property without due process of law, and is likewise opposed to compulsory licensing even of patents granted in the future. The provision in our Constitution for the granting of exclusive rights, which have served so admirably in the past, should be continued with respect to this new art in order that the development thereof may not be hampered. It would deter research and development work if the party engaged therein must bear his own losses if he is unsuccessful and must share his discoveries with others who sit idly by, in case he is successful.

Senator HICKENLOOPER. Mr. Chairman, may I interrupt here?

The CHAIRMAN. Surely.

Senator HICKENLOOPER. Mr. Folk, under the general principle of eminent domain, let us say, such as we use in land acquisition and other things with adequate compensation, do you still think that the compulsory turning over of patents to the Government and compulsory licensing would be in violation of the Constitution?

Mr. FOLK. Undoubtedly with reference to patents already issued, if it is not for a public use. Of course, I say the Government can condemn patents for its own use, for Government purposes, but when it condemns patents to distribute to anybody who wants to come into the field privately, that is a different matter.

Senator HICKENLOOPER. Let me ask you this: Suppose the Government decided that all firearms were the property of the Government for national defense, and that private individuals could neither manufacture or use firearms, and that any firearm already in existence or any patent for the manufacture of firearms should be acquired by the Government for the exclusive use of the Government.

Mr. FOLK. Of course, they could pass a law, a police regulation, forbidding the use of firearms, just as they did forbidding gambling devices, for example. Just because you forbid a patented device doesn't mean the patent is confiscated. The patent gives to the inventor the right to exclude others. So far as stopping him from manufacturing, you don't have to take over his patent at all.

Senator HICKENLOOPER. No; but suppose that you supplement that seizure by provision for adequate compensation? Of course, the fellow who holds the patent never thinks the compensation is adequate, but the law could set up what it considered a fair yardstick there.

Mr. FOLK. As I have said, under our system of government, private property in the case you mention should not be confiscated for the benefit of private individuals in the United States. That is the only answer I can give you.

Senator HICKENLOOPER. I wasn't approaching it from the standpoint of benefit to private individuals. I was merely trying to explore this question of the Government declaring as an over-all policy that this whole field has an overriding public interest, that the Government elects to take over the entire field, and then in the public interest making a declaration that certain activities can be farmed out, as we

do with the Navy. We say the Navy is a public responsibility, and yet we farm out the building of ships to private enterprise or private companies on occasions. Now, something comparable to that might be worked out.

Mr. FOLK. I can only say that if the Government wants to stop the manufacture of TNT or firearms by private individuals, it can do so, as far as I know. Certainly they could by some interpretations that might be given to it, but I do not think the Government would have the authority to take away the only thing the inventor has, the right to exclude others. If the Government itself took that over and manufactured it, that would be taking it over for Government purposes and just compensation should be paid for it. There is no need to take over the patent; a nonexclusive right would be all the Government would need in any event. Undoubtedly if the patent holder should find he was barred by law from making the device, he would be glad to sell his patent and get something for it.

Senator HICKENLOOPER. That patent law has been built up to encourage exploration, to encourage it by whatever financial consideration can flow from the work of an inventor. Now, if adequate compensation is set up for that invention, that is, for the genius or the exercise of the genius, then wouldn't that take the place of the exclusive right to manufacture and market? The exclusive right to manufacture and market, let us say, is in the nature of a reward and is a part of the encouragement for working out the invention, as I would view it.

Mr. FOLK. Of course, the reward to the inventor is only an incident. The whole purpose of it is to develop the art and science.

Now, I can not see any difference between the Government, seizing a million acres of land out West that is privately owned, saying, "We are going to take that over and submit it so the Homestead Act so that anybody can buy that property that wants to." I don't consider that as taking it for a public use, and I don't consider that the Government has any right to do it. I feel the same way with reference to patents. I see no distinction between one form of private property and another.

I am glad to raise this question; it is not a simple one.

Senator HICKENLOOPER. I want to make it clear, Mr. Folk, that as far as my own view is concerned, I am very zealous that private enterprise be not excluded from exploration in this field. There are certain fields of protection, however, which I think we will have to provide for. But it is rather confusing. There is a twilight zone in there.

Mr. FOLK. It isn't twilight to me; I am sorry it is to you.

The CHAIRMAN. In other words, your basic belief is that there is no difference between the instance you mention, in which the Government might take a million acres of land and put in out to private use, and operations in this field, the field of atomic energy?

Mr. FOLK. Well, I was giving it broader interpretation than that—to any patent rights they may have. The Government has a right to take the patent for its own purposes, but has no right, after it has granted the patent, we will say, to take it away from you and say, "We are going to give it to somebody else."

The CHAIRMAN. But we have to think of this problem in terms of its peculiarities, which is a masterpiece of understatement.

Senator HICKENLOOPER. How do you reconcile, then, the theory of eminent domain? Your argument then would carry just as much into the field of eminent domain and say that the State or the Government couldn't come and take any land for road purposes.

Mr. FOLK. That is a public use. That is provided for in the Constitution.

Senator HICKENLOOPER. Then you get down to the question of what is appropriate use, and that is where your twilight zone comes.

Mr. FOLK. Of course public use is a very difficult thing to define. It is easy to say what isn't public use; but sometimes it is very difficult to say what is public use. I will grant you that.

Senator HICKENLOOPER. I am not so certain I would agree with that. I think with changing conceptions of industry and business in our whole economic system, the public use may change from time to time. That is, what yesterday was manifestly in everybody's mind not a public use may tomorrow be generally accepted as a public use.

Mr. FOLK. That may be true, but let us not give the Commission any authority until we are definitely sure it is a public use in the strict sense of the term.

Senator HICKENLOOPER. I think I agree with that; I think we should be quite sure.

The CHAIRMAN. Let us take the TVA and see if we can make a helpful analogy. TVA used the powers of condemnation to secure large tracts of land. Now they are operating the thing as a Government institution, a Government monopoly in that area, actually operating it.

Would you say that it would be beyond the powers of the Government to lease out the management of any of those plants?

Mr. FOLK. I haven't given the matter sufficient thought. I have only treated the matter with respect to patents, as I understand it, and we are dealing with a rather difficult subject, as I think we all appreciate.

The CHAIRMAN. Yes; but I think that the Government would have the right to take the operation around the Norris Dam, we will say, and lease it out to Commonwealth & Southern for operation without running into the danger of a successful attack by the property owners who had that land taken away from them.

Mr. FOLK. I can conceive that that would be an incidental use in which the tail went with the hide, and you might deal with it in that way. But there must be back of it primarily a Government use in order that they can condemn that property.

I want you to understand that you have raised some questions here that I have not discussed with the Committee on Patents and Research, which is a very able committee, and necessarily you will have to interpret these as my individual views. I suppose you understand that. I don't believe they will differ with me, knowing the committee, but I want it definitely understood that I have not been instructed on that particular subject.

The CHAIRMAN. All right, sir.

Mr. FOLK. Now as to general comments—and we have to wind up somehow, you know—the creation of an Atomic Energy Commission such as is proposed in S. 1717 or even in the May-Johnson bills, H. R. 4280, H. R. 4566, and S. 1463, with the creation at the same

time of a National Science Foundation, along the lines proposed in the Kilgore or Magnuson bills, S. 1297 and S. 1285, respectively, would result in an overlapping of, and conflict in, the authority and functions of those two proposed Government agencies. Perhaps the functions of the Atomic Energy Commission can be combined with that of a National Science Foundation by the creation of an Atomic Energy Committee such as can readily be provided for in the above-mentioned bills for the creation of a National Science Foundation.

A careful consideration of S. 1717 makes it apparent that the broadest possible control, as distinct from regulation or policing, is given to the Commission with respect to every possible aspect of this new art. Enterprises involving some new industries that have already arisen, having no direct relation to the use of atomic energy, and new enterprises that are likely to be developed in the future involving the use of atomic energy, would be under the absolute control of the Commission. It would be a misnomer to refer thereto as "free enterprise."

While, as stated above, the National Association of Manufacturers recognizes the necessity for such regulation and policing of the new art of atomic energy as may be necessary to safeguard the public from danger therefrom or from misuse thereof, the National Association of Manufacturers at the same time is apprehensive that S. 1717 and other bills now in Congress along the same general lines would unnecessarily hamper the development of the art. The principal reasons the National Association of Manufacturers objects to such broad authority being given to the Commission as provided for in the above-mentioned bills may be summarized in recommendations made by the National Association of Manufacturers' Committee on Patents and Research and approved by the National Association of Manufacturers' Board of Directors.

The CHAIRMAN. Now, Mr. Folk, I take it that the provisions of the May-Johnson bill providing for Government control of operation are, in your opinion, too restrictive?

Mr. FOLK. They are more drastic than the McMahon bill, and the last bill that was introduced by Congressman May is quite an improvement—H. R. 4566, I believe. But there are still some features that should be changed, or this bill could be straightened out.

The CHAIRMAN. But even the May-Johnson bill in your opinion is too drastic and too liberal as far as the Government's sphere is concerned?

Mr. FOLK. That is exactly the opinion of the committee, and I am speaking for them when I say that. The resolutions they adopted will show that is the case, because that included the May-Johnson bill. [Reading from the resolution adopted by Committee on Patents and Research of the National Association of Manufacturers:]

They would impose severe and unnecessary restrictions and impediments upon research and exploration in one of the most advanced and potentially fruitful fields of scientific investigation and endeavor.

They would deter and impede the development of atomic energy for industrial and other nonmilitary uses in the United States and would tend to put the United States at a disadvantage in relation to other nations that did not adopt similar regulations.

They would discourage invention in this field by subjecting to Government condemnation and seizure patents, application for patents, and inventions relating to atomic energy.

They would interfere with and tend to destroy the freedom of development of science which is essential to technical, social, and industrial progress.

And, they would subject scientific research and development to bureaucratic control.

As above stated, the National Association of Manufacturers recognizes, however, the necessity for proper regulation and policing of this new art so as to obviate danger to the public therefrom.

I hope I have made the position of the NAM clear.

The CHAIRMAN. Any questions, Senator?

Senator MILLIKIN. I regret that I couldn't be in on the beginning of your presentation.

Mr. FOLK. The presentation is there, aside from the questions that have been asked, and which I was glad to have answered.

Senator MILLIKIN. I shall read the transcript with great interest.

Mr. FOLK. Thank you very much. We have given this very careful consideration. I have been associated, as I said, as patent adviser of the National Association for 7 years, and all these important questions have been given very careful consideration by them.

Senator MILLIKIN. Mr. Chairman, was this matter touched upon, as to what private right to patents should exist out of the research and development financed by the Government during the war in these various plants?

The CHAIRMAN. Mr. Folk stated it is his position that if the Government paid for this work that they were entitled to the patent rights. Isn't that right, Mr. Folk?

Mr. FOLK. That is what the Government has paid the man to do, and it belongs to the Government as a result. Of course, there may be cases in which the man made investigations preceding that and could show it wasn't included in what he was paid for, and that is a different proposition.

It has long been settled that not only in the Government, but anybody employing somebody to make an invention, when the invention is made it belongs to the man who employed him and paid for it. There is nothing new in that.

The CHAIRMAN. Mr. Folk is also the first witness that we have had before the committee who has taken the position, on behalf of his organization, that there should not be a Government monopoly of the production of fissionable materials, but that fissionable materials could and should be manufactured at will by private individuals under suitable safety and security regulations, and that any monopoly of this field by the Government—that is, the production of fissionable materials—would be an unwarranted invasion of our free-enterprise system as we know it, and he stressed that point. I wanted to make sure that you understood that that was his position.

Senator HART. May I ask one thing, Mr. Chairman, in order to get it straight?

The CHAIRMAN. Surely.

Senator HART. Did Mr. Folk take into consideration the possibility of international agreements which would be restrictive?

The CHAIRMAN. Mr. Folk and I had a brief conversation about that, and I asked him if he did not think that such a handling of the matter by private individuals might not impede and possibly obstruct an inspection system which might be worked out internationally, and he stated it was his opinion that he did not believe that it would. I think I am right.

Mr. Folk. I think we have got to conform to the international arrangements that are made and might affect the amount of policing and regulation you would have to do. I don't think you would affect the question of who makes the fissionable materials, or who owns the ores from which it is made, or who owns the processes by which it is produced, or that there is any necessity for a broad control of atomic energy.

My feeling is that you will discover a great many fissionable materials in which the atom can be split without any danger whatsoever to the public, and the Government should not interfere with the discovery of such devices, as I think it would if you put it under governmental control solely.

This is a very drastic bill, and I really rather dreaded having to take the position I did, but I thought it was due the committee that I tell you the views of the National Association of Manufacturers.

Senator MILLIKIN. Mr. Chairman, I wonder if the witness would accept a qualification to his statement, that we must accept the international arrangements that may be made. I assume that he meant the international arrangements which may be made, to which the Congress assents.

Mr. Folk. That is what I assumed, of course, naturally.

Senator MILLIKIN. May I ask the witness whether he could possibly divide this subject into, let us say, two phases: First, the phase that we are in now, where we don't know what the international arrangement will be, where we have a whole lot to learn about the whole subject; where we do know that we are dealing with a deadly thing, which might suggest that for a period of time, a short period of time, it is advisable for the Government to maintain complete control over the whole subject; and that once that period of time has passed, we could then open the thing up on a much broader public and private enterprise scale.

Mr. Folk. My suggestion wouldn't prevent that being done. When I say the Government should regulate and police, I think all the authority the Government needs to control the dangerous situation is given to the Commission. I don't think it is necessary for the Commission to be the only one manufacturing fissionable materials. If other people are allowed to manufacture it, it should of course be under policing so as to avert any possible danger to the public.

Senator MILLIKIN. I might go along with you easily on that as something for the future, once we know where we are in the use of this energy as a weapon. I suggest—and I am just thinking out loud—that perhaps we might look at the whole situation at the present time, at the uncertainty of foreign affairs, and whether we are set for peace or whether this is just an armistice, since we are lacking knowledge as to what may be agreed upon internationally, and that during that period of uncertainty it might be wise to make a complete and total control over the subject. However, as soon as we can say to ourselves that we are now entering a period of peace, that the weapon is no longer the predominant feature, that the development of this thing commercially and for peaceful purposes is now the predominant feature—at that point it seems to me we could make a drastic alteration of our views and say, "Now we are ready to turn this thing loose under control and supervision," as distinguished from the tight control of the energy that is proposed by all of these bills.

Mr. FOLK: You raise an interesting question, but I am fearful that once you have socialistic government control, which is state socialism, it is going to be very hard to ever throw it off.

The other feature I make is the proposition we have that so far as the public danger or safety is concerned it should be regulated and policed by your Commission. Further than that I don't think it is necessary to go. What difference does it make whether the Government owns that material or a private person owns that material, if the use of it is safeguarded?

Senator MILLIKIN. Well, I can see where the work in private enterprise on that energy might become so widely diffused that while control and supervision is certainly called for, it might become impracticable to maintain it.

Mr. FOLK. I have no objection to the bill being as it is, provided that any person indulging even in research or development or industrial use shall be required to give the Commission information as to what he is doing, so that the Commission can see whether the public safety is being safeguarded.

I don't believe we are far apart, except that I do object to the Government monopoly.

Senator MILLIKIN. I am in accord with your fundamental philosophy, but it seems to me there may be a period of time when we will have to violate some of our conceptions on the subject in the interest of public safety and in the interest of assuring the security of the United States.

Mr. FOLK. I am glad to get these various views, and I will repeat, as I said when you were not here, that you have gone into a great many phases of this for which I haven't received any approval by the patent committee, and I am stating my personal views in regard to that, as you will understand. I believe they will support me. That is all I can say. I have been with them 7 years in an advisory capacity, and generally I know what they think.

The CHAIRMAN. You say at the bottom of page 4 of your statement:

As the art develops it is almost certain that harmless fissionable materials may be discovered, not now known to be capable of fission, but which can be extensively utilized for industrial purposes without creating a public hazard, and for the use of which there will be no need even for regulation.

We briefly touched on that, Mr. Folk, but I wonder what scientific basis you have for any such prediction.

Mr. FOLK. I am hazarding a guess, because I know the radioactive materials are supposed, and I think it is generally accepted, to be spontaneously breaking down of the atom, and is doing it by such a slow process there is no danger. Now, I could conceive that some other material, for example lead—that the dream of the alchemist might come true by which you could change lead into gold, and could do it without any danger to the public in so doing.

Radium, for example, is a spontaneous breaking down of the atom. There is no danger to the public in general.

Isn't it possible that some other elements may be found, maybe having a lighter atomic weight than uranium and thorium, and still be perfectly safe for the public to use?

The CHAIRMAN. But all of them would produce energy, if they are going to be any good.

Mr. FOLK. Yes.

The CHAIRMAN. And if you can produce energy, that energy could be turned into a weapon.

Mr. FOLK. I doubt it. There might be some that wouldn't be. That is my point. Some might be perfectly safe and not a danger to the public. I don't like to tie it up beyond what you know now.

Senator MILLIKIN. You mean there might be an element exploited that might not be capable of these deadly chain reactions?

Mr. FOLK. That is exactly right.

Senator MILLIKIN. At the same time, it might produce energy which might be harmless for peacetime purposes?

Mr. FOLK. That is right; that is a guess, but I have seen so many wonderful things done during my lifetime that I am fully willing to make that guess.

Senator HART. There again, following Senator Millikin's thought that this is really interim legislation, though he did not so express it, those scientific developments, as I gather, are not yet in sight and there is no particular reason for worrying about them in any way right now. But, as I gather from the short time I have been here, you rather fear that something will stay on the books here, stay in the statutes, which will be too difficult to change when that time does arrive?

Mr. FOLK. That is one reason. That isn't the only one. I am also fearful that you will discourage people from searching for those materials in the ground. What is the use of discouraging them? The patents under this bill will go to the Government. If the researcher is unsuccessful, the loss is his; if he is successful, he has to turn it over to the Government.

That is one of my principal points, the discouragement of looking for the very things we want to find.

Senator MILLIKIN. The percentage of success in the patent field is infinitesimal, is it not?

Mr. FOLK. That has been my experience as to the last 50 years.

The CHAIRMAN. Thank you very much, Mr. Folk.

Mr. FOLK. Thank you for giving me this opportunity.

The CHAIRMAN. Mr. Bransome and Mr. Kett.

Mr. Edwin D. Bransome is president of the Vanadium Corp. of America, and Mr. Frederick Kett is general manager of the mining division of the Vanadium Corp. of America.

STATEMENT OF EDWIN D. BRANSOME, PRESIDENT, AND FREDERICK F. KETT, GENERAL MANAGER, MINING DIVISION, VANADIUM CORP. OF AMERICA

Mr. BRANSOME. Mr. Chairman, we have an apology to make. Mr. Kett will read this record, but in the presentation of it we thought we were addressing the committee in executive session. On page 3 of this record, we have some figures which we have ineffectually tried to blot out. We can pass around copies to the committee, or we can remove that page and pass them around to anybody who wants them.

The CHAIRMAN. I suggest that you let us have the statement as it is for the members who are present, and we will see that the matter remains secret.

Mr. BRANSOME. We are sworn to secrecy.

The CHAIRMAN. Yes; I understand.

Senator MILLIKIN. If we are omitting anything from the public session which you think we should deal with, we can have a short private session afterward.

The CHAIRMAN. Certainly.

All right, Mr. Bransome.

Mr. KETT. If it is to be assumed that atomic energy and its development is of importance to the safety and progress of the United States, then it is obvious that the sources of supply and stocks of raw materials from which atomic energy is derived are of paramount importance and that their availability should be the subject of immediate and exhaustive study.

Unless recent developments have materially changed the picture, it may further be assumed that uranium is still the only raw material for the development of atomic energy programs.

Published records indicate that world sources of uranium in substantial amount have been from:

1. Pitchblende—Canada and the Belgian Congo.
2. Certain vanadium ores known as roscoelite and carnotite from Western United States, chiefly Colorado, Utah, Arizona, and New Mexico.

Some pitchblende discoveries have been recorded in the United States, but to date not of sufficient importance to be considered a potential source of supply.

Senator MILLIKIN. May I interrupt? Do we have any roscoelite in Colorado?

Mr. KETT. Oh, yes.

Senator MILLIKIN. What is the layman's term for that?

Mr. KETT. That is the layman's name, roscoelite. It is a vanadium mica.

Occurrences of carnotites are reported in Russia, but grade and extent are not published or known to us.

If the foregoing is true in respect to the sources of uranium, then we are reduced to two methods of safeguarding the interests of the United States in respect to this raw material:

- (a) Importation and stockpiling here of all the pitchblende or uranium concentrates thereof available to the United States.
- (b) Intensive prospecting and development of carnotite and roscoelite ores in the United States and immediate mining and refinement of such ores, in accordance with the considered dictates of competent authority.

These programs could be carried out concurrently and so continued until imports of uranium containing materials were shut off by exhaustion or foreign legislation or international agreement.

Until uranium is conceded to be supplanted by other raw materials as requisite in the development of atomic energy, it would seem criminally negligent not to place the United States in a position to be self-reliant in respect to raw materials in times of emergency.

It seems needless to point out that times of emergency are usually dictated by the aggressor with due regard by him to the unpreparedness of the nonaggressor.

Within the boundaries of the United States, all carnotites and roscoelites carry uranium oxide, U_3O_8 , with run-of-mine carrying a maximum content for a vanadium milling grade ore of about 0.30 percent U_3O_8 , an average content of about 0.15 percent U_3O_8 , and a

minimum content of about 0.05 percent U_3O_8 , or 6 pounds, 3 pounds and 1 pound contained U_3O_8 per ton of vanadium ore.

Carnotite (not roscoelite) does occasionally occur in the form of concentrations containing up to a maximum of 30 percent U_3O_8 . These concentrations occur mostly in what are known as carnotite "trees" and are actually replacements of logs or branches of trees by more or less pure carnotite, always containing vanadium as well as uranium. These so-called "trees" are few and far between, encountered nearly always in the process of mining vanadium ore.

Senator MILLIKIN. Are there any deposits of what might be called exclusive uranium ores?

Mr. KERR. Not that I know of in the United States.

Senator MILLIKIN. They are all mixed?

Mr. KERR. They are all mixed with vanadium, except the pitchblende. There have been very minor amounts of pitchblende found in Colorado years ago, but as I say in here, they are out, as possible sources of uranium.

While some of these "trees" are very high grade, the average uranium oxide content is not over 4 percent and the total tonnage of such material for the whole of the uranium-producing area would probably not exceed x tons per year, or say y pounds of recoverable uranium oxide. This is an unimportant production compared to the possible uranium production from the vanadium operations, which production could provide z pounds of uranium oxide from the present facilities.

The uranium in these low-uranium-content, milling-grade vanadium ores up to 1940 has been allowed to go through the vanadium treatment processes into tailings, which were impounded. Such tailings were later disposed of to the Government.

In 1940, plant scale experimental work in the Vanadium Corp. of America Colorado plant demonstrated that a satisfactory recovery of the uranium values could be made in the course of the vanadium refining process; thereafter, Vanadium Corp. of America has continuously produced and marketed a uranium sludge containing some 50 percent U_3O_8 .

As before noted, carnotites and roscoelites carry both vanadium and uranium with run-of-mine ores containing far greater vanadium content than uranium. Therefore, if uranium becomes the major product and vanadium either a byproduct or waste product, uranium recovery will necessarily be expensive, but only in comparison to uranium recovered from pitchblende and not when its relative value in atomic energy program is considered.

However, marked economies may be effected if vanadium is recovered and credited to the operation, and such economies would obtain as long as the sale price of the vanadium so produced would permit competition with vanadium ores from other sources and vanadium uses were substantial.

Production of vanadium from United States vanadium-bearing ores is a highly technical operation and so far as is known no single process can be applied economically to ores from different localities with varying impurities. Complicated operating plants and highly trained technical personnel are requisites and such personnel must be continuously available.

Prospecting, development, mining, and processing of carnotite and roscoelite ores with uranium recovery as the major objective, it is believed, can best be accomplished by those private enterprises which are now or will be in the future engaged in the exploitation of vanadium and its various products. Government assistance would be advantageous, but Government restrictions or any other proposed legislation, except as to product disposal, would hamper production to the extent that an important going industry in the United States would be killed.

Senator HART. May I interrupt, Mr. Kett, in order to complete the picture?

In recent metallurgical developments, has anything been found, discovered, or developed which seems to endanger the use of vanadium in industry as has been the case over the last few years? Is there any new element or new alloy which is replacing it?

Mr. BRANSOME. I can answer that question in this way, Senator. Vanadium is always being displaced as are other elements from certain uses. Vanadium happens to be a rather expensive alloy, but they put it in because it is a master. The minute you can find some other element to supplement that which is cheaper, they will use it. There are always other uses cropping up.

Senator HART. I simply wish to bring out how important to our national industry as a whole is the continued production of vanadium. It would be less important than we now know if there were something else in sight which would supplant it.

Mr. BRANSOME. I think that question is self-answering. If there is something that will supplant vanadium, it will be supplanted in the march of progress.

Senator HART. My question is, have there been recent metallurgical developments which would indicate that?

Mr. BRANSOME. Not to our knowledge.

Mr. KETT. In regard to product disposal, namely uranium, it must be emphasized that the Government should have full control of such uranium products and that the processes used make such complete control a very simple matter.

Generally speaking, individual vanadium deposits are small; new deposits must be constantly developed and brought into production or the whole vanadium-mining industry in the United States of America will eventually—and not very far in the future—have to stop for lack of ore. Therefore, restrictions on vanadium production will automatically restrict efficient uranium recovery, if not make such recovery impossible. Whether the uranium is currently recovered in the vanadium process or allowed to go through the process into the impounded tailings for future recovery, the whole vanadium mining industry and the western plant facilities must be kept entirely healthy and in their highest state of efficiency as long as uranium in any quantity may be required at short notice.

We think that the right of location and patent—that is the patented ground, the mining property—should be expressly stated, at least where such location is made primarily and in good faith for elements other than radioactive ores.

We think that the right of condemnation and seizure should not be extended to mining properties, or to plants which are capable of producing radioactive elements but whose main operation is the produc-

tion of elements that are not radioactive, and which plants could operate without production or appreciable loss, actual or potential, of radioactive elements.

We think that S. 1717 should offer such facilities and protection to the vanadium producer as to stimulate to the utmost in the United States of America the search for and development of new sources of vanadium and its associate element, uranium.

The CHAIRMAN. Before you go into your summary, Mr. Kett, what specifically do you suggest should be incorporated in S. 1717 to accomplish that objective?

Mr. KETT. Taking the bill itself, on page 9, line 2, I will read that sentence, incorporating our suggestions:

The term "source materials" shall include any ore *after but not before mining, extraction, and removal from its place of origin* containing uranium, thorium, or beryllium * * *. [Italics indicate suggested insertion.]

That would cure the whole business. That would simply mean that anything still in the ground is not to be controlled. In other words, no Government department can take out 3,000,000 acres from circulation and say, "You cannot locate claims here, or patent claims, or have anything to do with it."

Senator HICKENLOOPER. You would still retain the independent prospecting rights and location?

Mr. KETT. I mean that the mining law should not be changed at all. Anybody should be allowed to stake out a claim, work it, and patent the claim, after which they own it in fee simple, with no restrictions on the prospecting, location, and development of claims containing vanadium and uranium, which it always contains out there.

Senator HICKENLOOPER. Just watch them after they get the ore out of the ground?

Mr. KETT. The minute the stuff is mined, OK—all the control you want on it; but don't stop free prospecting for the materials.

The CHAIRMAN. That would seem to me to be rather sensible. After all, what we are interested in is the uranium with no disposition, at least on my part, to try to control vanadium or any other useful metal that doesn't have fissionable possibilities.

Mr. BRANSOME. Mr. Chairman, I might add this: You have a few hundred small producers out there that are constantly prospecting for ore, producing it and selling it to the people that treat the ore. You certainly don't want to restrict those fellows.

In this bill at one point it goes beyond source materials and says: the Commission shall arrange for the exclusive operation of facilities employed in the manufacture of fissionable materials by employees of the Commission.

This in itself is so restrictive that it seems to me you have pulled a curtain down on all the progress of the development of fissionable materials except by a few people in the Government, who may or may not have the urge to go ahead in accordance with the dictates of their own desires to improve scientific knowledge.

The CHAIRMAN. I think that ought to be changed. Of course the intent is the package product, and not of course the ores in the ground.

Mr. BRANSOME. But it is poorly worded in there, Mr. Chairman, if I may presume.

The CHAIRMAN. Will you cite the page?

Mr. BRANSOME. It is page 7, line 10. That is beyond our source material job, but if that ever starts it will go back to source material, in my opinion.

The CHAIRMAN. You suggest the use of the word "manufacture" rather than "mining."

Mr. BRANSOME. That is right. As I say, I am going beyond the source materials into fissionable materials, but these words "by employees of the Commission," in my opinion, are impracticable.

The CHAIRMAN. Of course, everybody should be permitted to mine the material.

Mr. BRANSOME. Well, you mine the material, but suppose you are treating fissionable materials themselves. Suppose you take a huge company with a large research department. Any industry that goes in must be employed by the Commission. If my understanding of this is correct, employ means employ, and that means you must be hired and paid and controlled both as to discipline and duties by the Commission, which is impractical.

The CHAIRMAN. Well, I want to make sure that we understand one another. It is the intent of the bill, as you heard Mr. Folk and the committee discuss it, to make the manufacture of fissionable materials a Government monopoly in the field. It is not the intent of the bill to make a Government monopoly of the mining of the source materials.

Mr. BRANSOME. My only purpose in pointing out this particular wording, "employees of the Commission," is to indicate that it would require considerable exploration. Let me say this: I don't want to confuse you, but at any time we might go on, as a corporation—or other companies in our industry—into the fissionable material job, or go beyond just the source materials. We have research departments that are constantly doing that, so our interest is there.

The CHAIRMAN. Of course, that opens up a much wider field. As I said, I agree with you that the mining of the materials should not be a Government monopoly.

Is it your contention that you would like the Vanadium Corp. possibly in the future to go into the process of manufacturing fissionable materials?

Mr. BRANSOME. Our research and development department is constantly working on the use of uranium and other elements, whether they are heavy or light. Necessarily—well, not necessarily, but coincidentally we have developed certain processes in respect to uranium, and we may be getting into the fissionable materials, and that is our interest in this.

The CHAIRMAN. Was that work done before you entered into Government operations?

Mr. BRANSOME. On uranium? Not as a fissionable material, but we have patents on uranium for use in steel.

The CHAIRMAN. Have you any patents on it with relation to this process?

Mr. BRANSOME. No, sir.

The CHAIRMAN. Have you filed any applications for any patents?

Mr. BRANSOME. We may have, but not to my knowledge. If we have, they are in a very embryonic state.

The CHAIRMAN. But what you would like to have the right to do is to set up a plant to be owned by the Vanadium Corp. to manufacture fissionable materials?

Mr. BRANSOME. If we thought that was the thing to do. Without having that, everybody in that plant or in that laboratory would be infracting the law if they were not employees of the Commission.

The CHAIRMAN. Well, that is true.

I take it, then, that you believe that the manufacture of fissionable materials should not be the monopoly of the Government but that any company that wished to engage in manufacturing the finished product should be permitted to do so, to sell it on the market?

Mr. BRANSOME. With proper control as to manufacture, use and sale, with the proper controls as laid down by the Commission and subject to change as the need progresses. As Senator Millikin pointed out this morning, it might be necessary to hold the atomic energy project right now—and in my opinion it is—in complete subjugation to the Government.

The CHAIRMAN. In other words, if you were now prepared to go into the manufacture of fissionable materials, you do not think you should be permitted to do so at this time?

Mr. BRANSOME. I think we should be encouraged to go into it with the control that the product disposal is in the hands of the Government, at least for the time being, until this period that Senator Millikin says is over. In my opinion—I am speaking for myself—if your committee wanted to project a period of a year, 6 months, or whatever it is, and say, "We will review it at that time and find out if this emergency period is over," rather than say, "This is going to reside in the hands of the Government," that would be better, because as Mr. Folk very ably pointed out, once it gets in there you have got to take five sticks of black powder to blast it out.

Senator MILLIKIN. That is not enough.

Mr. BRANSOME. I guess that is right.

Senator HICKENLOOPER. That just makes the noise: it doesn't move the thing.

Mr. BRANSOME. So unless that restriction is limited, you are running into very severe danger again, in my humble opinion, of restricting your program and restricting your development, and very dangerously restricting it. As you know, and without any reflection on governmental agencies, when a governmental agency—at least the Government agencies that we have been in contact with—reach the age of maturity, they seem to me to sort of pull in; they are helpful, but, my gosh, I never saw them go out and bust anything wide open the way private industry will do; and that is just what we want to prevent—having this thing as a little club, and I mean a social gathering instead of having competition in the field, having everybody work on it at the same time. In the interest of safety of the United States and the progress of the world, if atomic energy is what we think it is, we have got to be awfully careful about handling the progress of it and not hold it down, not be so frightened of it. This thing isn't going to develop next week so that atomic energy is going to be such—and I hope the authorities agree with me—that you can produce enough atomic energy to run an automobile, or anything.

One authority says, "Sure, you could with a cupful of it." But you would have to have 50 tons of a protective element to keep from killing the driver.

So the point of all this fear of the atomic energy busting wide open overnight and having public or private enterprise do it is senseless. It took \$2,000,000,000—

The CHAIRMAN. And more.

Mr. BRANSOME. And more for a couple of bombs. You people know more about the project than we do. But there isn't one single company that is going to go out tomorrow or next week or next year, in my opinion, and have the power of the world—like Mr. E. Phillips Oppenheim used to write about—in his hand and start sending telegrams to somebody saying, "Do it my way or I will blow the world up."

I think that is a question of development. For goodness sake, don't stop the development.

Senator MILLIKIN. Let's get back now to the hills of Colorado.

Mr. BRANSOME. I would like to be there right now, Senator.

Senator MILLIKIN. I cannot say too strongly that I would like to be there, or my constituents might take me at my word.

If a prospector out in the hills of Colorado staked a claim, worked out, and found that the ore contained appreciable amounts of uranium, would there be any objection to announcing that that kind of uranium ore had been discovered?

Mr. BRANSOME. There is in here a paragraph which I would like to call to your attention. I cannot find it just at the moment; but if it is discovered, the prospector discovers it, the minute he brings that above ground he reports it if it has got radioactive material in it.

Senator MILLIKIN. Now, is there any objection, regardless of the wording of the bill, to that requirement?

Mr. BRANSOME. Not at all.

Mr. KETT. That could be handled through the county clerk's office, because all these discoveries have to be recorded with the county clerk before you can take the claims up.

Senator MILLIKIN. All right. Now, he commences to develop that prospect and get the ore out of it. What I am thinking of in the back of my head is whether there is any point in the mining of the ore—not the processing of it, but in the mining of it—where the Government could not maintain such a supervision that a misuse of that ore could be made. For example, I am thinking of the possibility of bootlegging an ore of that kind.

Mr. BRANSOME. Let me anticipate you. If you could take all the ore that you get in Colorado and put it out above ground, you cannot do a single thing with it until you separate the uranium from the vanadium; and even then, if you had tons of the ore, or a thousand tons of U_3O_8 , you are running into no more danger than you would by having a thousand tons of sand.

Senator MILLIKIN. I quite agree. Now, let's take an Oppenheim squint at this thing. Suppose a fellow had that stuff piled up, and suppose he sold the crude ore to some mischievous outfit that might want to deal in this thing in a secretive and harmful way.

Senator HICKENLOOPER. Some mad scientist.

Senator MILLIKIN. Well, this is all Oppenheim, as I say. Supposing he smuggled that ore into some foreign country that didn't have it and wanted it awfully bad.

Even taking that view of it, could we not by supervision and by knowledge of what is going on, maintain an adequate protection over the crude ore?

Mr. BRANSOME. Without question. Any part that slipped out I don't think would be very dangerous at all.

Senator MILLIKIN. Let's say that instead of doing that he sends his ore to one of your plants in Colorado. Now, what happens in that plant? You are after vanadium. Give us a little picture of what happens in your plant.

Mr. BRANSOME. If you would like to see it, Senator, we have got some samples here to show you what would happen.

Senator MILLIKIN. I would like to know what happens to this complex ore that has some uranium in it at a vanadium plant. Tell us just what happens there—I don't mean to describe your secret processes, but set before us the progress of that uranium ore.

Mr. BRANSOME. All right; you crush the ore itself. Then you treat it so as to get it in shape to roast it, and it goes through a huge roaster, a huge furnace. Finally you drop it into a quench box, into water. A certain part of that is soluble in water, and other parts have to be treated otherwise. At one point you have got your vanadium and uranium in solution. You separate those. There is no secret about that. The know-how is what counts. You separate those, and part of your vanadium goes with the uranium, and the vanadium keeps on. This goes out here [indicating] and is distinctly controllable. It is a small part of the ore itself, it is a small part of the content.

That goes out and is treated from there on, and we have been doing it for years. That goes into one bucket and the Army takes it over—the Manhattan district takes it over.

Senator MILLIKIN. Can you see any reason why there couldn't be a complete control and supervision over one of your plants that goes through that process without Government ownership?

Mr. BRANSOME. Oh, absolutely. It can go through without Government ownership and until the time it gets through there is nothing dangerous in it. You say, "Now, Government, it belongs to you; you can do what you want with it."

The Commission—I assume it is to be a commission—says: "You take this U_3O_8 . That goes to John Smith, that portion of it goes to John Jones, and that goes to somebody else"; and they are going to work on producing fissionable materials.

Senator MILLIKIN. As far as we have gone, there is no reason why the Government should own the mine?

Mr. BRANSOME. Not the slightest.

Senator MILLIKIN. And there is no reason why the Government should own a plant of the nature that you are describing?

Mr. BRANSOME. Every reason against it.

Senator MILLIKIN. Thirdly, that the Government is in position at all times to exercise a protective supervision over those two steps?

Mr. BRANSOME. That is right, complete control of inventory, which everybody does. Every company controls its inventory from start to finish. The Government can control that very easily.

The CHAIRMAN. Of course, there is no provision of the bill which calls for Government ownership of the production of the source material. You realize that?

Mr. BRANSOME. Yes.

The CHAIRMAN. And there is no provision of the bill that calls for the Government to own the material that you separate before you start the chain reaction process.

Mr. BRANSOME. That is right.

The CHAIRMAN. I just wanted to make sure Senator Millikin understood that.

Senator MILLIKIN. I would like to ask one more question, Mr. Chairman.

I think what I am going to suggest follows as a necessary corollary of what you already testified to. Is there any reason for governmental wholesale withdrawal of land believed to contain uranium ores, or ores that have uranium content?

Mr. BRANSOME. Following what the chairman said, we are in agreement that the restrictive measures that we are against are not continued in this particular bill. We came as a company to put ourselves on record for consideration for future bills, and we assume that this will be available to other committees, and to the Senate and the House, to read this discussion in the event of other bills coming up. We will always be willing to testify.

Senator MILLIKIN. I gathered the implication from your testimony that if you want to have uranium ores you have got to allow our established mining system to continue to operate, because that is the only system which will induce men of the prospector type to go out and find these things.

Mr. BRANSOME. Plus this fact, Senator, if I am not interrupting you, that vanadium deposits of carnotite are very small deposits in most instances. You will run along with a face about so big [indicating]. Now, that is not a very big face of ore, is it? That will pinch right down to as big as your finger, and you will run along underground sometimes 300 to 400 feet in a tunnel big enough for a man to walk and to put a car in and take it out before you find it widens out again. So you are a small man. Our crews, our prospectors, are out constantly going to various places. The dots on a map of the vanadium occurrences in Utah, Colorado, New Mexico, and Arizona will indicate that to you, and we would be glad to leave a copy with the committee. You can see they are just spotted all over the place.

The more people you have out seeking—they will be seeking uranium now, not vanadium—the more people you have doing it, the more you are going to produce. If you pull it into the Government domain, it is going to be done by a Government agency, I assure you it isn't going to be done within one snidge of what private industry is going to do.

Senator MILLIKIN. I would like to say for the record, for I don't know whether it is understood in the East and in other parts of the country, the prospector for ore is the greatest and perhaps the last remaining individualist in the United States. He operates on the same incentives that the inventor operates on. The next shot is going to make him rich, and he won't let anybody tell him where to put in that next shot. He knows where he is going to get rich, and he is going to work on that. He has his own inducements that bring him into that kind of a life. He has complete independence, and you couldn't get him to forsake it. You couldn't hire him by a corporation and tell him to go out and prospect a particular area. He wouldn't be interested in working for a private corporation.

He wants to find this mine and make its development, and get his place in mining history, and make a fortune just as an inventor operates under the same kind of stimulus.

You cannot regiment prospectors. You cannot give a prospector orders as to where he is going to look and what he is going to do.

Mr. BRANSOME. You can give them to him.

Senator MILLIKIN. You can give them to him, but he will pay no attention to them. He is a class of person all to himself, and he is the fellow that has developed the mining industry of this country.

Mr. BRANSOME. He has complete independence, beans and bacon.

Senator MILLIKIN. The worst thing that could ever happen, if we need metals in this country, is to attempt to regiment that individualist, the mining prospector.

I am sorry to have gone through all that, but that is not understood. You know, there is a very common impression that a fellow says to himself, "Well, I am going out and find a gold mine," and that then he takes a spade, goes up in the mountains, digs a hole, and finds or does not find a gold mine. Or, "I am going to get myself a silver mine."

There is an enormous ignorance and oversimplification of the matter. It is very rare that you have a gold mine or a silver mine. Our basic economy in mining rests on complex ores, such as the type of ore you are talking about. You just don't go out in the hills and sink your spade in and find one of those.

Those fellows will take a sack of beans and a side of bacon, and they will live in a hovel. They care nothing about the comforts of life. They go out in all kinds of weather pursuing their own theory of where they can find a mine. Ninety-nine or 990 times out of a thousand they don't find it, but it is that uncontrolled search for it, that unregulated search for it, that has developed the mines of this country. It would be a calamity if we ever did anything to interfere with that.

Mr. BRANSOME. Mr. Chairman, I might bring out that we were sincere on this front page of ours when we said we were looking at the interest of the United States. As a corporation, we would call it to your attention that we are not motivated entirely by self-interest—far from it—because our chief source of supply of vanadium has been from without the country and not within it. We could get along for quite a long time without any of this ore being produced for our individual company.

The CHAIRMAN. Will you go ahead, Mr. Kett?

Mr. KETT. We believe that the best interests of the United States will be served by encouraging the prospecting, development, and mining of uranium-bearing vanadium ores in the United States and that no further restrictions should be placed thereon except the licensing or other approved control of product disposal and proper accounting of such products as to amount, grade, and location, whether at mine, stockpile or treatment plants.

Representatives of the Government and the vanadium mining industry should agree as to the minimum quantity of uranium in vanadium ores which is practically extractable.

Plants or mills treating such uranium-bearing vanadium ores should be required to dispose of all uranium produced to the United States Government in a form that can be practically produced and at a price agreed upon by the United States Government and the producer.

The CHAIRMAN. Mr. Bransome, is your corporation the sole producer of vanadium in this country?

Mr. BRANSOME. No, sir; I would say we were by far the junior partner in this country.

The CHAIRMAN. Who is the major in the field?

Mr. BRANSOME. The subsidiary of Union Carbide.

The CHAIRMAN. Do you know which one?

Mr. BRANSOME. U. S. Vanadium Corp.

The CHAIRMAN. Are there any other competitors of any consequence?

Mr. BRANSOME. There have been sporadic competitors.

As we pointed out in here, the simple mining and production of vanadium ore is one thing. The treatment of it and the production of vanadium pentoxide in a form in which it can be used is a very complex job, and it requires so much know-how, so much detail and so much technical background—I think background is the wrong word, technical backing—of laboratory and chemists, metallurgists, and so on beside the mining department, that people think it is a cinch to go into the game and they find themselves——

The CHAIRMAN. Broke?

Mr. BRANSOME. Busted wide open.

The CHAIRMAN. In other words, to complete the picture, there are thousands of prospectors——

Mr. BRANSOME. I think thousands might be wrong.

The CHAIRMAN. Let us say hundreds of individual producers who ship their material for processing either to the U. S. Vanadium Corp. or to the Vanadium Corp. of America.

Mr. BRANSOME. And there are several small producers.

The CHAIRMAN. Are there small producers?

Mr. BRANSOME. I think there are still some. I don't know their functions since the emergency period, because the need for vanadium is not so great.

The CHAIRMAN. At least, the two big producers for the Manhattan district, as far as you know, were the subsidiary of the Union Carbide and yourself?

Mr. BRANSOME. That is right.

Senator MILLIKIN. That suggests, Mr. Chairman, that it would be a relatively easy matter to supervise that phase of the business?

Mr. BRANSOME. Well, I wouldn't want to say that, because we wouldn't want to discourage anybody from going in. There might be some people going into the business.

Senator MILLIKIN. As it stands today, there are the two big companies you mentioned, and possibly some smaller ones. There are not enough of them so as to have a great uncontrollable supervisory problem. Is that correct?

Mr. BRANSOME. If there were 50 more, it wouldn't make any difference. You could still control it.

Senator MILLIKIN. It would be an easy thing to supervise?

Mr. BRANSOME. An easy thing.

Senator MILLIKIN. And an easy thing under which the Government could make contracts for that kind of ore?

Mr. BRANSOME. It has been doing it.

The CHAIRMAN. Does all vanadium ore contain uranium?

Mr. BRANSOME. No; not all vanadium ores. The vanadium ores in this country contain uranium to a more or less degree. When get to any 0's—0.009 or 0.003 content—it just doesn't fit unless your

uranium becomes so precious as an element to produce atomic energy, and then you might spend a thousand dollars a ton on it to get 1 pound. But you must consider that 1 percent uranium is 20 pounds of uranium; 0.25 is just one-quarter that, or 5 pounds.

Now, you might get 90 percent of that, you might get 75 percent of it, but when you get down to 0.08—when you get below that, it gets difficult to get it out; it is too expensive. The expense is all relative.

The CHAIRMAN. What are these samples that you have got with you?

Mr. KETT. Do you want to look at them?

The CHAIRMAN. Yes.

Mr. BRANSOME. I think you can get more out of looking at a few samples of ore than by looking at any number of pages of description.

The CHAIRMAN. Senator Millikin has probably seen it in extenso.

Senator MILLIKIN. I would like to ask the witness whether in his opinion wholesale withdrawal of vast areas of land in the Western States that might have some uranium in it would be conducive or repressive to the development of uranium?

Mr. BRANSOME. Not only that, but stupid, in my opinion.

Senator MILLIKIN. It would have the effect of taking about half my State out of the Union, and they have got to declare war on us to do that.

The CHAIRMAN. They are going to carve a piece out of my State, you know, for the UNO.

I think it ought to be clear in the record, Senator, that there is no provision in this bill which attempts any such action, which I agree is a totally unnecessary procedure.

Senator MILLIKIN. The question is whether there should be something in the bill that would impose a restriction on other agencies of the Government against profligate action on the subject.

The CHAIRMAN. Do you know of any attempts by any Government department—the Department of the Interior would be the one affected—looking toward taking over any great amount of territory on the theory that they could obtain uranium?

Mr. BRANSOME. Dame Rumor hath it that that is the program, and that is why we are particularly concerned. Otherwise we certainly would not be coming down wasting your time and ours.

The CHAIRMAN. There has been no proposal advanced by the Secretary of the Interior, who testified extensively on the bill. There was no suggestion of that kind made.

Mr. BRANSOME. They did withdraw some 3,000,000 acres, didn't they?

The CHAIRMAN. Was that public land?

Mr. KETT. Yes. They returned all except 220,000.

Mr. BRANSOME. Two hundred and twenty thousand acres is quite a jag of land.

Mr. KETT. And that ground was taken out for another purpose, but it actually did cover practically all the vanadium territory in the State of Utah.

The CHAIRMAN. How was that done, Mr. Kett?

Mr. KETT. It was taken out by the Department of the Interior.

The CHAIRMAN. Acting under what authority?

Mr. KETT. That I don't know. Secretary Ickes just took it out. Mr. BRANSOME. He did it under an emergency war power, I believe; I am not sure about that, Mr. Chairman.

The CHAIRMAN. We can call on the Secretary for a statement as to why that was done.

Mr. KETT (indicating ore samples). This is the roscoelite containing about 2 percent vanadic oxide, and very little uranium. However, the uranium is recoverable.

This is an ordinary grade carnotite, 2 percent vanadic oxide and about .20 percent uranium oxide. That would be 4 pounds of uranium oxide per ton.

These are a little higher grade. You will notice they are a darker color. That is an indication of the vanadium content right there. The darker they get, the higher grade they are.

Here you commence to get still darker. That runs up to 6 percent vanadic oxide and about 5 percent uranium oxide. The uranium is not very evident but it is in there. The yellow color is uranium.

This is a carbonized piece of vanadium ore, high grade.

Here is a piece of petrified log. You can see the grain of the wood in that.

That would be considered pretty high grade uranium ore. You see the yellow. That is uranium. That is a replacement of wood.

This is still higher grade vanadium. This is calcium vanadate, the red on there.

Here the yellow begins to show quite plainly, the dark streaks being the vanadium and the yellow uranium.

Senator MILLIKIN. What percent?

Mr. KETT. That is about 4 percent each.

This is another piece of petrified wood, very much smaller, you see. It is a chip.

These are all in sandstone. They are impregnated in sandstone.

This is one that is impregnated in conglomerate. You see the little pebbles? That is rather rare. That came from down in the Indian Territory from the Navajo Reservation.

Here is a piece of high-grade uranium "tree." You can't get it any higher grade than that. That will carry 30 percent uranium oxide.

Senator MILLIKIN. I thought it would be heavier than that.

Mr. KETT. They say out West if you put it in your pocket and keep it there long enough, you will get a blister. I don't know whether you will.

That powder is what we manufacture.

Senator MILLIKIN. That is 50 percent?

Mr. KETT. Fifty percent uranium oxide. That comes from our place looking like this.

Mr. BRANSOME. And it will not blow up.

The CHAIRMAN. It occurs to me that the Navy has certain oil reserves for national defense, bearing upon the withdrawal by Secretary Ickes of 220,000 acres. Is that the amount, 220,000 acres?

Mr. KETT. That is all in the State of Utah.

The CHAIRMAN. Now, that was about 220,000 acres that they finally withdrew?

Mr. KETT. They finally withheld that.

The CHAIRMAN. I suppose that was on the same principle of sequestering for future uses for defense part of the natural resources. Have you any feeling about that, as to the wisdom of doing that?

Mr. KETT. No, I haven't, and I don't think that would curtail operations in the mineral field to any extent. I don't know just which acreage it is that the 220,000 is in.

The CHAIRMAN. It occurred to me there was an analogy between withholding certain public land that might have a high uranium content exclusively for defense purposes.

Mr. KETT. Well, there is no such thing.

Mr. BRANSOME. In this country.

Mr. KETT. It is all contained in such a very minor constituent of these vanadium ores that you cannot just say, "This is a uranium district." It never is. It is a vanadium district carrying perhaps a little more than the average amount of uranium. It is so definitely pinned to vanadium that you cannot separate them.

The CHAIRMAN. Thank you very much.

Mr. BRANSOME. Answering your question, we certainly would not, as a company or as individuals, be against anything that tends to cooperate toward the national defense either now, in time of emergency or to prepare for it in the future; and that is one of the main reasons for our coming down here, as we say in our statement.

The CHAIRMAN. Yes; I think we understand.

Mr. KETT. Could I add something, Mr. Chairman?

The CHAIRMAN. Certainly, Mr. Kett.

Mr. KETT. What we really would like to see in here is a very short clause. I wouldn't attempt to tell you the wording of it, but something like this:

"No land at present belonging to the United States Government or in the future acquired by them should be withheld or withdrawn from public location."

Senator MILLIKIN. Mr. Chairman, I would like to suggest that the witnesses give us the exact language that they would like to see by way of amendment, and submit the exact language to us, giving their own words on it.

Mr. BRANSOME. We would be glad to do that.

The CHAIRMAN. Let me ask you this. When you withdraw, as the Secretary has, this acreage, does that bar prospecting on the acreage?

Mr. KETT. The only way you can take out a claim then is through a lease, a Government lease from the Department of the Interior, and that is a long-winded procedure.

Mr. BRANSOME. You have to go into the Department of the Interior and get a prospecting license. Then they allow you so many acres—this is the present arrangement—in a State, and you must, after you do all your prospecting—and mind you, somebody could be following you along the path and then it is put up to public bid after you have put in all your work. The thing is not conducive to exploration and development of uranium materials.

We have I don't know how many acres in Arizona and New Mexico in the Indian reservations. We went in there and prospected, and then these things came up for public bid. The only reason we ever did that, Mr. Chairman, I assure you, was because the war was on. Otherwise we never would have bothered with it. There is no sense sending a man in, or 10 men in, on a desert and having them stay

there for 6 or 8 months to develop claims, and then have somebody follow you right along and say, "Sure, if we think it is good, we will take it," then not knowing what you are going to pay for it. They come in and get it.

The CHAIRMAN. That is very disturbing to the fellow that does it.

Senator MILLIKIN. This process of exploration on the public domain leads either to a possessory title in the miner or to complete title if he wants to go to patent; whereas, under the leasing system he never owns, he is a lessee on terms prescribed by the Government.

The CHAIRMAN. This committee will meet again at 10 o'clock Monday morning, in a room to be announced later.

(Whereupon, at 12:25 p. m., the committee adjourned until 10 a. m., Monday, February 11, 1946.)

ATOMIC ENERGY ACT OF 1946

MONDAY, FEBRUARY 11, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to adjournment, at 10 a. m. in room 324, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Millikin, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Bolland, staff director.

The CHAIRMAN. The committee will be in session.

Dr. Stewart, I understand that you are appearing from the Office of Scientific Research and Development. We are glad to have you with us. Will you go right ahead, sir?

STATEMENT OF IRVIN STEWART, DEPUTY DIRECTOR, OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT, ACCOMPANIED BY JOHN T. CONNOR, FORMER GENERAL COUNSEL, OSRD

Mr. STEWART. I shall be glad to, sir.

My name is Irvin Stewart. I am Deputy Director of the Office of Scientific Research and Development and I am appearing here in the absence of Dr. Vannevar Bush, the Director, who is temporarily in California.

The Office of Scientific Research and Development (OSRD) was established on June 28, 1941. Among other things it succeeded to the responsibilities of the National Defense Research Committee (NDRC), which had been established by the Council of National Defense on June 27, 1940.

When the NDRC was established, President Roosevelt instructed the Committee on Uranium, which had been established some months earlier with Dr. Lyman J. Briggs, Director of the National Bureau of Standards, as chairman, to report to the NDRC. The Briggs committee was made a subcommittee of the NDRC. When the NDRC on June 28, 1941, became an advisory committee within the OSRD, the Committee on Uranium continued as a section of the reorganized NDRC. Later the work on atomic fission was reorganized in such a way that it was conducted immediately under the Director of the OSRD rather than as a part of NDRC operations.

During the period of approximately 1 year when the NDRC had the power to contract, contracts were signed on its behalf by Dr. Bush as its chairman. When OSRD was established and Dr. Bush became its Director, he designated the executive secretary as the contracting officer of OSRD. I held that position at that time, so my

331

name appears as that of the Contracting Officer in most of the OSRD contracts in the field of atomic fission.

Research and development in the field of atomic fission continued to be a responsibility of the OSRD until the end of April, 1943, at which time the Manhattan district assumed that responsibility along with the responsibility for engineering and construction which it had originally assumed approximately 1 year earlier.

It is my understanding that your committee wishes to have the record contain the facts as to how OSRD and the War Department handled patent rights in the atomic fission project, and I wish to state the facts with regard to the patent provisions we inserted in OSRD contracts. I shall leave to Capt. R. A. Lavender, USN, retired, the OSRD and the Manhattan district patent adviser, the explanation of the contract provisions in the War Department contracts, and the administrative procedure that he followed under both the OSRD and the War Department contracts.

In its contracts OSRD used two forms of patent clause. The form adopted by the NDRC shortly after its organization in the summer of 1940, and known as the short form, provided essentially that the Government had the power to determine the disposition of all rights in discoveries and inventions made under NDRC contracts. A number of the vitally needed industrial organizations to whom NDRC submitted research and development contract proposals were unwilling to accept such a provision.

The CHAIRMAN. Now, you are talking about no field in particular, but you are talking about all fields?

Mr. STEWART. That is correct, that is the general statement.

The CHAIRMAN. Are there any companies in this field that refused to accept the short form?

Mr. STEWART. I will cover that a little later in the statement, sir.

The members of NDRC decided that some modification was required if research and development on weapons of war was to be conducted by the most competent and experienced organizations in the country with the speed which the state of world affairs indicated was essential. Therefore, Mr. Conway Coe, then Commissioner of Patents and a member of NDRC, was requested to negotiate the matter, and the discussions which followed with potential industrial contractors resulted in the recommendation by Mr. Coe and the adoption by NDRC of a second type of patent clause, thereafter known as the long-form clause, which was modeled after the patent provisions which had been used by the Army and Navy for many years in their contracts with nongovernmental organizations for research and development work. Essentially the long-form clause left with the contractor the title to inventions made under the contract, subject to a license in favor of the Government for military, naval and national defense purposes. With the adoption of the long-form clause NDRC signed a number of contracts, with industrial organizations which had been hanging fire for several months pending agreement upon a mutually satisfactory patent clause.

Those two types of patent clauses were regularly used by NDRC and by OSRD. The long-form clause was used primarily in those cases where NDRC or OSRD was dealing with a contractor who had an established position in the field of work or a substantial amount of basic information which NDRC or OSRD wished to have concentrated upon a specific problem concerning the development of a

weapon or an instrument of war. The short-form clause was used in cases where the Government took the initiative in stimulating the assembly of a group of men to work in a field where such a fund of information was not available in a single organization. As an illustration, I might mention the radiation laboratory established under an OSRD contract at the Massachusetts Institute of Technology to conduct work in the field of microwave radar. In that case scientists had to be gathered together from all over the country and many new laboratory facilities had to be acquired by the contractor. Therefore, we used the short-form patent clause in the contract, and the result has been that the Government has acquired title to scores of inventions in the field of microwave radar. In addition, the short-form clause was regularly used in OSRD medical research contracts because of the unusual public interest involved. This committee may be interested to know that a complete statement of the use of the long- and short-form patent clauses by OSRD has already been furnished by Dr. Bush to the Kilgore Subcommittee on War Mobilization. In summary, OSRD had 780 short-form contracts under which \$338,911,644.92 was obligated, and 1,410 long-form contracts under which \$165,675,748.52 was obligated.

At the time the program on atomic fission was taken over by NDRC, the initial contracts were executed with organizations which already had done work in that or related fields. Also, the program started on a small scale, and the chances of success in terms of weapons (which was the NDRC interest) were considered relatively modest. Therefore, the early NDRC and OSRD contracts in the field of atomic fission contained the long-form patent clause under which the contractors would receive titles to patents and the Government would receive a royalty-free license. As the project grew, as those contracts began to produce successful results, and as the tremendous possibilities of those successful results extending far beyond the field of military weapons began to take shape, Dr. Bush became concerned about the matter and reviewed the situation with various interested OSRD officials.

About that time also, in the late spring of 1942, Dr. Bush communicated the results of the combined efforts in this work to President Roosevelt, and the President fully grasped the significance of the project and the results of its solution. Therefore, the President decided that Government control should, at least initially, be exercised through the handling of patent rights, and he directed Dr. Bush to arrange as far as possible for the vesting in the Government of the title to patents on inventions and discoveries made on the project.

Dr. Bush and I then requested Mr. John T. Connor, OSRD counsel, to proceed, with the advice and assistance of Captain Lavender, to negotiate the matter with the various contractors involved. Mr. Connor first approached the Standard Oil Development Co. representatives, and found that they were receptive of the suggestion that the Government control the disposition of all patents on the atomic fission project by the use of the short-form patent clause. The Standard Oil people not only agreed to give the Government such control over inventions and discoveries thereafter made, but they also agreed to amend earlier contracts so as to cover all such work since its commencement under NDRC contracts.

Thereafter the problem was discussed with Columbia University, Westinghouse, the M. W. Kellogg Co., the University of Chicago, the

du Pont Co., the University of California and the other OSRD contractors in this field. Because of the unusual public interest involved, they all agreed to accept the suggested change to the short-form patent clause covering all research and development work in the field under OSRD contracts, and to make that change retroactive to the beginning of work under those OSRD contracts. It took a little time to work out the details of effecting the necessary contract amendments. We had the benefit of the legal advice of Mr. Oscar Cox, then general counsel of the Office for Emergency Management, and of his associate, Mr. Malcolm Langford. Acting upon the legal advice of Messrs. Cox, Langford, and Connor, we decided and the contractors agreed that no monetary consideration would be given by the Government for the patent rights that already had vested in the contractors through operation of the original provision, but instead the necessary consideration would be supplied by supplemental agreements continuing the work as each of the contracts involved required renewal.

Senator MILLIKIN. Had any applications for patents actually been filed at that time by any of these contractors?

Mr. STEWART. I am told yes.

Senator MILLIKIN. Will someone tell us about that later on?

Mr. STEWART. Yes; that will be covered.

The CHAIRMAN. I don't quite get the consideration, Doctor—"but instead the necessary consideration would be supplied by supplemental agreements."

Mr. STEWART. Our contracts, sir, were written for limited periods of time and for amounts of money not in excess of stated sums; and as we neared the end of a particular period, we put in more money and changed the patent clause at that time.

The CHAIRMAN. In other words, when you changed it from the long form to the short form, when you renewed the agreement, you gave them a little more money?

Mr. STEWART. Yes, sir; but that was for additional work.

The CHAIRMAN. Yes; I understand.

Senator MILLIKIN. What was the consideration for the acceptance of the short form?

Mr. STEWART. The fact that the work was to be continued beyond the period which originally had been stipulated.

The CHAIRMAN. Well, that isn't quite accurate as to why they took the short form instead of the long form, which was Senator Millikin's question. Providing your testimony is borne out, they really did it for patriotic reasons, didn't they?

Mr. STEWART. I thought it was the consideration of the narrower legal questions involved.

Senator MILLIKIN. That is exactly what I was probing, and I was wondering what the legal consideration was.

Mr. STEWART. The extension in time for the financing of the work for the extended period; but the basic consideration, as stated earlier, was that it was the public interest in the entire project that caused them to be willing to do it.

That process of supplementing and amending the contracts case by case took a few months, but all necessary contract amendments were executed well before the OSRD research and development contracts were terminated and the project transferred to the Manhattan

district in the spring of 1943. In its termination agreements OSRD inserted a provision under which it was expressly stated that the Government retained all of its patent rights.

The result is that, under all NDRC and OSRD research and development contracts, and under all subcontracts involving research on the atomic fission project, the Government received the right to determine the disposition of all patents covering inventions and discoveries made during the course of the required work. In five other contracts primarily for materials or for the maintenance of equipment in standby condition which did not involve research, OSRD used the long-form patent clause.

Senator MILLIKIN. Would any of the contractors providing materials or maintenance equipment be in a position to learn anything which they might patent?

Mr. STEWART. I believe not.

Senator MILLIKIN. Thank you.

Mr. STEWART. One contract for production, which as work progressed required investigation and research, carried the long form; it was never renegotiated because no inventions were made. In addition, there are three contracts under which "in-between" clauses were used in unusual factual cases.

For your information, the short-form patent clause used in OSRD contracts provides as follows:

PATENT PROVISIONS.—It is understood and agreed that whenever any patentable discovery or invention is made by the contractor or its employees in the course of the work called for in paragraph No. 1 hereof—

That was the paragraph defining the subject work—

the contracting officer shall have the sole power to determine whether or not a patent application shall be filed, and to determine the disposition of the title to and the rights under any application or patent that may result. It is further understood and agreed that the judgment of the contracting officer on such matters shall be accepted as final, and the contractor, for itself and for its employees, agrees that the inventor or inventors will execute all documents and do all things necessary or proper to carry out the judgment of the contracting officer. The contractor agrees that it will include the provisions of this paragraph in all contracts of employment with persons who do any part of the work called for in paragraph No. 1 hereof.

Senator MILLIKIN. I suggest that it is very clear as to who has the power to determine what shall be done with the power, but I suggest also that it is not made clear that the United States Government owns the patent.

Mr. STEWART. May I suggest that that is probably covered in the next paragraph?

In administering all OSRD contracts, including those in the atomic fission project, containing the short-form patent clause, Captain Lavender operated under a general delegation of authority that provided for (1) a reference either to the War Department or the Navy Department, depending upon which Department was the source of a request to OSRD to undertake the particular project, for a determination as to whether or not an application for a patent should be filed on behalf of the Government, (2) if the War or Navy Department determined that such an application should be filed, the filing of the patent application, and the arranging for the assignment of the entire right, title and interest to the Government.

Senator MILLIKIN. I still suggest that that does not say that the Government gets those patents free of consideration.

Mr. STEWART. May I ask your indulgence for just a couple of sentences more?

Senator MILLIKIN. Yes.

Mr. STEWART (continuing). And (3) if there was a determination by the interested Department that no patent application should be filed on behalf of the Government, notification of the contractor that, if it so elected, it might file in its own behalf with the understanding that it would grant to the Government a nonexclusive, royalty-free license for governmental purposes. That delegation of authority also provided that the procedure described above should not be followed in some exceptional cases wherein Captain Lavender was advised by the OSRD contracting officer for the particular contract that because of unusual facts some other disposition of the patent rights should be made.

For inventions and discoveries arising out of OSRD contracts in the atomic fission project, the general policy was established by Dr. Bush and me, and followed by Captain Lavender, of vesting title to patents in the Government.

Senator MILLIKIN. Now, what makes it clear that there is no consideration to the inventor?

The CHAIRMAN. Have you got a copy of the contract here, the long form and the short form?

Mr. STEWART. Yes; the short form I have just read.

The CHAIRMAN. Is that all there is to it?

Mr. STEWART. That is all there is to the short form.

Senator MILLIKIN. It seems to me, if I may suggest, as far as we have gone, that provides a very clear mechanism as to who shall make application and who shall determine who shall make application, and in the one case if someone else makes application that it would grant to the Government a nonexclusive royalty-free license for governmental purposes. In other words, it is a sort of a power of appointment, but so far I do not see that the United States Government gets that free of consideration.

The CHAIRMAN. Senator, if you will look at the language again, the contracting officer of course is the agent for the Government, and he shall have the sole power to determine whether or not an application shall be filed to determine the disposition of the title to and the rights under any application or patent that may result.

Senator MILLIKIN. Well, I still claim that that is in the nature of a power of appointment rather than a grant to the Government or a right reserved to the Government to have the patent free of consideration. That is just off the cuff. You gentlemen have given it a lot more study than I have.

Mr. STEWART. It has been our interpretation of the clause, which has been concurred in by all of our contractors, that under that clause we could order the title into the Government, and nobody has ever raised the question.

Senator MILLIKIN. Without consideration?

Mr. STEWART. Without consideration, yes; and I can state flatly that there has been no consideration in any case.

Senator MILLIKIN. And no one has made a claim for it?

Mr. STEWART. That is correct, sir. It was recognized, however, that in some cases some other disposition might be required, and Captain Lavender understood that any such exceptional cases should be referred to Dr. Bush and me for the determination required by the contract provisions.

So far I have discussed only the OSRD contract provisions. In addition, the Director of OSRD is concerned with the patent problems arising under the War Department research and development contracts as a result of an arrangement established at the request of Mr. Henry L. Stimson, then Secretary of War, at the time when the research and development work was transferred to the Manhattan district. At that time Mr. Stimson told Dr. Bush that in his opinion it was advisable to have one centralized administrative group handling all patent rights on the atomic fission project, and Mr. Stimson requested that the OSRD Director be the custodian of such rights. General Groves also pointed out that Captain Lavender had already set up a patent administrative organization and was familiar with the problems. As a result of those discussions, the War Department atomic fission research and development contracts provide that the OSRD adviser on patent matters shall be the contracting officer's representative for patent matters. Captain Lavender was the OSRD patent adviser and as such acted as the patent adviser for the Manhattan district.

Senator MILLIKIN. Does the Government as such have the right to make a patent application, or is that always in the name of an individual?

Captain LAVENDER. It is filed in the name of the inventor.

Mr. STEWART. I shall be glad to try to answer any questions you may have concerning the OSRD contracts and patent policy in this field. Before doing so, however, it might be advisable for Captain Lavender to describe the procedure he worked out for administering these problems arising under OSRD contracts, and you also may desire him to describe the contract provisions and patent administrative procedures under the War Department contracts.

The CHAIRMAN. Mr. Connor?

Mr. CONNOR. Sir, I have nothing to add to this statement, but I will be glad to answer any questions.

The CHAIRMAN. Thank you very much.

Captain Lavender.

STATEMENT OF CAPT. ROBERT A. LAVENDER, UNITED STATES NAVY, RETIRED, ACCOMPANIED BY COMMANDER ROLAND A. ANDERSON, UNITED STATES NAVAL RESERVE

Captain LAVENDER. My name is Robert A. Lavender, captain, United States Navy, retired, on duty in the Office of the Secretary of the Navy and assigned personally by the Secretary of the Navy to the Director of the Office of Scientific Research and Development, and appointed or designated by Dr. Bush as adviser on patent matters to OSRD.

Commander Roland A. Anderson is my first assistant on contractual and administrative matters.

The problem that faced the Manhattan district was quite different from the problem that was faced by OSRD. That is, in addition to carrying on the research and development, they were required to make contracts for the quantity production of all manner of equipment. The contracts ran from the construction of buildings and sewers in cities and towns, up to the construction of the apparatus that went into the heart of the atomic energy program.

In addition to that, they required research to work out further problems as were developed by OSRD and carry on other developments.

So it was felt that on a construction contract, or where they were purchasing merely equipment off the shelf from contractors, there would be no patent clause at all, and it would be no more than if the Government was going out and purchasing this equipment.

Senator MILLIKIN. May I repeat a question asked a while ago? I can see where if you buy something off the shelf there is no patent angle involved.

Captain LAVENDER. That is correct.

Senator MILLIKIN. Would a contractor that installed or assembled that stuff be in a position to observe anything else that might be patentable, or would he be in a position to patent the arrangement of that stuff?

Captain LAVENDER. I shall come to that, if you will indulge me for a moment, because I will now describe the four patent clauses that were used in the Manhattan district production and research contracts.

For the research contracts we had the regular short-form patent clause without any additional limitations. That is, the Government had the right to determine the disposition of the whole right, title, and interest in inventions.

Senator MILLIKIN. Let me ask you at that point whether in your opinion that is the same as saying the Government shall own the patent without consideration if it shall desire to do so?

Captain LAVENDER. That is correct, sir. Then a type of contract was used where they had the short-form patent clause modified, where the contractor, as a matter of contract right, could retain a nonexclusive license in outfields, and I shall define "outfield" as commercial activities, and "infield" as any mechanical device, apparatus, or process that is used in the atomic energy program. That type of contract was used where there was some information given to the contractor as to the research work that had been done, and it was, you might say, particularly applicable to the atomic energy field.

Then there was the third type of contract with the short-form patent clause, in which we had the right to determine the disposition of the rights under inventions made in carrying out the work under the contract, but the contractor retained the sole license under the inventions with the right to grant sublicenses. That contract was used where we went to a contractor in his own field of development, but there was some engineering or redesign for the particular work that we were engaged in. In other words, it was a contract where there was a slight modification of the standard production but with the chance that in working with this or assembling the material he may find some invention that did have some reference to atomic energy which the Government would desire to control.

Therefore, we said that as far as the commercial rights are concerned, he can have those rights the same as the ordinary development contract by the Navy and War Departments, but that the Government

still had the right to determine the disposition of the rights except for the reserved conditions, and it did have the title to the invention, so that the Government could exercise all of the powers that the title to the invention and the patent gives, and have not only the infield rights in whole, but would have a license under outfield rights as well.

Senator MILLIKIN. May I ask at that point, please, that you give us some examples of the type of thing you have been talking about?

Captain LAVENDER. We go to a contractor; for example, the Westinghouse Co. The Westinghouse Co. has established a very forward position in transformers and associated equipment. We asked them under several of these contracts to design control circuits and other equipment involving transformers, and also other equipment to be used with the calutron, which is one of the devices developed at the University of California, and the Manhattan district went to the contractor because he was preeminent in this field. So in giving him the information as to how it was going to be used, we realized that there was a possibility that there may be some invention that would so relate to the atomic energy program that we would want the title to it, but as far as any of the inventions in their application to commercial work were concerned, it was felt that the public should have the benefit of having that type of equipment put on the market for all commercial activities.

Senator MILLIKIN. Might that type of equipment, the information that would be given by a patent application, give possible clues as to other things that we might not want to reveal.

Captain LAVENDER. Well, those applications, of course, were very carefully scanned, and those applications are still in the Patent Office, because the Government files those applications. It has full control over them as to when they are going to be released to the public.

If an application is written so that there is no clue at all as to how it can be used, and there is no reason for that application to remain in the Patent Office, then the application may be issuable as a patent. But the Government still has control of that application so that it can keep its secret as long as it desires.

Senator MILLIKIN. By what authority does the Government impose a wall of secrecy around an application?

Captain LAVENDER. That is a provision in the law. It is 35 U. S. Code 37, which says that when the title of an invention is in the Government, the normal response of 6 months that is required for an applicant to respond to an office action by the Patent Office shall be extended to a period of 3 years so that the Government then can wait the 3 years until it submits its next amendment, and a claim again can be put in the application which would not be allowable, so that it is rejected again and then another 3 years is given. That is the machinery that has been set up by the Congress for the Government to control the date of issue of a patent.

Senator MILLIKIN. Has the Congress determined how you should establish priority in that case? Suppose I today filed an application covering the same subject matter as one of these impounded applications. How would I know that there was something of that kind there? What explanation would the Patent Office make to me?

Captain LAVENDER. At the present time there is a public law which says that during the emergency the Patent Office may issue orders of secrecy, in which case the applicant is notified of that order, and he is forbidden then to disclose it to any other person. The application is

not issued, so at the present time there would be set up in the Patent Office an interference. A notice would be given by the Patent Office of the pendency of another application which covers the same subject matter as one of these applications owned by the Government. We have received notification of one such interference. The interference is suspended and, as long as the present law, which is a war emergency law, continues, that application filed by the independent inventor will not issue. That will be one of the items that should be taken up by the Congress at this time to provide the machinery for the Commissioner of Patents to notify the Commission that is to be organized and authorized of the existence of an application covering common subject with the Government's program. Then arrangements may be made by negotiation for seizure of those rights to maintain its secret, if it is necessary to do so.

Senator MILLIKIN. Now, in the case where I have made that application, I get a notice that there is an interference, and I assume that you also have notice of my application and that there is an interference?

Captain LAVENDER. That is correct, sir.

Senator MILLIKIN. That being the situation, how am I able to protect myself against that interference? How do I know what the ground of it is? Am I just suspended off in the thin air until Congress does something?

Captain LAVENDER. Well, at the present time the application would be under an order of secrecy, so that your right to have interference has been suspended. The law also provides that if the Government uses that invention and infringes a claim that is later issued when the matter is fully determined, then the applicant is permitted to recover for the reasonable use of that invention before the application issues, whereas the rights of an inventor do not otherwise accrue until the patent issues.

Senator MILLIKIN. Does that general system prevail under the law in peacetime as well as wartime?

Captain LAVENDER. It does not.

Senator MILLIKIN. The justification, in other words, is a matter of wartime necessity?

Captain LAVENDER. That is right.

Senator MILLIKIN. Would you mind stating again now what the Congress should do?

Captain LAVENDER. I would suggest that the Congress merely authorize the Commissioner of Patents, authorize and direct the Commissioner of Patents to report to the Commission and give copies of applications, of all of the applications that have been filed and are being filed in the Patent Office that include statements regarding the release of atomic energy. The Commission then will be in a position, through other provisions, of obtaining rights under that invention through negotiations with the inventor. It can purchase the invention itself, and when it does so it will have control over its future disclosure.

Senator MILLIKIN. Thank you very much.

Captain LAVENDER. Now, the fourth group of contracts are those where the purchases are off the shelf, and it occurred in some cases where manufacturers were called upon to furnish equipment with which they had not been familiar in their manufactures before the

time of the contract. Time was necessary ordinarily in such cases to investigate the patents that may be involved in this equipment, if the contractor was to assume the liability for the infringement of patents. There was in these contracts for equipment, when there was not time, a clause which provided that the Government would assume the liability for the infringement of patents.

Where we purchased a piece of equipment off the shelf in which the manufacturer had had extensive experience, we used the same clause that is used in other Government contracts, namely, that the contractor assumed the liability of patent infringement.

The next problem that faced the district was that at times they would reach a point in the assembling of a plant or the changing over from the research work that had been done to quantity production where they ran into a great many very highly technical engineering problems.

The CHAIRMAN. Captain, I just want to get this straight. Dr. Stewart said they had the long form and the short form. He explained the conditions under which it had been used up until they turned it over to the Manhattan district.

Now, you have mentioned four variations, as I understand it, of the short form. You apparently didn't use the long form at all?

Captain LAVENDER. No; the long form was not used in its language, but we approached the long form in this way: In the third category, where the contractor retained as a matter of contract right the sole license under that invention, he really had the title except that the Government had the shell of the title, so that it could exercise full control over the invention.

The CHAIRMAN. Now, have you got a break-down with you of the numbers of contracts that were treated in each one of those categories?

Captain LAVENDER. That can be worked out. I haven't worked it out, but I can give you the approximate figures.

Of course, if you are going to work it out from a dollar point of view, the dollar values are very heavy in favor of the third category, because there is where all the quantity production was. I would estimate offhand, and I haven't ever worked it out, from my familiarity with it, that there are about 5 to 10 percent of the research contracts in which the Government had the whole right, title, and interest, and the contractor retained nothing. That is category 1.

It would run from 25 to 40 percent in category 2, and the rest of them were the equivalent to the long form, or category 3.

The CHAIRMAN. How many applications have been filed with your consent in the Patent Office?

Captain LAVENDER. The actual number of cases that have been filed, I have been told, should be given in executive session; but I have that approximate number and I can give it to you. That is about the only thing that they said should be given in executive session, but I should be very glad to give that.

The CHAIRMAN. Can I assume, Captain, from what you have told us that all applications that have been filed have been filed through you?

Captain LAVENDER. That is correct, except as provided for with the OSRD that where it has been determined that the Government is not going to file an application, then the contractor has the right to file that application subject to a license in favor of the Government.

I might elaborate a little bit on that point to tell you of the conditions under which it is determined that an application shall not be filed. Take a case where the invention is a small detail—it may be a frame that is used for handling a particular piece of equipment. We call it a “dolly.”

Now, the use of that invention is not extensive. There are an enormous number of patents in the background that have been issued to cover that. The inventions themselves are analyzed to see whether or not there is any improvement over the prior art. If it relates to anything toward the center of the atomic program, of course we file. If it is some little mechanical detail that perhaps may be used in a very few cases, where the chances of getting a valid claim are very small, it isn't worth it from a manpower proposition and expense to the Government to go ahead and prepare to file an application on that and then have it battled through the Patent Office year after year trying to get some claim that in the end doesn't amount to much to the Government. We might spend more trying to get a patent on it than we would if somebody else got the same idea and we had to pay royalty.

On the other hand, it may be that that invention relates fairly closely—as it would be under a third-category patent clause—to the particular work of the contractor; so to him it is different because he may be able to explore a market where it would pay him to file that application. We say then that as far as the Government is concerned it is not worth while to file, but if the contractor desires to file, let him file and we can get a license.

The CHAIRMAN. Well, Captain, what I don't know about patent law would fill a great many books, but what I want to find out is this: Are there any patent applications now in the Patent Office by private companies applying for patent rights on processes which brought about the fission of the atom?

Captain LAVENDER. There are some that have been filed by independent inventors.

The CHAIRMAN. Not connected with the Government's project?

Captain LAVENDER. Not connected with the Government's project at all.

The CHAIRMAN. And there are no patent applications down there that came through you bearing upon the basic situation of splitting the atom?

Captain LAVENDER. Oh, no. All of the applications that relate to any of the basic work of this project, as supervised by OSRD or the Manhattan district, have all been filed by me, and, in accordance with provisions of the contracts under which they arose, the assignments of title are such that the Government has the title to those inventions.

The CHAIRMAN. How about what might be termed “atomic energy devices”? Have any patent applications come through you on those? Have any of them been filed by any of the contracting firms?

Captain LAVENDER. No, we have filed all of the applications, I think, with the exception of a very few, most of which are those that have been turned back to the contractor, who has been told that he can file. The latter are all on minor, unimportant mechanical details and devices that have a particular commercial application.

There was in process just this last week, for instance, such an application. I received a letter from a company saying that they were going to file these applications that have arisen under a contract. I believe their contract was of category 2. Those applications are going to be taken over by me, because all applications that are filed that have anything to do with the processes involved must be filed and prosecuted by me.

The CHAIRMAN. Captain, were there any cases where the Government had the right, title, and interest in the patent but granted an exclusive license to private contractors?

Captain LAVENDER. Not except those in which the contract itself provided that right. There have been requests for licenses under certain inventions which have not been granted, because the Manhattan District or the War Department did not desire to establish any kind of a precedent that would in any way hamper the Commission that is going to be formed.

The CHAIRMAN. Well, Captain, I just want to get this straight. The Government does own outright quite a few patents?

Captain LAVENDER. That is correct.

The CHAIRMAN. Now, under the contract that was made with the contracting officer, the other parties to the contract were permitted to have an exclusive right to produce under those patents even though the Government held them. Is that correct?

Captain LAVENDER. They had the exclusive right in outfields.

The CHAIRMAN. In outfields?

Captain LAVENDER. In normal commercial application.

The CHAIRMAN. Not in any way connected with atomic energy?

Captain LAVENDER. That is right.

The CHAIRMAN. So the Government owns the title to the patent that is good for any application of atomic energy?

Captain LAVENDER. That is correct.

The CHAIRMAN. But if a pump, we will say, could be used in a hundred other different ways, the Westinghouse, we will say, has an exclusive right to use it in a hundred different ways?

Captain LAVENDER. That is correct. I will just define your word "exclusive," because that has a particular patent law meaning. Exclusive license is construed as a right to exclude others, even the owner of the title. For instance, if I had a patent, I could designate someone as the exclusive licensee, in which case I myself would have given up the right to use.

We use the word "sole license". That means that there will be only one licensee and that is the contractor.

But the Government, because it has the title, not only has not given away the infield rights, but it is also permitted to operate in outfields. I only mentioned that because "exclusive license" in patent law has a definite meaning whereby the exclusive licensee could even exclude the owner or the titleholder.

The CHAIRMAN. The Government then can operate in the outfield as well as Westinghouse?

Captain LAVENDER. That is correct.

Senator MILLIKIN. But no one else?

Captain LAVENDER. That is correct.

The CHAIRMAN. Now, do you regard the break-down of this as confidential information which should be given in executive session?

Captain LAVENDER. The break-down of the number of contracts?

The CHAIRMAN. That is the only thing that I understand you regard as that which should be given in executive session.

Now, are you prepared to give us a list of the patent holders?

Captain LAVENDER. You mean the contractors?

The CHAIRMAN. Yes.

Captain LAVENDER. Yes, but that normally will be furnished by the contract section of the Manhattan district, because they are the custodians of the contracts, and they will give you a list of those that come under the different categories. I can also furnish you that.

The CHAIRMAN. And you can furnish us the name of each company that has filed a patent application down at the Patent Office?

Captain LAVENDER. Those would be practically nil because all of them have been filed through my office.

The CHAIRMAN. You filed those?

Captain LAVENDER. I filed them.

The CHAIRMAN. Quite a few of them?

Captain LAVENDER. Yes, sir. It is only in those cases where the patent division has determined that the Government will not file an application that the application is filed by the contractor.

The CHAIRMAN. Through you?

Captain LAVENDER. No; he can file direct; but I would say there are not more than 15.

Senator MILLIKIN. Fifteen contractors or applications?

Captain LAVENDER. Fifteen applications.

The CHAIRMAN. Again just to make clear, what are those 15—I don't mean by name.

Captain LAVENDER. You mean the subject matter?

The CHAIRMAN. Yes.

Commander ANDERSON. They relate to mechanical developments.

Captain LAVENDER. I think one is a very minor improvement on a diaphragm pump, and after examination I determined that it wouldn't be worth while for us to try to get a patent on it. The company itself said, though, that they would like to file an application, so we turned it over. As a matter of fact, I take the initiative because it has been referred to me to determine whether or not an application should be filed. If I determine that it will not be filed, then it is my next move to inform them that they may. Then they will inform me whether or not they intend to do it.

The CHAIRMAN. And there are 15 of those that you feel the Government has no interest in and has turned over entirely to the private contractor?

Captain LAVENDER. Except that the Government has a license under the patent if and when it issues.

The CHAIRMAN. Even though it is in an outfield?

Captain LAVENDER. Even though it is in an outfield, yes, sir. There have been a great number of determinations that the patent division will not file the application, but it has only been in about 15 cases that a company has come back and said they would file.

The CHAIRMAN. I may be a little obtuse about it, but I understand you want to give in executive session the numbers of those which the Government has filed. When the Government has filed a certain number—X number—in those the Government has, or is claiming, the exclusive right, or only the exclusive right as pertains to the atomic energy field?

Captain LAVENDER. We can put it this way, that the Government holds the title to the invention and all patents that may issue thereon. If the contractor by contract right retains a license, then that license is operative in all outfields, but the Government has all infield rights. There are no exceptions of infield rights.

The CHAIRMAN. Now, this further question: Have they retained—any contractor—by contract right, any claim to use any of these things in two instances: (a) the production of fissionable material, or (b) the application of fissionable material to atomic energy devices in the future?

Captain LAVENDER. There has been no contractor who has retained any right to use the inventions in either of your classes (a) or (b).

The CHAIRMAN. All outside industrial uses?

Captain LAVENDER. Whatever license they have retained as a matter of contract right has been in outfields.

The CHAIRMAN. That clears it up for me.

Senator MILLIKIN. Of these applications that are impounded in the Patent Office, how many people have access to them?

Captain LAVENDER. We have set up a very definite way of handling these applications, and they are known in the Patent Office as "special handling" cases. These special handling cases are designated at the time that I filed them, in the letter forwarding the application to the Commissioner of Patents. These applications are sent down to Richmond—that is, to the examiners when they are down there—only by an official of the Patent Office and delivered personally to the chief examiner of the division. The chief examiner and his assistant were the only ones who were designated by the Commissioner of Patents to handle those cases. They are kept in separate safes in the Patent Office.

Senator MILLIKIN. That is two people. Does anybody else get to look at them?

Captain LAVENDER. I would say "No." An examiner may be examining one, and the chief examiner may be on a case and have someone come up. But I have been down there several times and I know that they are very strict as to anyone being around the examiners when they are working on those cases.

Senator MILLIKIN. So at one time you said the chief examiner and now you have mentioned chief examiners. How many people could this possibly clear through in the Patent Office?

Captain LAVENDER. Each case would go to the examiner of a division who is known as the chief examiner. Now, he may have one other person—his assistant—work on that case with him. In some of these divisions there are quite a large number of cases so that one person couldn't handle them all. The only other way I suggested was that another person in the Patent Office might see them would be, say, a person who happened to pass along at the time that this case was on the desk of the chief examiner.

Senator MILLIKIN. Is there a compartmentalization so far as these particular impounded applications are concerned, so that by rule or by law in some way or other one examiner cannot be talking to another?

Captain LAVENDER. Oh, yes. The Commissioner of Patents has issued very definite instructions as to the disclosure of information to anyone who is not entitled to receive it.

Senator MILLIKIN. Have these men been very carefully studied in the light of this particular problem?

Captain LAVENDER. I would say "Yes," because the chief of the division has been a person of long service and he didn't come into that position except as his integrity, his reliability, and other characteristics were very well developed. The heads of these divisions are all very well tried officials.

Senator MILLIKIN. You would have complete confidence?

Captain LAVENDER. I have complete confidence in the system.

Senator MILLIKIN. And complete confidence in all the individuals that are involved in it?

