1.0 Introduction

EA Engineering, Science, and Technology, Inc., PBC (EA) is currently contracted under the Hill Air Force Base (AFB) Performance-Based Remediation Contract No. FA8903-09-D-8560 to obtain site closeout at Site WR111, Magnesium-Thorium Disposal Trench, at the Little Mountain Test Facility (LMTF), formerly known as Little Mountain Test Annex. Cabrera Services, Inc. (Cabrera) is providing health physics services to support EA's investigation, remediation, and closure of the site. EA and Cabrera conducted a Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) compliant final status survey (FSS) (Nuclear Regulatory Commission [NRC] 2000) as part of a Decommissioning Plan. All remedial action activities at the site (hereafter referred to as Site WR111), including FSS activities, were conducted in coordination with the NRC via the U.S. Air Force Radioisotope Committee (USAF RIC).

1.1 Purpose

The purpose of this FSS Report (FSSR) is to describe the consistent approach for planning, performing, and assessing radionuclides of concern (ROCs) present in site surface soils through FSS and evaluate the Site's compliance with radiological cleanup criteria to achieve unrestricted release. This FSSR addresses post-removal action surveys for radiological contaminants at Site WR111. Cleanup activities were accomplished in accordance with the WR111 Little Mountain Test Annex Magnesium-Thorium Disposal Trench Remedial Design/Remedial Action (RD/RA) Work Plan (EA 2015a). The expected outcome of the selected remedy is that Site WR111 will not present an unacceptable risk to future land users via exposure to soil and would be suitable for a resident farmer.

The objective of this FSSR is to describe the consistent approach for planning, performing, and assessing ROCs present in site surface soils through FSS in order to demonstrate compliance with established dose-based criteria, based on comparison to Derived Concentration Guideline Levels (DCGLs). This objective is met when residual soils impacted by past operations have been remediated, and an FSS has verified that any residual radioactivity meets remediation goals.

THIS PAGE INTENTIONALLY LEFT BLANK

2.0 Facility and Site Information

2.1 Facility Location and Description

Site WR111 is located in a remote area west of Ogden, Utah, which is approximately 15 miles northwest of Hill AFB and adjacent to the Great Salt Lake (Figure 2-1). The disposal trench was approximately 200 × 150 feet (ft) in area and was enclosed by a chain-link fence in the southeastern corner of the LMTF (Figure 2-2). The fenced area was referred to as the Radioactive Disposal Area.

Based on the review of the Final Radiological Disposal Site Characterization For Little Mountain Testing Annex (AECOM 2009), material disposed in the Radioactive Disposal Area originated from the Marquardt Aircraft Ramjet manufacturing plant in Ogden. The U.S. Atomic Energy Commission (AEC), the predecessor agency to the NRC, issued Source Material License C-3650 to Marquardt Aircraft Company of Van Nuys, California, for possession of magnesium-thorium (Mg-Th) alloy to be used in the manufacture of controls, accessories, and engine parts. The maximum amount of Thorium-232 (^{232}Th) allowed by this license was 4,600 pounds, or approximately 0.23 curie of ^{232}Th.

In April 1959, Marquardt sent a letter to the AEC concerning disposition of Mg-Th scrap material. Apparently, the licensee was having difficulty in finding a supplier who would accept its scrap material. Documents show that 500 pounds of scrap Mg-Th were buried in a disposal trench in June 1959, and 1,500 pounds were buried in February 1960. In June 1961, Marquardt requested AEC approval to burn the machine chips and small pieces of Mg-Th scrap material accumulated at the Ogden facility. The licensee proposed to burn the material in a burial/burn trench that was 10 ft deep, 8 ft wide, and 20 ft long. The trench would be located in a remote, controlled area on government property. In September 1961, Source Material License C-3650 expired and License STB-434 was issued for the Marquardt facility in Ogden. This license included permission to incinerate source material in accordance with AEC regulations associated with treatment or disposal by incineration. Documents show that 3,600 pounds were incinerated in August 1961. Historical records indicate that this amount included sludge from the wet collectors from the pickling tanks (containing thorium fluoride) and lathe turnings/milling scraps (possibly containing cutting oil and/or solvents). No other documentation of disposal was identified in the docket files.

License STB-434 was terminated on 12 April 1971. No documentation is in NRC docket files to show that the AEC performed a closeout inspection or survey for this license or facility. In addition, the materials-disposition documentation was incomplete.

2.2 Previous Investigations

In the early 1990s, a number of investigations were conducted at Site WR111. The results of the investigations were summarized in the Final Summary Report: Low Level Radioactive Waste Contamination, Little Mountain Test Annex (Jacobs Engineering Group, Inc. 1994), and according to the report:

- In 1993, the NRC performed an inspection at the LMTF and identified two disposal pits where the highest exposure rate was about twice the background exposure rate recorded in the vicinity.

- In 1993, the Hill AFB Radiation Safety Officer collected 10 surface soil samples from a potential radioactive disposal area and a background surface soil sample. The result indicated that gross alpha concentrations for all 10 samples were greater than the background concentration.

- The Final Summary Report identified an area in the southeast corner of the LMTF as the Radioactive Disposal Area, which is in the general vicinity of the elevated gamma measurements observed by the NRC. The gamma-scan results for other disposal areas (north of the radioactive disposal area) exhibited elevated count rates; however, these were reported as within 25 percent of the background count.

In 2006, the U.S. Air Force Institute for Operational Health (AFIOH) performed a Global Positioning System (GPS)-referenced gamma radiation survey of surface soil for various areas of interest at the LMTF (AFIOH 2007). Only the radioactive disposal area showed elevated gamma count rates. The initial area thought to be the location of the trench (northeast portion of the site) did not show any elevated gamma count rates. Therefore, AFIOH concluded that areas outside of the fenced Radioactive Disposal Area were not impacted.

In Summer and Fall 2006, Parsons Infrastructure and Technology Group, Inc. (Parsons) conducted a remedial investigation of Operable Unit A at LMTF (Parsons 2007), which included Site WR111. In August 2006, four shallow bedrock monitoring wells (LM-060 through LM-063) were installed in the vicinity of WR111 (upgradient, downgradient, and sidegradient). In November 2006, the four wells were sampled and the samples were analyzed for volatile and semivolatile organic compounds (VOCs and SVOCs), metals, water quality parameters, gross alpha and gross beta, select gamma emitters, and thorium isotopes. ^{232}Th and Thorium-228 (^{228}Th) were not detected in groundwater at any of the wells, indicating that Mg-Th impact is not migrating to groundwater. Low concentrations of U-238 progeny (Thorium-230 [^{230}Th] and Radium-226 [^{226}Ra]) were identified in groundwater, but the concentrations were random and less than 1 picocurie per liter, which is indicative of natural uranium decay. Gross alpha radiation was detected in the downgradient well only. Low levels of gross beta radiation were detected at all four wells. The Parsons report concluded that the seemingly random pattern of low-level detections of ^{230}Th and ^{226}Ra, combined with the absence of ^{232}Th and ^{228}Th, represented radioactive decay of naturally occurring uranium rather than leaching from scrap metal in the Mg-Th disposal area. VOCs and SVOCs were not detected in the groundwater, indicating that organic compounds were not disposed in the trench or, if present in the trench, have not migrated to the monitoring well locations. Metal detections in groundwater were considered to be consistent with background.

