Donald C. Cook Nuclear Plant Unit No. 2
Docket No. 50-316
CPPR No. 61

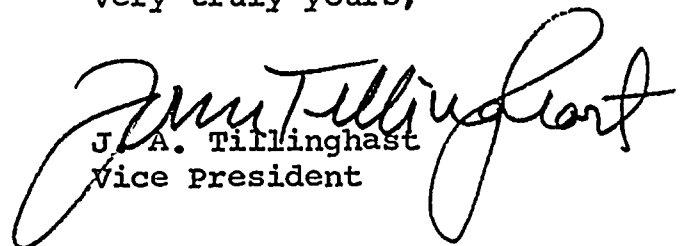

Mr. Edson G. Case, Acting Director
Office of Nuclear Reactor Regulation
U.S. Nuclear Regulatory Commission
Washington, D.C. 20555

Dear Mr. Case:

Transmitted to you today by Westinghouse Electric Corporation in their letter AEW-7039, dated November 28, 1977, are 40 copies of an analysis of the effects of the rupture of a major feedwater pipe for Donald C. Cook Nuclear Plant, Unit No. 2. This information is transmitted in response to NRC Question 212.8 as transmitted by Mr. K. Kniel's letter of April 13, 1977. The information included herein will be included as an amendment to our FSAR at a later date.

Very truly yours,

J. A. Tillinghast
Vice President

Journal of Management Education 30(6)p.789-804

Figure 1 is a line graph showing the percentage of total protein in the supernatant versus the percentage of total protein in the pellet for various proteins. The y-axis is labeled 'PERCENTAGE OF TOTAL PROTEIN IN SUPERNATANT' and ranges from 0 to 100. The x-axis is labeled 'PERCENTAGE OF TOTAL PROTEIN IN PELLET' and ranges from 0 to 100. The graph shows several data points for different proteins, with some points clustered together and others more isolated. The points are labeled with numbers 1 through 10, corresponding to the proteins listed in the legend.

| Protein | Percentage of Total Protein in Pellet | Percentage of Total Protein in Supernatant |
|-------------------------|---------------------------------------|--|
| 1. α -globulin | ~10 | ~90 |
| 2. β -globulin | ~15 | ~85 |
| 3. γ -globulin | ~20 | ~80 |
| 4. δ -globulin | ~25 | ~75 |
| 5. ϵ -globulin | ~30 | ~70 |
| 6. ζ -globulin | ~35 | ~65 |
| 7. η -globulin | ~40 | ~60 |
| 8. θ -globulin | ~45 | ~55 |
| 9. ι -globulin | ~50 | ~50 |
| 10. κ -globulin | ~55 | ~45 |

Figure 1. The effect of the concentration of the H_2O_2 solution on the amount of the released H_2O from the H_2O_2 -loaded hydrogel. The amount of the released H_2O was measured by the weight difference of the hydrogel before and after the release. The concentration of the H_2O_2 solution was 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10 wt. %.

(The following information was obtained from the records of the Federal Bureau of Investigation.)

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The *Agrobacterium* strains were incubated in the presence of 100 mg/ml of gentamicin and 100 mg/ml of rifampicin. The concentration of the *Agrobacterium* suspension was 10⁶ cells/ml. The transformation efficiency was determined by the number of transformants per 10⁶ cells.

New York, NY 10004

Gentlemen:

Thank you for your final report dated November 2, 1977, pursuant to 10 CFR 50.55(e) regarding valve wall thickness requirements. We completed our review of your final action in regard to this matter during an inspection conducted October 19-21, 1977, (50-316/77-23) and have no further questions.

Your cooperation with us is appreciated.

Sincerely,

R. F. Heishman, Chief
Reactor Construction and
Engineering Support Branch

November 2, 1977

Donald C. Cook Nuclear Plant Unit No. 2
Docket No. 50-316

Mr. J. G. Keppler, Regional Director
U. S. Nuclear Regulatory Commission
Office of Inspection and Enforcement
Region III
799 Roosevelt Road
Glen Ellyn, Illinois 60137

Dear Mr. Keppler:

This letter supplements our letters to you of August 4, 1972; October 12, 1972; August 1, 1974; October 22, 1974; and June 26, 1975, all of which were in response to your letter of June 29, 1972 which requested that we provide acceptable documentation of conformance showing that certain specified valves at the Donald C. Cook Nuclear Plant met minimum wall thickness requirements.

Our letter of June 26, 1975 indicated in Item 1 that 121 valves had been ultrasonically tested and found acceptable. Item 2 of this same letter indicated 15 valves had been ultrasonically tested and found to require additional evaluations or repair. Item 3 indicated 8 valves remained to be qualified by Westinghouse and shipped to the Plant.

A comprehensive audit of our valve wall thickness documentation for Unit #2 made by our site QA Department in October 1975 added seven (7) more suspect valves to the list of 15 mentioned above bringing the total number of suspect valves to twenty-two (22) and those found acceptable reduced to 114. Of these suspect valves:

1. Two (2) of the above valves were safety valves, SV-50 and SV-51, whose measured wall thickness was compared to the required thickness for the system design conditions calculated by the Cognizant Engineer and found to be more than adequate for the service. These valves are acceptable.

NOV 7 1977

Mr. J. G. Keppler
Regional Director

-2-

November 2, 1977

2. Three (3) of the valves were assumed to be three (3) inch valves when in reality they were two (2) inch valves with three inch increasers welded on. The wall thickness criteria should have been that of a two (2) inch valve which makes all three (3) of these valves acceptable.
3. One (1) valve was found to have two areas where the wall thickness was not less than 90% of the specified minimum. These areas are acceptable based on material strength. One additional area was below 90% of the specified minimum wall and was built up to an acceptable dimension.
4. One (1) valve was found to have been ordered to a rating higher than actually required by service conditions. We have reviewed the service for which this valve is intended and find that the wall thickness of the valve in all instances meets the strength requirements for the service conditions. This valve is acceptable.
5. Four (4) valves were found to have wall thicknesses not less than 90% of the specified minimum wall thickness but for which the physical characteristics of the valve material exceed the specification minimum by an amount sufficient to compensate for the measured reduction in wall thickness. These valves are acceptable.
6. Four (4) valves were reported as having several locations below the minimum wall in the transition area from valve to pipe. It was confirmed that the flow arrow and the dimensions shown on the UT maps were reversed for the inlet and outlet ends of these valves. The valves were procured to have a schedule 40 inlet and a schedule 140 outlet welding ends. Per ANSI B 16.5, the minimum dimension in the transition should never be less than 1.5 tp (tp, nominal pipe wall thickness). Therefore, these valves are acceptable.
7. Seven (7) valves, were found to have thickness below the specified minimum. One of these valves was returned to the manufacturer for wall build-up and the remaining six(6) were repaired on site to bring the wall thickness up to the specified minimum in the deficient areas.

Mr. J. G. Keppler
Regional Director

-3-

November 2, 1977

The eight (8) valves were received documented by a Westinghouse Quality Release and maps for each valve showing measured wall thicknesses and acceptance criteria. These valves are acceptable.

During hydro testing eight (8) small check valves (1-1/2" and 2") with seal welded bonnets, which had been accepted, were found to be leaking through the seat. These were replaced with valves of a different design whose wall thicknesses were measured and found acceptable.

This completes our valve wall thickness verification program for Units #1 and 2.

Very truly yours,

John E. Dolan
Senior Executive Vice President
Engineering