Captain LAVENDER. That is correct. I have on several occasions been to Richmond in connection with the work on this and have talked with the examiners that have most of my cases, and I have found them all to be a very fine, reliable group.

Senator MILLIKIN. Can you tell us whether you know as a fact that the background of these men, so far as their country of origin is concerned, has been studied.

Captain LAVENDER. I didn't quite understand.

Senator MILLIKIN. If John Doe, examiner, is born in X foreign country, has that feature of it been studied specifically in the case of all of them?

Captain LAVENDER. I don't know, but I can only say this: The heads of these divisions have been tested and tried throughout a number of years, and I don't think that there is any chance of a leak there.

Senator MILLIKIN. I do not by my questioning impute anything of that kind, but in all of these things we have to take extra precautions, and I have been wondering whether a special study of those men has been made in relation to this particular stuff in its relation to the foreign implications.

Captain LAVENDER. Well, I imagine that the security division of the Manhattan district has checked the system that was established, and probably the personnel.

Senator MILLIKIN. It might not be a bad idea to look into that.

Captain LAVENDER. I feel sure the Security Division has done that.

Commander ANDERSON. The Security Division has approved them and the handling of this method.

Senator MILLIKIN. We can interpret that as meaning the system, but do you give the same answer to the personnel?

Commander ANDERSON. They have all been approved by the Department of Commerce, and taken oath with respect to which they are requested to keep all applications under secrecy. They are under the Espionage Act.

Senator MILLIKIN. That doesn't quite go to the thing I am driving at, and that is as to their suitability for the job they hold in connection with this particular thing we are talking about.

Captain LAVENDER. I shall suggest that to the Security Division and ask whether or not they have investigated the individuals.

Senator MILLIKIN. I think the odds are that they have, but it is so important that I think we ought to know rather than speculate about it.

Captain LAVENDER. That is one thing I have not the direct responsibility for, otherwise I would be able to give you the answer.

I get clearance from the Security Division; that is, any person that comes into my employ is cleared not only by the FBI, but if he is an Army or Navy officer, he is cleared by the Service Intelligence, and then he is cleared again by the security officer of the Manhattan district.

Senator MILLIKIN. May I suggest, Mr. Chairman, that the Captain look into that specifically and give us specific information on it?

Captain LAVENDER. I shall be glad to do that.

The CHAIRMAN. Very well, Senator. Will you do that, Captain?

Captain LAVENDER. I shall be glad to.

The CHAIRMAN. Captain, are all of these patents in the status of patent applications, or have any patents been issued?

Captain LAVENDER. There are no patents issued that were filed by the Government. There are certain patents relating to atomic fission which have been issued to independent inventors before the emergency.

The CHAIRMAN. Before we got into it as a country?

Captain LAVENDER. That is right.

The CHAIRMAN. Now, are there any patent applications covering the making of the bomb?

Captain LAVENDER. Yes.

The CHAIRMAN. Are there any patent applications giving the bomb-making details in those patent applications?

Captain LAVENDER. Well, I think that I had better give you that in executive session if you are going into any of the details of it.

The CHAIRMAN. Not what details there were, but whether there were any of the details given in the patent application. You don't want to talk about that?

Captain LAVENDER. Not any more than just to say that the bombs are covered by applications.

The CHAIRMAN. I wonder what is the necessity for covering the bomb itself by applications for patents?

Captain LAVENDER. Well, it is very important for this reason: I knew that as soon as the bomb went off there would be a great deal of speculation among various scientists and others, engineers, who had not been connected with the project. I knew that a great many applications would be filed in the Patent Office, so I was interested in having filed in the Patent Office these applications, so that if any applications were filed and we got into interference, the Government would not be suffering the handicap of being the second one to file, because the first to file has a great advantage from an interference procedure point of view.

The CHAIRMAN. You see, Senator, this information which we have just received makes all the more pertinent your line of inquiry. I didn't dream, frankly, up until this point that there was a patent application down there showing how the bomb was put together. Did you?

Senator MILLIKIN. No. Personally, I regret it.

The CHAIRMAN. I, too.

Captain LAVENDER. I was reserving for any discussion in the executive session another special handling of these applications relating to bombs, which I am sure fully safeguard it. I didn't mention that at the time I discussed the special handling cases.

Senator MILLIKIN. I assume from your other answer on security that the physical custodianship of these various applications is such that there isn't the remotest chance of any intruder getting hold of them.

Captain LAVENDER. That is true, and again that particular phase was investigated by the Security Division of the Manhattan district, and it approved the special provisions that have been made on the basis that they were absolutely secure.

Senator MILLIKIN. Are you personally acquainted with that phase of the business?

Captain LAVENDER. Yes, I am.

Senator MILLIKIN. Are you satisfied?

Captain LAVENDER. I am satisfied.

The CHAIRMAN. Captain, how does the fact that you have filed an application on the making of the bomb compare with other military weapons in the practice that has been followed? For instance, the bomb sight.

Captain LAVENDER. I am not familiar with what the Navy Department has done in the filing of applications for bomb sights, because my last duty with the Patent Division of the Navy Department was in 1937. But the provisions that we are making, so far as the bomb is concerned, are far more extensive than what was done with the bomb sight applications at the time I was in the Department.

The CHAIRMAN. Do you know of any case where a perfection of a weapon has been filed on by the Government?

Captain LAVENDER. Yes; a great many of the devices that I know of have been kept under the provisions of 35 United States Code 37.

The CHAIRMAN. That practice was established to protect the Government, we will say, from foreign inventors claiming at a later time that they were responsible for the use of the weapon?

Captain LAVENDER. That is correct, and the foreign inventor or independent inventors coming in and filing an application only for the Government to find that it was in a disadvantageous position because it had not filed the application and was second to file.

The CHAIRMAN. Have there been any applications from foreign inventors on atomic bombs that you know of?

Captain LAVENDER. What they contain I do not know, but I do know that there are pending in the Patent Office quite a good many applications by foreign inventors.

The CHAIRMAN. Filed before we got into the thing?

Captain LAVENDER. I think most of them were filed after we got into it. There was one application that was filed over here on a patent that had already issued in France, and that is still pending in the Patent Office here.

The CHAIRMAN. When was that filed, do you know?

Captain LAVENDER. It was filed in France and issued in France in the fall of '39, and the corresponding application was filed over here a little over a year later.

Senator MILLIKIN. Mr. Chairman, I believe it would be a good idea if we went into that a little in executive session.

The CHAIRMAN. Perhaps we had better not pursue it now.

Senator MILLIKIN. Captain, what were the considerations that allowed these people to have outfield rights? Did they insist upon having outfield rights? Was it just something that was tossed in, or how did it come about?

Captain LAVENDER. First, the policy was well thought out, I believe. I had had experience in the research and development contracts with the Navy Department, and I realized that before we went to a contractor with a proposition that we ought to have a very definite policy that would be reasonable, having particularly in mind that where an invention had commercial application the public had the right to have that made available to it, so that there wouldn't be this impounding of inventions, or a limitation.

Now, the contractor, when he determines that an invention is made with commercial activities, has got quite a little risk money involved in it to take an invention and apply it commercially. It was thought out, as far as I was concerned, with these four categories, and then the proposition was put up to the contractors. Some of the contractors felt that they ought to have a sole license instead of a nonexclusive license.

Senator MILLIKIN. That is, sole as against the Government?

Captain LAVENDER. That is right. If it were a mere construction contract with very little chance of having anything of any value to the atomic energy program, they were given the right to retain a nonexclusive license, but in a good many cases, or in one case in particular that I am thinking of, I felt that they should have the sole license. I have had a very careful check on all of these contractors. I have seven branch offices throughout the country, and in each one of those places I have a fine staff of patent attorneys who check all of the invention records. They see the equipment as it is being built and they report these inventions.

In this particular case, I began to see inventions being reported that were just a little more than construction. That tipped me off right away that I should look into that matter because of the interests of the Government. I found that after they had gone into this work they realized that they would have to do some research—of development, as distinguished from research. I confine research to the basic principles. I found that they had assigned some of their engineers to this development work, whereupon I proposed to the company that we renegotiate that contract, that the subject work had changed as a result of the progress of the contract, and that it should be in category 2 where they only get a nonexclusive license. The company saw the logic of the matter and they agreed to renegotiate the contract so that on the next extension period there would be a legal consideration, and it was changed over to the category 2.

Senator MILLIKIN. Would any of these contractors to whom you refer have refused to go ahead with their work had they not been given some patent rights?

Captain LAVENDER. No, they went ahead. When the Manhattan district went to these people, to the contractors, and asked them to make something or do something without any contract at all except just a letter of intent, they went right ahead with their work; that is the reason why the contract would come along months later. Then the whole thing would be negotiated. I don't know of a single company that ever said, "We are not going to do anything on this until we get all of these contract rights worked out."

Senator MILLIKIN. Then those privileges they have gotten, whatever they are, are sort of a gratuity we have given them?

Captain LAVENDER. No, I don't think it is a gratuity. I think it is a good sound business proposition. If we had gone to these con-

tractors where they were furnishing the equipment and came under category 3, we will say, and said, "We want the whole right, title and interest, and you retain nothing," it would be natural for the Government to pay for it, because we were taking all of the invention rights. It has been purely from a business point of view of the Government that we don't take more than what we need to have to have control of the project.

Senator MILLIKIN. You have not been paying more. I premised the whole thing on whether or not you would have to pay more in order to deprive them of any patent rights, and in your opinion it was not necessary to pay more, so the thing still stands in my mind as a sort of a gratuity.

Captain LAVENDER. No; I see that I haven't made myself clear. I believe that it should be the policy of the Government that the Government pay for what it gets and doesn't pay for what it doesn't get.

The next thing is that the Government should take or get only that part which is necessary for its administration. So it would be sound business, then, if we are going to disrupt these commercial companies in their normal business and take their highest professional men away from them and pay only the per diem salary they are getting so that the company cannot go ahead with its normal development, that we should take from them only what is necessary for a particular policy and determination of the Government. It has been just a pure business proposition with me in recommending how much and how extensive rights we should obtain.

Senator MILLIKIN. Here is what is nagging at me, Captain. Let us suppose that John Doe is a little fellow making a valve of some grade, and Richard Roe is a big fellow making a valve, and you picked Richard Roe as the man to do this particular kind of a job for you. Now comes peace, and Richard Roe appears with a lot of improvements on a product which the Government has really paid for and put him in position to make. Where does that leave this little fellow, John Doe?

Captain LAVENDER. It left John Doe with the full opportunity, when the first man was working for the Government, to go ahead and exploit or advance his position in the manufacturing field; whereas you took the engineers from the other company and had them working on something that was for the Government.

Senator MILLIKIN. Yes; but with this distinction: John Doe, the little fellow, does not have the resources of the United States Government to go ahead with his developments, whereas Richard Roe has the resources of the United States Government behind him.

Captain LAVENDER. All right. There still is a very easily adjustable position, because the Government has the title to the invention, and if it comes under category 2—which it would be if it had more than just a sort of readjustment of a standard equipment of the company—the Government then can grant a license to the small man in exchange for a license under anything he may have.

Senator MILLIKIN. That is under one category, but what about the category where the contractor has an exclusive right as against the Government?

Captain LAVENDER. Well, in those cases it is true that the Government does not get the right to grant these licenses to the other company; but those cases cover merely a slight adaptation of the standard

company's products, and I don't think it would be very effective in changing the relative position between the small company and the big company before and after the date of the contract.

Senator MILLIKIN. To my mind it might very seriously, but let us pass to two relatively big companies. I don't care to make a demagogic point out of it. Take two big companies. One big company hasn't had this Government business; the other big company has, or the other big company has had the Government business as a result of Government money through the whole operation of our system, coming out with improvements and patents that puts the other big company under somewhat of a disadvantage. The other big company can say, "We paid our share of taxes to put our competitor in the better position he now is in."

The CHAIRMAN. And I might also point out, Senator, to further fortify the question, that A company might in the field have been put over to making tanks, where there was no possible peacetime advantage—that is, assuming they both competed in the same line of work—and then B company, which you are talking about that gets this exclusive right has an advantage, and A company would certainly be in a stronger position to complain about it.

Captain LAVENDER. I think in some cases, a very few cases, there may be inequality between two big companies after this project is over, but in all considerations of this phase great weight must be given to this factor: While the big company that was not engaged in this particular work for the Government was working along, he was not hampered by having his good top men taken from his company in an entirely unproductive field, as you might say, or to a great extent an unproductive field along the lines of his endeavor.

Senator MILLIKIN. But might he not in turn have been working on similar things in some other field?

Captain LAVENDER. Yes.

Senator MILLIKIN. And thus he has suffered the same dislocation?

Captain LAVENDER. He had the free choice of the field he was working in, a company not working for the Government.

Senator MILLIKIN. I think, Captain, if I were answering the question, the strongest thing I could say for it was that you wanted to stimulate the inventiveness and resourcefulness of the people who were working in this thing, and giving them some sort of little interest in what they were doing might have that tendency.

Captain LAVENDER. I have, of course, been in very close contact with this project in all of its phases, and I have been greatly impressed by the large number of really top engineers and designers that these companies have given to this project where I know that the work that they were doing, as far as the Manhattan district project was concerned, practically divorced them from giving any other energy, brains, and ability to the company that was employing them.

Senator MILLIKIN. I want to say to you very frankly that I am not much impressed with that argument because we took a lot of top-notch younger fellows and put them in the Army, and they didn't have any of those advantages.

Captain LAVENDER. Oh, that is true.

Senator MILLIKIN. And in the Navy, too.

The CHAIRMAN. Of course, the biggest percentage belong in the category that you are talking about, the biggest percentage of the patent applications belong in this category.

Captain LAVENDER. No; not the important ones. The important ones have arisen under the research contracts, and under those under category 2 where the company only retained by contract right a non-exclusive license.

The CHAIRMAN. But, Captain, as I understand it, the great bulk of the patent applications that come under the whole project are in the field where the outside company has an exclusive right with the exception of the Government.

Captain LAVENDER. No; I would say not. The number of inventions that are made by contractors having the third category are very minor in nature, and are of not so much importance, certainly not to the project, and they cover only minor improvements. In this general analysis of the situation, you cannot go by numbers, because some of the most important fields of this whole atomic energy program are covered by a very few outstanding basic patents.

The CHAIRMAN. Well, one company has advertised, I believe, that they have 5,000 improvements. Is that correct?

Captain LAVENDER. My understanding of the record is that it was 5,000 different applications of all their inventions to industry in general, not meaning that they had 5,000 inventions that they had made. One invention may be applicable, or one device may be applicable to 150 uses.

The CHAIRMAN. Bringing that 5,000 down, how many patent applications has that company filed, if you know?

Captain LAVENDER. That company has filed none. We have filed all those applications.

The CHAIRMAN. How many that you filed originated with that company?

Captain LAVENDER. Well, of course, that contract isn't over yet and we have people who are checking upon it. I would say that there are about perhaps 100 applications that will ultimately be filed, but one application may have many different applications to industry.

The CHAIRMAN. They probably didn't err on the side of understatement when they claimed the number of practical applications, when they said 5,000.

Captain LAVENDER. I don't think they did, either. I think they were conservative. When they referred to industry in general that is going to be benefited by the program, there is one invention that will probably have 500 different uses that I call to mind.

The CHAIRMAN. If an individual of a company works in the atomic energy field at his own expense, what restrictions are enforced about the patent values arising in this way now?

Captain LAVENDER. We do not permit anyone to work for a contractor who has not signed an agreement to assign his inventions in accordance with the contract.

The CHAIRMAN. Of course, under the law the way it is operating now, if John Jones went ahead and invented some very useful atomic energy device, there would be no provision under the law by which you could take it over.

Captain LAVENDER. I didn't understand that.

The CHAIRMAN. Well, let's assume John Jones is down in his laboratory, and he comes up with some invention on fission.

Captain LAVENDER. In his own laboratory?

The CHAIRMAN. Yes; his own small laboratory.

Captain LAVENDER. An independent inventor?

The CHAIRMAN. Right. Now, if he came up with something extraordinarily useful in the field, there would be no way that you could get hold of it.

Captain LAVENDER. Except that I think that the Government could go to him, if it involved the national defense. There is one part of the Espionage Act which does not require that the person disclose that information came as a result of some relation with the Government—that is, that he received it from the Government. But if the Government knew of this information, they could go to him and place him under the conditions of the Espionage Act, where he would not be permitted to disclose that to another.

Now, what would actually happen, the way that I visualize this is going to work out, is that if the Commissioner of Patents will be authorized and directed to notify the Commission of the existence of an application in which reference is made to atomic energy, then the Commission should have authority to go to him and to purchase or make some arrangement with him.

The CHAIRMAN. But in the absence of legal right, that is under an act of Congress, there would be no way that the Government could proceed to take over this patent.

Captain LAVENDER. They could not take over the patent, or an application for a patent, because that would require an assignment. The Government cannot file an application in its own name, so it must be filed in the name of the applicant. But I believe, although I do not know of any particular case in point that has been decided by the courts, that the Government, if it finds that some person has information the dissemination of which is contrary to the national defense, can under the provisions of the Espionage Act, if it so desires, require that that man do not disclose that information to anyone.

Now, that is in effect seizing the invention and restricting him more under police power.

The CHAIRMAN. That wouldn't change the ownership, but merely his right to divulge it?

Captain LAVENDER. That is right.

The CHAIRMAN. That you would have to pay some compensation for, I take it?

Captain LAVENDER. I don't think you would, because I think you could offer the compensation, but I think it would come under police power rather than seizing under eminent domain.

The CHAIRMAN. So Jones might make the greatest invention in the field that had yet been made, and still be deprived of any award for it?

Captain LAVENDER. If he did not want to accept the award that was offered to him through confidential negotiations.

Now, it is true that a person who has a patent cannot obtain from the Government, from the Army or the Navy, the facts concerning the equipment that corresponds to his patent if the Army and Navy do not desire to disclose that in the Court of Claims, and that leaves the claimant in the Court of Claims with a perfectly valid issued patent but no way to prove his case because the information as to the proof of the case is wholly within the knowledge of the Army and Navy. That case has been decided by the Court of Claims that they will not enforce a call for information against the Navy Department if the Navy Department certifies it involves the national defense.

Senator MILLIKIN. I know your own deep concern in this subject, Captain, and I am sure your mind will be relieved by a dispatch from London. I read it:

Prof. Harold J. Laski, chairman of the British Labor Party executive committee, said today the words, "Existing atomic bombs must be destroyed at once to be sure no power could compel submission of another power by using the new weapon." "It is also clear that the atomic bomb has thrown suspicion between major international states," Laski asserted, "and nothing is to be obtained by pretending that a commission on atomic energy set up by the UNO is anything more than a very small step on the path toward the disposition of these suspicions."

All we have to do, Captain, is to get rid of these bombs, get rid of our Navy, with a complete demobilization of our Army and Air Force and everything is just going to be swell.

Captain LAVENDER. Including making everybody forget everything they ever heard about fission, or anything else.

Senator MILLIKIN. That is right. So you see, we are wasting a lot of time, Mr. Chairman. Mr. Laski has solved these problems for us.

The CHAIRMAN. I think any solution that Mr. Laski had to offer would probably come in for rather strenuous examination, Senator.

We have interrupted you, Captain, with a lot of questions. Unless Senator Millikin has something, suppose you go ahead.

Captain LAVENDER. I don't know that there is anything more to say, except that I have this organization that is very close to the contractors. I have a group that is in each area in which research work is going on. I have instituted a regular procedure on the reporting of inventions, the determination of who the first inventor was, because it is most important that it be determined who the first inventor was, in placing his name on the application. Otherwise, the patent would be invalid. The work is proceeding and has been proceeding, I think, on a perfectly good, sound, and satisfactory basis since the Manhattan district took over.

Senator MILLIKIN. There is one question I would like to ask. What do you know about the patent applications of Kellogg or the existing patents owned by Kellogg relating to this subject?

Captain LAVENDER. Well, I might say that I know the whole story from beginning to end as far as negotiations and administration of their patents are concerned.

I do not know what patents they owned before they came into the Manhattan district activities. They, of course, are a subsidiary of the Kellogg Co. The Kellogg or Kellogg Co. has granted a license to the Government under all of the patents that it owns or controls that were developed before the effective date of the contract that may be used in any of the plants, equipment, or anything else that is related to the work that they were doing, which was a voluntary act on their part. So far as their patents are concerned, that is the situation.

As to the present condition, they started out with a long-form patent clause which was renegotiated to a short form. The clause that they have with the Manhattan district is No. 2, modified to this extent: They have the right to grant sublicenses; they have a non-exclusive license with the right to grant sublicenses. That comes within a recognized condition where they themselves do not manufacture, so the mere license for them to make and use and sell would be a vain thing. It would be of no value to them.

Under those circumstances, the same as with other contractors where they are not manufacturing, they have the right to grant sublicenses.

Senator MILLIKIN. There is no essential secrecy about the type of invention you are talking about?

Captain LAVENDER. No.

Senator MILLIKIN. What is the general nature of those inventions?

Captain LAVENDER. The general nature—there were valves that were used particularly with highly corrosive elements, where the valve that was in use before would not maintain any degree of tightness over a period of time.

Senator MILLIKIN. That has always been the main problem of a valve, hasn't it?

Captain LAVENDER. Yes, sir. There is one of them that goes to a means of supporting a bearing where the bearing surfaces would have to be made of a certain number of limited metals, and they would be attacked by corrosive elements. It is very effective in that there is no corrosion of the bearings.

There is another one on valves with a particular way of opening and closing the valves and there are inventions that are particularly adaptable to oil refining, the handling of gases, and other matters.

Senator MILLIKIN. Are those of enormous value, those exclusive license rights?

Captain LAVENDER. Well, the license rights are not very extensive because they only have a nonexclusive license, so the Government can grant licenses to other companies.

Senator MILLIKIN. I thought you said they had the right to sublicense. That is valuable, isn't it?

Captain LAVENDER. Oh, yes; it is. It is something that they would have to have; otherwise the license would be of no value, because they themselves do not manufacture this equipment.

Senator MILLIKIN. If a man has a valve that will hold where no valve has ever held before, he certainly has got something of enormous value.

Captain LAVENDER. He has, but the Government can still license other persons. They do not have the sole license.

Senator MILLIKIN. Oh, I didn't understand that.

Captain LAVENDER. There is a tremendous difference there. You see, that is getting closer toward the basic processes.

Senator MILLIKIN. Then let me probe that a little further. The Kellex Co. has the right to make the stuff itself.

Captain LAVENDER. That is right.

Senator MILLIKIN. Does it have the right to license it to John Doe Co.?

Captain LAVENDER. It does.

Senator MILLIKIN. The Government also has the right to license it to John Doe Co.?

Captain LAVENDER. That is correct.

Senator MILLIKIN. So if any unfair practice develops so far as Kellex is concerned, the Government could mitigate that by making its own sublicenses?

Captain LAVENDER. That is correct.

Senator MILLIKIN. The Government could let them out for nothing if it wanted to?

Captain LAVENDER. That is correct.

The CHAIRMAN. Has the Government, as far as you know, granted any licenses to any other companies?

Captain LAVENDER. No, because they desired not to make any decisions in view of the fact that the Commission is going to be formed. They didn't want to make any decisions as to the granting of licenses to individual companies.

The CHAIRMAN. Really Kellex's rights aren't worth very much if they can be destroyed by the issuance of, say, 6 or 10 licenses by the Government?

Captain LAVENDER. That is correct.

The CHAIRMAN. It is not worth very much?

Captain LAVENDER. That is right, but it does permit them to operate. They are permitted to operate as a matter of contract right, but it doesn't give them a dominating position in the field.

Senator MILLIKIN. The other fellow has a fishing license. He has either got to get a license from Kellex or the Government, and he might not get it from either. Is that not a correct statement?

Captain LAVENDER. That is correct. If the Government chose to lock it up, they would be vesting a very valuable right in Kellex; but just as soon as they release it to two or three others, I suppose they have pretty much destroyed their monopoly of the field.

Senator MILLIKIN. Mr. Chairman, have any of the names of other companies been mentioned, in your memory?

The CHAIRMAN. Yes, only incidentally, Senator. Mr. Rafferty, of Union Carbide & Carbon Corp., and whose subsidiaries, the Linde Air Products Corp. and the Carbide Corp., worked in this field, testified that they had devised, they thought, many things of future use and value to industry, but that they had not filed through the Government patent applications.

I believe du Pont has not made any claims at all for improvements or inventions.

Captain LAVENDER. No; the situation with du Pont was a little different. Du Pont said they didn't want to have anything to do with the determination as to who inventors were. They said, "We will give all of our men, the necessary men to work this out;" but the Manhattan District took the responsibility of ferreting out the inventors, for they wouldn't themselves lay any claim that any of their men made any invention.

The CHAIRMAN. What does that principle resolve itself into, practically?

Captain LAVENDER. Well, I might give you a little as to their reason as given. This is only second-hand knowledge, but they were working with the University of Chicago on this, and they didn't want to let anybody think that du Pont was coming in and was going to grab up any of the patents, so they said, "Well, we will just say to you, the Manhattan district, that we will cooperate with you in the getting of the records of these inventions, but you will have to take the initiative, because it is not going to be said that du Pont is going to make any claim that it made or that one of its employees made the invention."

They even went so far as to ask me at one time that every time that I prepared an application and sent it to one of these du Pont men for execution that I would have to make a certificate that no

one in the Chicago University had had anything to do with it. Well, I just told them that I was more or less of a practical person, and if I presented that to them for their signature, that meant that it had been checked by my group in Chicago on which were representatives of the Chicago University, and that it was to go ahead and be filed.

The CHAIRMAN. Acting under that principle, what rights has du Pont gotten?

Captain LAVENDER. Under that contract, they get nothing.

Senator MILLIKIN. Captain, if I understood your statement correctly, du Pont said: "We are not going to have anything to do with determining who made an invention; you fellows determine that."

But assuming that you fellows determine that a du Pont man had made the invention, then what happens?

Captain LAVENDER. Then they will do their part to cooperate to get the application executed.

Senator MILLIKIN. But what rights would du Pont then have in the application?

Captain LAVENDER. None. That related to certain du Pont contracts. There were other contracts with du Pont that were in category 2, in which they retained a nonexclusive license. But in working with the University of Chicago, the big contract was the one which they said they didn't want to have to make the initial decision that one of its employees was the inventor of a certain invention.

The CHAIRMAN. How about their subcontractors?

Captain LAVENDER. The subcontracts carried the same provisions, normally, but the patent clause can be changed with the approval of the Patent Division. If the subcontract is merely a purchase contract, then we approve the no-patent clause and use the same principle in determining what a subcontract patent clause should be as we do on the prime contract.

The CHAIRMAN. Did du Pont get anything out of any invention made by a subcontractor?

Captain LAVENDER. Not to my knowledge, but that matter is always present in the administration of these matters, because before the final payment is made on any contract or any subcontract it must be cleared by my division, so I am satisfied that all the inventions have been reported.

Now, with these thousands of contracts I cannot say whether or not du Pont in any of these cases did receive any right.

Senator MILLIKIN. So far as you know, Captain, du Pont has met in full spirit the basic proposition that they did not want to profit out of any of these inventions?

Captain LAVENDER. Yes, that is true.

Senator MILLIKIN. Has any large corporation failed in what you might think would be proper cooperation in any of these invention matters?

Captain LAVENDER. No; we are completely satisfied with the administration.

Senator MILLIKIN. But in the end the Government's interest was fully protected?

Captain LAVENDER. That is right.

Senator MILLIKIN. And on a nonselfish basis?

Captain LAVENDER. Yes.

The CHAIRMAN. Union Carbide took no patent rights at all, as I understand it.

Commander ANDERSON. Not on their basic contracts. There may have been some subsequent contracts on which they retained a nonexclusive license.

The CHAIRMAN. Similar to Kellex?

Commander ANDERSON. Yes, or duPont; but this basic contract had the short-form patent clause. There were several other prime contracts let in which they were permitted to retain a nonexclusive license.

The CHAIRMAN. Which could again be destroyed by the Government issuing licenses to other people?

Commander ANDERSON. That is right.

The CHAIRMAN. I am a little puzzled. What is that worth to a company like Kellex when it could be destroyed—any head start in the field?

Captain LAVENDER. No; it is not so much that they do have some head start, but it insures to the company that it will not have any islands in the general progress in which it cannot operate; that is, as it is proceeding along its normal course of development. It is a protective measure.

Senator MILLIKIN. And the Government's reserved right is a protective measure to competitors?

Captain LAVENDER. That is correct.

The CHAIRMAN. Of course, I can see the value to it, that if they are working intensely in the field they would be able to get from island to island without having the trouble of coming to the Government and getting each individual process licensed to them.

Captain LAVENDER. Well, I was using "island" in the opposite sense. I was thinking of progress in time as being more or less on the ocean, that the island would be out there, that they had to go around or they couldn't enjoy their normal progress of crossing, so that it is their protection that they will be able to operate in this field.

Senator MILLIKIN. It conjures to my mind the picture of Simon Legree chasing Topsy across the ice.

Captain LAVENDER. There is just one other thing that I might mention, and that is that at no time in this administration of patent rights has any company been granted any right under any inventions that were not made by itself, that is, by it as a contractor. In other words, we haven't granted any license to company A who has made inventions under 1, 2, 3; and 4, and granted licenses under those inventions 1, 2, 3, or 4 to another company, so that there isn't as yet any company that I know of that has got a position where he can use the other and perhaps necessary inventions that arose from other contractors; contractors have retained only the rights under the inventions that they, as contractor, made. That puts the Government in a good, strong position.

The CHAIRMAN. I think we ought to have a short executive session. The open hearing will now recess.

(Whereupon the committee retired into executive session, at 12:05 p. m.)

ATOMIC ENERGY ACT OF 1946

WEDNESDAY, FEBRUARY 13, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to notice, at 10 a. m., in room 424, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senator McMahon (chairman), Millikin, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The meeting will come to order. The first witness this morning is Mr. Klein, engineering manager, Stone & Webster Engineering Corp.

STATEMENT OF AUGUST C. KLEIN, ENGINEERING MANAGER, ACCOMPANIED BY J. R. LOTZ, CHAIRMAN, BOARD OF DIRECTORS, STONE & WEBSTER ENGINEERING CORP., BOSTON, MASS.

Mr. KLEIN. My name is August C. Klein. I reside in Newton Center, Mass. I am engineering manager of Stone & Webster Engineering Corp. I am a fellow of the American Society of Mechanical Engineers, a member of the American Gas Association, and of the engineering societies of New England.

I have written a great many papers on steam-power-plant design and construction and on the economics of the supply of steam and power to industrial utilities.

Senator MILLIKIN. In what branch of engineering are you?

Mr. KLEIN. As engineering manager, Senator, my work has to do with all of the various activities of Stone & Webster Engineering Corp.

Senator MILLIKIN. What I meant was: Are you a mechanical engineer or an electrical engineer?

Mr. KLEIN. I am a mechanical engineer by training. I am a graduate of Stevens Institute of Technology, with a degree of mechanical engineer.

Senator MILLIKIN. Thank you.

Mr. KLEIN. I am accompanied here this morning by Mr. J. R. Lotz, who is chairman of the board of directors of Stone & Webster Engineering Corp.

As to the atomic bomb project, from July of 1942 until July of 1945, my entire time was given to the duties of project engineer for Stone & Webster Engineering Corp. in the design and construction of the electromagnetic plant for the Manhattan district at Oak Ridge.

359

Since then I have continued in general supervisory charge of the work. Incidental to this major plant and included in my company's contract were a heavy water plant at Trail, British Columbia, the selection of the site for the Clinton engineer works, selection of a site for the metallurgical pilot plant at Argonne Forest, Ill., the design and construction of pilot-plant structures at Argonne Forest, Ill., and engineering and management of construction of the city of Oak Ridge and the procurement of uranium ore and other essential raw materials prior to the organization of the raw-materials branch of the Manhattan district.

I have outlined my connection with the project as a background for some comments and a principal recommendation which I believe your committee should carefully consider before bill S. 1717 is finally enacted.

Your committee has been through an arduous series of hearings at which statesmen, scientists, military and naval experts, and others have expressed their views. This morning I would like to speak to you as an engineer who has been through 4 years of practical daily contact with the problem to urge that you do not fail to include an outstanding construction engineer as a member of the Commission and as a division head in the organization proposed by your bill. He of all the membership of the Commission which will make recommendations to the President, the State Department, and the Congress, may be best qualified to appraise those recommendations in practical terms of time, dollars and ability of the country to produce.

To save time, with your permission, I will read a statement which has been prepared.

The legislation proposed by bill S. 1717 may well be the most important postwar legislation that Congress will be called on to pass for many sessions. It creates a Commission whose powers for domestic and international good can not be overestimated. In international relations it will be a powerful arm to the President and the State Department in advancing the cause of permanent peace, and in our domestic affairs it will have a profound influence on every phase of industry through the creation of cheap sources of power. It will also have a profound effect on medical science.

It is therefore highly important that the bill should be written to provide the best possible Commission organization, one which will achieve its objectives in the shortest possible time.

The bill, in general is, in my opinion, an excellent measure giving the Commission it proposes the broad powers over the development and utilization of atomic energy which are necessary to promote its objectives. However, the bill is, I believe, defective in that it fails to include a Division of Engineering under the provisions of the last sentence of section 11 (a)—that is the section which calls for additional divisions as may be determined by the Commission from time to time. The point I am making is that the creation of a Division of Engineering subsequent to the formulation of the Commission under the provisions of that section is not sufficient to provide the Commission with the necessary engineering strength for the reason that a Division of Engineering created under the provisions of that section would place engineering under the direction of one of the directors selected for his ability in the field of research, production, materials selection, or military application.

It is my belief that one of the directors should be an administrative engineer selected for his experience and ability in fields which qualify him to promote the aims of the act.

By this bill, the Congress will create a Commission to control one of the greatest industries in the country, an industry which will rank with the steel, automotive, and electric power industries.

The CHAIRMAN. That is your considered opinion?

Mr. KLEIN. It is, indeed.

The CHAIRMAN. Do you develop that in your statement?

Mr. KLEIN. I do not.

The CHAIRMAN. If not, I would like to explore that a little with you.

Mr. KLEIN. All right, Senator.

The CHAIRMAN. Wouldn't you, Senator Millikin?

Senator MILLIKIN. Yes.

The CHAIRMAN. That is a rather interesting statement.

Mr. KLEIN. I can foresee that within a period of time the ramifications of the use of atomic power for peacetime use, irrespective of its military applications, will extend to all industry. Such being the case, under the provisions of this act the Commission will retain control of many related operations that will be, first, the exploration and the mining of uranium ore; second, the refining of the uranium ore to bring it into the condition which is best suited for the separation or the production of fissionable materials from processes now available or to be developed through the agencies of research and engineering in the future; third, once that fissionable material has been developed, I believe it should be the principle of this Commission to extend the use of that material to all industry as quickly as possible. If, as we believe, we will obtain in that way a form of cheap energy, we will see this country dotted with superpower plants connected, as I bring forth a little later in the statement, with all of the leading electric power distributing systems in the United States. Some of those may be Government controlled and operated through agencies such as the TVA. Others may be operated under license or under control of this Commission by the electric generating utilities, and connected to their electric distribution systems; or it may occur that a series of interconnected electric systems will jointly develop one of these plants, or two or three of them, much the same as our large hydro-electric plants are now connected.

Senator MILLIKIN. Do you see any ramifications in the use of this energy other than for power or in the field of medicine?

Mr. KLEIN. Yes; I was using power in the narrow sense of electric power generation but there are other uses. The first use of atomic fissionable material will be to generate heat. That heat can be used to generate steam. That steam can be used in all industrial processes which now use steam either on account of its heat content or because of its chemical composition.

For instance, the gas industry uses a lot of steam to put through coal to make gas, in which it is broken up chemically.

Senator MILLIKIN. It also has some domestic significance, I suggest, because some towns are heated with steam heat.

Mr. KLEIN. That is correct, and in certain cases those stations might use fissionable material.

Senator MILLIKIN. Is there any chemical significance to it that you see, other than as a source of power?

Mr. KLEIN. Not that I can see at the moment, Senator.

Senator MILLIKIN. Other than medicine?

Mr. KLEIN. Not that I can see at the moment. This phenomenon of fission is not a chemical process; it is a physical process, the same as taking a rock and splitting it in two parts.

Senator MILLIKIN. If I run a machine-tool factory, aside from the power significance, can you see any application that I might have for this material?

Mr. KLEIN. I would say not within your lifetime or mine. I would say at some remote period fissionable material might be used in large industries for generating steam for heating.

Senator MILLIKIN. Of course, when we start a great field of experimentation in a thousand laboratories in this country, the Lord only knows what applications might be found.

Mr. KLEIN. That is correct, and that is one of the reasons for my statement that this will eventually be a tremendous industry, one of the greatest in the country.

The CHAIRMAN. Mr. Klein, I don't know whether I understood your last statement when you said, "Not during our lifetime."

Do you mean to say that you do not expect this development for power within our lifetime?

Mr. KLEIN. No; I did not make myself clear. I expect that within our lifetime we will see some of these large superpower plants that I spoke of; but the idea of having a piece the size of a pea buried under your doorstep and heating your house during its whole life, or dropping one in an automobile or airplane, I think will not come during our lifetime. I think that is far more remote, and we will need a great deal more experimentation and engineering development than we can expect in that time.

The CHAIRMAN. You know that is a very interesting observation coming from an industrial engineer like yourself. There has been, I think, some tendency to discount the scientists who said that, on the ground that they were not in a real sense practical men, but that is more impressive to me coming from you.

Now, let me ask you this question: If you are right, then within our lifetime there will be a very great redistribution of our economy. If superpower plants with atomic energy, that is, energy produced by fissionable material, become possible, that would raise very considerable havoc with the coal industry, for instance, would it not?

Mr. KLEIN. Senator, the dislocation of the coal industry or the dislocation of any industry will be gradual. It will be so gradual that I think the industries can take it in their stride.

As I recall the figures, we mined coal, oil, and natural gas—which are our principal media of heat—last year in an amount equal to about a billion and a half tons of coal.

The CHAIRMAN. Now, we mined 680,000,000 tons of coal.

Mr. KLEIN. I am adding oil and I am adding natural gas. Let us say a billion for round figures. One pound of uranium is equal to about 1,500 tons of coal—1 pound of fissionable material; so, if we divide those through, we have a requirement of something like 600,000 pounds, or 300 tons of fissionable material to replace our whole present fuel output.

The CHAIRMAN. 300 tons?

Mr. KLEIN. 300 tons of fissionable material.

Now, a carload of coal as we see it on the tracks carries about 50 to 100 tons.

The CHAIRMAN. So the entire energy output needed in the country could be hauled in six freight cars.

Mr. KLEIN. If you dare to do it. You would set up a bomb condition, the minute you get too much of it together.

The CHAIRMAN. But that gives you a graphic illustration of what it is.

Mr. KLEIN. The point I was trying to make, Senator, is that this thing is going to come gradually. The expense for plants to generate that much fissionable material is going to be prohibitive on the present basis, and we must have very much better techniques. We must have a great advance in our research discoveries, and a corresponding parallel advance in our engineering.

The CHAIRMAN. Of course, aluminum used to cost \$16 a pound, and it is down to 14 or 16 cents.

Mr. KLEIN. That is correct, and we may expect some similar improvement in this matter of recovering and separating fissionable material.

Senator MILLIKIN. Let me ask you this: Later on in your statement, do you venture a prediction as to how many years are involved before we make a good start at this?

Mr. KLEIN. I don't; I haven't done that.

Senator MILLIKIN. Do you care to make one?

Mr. KLEIN. I would like to think we ought to make a good start from the minute this Commission is created. The Commission should be created practically as a going concern, and that is the reason that I recommend a very strong engineering division, so that the Commission can proceed with strong research, engineering, and production divisions.

I believe the first work of the Commission will undoubtedly be directed toward military objectives.

Senator MILLIKIN. When you speak of a good start at the present time, assuming we had a Commission at the present time, do you visualize the use of the existing facilities that have been developed?

Mr. KLEIN. Oh, absolutely; we must continue to operate.

Senator MILLIKIN. Otherwise, if you have to start from grass roots, the investment required to make any quantity of that energy would be prohibitive under the present state of affairs?

Mr. KLEIN. We must start from what we have.

To revert to the statement, it will be well, therefore, for your committee to consider how the interrelated functions of research, engineering, production, and materials are usually controlled in large industrial organizations. Not all large industrial organizations perform all of these functions. Many of them draw on outside sources for research or engineering design and construction. Much research work for industrial corporations is handled by institutions, such as the Mellon Institute, the Battelle Institute, and by research fellowships created in our leading universities. The bill, incidentally, provides for just such assistance to the Commission. Not all of them handle their own engineering design and construction. Such organizations as Stone & Webster Engineering Corp. are available to furnish these services. However, for those who do perform all three of these functions research, engineering and production problems are handled by

separate groups, each headed by an executive specially selected for his ability in that particular field. These divisions necessarily have a different approach to the problems of the corporation and have different viewpoints which must be explored and harmonized whenever important action effecting the policies of the corporation is to be taken. We may visualize the work of the Atomic Energy Commission to be comparable to the work of such industrial corporations.

The CHAIRMAN. Frankly, according to the bill, I thought the Division of Production included a Division of Engineering.

Mr. KLEIN. I will tell you later why it should not.

The CHAIRMAN. That is all right. I am glad to know. That is why we seem to have overlooked engineering.

Mr. KLEIN. Let's do it the other way; let's make the Division of Engineering include production, although I believe they should be separate as I will point out.

As provided in the bill, there will be a Division of Research which should be headed by an administrative physicist of outstanding qualifications.

There should be a Division of Engineering, headed by an administrative engineer experienced in the field of design and construction and having a thorough knowledge of the industrial fabric of the country and of the possibilities and limitations of production-line manufacture of equipment. That is, the manufacture of equipment on a production-line basis.

There will be a Division of Production, headed by an administrative plant operator, and this division should concern itself primarily with the operation of plants for the production of fissionable material.

Let me amplify this point, if I may because it seems the right point to do so. We in our business have had a great deal of contact with the operators of all sorts of industrial plants and we find that more and more the heads of the production divisions are coming to concerns such as ours for handling their engineering and construction matters.

The operation of the fissionable material plants which are going to be turned over to the Division of Production and the change in technique which is going to be necessary for them to make during the entire life of the project will be sufficient to occupy the entire services of a top-flight production man. Those operators are interested in such things as labor relations, the orderly flow and sequence of materials to the plant and out of the plant, and standardization of operations. They could do a small amount of development engineering, but more and more the large industrial concerns are coming to a recognition of the fact that their engineering and construction problems should not be handled by a Department of Production. The principal job of those fellows of the Production Department is to get plant output, and that is sufficient to occupy, it seems to me, this Division of Production which you have set up here.

Senator MILLIKIN. I think, Mr. Chairman, it is largely a turn on words. The witness makes it clear that production does not necessarily mean the things he is talking about.

Mr. KLEIN. The operation of these three divisions would, it seems to me, be about as follows:

The Division of Research would undertake a broad research program, looking toward the discovery of basic information which will simplify or improve the production of fissionable material and further its commercial, military and medical uses.

The Division of Research would also investigate matters requested by the Division of Engineering and Production, and approved by the Commission as a whole. It would make recommendations regarding changes in operating and utilization practices.

The Engineering Division would have an important part in passing on such recommendations from the standpoint of determining plant investment costs and operating savings (the latter in conjunction with the Division of Production). It would also explore and report on the ability of industry to furnish any new equipment required and would prepare time schedules of the work involved. Later, upon approval of any such project, the Division of Engineering would supervise the design and construction of the plants, including procurement of equipment.

To amplify that a little further, I conceive that the work of this Commission will result in great improvements in our present methods of securing and utilizing fissionable materials. I believe that the work of the Commission may result in very extensive changes, improvements, and alterations to our existing plants and might even result, and probably will result, in the need of constructing entirely new plants, possibly utilizing new processes and new research discoveries.

Senator MILLIKIN. Let us just make a little imaginative foray at this point. Let us take out of the picture the war potential and the war use of this energy; let us assume—impractical as it may be—that we have reached a state of dependable peace where we can take that out of the picture.

At that point, do you think that the controls visualized by this bill and other bills would be necessary? At that point, why couldn't we turn this over to private enterprise with some security controls?

I was speaking of controls that would prevent the energy from getting away and doing harm or some such detrimental effect. Why couldn't we limit the work of the Commission to controls of that kind?

Mr. KLEIN. That might be possible when we reach that millennium, Senator, but I cannot see that we are going to reach it for an appreciable period of time; and during that appreciable period of time, I believe that the controls set up in this bill are necessary.

Senator MILLIKIN. So your premise is that we have a war factor to consider while we are also considering the exploitation of the energy for peaceful use?

Mr. KLEIN. I think that is correct. Close contacts among all three divisions would be maintained throughout the design and construction period, and the Engineering Division would be responsible for coordinating such contacts. I say that for the reason that the design and construction engineer has the best sense of timing of any of these divisions. We find in our work that it is our responsibility to set up time schedules and then make the research people and the production people make decisions that we need in order to live up to them. Both of them have a propensity to lag, and the engineer is time conscious and money conscious—that is, the design and construction engineer.

The rest of these division heads will not be so conscious, unless the engineers educate them.

The operations of these three divisions would always be closely related, whereas the operations of the other two divisions now provided by the bill would be more self-contained and independent.

Another function in which the Division of Engineering would play a leading part would be in connection with the utilization of fissionable material. The most important potential use of this material is to produce cheap heat which, in turn, may be used to generate steam or to heat air or some other medium for industrial process operations, or for the generation of electric power. Of these, electric power generation is of the greatest importance. All of these operations in the generation of heat, its use for process purposes, and for the generation of electric power are fields in which the engineer is best fitted to function.

In the use of fissionable material for power generation many problems must be overcome. It is not unreasonable to expect that they will equalize in magnitude those which were encountered and solved in the construction of the three fissionable material plants which have been constructed in the last 3 years. The first application of atomic energy will undoubtedly be in superpower plants, operated in conjunction with existing large electric distributing systems. It will be important to utilize as much as possible of the existing electric utility systems and in that field the knowledge and experience of the engineer will be essential. The services of an able Director of Engineering would be indispensable in connection with this major development of atomic power utilization.

The CHAIRMAN. Mr. Klein, even if we powered these powerhouses with atomic energy, it wouldn't change the distributive system, would it?

Mr. KLEIN. No. I made an analysis some time ago of the amount of replacement of equipment in a normal electric power system and came to the conclusion that about 6 percent of the present investment in a complete electric utility system would be replaced if fissionable material were used for the generation of all heat. It is not very difficult for any of these utilities to take 6 percent out of their depreciation reserve. They could take that sort of thing in their stride.

Senator MILLIKIN. Over a reasonable period of time?

Mr. KLEIN. Over a reasonable period of time; yes.

Senator MILLIKIN. I think that is an interesting statistic. Have you made the same kind of study on oil and coal?

Mr. KLEIN. No, I have not; but I can say to you that this was on the basis of replacing coal with fissionable material, generating steam, using steam in a turbine, generating electricity as we do now and distributing through our present distributing and transmission systems.

Now, if we had oil the replacement would be a little less because we would have no coal- and ash-handling system, you see, to discard.

It is possible also that by some not-too-remote stretch of the imagination we might use this heat to heat air, and that air be used in a modification of the present gas turbines. The statistics there would be about the same.

Senator MILLIKIN. Do you visualize that as this program advances there will probably be advances in the coal business that will enable it to divert, let us say, into the chemical field more than it is there now,

and thus perhaps the economy over a period of time of the coal-producing industry might not be disturbed appreciably at all?

Mr. KLEIN. That is quite possible, Senator, although I think that the one thing that will safeguard the coal industry is the growth of the country as a whole, the large number of new homes, the large industrial plants, and that that growth will be so great that it will absorb most of the available fissionable material, let us say, for a period of a good many years.

Then, again, the present power plants may be, and undoubtedly will be, retained in their present condition for the generation of peak-load power. Utilities always have a very sharp peak at some time of their operating year, and we have standing by thousands or millions of kilowatts of equipment to operate only a few hours a year; but necessarily, we must do it to take care of that sharp peak, and they will be retained for that purpose just as we are today retaining many power plants which would be inefficient or obsolete if they were operated for more than a few hours a year. It doesn't pay to throw away the investment, and I think that also will come into this picture.

Now, it might be well for me to point out a few of the reasons why the functions of the engineer and of the research scientist are so fundamentally different that the operations of the two should be separated and controlled by Directors of equal standing. These stem primarily from the difference in approach of the two toward their problems.

The scientist, dealing in research, discovers all sorts of facts about the world around us and the universe beyond. Frequently, these discoveries lie dormant for years, decades, or even centuries. Sooner or later the engineer takes them up and puts them to practical use, thereby furnishing society with improvements in living conditions and the general welfare of the people. Incidentally, the engineer's work causes these discoveries to yield monetary returns which in turn furnish the funds for financing additional research.

The scientist discovered helium in the sun's corona; engineers separated it from natural gas for military, medical, and commercial use. The scientist discovered the principles of catalytic chemical reactions. The engineer applied them to the design and construction of the great synthetic rubber and high-octane gasoline plants. Scientists developed means for separating isotopes and discovered the phenomenon of uranium-235 fission through observing the action of submicroscopic quantities of uranium. Engineers multiplied their experiments a billionfold, produced the atomic bomb, and opened the door to the era of atomic power.

The viewpoint of the engineer differs from that of the research scientist in the following respects:

The scientist's work is performed on a laboratory scale. The engineer must deal with full plant operation.

The scientist's experiments are completed within a period of a few hours or a few days and his apparatus can be constructed to have a very limited life. The engineer must design and construct plants which will operate continuously for months or years.

Senator MILLIKIN. I don't know whether this is an appropriate place to raise this, because I do not know what is in the rest of your paper.

We have spent, we have been informed, about \$2,500,000,000 under these different routes of approach we made in developing the energy. As I understand it, all of them will work, but some of them will work better than others, so there is an obvious waste of money, a necessary waste of money, in doing what we did in order to get results quickly in a virgin field where we were not completely sure of what we were doing.

Have you any notion as to the cost involved in starting from grass roots with any one of the known processes and building a plant that would develop the energy?

Mr. KLEIN. Well, the process that we are most familiar with is the electromagnetic process, so-called, that you saw at Oak Ridge. That process costs, according to General Groves' statement in the record, \$317,000,000 for engineering and construction and \$33,000,000 for research, or about \$350,000,000. That was the first plant to be designed and the first plant to be completed.

Senator MILLIKIN. Since you have that appendix here, I assume that you are going to develop this theme later in your paper. I don't want to interrupt the continuity, so let us defer that until you come to it.

Mr. KLEIN. The scientist is able to draw on the most highly skilled personnel to do his work. The engineer must provide apparatus within the capacity of plant operators of average intelligence and education. It is this phase of the work that calls for development of intricate automatic control equipment.

The scientist performs his experiments on a single piece of apparatus. The engineer must design equipment to multiply these operations manyfold. Duplicate pieces of equipment and spare equipment must be provided which are completely interchangeable. For this he requires a knowledge of shop practices and shop technique which is not essential to the scientist.

The engineer is always working against the important factors of time and cost. The scientist is not so concerned. In this connection I was interested in reading the testimony of the first witness before this Commission, Dr. Sachs, in which he states that "university research is inherently characterized by a 'traditional discursive attitude and leisurely tempo.'"¹

Such an attitude would quite properly permeate the Division of Research and would at the same time preclude its head from also directing a Division of Engineering effectively.

It is particularly important that a strong Division of Engineering be created from the moment that the Commission begins to function. While the testimony before this committee has indicated that it will take any other nation an appreciable period of time to construct a nuclear fission plant, a fissionable material plant, and that there is in fact a doubt whether the industrial economy of most foreign nations could support such a program at this time, the thing that we have to fear is that research either here or abroad will result in such radical improvements in the production of fissionable materials, conceivably through the discovery of new methods and the use of new materials, that the time will come when the industrial handicap other nations are under may be removed. It is to be expected that our research

¹ See pt. 1 of the hearings on atomic energy, p. 27.

work within the coming decade will produce just such a result, and the extent to which we maintain our present lead in the development of atomic energy will depend upon the skill and speed with which we implement our research discoveries by parallel engineering advancement and by the design and construction of new fissionable material production plants. It is especially important that we maintain our lead during the next decade, in order that we may continue to occupy a dominant position in the atomic energy field, and that we may thereby be enabled to use that position to create a strong United Nations Organization. Once that is done, and the production of fissionable material and use of atomic energy is controlled by international agreements, then we may continue our advances in making this great force freely available to all the countries of the world without fear of a war of aggression and annihilation.

I recognize the importance from an administrative point of view of having a small membership in the Commission; the smaller the number of the Commissioners, the greater the speed of action, and I therefore suggest that a place be made for the recommended Division of Engineering by the consolidation of two of the other divisions. The ones that seem best adapted to such a consolidation are the Division of Production and the Division of Materials.

Senator MILLIKIN. Mr. Klein, there has been some suggestion that you might make an entirely different approach to the subject, that instead of having a Commission of technical men—because to have such a condition, if you are going to give due weight to all of the branches of science and engineering involved here, you would have a very unwieldy affair and it would probably be such a large Commission that it would not function—the thing to do is to have a Commission of men who are not technical men but have under them a series of divisions branching off into all the necessary fields for the proper consideration of the subject.

What do you think of that?

Mr. KLEIN. I think the bill as it is set up sets up an organization which is preferable to the one you now suggest. I do think that every one of these directors as set up in here could be essentially an administrator, and should not be selected primarily for his technical knowledge. A technician without administrative ability would not function properly as one of the directors, or the head of one of these divisions. He should have, however, as a background for his administrative ability proper experience in the field which is represented by the principal division of which he is a director.

The research man should be an outstanding physicist. The production man should be one of the top flight and best large-scale industrial plant operators that we have in the country. He need not know too much about fissionable material. The head of the engineering division should be an outstanding engineering administrator, thoroughly familiar with the field of large-scale construction and design.

Senator MILLIKIN. Do you think that that assemblage of talent should be on the Commission itself?

Mr. KLEIN. I do, indeed.

The CHAIRMAN. Your suggestion is, as I just understood it from Senator Millikin, that these men should be members of the Commission with these qualifications. Do you mean that, or do you mean the heads of the projected divisions?

Mr. KLEIN. As I understand the set-up which the bill will make, there are five members of the Commission.

The CHAIRMAN. That is right.

Mr. KLEIN. There is a chairman, and each of the other commissioners is a director of a division. Now, it is those four directors that I am speaking of who should be administrators primarily with experience that would permit them to operate their divisions almost on a parity, hardly secondary.

Senator MILLIKIN. Your thought is that under those men you could then have, in your new echelon of organization, subdivisions in the whole field of knowledge?

Mr. KLEIN. That is right. Let's take our own organization, for instance, just as an example. I was a project engineer on this project. I am a mechanical engineer. Under me I had a chemical engineer in charge of the chemical division, a civil engineer in charge of the structural division, and a mechanical engineer in charge of steam power plants and utilities, and each of those was also an administrator and controlled the operations. But I did not pretend to be able to design the component parts.

Let me say that our employees have taken out of this project, or been asked to take out, some 200 patents. I haven't taken out a single one of those.

The CHAIRMAN. Mr. Klein, I feared that we were talking at cross purposes. You see, there is no intention to make the commissioners the heads of the divisions. [Reading from S. 1717:]

SEC. 11 (a). ORGANIZATION.—There are hereby established within the Commission a Division of Research, a Division of Production, a Division of Materials; and a Division of Military Application. Each division shall be under the direction of a Director who shall be appointed by the President, by and with the advice and consent of the Senate, and shall receive compensation at the rate of \$15,000 per annum. The Commission shall delegate to each such division such of its powers under this Act as in its opinion from time to time will promote the effectuation of the purposes of this Act in an efficient manner. Nothing in this paragraph shall prevent the Commission from establishing such additional divisions or other subordinate organizations as it may deem desirable.

You are in error in thinking that the Commission of five is to be divided up—at least as proposed in this bill—so that one commissioner has production, another commissioner has research, another commissioner would have engineering, if we were to adopt your suggestion. The Commission of five is the policy organization, you see. These are corresponding to a full-time board of directors as proposed in the bill, whereas the heads of these divisions are the operating works managers, you might say, in that particular field.

Mr. KLEIN. All right, if I have misunderstood the intent, that is the way I have read it, then I will alter these recommendations to recommend to your committee that you add to these a Division of Engineering also under the control of the top directors, so that from the inception of the operations of the Commission there is a strongly established Division of Engineering.

The CHAIRMAN. I just wanted to make sure that you understood.

Mr. KLEIN. I did not. I understood the fact that there were five commissioners, and apparently I interpreted that there was a chairman and four director heads, and the directors were commissioners.

The CHAIRMAN. That is not quite the same, but I don't think it affects your basic point that there should be a Division of Engineering and Construction.

Mr. KLEIN. As to this consolidation, maybe under the circumstances it isn't necessary, but let's go through with it, we are familiar with the materials problems which were of primary importance in this project, namely, the procurement of uranium ore and its refining. We undertook to get out the first uranium ore and see to its refining before the Manhattan district was in a position to function. On our entry into the project, facilities had to be provided in the form of additions to chemical manufacturing plants to provide for the rapidly growing demands for uranium compounds and for other materials such as carbor, beryllium, and so forth. Apparently this need for increased plant facilities has existed up to the present. We may assume that one of the first steps of the new Atomic Energy Commission would be to reduce plant operations to a fraction of the present rate; thereby, raw material requirements would be greatly reduced and present suppliers would find themselves with an excess of material production facilities. The problem of procuring materials, therefore, should be not difficult and this work could well be placed under the Division of Production. This is where it is handled in most large industrial concerns.

I also, even with the explanation of the chairman, still believe that the Division of Materials could well be under the control of the director who is responsible for production. He primarily is interested in getting his materials.

The CHAIRMAN. Let's see. You would have a Division of Production which would include procurement of materials. You would have a Division of Engineering and a Division of Research.

Mr. KLEIN. And a Division of Military Application. That would be the primary divisions set up.

Senator MILLIKIN. Whether you have them in the top commission or in the next lower echelon?

Mr. KLEIN. That is right.

The CHAIRMAN. It might be, of course, if this bill were enacted into law, that the President in selecting the top five commissioners might well also give considerable thought to qualifications along these lines. That would be highly desirable and advisable, perhaps, but certainly it would be essential when you came to the point of appointing or designating the man who was actually going to operate that particular section.

Mr. KLEIN. I, therefore, recommend consolidation of Division of Production with Division of Materials.

In passing on these suggestions, it may be well for your committee to consider the relative magnitude of the work carried on in the fields of Research, Engineering, and Production, during the development of the atomic bomb. These may be visualized by an analysis of the expenditures made by each group. The figures already appear in the record in the statement of expenditures submitted by General Groves. In the attached table they have been arranged to indicate how much money was spent on each of the processes for research, for engineering and construction, and how much is currently being spent for production.

If you will turn to the table at the end of the statement, you will find a statement of expenditures for the atomic bomb project which I have extracted from General Groves' testimony.

This table is captioned "Engineering and Construction, Research and Production Expenditures—Atomic Bomb Project."

There were three principal processes. The amount expended for engineering and construction, expressed in millions, was \$500 for the diffusion, \$317 for the electromagnetic, and \$302 for the metallurgic, exclusive of housing and exclusive of research.

Now, the amount expended on research for those three divisions was \$45,000,000, \$33,000,000, and \$42,000,000, respectively.

In other words, if we take the percentage of the whole, combined engineering, construction, and research, about 90 percent was spent for construction and engineering and 10 percent only for research.

I can visualize that in the future the percentages may not be so much at variance, but I can visualize that the expenditures for engineering and construction will always be many times the expenditures for research.

(The following table was submitted by Mr. Klein and made part of the record:)

*Engineering and Construction, Research and Production Expenditures,¹
Atomic Bomb Project*

Process	Engineering and construction		Research		Production cost per month	
	Amount, millions	Percent	Amount, millions	Percent	Amount, millions	Percent of construction
Diffusion.....	\$500	91	\$45	9	\$6.0	1.2
Electromagnetic.....	317	91	33	9	12.0	3.8
Metallurgical.....	302	88	42	12	3.5	1.2

¹ See statement by Maj. Gen. L. R. Groves in pt. 1, p. 73, of the hearings before the Senate Special Committee on Atomic Energy.

Senator MILLIKIN. I believe this is a good point now to renew my question.

If you were building any one of these plants from grass roots, what is your guess on what it would cost?

Mr. KLEIN. Let us go to the electromagnetic, of which we know the most. This shows we spent \$317,000,000 for that. I believe that if we were to start out anew, knowing all we know, with all the plans and specifications that we have, with all the knowledge of the manufacture as to techniques, production-line procedures, that plant—which took about 1 year to build from the time we broke ground—could be constructed under present conditions in about the same time, and it would cost not over two-thirds of that amount of money, or maybe less than two-thirds.

Senator MILLIKIN. Would you be willing to make just a rough guess that perhaps the percentage is the same on the others?

Mr. KLEIN. Senator, I really don't know.

Senator MILLIKIN. I won't press you on that.

Mr. KLEIN. Now coming to production, of course the figures are not so clean-cut. We have available only General Groves' statement of the production cost per month. That is \$6,000,000 for the diffusion.

Senator MILLIKIN. May I interrupt again? In regard to the testimony you have just given on possible saving of costs, if you were to do it all over again, I think that has a very direct bearing on the point that to go ahead with the job requires the use of existing plants; it is

perfectly obvious, at least to me, that there is no private enterprise that would be spending \$350,000,000 to build a plant of that kind.

Mr. KLEIN. You are quite right, Senator.

Mr. Lotz has just called my attention to a possible misstatement in my testimony. I said 1 year from the time we broke ground until the electromagnetic plant was completed. The electromagnetic plant was completed in two steps. Those figures are correct for the first step, and while the construction of the first step was going on, the research and development work had proceeded so satisfactorily that we were instructed to build another addition. That addition was started at a later date, and the two steps were completed in 2 years.

I still believe that if we were starting all over again, the principal plant would be done in a year and for about two-thirds of this cost.

Senator MILLIKIN. Do you have any knowledge, other than a general knowledge, of the industrial position of the other nations of the world?

Mr. KLEIN. Only a very general knowledge. I have never been to any of these foreign countries, only what I read and what I learn from talking to engineers who have been abroad.

Senator MILLIKIN. From that general knowledge, I will ask you a very general question: Is it your opinion that it would take any other foreign country, or a possible combination of foreign countries, a considerably longer time to reproduce from grass roots the electromagnetic process?

Mr. KLEIN. Oh, yes; very much longer. I think that any of the countries with the know-how—those are England, Canada, and possibly France and Denmark, and of those the only one that could support such a program is England, and it would take the British 3 to 5 years to do what we have done. I base that not on engineering considerations, but on the fact that they do not have the tremendous industrial organization that we have in the United States.

Senator MILLIKIN. Your answer runs along the general line of other testimony.

Mr. KLEIN. It was the industrial organization that put this thing over.

Senator HART. Mr. Klein, is the statement that you just submitted as part of the record based upon the conditions and the urgency under which the Manhattan district was working, or under our usual peacetime tempo?

Mr. KLEIN. That is based on the usual peacetime tempo, but presupposing we would have full Government assistance in the procurement of any necessary raw materials, and also a freedom from the present flurry of strikes.

Now, reverting to the production cost, General Groves in his testimony has stated that the cost of the diffusion plant will increase and the cost of the electromagnetic plant will decrease. I know from having been at Oak Ridge last week that the cost of operating the electromagnetic plant must have been decreased because of comments I heard by operators, and from very great improvements and economies that I have seen in personnel and in maintenance, and all the other factors which go to make a high production cost. I think on that account it might be reasonable to suppose that the cost of operating the diffusion plant and the cost of operating the electromagnetic plant might come to 2 percent a month, which means that

it would take 4 years of production expenditures to equalize the construction work which has already been completed.

Senator MILLIKIN. I don't quite get the significance of that.

Mr. KLEIN. I am trying to show you the relative expenditures of the Division of Production as compared with the Division of Construction and Engineering.

Senator MILLIKIN. And that statement about the equalization at the rate of 2 percent goes directly to that point?

Mr. KLEIN. It goes directly to that point; yes.

Senator MILLIKIN. You don't intend any other point by that?

Mr. KLEIN. No; it is just to get some sort of a figure within reason which will permit you to visualize what the responsibilities of the Division of Construction and Engineering, and the Division of Production, would be.

I further say that that is at the present rate of operation. Any production curtailment would reduce all production costs still further. Again, surely a director selected for his ability along production lines should not control the much greater rate of construction expenditures.

To summarize, I consider that the proposed Commission should be strengthened by the establishment of a Division of Engineering under the direction of a Director selected for his administrative and engineering qualifications, and that only by the inclusion of such a division can the Commission operate to the best advantage in accelerating the development of atomic energy for domestic utilization and for maintaining the dominant position which the United States now holds in the production of fissionable material and in its application.

Senator HART. Mr. Klein, we have in the country a very few valuable individuals who have a good deal of the mastery of engineering, as well as some branches of the basic sciences, physicists, and chemists. Of course they are very few.

In general, is it your experience that the two categories, the engineers and the scientists, are too much detached from each other, do not collaborate enough, do not know intimately enough the problems of the other side and of the developments that are going on?

Mr. KLEIN. There is not so much a lack of collaboration. We have got the best of collaboration from the scientists in the construction of this plant.

Senator HART. I was not particularly referring to the Manhattan district, but in general all through the country's activities.

Mr. KLEIN. In general, all through this country where there is a project we can get collaboration between the production, between the operators, between the research people and the engineers who are designing and constructing the plants. However, even with that collaboration and cooperation, there is a very definite difference in viewpoint of the three toward their problems, and my point here is that in setting up the administration of these three divisions we should have administrative heads, let us say, of the peculiar temperament that is best fitted to administer those divisions. Do I make myself clear?

Senator HART. Yes; but what I was getting at is to develop the situation that we have been living under for the last generation or two, wherein scientists are quite likely to develop something in their experiments in which, if an engineer or body of engineers were brought closely in touch, they would immediately see practical application.

But that does not always happen, in that the engineers are not cognizant of what is being done in the laboratories and not closely enough in touch with it.

Mr. KLEIN. I think with this set-up of the Commission as proposed here you would accomplish just that. You would have these various directors all working together in close harmony. Now, in many of our industrial concerns we have that cooperation. Part of the trouble is, Senator, that scientists can think up and can discover and propose far more things than the engineers or economy can take care of.

One of the leading chemical companies' president told me some years ago that his principal job was to sift out all of the proposals of all of the optimistic recommendations made by research groups down to a few which the financial structure of this company could handle.

Senator HART. And then usually gets in trouble with his scientists when he sifts out their ideas, too.

Mr. KLEIN. It might be. In this statement at one point I have said that the engineers would take the recommendations of the scientists, would appraise them in terms of cost and operating savings, and would present that information to the full Commission so that they might judge which of the recommendations of the scientists it would be proper to proceed with.

Senator HART. Under whatever form this legislation takes, and whatever organization we eventually arrive at, would it be your thought that some of those particular individuals of whom I speak, who are pretty well in touch with certain branches at least of fundamental science, and are also engineers, should be used to the greatest possible extent?

Mr. KLEIN. I would say so.

Senator HART. I suppose without naming names, you probably have some in mind yourself?

Mr. KLEIN. Yes; I would be glad to—

Senator HART. I was not asking your for any nominations.

Mr. KLEIN. I know, but I started to say I would be glad to tell you in executive session.

The CHAIRMAN. Mr. Klein, we have another witness, and I want to get on because we have got to close, but you made one statement in here that I think is worth while going back to, on page 7. I think it is worth going back to because it is one of the things that bother me. You say:

The thing that we have to fear is that research either here or abroad will result in such radical improvements in the production of fissionable materials, conceivably through the discovery of new methods and the use of new materials, that the time will come when the industrial handicap they are under—

meaning other countries—

may be removed.

Now, you go on to say:

It is to be expected that our research work within the coming decade will produce just such a result, and the extent to which we maintain our present lead in the development of atomic energy will depend upon the skill and speed with which we implement our research discoveries by parallel engineering advancement and by the design and construction of new fissionable material production plants.

You have noted, I presume, the provisions in the bill which provide for the exchange of basic scientific information. Assuming that we locked up within our own breasts all reports of scientific advances, not talking about technical know-how now, not talking about sending any plans for a bomb anywhere, but basic scientific information, would this country have more to lose by that course than any other country, in your opinion?

Mr. KLEIN. You mean by a free exchange of scientific information?

The CHAIRMAN. By restricting the free exchange of scientific information.

Mr. KLEIN. That is a difficult question to answer, Senator.

The CHAIRMAN. Well, your observation, Mr. Klein, that there may be a broad radical improvement, you see, points up the difficulty of the question.

Mr. KLEIN. The scientists have told you, and I think they are right, that there is going to be free interchange of scientific discoveries and knowledge.

The CHAIRMAN. You mean regardless of what we do about it by law?

Mr. KLEIN. I think that you are going to permit it by law. I mean, the scientists have all said that that is the lifeblood of research.

The CHAIRMAN. But do you agree with them as an engineer, as a so-called practical man that translates these esoteric ideas into concrete and steel? Do you agree with that?

Mr. KLEIN. I think it is all right for this reason: If we have a strong engineering organization, and if we continue in the lead industrially, we can do more quicker with such discoveries than any other nation in the world, and for a long time we will be one of the few nations who can support the construction or the extension of fissionable material plants in our basic economy.

The CHAIRMAN. Well, let us see if we understand what you mean. In other words, you would prefer to have access to the basic scientific information developed all over the world, because you feel we could translate it quicker into actuality than if we cut ourselves off from access to it by restricting our own?

Mr. KLEIN. Absolutely, because then we will be facing a hazard that some other nation might make a radical improvement in the process for the separation of fissionable material, and would be able to develop it far ahead of ours.

The CHAIRMAN. You cannot have your cake and eat it, too?

Mr. KLEIN. That is right. Given the same starting point, which is scientific information, we can do much more with it quicker than any other nation in the world, and over the next decade we are going to continue to occupy that position.

The CHAIRMAN. Do you see any intrinsic difficulties in trying to restrict the flow of basic scientific information, as an industrial engineer?

Mr. KLEIN. I see no difficulty in restricting the flow of engineering information, drawings, designs; but from my discussions with the scientists I do see a lot of difficulty in restricting the free interchange of scientific information.

Senator HART. May I ask why?

Mr. KLEIN. The question is: "Why?"

Senator HART. Yes.

Mr. KLEIN. One is because of the temperament of the scientists. You have here in your testimony, I believe, statements of noted scientists to the effect that scientific gossip is the lifeblood of research. I think that was one of the statements made before your committee. Also the scientists are articulate; they are always giving lectures; are always writing papers. Much of the profit that they get from their work comes from the ability to tell the world about it. Again, these scientists are masters of logic and deduction, and they can deduce from certain facts or actions a great deal without needing actual exchange of letters or reports.

For instance, I know that during this war the movement of German scientists, whether Dr. So-and-So moved from Berlin to another location, the segregation of a half dozen of them and the knowledge of what their particular forte in science was, enabled our scientists to draw some pretty good deductions as to what was going on.

The CHAIRMAN. Is this a fair analogy? I have been trying to give this a great deal of thought. The scientists might be compared with the poet who writes a poem. Now, it is pretty hard to keep that a secret, whereas the book publisher who might have a process for turning that out by the million cheaper than anybody in the world can turn it out, can keep it entirely secret.

Mr. KLEIN. I think it is a very good analogy.

The CHAIRMAN. In other words, if Shakespeare were alive today and wrote a sonnet, the chances of it not being known wherever men could read would be negligible.

Mr. KLEIN. Publication is second nature to an author, poet, and to a scientist.

Senator MILLIKIN. That is their reward.

Mr. KLEIN. That is their reward; yes.

Senator MILLIKIN. I would like to ask the witness, supposing it should be decided by this committee—and I don't ask you to participate in the decision or to express any opinion on it one way or the other—that the world is in a position where the primary, or let us say almost exclusive emphasis for a period of time, until there are further clarifications, must be on the weapon side of this business. Would you say that on that assumption there should be complete exchange of science that is contemplated by the bill?

Mr. KLEIN. I would say so, because I think the same considerations affect the problem, that is, the consideration that we are in a much better position to take advantage of any improvements in science than any other nation is.

Senator MILLIKIN. At the present time we have it, and the others may have the theory of it, but they don't know just how we do it. Aren't we therefore making a swap of something that is very substantial and sizable so far as we are concerned against something which is far less substantial so far as other countries are concerned?

Mr. KLEIN. Well, Senator, I believe from what I have read in the press and the Smyth report, that the basic scientific information with respect to these processes is now known to the scientists of several nations.

Senator MILLIKIN. I think that is true.

Mr. KLEIN. I think the British know, and I think the Canadians know it. I know they know it.

Senator MILLIKIN. So you don't mean to go any further than that type of knowledge?

Mr. KLEIN. That is right. I wouldn't give scientific information to any nation who wouldn't give us something in return.

Senator MILLIKIN. Would you say that we should exchange the science involved in the mechanical components of some parts of the electrical diffusion plant?

Mr. KLEIN. No; I see no reason for that; that isn't basic scientific information. That is design, mechanical information.

Senator MILLIKIN. I asked that question just to bring out an illustration that you have given. Do you limit your testimony to the exchange of basic science?

Mr. KLEIN. I understood that was what the chairman's question was directed to.

The CHAIRMAN. Yes; because those are the provisions of the bill, one provision calling for the free interchange of basic scientific information, very carefully guarding, although maybe not carefully enough, according to what the military men say, the technical know-how that goes into it.

Senator MILLIKIN. There is no point in exchanging technical know-how?

Mr. KLEIN. No; because we have it and nobody else has.

Senator HART. I suggest that Mr. Klein does not wish to be in the position of thinking that we should ever teach the world anything about manufacturing atomic bombs, because we hope that they are going to be abolished.

Mr. KLEIN. I sincerely second that.

The CHAIRMAN. Mr. Klein, you have been most helpful to the committee and I want to thank you very much for your intelligent presentation.

Mr. KLEIN. It has been a pleasure to come down to give you our thoughts on this legislation. I appreciate the courtesy.

The CHAIRMAN. The next witness is Mr. Basil Manly, formerly Chairman of the Federal Power Commission, and now vice-president of the Southern Natural Gas Co.

**STATEMENT OF BASIL MANLY, VICE PRESIDENT AND DIRECTOR,
SOUTHERN NATURAL GAS CO.**

The CHAIRMAN. Mr. [Manly, it occurred to me the other day that we might well take a few minutes of your time, and you of ours, to talk about the administrative provisions of the bill which we are considering inasmuch as you seem to have had a somewhat unique combination of experiences; namely, you were chairman of one of our important commissions, and you are now in an executive capacity with a large corporation.

Have you had time to look at the bill?

Mr. MANLY. I have, Senator. I haven't had time to make what I would regard as a thorough study of all its provisions. I would like to say, to begin with, that I know nothing about atomic energy except what I see in the papers, and I don't believe half of that. Therefore, any testimony that I give would relate to the organizational and administrative side.

I might say also that my experience in relation to governmental organizations is a little bit broader even than the time that I served with the Federal Power Commission.

During the first World War I occupied the rather unique position of assistant to the Joint Chairmen of the National War Labor Board, who at that time were former President Taft and Mr. Frank P. Walsh. When Mr. Walsh resigned in 1918, I succeeded him as Joint Chairman of the Board. That was rather a peculiar form of organization. There you had two chairmen of the board, one who had been selected by the labor groups, primarily the American Federation of Labor, and the other who had been selected by the employer interests, primarily at that time the National Industrial Conference Board.

I have off and on, over a period of nearly 40 years now, been connected with both public and private organizations. About half my time has been spent outside the government and about half in, so I think I see it from both the inside and the outside.

How would you like me to proceed, Senator? I have no prepared statement.

The CHAIRMAN. I appreciate that, Mr. Manly. Out of your background of Government experience, and now and before in private business, I would like your comments on the present proposed administrative set-up with relation to getting the job done satisfactorily.

Senator HART. May I interrupt, Mr. Chairman, to ask whether or not Mr. Manly has also considered Senator Ball's bill and the May bill solution of the problem?

Mr. MANLY. No, sir; I have not given those the same consideration. I have read the provisions of those bills in substance as they came out in the papers, but I wouldn't say that I have them in mind. I think my memory could be very easily refreshed. I have a chart that compares the principal provisions of all three, which has been very helpful to me.

The CHAIRMAN. Perhaps, Mr. Manly, this might be helpful. The May-Johnson bill, as I recollect it, provides—and you have your chart there—for a nine-man Commission to be selected by the President, who would not be full-time Commissioners.

Mr. MANLY. Serving on a part-time basis; yes, sir.

The CHAIRMAN. And there would be a Director and Assistant Director who would be the actual operating heads of the Commission, subject to the meetings of this Board of Directors.

Mr. MANLY. Yes, sir.

The CHAIRMAN. I think that is a fair statement, isn't it, Senator Hart?

Senator HART. Yes.

The CHAIRMAN. Whereas the bill that I proposed provides for five full-time Commissioners to be appointed by the President.

Mr. MANLY. On that point of full-time as against part-time service, I have no question in my mind of the wisdom of providing for full-time service of the men who are to be held responsible for carrying forward this most important matter. I base that to some extent on my experience in relation to the Federal Power Commission. The Federal Power Commission when originally created in 1920 consisted of three Cabinet members—the Secretary of War, the Secretary of Agriculture, and the Secretary of the Interior—who made up the Commission.

VP
So. Nat. Ex. Co.

Under them they had the executive secretary. That ran along for 10 years. It was not satisfactory; it was subject to criticism from the beginning.

Finally, during the administration of President Hoover, it was changed and provision was made for a full-time, five-man Commission. I don't think it is necessary to go into detail on that, but what happened is what will inevitably happen in a situation of that kind where very busy men are expected to come in from time to time and get information and approve or disapprove matters that are brought before them. The executive secretary, the administrative head, the full-time man becomes the actual control both of policy and results. I think it is inevitable. You can not run in and out of these big jobs and really keep your fingers on the important developments. So as to that aspect of the matter, I would have no question at all that your basic group, your policy-forming group, should be full-time members of the Commission, and I think a commission in matters of policy is wiser than a single administrator. I think the interchange of ideas, the clash of different points of view is always valuable. Even though not all of the men on the Commission may be as good as you would like to see them, still they contribute something from the point of view of experience, and so forth. *

—It seems to me, however, that I would go one step further and say that the men who are going to make the decisions should be civilians. But I think that representatives of the War Department and the Navy Department, our defense forces as now set up, and probably a representative of the Department of State—either the Secretaries of those three Departments, or whoever they designate—should sit with the Commission without vote at all of their meetings. They should participate in the discussions in their initial stages so that the Commission has not pushed forward along a line which may affect either the international relations or the military problems to the point where it is becoming crystallized in the Commission before the military, on the one side, and the Department of State on the other, knows what is going on and has a chance to get their voice in.

Very frequently a policy can be shaped in its initial stages by discussion, so that conflicts are avoided and a working arrangement is formulated; whereas, if it goes forward until it has been crystallized, particularly until some publicity has been given it, men's pride becomes involved, and various and sundry other things happen that make friction.

The CHAIRMAN. Why wouldn't you give them a vote?

Mr. MANLY. I don't believe they need a vote, in the first place; and I don't believe they will be in a position to devote continuing consideration to the matters that are coming before the Commission.

For one thing, I doubt whether they would be in a good position to make decisions on policy matters. They know the policy as affecting their own particular organization and the matters for which they are responsible; but you will have in addition a great many other matters, a great many other questions of policy on which I am not too sure that a vote on the part of the State Department, on the part of the Army or Navy, would be necessary or desirable. m/

The CHAIRMAN. In other words, you want to make sure they get their viewpoint in on matters that concern them?

Mr. MANLY. Matters that concern them, and get it in early and get it in behind closed doors, and not be in the position of coming before the Commission to present their views; but rather sitting with the Commission around the table and discussing the thing in the hatching period.

Senator MILLIKIN. Do you preface your opinion on the assumption that the energy as a weapon has a secondary place at that stage of the game, or do you still have the same opinion on the assumption that the weapon end of it is the most important end?

Mr. MANLY. Well, I assume that as far as the weapon end of it is concerned, if the Army and Navy are in a position to know what is going on at all stages of the procedure, and if this Commission is, as I think it should be, directly subject to the President with its members removable by the President on short notice, so to speak, the Army and Navy will be in a pretty good position to see that the interests of the country, as far as weapons are concerned, are carried out. The President, as Commander in Chief, and the military and naval forces, as far as my experience has gone, have always been able to bring their views very strongly to bear where matters of national safety were involved.

Senator MILLIKIN. Would you carry that to the extent of saying that we ought to submit our military affairs to a civilian commission in other matters, as far as other weapons are concerned?

Mr. MANLY. No. For the same reason that the Constitution, or rather, our customs, provide that the Secretary of War and Secretary of the Navy should be civilians, I would be inclined to leave the relation of the military and naval decisions to other phases of the policy in relation to atomic energy to a civilian commission.

Senator MILLIKIN. Passing the atomic bomb and the use of this energy as a weapon, do you think that in times not entirely times of peace—for in my opinion we are not entirely in time of peace yet—do you think that on that assumption there ought to be a civilian commission that would determine the use of weapons and the extent to which they should be used, and the productive plans for such weapons?

Mr. MANLY. Well, as to these details, I would hold a great deal of uncertainty as to just how that should be worked out. I should think it is certain in the field of devices for the military use of atomic energy that the development of those devices with the approval of the Commission would be left to the military and naval forces.

Senator MILLIKIN. If there is an uncertainty in your mind as to whether lesser weapons should be put under the control of a civilian commission, how can you escape the conclusion that this greatest of all weapons should be treated differently and put under the control of a civilian commission?

Mr. MANLY. Well, I don't believe that in the long run there is a great difference of opinion there, or a very great departure from what we have now, Senator, in this respect: The Army and Navy now have to come to Congress to get the money. In other words, they come to a civilian body to get the appropriations.

The CHAIRMAN. Through a civilian Secretary.

Mr. MANLY. And come through a civilian Secretary to get the money to carry forward their whole plan for military and naval development. They give to Congress a picture of their basic program,

without necessarily going into detail, although Congress, I think, requires a good deal of detail as to just how the money is going to be spent.

So it seems to me that your relation to your civilian body in the Atomic Commission would be very much the same, and the relation to Congress would be very much the same; namely, that the military and naval leaders would, I take it, privately present to the Atomic Energy Commission their plans for the development of military devices, naval devices, and that those programs would then in due course go to Congress for the necessary appropriations.

Senator MILLIKIN. I should like to suggest that there is no analogy to my mind; there are several distinctions. The Secretary of War, who is a civilian, is definitely attached to a definite job that limits itself to military considerations. He does not concern himself with the use of any energy involved in any type of munitions. As to its possible peacetime application, he has but one job and that is exclusively confined to the military, whereas this Commission has a comingled function of thinking of it as a weapon and thinking of it as peacetime energy.

Now, as to the congressional angle, our discussion suggests that instead of following the congressional tradition and the constitutional requirement of Congress maintained in supplying our military forces, we are making a rather far-fetched delegation of that function to a commission. It is true that these military men come to the Congress and ask in general terms for an appropriation of \$100,000,000 for the Navy, and possibly there might even be an explanation of the general type of munitions, ordnance, or ships that it is intended to fashion. Congress knows nothing about the innards of construction or the innards of any particular piece of ordnance or any powder or any of that sort of thing; and to complete my thought on the distinction that Congress knew nothing whatever about the particular power that we are talking about, it was done completely in secret.

Mr. MANLY. Well, that was during wartime. I am assuming that this is a bill looking forward into peacetime. If we were still at war, I don't think we would be considering this particular type of measure at this time.

Senator MILLIKIN. I think you have made a very sound distinction.

Mr. MANLY. I draw, Senator, another distinction, too, that I haven't quite been able to solve in my own mind. It seems to me, considering this whole situation, you do have to draw a distinction between the situation that will exist if there can be worked out international agreements, firm international agreements either under the United Nations, or bilateral, and the situation that will exist if such agreements prove to be impracticable.

Senator MILLIKIN. I think that is a very sound distinction, and that is what I was driving at a little while ago on what exactly you are premising your conclusion.

Let us assume—and I don't ask you to join in the assumption—that this committee were to conclude that while we say we are in peace, we are in a very uneasy armistice. That certainly would suggest a different line of procedure than if we should conclude that we now have a stable peace and fashion our future plans on that assumption. I think you will agree with me on that.

Mr. MANLY. Yes; I agree with you on that, sir; but I do think that the Navy doesn't in peacetime simply ask for \$100,000,000 to build up the Navy. They come in with minute specifications showing the class and type of vessel, the method of propulsion, the caliber of the guns, and pretty nearly everything else. There have been some cases, I believe, in the past, where Congress, against the advice of the experts in the Navy, have not authorized types of vessels which would have meant progress.

Senator MILLIKIN. I agree with that.

Mr. MANLY. I believe also that Congress had something to do with appropriating for a ship back in the old days that had one gun that was worked by compressed air and fired a dynamite bomb that wasn't exactly a howling success.

What I see is that this Atomic Commission, being the body responsible for having a continuing interest in all aspects of the problems relating to atomic energy, would screen for Congress the military and naval proposals in more or less the same way that a congressional committee now screens the proposals for appropriations; but it would have to go to Congress, as I see it, for implementation before you were through, unless the state of world affairs was such that it was handled behind closed doors, even in Congress.

Senator MILLIKIN. You would not suggest, in other words, that Congress should delegate to a commission its own constitutional power of deciding the matters of the type that we have been discussing?

Mr. MANLY. No, sir; absolutely not.

The CHAIRMAN. Well, you mean by that that you wouldn't turn over the appropriating power?

Mr. MANLY. I wouldn't turn over the appropriating power. Also you have practically the same problem, it seems to me, here with relation to the military and naval forces that you have with reference to proposed licenses for civilian manufacture. As I read the bill, I am not quite sure that I understood those provisions, but it seemed to me to provide that the particular license that was proposed to be granted should be submitted to Congress, and if Congress took no action within 90 days that the license should then become effective. It seems to me that that is not quite right. It seems to me that instead of submitting the individual licenses to Congress for approval, or rather for disapproval or nonaction, it would be much sounder to submit to Congress the rules and regulations, the specifications, practically speaking, under which the Commission proposes to issue a particular class of license.

Let us say one of the first applications of atomic energy would be for the operation of power plants, which would probably mean a licensing of General Electric, Westinghouse, and Allis-Chalmers, the only three of any consequence, to perfect atomic energy for the operation of power plants. It seems to me that if you had specified the basic conditions that would be embodied in licensing that group of manufacturers, that would be all that is really necessary in order to protect the public interest, and you would avoid clogging Congress up with a large number of individual licenses. This would also prevent the possibility of discrimination that it seems to me might without any intention arise if each license had to go before Congress and be there 90 days before it became effective. One man's license

or one manufacturer's license might go up at a time when Congress was busy with other matters, and his license would get by because Congress didn't get around to looking at it. The other fellow goes up, and when the pressure is not quite so heavy or someone raises a question about it, his license gets tied up for 90 days and may be rejected.

The CHAIRMAN. I can see your point. However, you are up against this: The Westinghouse might come in with a proposal, an application that would take 10 percent of the coal out of production, whereas GE might come along a year later with—again generically speaking—a heating device that would wipe out 90 percent of the coal overnight.

Now, that is what we were designing to give the Congress an opportunity to pass on.

Mr. MANLY. Well, I should think that that probably might be covered by submission of the rules and regulations under which licenses in that particular class of manufacture were involved. In other words, it would seem to me that one of the considerations that the Commission would indicate it would take into consideration in granting a license would be the extent of fuel displacement. It is the same problem that we have had over at the Federal Power Commission in relation to issuance of licenses for pipe lines which displaced a certain amount of coal.

The CHAIRMAN. The proponents of the May-Johnson bill have argued that it is impossible to expect that we will get for a full-time commission that caliber of men which is necessary to exercise the great powers that this Commission will have. Do you subscribe to that opinion? Have you noted the salaries provided?