From 2007 to 2009, AECOM performed a more detailed investigation to assess site conditions at Site WR111. Investigative work included identifying and sampling appropriate background location(s); geophysical surveying to define site boundaries; performing gamma walkover survey (GWS) measurements with GPS mapping; and collection of surface and subsurface soil samples for radiological and chemical analytes (i.e., VOCs and SVOCs).

The characterization survey showed that the maximum ^{232}Th concentrations in the Radioactive Disposal Area were 7.1 ± 0.4 and 99 ± 3 picocuries per gram (pCi/g) for surface soil and subsurface soil, respectively. The ^{232}Th background concentration for surface soils was 1.65 ± 0.03 (pCi/g) and for subsurface soils 1.60 ± 0.04 pCi/g (uncertainties were two standard deviations). Results of the AECOM investigation indicate that site soils within the fenced Radioactive Disposal Area were impacted with ^{232}Th and decay progeny above background levels (AECOM 2009). The report also indicated that elevated radiological activity may extend beyond the fence line to the south and east. While ^{226}Ra was also detected in the soil samples, the concentrations appeared to be consistent with background, and ^{226}Ra was not considered to be a site ROC.

Sampling results from the investigation also showed that no VOCs or SVOCs were detected above reportable limits in soil.

2.3 Current Site Investigation

In July 2013, EA and Cabrera performed a supplemental site characterization survey of potentially impacted soil at Site WR111 to assess conditions at the Radioactive Disposal Area, confirm existing assumptions about the nature and extent of radiological contamination in soil, and to collect samples for waste disposal characterization. Investigative activities included the following tasks:

- Limited GWS of the central and southeastern portions of WR111 was performed with a Ludlum 44-20 sodium iodide (NaI) detector coupled with GPS, to identify areas of elevated activities in order to strategically position boring locations in areas beyond those previously identified as radiologically impacted. GWS was performed with the detector 10 centimeters (cm) above the ground surface.

- Fourteen soil borings were advanced by direct-push method as terrain and access permitted. Subsurface soil samples were collected by advancing a steel macro-sampler core barrel (minimum 2-inch (in.) outside diameter) with acetate sleeves to a depth of 12-15 ft below ground surface. Core scans were obtained from each soil boring. Five out of the 14 boreholes did not advance to the investigational depth due to refusal and an additional two boreholes collapsed. As a result, downhole gamma readings were not collected from each soil boring.

- Subsurface soil cores were scanned for radiological contamination using a Ludlum 44-20 NaI detector.

- Downhole gamma loggings, in conjunction with core scanning, were performed to assist in determining the location of biased subsurface soil samples. Downhole gamma measurements were conducted utilizing a Ludlum 44-2 (1 × 1-in.) sodium iodide detector not collimated with lead shielding. The instrument was lowered into the borehole to the target depth and one-minute static measurements were collected at 6-in. intervals proceeding upward until the top of the borehole was reached.

- Surface and subsurface soil from boring intervals with the highest gross count rates were selected for biased soil sampling. A total of 29 soil samples, including 2 duplicate samples, were submitted to the offsite laboratory for radiological analysis. In addition, 3 samples were submitted to the offsite laboratory for chemical analyses to support future disposal activities, including toxicity characteristic leaching procedure for U.S. Environmental Protection Agency (EPA) regulated analytes, polychlorinated biphenyls, ignitability, corrosivity, and reactivity.

A total of 29 soil samples were submitted to Test America, Inc. (TestAmerica) and analyzed for natural radium, thorium and uranium isotopes using gamma spectroscopy via EPA Method 901.1. Three samples had elevated levels of ^{226}Ra and ^{232}Th. In order to obtain a more accurate ^{226}Ra activity value, the three samples were re-analyzed for ^{226}Ra via EPA Method 901.1M, which measures the ^{226}Ra daughter progeny (Lead-214 and Bismuth-214) at equilibrium. The 3 samples were also analyzed for isotopic thorium (including thorium-228, ^{230}Th, and ^{232}Th) by the alpha spectroscopy method EML Health and Safety Laboratory (HASL) 300 Modified (U.S. Department of Energy 1997) in order to determine the source of the elevated ^{226}Ra activity (^{226}Ra is a daughter of ^{230}Th). One of the three elevated activity samples (analyzed by gamma spectroscopy) also had an elevated uranium concentration with high uncertainty. Therefore, all 3 samples were analyzed by Isotopic Uranium (including Uranium-234, Uranium-235, and

Uranium-238) by EML HASL 300 Modified (U.S. Department of Energy 1997). Alpha spectroscopy is more accurate with a higher confidence level for reporting the activity of alpha emitting radionuclides. For this reason, the alpha spectroscopy results for the three reanalyzed samples (WR111-SB-WR701-BS-P-05, WR111-SB-WR708-BS-P-08, and WR111-SB-WR710-BS-P-05) were used during subsequent data evaluation activities. The results showed that the elevated ^{226}Ra activity is progeny from the elevated ^{230}Th resulting from the site Mg-Th contamination in all 3 samples. In addition, the isotopic uranium results were all representative of background activity levels. Alpha spectroscopy results are provided in Table B-1 (pages 1 through 8) in Appendix B of the Decommissioning Plan (EA 2015b).

Results of the surveys and sample analyses were used to identify specific areas of radiological contamination at Site WR111. A detailed analysis of the analytical results from the 2013 investigation is presented in Section 3.0 of the Decommissioning Plan (EA 2015b).

2.4 Radionuclides of Concern

Based on the results of the previous investigations and current site characterization, a number of sample results for the radionuclides ^{226}Ra, ^{230}Th, and ^{232}Th exceeded their corresponding NRC surface soil screening values (NUREG-1757, Vol. 1, Table B-2 [NRC 2006]). Therefore, ^{226}Ra, ^{230}Th, and ^{232}Th were considered as the ROCs for Site WR111.

2.5 Residual Derived Concentration Guideline Limit for Each Radionuclide of Concern

As described by MARSSIM, a DCGL is a derived radionuclide activity concentration within a survey unit (SU) that corresponds to a dose-based release criterion. The DCGLs presented in this document are based on the Radiological Criteria for Unrestricted Use requirements set forth by the NRC in 10 Code of Federal Regulations (CFR) Part 20.1402. In accordance with these requirements, a site is considered acceptable for unrestricted use if the residual radioactivity that is distinguishable from background radiation results in a Total Effective Dose Equivalent to an average member of the critical group that does not exceed 25 millirem per year (mrem/yr), and the residual radioactivity has been reduced to levels that are as low as reasonably achievable (ALARA).