Mr. MANLY. Yes. I think the Government salaries need a revision throughout their entire realm, especially in the executive and legislative branches; but I think you have been more generous in your provisions than Congress usually has been in making provision for full-time jobs of that kind.

Certainly it seems to me that the caliber of men you get will depend on their interest in the problem rather than on the exact number of dollars of compensation, provided that the amount that is carried in the salary is sufficient to keep a man from having to worry about his finances at all times, which is a real problem, I can assure you, and one of the reasons I left the Government.

The CHAIRMAN. Do you think from your observation that we have enough natural resources in the shape of men who would be interested in going on this Commission so that we would not need to be too fearful that we couldn't staff the Commission with suitable men?

Mr. MANLY. I don't think there is any question about the availability of men in this country, and I think you are more likely to find them out of the 130,000,000 or 140,000,000 outside of government than you are by picking them out of government service, or attempting to bring in men on a part-time basis.

Anyhow, I would rather have a man that wasn't necessarily the absolutely top man in the country working on a problem full time than to have the top-notch man dropping in on an occasional basis to attempt to decide matters of policy.

Senator HART. Mr. Manly, in your own company right now, does the board of directors have something to do with deciding policies?

Mr. MANLY. They have everything to do with deciding policies.

Senator HART. They are all part-time men, are they not?

Mr. MANLY. In the case of our company they happen to be all full-time men, with the exception of one man.

Senator HART. Over the country, that is not very usual?

Mr. MANLY. That is not generally true, and I think possibly we are too far over in having a board made up of executives of the pipe-line company and its affiliated companies.

Senator HART. I am not sure I understand you now, Mr. Manly.

Mr. MANLY. I mean that the board of directors of Southern Natural Gas Co. happens to be made up primarily of the operating heads of the company and the subsidiary distributing companies.

Senator HART. But did I understand you to say you don't think that is a particularly healthy and good arrangement?

Mr. MANLY. I think we might be better off to have a certain number of additional men who have no relation to the company.

Senator HART. That leads me to ask you if perhaps that same principle might not apply in this legislation which we are thinking of. The board of directors, or call it what you may, composed in part of the executives who are full time and doing the carrying on of the work from day to day, and in part of men of broad experience who are part time, and those seem to me to be fairly well described under the terms of either Senator Ball's or Mr. May's bill.

May I ask you to tell us a little further your thoughts in that way? I am not sure I understand you now.

Mr. MANLY. Well, Senator Ball's bill is five Cabinet members and four public members.

Senator HART. I think it was the May-Johnson bill.

Mr. MANLY. The May-Johnson bill were all part time, and I have forgotten the specifications as to how they should be selected.

Senator HART. I merely use that reference to describe that. The question was the compensation of our top-line organization on the board-of-directors principle and composed in part of men similar to those contemplated by the May-Johnson bill, and in part by the full-time executives.

Mr. MANLY. Well, I thought the suggestion that I had made earlier about the participation by the representatives of War, Navy, and State in the deliberations of the Commission might meet that in part. It is true that I expressed the opinion that it was probably just as well for those representatives not to have a vote on the Commission. I see no objection to their having a vote. Normally the action of such bodies comes out of discussion in which a majority view prevails, and there may be one or two dissenters, or what not. Ordinarily you get the situation pretty well cleared, and I don't know that the voting question is too important, although it seems to me that it would be sounder if you are going to fix responsibility in a commission to give them the sole responsibility and let your five-man commission have the votes.

The CHAIRMAN. Mr. Manly, of course the organization as proposed by the May-Johnson bill, as far as I know, is unique in our Government. The Federal Power Commission, the Interstate Commerce Commission, and SEC—what other Government commissions occur to you?

Mr. MANLY. The only one that I know that was set up as a part-time agency was the National Resources Board.

The CHAIRMAN. That was a war situation?

Mr. MANLY. No; that was prewar. For whatever reason Congress had, Congress decided to get rid of it.

The CHAIRMAN. You see, I was practicing law before I came to the Senate, and I had quite a good deal to do with WPB for clients of mine, and I find the place in many instances was staffed with the part-time men. It was part time for the Government and full time for the bunch that they represented, and I could give you instance after instance of that from my own personal knowledge.

Now, you were Chairman of the Federal Power Commission during the period of the war. I haven't discussed this with you; as you know, our conversation was a very brief conversation. You had considerable to do with that organization, with the part-time men in that organization, did you not?

Mr. MANLY. You mean with the National Resources Board?

The CHAIRMAN. Were they in WPB?

Mr. MANLY. No; that was a separate agency.

The CHAIRMAN. I never ran into them.

Mr. MANLY. It was supposed to be a planning organization. Mr. Delano was Chairman of the Board, I believe, throughout its life. I think Professor Merriam, of the University of Chicago, was one of the members, and I have forgotten who the third one was now, but I was mentioning that not at all in criticism of them. I think they did about as good a job as could be done with the enormous problems given them, the almost unlimited scope of the field that they attempted to cover.

The CHAIRMAN. There were many men in the WPB—I don't mean to make any indictment—many men on a part-time basis that did really wonderful work; but there were others I know of my own personal experience whose work I didn't like so well.

Now, of course, the directors who are part time of a mercantile establishment or a manufacturing establishment are only interested in one thing, are they not—does the business produce profits?

Mr. MANLY. Well, they have got to be interested in a good deal more than that now.

Senator HART. Of course, the chairman does not mean to reflect upon their patriotism?

Mr. MANLY. I mean the making of profits and the continuance of business these days involve a measure of concern about your labor problems, which is a field by itself, problems in the utility field of relationship with regulatory agencies and other matters of that kind. When you get down to it, of course, the decision in a business institution is going to be controlled by whether or not it will produce ultimate profits—not necessarily immediate profits but ultimate profits for the institution.

The CHAIRMAN. That is the basis of our capitalistic system.

Mr. MANLY. Yes.

The CHAIRMAN. However, when we get in the field of government, of its very nature it has different considerations. Isn't that true?

Mr. MANLY. That is true, and I think you have the fact that men cannot have their primary concern in other interests, whether it is a professorial interest or a business interest—and come in every other

month, or something like that, and get themselves thoroughly oriented to the problems that come before a government agency.

Senator HART. I don't understand just what your thought is as regards the quality of men whom the Government can get full time. Now, I am sure that you are acquainted, for instance, with the qualifications of the men who are on that National Resources Board. Is it your thought that within any salary limitation that is practicable, that be gotten through Congress, the Government can obtain men of the requisite caliber for these committee members?

Mr. MANLY. I think so, Senator. I think the nature of your problems here will have a strong appeal to the interest and the patriotism both of men of first-class caliber. If you are able to fix a salary in the range of \$20,000 to \$25,000, or something like that, that would relieve men of their most pressing financial requirements, you will be able to get really first-rate men during the formative period. After 10 years from now or 15 years from now, when it settles down to a routine matter of administration, you may not be able to get men of first-rate caliber for those salaries.

Senator HART. Now going back to your suggestion regarding those three Cabinet officers sitting in on proceedings while policies were being formed but having no vote, in response to Senator Millikin you had considerable to say and you made your position clear as regards the armed forces.

Now, the Secretary of State has quite a different field. There is no question usually of coming to Congress for appropriations, so that is not a factor.

The atomic energy, particularly from the weapon standpoint, is a very important factor in our international relations. Do you think that it would be right to let the Secretary go before this Commission, state his case, and then be turned down on something that is very vital without having an opportunity even for a voice?

Mr. MANLY. No, Senator, I was decidedly not suggesting that the Secretary of State should go before the Commission. I was trying to avoid that situation. It seemed to me that he or his representative should be a participant by right in all of the executive discussions of the Commission rather than being placed in the position of having to appear before such a body and publicly state their reasons and considerations.

Senator HART. Do you not apprehend that under that set-up we would have a continuation on a very considerable scale of two bodies coming to the President in discord and the President having to resolve the difficulty himself?

Mr. MANLY. Well, Senator, I have watched them for a long time, and I have never seen any method of eliminating discords in public affairs.

Senator HART. Well, various Cabinet officers have been before the committee and expressed themselves as of the belief that either Cabinet officers or very high level men under them should be ex officio members of the committee, and their thought was the avoidance of that. I may not have stated it correctly; it may only have been implied.

Mr. MANLY. I would question whether you would improve that situation by giving them a vote on the Commission. It seems to me that the important thing from their standpoint is to know just what

is going on in the Commission first hand in all of its initial stages and be in a position where, if the policy that the Commission is formulating seems to be embarrassing either from a military standpoint or from the international standpoint, they can go before the President and bring whatever pressure, if you want to call it that, that seems to be justified by the facts rather than to have the situation develop to a point where some action has been taken, some policy has been formulated, that is embarrassing, and then have to go either before the Commission or the President and make an open break out of it.

The CHAIRMAN. Thank you very much, indeed, Mr. Manly.

Mr. MANLY. I am sorry that what I have had to say is, as you know, on very short notice and was not necessarily thoroughly considered. I have simply been trying to give you honestly my reactions.

(Whereupon, at 12:35 p. m., an adjournment was taken until 10 a. m., Thursday, February 14, 1946.)

ATOMIC ENERGY ACT OF 1946

THURSDAY, FEBRUARY 14, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington D. C.

The special committee met, pursuant to notice, at 10 a. m., in room 312, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Johnson, Austin, Millikin, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The committee will come to order.

We are honored this morning, gentlemen, by having Secretary Patterson with us.

Will you proceed, Mr. Secretary.

STATEMENT OF THE HONORABLE ROBERT P. PATTERSON, SECRETARY OF WAR

Secretary PATTERSON. By your leave, Mr. Chairman, I will go over this brief statement, and then I will be glad, indeed, to answer any questions.

Now, I am glad to express the views of the War Department regarding S. 1717 on which I have been asked to comment.

I might say at this point that I know of no more important piece of legislation that has come before the Congress during the 6 years that I have been in the War Department.

The possible military use of the energy released by atomic fission was brought to the attention of President Roosevelt in 1939. After preliminary development by the National Defense Research Committee and the Office of Scientific Research and Development, the project of producing atomic bombs was committed to the War Department in 1942. The project was pressed as a war measure with the greatest energy. The dropping of the two atomic bombs on Hiroshima and Nagasaki last August was followed within a week by the surrender of Japan. Meanwhile, the secrecy of the project had been preserved, a difficult matter in a program involving expenditure of 2 billion dollars and a scale of direct employment that reached 125,000 persons.

The enterprise was an unqualified success. Too much cannot be said in tribute to the scientists who developed the basic scientific facts and processes, to the industrial groups who with infinite skill translated the work of the scientists into the final product, to General Groves and his assistants who directed the vast enterprise, and

to the Congress for the trust reposed in the War Department in appropriating the vast sums that were necessary without insisting on disclosure of the details and thus risking premature revelation of what was being done.

Long before the bombs were dropped it was realized that there were unmeasured possibilities in the development of atomic energy for industrial and other peacetime purposes as well as for use as a war weapon. In May 1945 Secretary Stimson, with the approval of the President, formed a committee to consider the subject and to recommend legislation for the control and development of atomic energy. The committee consisted of Secretary Stimson; James F. Byrnes (prior to his appointment as Secretary of State); Will Clayton, Assistant Secretary of State; Ralph Bard, Under Secretary of the Navy; George Harrison, president of the New York Life Insurance Co. and special assistant to the Secretary of War; Dr. Vannevar Bush, Chairman of the Office of Scientific Research and Development; Dr. Karl Compton, president of Massachusetts Institute of Technology; and Dr. James Conant, president of Harvard University.

I know of no committee appointed during wartime or thereafter that had higher talent than that committee. The committee had the assistance of a scientific panel composed of four of the leading scientists in the project, Dr. J. R. Oppenheimer, Dr. E. O. Lawrence, Dr. A. H. Compton, and Dr. Enrico Fermi. Legislation was drafted under direction of this committee and with the cooperation of the State Department, Interior Department, and Department of Justice, the bill being later introduced as the May-Johnson bill.

Senator AUSTIN. These names given in this paragraph of your statement really represent the authors of the May-Johnson bill?

Secretary PATTERSON. Yes, sir. The draftsmanship was done under their direction. I think the actual draftsmen were Captain Davis, who is sitting here, who had a hand in it, and Mr. Marbury, a Baltimore lawyer who was then in the employ of the War Department, and Under Secretary Royall, who was then a brigadier general.

Isn't that right, Captain?

Captain DAVIS. That is right, sir.

Secretary PATTERSON. I will not at this time go into the details of the May-Johnson bill. The objectives, fully stated in the bill, are to promote the national welfare, to secure the national defense, to safeguard world peace, and to foster the acquisition of further knowledge concerning atomic energy. Responsibility was transferred from the War Department to a new civilian agency, to be known as the Atomic Energy Commission, to take over and manage all source materials of atomic energy, all stock piles of materials, and all plants and property connected with development and use of atomic energy. Full ownership and control are vested in the United States. It is provided that the Commission interfere as little as possible with private research, and employ other governmental agencies, educational and research institutions, and private enterprise to the maximum extent. The Commission is given power to adopt the necessary security regulations to control the collection, publication, and transmission of information on release of atomic energy, as required by considerations of national defense or military security.

The House Military Affairs Committee held hearings on the bill. It was freely criticized as a measure drafted by the military and

intended to perpetuate military control of atomic energy, although the true facts are that it was drafted by the committee of civilians named above, or under their supervision, and that it provides for transfer of responsibility from the War Department to a civilian agency. The House committee, after adding several amendments including those further emphasizing freedom of research and investigation, reported the bill favorably.

I should add that the President, since introduction of the May-Johnson bill, has indicated that he is of the opinion that a number of changes should be made in it. The War Department will, of course, advocate such changes in discussion of any detailed legislation.

It was also realized by the War Department, prior to the time when the bombs were dropped, that the means of producing the atomic bomb would not forever remain the exclusive property of the United States, that in time other nations would be in a position to produce weapons utilizing atomic energy. Secretary Stimson was one of the first to recommend a policy of international supervision and control of the entire field of atomic energy, with a view to outlawing its utilization in war and to fostering world-wide exchange of information on atomic energy in connection with industrial and other peaceful purposes. I have been and still am of the same opinion as Secretary Stimson.

These matters were formulated and communicated last September, just following the close of hostilities.

Senator AUSTIN. Will the Secretary permit a question at that point? Secretary PATTERSON. Surely.

Senator AUSTIN. Does the Secretary agree with the policy of the administration which has been publicly stated in connection with our international agreement between Britain, Canada, and the United States, that not until after—and I repeat it for emphasis—not until after effective security has been established against a destructive use of atomic energy shall we exchange reciprocally knowledge respecting the constructive use of atomic energy?

Secretary PATTERSON. I am in full accord with the policy as laid down by the Secretary of State on that subject; yes, sir; that not until there are effective safeguards should there be revelation of any of the secret techniques.

As the result of conferences on the international level, held last November and December and initiated by the President and the Secretary of State, the United States, Canada, United Kingdom, and the Soviet Union joined in recommending to the United Nations that a commission be set up to study and make proposals on exchange of basic scientific information, on control of atomic energy to insure its use for only peaceful purposes, on elimination of atomic weapons from national armaments, and on effective safeguards by inspection and other means to protect complying states against violations and evasions—the work of the commission to proceed by separate stages. The United Nations last month passed a resolution establishing such a commission.

Senator MILLIKIN. May I interrupt?

What do you mean by "proceed by separate stages"?

Secretary PATTERSON. There were four features to the program. The meaning is that those four stages should be taken up separately and progressively.

First, the exchange of basic scientific information with safeguards at each stage; and, second, the control of atomic energy to insure its use for only peaceful purposes; and so on through the four stages.

The Secretary of State has pointed out, in this regard, that the provision as to safeguards in the resolution is intended to apply to all phases of any plan recommended by the United Nations Atomic Energy Commission—including the first stage.

The CHAIRMAN. Do I understand, Mr. Secretary, under the policy of our Government as it is now laid out that it would be possible to proceed with an exchange of basic scientific information, or to proceed to exchange scientists before an effective inspection system has been accepted by each country involved?

Secretary PATTERSON. I don't think the policy on that has been yet thoroughly worked out. I understand that the Secretary of State, with the aid of some advisers, is now considering what measures should be advocated by our representatives on the Atomic Energy Commission of the United Nations Organization. That is my understanding.

The CHAIRMAN. I think it has been pretty well worked out as far as this committee is concerned. I think we pretty well agree on how we feel about it.

Secretary PATTERSON. I was speaking of the advisory committee to the Secretary of State on the subject.

The CHAIRMAN. Yes; I understand.

Secretary PATTERSON. I don't think the work of that committee has yet been completed. They are still meeting, I think.

I would like to speak for a moment on the need of prompt action. The President, in his message to Congress of October 3 on atomic energy, gave warning against postponement of decisions and urged prompt action in passing legislation to cover domestic policy. Prompt action, as I see it, is needed for the following reasons:

1. For lack of a defined national policy, the organization that was built up during the war to carry forward the development of the atomic bomb is disintegrating. To allow this effective group of scientists, executives, engineers, and skilled workers to become lost to the field of atomic energy development would be nothing short of a calamity.

Senator MILLIKIN. Mr. Secretary, do you appreciate the difficulty in the finding of a national policy until we have some information as to what the international policy may be?

Secretary PATTERSON. I think we have to phrase our national policy and make it flexible so that it will be at all times consonant with international policy; but I think we have to go ahead with the adoption of legislation for national policy, bearing in mind the consideration that at all times it must be in step with international policy.

Senator MILLIKIN. Well, you would not say it should be in step with international policy if, from a national policy standpoint, we considered that international policy did not properly protect our own security?

Secretary PATTERSON. I cannot conceive of our being a party to international arrangements that the executive and legislative branches of the Government did not agree with. I cannot conceive of that.

Senator MILLIKIN. It is difficult in advance of knowing what that might be, I suggest, to define a rational domestic policy.

Secretary PATTERSON. There are certainly a great many matters, in any event, as to which our national policy should be laid down and declared that couldn't possibly be in collision with any international undertakings.

Senator MILLIKIN. I would agree completely on that.

Secretary PATTERSON. 2. Before this Nation proceeds any appreciable distance toward any specific international program it should put its domestic house in order. As we move forward along the lines of the Agreed Declaration of the President and the Prime Ministers of the United Kingdom and Canada of last November and the subsequent Resolution of the United Nations, other nations will look increasingly to us for guidance in working out a secure system of international control. The sooner we establish domestic policy and an organization to carry out that policy and gain experience under peacetime conditions in supervising and controlling this field at home, the sooner we can help effectively to lead the way in shaping any international system.

3. Only by a vigorous program of fundamental research and the furtherance of basic knowledge and application in this field can we hope to advance adequately the usefulness of this new science. At present, the War Department has full control over the entire field. Continuation of this situation is not calculated to advance fully the research and development of peacetime uses of atomic energy, for it is not the primary mission of the War Department to do so. The present uncertainty as to future policy should be cleared up without delay in order to prevent any hindrance to full development of peacetime uses of atomic energy.

I should say here that it has been the policy of the War Department since last September, 6 months ago, as soon as the war was concluded, that in the view of the measureless possibilities in the line of atomic energy for peaceful and humanitarian purposes, this project should be turned over to a new civilian agency. There has been no disposition whatsoever on the part of the War Department to keep control of this project. On the contrary, we have recommended at all times that it be turned over to a board or agency for the full development of this enormous source of energy for all purposes.

Senator MILLIKIN. I should like to ask the Secretary whether he believes that the war phase of this weapon energy has now passed and that we can put our full energies into the development of peacetime use?

Secretary PATTERSON. I do not think that the military significance of atomic energy has entirely passed.

The War Department is in accord with the policies outlined by the President in his letter of February 1 regarding legislation on this issue of critical importance:

1. A civilian commission for control of atomic energy, a three-man group devoting full time to the activity.

2. Government ownership of fissionable materials.

Senator MILLIKIN. Mr. Secretary, what is the meaning of "Government ownership"? In speaking of Government ownership of fissionable materials, do you mean the raw material in the group?

Secretary PATTERSON. No; I mean the enriched or processed materials. I think the bill before us calls the other material "source materials," and that means the ores as they come out.

Senator MILLIKIN. I believe you have answered my question, but let me ask you categorically, do you believe the Government should own or take ownership of material in the ground, or raw material on top of the ground, in connection with this control?

Secretary PATTERSON. My belief is that the Government should have full power to acquire the ore in the ground and to explore for it, and own all source materials so mined, as well as fissionable materials, as to all sources within the continental United States or territory subject to our jurisdiction.

Senator MILLIKIN. I suggest that would be very impractical, considering the system under which we develop our mining resources. This particular type of mineral is usually associated in complex ores. The mining business, therefore, could not progress in the way it has been working if there were a threat over its head that it would come under the ownership of the Government.

We have had testimony, for example, by the Vanadium people, who point out how intimately associated uranium ores are with other types of ores. If because there happened to be a uranium element in any ore it came under the threat of Government ownership, we would have a very devastating effect on the development of our mineral resources.

In that connection, I suggest it is not necessary to own it. You can exercise adequate control once the thing has been discovered and has been brought to a processing plant.

Secretary PATTERSON. I say full power. I don't mean automatic ownership just by the fiat of a statute, but full power to acquire either by purchase or condemnation the ores in the ground that contain appreciable or practicable amounts of the source materials. That I think the Commission should have power to acquire.

Senator MILLIKIN. The difficulty there, Mr. Secretary, is that you don't know whether it has a practical amount of this particular energy-producing ore until after you have mined it. There is no way in God's world to look over an area and say, "This area contains ore of the kind we are interested in in appreciable quantities."

It is a gophering proposition. You find it at this point in a mining operation; it disappears at that point, and it might not appear for miles and miles and miles.

Secretary PATTERSON. I realize that and that is the reason why I would give the Commission control in the shape of power to acquire.

Senator AUSTIN. You hold the view, apparently, that this source material would not be a subject of the general power of eminent domain to take private property for public use. Do you hold that view?

Secretary PATTERSON. I would certainly give the Commission that power as regards all source materials containing substantial percentages.

Senator AUSTIN. If the Government has that power constitutionally, it wouldn't be necessary to give it by statute, would it?

Secretary PATTERSON. I think the act ought to provide that, Senator—the power of eminent domain.

Senator AUSTIN. Then it is on the theory that it is not the type of property that can be taken for public use. However, we won't carry that discussion out. That is more of a technical discussion than anything else.

Secretary PATTERSON. Well, when you think of the properties that can be taken by eminent domain for public use, of course upon payment of fair compensation, for use by railroads and all kinds of public uses, possibly highways, property is always subject to acquisition by eminent domain for public purposes of that sort, but there is nothing very startling in it.

Senator AUSTIN. As a matter of fact, we have been taking property already appropriated for public use for another public use, have we not?

Secretary PATTERSON. Yes; where it is a superior one.

Senator MILLIKIN. You are referring to the preservation of a right which in one form or another already exists, but you are not advocating a policy that shall be universally applied. It is a right, the policy to be determined if the necessity should arise?

Secretary PATTERSON. Yes, sir. I think there would be difficulties if you vested absolute ownership in the Commission as to all uranium-bearing ores in the ground. You wouldn't know where you were at. But the Commission should have full power to acquire them either by purchase or by exercise of eminent domain.

Senator MILLIKIN. You would have to buy several of our States and parts of 10 or 12 others, because the ores have a trace of uranium.

Secretary PATTERSON. I think a practical formula for that could be worked out that would get for the Commission all of the power and authority that they reasonably need, and yet exclude from them matters of the extent that you mention.

Senator MILLIKIN. But you are preserving a right, if policy should indicate the need for the exercise of that right, as distinguished from laying down a policy of acquisition?

Secretary PATTERSON. Yes, sir. I was speaking of the points covered in the President's letter to Senator McMahon of February 1.

3. Availability of devices utilizing atomic energy by means of compulsory nonexclusive licenses under private patents and regulation of royalties.

4. Adequate provision for independent research and development.

5. Ultimate use of atomic energy for exclusively peaceful ends, by means of safe, effective international arrangement.

Senator HART. Mr. Secretary, turning back to your first point, in which you say the War Department is now in accord with a considerable change as regards the top level control of the new organization. The May-Johnson bill, formerly advocated, sets forth one method and now you say that the War Department advocates a three-man group devoting full time to the activity.

I would like to discuss that with you a little, Mr. Secretary.

In the first place, is it your feeling that the Government can acquire the full-time services of three men who are fully competent to be charged with that highly important activity?

Secretary PATTERSON. I believe so. Initially we advocated the appointment of a nine-man board as provided in the May-Johnson bill, not to be full-time people. That was under a plan that provided that the executive or administrative matters under the supervision of the Commission should be in an administrator, and I believe provision was made for a deputy administrator. There was a great deal of discussion as to that matter before the House Military Affairs Committee. Some members thought that a better plan would be for, I believe, a three-man group. I am not sure; they may have said five; but at any rate a full-time commission.

The matter was discussed in the Office of War Mobilization with quite a number of executive agencies represented, and also with the President, and the preference of the President was for a three-man group full time.

It was also a closely debatable matter as to which plan would work best, and the War Department is in accord with the decision finally made. I think it was the consensus of opinion of most of those who participated in the conferences at the Office of War Mobilization that that would be a preferable organization; and although we were initially of the other viewpoint, we support a civilian commission of a three-man group full time.

A good deal can be said on both sides, Admiral.

Senator HART. Are you yourself of the belief that those commissioners should serve at the pleasure of the President or for stated terms?

Secretary PATTERSON. Well, there, again, I think the provisions were originally recommended were for a 9-year term, removable prior to the full expiration of that. That was also discussed in full before the Office of War Mobilization, and at the White House, and considerations to make the Commission fully responsive at all times to the policy of the President were pressed at those meetings, I thought with a great deal of force, and our views on that subject have been modified as well in the last 6 months.

I am in accord with the provisions that the members of the Commission should serve at the pleasure of the President.

Senator HART. Mr. Secretary, under that arrangement, how do you visualize the future as regards calling into the picture men of the caliber that was contemplated when the original provisions of the May-Johnson bill were decided upon?

Secretary PATTERSON. I believe that there would be a response to a call by the President for three full-time members of the Commission, a response on the part of men most qualified for those positions, and that there would be acceptance by people of the post realizing the tremendous importance of it and the influence that they would have on the national welfare for years to come. Those details of structure, both as to the number and as to the term, are closely debatable; there is no question of that.

I have listened to contentions pro and con on these things for quite some extensive period, and there is no final conclusive answer. It is a matter of which plan appeals to a man's individual judgment.

Senator HART. Mr. Secretary, you have been carrying on a tremendously large business during this war, and the work under this Commission bids fair to be vast, as I am sure you will agree.

Secretary PATTERSON. Yes, sir.

Senator HART. Do you visualize under the terms of the bill that you are discussing that that Commission of three men would be able to carry on all of the administrative work which will devolve upon them, and at the same time be sufficiently free to seriously think over the questions which will arise on policy on high-level matters?

Secretary PATTERSON. I believe that a commission of three or five or nine would find it advisable to have an executive manager, call him what you may, to handle the administrative matters, and to do a lot of supervisory work.

Senator HART. I have just one more question, Mr. Secretary.

S. 1717 provides for an advisory committee to assist the Commission. What has been your experience during the war years as to the probable status and the probable power that such an advisory committee would be able to exercise?

Secretary PATTERSON. My experience has been that we have had in many instances invaluable assistance from advisory committees. I have in mind the experience of the Ordnance Department on its ordnance-industry integrating committees along special lines, shell production, and things of that sort, where the experience of many producers was pooled and made available to all. I think they perform a valuable function.

Senator HART. Did you have full hope that as good a situation in that respect would exist during years of peace as they have during war periods?

Secretary PATTERSON. No.

Senator HART. Thank you.

Senator MILLIKIN. Am I correct in assuming, Mr. Secretary, that your recommendation that the matter be turned over to a civilian commission is premised on whether Congress reaches the conclusion that the world is really postured for peace?

Secretary PATTERSON. No; it is not premised on that, wholly. As I have pointed out, it was our view last September and October that the matter should be turned over to a civilian commission. That does not mean that the military aspects of the matter should not continue to receive the attention of the armed forces.

Senator MILLIKIN. Would you favor turning over to a civilian commission, on the assumption that Congress might conclude that the world is not postured for peace, the rest of your military activities—the Navy, the Army, and the Air Force?

Secretary PATTERSON. I think we have hopes of world peace on a permanent basis, of course. Nevertheless, we have to maintain an Army and a Navy on the sense that that hope will not be fulfilled; and in the same way here, I think that while this is a matter of vast importance to the Nation in time of peace on account of the vast possibilities, it has its military significance, too, and those matters having to do with military significance must be borne in mind, and as I hope to point out later in the statement, the contact of the armed forces with that phase of the matter should be preserved.

Senator MILLIKIN. Let me ask you again, Mr. Secretary, on the assumption which I made that Congress should conclude the world is not postured for peace, regardless of the technicality of the situation, regardless of whether we have a technical state of war, or don't have a technical state of war, assuming that the Congress concludes that the world is not postured for peace, why should we turn this, the greatest of all weapons, over to the control of a civilian agency any more than we should turn over to a civilian agency the rest of the energy of the Army, the Navy, and the Air Force?

Secretary PATTERSON. I believe that the turning over of it to a civilian agency does not foreclose contact of the armed forces with the matter. It should not foreclose that contact, and that consultation, advice, and participation by them in the military features of it.

I don't think, in other words, that there is any reason why you cannot have the project as a whole turned over to a civilian agency and at the same time continue research and development along the lines of

military weapons, provided you have the proper contact between the new civilian agency and the armed forces.

Senator MILLIKIN. The same thing would be true as to the lesser weapons which the Army has under its control, and the Navy has under its control, and the Air Force has under its control?

Secretary PATTERSON. Yes, sir.

I think the development of atomic energy, however, is an integral. I don't believe you ought to split it up among various Government agencies. It is sound, I believe, to commit the development and the fostering of it along the soundest lines to a new civilian agency, and at the same time make sure that the armed forces have close and intimate contact with the military features of it.

Senator MILLIKIN. Mr. Secretary, I am not advocating a position; I am just trying to get as far to the bottom of this thing as I can through my own thinking processes.

Let's look it right in the face. If Congress should conclude that the world is not postured for peace, why should this energy be turned over to a civilian energy?

Secretary PATTERSON. I believe that it has manifold possibilities of a civilian character that it is necessary to press forward with. A civilian agency can do that better than the War Department. I think that the development of it should be handled as an entity, and that the military aspects of it can perfectly well be taken care of under such a set-up as long as those military aspects are of importance, which they are today, by virtue of provisions in your act insuring that the military development be carried on by the Commission in close cooperation with the armed forces.

Senator MILLIKIN. Mr. Secretary, doesn't that come down to a decision as to what is the predominant use for this energy at the moment? If we should conclude that its predominant usefulness at the moment is a possible war usefulness, does not that put in a secondary position the peacetime use of it?

Secretary PATTERSON. That is so; yes.

Senator MILLIKIN. And that is the assumption on which my basic assumption was made, that Congress should conclude that we are not postured for peace.

As to the civilian usefulness of it, we have had testimony that divides the usefulness roughly into two categories, one for power, electrical energy, and the other for medicinal purposes. Now, you have suggested that we should push forward in those fields, and I quite agree with you. But we need not push forward in those fields, I suggest, as long as the imperative overriding consideration has to do with the energy as a military weapon, for medicine is covered in a more inadequate fashion by existing remedies. The same use that has been suggested in the way of power is covered at the present time by, let us say, a less efficient method.

Could we not lock the whole thing up, if security required it, for a year or 2 years without damaging our peacetime life in any material respect?

Secretary PATTERSON. That may be. I would not be here advocating the turning over of it to a new civilian agency if I thought that the national defense of the Nation would suffer from that.

Senator MILLIKIN. I understand that thoroughly, but that again suggests that our basic decision is: What is the state of this world;

can we assume now that we are off on the road to peace and that therefore we are ready to give this a full play in peacetime development? Or are we brought to the conclusion that the world is not in that highly desirable state, and that this thing should be protected for a time as a weapon?

Secretary PATTERSON. But I do not think it is necessary at all that the national defense would suffer by the turning over of that to a new civilian agency under proper safeguards and proper provisions in the basic act.

Senator MILLIKIN. Then I suggest, Mr. Secretary, unless you believe that the world is postured for peace, the same line of argument would warrant or would call for turning over to a civilian agency the control of all our armed forces.

Secretary PATTERSON. Well, this is a unique weapon.

The CHAIRMAN. Mr. Secretary, this assumption about the world being postured for peace—to adopt Senator Millikin's suggestion—rather contemplates that there is some esoteric concept quite outside of whatever this country may do in the international field which postures the world for peace.

Does it occur to you that the fact that we might turn this over to a civilian commission, with such controls and such modifications as you may feel necessary to protect the military security, would that in itself have anything to do with posturing the world for peace?

In other words, if this country indicated that it regarded the potential monster as probably something that could be used for peaceful and constructive purposes rather than holding it back and ready for destruction, do you think that might have some effect on the peace of the world?

Secretary PATTERSON. Yes, it might. I think the turning over of this project to a new civilian agency is in line with our national policy on other matters, our national policy, as I see it, to promote world peace.

At the same time, certain safeguards, such as the maintenance of an Army and Navy on the terms that we may not get world peace—we certainly haven't attained it to date, but we have hope of a better day.

Senator AUSTIN. May I ask a question, Mr. Chairman, after you get through?

The CHAIRMAN. Certainly.

Mr. Secretary, I believe there is hardly any weapon of war that doesn't find its basis now in electricity. Isn't that true?

Secretary PATTERSON. You are going to have electric power to have any munitions production; that is clear enough. You have got to have coal, and you have got to have iron and copper.

The CHAIRMAN. Following that argument, assuming that the world is not—again, to use Senator Millikin's very descriptive word, which I think is a good one—postured for peace, there might be some argument that could be made that all electricity in the country should be turned over to the War Department for its safekeeping.

Secretary PATTERSON. Well, I don't propose that.

The CHAIRMAN. No—but why? Because it would destroy the fundamental civilian character of our Government, would it not, Mr. Secretary?

Secretary PATTERSON. Well, as I say, I am not advocating any such proposition, and never have.

The CHAIRMAN. Whether for my reason, for others, or for your own, at least you don't advocate it.

Secretary PATTERSON. No; I do not.

The CHAIRMAN. Senator Austin.

Senator AUSTIN. Mr. Secretary, you made a remark a moment ago in passing that this has to be considered with reference to many other activities of Government. I just want the record to show a well-known fact, I think, and that is that the Congress is considering a new structure, the Department of Common Defense, and that whatever this legislation may produce in the way of civilian control would probably be fitted into that department in such a way as to establish the proper relationship between civilian activity and purely military activity, and the whole will be attempted to be coordinated in such a way that for pursuits of peace the civilian activity will be provided for, and for pursuits of war the military activity will be provided for.

That is something that we have in the background, as we consider this, is it not?

Secretary PATTERSON. Yes, sir.

Senator MILLIKIN. I think the chairman's question to you, Mr. Secretary, carries clearly a theory which I don't know whether the chairman holds or not—and that isn't important for present purposes—that we can get peace by gestures; that we can get peace by giving a civilian aspect to our most powerful weapon.

I suggest that it follows in logic, that if that is a useful gesture, then we cannot escape making the same gesture as to our lesser weapons, to wit, the Navy—we could turn the Navy into plowshares—and the Army and the Air Force. Certainly we shouldn't lessen that gesture in our less important weapons.

Secretary PATTERSON. Well, it is a matter of policy for Congress to determine, and Congress does do it. In time of war you have a very large Army and Navy, and then according to the outlook taken by Congress, which determines the funds—and that is where it all comes from every year—the size of the armed forces is diminished; and our experience in the past has been that it gets to a very low level; indeed, far too low a level, in my opinion, and then, as trouble looms, Congress appropriates more funds for the raising of larger military forces. The thing is always determined by the will of the people as expressed by Congress.

I am speaking along very broad lines, and not with particular application to this bill, but it has its bearing on this, I think. We have here a vast new source of power. There is no use in my trying to predict where the range of it will go; not even the scientists that I have discussed it with could do it, and if they cannot, how could I?

However, we have that new source of power, believed to have vast importance along lines not yet developed—as a source of power and energy, and aid to medical science, and I am sure many other things that we haven't even envisioned yet. They are of great importance to the welfare of the Nation along lines of everyday, ordinary life, I believe, of civilian character.

At the same time, the only development of it thus far that has been brought right to the final product has been military, as a weapon.

I would say the policy of Congress on that matter would be to make sure of the development of both, as long as there is the need.

When the time comes that you have firm, steady international controls that you in Congress have confidence in, of course then the military aspect of it sinks to insignificance.

Senator HART. Mr. Secretary, following Senator Millikin's line of reasoning, but not going so far with it as the entire Army and Navy, I read one of the clauses that appears in the Moscow agreement which preceded the international arrangement, where it says that the powers concerned there at Moscow agree to sponsor this thing, and I quote, "for the elimination from national armaments of atomic weapons and of all other major weapons adaptable to mass destruction."

Now, Mr. Secretary, the heavy bombers, the large planes, are clearly included in that, are they not? They are major weapons of mass destruction. Is that not true?

Secretary PATTERSON. It may be. My attention had been directed to that resolution bearing, as it does, on atomic energy. That is the primary subject. I read those words that you have just quoted. It may be that they have a broader significance.

Senator HART. It says, "all other major weapons." Now, it certainly has been claimed, possibly in the right, but I don't think so, that the area bombing of both our enemies was tremendously effective in the mass destruction that was accomplished there by it. So I ask you, Mr. Secretary, would it not be—if we meant what we said—rather necessary to put under the control of the Commission that particular weapon, also?

Secretary PATTERSON. That weapon, the long-range heavy bomber, I would say—one single weapon, one bomber—was probably not capable of bringing about that mass destruction. The heavy forces employed by us, for instance last year, certainly did bring about area destruction or devastation, but I should not suppose that the Atomic Energy Commission of the United Nations would have that in mind.

Senator HART. Well, Mr. Secretary, you will agree that it is a weapon of mass destruction, and when you get down to cases the only difference is that in one instance we will use one plane, and in another you would use some hundreds, but you would accomplish practically the same thing in the way of mass destruction.

Secretary PATTERSON. It is not comparable to the power for mass destruction that is released by an atomic bomb, not on the same scale at all.

The CHAIRMAN. You don't agree with Seversky, then. Did you read Seversky's article? We are going to have him in here tomorrow, you know.

Secretary PATTERSON. Yes; I don't know that I disagree with him. He believes, I think, that the destruction by one atomic bomb at Hiroshima and by one at Nagasaki was very significant indeed, that it would take a very large force of planes employing any other weapon to bring about anything the equivalent of it.

Senator MILLIKIN. I should like to ask the Secretary to tell us the results of our past experience in endeavoring to gain peace by self-immolation with special reference to the disarmament conference at San Francisco, the Naval Disarmament Conference, with respect to the matter the Secretary referred—to wit, the congressional reaction to reduce our arms to a practical point of impotency, and to any other illustrations of that kind that he can think of.

Secretary PATTERSON. The past results have been discouraging, indeed, Senator. There is no question of that. We hope that we have a more effective organization and a better will for peace at this time than ever before; and I am not without my hopes.

Senator MILLIKIN. If we don't have the will to peace, we have nothing.

Secretary PATTERSON. That is certain, and if others don't, too.

Senator MILLIKIN. So we must have a will to peace in our deliberations.

Secretary PATTERSON. Yes, sir.

I hope that the day is not distant when international controls for elimination of atomic weapons as instruments of war, together with effective safeguards to insure compliance by all nations, can be devised and put into operation, under auspices of the United States. That day has not yet come, however, and in the interval we are faced with the fact that the atomic bomb is the most potent weapon of war yet devised by man. It is plain that in the interval the place of the atomic bomb in the armament of this Nation cannot be overstated.

S. 1717 contains a recognition of the military aspect of atomic power. Section 6 provides that the Commission shall do research and development in the military applications of atomic power, subject to international agreement in the future, shall have custody of all atomic bombs and other atomic weapons, and may produce them in the future to the extent directed by the President. In other words, while recognizing the military aspects of atomic energy, this bill does not recognize the direct concern of the armed services in atomic weapons.

The War Department cannot subscribe to these provisions which virtually exclude the armed services from all phases of military application of atomic energy. Under the bill the Commission would have sole responsibility for all further research and development in the military field. The Army and Navy would be utter strangers to what was going on, as much so as the army and navy of a foreign power, although they might be called on to operate the weapons so developed, on short notice and without knowing what they were. There are no provisions requiring, authorizing or even suggesting any consultation or contact with the War and Navy Departments on the many problems of national defense that are necessarily involved in the control of atomic energy.

The War and Navy Departments are charged broadly with responsibility for the national defense. Unless it is proposed to relieve them of this responsibility or to cripple them in their performance of it, adequate provision should be made for their activity, in conjunction with the Commission, in the military part of this field from which has come the most devastating weapon in existence, a weapon for which no defense is foreseen. Legislation in the field of atomic energy, under present-day conditions and until there is firm assurance of effective international controls, should, in my opinion, provide for direct participation by the War and Navy Departments in the military applications of atomic energy. The War Department has developed this point more fully in its formal report on the bill and will submit specific provisions along this line if the committee desires to have them.

The CHAIRMAN. I think we ought to have them, Mr. Secretary.

Secretary PATTERSON. Yes; I can provide them.

Any other policy, in my opinion, is taking the greatest risks with the safety of the Nation.

The War Department is also concerned about that portion of section 6 which provides:

The Commission is authorized and directed to have custody of all assembled or unassembled atomic bombs, bomb parts, or other atomic military weapons, presently * * * produced.

The War Department urges that present stocks of atomic bomb components should remain in the hands of the military forces. Atomic bomb components have been produced by the Army and constitute a vital and integral part of the Army's ordnance, which should not, at this time, be removed from the Nation's arsenal. Changes would, of course, be made in the event of disarmament of atomic bombs by effective international arrangement.

Senator MILLIKIN. I would like to ask the Secretary whether he would consider a mere paper agreement an effective international agreement?

Secretary PATTERSON. No.

Senator MILLIKIN. That would have to be supplemented by works and deeds, as distinguished from just a lot of noble-sounding words; is that correct?

Secretary PATTERSON. Yes, sir; there have got to be safeguards for it, of course.

There is one other matter relating to the national security on which I should like to comment.

The CHAIRMAN. In view of Senator Millikin's comment, lest I be charged with any naïveté, I think I should say I join in your last statement. I wouldn't be satisfied, either, with mere words, Senator.

Senator MILLIKIN. The thought never crossed my mind that the Chairman would.

Secretary PATTERSON. I firmly believe that scientific research and discovery must be actively encouraged if we are to remain strong in this field. The highest interests of the Nation require that our knowledge of nuclear phenomena must be greatly expanded. To this end I feel that any legislation that is adopted should lay down a policy of minimum interference with small-scale private research which does not involve the release of atomic energy in large amounts and that such legislation should not contain provisions which negate that policy. While S. 1717 announces a policy of "assisting and fostering private research and development on a truly independent basis to encourage maximum scientific progress," it contains, perhaps unintentionally, a series of severe restrictions on such research and development. It is submitted that S. 1717 should contain provisions similar to those of the amended May-Johnson bill which guard against interference with small-scale or university research. I consider this point of direct interest to the War Department, for we must advance if we are to remain strong.

Among the more important restrictions imposed by S. 1717 on small-scale independent research, which the War Department deems unnecessary, are the following:

1. All research is subject to reporting and inspection requirements;
2. All fissionable materials, however minor in amount and wherever

used or produced—even in small-scale laboratory research—are owned by the Commission and subject to its control.

3. All uses of source materials, however minor, are subject to regulation and control by the Commission.

4. All experimental devices utilizing fissionable materials are subject to Commission license.

It is of great importance that as much information as can be made available without prejudice to the national safety should be freely circulated. At the same time it is of vital importance that adequate means be provided for holding information secure in all cases where the release or communication of it would plainly be prejudicial to the national safety. In determining what information would endanger national safety if released, common prudence requires that these agencies of government charged with responsibility for national defense—the armed forces—should be consulted. The announced policy of the United States is that the technical secrets of atomic bomb manufacture should be held secure. Security provisions of domestic legislation should reflect this policy and provide adequate means of protecting such information as long as circumstances require. There should not be a shadow of doubt on the Commission's authority and power to safeguard information of a secret character that is vital to the national defense.

S. 1717 places reliance on the Espionage Act. We are convinced that the Espionage Act is an inadequate instrument in this instance, and I say "in this instance" because of the extreme importance of the matter we are dealing with. The Espionage Act does not clearly prohibit the transmission of military information orally or by personal written communication even by present or former government employees unless actual subversive intent can be shown; nor does it prohibit the communication of information of military value that is discovered or developed by private persons. Prosecution under significant portions of the Espionage Act having to do with national-defense information faces the difficult task of proving that the defendant obtained the information with intent or reason to believe that it would be used to injure the United States or to aid a foreign nation. Standing by itself, the Espionage Act is not enough for this particular purpose here.

The CHAIRMAN. What law on the books, Mr. Secretary, protects developments in radar or bombsights, or the most vital national-defense secrets?

Secretary PATTERSON. The Espionage Act is doubtless the act that is most relevant, but careful reading of the Espionage Act shows that not all the communications of information of importance to the national defense is covered by it, and I believe that the power of the Commission to adopt security regulations where they believe it necessary for the national defense and the national safety should be utterly undoubted.

The CHAIRMAN. Well, I am not disagreeing for the moment with you. I just want to explore the possibility of following your suggestion of closing this door to the barn, a wide door, it may be true, and leaving all the other entrances and exits open.

Let us take the cryptogram machine, or whatever you call it, that broke down the "winds" messages, so-called. I, among many other people, regretted that information was disclosed that we had that

machine. Now, forgetting for a moment that the existence of that machine was disclosed in this Pearl Harbor committee, what protection did the Government have on that piece of machinery?

Secretary PATTERSON. Well, you have the protection afforded by the Espionage Act, and the provisions of it, and in time of actual war, of course, there is a fairly broad provision in the Espionage Act, the concluding provision.

But the other ones deal with specific cases, and I think the statement I made a few moments ago is true, that it is hard to find anywhere under the Espionage Act anything dealing with disclosure of information unless it is with actual intent or reason to believe that it will injure the Nation, or advance the interest of a foreign nation, because certainly the first five clauses of it are all qualified with the existence of that intent.

The CHAIRMAN. Now, bacteriological warfare has been referred to in the press, and in various articles, and also, I believe, by members of our Department. If we decided to write into this bill great power to issue such regulations, as an astute commission might deem necessary, and make them crimes, all I am pointing out is that we would leave great fields untouched, such as bacteriological warfare.

Secretary PATTERSON. I would make the regulations subject to the approval of the President.

The CHAIRMAN. Wouldn't it be better to try to design a general statute to cover all military information rather than to work out on this particular problem?

Secretary PATTERSON. I appreciate, Senator, that an effort was made in the draft to handle the subject, but it contained some language the meaning of which is not clear to me, something like "adopt administrative interpretations of the Espionage Act." I don't know what that means. The Espionage Act, itself, has nothing to do with administration.

The CHAIRMAN. Wouldn't it be well, Mr. Secretary, if the War Department was to recommend to the Congress amendments to the Espionage Act?

Secretary PATTERSON. In handling security under this measure, I would put it right in the measure, itself, and would give the Commission authority to adopt the security regulations, in line with the general basic policy of having the freest possible circulation of information in this field, and subject to the provision that they be with the approval of the President.

The CHAIRMAN. Of course, after you did that you would leave wide fields of valuable information protected only by the act, itself, wouldn't you?

Secretary PATTERSON. This matter is of such urgent importance that I would put it right in this act.

Now, you have a provision in there somewhere that the classification of information for release shall take it out of the Espionage Act, but the failure of the Commission to do it shall not bring it within. I don't know what the meaning of that is.

Senator AUSTIN. I think the Secretary's attitude in the matter is justified by the history of the many attempts to tighten up the Espionage Act. I used to sit in the Judiciary Committee, and I was a member of the subcommittee for enactment of the Espionage Act.

We just couldn't amend that act to cover the whole field. We encountered all kinds of obstruction and objection because the attempts did cover such a broad ground that there was a fairly reasonable claim that it interfered with freedom of speech and publication, so there was a very powerful bloc against it, and it has been utterly impossible to take that act and amend it into the condition that would protect the military secrets of the United States.

Secretary PATTERSON. As I read the Espionage Act, each division of it deals with a specific case. It is not in broad coverage except as you add them all together, and even then there are plenty of empty spaces. The first has to do with entry on or flying over or getting information about a fort with intent, and so on. Then they have a provision about copying or making a sketch or photograph of plans or papers, and then there are four or five more; but they are a series of specific provisions against particular things, and for most of them you have to prove the intent.

The CHAIRMAN. Which, in itself, is a pretty sound protection of the Anglo-Saxon system.

Secretary PATTERSON. I quite agree, Senator. It is all a question of how important you see it.

Take the technique of the actual bomb manufacture, for instance. The Commission ought to have the fullest power to protect that information. There shouldn't be the slightest doubt about it. If anybody just saw fit to exercise free speech about it, is it thought for a minute that that should be done?

The CHAIRMAN. Now, there are other fields in which it is just as important?

Secretary PATTERSON. No, sir; not as important as this weapon that I know of.

The CHAIRMAN. You don't regard bacteriological warfare as important?

Secretary PATTERSON. I don't regard anything as important under present conditions as the atomic bomb. I think I said here "the most potent weapon yet devised," and that is true; there is no question about it. There ought not be the slightest doubt about the security of that part of it.

It is strongly recommended that the Commission should be empowered to adopt whatever security regulations are found to be clearly necessary in terms of the national security. Basic scientific information should be freely disseminated, but the Commission should be empowered to define by reasonable regulations what is included in this concept, having due regard for the national interest.

The CHAIRMAN. Let's see if I understand it. You mean the Commission should decide what is basic scientific information?

Secretary PATTERSON. I think they should outline the boundaries of it; yes, sir. I don't think there would be much doubt about most of it.

The CHAIRMAN. Do you advocate any veto power by the military as to what constitutes basic scientific information?

Secretary PATTERSON. No, sir.

The CHAIRMAN. Do you contemplate that the Commission, before releasing basic scientific information, should submit it to the War Department for its review?

Secretary PATTERSON. I see no harm whatsoever in having consultation before that, but the matter should be in the power of the Commission subject to approval by the President.

The CHAIRMAN. Now, of course, on technical know-how—

Secretary PATTERSON. I think the Commission should, of course, consult on a matter of that sort with the Army and Navy to get their ideas, but not to be bound, however, by what they say.

The CHAIRMAN. Thank you.

Secretary PATTERSON. The part about this bill that concerns me is the exclusion from every consultation of the people who are responsible for the national defense—even from consultation.

The CHAIRMAN. There is a Division of Military Application, Mr. Secretary.

Secretary PATTERSON. But it doesn't mention anywhere any contact with the War Department or Navy Department. I don't think the names appear in the bill anywhere. There is nothing there to suggest that the division you mention would have any contact or connection or speaking acquaintance with anyone in the War Department or Navy Department.

Domestic security policies and procedures should be consonant with whatever action is taken by the United Nations concerning the exchange of information. To make sure that security regulations are not excessive, they should be subject to approval by the President.

I appreciate the concern that is felt by people in excessive security regulations, and you have got the two interests that I think anyone who studies the matter must concede exists: A policy of the freest dissemination possible in order to exploit any possibilities of this power, and at the same time, certain facts that must be protected by security regulations. I know of no better way than to vest it in the Commission. They, of course, should consult with those in the armed forces as to their ideas, too, and their regulations, I believe, should be subject to approval by the President.

The CHAIRMAN. Of course, I suppose it has occurred to you, when you stated that you measured the two diverse considerations, that any setting up of extreme secrecy provisions here would be likely to bring about the same action in foreign countries on limitations of scientific information.

Secretary PATTERSON. Everything I have said is subject to the international situation and to the international engagements that we are committed to.

The CHAIRMAN. Well, do you think that there is any possibility that this country might lose a war or weaken its national defense if it set up airtight secrecy restrictions on the dissemination of scientific information, more than it would if it adopted a more liberal policy?

Secretary PATTERSON. Well, we come right back to what you said a moment ago, Senator. I can imagine no useful purpose to be served by revelation of the technique of bomb manufacture. Can you?

The CHAIRMAN. I can't, either, no.

Secretary PATTERSON. I can imagine very harmful effects from it, extremely harmful, and I can imagine nothing useful.

The CHAIRMAN. But I can also see, Mr. Secretary, considerable harm that might come, because of scientific progress, by a continuation of the Manhattan district's philosophy as to the security and as to how they are operating the project.

Now, I fully appreciate that you can say that we are trying to get rid of it—at least I am going to do my best to see that that comes about, but I can see—

Secretary PATTERSON (interposing). It was pretty useful in time of war, wasn't it, Senator?

The CHAIRMAN. Yes, of course it was. I can see, however, Mr. Secretary, that from talking with the scientists, many of them, who furnished the essential ideas under which this was made, they will not continue under the same kind of secrecy restrictions as they did under wartime. I think you can agree that will have its influence.

Secretary PATTERSON. Of course, I am interested in their views on it. They are of value.

There are many other points in which it is believed that S. 1717 should be amended and clarified if it is to carry out effectively its announced objectives. They have no direct bearing on national security, however, and I should prefer not to discuss them in this statement. They are covered in the report that the War Department has prepared in response to the committee's formal request. The report is now being processed through the Bureau of the Budget.

Senator MILLIKIN. Mr. Chairman, has the Navy Department been asked for a formal report?

The CHAIRMAN. They have, Senator.

Senator MILLIKIN. Has it come in?

The CHAIRMAN. Not yet.

Senator MILLIKIN. Has the Air Forces?

Secretary PATTERSON. That is covered in the War Department report.

Senator JOHNSON. Will the War Department report reflect the viewpoint of General Arnold? I notice that he made a public statement yesterday, I think it was, with respect to the atomic bomb. Will the War Department report reflect that viewpoint?

Secretary PATTERSON. The War Department, Senator, will reflect the views of the head of the Department; but, of course, the views of the head of the Army Air Forces are considered in formulating the opinion of the War Department to be embodied in its report.

Senator JOHNSON. Well, I hope it will be possible in the report that is submitted by the War Department to reflect the viewpoint of the Army Air Corps, the Army Air Forces.

Secretary PATTERSON. It certainly would.

Senator MILLIKIN. Mr. Senator, I wonder if it might be convenient for the Secretary to furnish the committee with the full text of General Arnold's remarks?

Secretary PATTERSON. Yes. When were they made?

Senator JOHNSON. Yesterday the press reported them.

Secretary PATTERSON. I can get the text, and would be glad to furnish it. Of course, if you want his individual views it might occur to you to call him up here, Senator.

Senator JOHNSON. I would like to have General Arnold appear before this committee and give his views.

Secretary PATTERSON. He might have individual views as to certain features of it that were not in accord with the views as stated by the War Department.

Senator JOHNSON. General Arnold has made a considerable study of the postwar defenses of the United States, and I think his views would be very important.

Secretary PATTERSON. He is in the course of retirement and not active any longer in the War Department.

Senator JOHNSON. He did have much to do with outlining the defenses of America as the plan worked out.

Secretary PATTERSON. His views would be of value on anything relative to the national defense, of course, particularly about the employment of air power and weapons that were launched that way.

The CHAIRMAN. Do you know where he is now, Mr. Secretary?

Secretary PATTERSON. I think he is right here in Washington. He was up in Philadelphia last evening, I think, or is going there tonight.

The CHAIRMAN. I was afraid he had gotten to the west coast.

Secretary PATTERSON. I think he is going to be around here for the remainder of the month.

The CHAIRMAN. We will see that he is called, Senator.

Secretary PATTERSON. In conclusion, the War Department stands with those who desire the establishment of a sound and effective national policy for the development of atomic energy geared to the highest interests of the Nation and of the world. Knowledge in this field must be greatly expanded, and to this end the War Department favors minimum interference with independent fundamental research consistent with requirements of national safety. We look forward to the day when this tremendous force may come to be used solely for peaceful purposes. We are convinced, however, that until such time as international arrangements and safeguards to make this goal effective have been worked out, stage by stage, legislation relative to atomic energy should make provision that the War and Navy Departments be consulted and take part in those phases of atomic energy relating to military application. We are also convinced that the power of the Commission to adopt adequate regulations for protection of information vital to the national defense should be stated in terms that admit of no doubt or debate. We urge that S. 1717 be amended to cover these essential matters.

That concludes my statement, Mr. Chairman.

The CHAIRMAN. Are there any questions of the Secretary?

I take it, Mr. Secretary, just to emphasize the story, that you approve of the bill, with some exception. I want to make certain—I don't know how long it will take us to get your report out of the Bureau of the Budget. I assume that we can hurry it out of there. When we get it, I take it that the report is pretty well synthesized in your statement here.

Secretary PATTERSON. We have a number of matters commented on in the report that are not covered in this statement. They are in some respects details of draftsmanship.

The CHAIRMAN. Of a minor nature?

Secretary PATTERSON. Well, they don't interfere with any of the main objectives covered in the President's letter, those five that I mentioned. We are in accord with those.

The CHAIRMAN. I take it that what you are essentially interested in is a great power of participation by the armed forces in the weapon side of it, plus a tightening up, as you see it, of the necessary security regulations?

Secretary PATTERSON. Yes, sir.

The CHAIRMAN. Those are two things you wish to emphasize?

Secretary PATTERSON. Yes, sir; until such time as we have international arrangements supported by effective safeguards.

The CHAIRMAN. Thank you very much.
We have with us Dr. Jewett.
Will you come forward, please.

STATEMENT OF DR. FRANK B. JEWETT, PRESIDENT, NATIONAL
ACADEMY OF SCIENCES

Senator HART. Mr. Chairman, I think it might be well for the record to show Dr. Jewett's qualifications.

Dr. JEWETT. I am president of the National Academy of Sciences, which is a corporation set up by Congress to advise government on matters of science and technology.

Until last year, and for 40 years, I was director of research for the American Telephone & Telegraph Co., the Bell Laboratories, so my whole life practically has been spent as an industrial-research director, although I started as a fundamental scientist.

Is that enough of a qualification?

Senator HART. There is one more thing. I have a feeling that the doctor also has high attainments as an engineer. We heard yesterday something about the engineer-versus-scientist argument. Is that not the case, Doctor?

Dr. JEWETT. Well, yes. Of course, it is largely incorporated as an industrial-research director; but I have been president of the American Institute of Electrical Engineers, and I am rated as an engineer by engineers, and as an industrial-research man by scientific people. I suppose the industrial-research people think I am a good engineer, and the engineers think I am a good industrial-research man.

There is, Senator, a bit of qualification in this prepared statement. I would like to make a preliminary remark. I had no thought of asking to be heard at this meeting, and, consequently, I have paid only general attention to the forms of these various bills, or to the testimony. I have been busy on other things.

Consequently, when, through Mr. Boland, I received word last week that you thought some of my views might be of some importance to you, I had very little time to consider the several bills that are under consideration.

When I came to look them over in the little time that I had, I found that they were so voluminous in amount and so involved with an intricacy of minute police powers for an undetermined future, that it seemed to me about the only thing I could do which might be of any value to you would be to try to analyze from my own point of view the problem which confronts you, and all of us, in this sector, and to see if I could find out what the fundamental things were, and then what answer I would myself try to give if I were in your place.

That I have attempted to do, and I have not attempted to consider the bills in detail, although having set down my own conclusions on what seemed to me the fundamentals, I have gone over the bills again to see how far my own conclusions confirmed, or were at variance, to those conclusions. I think possibly what I have done is more by way of a philosophy than it is a detailed consideration of pending legislation. In looking over the bills after I had done this, I found that many of the points that I had in mind have been covered in one or another of the bills. I have some general conclusions about the legislation which I will give at the end.

I listened to part of Mr. Patterson's testimony, and the questions which you asked of him, and they indicated some interpolations which I might make in my prepared statement; but I think possibly it would be better to wait until the end.

Much of this may seem a bit trite, but it seemed to me to go down, from my point of view at any rate, to the grass roots of this thing.

While I have read the bills for the development and control of atomic energy which are now before the Commission, S. 1557, S. 1717, and S. 1463, revised H. R. 4280, and some of the published testimony which your hearings have developed, I have not until the past few days made any serious attempt to formulate my ideas as to the specific form of legislation which it seems to me the situation that confronts us demands. Further, in the few days since I learned last week that you felt my views might be helpful, I have not had time to compare the specific provisions of the several bills critically.

Although I was trained and am rated as a physicist, I am not an expert in nuclear physics. For more than 40 years I have been an industrial-research director. As such, I have been compelled to keep abreast of the advances in fundamental science and to appraise and develop their practical possibilities. This appraisal and development has involved not only civilian usage but military usage as well. Both in World War I, during the interval of peace, and in the recent conflict, I have been largely concerned with military research and development problems.

So far as this particular subject is concerned, I had intimate contact with the atomic bomb development project in the early stages through the selection and appointment of the National Academy of Sciences Committee, which reported on the feasibility of the project, and later as a member of the National Defense Research Committee when it was responsible for the preliminary development work.

With this background, it seems to me that if my views are of any value to the committee they are concerned primarily with the basic factors which should govern the provisions of any legislation which Congress may ultimately enact.

Because of the possibilities for future development in nuclear physics and of the great dangers to the Nation which inhere in these developments if they are not wisely directed, it seems clear that Congress must concern itself with this sector of science and technology in a way it has never before been called upon to do. Further, it should do so as promptly as possible if matters are not to get out of hand both domestically and in our international relations. Until we have a definite policy and one which we can enforce reasonably well within our own boundaries, we will continue in a weak position in our dealings with other nations. For the moment we have won the atomic bomb race and if we had a definite domestic policy as to the future development of atomic energy and a clear picture of how that policy should fit into a world pattern, we could use our commanding position with great power in an endeavor to bring other nations to a common point of view.

In passing, it seems to me that one of the most difficult problems which confronts us, and Congress in particular, in its consideration of proposed legislation, is to decide which side of the street to play.

If we are convinced that the world is sincerely minded to seek to abolish global war, legislation of the kind here under consideration

can take on one pattern. If, however, we are not so convinced and feel that we are likely to be entering an armistice period at the end of which the Nation is likely to be plunged suddenly into a catastrophic fight for its existence, the pattern may be quite different.

The provisions and phraseology of any law enacted will, I think, almost certainly indicate our present judgment as it is difficult for me to see how we can play both sides of the street fully and safely simultaneously.

What are the primary factors with which we must be concerned in legislation designed to implement a policy designed to be in the best over-all interest of the United States? They are, I think, four in number, namely:

1. Fundamental science.
2. Technology, i. e., applied or industrial science as it relates to the use of fundamental knowledge in either the physical or biological fields.
3. Military applications of atomic energy.
4. The incidental hazards to life in the carrying on of experimental and development work; of manufacture and use of highly lethal materials.

FUNDAMENTAL SCIENCE

Some hundreds of years of human experience have shown conclusively that science progresses best and most rapidly when there is complete freedom of intercourse among scientists and full publication of the results of research. This is true not alone within a nation but for the world at large, since no one can foretell where or by whom important advances will be made and each step forward is an aid to all.

This freedom is of importance not only to fundamental science per se but to the technologies which have their roots in fundamental science. Whether they be the technologies of peace or war they cannot go beyond the limits set by their root structure.

Until recently, notably until the military possibilities of atomic energy broke on a war-torn world, few, if any, questioned the validity of this basic principle of scientific research.

If we could be sure of a return to the scientific freedom which existed up to 1939, our course in this sector would be clear. Our national interest would impel us to stimulate prompt publication and interchange of all new knowledge and to keep at a minimum in any legislation anything which tended to hamper it.

Whatever our judgment of the future, it is still a goal we should strive for and strive to have other nations follow. Anything by way of legal prohibitions in this sector is detrimental to the Nation's interest since they limit us to what we ourselves can do in a field where experience has shown that no nation and no people are self-sufficient. Further, any prohibition by us or any other great nation is a breeder of reprisal and suspicion.

If national isolationism in fundamental science had been the rule in the past few decades, there would have been no atomic bomb—certainly we would not have had one. Five years ago it was possible because of a stock pile of fundamental knowledge internationally accumulated for us to embark with assurance of probable success on the technological development of the bomb. Ten years ago no amount of effort or money could have given us or anyone else this assurance—the stockpile of basic knowledge was not complete.

Full international freedom in the dissemination of fundamental research knowledge is, therefore, in the interest of all, no matter what restrictions nations may put on its technological use.

If, however, some powerful nation elects to follow a different course while future wars are still in the picture, it will be a serious matter to legislate for full and free publication. Such a course would mean that the United States would always have less than a complete stock pile of fundamental knowledge with which to build.

If we could have complete freedom within the Nation and complete prohibition otherwise, the situation would be mitigated. This, however, is an impossibility in any save a totalitarian government having drastic powers of regimentation.

To attempt it in our form of government would probably be worse than useless—it could not succeed and the attempt would undoubtedly raise grave international questions as to our intentions. Anything less than free intercourse among our own scientists would be an added serious handicap.

Whatever the final decision of Congress as to the phraseology governing this particular item in a law for the control of atomic energy, it seems to me that Congress should not delegate authority of modification to any board or commission created to administer the law. A matter which affects the future interests of the Nation so gravely in so many different directions seems to me too great a responsibility to entrust to a small group of men no matter how capable.

The CHAIRMAN. Doctor, I don't quite understand your point. I understand that you advocate as free a dissemination as possible of scientific information.

Dr. JEWETT. Yes. Here is what I really meant, Senator. This was hastily written.

Suppose that the Congress should decide that free dissemination of the kind we had a few years ago was in the interest of nations. Suppose they decide that today, and we had created a commission. The situation changes tomorrow or the day after. It makes it appear to some people that that is an unwise provision, that we are doing ourselves damage by telling all and sundry of our creations in fundamental science and that another policy, a policy of restriction, should be imposed. I think that the decision to change from a policy of free dissemination to one of restriction is something which Congress itself should decide and not delegate to some small body of men, no matter how capable.

The CHAIRMAN. We are faced now with an immediate problem.

Dr. JEWETT. That is right.

The CHAIRMAN. We have atomic energy and the necessity for continuing research in the field. We can all agree on that.

Dr. JEWETT. I am talking, you understand, about dissemination of fundamental knowledge to all and sundry. That is what we did before 1939, before the war came on. That was the rule of science—free publication, free discussion internationally.

The CHAIRMAN. Do you think we should restrict it now by law?

Dr. JEWETT. I do not.

Senator JOHNSON. Mr. Chairman, I think it is unfortunate that Dr. Jewett has not read my bill, wherein I hold back some of the delegation of this authority and keep it in the Congress instead, for the reason which he has given—that we don't know.

Dr. JEWETT. You understand that what I am reading here, Senator, was my analysis of the problem, as I saw it, and then I have tried to relate it.

Senator JOHNSON. I understand that, but I wanted to call the attention of the chairman to one of the outstanding merits to be found in the bill which I have recently introduced.

Dr. JEWETT. My point simply is this, that the restriction—whatever you do in technology, whatever you do in connection with war preparedness, and I will cover some of those later—free dissemination of scientific knowledge the world over has been proven to be the surest way of building up the maximum stock pile which the ingenuities of people can use. The minute you try to restrict that, and particularly if it brings about reprisals, then each nation is, in the last analysis, dependent upon what it alone can produce without benefit from anybody else.

If you have been living in a world of free dissemination of scientific knowledge, and a nation suddenly decides to alter that policy, it immediately not only limits itself to its own things, but it immediately raises questions as to why it has done it. So it is a dangerous thing to alter a policy once it has been established by Congress.

The CHAIRMAN. Not established by Congress; Congress simply has never legislated in the field.

Dr. JEWETT. Assuming that it had, and some of these bills indicate the desire for free dissemination of fundamental scientific knowledge. Having expressed that, anything that changes that picture is a serious matter, and I say it is so serious a matter that it should be retained in Congress and not delegated to a small group of men.

Senator JOHNSON. Thank you, Dr. Jewett, for putting a little water on my wheel.

The CHAIRMAN. I don't think the Doctor really has.

Senator JOHNSON. I hope the chairman won't take all the comfort that the Doctor has given me away from me.

Dr. JEWETT. I think before I get through I am going to be like the Kilkenny-cat fight; I think I am going to hit you all. I hope I haven't put any grit on the wheels.

The CHAIRMAN. Senator Johnson's proposal, Dr. Jewett, just came in the other day. You may not have seen it. It proposes the substitution of a 10-man congressional commission to operate this situation, 5 from the House and 5 from the Senate, rather than an executive commission.

I might say parenthetically, I can sympathize with Senator Johnson's point of view. It raises, however, some constitutional difficulties, because we are a nation of division of powers between the legislative, the judiciary, and the executive.

Dr. JEWETT. It seems to me to raise a very practical difficulty, too. Every one of you is liable to get left out in the cold at the next election.

Senator JOHNSON. We will be replaced by others.

Dr. JEWETT. But they wouldn't carry over your wisdom as members of the Commission.

Senator JOHNSON. It will still protect the country, and the control will be left in Congress.

The first paragraph of my bill is very short, and I want to read it into the record at this point, if the witness will not object:

The Congress hereby declares that the problems involved in the regulation and control of atomic energy are s
dependent for their solution

upon developments which will occur in the near future in the fields of scientific research and development and of international cooperation and upon the results of tests with respect to the military application of atomic energy that it would be inadvisable at the present time for the Congress either to legislate with a view to the permanent regulation and control of atomic energy or to vest the powers of regulation and control in any agency other than one directly representative of and responsible to the Congress. It is therefore the intention of the Congress, in the enactment of this legislation, to provide temporarily for the regulation and control of atomic energy and to vest the powers of regulation and control in a Congressional commission composed solely of Members of the Congress.

That is briefly what my bill attempts to do, and it is for the reasons which I have understood the witness is advocating that there are so many imponderables, so many "ifs" in this whole question of control that Congress ought not to delegate too rapidly its authority, and especially its right to make changes as changes seem to be indicated.

Dr. JEWETT. I had not seen this S. 1824 you have been reading from.

Take, for example, on page 2 of S. 1717, the second of the express purposes of the act, what you are attempting to do. It says:

A program for the free dissemination of basic scientific information and for maximum liberality in dissemination of related technical information.

That is an expression of a point of view on the part of Congress, and all I am saying is, that having seriously considered and taken that as a definite point of view, it is not the type of thing that I would delegate to a small group of men. If the Nation's needs require a change, then it is something that the legislative body which passed the original legislation ought, in my judgment, to take cognizance of, whether it does it the way Senator Johnson has in mind, or some other way. All I am saying is, I wouldn't give a commission the authority to modify a point of view expressed by Congress.

Senator MILLIKIN. If you are going to have a free exchange of scientific information, of course, it follows from the statement of that, that it must be truly free among scientists who are not under any sort of coercion. Is that not correct?

Dr. JEWETT. Yes. Practically through all my life, and up to the beginning of this war, fundamental science—I am not talking about technology, now, but fundamental science—operated, and had operated, for a couple of hundred years, on the basis of complete free international interchange of information. Men got together and talked; they formed themselves together in societies; they published papers; they had international congresses; and what we did was to build up an enormous stock pile of fundamental scientific information which the ingenuity of each nation made use of as it saw fit.

On this atomic bomb, of course, our contribution to the fundamental stock pile was small—quite important, but nevertheless small—a different rule obtained, and had we been dependent upon our own contributions to fundamental science, we never could have had an atomic bomb here.

Senator MILLIKIN. In those days, to the extent we had police power states, that power was not exerted on the true scientist, was it?

Dr. JEWETT. No; very little; and the evidences are these international associations and congresses. People get together and talk, and every time a new bit of information comes out which is valid—and the scientists are pretty careful not to publish stuff they don't think is valid—it is published and disseminated broadly.

Senator MILLIKIN. Is it not conceivable that scientists in police power states might be under such coercion that what they put out

by way of exchange might be a slanted type of goods rather than a free and honest and uncoerced type of goods?

Dr. JEWETT. Yes; it might even go further in a completely power state and have them pass out no information. So, then, what you have got, if you have that sort of situation—and we are following a different philosophy—is that they have all that we have, plus what they have; and we have only what we have, ourselves.

Senator MILLIKIN. We are getting the short end of the swap?

Dr. JEWETT. Sure.

Now, if I may interpolate, if I had to make the decision at the present time with regard to this, despite the fact that I am very skeptical about the world's ability to abolish war, although at any rate we are making an attempt to do it, I think that rather than take the horn of the dilemma of saying we will not disseminate fundamental scientific knowledge, and raise all the suspicions as to our motives why that occurred, I would try to bring about free interchange again, and be guided in the future by what the results were.

Senator MILLIKIN. Of course, you are aiming at a goal of free interchange of science, and I assume that you mean free interchange of science.

Dr. JEWETT. That is right.

Senator MILLIKIN. Up to the time that you achieved that, of course you do not have a free interchange of science. You either have no exchange, or a partial exchange, or a slanted exchange. Is that not correct?

Dr. JEWETT. Correct.

Senator MILLIKIN. From that may we not conclude that until you also have a free interchange of all kinds of information, that you cannot isolate this particular type of exchange?

Let me put it another way: Must you not evaluate what you are getting against the background out of which it comes?

Dr. JEWETT. I think the answer to that is "yes," but when you say "free interchange of information," I don't think you can or ever should or ever will have a free, completely free, interchange of all technological information. I don't think you will ever have that within the Nation, itself, because that represents the skills and techniques which men in a competitive world, or nations in a competitive world in peace, use. They won't pass that kind of information out.

Senator MILLIKIN. I quite agree. I was speaking of the general liberty of the press; the general free interchange of information, political information, all kinds of information.

Dr. JEWETT. I think it is all tied up with the same thing.

Senator MILLIKIN. Yes; it is; and unless you have that you do not have the factor against which you can evaluate what you are getting.

Dr. JEWETT. Let me see if I can state my personal point of view again.

If I had to make the decision, we, as a Nation, have set our hands, rightly or wrongly, to the idea of making this UNO work. Now, having done that, as the lesser of two evils in a world where I may be suspicious of the motives or intents of other people, I wouldn't compromise my decision by an act which indicated that I didn't believe that the thing that I was shouting about was going to work; but I would be darn well prepared to make a change if I found the thing wouldn't work.

Senator MILLIKIN. In other words, if you were sitting up here, and had to make recommendations for the security of the Nation, you would look at the picture exactly as it is and govern yourself accordingly, would you not?

Dr. JEWETT. Yes; that is right.

The CHAIRMAN. Doctor, as I take it, you don't want any legislation now of any kind giving anybody the right to pass upon what kind of scientific information should be disseminated, and what kind should not be disseminated?

Dr. JEWETT. I think my answer would have to be "yes" to that, on the ground that in the over-all interest of this country, I think in the field of science the goal of free interchange is in our best selfish interest, because it tends to build up the greatest stockpile of knowledge. We are an ingenious people, and we think we know how to use information pretty effectively. I would hate like the dickens to go into another crisis X years hence with one hand tied behind me because of the lack of some information that was obtainable.

The CHAIRMAN. Of course I agree with your general philosophy, but in drawing the bill I also realized that we had to set down some guidance for the Commission in handling this very dangerous matter. I cannot reconcile your general philosophy with what I consider to be the broadest possible provisions to implement that philosophy with regard to this very explosive situation.

Dr. JEWETT. In that section of 1717 which I read, you did express the philosophy, a broad philosophy, and I agree with it.

Now, all I have been trying to say is that in this bill—and I didn't have this bill, or any other bill particularly in mind—having expressed that as the national point of view, as reflected through the Congress, I would certainly not give any appointed small group of men a power to change that view without coming back to Congress. That is the only point I was trying to make.

The CHAIRMAN. Today, the way the Manhattan project is operated, you realize that there is no information coming out of it at all, that over a month ago recommendations were made to General Groves for the release of certain scientific, basic scientific, information, and, so far, there has been no action on that matter at all. That is just being bottled up, you see.

Dr. JEWETT. Well, I don't know enough about what is in the Manhattan district project to know; but I suspect that the great bulk of the stuff that is in there is not basic scientific knowledge, but is technical knowledge, and that is quite a different breed of cat.

Senator HART. Doctor, is it your estimation that with the publication of the Smyth report, and what has gone on incident to that a little more, we already have given the world about all of the fundamental scientific secrets that we had in this project?

Dr. JEWETT. Well, I certainly think that with all that has been published and said so far, the proof positive of the fact that the problem can be solved was in Hiroshima and Nagasaki. If you gave out more in detail, you might shorten the period when somebody else so minded could solve the thing. The fact they know the problem can be solved, plus what has already been given out, makes it seem to me perfectly clear that anybody who wants to pay the price for it—it may be a big price—can do what we have done.

Senator HART. Doctor, you are talking about technological secrets?

Dr. JEWETT. That is right. Most of the fundamental facts were known before we started the project.

Senator HART. You don't think we actually had held back?

Dr. JEWETT. I simply don't know, but I know that the great bulk of the basic knowledge was the common stock pile with which we started. The situation at the time that I was asked to appoint this Academy committee to review this thing about 5 years ago was one which had to be judged on existing knowledge. The report of the committee indicated the probable feasibility of doing this thing, and was based solely on a common stock pile of knowledge which indicated that the thing could be done. It was a highly difficult technological problem, and it was very much of a gamble as to whether within the limits of a war you could solve the problem. But it looked as though you might if you were willing to pay a big enough price for it, and the end of the road was success.

Now, that situation no longer exists anywhere in the world. There is no question as to the ability to succeed; we have succeeded, we have proved it, so that anybody who wants to start now, even if they started with no more information than we had at that time—and they have a lot more—would know perfectly well that they could succeed if they were willing to pay the price for it.

Mr. Chairman, did I make clear the one simple point I had when I read that last sentence, that Congress having expressed a point of view representing the point of view of the Nation, I think it would be very dangerous for any lesser authority to modify that point of view.

The CHAIRMAN. Even the War Department?

Dr. JEWETT. I don't give a—yes; even the War Department.

Senator MILLIKIN. I wish you had finished that; it would have been very refreshing.

Dr. JEWETT. Senator, I have worn both uniforms, you know.

The CHAIRMAN. I think we understand.

Dr. JEWETT. Shall I go on?

The CHAIRMAN. Surely.

TECHNOLOGY

Dr. JEWETT. In some respects the ground rules governing technological employment of fundamental science are similar to those governing basic knowledge; in other respects they are different.

Industry has gradually learned that so far as possible it is in its best interest and the best interest of its individual units to foster publication of results and free intercourse among its scientists and engineers. It has four avenues for this, namely, publication in the scientific and technical press, the open discussions of scientific societies, the publication of patents and the evidence which the use of its products give to all who have access to them.

Patents are a peculiar form of publication which are open to technology but are rarely employed in fundamental science. They are usually more specific in their disclosures of new things than are ordinary scientific papers and they endow for a time the thing disclosed with a property right which can be legally maintained. Since they do not, however, prevent anyone from employing them for experimental purposes in a search for improvements or alternatives, they are in addition to ordinary scientific disclosures.

The principal fundamental in which technological development differs from basic scientific research lies in the field of techniques and skills. These represent the ingenuities of the technologist and determine his ability to survive in a competitive situation whether it be the competition of peace or the greater national competition of war. In varying degrees that are closely guarded—that is the techniques and skills—and so long as the question of survival and competition continue they will continue to be despite legislation to the contrary.

Experience, and our own experience particularly, has shown the wisdom of stimulating a free technology as widely as possible with a minimum of governmental restraints. This is true for both peace and war. Our astounding achievements in World War II were due primarily to the magnitude and power of our national technological structure and not to our preeminence in fundamental science or in our specific military preparations.

Nothing, so far as I can see, has developed during the war to alter our established attitude toward technology.

The coming of the atomic bomb has introduced a new factor—it has not destroyed the old ones. It requires a new appraisal and alignment and some modification of the rules. Whether the future is to be one of war or of long-continued peace, the best interest of the Nation will be served by the fullest possible development of this new sector of science. Every unnecessary legal restraint should be avoided since each restraint in one way or another deprives us of maximum ability to meet unforeseen crises when they arise.

MILITARY APPLICATIONS OF ATOMIC ENERGY

So long as war in the future and the maintenance of an Army and Navy are considered an essential part of our social structure, the age-old rules which govern military thinking and acting will persist. No legislation will change them, nor should it.

There are some military things deemed by military men to be of such importance to the Nation that even in the stress of war they are not willingly disclosed even to an ally. This is no narrow clannish thing—it is grounded in age-old human experience. The friend of today may be the enemy of tomorrow or the friend or ally of an enemy. We have recently had a vivid illustration of this in the quickly altered positions of Germany and Russia and of Russia and Japan.

It would, therefore, be hazardous in the extreme to enact legislation which tended to weaken the control of the military on maintenance of secrecy on the military technological developments of atomic energy. If such weakening is justified in this sector, there is little merit in trying to maintain it in other sectors.

In saying this I do not wish to be understood as advocating military dominance or control over the future of fundamental science or civil technology in the domain of nuclear physics, or any other domain for that matter. Quite the contrary.

While I am clear in my own mind as to the ultimate responsibility of the military in those fields of technology which are solely or primarily military, I am equally clear that they should not be in position to dictate in other fields. If restraints in such fields are needed because of military requirements, they should, in my judgment, be otherwise imposed.

It is in no sense a derogation of the capacity of professional military men to say that as a group they are ill qualified to administer fundamental science or civil technology. Their incapacity as a group resides in the fundamentals of their assigned task and in the influence of a lifetime of training for that task. Any of us in their position would be similarly affected.

Specifically, the factors are three: The requirement of implicit, unquestioning obedience in time of battle; the consequent deferring to higher human authority; and the necessity of making instant decisions for action on the basis of meager data, all three of which, I might say, are antagonistic requirements certainly for fundamental science and for civil technology.

If these views are valid, and I think they have merit, it seems to me that any legislation which is enacted should be carefully scrutinized to insure that the real interests of the military are safeguarded without putting them in position to impose these interests detrimentally on other sectors.

HAZARDS

There is little that needs to be said about this factor other than to mention the fact that experimentation in some sections of nuclear physics, some of the substances involved which have to be handled technologically and transported, are of a character which involve hazards to life or jeopardy to the functioning of other nearby essential things.

They constitute therefore a matter which involves the attention of government. That attention, however, is not different in kind from the attention which government gives to the employment of other hazardous things. It is the exercise of the minimum of police power needed to insure safety without unduly hampering individual or group initiative.

CONCLUSIONS

On the basis of the foregoing and other similar considerations which seem to me fundamental, I have tried to formulate my own views as to what legislation should seek to accomplish if we, as a nation, are to derive maximum benefit from future developments.

In the present state of our scientific knowledge all of the numerous prospective values of atomic fission are tied to the utilization of certain raw materials which must be mined, processed, and manipulated whether the end sought is in industry, the military, or the fields of biology and medicine.

It seems to me that government, the agency for all of us, should as a primary act take control of all such basic material and such of the secondary products as require control. This whether these are locally produced or imported.

Under this primary control, I would grant licenses freely to responsible men or groups for mining, processing, industrial, or other uses under conditions of strict accountability for all such materials and full reporting as to the use made and of adherence to such regulations concerning hazards as might be prescribed.

In a word, I would seek to have the legislation encourage maximum development with a minimum of restriction and a minimum of policing.

From the nature of the subject matter, I would make the penalty for willful violation of the license severe.

Because of the peculiar nature of the materials involved, policing of any major operations is simpler than for most other things.

In a way the pattern I have in mind is not dissimilar to the one employed in the control of narcotics and dangerous drugs. Any of us can get these things on a valid prescription but not otherwise. The control is in the control of the State through its licensing and reporting system. The doctor is licensed to issue the prescription and is under constant threat for violation; the druggist will honor the prescription and must make full accounting for all materials in his possession under threat.

Senator MILLIKIN. I should like to ask the witness how far he would go in the location and development of mining claims. I assume that the witness is familiar with the way in which claims are made, and the effect upon the public domain.

Dr. JEWETT. Fifty years ago when I lived in a mining country, Senator, or 40 years ago—

Senator MILLIKIN. It hasn't changed any; it is the same thing. Don't you think that a supervision over the mining—I am talking now about the prospecting and developing of mining claims—so long as you are dealing with the raw material would be sufficient?

Dr. JEWETT. Yes.

Let us talk specifically about a mining claim where the fellow is getting out uranium, if you like. All right, he has located a claim, gone through the necessary processes, and I think all I would do for that particular material would be to say, "Go ahead and produce all you can, but you have got to report everything in the thing." In a way, that is what we are doing with gold, at the present time, isn't it?

Senator MILLIKIN. Yes; and silver.

Dr. JEWETT. In other words, that particular material became a matter of national interest, which is peculiar to that particular thing.

Senator MILLIKIN. You wouldn't suggest that all the mining area of this country, because it might have some uranium content, should be subjected to Government ownership, would you?

Dr. JEWETT. No; I should think not; because I suspect that you could find a little uranium in almost any piece of soil.

Senator MILLIKIN. Testimony we have had concerns that.

Dr. JEWETT. So the question would then become a question of where do you draw the line in this thing. How much uranium is uranium?

Senator MILLIKIN. A fellow goes out and stakes a claim and makes a discovery, and he finds some ore that had some uranium in it. If he has to report that, the Government then has an opportunity to walk in and see what happens to it, and is that not sufficient at that stage of the game?

Dr. JEWETT. Personally, I think so, and I think insofar as you can put the controls back to the limiting things, you have exercised the greatest control you can without an enormous amount of police power.

Senator JOHNSON. Couldn't that then be controlled through some control of assaying, or sent in to be analyzed, and couldn't the assayer be required to report any important quantities of uranium, or other fissionable products? Couldn't he be required to report that so the Government would be on notice?

For instance, the amount might be very small, and the mining operation might desire to throw out the uranium; but it seems to me that this ore has become so important now that the Government should be put on notice that certain ores do contain this element, and it could be handled through the assayer.

Dr. JEWETT. Yes; it could be handled there. I had not tried to think the thing out. I would assume, if you adopted the reporting system as a means of control, it would apply to any links in the chain that were important. I don't know enough about the drug and narcotics thing, but my understanding is that a company producing morphine is compelled to report how much they produce, and where it goes, under penalty; the wholesaler, when he gets it, has to keep his records; and the retailer has to keep his records, and, finally, the physician's prescription, which takes a certain small amount of that out of stock, is the defense which the druggist has for accounting for the amount of material in his possession, and so it goes right on back.

And who is this fellow who finally gives the order which begins to take this out into the general population? He is the man who the State—not the United States; in this case, but the State—has licensed to do that very thing. Why? He has had a kind of training, has passed a certain kind of examination, and he is the uppaid agent of the State authorized to disseminate this very deadly thing.

But the whole thing has to match up, and if the controlling agency finds there is a big discrepancy somewhere along the line, it serves notice that you have to look for it.

Senator JOHNSON. In the production of carnotite ores, where vanadium is the objective, it might be much easier, and much less expensive to the mining company, to let the uranium part go on down the river and go in the dump to be wasted.

Dr. JEWETT. It might, from their standpoint, but if the control agency, commission, or whatever you have, felt that that material should not be wasted, then they could step in, if they knew about it.

Senator JOHNSON. Yes; of course, and the important thing is that they know about it.

Dr. JEWETT. That is right, and I don't believe that you can get that thing. I think if you start at the place where the factors are the least, you have the biggest change of control. The minute you try to get a policing policy that goes out and polices everybody, it is like OPA. I suppose it is correct that the British did a better job of rationing food during the war than we did. If that is so, the reason is quite clear. A large part of England's food supplies came in through a limited number of inlets, and they had control of the thing where the thing was easy to control. With us scattered all over a continent, we have thousands of inlets into the final stream, and it is almost impossible to control.

PATENTS

I would not attempt to incorporate special patent provisions in the basic law governing atomic energy. They have little or no place, so far as fundamental science is concerned. In the field of technology, they are not different in kind from patents in other fields and should, I think, be controlled by such general laws as Congress may enact. If experience indicates need for special patent treatment in this field, Congress will be in far better position to enact wise legislation as a

result of it than to make the attempt now when so much is conjectural and speculative.

CONTROL BODY

It seems to me that on account of the character of the problem an independent administrative and control board or commission with clearly defined duties and responsibilities and with definite limitations of power is indicated. Clearly at this stage such a board should be composed of men of the highest caliber and integrity.

Whether such a board should be full or part time, compensated or uncompensated, are rather secondary, I think, provided it is implemented with an adequate executive staff.

The board should be wholly or predominately civilian. If wholly civilian, it should have suitable liaison representatives from the military services. If partially military, I think such membership should be limited to a single representative from each service.

I am strongly of the opinion that secretaries of executive departments or heads of bureaus should not be designated as members of the board. This is not because I doubt either their ability or competence, although in many cases they may not have the specific competence for this particular job. Rather, it's because my experience has indicated that such men having heavy loads of other work are forced almost invariably to delegate their duties to subordinates.

In extension of that last remark, I would like to make a remark to show that it isn't just theoretical.

As president of the National Academy of Sciences, by law I am the chairman of a Federal independent agency which Congress set up, the board of which is composed of civilians, and the heads of three of the great departments—the secretaries of three of the great departments—and I have been in that position for 6 years. Not once in that 6 years have I been able to have a full meeting of the board, or any meeting of the board, except once, when any of the secretaries was able to be present. They were always represented. The board could operate because the majority were civilians who did appear, and the secretaries always concurred in the findings of the board. But the board was deprived of the actual presence at the discussions of the men who were designated by Congress to serve. Now, they were represented by their subordinates, and it wasn't because they didn't want to serve. It simply was because it was an additional load placed on already too busy men.

So it is a fallacy, I think, to assume that the designations of heads of great operating departments would mean that they could give the attention to specific things of this kind which they are or should be capable of giving had they the time to serve. That is why I am opposed to that sort of thing.

The CHAIRMAN. Do you think they are any busier than Senators?

Dr. JEWETT. I doubt if they are as busy.

I can conclude my remarks, Senator, very promptly.

After I got my ideas oriented that way, I went back and started to look over the three bills which had been sent to me, and these are the conclusions I came to.

I realize that you men are struggling to reach a common judgment and that what you do will not be exactly in the pattern of any one of these bills. From the very nature of things, the reason you are sitting

*President
Not head
of Services.*

around here talking is that you are trying to find an answer which represents the best judgment of the group.

What I am going to say is no particular reflection on any of these preliminary bills. It seemed to me that taking them as a group they are far too long and too detailed about an unknown future. They put the wheels in motion of a delegation of authority, and the setting up of machinery that once set up is difficult to change.

I should think the thing to do when you get through with your hearings, which is probably what you will do, and which is a one- or two- or three-man job, is to boil this thing down and put the acid test on it against some fundamentals. What are we trying to do? What is the minimum of legislative action that we should take to insure doing that thing? What is the best machinery to administer the will of Congress on the thing?

I think you should come out with a much shorter statement than I have seen in any of these bills. I would start at the grass roots of the raw materials, and I would build my police power up only so far as it was necessary to insure what I wanted. I think I would insist that everybody who dealt in this field that Congress thinks is important should be under very strong command to make a full accounting for what he does.

Now, in going over the bills, and having listened to some of the questions you asked Mr. Patterson, and using S. 1717 simply as an example, as I went through it I made some notes here, and I have indicated what I would do.

If you are going to set up a commission subject to the observance of a minimum of restrictions, I would give practically everybody who is reputable, whether it be an individual or a group, who had the facilities and who was willing to observe the rules—I would give them a license to go ahead.

The military services are one of the parties that I would consider. I think the provision in 1717, for instance, for the control of the military, is not only a dangerous provision, but I think it won't work. Isn't it in 1717 where the Commission will take complete control of developments of military matters? I don't think any civilian body can or should usurp or take over the responsibility of the military.

As I listened to Mr. Patterson, I think that was his feeling, too. I would treat the military applications, as long as we have got to have an Army and a Navy, just as I would the applications of an industrial concern or a college. The Commission has full control, and should be fully informed as to the general use which is made of material which is turned over to any of its licensees; but when it comes to the development of the technique of using that material for military purposes, I think as long as we have an Army and the Navy and the Air Corps, we have got to lodge the responsibility for proper use in them, and I don't believe any group of civilians can take it away from them, or take it away from them safely. I would treat the Army and the Navy under your Commission just like I would treat anybody else. Sure, they will be the biggest ones. They will be operating in a peculiar field, and they will be under necessity of reporting to this body, which is the agent of Congress in the whole, as to what general use they have made without disclosing the technical military values, so your agents will at all times know how much material there is, about what it is being used for.

Personally, I certainly wouldn't put a military problem in the hands of a civilian commission.

The CHAIRMAN. Are there any questions?

Senator HART. I have one question, Mr. Chairman.

I am sure you have had lots of experience with security, Doctor. Do you think that on the assumption that we need to continue to keep secrets, that the Espionage Act is sufficient, or should there be something in this law?

Dr. JEWETT. It has been so long, Senator, since I have read that, that I am really not in a position to answer. My impression is that it is not enough.

May I make one other observation, Senator, which may or may not have any bearing on what you are considering. I think I wrote a note to Dr. Condon on it. It has to do with the power possibilities of atomic energy.

As I say, it might not have any place in this particular legislation, but it is a thing that I think ought to be borne in mind. In the last analysis, the utilization of energy from whatever source it is derived is not wholly a scientific or technical matter; it is an economic matter.

We use water power, we use steam power, or what not, if both are available, depending on which one is the cheaper for us. At the present time, we get practically all our power from the utilization or burning of some form or other of coal or oil or their derivatives. We know we are still far from the maximum of what we can do there.

If you come down to atomic energy, the kind we are talking about here, or any kind of atomic energy, you don't want to forget that the greatest manufacturing plant for atomic energy is outside the earth; the sun is the greatest atomic energy producer that there is. It does part of the manufacturing process, and sends part of its end product down here. What we are dealing with in this thing here is what the solar system did billions of years ago and left us some half fabricated materials in the crust of our earth, and we are carrying these things on.

But the sun is pushing down energy here all the time, and, of course, there have been all sorts of talk from time immemorial about harnessing the sun's energy, usually in a piffling way.

But there is one place where the sun's energy is harnessed continuously in large amounts, and that is in the growing things in the tropics. Now, we all know that hither and yon people have made attempts to get mechanical energy out of the results of growing things, notably in alcohol produced from sugar, or other wood products. But never has anybody attacked that problem in its entirety and on anything like the scale which the Manhattan district project attacked this particular one.

While nobody could say what the future has in store, I personally think that we, or anybody else who is able to do so, could pour hundreds of millions of dollars, and all the manpower in a coordinated attack on this problem involving the botanists in their modification of the species of growing things, the biologists, the chemists, physicists, and engineers on the thing. It is not at all inconceivable to me that in some distant time you will find atomic energy being put into the power field via the atom-splitting business in the sun through this kind of thing.

All I am saying is that insofar as that kind of a possibility has any influence upon the power and energy side of this thing, even

though it has no place in your present legislation, you want to remember, I think, that there is always the possibility that no matter what technologically we can get out of this by power, it may not be economically the cheapest kind of power that you could get from atom splitting.

The CHAIRMAN. Thank you very much, Dr. Jewett. We are delighted to have had you, Doctor.

The committee will meet at 10 o'clock tomorrow morning to hear Major de Seversky, and some other witnesses.¹

(Whereupon, at 12:55 p. m., the committee recessed until 10 a. m., Friday, February 15, 1946.)

¹ For the statements of Major de Seversky and other witnesses who appeared before this committee on February 15, see pt. 5 of the hearings on atomic energy. The hearing on that day was not part of the series of hearings on S. 1717.

ATOMIC ENERGY ACT OF 1946

MONDAY, FEBRUARY 18, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to notice, at 10 a. m., in room 312, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Austin, and Hickenlooper.

Also present: Dr. Edward U. Condon, scientific adviser to the special committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. Mrs. Stone is appearing for the League of Women Voters.

STATEMENT OF MRS. HAROLD A. STONE, DIRECTOR, NATIONAL LEAGUE OF WOMEN VOTERS

Mrs. STONE. I have with me Mrs. Allan C. G. Mitchell, director in charge of foreign policy for the League of Women Voters, and I would like her to present a brief portion of the testimony. I am Mrs. Harold A. Stone, a director of the National League of Women Voters.

In appearing before the Special Committee on Atomic Energy, the League of Women Voters would like to divide its testimony into three parts. First, we believe that we should express our preference for putting the new agency for the control of atomic energy under a single head and within the regular framework of the executive branch. Second, we should like to express our approval of many features of the McMahon bill, although pointing up several provisions which the League would like to see changed; and, third, we should like to state our opposition to the May-Johnson bill.

The league believes that the drama of atomic energy has confused both the leaders and the people of the Nation and caused them to overlook the tested and familiar pattern created by our Constitution for holding the administration of the most important aspects of government within the immediate framework of the executive.

Finding suddenly a new and infinitely greater kind of power in the possession of our Government, we have cast about frantically for some mechanism and some omniscience to assure its proper use. We have longed for some social invention, and wished for some supermen to assume this staggering new responsibility, which has seemed too much for ordinary mortals and mortal institutions to cope with.

427

We have no new institution. We have no supermen. Several months of sobering reflection have led us back to what we have. We have a representative government with a legislative and an executive. These two branches have mutual responsibilities for the conduct of our Government. The legislative branch enacts the laws. The executive branch administers them.

The League of Women Voters believes that atomic energy should be controlled by our Government in the public interest and its benefits developed as rapidly as possible. It recognizes the immensity of the administrative problem involved in controlling the production of atomic energy, already a \$2,000,000,000 project, already functioning, daily adding to our supply of a vast new source of energy. We recognize that this is indeed something new—that never before has our Government held the responsibility from the beginning for a new source of power, which promises intimately to affect the daily lives of all of us within a few years.

The League of Women Voters believes that the situation calls for administrative skill of the highest order, that we should apply the best of our knowledge of public administration in setting up the new agency. We believe that authority and responsibility should be direct and simple, visible to the citizen. This can be done best, we believe, by placing the agency under the direction of a single head, appointed by the President with the advice and consent of the Senate. The importance of the agency would probably command for its head a position in the President's Cabinet. The League of Women Voters believes it of great importance that the work of the new agency be coordinated with the work of other Federal agencies through the already established executive organization. The ramifications of atomic energy will not be confined, but will inevitably reach out and affect the work of every major department of the Government. The league, therefore, believes that the new agency must be directly responsible to the President, who is in turn responsible to all of the citizens. It is the President, in our system of government, who alone can coordinate the work of the various executive agencies. To limit the authority of the President over the new agency for the control of atomic energy, would make it difficult, and might eventually make it impossible, for him to discharge his constitutional duty as Chief Executive.

The league believes that we should not place this great new function apart from the executive in the "headless fourth branch of government," responsible to no one and impossible of coordination with the general policies and work of the Government. Atomic energy is not something which may be kept apart, unsullied by the many other aspects of government with which it will inevitably be interrelated. That it is fraught with such significance to our citizens, is all the greater reason why the new agency should be directly responsible to our duly elected Chief Executive. We believe, therefore, that the Congress should create a new agency, with a single head, responsible to the President.

Because there are many new and unknown aspects of atomic energy, the league believes that the law should provide for a small advisory commission to assist the Administrator. This would be composed of eminent civilians serving on a part-time basis.

The CHAIRMAN. Pardon me a minute. Would you advise that the one-man administrator be a civilian or a military man?

Mrs. STONE. A civilian. I will come to that again.

Even though we differ with the basic structure, preferring a single administrator rather than a commission, the League of Women Voters believes other provisions of the McMahon bill are excellent and should be incorporated in whatever final legislation your committee recommends. The league agrees that control of atomic energy should be vested with the Government, and that it should be under civilian control. We believe that the provisions for licensing and control are excellent, retaining, as they do, national control over production of atomic energy, while allowing private-enterprise ownership of source materials, byproducts, and devices for the application of atomic energy.

The provisions for the free development of scientific research, with adequate safeguards of technical data where it relates to national defense, we believe to be good. It is wise that the new agency carry on research but have no monopoly on research. The provisions for inspection and for safeguarding health are also adequate.

Because of the league's deep interest in international cooperation we note with special approval the provisions which would assure that our domestic policies for atomic energy not conflict with our international policies. We are also especially glad to note in previous testimony preponderant agreement that the agency should be a civilian agency. We are pleased that the bill so provides.

The league believes that it is an extremely wise provision that the quantities of fissionable material to be produced should be determined by the President, and that the President should specify what atomic weapons are to be used by the armed forces.

With the provisions for the internal organization of the Commission, the league must differ emphatically. Divisions of the agency should not be specified by statute, nor should their heads be appointed by the President with the advice and consent of the Senate. We believe that it will not help the President to give him the power to appoint such division heads. Such appointments threaten the unity of an organization, and make it difficult for the head of the agency to be held responsible by the President. Such provisions do not make for good administration. They foul lines of authority and responsibility and make for confusion, buck-passing, and stalemates when important decisions are at stake. Specifying the internal arrangement of the organization makes for a rigid rather than a flexible organization.

The league believes that if the Congress does create a commission, a general manager should be provided and that the heads of divisions should be appointed by and be responsible to him, in order that he may in turn be held responsible by the Commission.

The CHAIRMAN. Mrs. Stone, theoretically there might be something to be said for your observation about making it too rigid. I have in mind, for instance, the Department of Justice, with which I used to be associated. The five Assistant Attorneys General are nominated by the President and confirmed by the Senate. As a matter of practice, the Attorney General nominates them.

Mrs. STONE. I realize that, and there is, of course, the possibility that it would work out that way.

Now, I would like to comment briefly on the May-Johnson bill. The League of Women Voters is opposed to the May-Johnson bill. We believe it unwise to create a large and unwieldy commission over which the President of the United States would have so little authority. We believe that the bill emphasizes military security, rather than the development of atomic energy for peacetime uses. We disapprove of the broad powers granted the Commission, particularly because of their implications for our foreign policy. It would be possible for the Commission proposed in the May-Johnson bill to cripple or run contrary to the foreign policy of the President and State Department, since it would have the power to determine the quantities of fissionable material to be produced, and how much should be made into bombs. We believe that to give the Commission power to issue restrictive regulations on the dissemination of scientific information might result in the hampering and restricting of the development of science. Finally, we believe that the Government must be the sole owner and producer of fissionable material, and that the provisions of the May-Johnson bill which would permit private ownership of such materials are loosely and dangerously drawn.

We should like to comment on another aspect and that is whether or not the proposed legislation would fall under the Reorganization Act of December 1945.

The league has followed with great interest the law providing for the reorganization of the executive establishments, which Congress so wisely passed in December 1945. We believe that the new agency for the control of atomic energy should not be exempted from the provisions of the Reorganization Act.

In summary, we wish to make it clear that the League of Women Voters is opposed to the May-Johnson bill. We support the McMahon bill in all of its important provisions for the control of atomic energy, although we should prefer to see the agency headed by a single individual, responsible to the President, rather than by a commission.

With me is Mrs. Mitchell who has a brief statement on the international aspects, and if it is possible, she would like to read that.

The CHAIRMAN. Thank you very much, Mrs. Stone. Of course, we are directing our attention now to the domestic aspects, but I am sure we would be glad to hear Mrs. Mitchell.

**STATEMENT OF MRS. ALLAN C. G. MITCHELL, DIRECTOR,
NATIONAL LEAGUE OF WOMEN VOTERS**

Mrs. MITCHELL. Senator, we realize that these hearings are on the domestic legislation. However, we feel that the two aspects of the problem will ultimately be closely tied, and we support the provisions in the McMahon bill so wholeheartedly because they seem adequate to enable the correlation between the domestic legislation and eventual international agreements. I have just a few words about the general philosophy of the international arrangements, when they come.

The league feels very keenly that the international program for the control of atomic energy must always be considered in the light of the

pledges which the United States and other United Nations have made for the establishment of a collective security system.

We feel that the whole success of the collective security system will to a large extent depend on the ability of the United Nations to devise a workable program for the control and reduction of armaments. I think it is quite obvious that any excessive or uncontrolled armament on the part of any of the United Nations, particularly a great power, would be a constant threat to United Nations system of joint defense. Therefore, the problem of the control of atomic weapons is a part of this larger United Nations problem of the control and reduction of arms as a foundation for the new world system of joint responsibility for security.

The League of Women Voters believes that the United States, as a permanent member of the Security Council and at present the sole producer of the bomb, should take the lead in bringing about United Nations agreement to reduce and regulate arms. In order to assure adequate control of atomic weapons—because that does, of course, present a very difficult technical problem—the Security Council should be responsible for supervising the production and use of atomic power.

The Security Council should control weapons derived from atomic energy as part of an international program of arms control under which all nations would submit to such agreed-upon controls as exchange of information, registration, inspection, and licensing.

The CHAIRMAN. Thank you very much, Mrs. Mitchell and Mrs. Stone.

Mr. John Parker, will you come forward?

It is nice to have you with us this morning, Mr. Parker.

You are vice president of the Consolidated Edison Co. of New York?

Mr. PARKER. I am.

The CHAIRMAN. You have a prepared statement?

Mr. PARKER. I have, sir.

The CHAIRMAN. Will you go ahead, Mr. Parker.

STATEMENT OF JOHN C. PARKER, REPRESENTING THE ASSOCIATION OF EDISON ILLUMINATING COMPANIES

Mr. PARKER. My name is John C. Parker. I am speaking for the Association of Edison Illuminating Companies. I am a member of the executive committee of the association and chairman of its special committee on appraisal of atomic energy as a source of electricity supply.

The association is very glad, responsively to your request, to present before your committee a prepared statement authorized by the association, a 60-year-old association made up of operating companies serving the majority of the customers of the light-and-power industry.

The association was, as I have said, founded a little over 60 years ago and is made up of member companies who, since the beginning of the electric light and power industry, have served communities widely scattered throughout the country. The association is devoted to the advancement of electric service to the public for light, heat and power. It has consistently throughout its existence operated primarily as a conference of executives with the assistance of the technical and commercial personnel of the member companies for the

purpose of interchange of ideas and information looking toward high standards of dependability and flexibility in service and to the enhancement of operating economies and progressively and consistently lower charges to the consumers. Its member companies are not manufacturers of equipment.

That the association regards very seriously the possibilities of atomic energy in the field of electrical energy production and its responsibility to help in its development is evidenced by the fact that this is the first time in its long history, to my best knowledge and belief, that the association ever has made an appearance before a legislative or administrative body. It is now doing so through a special committee whom I represent, and which has been set up to explore and appraise both the favorable possibilities and the limitations that may affect the use of atomic energy in the field of electric power supply.

The committee consists of five members, all engineers and executives, each in one of the important utility enterprises of the country.

The membership of the committee is:

Alex D. Bailey, executive vice president of the Commonwealth Edison Co. of Chicago, formerly president of the American Society of Mechanical Engineers.

Kilshaw M. Urwin, who is present this morning, manager of the engineering department, Philadelphia Electric Co., formerly vice president of the American Society of Mechanical Engineers. For nearly 6 months during hostilities in Europe Mr. Irwin was in England and on the Continent serving as executive director of the London staff of the Public Utilities Committee of the Combined Production and Resources Board. He is at present chairman of the power generation committee of the association.

James W. Parker, president, the Detroit Edison Co., formerly president of the American Society of Mechanical Engineers.

John C. Parker, formerly president, Brooklyn Edison Co., Inc., more recently vice president, Consolidated Edison Co. of New York, Inc. (in charge of planning, development, and research), formerly president, American Institute of Electrical Engineers.

Philip Sporn, executive vice president, American Gas & Electric Service Corp., the recipient of the Edison Medal of the American Institute of Electrical Engineers for 1946.

Each of these men, during the war period, served as consultant to one or more of the defense offices, including the War Production Board and its predecessors, Foreign Economic Administration and War Manpower Commission.

The secretary of the committee, Ward F. Davidson, who also is present this morning, research engineer of Consolidated Edison Co. of New York, Inc., has devoted practically all of his time since early in 1942 to the work of the Office of Scientific Research and Development and is at the present time Deputy Executive Officer of the National Defense Research Committee thereof.

It is believed that the men who comprise this committee are (1) of such a character that they are able to appraise technical possibilities and at the same time to measure the economic and social results that can be obtained in a new technique; (2) well grounded in the tradition of the utility industry which continuously has sought to advance the results of scientific development into practical realization through

stimulating manufacturers to produce equipment embodying the latest scientific developments, through the assembly of such equipment into generating and transmission systems, and through the persistent supervision of its operation into successful realization; (3) well fitted to contribute to the development of atomic energy along engineering or practical lines and to guide the work of others so that, to the extent that atomic energy can be developed in the electro-power field on a practical basis, it will be done with a minimum of waste and in the shortest time.

The instruction under which this committee is acting is to be utterly objective in its appraisal and not to approach the multitude of difficult problems involved with any predetermination arising from any conception of any industry policy other than the exploration of the probabilities of a better service to the community.

Neither this committee nor the Edison Association seeks to probe into matters which both freely recognize must, for the moment at least, be restricted from general dissemination. More specifically the committee proposes to avoid inquiry into the specific technique of the processing of fissionable materials or their utilization in fields other than that of heavy power generation. It goes without saying, however, that the committee of appraisal would be immeasurably aided in its work by such knowledge of the economic factors surrounding the materials involved in energy production by atomic fission as can properly be made available to it. Indeed such knowledge, which we do not now possess in more than the most rudimentary degree, is quite essential to any competent appraisal of the possibilities.

With that in mind and subject to a clear understanding with them that the committee does not seek to go beyond the limits of propriety, the members of the committee are conducting conversations with various scientists and engineers who are believed to have knowledge in this new field. The committee fully believes that such conversations, carried out under appropriate restrictions, are conducive to the advancement of the national welfare.

The mere technique of utilization poses questions of the first magnitude. The ability to transform nuclear energy into heat in unconventional boilers--which, with quite incomplete knowledge on the committee's part, seems to be the most probable process--and to do that without risk either to plant personnel or to the general public; to develop efficient systems of control; to find the materials most suited to such operations and to carry them through engineering development and construction will require a high degree of collaboration extending well beyond the abilities and the available time of any committee of five men. The committee therefore will seek, subject to their approval and willingness to cooperate, the assistance and advice not only of scientists and engineers but of the departments of government so far as it appropriately may be extended. It will also seek to enlist the design and other technical talent of manufacturers.

The CHAIRMAN. Mr. Parker, as far as your committee has gone now in its studies, have you been handicapped very much by the restrictions on the dissemination of information?

Mr. PARKER. Categorically, I would say "No," sir. Possibly that is because we have been at great pains not to probe more deeply than propriety had indicated. There have been no official barriers placed

in our way so far. On the contrary, we have met a very understanding spirit of cooperation.

The CHAIRMAN. Are there some things that you would like to know in order to continue your studies that you thought you had better not inquire about at this time?

Mr. PARKER. We have not as yet undertaken to explore one question which is of the very essence of practicality, and that is the economics of procurement of fissionable materials.

The CHAIRMAN. Cost of production?

Mr. PARKER. Cost of production. That, sir, I think we have stayed away from on the assumption that first we would better determine the technical feasibility and then come to that later when the cost facts probably are known to the people who are most closely related to production.

The CHAIRMAN. Thank you.

Mr. PARKER. Returning to my prepared statement:

It appears now that the two most likely fields of energy utilization are to be found in marine propulsion and in large land power plants. The committee, therefore, proposes to offer to the United States Navy such collaboration as the Navy finds to be consistent with the purposes of national security. There is no doubt that such collaboration would make available to the committee important technical information. On the other hand, it is believed that the committee can, through its familiarity with the problem of power-plant design, construction and operation, be of some appreciable service to the naval authorities. It is quite possible, as was the case with higher-pressure and higher-temperature steam development, that large land installations may afford an excellent proving-ground for the exacting requirements of the naval service.

The Senators are aware, of course, that not only the operating costs but the investment in new types of boiler equipment are important to the successful service of the public. It will be necessary, therefore, for the committee to estimate the minimal costs at which equipment may be provided for transforming nuclear energy into the heat in steam or perhaps other media for use in heat engines.

Beyond this there is a remote possibility that, at some future date, some fraction of the energy available within the atom may be released directly in the form of electrical energy with the intervention of equipment other than heat engines. This and the way in which such direct transformation may be correlated with thermal processes require open-minded investigation.

However, regardless of the route by which it is achieved, anything that will reduce the cost of production of electrical energy is none the less of benefit to the national economy, and will become an object of assiduous research and investigation by this committee. It is proper to point out, however, that zealously though the industry will seek to develop the possibilities, revolutionary results in the cost of supplying the public are not to be expected but rather sober, level-headed betterment. The reason for that is worth pointing out.

Most of the investment and much of the operating cost of present systems lie outside the generating plants—for example, in the distributing systems and in the multifarious services to customers. There is no present indication that atomic energy will relieve that major

element in cost. Much of the investment in generating stations will remain as at present. At present it seems probable that steam turbo-generators and their extensive auxiliary equipment, the electrical switchgear and the housing of this equipment will be retained, that the boiler plants of some parts of the stations will be retired, and be replaced by a new type of boiler involving some probably heavy investment and using a possibly—hopefully—cheaper fuel than is now available.

It is evident, if this preliminary hypothesis proves correct, that the primary advantage to the national economy through such use of nuclear energy will be in the service of that part of the utility load in which fuel costs play the relatively biggest parts, namely, industrial and heavy traction load, and that the economies here will probably be not much greater than the difference in fuel cost.

Limited though those economies may be, the committee and the Edison Association which it represents believe them to be of importance to the industrial development of the country. They believe that whatever body is set up to administer the distribution of fissionable materials well might require that such economies be passed on to the consumers conformably with the determinations of the local regulatory authority. Such economies, of course, should be the net economies giving due weight to new investment occasioned by a new type of boiler or other conversion equipment.

There has been some popular misconception as to the amount of energy that would become available through atomic processes. A clear perspective in this matter is to be had from a realization that never at any time has the country suffered from a deficiency in the amount of power available. Indeed it seems clear that the ultimate supply of energy available from coal and from water power is more than sufficient for all the probable needs of the country for centuries to come. All that is necessary vastly to expand the availability of electrical power is the construction of plants, transmission and distribution systems. Even more significant, however, are the much more expensive plants and devices for utilization. All this will be the case whether the source of energy is the newly understood atom or the more conventional sources. It is true that some expansion of electric energy use may result from the development of atomic energy insofar as such development brings about a reduction in cost of generation, and therefore makes possible the electrification of certain large-scale chemical or metallurgical processes now carried out on a directly thermal basis. But that, if at all, will occur only after an extended period of time and as it proves economical.

Another popular misconception which must be mentioned in order to make clear the attitude of the public utilities is the thought that they might be unduly apprehensive of the incipient obsolescence of their plant and property by a new technique. If the present probabilities develop, namely, that nuclear energy will be used in the production of steam for high-temperature turbines, the process will be highly analogous to a current one quite common to the light and power industry, namely, the use of so-called topping turbines. When new and more efficient heat cycles, using much higher steam pressures and temperatures, became available, the utility companies recognized the possibility of removing some or all of their older boilers, of pro-

ducing steam at high temperature and high pressure and then, in new turbogenerator sets, while doing useful work, degrading it to the level formerly produced in the lower-pressure, lower-temperature boilers and further using it in the existing turbines. A strictly analogous process seems quite probable when and if the technical and economic problems of atomic energy utilization are worked out. Old boiler-plant and combustion equipment may be removed, giving place to the newer type of boiler, with or without its own high-pressure, high-temperature turbine. Thus steam would be produced for use in the present turbogenerators either directly or through the intervention of an atomic Topping turbine.

Even should some appreciable part of the atomic energy ultimately be found capable of direct conversion to the electrical form it would work as one horse of a two animal team, the other being the heat process, both in parallel supplying power to central station bus bars. But this prospect does not appall either the committee or the industry. On the contrary, the industry will welcome and seeks to aid the development of any attractive possibilities in nuclear power production quite as it has the development of improved combustion processes and more favorable steam cycles.

When it becomes reasonably certain that sound economic advantage will result from atomic sources it is fully expected that the rate of increase of central station energy utilization will make possible the introduction of atomic "toppers" for base load purposes, that is for energy production round the clock so that the fullest operating advantage may be had from the replacement of the current conventional practices. On the other hand it seems equally probable that the cost of new equipment will not be warranted or if so only in lesser degree by that part of the load which is of short duration. Thus, much of the unconverted present conventional equipment will represent the most realistically economical method of meeting the requirements of the community and will therefore have an undisturbed usefulness throughout its natural physical life.

For these reasons combined with the necessity for continuing our present and highly significant systems of transmission and distribution there is no reason why the industry should be alarmed by any considerations of obsolescence. Indeed, were the economic attractions of atomic energy in the course of time to prove so great that even peak load and reserve equipment would be forced into the scrap heap, that fact in itself would say that there were advantages sufficient to warrant—indeed to make welcome—the processes of supersession. The committee thus feels that there are no obstacles, tangible or otherwise, to its full and open-minded exploration of the possibilities inherent in atomic energy to develop a more economical system of electric energy supply and more widespread use of electrical energy to enhance and stimulate the national economy.

In this connection the public-utility industry of the country has only one reservation and that is that atomic materials should be available for industrial use without differentiation as to the type of utility to which it is made available and with the single collateral requirement that any resultant net economies be passed on to the consumers under the supervision of regulatory authorities on the local level.

As an association we completely endorse the theory that the processing of such material must be under the control of some such

commission as it is proposed in the bill (S. 1717) under discussion. The possibilities of misuse under any other scheme of production are too ghastly to be contemplated. As a collateral of such control, licenses for use seem quite inevitable. Such licenses for all uses whatsoever obviously must be surrounded by safeguards against injury to life and health. These safeguards quite clearly must be uniform and effective. The greatest measure of effectiveness is, in our judgment, in the denial of release of materials to those who do not comply with the prescriptions.

The Association of Edison Illuminating Companies regards as of distinctly minor significance any question of patent rights that may result from the studies of this committee or subsequent development committees. It is none the less speaking for itself as an association, very glad to say here that all of the results of the association's developmental work will be widely disseminated. Insofar as they are reflected by any patents granted, they will be made available to others on a reasonable, nonexclusive licensing basis. It would consider it proper, and would be glad to agree, that such licensing processes and fees be regulated by an appropriately constituted governmental agency. In making this declaration of policy the association does not, of course, assume to control the otherwise legal conduct of individuals, particularly those engaged in the manufacture of apparatus and machinery.

In brief summary, the industry, for whose oldest association I speak, is keenly and constructively interested in the peaceful uses of atomic energy for the benefits of the users of electrical power throughout the country whether on the systems of its member companies or otherwise; is at the present time, like most of the American public, not sufficiently informed of the basic facts to be able to make any sound forecasts; seeks such fuller knowledge as may properly come to it; and is committed to the aggressive prosecution of all favorable possibilities by the application of its technical and economic resources.

The association does not at the present time offer comment on minor details of the bill before you which it assumes will somewhat be modified, but regards the general structure of the bill as being most favorable to the orderly development of peaceful uses of a new technique which can be of great service to mankind.

Senator AUSTIN. I wish you would explain what you mean specifically by "topping."

Mr. PARKER. When the metallurgic arts and the art of design became such that it was possible to build steam turbines with their associated generators operating at temperatures of the order of magnitude of 950° to 1,000°, and at pressures running up to 2,500 pounds to the square inch, relatively small turbines of that character were produced which, after having done useful work in driving the electrical generators, exhausted their steam at more moderate pressures and temperatures, generally at the temperatures and pressures previously used in the stations into which these new turbines were to be installed. These turbines were high-speed, relatively small units with their boilers, and where they were installed did about half of the useful work of making electrical energy, discharged their steam—still capable of doing a great deal of useful work—into the older equipment which didn't any more have boilers for supplying them directly, and

then roughly an equal amount of work was done in those lower-pressure, lower-temperature turbogenerators.

Senator AUSTIN. Does that process correspond to the superheater engine found on locomotives?

Mr. PARKER. To some degree, sir, yes; though not in technical detail. The superheat engines used on locomotives are designed as these Topping turbines are, to use a considerably more efficient cycle of heat conversion. In that respect they are similar but in more minute technical respects quite dissimilar.

Senator AUSTIN. I wish you would define "supersession" as you have used it.

Mr. PARKER. "Supersession," as we conceive it, is the process by which older equipment must be replaced when the advancement of the arts of design or of material production makes possible more efficient processes under which the operating costs are reduced to the point warranting discarding the old equipment.

Senator AUSTIN. Thank you, sir.

Senator HICKENLOOPER. Mr. Parker, do I understand correctly your association you are representing here this morning is something in the nature of a research association or a study association to study new methods or to explore new fields, and that you are not as an association directly interested in sales or the promotion of any specific type or kind of electrical energy, power, or equipment?

Mr. PARKER. As to equipment, we are not directly interested or even indirectly interested in the promotion of any specific type. The association is a conference of executives, which, during its existence, has sought to explore all of those things which would be beneficial to the industry and our member companies, frankly, sir, but also in that process to the customers of the member companies. That necessarily means that the association has been quite interested in exploring the possibilities of improved methods of utilization of electricity after it is delivered to the consumer.

Notably, for instance, it has done a great deal throughout its life collaborating with the manufacturers to bring about a better standard of efficiency and life for the simple incandescent lamp. That has been one of its major activities in its earlier years, the promotion of more efficient and better standards of lamp manufacture and the utilization of illumination.

Similarly, it has devoted itself to stimulating the production of more efficient motors. Primarily, I should say, however, through such committees as that of which Mr. Irwin is chairman, it has sought to study collaboratively among the members and with the manufacturers the methods of producing more efficient production apparatus.

Senator HICKENLOOPER. I see that the comic strips have now developed an atomic light. I don't presume that you have gone into that field yet.

Mr. PARKER. We haven't yet, sir.

Senator HICKENLOOPER. I merely wanted to be certain that your association was really an over-all study group that takes in the entire field and is not devoted to special promotion, primary promotion, of either equipment or service.

Mr. PARKER. That is quite right, sir. I think we are entirely objective in that respect.

The CHAIRMAN. I was especially interested, Mr. Parker, in the forthright endorsement of the proposition that the Government should produce this fissionable material. I believe you said in your statement that the consequences might be pretty horrible to contemplate if that was not done. Would you care to develop that, sir?

Mr. PARKER. Fundamentally, sir, it seems perfectly clear to me—I cannot say that the association has explored this minutely, but it has arrived at the conclusion that you have stated, that for any body of individual citizens without the most compelling restraints to have possession of the processes of production of materials which have demonstrated their capacity to two Japanese towns just would be a complete subversion of every element of public safety.

That would be the first thing. The second thing is that the large-scale technique of promotion of the scientific knowledge that already was under way had been at the expense of the people of the country as a whole. Two billion dollars of the resources of the country have been put into this thing. Now, it does seem perfectly clear that whatever may be the active agent in the further production of fissionable material, the control of a thing created by the people of the Nation must rest in the people of the Nation.

The CHAIRMAN. Thank you very much, sir.

Senator HICKENLOOPER. Would you envision the possibility in the future that private industry in some capacity might, under very rigid license and supervision, be permitted to produce at least up to the point of power production in this field, or do you at the present time think that it is more probable that the Government should produce this alone at all foreseeable times in the future?

Mr. PARKER. May I reply to that as an individual, and not speaking for the association?

Senator HICKENLOOPER. Surely.

Mr. PARKER. In response to the chairman's question, I spoke of controls by government. I think it would be most desirable that as much as possible in the active production be done under the thing that—for want of a better phrase—we call the free-enterprise system and by a plurality of producers, but subject to the most extremely tight controls.

Senator HICKENLOOPER. Mr. Parker, at this moment, I am in thorough accord with various expressed opinions that the Government should rigidly take this matter until they can see what the future holds for it. I am not advocating, nor do I believe we should turn it loose to private investigation at the moment.

When you start to make a bomb, the first 75 percent is the production of the material, and the remaining 25 percent is the technical production of the bomb. It was that division that prompted my question as to whether or not sometime in the future it might be possible to permit the experimentation and the development of that first 75 percent by private industry under rigid controls, but of course not permitting any private individuals to go the other 25 percent and tinker with the making of a bomb.

I presume that is not beyond possibility, nor beyond reason and probably would be desirable if proper safeguards could be worked out.

Mr. PARKER. To me it seems intensely desirable for the further purpose of getting a diversity of minds and philosophies at work and stimulating the competitive zeal of the different producers.

Senator HICKENLOOPER. In other words, it would be the same argument, I take it from your answer, as the scientists use when they say they must have friction of the mind in science and therefore freedom in order to develop. It would be desirable to have that same friction of the mind and friction of competition, for instance in free enterprise, providing safeguards could be established for the control and the production of large quantities of this material.

Mr. PARKER. I feel that very fully, sir.

The CHAIRMAN. Thank you very much indeed, Mr. Parker, for coming down.

Mr. PARKER. Thank you, sir, for the privilege of being here.

The CHAIRMAN. This will adjourn the hearing for today.

The projected last hearing of this series of hearings will be at 10:30 a. m., tomorrow morning, and at that time, unless some other Senator has a definite witness that he wants to hear—and I think that possibility has been pretty well exhausted—we shall close the hearings tomorrow on the domestic phase of the question and go into executive session and resume on the international phase of it a little later.

(Whereupon, at 11:40 a. m., an adjournment was taken until 10:30 a. m., Tuesday, February 19, 1946.)

ATOMIC ENERGY ACT OF 1946

TUESDAY, FEBRUARY 19, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to adjournment, at 10:30 a. m. in room 312, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon, Johnson, and Hickenlooper.

Also present: Dr. Edward U. Condon, scientific adviser to the special committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The hearing will come to order.

Dr. McDonald, you may proceed.

STATEMENT OF DR. RALPH McDONALD, EXECUTIVE SECRETARY, DEPARTMENT OF HIGHER EDUCATION, NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES.

DR. McDONALD. Mr. Chairman, I am Ralph McDonald, appearing before your committee as the authorized representative of the Department of Higher Education of the National Education Association. The National Education Association is the voluntary professional organization of educators in the United States and its Territories. It is composed of the 48 State education associations and 1,425 local education associations throughout the Nation, having a total dues-paying membership of 733,409, or more than 70 percent of all persons professionally engaged in education in the Nation and its Territories. In addition to this membership affiliated through its constituent associations, the National Education Association has 331,605 direct dues-paying members. Membership of the National Association extends into every State, Territory, city, and county, and into practically every school, college, and university in America. Founded in 1857, the Association has as its purpose the advancement of the cause of education. The department of higher education is composed of the members of the National Education Association who are engaged in teaching or administration in colleges and universities.

On behalf of our members I should like to thank the chairman and members of this committee for the epochal service you are rendering not only to our Nation but to the world. By your earnest and intelligent approach to the foremost fact of our times you have succeeded in removing the consideration of atomic energy from a narrow and fearsome military atmosphere to the broader and more constructive realm of science and public welfare.

441

The CHAIRMAN. Under some difficulties, Doctor.

Dr. McDONALD. You have conducted one of the most thorough-going and open-minded studies ever made by a congressional committee, driven by a realization that the action taken by this Nation with respect to atomic energy may determine the future for all mankind. As educators we have admiration for your procedures; as citizens we are deeply grateful to you.

There are two major areas of your committee's subject matter on which we do not care at this time to offer any comment, feeling that discussion of those areas on our part is unnecessary.

First, this statement will not deal with those questions on which there has developed no major controversy, as, for example, the question of whether there should be a Commission on Atomic Energy, or the question of whether there should be through the United Nations Organization a world policy to prevent atomic warfare.

With respect to these broad areas of general enlightened agreement I should like, however, to go on record as endorsing the provisions and the implications of S. 1717.

Second, this statement will not deal with the details of administration or policy which must, in the final analysis, be worked out carefully by the committee with its experts and later with the Atomic Energy Commission and its experts, giving due consideration to the recommendations of those most competent to testify with reference to the various matters involved. Examples of what I have in mind are: Detailed administration and policy on patents; internal organization of the work of the Atomic Energy Commission; other matters of similar level.

In order to keep within the proper sphere of competent interest for educators and to be as helpful to the committee as possible, this statement will go directly to some of the fundamental issues which we deem of great importance.

For convenience and clarity, I shall discuss these issues in the order with which they are dealt in S. 1717, the Atomic Energy Act of 1946.

Section 1 of S. 1717 meets with our strong endorsement. Because of the manner in which atomic energy first became generally known to the world on August 6, most of us are still inclined to recognize only the destructive possibilities of atomic energy. The statement of purposes contained in the bill gives complete recognition to the necessity for control to protect the national security, but it goes further and proposes a constructive program pointing to the development of atomic energy as a source of great good for mankind.

It is clear to us that atomic energy holds the awful threat of utter human destruction. It is also clear that, with decent and enlightened direction, atomic energy holds the promise of vast new developments which can lift the lives of people everywhere to a high and hitherto unimagined level.

We endorse the establishment of a Commission as set forth in section 2 of S. 1717.

While the Commission will have both policy and administration functions, it is clear that the most crucial responsibilities of the members of the Commission themselves will be in regard to policy. According to the terms of the bill, the Commission is fully authorized to employ expert administrators for the various activities which they will direct.

The tremendous import of atomic energy makes it unthinkable that one Administrator with an advisory committee be put in charge of our national policy respecting it. Mr. Harold Smith, Director of the Budget, was probably right in suggesting that there be a single administrative head for the production and other administrative machinery, but such a central administrator should be, in my judgment, appointed by the Commission and be responsible to it.

I believe Mr. Smith pointed out that probably the administrative heads ought to be directly responsible to the Commission, which in turn would be responsible to the Congress, rather than by creating a division of authority there by having them directly responsible to the President.

As to whether the membership of the Commission should be three, five, or seven—either number would seem acceptable.

It has been suggested that the best men might not be obtainable at the salaries specified, \$15,000 a year for other members and \$20,000 for the chairman. This argument is based on a misconception of the motives which govern the actions of men of principle and competence. Men of the type to whom the tremendous responsibilities of this act should be entrusted would not be concerned about personal income above the level specified. Certainly, there could be no objection to higher compensation as a matter of right, but it would be a tragedy for any person to hold such a post if he were for one moment concerned over financial compensation beyond the requirements for maintaining a satisfactory economic standard for his family. The universities of the Nation have literally thousands of men who have deliberately chosen their present careers in preference to positions which would have paid them much more money. Up to the income level necessary for maintaining an adequate standard of living and security, compensation is vitally important to anyone. Beyond that point, financial compensation would be relatively unimportant to any person of the caliber who should even be considered for an appointment to the Atomic Energy Commission.

The CHAIRMAN. Doctor, I am very grateful for your statement in one paragraph where you express what I have felt about the objections that have been made that we couldn't get the right caliber of men for this Commission. I am grateful to you, at least personally grateful, for having put the argument so succinctly.

Dr. McDONALD. There are so many examples that fall within the observation of all of us to indicate that the men of the type of whom the responsibilities of this Commission should be entrusted are not primarily concerned with building up large estates for themselves beyond what would be necessary for security and satisfactory standards for their families, in my judgment.

Senator HICKENLOOPER. Doctor, at that point may I explore that with you? It is my impression—and I don't know that anyone has testified here that any appointee would want to make money out of this as a commercial proposition—that the testimony has mostly gone to this point: First, people of the caliber that you want to get will have established their economic standard of living which because of their past means that they would require, for their peace of mind, comfort, and family responsibilities a substantial salary, the amount being subject to argument within reasonable limits.

But this question was raised the other day, that on a full-time basis no salary would command certain men who might be very desirable to have on this job; that is, there are many men in the country who have a tremendous capacity, but who have some other field of general advancement that would preclude their accepting exclusive employment on this Commission, regardless of salary. That was advanced by one witness, I believe, in supporting his argument that we might well consider a rather mixed Commission; that is, provide for certain men on a part-time basis who would devote all the time that would be necessary on their part, but who would not want to leave entirely other fields of activity that they had spent their lives in building up. There are other individuals who would be willing to devote their entire time as members of this Commission.

I am frank to say that that is an intriguing argument to me because it would open up the field for the acquisition of the best possible men in this country, regardless of salary or anything else, if you could get one or two of them on a part-time basis or on a voluntary basis, you might say.

Dr. McDONALD. That is one of the features, Senator, that I like particularly about S. 1717, in that while the main responsibility would rest in the hands of those Commission members who are full-time—and that seems to me to be essential—at the same time, through the machinery of advisory boards, such persons as you have indicated could give their fullest and most advantageous service to the Government in that relationship.

Senator HICKENLOOPER. This goes a little beyond that. The thought behind my suggestion was that these part-time people would have equal authority with the full-time people on any decisions of policy, but some provision where we might gain their cooperation and the advantage of their experience and judgment might well be worked out.

Dr. McDONALD. I should think, Senator, that with a force that is potentially so free and that actually, even according to its present stage of development, is so fraught with possibilities of destruction that it would be absolutely essential for at least as many as three persons to be completely disassociated from any other major and dividing interest that would require the use of some of their time and effort in order that they might devote their full time. I think it would require not only their full time in terms of regular office practice, but I think probably the proper type of men would be studying about this thing night and day, as no doubt the members of this committee are at the present time, using the major portion of their time in the consideration of this very matter. In the long run it would seem to me that it would be absolutely essential to have people who could concentrate their interest exclusively.

Senator HICKENLOOPER. I think I agree with that, at least at this moment, that it is essential to have at least a portion of the Commission—the percentage is more or less immaterial—that is full time, devoted exclusively to this, but I am rather intrigued with the suggestion that, in addition to that, some people with equal authority as members of the Commission might be available for part-time service. I haven't made up my mind on it finally at all.

Dr. McDONALD. My fear in that connection, Senator, would be that the time for decision on a very important matter might arrive,

Ralph McDonald
see
Hick Ed.
NEA

and that the persons who would make that decision would of necessity have to have complete and full and thorough understanding of all other matters related to it; if part-time people in such an instance had given only a part of their time, they probably would not have had opportunity to have full and complete understanding, and consequently the votes of such people in a close vote in the Commission might actually turn the decision of the Commission one way or the other, whereas it would not be a lack of capacity to judge on their part, but a lack of full, complete, and detailed information.

Senator HICKENLOOPER. Of course, there is that phase of it. My thought on the other side, however, would be that any part-time individual who might be chosen as a member of this Commission should be of such caliber and capacity that he would not only realize his own reservations of possibility in this field, but would be of such capacity to devote all time to completely familiarize himself. I think there are many such men in the country. I don't know what the committee will decide on the matter.

Dr. McDONALD. I can see very well the point that there may be individuals who could make a real contribution to our national thinking and to our national policy on this important subject who might not be free to disassociate themselves completely in every other undertaking and devote full time to it; but I should think that there are such men you would be able to find equal in mental ability, in background and experience, who would be able to disassociate themselves completely, in which case you could use the full-time available man as the decision-making member of your Commission, and use your other individuals as members of an advisory committee or board, which would give you the full advantage, it seems to me, of both minds.

Senator HICKENLOOPER. Thank you.

The CHAIRMAN. Well, the answer to that, Doctor, that has been made is this: That the man who is selected as a full-time member becomes, shall we say, bureaucratic; and the advisory member who is the fullest, maybe of some wisdom and light on a specific proposition is disregarded by these "bureaucrats" who go ahead and disregard the advice of the advisory board. That has been the argument that has been made against that.

Dr. McDONALD. I think definitely there is a danger of the development of bureaucratic ideas and attitudes on the part of the members of any commission which is given charge of the vast enterprise that will be involved here; but it seems to me that there are safeguards proposed in S. 1717, and also suggested by other persons other than the authors of this bill, that would permit some check against that bureaucratic attitude. For example, the members of the Commission are removable at the will of the President. Not only that, but there is a requirement that the Commission quarterly make complete and detailed reports to committees of Congress.

It would seem to me that the tendencies toward bureaucracy would be curbed much more effectively for this Commission than is the case in usual government commissions. I do think that is a very real danger, and I think it should be guarded against. I have a feeling it is guarded against by the provisions suggested in S. 1717.

S. 1717 in a subsequent section provides for the establishment of advisory boards to the Commission. Through such boards the Com-

mission would make use of the very type of people who are suggested for a part-time advisory committee to a single all-powerful administrator. I should like to make this comment in relation particularly to the point which was made just a moment ago, that as between the establishment of a single all-powerful administrator and the establishment of a board which would be composed of some part-time members and some full-time members, it seems to me the board would be far to be preferred above the single administrator.

Senator HICKENLOOPER. Now, would you care to express yourself on this? Manifestly I think in any activity of this kind there should be somebody to run it. Five or six people cannot run it; they have to have a general manager, or something of that sort, and manifestly with considerable leeway to carry out the policies of the board.

Now, do you think it would be advisable to have that administrator or general superintendent, or whatever you want to call him, appointed by the President or selected by the board, which in turn will be appointed by the President?

204 Dr. McDONALD. I think I would agree with the suggestion of Mr. Smith that that administrator should be responsible to the board. He should be appointed by the Commission, and his responsibility to the governing head of the Nation, it seems to me, will be taken care of by the fact that they in turn are responsible to the President, particularly since they are removable at the will of the President.

Senator HICKENLOOPER. In other words, if a general administrator is appointed by the President, he holds his appointment by the President and not from the board. He holds himself primarily responsible to the President and not to the board, and the board in turn is responsible to the President, but it gives a division of authority.

Dr. McDONALD. A division of authority; yes; I should think that would be the case.

Members of the policy-making Commission itself should by all means be full-time, paid servants of the Government, with no distracting or dividing interests whatever. The magnitude of the ultimate consequences of their action would impose upon the members of the Commission the heaviest conceivable burdens of study and decision, which would certainly occupy their full time. We hope that they may not only be full-time, but that they may be also the brainiest, most resourceful, and most public-spirited men who can be found in America.

Section 3 of S. 1717 provides a sound and productive policy for promoting the advancement of scientific knowledge.

Effective scientific knowledge can be carried on only under a policy which (1) makes widely available the equipment, materials, and other resources for endless experimentation, (2) gives complete freedom of study and experimentation to researchers, and (3) provides for full and unimpeded flow of scientific knowledge.

To assume that scientific knowledge can be advanced under conditions of secrecy is unrealistic. The advancement of knowledge is directly proportionate to the volume and efficiency of communication from mind to mind, from laboratory to laboratory, from nation to nation.

In the field of atomic energy we are dealing with a force potentially so destructive that secrecy would seem desirable with respect to every

aspect which can be kept secret, especially when there exist powerful national governments which are not responsive to the will of the people they rule. The fact is that in the long run there is probably very little, if anything in the area of theoretical scientific information which is or can be kept secret; our scientists testify almost unanimously to this fact.

American scientists desire only that a free flow of such basic scientific information as in its very nature is not and cannot be secret be promoted among our own scientists. My personal opinion is that knowledge of atomic energy in the hands of any government which is totalitarian and not fully responsible to its own people is dangerous to all mankind. Such knowledge in the realm of scientific theory is not and cannot be withheld, however.

Our wisest course, it seems to me, is to promote the widest dissemination among American scientists of such basic scientific information as the Commission may determine not to be dangerous to our national security. Granting that the free flow of such information among American scientists will permit a totalitarian power to acquire such knowledge, our best safeguard against such a nation in the event of an atomic war would be through the great progress our own scientists would make by continuous effective experimentation. If we do not have such wide dissemination of scientific knowledge, our own progress in atomic energy protection will be much less. The result would be that our very effort to maintain secrecy might permit an aggressive nation to go miles ahead of us in experimentation and development.

The CHAIRMAN. Doctor, I will make an argument now against a theory which you stated, which I believe in. Let's assume that through further experimentation we can develop an explosive releasing 5,000 times as much energy; you might say 4,900 or take any figure you please—but tremendously greater.

Senator HICKENLOOPER. I don't like to have you mention such things, Mr. Chairman; it scares me to death.

The CHAIRMAN. Take any figure you want that would show an advance. Now, if any other country reaches the point of having the Nagasaki bomb, what good is the fact that you have improved your bomb by any multiple that you want? What good does it do you? Do you follow my thought, Doctor?

Dr. McDONALD. If you are not here, the Congress is not here, the President is not here, and the military leadership of the Nation are not here by virtue of some explosion that took place before we realized we were about to get into war, I doubt whether our possession of those things would be of much value to us. They might permit us to cause a greater destruction to the enemy, and ultimately give to those people who remain in America after the destruction has been wrought all over the earth a better opportunity, we will say, to have a dominant voice in whatever remains of humanity. I do think that it would be advantageous for us to possess the most modern and the best knowledge that is possessed anywhere in this area, though I can see that there is only one real safeguard against ultimate human destruction, and that is for us to learn somehow either to live without war—which is really the only ultimate possibility—or certainly to remove completely from the realm of such wars as may be permitted to go on, like the one in China, the use of atomic weapons.

The second course seems to me to be very largely wishful thinking. Senator HICKENLOOPER. How are you going to prevent countries from using every last weapon they can get their hands on when it is a question of national destruction or national survival?

Dr. McDONALD. Frankly, Senator, I don't think you can prevent that and I think it is wishful thinking to assume that this Nation or any other nation could come through an atomic war with anything that is really worth having.

Senator HICKENLOOPER. In other words, there won't be any future wars fought by Marquis of Queensberry rules. They will use every method and means they can get hold of.

Dr. McDONALD. I think at the present time—and I am not just one of these boasting Americans, I hope—there is no nation on earth that is composed of more enlightened and humanitarian people on such things than the United States, and we did use the atomic bomb, so it would seem to me that a discussion of the possibility of having wars between great nations without their use of, as you say, the ultimate in weapons that they know about is just wishful thinking.

Senator HICKENLOOPER. Well, it is human nature when you get into war to lick the other fellow as quickly as you can.

Dr. McDONALD. When you realize you are going to be destroyed, then it is human nature to cause as much destruction to your enemy as you can before you are finally put out of existence.

Senator HICKENLOOPER. It is a very confusing situation.

Dr. McDONALD. I see no possible solution to this problem internationally except for the nations of the world to find out somehow how they can live without war. It is absolutely essential, and it seems to me that it is within the realm of possibility. I think this is, of course, the fundamental issue before all of us.

The CHAIRMAN. Doctor, I don't want to hold you too long, but if you believe that no other nation could develop the present-type bomb in any given period of time—I have concluded it is more or less anybody's guess. You can guess 2 years, you can guess 10 years, and of all the witnesses who have come and testified before this committee there hasn't been one of them that has really been able to substantiate their estimate with any facts; it is a guess.

Now, if it were to be impossible for any other country to duplicate our present-type bomb, you could make out quite a case for locking it up—that is, locking science up so that there would be no possible exchange of any scientific information. Isn't that the basic theory under which the people who want to restrict scientific investigation are proceeding, namely, the fallacy that it cannot be reproduced anywhere else, when I think the better judgment is that it can. Now, just how soon neither you nor I nor anybody else that has testified before this committee knows.

Dr. McDONALD. I think that is correct, Senator McMahon. It is utterly impossible for the basic scientific information which made it possible for our engineers to develop the bomb to be kept secret. That is a matter of utter impossibility. As a matter of fact, the knowledge did not develop even primarily in this Nation.

Senator HICKENLOOPER. Every nation knows it now, don't they, in your opinion?

Dr. McDONALD. Yes; as a matter of fact, they had access to the information beforehand.

Senator HICKENLOOPER. The basic knowledge?

Dr. McDONALD. The basic research. Now, with respect to the devices and the machinery by means of which you take this basic scientific information and convert it into a destructive device, it may be that within that area—and I think undoubtedly in that area at the present time—the United States may have certain processes that are not fully and completely known. I think that with respect to those things, Mr. Chairman, the problem is simply one of time during which the other nations will develop their own devices. They may not correspond to ours at all, but when the basic scientific information is known, then human ingenuity in any major area is such that it is just a matter of time until, if they desire to do it, they will convert that scientific information into devices and instruments of destruction. So I think these items of knowledge which may be possessed at the present time by our engineers and scientists are of such a nature that it is inevitable that in other nations they will produce comparable devices and techniques, though they may be different. They might even be better. The probability is they will not be so good, but they will—so far as turning out bombs is concerned—be just as effective in the final analysis.

It would seem to me that the only area in which we would be justified at all in thinking in terms of the possibility of having secrets is in the area of processes and techniques and devices for the manufacture of any particular instrument of destruction, and in that area it would seem to me that the Commission, as suggested in S. 1717, would have full authority to maintain whatever elements of secrecy exist.

Of course, there is a danger there and that is that the very fact that we demonstrate to the world by our efforts to maintain secrecy that we have something which we think is important in the way of destruction makes it inevitable that a network of spies will infest our country from any nation that might be in fear of us; and if we kill off a hundred or two, then that will not stop the process. There will be another network, because they, having been thrown into an attitude of fear, do not know what it is that we are holding by means of which we might destroy them, will take the only course open to them, namely, to send their own citizens or employees, or if they can get citizens of other nations, employ them to try to uncover these secrets, which in the long run would have great disadvantages.

I do think, however, that in the present situation of world insecurity, until this Nation primarily can take a leadership, and a meaningful leadership for peace, the Commission on Atomic Energy would be justified in drawing that line as sharply as it can. It seems to me that for the present, that should be done; but I do not think in the field of basic scientific theory there is anything that can possibly be kept secret.

Basic research, as contrasted with applied research and technology, is rarely remunerative to a scientist. Yet it is upon such basic research that practically all scientific advance rests. Therefore, the Atomic Energy Commission, as directed in S. 1717, should liberally subsidize research and developmental activities in colleges and universities, in laboratories and engineering establishments, and elsewhere.

Particularly appropriate and necessary is the promotion, through subsidies, grants, and loans, of studies in the field of social, political, and economic effects of atomic energy.

With respect to this dissemination of information by means of which experimentation may be encouraged, it seems to me that is fundamental even to the military defense of our Nation, because I do believe we have in the United States the brains which, if they are freed and given the opportunity, will give to this Nation as rapid advancement of its knowledge in this area as can be obtained anywhere, but they cannot do that if they are not free. It seems to me, for example, that in this whole area of the finding of devices by means of which we might protect ourselves from the bomb, that if we make research as free and widespread as possible we are in much better position to hope that at least some element of safety might be upturned in this process of research. It would seem to me the most dangerous thing for us to do in terms of our own future national safety would be to bottle this thing up and keep our own scientific minds from working on it fully, freely, and as completely as they will.

The CHAIRMAN. Doctor, it has been stated by every authority on this subject that there is no defense to the atomic bomb. It is pretty hard to foresee one. Do you think there would be any possibility in the nature of things of inventing one if you pursued a policy of smothering scientific investigation and research?

Dr. McDONALD. It seems to me that it would be impossible under such conditions ever to hope to achieve defenses against it. I do think, however, as I have talked to a great number of these scientists, I have gathered this as being their opinion: They do not know now of any defense, and they cannot, on the basis of their present knowledge, conceive of an adequate defense; but it certainly was true of me, and it was probably true of a great many Americans in 1940, that we had no way of conceiving the atomic bomb. I do feel that we ought to open the doors to the widest possible research in the hope that these brains which I know we possess in this Nation, freed and even inspired by the desire to do something about this thing, might find some means at least to reduce the ultimate damage that it could cause.

But I think if we establish a pattern of secrecy around this thing, build walls around it, it will be utterly impossible for those results to be accomplished.

Sections 4, 5, 7, and 8 of S. 1717 would seem to establish the Commission in complete control of all materials, devices, sources, and property having a direct relation to atomic energy.

We share the desire expressed by Henry Wallace and others that the restrictions of the Commission not be carried to the point of the trivial and unessential. We share also the wish expressed by certain leaders of industry that the greatest possible encouragement consistent with national security be given to private enterprise in the development and production of devices and applications.

Senator HICKENLOOPER. In other words, I take it you believe that there is as much advantage to be gained in that field of competition and section of the mind as the scientists believe to be gained in what they call the section of the minds of the scientists in that field?

Dr. McDONALD. Yes, and I think in each instance the line would have to be drawn in terms of the most intelligent policy of national safety that can be worked out.

Senator HICKENLOOPER. With adequate controls and safeguards?

Dr. McDONALD. Yes, sir. These desirable aims are secondary, however, to the absolute necessity of controlling atomic energy developments so as to insure national safety and promote world peace. If we are to implement effectively any international agreement on atomic energy, it would seem essential that all aspects and facets of atomic energy production be placed under the undisputed control of the Atomic Energy Commission. We dare not do less with a force so gigantic. Direct Government ownership and the right of seizure are strong measures, but there is no other safe course, it seems to me.

Perhaps as our knowledge of atomic energy is extended it may be possible to relax some of the strict controls proposed under S. 1717. For the present, however, complete and strict control is imperative, and I do not want to be understood as passing judgment with respect to details in that area. It is only on the principles that I think I in any sense would be considered a competent witness.

Section 6 of S. 1717 provides that the Commission shall have charge of all atomic weapon production facilities and shall conduct research and developmental work in the military application of atomic power.

A close liaison with the military branches of the Government would seem to be necessary in these matters. Such a close liaison is clearly practicable under S. 1717. The Director of the Division of Military Application could, if the President desired, be a military man. Certainly, through the Division the fullest kind of cooperation and integration with military plans would be possible.

Of course, if the committee were to amend this act in line with the corrections of Budget Director Smith and others giving to the Commission the authority to designate its administrative head, then that decision would be with the Commission rather than the President as to whether a military man would head this Commission.

A safeguard against unwise action of the Commission in military matters is afforded not only by the fact that Commission members would be removable by the President, but also by the fact that the direction of the President is specifically required in the manufacture and delivery of atomic weapons.

We concur with the opinion expressed by the scientists, implied by President Truman, and concurred in by Secretary of War Patterson, that the Commission should not be composed of professional military men. It is an error to assume that the military high command developed and perfected the atomic bomb. When the financial expenditures incident to the project became too great to be met from President Roosevelt's contingency funds, the money was channeled to the project through Army appropriations. Army supervision over the personnel was established to insure national security.

Civilian control—real civilian control, not generals in civilian clothes—is absolutely essential.

For atomic energy control to be placed in the hands of military authorities by the United States would, in my opinion, produce an atomic bomb race between nations and would at the same time probably hinder scientific advance in the improvement of the bomb itself.

The training of the orthodox military man is the antithesis of the training of a scientist. A general who has been successfully educated as a military leader would be unlikely by virtue of that training to

possess the point of view necessary to consider scientific problems sympathetically.

The trained military mind deals in fixed ideas; it is schooled to rest upon authority. The scientific mind is continuously fluid and questioning; it is schooled to critical examination of every dictum and datum.

Military training seeks to make soldiers think alike, act alike, so that many respond as a unit instantaneously and mechanically. Scientific training seeks to make the mind independent, exploratory, inquiring.

If atomic energy developments are subjected to military control, progress in scientific knowledge is less likely to result than is a vast secret production of more and bigger bombs of the type we know about.

We must recognize the possibility of war, and the fullest application of scientific discoveries should be made in the military field. It seems probable that greater advancement in military applications will be made if research is promoted by a civilian commission, with a military division operating under the Commission in liaison with military authorities.

It is my understanding that our atomic energy activities are now under military control, and that our plants are probably even now manufacturing more atomic bombs secretly. If that is the case, then immediate passage of a measure such as S. 1717 is urgently needed to establish a sound national policy on atomic energy.

One of the most admirable features of S. 1717 is its provision for wide dissemination of basic scientific information. By drawing a sharp distinction between such basic scientific information on the one hand and techniques and processes on the other, the bill would encourage the flow of useful knowledge and at the same time safeguard completely everything in the way of secrets which the United States now has or might later acquire, particularly of a military nature.

One of the most important agencies of the Commission would be the Board of Atomic Information, as proposed in section 9 (b). We are literally being ushered into a new age by the impact of atomic energy upon our society. As President Truman truly said, "In international relations, as in domestic affairs, the release of atomic energy constitutes a new force too revolutionary to consider in the framework of old ideas." To enable the people of the United States to adapt the framework of their ideas to this revolutionary force it will be necessary for an unprecedented job to be done in education, particularly in science. The Board of Atomic Information will have the resources and the responsibility for encouraging and hastening that education.

Section 13, requiring quarterly Commission reports of a very comprehensive and revealing nature, is one of the fundamentals of legislation in this field.

The best safeguard the people can have against the monstrous damage which might come from misuse of atomic energy is to establish complete control in the Atomic Energy Commission and make the Commission fully responsible and responsive to the President and Congress. Reports should be regular and complete, with no reservations whatever unless dictated by the President and the appropriate committee of Congress for reasons of national security.

Certain amendments could be made to S. 1717 which would strengthen or clarify some of the more important provisions.

The atomic scientists have suggested an amendment which we consider sound and desirable, namely, that a general section be added making it clear and specific that international agreements would supersede any conflicting provisions of the domestic act.

Another amendment proposed by Secretary Patterson would require rather than simply permit close liaison between the Commission and the military branches of the Government. For obvious reasons national security must be the most compelling immediate objective of our policy. Therefore, the Patterson amendment—to require rather than permit—seems to be sound, provided that such required liaison does not weaken the civilian control of our national policy on atomic energy.

We should like to call your attention to the relation which will exist between the work of the Atomic Energy Commission and the activities of the proposed National Science Foundation and those of the United Nations Educational, Scientific, and Cultural Organization recently established at London. Amendments may be necessary to insure liaison and cooperation in the work of these agencies.

The National Education Association takes an official stand on specific legislation only by action of its delegate assembly which met last in Pittsburgh in 1944 and will convene next in Buffalo July 2, 1946. No interim official position has been taken on the specific bills before this committee by the executive committee of the NEA. Such a position has, however, been taken by the executive committee of the department of higher education.

In presenting this statement I have appeared by general authority of the executive committee of the department of higher education and with the approval of Willard E. Givens, executive secretary of the entire National Education Association. The views presented represent not only the official position of the department of higher education but my best effort as an official of the NEA to bring to your committee the opinions of our leaders and membership as I am able to judge them.

Recognizing the experimental and fluid character of any legislation on atomic energy which may be enacted at this time, and recognizing also the urgent necessity of the immediate adoption of a sound initial national policy on this subject, I should like to urge the passage of a measure which fulfills as nearly as possible the purposes indicated by President Truman in his message of October 3, 1945—and emphasized in his letter of February 1, 1946—and as conceived in the statement of general purposes contained in section 1 of S. 1717. Above all, I hope that legislation in this critical interim period may be such as to provide the greatest possible safeguards for our national security while at the same time stimulating further research and promoting the movement toward world peace.

The CHAIRMAN. Doctor, I want to thank you very much indeed.

Dr. McDONALD. We are very grateful to this committee.

Senator HICKENLOOPER. That is a very fine statement. We could probably visit with you a whole day on these things.

Dr. McDONALD. I am at your service, Senator.

The CHAIRMAN. Mrs. Sibley.

**STATEMENT OF MRS. HARPER SIBLEY, PRESIDENT, UNITED
COUNCIL OF CHURCH WOMEN**

Mrs. SIBLEY. I am here, Senator McMahon, not as an expert on the details of governmental organization, nor as a scientist; you have already heard from both those groups. I am here as president of the United Council of Church Women, acting under a resolution passed by their national board meeting in Washington October 23 to 25—and you may perhaps remember that we were in your office that day, which was the day you received your appointment, Senator—and representing the moral conscience of great groups of Christian women organized in over 11,000 communities in the United States.

For the record, I will quote their resolution:

We reaffirm the principles involved in freedom of scientific research relative to peacetime uses of atomic energy. We oppose the May-Johnson bill (S. 1463) which forfeits democratic control of a power which should be used for the good of mankind. The May-Johnson bill makes it possible for a powerful administrator to gain control of atomic energy and the production of atomic bombs and not be removable even by the President. This could lead to complete military control.

We urge Congress to hold full public hearings so that people understand the issues before legislation is adopted on atomic energy.

On July 16, 1945, an atom—that tiny measure of the universe—was shattered, and at that moment history was split in two, so that old patterns lost their meaning; so that old men who would say that marching boys could save us from the bomb have failed to measure what happened that day in New Mexico.

In case you have forgotten, let me quote to you from the War Department's official release of the New Mexico test, July 16, 1945:¹

Mankind's successful transition to a new age, the atomic age, was ushered in July 16, 1945, before the eyes of a tense group of renowned scientists and military men gathered in the desert lands of New Mexico to witness the first end results of their \$2,000,000,000 effort. Here in a remote section of the Alamogordo Air Base, 120 miles southeast of Albuquerque, the first man-made atomic explosion, the outstanding achievement of nuclear science, was achieved at 5:30 a. m. of that day. Darkening heavens pouring forth rain and lightning immediately up to the zero hour heightened the drama.

Mounted on a steel tower, a revolutionary weapon destined to change war as we know it or which may even be the instrumentality to end all major wars was set off with an impact which signalized man's entrance into a new physical world. Success was greater than the most ambitious estimates. A small amount of matter, the product of a chain of huge specially constructed industrial plants, was made to release the energy of the universe locked up within the atom from the beginning of time. A fabulous achievement had been reached. Speculative theory, barely established in prewar laboratories, had been projected into practicality.

* * * * *

The entire cost of the project, representing the erection of whole cities and radically new plants, spread over many miles of countryside, plus unprecedented experimentation, was represented in the pilot bomb and in its parts. Here was the focal point of the venture. No other country in the world had been capable of such an outlay in brains and technical effort.

* * * * *

Gen. Farrell's impressions are: “* * * We were reaching into the unknown and we did not know what might come of it.”

¹ First Test Conducted in New Mexico, official press release by the War Department, issued August 6, 1945

It can safely be said that most of these present were praying—and praying harder than they had ever prayed before. [Continues reading:]

"If the shot were successful, it was a justification of the several years of intensive effort of tens of thousands of people—statesmen, scientists, engineers, manufacturers, soldiers, and many others in every walk of life.

"In that brief instant in the remote New Mexico desert, the tremendous effort of the brains and brawn of all these people came suddenly and startlingly to the fullest fruition. Dr. Oppenheimer, on whom had rested a very heavy burden, grew tenser as the last seconds ticked off. He scarcely breathed. He held on to a post to steady himself. For the last few seconds, he stared directly ahead and then when the announcer shouted "Now" and there came a tremendous burst of light followed shortly thereafter by the deep growling roar of the explosion, his face relaxed into an expression of tremendous relief. Several of the observers standing back of the shelter to watch the lighting effects were knocked flat by the blast.

"The tension in the room let up and all started congratulating each other. Everyone sensed 'This is it.' No matter what might happen now all knew that the impossible scientific job had been done. Atomic fission would no longer be hidden in the cloisters of the theoretical physicists' dreams. It was almost full grown at birth. It was a great new force to be used for good or for evil. There was a feeling in that shelter that those concerned with its nativity should dedicate their lives to the mission that it would always be used for good and never for evil.

"Dr. Kistiakowsky threw his arms around Dr. Oppenheimer and embraced him with shouts of glee. Others were equally enthusiastic. All the pent-up emotions were released in those few minutes and all seemed to sense immediately that the explosion had far exceeded the most optimistic expectations and wildest hopes of the scientists. All seemed to feel that they had been present at the birth of a new age, the age of atomic energy, and felt their profound responsibility to help in guiding into right channels the tremendous forces which had been unlocked for the first time in history.

"As to the present war, there was a feeling that no matter what else might happen, we now had the means to insure its speedy conclusion and save thousands of American lives. As to the future, there had been brought into being something big and something new that would prove to be immeasurably more important than the discovery of electricity or any of the other great discoveries which have so affected our existence.

"The effects could well be called unprecedented, magnificent, beautiful, stupendous and terrifying. No man-made phenomenon of such tremendous power had ever occurred before. The lighting effects beggared description. The whole country was lighted by a searing light with the intensity many times that of the midday sun. It was golden, purple, violet, gray, and blue. It lighted every peak, crevasse and ridge of the nearby mountain range with a clarity and beauty that cannot be described but must be seen to be imagined. It was that beauty the great poets dream about but describe most poorly and inadequately. Thirty seconds after the explosion came first, the air blast pressing hard against the people and things, to be followed almost immediately by the strong, sustained, awesome roar"—

which warned of doomsday and made us feel that we puny things were blasphemous to dare tamper with the forces heretofore reserved to the Almighty. [Continues reading:]

"Words are inadequate tools for the job of acquainting those not present with the physical, mental, and psychological effects. It had to be witnessed to be realized."

Shall we add to their blasphemy by daring to try to keep for ourselves the results of this revelation for good or for evil and thereby endanger through suspicion our very survival?

We seem to be indulging in a state of psychological bigamy. We are entering into a new relationship of the most intimate and responsible nature with the rest of the world through the United Nations Organization, while at the same time attempting to preserve a defen-

sive nationalism by retaining exclusive control of this new powerful source of energy.

During the last quarter century and especially during the iron years of war the United States has achieved, or had thrust upon it, primary responsibility for world leadership. Rich, powerful, progressive, enlightened, relatively unscathed by war, the oldest republic, the oldest democracy, with long traditions of peace, federalism, and international morality, we, better than any other nation, are in a position to furnish that leadership. It is a responsibility we cannot evade.

Let us recall now and take to heart, Lincoln's admonition in an earlier crisis:

We, even we here, hold the power and bear the responsibility. * * * We shall nobly save or meanly lose the last best hope of earth. * * * The way is plain, peaceful, generous, just—a way which if followed the world will forever applaud and God must forever bless.

In addition, we quote from him:

Fellow citizens, we cannot escape history. We of this Congress and this administration will be remembered in spite of ourselves. No personal significance or insignificance can spare one or another of us. The fiery trial through which we pass will light us down, in honor or dishonor, to the latest generation. We, even we here, hold the power and bear the responsibility.

In closing, I have been given the privilege of reading a telegram which has just come from the Midwest Conference of Atomic Scientists and Religious Leaders:

The Midwest Conference of Atomic Scientists and Religious Leaders, representing churchmen and religious leaders from the Catholic, Protestant, and Jewish faiths, as well as natural scientists and social scientists who have given serious study to the problems arising out of the discovery of atomic fission, urges the prompt enactment into law of the principal provisions of S. 1717, known as the McMahon bill. We call attention to the following four principles which we earnestly hope will guide the policy of the Government of the United States:

1. That the production of atomic bombs and the control of the development of atomic energy be promptly placed under international regulations.
2. That the domestic development of atomic energy and the control of fissionable materials be placed in governmental rather than in private hands, so that it may be used in the public interest.
3. That the subject of atomic energy and its development shall be divested of the atmosphere of secrecy which hampers research and breeds international suspicion, and tension, and that there shall be adequate opportunity for public scrutiny of the action and policies of national and international agencies entrusted with the control of atomic energy.
4. That the agency to be created for the development and control of atomic energy shall be composed of civilians rather than military personnel.

Since the McMahon bill embodies these principles, we urge its passage and express our opposition to such amendments as are designed to undermine or vitiate these principles.

Rabbi Jerome P. Folkman, Rabbi Jacob J. Weinstein, Dr. Charles O'Neil, Dr. Leo R. Ward, Dean Charles W. Gilkey, Dr. Bernard Bell, K. S. Kole, Warren C. Johnson, R. J. Moon, J. E. Rose, K. Way, Louis Wirth.

The United Council of Church Women of the United States associates itself with this statement.

The CHAIRMAN. Thank you very much, Mrs. Sibley.

Senator HICKENLOOPER. May I ask Mrs. Sibley a question, Mr. Chairman?

The CHAIRMAN. Certainly.

Senator HICKENLOOPER. I am not quite clear from your statement, Mrs. Sibley, whether your association or organization advocates the

immediate disclosure to other nations, or the United Nations Organization, of all of the techniques of the atomic bomb before we get any reliable assurance that other nations will not use it.

Mrs. SIBLEY. We never had a referendum on that point. We are a very large organization, and we would not urge that the second steps be taken before the first; but we urge that that be the direction—that international control and sharing of secrets be the direction in which we progress.

Senator HICKENLOOPER. We have a problem facing us now as to what policy the legislation should take as to whether or not we should disclose fully to other nations before any reliable agreements for the maintenance of peace are reached, or whether we should keep our major secrets of atomic explosion, at least.

Mrs. SIBLEY. I can speak now only for myself, because we have had no referendum on that subject. But I ask which is cause and which is effect, and whether it is possible to create these assurances in an atmosphere of suspicion which secrecy engenders—as, for example, in our current handling of the Canadian situation. My own hope is that it will be made a part of the international knowledge as soon as possible.

Senator HICKENLOOPER. Yes; I think that is a desirable goal; but still my question is, and I don't care to have you embarrass yourself, do you as an individual, perhaps, not speaking for your organization, believe that we should now, under present existing conditions, disclose all of the secrets about the atomic bomb?

Mrs. SIBLEY. I do. Period.

Senator HICKENLOOPER. Before we get any reliable assurances of peace?

Mrs. SIBLEY. I think it is the basis of those. I don't think you can bargain with a thing like that in your pocket and expect any kind of assurances, because you are not keeping faith with the thing that you are trying to assure.

Senator HICKENLOOPER. I think history shows that we have kept a lot of faith in this country with peace and humanitarianism.

Mrs. SIBLEY. Not enough. You will remember, Senator, if I am not out of order, that after the last war you promised many things and the Senate prevented some of those things from happening.

I was in the League of Nations when the Germans were admitted. I was in Manchuria at the time the Lytton Commission was making its study. I was in Shanghai at the time of the first Shanghai incident, and I was in Berlin as the guest of Mr. Goebbels at the International Chamber of Commerce at the time the thing was building, and the fact that the United States was not a part of a great international organization at the time allowed those things to happen, allowed things to go on in both Manchuria and western Europe.

Senator HICKENLOOPER. That is a question of serious disagreement.

Mrs. SIBLEY. Granted, but it is our conviction.

Senator HICKENLOOPER. I wanted to get your opinion.

Mrs. SIBLEY. Thank you, Senator.

The CHAIRMAN. Commander Brunauer.

**STATEMENT OF COMMANDER STEPHEN BRUNAUER.
UNITED STATES NAVAL RESERVE**

Commander BRUNAUER. My name is Stephen Brunauer. Prior to my entering the Navy I was a research chemist in the Department of Agriculture. In the last 3 years I have been in charge of explosives research and development in the Navy Bureau of Ordnance. Perhaps it is obvious and unnecessary to state that I am not testifying here for the Navy; I believe that Secretary Forrestal, who appeared before you, gave you the official views of the Navy on atomic energy legislation. I testify here in the first place as a citizen of the United States, vitally interested in the fate of my adopted country and the native country of my children. In the second place, I speak as an officer of the Naval Reserve interested in preserving the military strength of my country, because I believe that that is the best safeguard for the peace of the United States and of the world.

Finally, I wish to speak as a research man, interested in the fate of science, because I believe that science if properly handled is capable of providing the foundation for greater spiritual and material welfare or my fellow citizens and for all mankind.

The views I advance here are my own views, but they represent not my views alone—otherwise I would not have had the courage to appear before you. I have discussed them with a considerable number of scientists, atomic and otherwise, with Navy officers and with friends in other occupations, including some Members of Congress, and the response I received made me feel that even if I may be wrong in some of the things I believe in, I cannot be wrong in all of them.

I do not intend to discuss here the international aspects of the problem. I am fully convinced that it is more important than the domestic legislation, but this tremendous problem cannot be solved by the United States alone, it has to be worked out together with the other nations in the United Nations Organization. One of the great contributions this Nation can make to the solution is to enact far-sighted domestic legislation that will serve as a model to all other nations which in the future will also produce atomic energy for peaceful and for military purposes. I further believe that I could not say anything on the international problem that has not been said here before by men better qualified to discuss this matter than I am, and I am convinced that any one of you gentlemen could give me far better counsel on the subject that I could give you.

I have studied all the bills introduced on the control of atomic energy, but I shall discuss only certain phases of three of them: the Johnson-May bill (S. 1463), the Ball bill (S. 1557), and the McMahon bill (S. 1717).

Although I believe that I can make a contribution of some value primarily on the part of the legislation that deals with the military applications of atomic power, nevertheless I shall take the liberty of expressing my opinion first on three other points: the composition of the proposed Atomic Energy Commission, the attitude to be adopted toward fundamental research, and the provisions regarding patents on the utilization of atomic energy for peaceful purposes.

COMPOSITION OF THE COMMISSION

Regarding the composition of the Commission, it seems to me that the Ball bill proposes the best system for carrying out the great task that confronts that body. It is a compromise between the Johnson-May bill which proposes nine members, each to serve for 9 years, and the original McMahon bill (S. 1359), which made up the Commission almost entirely from members of the President's Cabinet.

The Ball bill proposes five secretaries and four other members, the latter to serve for 6 years.

The new McMahon bill (S. 1717) proposes five full-time Commission members to serve at the pleasure of the President.

It seems to me that changing the entire membership of the Commission with every change of administration would be apt to disrupt the work of the Commission. The provisions of the Ball bill would insure continuity, since four of the members would remain in office. The objection that the task is so great that full-time members are needed for the Commission is solved in the Ball bill by appointing full-time assistants for each member of the Commission, whose principal duty is to keep each member fully informed on all atomic energy problems. These assistants are not to be appointed by each member individually, but by the Commission as a whole, and their appointment would not terminate with a change of administration. I look upon the Commission as a top policy-forming body, and believe that its prestige would be tremendously enhanced by the presence of members of the President's Cabinet. At the same time this would insure a close integration between the problems of the Commission, and all other important problems that face the Nation. I should like to touch on one other point in this connection, namely, the frequency of reports by the Commission to the President and to the Congress.

The McMahon bill proposes four reports per year. This provision, if enacted, might leave the Commission little time for anything except writing reports. The Johnson-May bill and the Ball bill propose annual reports, which would probably prove entirely satisfactory.

Incidentally, I haven't seen that any of the bills suggest military control, a Commission which would be composed of military men. As far as I can see, in all the bills the control would be in the hands of civilians, and in the case of the Ball bill it would consist of nine civilian members, and the armed forces would be represented only by the Secretary of the Navy and the Secretary of War, who would, of course, constitute a minority in a Commission of nine members.

FUNDAMENTAL RESEARCH

The Johnson-May bill established very severe security restrictions for fundamental research: the bill as reported out of the Military Affairs Committee of the House of Representatives toned down somewhat the severity of these restrictions. The Ball bill and the McMahon bill insure full freedom of fundamental research.

I believe, together with all my scientist friends with whom I have discussed this problem, that fundamental research should be free and unfettered. No scientist should need the permission of any agency to investigate nuclear reactions, or to publish his findings. There is a tendency on the part of scientists to flock into the most promising field automatically. It is certain that a large and continually increasing fraction of physicists and chemists will work on nuclear physics and chemistry in the coming years and decades, and that tremendous progress will be made—if the field remains free. If, on the other hand, a scientist faces a jail sentence for discussing his research with another scientist who is "not entitled to receive" such information, the result will be that scientists will leave the field and progress will be stifled.

* And yet, gentlemen, for all that, the problem is not as simple as it appears on the surface. When Hahn and Strassman discovered nuclear fission 7 years ago, some scientists began to see dimly the atomic bomb, and when shortly thereafter Fermi and Szilard discovered the chain reaction, some began to feel that the atomic bomb was in the bag. Three of these scientists, the three initiators of the atomic bomb project in this country, Szilard, Wigner, and Teller, testified already before you gentlemen.

The papers I mentioned were published freely in scientific journals, and these publications resulted in the atomic bomb projects in the United States, the United Kingdom, in Germany, and elsewhere.

It is quite certain that there will be fundamental scientific discoveries in the future that will have far-reaching military implications, and if there is some way to keep these out of open publications, they should be kept out as military secrets. I do not know how to solve this difficulty, but I am firmly convinced that much more harm would come from restricting research than from freedom of research. If there is no satisfactory way to solve this problem, I believe that we should accept the provisions of the Ball bill or the McMahon bill.

UTILIZATION OF ATOMIC ENERGY FOR PEACEFUL PURPOSES

I should like to make only one remark on this extremely complicated subject, namely, regarding patent rights. The McMahon bill makes all patents the property of the Government, giving just compensation to the inventor. I am afraid that this system would result in very slow progress in the development of atomic energy for peaceful utilization. Our big industrial organizations are not used to conduct research and development on the basis proposed by the McMahon bill, except in time of war, and I am afraid that their attitude would be lukewarm toward such nonprofit proposition in time of peace. On the other hand, I believe that great advances can be expected if our industrial organizations are allowed to develop freely their processes, patent them, produce them, and draw profit on them. The Johnson-May bill and the Ball bill both establish the policy of widespread distribution of licenses on equal terms to all qualified organizations, and discouraging the growth of monopoly, restraint of trade, and unlawful competition. Perhaps, if this policy is followed, the industrial corporations can be permitted to possess patent rights. What I said here is purely a layman's view, but I had a good deal of contact with the research organizations of the industries during the war, and I have some idea how their minds work.

MILITARY UTILIZATION OF ATOMIC ENERGY

I am coming now to the last subject, about which I should like to talk to you in somewhat more detail, because I feel that I know more about it and perhaps can say something that has not been said here before. I believe that military research, development, and utilization of atomic energy is vitally important; it may determine the continued rise or a cataclysmic fall of our country and of the type of civilization we believe in. A wise solution of this problem is essential. I believe that a simple and workable solution is on hand; it has been tried during the war, and it worked, and I believe it would work in peace.

The three bills I am discussing here present three different solutions of the problem. The McMahon bill proposes that all military research and development be conducted by the Commission and thus excludes completely the armed services from such activities, except I understand full well that liaison would be permitted.

The Johnson-May bill gives the authority over all military research and development to the Commission, but the Commission can authorize the Army and Navy to perform research and development. Indeed, this bill lays down the policy of utilizing existing research institutions to conduct experimentation in the field, and if this policy is followed, the research laboratories of the Army and Navy would probably be utilized. The Ball bill gives military research and development jointly to the Army, the Navy, and the Commission. This is the system that has been tried and found workable, and I shall attempt now to give you my reasons why I believe that it is vital that this system be adopted by Congress in preference to the others proposed.

To start with, I do not need to emphasize what disastrous effects another world war, fought with atomic weapons, would bring upon the United States and on the rest of the world. This has been emphasized here and elsewhere by outstanding scientists, men of public affairs and others, equally well or better qualified than I am to discuss that subject. I can only repeat on the basis of what I know that what they said was true. I can only add my firm conviction that the best safeguard to avoid a disastrous war is the military strength of the United States. This strength, combined with wisdom in handling the international problem, will give time and opportunity to the United Nations Organization to work out the infinitely varied and complicated problems of the nations and to lead us eventually into a better world in which there will be no need any more for individual, national armies and navies. But military strength is vital now, and will be for some indefinite and unforeseeable time to come.

The military strength of the United States will be built around atomic weapons. These will be not the only but the most important items of national defense. Since it is well known to all nations that the United States possesses atomic bombs, and that there are three large plants now, and possibly others later, that are manufacturing active materials, it is inconceivable to me that any nation would dare to attack the United States or any other nation that may be defended by the United States, unless that aggressor nation has an abundant supply of atomic weapons.

Therefore, I believe that if there will be another world war, it will be an atomic war. This does not mean that only atomic weapons will

be used. In this last war, the most modern of all wars, alongside radar-fuzed projectiles the fighting nations used knives and sticks and arrows, and I believe that another war would also utilize these ancient weapons. In fact, a scientist friend of mine risked the facetious theory that in the next war the opposing sides will demolish each other's industries completely with atomic-power-propelled guided missiles containing atomic explosives in the first 5 minutes, and thereafter the war will be fought with knives, axes, scythes, spades, and sticks.

If we accept the proposition that the military strength of the United States is essential for the welfare of the world, then I believe that the following three facts are self-evident:

1. That from now on atomic weapons will constitute the most important items of national defense.
2. That the security of the Nation will be primarily dependent on the effectiveness of its atomic weapons and of its countermeasures against atomic weapons.
3. That it is therefore of paramount importance that research and development of atomic weapons and of countermeasures against atomic weapons be conducted in the most efficient manner.