A detailed evaluation and derivation of DCGLs for WR111 is provided in Appendix C of the Decommissioning Plan (Site- Specific DCGL Evaluation) (EA 2015b). As identified in Appendix C of the Decommissioning Plan, surface and subsurface soil at Site WR111 is the medium of concern. Two receptor scenarios were considered during the derivation of ROC-specific DCGLs for soil. A residential farmer was considered as the critical receptor for the base case site exposure scenario. One additional exposure scenario was evaluated to confirm that the base-case resident farmer scenario is bounding for the development of soil DCGLs. Site WR111 is currently federally owned and, hence, a very conservative airman exposure scenario was also selected. For each scenario, the receptor is potentially exposed to residual radioactivity in surface and subsurface soil that is remaining after the site has been released for use without radiological restrictions.

The residential farmer receptor is assumed to live onsite for 350 days per year for 30 years (EPA 2000). Under a resident farmer scenario, a family is assumed to move onto the site after it has been released for use without radiological restrictions, build a home, and raise crops and livestock for family consumption. The resident farmer is exposed through different exposure pathways to residual radioactivity present in the site soil. Members of the critical group can incur a radiation dose by:

- Direct radiation from radionuclides in the soil
- Inhalation of resuspended dust
- Ingestion of food from crops grown in the soil
- Ingestion of milk from livestock raised in the area
- Ingestion of meat from livestock raised in the area
- Ingestion of the soil.

As discussed in Appendix C of the Decommissioning Plan, there is no complete groundwater exposure pathway or surface water exposure pathway; therefore, these pathways were not considered (EA 2015b).

Under the airman scenario, the airman is modeled as a typical outdoor site worker who spends most of the time outdoors. The airman is assumed to be onsite for 25 years (EPA 1991). A typical industrial worker usually spends 250 days per year at the site. As a conservative approach, the airman is assumed to spend 300 days per year at this site, with a 10-hour work day. During the 10-hour working day, the airman is assumed to spend 2 hours indoors and 8 hours outdoors.

Complete exposure pathways applicable to the airman scenario include:

- Direct radiation from radionuclides in the soil
- Inhalation of re-suspended dust
- Ingestion of soil.

Table 2-1 presents the DCGLs for ROCs in soil at Site WR111. Among the two receptor scenarios, the most conservative DCGL for each ROC was selected as the site-specific DCGL. Each DCGL represents the concentration (based on the presented model) that would produce a 25 mrem/yr exposure.

When there are multiple ROCs present in the soil, the allowed soil concentration levels must follow the sum of the ratio (SOR). This will ensure that the sum of the individual fractions for each isotope to its individual DCGL fraction does not exceed unity. The SOR at Site WR111 is calculated as follows:

$$\mathrm{SOR} = \frac{\mathrm{Ra\text{-}226}_{\mathrm{Conc}}}{\mathrm{Ra\text{-}226}_{\mathrm{DCGLw}}} + \frac{\mathrm{Th\text{-}232}_{\mathrm{Conc}}}{\mathrm{Th\text{-}232}_{\mathrm{DCGLw}}} + \frac{\mathrm{Th\text{-}230}_{\mathrm{Conc}}}{\mathrm{Th\text{-}230}_{\mathrm{DCGLw}}}$$

where

$\mathrm{Ra\text{-}226}_{\mathrm{Conc}}$ = Measured activity concentration for ^{226}Ra.
$\mathrm{Th\text{-}232}_{\mathrm{Conc}}$ = Measured activity concentration for ^{232}Th.
$\mathrm{Th\text{-}230}_{\mathrm{Conc}}$ = Measured activity concentration for ^{230}Th.
$\mathrm{Ra\text{-}226}_{\mathrm{DCGLw}}$ = Site-Specific $\mathrm{DCGL_w}$ for ^{226}Ra.
$\mathrm{Th\text{-}232}_{\mathrm{DCGLw}}$ = Site-Specific $\mathrm{DCGL_w}$ for ^{232}Th.
$\mathrm{Th\text{-}230}_{\mathrm{DCGLw}}$ = Site-Specific $\mathrm{DCGL_w}$ for ^{230}Th.

3.0 Data Quality Objectives

This FSS was planned and conducted for each survey unit associated with impacted soils. The survey was developed in accordance with the guidance presented in the MARSSIM in order to follow the Data Quality Objective (DQO) process. The DQO process provides systematic procedures for defining the criteria that the survey design should satisfy, including what type of measurements to perform, when and where to perform measurements, the level of decision errors for the survey, and how many measurements to perform.

The DQO process included the following seven steps (EPA 2000):

- State the Problem
- Identify the Decision
- Identify Inputs to the Decision
- Define the Study Boundaries
- Develop the Decision Rule
- Specify Tolerable Limits on Decision Error
- Optimize the Design for Obtaining Data.

The DQOs are described below as they apply to the FSS at Site WR111.

3.1 Step 1: State the Problem

3.1.1 Problem Description

Characterization data indicated that surface and subsurface soil at Site WR111 were potentially contaminated with ^{226}Ra, ^{230}Th, and ^{232}Th from disposal of Mg-Th waste. As a result, remediation activities were required at the site to address the contamination. The objective of FSS activities was to obtain data of sufficient quality and quantity to support unrestricted release of Site WR111 following remedial activities. The levels of residual radioactivity must be determined by the FSS to confirm compliance with the radionuclide-specific DCGLs.

3.1.2 Planning Team Members

FSS planning was performed by a team of Cabrera and EA personnel, with input from the Air Force Civil Engineer Center (AFCEC), Hill AFB, and the NRC via USAF RIC.

3.1.3 Primary Decision Maker

The ultimate decision regarding site disposition will rest with the USAF RIC. The USAF RIC oversaw all decommissioning activities on behalf of the NRC and will work with the NRC to accomplish decommissioning of soils and release for unrestricted use.

3.1.4 Available Resources

Sufficient resources were available through the combined staff of EA, Cabrera, and subcontractors, to perform and complete all work required in achieving the FSS objectives.

3.2 Step 2: Identify the Decision

This FSSR will be used to demonstrate that the residual radionuclide concentrations in soil comply with their corresponding DCGL. Compliance will be verified using guidance found in the FSS Plan (FSSP) (Appendix D of the Decommissioning Plan [EA 2015b]), which was prepared in accordance with MARSSIM. Specifically, the compliance was demonstrated by:

- Collection of systematic surface soil samples consistent with MARSSIM
- Performance of GWS to identify gross contamination and small areas of elevated radiological activity
- Collection of biased measurements in areas of elevated radiological activity
- Comparison of residual soil concentrations for each ROC with respect to their corresponding remediation goals
- Collection of soil samples from background reference area
- Performance of statistical tests to verify that remediation goals were met and, therefore, the soil did not present a current or potential threat to public health, welfare, or the environment
- Review of the data to verify that they were of sufficient quality.

To demonstrate that an SU met remediation goals, four evaluation questions must be answered:

1. Was the SOR of each sample less than 1?
2. Was the combined SOR for the average SU activity and any small areas of elevated activity in that SU less than 1?
3. Did surface soil sample results satisfy the Wilcoxon Rank Sum (WRS) statistical test as described in MARSSIM?
4. Were the data of sufficient quality to support the conclusions (i.e., have Data Quality Indicators been met)?

If the answer to any one of these evaluation questions was “no” for any SU, then remediation goals were not satisfied. The remediation contractor would be required to remove additional soil and the SU would be reevaluated.

3.3 Step 3: Identify Inputs to the Decision

The Data Quality Assessment process as described in the MARSSIM and in the Guidance for Data Quality Assessment (EPA 2000) was used to determine if data obtained from environmental data operations were of the right type, quality, and quantity to support their intended use.

The "graded approach" concept was also used to assure that survey efforts were maximized in those areas where there was the highest probability for residual contamination or greatest potential for adverse impacts of residual contamination. Examples of integrating the graded approach into the MARSSIM process included the use of historical site assessments, characterization surveys, site conditions, equipment capabilities, and results as the survey progressed to establish or adjust the degree of scanning coverage of a survey area, SU size, SU classification, sampling frequency, and criteria for the evaluation of elevated measurements.

Field activities for the FSS are summarized below:

- GWSs were performed to identify elevated areas of surface radioactivity at Site WR111.
- Both systematic and biased volumetric samples were collected.
- Samples from the background reference areas were collected.

3.4 Step 4: Define the Study Boundaries

Study boundaries were defined by both horizontal (areal) and vertical parameters. The horizontal boundaries are defined in this FSSR by the potential for containing contaminated soil. The horizontal boundaries of the study were determined utilizing on-site gross gamma readings of the limits of excavation and comparing these readings to those collected from the background reference areas. The vertical extent or depth of contamination was initially determined utilizing down-hole gamma readings and sample results collected from previous site characterizations, and during the remediation, the vertical extent was determined utilizing on-site gross gamma readings of the limits of excavation and comparing these readings to those collected from the background reference areas. Classification of areas by contamination potential and then grouping areas into SUs was a critical step in the survey design process. An area is Class 1 if, prior to excavation activities, it is known to contain contamination above remediation goals. An area is Class 2 if contamination above remediation goals is not believed to be present. Following the MARSSIM approach, the remediation goal was also referred to as the $DCGL_W$ (the DCGL for average concentrations over an entire survey unit, used with statistical tests).

Division into specific Class 1 or Class 2 SUs depended on the actual extent of remediation; final designation of SUs was, therefore, conducted after remediation was completed and just prior to initiating post-remediation screening and the FSS. Generally, excavated areas were Class 1 and the boundary areas surrounding the excavated areas were Class 2. The SU boundaries were established by Cabrera and EA, in coordination with AFCEC, Hill AFB, and USAF RIC.

3.4.1 Population of Interest Defining Characteristics

The population of interest for the site was the concentration of the three ROCs and their associated $DCGL_W$ values in surface soils.

3.4.2 Temporal Boundaries of the Decision Statement

Time frame to which the decision applies:

- $DCGL_w$ values were based on risks to an average member of the Critical Group over a 1,000-year period following the study.

Time for data collection:

- Data collection and analysis were performed as soon as practical, as timely completion of the site restoration is contingent upon the results of the FSS.

3.4.3 Scale of Decision Making

Decisions were made for small areas in the SU that may exhibit elevated levels of radioactivity, then for the entire SU regarding whether or not it met the criteria for unrestricted release. A separate decision regarding compliance with the release criterion was made for each SU.

3.4.4 Constraints on Data Collection

Data collection activities could have been constrained due to excessive moisture or rain, which can have an adverse effect on field instrumentation. However, the constraint was limited due to the arid climate and minimal rainfall. The excavation also grew to such an extent that soils could not be sufficiently sloped to allow safe entry and survey of the sidewalls as described in the FSSP. However, alternative methods (i.e., survey instrumentation with longer cords and a flexible extension pole) allowed for all data to be collected to satisfy the requirements in the FSSP.

3.5 Step 5: State the Decision Rules

Figure 3-1 illustrates the sequence of events and decision rules that are followed in the MARSSIM FSS evaluation process. This evaluation process was used to determine whether an SU met remediation goals or if additional remediation or investigation and data gathering was required.

3.6 Step 6: Define Acceptable Decision Errors

As part of the DQO process, the null hypothesis (H_o) for demonstrating compliance of data with cleanup goals must be stated. The H_o for this FSS is that the soil sample concentrations in the SUs exceed the background by more than the $DCGL_{W.}$ In rejecting the H_o, the alternative hypothesis (H_a) must be accepted. The H_a for this FSS is that all measurements or soil sample concentrations in the SU do not exceed the background by more than the $DCGL_W$, and the finding would be that the SU meets the acceptance criterion.

Appendix D of MARSSIM (NRC 2000) provides a discussion regarding decision errors. This discussion includes the concept that acceptable error rates must be balanced between the need to make appropriate decisions and the financial costs of achieving high degrees of certainty.

> *"Errors can be made when making site remediation decisions. The use of statistical methods allows for controlling the probability of making decision errors. When*

> *designing a statistical test, acceptable error rates for incorrectly determining that a site meets or does not meet the applicable decommissioning criteria must be specified. In determining these error rates, consideration should be given to the number of sample data points that are necessary to achieve them. Lower error rates require more measurements, but result in statistical tests of greater power and higher levels of confidence in the decisions. In setting error rates, it is important to balance the consequences of making a decision error against the cost of achieving greater certainty."*

The non-parametric WRS test was used to evaluate the residual contamination in the SU relative to the H_o. To enable testing of survey data relative to the acceptance criterion, the acceptable decision errors were established for Site WR111. These are shown in Table 3-1.

Acceptability decisions are often made based on acceptance criteria. If the mean and median concentrations of a contaminant are less than the associated acceptance criteria, for example, then the results can usually be accepted. In cases where data results are not so clear, statistically based decisions are necessary. Statistical acceptability decisions, however, are always subject to error. Two possible error types are associated with such decisions.

The Type I decision error provides a 95 percent confidence level that the statistical tests will not incorrectly indicate that an SU satisfies acceptance criteria when, in fact, it does not. The Type II decision error provides a 95 percent confidence level that the statistical tests will not incorrectly indicate that an SU does not satisfy acceptance criteria when, in fact, it does. Type II errors are more a function of labor and survey costs and do not adversely impact public safety or health, and thus are subject to adjustment as needed. For the purposes of the FSS, the acceptable error rate for both Type I and Type II errors is 5 percent (i.e., $\alpha = \beta = 0.05$).

A minimum of 10 percent replicate and split samples were collected for field quality control (QC) purposes. Data quality indicators for precision, accuracy, representativeness, completeness, and comparability have been established.