During the war military research was conducted primarily by three organizations: The Army, the Navy, and the Office of Scientific Research and Development. This system led to such milestones in progress as radar, VT fuzes, and the atomic bomb. Such independent research with close liaison and collaboration, I believe, would be the best system in peacetime, as it was in war, in all fields of military research. This is the system advocated by Dr. Vannevar Bush in his report to the President, entitled "Science, the Endless Frontier."

When I support Senator Ball's proposition that research and development of atomic weapons should be a joint responsibility of the Commission and the services, I do not mean, nor did he mean, I believe, that research should be conducted by Regular Army and Navy officers. What I mean is research done by civilian scientists and technologists working for and within the armed forces, in daily contact, consultation, and collaboration with the officers of the armed forces. Such close contact insures on the one hand that the scientist does not go off on tangents and develop weapons that cannot be used by the military; on the other hand it makes the officer thoroughly familiar with the weapons developed since he himself participated in the development from the ground up. It is a liberal education for both sides; it makes the scientist more practical and the officer keener and better trained. The other extreme is to have the weapon developed by a separate civilian agency, then dropped into the lap of the military in its complete and final form, to be used by them if they can.

The use of atomic weapons will inevitably revolutionize warfare. I should like to point out here only some of its implications relative to naval warfare. It is almost certain that atomic weapons will not be the only ones used by the Navy. For defensive purposes probably ordinary high-explosive weapons will be used for the most part. Thus development of a variety of weapons will continue, but all developments must center around atomic weapons. It is impossible to conduct intelligently the development of either atomic weapons or other kinds of weapons without a unified planning of the entire program. Furthermore, countermeasures against atomic weapons are

very intimately tied up with the nature of these weapons, and must be developed simultaneously and in close relationship. During the war, we always developed our countermeasures simultaneously, and often we did not put any munition into use unless we knew how to counteract it. Sometimes completed munitions were kept in reserve until we were able to counteract it, because the enemy can always capture a sample of the munition and can use it against us; if we have no countermeasures, then we are just as much out of luck as the enemy.

Along with the development of weapons, ships and airplanes must be built or modified to be able to carry these weapons and to combat the enemy's weapons by countermeasures. It is likely that certain types of ships must be eliminated; battleships might have to go if the cost of an atomic bomb is much smaller than that of a ship, unless very effective countermeasures are found. The tendency will probably be toward fast, smaller ships. The tactics of naval warfare may be changed. Convoys and any sort of bunching of ships may have to be avoided. Ships may have to be scattered to larger distances to avoid the sinking of several by one bomb; the scattering in turn would lead to greater vulnerability to submarines using ordinary torpedoes. Large harbors must be decentralized to avoid destruction by a small number of atomic bombs. Since ships, weapons, tactics, harbors will all have to change, it seems reasonable that all these developments should take place within the Navy, simultaneously and in complete harmony.

It is a very unsatisfactory procedure to have the center of all these developments outside the Navy in a separate civilian agency. It is not sufficient to have a few liaison officers in this agency, who come back with stories of the atomic research trying to influence other developments; the development of atomic weapons and their countermeasures must be the nucleus, the core within the Navy from which all activities radiate.

I should like to bring up, if I may, a few additional reasons why it would be undesirable to deprive the armed forces of the right to develop their most important weapons. During the war, under the pressure of war, civilian organizations performed wonders in military research, but during peacetime, with this pressure removed, I am afraid the main driving force would be lacking. Civilians working within the armed forces obtain the drive not from the control of the military, but from the daily contact with them; they talk, eat, live their daily lives with the users of their products, they know what is wanted, they know for whom they are working. Liaison is only a partial and very incomplete substitute.

A corollary of the above is that there is some danger that if all military research and development of atomic weapons is entrusted to a completely civilian organization over which the armed forces have no authority, it may happen that this organization will spend most of its time on fundamental research, or on research directed toward peaceful applications of atomic energy, and will neglect the military applications. Since the armed forces have no control over the situation, they can only complain to the Commission, which may or may not have any effect; even if it has, it would result in lost time and effort. Such situation could not arise if the military developments could be made the joint responsibility of the Commission and the services.

Even during the war, when scientists and engineers put everything into their work to help the war effort, the control of the atomic bomb project was handed over by the OSRD to the Manhattan district of the Army engineers. The procurement and engineering functions were taken over in the summer of 1942, the research and development in the spring of 1943. I gather that to this date the top men of OSRD, Drs. Bush, Conant, and Tolman, are convinced that this transfer was wise; at least I have not seen a statement to the contrary from any of them. You have heard here, gentlemen, and I have heard elsewhere, that the security system of the Army retarded the completion of the bomb by a year, or year and a half. Such statements are very hard to reconcile with the fact that the whole course of the project was planned carefully 3 years or longer ahead of time, and that everything came through on schedule or somewhat ahead of schedule. I do not mean to imply that the security system of the Manhattan engineer district was necessarily ideal. But it is unfortunate that certain atomic scientists, instead of suggesting merely improvements in the security system, suggest that the armed forces be thrown out of the development of atomic weapons completely. On the basis of what I said previously, I am convinced that the participation of the military in military research in peacetime is even more essential than in wartime.

It has been often stated that civilian scientists and engineers do not like to work for a military organization; that they would rather work for a civilian agency. This statement is partly true; the fact is that some of them prefer it one way, some the other way. Many scientists who worked with or for the Navy during the war are not only willing but anxious to accept intelligent guidance in their work by the men of the fleet who will use their products. Others think differently, but the Ball bill solves this difficulty; those who do not want to work within the services can find their place in the civilian agency set up by the Commission.

These are the main points I want to put before you, gentlemen. I deeply appreciate the honor of your request to express my views on the subject.

The CHAIRMAN. Thank you very much, Commander.

Senator HICKENLOOPER. May I ask the commander a question?

The CHAIRMAN. Surely.

Senator HICKENLOOPER. Commander Brunauer, I assume that your statement and your conclusions and recommendations are largely predicated upon the practical assumption that reliable assurances of peace among nations may not be reached?

Commander BRUNAUER. That is correct, sir. I hope they will be reached.

Senator HICKENLOOPER. I hope you don't misunderstand my question. I do not say you advocate they will not be reached, but your statement is predicated upon the necessity for this country in the future to defend itself, or be prepared to defend itself.

Commander BRUNAUER. If the United Organization fails and war will still come.

Senator HICKENLOOPER. Is it your thought that until such time as we get reliable assurances of peaceful intentions among nations that we should not discard or throw overboard the military aspects of research in atomic energy?

Commander BRUNAUER. That is completely true, sir.

Senator HICKENLOOPER. Now, let me ask you this further: Assuming that sometime in the future, either the near future or the reasonably near future, the nations of the world are able to get into such reliable guaranties of peace and the maintenance of peace, would you then think we would be justified in the discontinuance of purely military research in the atomic bomb field, providing all other nations agreed to that and we had proper inspection or proper safeguards that were satisfactory to this country?

Commander BRUNAUER. Yes, sir; I do feel that way. If the country feels satisfied that the safeguards are sufficient to prevent wars, then I definitely feel that way.

Senator HICKENLOOPER. But you still don't believe in throwing away your gun so long as you think there may be a prowler in the house?

Commander BRUNAUER. Yes, sir; more than that, I believe that to hold on to the guns at present will contribute to the eventual solution of the problems of the nations in the United Nations Organization.

Senator HICKENLOOPER. You feel that on any control commission or board that is set up, there should be some representation of the military field of atomic energy, temporarily at least?

Commander BRUNAUER. Yes, sir; not necessarily a military man. It would be perfectly satisfactory to me to have the Secretaries of War and the Navy represent the military of the country on such a commission.

Senator HICKENLOOPER. But is this the point I understand you are making, that during this immediate period of time, or while the threat or possibility of military action remains, that the military interests of this country in this bomb should be in some specific capacity represented on any commission that is set up?

Commander BRUNAUER. Yes, sir.

Senator HICKENLOOPER. Thank you very much.

The CHAIRMAN. Thank you, Commander.

The committee will meet in executive session at 10:30 tomorrow morning.

(Whereupon, at 12:15 p. m., the special committee recessed until 10:30 a. m., Wednesday, February 20, 1946, to reconvene in executive session.)

ATOMIC ENERGY ACT OF 1946

WEDNESDAY, FEBRUARY 27, 1946

UNITED STATES SENATE, SPECIAL COMMITTEE ON ATOMIC ENERGY, Washington, D. C.

The special committee met, pursuant to notice, at 10 a. m., in room 104-B, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Johnson, Byrd, Austin, Millikin, Hickenlooper, Hart, and Vandenberg.

Also present: Dr. Edward U. Condon, scientific adviser to the special committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The hearing will come to order.

General Groves, you have been before the committee a couple of times before, the first time, as I recollect it, on the general information proposition, and then we heard you in executive session on some matters pertaining to the security provisions of a proposed bill. The committee, as I understand it, has decided to invite you to come back this morning to give us your personal views on proposed legislation.

Now, you go right ahead, General.

STATEMENT OF MAJ. GEN. L. R. GROVES, UNITED STATES ARMY

General GROVES. I had hoped to receive a letter from the committee or to have one sent to the Secretary of War outlining my position in appearing, because, after all, it is rather unusual for an Army officer to be asked to appear before a Senate committee to give his personal views as divorced from the War Department.

Senator VANDENBERG. No more unusual than atomic energy.

General GROVES. That is correct, but I have talked to the Secretary of War on the telephone and have received instructions from him, and I feel the only limitation which he has placed on me is that if I give any testimony which I feel is at variance with War Department views, I should state that fact, and so, from time to time, I will emphasize that it is a personal viewpoint and I am not speaking for the War Department.

At the outset, I would like to make it perfectly clear that I have never sought nor do I now aspire to any appointment on or under any proposed commission on atomic energy. Therefore, I do not have any more personal interest in the eventual details of any legislation than any other citizen should have. My only desire is to have the very best form of legislation enacted.

467

I would like to talk about a viewpoint that I regard as most essential to adequate legislation in this field. First is the make-up of a commission and the duties of a commission.

If the Commission is to function—in fact, if the whole control of atomic energy and development is to function, as I feel that it should—anything in the way of security regulations or regulations affecting other citizens outside of the project itself should be made by the Commission and not by an administrator. There is nothing that can hurt good administration more than to have an administrator who gets to making rules and regulations that affect things other than the immediate operations of his own organization.

I think that any form of bill should avoid giving to an administrator or to any one other than the top commission the power to make regulations, and I refer particularly to security but also to any other form of regulation that might be necessary to adopt. I include in such things any support, and I believe that such support will be necessary to colleges and to universities, to scientific research. I think that should be in the hands of a commission so that the administrator is not put in the position of being someone who has too much power.

During the war that was not feasible. I was both the administrator and the commission, but I had very rigid instructions from the President of the United States and the Secretary of War and the Chief of Staff about security. All of the security measures taken by the Manhattan project during the war and to date are in accordance with the written instructions of President Roosevelt to me, emphasized by oral instructions from him, and by the very pointed verbal instructions of General Marshall.

The type of commission, I think, that you get in this legislation will control whether atomic energy is properly handled in this country or not. It is to me an important factor to get commissioners with the high qualifications that are necessary. The May-Johnson bill provided for nine commissioners who were part-time commissioners. There have been objections to part-time commissioners. I would like to review why I personally—and this is a personal opinion—feel that there are advantages to the part-time commissioners.

It is on two bases: First, that a commission which is made up of part-time people who have other interests will be a better commission. I feel that with the regulatory powers—that is, the power to make rules that affect so many people and affect the United States so vitally—it is important to have a number of men on the Commission. I think that nine is a satisfactory number. Seven would be all right, or 11. I think if you get too many, then it becomes a debating society or people who just sit there and vote "aye." That is not a War Department position at this time.

Senator AUSTIN. I do not understand that. You say the War Department does not favor a commission?

General GROVES. I think I explained before you came in that Secretary Patterson had given me verbal instructions to the effect that while I was to discuss this problem thoroughly with the committee and give my personal views, anytime that I felt that I was not representing the War Department's views I was to make a point of it, and I am making the point that this is a personal view and I am not

speaking for the War Department as to how many members should be on the Commission, or anything to do with that.

Senator JOHNSON. Do you know what the War Department's position is on that point?

General GROVES. Well, I don't know what it is. I prefer not to state what that is, because I am not certain enough of it.

Senator AUSTIN. They have not told you, have they, that they are opposed to that?

General GROVES. They have sent to the Bureau of the Budget a report, I believe, on the McMahon bill which would indicate that. I have glanced at that report, read it very hurriedly, and I did not prepare it.

Senator AUSTIN. Have you seen Secretary Patterson's testimony before the committee in that respect?

General GROVES. Yes, sir.

Senator HART. Insofar as I understand, that testimony does set forth the War Department's position.

General GROVES. Until it is changed, that would certainly be correct, sir.

Senator MILLIKIN. You did not write that report?

General GROVES. On the McMahon bill; no, sir, I did not.

Senator MILLIKIN. Would you be at liberty to say who did write it?

General GROVES. No; I don't think so, because I do not know exactly who wrote it all. I know it was prepared under the direction of the Secretary and the Under Secretary and that it was personally discussed as to the major factors with the Secretary.

Senator MILLIKIN. Can you say whether it was written by men who have worked with you in these matters, or by anyone who has worked in these matters in a military capacity?

General GROVES. It was not written by any such person. Our office was consulted and our views were given to them.

Senator HART. General, were any of the members of the original interim committee, whose work founded the original message from the President and the original bill, involved or included in that discussion which preceded Secretary Patterson's testimony?

General GROVES. I do not believe so, but I am not certain, sir. I have no knowledge that they were, and it is my belief that they were not. There may have been one or two who were consulted by phone, but I am not aware of it.

The CHAIRMAN. General, are you aware of a directive issued by the President to the various executive departments setting forth the Executive policy on this matter? Have you seen the memorandum?

General GROVES. Yes, sir; I have seen that.

The CHAIRMAN. And the Secretary of War testified after the receipt of that memorandum in conformity with the memorandum, did he not?

General GROVES. Yes, sir.

The CHAIRMAN. And the Executive policy as it was outlined was for a three-man full-time Commission. I believe that was the Presidential recommendation.

General GROVES. Yes, sir.

The CHAIRMAN. So that gives the official War Department position?

General GROVES. I think so.

Senator AUSTIN. There was supplementary to that an additional board, was there not, in the recommendation?

The CHAIRMAN. I think not, Senator.

General GROVES. I think not, sir.

Senator AUSTIN. I had the impression that there was a provision for an advisory board.

The CHAIRMAN. That is called for in the bill. The power is set up for it.

Senator AUSTIN. That is all right. I am not trying to get a wedge in between the bill and the President or the Secretary of War. I would like to find out whether it is the policy of the War Department to establish a permanent board of three men or three members accompanied by an advisory board.

General GROVES. I don't believe the Secretary testified to that, and as far as I know, the statement was made that it would be a three-man full-time board. What was said and what contact was had with the members of the interim committee I am not aware of in their preparation of that final statement. I believe that previously it had been discussed with them and the feeling had been expressed by some that they would not get as high-caliber men for this task by having a full-time Commission as they would by having a part-time Commission.

When the part-time Commission was originally selected, the theory was adopted on the ground of trying to figure out how you could get a board that would be able to handle this matter. It was not felt that you could get men of the caliber that we needed in many fields to accept permanent positions.

It was also felt, and I think that that has been testified to before the committee by Mr. Smith, Director of the Budget, that the objection is to having a three-man Commission exert executive powers such as were exerted in the days of ancient Rome when they tried to have three men run a state administratively. I think that we have examples of that in this country, and when we have a board which has executive powers, we soon have a situation where there is either turmoil or one strong man emerges, and from there on it is his board or his commission.

In this particular problem, the qualities of the men that are required to be on the Commission are unusual. It isn't anything that a man can just walk into and function perfectly, or even well, by being appointed by the President and confirmed by the Senate. I don't think that that is a full qualification. I think it requires men who have background in many fields. That was one reason why the nine-man Commission appealed to me personally and my personal decision to say that that was the best idea was made by taking various sizes of commissions, both part-time and full-time, and trying to list people that I thought would make up a satisfactory Commission. That is the basis on which the nine-man, part-time Commission appealed to me.

Senator HART. May I pick that up a little, General?

In checking your idea, do I understand that you rather canvassed the field in the United States to see who, in your opinion, after this great wealth of experience, would be able to measure up to the requirements that you conceded would be necessary?

General GROVES. That is correct, and in some instances to make up this Commission, I made no effort where I was getting into a field that I was not certain of. All I did was to specify the qualities of the man, but to make certain that men of that quality could be obtained. For example, such a board or commission should have representation from science, and that means men who really know what it is all about. You cannot find nuclear physicists who are disinterested. They all will be very vitally interested by anything that is done by this Commission, and I feel very strongly that no one belongs on such a commission who is interested in any way in anything which will really cross swords with his duty as a member of the Commission.

If you take a man such as President Conant, of Harvard, or President Compton, of MIT, they are automatically barred in my opinion, although they would personally be ideal members, because their institutions are vitally interested in nuclear physics research.

I felt that to get men of that caliber, we would probably have to go to the smaller liberal arts colleges, not the universities, the ones that did not have a direct interest in nuclear physics and find a man there, presumably the president of a college such as Williams or Amherst or Lafayette, or something of that character, and that that type of representation was essential.

The CHAIRMAN. General, going over these names that occurred to you as properly qualified appointees on the Commission, you have said that you gave consideration to Mr. Conant and Mr. Compton but had to reject them for the reason given. Will you tell us some of the other names you thought about?

General GROVES. Well, I can give you the quality of the people. For example, I felt that Dr. Bush could be a member of such a commission without interference with other interests. I felt that another man who would be barred by reason of his recent appointment as president of Purdue was Compton, a very able man. You run down the line and you find that any scientist who is an academic scientist—and we need academic scientists on such a regulatory body—would fall into the class I spoke about. He would have to be a man who had taught science and then had become the president of a smaller college.

The CHAIRMAN. Have you any list of names prepared?

General GROVES. In that field we felt that we could get men of that caliber from the colleges. We also felt in industry that we could get men who were accustomed to big things in industry, but it would mean barring, for example, anybody who would be affected by this, and that would primarily bar men from companies which are working with us, companies which might have an interest in seeing us succeed or not succeed, or where the people might have some claim for saying, "Well, that company would like to see this delayed." For example, that would bar, in my opinion, any man who was an executive in either General Electric or Westinghouse.

The CHAIRMAN. Have you a list in your files, General, of these men whom you have thought about?

General GROVES. Yes, sir; I have a number of such calculations.

The CHAIRMAN. With specific names?

General GROVES. With specific names or qualities.

The CHAIRMAN. Would you please send those to me?

General GROVES. Yes; I would be delighted to.

Senator VANDENBERG. Does your idea of this nine-man Commission contemplate that it is totally civilian, or are the services represented?

General GROVES. I felt that the services would have to be represented, and I think that primarily for this reason, that at the present time this is the most powerful military weapon in existence. It is a weapon which can control all future warfare and can spell defeat or victory for a nation and I felt that, until a time should be reached when we knew that the thing could be controlled and could be inspected and could be handled so that we knew we would never be subjected to an attack by this weapon, the Army and Navy would have to be represented.

The CHAIRMAN. You mean on the Commission itself.

General GROVES. On the Commission itself, or in some capacity that would insure that the Army and Navy views were not overlooked.

Senator VANDENBERG. You mean men in active service now?

General GROVES. Men in active service or men on the retired list, although I have always felt that with this length of time which was proposed of 9 years—and that was proposed because it was felt it would take at least 2 years before the man really got into the swing of it if he was not in the field to start with—you would have to have a man who was young enough when he went on the Commission so he could serve his full 9 years and be physically and mentally fit at the time he went off.

Senator JOHNSON. Why should not the Air Force be represented also?

General GROVES. I have always considered the Air Forces as part of the Army or Navy at the present time, and when I say "military representatives," I include land, sea, and air.

Senator JOHNSON. Then, you do include the Air Forces?

General GROVES. By all means, sir.

Senator JOHNSON. Senator Austin may know a great deal more about the trend of things in that direction than any of the rest of us since he is working on the new unification bill, but it would seem to me that all three of the armed forces should be represented on this Commission.

General GROVES. That is correct. As soon as they become three instead of two, or as soon as they become one, as far as I am personally concerned, I would like to see from two to four men on that Commission who were either active or retired, and I would like to see at least one of those from the Air Forces, and I am not particular about the others, except that I think there should be one from the Navy and one from the Army Ground Forces. As long as there are from two to four, I think that the Army and Navy interests, which are essentially the defense of the United States, would be properly taken care of.

Senator VANDENBERG. You said that you were interested in the age level so that you wouldn't lose capacity. Your view and Senator Hart's agree on that subject?

General GROVES. I am afraid I might be younger than almost anyone here except the chairman, and maybe I am younger than he is, so maybe it wouldn't be right for me to say as to that.

The CHAIRMAN. General, I take it, when you say service representation you mean service personnel, not the Secretary of War?

General GROVES. I do not mean a civilian head of a department and I do not mean a man who has to go to the Secretary of War or the Chief of Staff to be told how to vote on anything. In other words, what I want, and feel is absolutely essential, is a man who has the background and who is not going to forget for one minute that, as long as this is a prime, or the prime, military weapon of the country, defense must come first and other things will have to come afterward until the international situation is resolved so that we do not have to worry about this as a military weapon.

Senator MILLIKIN. Do you think, General, that the bill that comes out of this committee should conform itself to the fact that the weapon angle of it is the predominant angle at the present time?

General GROVES. I think so, but I do believe that the bill as it comes out should recognize that while it is a predominant angle at this time, we are prepared for the future and the bill should prepare for the future and not intimate to anyone that we are thinking of this only as a weapon.

Senator MILLIKIN. That would be a matter of mechanics?

General GROVES. I think it is a matter of wording the bill so that it is clear that we are not as a Nation embarking on a policy that we are going to have this as a weapon for all time and that is all we are interested in.

My view is that we are interested in it as a weapon as long as we have to be, and on the day when we can say we can forget this as a weapon, that will be fine.

Senator MILLIKIN. You agree that the weapon is the predominant thing at the present time?

General GROVES. At the present time; yes, sir.

Senator MILLIKIN. Do you see anything on the horizon that leads us to believe that within, say, a year or two it will lose its predominancy?

General GROVES. As a weapon?

Senator MILLIKIN. As a weapon.

General GROVES. No, sir; I cannot see anything.

You are thinking, I suppose, primarily of defense against this, and I see nothing, and I have yet to be told by anyone in whom I have any scientific confidence that there is any possible angle which could be attacked that might result in a defense.

Senator MILLIKIN. Aside from the defense angle, that is, a specific defense to this specific weapon, do you see anything in the world situation that leads us to believe that we may get into such a state of stable peace within the next year or two that we could shift the predominancy of the energy from a war weapon to that of peacetime exploitation?

General GROVES. I don't believe that we can ever shift from the predominancy of this as a war weapon so long as we are unable to make certain that there will be no war.

Senator MILLIKIN. Then, until that time the bill, in your judgment, should reflect that fact?

General GROVES. Yes, sir.

The CHAIRMAN. General, I may be in error, but I seem to remember upon a number of occasions—I am not sure whether you did it before the committee when you were here before, but I seem to have read in the paper at least, accounts of some speeches that you made in which

you indicated that you believed that the War Department wanted to get out of this just as quickly as possible. Do you regard your recommendation for War Department generals to be members of this Commission to be in harmony with that former statement?

General GROVES. Yes, sir; because at the present time and in the past, the War Department has had sole control, and it is the sole control that I feel it should get out of.

I think also that when I said from two to four men with military experience on a commission of nine, that means the majority will be in the hands of civilians, as I feel it should.

The CHAIRMAN. Now, General, let's see if we can harmonize that viewpoint with your answer to Senator Millikin's question that you regarded this thing primarily now as a weapon. If that is the major emphasis at this time, would it not follow logically if you adopt your theory that there should be a majority of military on the Commission?

General GROVES. No, sir, because I believe that the Commission should be primarily civilian. It is the feeling of the United States and of all the Anglo-Saxons, dating from the time that Cromwell went into Parliament, that you cannot have an organization with the powers that that organization will have that is not definitely subject to a civilian majority. I believe that the Secretary of War should be civilian and should have civilian assistants for the same reason, and yet that does not keep the Chief of Staff, who is the military adviser to the President, from exerting a great deal of influence on military matters. At the same time, it leaves it to the Secretary of War as the head of the War Department.

Likewise, on this Commission I feel that the Commission must have a civilian majority, and I feel that very strongly because of certain things that the Commission must be responsible for, which are primarily security matters, and these regulations which they must frame and adopt. I think it would be most adverse to the future of atomic energy and to the future of the country to have the action of the Commission attacked on the ground that it was a military commission.

The CHAIRMAN. Do you think that you would obviate that crime by having a 5-4 representation?

General GROVES. I think you would, and I would like to recall that I said from two to four.

The CHAIRMAN. Four more desirable than two?

General GROVES. I think the actual number on it, Senator, depends a great deal on what Senator Austin is going to do. In other words, if we have a unified service, if we have two as we have at present, or three, that will determine really what you should have on that Commission.

I would hate to see a commission or anything established in the law that said the President had to appoint a definite number of military men. I would not object personally to having it stated that he can appoint or should appoint not less than two or more than four.

The CHAIRMAN. Now, I seem to have read an interview with General Eisenhower, and I have called the interview to the attention of the Chief of Staff, in which he advocated an all-civilian commission. Have you discussed that with the Chief of Staff?

General GROVES. I don't recall that.

The CHAIRMAN. I read it in the Christian Science Monitor, a story by Mr. Roscoe Drummond.

General GROVES. I don't believe I discussed that particular thing with General Eisenhower, although I do not recall—I may have.

The CHAIRMAN. That is the way he was quoted in this story, as believing there should be an all-civilian commission.

General GROVES. Now, I would like to repeat what I said before, that I felt that none of these active or retired officers who were on this Commission should be serving as representatives of the War and Navy Departments; that they should be serving as individuals, with that background and that ability to see that side of the picture.

The CHAIRMAN. You have always exercised becoming modesty, but it seems to me you have drawn a bill of particulars here which you could fit pretty well.

General GROVES. Well, I do not want to fit it. I think there are others that could fit it. I think that initially—I don't know how long the transition period will last—there are others that can fit that bill today, and I still stand by my statement of neither seeking nor aspiring. As a matter of fact, while formerly it would have been a question of doing what I was asked to do, I think the experiences of the last 4 or 5 months have taught me that it would now take very strong urging. I would have to be told that it was a must and not just "we would like to have you" or "we think you should." Somebody has got to do some arguing now.

Senator JOHNSON. General Groves, would you see any objection to a requirement in the law that the President shall appoint someone from the military branches as recommended by the Chief of Staff of the particular military branch?

General GROVES. No; I would not see any objection to it.

I have always felt, however, that the less strings that were tied to the President in the matter of appointment the easier it was, but I have no real objection to it.

Senator JOHNSON. He would probably do that anyway?

General GROVES. He would do that anyway except for good and sufficient reason, and I do not know just how it could be done if it were done that way. It would be difficult to make it legal and it would be awkward, and I think it would be something that you could depend on the President. After all, if he loses confidence in the Chief of Staff, he has a very easy remedy.

Senator VANDENBERG. In any event, when one of these officers is appointed, he severs himself permanently from the Military Establishment?

General GROVES. As long as he is a member of that Commission.

Senator VANDENBERG. That wouldn't be long enough.

General GROVES. It would be 9 years, and that means that he severs it permanently really from a practical standpoint.

Senator VANDENBERG. "Permanently" is the word.

Senator JOHNSON. Of course, our Army officers have retirement privileges and you might, if you tried to circumvent that too closely, disqualify a great many very able men who would be very desirable on such a commission because their retirement is a matter of great importance to them. If you are going to sever them from such privileges, certainly you are going to have to do a lot of coaxing.

Senator VANDENBERG. I wouldn't sever them from those privileges, Senator, but as generally indicated these men have got to be absolutely free from domination. If they contemplate a return to the service, they are not free from domination. I do not want to interfere with any of their rights; I just do not want them to come back later and capitalize on what they have done.

Senator HART. Senator, after a military man drops out of his own branch for 9 years, he is not likely to be again actively employed in any case, but if he may return to the service pay roll as a pensioner, then his rights are looked after somewhat like one in uniform becoming a Senator and going back.

General GROVES. I think that has given you my views on the proposed nine-man Commission.

Now, there were other types of commissions proposed. I would like to state that my experience has never made me a believer in ex officio members of such commissions who are busy heads of Government departments, because we want men who can spend whatever time is necessary and, particularly, can attend meetings; we want a man who cannot send some assistant over there to sit for him and have the assistant come back and not be able to tell him even what went on at the meeting.

Now, that may be at variance with the idea of a part-time man, but a part-time man to me is not a man who sits 1 day a month and then comes down and sits and forgets it in-between time. He is working in-between time on problems. He is able to take trips of 2 or 3 weeks at a time, at his convenience, of course, and it can be arranged.

As to the permanent type of commission, I think the real objections that I see to it are first, that I cannot picture that permanent commission as a group of three or five running an executive agency, unless one man becomes dominant. I think also that I would like to see very much the regulatory features of the Commission separated from the executive and the administrative. It will make it much easier for the administrator if all he is doing is executing the rules established by the Commission.

*Separating of regulatory
from admin.*

I think one of the other duties of the Commission, besides passing on regulations, and not only passing on them but, as it means to me, really determining what they will be, is to serve as a board of directors on the general administration by the executive, the administrator. I think that is essential. I think there has to be one top administrator, and not, as was proposed in Senator McMahon's bill, four different departments, each of which would report to the group of three men. I don't know just what qualities those three men would have. I have tried to figure out just what they should be.

If you have one man with military experience and you have one with industrial and one with academic science, you have got just about a bare framework. I don't know whether there should be someone with legal ability in there or not, but you would at least have to have those three—the military, industrial, and academic—and that leaves out a number of things. It leaves out more than one military man, for example, who would either have to be air, ground, or sea, and you have problems involved in that.

Senator JOHNSON. You are leaving out an engineer, also.

General GROVES. It would leave out an engineer. You would have to make your choice between an engineer and an operating man, and these big industrial operations are not easy. They involve labor problems that are most complex; they involve management problems, and they involve a tremendous number of problems where you want the advice of those men.

Now, I would like to recall for you for a few moments what the military policy committee did for me during the past. The military policy committee, as I viewed it, had one primary purpose, and that was at any time that they lost confidence in me they were to tell somebody, and that somebody would then say, "You are through."

Senator MILLIKIN. May I interrupt to ask who made up the military policy committee?

General GROVES. It was made of Dr. Bush as the chairman, with Dr. Conant as his alternate, and with General Styer and Rear Admiral Purnell. Now, actually Conant sat with every meeting of that military policy committee. I also sat with it—that was required in the set-up.

In addition to keeping their opinion on me up to date so that they could report to the proper authorities—that is, the Secretary—and say, "You had better get rid of him," they also passed on major decisions in advance. I didn't embark on the construction of Hanford, for example, without the full concurrence of that military policy committee. I presented the facts; I answered all the questions. Styer and Purnell could handle the military part of it. Bush and Conant could handle the scientific part, and we didn't have any industrialists on that, although I often wished that I had a man to go to for advice; but I had plenty of other industrialists. We went to them for advice constantly. Dr. Conant was an adviser to me from the start. As he puts it very modestly, he said that he was a "kibitzer" on this project. He was the type of kibitzer that tells you what you had better discard and how many cards to draw, too. While he didn't interfere in any way, it was always advice, still it was very sound advice, and that was true also of Dr. Bush. If a problem came up that was essentially chemistry, then Dr. Conant's advice was listened to very carefully, and it was, as a matter of fact, always followed. The same thing was true with Dr. Bush's advice.

When you have men of that caliber—and that is the type of man I would like to see on such a commission—when they give advice you had better listen to it or be very certain that you are right, and then you have to convince them, or probably you are wrong anyway.

Senator JOHNSON. Were Drs. Conant and Bush consulted in the drafting of the so-called May-Johnson bill?

General GROVES. They were members of that interim committee, sir.

Senator JOHNSON. Then, they approved the nine-man Commission?

General GROVES. Yes, sir; and particularly the part-time features of it.

The CHAIRMAN. How often, General, did this policy committee meet?

General GROVES. That policy committee met—I don't recall exactly—at irregular intervals whenever I felt there was anything I needed their help on, or they felt they should be brought up to date. That was an official meeting. Actually, when he was in Washington,

I should say that I saw Styer at least every week or 10 days; I saw Conant about every week to 2 weeks, depending on how often he came to Washington, and every time he came to Washington I saw him. I saw Bush just a little less frequently, but that was not necessary because I saw him through Conant who took everything that I said back to Bush. I saw Purnell on anything that I felt I needed his particular advice on, or any important matter that came up.

For example, if we got a report that one of these constants was turning the wrong way, and instead of being able to make a bomb with, say, that much material [indicating] we were going to have to use that much [indicating], they were informed immediately, and they were informed just as the board of directors in a company would be informed. When they came to the board of directors meeting, they knew what it was all about. They were not there just to collect a fee, for there were no fees; they were there and knew everything that went on, but didn't know about the details.

The CHAIRMAN. Admiral Purnell, I believe testified before the committee. It is hard to recollect all the testimony that has been before us, but as I recollect his testimony, my general impression at least was that he had not been in too close contact with the project. Have you read his testimony?

General GROVES. Yes, but also it was quite a while ago.

The CHAIRMAN. Do you agree with my impression?

General GROVES. I would like to say in my opinion that dealt with the one phase of it which was the work done at the Naval Research Laboratory.

The CHAIRMAN. That is where he was consulted?

General GROVES. No, sir; that is the part that he did not know as much as you might have expected him to, but that was because there were many complications concerned with that that dated back long before I came into the project. There were a lot of technical and personal problems there that I would rather not go into in open hearing, but it was a touchy thing to handle, and it was nursed and handled just as carefully as it could be done.

The CHAIRMAN. I gather from your description, General, that you really carried the main burden of the policy making of the Manhattan project.

General GROVES. I would not say that is correct.

Now, for example, take the Hanford works. The decision to build the Hanford works was made with the full approval of the policy committee in advance. Every important decision was taken in advance. We built three piles there, and that decision was approved by the policy committee in advance with a description of just what we thought we would get out of each pile.

The fact that we built two chemical separating plants there was approved by the committee in advance. Then, there was a time when one member suggested that we not complete the third pile. We got some erroneous scientific data, and we thought we could do much better than we could do, and because of that erroneous scientific data one member suggested that we not complete the third pile. That was a subject of considerable discussion in that policy committee and the decision that was reached was, you might say, squarely on all of us.

My general feeling always was this, that while I was responsible for the major decisions, no member of the policy committee would

ever be in a position where he would say that he did not know that these decisions were being taken and that if he had known he wouldn't have approved them, because they knew of the major decisions and they approved of them and approved of them in advance, and quite a number of them that were quite important were really taken on the initiative of one of the members of that committee.

There was one particular thing that I would prefer not to state where I was overruled by the policy committee on a certain matter with respect to organization, and that was all there was to it.

The CHAIRMAN. Do you have a record of how many times this policy committee met with you?

General GROVES. Formally?

The CHAIRMAN. Yes.

General GROVES. Yes, sir.

The CHAIRMAN. Do you know how many it was?

General GROVES. No; but I should say offhand that the formal meetings would run from about a month apart to about two to two and a half months, and it all depended on the situation. If there was nothing to be discussed, they did not meet.

The CHAIRMAN. Would you mind submitting for me the number of formal meetings of this advisory board?

General GROVES. I would be glad to, and also with the understanding that that did not mean they were not in constant touch with the situation. There were certain meetings that were held at longer periods than we would like to otherwise because of the fact that we could not always get these people together. Some of them left the country, as you know, from time to time.

The CHAIRMAN. That is always the difficulty with part-time people who have other interests. They might find it difficult to consult in matters of policy.

General GROVES. That is correct, but we never had any trouble with them when they were in this country. It was when they went abroad, to the Pacific and to Europe, that we had trouble.

If there is no provision adopted which includes men with military experience—and I mean by that long military experience, not just the experience of serving in either this war or the last—I believe that something should be done to correct anything which excludes the armed forces.

We have talked a lot about unification of the armed forces, and yet if this is done we would take the controlling weapon, you might say, certainly the controlling weapon of a surprise attack, and divorce it from the armed services and say that the Chief of Staff and the Chief of Naval Operations will have nothing whatsoever to do with it excepting insofar as this Commission permits them to. I think that means that if any such bill is adopted which does not include men with military background on the Commission, the Commission should be directed by law to submit to the Joint Chiefs of Staff all matters of policy prior to adoption and before publication.

In the event that the Joint Chiefs do not concur in such policies, I think they should be submitted to the President for decision. I think it should also direct continuous consultation and maintenance of liaison with the War and Navy Departments on all matters of security, military research, and military applications of atomic energy and development, manufacture, storage, and use of atomic bombs.

The CHAIRMAN. Do you mean by what you have just said that all releases of information, including basic scientific information, should be submitted to the Joint Chiefs of Staff?

General GROVES. You mean each piece?

The CHAIRMAN. Yes.

General GROVES. No, sir; the policy.

Now, I would like to state, for example, how the Smyth report was drawn up. The Smyth report was drawn up by putting down on paper in about the equivalent of a sheet and a half of double-spaced typewriting the rules under which the report would be drawn. Those rules were drawn up originally by me, I think in consultation with various people—I am sure in consultation with Drs. Tolman, Conant and Bush. They were approved later formally by people above me in the War Department—that is, the Secretary—and I don't recall whether they were shown to the President or not. I cannot say, but those rules set forth the basis on which the Smyth report would be written.

Essentially they were that it could not contain anything that was not already known beforehand, and they gave certain exceptions to that as to what could be told; that is so that men of the stature of Hahn or Eisenberg of Germany could not get the answer once knowing the bomb had gone off, and it permitted certain things that we knew could not be kept secret over 10 minutes after the bomb was let off.

The CHAIRMAN. Do you advocate the release of any further basic scientific information?

General GROVES. I will comment on that. These were rules that every person in this room could understand. There wasn't anything scientific about them. They were the type of rules, written by people who had intimate knowledge of the project and intimate knowledge of science and engineering, which would guide Smyth in preparing his report. The report was read afterward by a group of several scientists, particularly Dr. Tolman, on whom I placed the greatest confidence, with the rules right in front of him.

Smyth and Tolman both said that these rules were carried out in the preparation of this report. I read the report also. There were some things in there that I couldn't have told whether they met the rules or not. Maybe some of the physicists couldn't tell when you got over in to the chemical field, but in each instance the necessary check was made by the man who did know that particular small phase of the problem who said that it was within the rules.

Now, the chiefs of staff would concur in the rules and then it would be up to the other people to enforce the rules.

Now, to return to your question, Senator.

The CHAIRMAN. I asked you if you advocated the release of basic scientific information.

General GROVES. I advocate personally—I am very much interested in it—the release of all scientific and engineering information which will not be adverse to the national defense of the United States. Now, in putting that on a practical standpoint, I believe that it means almost all of the medical data which we have secured. It means a tremendous amount of what is properly termed "basic scientific information," things that we learn which have no effect on national defense.

The CHAIRMAN. Are you in agreement with the report of your committee, the War Department's committee, who sent us a copy of the letter addressed to you advocating certain declassifications.

General GROVES. That is the Tolman committee. Tolman was the chairman of that.

The CHAIRMAN. I believe it was Oppenheimer, Urey and Compton.

General GROVES. Yes, I know that. That report has been studied by me in detail. It has been discussed with a few of the members, all the members that could be gathered together at the particular time. As a result of that decision, they have given me an additional report explaining a few of the things that were not clear as to just how far they intended to go, and my own reaction to the report is that in general I am very much in favor of adopting every single recommendation that they have made. There are a few exceptions that I am still worrying about, but I would say offhand that 90 percent of their recommendations I am in favor of.

In view of the statements that have been made before this committee, and in the press and in the editorials of the press, repeated time after time, I feel that it is hardly proper for me to release that without authority from above, and I am taking the necessary steps and don't mind saying that I believe that almost everything in that can be released, and it is a question of when. If it were within my hands, I think that I could tell you exactly what I would do, and I think you would know.

Senator JOHNSON. Can it be released soon enough to assist this committee in drafting the legislation that we expect to draft during the next 2 weeks?

General GROVES. I don't believe it would be of any value to you in drafting it, but I would be very happy to give you as a secret document for your use in the committee the report of the Tolman committee with its addendum showing the things that will help you understand it. I would be very glad to have an officer who served as the nonvoting secretary appear with the report and explain to you just what that means, but it would have to be done in executive session.

Senator VANDENBERG. May I ask you a question, General?

In dealing with the United Nations on this subject, we have proceeded on the theory that any arrangement made by the United Nations Atomic Energy Commission will require the approval of Congress. In other words, we are proceeding on the theory that there is not only a general policy factor involved in this matter, but there is also \$3,000,000,000 worth of American property involved, and that in the final analysis the American Congress is the only power that can make a conclusive decision.

Now, you cannot transfer that analogy completely to the domestic situation, but I want to ask you whether you conceive that Congress has any continuing responsibility of any nature in connection with this affair, and, if so, how you would implement that responsibility?

General GROVES. I feel that Congress has a very definite responsibility, and certainly those of us who have appeared before congressional committees are fully aware of that, particularly when we come seeking money.

I feel that the best control the Congress has on any executive activity really is the power of the purse strings.

On this problem I feel that there are many things; for example, take this release of information that I am now faced with. It is a very difficult decision to make, not because I feel personally that it will hurt the national defense, for as I say, 90 to 95 percent of the data I feel could be released. But it is a decision that I don't believe, in view of what has occurred in the past with respect to the Smyth report, I am justified as an executive officer in releasing.

Now, if the President of the United States tells me to release it, then I will assume that he will decide whether it should be referred to Congress or not. Now, I don't believe that it is sound administration to have to refer such a matter to Congress. If this committee should tell me that they were opposed to releasing that information, I certainly wouldn't release it of my own free will.

Senator VANDENBERG. Let me be specific about this thing. Would you object to the inclusion in this legislation of the creation of a standing joint House and Senate committee for purposes of consultation and advice with absolutely no executive authority but as a permanent liaison with a right of constant knowledge and information with respect to what the Atomic Energy Commission is doing?

General GROVES. I don't know what the views of the War Department are, but I can state what I personally feel about it. I would not mind that in the least, and I think if I were connected with this in the future I would be very happy to have it. I would certainly, on a matter of this importance and with so much security bound into it, prefer to have one committee with which to deal rather than two.

Senator VANDENBERG. Thank you.

Senator BYRD. General, could I ask you if you are in agreement with the declaration of policy contained in the McMahon bill, page 2, "A program for the free dissemination of basic scientific information and for maximum liberality in dissemination of related technical information"?

General GROVES. I would say "yes," provided that nothing will be disseminated that in any way will injure the national defense.

Senator BYRD. You think it ought to be restricted to that?

General GROVES. I think there has to be some restriction as to the national defense attitude. Now, I don't know just when you came in, Senator Byrd, but I expressed the view that until various people that are handling international affairs and other nations really put this world on a peaceful basis and we know there isn't going to be any more war, this is a military weapon of prime importance.

If there is anything that can be done so that it can be inspected internationally, so that this particular weapon cannot be used in time of emergency, then of course that, so far as atomic energy goes, puts the world at peace. I don't know of any way.

As you know, we have got a group of men studying that particular question right now, and I would prefer not to discuss the tentative stories that have come to me from that committee. All I can say is that I think they are finding that it is not entirely an easy task. I didn't say it is impossible; I don't know, and I would prefer not to say until I get the views of the whole committee.

I was very particular in appointing that committee to see to it that it had on its roster—I think there are nine men on it, approximately—a minimum of three and I think nearer five who are very much in favor of international control.

Senator JOHNSON. What is the specific task, please?

General GROVES. The task is to study the practicability and actually to come up with a plan that is scientifically and militarily possible, you might say really scientifically possible, of how atomic energy programs can be inspected throughout the world so that we can be sure that no one can make a bomb without our knowing about it in ample time.

Senator AUSTIN. Mr. Chairman, I would like to ask the general if what he has said is not in accord with the declaration by Great Britain, Canada, and the United States, that not until after effective security against the destructive use of atomic energy has been set up in working order shall the information be reciprocally exchanged and acknowledged with respect to the constructive use of it?

General GROVES. I am fully in agreement with that, and I think everything I have said is in agreement with that.

Senator AUSTIN. I so understood it.

General GROVES. As a matter of fact, in that statement there was only one word that I would have liked to have seen changed in the whole statement, which is pretty good for me.

Senator JOHNSON. What was the word?

General GROVES. I don't mind saying that, but I would like to have it off the record. I will tell you afterward.

Senator MILLIKIN. General, in view of the many variables in the picture, such as the fact we do not yet know what the international arrangement will be on this subject, and the general uncertainty of the whole subject, what would be your reaction to approaching this on a temporary basis of conserving our military security and of letting out as much as can be left for peacetime civilian use, but with the prime approach being that we are cognizant of the fact that there are so many uncertainties that therefore this is not the time to lay out a long-range program, but that it is the time to make an interim measure.

General GROVES. I feel that the Commission would approach it from that standpoint; any commission which is appointed and thought they were sitting down to settle this thing for all time to come would be an improper commission, in my opinion; they would have to approach this on the interim basis.

Right today we haven't got international peace guaranteed for all time to come, and until that comes or when that does come the position would shift.

Senator MILLIKIN. So regardless of the form of the bill, that in act is what we have to do?

General GROVES. I think that is essential. Now, there has been a great deal of discussion about security. I spoke about that in the executive session in response to your request.

The CHAIRMAN. General, before you go into that, that nine-man committee that you say is working in the War Department I presume is the same committee that was appointed at the chairman's suggestion to the Secretary of War?

General GROVES. Yes, sir, at your suggestion.

The CHAIRMAN. We have had no report from the workings of that committee. When do you anticipate that we will receive such a report?

General GROVES. I would like to ask General Nichols,¹ who is in the room, if he can give me that.

General NICHOLS. They are supposed to have the report to us by March 8.

The CHAIRMAN. And that will be made available to this committee?

General GROVES. It will be made available as soon as I have read it. I would like to read it first to see if there is anything that requires further study and so that they can go right to work on that.

Now, we have again an officer acting as their nonvoting secretary so as to push this thing along and get it at the earliest possible date.

The CHAIRMAN. Thank you.

General GROVES. With respect to security, no one is more interested in having freedom of research. That is essential to scientific advancement; I believe in it thoroughly. I believed in it before this project started, and I believe in it more thoroughly now.

All of the scientists that I know are in favor of it, and the ones to whom I have talked—and particularly those men in whom the experience of 3½ years has taught me to have confidence that their opinions are absolutely sound, are all also very strongly in favor of it. I think we all are. It is almost an axiom.

But until other nations are willing to join us in reciprocal arrangements which will effectively control this problem, we have got to continue in accordance with the announcement at the White House by the President and Mr. Attlee and Mr. King. I think as a nation we must do that.

In other words, we cannot afford to give all the information we have, or any essential part of it—and I am referring by the word "essential" to that which will really aid another nation in doing this work—until such time as we are assured that it will not be used against us. That, to me, of course, means a like assurance on our part that we are not going to have to use it and won't use it.

Senator VANDENBERG. In a word, General, you agree that security must precede disclosure at every stage?

General GROVES. Yes, sir.

Now, I think also I would like to emphasize again that the security rules must be made by the Commission sitting as a commission, and I would like to see that emphasized in the bill.

I think it was in the May-Johnson bill that that was something the Commission could not delegate to the administrator. If it wasn't in there, it should have been, because that is a sound way to do it. I don't think one man should be deciding that, and I don't think one man should have too great an influence on it. I also feel there is nothing that will do more to break down the morale of the organization and the influence of the administrator on the whole organization, and the effective cooperation of the people with whom he has to work outside, such as university and industrial laboratories, than placing on his shoulders the responsibility for drawing up regulations that can have criminal effects, or if not criminal, at least a smear on the reputation of the man who is guilty.

Senator HICKENLOOPER. General, may I ask a question, please?

General GROVES. Yes, sir.

¹ Brig. Gen. Kenneth D. Nichols, district engineer, Manhattan district, Oak Ridge, Tenn.

Senator HICKENLOOPER. Did you express yourself earlier in the meeting as to whether or not the administrator should be appointed by the President or selected by the Commission?

General GROVES. No, sir, I did not. My own feeling is that I don't care personally much. I liked what I saw in the original bill, that he would be appointed by the Commission, because then he looks to the Commission as his master. If he is appointed by the President, from what I have seen in Washington since I have been stationed here, which has been almost continuously with the exception of 3 years since 1931, there is a tendency at times for people who are appointed by the President to fail to recognize the man's authority for whom they are working, and I believe that the administrator must be the creature of the Commission.

I would have no objection that amounts to anything if the bill should say "We want him appointed by the President and confirmed by the Senate," but I think he is a very important man and he must be of the highest quality. Any man that accepts this position must go in there feeling that he has got a position that will last for a number of years, but I hope not too long, because I think it is a position which is too important to have it fall into the hands of one man and let him continue in that position.

Senator AUSTIN. General Groves, I understand you to mean that even though he might be appointed by the President and confirmed by the Senate, still you would want the recommendation of the man to come from the Commission?

General GROVES. I would like him to feel that the Commission employed him and can fire him. I would think it would be terrible to have an administrator there about whom even a minority of the Commission had doubts as to his ability or had quarrels with, or anything else that would cause trouble.

The CHAIRMAN. General, as to these regulations that you would have this Commission empowered to make, is it your opinion that before issuance, inasmuch as they would be in fact the same as criminal acts, that is, the violation of them would constitute criminal acts, that they should have the approval of the President?

General GROVES. I have no real strong views on that. The only reason that I would prefer not to have them approved by the President is that before they are issued I think it would be just a form for him to approve them. Now, if he would really study them, if he could study them himself, that would be a different thing.

The CHAIRMAN. Of course, we hold the President responsible in fixing his approval on bills involving the sum of \$156 appropriated by the Congress. Doesn't it impress you that before any commission is empowered to issue what might be loosely called criminal statutes, they would like to have the same kind of approval?

General GROVES. I have no real views on it except that I think the President is already overburdened, and for him to review a highly technical regulation which this would be would just be adding to that burden.

Now, as I say, as far as the operations of the Commission go, I have no views on it. I would just hate to see anything more thrown on the President than he has to have on him.

The CHAIRMAN. I personally would rather try to remove from him some of the administrative acts on purely civilian matters that don't

affect the life and liberty of our citizens, and call upon him to fix his approval to something that might send a man to jail.

I am sympathetic with the burden, but I still would like to protect as well as I could the liberty of our people.

General GROVES. As far as I am concerned, I think that is a matter that I really have no views on. It is just a preference, and I wouldn't want you to feel that I really had any feelings one way or the other.

Senator MILLIKIN. General, on what theory do you justify turning over the control of military security, so far as this energy is concerned, to a civilian commission?

General GROVES. I would really like to see—even assuming that the May-Johnson bill were adopted in its entirety now, and even to the point where there is an amendment requiring at least two and not more than four officers to serve as members of that Commission—the Commission directed to submit policy matters to the joint chiefs of staff before action was taken.

I think that is in step with what we in the country all believe in in one form or another, which is unified command. We may not express in just the same way where this command starts to split off, but there must be that unified command. I think at the present time certainly the Joint Chiefs of Staff are the top military command in the sense of being in uniform.

Now, you could say that that should go to the Secretary of War and the Secretary of the Navy, but it wouldn't have any effect. There would be no difference except that the joint chiefs with present membership would give that direct representation, you might say, to the air forces as well as to the ground and sea.

Senator MILLIKIN. At the present time we have a civilian as Commander in Chief, and we have civilians as Secretaries of War and Navy. They are a part of the hierarchy of military control and have definite positions of responsibility in that hierarchy.

The thought keeps nagging at me that we are setting up something entirely new in having an independent outside body entirely controlled by civilians determining the military security and secrecy of this country.

General GROVES. Well, that is why I would like to see this reference to the joint chiefs which, in addition to the chiefs, you might say, of ground, sea, and air, includes the Chief of Staff to the President himself, so that you are getting the representation there of the people who are really unifying the military defense.

Senator MILLIKIN. Isn't that another way of saying that as long as the energy as a military weapon continues to be predominant, regardless of the mechanics we adopt in the bill the military must keep its hands on it?

General GROVES. I think it has got to keep its hands on the part that is necessary for national defense, and that they should be overruled on matters of policy only by the man at the top, the President, who is after all the man who is responsible for the defense of the United States.

Senator AUSTIN. That point is very well taken, I think, and probably should be considered if we consider that unification is to be considered in any such legislation.

General GROVES. There is one bit of testimony that I would like to have you look at in drawing up any legislation, and that is the

testimony by Secretary Ickes when he was talking about the difficulties of operating any organization such as this with all of the present restrictive laws.

Senator VANDENBERG. You mean ex-Secretary Ickes?

General GROVES. I stand corrected, Senator.

I would also like to make the point that my study of the four bills indicates to me the great importance, in actually preparing any bill, of checking the provisions of all four of these bills to see that nothing has been overlooked that should be in. There are important factors in each one of these bills that I think should be very carefully considered before that idea passes by the board.

Senator HART. General, if I may pick you up right there, is it your belief that this legislation which we are attempting to draw up should have very much to say about the patent situation, or is that something that is so involved that perhaps it should be contained in other legislation?

General GROVES. I think that the patent situation should be covered rather briefly in the bill. I think that you know from specific testimony that we have pretty good control of the patent situation. In other words, anything that United States money has paid for, in the development in any way, we have a very good control of. There are certain things, of course, that are invented by people who don't work for us that we haven't paid for, and there we have a problem; but I believe that anything that directs the Commission, or whatever body is set up, to insure that the patent position of the United States is protected at all times should be enough. I didn't need any such direction when I took over, because we immediately put into effect the previous policies that came to us from OSRD, that Dr. Bush had drawn up, and I think we probably went just a little further in this case because it was so essential that no one be able to interfere in any way with our use of any process that we needed to make this thing work.

Senator HART. You mean by that, General, that the Manhattan district found that the patent laws as they were, were entirely workable and suitable for its purposes?

General GROVES. I think they were. There are some problems that we are faced with in the handling of secret patents, and I am not as familiar with patent law as I am with some other things, but in general it revolves around the secret patents. Secret patents were asked for primarily to prevent the possibility of someone later filing a patent on something that we had discovered, and then we would be in the position of having to upset his patent rather than having a definite bar against it.

The possible financial losses to the United States were so great that we felt it was very desirable to protect ourselves patent-wise, and just what the law is on secret patents, how long these patents can be held secret, I am sorry I cannot answer. I think you can get that testimony; certainly Captain Lavender could give it to you.

The CHAIRMAN. We have had him before the committee.

General GROVES. I mean on that particular point. As far as I know, the law is adequate as long as hostilities do not cease. Now, what happens when they cease I cannot tell you.

Senator MILLIKIN. General, do you believe that a civilian commission or a predominantly civilian commission should have the power to tell our military forces how many bombs to make, how many bombs to keep, how to make them, where to keep them, or what to do with them?

General GROVES. No, sir; I think that that would fall into the classification of policy, and would have to receive the approval of the joint chiefs of staff, and certainly if a commission attempted to dictate as to where these would be kept, or anything of that kind, and overrule the wishes of the joint chiefs, I think there would have to be a decision by the President and one that would upset some of the decisions of the Commission.

Senator MILLIKIN. So that legislation on the subject eventually would have to have a view to the military problem of the nature that I have described?

General GROVES. Yes, sir; and I think I read earlier in the hearing my views on how the Joint Chiefs of Staff would come in and would solve that problem satisfactorily. In other words, the joint chiefs would have to have presented to them the policies that affected such matters; in other words, anything affecting the military would have to be approved by the Joint Chiefs of Staff.

It certainly would be something that they would be very vitally interested in if a decision were made to stop producing all active material, for example, because that of itself would definitely limit the number of bombs that might be available.

The CHAIRMAN. General, assuming we had a nine-man commission made up of five civilians and four military men, a part-time commission, would you have the military men vote on questions of peacetime uses and applications of atomic energy?

General GROVES. Oh, by all means. They would be full members of the Commission.

The CHAIRMAN. What special qualifications would you think the military might have to run the civilian end of the matter?

General GROVES. Well, I think I will put it this way: If you try to take the Commission and say an individual member will not vote unless he is a specialist on that problem, you would never be able to get a full vote of the Commission. For example, if a legal matter came up and there happened to be one lawyer on the Commission, he would decide that; and in the same way you might say, "Why should an academic scientist vote when it came to industrial operations?"

It is getting out of his field, but by service on this Commission I feel that all of these men would be broadened tremendously as the years went on, and each year they would have a better viewpoint on the rest of it.

Certainly in the military policy committee, as I said before, when it came to a matter of chemistry, everybody deferred to Conant. If it was a matter of electrical energy, we all deferred to Bush. When it came to something to do with the Navy, we might ask Admiral Purnell some questions as to why that was necessary, but I personally would not dream of telling him how fast a ship could go or how it should go or anything about it. I think that is the general effect of any commission.

Senator JOHNSON. Mr. Chairman, I should like to ask General Groves this question:

I discover an inconsistency in your testimony with respect to the Commission. In the first place, you advocate a part-time Commission; in the second place, you advocate certain members with military experience serving on that Commission; in the third place, you advocate that these military representatives sever all connections with the military.

Now, just how can that be done? If they are part time, they sever all connections with their careers, and then have a part-time occupation; is that consistent?

General GROVES. No; it is not; and I think that the problem is just how that particular thing can be handled if those officers are on the active list. It is very doubtful. I cannot understand quite how an officer who is on the active list, who was made a member, would be able to do the two jobs unless the Secretary of War just said, "Well, when you represent me on this you are not representing me; you are representing the people."

I think the real answer to it is that there will be a tendency to use retired officers on such duty, and officers who have been retired rather earlier than the usual age.

Senator JOHNSON. In that case, of course, they would lose some of their privileges of retirement.

General GROVES. No, sir; not if the bill provided that they could serve in a part-time capacity and still retain their retirement privileges. That was provided for in the May-Johnson bill.

Senator JOHNSON. Yes, but you do not advocate that. You want them to sever all military connections.

General GROVES. If they are retired, of course, they are severed from military connections.

Senator JOHNSON. Obviously, but that wasn't your testimony. You didn't want to restrict it to retired officers. You didn't want to restrict service on this board to retired officers.

What I am trying to get at is that if we are going to use active officers, must we not have a permanent service? You cannot have part-time service and use active military officers and require them to sever their military connections.

General GROVES. I think the primary place where active officers would be more apt to be used would be in the administrative staff and as the administrator or deputy administrator.

When it comes to the Commission, it is very difficult for me to imagine anyone serving as a member of that Commission as an active officer, although I think provision should be there. He might serve for a certain period as an active officer, but I feel personally that the term of office should be long enough so that that officer knows what it is about, for a long enough period so that he will be really useful.

I cannot picture an active officer getting into that position. But I can see certain active officers who could serve on such a commission and represent their own views without any difficulty whatsoever.

I can imagine, for example, if the Surgeon General of the Army should be particularly fitted for such duty, I can imagine his serving a part-time membership on such a commission and not representing the War Department. I think there may be other special cases of that kind.

Senator JOHNSON. What about such a man as Admiral Blandy?

General GROVES. I think that as long as the Navy retains its sea-duty requirements, that would automatically bar a man of that type.

Senator JOHNSON. Would that be advantageous?

General GROVES. Well, I don't know. I think it is advantageous to require them to serve a considerable length of time on such a commission. You could say, of course, "You are only on it 3½ years"; but we grew up with it, and that is entirely different from somebody who comes in now. They won't grow up with it, and they have to start way behind, so that your problem there is whether you can take an officer like Admiral Blandy and say, "You are going to this Commission for 9 years, and that means you cannot have any more sea duty, or you can only have sea duty when you are not serving on this Commission." I don't think the admiral can have a position where he has to leave his command every month or possibly every 2 months, or more, which is not controlled by the best interests of his command.

Senator JOHNSON. Will this Commission have a tremendous amount of work?

General GROVES. I don't know how much they will have. I think they will have a considerable amount initially, because after all they have got to study it. I think any new member will have a considerable amount of work, but I cannot picture their spending full time on it.

Senator JOHNSON. It wouldn't be like the Interstate Commerce Commission, where applications pour in every day in such volume?

General GROVES. No, sir; because I think those applications would be decided on a policy basis. In other words, they would adopt a policy, and then when the application came in on anything that had to be passed on by them it would be a simple matter to say it either falls within our rules, or doesn't. There is nothing such as the Interstate Commerce Commission has, for example.

Senator JOHNSON. Nor the Federal Power Commission?

General GROVES. Nor the Power Commission, with its multitudinous number of applications.

Senator JOHNSON. Or the Federal Trade?

General GROVES. No, sir.

Senator JOHNSON. The decisions would be few and at greater intervals after the initial work?

General GROVES. After the initial work. I think that if any one moved into this who had not already been in it, I would advise him to spend at least 3 months just finding out what he could; that would mean three solid months of very strenuous effort. Then I think, depending on his background, he would move in and then spend much less time.

I think if you should have somebody on it like Dr. Bush, for example, he would not have to do anything of that kind. He could start right in on a part-time basis except for the drafting of the initial regulations on security, which I picture would take quite a time.

Senator HICKENLOOPER. I assume that what you mean by the fact that it would not take too much time for the Commission, or that it would take full time, means that the Commission would write policies and the administrator and his staff would then carry out the details of the administrative activities and the issuance of licenses, the checking, and all that?

General GROVES. As I see it, the administrator would take care of the administrative details. Now, we contemplate that his administrative duties will divide really into two classes: those of operating the existing organization as it may be reduced, and those of handling the outside contacts. For example if a university wishes to go into research work and wants to get a certain amount of enriched material, which of course has a high value, he would in that department of his activities make the necessary investigation to get all the papers together, and then he would present to the Commission the story of that university: "They can meet our policy requirements on security; they meet our policy requirements on really putting some effort into this thing; they are not just getting it so they can stay in the swim and say, 'Oh, yes; we have a department in nuclear physics.'"

In other words, he would present to them the story either with the statement that it meets all of their policy requirements or meets all the policy requirements with a few exceptions, and these exceptions are such and such, and I think they can be handled in such a way.

Then the Commission would have to decide it. They would also, perhaps, have to actually have appear before them the representatives of any such institution if they were going to decline.

Senator HICKENLOOPER. Would that view be compatible with freedom of scientific research? In other words, is it your view that the Commission should screen applicants, let us say, colleges or universities rather carefully, and have some rather rigid standards before they would be permitted to go into this field by the Commission?

General GROVES. Before the Commission gives them Government material, I think they should meet requirements that will insure the best interests of the United States.

Senator HICKENLOOPER. In your view, should those requirements go beyond just a rough outline of a reliable institution, that is, from the standpoint of reputation and history, a reasonable showing that they seriously want to investigate this field, and a reasonable assurance or reliance that they would maintain adequate security and not use it for subversive or destructive purposes?

General GROVES. That would be my idea.

Senator HICKENLOOPER. And then give them more or less free leeway where if they want to go into the field of atomic research as an original study, or if they want to enlarge or want to experiment in that field, they may do so.

General GROVES. You see, the only problem that comes up that is going to be very difficult—and I am sorry for the administrator if he has to decide it—is what to do with the enriched material that the Commission may decide—as a certain percentage—may be loaned to educational institutions for research work. There won't be enough to go around, and somebody has got to decide which institution gets how much. It isn't enough to say, "We will divide it," because they have to have a certain amount.

Senator HICKENLOOPER. Well, to illustrate a little bit more clearly, perhaps, my thought in this matter, I have in mind a very small college that has not been very well financed. It has been struggling for a number of years, and yet in that situation one man in that college some years ago went into a highly specialized field and today this little poverty-stricken college probably has the most extensive department of that particular kind, small as it may be, in the United

States. It is an extremely valuable department—and of course this department does not compare with nuclear energy, or anything of that sort, but it is an outstanding department.

If regulations were somewhat restrictive, it would be very easy for me to envision some commission saying to this college, "Oh, you are a little one-horse college; you have no finances; your equipment isn't very good; we will deny you the right to go into this field."

Now, it is entirely possible that many small institutions perfectly reliable in their history and their intentions might under too restrictive a policy be barred from investigating this field and thereby impinge upon the freedom of academic research.

General GROVES. I don't think there should be any restriction on any academic research unless such restriction is essential to the national defense or unless such research demands or requires Government support.

If it requires Government support, I think it is the duty of the Commission to decide that the Government is getting the best return on its money. If it is a case of something impinging on national defense, I think that would come about by a sudden discovery and nobody can tell what that might be; for example, what we all feared in the early days, that Germany might have a "bathtub" method of separating U-235. The more we studied it, the more we learned about it, the more we felt that the bathtub would get pretty complicated; and we now believe, I think most people, since we have investigated a great many of those "bathtub" methods and they are always disappointing, they are fine in theory but when you start to work them you do all the separation and when you get through you cannot tell that you have separated anything. We haven't been able to find a method yet, but that is a thing that might happen.

For example, if someone should achieve the thing that people have dreamed of since this started, of getting atomic energy out of a common element, I think if that came up and it was discovered in a small college or in any college, the Commission should immediately be able to control that situation until somebody else moved in and could control it.

In other words, I don't believe that if we make some startling discovery in a college laboratory that that should necessarily be published if it is going to upset our national defense as completely as any such discovery as I have described will do. I don't think they will discover that in my lifetime, and I am not worried about it; but at the same time, it is perfectly possible. After all, lots of things have been discovered in our lifetime that we did not know about when we first started to walk on the ground.

Senator HICKENLOOPER. I think it is perfectly logical to say that the Commission should keep very close supervisory knowledge and control over the results of research to see that those results of research are not used to the point of endangering our national safety.

I think that could be done without destroying the freedom of basic research.

General GROVES. I think it can be done that way.

Now, for example, you are familiar with our laboratory at the Argonne. You have been told about it, and there we are now trying, and have actually drawn up, proposed regulations and a system of establishment which will put that laboratory on a basis where it will practically have free and open research. The only requirement that

we hope to have in there is that if at any time we decide that certain work going on there should be secret, we have the right then to ask the man to continue on a secret basis or to abandon the work and turn it over to us. That probably will be the only limitation on the use of that Argonne laboratory by the colleges and universities not only of the Middle West, but for the time being of the entire United States.

Senator HICKENLOOPER. In other words, the restrictions would apply to the application of the results of research rather than restrictions on basic research itself?

General GROVES. Yes; and that is not hard to do if you have cooperation and general good feeling among all concerned, and we have had that with the laboratories, despite what you read in the papers, right straight through this project.

We don't know all of the people that work for us. After all, our direct pay roll ran to a total of 539,000 people, and obviously I didn't know them all. But the leaders were known, and the relationships, at least as far as I was concerned, were entirely satisfactory and quite happy.

The CHAIRMAN. Wasn't that your indirect pay roll, General? Wasn't your direct pay roll around 200,000?

General GROVES. That was the pay roll of people who worked directly for us, either on our own pay roll or on fixed-fee contracts. It did not include such things as manufacturers who made parts for us on a unit-price basis.

Senator MILLIKIN. General, if this were an energy that were a purely military energy we would have no problem here at all, would we?

General GROVES. No, sir.

Senator MILLIKIN. So we have two things that we have to watch in this bill: One is to encourage science as far as consistent with military security—abstract science and applied science; and the other is to encourage so far as we can, consistent with military security, the commercial and peacetime uses of this energy. Both of those things are subordinated at this present state of affairs to our military security. Is that not correct?

General GROVES. That is correct.

Senator MILLIKIN. And any bill which correctly protects and properly proportions its emphasis according to those things would, generally speaking, be a satisfactory bill, would it not?

General GROVES. Entirely. I would like to add there that I personally believe that we are going to get some peacetime benefits from atomic energy. How much, I don't know, and no one else knows. We are certain that there are going to be many benefits in the medical field, particularly in diagnosis; and as to the benefits from a power standpoint, we really don't know, and no one else knows. We can draw up theories; we can prove it on paper, and you can get any answer you want to. But the problems involved are tremendous and it is going to be, unless a tremendous amount of money is poured into it, a long time before that development reaches anything that becomes commercial.

Senator MILLIKIN. But we should put out as much scientific information as is possible, consistent with military security. We should do everything that we can to encourage these peacetime uses of the energy, consistent with military security. The overriding pre-

dominant thing at the present stage of the business is our military security.

General GROVES. Yes, sir.

Now, another point is: Why has the Manhattan project done certain work on what you might say are peacetime applications? We have done that for two reasons: First, because in doing it we felt that we would be increasing our knowledge which would enable us to do a better job on the military end of it. That was the real justification. We have also had the secondary consideration that we felt that we were carrying on what would eventually have to be done, and it might turn into something of value for peacetime uses; but certainly with the appropriations as they were made for military purposes, the only justification we would have in the past in our appropriations was to carry it on for the military advantages.

The work that has been done in peacetime applications has all been done with the idea that that increase in knowledge would enable us to do the military job better.

Senator HICKENLOOPER. On that point, as I see it now, General, is there any possible reason why basic research in the atomic energy field should demand that it be given strictly military secrets of the making of the bomb in order to aid that research?

General GROVES. No; and I think that except in one way the more that a scientist knows in his own field and related fields, the better job he can do. But I think in this case the military security overrides that, so that we are in effect decreasing, perhaps, in some instances, his ability to do his best work in his scientific research, because there are certain things he doesn't know that if he did know he would be able to do better. It is just as if suddenly the things that we did might be of value—I am not saying they are—for example to the steel manufacturers; but if they are vital to our military security, the manufacturers have to get along without them or have to find it some other way.

The CHAIRMAN. General, one of the greatest achievements for military security would be the devising of an invention of defense for the atomic bomb.

Now, you have just stated in effect that the compartmentalization of it, due to the necessity for military security, would decrease scientific achievement and advancement. I rather take it that any such proposal would commensurately and proportionately decrease the chances of devising a defense to the atomic bomb.

General GROVES. I don't think so, except very indirectly. It is hard to speak of how to devise something that nobody has yet figured out even the slightest indication of how to do, but the only thing that appeals to anyone is to shoot this thing down in the air, and that means stopping anything that comes through the air. That really does not depend on what is in it or anything about it.

The CHAIRMAN. Yes; but logically, General, it strikes me that you cannot escape the conclusion that since unfortunate restrictions that might have to be placed on this thing for military security might obviate any chance of getting the greatest security of all, which would be a defense for it. You say to me that none has been thought of and none has been suggested. I grant you that is true, and up until 1939 nobody thought this thing could be done.

I cannot see how you can escape the conclusion that the restrictiveness applied under what you term the necessities of military security

would very much prejudice our chances, small though they might be, for getting a defense.

General GROVES. I couldn't agree to very much prejudice. I would say they might possibly prejudice, but not very much.

The CHAIRMAN. It is a very important consideration.

General GROVES. Now, I think that really when it comes to military security and the relative advantages of giving out information and not giving it out, what we are interested in from the military standpoint is the relative movement, you might say, of ourselves and other nations. It isn't so much how fast we progress; it is the relative motion of the two.

The CHAIRMAN. General, I have just two questions more, if there are no further questions. I don't want to interrupt.

The first question is this, General: Would you tell us what year you graduated from West Point?

General GROVES. 1918, November.

The CHAIRMAN. And you were commissioned a second lieutenant.

General GROVES. That is correct.

The CHAIRMAN. When were you commissioned a first lieutenant?

General GROVES. May 1, I think, 1919.

The CHAIRMAN. And then a captain?

General GROVES. October 1, 1934.

The CHAIRMAN. And then a major?

General GROVES. I think in July of 1940.

The CHAIRMAN. And then a lieutenant colonel?

General GROVES. I was commissioned a temporary colonel on November 12, I think, of 1940.

The CHAIRMAN. And then your next promotion?

General GROVES. Then I was made a brigadier in September of 1942, and sometime after that I was made a permanent lieutenant colonel.

The CHAIRMAN. And that is your rank now?

General GROVES. Permanent rank. Then I was made a temporary major general in 1944, I think.

The CHAIRMAN. Now, General, between 1919 and 1934, just selecting at random when you were a first lieutenant, what was your principal work?

General GROVES. My principal work from then, besides going to school—I have been going to school since I entered college for 10 years. I have one degree. I don't have any of these doctor's degrees, but I have had 10 years of collegiate and above. During that time I was either a student or a company commander, with the exception of 2 years when I was assistant to the district engineer at Galveston primarily on construction work and general management, and 2 years in Nicaragua.

The CHAIRMAN. Your first experience translating engineering into science has been in connection with this project, has it not?

General GROVES. No; I had 4 years in the Office of Chief of Engineers, a little less than 4 years, from 1931 to 1935.

The CHAIRMAN. What was your rank then?

General GROVES. I was a first lieutenant and a captain. Of course, you know the reasons for rank.

The CHAIRMAN. I don't quarrel with it, General.

General GROVES. I did, a great deal.

The CHAIRMAN. I think it is important that it be in the record.

Now, just one final question.

Senator MILLIKIN. The chairman has demonstrated how fast you learn, General.

General GROVES. I didn't answer your question completely. From 1931 to 1935 I was in the Chief of Engineers Office in charge first of procurement and development of new equipment, and in the last year in charge of the supply division, which included this subbranch of development of equipment.

Senator JOHNSON. I think it should be said, Mr. Chairman, in connection with the promotions that in the first years of the general's service we did not have the automatic-promotion formula that we now have, and that officers had to wait for a vacancy in the next grade, and that there were bottlenecks. They had what the Army calls a "hump," and so the promotions were very far and few between in those earlier years.

The CHAIRMAN. General, you are familiar with the letter addressed to me by the President of the United States on February 1, 1946, in relation to the atomic energy legislation?

General GROVES. I have read it. I don't recall the exact details of it.

The CHAIRMAN. The President stated:

The Commission established by the Congress for the control of atomic energy should be composed exclusively of civilians.

You find yourself in disagreement with that.

It is essential that the members of the Commission be full-time Government employees.

You find yourself in disagreement with that.

In the President's message of October 3, which he quotes, he said:

Our science and industry owe their extent to the spirit of free inquiry and the spirit of free enterprise that characterizes our country. This is our best guaranty of maintaining preeminence in science and industry upon which our national well-being depends.

Legislation in this field must assure genuine freedom to conduct independent research and must guarantee that controls over the dissemination of information will not stifle scientific progress.

I take it you are in agreement with that statement?

General GROVES. Yes, sir.

The CHAIRMAN. Thank you very much.

Senator HICKENLOOPER. General, I just want to make clear my understanding that you did not volunteer or urge this appearance on your part today, did you?

General GROVES. No, sir.

Senator HICKENLOOPER. You came at the specific invitation of the committee to express your personal views and at the urging of the committee, did you not?

General GROVES. Not only at the invitation of the committee, but at the order of the committee.

The CHAIRMAN. I think that should be in the record, Senator Hickenlooper, for the General's protection.

Senator HICKENLOOPER. I thought it was going to be in the other day, but it apparently isn't.

The CHAIRMAN. Thank you.

(Thereupon, at 12:10 p. m. the committee recessed.)

ATOMIC ENERGY ACT OF 1946

THURSDAY, APRIL 4, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to call, at 10:30 a. m., in room 104-B, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Byrd, Austin, Millikin, Hickenlooper, and Hart.

Also present: Dr. Edward U. Condon, scientific adviser to the special committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. The hearing will come to order.

Mr. Warren, there are certain proposed provisions of S. 1717 for the operation of this Commission which bear upon the Office of the Comptroller General and your duties. Most of them might be termed of a relieving nature, as I don't doubt that you have noticed.

The committee would be glad to hear such comments as you wish to make on the provisions that pertain to your jurisdiction.

**STATEMENT OF LINDSAY C. WARREN, COMPTROLLER GENERAL
OF THE UNITED STATES, ACCOMPANIED BY FRANK L. YATES,
ASSISTANT COMPTROLLER GENERAL OF THE UNITED STATES,
AND EDWIN L. FISHER, ACTING GENERAL COUNSEL, GENERAL
ACCOUNTING OFFICE**

Mr. WARREN. I appreciate the invitation to appear here this morning.

Senator BYRD. Mr. Chairman, may I interrupt to suggest that I think Mr. Warren ought to discuss, too, the provisions on page 8 with respect to—

The Commission may make such arrangements without regard to the provisions of law relating to the making, performance, amendment, or modification of contracts—

et cetera; also pages 10, 14, and 16 in relation to each other, and then discuss page 39.

The CHAIRMAN. You may proceed, Mr. Warren.

Mr. WARREN. Gentlemen, until yesterday I personally had never seen or heard of the provisions on page 8 or on page 39 of this bill.

It is not necessary for me to remind you that the General Accounting Office as well as the Comptroller General is an agent of the Congress. We are entirely disassociated from the executive branch of the Government, and that view was reaffirmed by the Congress with

497

the passage of the recent reorganization bill which provided that the Comptroller General of the United States and the General Accounting Office are a part of the legislative branch of the Government. Therefore, except for the friendly interest of Members of Congress who believe in responsible fiscal accountability, naturally we would have no way in the General Accounting Office to know of provisions such as this. The General Accounting Office in my opinion is the last great bulwark in this Nation for the protection of the taxpayers against unbridled and illegal expenditures of appropriated funds, and it is therefore peculiarly the office of the Congress.

I am unalterably opposed to the provisions carried in subsection 10 on page 39. An analysis of it will show you and will convince you that it is a mockery and a fraud, and if it should become a law in this form—and I have been called upon many times in the past to express myself on it—in all candor I would have to use these same expressions. It is utterly meaningless and would constitute an unwarranted waste of appropriated money.

The CHAIRMAN. Which section are you talking about?

Mr. WARREN. I am talking about subsection 10 on page 39.

The CHAIRMAN. You mean the whole section?

I understood you to say the latter part of it.

Mr. WARREN. Well, you would have to consider the section as a whole.

In the first place, it says that this Commission may—

(10) determine its own system of administrative accounts and the forms and contents of its contracts and other business documents.

Senator BYRD. Mr. Warren, could I ask you a question there?

It was stated to the committee yesterday by one of the associates of the committee that these provisions have been agreed to by the assistant general counsel of the Comptroller General's Office. Is that correct?

Mr. WARREN. Senator, that is absolutely incorrect. He is here today. Mr. Fisher is acting general counsel. Mr. Ellis is one of my administrative assistants. They are two of the ablest men that we have in the General Accounting Office. They have my full confidence, and they tell me that never, directly or indirectly, did they agree to any such provision as this, which is contrary to the entire policy of our Office.

One of the primary purposes of the General Accounting Office is to establish the accounts and forms. We do that for every agency of this Government, and this question is therefore pertinent: Why should it not be done in this case? What is there in this that would call for this Commission to set up its own accounting system and its own forms?

It says here:

The Comptroller General shall audit the transactions of the Commission and within 6 months after receipt of each voucher shall file a report with the Commission with respect to each accountable officer showing each action to which exception is taken pending further information and each action which after full examination would have been disallowed except for the provisions of this paragraph.

If that were required, it could be done without this language if we had anything to do with the audit of it.

The expenses of such audit shall be paid from appropriations for the General Accounting Office and in conducting such audit, the Comptroller General may use personnel of his own selection and shall have free and open access to all papers, books, records, files, accounts, plants, warehouses, offices, and all other things, property, and places belonging to or under the control of or used or employed by the Commission * * *

We have all that authority anyway. That doesn't mean a thing, unless you want to restrict certain information from us by excepting access to the information restricted.

The CHAIRMAN. That is the purport of the language, isn't it, Mr. Warren?

Mr. WARREN. Well, I don't so construe it there, unless that is the sole reason for it. But I will get to the restriction in just a minute. [Reading:]

and shall be afforded full facilities for counting all cash and verifying transactions with and balances in depositaries * * *

We would have that right under existing law.

Senator MILLIKIN. You missed some significant words there:

except where access to information restricted under section 10 would be involved * * *

Mr. WARREN. I mentioned that. [Continuing to read:]

but, notwithstanding the provisions of any law governing the expenditure of public funds, the General Accounting Office in the settlement of the accounts of the Commission or any accountable officer or employee of the Commission, shall not disallow credit for, or withhold funds because of, any expenditure which the Commission shall determine and certify to have been necessary to carry out the provisions of this act.

Of course, gentlemen, that is the joker. They could do anything on the face of the earth, practically, and the Commission would then decide it was all right. You provide for an audit all the way down, and at the very end you say that regardless of what you found in the audit, the Commission can upset everything that you have done.

The CHAIRMAN. Mr. Warren, may I ask you a question?

Mr. WARREN. Certainly, Senator.

The CHAIRMAN. You quote this clause in line 10:

or withhold funds because of, any expenditure which the Commission shall determine and certify to have been necessary to carry out the provisions of this act.

Now, as I understand it, under the law, after you disallow the accounts of any disbursing officer, you can file a notice with the Treasury of the United States to cut off further payment of funds to that department.

Mr. WARREN. We could do that; yes.

The CHAIRMAN. That is within your power.

Mr. WARREN. Yes.

The CHAIRMAN. Now, I presume that you are aware of the facts—or I should say I presume you may be, for maybe you haven't been informed—that from a scientific and engineering standpoint it is absolutely necessary that some of the operations of this Commission be not interrupted for 1 second.

Mr. WARREN. Correct.

The CHAIRMAN. The managers of the projects have told us that time and time again, and Senator Hickenlooper, who made a special trip to Hanford at my request, when he was on the west coast, came

back and emphasized that more than any one thing it had to be a continuous operation.

So it would be rather unfortunate if there was in the hands of any office outside of the Commission the power to withhold funds and thereby close off operations.

Mr. WARREN. I may surprise the committee when I tell you that we were in on the atomic secret from the very beginning. There were confidential conferences between the Under Secretary of War, at that time Judge Patterson, and General Groves, the Assistant Comptroller General, and myself. We have audited or are auditing every single penny expended on this project, and that was in wartime. We had our men passed on by the FBI within the enclosures and compounds of these two projects. We audited on the spot and kept it current, and I might say it has been a remarkably clean expenditure.

I have had no conversation with General Groves in several months. I will say, however, that he has personally thanked me and other officials of the General Accounting Office several times for our fine cooperation, and I understand that in a public speech here in Washington, before a group of scientists, he expressed high commendation of the work of the General Accounting Office.

We gave one quick favorable decision on a matter that was presented on this project, but the very fact, gentlemen, that our men were there where the agents of the Government could consult with them time after time assured, in my opinion, a proper accountability.

I would suggest if you have any doubt as to this cooperation that you might ask General Groves, because I will say this for him: From the very beginning he has insisted upon a full audit and a full accountability to the General Accounting Office.

Now, if that went on in war, if we passed upon \$2,000,000,000 of these expenditures in war, I cannot see the argument as to why they should not be audited in peace.

Senator MILLIKIN. Mr. Chairman, I must say that that comes to me as an astonishing piece of good news.

I have often wondered what would turn up when we did get into that 2½ billion-dollar expenditure. By that remark, I do not mean to disparage anyone connected with the operation, but I often wondered how, without the kind of control that you give, they could go through with an operation of that magnitude without making some very bad blunders.

Mr. WARREN. Senator, as far as the General Accounting Office is concerned, we carefully picked our men. We sent the very best we had there, and I invited the inspection of those men by the FBI. They were ever present on the job.

Up to the present time, we have audited 100,265 vouchers on that project.

Senator MILLIKIN. How many?

Mr. WARREN. 100,265 vouchers on that project, totaling \$1,778,000,000. They have been given a most thorough examination to determine whether the expenditures have been properly accounted for, pursuant to applicable laws, Executive orders and regulations.

There only remains to be audited on both projects \$48,000,000, and that is all under way now.

Senator MILLIKIN. May I ask how many men were actually in on that audit?

Mr. WARREN. Twenty-three.

Senator MILLIKIN. They were all examined by the FBI?

Mr. WARREN. Absolutely.

Senator MILLIKIN. At your request?

Mr. WARREN. At my request, and it would be my purpose, if we have anything to do with this, to keep this audit current, just as we did in wartime, and have our men of the same high type and right on the project.

Senator MILLIKIN. By keeping it current, you mean there would not be any backlog of unresolved questions, and by that method there would not be the delays and the possible discontinuity of some operation that would have to be continuous through its very nature?

Mr. WARREN. When you say "current" in the Government, you mean anything from 60 or 90 to 120 days.

I can say with great positiveness to this committee that we will do this in 30 days from the receipt of the vouchers, if we have our own men right on the project, as we would do.

Senator MILLIKIN. Do you ever have in your operations what might be called an interlocutory opinion? Suppose that Senator Byrd were the head of some Government agency and he had to do something under the nature of his job and yet was in some doubt as to whether what he had to do would be approved. Under the circumstances, he could not wait to have it approved. Do you ever give a sort of preliminary, informal interlocutory opinion on that?

Mr. WARREN. I wouldn't say that it is so much informal, but that is a part of our duties under the Budget Accounting Act, and we strive to give these opinions to department heads and agency heads within 10 days; sometimes we do it within a day.

Senator MILLIKIN. That is independent of whatever delay there may be in routine matters that come into your office?

Mr. WARREN. Absolutely; that has precedence.

Senator MILLIKIN. That is what I mean.

The CHAIRMAN. Now, getting back to the question I asked you, Mr. Warren, do you think it would be wise to have in the hands of anybody, in view of the situation I have described to you, the power to withhold funds that would shut down the operation of the manufacturing plants which, if shut down, might cause the Government untold damage?

I am quite sure that if you were there—or any of your associates—it would be treated reasonably, but, of course, you know we do not legislate on that basis.

Mr. WARREN. Well, if you will let me say this: I think that is a very far-fetched question, because, of course, we have never closed down anyone. We have never, so far as I can find out, and certainly not in the 5½ years that I have been Comptroller General, hindered the operation of anything.

If an expenditure was absolutely illegal, then I would be utterly failing in my duty to the Congress if I did not challenge it.

Senator BYRD. On what ground would you challenge an expenditure?

Mr. WARREN. Well, if it was absolutely illegal.

Senator BYRD. On any other ground?

Mr. WARREN. No; I cannot challenge waste or extravagance; that is entirely beyond my scope. I cannot do that; I am not permitted to do that. It is only an illegal expenditure.

Senator BYRD. In other words, it is your duty as the representative of Congress to see that the expenditures are in accordance with the terms of appropriation bills?

Mr. WARREN. And the contracts.

Senator HICKENLOOPER. In other words, you are not to question administrative discretion provided the money is being used for the purposes provided in the statute?

Mr. WARREN. Absolutely. We have no more to do with the administrative end of it than the man in the moon, and we would not have anything to do with it.

Senator HICKENLOOPER. Well, I presume you test the administrative end to see whether it is being administered in the field set out by the statute, but you do not have any jurisdiction over administrative discretion within the field outlined by the statute for the expenditure of those moneys?

Mr. WARREN. None whatever; nor would I permit such a thing if it were attempted.

Mr. YATES. As to the two phrases "shall not disallow credit for" and "withhold funds because of," I think it might be well, Mr. Chairman, to explain a little more in detail what those two things mean in our operations in the General Accounting Office.

The CHAIRMAN. Before you do that, I would like to make this comment, Mr. Yates. I have never talked with the War Department or any representative of it as to their relationship with your office during the period of the operation.

The same provisions that are in here appear, I believe—it is a long time since I have checked it—in the May-Johnson bill which was born in the War Department.

I don't make that as an assertion of fact, because I have not checked it in a long while, but that is my impression, and I just wondered if, in view of your experience, you could tell us why they do it that way?

Mr. WARREN. May I answer that?

The CHAIRMAN. Yes; I would like some information on it.

Mr. WARREN. You are correct, as I now recall, that similar language was in the original bill. Two members of the majority, including the chairman of the House committee, and two members of the minority called me about that provision. They said that they were absolutely opposed to it, and we told them the same thing, although their prohibition was contained in about six lines rather than a page, as here.

The CHAIRMAN. This is just as effective, I take it?

Mr. WARREN. I would think so, without looking it over here now. They asked me if I would propose some other language, and I proposed the following:

Notwithstanding the provisions of any other law governing the expenditure of public funds, the General Accounting Office in the settlement of the accounts pertaining to the operations of the Commission may allow credit for any expenditure shown to have been necessary to carry out the provisions of this Act.

Now, that leaves the law just as it is, but puts the discretion in the Comptroller General rather than in the Commission, because then Congress has a target to shoot at if there is anything wrong. You would never find anything, you would never hear anything, about the

Commission handling these. But if I should do anything wrong, then I am subject to removal or impeachment, and you have got it centered in one person—not that I want that authority. Instead of leaving that discretion in the Commission, under this language you could leave it in me.

I understand that the House committee tentatively adopted this. Now, I was further informed—subject, of course, to being corrected—upon high authority in the House committee that the War Department itself suggested that all reference to the General Accounting Office be completely eliminated from the bill, and that is the way it stands now over there, which, of course, leaves us to audit just as we did during the war.

The CHAIRMAN. Well, that certainly is an interesting situation. I was informed that the committee that drew the original May-Johnson bill gave great consideration to that. In fact, that is what first started me thinking about this, because when the bill was originally introduced we did not have a section pertaining to the General Accounting Office, and on a comparison with the May-Johnson bill I saw that that was there and did a little investigating. It seems to be a very strong point with those who drew the May-Johnson bill that they wanted this language in there.

Now, of course, you have tentatively offered this suggestion to put the discretion in the Comptroller General instead of in the Commission. That is an interesting suggestion, Mr. Warren, but I frankly cannot see how the Government's interests would be better protected by having the discretion in the reviewing officers rather than in the people that must actually do the day-to-day operation, because they are removable by impeachment, too, for malfeasance in office.

We have, I might say further, a joint congressional committee provided for in this bill which, under the terms of the act, is to keep in very close touch with the Commission, and I imagine that committee will be doing a little reviewing on its own account.

Senator BYRD. They wouldn't do any auditing, would they?

The CHAIRMAN. As far as the Commission is concerned, Senator.

Mr. WARREN. I didn't want that myself. That was drawn at the suggestion of some members of the House committee. I think that is all right, but personally I do not want it.

The distinction is this, Senator: The difference lies between an examination by those who spend the money and one by an independent agency looking over it which is not responsible under the executive branch of the Government but is responsible to the Congress itself.

Now, there is a school of thought in the Government that is violently opposed to any audit, that is violently opposed to any fiscal accountability to anyone but themselves. That is true. And no one knows that any better than the Senator from Virginia, and the great fight in Congress here within a year, in the passage of the Byrd-Butler-Whittington bill, which in my opinion was the most forward step in fiscal accountability the Congress has taken in the last 25 years.

But resistance from certain forces, as Senator Byrd knows, was ever present in every possible way.

Senator BYRD. It took us 5 years to get it through.

Mr. WARREN. Now, I am not using extreme language, and I merely ask you to believe me when I say this from experience. The language in subsection 10 is an absolute fraud and a joke and means nothing whatever.

The CHAIRMAN. The only correction that I would make of you, Mr. Warren—and I did not write that subsection—when you denominate it as a fraud is that that has the connotation of intent to deceive. Now, I think you would agree with me that it would be a bold spirit indeed that would write language that is so obviously fraudulent as you denominate this to be, with the hope that it might get through 535 Members of Congress.

Mr. WARREN. Senator, I have seen language like this submitted.

The CHAIRMAN. You take out the intent to deceive?

Mr. WARREN. Well, you know what I am talking about, but I have seen language like this proposed time after time, and it is proposed deliberately. I don't know of any other way except to say that it is proposed to deceive. I don't know of any other way to express it. It is to break down these controls.

Now, the whole position of the Congress in the last year has been to draw back and to vote back controls where they have been let down to see that they are now safeguarded in accounting. That was done in the Butler-Byrd bill.

The CHAIRMAN. Mr. Warren, there is a provision in the bill or in this suggestion for a complete audit by your Office?

Mr. WARREN. Yes; but what does that mean, Senator? It means that we would spend thousands, maybe over a hundred thousand dollars. Say that we do audit. Then, whatever we find, the Commission will say, "Oh, well, we are paying for that."

The CHAIRMAN. If you find any crooked business going on, I presume you would report it to the Congress, would you not?

Mr. WARREN. Well, this doesn't even provide for a report to Congress. I won't quibble on that.

The CHAIRMAN. I would assume you would.

Mr. WARREN. I have a right to do it, anyway.

The CHAIRMAN. That is right.

Mr. WARREN. Now, you want me to be frank, I know.

The CHAIRMAN. I am working for information.

Mr. WARREN. With all due respect, because I have the greatest respect for the Congress, since I was a Member of it for 16 years, we are very discouraged about the reports that we send to Congress. That is part of my duties, to report to Congress, and no matter how flagrant some of the things are we do not find that we ever get any results.

I think one of the reasons for that is that there is no special committee that these reports go to. Right now, the House is showing a little interest in holding some hearings on some reports, but I have been sending reports to Congress for 5½ years, and I do not get any encouragement.

The CHAIRMAN. Do you hand them to the press, too?

Mr. WARREN. No, sir; but they are published. They are printed up here.

The CHAIRMAN. You mean they are available to the press?

Mr. WARREN. Yes, whenever you have them printed.

I might say that last year I sent to Congress 14 reports required by law. There were 148 reports sent up that I prepared that were requested, and I also sent up 32 recommendations.

I sent to the Congress or to committees of Congress approximately 300 to 400 reports on extravagance, and that was the end of it. Of course, I cannot stop extravagance, but I am talking about the reception you meet in Congress.

Therefore, when you say that we come in and just report to Congress when you are going to audit \$2,000,000,000, of course it is meaningless.

Our position is that if you gentlemen in your wisdom and discretion think that we should have nothing to do with this, I very strongly urge you and recommend that it be specifically stated in here.

If you want us to have anything to do with it, then section 10 should be eliminated entirely. If we have anything to do with it, we will go along just as we have during the war, in auditing these accounts. But please do not let any such language as subsection 10 stay in the bill, gentlemen, because it means absolutely nothing.

Senator BYRD. Mr. Comptroller, you have full power to audit every department now?

Mr. WARREN. That is correct.

Senator BYRD. Including the corporations, including the TVA?

Mr. WARREN. That is correct.

Senator BYRD. That is the complete power that was covered by the Byrd-Butler-Whittington bill, so this would be the first department of all the agencies of the Government, as the laws now exist, that would not be subject to the kind of audit you think it is necessary to make?

Mr. WARREN. That is correct.

Senator BYRD. Now, you have the same power to withhold an appropriation from the War Department?

Mr. WARREN. That is correct.

Senator BYRD. You have it from the Navy; you have it from every branch of the Government, and I am unable to see why any injury to the service of the Government would occur by extending the power to this operation.

Mr. WARREN. Senator, that is a specious argument advanced by those who are opposed to any audit. It is nothing new with us. We hear the same argument. We heard it on the corporations, as you well know.

The CHAIRMAN. Mr. Warren, I do not want you to misunderstand your appearance here this morning. We are frankly looking for information.

The basis of it is in the War Department prepared bill, the so-called May-Johnson bill. I cannot emphasize that too much, because it came out of the Department which you state—and I don't doubt your statement—had such happy relationships with the Accounting Office in the operation of this project.

I turn to the subject "Audits" under section 15 of the May-Johnson bill, and it contains exactly the same provision—and that is where we got it—that we wrote into this bill, which is:

Notwithstanding the provisions of any other law governing the expenditure of public funds, the General Accounting Office in the settlement of the accounts of the Administrator or other accountable officer or employee of the Commission,

the Administrator, or their agents, shall not disallow credit for, nor withhold funds because of any expenditure which the Commission shall determine and certify to have been necessary to carry out the provisions of this act.¹

If it is fraudulent, I just want to denominate the source of the fraud.

Mr. WARREN. I say it means nothing so far as an audit is concerned, and there may be people in the War Department—I know there are people in the War Department—who are opposed to General Accounting audits.

I have just quoted what General Groves has told us personally, and what he is alleged to have said at a banquet here.

Senator BYRD. It would seem to me that the committee in the House could have obtained the same impression that this committee obtained yesterday, when we were told by one of the employees of this committee that this provision had been agreed to by the assistant general counsel of the Comptroller's Office.

The CHAIRMAN. Senator, I think that can be explained.

Senator BYRD. I know, but I am speaking of how these things occurred.

The committee was considering this yesterday and was going over it and was told then it had the full approval of the Comptroller General's Office.

I was the member that questioned that and called Mr. Warren on the phone, and he said it was totally and absolutely untrue.

Senator MILLIKIN. Mr. Warren would be abrogating his office.

Senator BYRD. The committee was informed of that, and maybe the House committee was likewise so informed.

The CHAIRMAN. I have inquired into that series of circumstances, and I would be willing to go into it now, but I think it can be explained to your entire satisfaction.

Senator BYRD. I will say that that information came very near to having this bill passed out by this committee with a unanimous report on that particular provision under a misunderstanding of what actually occurred. I think that that is quite a serious matter.

The CHAIRMAN. Let me ask Mr. Warren whether this language was submitted by him to the chairman of the Military Affairs Committee of the House.

Mr. WARREN. Senator, I have never appeared on this measure before the House Committee on Military Affairs. It was all over the phone. Four members of that committee, four very prominent members—two Democrats and two Republicans—called me on the phone. They were in the same room, and they said that they were unalterably opposed to section 15 of the House bill and were going to seek to strike it out. They then asked us to submit something along the lines of which I have just read here, as a substitute, as a proposal that they were going to make rather than us. Later on I was told that this had been tentatively approved. Still later on I was notified by the chairman of the committee that the War Department itself had agreed that the entire section should be stricken.

Senator HICKENLOOPER. As I understand it, Mr. Warren, this language that you have just referred to that they asked you to suggest

¹ See H. R. 4280, 79th Cong., 1st sess., introduced in the House of Representatives by Mr. May on October 3, 1945, and referred to the Committee on Military Affairs; see also S. 1463, 79th Cong., 1st sess., introduced in the Senate by Mr. Johnson of Colorado on October 3 (legislative day, October 2) 1945, and subsequently referred to the Special Committee on Atomic Energy.

as a substitute is not language that you were affirmatively urging in the bill, but you were merely complying with their request to suggest something, if a substitute were necessary for the language to which they objected in the bill?

Mr. WARREN. Senator, that expresses it absolutely.

Senator HICKENLOOPER. I want to get your attitude straight on this thing.

Mr. WARREN. You have expressed it correctly. I have no objection to this, but I am not seeking this. I don't want any more power.

Senator HICKENLOOPER. Do I understand that the gist of your statement here is that you think the reference to the General Accounting Office or the Comptroller should be eliminated from the bill, leaving you in the same position with respect to auditing this activity as other governmental activities?

Mr. WARREN. That is absolutely my position, but if the committee wishes any substitute, I have no objection to this, although I am not advocating this.

Senator MILLIKIN. I don't want you to have the power to waive it any more than I would the Commission.

The CHAIRMAN. Let me ask you this, Mr. Warren: You would like all references to the Comptroller General stricken out. Would you advocate the rules on competitive bidding on the awards to scientific institutions for research?

Mr. WARREN. May we turn to page 8. I think that is where you have it.

Senator MILLIKIN. Mr. Chairman, before we get into that, I would like to ask Mr. Warren categorically whether anyone in the House ever submitted him section 10 for his approval or comment.

Mr. WARREN. Never.

Referring to (2) on page 8, I certainly think that you should give them authority to make partial and advance payments. I think that is all right. I think that you should give them the right to waive advertisement. I think that may be essential and necessary.

The CHAIRMAN. Where is that, you say?

Mr. YATES. On pages 8, 11, 14, and 16.

Mr. WARREN. Now, here is something that I might call your attention to:

Such arrangements shall contain such provisions to protect health, to minimize danger from explosion and other hazards, and to require the reporting and to permit the inspection of work performed thereunder, as the Commission may determine * * *.

That would give them the right, gentlemen, in that broad language—which is probably necessary and proper, assuming that these projects would be in isolated places—to set up health facilities and all of those things right here in the District of Columbia. If we had to construe that, we would so hold.

I don't know whether that is your idea, to let them set up all those facilities here or on the project; but it is so wide that they could set it up anywhere, including the District of Columbia if they wanted to.

The CHAIRMAN. Now, where do you read that?

That provides the arrangements for health and minimizing danger from explosion.

Mr. WARREN. Also on page 38, section 12(a) (5), the committee is authorized to—

construct, acquire, provide, or arrange for such facilities and services for the housing, health, safety, welfare, and recreation of personnel employed by the Commission as it may deem necessary * * *

Now, we are not questioning that, except the broad provisions of it. We would at once construe that all of that could be provided in the District of Columbia if the Commission saw fit to. I just merely call the committee's attention to that.

The CHAIRMAN. Of course, you realize that Oak Ridge and Hanford are two towns by themselves.

Mr. WARREN. Yes.

The CHAIRMAN. You have got to keep personnel there, and it would be impossible to do it without some recreational facilities.

Mr. WARREN. I am in full accord, Senator, with that, but I was wondering if you wanted to give the Commission the right to put it here in the District of Columbia. I can see where it should be on the projects, and I am wondering whether you want to restrict that somewhat.

The CHAIRMAN. I don't think there is any intention to give the Commission the right to erect any dance halls in the District of Columbia.

Mr. WARREN. They could do it under this provision; we have studied it very carefully.

The CHAIRMAN. What language do you suggest to modify?

Mr. YATES. If they restrict it to isolated places, it would take care of it, the isolated project areas.

Senator BYRD. Projects?

Mr. YATES. Projects; yes.

The CHAIRMAN. Would that be sufficient?

Mr. YATES. I would think so; yes.

Senator BYRD. I wish you would continue on this page 8 and give your comments as to any changes you would suggest there.

The Commission may make such arrangements without regard to the provisions of law relating to the making, performance, amendment, or modification of contracts * * *

Do you object to that?

Mr. WARREN. Well, we might not object to it in regard to contracts. We say a greater authority is not needed here than was essential to the prosecution of the war.

Senator BYRD. This applies to contracts, agreements, grants-in-aid, and loans, at the top of page 8, and permits them to make arrangements without regard to the provisions of law for those four categories.

Senator MILLIKIN. I would like to ask, first, what are the provisions of law which this language is intended to circumvent? What is the thing that is feared here?

Mr. FISHER. Section 3709, I think is the statute that they are generally after here, on the competitive bidding. They don't want to have to advertise and get bids and take the lowest bidder for research and development.

Senator MILLIKIN. The language is broad enough, though, to include the whole field of law.

Mr. FISHER. They have authority to amend contracts and modify contracts by virtue of their authority to make contracts. This has

been construed under the War Powers Act, which is similar language, as authorizing an amendment or modification without consideration.

If you have got a contract for doing a job for \$100,000, you can amend it just to get in \$300,000 if you want to.

Senator MILLIKIN. I should like to invite your attention to the first sentence, commencing on line 1, page 8:

To this end the Commission is authorized and directed to make arrangements, including contracts, agreements, grants-in-aid, and loans—

Now, has there been any interpretation of language of that kind, so far as contracts and agreements are concerned? What is the scope of that? Is there any limit?

Mr. FISHER. Just except to the extent of this research assistance; that is all.

Senator MILLIKIN. To the extent of those specified things?

Mr. FISHER. That is right.

Senator MILLIKIN. They could make any kind of contract or any kind of agreement, in addition to grants-in-aid and loans, as to these specified things?

Mr. FISHER. That is right. Their loans and grants-in-aid would be in the nature of a contract.

Senator MILLIKIN. Now, coming down again to the language on line 18, if the purpose is to suspend competitive bidding, would it not be better to say so rather than to have language there which is broad enough to cover anything that might touch the subject matter in the law?

Mr. FISHER. I think it should be confined to that.

The CHAIRMAN. Let me ask you this, just looking for information.

Senator, it would be rather a bad thing if the Commission was required at any time to conform with anything that grew out of the competitive bidding section. Let us assume that the Commission was going to put out \$200,000 on research over a period of 4 years on "plutonium-590." You wouldn't want anybody to know that we were even thinking that research would produce 590; we wouldn't want to notify the world. We will agree that that shouldn't be done.

Senator MILLIKIN. Let us assume that to start with.

The CHAIRMAN. Now, let us assume there is some trouble in the contract, and due to the amount of work that is necessary, they have got to revise that contract. Would we have the right to revise it without any trouble at all?

Mr. FISHER. For a consideration.

The CHAIRMAN. What do you mean?

Mr. YATES. If there is a consideration moving to the Government, not necessarily financial.

Mr. FISHER. They want to change the scope of their research, enlarge or decrease it.

The CHAIRMAN. You people have the right to reject their modification of the contract?

Let us assume that the contract is for \$200,000. You get into a year's work of research, and it turns out to be a much vaster project than they anticipated. Instead of \$200,000 they up the ante to a million dollars, to the University of Florida.

Mr. YATES. But they are going to get additional work.

The CHAIRMAN. Well, they are going to get additional work in the way of getting three additional appliances to do some additional experimentation.

Now, do you pass on the value of the consideration that is moving for the revision of that contract?

Mr. YATES. Yes, Senator, in determining whether payments under the contract are proper and legal payments.

The CHAIRMAN. Now, that is the point I want to arrive at. If you remove the competitive bidding restrictions, you would have nothing to say about the original contract. That is, they can work without bids.

Mr. YATES. That is right.

The CHAIRMAN. But they could not change that contract and up the ante without your passing on whether the consideration that was moving to the Government was sufficient to justify the increased cost?

Mr. YATES. That is correct, Senator, and I think that is as it should be. Of course, we would never raise a question there unless obviously the consideration fails.

The CHAIRMAN. Wait a minute—unless the consideration fails. What do you mean by that? I assume there would be no guaranty, Mr. Yates, that research was going to result in a finished product.

Mr. YATES. I don't mean that, Senator. I mean unless the consideration fails to appear in any sufficient degree so that any reasonable man would regard it as consideration.

For instance, if the Government is going to amend the contract, increase the price, but is going to get some additional work, we don't question the value of that additional work. We question whether there was additional work; we question whether it required additional cost. We raise no questions other than what a court would raise in a similar case.

The CHAIRMAN. In other words, you say it is all right in the first instance not to have competitive bidding because of the necessity for nondisclosure of what you are doing. You recognize that, I take it?

Mr. YATES. Not in all their contracts, but we think they will need freedom from that section in a great many of them.

The CHAIRMAN. You recognize it as a predicate of operation under many of their contracts. Now, if those same contracts, however, should have to be revised due to the developments arising under the contract, you feel that at that point you should have the right of veto in the revision of that contract?

Mr. YATES. If they alter the payments under the contract, yes.

Mr. FISHER. If they have a provision in the original contract to increase and add to it, there is no question raised. We would question it—to take a ridiculous situation—if you had a million-dollar contract and you asked the contractor later on to furnish one crate of oranges and upped the contract price another million dollars. Obviously, we would question that.

If you agree to buy an automobile, without advertising, for \$1,000, and then the contractor has a strike and runs into trouble, and when he gets through he thinks he will lose money unless he gets \$2,000, we would question an amendment to that to pay him another thousand.

The CHAIRMAN. You have given an absurd example, in the crate of oranges. Let me give you one as absurd and find out what your answer would be.

Let us assume that the Commission, in going along under this \$200,000 contract looking for "plutonium-590," suddenly hears about a scientist over in Czechoslovakia who has the answer, so everybody says, locked up in his head, and he wants \$250,000 as the price to come over here and produce "plutonium-590."

Now, the Commission in judging the situation and the necessity for that grade of plutonium makes a contract with the University of Florida to get that man and adds \$250,000 to the contract.

Now, the Comptroller General could look at it and say, "That is a lot of money for one fellow; we won't allow that."

Mr. YATES. We would not question that, but would probably report it to Congress as being a most ridiculous thing which Congress ought to look into.

The CHAIRMAN. It might be ridiculous in your eyes, but that might be the difference between his giving that to an enemy nation and blowing us off the face of the earth or our having it right in this country—and that is what the five Commissioners might know and you would not know.

Mr. WARREN. As I said, Senator, we would not question that, but we might report it. I take it that we can report anything in the world that comes under our notice.

The CHAIRMAN. Of course, that was what I was rather relying on, Mr. Warren—your power of publication and report—to see that the public funds are not wasted, in the same way that Price, Waterhouse would audit Jones & Laughlin Steel Co. in its operations and report to its stockholders that they had gone through the books and found that they were in balance.

I reiterate that I have no terribly fixed conviction on this. I am examining the works of the Commission. I want the Commission to be a success, as we all do, and I think we have to realize that this Commission is going to be engaged in a very unusual activity, a very unusual governmental activity. It is not going to be the Post Office Department. It is not going to be the Department of Justice. It is going to break in new and untried ground.

Now, have you given any thought to that aspect of it, the necessity for quick and unusual decisions that this Commission is going to have to make?

Mr. WARREN. Absolutely, and the best evidence that there would be no strait-jacket attempts on the part of the General Accounting Office is the fact that we have passed upon \$2,000,000,000 of their expenditures with a war on.

The CHAIRMAN. Of course, a war creates certain pressures on all of us, you know. I don't think any Comptroller General should cut off funds with an atomic bomb in the making.

Mr. WARREN. Senator, I think we have an appreciation of the magnitude of this thing so as to have the same view.

Senator BYRD. Of course, this is one of the secret things the Government is doing. There are a lot of others. You have the same power as to all of the other contracts of the Army and Navy.

Mr. WARREN. Every contract entered into by the Government is filed with the General Accounting Office. We have seen them all.

Senator BYRD. And have you had any difficulty at any time where you have been compelled to refuse approval?

Mr. WARREN. None at all. We have questioned some transactions under the First War Powers Act and have collected back some money where it was abused.

The CHAIRMAN. Of course, I realize you have the same power with regard to jet planes and the rest of it, but each time there has been urged in the committee, Senator Byrd, for a basis of comparison on security restrictions, we have been immediately reminded that this was sui generis, and this was the weapon of saturation, the weapon that required more of security and secrecy regulations than anything else, than the jet plane or naval guns, or anything of that nature.

I am just wondering—and I am asking the question, trying to test it out—whether the nature of the Commission's work is not such as to demand something of the same approach in the way of its fiscal operations as we approached it with security regulations. In other words, we are acknowledging on the one hand that it is a very unusual situation in trying to legislate for it, and we are—if we adopt the Comptroller General's viewpoint, and it may be entirely consistent—nevertheless sitting within the framework of existing ideas.

Mr. WARREN. Now, Senator, let me supplement what I have said by telling you this, too.

(Discussion off the record.)

Senator HICKENLOOPER. May I ask this to clarify?

Let us assume—we are assuming some perhaps ridiculous cases or far-fetched cases—that a scientific and technically or theoretically sound technical process has been projected but hasn't been built yet, for the production of some desirable material for use in some field in this thing, but it is all on paper. It looks good and it ought to work. A contract is let for the production of that particular thing as specified. Then, the contracting people get about two-thirds with that and something is discovered, so that they say they need material. They say: "We can go ahead and build this thing as you prescribe just exactly according to the contract. We can build it as you prescribe, but we now discover that we can make a workable thing out of this thing or we can make something else out of this thing by the use of some more expensive materials and some much more expensive activities, and we ask you to modify this contract and increase it by a half a billion dollars, or something like that."

Would that be such a modification of the contract that you would consider that a consideration was moving toward the Government?

Mr. Warren. I would certainly think there was a very strong consideration moving to the Government on the statement of facts.

Mr. YATES. It is a good illustration.

Senator HICKENLOOPER. I should have said that the Government did not prescribe to the contractor that we wanted to produce a result. The Government prescribed the manufacture of certain things, prescribed a detailed machine, detailed specifications. If you met those specifications, whether it works or not would be immaterial. That is what they contracted for, but in the process the Government became convinced they didn't either have the proper information when they laid down their contract or they would like to accomplish a different result at greater expense. That would be a consideration moving toward the Government?

Mr. WARREN. I don't think there is any question about that.

Mr. FISHER. We have those every day, and there is no question about it.

Mr. YATES. Those are called "change orders."

Mr. WARREN. We have the appreciation that this is an untried field. We realize that we must be reasonable.

Senator HICKENLOOPER. One other illustration. The contractor makes an agreement with the Government to produce a certain specified and detailed job. He goes through that job and meticulously produces according to the blueprints and the plans and the formula, whatever it may be. He gets down about two-thirds of the way through that thing and says: "Well, I just bit off more than I can chew. I haven't got the money to finish it." There is no question of the alteration of the plans. He just hasn't got the money to finish it. We have got it in process up to this point, and the contractor says: "Now, I have either got to have some more money or I stop right here on this thing, because I cannot go any further; I cannot get any loans; I cannot get any money; I cannot pay my workmen; I cannot get materials."

The Government says: "Well, you probably did bite off more than you can chew. We will agree that maybe now it seems the price was too low which you charged us for that. We will go on and put in a hundred million dollars more on this thing so that this can be completed."

Now, where does that fall?

Mr. FISHER. We would question that if the contract was established originally at a fixed price.

Senator HICKENLOOPER. All right. Then let us assume a situation where that particular contractor was peculiarly adapted to make that thing and that the Government considered that it would cost the Government more to have someone else start in on this process under peculiar circumstances than it would to throw in another hundred million to let that fellow finish it. Would that be a consideration in that case moving toward the Government?

Mr. FISHER. We could not recognize that as legal consideration, but what you could do in those cases is to authorize those particular parts of contracts to be made on the cost-plus basis.

Senator HICKENLOOPER. I am not assuming on a cost-plus basis. I am assuming a rigid contract.

Mr. FISHER. We would question it. To get around that particular thing, you could authorize them to make it on a cost-plus basis.

Senator HICKENLOOPER. I presume the Government would always have an out if the contractor came to the end of the rope. The Government could make a new contract with somebody else to step in and finish it.

Mr. YATES. And hold the original contractor for the difference in cost.

Senator HICKENLOOPER. If he is broke, it would not do much good.

Mr. YATES. That would be the Government's remedy.

Senator MILLIKIN. Mr. Chairman, I have been very much disturbed by much of the language in section 3 (a), and I am back on page 8 again.

It seems to me that this language is so broad, so limitless, that the Commission could go before an appropriations committee, and while,

of course, it could not control the action of the Appropriations Committee, it could make a claim that it was the intent of Congress to put no limit on their judgment, and therefore their Appropriations Committee should accept their judgment.

I do not assume for one moment that an appropriations committee would accept that argument in full but it might be greatly influenced by it. I am wondering what the usual technique would be to put some sort of a limit on these grants-in-aid, and loans, and these contracts and agreements. Is there any way to get some sort of an advance consent of Congress, which is to say in the whole process of the Appropriations Committee. I am not asking for advance consent of the appropriation, but of the Congress.

Of course, I assume that we could put a money limit on all or any part of these specified expenditures. Are there any other techniques that could be used to put some sort of a ceiling on this thing?

The CHAIRMAN. Five hundred and thirty-five Members of Congress.

Senator MILLIKIN. I mean it is customary when we give an authorization to put a dollar sign after it.

Mr. FISHER. That is about the only way you can limit it. You couldn't very well do that here unless you made the limit extremely high.

Senator MILLIKIN. You could on a number of the items. When you get into the strictly military field, you would have a tough problem, but no tougher than when the Appropriations Committee considers naval appropriations or any of the usual military provisions.

Is it your judgment, then, that if a ceiling is to be put on that it be put on terms of authorizations limited by dollars?

Mr. FISHER. That is about the only way I know that you could do it:

The CHAIRMAN. Mr. Warren I would like to ask you a couple of questions. You denominated this language as, if at least not intended to be fraudulent, fraudulent on its face. Let me ask you this.

Mr. WARREN. Perhaps I should say, Senator, that it creates the impression that it is effective, and it is deceptive because it is not effective.

The CHAIRMAN. Well, let us find out the limit of its effectiveness. It is effective in permitting you to go with your auditors and accountants to examine every single account and every single transaction that this Commission makes.

It is effective in the sense that it permits you to report on what you find to the Congress.

Mr. WARREN. Well, it doesn't even say that. I would hold, however, I could report.

The CHAIRMAN. You said you had a right to do that?

Mr. WARREN. Yes.

The CHAIRMAN. Now, it is effective then in those two respects. Where it is not effective, in your opinion, is that it does not permit you to (a) disallow certain expenditures as having been made not in accordance with the law, and (b) to withhold funds pending the restoration of the disallowance by the disbursing agent to the Treasury of the United States. Those are the two ineffectives.

Mr. WARREN. Well, the last thing that you mentioned is one of the last resorts of the Comptroller General and in fact is his real power.

Of course, the withholding power primarily is intended for cases of failure to account, not for mere disallowances. There has been

no occasion to ever exercise that since I have been Comptroller General.

The CHAIRMAN. I just wanted to get the problem set out in the four corners of it, in view of the strong language that you did use, that those are the two things which you think are essential; namely, (a) the power to disallow and call upon the disbursing clerk, call him what you will, of the organization to restore some money to the Treasury and (b) to withhold funds. Those are the two powers; am I right?

Mr. YATES. Yes, Senator. But there is a third that is not so tangible.

The CHAIRMAN. What is it?

Mr. YATES. It is the effective result of the audit by the General Accounting Office which flows from the knowledge on the part of the spending officers that the General Accounting Office can disallow credit or withhold funds.

Now, if you will write in the law that the very spending agency, the Commission itself, can by a stroke of the pen remove any disallowance of credit or withholding of funds, then all responsible officers for funds know that the Commission under which they are operating can save their own skins, and your effective deterrent is gone.

The CHAIRMAN. I am very glad to have those three things set out.

Senator BYRD. Isn't there another one, Mr. Chairman, that under this provision the Commission determines its own system of administrative accounts; it fixes its own forms, which must be audited?

The CHAIRMAN. Until I am informed differently, I assume that that isn't too important.

Senator BYRD. I am just discussing the provision as it stands now.

Mr. YATES. It is important, for this reason: The Commission conceivably—I do not charge that any Commission would—could establish forms that would give so little or no information that an audit would be fruitless.

The CHAIRMAN. Of course it might, but this thought occurs to me, Mr. Yates: If you were on the Commission and had an understanding of the desperate necessity for secrecy in regard to a certain proposition, you would not want a detailed form of any kind.

Mr. YATES. No; we don't want that, and that isn't necessary, but we want enough on the voucher and the contract to establish that there is an obligation. They could establish forms that would even preclude that.

Senator BYRD. There couldn't be any more desperate need for secrecy than on the Manhattan project, and every detail of that was audited in time of war.

Mr. YATES. May I make one explanation of those words "disallow credit" and "withhold funds"?

The CHAIRMAN. Yes.

Mr. YATES. I am afraid they might not be understood.

The words "disallow credit" pertain to the action in the audit of a disbursing officer. When credit is disallowed, it is in the accounts of a disbursing officer, and he must explain or furnish additional facts to justify the change of that action and the subsequent allowance of credit. Sometimes credit cannot be allowed. It is obviously and outrightly illegal.

"Withhold funds" pertains to action within the control functions of the General Accounting Office and goes to the issuance of warrants and authorizations of requisitions for funds. Now, funds would never be withheld. That is, the Comptroller General would never decline to approve a Treasury warrant for funds, nor would a requisition be disapproved except in two general situations:

One is that the disbursing officer seeking the funds on a requisition has failed to account faithfully for his uses of Federal funds. He has failed to render his accounts completely or as required by law.

The other general situation would be where there is asked on a warrant money in excess of that appropriated by Congress or from an appropriation which Congress has not made for that purpose. It has made the appropriation for some entirely different purpose.

I have the very definite impression that those who are seeking this freedom from the disallowance of credit and from the withholding of funds are attaching to it too much importance and if there is anything in the importance they do attach to it, it would reach a result that the Congress of the United States would not want them to reach anyway.

You would not want the General Accounting Office to approve a warrant setting up funds on the books of the Treasury from an appropriation that you made for an entirely different purpose, or perhaps to an entirely different office. You would not want, even in this project, the General Accounting Office to approve a warrant for more money than the Congress has yet appropriated.

You would not want, I take it, that we should approve a requisition for funds to a disbursing officer who has failed and perhaps consistently refused to send in an accounting for his stewardship of the Government's funds.

Now, those, in a general way, are the only circumstances involved there, Mr. Chairman.

The CHAIRMAN. Let me ask this question, and I ask it in all earnestness, trying to find out what is the best thing to do. This, of course, is a huge manufacturing enterprise. It is not a usual thing in which the Government is engaged. That is true; is it not? I suppose it is comparable to operating the United States Steel Corp.

Mr. YATES. It is scientific, manufacturing, experimental.

The CHAIRMAN. It is equivalent to operating the United States Steel Corp. or General Motors.

Senator MILLIKIN. Du Pont would probably be more applicable.

Mr. YATES. I will accept that, Mr. Chairman.

The CHAIRMAN. They, of course, have their board of directors, and they go ahead and try to do the best job they can for the stockholders.

Now, if you were running du Pont, or in the operation of du Pont, I assume, we might say, they would have Price, Waterhouse, or Ernst & Ernst. They come in and make an accounting and report to the stockholders. That is the beginning and the end of their responsibility; is it not?

Mr. YATES. Of the firm of accountants, as I understand commercial accounting; yes.

The CHAIRMAN. How would you think it would affect the operations of the business if Price, Waterhouse or Ernst & Ernst had a right to enter into the policy making of du Pont Co.? Would you approve of that as a stockholder of the du Pont Co.?

Mr. YATES. Mr. Chairman, that brings up a question that has so many angles we could discuss it for the next 5 hours.

The thing you are really bringing into question is the relationship, if any, between a so-called commercial type of audit and the system of accountability of Government fiscal officers which the Congress years ago established.

There really, in my opinion, is little relationship between the circumstances and the results. The Congress has enacted a law based on the theory that when money is handed out to a fiscal officer he must come in and account for his uses of that money.

The CHAIRMAN. Doesn't it run into conflict, though? That law was enacted to establish governmental operations, such as the Post Office Department. Does it apply when the Government enters into a strictly manufacturing enterprise? Do the same principles apply?

In other words, we are after the most efficient operation that we can get here of a manufacturing enterprise of vast dimensions. Now, you operate that in accordance with the traditional method that you advocate for efficiency, or you operate it in the way that a huge manufacturing organization is operated.

Senator BYRD. May I inject there, Mr. Chairman, that the Government has been for years and years conducting vast business enterprises. They conduct all the navy yards all over the country. They conduct arsenals and conduct many other things in time of peace—and in time of war they conducted many plants that were audited by the General Accounting Office without any difficulty whatever.

The CHAIRMAN. You know a great deal more about this, Senator; this is new to me.

Senator BYRD. They have run the navy yards for years. They run the navy yard in Norfolk which employs 40,000 people, the largest operation in Virginia, and that has been running without trouble.

Let me say about the policy that I do not believe Mr. Yates intends to leave the committee under the impression that the Comptroller General attempts to define policy. All he does is see that these expenditures are made in accordance with the law. Congress defines the policy, not the Comptroller General.

The CHAIRMAN. Of course, Senator, I was just thinking out loud. I think, of course, as a statement of principles, that is true, but in the day-to-day operation of a business enterprise of this magnitude, quick decisions have to be made.

For instance, let us take an example: Let us assume that in a far-away place we have a project. We have 3,000 workers there, and we set up recreation facilities. We also set up a cafeteria, and there we furnish a meal for 25 cents that costs the Government 40 cents. That might amount to very little in the sum total of maintaining the morale of those 3,000 workers.

Senator BYRD. But it first ought to be authorized by Congress, shouldn't it, and that is all that the Comptroller General determines?

Mr. FISHER. The bill authorizes recreational facilities. We would not question a case like that, Mr. Chairman. That would be nothing we could question.

The CHAIRMAN. Even though there was a loss?

Mr. FISHER. We might report that to Congress as bad administration, but there would be nothing we would disallow in the accounts.

The CHAIRMAN. You might recognize that to be good administration.

Senator MILLIKIN. Mr. Chairman, as I see this thing, I think your analogy of an auditor passing on the policy of the company would be better if you considered an outside legal review.

A lawyer looking at the business of the company says to himself, "Is this piece of business in accordance with our charter, in accordance with our bylaws; is it in accordance with the authority given by the minutes of the board of directors?"

Now, the Commission will have its inside legal staff to determine those things. This method, by preserving alive the powers of the Comptroller, gives you an additional legal review. The lawyer in the company doesn't stick his nose into the detail of how the minutes are carried out or how the bylaws are carried out unless he is asked to. His business is to advise the directors, "Is this thing that we propose to do within our charter, within our limits, within our bylaws?" That is the end of his immediate concern. Now, he may have other duties.

As I understand it, you gentlemen look to see first that you have a voucher before you. You look to see whether that comes within the terms of the law. Isn't that your job?

Mr. WARREN. Yes, sir.

Senator MILLIKIN. So what we are doing is enclosing another legal review on the Commission's own lawyers.

Now, that brings me to this question: I am very much interested in the security features of this bill. You preserve the security through the knowledge of your own employees, and you say that you had them all cleared by the FBI. That is what you did on your own initiative. The law didn't tell you to do that. If we allowed the Comptroller to have his normal powers here, and struck out subsection 10, would it be advisable to incorporate some definite mandate that you do follow a security routine? You might not always be there. Some careless fellow might be in there.

Mr. WARREN. Of course, if there was any phase of it which Congress thinks should be secure from us, I have no objection to that phase at all. In fact, when we were let in on the secret, we asked no questions whatever, Senator.

Senator BYRD. You must make a brief statement, Mr. Warren. Senator Austin wasn't here when you discussed that part of it.

Mr. WARREN. We were in on this secret from the very beginning, Senator. A memorandum which other people may not have understood because it was couched that way on account of its secretiveness was filed in the safe in my own office at the time. We audited every dollar of the Manhattan project and the one out on the west coast. We have been publicly commended by General Groves for our fine cooperation, and have been thanked by him.

The audit was kept current, and if we are given that same authority we will keep it, and will have our men on the very project as we did have before.

There hasn't been, as I told Senator Millikin, any difficulty. This expenditure has been remarkably clean. I do think, however, that the fact that we were there, like the policemen on his beat, had a very salutary effect. Our auditors were the greatest help and assistance to those who were spending money on the project. Time and time again they would consult us, and that was very salutary.

I have yet to receive a single solitary complaint about either the conduct of our men or lack of efficiency or thoroughness on their part.

Senator MILLIKIN. Mr. Warren stated that in order to preserve the security of the thing as far as his department was concerned, he had the men who worked on this cleared by the FBI.

Senator AUSTIN. Yes; I understood that.

Senator MILLIKIN. That gave me a lot of comfort insofar as the tax is concerned. Now, I am wondering whether something of that kind should be required by law.

I would like to ask one more question categorically: Did any assistant counsel of your department advise or consult with anybody on section 10?

Mr. WARREN. The acting general counsel is Mr. E. L. Fisher.

Mr. FISHER. I consulted with Mr. Miller, who came down from the Office of the Legislative Counsel. We had a copy of the old S. 1717, which he informed me was being rewritten. In fact, he was going to try to get it printed up that night. He had a big mimeographed copy of how they were going to change it, so we had nothing. The original S. 1717 had no provisions at all in it, and we just discussed it generally.

Senator AUSTIN. You mean provisions relating to audit?

Mr. FISHER. That is right. We discussed generally the operations of the General Accounting Office. The gentleman wasn't informed on the audit procedure and how we operate, and he discussed, of course, the feeling, I presume, of the committee or the people back of him that they wanted to restrict our audit to some extent, no part of which, of course, I agreed with.

He left me with the impression that they either would cut the General Accounting Office clear out of the picture, or probably put in some such provision as this.

Senator MILLIKIN. Was that provision before you?

Mr. FISHER. No; we had no language whatever.

Senator AUSTIN. Did you assent to that final proposition?

Mr. FISHER. I told him either way we would object to it.

The CHAIRMAN. I am trying to reconstruct what happened. I called attention to the fact that that provision appeared in the May-Johnson bill. Then there was representation made to me that this was not in very good form, and I suggested—I think this is the way the misunderstanding arose—to counsel that they go over to the General Accounting Office and find out what language would do better than what is written in the May-Johnson bill.

So it wasn't with the idea of going over to get your assent, as I understand it.

Mr. FISHER. I didn't understand it as that.

Senator BYRD. The committee was told that the General Accounting Office did consent to it. We were told that yesterday.

Mr. FISHER. There was no consent whatever.

The CHAIRMAN. You saw this language which appears here?

Mr. FISHER. No; we didn't see that. You see, I had a copy of the original S. 1717 which had nothing in it.

The CHAIRMAN. Is this the language that comes out of TVA Act?

Mr. FISHER. That follows it to a certain extent.

The CHAIRMAN. Now, just for my information, for I am not familiar with this, how do they operate differently than the set-up under section 10?

Mr. FISHER. They operate substantially on that basis, except that the TVA law specifically requires us to report to Congress anything that we think is illegal or wrong, and also to make an annual audit and report back to the TVA, get their comments and criticisms and send our reports with their comments to the Congress.

In addition to that, they will get the regular commercial corporation audits. You see we get two audits working in there—an audit which this would propose, and the regular commercial audit.

The CHAIRMAN. For my information, have you reported anything to the Congress that is wrong with the TVA operations?

Mr. FISHER. I cannot answer that. We probably have in the past. We had some trouble with the TVA years ago.

Mr. WARREN. May I inject there, the reason that provision is in the TVA Act is this: Shortly after I became Comptroller General, the TVA got an opinion from the Attorney General saying that they were not under the Budget and Accounting Act. There was no way we could contest that, because the Attorney General would have been our attorney, and I am quite sure he would have gone in and confessed judgment, having delivered the opinion.

The matter was placed before Congress, and more or less as a compromise—because they were then clearly out of it, and they claimed they were going to be bound by the Attorney General's opinion and therefore were not under us at all—those provisions were more or less agreed upon. But never since then have I ever taken the position that that was a pattern for anything else. We would have vigorously opposed that as a pattern, and we are just waiting a fair test before making any report to Congress on it.

The CHAIRMAN. That interests me. I have never gone into the controversy, but I knew there was a controversy.

Mr. WARREN. It was a controversy that I inherited when I came in there, Senator, and I had been in just a few months when the Attorney General issued a very sweeping opinion that they were not even under the General Accounting Office. I didn't want the Attorney General at that time to be my attorney in testing it.

The CHAIRMAN. Is there anything, since you have been Comptroller General, that stands out in your mind as subject to criticism?

Mr. WARREN. Well, we have challenged some things to the board of directors. You see, under the provisions of this thing this Commission could be the most capricious set in the world if they saw fit.

The CHAIRMAN. You could be capricious, too, in disallowing, Mr. Warren, if you wanted to.

Mr. WARREN. Yes; if I wanted to, but there is an entirely different slant on that. I have no ax whatever to grind. I am wholly independent and accountable and answerable only to the Congress itself. I am your agent; I am acting for you.

They are in the executive branch of the Government, and I am not. They are the ones that make the expenditures, and if they were so minded—understand this is no inference—if they wanted to, they would have the power to cover up.

Senator HICKENLOOPER. They would have power by merely making the assertion that they considered that to be essential?

Mr. WARREN. Absolutely, and that would end it, and it would be the conclusion.

We have no prejudices. We have no friends to reward in the Government and no enemies to punish. I think, if I can say it modestly, that my policy has been to call them as I see them.

Senator HICKENLOOPER. As I recall, the Comptroller may have pride of ancestry but no hope of prosperity.

Mr. FISHER. I would like to, explain the disallowance a little, too.

As a normal thing, when we make a disallowance it does not handicap their operations at all. We make it a month or two after it has been done. They go right ahead, but we have put the disbursing officer on notice that when we settle his accounts at the end of a 3-month period, or so, he is going to owe us that much money.

Then, we take that and report it to the Department of Justice to have the Attorney General sue the disbursing officer and his surety to recover that money.

The CHAIRMAN. How many suits have you got pending?

Mr. YATES. Meanwhile the officers can come to Congress and get relief, so there is no suit in that event.

Mr. FISHER. I do not know how many suits we have, but I can find out the number for you.

Senator BYRD. Before we leave the TVA, my understanding is this: The TVA collects a large sum of money each year, and the question in controversy was whether or not that fund should go back into the Treasury to be reappropriated by Congress, or whether the TVA would have the right to use it for the expansion of their business. That was the issue before Congress as I remember.

Mr. YATES. That was the appropriations issue which Senator McKellar has always been interested in.

Senator BYRD. It was a question of yearly income of the TVA, as to what disposition they should make of that or whether it should be going into the Treasury.

Mr. YATES. And their collections are large.

Senator BYRD. Very large.

That presented an entirely different question.

Mr. YATES. It was a different situation all the way through, Senator.

The CHAIRMAN. You agree, as I get it, that competitive bidding should not be required.

Mr. WARREN. Yes; I agree with you on that.

The CHAIRMAN. That is required under the law, and if that were not in the bill you would have to require competitive bidding for the disbursement of funds.

Mr. WARREN. That is right.

Mr. FISHER. Not in all cases.

Senator HICKENLOOPER. I thought the competitive bidding discussion was limited.

The CHAIRMAN. Don't you think it would be highly unfortunate if competitive bidding restrictions were put on the building of a pile?

Senator HICKENLOOPER. Not necessarily. It involves an awfully lot of money and could involve a lot of favoritism.

The CHAIRMAN. I realize that, but also if competitive bidding were to be followed, you might have some very questionable people with the low bid designedly.

I can remember when the Germans bid much lower for the Moscow subways—it seems to me now I remember this anecdote—they bid

much lower on the Moscow subways than an English firm did. They wanted to put it much nearer the top of the ground, which would have been just as expensive. They awarded it to the English for putting it deeper down. It might have been highly inconvenient for the Russians if it had been built by the Germans. Now, I am just wondering, assuming competitive bidding had existed, whether they wouldn't have had to give it to them.

Senator BYRD. Would you object to a provision that where the Commission thought competitive bidding should not be carried out—would you object to not having competitive bidding?

Mr. WARREN. No; because I visualize so many things where you should not have competitive bidding. Of course, on some things I think you should have.

The CHAIRMAN. Wouldn't you leave that in the power of the Commission?

Mr. WARREN. I have no objection in the world to that.

Mr. YATES. Would it be helpful, Mr. Chairman, to modify the wording so as to place upon the Commission the responsibility of concluding that it would not be in the interest of security to ask for competitive bidding?

Senator BYRD. And make a report to that effect?

Senator MILLIKIN. And conform the language so we will know what we are talking about.

Mr. YATES. Not to remove competition in cases where it could safely be had.

Senator BYRD. Make a report to the Comptroller General that they thought it advisable.

The CHAIRMAN. You wouldn't have that within the determination of the Comptroller General?

Senator BYRD. No; but have them make a report.

The CHAIRMAN. A certification by the Commission that in the interest of public defense and security they were not putting this item out for bid.

Now, what else do you think would be harmful if you were to exercise your jurisdiction? How about this changing of contracts on the example I gave about paying the Czechoslovakian \$250,000, where Mr. Yates said he thought that ought to be reported to Congress.

Mr. YATES. Just because of the amount.

The CHAIRMAN. I would make it \$2,500,000.

Mr. WARREN. Reports to Congress are, of course, entirely within my discretion or Mr. Yates'. It is hard to say what we would report or what we would not report.

The CHAIRMAN. But you would not restrict the Commission in its right to change its contract?

Mr. WARREN. None whatever.

The CHAIRMAN. So that is all right in the bill.

Mr. YATES. The authority to contract carries with it the discretion to determine the contract price.

The CHAIRMAN. What you really are driving at, as I see it here, is the right to disallow and the right to cut off; is that right?

Mr. YATES. The right to make the audit effective so it is worth its cost.

The CHAIRMAN. That may be translated into this language, but what the power is is the right to cut off and the right to disallow.

Mr. WARREN. Just as we do other agencies of the Government.

Senator BYRD. Let us get that clear. If you exercise that power, you then file a statement showing there is an illegal expenditure?

Mr. WARREN. That is right, and they then answer that.

Senator BYRD. That is made a matter of record. In other words, he cannot just arbitrarily say, "I disallow this," and go on record. You have got to give your reason as to why it is not in accordance with the appropriation legislation of Congress.

Mr. YATES. And a statement embodying those reasons goes to the responsible administrative officials.

The CHAIRMAN. Now, as quickly as possible, gentlemen, I would like our lawyers here to get together with your lawyer for the purpose of drawing up language because it ought to be put to the vote of the committee, and I want to hear one other witness or possibly two on this subject, because I think it is tremendously important.

Senator BYRD. I would suggest, Mr. Chairman, if you have any doubt about the War Department, to summon either the Secretary of War or General Groves. Did General Groves have something to do with writing this bill?

The CHAIRMAN. I think Royall did. My limited research, Senator, indicates that Under Secretary Royall was responsible for this elimination of the Comptroller General's, which participation provision we adopted.

I am sorry, Mr. Warren, that you didn't denominate it as fraudulent then rather than now, because it is simply an adoption here without any intent to deceive.

Mr. WARREN. I didn't intend any offense on that, Senator, you know.

The CHAIRMAN. I am sorry, but I wish you hadn't used that phrase. I might as well be frank with you.

Senator BYRD. I would like to ask, if you have Mr. Royall that you also have General Groves because he has dealt with the General Accounting Office on the Manhattan project.

Before you adjourn, may I ask the Comptroller here with respect to line 14 on page 40, whether he has any comment?

Mr. WARREN. I would like to read a paragraph about that.

Section 12 (b) on page 40 of the bill provides:

The President may exempt any action of the Commission from the provisions of any law relating to contracts, purchases, sales, audits, reports, and similar matters whenever he determines that such action is essential in the interest of the national security.

While it may be that in isolated cases the authority which the bill would confer on the President might be necessary to the national security, the language of the bill at present is such as to authorize a disregard of all laws relating to contracts, purchases, sale, audits, reports, and so forth, on a broad and general basis; and conceivably the authority could be exercised in such a way as to eliminate the Comptroller General from the picture entirely irrespective of other provisions of the bill.

To this extent the provision is much broader than title II of the First War Powers Act of 1941, which relates only to contracts, whereas the provision in this bill relates to any action and extends to all audits, reports, and so forth.

Senator BYRD. Of all other departments?

Mr. WARREN. Yes. If some such authority is deemed necessary, it should require exemption by the President in advance, and only with respect to specific individual actions.

Senator BYRD. Would you construe that that applies to all audits of every department by the use of any law?

Mr. FISHER. No.

Mr. WARREN. I think he is referring only to action by the Commission.

Senator BYRD. It says "provisions of any law relating to contracts."

Mr. FISHER. That exempts the action of the Commission.

The CHAIRMAN. In other words, you would strike out "purchases, sales, audits, reports, and similar matters." Is that the purport of what you have just said, Mr. Warren?

Mr. WARREN. Well, I would certainly strike out "audits."

Senator MILLIKIN. Would you substitute anything for it?

Mr. FISHER. The purport is so broad that it would presumably let him do it after the fact instead of in advance, and I assume they would know in advance when the situation arose.

The CHAIRMAN. I don't see why knowing in advance is important—for security, that is the only reason I can see, so long as it is going to be audited.

Mr. FISHER. Rather than come out broadly and say, "Any action of the Commission relating to contracts is exempt," I think it should be confined to specific instances.

The CHAIRMAN. Will you also suggest a wording of that. As I say, I would like you gentlemen to get together on this as quickly as possible so that we could have a concrete proposal to which I would like to direct the attention of a couple of other witnesses.

Mr. YATES. A proposal for an amendment to the bill as it is now worded?

The CHAIRMAN. Keeping in mind the necessity for the competitive bidding elimination, and changes in the contract under the contracts as made.

Mr. FISHER. You still want that provision in the bill to let them make changes and amendments?

The CHAIRMAN. Are you against that? I thought you finally were in favor of that.

Mr. FISHER. No; I do not think we would be in favor of it without limitation, as it is now. They could amend a contract anytime for consideration. It is these gratuities that they try to get by amending contracts. Under the War Powers Act, for instance, the War Department could come along after the contract had been completed and amend the contract then to pay back the liquidated damages that had already been withheld, a simple gratuity.

The CHAIRMAN. They had that power?

Mr. FISHER. We objected to those things, but that is what they tried to do.

Mr. YATES. We objected on the ground that it couldn't further the prosecution of the war after the contract was completed and ended.

The CHAIRMAN. I can see where another argument can be made on that. It kept the contractor in business to go ahead and take another contract.

Mr. YATES. Where that argument was made, of course we considered it fully.

The CHAIRMAN. We are going to have a couple more witnesses.

(Whereupon, at 12:20 p. m., the committee recessed until 10:30 a. m., Monday, April 8, 1946.)

ATOMIC ENERGY ACT OF 1946

MONDAY, APRIL 8, 1946

UNITED STATES SENATE,
SPECIAL COMMITTEE ON ATOMIC ENERGY,
Washington, D. C.

The special committee met, pursuant to notice, at 10:30 a. m., in room 104-B, Senate Office Building, Senator Brien McMahon (chairman) presiding.

Present: Senators McMahon (chairman), Connally, Byrd, Vandenberg, Austin, Millikin, Hickenlooper, Hart.

Also present: Lindsay C. Warren, Comptroller General of the United States, accompanied by Frank L. Yates, Assistant Comptroller General of the United States, and Edwin L. Fisher, assistant general counsel, General Accounting Office; Dr. Edward U. Condon, scientific adviser to the special committee; James R. Newman, special counsel; and Christopher T. Boland, staff director.

The CHAIRMAN. General Groves, we have heard testimony from the Comptroller General relative to what provisions he thought should and should not be in an act governing the Atomic Energy Commission.

We heard this testimony on Thursday. The committee decided to ask you to come over this morning for a few minutes to give any ideas that you might have as to the necessity for any exemptions from the general statutes governing the Comptroller General, if you thought there should be any exemptions, and what their nature should be.

Now, we have, as you know, the power in the Comptroller General to audit and disallow. I believe it is fair to say, Mr. Warren, that you are in agreement that there should not be competitive bidding.

Mr. WARREN. I assume you got the proposed amendments you asked us to provide.

Senator AUSTIN. Mr. Chairman, my recollection is that on that point we had a specific idea under consideration, and that was placing in the Commission the duty of certifying that competitive bidding would not be in the interest of security, in order to waive competitive bidding.

Wasn't that what was under consideration?

Mr. WARREN. That is my understanding, and we have incorporated that view in the proposed amendment.

(The amendments offered by the Comptroller General are as follows:)

S. 1717—A BILL FOR THE DEVELOPMENT AND CONTROL OF ATOMIC ENERGY
AMENDMENTS SUGGESTED BY THE GENERAL ACCOUNTING OFFICE

Amend the sentence beginning at line 17, on page 8, so that it will read as follows:
"The Commission may make such arrangements without regard to the provisions of section 3709, Revised Statutes, upon certification by the Commission

525

that such action is necessary in the interest of common defense and security, or upon a showing that advertising is not reasonably practicable, and may make partial and advance payments under such arrangements, and may make available for use in connection therewith such of its equipment and facilities as it may deem desirable."

Amend section 4 (c) (2), line 16, page 10, by striking out the words "with or without modification."

Amend section 4 (c) (2), so that the sentence beginning on line 10, page 11, will read as follows:

"Any contract made under the provisions of this paragraph may be made without regard to the provisions of section 3709, Revised Statutes, upon certification by the Commission that such action is necessary in the interest of common defense and security, or upon a showing that advertising is not reasonably practicable, and partial and advance payments may be made under such contracts."

Amend section 5 (a) (5) so that the sentence beginning on line 14, page 14, will read as follows:

"The Commission is authorized to purchase or otherwise acquire any fissionable material or any interest therein outside the United States, or any interest in facilities for the production of fissionable material, or in real property on which such facilities are located, without regard to the provisions of section 3709, Revised Statutes, upon certification by the Commission that such action is necessary in the interest of common defense and security, or upon a showing that advertising is not reasonably practicable."

Amend section 5 (b) (5) so that the sentence beginning on line 13, page 16, will read as follows:

"Any purchase made under this paragraph may be made without regard to the provisions of section 3709, Revised Statutes, upon certification by the Commission that such action is necessary in the interest of common defense and security, or upon a showing that advertising is not reasonably practicable, and partial and advance payments may be made thereunder."

Amend section 12 (a) (5), which begins at line 6, page 38, so that it will read as follows:

"(5) acquire such materials, property, equipment, and facilities, establish or construct such buildings and facilities, and modify such buildings and facilities from time to time as it may deem necessary; and construct, acquire, provide, or arrange for such facilities and services at project sites for the housing, health, safety, welfare, and recreation of personnel employed by the Commission as it may deem necessary;"

Amend the bill so as to omit entirely section 12 (a) (10), on pages 39 and 40.

Amend section 12 (b), which begins at line 14, page 40, so that it will read as follows:

"SECURITY.—The President may, in advance, exempt any specific action of the Commission in a particular matter from the provisions of law relating to contracts whenever he determines that such action is essential in the interest of the national security."

The CHAIRMAN. We are agreed, General, on the noncompetitive bidding upon certification. Taking it from that point, and particularly with regard to the security aspects of it, what do you see that is necessary to protect security, as far as the Comptroller General's Office is concerned?

STATEMENT OF MAJ. GEN. LESLIE R. GROVES

General GROVES. I would say that, if the Comptroller General's Office functioned in the future as it did in the past with me, there is nothing needed, because everything was done, as far as I could tell, to protect security. The personnel that audited the accounts, the protection of papers—everything was entirely satisfactory from start to finish without any argument, without the slightest question at all. There was just complete agreement as to that.

I feel very strongly that the audit of accounts should be in the hands of the Comptroller General. Those of us who have been in the Government service for a number of years have had lots of difficulties

with the Comptroller General's Office, particularly under the previous administration.

Senator VANDENBERG. You mean the previous administration of the Comptroller's office?

General GROVES. That is correct, sir, and even with those difficulties, I always had the very strong personal feeling that it was a very desirable thing, because it gives the United States the protection it needs and it also removes, from the officer who is responsible, a tremendous responsibility. It would be a very bad thing, in my opinion, to remove these accounts from the control of the Comptroller General. I think it would also be bad to remove them from him in the sense that the Commission could say, "Well, we are not interested in that; we will just say that that is O. K."

Now, I think, in the appropriations, there should be some provision for certain expenditures, such as now exists, I believe, with respect to the FBI. I am not familiar with the FBI appropriations; whether they can certify, but I think there may be, depending on the bill, which I have not seen in its present form, the necessity for some such appropriations in a limited sum, but I cannot see anything that should remove from the Comptroller General the power of audit.

I think it would be a mistake to do it.

The CHAIRMAN. Now, do you know what the genesis of this provision was in the May-Johnson bill?

General GROVES. No, I don't. I know that the Interim Committee apparently felt that was a desirable thing, but, when it was acted on in the House, I believe that as the bill was reported out by the May committee that particular section was struck out.

The CHAIRMAN. Is that right, Mr. Warren?

Mr. WARREN. Mr. May informed me late Thursday afternoon that it was stricken out after the Department had seen the attitude of the committee—it was stricken out on the suggestion of General Royall.

General GROVES. In other words, it was with the full assent and even the recommendation of the War Department.

The CHAIRMAN. You don't know how it got in there in the first place?

General GROVES. No; I do not.

The CHAIRMAN. But the Interim Committee put it in?

General GROVES. Yes; because it was the Interim Committee's bill.

The CHAIRMAN. I would like to ask Mr. Warren what the provision is that General Groves is talking about in the FBI.

Mr. FISHER. They have a right to make a certification without disclosing what the money is spent for.

Mr. YATES. That only goes to a limited part of the appropriation. It is something like the fund which the Congress has provided in the appropriation for the War Department. A certain limited amount of money may be expended for unforeseen emergencies upon certification.

The CHAIRMAN. How much is that in the case of the War Department?

Mr. YATES. I cannot tell you that exactly, Mr. Chairman, but it is a very small amount compared to the total appropriation.

The CHAIRMAN. There is no provision for that, of course, in here?

Mr. FISHER. No.

The CHAIRMAN. Now, should there be anything in here to carry out General Groves' idea on that?

Mr. YATES. It wouldn't be necessary, Mr. Chairman, because it could be done, as General Groves is suggesting, and has been done in like situations before, by the Appropriations Committee.

The general bill that you have here authorizes the necessary appropriations. Now, if the Appropriations Committees wish to provide that a certain part of that appropriation which they may make pursuant to the authorization may be expended upon certification for emergency purposes, that in the past has been regarded as within the province of the Appropriations Committees.

The CHAIRMAN. That could not be raised as a question of legislation in the appropriations bill?

Mr. YATES. I would not think so.

The CHAIRMAN. Now, General, there has been some discussion about the right of the Comptroller General to audit the vouchers.

You give a contract, we will say, for half a million dollars for research in Chicago. You might not even want to put on the voucher what the research was for. You can conceive of that situation, can't you?

General GROVES. Yes; that is a possibility, but I don't think that would hurt. Maybe the Comptroller General might say, "We want to have a certification that this is for the purposes of the Atomic Energy Commission," but then he audits the accounts just the same.

The CHAIRMAN. But under the Comptroller's language as submitted—if I am mistaken, I wish you would correct me—in that particular situation it might be highly necessary that it not be divulged on a voucher what the research contract was about.

Would you insist on having that detailed for you?

Mr. FISHER. I don't think so.

Mr. YATES. The contract, Mr. Chairman, would be required by general law, to be filed in the General Accounting Office, anyway. There is nothing in the pending bill to the contrary.

The CHAIRMAN. That is a public record?

Mr. YATES. Well, it is a public record subject to the control of the General Accounting Office, as to where it is exhibited.

The CHAIRMAN. Let me understand that. I, as a citizen—could I not go down and ask for that to be produced?

Mr. YATES. You could ask for it, Mr. Chairman, and if you could show that you had a public purpose or an important purpose to be served, and if there were no other objections, we would exhibit them. But if they were of a class of confidential contracts, such as we have had during the war period, we would hold it confidential, and decline to exhibit to you.

The CHAIRMAN. Well, my point is, let us assume there is a contract for "uranium-635½" to Chicago to a million dollars.

Now, it might be that we wouldn't want to disclose that we were even trying to find "uranium-635½." I admit that I am at a loss. How would you conceal that?

General GROVES. The way that would be done, in my opinion is this: We would prepare a contract, and this contract would have attached to it a secret letter, and the contract would have a code which would make the contract something that could be used to a much larger extent in the Comptroller's office, just as in our office. But this secret letter would be available to the Comptroller General. If he wanted to file it down in his office, in his private safe, there

could be no objection on the part of the Atomic Energy Commission, and that is exactly the way we handled things in this affair.

Mr. WARREN. May I interpose there, Mr. Chairman?

I think General Groves will agree that, although we were taken in on this secret at practically the very start, we have religiously refrained from asking even any question about it in any way, shape, or form. I think that is correct, isn't it?

General GROVES. That is correct.

Mr. WARREN. We wanted to know nothing about it other than the general audit provision.

General GROVES. There were complicated financial arrangements in these contracts, unheard of before, and such a particular arrangement was discussed and received the approval of the Comptroller General in advance, that we were proceeding in a legal manner, and he agreed with us that it was the best way to handle it.

The CHAIRMAN. General, on your ultra-secret material heretofore in the operation of the project, was that all filed with the Comptroller General?

General GROVES. Such part of it as we wished to have filed. In other words, so that he could make an intelligent audit, and carry out his responsibility to the Congress, we assumed that anything that he felt was necessary was all right for him to have, and he felt that he didn't want to have anything more than he had to have. If you have two people operating in that way, there is never any friction, and that is exactly the way this worked out.

Now, in the bill that you have here, I notice that you say the Comptroller General may use personnel of his own selection. Well, that is the way it was operated here. He used personnel of his own selection, but he told us who they were in advance, and he was satisfied that we felt that personnel was responsible from a security standpoint.

If he hadn't been willing to do that, I don't know what we would have done. But as long as it is operated as this was, we won't have friction.

The CHAIRMAN. General, did you give any testimony before the committee that drew up the May-Johnson bill or consult with them?

General GROVES. You mean the Interim Committee? I talked with them at considerable length.

The CHAIRMAN. Did you talk about the Comptroller General's provision?

General GROVES. I don't recall.

Senator MILLIKIN. Mr. Chairman, what is that Interim Committee?

The CHAIRMAN. They drew up the May-Johnson bill, Senator. It was a committee appointed by the Secretary of War with the consent of the President. I think there were eight members on it.

Senator MILLIKIN. Not a congressional committee?

The CHAIRMAN. No.

General GROVES. All civilian members. There were no men in uniform on it.

Senator HART. It was Dr. Vannevar Bush and Dr. James B. Conant.

General GROVES. Karl Compton, of MIT.

Senator HART. Henry L. Stimson, Secretary of War, and the Under Secretary of the Navy, Ralph A. Bard.

General GROVES. William L. Clayton, Assistant Secretary of State; James F. Byrnes, representing the President; and George L. Harrison, special consultant to the Secretary of War.

Senator HART. I think Mr. Wallace was on that.

General GROVES. He wasn't on that, but Mr. Byrnes was. It was at the time that Mr. Byrnes was a private citizen; and later, when he became Secretary, he continued with it.

Senator BYRD. General, do you think the auditing of the Manhattan project in any way endangered any of the secrets?

General GROVES. No, sir.

Senator BYRD. And you think the audit in the future can be handled in the same way, namely, that there would be an audit made by the General Accounting Office?

General GROVES. I see no reason why it cannot be handled that way and I am sure it will be, as long as the present administration of the Comptroller General's office is as it is today and as long as the Atomic Energy Commission does its part in the getting along, too.

Senator BYRD. Have the suggested amendments been shown to you?

General GROVES. I have just seen them this morning. I did not know what some of these revised statutes were, unfortunately; but, as I understood them, they essentially said that you could enter into contracts without advertising and without competitive bidding.

Now, that is very essential, because it is the same thing as if you were trying to get competitive bidding when you want to get a doctor to perform an operation on you. That is the kind of affair that you have here, and I don't see how you could have competitive bidding from the standpoint of security; but let alone security, just from the standpoint of getting the best possible job that has to be gotten.

The CHAIRMAN. Mr. Warren, how about the State Department? Do they have any procedure whereby they spend money on a blanket authorization?

Mr. FISHER. Yes.

The CHAIRMAN. That is the same nature as the FBI?

Mr. FISHER. Generally, the same purpose, just not to disclose the purpose for which the money was spent, and make certification that it was spent for confidential purposes, which it is not in the public interest to disclose.

The CHAIRMAN. Now, that has no legislative authorization? It is simply before the Appropriations Committee?

Mr. FISHER. It is in the statutes of the State Department.

The CHAIRMAN. Would there be any objection, from the Comptroller General's standpoint, to putting it in here? Do you think we will need it?

Mr. YATES. I don't think you do, Mr. Chairman.

Mr. WARREN. I don't think you need it, although we are not opposing that.

The CHAIRMAN. Why, if they need it, would this Commission not need it, or do they need it themselves?

Mr. WARREN. Well, they probably do, dealing with world affairs as they do and highly confidential matters between nations. Probably they do need it.

The CHAIRMAN. Of course, there would be some highly confidential operations in this Commission, I presume.

Mr. YATES. I thought your question was whether the authorization is needed or not.

The CHAIRMAN. Well, since it is written into the Revised Statutes applying to the State Department, I questioned whether, unless we wrote it into this bill, the Appropriations Committee could make that kind of appropriation. Frankly, I don't know. The very fact that it appears in the Revised Statutes of the State Department, which apparently thought it was necessary, leads me to believe that maybe it should be in here.

Mr. WARREN. You have reference to a point of order?

The CHAIRMAN. Yes.

Mr. WARREN. I don't think it is subject to a point of order.

Senator VANDENBERG. I see no objection to putting it in the statute, do you, Mr. Warren?

Mr. WARREN. No; I do not, Senator.

Senator VANDENBERG. Well, let's put it in.

The CHAIRMAN. Are there any other questions, gentlemen?

Senator AUSTIN. I would like to ask General Groves to read that first amendment and see if he has any suggestion regarding it.

I will read it, if you wish to have me:

The Commission may make such arrangements without regard to the provisions of section 3709, Revised Statutes, upon certification by the Commission that such action is necessary in the interest of common defense and security, or upon a showing that advertising is not reasonably practicable, and may make partial and advance payments under such arrangements, and may make available for use in connection therewith such of its equipment and facilities as it may deem desirable.

Senator MILLIKIN. I don't understand that "equipment and facilities" reference. What is that?

The CHAIRMAN. Well, Senator, the Commission might have some technical equipment; but it might want to ship that out to the University of Iowa to assist them in connection with the performance of their contract, without any compensation, of course.

General GROVES. Of course, without that language being in there, that last clause, I wouldn't hesitate to make the equipment and facilities available in the performance of the contract. I have done it in the past, long before this ever came up.

For example, it was quite customary, if we wanted a design problem solved on antiaircraft searchlights, to say, "Here is the searchlight; now you work out your design on this particular light which belongs to the United States," and it was perfectly legal. At least, it was never questioned by anyone.

Mr. FISHER. I think they could do it without the language. I don't see that the language hurts it any. It is a right they would have under their contract anyway.

The CHAIRMAN. Would there be some thought that they would have to pay some rental for it, or anything like that?

Mr. FISHER. Not necessarily. If you provide it in the contract they take care of it that way, you see.

Senator BYRD. What is the language "upon a showing that advertising is not reasonably practicable"? Does that mean it is subject to the approval of the General Accounting Office?

Mr. FISHER. A recitation of the facts which would make advertising impracticable.

Senator BYRD. A certification which is final, or is it subject to review by the General Accounting Office?

Mr. FISHER. That particular feature there, the "reasonably practicable," isn't a certification; it would be a recitation of the facts, stating why it is not practicable. It is too easy to say it is just impracticable, without saying why.

The CHAIRMAN. That would put the final decision in the Comptroller General, wouldn't it?

Mr. YATES. It would require, Mr. Chairman, a showing. If a question is raised in the General Accounting Office, it would require a showing of the reasons to the General Accounting Office.

The CHAIRMAN. If you didn't agree with those reasons you could disallow, couldn't you?

Mr. YATES. Certainly.

General GROVES. Not with this language. It says "upon certification by the Commission," or "upon a showing."

The CHAIRMAN. We are talking about the alternative. In other words, let us assume the Commission could not honestly make a certification that it was in the interest of common defense and security, although I cannot imagine any contract that they would have that they couldn't certify under that provision.

Senator VANDENBERG. Why not take out the three words "upon a showing" so that it reads:

upon certification by the Commission that such action is necessary in the interest of common defense and security, or that advertising is not reasonably practicable.

Senator BYRD. I think they ought to give their reasons, though.

Senator VANDENBERG. That would be a certification. A certification is stronger than just a showing.

Senator BYRD. Does a certification show the reasons why the action is necessary?

Mr. YATES. In a doubtful case, a showing might be more effective than a certification, Senator Vandenberg. It is one thing to certify to something and another thing to state your reasons in the record for reaching that conclusion.

Senator VANDENBERG. I retire in complete humiliation.

General GROVES. From an operating standpoint, who is going to make the decision then? That wouldn't mean that the Comptroller General would pass on that showing, would it?

Mr. YATES. Yes; it would, General Groves. Of course, the certification would be accepted, except in a very unusual case which was highly doubtful, and therein would come the effectiveness of the showing.

Senator BYRD. In other words, they can make a certification for all action in the interest of common defense and security; and upon other things that they cannot make such a certification, they have to make a showing.

Senator VANDENBERG. And a showing, you say, is more useful than a certification?

The CHAIRMAN. To the Comptroller General.

Mr. YATES. I think it is more effective in a doubtful case, Senator.

Senator VANDENBERG. Maybe we ought to have a showing in both cases, then.

Mr. FISHER. They practically would have to disclose to us what the point in issue was in national security, otherwise.

Senator BYRD. That covers the national security end of it entirely.

General GROVES. That is all right as far as I can see, because if it isn't covered by the common defense and security, if we think back of what has been covered on the defense and think of the court decisions of various kinds, I think almost everything is covered by that, really.

Senator BYRD. That would probably cover 95 percent, anyway, wouldn't it?

General GROVES. That is correct.

The CHAIRMAN. There isn't anything you cannot bring in under common defense and security. Don't you agree?

General GROVES. That is correct; and the courts have held that repeatedly.

Senator BYRD. I would like General Groves to express his judgment on these other suggested amendments. The next one is to amend section 4 (c) (2), line 6, page 10, by striking out the words "with or without modification."

General GROVES. It doesn't make any difference to me. I don't understand why they want to strike it out, but I don't see any objection to it.

Mr. FISHER. That is unnecessary language, if you are going to make what would be termed a "legal modification." If you are just going to increase the contract price and pay the man a lot more money for doing the same thing, that would be what we would call a contract without consideration, and we are not recommending that you permit it in the other sections and see no point in having it here. They can amend any contract that they have if they get presumptive value out of it without being permitted in the bill.

General GROVES. This would permit them to modify it and give a man \$2 for what he contracted to do for \$1?

Mr. FISHER. That is right.

The CHAIRMAN. Now, have you used that provision, General, in the operation of the project? Have you found it necessary to amend your contracts sometimes?

General GROVES. Oh, yes; we have amended a lot of contracts, but I cannot recall any contract that was amended to give a man \$2 for something he had agreed to do for \$1.

The CHAIRMAN. How about \$2 for something he agreed to do for \$1.80?

General GROVES. Well, the same thing. In other words, any increase in price would have to be justified in some way or other.

Now, when you are dealing with anything like this, you always have those very difficult problems that in civilian life you would meet by just saying, "Well, we put this man into an impossible hole, and we have got to take him out."

We cannot do that in the Government service, and that is all there is to it. It is one of the unfortunate things, to do business that way, but we haven't the right to give away the Government's money, and for that reason I see no reason why this isn't all right.

The CHAIRMAN. Under the War Department appropriation bill as it has been carried on, they made considerable use of that, I understand, increasing the model contract.

General GROVES. I am not familiar with that.

Mr. FISHER. They did quite a lot under the First War Powers Act, probably 95 percent of which they don't have to rely on the First War Powers Act for, or maybe 99 percent.

Mr. WARREN. After all, equitable jurisdiction remains where it ought to remain, in the Congress, does it not?

General GROVES. That is correct, and it has got to remain there.

We had very unfortunate cases, things where if we were in a civilian organization we would just go out and pay the money; but you cannot pay it. You have that when you have a personal injury suit, where a man is crippled for life, and there is nothing you can do about it. It is a very unfortunate thing, because if you were in private business you would say, "We will pay this man; we will make him a gift." But as Government officers, we cannot make him that gift, much as we feel it is the thing to do, which should be done. I am perfectly anxious to have it introduced in Congress as a bill for relief, but I think that would apply.

The CHAIRMAN. Are there any further questions?

Senator BYRD. The amendment in line 10, page 11, I suppose, is in line with this other amendment on page 8.

General GROVES. As I understand it, it is the same as the one on page 8. It does the same thing.

Mr. FISHER. That is right.

Senator BYRD. What change does the amendment on line 14, page 14, effect?

The CHAIRMAN. To certify that it is necessary in the interest of national defense.

Mr. FISHER. In the bill they have it that they can make purchases without regard to the provisions of law relating to the making, performance, amendment, or modification of contracts.

That is the same provision that is in these other paragraphs that we are suggesting be amended all to read the same way.

General GROVES. You refer to it so much. Have you got section 3709 of the Revised Statutes?

Mr. FISHER. That is the statute that requires advertising for competitive bids.

General GROVES. Then what is the difference?

Mr. FISHER. You just don't have to get competitive bids. You can make any contract. But "without regard to the provisions of law relating to the making, performance, amendment, or modification of contracts," would come back to the same authority of giving the man \$2 instead of \$1 after you have made a contract.

Senator BYRD. Your suggested amendment there provides mainly that it has to be certified that it is in the interest of common defense and security?

Mr. FISHER. That is right, just like the one on page 8 for the showing that they couldn't advertise for competitive bids.

Senator BYRD. The next is along the same lines, page 16, line 13?

Mr. FISHER. That is the same situation.

Senator BYRD. And the next one on line 6, page 38?

Mr. FISHER. The purpose of that amendment is merely to restrict the housing, health, safety, welfare, and recreation of personnel to the project sites.

The CHAIRMAN. You couldn't build any places in Washington here for this personnel?

Mr. FISHER. That is right.

The CHAIRMAN. That is sensible.

General GROVES. That is the only thing? You have made that apply at the project site?

Mr. FISHER. That is right.

General GROVES. Now, what is your definition of a "project site"?

Mr. FISHER. These isolated places.

General GROVES. Let us just assume that we had work carried on, say, at Columbia University. How would that affect us? Would that be a project site?

Mr. FISHER. I don't think it would.

Senator BYRD. I think it ought to be a project site in terms of this amendment. They certainly shouldn't put up recreation facilities at Columbia, because they have a contract to do this work. That shouldn't open the door to have a lot of recreation facilities.

Mr. FISHER. I didn't write the law, but I imagine it was to construct these facilities at out-of-the-way places.

Senator BYRD. This money is going to be distributed all over the United States. I think there ought to be some limitation as to what they can do for recreation purposes. I certainly, for one, don't think it ought to apply to any university that has a grant. That grant should be used for research and not for recreation purposes.

Senator HICKENLOOPER. Should the limitation, Mr. Chairman, be put in there to the effect that these facilities for health, housing, welfare, and recreation, should be limited to project sites where such facilities are not generally available for use or something of that kind?

The CHAIRMAN. It is just the recreation of personnel that you would want to restrict. The housing, health, safety, and welfare might be as necessary there as at Oak Ridge.

Senator Byrd's point is that they have a movie house at One Hundred and Sixteenth Street, and you wouldn't have to build one at Columbia University; so the limitation, I take it, would come only on the recreation of personnel. Isn't that right, General Groves?

General GROVES. That is what I assumed. I just asked the question as to what the project site was.

Mr. FISHER. You wouldn't want to build houses for employees here in Washington and give them to them either, or on the university campus. I don't think you would want to build houses for employees.

General GROVES. It doesn't make any difference where your employee is. If you have this question of safety come in, you have got to provide the safety.

The CHAIRMAN. Take the Argonne Laboratories in Chicago. They are near civilization, aren't they?

General GROVES. About 20 miles out, but there, for example, we have to provide housing because you have a man who has to be available all the time.

Suppose we were running a continuous experiment of some kind where we wanted the man to be present. Then you have to provide the housing. Now, our housing provided at the Argonne was a bunk-room with a lot of bunks in it, but it was still properly considered as housing.

The CHAIRMAN. Do you have any recreation there?

General GROVES. I don't think we did. Nothing in the sense that you would think of it.

The CHAIRMAN. Cafeteria?

General GROVES. We had a lunchroom that was far from anything that would be put up here, but you have to spend some money for it. However economically you do it, you are still spending money.

The CHAIRMAN. We are not talking about the economy of it, but the necessity for it. I think you are right that if you are going to have a place like that, you have to have the power to do those things. That is the difficulty, Senator; take it only 20 miles out of Chicago, and all those things might be necessary.

General GROVES. I would hate to see that limit you.

The CHAIRMAN. I don't think, General, the Commission would be likely to be setting up any moving-picture theaters in Washington. Do you, Senator Vandenberg?

Senator VANDENBERG. I don't.

General GROVES. I think it would be perfectly safe, Senator Byrd, to have that "project sites" either removed, or have it understood that it meant anywhere where there was work going on, and then it wouldn't make any difference.

The CHAIRMAN. Have you a suggestion, Senator Byrd, for amending it?

Senator BYRD. No, I haven't. I don't exactly understand what the project sites means.

Senator VANDENBERG. Everything.

Senator BYRD. It wouldn't mean offices here in Washington. It would mean any place where any work was going on.

General GROVES. That is what it would mean to me.

Mr. FISHER. My thought was like the project at Oak Ridge.

Senator BYRD. You mean isolated places, and all that. It wouldn't mean that necessarily; it would mean any place where work was going on. It might be in the middle of New York City, mightn't it?

Mr. FISHER. If it were interpreted that way.

Senator BYRD. Why wouldn't it? The project site is where you are working on a project.

General GROVES. That is my understanding of it.

Senator BYRD. I don't think that language is good language. Have you any further suggestions?

Mr. FISHER. No, sir.

Senator CONNALLY. That is a pretty broad authorization.

Senator BYRD. You say there "where the recreation is not available." You have housing, safety, health, welfare—I don't know what "welfare" means—most anything—and recreation of personnel at the project site, which may be any place. You might have one here in Washington, might you not?

General GROVES. Yes, sir. We have work going on at various places in Washington, and you can call those project sites perfectly properly. That is why the word bothered me.

Senator BYRD. I am not objecting to having the proper recreation and welfare, but one single agency should not be permitted to have its own operation unless they are out in Oak Ridge, where they are separated from everything else.

If you build a new town as you did at Oak Ridge, where you have no facilities at all, then you have to furnish those facilities. If we let every individual agency of the Government have it separately, it is going to be a pretty far-reaching thing.

I would like to ask General Accounting Office to reconsider that and see if they cannot get some better language. I believe there should be some limitation with regard to it.

Senator AUSTIN. Why not put a qualification on it—"project sites at which such facilities are not available"?

Mr. WARREN. The committee's report could well cover that. We always look at committee reports in construing legislative language.

Senator CONNALLY. But it is better to have it in the law, rather than go back.

Mr. WARREN. I agree with you, Senator.

Senator BYRD. What do you think of the language suggested by Senator Austin?

Mr. YATES. I think it would be helpful.

The CHAIRMAN. Where would you put it?

Senator AUSTIN. Right after "sites," modifying "sites," "where such facilities are not available."

Senator VANDENBERG. "Where such facilities or services are not available."

Senator AUSTIN. Are there services in there?

General GROVES. "Welfare."

Senator AUSTIN. I think this was limited to buildings. Let's read it.

(5) acquire such materials, property, equipment, and facilities, establish or construct such buildings and facilities, and modify such buildings and facilities from time to time as it may deem necessary; and construct, acquire, provide, or arrange for such facilities and services at project sites where such facilities and services are not available * * *.

Senator HART. Senator, do we need those words "and services"?

General GROVES. If you have an office that has as many as 100 female employees, you normally have to have a welfare worker among those employees. I think that is the standard in Washington.

Senator BYRD. Doesn't the general law cover that?

General GROVES. I should think so.

Senator BYRD. The point I am making is that this is a particular law applying to a certain agency of the Government. Doesn't the general law provide for welfare workers?

Mr. FISHER. I don't know that they call it welfare workers as such.

Senator BYRD. I mean a welfare officer, or whatever you call it.

Mr. YATES. I don't know of any specific provision for it, Senator Byrd, in any general law.

Senator BYRD. They have nurses.

The CHAIRMAN. Does that satisfy you, Senator Byrd, with that addition?

Senator BYRD. I believe so.

The CHAIRMAN. Are there any further questions?

Senator CONNALLY. That is separated by a semicolon. Are you sure that goes back to the acquisition of facilities and things in the first part of that paragraph? I am not sure that that is true.

Senator AUSTIN. Well, the verb "acquire"—

Senator CONNALLY. You put in the words "are not available." Will that be translated back up into the first three lines of that paragraph? It is set off by a semicolon.

Senator AUSTIN. But it goes back to the word "such"—"construct such buildings, acquire, provide, or arrange for such facilities and services."

Senator CONNALLY. That doesn't necessarily mean the "such" in the first three lines but means "such as are not available."

Senator AUSTIN. "Such facilities" refers there to the ones mentioned in the phrase set off by the semicolon. There isn't any other place to go with that "such."

Senator CONNALLY. Why a semicolon, then?

Mr. YATES. I suggest, Senator Austin, we cut out the semicolon, and then there will be no question.

Senator CONNALLY. Well, I won my point.

We had a supreme court in our State that got to be called the "semicolon court," because it decided some fool case as to where the semicolon was.

Senator VANDENBERG. I don't see any analogy.

Senator CONNALLY. Well, we decided this paragraph on a semicolon.

The CHAIRMAN. Now, you have taken out 12 (a) (10) on pages 39 and 40. That is the language which the Comptroller objected to.

Have you any further questions, Senator Byrd?

Senator AUSTIN. There is quite a change in the next paragraph, (b), security.

The CHAIRMAN. You mean the President may exempt?

Senator AUSTIN. Yes.

The CHAIRMAN. May in advance exempt.

Senator AUSTIN. That really changes the meaning of the paragraph. I have no objection to it myself, but it is quite a change.

The CHAIRMAN. In other words, they have to go to him now and show why they need an exemption before they may make the expenditure.

Senator AUSTIN. Yes; and there must be specific matter submitted and it is narrowed again by the words "in a particular matter," so that each one of those efforts has to be taken up in advance.

The CHAIRMAN. That is right.

Senator AUSTIN. Separately and individually?

Senator VANDENBERG. Don't you want consistent language—"in the interest of common defense and security?"

Senator AUSTIN. I always want that.

Senator VANDENBERG. "Common defense and security" should be in there, and strike out "national."

The CHAIRMAN. Are there any further questions of the Comptroller General or General Groves?

General GROVES. I would like to ask a question. If you eliminate 12 (a) (10), does anything take its place at all?

Senator AUSTIN. Yes. The first paragraph in the suggested amendment really takes its place.

Senator BYRD. You mean the amendment to the security clause?

Senator AUSTIN. The first paragraph:

The Commission may make such arrangements without regard to the provisions of section 3709 * * *.

No; that doesn't substitute.

Senator BYRD. That simply goes back to the general law.

Mr. FISHER. That is right.

Senator HART. May I ask the Comptroller General why his amendment omits these words after "contracts." The original language includes "purchases, sales, audits, reports, and similar matters."

The CHAIRMAN. Where are you reading from, Senator Hart?

Senator HART. Line 17, page 40.

Mr. WARREN. That came as a suggestion from several members of the committee, as I understood it. That should be reformed so that the President should act in advance. In the original draft of it, we objected to the word "audits."

Mr. FISHER. Then you have "contracts, purchases, and sales" there. Purchases and sales are contracts anyway; that is a sort of repetition there.

Senator CONNALLY. You mean you objected to exempting it from an audit; is that what you mean?

Mr. WARREN. Yes, and members of the committee—that is, Senator Hickenlooper and Senator Byrd, as I recall—suggested that that whole section there be re-formed so that the President should act in advance in a given case.

Senator BYRD. Then it specifies the particular case. Your suggestion would required the President to deal with a specific case rather than in generalities.

The CHAIRMAN. And also takes away from him the power to exempt the Commission from standard audit and reporting. Purchases and sales are certainly included within contracts. Do you want to make any comment on that, Senator?

Senator HART. No; I wasn't here when it was discussed.

The CHAIRMAN. Are there any further questions?

Senator BYRD. I would like to ask General Groves if he doesn't approve the deletion here of subsection 10.

General GROVES. I have just asked one question here on the side, and I see no reason why it shouldn't be deleted. I would like to state that I haven't seen this committee print before, so I assume that these things don't tie in in any way that is strange to me. I have only testified on what has been shown me this morning.

The CHAIRMAN. All right, gentlemen. I think we are through with this.

Senator HICKENLOOPER. I would like the committee to know Dr. F. H. Spedding, of Iowa State College. He did a tremendously vital part of this whole project. He happened to be in Washington, and I asked him to come down and see the committee work. He isn't here to testify; he says he has nothing to add to what the committee has done so far. The whole story of his activities is quite interesting.

The CHAIRMAN. The committee will now go into executive session. (Whereupon, at 11:25 a. m., the committee retired into executive session.)

ATOMIC ENERGY

TUESDAY, JUNE 11, 1946

HOUSE OF REPRESENTATIVES,
COMMITTEE ON MILITARY AFFAIRS,
Washington, D. C.

The committee met at 10 a. m., Hon. Andrew J. May (chairman) presiding.

The CHAIRMAN. The committee will please be in order. The committee has met for the purpose of getting some advice from Secretary Patterson, as well as recommendations, on the question involved in S. 1717, commonly known as the atomic energy bill, it being an act for the development and control of atomic energy.

For the purpose of the record we will insert S. 1717 at this point. (S. 1717 is as follows:)

[S. 1717, 79th Cong., 2d sess.]