- The acceptable criteria related to precision and accuracy for the project are presented in Section 8.3.
- Representativeness and comparability are assured through the selection and proper implementation of systematic sampling and measurement techniques.
- Completeness refers to the portion of the data that meets acceptance criteria and is, therefore, useable for statistical testing. The objective was 90 percent for this project.

3.7 Optimize the Design for Obtaining Data

Scoping surveys, field screening techniques (remedial support surveys), surface contamination scans, field QC, and the Data Quality Assessment process were used throughout the characterization, remediation and FSS process to focus efforts and to optimize costs.

4.0 Survey Instrumentation and Techniques

This section describes the GWS, and volumetric sample collection and analysis instruments and methodology that were used during the FSS of Site WR111. Specific survey and sampling requirements including percent coverage and types of surveys, numbers and types of samples, and analytical tests that were performed are discussed in the following sections. More detailed descriptions related to design of the FSS are presented in Section 5.0. Minimum detectable concentrations (MDCs) and minimum detectable count rates (MDCRs) required for the GWSs for project ROCs ^{232}Th and ^{226}Ra were calculated in accordance with MARSSIM and NUREG-1507, as presented in Attachments A and B of the FSSP (Appendix D of the Decommissioning Plan [EA 2015b]). The MDCs for ^{232}Th and ^{226}Ra in soil are provided in terms of pCi/g in Table 4-1. Note that ^{230}Th is an alpha-emitting radionuclide with no photon emissions, and cannot be detected using GWS measurement techniques.

4.1 Gamma Walkover Surveys

GWSs were performed in accordance with Cabrera OP-001, Radiological Surveys. Surveys were performed to measure surface radioactivity on the grounds. Equipment required for performing the GWS survey included the following:

- Trimble Pathfinder Pro XRS/XH GPS
- Ludlum Model 44-20 NaI gamma scintillation detector coupled to a Ludlum Model 2221 rate meter, equipped with RS-232 data download port
- Hardware: Personal computer, color printer, large capacity data storage device (e.g., zip drive)
- Software: Trimble Pathfinder Office, ArcGIS (or equivalent computer aided drawing software) with coordinate geometry capability.

The survey was performed following MARSSIM protocol by walking straight parallel lines at a speed of 0.5 meters per second over an area with the detector kept a fixed distance from the ground (≤ 4 in.). A three-wheeled cart was used for mounting the GPS and rate meter to stabilize the geometry for data collection in flat or open areas. Survey passes were approximately 0.5 meters apart. This system logged the gross gamma reading and position (in State Plane Coordinates) automatically every second. After completion of the survey, the raw data was downloaded from the GPS and transmitted to a data processing specialist for export into a geospatial software program.

Evaluation of the GWS data included geospatial imaging for visual trend analysis and comparison of count rates to investigation levels for identification of distribution outliers. Investigation levels were equal to three sigma (standard deviations) above the mean reference area count rates for the surface soils and trench soils data sets.

The GWS results were processed and organized and then reviewed by the Data Management Coordinator and evaluated by the Project Health Physicist. The review combined observation of individual data points that exceeded the investigation levels with any identifiable spatial patterns or trends that might indicate areas of relatively elevated activity, particularly those that corresponded to the areas where historical data indicated contamination within the particular excavation unit.

Section 5.5.3 in MARSSIM discusses the recommended scanning survey coverage for land areas. The objective of a scanning survey is to identify locations within the SU that exceed the cleanup level. These areas of elevated readings were marked for additional investigation. For Class 1 areas, scanning surveys are designed to detect small areas of elevated activity that are not detected by the soil samples collected using the systematic pattern. To achieve this goal, a 100 percent GWS was performed over all Class 1 soils. Class 2 SUs have a lower probability for areas of elevated activity than Class 1 SUs, but some portions of the SU may have a higher potential than others based on remediation efforts. The coverage goal for Class 2 areas was 100 percent as a conservative measure with 50-100 percent considered acceptable, depending on safety and accessibility.

4.2 Volumetric Sample Collection and Analysis

Volumetric samples of soil samples were collected from Site WR111 and the background reference area and were sent to TestAmerica for analysis and analyzed in accordance with TestAmerica's standard operating procedure. TestAmerica is certified as part of the National Environmental Laboratory Accreditation Program to perform these radiological analyses. Samples were collected in accordance with Cabrera OP-005: Volumetric and Material Sampling. Sample chains-of-custody were maintained in accordance with Cabrera OP-008: Chain-of-Custody.

Soil samples were collected using a stainless-steel trowel, and homogenized in a stainless-steel bowl prior to containerization. During the homogenization of soil samples, twigs, stones, and other non-soil items were removed from the sample material in the field and excluded from the laboratory samples to avoid biasing results low. Samples were not preserved in the field, as there were no preservation requirements for radiological analyses. One set of QC samples (e.g., field duplicate (FDUP), matrix spike [MS], and matrix spike duplicate [MSD]) were collected as required by each test method for each medium sampled.

Samples were handled, packaged, labeled, sealed, preserved, and shipped as described in the Cabrera OP-362: Sample Management and Shipping. Utensils and equipment that contact the sample material were decontaminated between sampling locations, as necessary, to prevent cross-contamination of the samples. A Ludlum 43-93 detector and smear sample were used to ascertain that no cross-contamination occurs between samples.

Hand augers/hand trowels/shovels, mixing utensils, and homogenizing bowls were decontaminated between samples in order to avoid cross-contamination. Decontamination was performed by wiping the tool or bowl with a MASSLINN® wipe to remove any residual contamination.

Systematic, biased, and field QC soil samples were numbered, logged, and transferred under applicable chain-of-custody procedures to an offsite laboratory for analyses. FDUP samples were collected at the frequency of 10 percent. Soil samples were submitted to TestAmerica. All soil samples were analyzed for ^{226}Ra (EPA Method 901.1 modified) and isotopic analysis for ^{230}Th and ^{232}Th (method HASL 300 Modified) (U.S. Department of Energy 1997).

The analytical test methods used to analyze radionuclides in volumetric samples at the offsite laboratory were able to achieve MDCs that were 10-50 percent of the soil screening criteria presented in Table 2-1.

4.3 Gamma Dose Rate Measurements

Gamma dose rate measurements were qualitatively performed during the FSS to ensure worker health and safety and to identify unusual dose rate conditions. Measurements were performed using a Bicron

MicroRem tissue-equivalent scintillation detector, or equivalent, and were collected in accordance with Cabrera OP-023: Operation of micro-R Meters, Rev 0. Measurements were performed using the "slow" response time constant setting. The detector was positioned over the area of interest and allowed to stabilize prior to recording the measurement. The technician used their judgment to determine when the instrument had stabilized, estimated to take at least 15 seconds. Such measurements typically were performed at 30 cm from and/or on contact with the surface being evaluated.

5.0 Final Status Survey Design

The FSS at Site WR111 was designed in accordance with FSS guidance from MARSSIM (NRC 2000). FSS activities consisted of scanning surveys over 100 percent of the reasonably accessible surface soil. Discrete soil sampling was performed at frequencies based on MARSSIM guidance. Survey activities also included biased soil sample collection and the performance of gamma dose rate measurements. The FSS was designed such that the radiological background present in the soil was considered for statistical comparisons to release criteria.