AN ACT For the development and control of atomic energy

Be it enacted by the Senate and House of Representatives of the United State of America in Congress assembled,

DECLARATION OF POLICY

SECTION 1. (a) FINDINGS AND DECLARATION.—Research and experimentation in the field of nuclear chain reaction have attained the stage at which the release of atomic energy on a large scale is practical. The significance of the atomic bomb for military purposes is evident. The effect of the use of atomic energy for civilian purposes upon the social, economic, and political structures of today cannot now be determined. It is a field in which unknown factors are involved. Therefore, any legislation will necessarily be subject to revision from time to time. It is reasonable to anticipate, however, that tapping this new source of energy will cause profound changes in our present way of life. Accordingly, it is hereby declared to be the policy of the people of the United States that, subject at all times to the paramount objective of assuring the common defense and security, the development and utilization of atomic energy shall, so far as practicable, be directed toward improving the public welfare, increasing the standard of living, strengthening free competition in private enterprise, and promoting world peace.

(b) PURPOSE OF ACT.—It is the purpose of this Act to effectuate the policies set out in section 1 (a) by providing, among others, for the following major programs relating to atomic energy:

- (1) A program of assisting and fostering private research and development to encourage maximum scientific progress;
- (2) A program for the control of scientific and technical information which will permit the dissemination of such information to encourage scientific progress, and for the sharing on a reciprocal basis of information concerning the practical industrial application of atomic energy as soon as effective and enforceable safeguards against its use for destructive purposes can be devised;
- (3) A program of federally conducted research and development to assure the Government of adequate scientific and technical accomplishment;
- (4) A program for Government control of the production, ownership, and use of fissionable material to assure the common defense and security and to insure the broadest possible exploitation of the field; and

(5) A program of administration which will be consistent with the foregoing policies and with international arrangements made by the United States, and which will enable the Congress to be currently informed so as to take further legislative action as may hereafter be appropriate.

ORGANIZATION

SEC. 2. (a) ATOMIC ENERGY COMMISSION.—

(1) There is hereby established an Atomic Energy Commission (herein called the Commission), which shall be composed of five members. Three members shall constitute a quorum of the Commission. The President shall designate one member as Chairman of the Commission.

(2) Members of the Commission shall be appointed by the President, by and with the advice and consent of the Senate. In submitting any nomination to the Senate, the President shall set for the experience and the qualifications of the nominee. The term of office of each member of the Commission taking office prior to the expiration of two years after the date of enactment of this Act shall expire upon the expiration of such two years. The term of office of each member of the Commission taking office after the expiration of two years from the date of enactment of this Act shall be five years, except that (A) the terms of office of the members first taking office after the expiration of two years from the date of enactment of this Act shall expire, as designated by the President at the time of appointment, one at the end of three years, one at the end of four years, one at the end of five years, one at the end of six years, and one at the end of seven years, after the date of enactment of this Act; and (B) any member appointed to fill a vacancy occurring prior to the expiration of the term for which his predecessor was appointed, shall be appointed for the remainder of such term. Any member of the Commission may be removed by the President for inefficiency, neglect of duty, or malfeasance in office. Each member, except the Chairman, shall receive compensation at the rate of \$15,000 per annum; and the Chairman shall receive compensation at the rate of \$17,500 per annum. No member of the Commission shall engage in any other business, vocation, or employment than that of serving as a member of the Commission.

(3) The principal office of the Commission shall be in the District of Columbia, but the Commission or any duly authorized representative may exercise any or all of its powers in any place. The Commission shall hold such meetings, conduct such hearings, and receive such reports, as may be necessary to enable it to carry out the provisions of this Act.

(4) There are hereby established within the Commission—

(A) a General Manager, who shall discharge such of the administrative and executive functions of the Commission as the Commission may direct. The General Manager shall be appointed by the President by and with the advice and consent of the Senate, and shall receive compensation at the rate of \$15,000 per annum. The Commission may make recommendations to the President with respect to the appointment or removal of the General Manager.

(B) a Division of Research, a Division of Production, a Division of Engineering, and a Division of Military Application. Each division shall be under the direction of a Director who shall be appointed by the Commission, and shall receive compensation at the rate of \$14,000 per annum. The Commission shall require each such division to exercise such of the Commission's powers under this Act as the Commission may determine, except that the authority granted under section 3 (a) of this Act shall not be exercised by the Division of Research.

(b) GENERAL ADVISORY COMMITTEE.—There shall be a General Advisory Committee to advise the Commission on scientific and technical matters relating to materials, production, and research and development, to be composed of nine members, who shall be appointed from civilian life by the President. Each member shall hold office for a term of six years, except that (1) any member appointed to fill a vacancy occurring prior to the expiration of the term for which his predecessor was appointed, shall be appointed for the remainder of such term; and (2) the terms of office of the members first taking office after the date of the enactment of this Act shall expire, as designated by the President at the time of appointment, three at the end of two years, three at the end of four years, and three at the end of six years, after the date of the enactment of this Act. The Committee shall designate one of its own members as Chairman. The Commit-

tee shall meet at least four times in every calendar year. The members of the Committee shall receive a per diem compensation of \$50 for each day spent in meetings or conferences, and all members shall receive their necessary traveling or other expenses while engaged in the work of the Committee.

(c) **MILITARY LIAISON COMMITTEE.**—There shall be a Military Liaison Committee consisting of representatives of the Departments of War and Navy, detailed or assigned thereto, without additional compensation, by the Secretaries of War and Navy in such number as they may determine. The Commission shall advise and consult with the Committee on all atomic energy matters which the Committee deems to relate to military applications, including the development, manufacture, use, and storage of bombs, the allocation of fissionable material for military research, and the control of information relating to the manufacture or utilization of atomic weapons. The Commission shall keep the Committee fully informed of all such matters before it and the Committee shall keep the Commission fully informed of all atomic energy activities of the War and Navy Departments. The Committee shall have authority to make written recommendations to the Commission on matters relating to military applications from time to time as it may deem appropriate. If the Committee at any time concludes that any action, proposed action, or failure to act of the Commission on such matters is adverse to the responsibilities of the Departments of War or Navy, derived from the Constitution, laws, and treaties, the Committee may refer such action, proposed action, or failure to act to the Secretaries of War and Navy.

If either Secretary concurs, he may refer the matter to the President, whose decision shall be final.

RESEARCH

SEC. 3. (a) RESEARCH ASSISTANCE.—The Commission is directed to exercise its powers in such manner as to insure the continued conduct of research and development activities in the fields specified below by private or public institutions or persons and to assist in the acquisition of an ever-expanding fund of theoretical and practical knowledge in such fields. To this end the Commission is authorized and directed to make arrangements (including contracts, agreements, grants-in-aid, and loans) for the conduct of research and development activities relating to—

- (1) nuclear processes;
- (2) the theory and production of atomic energy, including processes, materials, and devices related to such production;
- (3) utilization of fissionable and radioactive materials for medical, biological, health, or military purposes;
- (4) utilization of fissionable and radioactive materials and processes entailed in the production of such materials for all other purposes, including industrial uses; and
- (5) the protection of health during research and production activities.

The Commission may make such arrangements without regard to the provisions of section 3709 of the Revised Statutes (U. S. C., title 41, sec. 5) upon certification by the Commission that such action is necessary in the interest of the common defense and security, or upon a showing that advertising is not reasonably practicable, and may make partial and advance payments under such arrangements, and may make available for use in connection therewith such of its equipment and facilities as it may deem desirable. Such arrangements shall contain such provisions to protect health, to minimize danger from explosion and other hazards to life or property, and to require the reporting and to permit the inspection of work performed thereunder, as the Commission may determine; but shall not contain any provisions or conditions which prevent the dissemination of scientific or technical information, except to the extent such dissemination is prohibited by law.

(b) **RESEARCH BY THE COMMISSION.**—The Commission is authorized and directed to conduct, through its own facilities, activities and studies of the types specified in subsection (a) above.

PRODUCTION OF FISSIONABLE MATERIAL

SEC. 4. (a) DEFINITION.—As used in this Act, the term "produce", when used in relation to fissionable material, means to manufacture, produce, or refine fissionable material, as distinguished from source materials as defined in section 5 (b) (1), or to separate fissionable material from other substances in which such material may be contained or to produce new fissionable material.

(b) PROHIBITION.—It shall be unlawful for any person to own any facilities for the production of fissionable material or for any person to produce fissionable material, except to the extent authorized by subsection (c).

(c) OWNERSHIP AND OPERATION OF PRODUCTION FACILITIES.—

(1) OWNERSHIP OF PRODUCTION FACILITIES.—The Commission shall be the exclusive owner of all facilities for the production of fissionable material other than facilities which (A) are useful in the conduct of research and development activities in the fields specified in section 3, and (B) do not, in the opinion of the Commission, have a potential production rate adequate to enable the operator of such facilities to produce within a reasonable period of time a sufficient quantity of fissionable material to produce an atomic bomb or any other atomic weapon.

(2) OPERATION OF THE COMMISSION'S PRODUCTION FACILITIES.—The Commission is authorized and directed to produce or to provide for the production of fissionable material in its own facilities. To the extent deemed necessary, the Commission is authorized to make, or to continue in effect, contracts with persons obligating them to produce fissionable material in facilities owned by the Commission. The Commission is also authorized to enter into research and development contracts authorizing the contractor to produce fissionable material in facilities owned by the Commission to the extent that the production of such fissionable material may be incident to the conduct of research and development activities under such contracts. Any contract entered into under this section shall contain provisions (A) prohibiting the contractor with the Commission from subcontracting any part of the work he is obligated to perform under the contract, and (B) obligating the contractor to make such reports to the Commission as it may deem appropriate with respect to his activities under the contract, to submit to frequent inspection by employees of the Commission of all such activities, and to comply with all safety and security regulations which may be prescribed by the Commission. Any contract made under the provisions of this paragraph may be made without regard to the provisions of section 3709 of the Revised Statutes (U. S. C., title 41, sec. 5) upon certification by the Commission that such action is necessary in the interest of the common defense and security, or upon a showing that advertising is not reasonably practicable, and partial and advance payments may be made under such contracts. The President shall determine at least once each year the quantities of fissionable material to be produced under this paragraph.

(3) OPERATION OF OTHER PRODUCTION FACILITIES.—Fissionable material may be produced in the conduct of research and development activities in facilities which, under paragraph (1) above, are not required to be owned by the Commission.

(d) IRRADIATION OF MATERIALS.—For the purpose of increasing the supply of radioactive materials, the Commission is authorized to expose materials of any kind to the radiation incident to the processes of producing or utilizing fissionable material.

(e) MANUFACTURE OF PRODUCTION FACILITIES.—Unless authorized by a license issued by the Commission, no person may manufacture, produce, transfer, or acquire any facilities for the production of fissionable material. Licenses shall be issued in accordance with such procedures as the Commission may by regulation establish and shall be issued in accordance with such standards and upon such conditions as will restrict the production and distribution of such facilities to effectuate the policies and purposes of this Act. Nothing in this section shall be deemed to require a license for such manufacture, production, transfer, or acquisition incident to or for the conduct of research or development activities in the United States of the types specified in section 3, or to prohibit the Commission from manufacturing or producing such facilities for its own use.

CONTROL OF MATERIALS

SEC. 5. (a) FISSIONABLE MATERIALS.—

(1) DEFINITION.—As used in this Act, the term "fissionable material" means plutonium, uranium enriched in the isotope 235, any other material which the Commission determines to be capable of releasing substantial quantities of energy through nuclear chain reaction of the material, or any material, artificially enriched by any of the foregoing; but does not include source materials, as defined in section 5 (b) (1).

(2) **GOVERNMENT OWNERSHIP OF ALL FISSIONABLE MATERIALS.**—All right, title, and interest within or under the jurisdiction of the United States, in or to any fissionable material, now or hereafter produced, shall be the property of the Commission, and shall be deemed to be vested in the Commission by virtue of this Act. Any person owning any interest in any fissionable material at the time of the enactment of this Act, or owning any interest in any material at the time when such material is hereafter determined to be fissionable material, or who lawfully produces any fissionable material incident to privately financed research or development activities, shall be paid just compensation therefor. The Commission may, by action consistent with the provisions of paragraph (4) below, authorize any such person to retain possession of such fissionable material, but no person shall have any title in or to any fissionable material.

(3) **PROHIBITION.**—It shall be unlawful for any person, after sixty days from the effective date of this Act to (A) possess or transfer any fissionable material, except as authorized by the Commission, or (B) export from or import into the United States any fissionable material, or (C) directly or indirectly engage in the production of any fissionable material outside of the United States.

(4) **DISTRIBUTION OF FISSIONABLE MATERIAL.**—Without prejudice to its continued ownership thereof, the Commission is authorized to distribute fissionable material, with or without charge, to applicants requesting such material (A) for the conduct of research or development activities either independently or under contract or other arrangement with the Commission, (B) for use in medical therapy, or (C) for use pursuant to a license issued under the authority of section 7. Such material shall be distributed in such quantities and on such terms that no applicant will be enabled to obtain an amount sufficient to construct a bomb or other military weapon. The Commission is directed to distribute sufficient fissionable material to permit the conduct of widespread independent research and development activity, to the maximum extent practicable. In determining the quantities of fissionable material to be distributed, the Commission shall make such provisions for its own needs and for the conservation of fissionable material as it may determine to be necessary in the national interest for the future development of atomic energy. The Commission shall not distribute any material to any applicant, and shall recall any distributed material from any applicant, who is not equipped to observe or who fails to observe such safety standards to protect health and to minimize danger from explosion or other hazard to life or property as may be established by the Commission, or who uses such material in violation of law or regulation of the Commission or in a manner other than as disclosed in the application therefor.

(5) The Commission is authorized to purchase or otherwise acquire any fissionable material or any interest therein outside the United States, or any interest in facilities for the production of fissionable material, or in real property on which such facilities are located, without regard to the provisions of section 3709 of the Revised Statutes (U. S. C., title 41, sec. 5) upon certification by the Commission that such action is necessary in the interest of the common defense and security, or upon a showing that advertising is not reasonably practicable, and partial and advance payments may be made under contracts for such purposes. The Commission is further authorized to take, requisition, or condemn, or otherwise acquire any interest in such facilities or real property, and just compensation shall be made therefor.

(b) **SOURCE MATERIALS.**—

(1) **DEFINITION.**—As used in this Act, the term "source material" means uranium, thorium, or any other material which is determined by the Commission, with the approval of the President, to be peculiarly essential to the production of fissionable materials; but includes ores only if they contain one or more of the foregoing materials in such concentration as the Commission may by regulation determine from time to time.

(2) **LICENSE FOR TRANSFERS REQUIRED.**—Unless authorized by a license issued by the Commission, no person may transfer or deliver and no person may receive possession of or title to any source material after removal from its place of deposit in nature, except that licenses shall not be required for quantities of source materials which, in the opinion of the Commission, are unimportant.

(3) **ISSUANCE OF LICENSES.**—The Commission shall establish such standards for the issuance, refusal, or revocation of licenses as it may deem necessary to assure adequate source materials for production, research, or development activities pursuant to this Act or to prevent the use of such materials in a manner incon-

sistent with the national welfare. Licenses shall be issued in accordance with such procedures as the Commission may by regulation establish.

(4) **REPORTING.**—The Commission is authorized to issue such regulations or orders requiring reports of ownership, possession, extraction, refining, shipment, or other handling of source materials as it may deem necessary, except that such reports shall not be required with respect to (A) any source material prior to removal from its place of deposit in nature, or (B) quantities of source materials which in the opinion of the Commission are unimportant or the reporting of which will discourage independent prospecting for new deposits.

(5) **ACQUISITION.**—The Commission is authorized and directed to purchase, take, requisition, condemn, or otherwise acquire, supplies of source materials or any interest in real property containing deposits of source materials to the extent it deems necessary to effectuate the provisions of this Act. Any purchase made under this paragraph may be made without regard to the provisions of section 3709 of the Revised Statutes (U. S. C., title 41, sec. 5) upon certification by the Commission that such action is necessary in the interest of the common defense and security or upon a showing that advertising is not reasonably practicable, and partial and advance payments may be made thereunder. The Commission may establish guaranteed prices for all source materials delivered to it within a specified time. Just compensation shall be made for any property taken, requisitioned, or condemned under this paragraph.

(6) **EXPLORATION.**—The Commission is authorized to conduct and enter into contracts for the conduct of exploratory operations, investigations, and inspections to determine the location, extent, mode of occurrence, use, or conditions of deposits or supplies of source materials, making just compensation for any damage or injury occasioned thereby. Such exploratory operations may be conducted only with the consent of the owner, but such investigations and inspections may be conducted with or without such consent.

(7) **PUBLIC LANDS.**—All uranium, thorium, and all other materials determined pursuant to paragraph (1) of this subsection to be peculiarly essential to the production of fissionable material, contained, in whatever concentration, in deposits in the public lands are hereby reserved for the use of the United States; except that with respect to any location, entry, or settlement made prior to the date of enactment of this Act no reservation shall be deemed to have been made, if such reservation would deprive any person of any existing or inchoate rights or privileges to which he would otherwise be entitled or would otherwise enjoy: *Provided, however,* That no person, corporation, partnership, or association, which had any part, directly or indirectly, in the development of the atomic bomb project, may benefit by any location, entry, or settlement upon the public domain made after such person, corporation, partnership, or association took part in such project. The Secretary of the Interior shall cause to be inserted in every patent, conveyance, lease, permit, or other authorization hereafter granted to use the public lands or their mineral resources, under any of which there might result the extraction of any materials so reserved, a reservation to the United States of all such materials, whether or not of commercial value, together with the right of the United States through its authorized agents or representatives at any time to enter upon the land and prospect for, mine, and remove the same, making just compensation for any damage or injury occasioned thereby. Any lands so patented, conveyed, leased, or otherwise disposed of may be used, and any rights under any such permit or authorization may be exercised, as if no reservation of such materials had been made under this subsection; except that, when such use results in the extraction of any such material from the land in quantities which may not be transferred or delivered without a license under this subsection, such material shall be the property of the Commission and the Commission may require delivery of such material to it by any possessor thereof after such material has been separated as such from the ores in which it was contained. If the Commission requires the delivery of such material to it, it shall pay to the person mining or extracting the same, or to such other person as the Commission determines to be entitled thereto, such sums, including profits, as the Commission deems fair and reasonable for the discovery, mining, development, production, extraction, and other services performed with respect to such material prior to such delivery, but such payment shall not include any amount on account of the value of such material before removal from its place of deposit in nature. If the Commission does not require delivery of such material to it, the reservation made pursuant to this paragraph shall be of no further force or effect.

(c) BYPRODUCT MATERIALS.—

(1) **DEFINITION.**—As used in this Act, the term "byproduct material" means any radioactive material (except fissionable material) yielded in or made radioactive by exposure to the radiation incident to the processes of producing or utilizing fissionable material.

(2) **DISTRIBUTION.**—The Commission is authorized to distribute, with or without charge, byproduct materials to applicants seeking such materials for research or development activity, medical therapy, industrial uses, or such other useful applications as may be developed. In distributing such materials, the Commission shall give preference to applicants proposing to use such materials in the conduct of research and development activity or medical therapy. The Commission shall not distribute any byproduct materials to any applicant, and shall recall any distributed materials from any applicant, who is not equipped to observe or who fails to observe such safety standards to protect health as may be established by the Commission or who uses such materials in violation of law or regulation of the Commission or in a manner other than as disclosed in the application therefor. (d) **GENERAL PROVISIONS.**—

(1) The Commission shall not distribute any fissionable or source material to any person for a use which is not under or within the jurisdiction of the United States or to any foreign government.

(2) The Commission shall establish by regulation a procedure by which any person who is dissatisfied with the distribution or refusal to distribute to him, or the recall from him, of any fissionable or byproduct materials or with the issuance, refusal, or revocation of a license to him for the transfer or receipt of source materials may obtain a review of such determination by a board of appeal consisting of three members appointed by the Commission. The Commission may in its discretion review and revise any decision of such board of appeal.

MILITARY APPLICATIONS OF ATOMIC ENERGY

SEC. 6. (a) AUTHORITY.—The Commission is authorized to—

(1) conduct experiments and do research and development work in the military application of atomic energy; and

(2) engage in the production of atomic bombs, atomic bomb parts, or other military weapons utilizing fissionable materials; except that such activities shall be carried on only to the extent that the express consent and direction of the President of the United States has been obtained, which consent and direction shall be obtained at least once each year.

The President from time to time may direct the Commission to deliver such quantities of weapons to the armed forces for such use as he deems necessary in the interest of national defense.

(b) **PROHIBITION.**—It shall be unlawful for any person to manufacture, produce, transfer, or acquire any equipment or device utilizing fissionable material or atomic energy as a military weapon, except as may be authorized by the Commission. Nothing in this subsection shall be deemed to modify the provisions of section 4 of this Act, or to prohibit research activities in respect of military weapons, or to permit the export of any such equipment or device.

UTILIZATION OF ATOMIC ENERGY

SEC. 7. (a) LICENSE REQUIRED.—It shall be unlawful, except as provided in sections 5 (a) (4) (A) or (B) or 6 (a), for any person to manufacture, produce, or export any equipment or device utilizing fissionable material or atomic energy or to utilize fissionable material or atomic energy with or without such equipment or device, except under and in accordance with a license issued by the Commission authorizing such manufacture, production, export, or utilization. No license may permit any such activity if fissionable material is produced incident to such activity, except as provided in sections 3 and 4. Nothing in this section shall be deemed to require a license for the conduct of research or development activities relating to the manufacture of such equipment or devices or the utilization of fissionable material or atomic energy, or for the manufacture or use of equipment or devices for medical therapy.

(b) **REPORT TO CONGRESS.**—Whenever in its opinion any industrial, commercial, or other nonmilitary use of fissionable material or atomic energy has been sufficiently developed to be of practical value, the Commission shall prepare a report to the President stating all the facts with respect to such use, the Commission's estimate of the social, political, economic, and international effects of

such use and the Commission's recommendations for necessary or desirable supplemental legislation. The President shall then transmit this report to the Congress together with his recommendations. No license for any manufacture, production, export, or use shall be issued by the Commission under this section until after (1) a report with respect to such manufacture, production, export, or use has been filed with the Congress; and (2) a period of ninety days in which the Congress was in session has elapsed after the report has been so filed. In computing such period of ninety days, there shall be excluded the days on which either House is not in session because of an adjournment of more than three days.

(c) **ISSUANCE OF LICENSES.**—After such ninety-day period, unless hereafter prohibited by law, the Commission may license such manufacture, production, export, or use in accordance with such procedures and subject to such conditions as it may by regulation establish to effectuate the provisions of this Act. The Commission is authorized and directed to issue licenses on a nonexclusive basis and to supply to the extent available appropriate quantities of fissionable material to licensees (1) whose proposed activities will serve some useful purpose proportionate to the quantities of fissionable material to be consumed; (2) who are equipped to observe such safety standards to protect health and to minimize danger from explosion or other hazard to life or property as the Commission may establish; and (3) who agree to make available to the Commission such technical information and data concerning their activities pursuant to such licenses as the Commission may determine necessary to encourage similar activities by as many licensees as possible. Each such license shall be issued for a specified period, not to exceed one year, shall be revocable at any time by the Commission in accordance with such procedures as the Commission may establish, and may be renewed upon the expiration of such period. Where activities under any license might serve to maintain or to foster the growth of monopoly, restraint of trade, unlawful competition, or other trade position inimical to the entry of new, freely competitive enterprises in the field, the Commission is authorized and directed to refuse to issue such license or to establish such conditions to prevent these results as the Commission, in consultation with the Attorney General, may determine. The Commission shall report promptly to the Attorney General any information it may have with respect to any utilization of fissionable material or atomic energy which appears to have these results. No license may be given to any person for activities which are not under or within the jurisdiction of the United States or to any foreign government.

(d) **BYPRODUCT POWER.**—If energy which may be utilized is produced in the production of fissionable material, such energy may be used by the Commission, transferred to other Government agencies, or sold to public or private utilities under contracts providing for reasonable resale prices.

INTERNATIONAL ARRANGEMENTS

SEC. 8. (a) DEFINITION.—As used in this Act, the term "international arrangement" shall mean any treaty approved by the Senate or international agreement approved by the Congress, during the time such treaty or agreement is in full force and effect.

(b) **EFFECT OF INTERNATIONAL ARRANGEMENTS.**—Any provision of this Act or any action of the Commission to the extent that it conflicts with the provisions of any international arrangement made after the date of enactment of this Act shall be deemed to be of no further force or effect.

(c) **POLICIES CONTAINED IN INTERNATIONAL ARRANGEMENTS.**—In the performance of its functions under this Act, the Commission shall give maximum effect to the policies contained in any such international arrangement.

PROPERTY OF THE COMMISSION

SEC. 9. (a) The President shall direct the transfer to the Commission of all interests owned by the United States or any Government agency in the following property:

(1) All fissionable material; all atomic weapons and parts thereof; all facilities, equipment, and materials for the processing, production, or utilization of fissionable material or atomic energy; all processes and technical information of any kind, and the source thereof (including data, drawings, specifications, patents, patent applications, and other sources) relating to the processing, production, or utilization of fissionable material or atomic energy; and all contracts, agreements, leases, patents, applications for patents, inventions and

discoveries (whether patented or unpatented), and other rights of any kind concerning any such items;

(2) All facilities, equipment, and materials, devoted primarily to atomic energy research and development; and

(3) Such other property owned by or in the custody or control of the Manhattan Engineer District or other Government agencies as the President may determine.

(b) In order to render financial assistance to those States and localities in which the activities of the Commission are carried on and in which the Commission has acquired property previously subject to State and local taxation, the Commission is authorized to make payments to State and local governments in lieu of property taxes. Such payments may be in the amounts, at the times, and upon the terms the Commission deems appropriate, but the Commission shall be guided by the policy of not making payments in excess of the taxes which would have been payable for such property in the condition in which it was acquired, except in cases where special burdens have been cast upon the State or local government by activities of the Commission, the Manhattan Engineer District or their agents. In any such case, any benefit accruing to the State or local government by reason of such activities shall be considered in determining the amount of the payment. The Commission, and the property, activities, and income of the Commission, are hereby expressly exempted from taxation in any manner or form by any State, county, municipality, or any subdivision thereof.

CONTROL OF INFORMATION

SEC. 10. (a) Policy.—It shall be the policy of the Commission to control the dissemination of restricted data in such a manner as to assure the common defense and security. Consistent with such policy, the Commission shall be guided by the following principles:

(1) That information with respect to the use of atomic energy for industrial purposes should be shared with other nations on a reciprocal basis as soon as the Congress declares by joint resolution that effective and enforceable international safeguards against the use of such energy for destructive purposes have been established; and

(2) That the dissemination of scientific and technical information relating to atomic energy should be permitted and encouraged so as to provide that free interchange of ideas and criticism which is essential to scientific progress.

(b) DISSEMINATION.—The Commission is authorized and directed to establish such information services, publications, libraries, and other registers of available information as it may deem necessary or desirable to provide for the dissemination of information in accordance with subsection (a).

(c) RESTRICTIONS.—

(1) The term "restricted data" as used in this section means all data concerning the manufacture or utilization of atomic weapons, the production of fissionable material, or the use of fissionable material in the production of power, but shall not include any data which the Commission from time to time determines may be published without adversely affecting the common defense and security.

(2) Whoever, lawfully or unlawfully, having possession of, access to, control over, or being entrusted with, any document, writing, sketch, photograph, plan, model, instrument, appliance, note, or information involving or incorporating restricted data—

(A) communicates, transmits, or discloses the same to any individual or person, or attempts or conspires to do any of the foregoing with intent to injure the United States or with intent to secure an advantage to any foreign nation, upon conviction thereof, shall be punished by a fine of not more than \$20,000 or imprisonment for not more than twenty years, or both;

(B) communicates, transmits, or discloses the same to any individual or person, or attempts or conspires to do any of the foregoing, with reason to believe such data will be utilized to injure the United States or to secure an advantage to any foreign nation, shall, upon conviction, be punished by a fine of not more than \$10,000 or imprisonment for not more than ten years, or both.

(3) Whoever, with intent to injure the United States or with intent to secure an advantage to any foreign nation, acquires or attempts or conspires to acquire any document, writing, sketch, photograph, plan, model, instrument, appliance, note or information involving or incorporating restricted data shall, upon con-

viction thereof, be punished by a fine of not more than \$20,000 or imprisonment for not more than twenty years, or both.

(4) Whoever, with intent to injure the United States or with intent to secure an advantage to any foreign nation, removes, conceals, tampers with, alters, mutilates, or destroys any document, writing, sketch, photograph, plan, model, instrument, appliance, or note involving or incorporating restricted data and used by any individual or person in connection with the production of fissionable material, or research or development relating to atomic energy, conducted by the United States, or financed in whole or in part by Federal funds, or conducted with the aid of fissionable material, shall be punished by a fine of not more than \$20,000 or imprisonment for not more than twenty years or both.

(5) No person shall be prosecuted for any violation under this section unless and until the Attorney General of the United States has advised and consulted with the Commission with respect to such prosecution.

(6) This section shall not exclude the applicable provisions of any other laws, except that no Government agency shall take any action under such other laws inconsistent with the provisions of this section.

(d) INSPECTIONS, RECORDS, AND REPORTS.—The Commission is—

(1) authorized by regulation or order to require such reports and the keeping of such records with respect to, and to provide for such inspections of, activities and studies of types specified in section 3 and of activities under licenses issued pursuant to section 7 as may be necessary to effectuate the purposes of this Act;

(2) authorized and directed by regulation or order to require regular reports and records with respect to, and to provide for frequent inspections of, the production of fissionable material in the conduct of research and development activities.

PATENTS AND INVENTIONS

SEC. 11. (a) PRODUCTION AND MILITARY UTILIZATION.

(1) No patent shall hereafter be granted for any invention or discovery which is useful solely in the production of fissionable material or in the utilization of fissionable material or atomic energy for a military weapon. Any patent granted for any such invention or discovery is hereby revoked, and just compensation shall be made therefor.

(2) No patent hereafter granted shall confer any rights with respect to any invention or discovery to the extent that such invention or discovery is used in the production of fissionable material or in the utilization of fissionable material or atomic energy for a military weapon. Any rights conferred by any patent heretofore granted for any invention or discovery are hereby revoked to the extent that such invention or discovery is so used, and just compensation shall be made therefor.

(3) Any person who has made or hereafter makes any invention or discovery useful in the production of fissionable material or in the utilization of fissionable material or atomic energy for a military weapon shall file with the Commission a report containing a complete description thereof, unless such invention or discovery is described in an application for a patent filed in the Patent Office by such person within the time required for the filing of such report. The report covering any such invention or discovery shall be filed on or before whichever of the following is the latest: (A) The sixtieth day after the date of enactment of this Act; (B) the sixtieth day after the completion of such invention or discovery; or (C) the sixtieth day after such person first discovers or first has reason to believe that such invention or discovery is useful in such production or utilization.

(b) USE OF INVENTIONS FOR RESEARCH.—No patent hereafter granted shall confer any rights with respect to any invention or discovery to the extent that such invention or discovery is used in the conduct of research or development activities in the fields specified in section 3. Any rights conferred by any patent heretofore granted for any invention or discovery are hereby revoked to the extent that such invention or discovery is so used, and just compensation shall be made therefor.

(c) NONMILITARY UTILIZATION.—

(1) It shall be the duty of the Commission to declare any patent to be affected with the public interest if (A) the invention or discovery covered by the patent utilizes or is essential in the utilization of fissionable material or

atomic energy; and (B) the licensing of such invention or discovery under this subsection is necessary to effectuate the policies and purposes of this Act.

(2) Whenever any patent has been declared, pursuant to paragraph (1), to be affected with the public interest—

(A) The Commission is hereby licensed to use the invention or discovery covered by such patent in performing any of its powers under this Act; and

(B) Any person to whom a license has been issued under section 7 is hereby licensed to use the invention or discovery covered by such patent to the extent such invention or discovery is used by him in carrying on the activities authorized by his license under section 7.

The owner of the patent shall be entitled to a reasonable royalty fee for any use of an invention or discovery licensed by this subsection. Such royalty fee may be agreed upon by such owner and the licensee, or in the absence of such agreement shall be determined by the Commission.

(3) No court shall have jurisdiction or power to stay, restrain, or otherwise enjoin the use of any invention or discovery by a licensee, to the extent that such use is licensed by paragraph (2) above, on the ground of infringement of any patent. If any action for infringement against such licensee the court shall determine that the defendant is exercising such license, the measure of damages shall be the royalty fee determined pursuant to this section, together with such costs, interest, and reasonable attorney's fees as may be fixed by the court. If no royalty fee has been determined, the court shall stay the proceeding until the royalty fee is determined pursuant to this section. If any such licensee shall fail to pay such royalty fee, the patentee may bring an action in any court of competent jurisdiction for such royalty fee, together with such costs, interest, and reasonable attorney's fees as may be fixed by the court.

(d) ACQUISITION OF PATENTS.—The Commission is authorized to purchase, or take, requisition, or condemn, and make just compensation for, (1) any invention or discovery which is useful in the production of fissionable material or in the utilization of fissionable material or atomic energy for a military weapon, or which utilizes or is essential in the utilization of fissionable material or atomic energy, or (2) any patent application covering any such invention or discovery. The Commissioner of Patents shall notify the Commission of all applications for patents heretofore or hereafter filed which in his opinion disclose such inventions or discoveries and shall provide the Commission access to all such applications.

(e) COMPENSATION AWARDS, AND ROYALTIES.—

(1) PATENT COMPENSATION BOARD.—The Commission shall designate a Patent Compensation Board, consisting of two or more employees of the Commission, to consider applications under this subsection.

(2) ELIGIBILITY.—

(A) Any owner of a patent licensed under subsection (c) (2) or any licensee thereunder may make application to the Commission for the determination of a reasonable royalty fee in accordance with such procedures as it by regulation may establish.

(B) Any person seeking to obtain the just compensation provided in subsections (a), (b), or (d) shall make application therefor to the Commission in accordance with such procedures as it may by regulation establish.

(C) Any person making any invention or discovery useful in the production of fissionable material or in the utilization of fissionable material or atomic energy, or a military weapon who is not entitled to compensation therefor under subsection (a) and who has complied with subsection (a) (3) above may make application to the Commission for, and the Commission may grant, an award.

(D) Any person making application under this subsection shall have the right to be represented by counsel.

(3) STANDARDS.—

(A) In determining such reasonable royalty fee, the Commission shall take into consideration any defense, general or special, that might be pleaded by a defendant in an action for infringement, the extent to which, if any, such patent was developed through federally financed research, the degree of utility, novelty, and importance of the invention or discovery, and may consider the cost to the owner of the patent of developing such invention or discovery or acquiring such patent.

(B) In determining what constitutes just compensation under subsection (a), (b), or (d) above, the Commission shall take into account the considera-

tions set forth in paragraph (A) above, and the actual use of such invention or discovery, and may determine that such compensation be paid in periodic payments or in a lump sum.

(C) In determining the amount of any award under paragraph (2) (C) of this subsection, the Commission shall take into account the considerations set forth in paragraph (A) above, and the actual use of such invention or discovery. Awards so made may be paid by the Commission in periodic payments or in a lump sum.

(4) JUDICIAL REVIEW.—Any person aggrieved by any determination of the Commission of an award or of a reasonable royalty fee may obtain a review of such determination in the Court of Appeals for the District of Columbia by filing in such court, within thirty days after notice of such determination, a written petition praying that such determination be set aside. A copy of such petition shall be forthwith served upon the Commission and thereupon the Commission shall file with the court a certified transcript of the entire record in the proceeding, including the findings and conclusions upon which the determination was based. Upon the filing of such transcript the court shall have exclusive jurisdiction upon the record certified to it to affirm the determination in its entirety or set it aside and remand it to the Commission for further proceedings. The findings of the Commission as to the facts, if supported by substantial evidence, shall be conclusive. The court's judgment shall be final, subject, however, to review by the Supreme Court of the United States upon writ of certiorari or petition therefor under section 240 of the Judicial Code (U. S. C., title 28, sec. 347), by the Commission or any party to the court proceeding.

GENERAL AUTHORITY

SEC. 12. (a) In the performance of its functions the Commission is authorized to—

(1) establish advisory boards to advise with and make recommendations to the Commission on legislation, policies, administration, research, and other matters;

(2) establish by regulation or order such standards and instructions to govern the possession and use of fissionable and byproduct materials as the Commission may deem necessary or desirable to protect health or to minimize danger from explosions and other hazards to life or property;

(3) make such studies and investigations, obtain such information, and hold such hearings as the Commission may deem necessary or proper to assist it in exercising any authority provided in this Act, or in the administration or enforcement of this Act, or any regulations or orders issued thereunder. For such purposes the Commission is authorized to administer oaths and affirmations, and by subpoena to require any person to appear and testify, or to appear and produce documents, or both, at any designated place. No person shall be excused from complying with any requirements under this paragraph because of his privilege against self incrimination, but the immunity provisions of the Compulsory Testimony Act of February 11, 1893 (U. S. C., title 49, sec. 46), shall apply with respect to any individual who specifically claims such privilege. Witnesses subpoenaed under this subsection shall be paid the same fees and mileage as are paid witnesses in the district courts of the United States;

(4) appoint and fix the compensation of such officers and employees as may be necessary to carry out the functions of the Commission. Such officers and employees shall be appointed in accordance with the civil-service laws and their compensation fixed in accordance with the Classification Act of 1923, as amended, except that to the extent the Commission deems such action necessary to the discharge of its responsibilities, personnel may be employed and their compensation fixed without regard to such laws. Attorneys appointed under this paragraph may appear for and represent the Commission in any case in any court. The Commission shall make adequate provision for administrative review of any determination to dismiss any employee;

(5) acquire such materials, property, equipment, and facilities, establish or construct such buildings and facilities, and modify such buildings and facilities from time to time as it may deem necessary, and construct, acquire, provide, or arrange for such facilities and services (at project sites where such facilities and services are not available) for the housing, health, safety,

welfare, and recreation of personnel employed by the Commission as it may deem necessary;

(6) with the consent of the agency concerned, utilize or employ the services or personnel of any Government agency or any State or local government, or voluntary or uncompensated personnel, to perform such functions on its behalf as may appear desirable;

(7) acquire, purchase, lease, and hold real and personal property as agent of and on behalf of the United States and to sell, lease, grant, and dispose of such real and personal property as provided in this Act;

(8) contract for the expenditure of funds for the purposes specified in section 10 (b) without regard to the provisions of section 87 of the Act of January 12, 1895 (28 Stat. 622), and section 11 of the Act of March 1, 1919 (40 Stat. 1270; U. S. C., title 44, sec. 111); and

(9) without regard to the provisions of the Surplus Property Act of 1944 or any other law, make such disposition as it may deem desirable of (A) radioactive materials, and (B) any other property the special disposition of which is, in the opinion of the Commission, in the interest of the national security.

(b) **SECURITY.**—The President may, in advance, exempt any specific action of the Commission in a particular matter from the provisions of law relating to contracts whenever he determines that such action is essential in the interest of the common defense and security.

(c) **ADVISORY COMMITTEES.**—The members of the General Advisory Committee established pursuant to section 2 (b) and the members of advisory boards established pursuant to subsection (a) (1) of this section may serve as such without regard to the provisions of sections 109 and 113 of the Criminal Code (18 U. S. C., secs. 183 and 203) or section 19 (e) of the Contract Settlement Act of 1944, except insofar as such sections may prohibit any such member from receiving compensation in respect of any particular matter which directly involves the Commission or in which the Commission is directly interested.

COMPENSATION FOR PRIVATE PROPERTY ACQUIRED

SEC. 13. (a) The United States shall make just compensation for any property or interests therein taken or requisitioned pursuant to sections 5 and 11. The Commission shall determine such compensation. If the compensation so determined is unsatisfactory to the person entitled thereto, such person shall be paid 50 percent of the amount so determined, and shall be entitled to sue the United States in the Court of Claims or in any district court of the United States in the manner provided by sections 24 (20) and 145 of the Judicial Code to recover such further sum as added to said 50 percent will make up such amount as will be just compensation.

(b) In the exercise of the rights of eminent domain and condemnation, proceedings may be instituted under the Act of August 1, 1888 (U. S. C., title 40, sec. 257), or any other applicable Federal statute. Upon or after the filing of the condemnation petition, immediate possession may be taken and the property may be occupied, used, and improved for the purposes of this act, notwithstanding any other law. Real property acquired by purchase, donation, or other means of transfer may also be occupied, used and improved for the purposes of this act, prior to approval of title by the Attorney General.

JOINT COMMITTEE ON ATOMIC ENERGY

SEC. 14. (a) There is hereby established a Joint Committee on Atomic Energy to be composed of nine Members of the Senate to be appointed by the President of the Senate, and nine Members of the House of Representatives to be appointed by the Speaker of the House of Representatives. In each instance not more than five members shall be members of the same political party.

(b) The joint committee shall make continuing studies of the activities of the Atomic Energy Commission and of problems relating to the development, use, and control of atomic energy. The Commission shall keep the joint committee fully and currently informed with respect to the Commission's activities. All bills, resolutions, and other matters in the Senate or the House of Representatives relating primarily to the Commission or to the development, use, or control of atomic energy shall be referred to the joint committee. The members of the joint committee who are Members of the Senate shall from time to time report to the Senate, and the members of the joint committee who are Members of the

House of Representatives shall from time to time report to the House, by bill or otherwise, their recommendations with respect to matters within the jurisdiction of their respective Houses which are (1) referred to the joint committee or (2) otherwise within the jurisdiction of the joint committee.

(c) Vacancies in the membership of the joint committee shall not affect the power of the remaining members to execute the functions of the joint committee, and shall be filled in the same manner as in the case of the original selection. The joint committee shall select a chairman and a vice chairman from among its members.

(d) The joint committee, or any duly authorized subcommittee thereof, is authorized to hold such hearings, to sit and act at such places and times, to require, by subpoena or otherwise, the attendance of such witnesses and the production of such books, papers, and documents, to administer such oaths, to take such testimony, to procure such printing and binding, and to make such expenditures as it deems advisable. The cost of stenographic services to report such hearings shall not be in excess of 25 cents per hundred words. The provisions of sections 102 to 104, inclusive, of the Revised Statutes shall apply in case of any failure of any witness to comply with a subpoena or to testify when summoned under authority of this section.

(e) The joint committee is empowered to appoint and fix the compensation of such experts, consultants, technicians, and clerical and stenographic assistants as it deems necessary and advisable, but the compensation so fixed shall not exceed the compensation prescribed under the Classification Act of 1923, as amended, for comparable duties. The committee is authorized to utilize the services, information, facilities, and personnel of the departments and establishments of the Government.

ENFORCEMENT

Sec. 15. (a) Whoever willfully violates, attempts to violate, or conspires to violate, any provision of sections 4 (b), 4 (e), 5 (a) (3), or 6 (b) shall, upon conviction thereof, be punished by a fine of not more than \$10,000 or by imprisonment for not more than five years, or both, except that whoever commits such an offense with intent to injure the United States or with intent to secure an advantage to any foreign nation shall, upon conviction thereof, be punished by a fine of not more than \$20,000 or by imprisonment for not more than twenty years, or both.

(b) Whoever willfully violates, attempts to violate, or conspires to violate, any provision of this Act other than those specified in subsection (a) and other than section 10 (c), or of any regulation or order prescribed or issued under sections 5 (b) (4), 10 (d), or 12 (a) (2), shall, upon conviction thereof, be punished by a fine of not more than \$5,000 or by imprisonment for not more than two years, or both, except that whoever commits such an offense with intent to injure the United States or with intent to secure an advantage to any foreign nation shall, upon conviction thereof, be punished by a fine of not more than \$20,000 or by imprisonment for not more than twenty years, or both.

(c) Whenever in the judgment of the Commission any person has engaged or is about to engage in any acts or practices which constitute or will constitute a violation of any provision of this Act, or any regulation or order issued thereunder, it may make application to the appropriate court for an order enjoining such acts or practices, or for an order enforcing compliance with such provision, and upon a showing by the Commission that such person has engaged or is about to engage in any such acts or practices a permanent or temporary injunction, restraining order, or other order shall be granted without bond.

(d) In case of failure or refusal to obey a subpoena served upon any person pursuant to section 12 (a) (3), the district court for any district in which such person is found or resides or transacts business, upon application by the Commission, shall have jurisdiction to issue an order requiring such person to appear and give testimony or to appear and produce documents, or both, in accordance with the subpoena; and any failure to obey such order of the court may be punished by such court as a contempt thereof.

REPORTS

Sec. 16. The Commission shall submit to the Congress, in January and July of each year, a report concerning the activities of the Commission. The Commission shall include in such report, and shall at such other times as it deems de-

sirable submit to the Congress, such recommendations for additional legislation as the Commission deems necessary or desirable.

DEFINITIONS

SEC. 17. As used in this Act—

(a) The term "atomic energy" shall be construed to mean all forms of energy released in the course of or as a result of nuclear fission or nuclear transformation.

(b) The term "Government agency" means any executive department, commission, independent establishment, corporation wholly or partly owned by the United States which is an instrumentality of the United States, board, bureau, division, service, office, officer, authority, administration, or other establishment, in the executive branch of the Government.

(c) The term "person" means any individual, corporation, partnership, firm, association, trust, estate, public or private institution, group, the United States or any agency thereof, any government other than the United States, any political subdivision of any such government, and any legal successor, representative, agent, or agency of the foregoing, or other entity, but shall not include the Commission or officers or employees of the Commission in the exercise of duly authorized functions.

(d) The term "United States," when used in a geographical sense, includes all Territories and possessions of the United States.

(e) The term "research and development" means theoretical analysis, exploration, and experimentation, and the extension of investigative findings and theories of a scientific or technical nature into practical application for experimental and demonstration purposes, including the experimental production and testing of models, devices, equipment, materials, and processes.

(f) The term "equipment or device utilizing fissionable material or atomic energy" shall be construed to mean any equipment or device capable of making use of fissionable material or peculiarly adapted for making use of atomic energy and any important component part especially designed for such equipment or devices, as determined by the Commission.

(g) The term "facilities for the production of fissionable material" shall be construed to mean any equipment or device capable of such production and any important component part especially designed for such equipment or devices, as determined by the Commission.

APPROPRIATIONS

SEC. 18. (a) There are hereby authorized to be appropriated such sums as may be necessary and appropriate to carry out the provisions and purposes of this Act. The Acts appropriating such sums may appropriate specified portions thereof to be accounted for upon the certification of the Commission only. Funds appropriated to the Commission shall, if obligated by contract during the fiscal year for which appropriated, remain available for expenditure for four years following the expiration of the fiscal year for which appropriated. After such four-year period, the unexpended balances of appropriations shall be carried to the surplus fund and covered into the Treasury.

(b) Such parts as the President may determine of the unexpended balances of appropriations, allocations, or other funds available for expenditure in connection with the Manhattan Engineer District are hereby transferred to the Commission and shall be available for expenditure for the purpose of carrying out the provisions of this Act.

SEPARABILITY OF PROVISIONS

SEC. 19. If any provision of this Act, or the application of such provision to any person or circumstances, is held invalid, the remainder of this Act or the application of such provision to persons or circumstances other than those as to which it is held invalid, shall not be affected thereby.

SHORT TITLE

SEC. 20. This Act may be cited as the "Atomic Energy Act of 1946."

Passed the Senate June 1 (legislative day, March 5), 1946.

Attest:

LESLIE L. BIFFLE, *Secretary*.

STATEMENT OF HON. ROBERT P. PATTERSON, SECRETARY OF WAR

The CHAIRMAN. Secretary Patterson, we are interested in having any statement you care to make to the committee at this time on S. 1717.

Secretary PATTERSON. I have a fairly short prepared statement, Mr. Chairman, which I should be glad to read and then answer questions.

The CHAIRMAN. That will be very agreeable.

Mr. THOMAS. A parliamentary inquiry, Mr. Chairman?

The CHAIRMAN. The gentleman will state it.

Mr. THOMAS. What bill are we considering now?

The CHAIRMAN. S. 1717.

Mr. THOMAS. What happened to the bill that we have already reported?

The CHAIRMAN. It is on the calendar of the House and is before the Rules Committee.

Mr. THOMAS. Why do we not take that up? What is the purpose of taking up the Senate bill?

The CHAIRMAN. We are taking up this bill for the purpose of getting the Secretary's views. We will talk about the other matter when we go into executive session.

You may proceed, Mr. Secretary.

The War Department favors prompt passage of S. 1717, intended to establish national policy in regard to atomic energy.

In the first place, the bill is believed to be along sound and constructive lines.

In the second place, promptness in passage of legislation is of urgent importance. This bill has already passed the Senate, and of the various bills that have been introduced on the subject of atomic energy it has made the greatest amount of progress toward ultimate passage.

The reasons for War Department support of this measure will be made evident, I believe, by a review of our record on atomic energy.

MANHATTAN DISTRICT

President Roosevelt in 1942 gave the War Department the responsibility of developing atomic energy as a weapon of war. The possibilities of an atomic bomb had been brought to his notice as early as 1939, and preliminary work on the matter had been carried forward by the National Defense Research Committee and the Office of Scientific Research and Development.

It was a responsibility of vast proportion and momentous consequences. We organized the Manhattan district to carry the project through to success. General Groves of the Corps of Engineers was placed in command, under direct supervision of the Secretary of War. Mobilization of scientists and of industrial concerns was intensified, and the program was pressed with the utmost vigor. The enormous scale of the enterprise can be gaged from the fact that at the height of activity 130,000 people were directly employed in it and \$2,000,000,000 were expended on it before the first bomb was dropped. Despite this, secrecy was imperative and was, on the whole, well maintained.

From the outset it was a war project, pure and simple. Success was signalized by the bombs dropped on Hiroshima and Nagasaki in August of last year. The Japanese gave their unconditional surrender a week later.

The War Department does not claim any disproportionate credit for what was achieved. Great credit is due to the scientists who developed the basic scientific information; to the men in industry who translated the scientific information into the final product; to the skilled and unskilled workers who labored long and hard; and to the Congress which made available vast sums of money without premature revelation of this great activity.

PLANNING FOR POSTWAR DEVELOPMENT

Secretary Stimson did not wait for the war to come to a close before starting plans for postwar development of atomic energy under civilian direction.

In May 1945, in anticipation of the probable success of the atomic bomb and of the prospect of an early end of the war, the Secretary, with approval of the President, took steps to initiate a long-range policy on atomic energy. He appointed the following special committee to survey the subject and to submit a program: Secretary Stimson, chairman; James F. Byrnes (then a private citizen); Will Clayton, Assistant Secretary of State; Ralph Bard, Under Secretary of Navy; George Harrison, Special Assistant to Secretary of War; Dr. Vannevar Bush, Chairman of the Office of Scientific Research and Development; Dr. Karl Compton, president, Massachusetts Institute of Technology; Dr. James Conant, president, Harvard University.

The special committee was assisted by a scientific panel drawn from the most eminent scientists working on the atomic energy project: Dr. J. R. Oppenheimer, Dr. E. O. Lawrence, Dr. Arthur H. Compton, Dr. Enrico Fermi.

After months of steady work the special committee recommended that legislation be adopted by Congress to direct the postwar development of atomic energy. The main objectives in the suggested legislation were to be as follows:

1. Creation of a civilian agency, a commission appointed by the President to take over the Manhattan project and relieve the War Department of responsibility for development of atomic energy.
2. Research and development to be conducted by the Commission for scientific, industrial, military, and medical purposes, with maximum use made of educational and research institutions and private enterprise; the Commission also to aid, encourage, and not interfere with independent research where the quantities involved should not be of military or industrial value and should not result in undue hazards.
3. The Commission to have the right to acquire all source materials, fissionable materials, patents, processes, and information with power to grant licenses on equal terms to qualified persons with a view to discouraging monopolies.
4. Exclusion of other persons from production, utilization, export and import of appreciable quantities of materials comprising the sources of atomic energy, except under conditions laid down by the Commission.

5. Security regulations to be adopted by Commission as required by considerations of national defense, with penalties for violation of regulations or terms of the act.

6. Activities of the Commission to be consistent with foreign policy and national defense as communicated to the Commission by the President.

The President approved of this general program. On October 3 of last year he sent a message to Congress, urging prompt passage of legislation and outlining the chief points to be covered, substantially as set forth above.

MAY-JOHNSON BILL

At the same time the War Department caused the bill later known as the May-Johnson bill to be introduced. The bill embodied the program formulated by the Stimson committee, as mentioned above, and was drawn up under supervision of the committee. It had already been submitted to and approved by the State Department, Department of Justice, and Department of the Interior.

The House Military Affairs Committee held prompt hearings. This was last October. Some witnesses criticized the bill as not containing sufficient safeguards for independent research. The War Department recalled the scientific panel and requested the members of it to consider these objections. The scientific panel suggested certain clarifying language to reinforce the provisions relative to research. The War Department tendered these provisions as amendments. This committee, after giving effect to these amendments and other amendments, reported the bill favorably last November.

I wish to express appreciation to this committee for the intensive and exacting study given to this problem last October. The bill then reported out marked the first legislative effort to chart a national policy on control of this new force that inevitably will bring about profound changes in the future of all peoples. You realized then that the situation called for prompt attention. There was and still is need for avoiding undue delay. The project was in charge of the War Department as a war measure. The War Department was not charged with responsibility for long-range development of atomic energy for peacetime uses. Continued uncertainties as to future policy were bound to be damaging to current operations of the enterprise. And with international arrangements on atomic energy clearly called for, it was vital that something be done to put our own house in order.

The May-Johnson bill came in later for heavy criticism. It was said that the bill was drafted by the military. This was conclusively disproved by the fact that the bill represented the conclusions of the special committee named by Secretary Stimson, with all members civilians; and a very distinguished and eminent committee it was.

The CHAIRMAN. Mr. Secretary, do you mean to say that every one of the committee was a civilian, there were no members of the armed forces?

Secretary PATTERSON. Every one of them was a civilian; yes, sir.

Mr. JOHNSON. Are the names of those men in the record?

Secretary PATTERSON. I named them a moment ago. It was also said that the bill was to perpetuate military control of atomic energy. A reading of the bill rebutted that charge, since complete control was to pass to the proposed civilian agency. No vestige of authority was left in the War Department. But the critics would not read the bill. Then the charge was made that at any rate the bill permitted the President to appoint military personnel as members of the new Commission, and likewise permitted the Commission to employ military personnel. That charge was true, but the provision was merely permissive. Unless the President or the Commission saw fit to appoint them, no one in the Army or Navy would have a place in the enterprise.

I am not saying for a moment it would have been a bad feature to have had them in it, but nevertheless the bill did not do it.

These matters were all set forth, but the censure continued nonetheless. There was never any substantial basis for these complaints. The issues raised were utterly unreal.

S. 1717 (McMAHON BILL)

The Senate last fall created a special committee on atomic energy. That committee devoted a large amount of time to a study of the subject and to the taking of testimony. Senator McMahon introduced S. 1717, and that bill after many amendments was reported favorably by the committee. It was passed by the Senate last week. That is the bill before you now.

S. 1717, in the content passed by the Senate, does not depart in objectives or in principal provisions from the program suggested last summer by the Stimson committee. There are many differences in detail, and a number of new features have been added in response to later developments. But in the main the treatment is the same—a new civilian agency composed of members appointed by the President—nine in the former bill and five in this bill; part time in the other bill and full time in this one. There are differences in detail but, as I say, a new civilian agency composed of members appointed by the President; aid and encouragement for research; ownership and operation of facilities to produce fissionable materials; ownership of fissionable materials; control of ores that are source materials; issuance of licenses to utilize atomic energy; control of information of a restricted character, with penalties for violations. These are the chief functions of the Commission. The bill calls for civilian control, and the War Department at all times has supported civilian control, notwithstanding statements to the contrary.

S. 1717 contains provisions relative to national defense that are new. I shall comment briefly on them. In the first place, a military liaison committee is set up, composed of representatives of the War and Navy Departments. The Commission is directed to advise and consult with this military committee and keep it fully informed on all atomic energy matters deemed by the Commission to relate to military applications, including the control of information. It is also provided that the military committee may make recommendations on matters relating to military applications, and in case it concludes that action or failure to act on the part of the Commission

is adverse to the responsibilities of the War Department or Navy Department, it may report the matter to the Secretaries of War or Navy, either of whom may take the case to the President for final decision.

In the second place, there is specific authority given to the Commission to conduct research and development work in military application of atomic energy; also to engage in production of atomic bombs and other weapons utilizing fissionable materials, to the extent directed by the President; and the President is empowered to direct delivery of such weapons to the armed forces.

These provisions, in my opinion, are adequate for purposes of national defense. No comparable provisions for participation by representatives of the War and Navy Departments are embodied in the May-Johnson bill. In this respect the bill under discussion goes further in safeguarding national defense than the May-Johnson bill or any other bill on the subject.

S. 1717 gives the Commission authority to protect restricted information in the interest of the common defense or security. As to violations of restricted information, they are punishable only where the offender acts with intent to injure the United States or to secure an advantage for a foreign nation or acts with reason to believe that the information will be so used. In this respect the coverage is not as broad as in the May-Johnson bill, which penalizes any violation of security regulations. It is a question of judgment as to which provision promotes the national security to the best advantage. If S. 1717 should prove inadequate, it can be amended in this respect later.

CONCLUSION

In the view of the War Department this bill is in the national interest. The field of atomic energy has limitless possibilities. At this early stage of development it would be vain to try to frame a measure that will answer our needs for all time. Any bill that is passed now is bound to require later amendments as the situation unfolds and as new applications are realized.

S. 1717 answers the needs as we can appraise them today. It gives adequate attention to the aspects of atomic energy that relate to national defense. I believe that it is sound legislation.

There are urgent considerations in favor of prompt action. We asked for prompt action last year, because of the unfortunate effects of uncertainty on the operations of the project and because of the need of deciding domestic policy on atomic energy before taking action on international arrangements. These factors are even more pressing now, with the United Nations Commission on Atomic Energy due to meet in a few days. In view of the recent passage of S. 1717 by the Senate, it offers much better prospects for expeditious action than the May-Johnson bill or any other bill on the subject of atomic energy. And on those grounds I urge a favorable report.

The CHAIRMAN. Mr. Secretary, do you recall when this matter first came up early last year, I was in Kentucky and called you by long-distance telephone and suggested that speedy action ought to be taken to see to it that legislation was enacted to enable us to protect the military secret of the atomic bomb?

Secretary PATTERSON. I think I do; yes.

The CHAIRMAN. In pursuance of that, the Secretary of War then appointed this committee to which you have referred that went to work on a study of how to make it secure, and what legislation was necessary, I believe?

Secretary PATTERSON. Yes, sir; that was in May of last year. Secretary Stimson and his assistant, Mr. George Harrison, who was giving close attention to this project, came to the conclusion that within a few months bombs would actually be dropped. All indications were that they would be a success. Of course, they might not result in the end of the war. Then again those bombs might have that effect. So it seemed to them that it was time to give study to long-range utilization of the Manhattan project.

The Secretary discussed that with the President, and with the President's approval, he appointed that eight-man committee. That was the start, so far as I know, of all effort and all study having to do with the postwar development of atomic energy.

That committee came to the conclusion that legislation was required and that they would recommend in the legislation that the matter be turned over to a civilian agency, taken out of the War Department, because it had so many possibilities of a peacetime character that the War Department had no mission in relation to it. That was the fundamental point in the study given it by the eight-man committee.

The CHAIRMAN. My view about the matter is that the technique of the atomic bomb and the secrets connected with it constitute a vital military secret; and that that secret ought to be preserved while at the same time we should allow research and development of whatever features there were that might lead to civilian improvements and civilian benefits.

Secretary PATTERSON. I agree entirely with that. I believe that S. 1717 accomplishes and achieves those objectives by placing it in the hands of the Commission on Atomic Energy with the direction to carry out, or with the authority at any rate to carry out military applications, further military applications, and to have a military liaison committee to participate in that activity. The bill does that.

The CHAIRMAN. What authority, Judge, do you think that liaison committee actually has under the provisions of this bill, other than to listen and report and recommend? They cannot enforce anything that they want to do?

Secretary PATTERSON. Of themselves, they cannot. They are supposed to consult, be advised and be kept informed by the Commission. There is supposed to be a two-way traffic of exchange of information, they to advise the Commission of military needs and the Commission to advise them of what they view as the military possibilities. And then they can report anything that they see fit in the way of the committee's action or proposed action or failure to act, to the Secretaries of War and Navy who, if they see fit, can take the matter to the President and the President makes the decision. I think that is a good arrangement.

The CHAIRMAN. In other words, the Secretary of War and the Secretary of the Navy have nothing to do whatsoever except to complain to the President if something is proposed that they do not want done?

Secretary PATTERSON. That is, assuming that they are at loggerheads with the Commission. Then they have recourse to the President.

The CHAIRMAN. Not loggerheads, but where there is an honest difference of opinion about what they can do.

Secretary PATTERSON. That is right; that is what I mean by loggerheads. I do not mean anything personal.

The CHAIRMAN. We have an instance in high places right now where people are at loggerheads, so I do not like to call it that.

Judge, I think your statement commended very highly the House bill, that has been on the calendar for 7 months. I think your statement justifies the bill. Here is my position on this legislation—

Secretary PATTERSON. I can only say this, Mr. Chairman. This bill, S. 1717, was drafted after months and months of work by an able committee in the Senate. Naturally enough, with all of that study devoted to it, and with some 6 months more of development in the background for this bill, it has a number of detailed provisions of a valuable character I believe that neither the Stimson committee in the War Department nor this committee had time to consider. It is still my belief that if prompt action could have been had on the bill that was in this committee last fall, it would have been beneficial. But we did not get prompt action on it.

Now this bill comes out. And I said that in its main features it is so close to the earlier bill, in its main outline, main treatment, that a comparison on those phases between the two bills is not very profitable.

In some ways I think this is a better bill. It certainly goes further in dealing with the national defense aspects of atomic energy than the earlier bill did. There was nothing in the May-Johnson bill creating a military liaison committee, no specific provision in it at all as to how the Army or the Navy would keep posted on what was going on in atomic energy. This bill does and it is better in that feature.

The CHAIRMAN. Did not the May-Johnson bill reserve to the War Department the authority to control the atomic bomb activities, and for that reason they did not need somebody to advise them?

Secretary PATTERSON. It did not give the War Department anything—the May-Johnson bill. It did not give it anything. The charge was made that the War Department was holding onto this thing. We were just thrown out of the window in that bill; that is the plain fact. Or we rather jumped out of the window ourselves.

The CHAIRMAN. Did you not approve it at that time?

Secretary PATTERSON. Yes, sir.

The CHAIRMAN. And General Royal approved it?

Secretary PATTERSON. Yes, sir; that is right.

The CHAIRMAN. And it was reported after long study and after a week's consideration, day after day here, on the question of amendments?

Secretary PATTERSON. That is right.

The CHAIRMAN. Here is my position in the matter, and I wonder if you have any objection to this amendment, assuming that the Senate bill gets to the floor. All I want to do is to get it to the floor of the House so we can act on it in view of some questions that are raised now by the Navy Department and the Department of Justice that you, perhaps, do not know about.

Secretary PATTERSON. No; I did not know that.

The CHAIRMAN. What I think ought to be done is, we ought to report this bill out and with the permission of the House substitute

the House bill, and then let the matter go to conference where we can all get together and have the benefit of counsel on both sides and then work out whatever is necessary, if there are any changes that ought to be made.

Secretary PATTERSON. Of course, I would never counsel hasty action or thoughtless action just for speed. Nevertheless, if the bill impresses the committee as having a good framework—and, as I say, any bill you pass is going to have many future amendments to it, it is bound to—if it impresses you, though, as it does me, as having a good basis, I believe that fairly prompt action is indicated.

The CHAIRMAN. I want prompt action. But let me ask you this. What provision of this bill authorizes the communication of civilian uses to foreign countries or other people throughout the world? Is there anything in it that requires the appointment of inspectors or investigators?

Secretary PATTERSON. No.

The CHAIRMAN. There is nothing in the bill which says that you shall appoint them. What do you think about that?

Secretary PATTERSON. Of course, that operation under the bill here comes under the jurisdiction of the Commission.

The CHAIRMAN. The Commission?

Secretary PATTERSON. Yes, sir. The Commission here has about the same powers on classification of information that is contained in the May-Johnson bill. The May-Johnson bill calls for regulations to be adopted to control information. This bill, S. 1717, provides that information may be freely disseminated by the Commission unless they say it is restricted data and if it is restricted data, then it may not be. It is a different way of expressing the same idea, as I see it.

The CHAIRMAN. Suppose as the result of international negotiation there is an arrangement made by which it is to be shared by other nations and inspectors and investigators are to be appointed. Do you not think the War Department and the Navy Department ought to have some power in the matter of saying who those inspectors should be, through their intelligence services?

Secretary PATTERSON. That, of course, goes into things that no bill before Congress deals with. That goes into international arrangements. This bill, or any bill that you pass, would be subject to treaty.

The CHAIRMAN. You mean to say that international agreements can vitiate the legislation?

Secretary PATTERSON. Well, I understood that treaties were part of the high law of the land.

The CHAIRMAN. They are, but they do not repeal statutes, as I understand.

Secretary PATTERSON. However, that gets into a field that is not covered by any legislation.

The CHAIRMAN. Mr. Thomason, have you any questions?

Mr. THOMASON. Mr. Secretary, in view of the international situation and conferences soon to be held, I think there ought to be very prompt legislation on this subject.

Secretary PATTERSON. I agree.

Mr. THOMASON. This committee is primarily a military committee, of course. This subject is very much larger than that. I do not

think it is so very important whether we are taking up on the floor of the House the House bill or the Senate bill or who the authors may be. It is a question of dealing with this in a very broad and constructive way.

I have read a good part of the hearings since our last meeting the other day, and they are very interesting. It seems to me that in view of the amendment offered to the original Senate bill by Senator Vandenberg and later adopted, together with the views of Admiral Hart and others, the secret of the bomb as well as the way it is to be handled, is pretty well taken care of.

It was interesting to observe, too, after the adoption of the Vandenberg amendment, the Senate's special committee after months of hearings of the greatest scientists of this country and perhaps other countries, passed that bill out unanimously and it later passed the Senate unanimously. So there must be something pretty constructive about it.

I would just like to ask this for the record, although I think it has probably already been answered; but I think we should be very specific about it. Do you as Secretary of War and, of course, speaking for the War Department, say to this committee that in your judgment and in the judgment of the War Department, the secret of the atomic bomb is properly safeguarded by this bill?

Secretary PATTERSON. I believe so. Of course, with any bill that sets up a commission, you have to have sound and efficient administration. We have a right to assume that we will get that. If that is accomplished, I believe the answer to your question is yes.

Mr. THOMASON. Do you say to this committee, in your capacity as Secretary of War, that you are satisfied with the provisions in this bill in section 3, known as the military liaison committee, that the War Department, charged with our national defense and our national security, would be properly informed and properly advised at all times regarding any military matters that the War Department ought to know about and through your representatives on the military liaison committee, those matters could be promptly reported to the President of the United States?

Secretary PATTERSON. Yes, sir; you are referring I think, Mr. Congressman, to paragraph (c)?

Mr. THOMASON. That is right, at the top of page 7 of the Senate bill.

Secretary PATTERSON. Yes.

Mr. THOMASON. In other words, you are entirely satisfied—

Secretary PATTERSON. Paragraph (c) of section 2.

Mr. THOMASON. You are entirely satisfied with the military security that would be provided to this country insofar as it affects the atomic bomb, by the provisions of that section?

Secretary PATTERSON. Yes, sir.

Mr. THOMASON. That is all.

Secretary PATTERSON. I might say that this was not in the original bill and in my testimony before the special committee of the Senate, I commented on section 6, I believe it was, dealing with military applications, pointing out that under section 6 as it then read, the commission was authorized to carry on research and production of military weapons, but that the Army and Navy were excluded. And then this paragraph (c) of section 2 provided for a military liaison committee,

which was later written into the act, and with that I am entirely satisfied.

Mr. THOMASON. That is the Vandenberg amendment.

Secretary PATTERSON. Yes, it is.

The CHAIRMAN. Mr. Short is recognized.

Mr. SHORT. Mr. Secretary, I suppose you approve the report by the State Department, the Lilienthal report, in which Mr. Oppenheimer and Compton and others were involved—in which they distinguished between the dangerous elements of this whole atomic research and the nondangerous elements. I am wondering if the Senate bill, 1717, makes proper provision for private industry to explore and carry on this work, or whether ownership and control are wholly going to be under the Government.

Secretary PATTERSON. No. I think the plan is like that in the May-Johnson bill, differing in detail, however. It provides that licenses may be issued by the Commission for industrial uses. It goes into more detail than the earlier bill does but I think the details are all good. You have got to report to Congress and let Congress take a look at it, I believe, for 90 days before the issuance of licenses.

Mr. SHORT. I was just wondering if the bill goes far enough. And the reason I ask you that question is that some representatives of the industries that worked and cooperated with the Government, contributed their time, and did it all out of patriotism during the war, are very much concerned about the control of this in the future, particularly as to the nondangerous elements for industrial or commercial purposes. They would like to see it done in the traditional way of free competitive enterprise.

Secretary PATTERSON. This whole business was developed with United States money, taxpayers' money, appropriated by Congress. The whole development was a Government development. It seems to me plain that ownership of the enterprise should remain in the Government. I think they do, however, provide for utilization on fair terms under license, with the national welfare paramount, to industrial concerns on terms specified in the act and to be, of course, implemented by decisions of the Commission. I do not think any exception can be taken to that.

The two acts are not far apart on that feature, as I read them.

Mr. SHORT. I wanted to have your views.

Mr. HOLIFIELD. Will the gentleman yield to me?

Mr. SHORT. I yield.

Mr. HOLIFIELD. Is it not true, Mr. Secretary, that section 14 which sets up the joint congressional committee of the House and Senate for a continuing study and for the purpose of future legislation, provides a safeguard by action of the legislative branch, both as to any complaint that the military might have, and as to any complaint that private enterprise might have, in the way of the misuse of the power of licensing by the Commission?

Secretary PATTERSON. I think so.

Mr. HOLIFIELD. I think that is an important feature.

Secretary PATTERSON. I was referring to the part that has to do directly with licenses.

Mr. HOLIFIELD. I was referring to a broader power, as set out in section 14 on page 43, which means that this is not a conclusive act,

that there will be other legislation and that the power resides in Congress to check on the Commission both as to military licenses and commercial licenses.

Secretary PATTERSON. I think that is a good provision, section 14.

Mr. HOLIFIELD. I think so, too.

Secretary PATTERSON. That is new in this act. It was not in the earlier act. It is a good provision.

Mr. SHORT. I yield to the gentleman from New Jersey, Mr. Thomas.

Mr. THOMAS. I would like to ask Mr. Holifield since when has this Congress had any interest in private enterprise?

Mr. HOLIFIELD. I believe my friend is being facetious on that. I think most of our legislation does have an effect on private enterprise.

The CHAIRMAN. A pretty bad effect, sometimes. But that is neither her nor there.

Mr. SHORT. I would like to call the attention of the Secretary to a provision on page 19, line 5:

Provided, however, That no person, corporation, partnership, or association, which had any part, directly or indirectly, in the development of the atomic-bomb project, may benefit by any location, entry, or settlement upon the public domain made after such person, corporation, partnership, or association took part in such project.

Secretary PATTERSON. Well, that is to prevent an inside job, I suppose.

Mr. SHORT. What would you do with a firm or a corporation that has been developing thorium, one of the ingredients of the atomic bomb, since 1906, from monosite sand. Of course, most monosite sand comes from Brazil and India, but we have made discoveries of it in this country in one or two spots. Miners excavating for silver and gold accidentally ran across it.

Will this provision on page 19 prevent that company from going ahead with the development of our own deposits in this country?

Secretary PATTERSON. I do not know. I would have to give some further study to these lines that you specify, Mr. Short. It only has to do with the public land.

Mr. SHORT. I asked that in connection with the conference report that we recently unanimously passed on strategic and critical materials—the stock-piling bill—where we did make provision for departments of the Government to carry on explorations to develop self-sufficiency in this country, no longer to rely wholly or largely upon importations of strategic materials. This ties in more or less with that.

The gentleman from New Jersey [Mr. Thomas], whether he knows it or not, has a company in his district, in Mayfield, and I know of one out in Illinois, that have been developing this thorium for a number of years. They say that with that provision in there they will just quit business and you will not have any atomic bomb, and some of the private enterprises that have developed this bomb—in fact, the one at Oak Ridge, the plant in Tennessee—say that while they were willing during the war to go ahead and let subcontracts, if the Senate bill prohibits the letting of subcontracts, you will have no atomic bomb.

Secretary PATTERSON. I had the impression that this bill had a provision in it or provisions, to encourage the discovery of ores within the United States that would be source materials for atomic energy. I do not have that part of the act right at hand, but I think it does.

Mr. SHORT. I should like you to give further consideration to that provision on page 19 and also to the question whether or not the Senate bill allows the letting of subcontracts.

Mr. SPARKMAN. Will the gentleman yield?

Mr. SHORT. I yield.

Mr. SPARKMAN. Of course, I would like to remind the gentlemen that the provision on page 19 is very restrictive and relates only to entry on public lands. It simply prevents one of these firms who may have worked with it, from having the opportunity to get an undue privilege on public lands. With reference to the matter of subcontracting, I would like to say that when we get into executive session I propose to offer an amendment on page 11, to insert simply these words, in line 18, after the word "contract," "except as authorized by the Commission." That would permit subcontracting, with the permission of the Commission.

Mr. SHORT. That is all right. I am glad you are going to offer it, because it is quite necessary to be put in there; because you know there is no organization in this country that will do this work alone. They will hire the best scientists in the country.

Mr. ELSTON. Will the gentleman yield?

Mr. SHORT. I yield to the gentleman from Ohio.

Mr. ELSTON. On the other hand, no company, no individual, may engage in any exploring operations or experiments, or do anything in connection with the development of atomic energy or the discovery of any of the materials that might be used in the development of atomic energy, without the specific license and consent of this Commission; is that not correct?

Secretary PATTERSON. I believe that is. The earlier bill contained similar provisions on that score. It is intended to vest full control over the ores, the refined substances called fissionable.

Mr. ELSTON. And private industry would have nothing to do with the development of anything unless the Commission saw fit to give them a license?

Secretary PATTERSON. I think that is so.

Mr. ELSTON. And then they go even further, under section 10, and say that information with respect to the use of atomic energy for industrial purposes should be shared with other nations on a reciprocal basis as soon as the Congress declares, in a joint resolution, that effective and enforceable international safeguards against the use of such energy for destructive purposes have been established. That is in section 10 on page 28.

Secretary PATTERSON. I think that is a good provision.

Mr. ELSTON. May I ask one more question? As a matter of fact, does the bill restrict anybody except the American people, American industry and the War and Navy Departments of this country?

Secretary PATTERSON. I do not know that any legislation we could pass could restrict a foreign country.

Mr. ELSTON. I agree that we could not. But the whole purpose of the bill is to restrict American industry, the American people and the War and Navy Departments in their activities in the development of atomic energy or atomic weapons. Our greatest fear today is that some other nation might get this information.

Mr. SHORT. They are working on it.

Mr. ELSTON. So this bill does not in any respect at all keep any other nation from getting the information. In fact, it makes it mandatory that we give the information.

Secretary PATTERSON. No.

Mr. ELSTON. Concerning the development of atomic energy for industrial purposes, to other countries.

Secretary PATTERSON. Well, that section 10 on information means this, that the utmost in the way of circulation of information be had except where the commission marks it restricted and then it throws the safeguards around the restricted information.

The CHAIRMAN. Gentlemen, it will be necessary for the committee to adjourn, as there has been a call of the House.

Judge, I have a rather lengthy letter here from the Attorney General addressed to the Speaker making a great many criticisms of the legislation from the viewpoint of the Department of Justice. He is inclined not to want to delay completion of the legislation, but has made these suggestions, and I think it would be rather fair to you to furnish you with a copy of that so you may look it over and see if you have any recommendation thereon to make to the committee.

Secretary PATTERSON. Thank you.

The CHAIRMAN. Can you return tomorrow morning at 10 o'clock, Mr. Secretary?

Secretary PATTERSON. I would be very glad to. I might say, in urging passage of this legislation, I do not take back a thing that I said about the earlier bill. It was a good bill. Nevertheless it has been misunderstood—and that is not the first time—and I am perfectly willing to pocket any pride in that legislation and take this bill, S. 1717, which is a good bill. It will result in early passage and getting this thing underway, and I recommend this bill.

The CHAIRMAN. I take the same position, Judge, but I think there are so many vital things that we ought to look into. The committee will adjourn until tomorrow at 10 o'clock.

(Whereupon the committee adjourned to meet on Wednesday, June 12, 1946, at 10 a. m.)

ATOMIC ENERGY

WEDNESDAY, JUNE 12, 1946

HOUSE OF REPRESENTATIVES,
COMMITTEE ON MILITARY AFFAIRS,
Washington, D. C.

The committee met, pursuant to notice, at 10 a. m., for further consideration of S. 1717, Hon. Andrew J. May (chairman) presiding. The CHAIRMAN. The committee will please come to order. Do you have any further statement, Judge?

STATEMENT OF HON. ROBERT P. PATTERSON, SECRETARY OF WAR—Resumed

Secretary PATTERSON. I have no further statement to make, Mr. Chairman.

The CHAIRMAN. Mr. Thomas.

Mr. THOMAS. Mr. Secretary, have you conferred with the Secretary of the Navy in connection with S. 1717?

Secretary PATTERSON. Only in a general way, and I was conferring just now with Assistant Secretary Kenney, of the Navy, who is here. That also was very brief.

Mr. THOMAS. I mean, during the time the bill was being prepared, did you confer with the Secretary of the Navy?

Secretary PATTERSON. I talked to him from time to time, never in very great detail.

Mr. THOMAS. Did you confer with the Secretary of State?

Secretary PATTERSON. Not on the provisions of the McMahon bill; no. I have conferred with him on atomic energy.

Mr. THOMAS. Did you confer with the Attorney General?

Secretary PATTERSON. Of course, his interests are mainly in foreign relations, in that aspect of it.

Mr. THOMAS. How about the Attorney General—did you confer with the Attorney General?

Secretary PATTERSON. I do not think I ever conferred with the Attorney General about it.

Mr. THOMAS. Now, when we had the other bill before us, the one that we voted out, in your testimony you made this statement, and I quote from the hearings before the Committee on Military Affairs before the House of Representatives on atomic energy in connection with H. R. 4280, where you said:

In the opinion of the interim committee, the legislation you now have is the soundest and most comprehensive that could be drawn to cover all those phases of domestic control of atomic energy that require action in the interest of national security, world peace, and the promotion of human welfare.

You recall making that statement on that bill?

Secretary PATTERSON. Yes, sir.

Mr. THOMAS. Now you come in and say practically the same thing in connection with S. 1717.

Secretary PATTERSON. I think I pointed out yesterday that you have 8 months' more experience at this time than you had last October and that the draftsmen of S. 1717 therefore have the advantages of 8 months' more experience with the project and that much longer time in which to draft a bill.

Mr. THOMAS. That is just the point I was leading up to. Why the hurry now? Do you not think that maybe with 8 months' more experience we may be able to effect a better bill?

Secretary PATTERSON. No, sir. While the 8 months' experience has been of advantage in drafting a bill, there have been some very serious disadvantages from an 8 months' delay. You can imagine what goes on in a project where the future of it is just shrouded in uncertainty and the drifting away from the project that will take place where men who are working in it do not know what the United States is going to do about it.

There are various decisions of the highest importance to be made, some of them of a long-range character. It is not right to ask General Groves and his people to make those decisions when it is practically certain that they are not going to be responsible for the project in days to come. No; it has been a matter of great embarrassment that there has been no permanent legislation written yet on this bill.

Mr. THOMAS. Is that your only reason, though, for hurrying legislation?

Secretary PATTERSON. No. Then there is the international aspect of it, too, with the United Nations Commission on Atomic Energy about to meet. I think that is also an element that presses for speed. I think I said yesterday that I thought it would have been well if we had had legislation passed, actually passed, last November; but when we pressed for that—well, we did not get it.

Mr. THOMAS. Supposing, in the drafting of this bill, we should give the Army and Navy veto power on the consideration of the Commission in connection with atomic energy, would you be in favor of that?

Secretary PATTERSON. No. I am content with the veto power in S. 1717 as given to the President, in effect to protect national defense.

Mr. THOMAS. But would you not include the Army and Navy?

Secretary PATTERSON. As the bill provides, he may act on the suggestion of the Secretary of War, the Secretary of the Navy, or both.

Mr. THOMAS. Yes; but in the meantime, either unwittingly or otherwise, a member of this Commission or an employee of the Commission might give away some very great secrets. Do you not think it would be better to permit the Army and Navy to be closer to the picture all the time?

Secretary PATTERSON. They are given by this bill a consultative capacity and security regulations, and measures for security of information are to be adopted by the Commission. I think that is right; it ought to be the prime responsibility of the Commission.

Mr. THOMAS. The thing that bothers me, Judge, is that I think there is a desire on the part of some people to forget the security angle

of it and forget the atomic bomb end of it and forget that it is a weapon that is probably doing more to bring about peace than anything else right at the present time, and going all of the way over the other way and opening the door to other nations in the world and saying, "Here we are"; or, at least, "You can come in and have some of this."

Secretary PATTERSON. I think there is that tendency in some quarters; I agree with you; but I do not think that tendency prevailed in the writing of this bill, S. 1717. I think the bill devises adequate safeguards against the activities of the people you mentioned.

Mr. THOMAS. Do you not think, though, with so much unrest in the world, that it would be better for us to just delay a little while longer until things are more peaceful?

Secretary PATTERSON. Delay in writing legislation?

Mr. THOMAS. Yes.

Secretary PATTERSON. No. I want to see this enterprise go forward with good vigor, and it will go forward to the best advantage if you give them some legislation without delay.

Mr. THOMAS. We are making atomic bombs now, are we not? That has been in the newspapers. I think it is common knowledge.

Secretary PATTERSON. The project is in operation; that is true.

Mr. THOMAS. Do you not think we should do everything we possibly can to safeguard that project and not open the doors with some legislation so that you might permit somebody else to come in?

Secretary PATTERSON. I think you will promote the project to best advantage if you pass this bill promptly.

Mr. THOMAS. I do not understand it; I do not see why.

Secretary PATTERSON. I just said that in my humble opinion, it would have been wise to have done it last November.

Mr. THOMAS. And you said by a delay of 8 months we got a better bill.

Secretary PATTERSON. But I have said also that the delay was to the detriment of the operations of the project.

Mr. THOMAS. Who wanted this legislation, in the first place? Did the War Department want the legislation, did the President want it, or who wanted it?

Secretary PATTERSON. The War Department wanted it, and the President wanted it; both. We said so last October when we came down here. I am not charging any delay to you gentlemen. You acted promptly.

Mr. THOMAS. That is all I have, Mr. Chairman.

The CHAIRMAN. Mr. Brooks.

Mr. BROOKS. I have no questions, Mr. Chairman.

The CHAIRMAN. Mr. Martin.

Mr. MARTIN. Judge Patterson, I am quite disturbed by this provision making the Commission five full-time civilian members. Apparently from the Senate report on Senate 1717, page 11, it is very definitely limited to civilian membership.

Secretary PATTERSON. Yes; it is.

Mr. MARTIN. I am wondering whether the War and Navy Departments have thought of changing that provision to enable a representative of the War and Navy Departments to take a position as one of the commissioners.

Secretary PATTERSON. Well, of course, we did think of that; and the May-Johnson bill gave the President leave to use military personnel among the nine men on the Commission that was provided by the May-Johnson bill.

Mr. MARTIN. Now, that leave was not given in this bill, as far as the Commission is concerned?

Secretary PATTERSON. No; as far as the Commission is concerned, that leave does not appear in this bill. Of course, there was nothing mandatory, either, in the May-Johnson bill. The President could have appointed nine civilians and it would have been entirely inside of the terms of the act. It was only discretionary.

Mr. MARTIN. This bill apparently makes it mandatory that there not be nine.

Secretary PATTERSON. That is right. The bill at least does not take the case out of that 1870 act.

Mr. MARTIN. Would the War Department be opposed to any amendment to this bill authorizing one or possibly two members of the Commission to be representatives of the armed forces?

Secretary PATTERSON. We did not advocate it, and we do not advocate it. We believe that the national-defense aspects—and they are important on atomic energy—are adequately cared for by that paragraph in section 2, providing for the Military Liaison Committee.

Mr. MARTIN. I call attention to one statement on page 11 of the Senate report, as follows:

The decision to limit membership eligibility to civilians was adopted by the committee in keeping with the established traditions of the Government.

I wonder what other potential weapons in history have been so strictly limited as to direct military participation?

Secretary PATTERSON. Well, I think the theory of this act is that the President has the function of taking care of military interests in the operations involved here.

You notice not only does he make decisions under that paragraph in section 2, but also under section 6 he tells the Commission how many weapons to produce and also directs deliveries of them to the armed forces. That is on page 22.

Mr. MARTIN. That is contemplating the operation or functioning of the program under the direction of the President. What I am asking about here is what is the tradition referred to as being in line with the making ineligible of direct representatives of the national defense on such a commission as this? Do you know of any case where the armed services have been specifically barred from a commission controlling any weapon or a potential weapon?

Secretary PATTERSON. That is not exactly the way it is, Mr. Martin. They are not specifically barred. There is no language in this act taking the case out of the 1870 act, and, therefore, in effect, they are ineligible, an officer in active service is ineligible, for membership on the five-man Commission.

Mr. MARTIN. Exactly that. Unless we put some provision in here and except them from the 1870 act they will be ineligible and barred from the Commission.

Secretary PATTERSON. I have agreed that that does not state it specifically.

Mr. MARTIN. The application of the 1870 act to a measure controlling a weapon, or a potential weapon, of this character seems rather out of step with tradition. I know of no case in our history where the armed forces are barred in such an effective way from participation in the development or the management of the development of a weapon.

Secretary PATTERSON. If this were exclusively a weapon, I would heartily agree with that.

Mr. MARTIN. You will admit it is a potential weapon, Mr. Secretary.

Secretary PATTERSON. Oh, yes; and thus far its only application has been that of a weapon.

Mr. MARTIN. My viewpoint is from that of national defense and the effect on national defense of the barring of men who are best qualified to deal with national defense from serving on a commission having control of such a potential weapon.

Now, let us go down a step to the general manager and the division managers operating under him. There is one division there in section 2 of the bill—section 2 gives this Commission outline, and then under that there is subsection 4 (a), which deals with the general manager and the four division heads. One of those divisions is the Division of Military Application. Now, does the act of 1870, unless we make some exception here, bar a direct representative of the armed forces from serving as head of the Division of Military Application?

Secretary PATTERSON. I should say that it did bar him.

Mr. MARTIN. Is that in keeping with the traditions of our Nation?

Secretary PATTERSON. Well, I think so. There are plenty of cases where in the last war weapons were developed, say, by OSRD, the Office of Scientific Research and Development.

Mr. MARTIN. That was developmental work. This is the Division of Military Application. This has not a thing to do with the development. This is the Division of Military Application.

Secretary PATTERSON. They do not mean applications in the field.

Mr. MARTIN. What do they mean? They say "application."

Secretary PATTERSON. Oh, no; they mean military utilization of atomic energy. That is what they mean. They mean research and development of new weapons.

Mr. MARTIN. And that must be by a man who has no direct connection with our armed forces?

Secretary PATTERSON. I do not think that this is necessarily in violation of our traditions. There have been a good many weapons developed by military personnel and a good many weapons developed by civilian personnel just in the last 5 years.

Mr. MARTIN. I grant you that, but to have all representatives of the armed forces barred from this Division of Military Application of such weapons, to have them barred from that important position in the military field, strikes me as rather farfetched from the best development of our national defense, and that is the only approach I am making here.

Secretary PATTERSON. I think we probably are putting different constructions on military applications. As used in this paper it means to me improvements, experiments, and research and development for more powerful weapons. It does not mean at all how the armed forces are going to use them. That is not the business of this Atomic Energy Commission.

Mr. MARTIN. They make such a fine distinction here as to say that, "The Commission shall require each such division to exercise such of the Commission's powers under this act as the Commission may determine, except that the authority granted under section 3 (a) of this act shall not be exercised by the Division of Research," and section 3 (a) has to do with research and development.

Secretary PATTERSON. This Commission has absolutely no power over the employment of atomic weapons in the field.

Mr. MARTIN. That leads me to think that research and development is not what they intended to include under military application.

Secretary PATTERSON. I am sure they do, because you go over to section 6 and it empowers the Commission to make research and development of military applications.

Mr. MARTIN. Here we have the specific statement in the proposed bill, "except that the authority granted under section 3 (a) of this act shall not be exercised by the Division of Research." I think they are taking research and development out from under these divisions here that we are talking about, but I am trying to get down to what is meant by military application, and why is it taken away from representatives of the armed services.

Secretary PATTERSON. Military application means, as I see it, the research, development, and production of these atomic bombs. That is what it means, improvement in atomic bombs.

That would be the military application of atomic energy and then they turn them over to the armed forces as directed by the President and from that time on the Commission may have advisory powers, or it may forget the thing, if they know what goes on, where control is passed then to the armed forces. They do not mean military application by what goes on at Bikini this summer.

Mr. MARTIN. But now accepting your construction, is it your opinion that the military application, as you have defined it as that of research and development and construction or production of the military phases of atomic energy, is best handled by men having no connection with the armed forces?

Secretary PATTERSON. I think when you give them the Military Liaison Committee that is provided for on page 7, and when you read section 6—

Mr. MARTIN (interposing). That is purely advisory there. I am talking now about the Director of this Division of Military Application, a \$14,000 executive.

Secretary PATTERSON. Well, I believe that you have got to have this atomic energy enterprise handled as an entity. Therefore you have got to have it under some one body.

Mr. MARTIN. Is there any objection to our making a military man eligible to the Office of Director of Military Application?

Secretary PATTERSON. Well, I have no objection myself.

Mr. MARTIN. That is all.

Secretary PATTERSON. I would have none. There is certainly force in what you say, although I think the bill is adequate.

The CHAIRMAN. Mr. Elston, do you have any questions?

Mr. ELSTON. Judge, you say that there is necessity for very prompt action at this time in the enactment of this legislation. Now, can you give us any reasons why it is essential that we proceed to enact this bill immediately?

Secretary PATTERSON. Well, you may dismiss what I say, Mr. Elston because I always come down here with urgent cases. Sometimes I get urgency and sometimes I do not, and still we seem to bump along, but to direct myself to your inquiry, I submit that the considerations favoring promptness in this are these:

The operation of the enterprise by us has been injured and will be injured further by delay. There is absolutely no congressional act on atomic energy.

As I explained yesterday it was committed to the War Department as a war project simply by direction of the President in 1942. Congress has never acted on it. All you have done is appropriate funds in very general language without any reference to this particular project, so that we have been acting without any guide at all.

It is a matter of such enormous importance to the Nation and to the whole world that the will of Congress and the policy of Congress in regard to this ought to be declared without delay.

It has had an affect upon the personnel of the enterprise, and there has arisen uncertainty and doubt as to what the future of the project is to be and what the will of Congress is to be upon it.

It has also embarrassed those in charge of the project in making decisions that are urgently required, decisions that may affect the future, and also we have these arrangements on an international basis going forward, and we do not even know what our own domestic policy is going to be.

How can those people who represent us on the United Nations Commission make commitments as to what the United States will do on a reciprocal basis when we have not even got control of atomic energy within our own borders?

Mr. ELSTON. Well, have any other nations passed any legislation similar to this?

Secretary PATTERSON. I cannot say, but that would have not a great deal of bearing on it, in our opinion, because we are farther along the path than any other nation. We are the only nation which has actually got a plant in operation.

Mr. ELSTON. What about Great Britain and what about Russia?

Secretary PATTERSON. They are nothing like we are; they are nowhere nearly along the path that we are. We are years ahead of them.

Mr. ELSTON. Do you not think it would be better to come to some international understanding and have some definite international policy laid down before we begin to enact legislation to carry it out?

Secretary PATTERSON. No, sir. This act makes allowance for that, and the act is subject to any international arrangement to be made. Therefore there is no need for that.

Mr. ELSTON. At the present time there is no international understanding or policy with respect to dealing with atomic energy?

Secretary PATTERSON. Only insofar as it was laid down last December and then in the London meeting in January of the United Nations they did agree upon certain broad proposals there and agreed to form the United Nations Commission.

Mr. ELSTON. Would not a better plan be for them to agree on a policy and then have all interested nations to enact some kind of legislation?

Secretary PATTERSON. That is putting the cart before the horse.

Mr. ELSTON. It seems to me it is just the reverse.

The CHAIRMAN. You think the horse ought to be before the cart anyway, regardless, Mr. Secretary?

Secretary PATTERSON. Yes. I do not see how we can commit the Nation on an international level to what we will do when we cannot even say what our own citizens may do or may not do in regard to atomic energy because we have no legislation on that point.

How can we say that a nation should be an exporter or an importer or something like that of these atomic energy materials or equipment when, for all I know it is perfectly legal in this country for anyone to do as he pleases right today on atomic energy?

Mr. ELSTON. Well, can you not trust American industry to do what is right?

Secretary PATTERSON. In the main, yes; but you still have got to have laws on it.

Mr. ELSTON. You never had any laws regulating the use of electricity or gunpowder.

Secretary PATTERSON. I do not agree with you on that.

Mr. ELSTON. Or other forms of power, but we got along all right.

Secretary PATTERSON. I think we have a lot of laws directing the control of those activities.

Mr. ELSTON. Yes; but we never had any law that restricted industry from research or development in the field of electricity or any other form of power.

Secretary PATTERSON. This is supposed to encourage, and I think does encourage, research and development by private industry.

Mr. ELSTON. It only would encourage them if the Commission does see fit to give them the right to go ahead.

Secretary PATTERSON. They are directed to.

Mr. ELSTON. There is not anything in this bill that would compel the Commission to give industry the green light to go ahead and develop the industrial use of atomic energy. They could give it to one company and refuse to give it to another company.

Secretary PATTERSON. This bill does not provide that. This bill, like the May-Johnson bill, provides that it shall be done on the broadest possible basis, on an equitable basis.

Mr. ELSTON. It is entirely within the discretion of the Commission. There is no appeal beyond the Commission.

Secretary PATTERSON. There is no appeal above the Commission, I think that is true.

Mr. ELSTON. Their decision is final. If they want to exclude one company and include another company they can do it and nothing can be done about it.

Secretary PATTERSON. I do not think there is any language in the act that would permit an arbitrary decision like that.

Mr. ELSTON. I do not see anything that would prevent it. There is no appeal from the decision of the Commission.

Secretary PATTERSON. They provide, however, for appeals within the Commission.

Mr. ELSTON. It is an appeal within the Commission, but if the Commission ultimately makes a decision you cannot go beyond that. That is too much like the OPA.

Secretary PATTERSON. If they were to launch out on a course like you described, Mr. Elston, they would be violating the provisions of

section 5 and certainly section 7. In section 7, then, they have procedure for the utilization of atomic energy which gives Congress a chance to make its will known about the matter by providing a 90-day cooling period.

Mr. ELSTON. Those cooling periods do not seem to be very popular right at the moment.

Mr. SPARKMAN. Will the gentleman yield at that point?

Mr. ELSTON. On the cooling-off period?

Mr. SPARKMAN. I did not ask for that, but since you give me that opportunity you gentlemen voted for it.

Mr. ELSTON. I certainly did, and I will vote that way again.

Mr. SPARKMAN. Judge Patterson, under the utilization title of this bill Congress always retains control, does it not?

Secretary PATTERSON. Yes, sir.

Mr. SPARKMAN. And also in setting up the Joint Committee, it is recognized that Congress shall retain control and further than that is it not true that the Commission has to report periodically to the President of the United States and to the Congress?

Secretary PATTERSON. Yes.

Mr. SPARKMAN. In order that we may keep constantly advised as to what progress is being made?

Secretary PATTERSON. Yes.

Mr. ELSTON. Is not that exactly what a number of other Government agencies do?

Secretary PATTERSON. Yes.

Mr. ELSTON. And does not Congress have a check on all Government agencies? There is nothing new in that.

Secretary PATTERSON. I think the Joint Committee on Atomic Energy as provided for in section 14 is somewhat of a novelty.

Mr. ELSTON. That just specifically sets up, Judge, what actually would happen anyhow?

Secretary PATTERSON. Yes.

Mr. ELSTON. It requires the same review by the Congress and the Congress can review the activities of any agency.

Secretary PATTERSON. Yes.

Mr. ELSTON. The thing that we are up against today is that we have laid down in the law certain rules, limitations, and restrictions on Government agencies, and they do not pay any attention to them.

Secretary PATTERSON. I think this Joint Committee on Atomic Energy, of course, is intended to keep Congress adequately informed. I think that is the purpose of that Committee. Of course, it is not the administrative body.

Mr. ELSTON. Judge, I do not want to prolong the questioning on that particular point, but you maintain, do you, that the War Department needs this legislation in order to go ahead and conduct research into weapons and to go ahead and develop weapons such as the atomic bomb? You have done an excellent job, a magnificent job under just an Executive order, and there is nothing today that would prevent you from going ahead and doing the same thing if Congress gave you the authority that you mentioned a moment ago. In other words, if Congress gave you the legislative authority that you already have by Executive order. Now, if you had that authority the people in these plants that you speak of would know where that plant was

going and there would not be any difficulty at all in going ahead and developing atomic weapons, would there?

Secretary PATTERSON. I believe there would. The need has been felt in the War Department since the close of the war, say since last September, for a declaration by the Congress of a long-range policy on atomic energy.

I agree with you that we can operate it. We have been operating it since the close of the war. We can operate it in June, July, August, and so forth, but I think if it is to be operated to the best advantage not only for war purposes, but for broad-scale development, that it would be better if an agency like the agency described in this bill were given the responsibility for it.

Mr. ELSTON. Although such an agency was never before set up?

Secretary PATTERSON. That is true.

Mr. ELSTON. In fact, before you had the Navy Department and War Department to go ahead and develop weapons, and you mentioned at the outset that there had been some criticism of the previous legislation because it had the appearance of giving too much control to the War Department, the Army, and the Navy. Now, the minority views of this committee are not along that line. As a matter of fact, the minority views of this committee are that the War Department and the Navy Department were, perhaps, not given enough authority in the matter. There was objection to turning everything over to a civilian agency, and now we are going even further, and we are turning over more to a civilian agency than was contemplated in the May-Johnson bill. The War Department now has control completely closed on them.

Secretary PATTERSON. No; I think there is a better provision and a better means provided by this act for participation by the military in future developments of atomic energy than in the May-Johnson bill. The charges you mentioned were always without foundation, utterly without foundation, Mr. Elston.

Mr. ELSTON. I agree with you 100 percent——

Secretary PATTERSON. But faced with the text of the act they could not say a word.

Mr. ELSTON. But as it is now if this legislation passes you would have to get down on your knees for authority from a civilian Commission on which the War and Navy Departments are not even represented. While I do not think we are quite in that bad a position, I think the concern on the part of the people that are working in these projects has arisen by reason of the fact that there has been so much talk about legislation, and if the matter had been permitted to go along there perhaps would not have been that apprehension on their part.

Secretary PATTERSON. I agree with you that that is arguable.

Mr. ELSTON. Now, would you mention one thing that has happened which has been detrimental or injurious to this country by reason of the fact that prompt action was not taken on the May-Johnson bill?

Secretary PATTERSON. No one specific act, no.

Mr. ELSTON. Now, Judge, I want to ask you about the constitutionality of the law. Do you maintain this proposed act is constitutional?

Secretary PATTERSON. It would not occur to me to doubt it.

Mr. ELSTON. Are you familiar with Supreme Court decision in the Shechter case which held NIRA unconstitutional?

Secretary PATTERSON. In general.

Mr. ELSTON. Now, the Supreme Court of the United States in that case held the act was unconstitutional because Congress had delegated to an agency of the Government the power to write codes to provide that certain acts should be punished. In this proposed act we go much farther than Congress ever attempted to go in the NIRA because in this proposed act we give to this Commission the power and the authority to make regulations the violation of which shall be felonies, not misdemeanors, but felonies.

Do you think the Congress has the power to delegate to any agency the right and the authority to make a law which will imprison a person in a penitentiary for a period of more than 1 year and a day?

Secretary PATTERSON. I have read this proposed act and given it some study. It did not occur to me that there was any undue delegation of authority to this Commission by Congress. The part on penalties and enforcement is reasonable in every way, I believe.

Mr. ELSTON. Let me call your attention to this section, Judge. You may have overlooked it because you have a tremendous amount of work to do. Section 15 (b) provides:

Whoever willfully violates, attempts to violate, or conspires to violate, any provision of this Act other than those specified in subsection (a) and other than section 10 (c), or of any regulation or order prescribed or issued under sections 5 (b) (4), 10 (d), or 12 (a) (2), shall, upon conviction thereof, be punished by a fine of not more than \$5,000 or by imprisonment for not more than two years, or both.

Does not that confer upon this Commission the power to make regulations, or even orders, and if they are violated the violator can be sentenced to the penitentiary or fined as much as \$20,000?

Secretary PATTERSON. Well, the \$20,000, of course, is an aggravated offense, to cover what is, in substance, treason.

Mr. ELSTON. Let us leave it at \$5,000. The \$20,000 is for a more aggravated offense, that is true, but the imprisonment for not more than 2 years and the fine of \$5,000 may apply for the violation of an order of the Commission?

Secretary PATTERSON. I have not traced down what the other provisions are in the sections that are enumerated, sections 5 (b), section 10 (d) or 12, but it is not surprising to me at all, and I think I can find you many more other statutes enacted by Congress along similar lines.

Mr. SHERIDAN. Will the gentleman yield?

Mr. ELSTON. Yes.

Mr. SHERIDAN. On what basis does the gentleman think that the Supreme Court would be consistent?

Mr. ELSTON. Of course, I would say to the gentleman from Pennsylvania that at the time the Supreme Court of the United States declared NIRA unconstitutional we had some lawyers on the bench. Maybe they would not today.

Mr. SHERIDAN. Of course, judge, the penalties that Mr. Elston objects to were carried also in the May-Johnson bill which was reported out, and is it not true that the Selective Service and Training Act carried similar penalties.

Secretary PATTERSON. Why, yes. Hundreds of acts do. I have no doubt of that at all.

Mr. SHERIDAN. Practically every act that has been passed setting up an enforcement agency to enforce certain things has carried similar penalties, has it not?

Secretary PATTERSON. An act would not be worth much if it did not.

Mr. SHERIDAN. And, of course, it is always subject to court review.

Mr. ELSTON. There are many acts on the statute books today that have not been declared unconstitutional because they have not been tested. They have been passed in recent years where there has not been an opportunity to test them, but the NIRA was tested. If there is any difference between the authority given in that act and the authority given in this proposed act I would like to know what it is.

Secretary PATTERSON. Well, the power to pass orders and regulations would not amount to much if they could be violated without any penalty attached to their violation.

Mr. ELSTON. Judge, I grant you that that is true, but the law says that Congress must indicate the standards and Congress has not done that in this proposed act. They have given them general authority to enact any regulation or order they see fit to carry out the general provisions of this proposed act, and for the violation of any one of those orders they have provided penalties.

Secretary PATTERSON. I think this act does go into great detail. I rather think that if it were subject to any criticism under any head it would be too much detail rather than too little.

Mr. ELSTON. I think if you will examine NIRA you will find that it does not go into as much detail as that act went into.

Now, is there anything in this act that would prevent the Commission from giving away the secrets of the atomic bomb?

The CHAIRMAN. Do you mean any penalty on the Commission for doing it?

Secretary PATTERSON. Yes; of course, what the Commission will do depends upon the quality of administration that it gives to any statute, but certainly the provision here on security of information covers it.

Mr. ELSTON. To what section are you referring?

Secretary PATTERSON. I am referring to section 10.

It shall be the policy of the Commission to control the dissemination of restricted data in such a manner as to assure the common defense and security. That is a charge by Congress to the Commission not to give away important secrets that have to do with defense and security information.

Mr. ELSTON. Now, let us follow what comes next:

Consistent with such policy, the Commission shall be guided by the following principles:

(1) That information with respect to the use of atomic energy for industrial purposes should be shared with other nations on a reciprocal basis.

Secretary PATTERSON. And—

as soon as the Congress declares by joint resolution that effective and enforceable international safeguards against the use of such energy for destructive purposes have been established.

That put it entirely within the power of Congress.

Mr. ELSTON. Well, Congress only passes some legislation or some resolution setting up international safeguards, but when Congress does

that there is not anything to prevent the Commission from giving away the secrets of the atomic bomb. In fact, the section just read requires them to do it, not necessarily the secrets of the atomic bomb, but that information with respect to it shall be shared with other nations on a reciprocal basis.

Secretary PATTERSON. It forbids any action in that connection until joint action by Congress.

Mr. ELSTON. That means giving them information with respect to the use of atomic energy, with respect to the industrial use of it, to other nations. Now, as a matter of fact, the whole purpose of this bill is to give away information in respect to atomic energy, is it not?

Secretary PATTERSON. No, sir.

Mr. ELSTON. What other purpose does the bill have?

Secretary PATTERSON. It has a lot of other purposes but the very words you mentioned are conditioned upon Congress declaring later by joint resolution certain things. There is nothing for the Commission to do until in fact Congress has taken further action. That seems to be very plain.

Mr. HOLIFIELD. On page 4, in lines 18 to 20, provision is made that the President can remove any member of the Commission for inefficiency, neglect of duty, or malfeasance in office, which would clearly give the President a check on the Commission, and in other places the Commission is directed to do certain things.

Mr. ELSTON. It would do a lot of good to remove a member of the Commission after he had given away the secrets of the atomic bomb.

Mr. ALMOND. Mr. Secretary, on page 21 under (d) general provisions, beginning on line 17 it provides:

The Commission shall not distribute any fissionable or source material to any person for a use which is not under or within the jurisdiction of the United States or to any foreign government.

It has been suggested that that provision be amended by adding to the bill after the word "Government" in line 20—

or to persons within the jurisdiction of the United States where issuance thereof would be inimicable to the common defense and security.

Do you think that would be a wholesome and protective amendment?

Secretary PATTERSON. I agree with that objective. Of course, if a person whom the Commission believed to be hostile to this Nation could get fissionable material under this language without the words you mentioned I would be in favor of the words being added, but I take it that the Commission has power to do that under the bill as it stands.

Mr. ALMOND. Do you not think it would be safer, though, to make a positive restriction in that direction and have the Congress speak there positively stating that that shall not be done?

Secretary PATTERSON. If there is any possibility of it being done without that language being added I would be in favor of the language being added. I have the impression, however, that the Commission has power to deny materials to such a person already under the act. If there is any doubt about it I think language ought to be added to make that clear.

Mr. ALMOND. That is all.

The CHAIRMAN. Mr. Johnson.

Mr. JOHNSON. I think you ought to clear up here just about the secret of this bomb. When hearings were held by the committee before, if I got the correct interpretation of the witnesses' language, they said that it was common knowledge among the scientists of the world as to atomic energy. They said that all the real secret, if there is one, is the manner in which the bombs may be made. Is that a correct statement?

Secretary PATTERSON. I do not think it is quite correct. I think there is widespread information on the basic scientific data. On the industrial processes resulting in the release of atomic energy or in the production of the materials from which the bomb is made there are a great many secrets.

Mr. JOHNSON. And is it a fact that the United States and perhaps Britain, in part, are the only ones who know those secrets?

Secretary PATTERSON. I think we are the only ones.

Mr. JOHNSON. In other words, the industrial know-how is still a secret?

Secretary PATTERSON. A great many facts in it are certainly still secrets.

Mr. JOHNSON. Suppose this occurred, just looking ahead into the future, that we entered into some kind of an international agreement in this sort of form, that the international security organization would have a right to make bombs. I assume in that case we would tell them the secrets, the industrial secrets that we have as to how they shall be manufactured and, of course, the countries would all agree that they would be not only the places where the secret reposed but where the bombs could be made, is that right?

Secretary PATTERSON. You are going to have Mr. Baruch before you. I think he is a specialist in that. You are getting me off on to some fields that are quite different from the matters, of course, covered in the bill today.

Mr. JOHNSON. Well, the language in here contemplates that very thing, as I understand it, some of those sections which said it would make necessary international safeguards, and is it not the very basic idea of the United Nations that there shall be a common security agency to protect all the nations? Is not that correct?

Secretary PATTERSON. That is one of the plans.

Mr. JOHNSON. Well, they would be the ones who would have to handle the atomic bomb. What I am looking forward to is this condition if a nation withdrew from that she would have all of the secrets that the international group had and they could use those secrets on us and on others. Would not that logically follow?

Secretary PATTERSON. There are reasons along that line, perhaps, but I would prefer not to get into that, Mr. Johnson, if you will excuse me, because it has nothing to do with the provisions of this S. 1717. It has to do with United Nations action.

Mr. JOHNSON. I want to ask you one more question. In 1922 we sat down and determined to reduce the size of the navies of the world, and we all agreed to that, and we scrapped the greatest bulk of shipping. In less than 10 years one nation withdrew from that agreement. Now, could we not have a repetition of that very thing in the plan we have here?

Secretary PATTERSON. Well, perhaps you could, but what has that to do with the merits of this bill?

Mr. JOHNSON. It has to do with the merits of the bill. This bill is a step to get us into an international group.

Secretary PATTERSON. It is more than that, of course. This measure would be necessary if you had complete failure of all efforts on the international level.

Mr. JOHNSON. That is right, but is this not the basic underlying idea of this bill: First, that we are to control absolutely the material and the processing and construction of atomic bombs and other atomic energy uses?

Secretary PATTERSON. Yes, sir.

Mr. JOHNSON. That is complete control in every detail?

Secretary PATTERSON. Yes, sir.

Mr. JOHNSON. Is that not just a step, then, if we are going to build up world security, after we have gotten control of all this, to turn it over to an international group of which we are a party?

Secretary PATTERSON. That may be, and yet to govern the relation in this country between our own citizens, and so on, this act is necessary, or an act like it.

Mr. JOHNSON. You think it is so dangerous to let loose that we must control it; is that the idea?

Secretary PATTERSON. Yes, sir.

Mr. JOHNSON. The idea is, that from the viewpoint of materials and atomic energy, to let the public handle it without complete regimentation?

Secretary PATTERSON. I think that is so, in any appreciable quantities.

Mr. JOHNSON. Would the security groups in our country, the Army and Navy, would they have any real control over it after that happens, except just to go to the President, who has a million other things to do without worrying about Army and Navy troubles.

Secretary PATTERSON. I think the machinery set up in this act will function and will work without resort to the President, but provision for resort to the President, recourse to him, is provided in the act.

Mr. JOHNSON. Does not the report that the Secretary of State issues here, does that not merely contemplate that this is just one of the steps finally to get this thing in the lap of an international group?

Secretary PATTERSON. It has other objectives, too, as we have just discussed. That is one of the objectives.

Mr. JOHNSON. In your responsibility as Secretary of War, do you not think you can weed out of this act the fact that some day this will be out of your hands, it will be in the hands of a foreign group of which you are only one member?

Secretary PATTERSON. The War Department has supported efforts to control atomic bombs by compact of nations.

Mr. JOHNSON. We just want to try to explore the fact that we might some day find ourselves without any weapons of this kind, and the secrets and the weapons in the hands of a foreign group. Is that not what could happen?

Secretary PATTERSON. That could happen.

Mr. JOHNSON. There is that possibility. There is that danger there in the whole program. Is that not true?

Secretary PATTERSON. Yes, sir. You must do the best you can on control of this force.

Mr. JOHNSON. The real control, if it will work, I think it is your opinion and mine also, that the real control, if it will work, is to have it where the family of nations can handle it.

Secretary PATTERSON. Yes, sir.

Mr. JOHNSON. That is really what we are aiming at, is it not?

Secretary PATTERSON. Yes, sir. If you do not have that, the time will surely come when everybody has atomic bombs.

Mr. JOHNSON. In this bill, do you read the language to mean that if we perfect the necessary treaties that the Commission without any further permission of Congress can turn over the secrets of the manufacture of atomic bombs?

Secretary PATTERSON. I do not understand that; no.

Mr. JOHNSON. I am assuming there is a treaty in which we develop an international police force and equip them with the appropriate weapons of that day. Do you still think we need further action by Congress to turn those secrets over?

Secretary PATTERSON. That involves two sections of this bill. There is a section that makes this act subordinate to international agreements. Is that 7?

Mr. JOHNSON. That refers to restricted data.

Secretary PATTERSON. No; there is a section here. Then there is another section 10, which Mr. Elston was just discussing which does require further congressional action before such information can be released.

Mr. JOHNSON. Mr. Secretary, will you look on page 29, please, subsection (1). It says that restricted data as used in this section means all data used in the manufacture and so forth of atomic weapons—

but shall not include any data which the Commission from time to time determines may be published without adversely affecting the common defense and security.

In that section, they have the determination of that, and not you.

Secretary PATTERSON. Yes; just as we have had it down to the present time. The War Department has had it, and we have released a great deal of data and have exercised the power here committed to the Commission.

Mr. JOHNSON. Is it your idea on the other one, here, if we effect an international agreement whereby we agree to give these weapons to an international police force, this Commission can do that without any further act of Congress, or the President can do it also?

Secretary PATTERSON. They cannot release this information to be shared with other nations on a reciprocal basis until—

the Congress declares by joint resolution—

I am reading at the top of page 29—

that effective and enforceable international safeguards against the use of such energy for destructive purposes have been established.

Mr. JOHNSON. That is reciprocal arrangement. I am talking about the situation where we have the United Nations Security Force organized. We turn over the atomic weapons to them, and the manner of making them. Can that all be done if it is under a treaty without any further conduct on the part of the Congress or the President?

Secretary PATTERSON. It shall mean any treaty approved by the

Senate or international agreement approved by the Congress. That is on page 26. If that is done and it conflicts with any provisions of this act in that respect, it shall be deemed of no further force and effect. That is what it says.

Mr. JOHNSON. Whatever the treaty arrangements are, that would be the binding law, on everybody in our country, with reference to atomic energy and atomic weapons?

Secretary PATTERSON. I think so.

Mr. JOHNSON. In the bill, I do not remember the section, there is a very broad reference to patents. I have mentioned this to you. Is it your construction, or could you put one in the record later, that anybody who wants to get a patent that in any way has something to do with atomic energy or atomic principles, no matter how remote from the manufacture of a bomb, must clear through this Commission?

Secretary PATTERSON. I suspect you are right on that. Section 11 covers patents and inventions and it covers about seven pages. I honestly do not know all of the details of those seven pages.

Mr. JOHNSON. I wonder if somebody could put something in the record on that.

Secretary PATTERSON. The May-Johnson bill was very short on that. I think it gave the Commission power to acquire any patent.

Now this goes into great length, as to compensations and a great many matters. I can be of no real aid to you on that patent question.

Mr. JOHNSON. Has the War Department acquired all patents as affect this fissionable material or affecting atomic bombs; have we acquired all of them?

Secretary PATTERSON. We have acquired practically all of them, I believe. We have gotten all that we could.

Do you mean have we made an effort to get them into Government control? Yes; we have.

Mr. JOHNSON. Have you gotten all of them, though?

Secretary PATTERSON. Do you mean have we gotten all inventions?

Mr. JOHNSON. Yes; all patents; those that are actually patented by the Patent Office.

Secretary PATTERSON. It is my impression that we have virtually all of them.

The CHAIRMAN. Are there any further questions?

Mrs. LUCE. I have just a general question, Mr. Secretary: As between giving this atomic baby to the free American enterprise system to develop into a kind of Henry Ford, you are satisfied with this decision of Solomon which splits and baby neatly into two parts and sutures it together and hands it over to a commission; is that correct? It is not in your mind the best possible compromise to split the baby?

Secretary PATTERSON. I have said that I am in favor of the passage of the bill.

Mrs. LUCE. May I ask you if you are in effect in favor of splitting the baby?

Secretary PATTERSON. I do not think the bill splits the baby.

Mrs. LUCE. Then in effect the baby is given to the Government.

Secretary PATTERSON. It has always been with the Government. The people as a whole have put every nickel into this enterprise. It has been under Government control from the outset. The War De-

partment has had it nearly 4 years. As I have explained, a year ago, in developing plans for postwar use, we said that it was time, on account of the vast possibilities in many fields that atomic energy would have application to, it would be taken over by a civilian agency. We say that then and we still say it.

Mrs. LUCE. I understand that. Then that really does make the development of this energy and new form of production—that does make the position of atomic energy in our Nation's life unique?

Secretary PATTERSON. Yes; I think it does.

Mrs. LUCE. In other words, this is a radical new departure for the American people when they take a great new resource and put it hedged around with tremendous restrictions in the hands of a five-man commission. That is a very new departure in American life.

Secretary PATTERSON. This goes further, I believe, than anything in the past. I think it is necessary to do so on account of the tremendous force and the vast possibilities in this energy; also, it is unique in the speed with which it was developed and the manner in which it was developed. Electric power did not come along that way at all. All kinds of people were experimenting in that and in all kinds of places and under all kinds of conditions. This one, however, from 1942 on, was a war measure exclusively developed under control of the War Department and the taxpayers' funds went into this, to the exclusion of all other funds.

Mrs. LUCE. Then would you also add, Mr. Secretary, that the fact that we are turning it over to a commission is an indication that we still contemplate probabilities that it will be used destructively rather than that it will be used in the ways of peace?

Secretary PATTERSON. No, the hazards in the way of peace alone are so considerable, the dangers from abuse of it are so tremendous that you have to have strict control by an administrative body in any event.

Mrs. LUCE. Do you think more than 45,000 people a year might be killed experimenting with it? That is the number that get killed by automobiles, and nobody has proposed socializing the Ford plant, just because thousands of people get killed. Industrial accidents far outweighed our losses in the war, but no one advocated socializing industry because of that particular danger.

Secretary PATTERSON. I believe the devotion of public money also to this enterprise makes it appropriate and fitting that the Government's interest in it, for the whole Nation, be recognized by vesting these powers in a commission. There was no private capital, nothing came out of your pocket or mine, except as we paid taxes for this.

Mrs. LUCE. May I ask you, if you could imagine—and this requires some imagination—a completely peaceful world as of tomorrow, with all peace treaties signed, everyone reasonably satisfied with their frontiers, trade agreements and so on, would it not be your inclination, as quickly as possible, to return the development of atomic energy to proper private initiative?

Secretary PATTERSON. Did you say "Return it"?

Mrs. LUCE. Yes.

Secretary PATTERSON. It has never been there.

Mrs. LUCE. In any event, do you not think it would be proper to "give" it to private initiative?

I believe it was due to the public laboratories in this country that made it possible for you to take it over.

Secretary PATTERSON. Yes, but it was always maintained by Government funds and under Government contracts. A great deal of it went on, but it went on as a division of the Manhattan project.

Mrs. LUCE. May I just repeat my question: In the event of peace in the world, do you still think that this great, new source of energy should be, in effect, owned by a commission which is not even socialistic, it is a commissariat.

Secretary PATTERSON. Yes. Do you mean barring all war, supposing war were safely outlawed and out of the picture, would you still have a plan like that in this bill?

Mrs. LUCE. Yes.

Secretary PATTERSON. I would say yes.

Mr. ELSTON. Following up the questions asked by Mrs. Luce, of course you do not contend, Mr. Secretary, that the atomic bomb and all other secrets of atomic energy were developed after the war started. Scientists had been working on this for a great many years and they were not working under Government supervision, and they were not working at the expense of the taxpayer.

Secretary PATTERSON. No, but there was very little progress made prior to 1940.

Mr. ELSTON. It was the ideas that were thrown together after we got into the war that brought about the atomic bomb.

Secretary PATTERSON. The expenditure of \$2,000,000,000 of public funds produced progress in 3 years that, in more normal times, would take 50 years.

Mr. ELSTON. It was all done without this kind of a commission.

Secretary PATTERSON. It was all done by the War Department, by the Government.

Mr. JOHNSON. As a matter of fact, was not the first bomb cracked out at the University of California under the direction of Dr. Lawrence, and that paved the way for all this work, did it not?

Secretary PATTERSON. Will the gentleman repeat his question?

Mr. JOHNSON. The first atom was split at the University of California. Dr. Lawrence was the man in charge of the work out there.

Secretary PATTERSON. I think Dr. Lawrence played a leading role certainly in the whole thing. Whether that was the very first or not, I cannot say—of course, California would claim it, all right.

Mrs. LUCE. Mr. Chairman, may I say just one more word: Mr. Secretary, I am not suggesting that I am not for this bill, because I think it is the best possible compromise we can make in this tragic problem in the kind of a world in which we live, but I just wish to suggest, I do not believe that it is the thing you would do if it were not the kind of world we have.

The CHAIRMAN. Mr. Secretary, we wish to thank you very much. We are sorry to have kept you so long.

Our next witness will be the Honorable W. John Kenney, Assistant Secretary of the Navy.

STATEMENT OF HON. W. JOHN KENNEY, ASSISTANT SECRETARY
OF THE NAVY

The CHAIRMAN. You may proceed with your statement, Mr. Kenney.

Mr. KENNEY. Before discussing the position of the Navy Department on the provisions of S. 1717, a bill for the development and control of atomic energy, I wish to state that the Navy Department has not yet been advised by the Bureau of the Budget as to whether or not the views expressed in this statement are in accord with the program of the President. I would also like to add that my discussion will be directed primarily toward the military aspects of the bill and how it affects the Navy Department.

At present there is no international arrangement guaranteeing this Nation against attack by atomic munitions. It is to be hoped that in time fully effective arrangements to that end can be established. Even then there are grave doubts as to whether any such arrangements are inherently possible of providing complete security. In the absence of such arrangements, or in the event of the failure to function properly in practice, this Nation must be prepared to defend itself. A considerable share of the responsibility for defense rests with the Navy. The Navy cannot discharge that responsibility unless it has adequate opportunity, within the limits of any international agreements, to prepare for the use of munitions as effective as those which may be used against us. Nor can the Navy, when danger to the Nation has arisen, receive weapons developed exclusively and secretly by a civilian commission and use them effectively. For the effective use of any weapon not only is the warhead required but, in addition, the military characteristics of the weapon as a whole must be investigated, tested, and developed. Joint research must be conducted on which the military applications can be based. Vehicles suited to carry it must be developed around the size, weight, and other characteristics of the weapon. Safety devices and precautions must be incorporated suitable to the manner of use, the personnel who will use it, and the ships, planes, or ground stations which will transport, launch, or store it.

Men must be selected and trained to use it with maximum efficiency. All this takes time and continuity of effort under the supervision of the organization which will in case of necessity be responsible for the employment of the weapon. Therefore, the Navy has an interest in being able to follow closely all work done in the field of atomic munitions in the next few years.

With respect to the use of power, as distinguished from the use of explosives, the Navy is in a unique position. The Navy is the greatest user of power and the largest power engineering organization in the world, which gives it an interest in the development and application of atomic energy for power uses. In addition, the fact that ships must carry their fuel makes it probable that the first general use of atomic power will be at sea rather than ashore. This development will be a tremendous and vitally important task to which the existing ships and other facilities of the Navy will be useful, if not indispensable, and will foreseeably carry with it an enormous ancillary program of redesign and complete readaptation of the ships so

powered. The effectiveness of any Navy is measured largely by its mobility and consequent ability to concentrate force when, where, and for as long as needed. This ability varies directly with ship's speed and fuel capacity. To defend the Nation's interests successfully, a Navy must be equal or superior to other navies in this respect. Failure to excel in this jeopardizes the safety of the Nation. Research, development, and engineering on a large scale must be integrated in the Navy's program to accomplish this.

Any legislation enacted for the development and control of atomic energy should recognize these important interests of the Navy, and, in our opinion, the provisions of S. 1717, as amended by the Senate, are satisfactory in most respects. The two points of most interest and concern to the Navy are—

(1) Whether the armed services will have adequate opportunity to be heard in the deliberations of the Atomic Energy Commission, and

(2) Whether the armed services will be free to conduct an energetic program of research and development in those phases of the field of atomic energy, for which they are largely responsible.

The provisions of section 2 (c) of S. 1717, under which a military liaison committee would be established, sufficiently insure that the views of the War and Navy Departments on matters affecting the armed services are given consideration in the deliberations of the Atomic Energy Commission. That provision in S. 1717 achieves the same objectives as would have been achieved if the Army and the Navy each had one representative on the commission of nine members proposed in H. R. 4566, the so-called May-Johnson bill. Although the "straw man" issue of military control versus civilian control of the Atomic Energy Commission has been raised and argued by others, the Navy Department has consistently been in favor of civilians having the power of decision in the affairs of the Atomic Energy Commission, although the Navy has been equally insistent on recommending that any legislation enacted contain provisions insuring that the War and Navy Departments have a voice in the affairs of the Atomic Energy Commission.

I think there are two interests that must be reconciled. The field of research and development is primarily a scientific field and one that is not susceptible of what we might term "military domination," but, on the other hand, it must be recognized that the military departments have certain responsibilities in the protection of military interests. I think a lot of the confusion and talk about the so-called military control features of the May-Johnson bill failed to recognize and evaluate both of those two interests.

The CHAIRMAN. What authority or power does the liaison arrangement in the Senate bill 1717, what power does that give either the Army or Navy to have anything to say about this?

Mr. KENNEY. That section provides that the Commission shall advise and consult. You will notice it places an obligation on the Commission to advise and consult with the committee, that is, the military liaison committee, "on all atomic energy matters which the committee deems to relate to military applications." That includes the developments relevant to the manufacture, use and storage of bombs.

The CHAIRMAN. What can you do about it?

Mr. KENNEY. There is also an obligation imposed on the commission to keep us informed. [Reading:]

If the committee at any time concludes that any action, proposed action, or failure to act of the Commission on such matters is adverse to the responsibilities of the Departments of War or Navy, derived from the Constitution, laws, and treaties, the committee may refer such action, proposed action, or failure to act to the Secretaries of War and Navy. If either Secretary concurs, he may refer the matter to the President, whose decision shall be final.

In other words, the forum is present in which we can present our case; namely, the President of the United States, and an obligation is imposed upon the Commission both to advise and consult with, and to keep the military liaison committee fully informed, so that the forum may be used when deemed necessary by the Armed Services.

The CHAIRMAN. How would you like to have written in there substantially this: "In advance of any final decision to advise and consult"?

Mr. KENNEY. I would have no objection to that because I would assume that the obligation to keep the Army and Navy informed on all such matters would result in requests for advice before any conclusive action is taken.

Mr. SHERIDAN. Would that not be superfluous, that under the present provisions of the bill, that when your liaison committee reports to the Secretary of the Navy or the Secretary of War, he has to concur in their conclusions and then the decision of the President is final, that decision of the President is final over and above any decision of the committee.

The CHAIRMAN. Is there anything requiring concurrence by the Army or Navy?

Mr. SHERIDAN. I believe I read that in the bill. Does the Secretary have to concur?

Mr. SPARKMAN. He does not have to concur, but if either Secretary protests the action of the Commission, he then may appeal to the President and the President has final authority.

Mr. KENNEY. That is correct, Mr. Sparkman. If the military liaison committee thinks it should or does disapprove the action of the Commission, they can refer it to the Secretary of War or Navy and have either of those Secretaries consider it. If one should object, he can then take it up with the President whose decision will be final.

Mr. SPARKMAN. If they concur, there is no need to carry it on.

Mr. KENNEY. No, then the armed services would have had their opportunity to speak.

Mr. HOLIFIELD. Mr. Chairman, may I question the witness on this point: That the language contained in the clause which says, "which the committee deems to be of military interest," that particular clause gives to the military liaison committee a broad, over-all control, or, you might say, jurisdiction, in regard to approaching the President on any matter which they deem to be of military application.

Mr. KENNEY. That would be the way I would interpret it.

Mr. HOLIFIELD. The Vandenberg amendment, of course, which that is, gave full protection in the eyes of the military to their right to go into and investigate and have knowledge of and complain, if necessary, for any violation of the military concept of security.

Mr. KENNEY. It is our belief—I will use the word “correlative”—that the correlative rights of the military regarding atomic energy are protected in section 2 (c).

Mr. SHERIDAN. May I refer the Under Secretary to the top line of page 8, in following through the duties of the liaison committee, wherein the committee may refer such action, proposed action, or failure to act to the Secretaries of War and Navy—

If either Secretary concurs, he may refer the matter to the President, whose decision shall be final.

Mr. KENNEY. I construed that as meaning that if either the Secretary of War or the Secretary of the Navy concurs in the opposition of the committee to the action of the Commission, he may then refer it to the President.

Mr. SHERIDAN. The decision of the President is then final?

Mr. KENNEY. Yes. The decision of the President on military matters should be final under any circumstances, because the President is the Commander in Chief.

It should be noted under section 2 (c) the Atomic Energy Commission has the duty of advising and consulting with the Military Liaison Committee—

on all atomic energy matters which the committee deems to relate to military applications, including the development, manufacture, use, and storage of bombs, the allocation of fissionable material for military research, and the control of information relating to the manufacture or utilization of atomic weapons.

In the opinion of the Navy Department, this and the other provisions of section 2 (c) constitute an effective mechanism whereby the armed services will be informed of, and will participate in, the work of the Atomic Energy Commission having to do with military applications in the atomic energy field. Therefore, the Navy Department strongly supports those provisions of the bill and urges that they be reaffirmed by the committee and by the House of Representatives.

If the provisions of section 2 (c) are retained, the Navy Department has no objection to the provisions of section 6 under which the Atomic Energy Commission would control in the first instance the production of atomic weapons. As we understand it, the civilian Commission would have the initial power of decision over such production, but the Military Liaison Committee would act in an advisory and consulting capacity to the Commission and would be able to appeal through the Secretaries of War and the Navy to the President if the committee disagrees with “any action, proposed action, or failure to act” (sec. 2 (c)) of the Commission on the ground that the lawful responsibilities of the War and Navy Departments are being jeopardized.

In addition to that voice in the military applications of atomic energy, section 6 (a) provides that the President “may direct the Commission to deliver such quantities of weapons to the armed forces for such use as he deems necessary in the interest of national defense.” The effect of all those provisions is to leave the final power of decision over all questions involving military applications to the President, and the Navy thinks that such an arrangement is desirable in view of

the President's position as Commander in Chief of the armed forces and his responsibility for the conduct of the foreign affairs of the Nation.

The second question of prime importance to the Navy Department concerns the provisions of S. 1717 that might be construed to relate to the research and development activities of the Navy in the field of atomic energy.

At that point, I would like to point out that one of the express purposes of the bill is a program of assisting and fostering private research and development to encourage maximum scientific progress.

The Navy Department is vitally interested in the development and use of atomic energy for many purposes, particularly as a source of power in ship propulsion. Plans are already under way whereby an extended program of research and development will be undertaken in the near future in the field of atomic power for use in ship propulsion. Our plans contemplate that eventually such a program will be carried out by projects placed with governmental organizations, including naval laboratories, and by means of contracts with private educational institutions and commercial organizations.

During the course of consideration by the Senate of the provisions of S. 1717, the Navy was concerned lest the language of section 3 of the bill be construed in such a way as to raise questions concerning the legal authority of the Navy Department to undertake such research and development activities, particularly by means of contracts with nongovernmental organizations. We were assured by the Senate Special Committee on Atomic Energy that, correctly interpreted, section 3 confers power on the Atomic Energy Commission to enter into research and development contracts in the designated fields, and to conduct research in those fields through its own facilities, and does not exclude other governmental agencies from entering into such contracts and conducting such activities in their own laboratories, if those other agencies are otherwise authorized by law to perform such activities. As we understand it, the Navy Department will be able to continue its research and development activities in the broad field of atomic energy and continue to enter into research and development contracts with nongovernmental organizations providing for such research and development work without receiving prior approval of its own programs by, or prior clearance of its proposed contractual arrangements from, the Commission.

Mr. ELSTON. Do you find any provision in S. 1717 that gives you that right or authority; does not S. 1717 require you to go to the Commission for all authority?

Mr. KENNEY. I would not construe that this way.

One of the express purposes of the act is to authorize "A program of assisting and fostering private research and development to encourage maximum scientific progress." We then find on page 23 in section 7 (a), which is the provision with respect to the issuance of licenses, this sentence:

Nothing in this section shall be deemed to require a license for the conduct of research or development activities relating to the manufacture of such equipment or devices or the utilization of fissionable material or atomic energy or for the manufacture or use of equipment or devices for medical therapy.

I think when you read this whole act in its entire context, taking into account the report of the Senate Special Committee on Atomic

Energy to which I have heretofore referred, that it is clear that the field of fundamental research is free. Activities in the field of atomic energy only come under the jurisdiction of this Commission at the time you get to the point of production, or at the time you need to require the use of fissionable material. There is one slight inconsistency on that point, Mr. Elston, which I should like to point out. At page 27, lines 16 and 17, in section 9 (a) (2) it is stated that, as to all property owned by the Government and in the custody of Government agencies, the President shall direct the transfer to the Commission "of all facilities, equipment and materials, devoted primarily to atomic energy research and development."

It is my understanding that what the drafting committee of the Senate meant in those two lines was that the Commission would take over certain existing research facilities of the Manhattan District of the War Department; namely, Oak Ridge, and other similar facilities, and not that they would then step out next month and take over new research facilities that were being developed by the Army or Navy or other Government agencies.

Mr. ELSTON. The bill provides that everything shall be turned over to the Commission, including atomic bombs as may have been developed, everything used and useful in the development of atomic bombs. Everything is turned over to the Commission. Therefore, how would it be possible for the Army and Navy to proceed with their plans for the development of atomic weapons without the consent and authority of the Commission?

Mr. KENNEY. That is why I raised the point that I think the language in lines 16 and 17 must be changed so that it is clear that it does not include the taking over of all of those properties, which are presently being used or will be used by the Army and Navy in our own research. The bill itself, I think, clearly indicates that we are to be free in the field of research at this time. The committee of the Senate concurred in that interpretation of the bill.

Mr. ELSTON. That is not the law, though. The interpretation of the committee is not the law.

Mr. SPARKMAN. Would it cure the inconsistency that you point out, to simply insert the word, "all 'existing' facilities and equipment"?

Mr. KENNEY. I think you must go a little further than that, because I think we in the Navy have some existing facilities which are used now in fundamental research which I do not believe that it is contemplated that the Commission would take over. I would like to take that up with the drafting committee and find out specifically what they had in mind. Probably the better thing to do would be to enumerate specifically the various things they contemplated taking over. This language here is quite broad.

Mr. JOHNSON. Is it your interpretation that in the future, if you wanted to experiment in atomic weapons in one of your navy yards that this law would not stand in your way, or would you have to get a permit from this Commission to do so?

Mr. KENNEY. If we wanted to do research work in the field of development of atomic weapons, we would be free to do so. If it required the use of fissionable material, we would then have to come to this Commission. In that section that I referred to before, the President has the power to direct the delivery of certain quantities of

weapons to the armed forces for such use as he deems necessary in the interests of national defense.

Mr. JOHNSON. Then your answer is that in order to make a bomb in any navy yard you have to clear through the President, then?

Mr. KENNEY. To do the research work, no, except that if the use of fissionable material is required. Once we get beyond the field of research into the field of production, then we come to the Commission.

Mr. ELSTON. Why is there any necessity for the section setting up a Military Liaison Committee if you already have the authority to go ahead with research and development?

If you read the section about the Military Liaison Committee, it would indicate that the Commission has complete and absolute authority and the reason for setting up the liaison committee is so that the committee, if it wants to do something, must consult the Commission to get their authority. They do not limit it simply to the production of fissionable material. That section is broad. It would seem to include everything, every activity in the War and Navy Departments; it would have to be discussed with the Commission, and the Commission would have to give its authority before you could proceed with anything.

Mr. KENNEY. I would not so construe it in the field of research to be performed by the Navy, rather than by the Commission. I would so construe it to apply to the field of production to be performed by the Navy, and I think there are a lot of the things we are talking about here that go beyond the field of research. I would construe the bill as a whole to limit the Navy's power only in the field of production.

Mr. ELSTON. Can you point out to me anything in the Military Liaison Committee section that indicates that it does not include research?

Mr. KENNEY. This section, subsection 2 (c), does not specifically refer to the problem of research to be performed by the Navy. It merely sets forth what shall be the functions of the Military Liaison Committee and their relationship to the Commission in the work of the Commission.

Mr. SHERIDAN. How about page 10, section 4, subsection (c), wherein is included the phrase "Ownership and operations"?

Mr. KENNEY (reading):

The Commission shall be the exclusive owner of all facilities for the production of fissionable material other than facilities which (A) are useful in the conduct of research and development activities in the fields specified in section 3, and (B) do not, in the opinion of the Commission, have a potential production rate adequate to enable the operator of such facilities to produce within a reasonable period of time a sufficient quantity of fissionable material to produce at atomic bomb or any other atomic weapon.

Mr. SHERIDAN. In your experimentation in ordnance and production of munitions, would it not be reasonable to expect the Navy Department to produce fissionable material enough to produce one bomb?

Mr. KENNEY. Yes.

Mr. SHERIDAN. Then under that, all the material you use or facilities, would become the property of the Commission, would it not?

Mr. KENNEY. Well, again it gets to the question of quantity. In our research laboratories, we ordinarily would not manufacture enough there to in any way involve production. It is only when we

get out into the field of production that the Commission steps in. The field of research is left open.

Mr. SHERIDAN. You would naturally want to produce one bomb. Line 24 prohibits one atomic bomb or one weapon. Now you and I have been around the research laboratories for ordnance in the Navy and the Army and you know they have more material than to be used in one instrument. Would that not all become the property of the Commission?

Mr. KENNEY. Yes. The Navy would then have to go to the Commission and obtain a license or contract to operate such facilities.

Mr. SHERIDAN. That goes right back to Mr. Elston's suggestion.

Mr. ELSTON. Right there, Mr. Kenney, if your interpretation of the act is correct, why is there any necessity for setting up a Division of Military Application within the Commission?

Mr. KENNEY. If I may continue with my statement, I will go into that question, as to the proper function of those divisions of the Commission in the field of research.

Mr. ELSTON. What would the director of a Division of Military Application have to do, if you have already the authority to go ahead and conduct all sorts of research? What would he do?

Mr. KENNEY. To be perfectly frank with you, Mr. Elston, I am not clear in my own mind from a reading of those sections as to just exactly what was intended by them; and I would like to suggest that, for the correct interpretation of those sections, you possibly talk to Mr. Newman, whom I believe is here in the committee room today, who was one of the men who worked on the drafting of the bill. I have some doubts in my own mind as to just exactly what those sections mean.

Mr. MARTIN. Do you mean the section creating the Director of Military Application?

Mr. KENNEY. Yes, sir; that is right.

To continue with my statement: In the opinion of the Navy Department, it is essential that the authority of the Navy Department to conduct such research and development activities be clearly expressed within the legislation itself or in the committee's reports.

S. 1717, in its present form, thus satisfactorily covers the Navy's primary interests in having a voice in the affairs of the Atomic Energy Commission and in being able to conduct its own research and development programs without undue interference from the Commission. In studying the provisions of S. 1717, however, some other questions were raised, and I wish to bring the following points to the attention of this committee for your consideration:

(1) In section 2 (a) (4) (B), four divisions are established to handle the work of the Commission, and it is stated that "the authority granted under section 3 (a) of this section shall not be exercised by the Division of Research." At no other place in the bill is there any mention of where within the Commission the authority granted under section 3 (a) for entering into research and development contracts is to be exercised, and it seems that provisions should be made somewhere in the bill for the exercise of this authority.

(2) The words "fissionable material" are used several times in sections 1 (b) (4), 2 (c), 3 (a), and 4 (a), but are not defined until later in section 5 (a) (1). If such definitions are to be placed through-

out the bill, it would seem preferable to define the words in the section where first used. On the general question of definitions, however, it is noted that many terms are defined in various sections throughout the bill, and there also is a general section, section 17, entitled "Definitions." It would seem to make for a clearer understanding of the bill if all definitions now scattered throughout the bill were covered in section 17.

(3) The exemption of contracts of the Commission from the provisions of section 3709 of the Revised Statutes (U. S. C., title 41, sec. 5) provided for under certain conditions in many of the other provisions, probably also should be provided for in section 5 (b) (6) page 18, lines 11 to 19 for contracts covering exploratory operations, and so forth. Also, it would seem preferable to have a general provision exempting the contracts of the Commission from the provisions of section 3709, rather than by the repetition of the same language in five or six separate places. That is merely my suggestion as to how it be done, if that is what Congress wishes to do, Mr. Chairman.

(4) Also of great importance to the Navy are the provisions of sections 5 (a) (4), 5 (c) (2), 5 (d) (1) and 7 (c) under which the Commission apparently would be unable to prohibit the distribution of fissionable or other materials and licenses to persons within the boundaries of the United States on the ground that they are deemed to be undesirable from the national security viewpoint. It is extremely important that the Commission have the specific authority within its discretion to refuse to distribute fissionable or other material to residents of the United States of questionable loyalty. Therefore, the Navy urges that the words "or to persons within the jurisdiction of the United States where issuance thereof would be inimical to the common defense and security" be inserted at the end of section 5 (d) (1), page 21, line 20; and section 7 (c), page 26, line 5.

The CHAIRMAN. Have you drafted those amendments which you want to submit for the committee's consideration?

Mr. KENNEY. We have suggested that the words "or to persons within the jurisdiction of the United States where issuance thereof would be inimical to the common defense and security" be added.

The CHAIRMAN. Have you drafted any amendments to the form of your statement, there?

Mr. KENNEY. Yes; I have those. The specific language has been set forth in my statement, Mr. Chairman.

The CHAIRMAN. That is the very question you have not answered. I know they are in your statement, but have you written out the actual language?

Mr. KENNEY. Yes; and I have recommended that the language be inserted at the end of line 20 on page 21 and at the end of line 5 on page 26.

(5) Also important to the Navy Department is the licensing provision of section 7 under which the Commission will exercise stringent controls over the manufacture of "any equipment or device utilizing fissionable material or atomic energy"—page 23, lines 11 and 12—and the utilization of "fissionable material or atomic energy with or without such equipment or device"—page 23, lines 12 and 13. These provisions are far reaching in their consequences because in future years their effect will be to give the Commission the power of life or

death over many industries. In view of its importance, therefore, it seems advisable at this time to reconsider certain of the provisions of section 7 (c) which are in effect a modification of the existing anti-trust laws.

Mr. ELSTON. You make a statement here that in future years, the effect of this provision, that is, the licensing provision, will give the Commission the power of life or death over many industries. As a matter of fact, it would give the Commission the power of life or death over all industries; would it not?

Mr. KENNEY. I would not think so; no. My point here is directed primarily to the provision of the act which would give the Commission the power to refuse to grant a license where, in their opinions, the license might serve to maintain or foster the growth of monopoly, restraint of trade, unlawful competition or "other trade position inimical to the entry of new, freely competitive enterprises in the field." I have a great deal of question in my mind as to whether you should give decisions of a judicial character of this kind to a commission which is scientific in nature. Also, the bill does not set forth what are the standards of restraint of trade, unlawful competition, or monopoly to which it has referred.

Mr. ELSTON. Do you think we should give to any Commission the power of life or death over any industry in this Nation?

Mr. KENNEY. I believe that, because of the unique character of the problem that we have here, the powers given to the Commission with the modifications that I speak of here, are not too broad.

Mr. ELSTON. Now, Mr. Kenney, while you are here, let me ask you about the matter I was touching on before, because I think that is one of the vital parts of the bill. You seem to think that the bill will not retain the Army and Navy Departments, and it will permit them to go ahead with research and development. Let me call your attention to the Senate report which accompanied the bill, on page 12, where they refer to the Military Liaison Committee. This is what it says in that report:

A Military Liaison Committee appointed by the Secretaries of War and Navy is to consult with the Commission on all activities relating to the military applications of atomic energy. This provision has been adopted to give the armed forces a proper voice in such matters as development, manufacture, storage, and use of bombs, allocations of fissionable materials for military research, control of information relating to the manufacture and use of atomic weapons.

Now is that not all-inclusive?

Mr. KENNEY. That is all-inclusive, Mr. Elston, but I still feel that it does not unduly restrict us in our activities. Principally what they are talking about there is the control of the issuance of fissionable material, and the work of the Commission itself. To that I referred before. I think that is perfectly proper. We are there required to give the Commission information as to what we are doing in our research field, and I certainly feel that the Commission is entitled to that information.

Mr. ELSTON. Does that which I have just read not indicate that whatever authority you got you get from the act itself and you get it through the means of the Military Liaison Committee?

Mr. KENNEY. Our power of research we get under our own statutes. There are certain other powers, certain production rights, which are put by this bill exclusively under the control of the Commission.

Mr. ELSTON. Of course, this act would set aside and repeal any existing law, because this is special legislation. When the Senate committee files a bill and makes a report, and the report accompanies the bill and it explains a section which you admit and I can certainly see is not clear, and they say what I have just read, does it not look like the Army and the Navy must go to the Commission for every type of authority, and that your only means of getting that authority is to proceed through the Military Liaison Committee?

Mr. KENNEY. The committee has also said on page 19 of that same report:

In military research, as distinguished from production of atomic weapons, the committee has adhered to the general principle of allowing great latitude and freedom. The armed services, as well as private individuals, are permitted to engage in independent military research, and under the provisions of section 3 are to be assisted by the Commission in their activities. It is not the intent of the committee to restrict the existing powers of military departments in entering into research and development contracts with nongovernmental organizations provided that all such contracts are in all their aspects subject to provisions of this bill. All military research is subject to inspection and reports as provided in section 10. The Commission itself is directed to engage in military research, working through its Division of Military Application, in close cooperation with the Departments of War and Navy.

I construe that as making the Army and Navy subject only to certain provisions of the bill; those methods and manners of control to which I have already alluded in connection with the control of and issuance of fissionable material and certain licensing of production.

Mr. MARTIN. Mr. Kenney, do you have any objection to lifting the ban against representatives of the armed forces in the membership of the Commission?

Mr. KENNEY. The Secretary of the Navy in appearing before the Senate committee advocated that representatives of the War and Navy Departments should be members of the Commission. That committee heard his testimony and deliberated for a certain length of time on the subject.

Mr. MARTIN. That is the Senate committee?

Mr. KENNEY. Yes; that is the Senate committee.

There had been a great deal of discussion about what they term the undue influence of the military on this Commission.

The CHAIRMAN. Whom do you believe ought to have something to say about a matter of international importance like this?

Mr. KENNEY. Let me make one point here; I think it would be desirable if the President is free to appoint a War Department representative and a Navy representative as members of the Commission; however, I am perfectly willing to defer to the decision made by the Senate because I feel our interests are adequately protected in subsection 2 (c) to which I have previously referred.

Mr. MARTIN. Regarding this general manager and his four assistants in section 2 of the bill that you referred to a moment ago; subsection (4) (B). Those four division heads are so important that they are provided a salary of \$14,000 per annum. We notice that one of them is head of the Division of Military Application, under the general manager, who is functioning under the Commission. Now, my question is, Do you think it better for our national defense to retain the law in its present form which bars a member of the armed

forces from serving in the capacity of director of military application?

Mr. KENNEY. I think it would be preferable, Mr. Martin, to leave the hands of the President and the Commission free for such appointments. If the Commission wished to appoint a military man to that position, I think it should have the right to do so.

Mr. MARTIN. The law now makes the military man ineligible, and the hands of the President are not free unless we free them.

Mr. KENNEY. My own feeling is that I think the President and the Commission should be free to make the choice as to whether that man should be a military man or not.

Mr. MARTIN. As a matter of policy, do you think that we would gain in the matter of our national defense to make provision whereby the President may appoint a representative of the armed forces in that position?

Mr. KENNEY. That is a question of personalities. Under some circumstances a civilian would be a far better man to put in the position.

Mr. MARTIN. Let us talk about generalities. I cannot see the reason for putting a bar against the participation of the armed forces in that particular job, or on the membership on the Commission itself.

Mr. KENNEY. I agree with you on that, Mr. Martin. We have expressed our feeling on that previously. I think Secretary Patterson has also expressed his feeling on that by originally supporting the May-Johnson bill.

Mr. MARTIN. What is your feeling on that?

Mr. KENNEY. I think it would be desirable that the hands of the President and the Commission be free.

Mr. ELSTON. Perhaps it is because of that bar against the Army and Navy having any voice in the matter, other than as you have indicated, that has made the communistic organizations of this country and elsewhere so enthusiastically in favor of this bill.

Mr. CLASON. This is entirely different from the conception of the way the bomb should be handled under the British system; is it not? As I read the statement of the Prime Minister on October 29 in the House of Commons, they were turning over the development of atomic energy to the service departments under the Minister of Supply, and they were talking to the Prime Minister about between £30,000,000 pounds and £40,000,000 for the development of atomic energy, not only for military purposes, but for civilian purposes.

Mr. KENNEY. I think it is always extremely difficult to compare what we do with what the British do, because our forms of government are somewhat different. Their Ministry of Supply happens to be a civilian organization. I do not agree that that is a proper and efficient organization for the procurement of military material. Therefore, I think it is extremely difficult for us to compare what is being proposed in this bill with what Great Britain is doing.

Mr. CLASON. Great Britain is using her governmental funds for the development of research in atomic energy for the benefit of the shipbuilders and for automobile builders and everybody, are they not; whereas, in this country, by this bill, you will almost prevent any private concern like General Motors from daring to spend any sum of money, such as \$120,000,000 when at any moment their license may be taken away from them, provided they get such license. They may not even get a license. What is there to protect industry under this

bill? Can General Motors or anybody go in and say, "We want to go ahead and do some research work, and get a license, and spend a lot of money on making engines for ships or for automobiles"?

Mr. KENNEY. I assume that when the Congress of the United States establishes a bill and appoints a commission which is to be composed of members appointed by the President of the United States, that those men are going to be men of stature and they are going to exercise their authorities reasonably and in accordance with due process of law.

Mr. CLASON. Should not Congress lay down the license and the law so they will have to give licenses to persons if they meet certain specifications or requirements? Why should we leave it to them, and then to the Supreme Court, which is apparently in such a mess at the present time?

Mr. KENNEY. You have given the Commission the power to lay down regulations. Those regulations would have to meet the test of reasonableness under the Constitution of the United States. Any action over that would have to go before the courts. I do not think that we know enough at this time to express what would be a detailed basis for granting a person a license.

Mr. CLASON. You do not believe the Commission now being discussed has any better chance of being in harmony than a Supreme Court has, do you? Why should not the Congress lay down the rules and laws?

Mr. KENNEY. That would be difficult to do with any exactness at this time because of the subject. With the permission of the committee, I would like to return to my statement concerning certain of the provisions of section 7 (c) which are, in effect, a modification of the existing antitrust laws. This section provides that—

Where activities under any license might serve to maintain or to foster the growth of monopoly, restraint of trade, unlawful competition, or other trade position inimical to the entry of new, freely competitive enterprises in the field, the Commission is authorized and directed to refuse to issue such license or to establish such conditions to prevent these results as the Commission, in consultation with the Attorney General, may determine.

This provision would be an extremely difficult one to administer. In the first place it lays down no standards which the Commission could use as a guide for determination of the banned activities. Furthermore, it would seem inadvisable to give to this Commission—an agency, primarily scientific in character—powers calling for decisions of a technical, judicial nature.

The determination of what constitutes monopoly, restraint of trade and unlawful competition raises some of the most complicated questions under the antitrust laws, and if a provision of this character is required it should be enacted as an amendment to the antitrust and unfair competition laws rather than by the granting of such authority to a body which must by its very nature be untrained in the determination of such matters. Also, no provisions have been included to assure an applicant for a license that the determination of the Commission, which may bar such applicant forever from entering into a broad area of business enterprises, would be made only after a full and a fair hearing and in conformity with due process of law.

Except as I have heretofore indicated, the provisions of S. 1717 are satisfactory to the Navy Department, and we urge that prompt and favorable consideration be given to the bill by this committee.

The CHAIRMAN. With the consent of the committee, we will stand adjourned until 10 o'clock tomorrow morning, at which time we will meet for the purpose of considering amendments to the bill.

(Whereupon, at 12:10 p. m., the committee adjourned, to reconvene Thursday, June 13, 1946.)

ATOMIC ENERGY

WEDNESDAY, JUNE 26, 1946

HOUSE OF REPRESENTATIVES,
COMMITTEE ON MILITARY AFFAIRS,
Washington, D. C.

(Statement by Conder C. Henry before the House Military Affairs Committee in executive session on June 26, 1946, on S. 1717, an act to regulate and control atomic energy.)

STATEMENT OF CONDER C. HENRY

Mr. HENRY. Mr. chairman and gentlemen of the committee, I shall make my comments on S. 1717 brief to a practical end. Before doing so, however, I wish to thank the committee for according me an opportunity to appear before it to express my views on the measure, and I hope that what I am about to say will be of some help in the committee's deliberations.

Perhaps it is unnecessary for me to qualify myself, but I might mention the fact that as Assistant Commissioner of Patents during World War II, I issued a large part of the secrecy orders which were issued under Public Law 700 in applications for patents. Also, I had the privilege of inspecting for the Patent Office the plants at Oak Ridge, Tenn., and at Hanford, Wash., at which were produced the materials for making the atomic bomb. Hundreds of inventions there used had previously been made by private inventors. As to inventions relating to the bomb, I think that they should be viewed as being merely a part of an evolutionary process and as constituting only steps forward in man's upward struggle for the achievement of complete freedom.

Considering the time they were made and the accumulated knowledge available to those who made them, they are not, in my judgment, any more startling or important and are not capable of any more or less beneficial or harmful uses than others made in earlier times and which were accompanied by far less furor. There might be mentioned in this connection, the spinning jenny, the internal-combustion engine, high explosives, the linotype machine, radio, the submarine and the aeroplane. These and many other earlier inventions revolutionized the art of war and the economy of nations, but they were dealt with in this country by practical men under our constitutional processes in such manner as insured their full development and utilization. My entire argument today will be that our experience of the past in dealing with these older inventions is a guide for the future in dealing with this latest one.

The bill before you is concerned with fissionable materials and with atomic energy generally. It endeavors to solve the problems created

by the discovery of this new source of power, and such problems are rendered unnecessarily complicated by the manner they are dealt with in the bill.

I suppose that most of you have been trained in law and perhaps some of you in the mathematical sciences. Lawyers and scientists know that when they are confronted with a problem, the solution of which seems difficult, the method of attack is to divide the problem into its component parts and then solve each part one at a time. Applying this technique to the bill, it will be seen that it does not present one integral problem but three in juxtaposed position, the solution of neither of which is necessary for the solution of the other. As I view the matter, such problems are:

1. The problem relating to the production and control of fissionable materials and byproduct materials. Sufficient facts are known to permit of the solution of this problem now;

2. The problem of forecasting the "political, economic, and international effects of the utilization of atomic energy" (p. 24); and

3. The problem relating to the nationalization of inventions not yet made relating to such energy.

Manifestly, in the 10 minutes time allotted to me it will not be possible to discuss these problems in detail. There are, however, certain broad observations with respect to them which can be made.

First, the problem of controlling production and use of fissionable material is the only problem which is capable of present solution. By injecting into this problem considerations concerning the prospective economic and social effects of the industrial utilization of atomic energy and also concerning patents for inventions which may be evolved in the future, the factors necessarily involved in the solution of the main problem are greatly clouded.

Insofar as the bill provides for the control and policing of the production and use of atomic energy on a scale which would constitute a hazard to life or health, and for the disposal and licensing of fissionable material, I think that for the most part it admirably accomplishes the purpose. However, I am unable to see any logic or justifiable reason for incorporating in a bill designed primarily for dealing with the very practical problem of policing the production and use of fissionable materials now in existence, provisions for a new patent policy and for studies of the future social effects of inventions not yet made. These three matters should, in my judgment, be dealt with separately in separate measures as involving unrelated considerations.

Please project your minds backward to the year 1900. I suppose that in 1900 many of you gentlemen were launched on the careers which placed you among the policy makers of the Nation. At that time we did not have many telephones, and no electric refrigerators, radios, aeroplanes, submarines, or articles made of plastics, and the automobile was just being introduced. Inventions in these fields constitute the basis of huge industries which provide enormous investment outlets and jobs for millions of people.

Suppose there were a law on the statute books dating back to that year such as is represented by the bill before you, can it be truthfully said, or can you believe, that we would have achieved the industrial supremacy we now enjoy, or would have made discoveries which insured our success in two world wars? Such a law would have closed the field to private citizens to make and secure patents for inventions

relating to automobiles, for example, out of which sprang the military tank. It also would have enabled sociologists and economists from the very beginning to raise their raucous voices against any progress in the field of automotive transportation because of the misapprehensions they may have entertained about the impact automobiles would have on the established livery-stable and horse-breeding industries as well as on the expected dislocation of people occasioned by the decentralization of urban populations into outlying communities because of the easier and faster method of transportation. More importantly, it would have destroyed the incentives provided by the Constitution to make new discoveries and to invest speculative capital needed to develop them into marketable products. In this connection, I wish to comment briefly on these incentives.

In effect our patent laws simply provide that if a man will spend his time and money in discovering something of the kind named in the patent statutes which is new and useful, he may receive a patent (not a reward) for it, by which he may exclude others for a limited time from making, using or selling his new invention. Essentially, he must make a discovery and, therefore, add something to the sum of human knowledge. Furthermore, when he receives his patent, he must establish a new enterprise, or sell his invention to someone else, if he expects to recoup the money spent in making the invention in the first place. The Government does not spend anything. Its purpose is accomplished by providing the incentives which induced the disclosure of the unknown to the public and the establishment of the new enterprise.

Over 2,400,000 patented inventions were made since our Government was founded as a result of these incentives, and substantially all of our industrial economy is built on them. Unquestionably, they insured our success in the inventive type of warfare in which we were engaged during both world wars.

By removing the incentives provided by our patent laws, the bill is a radical departure from anything known in our history. The only parallel I can find to it is the Soviet patent law. That law provides, in part, as follows:

69. If the invention or technical improvement is accepted for utilization, the inventor or individual who proposed the technical improvement receives, depending on the technical significance, savings or any other effect produced by his invention or technical improvement upon the national economy, and the degree of perfection of this invention or technical improvement, a remuneration in accordance with the instruction approved by the Council of People's Commissars of the USSR.

* * * * *

71. All utilized inventions and technical improvements, as well as the remuneration paid for them, are noted in the Labor Book of the inventor or individual who suggested the technical improvement.

72. The inventors have, other conditions being equal, a priority for positions as scientific workers in scientific research and experimental institutions and enterprises related to the field in which their invention has been made.

The above quotation is from *Sobrainie Postanovlenii i Rasporiazhenii Pravitelstva Soyuza Sovetskikh Sotsialisticheskikh Respublik*, March 25, 1941, No. 9, article 150, an unofficial translation of which was furnished to me by our State Department.

I am not informed as to whether anything worthwhile has been produced under the Russian law. I do not know nor have I heard of anything.

The adoption of a similar law by the enactment of the bill before you, which substitutes bureautic "rewards" for the exclusive rights provided by present law, would, in my judgment, effectively retard the making of new inventions for the establishment of new enterprises based on them for the utilization of atomic energy for commercial, industrial, and military purposes by private initiative, enterprise and capital. I trust it will be remembered that regardless of what suppressive measures may be adopted by this country in this respect, other countries that are our industrial rivals may continue to pursue a more enlightened policy. The most that we can do to encourage inventors is not too much to demand to insure the continuance of our industrial world supremacy, or even our national security.

Obviously, the bill is predicated on the proposition that foreign nations might gain an advantage by learning from published patents, or as a result of our patent procedures, of new inventions made by citizens of this country. My answer is that full secrecy can be preserved without modification of our patent laws and that few such inventions will be produced if the incentives to produce them are destroyed. No departure from our historic patent policies are necessary for security purposes, and no such proposal was either advocated or adopted during the recent period of hostilities. Ample security is possible, and was secured during the war period, without departing from any of our established fundamental patent practices.

Underlying this bill, gentlemen, is the idea of fear, virtually confessed in its preamble. Because of this fear, unwarranted change in the normal course and direction of American business philosophy is advocated.

My recommendation is that the patent provisions of this bill be eliminated, especially since under present law the government now has the right to use any patented invention, although the patent owner may not consent to such use. This recommendation I believe to be entirely consistent with the findings of the section of patent, trademark and copyright law of the American Bar Association which, acting through its committee on patent law division (of which I am a member) and its Council, with the full knowledge and consent of the Board of Governors of the Association, drew up a resolution disapproving those portions of S. 1717 which provide for the compulsory licensing of patents and prohibits the creation of patent property for certain subject matter. Copies of that resolution were sent to all members of this committee.

I've endeavored to amend the bill to accomplish these purposes. In making these amendments, the intention was to deal with the problem as Congress has always dealt with similar problems, that is, by stating the known facts and then by dealing with them. The first thing to fall by that standard was the vague generalities of the preamble. I will leave those suggested amendments with the Committee for such use as it may deem fitting, and I feel sure that the reasons which I have not given for some of such amendments will readily suggest themselves.

I thank you.

SUGGESTED AMENDMENTS TO S. 1717

Cancel section 1 and substitute therefor:

"FINDINGS OF FACT AND DECLARATION OF POLICY

"SECTION 1. Congress finds (a) that research which led to the invention or discovery of the atomic bomb opened up new fields for further research and invention for the industrial and commercial utilization of the explosive chain-reacting fissionable materials used in the bomb and of the nonexplosive substances produced as byproducts of the manufacture of such materials; (b) that it is essential for the national defense and public welfare to secure the vigorous, expeditious and expending national and private exploration and development of these new fields; (c) that this can best be done by the time tested constitutional methods which in the past have promoted the progress of the sciences and useful arts and thereby contributed to the industrial achievements of the Nation and to the waging of successful war; (d) that the only plants for quantity production of such materials are now owned by the Federal Government; and (e) that because of the nature of such materials it is necessary for Government inspection, regulation, supervision or control not only of all such activities to the extent necessary for the safety of the Nation and for the protection of the life and health of the people, but also of source materials.

"Accordingly, it is hereby declared to be the policy of Congress (1) to retain ownership or control of its plants in which were produced the materials for the manufacture of the atomic bomb and for assemblage of the bomb, and to conduct or sponsor research in fields involving the production and utilization of nuclear energy; (2) to regulate or control the use and distribution of source materials; (3) to encourage free research in the field of nuclear energy and to further the making and use by private initiative, enterprise, and capital of new inventions or discoveries for the practical utilization of nuclear energy for scientific, industrial, and commercial purposes; and (4) to control such activities concerned with the release and utilization of nuclear energy as are on a scale which would constitute a national hazard. The primary objectives of this act, therefore, are to provide for the continued operation or control of its plants in which fissionable materials are produced and in which the atomic bombs were assembled, to control source materials for the production of nuclear energy, to promote the national defense and general welfare by furthering the acquisition of knowledge relating to nuclear energy, and to the making of new inventions or discoveries concerning the practical utilization of nuclear energy, and to protect the health and safety of the inhabitants of the United States."

On page 10 cancel subsection (c) under section 4 commencing with line 16 and substitute the following therefor:

"(1) OWNERSHIP OF PRODUCTION FACILITIES.—The Commission is authorized to own and operate facilities for the production of fissionable material. Private ownership or operation is expressly forbidden except under license by the Commission, provided, however, that no license for operation or ownership is required for facilities which (A) are useful in the conduct of research and development activities in the fields specified in section 3, and (B) do not, in the opinion of the Commission, have a potential production rate adequate to enable the operator of such facilities to produce within a reasonable period of time a sufficient quantity of fissionable material to produce an atomic bomb or any other atomic weapon."

On page 13, line 16, insert after the word "reaction" the following: "employing nuclear chain fission".

On page 14, line 20, insert after the word "material" the following: "owned by it".

On page 16, line 25, and page 17, line 16, cancel the words "are unimportant" and substitute therefor: "do not constitute hazards to national health or safety".

On page 17, line 6, cancel the words "inconsistent with the national welfare", and substitute the following: "constituting a hazard to national health or safety".

On page 17, lines 22 and 23, cancel, "to the extent it deems necessary to effectuate the provisions of this Act." and substitute: "upon determination that such action is necessary in the interest of the common defense and security."

On page 18, line 18, after the word "inspections" insert the following: "of the use of such materials."

On page 21, line 2, after the word "materials" insert "owned by it".

On page 23, line 9, after the word "sections" insert "4", and on line 13 after the word "device" insert "when such manufacture or use constitutes a hazard to national health or safety".

On pages 25 and 26, cancel all of the part of page 25 which starts with line 7 and that part of page 26 which ends with the period in line 2 of that page and substitute therefor the following: "The Commission in issuing licenses shall grant them for a period not to exceed 5 years in accordance with such procedures as the Commission may establish and may be renewed on the expiration of such period. The granting of licenses shall be in such a manner as to encourage competition and where licenses are granted the Commission will not as a condition precedent require the dissemination of technical information and data concerning activities carried on pursuant to such licenses."

Page 24, lines 4 and 5, cancel the Commission's estimate of the social, political, economic, and international effects of such use.

Cancel all of the patent provisions starting with line 8 of page 32 and ending with the last line on page 38.

On page 48, after subsection (a) of section 17, insert a new subsection (b) as follows:

"(b) The term 'nuclear fission' shall be construed to mean that process which takes place in nuclei wherein the nucleus is split into fragments, at least two of which contain a substantial fraction of the mass of the original nucleus."

On page 49, line 19, after the word "device" insert "peculiarly adopted for and"

On page 50 add a new paragraph, section 20, after line 23 reading as follows:

"Sec. 20. This Act shall expire three years after the date of its approval."

Renumber sections and subsections accordingly.

X

I. Atomic Energy Commission.

A. Commissioners.

1. Functions - 38, 157
2. Membership on statutory boards - 38
3. Qualifications - 45, 156, 172, 254, 263, 264, 289, 290, 387, 443, 470, 471.
4. Tenure of office - 34, 71, 216, 253, 257, 459, H41.

B. Composition of Commission.

1. Ex-officio members - (i.e. Secretary of State) 72, 75, 77, 80, 92, 93, 287, 289, 293, 387, 423, 472, 476, 488.
- ✓ 2. Full time or part time - 38, 77, 78, 93, 168, 194, 253, 254, 260, 261, 262, 286, 287, 294, 295, 296, 379, 384, 385, 386, 444, 453, 468, 471, 489, 490.
3. Military or civilian - 38, 39, 44, 72, 75, 102, 121, 143, 146, 153, 158, 175, 176, 177, 193, 194, 196, 197, 201, 380, 381, 400, 402, 453, 464, 465, 472, 473-77, 489, H31, H32.
4. Representation of group interests - 43, 44, 84, 173, 187, 286, 360, 471, 474, 476, 477.
5. Size of Commission - 41, 43, 80, 385, 396, 468, 469, 474.

C. Employees of Commission.

1. Facilities for - 508, 534, 535, 536, 537, 538.
2. Non-citizens - 96.
3. Securing of adequate personnel - 97.
4. Use of Commission employees in production facilities - 251, 264, 265, 319, 320.

D. Functions. - 32, 490.

E. General Manager.

1. Appointment of - 485, 446, 476, 491.
2. Need for - 36, 37, 72, 73, 94, 252, 396, 443.

F. Internal Organization.

1. Advisory Committee and Boards - (See Military Liaison Committee) - 45, 78, 79, 171, 173, 253, 254, 259, 287, 288, 290, 291, 292, 293, 294, 397, 444, 446, 477-9.
2. Corporations, powers to create - 38.
3. Desirability of statutory divisions - 35, 174, 255, 363, 429.
4. Division heads, how chosen - 38.
5. Division of Engineering - 360, 363, 364, 365, 367, 368, 369, 371, 375.
6. Division of military application - 159, 201, 451, H33, H34, H59.
7. Functions of divisions - 365, 366, 367, 368, 369, 371, 375.
8. Need for flexibility - 36.
9. Reorganization Act of 1945, Exemption from - 36.

G. Transfer of Atomic Energy facilities to Commission. - H53

II. Atomic Energy Bills and the Atomic Energy Act.

- A. Constitutionality of Act - H38, H39, H40.
- B. Declaration of policy of Act - 179.
- C. Interim nature - 73, 74, 95, 111, 118, 202, 313, 409, 439, 453, H68.
- D. May-Johnson Bill - 221, 222, 223, 258, 259, 271, 272, 273, 288, 311, 385, 390, 391, 395, 414, 427, 430, 459, H16, H18, H22, H23, H29, H30.
- E. Purposes of Act - 90, 91, 110.
- F. S. 1557 (Ball Bill) - 459 - 462.

III. Atomic Bomb.

(See Government Monopoly; President)

IV. Atomic Energy

A. Definition of - 302

B. Nuclear fission, definition - H 68

(See Fissionable Materials; Source Materials)

C. Peaceful uses of - 105, 106, 107, 108, 212, 213, 217, 218, 226-232, 274-279, 303, 360, 361, 362, 363, 366, 425, 433, 434, 435, 436

D. Utilization of - (See Congressional Control)

V. By-Products. - 225, 276

A. By-product power, distribution of - 95, 276

B. Definition - 249, 250

VI. Congressional Control of Atomic Energy Commission. - 43, 117, 118, 119, 148, 202, 445, 481-2

A. Analogy to control of other agencies - 34, 40

B. Appropriations - 35, 382, 383, 513, 514

C. Licensing of Atomic Energy devices - 35, 130, 234, 235, 383, 384, H25, H36, H37

D. Reports to Congress - 35, 39, 130, 156, 209, 445, 452, 459, H37

VII. Fissionable Materials.

A. Definition - 50, 51, 52, 179, 180, 181, 182, 183, 208, 258, 259, 300, H55, H56

B. Definition of fissionable material production - 51, 52, 163

C. Distribution - 94, 168, 169, H41, H56

VIII. General Accounting Office

A. AEC Control of Administrative Accounts. - 498, 499, 504, 514

1. Competitive bidding exemption - 521, 522

2. Contract exemption - 508, 509, 539, H56

B. Special Relations to Other Agencies

1. AEC - 517

2. TVA - 519 - 521

- 3. FBI - 527
- 4. State - 529
- C. Control of Manhattan District Expenditures. - 500
 - War Powers Act - 534
- D. Functions and Powers - 497, 498, 501, 502, 514, 515
 - 1. Determining illegality of contracts - 509-13, 518, 522, 523, 533
 - 2. Withholding funds - 499, 514-16
- E. Security, Protection of - 500, 511, 512, 515, 518, 519, 526-9, 532, 533
- F. Suggested Amendments to S1717 - 525, 526, 531-9
 - Appropriations - 513, 514, 528, 530
- IX. Government Monopoly, Need for and Extent of (See Patents) -
 - 179, 195, 314, 365, 393, 437, 439, 451, H25, H46, H47, H59
 - A. Anti-trust Policies - 109, 110, 305, H57, H60
 - B. Custody of Atomic Bombs - 403
 - C. Fissionable Materials - 33, 49, 91, 94, 113, 169, 170, 285, 297, 298, 302, 304, 305, 312, 393, 403, 437, 439
 - D. Military and Peaceful Uses, Separation of - 49, 80, 81, 214, 215
 - E. Production of Weapons - 278, 279
 - F. Source Materials - 33, 49, 91, 113, 303, 312, 319, 320, 323-330, 393, 404
- X. International Control of Atomic Energy. - 196, 220, 221, 238, 239, 313, 391, 392, 400, 401, 430, 448, 454-457, 481, 482, 484, 495, H43, H27, H44, H45
 - A. Canadian House of Commons Debates - 9 - 30
 - B. Cyclotron Destruction - 267
 - C. Defense Against Atomic Bomb - 275
 - D. Inspection - 112, 131, 221, 225, 237, 240, 241, 244, 266, 298, 299, 422, 482, 483, H23
 - E. International Agreements, Definition of - 85, 481

F. Production of Atomic Weapons - 193

G. Relation of Disarmament to - 74, 140, 141, 142, 143, 148, 242, 401, 406

H. UNESCO - 67

XI. Information, Control of

A. Applied Technology (know-how) 33, 48, 53, 55, 99, 144, 165, 277, 378, 407, 408, 415, 416, 417, 419, 449, H24, H41, H42

B. Basic Scientific Information, Definition of - 33, 48, 53, 55, 144, 165, 377, 407, 408, 413, 414, 416, 417, 447, 460, 480, 484, 494, 494, H23, H41, H42

C. Benefit to U.S. from Free Exchange - 123, 129, 210, 211, 212, 376, 495

D. Board of Atomic Information - 452

E. Consultation with Military Services - 404, 484, 485

F. Employees, Disclosure of Information - 96

G. Espionage Act - 86, 87, 88, 155, 268, 346, 353, 404, 405, 406

H. Obligation to Disseminate Information - 54 - 493

Relationship between Section 3 and Section 9 of Atomic Energy Act. - 54

I. Smyth Report - 53, 165, 480

J. Statutes Obstructing Dissemination of Information - 98

XII. Manhattan Project - 151, 152, H16, H17

A. Cost of - 372, 373, 374

B. Expenditures (See General Accounting Office)

C. Military Policy Committee - 477, 488

D. Nine-man Committee - 483

E. Size - 493

XIII. Merger, Armed Services - 400, 408, 472, 474, 478

XIV. Military Application, Definition of - H33, H34

- XV. Military Liaison With Commission. - 75, 76, 381, 382, 402, 404,
407, 424, 479, 486, H19, H20, H21, H24, H32, H49, H50, H51,
H54, H57.

Military Application, Division of

(See Atomic Energy Commission, Internal Organization)

XVI. Patents.

- A. Applications for Patents Relating to Bomb Itself - 347.
- B. Compensation Awards and Royalties.
 - 1. Patent Compensation Board - 57, 58.
 - 2. Judicial review - 57, 59.
 - 3. Standards - 58.
- C. Compulsory licenses - 60, 61, 62, 64, 65, 69, 226, 306.
Constitutionality of compulsory licensing - 306, 307,
308, 309, 310.
- D. Discoveries and inventions in Government financed projects -
66, 67, 68, 226, 233, 284, 301, 312, 351.
- E. Exclusive license, definition of - 343.
- F. Government Ownership of Patents - 56, 57, 111, 116, 225,
226, 301, 306, 339, 340, 437, 331-358, 422, 460, H63-68.
- G. Patent Contracts During War - 331 - 358.
- H. Purposes of Patent System - 61, 62, 66, 309, H64, H65, H66.
- I. Secrecy - 339, 340, 344, 345, 346, 347, 348, 353, 487, H66.

XVII. President's Relation to AEC.

- A. Appointment and Removal of Commissioners - 34, 71, 396,
429, 475, H41.
- B. Determination of Amount of Fissionable Material Produced -
40, 81, 82, 83, 429.
- C. Determination of Bomb Production and Disposition - 81, 82,
83, H51.
- D. Transfer to Commission of Atomic Energy Facilities - H53.

XVIII. Research and Development.

- A. Authority of Commission to make Contracts - H55.
- B. Compartmentalization - 207, 277, 493, 494.
- C. Criteria for Research Assistance - 115, 168, 491, 492.
Competitive bidding law - 508, 509.
- D. Development During War - 218.
- E. Development and Testing of Weapons - 278, 279, 461, 462, 463, 464.
- F. Education of Scientists - 248, 249.
- G. Military Services, Authority to Conduct Independent Research and Development - 84, 209, 419, 420, 461, 462, 463, 464, H49, H52, H53, H54, H55.
- H. Power of Commission to Punish Violations - 169, 484, 485, H39.
- I. Relationship Between Government Research and Private Research - 114, 206, 265, 492, 493.
- J. Reporting and Inspection - 403.

XIX. Source Materials.

(See Government Monopoly)

- A. Definition - 250, 251, 300, 319.
- B. Distribution - 323, H41.
- C. Location - 316, 317.
- D. Prospecting, Mining, and Refining - 281, 282, 316, 317, 318, 319, 323, 324, 325, 326, 328, 394, 421, 422.
- E. Reservation in Public Lands - 95, H26, H27.
- F. Withdrawal of Public Lands - 327, 329, 330.