5.1 Classify Areas by Contamination Potential

As discussed in MARSSIM (NRC 2000), areas of sites undergoing an FSS should be classified into SU according to their potential for residual radioactivity. Section 2.2 of MARSSIM provides the following definitions for classifying areas (herein identified as SUs):

Non-Impacted Areas	Areas that have no reasonable potential for residual contamination.
Impacted Areas	Any area not classified as non-impacted; areas with the possibility of containing residual radioactivity in excess of natural background or fallout levels.
Class 1 Areas	Impacted areas that have, or had prior to remediation, a potential for contamination (based on site operating history) or known contamination (based on previous radiological surveys) above the $DCGL_w$.
Class 2 Areas	Impacted areas that, prior to remediation, are not likely to have concentrations of residual radioactivity that exceed the DCGLw.
Class 3 Areas	Impacted areas that have a low probability of containing residual radioactivity.

Using MARSSIM as guidance, the site was divided into three Class 1 SUs and one Class 2 SU as shown on Figure 5-1. The SU classifications were based on the remedial action and support surveys results. MARSSIM suggests that outdoor Class 1 and Class 2 SUs be not more than 2,000 and 10,000 square meters, respectively, in size.

5.2 Select a Background Reference Area Data Set

A background reference set must be identified if the contribution of naturally occurring levels of the ROCs is to be subtracted from survey measurements (through application of the WRS test).

There are two areas that required reference area comparison at the conclusion of the remediation: the surface soils underlying the Layback Soils Staging Area, and the subsurface soils at the limits of excavation of the WR111 trench. Therefore, there were two reference areas for this project: a surface soil reference area and trench reference area. The approved background areas had a GWS conducted and the data was reviewed for areas of elevated activity prior to surface soil sampling to establish the background reference data sets. Eighteen total background soil samples were collected and analyzed by TestAmerica, the same offsite laboratory utilized for analysis of survey unit samples from Site WR111.

5.3 Prepare Site for Survey Access

Site WR111 is located on federally-owned land and, therefore, approval from Hill AFB must be obtained before entering the site. Requests for site access were submitted by EA prior to mobilization. Access to the Site was ultimately made available through a dedicated gate opening to the adjacent property and security of the LMTF was ensured by installing a fence around Site WR111.

The site access agreement included information relative to the following additional topics:

- Security concerns, locking of the facility, and key control, where applicable
- How grids, survey locations, and surface nomenclature may be marked (or not marked) on survey surfaces
- What may and may not be moved, repositioned, or dismantled in order to gain access for survey, and notification requirements for such
- Cleanliness needs for survey execution and responsibilities for achieving this level of cleanliness
- Coordination with Hill AFB personnel for utility mark-out via Red Stakes.

5.4 Establish Survey Location Reference System

An FSS reference coordinate system was developed and installed early in the FSS process. Coordinates were referenced to the State Plane Coordinate System (e.g., North American Datum 83 U.S State Plane meters). The reference coordinate system was established such that the grid spacing satisfied the survey design requirements (and, therefore, the grid intersections correspond to the survey data point locations) for Class 1 and Class 2 SUs.

Measurement locations within Class 1 and Class 2 areas were placed on a triangular grid overlaid on the ground surface. The spacing of the grid in each area depended upon the calculated area since the number of locations did not change.

A Geographic Information System (GIS) program was used to lay a triangular grid with proper length spacing over the SUs. A random start point for the grid was established using a computer-generated random coordinate set. The number of sample locations corresponding to the random-start triangular grid was determined using GIS.

Each survey was designed to optimize the data collection procedure, taking into account the SU's configuration, hazards, and other obstructions. Copies of the base map on which temporary structures, roads, or other major features have been located was available onsite. The boundaries of the SUs were identified and clearly marked.

5.5 Number of Systematic Soil Samples

MARSSIM provides a method to determine the minimum number of measurement locations required in a given SU to support decision-making and achieving survey objectives. A minimum number of measurement locations are required in each SU to obtain sufficient statistical confidence that the

conclusions drawn from the measurements are correct. The following subsections describe the bases for and derivation of the minimum required measurement locations per SU.

5.5.1 Estimation of Relative Shift

The minimum number of measurement locations required is dependent on the distribution of site residual radionuclide concentrations relative to the $DCGL_w$ and acceptable decision error limits (α and β). The relative shift describes the relationship of site residual radionuclide concentrations to the $DCGL_w$ and is calculated using the guidance found in Section 5.5.2.3 of MARSSIM. The relative shift was calculated as follows:

$$\Delta/\sigma = \frac{DCGL_w - LBGR}{\sigma}$$

where

$DCGL_w$ = Derived Concentration Guideline Level over a wide area.
LBGR = Concentration at the lower bound of the gray region. The Lower Bound of the Grey Region (LBGR) is the concentration at which the SU has an acceptable probability of passing the statistical tests.
σ = An estimate of the standard deviation of the concentration of residual radioactivity in the survey unit (which includes real spatial variability in the concentration as well as the precision of the measurement system).

MARSSIM recommends that it may be reasonable to assume a value for sigma on the order of 30 percent, which is equivalent to a sigma value of 0.3 (NRC 2000). Using a $DCGL_w$ equal to an SOR of 1, an LBGR of 0.5 (half the $DCGL_w$), and a sigma equal to 0.3, the relative shift was calculated to be 1.67, which is rounded down to 1.6 to be conservative.

5.5.2 Determination of Systematic Samples (Number of Required Measurement Locations)

The WRS statistical test was used to determine when SUs were suitable for release for unrestricted use, according to the DCGLs. The minimum number of systematic measurement locations required in each SU for the WRS statistical test was determined using Table 5.3 in MARSSIM (NRC 2000). Section 4.6 establishes the acceptable decision errors for the SUs as $\alpha = \beta = 0.05$. Based on the relative shift established above and these decision errors, the estimated minimum number of required measurement locations is 16. MARSSIM recommends an additional 20 percent to protect against lost or unusable data. Therefore, a minimum of 18 sample locations was required in Class 1 and 2 SUs, and the reference area.

5.5.3 Systematic Measurement Locations

Field personnel initially marked the perimeter of each SU using GPS. Actual SU dimensions were measured in the field and were contingent upon the extent of excavations performed in the course of remediation. These data were then transferred into the GIS so that a triangular sampling grid could be established. A random start point was generated and systematic sample locations will be calculated in an equilateral triangular grid pattern using the spacing given by the equation shown below (Equation 5-5 from MARSSIM).

$$L = \sqrt{\frac{A}{0.866 \times N}}$$

where

L = Triangular grid spacing for SU.
A = Area of SU.
N = Number of sample locations.

Measurement spacing results (L) using the equation above are presented in Table 5-1. Site SU delineations, reference area, and Class 1 and Class 2 sampling locations are presented in Figure 5-1.

After the systematic sample locations were established and prior to sample collection, soil sample locations were marked in the field. Table 5-1 lists each SU by matrix type, area, number of samples to be collected in that SU, and the distance between each sample using a triangular grid pattern.

5.5.4 Determination of Biased Samples

Areas exceeding the investigation level were investigated with hand-held instruments (Ludlum 44-20 NaI detectors) to locate the highest gross gamma activity. Biased samples were collected within each SU at the location(s) GWS data and the hand-held instrument investigation data indicate elevated radioactivity. The number of biased locations was determined by the Project Technical Team based on the actual survey results.

5.6 Gamma Dose Rate Measurements

Gamma dose rate measurements were performed at all systematic and biased soil sample locations. Gamma dose rate measurements were recorded prior to the collection of any soil samples. Gamma dose rate measurements were performed to ensure worker safety and to identify unusual dose rate conditions. Gamma dose rate measurements were performed as described in Section 4.3.

5.7 Deviations from the Survey Design

There were several significant deviations from the survey design described in the Decommissioning Plan (EA 2015b). These deviations did not prevent achieving the project objectives.

5.7.1 Global Positioning System Quality Control and Reception

The FSSP described collecting GPS point features at the beginning and end of the day at a fixed location established at the beginning of the FSS. Results of these feature counts were to be compared to the mean of a series of sequential initial positions to ensure no more than 1-meter variability occurs. A feature count outside these criteria was cause for notification of the Field Site Manager and evaluation of conditions prior to further counts and/or removal of the GPS from service. GPS units must pass a feature count prior to field use.

During the field work, the decision was made to not perform these measurements. The GPS reports the position dilution of precision (PDOP) constantly while in operation. The PDOP is the measure of the potential error in positional accuracy. Anytime the PDOP exceeded 1.0 meters, due to the position of

satellites, or the trench excavation sidewalls causing interference, the field team stopped data collection. Monitoring the PDOP was considered equivalent to performing the precision of the GPS on a daily basis.

There were also occasions when the geometry of the excavation blocked satellite reception and prevented using the GPS to provide position-correlated scan results that accurately recorded measurement locations. The results of the gamma walkover survey in the excavations (Figures 7-2) indicated results outside the boundary of the SU and show areas where no scan data were recorded. These apparent gaps in the survey and erroneous scan measurement locations result from the limited GPS reception and do not reflect the extent of the survey. The technicians performing the scan surveys were aware of the problem with limited GPS reception and took extra care in identifying areas of potentially elevated gamma radiation and describing locations where samples were collected. This information was used to qualitatively determine the locations of potentially elevated activity and ensure the survey objectives were achieved. The data are presented using the best available information. Locations of biased soil samples based on elevated gamma scan results were verified by scanning the area surrounding an elevated gamma scan result to identify the maximum reading. Biased soil samples were collected at the location where the highest gamma reading was identified.

Before data collection began each day, the GPS was inspected for physical damage, battery voltage levels and erroneous readings in accordance with standard operating procedures.

5.7.2 Gamma Activity Instrument Check Source

Section 8.2.1. of the FSSP (Appendix D of the Decommissioning Plan [EA 2015b]) describes using a Cesium-137 (^{137}Cs) source to perform initial and daily quality control response checks for NaI detectors. A Cobalt-60 (^{60}Co) source was used instead of the ^{137}Cs source for these response checks. The reason this was done is because the ^{137}Cs check source, when shipped, is required by the U.S. Department of Transportation to be shipped as an exempt quantity of radioactive material, with additional labeling and survey requirements, and potential limitations on shipping carriers. The activity of the ^{60}Co check source did not trigger these same requirements, and, therefore, was not subject to this additional shipping requirements. The change in sources used for these qualitative response checks did not change the instrumentation source check procedure, or affect the quality of the data collected.

5.7.3 Use of MARSSIM Equation 8-2

In Section 7.0 of the Decommissioning Plan (EA 2015b) , the DCGL used for elevated measurement comparison ($DCGL_{EMC}$) was described as being used for biased samples. For every biased sample location within an SU where the Net SOR was greater than 1.0, an elevated measurement comparison is made. MARSSIM describes that any sample with a Net SOR greater than 1.0 (i.e., a sample that exceeds the $DCGL_W$), whether that sample is a systematic or biased sample, must be evaluated using the $DCGL_{EMC}$ to determine whether the SU will meet the release criteria.

Net SOR_{EMC} is calculated using the $DCGL_{EMC}$ as follows:

$$\text{Net SOR}_{EMC} = \sum_i \left[\frac{(\text{Conc}_i - \text{B}_i)}{DCGL_{EMC}} \right]$$

The Net SOR_{EMC} was used to evaluate each sample with a Net SOR that was greater than 1.0. However, MARSSIM Equation 8-2 must also be used to evaluate whether the dose or risk of a survey unit is less than the release criteria.

Section 6.0 of this report describes the methods used to evaluate doses or risks when there are multiple ROCs using the sum of ratios calculation. MARSSIM Equation 8-2 can be used when an isolated area of elevated activity is identified in a survey unit to demonstrate the dose or risk is less than the release criterion.

$$\frac{\delta}{DCGL_W} + \frac{(average\ concentration\ in\ elevated\ area - \ \delta)}{DCGL_{EMC}} < 1.0$$

Where, δ = estimate of the average residual radioactivity in a survey unit

Because the equation is written in terms of DCGL values, this equation can only be applied to a single radionuclide at a time. There is no guidance for demonstrating compliance with the release criterion when areas of elevated activity are present for multiple radionuclides of concern. However, since multiple radionuclides of concern are present at Site WR111, EA adjusted the parameters in MARSSIM Equation 8-2 to conservatively account for those radionuclides and allow comprehensive review of the data, as follows:

- Area factors were used in place of $DCGL_{EMC}$ values because the calculation is based on SOR values instead of concentrations.
- Average SOR for each survey unit were used instead of average concentration.
- Average SOR for elevated area samples were used instead of average elevated concentration.
- The SOR (i.e., "unity") was used in place of $DCGL_W$.

The adjusted MARSSIM Equation 8-2 is the following:

$$\frac{\delta}{SOR} + \frac{(average\ SOR\ in\ elevated\ area - \ \delta)}{Area\ Factor} < 1.0$$

Where, δ = estimate of the average SOR in a survey unit

MARSSIM Equation 8-2 was utilized to evaluate the compliance of SUs 2 and 4 with the release criteria. These results are presented in Section 7.0 of this report.

5.7.4 Survey Unit Boundary Changes

EA conducted excavation and FSS activities in June-August 2016 to remove radiologically-impacted soil at Site WR111. After reviewing the FSS data, it was apparent that residual radiological activity in soil above cleanup criteria still remained at the site. After consulting with AFCEC, NRC and the USAF RIC, additional excavation and FSS activities were performed in May 2017. FSS was performed in areas that were remediated, and the 2017 GWS and sample data replaced the data from these areas collected in 2016. After reviewing the data from 2016 and 2017, it was apparent that residual radiological activity in soil above the $DCGL_W$ remained at the Site. Rather than performing further remediation, a series of systematic samples were collected to the south of the previous survey area in an attempt to bound the contamination. After receiving these sample results, it was clear that the contamination was successfully

bounded by the samples collected on the south, southwest, and southeast of the previously surveyed areas. The SU boundaries were revised so that the following three conditions were met:

1) Each SU contained at least 18 systematic sample locations.

2) Each Class 1 SU remained less than the MARSSIM SU size limit of 2,000 m^2.

3) Systematic samples in a Class 2 SU successfully bounded the Class 1 SUs on the east, south, and west.

As a result of these revised SU boundaries, several samples that were previously part of one SU were now included in the dataset of a different SU. For example, sample SU03-S-058-SS-P-00 was previously included in the SU 3 dataset, but as a result of the boundary changes, it is now included in the SU 4 dataset. Sample locations, and the revised SU boundaries, are displayed in Figure 7-2. Sample data for each SU are provided in Tables 7-2, 7-4, 7-6, 7-7, 7-9, 7-10, and 7-12.

5.7.5 Radioactive Air Filter Sample Analysis

Section 9.0 of the FSSP (Appendix D of the Decommissioning Plan [EA 2015b]) states that air filters from air monitoring stations will be sent to TestAmerica to analyze for gross alpha and gross beta. These filters were instead counted using on-site smear counter for gross alpha and gross beta to provide real-time data for radiological air sampling and allow for additional administrative controls to be implemented if necessary. No filter concentrations exceeded the effluent or derived air concentration action levels in the RPP. All types of filters (i.e., perimeter, work area, and breathing zone) for the entire project were then composited into three samples and sent to TestAmerica for isotopic thorium analysis. This approach was taken to provide definitive data regarding the potential airborne concentrations of thorium during site activities. None of the three samples exceeded their respective action limits in the RPP. Air monitoring results are provided in Appendix K of the Closure Report.

6.0 Data Evaluation and Interpretation of Survey Results

In accordance with MARSSIM guidance, a preliminary data review was performed to identify patterns, relationships, and potential anomalies present in the survey data. In this review, basic statistics including the mean, standard deviation, maximum, and minimum values were calculated for each SU. A graphical review of the data was performed consisting of posting plots and histograms. Posting plots were used to review the spatial independence of measurements within SUs, while histograms were employed to review the overall symmetry of the data.

Once the data were reviewed, systematic soil sample results for each SU were compared to the respective $DCGL_W$. Due to the presence of multiple ROCs in the soil, the allowed soil concentration levels are evaluated by employing the SOR. This ensures that the sum of the individual fractions for each isotope to its individual DCGL fraction does not exceed unity and enables field measurement of a gross activity DCGL. The gross activity SOR for samples at Site WR111 is calculated as follows:

$$SOR = \frac{Ra\text{-}226_{Conc}}{Ra\text{-}226_{DCGLw}} + \frac{Th\text{-}232_{Conc}}{Th\text{-}232_{DCGLw}} + \frac{Th\text{-}230_{Conc}}{Th\text{-}230_{DCGLw}}$$

where

$Ra\text{-}226_{Conc}$ = Measured activity concentration for ^{226}Ra.
$Th\text{-}232_{Conc}$ = Measured activity concentration for ^{232}Th.
$Th\text{-}230_{Conc}$ = Measured activity concentration for ^{230}Th.
$Ra\text{-}226_{DCGLw}$ = Site-Specific $DCGL_w$ for ^{226}Ra.
$Th\text{-}232_{DCGLw}$ = Site-Specific $DCGL_w$ for ^{232}Th.
$Th\text{-}230_{DCGLw}$ = Site-Specific $DCGL_w$ for ^{230}Th.

For every sample location within an SU where the SOR is greater than 1, the Net SOR for that sample location was calculated. Net SOR considers the concentration of each radionuclide less its respective background concentration (as established by the reference area soil sample results) divided by the $DCGL_w$ established for the radionuclide, as follows:

$$\text{Net SOR} = \sum_i \left[\frac{(Conc_i - B_i)}{DCGL_{Wi}} \right]$$

where

$Conc_i$ = Concentration of ROC "i" present in the soil sample.
B_i = Average concentration of ROC "i" present in the reference area.
$DCGL_{wi}$ = $DCGL_w$ of ROC "i."

For each systematic or biased sample within an SU, individual measurement values that exceed the appropriate action level, an elevated measurement comparison ($DCGL_{EMC}$) was calculated as a release criteria. The $DCGL_{EMC}$ is the DCGL for residual radioactivity evenly distributed over a wide area ($DCGL_w$), modified using a correction factor (i.e., an area dose factor) to account for the difference in area and the change in dose or risk. An area dose factor "is the magnitude by which the concentration within the small area of elevated activity can exceed $DCGL_w$ while maintaining compliance with the

release criterion" (NRC 2000). The $DCGL_{EMC}$ was calculated as follows:

$$DCGL_{EMC} = DCGL_w \times \text{ Area Factor}$$

For example, the action level for ^{226}Ra may be modified for a 1 square meter outdoor area using the area dose factor of 54.8 listed in MARSSIM Table 5.6, yielding a $DCGL_{EMC}$ of 109.6 pCi/g (i.e., [2.0 pCi/g] × [54.8]).

The Residual Radioactivity (RESRAD) computer code was used to calculate the maximum allowable elevated concentrations pertaining to the project ROCs. The DCGL values calculated for this project are provided in Table 6-1. The area factors calculated for this project are provided in Table 6-2. The RESRAD models are provided in Attachment D of this report.

For every systematic or biased sample location within an SU where the Net SOR is greater than 1, an elevated measurement comparison is made.

Net SOR_{EMC} is calculated using the $DCGL_{EMC}$ as follows:

$$\text{Net } SOR_{EMC} = \sum_i \left[\frac{(\mathrm{Conc_i} - \mathrm{B_i})}{DCGL_{EMC}} \right]$$

Where

$Conc_i$ = Concentration of ROC "i" present in the soil sample.
B_i = Average concentration of ROC "i" present in the reference area.
$DCGL_{EMC}$ = DCGL for elevated measurement comparison

If the Net SOR results for all samples for an SU were less than 1, the SU meets the release criteria. If the Net SOR result for any sample in an individual SU is greater than 1, the SU does not meet the release criteria and additional testing must be performed.

In addition to Net SOR data evaluation, comparison of reference area (background) radionuclide concentrations with SU concentrations was performed using the two-sample WRS statistical test. This test is selected because the ROCs also occur naturally (i.e., background). The two-sample WRS statistical test assumes the reference area and SU data distributions are similar except for a possible shift in the medians. It should be noted that the WRS test was performed using gross SOR values since the WRS test compares the SU results against the reference area results. In addition, biased soil sampling results were excluded during the WRS statistical test since they violate the random criteria used to establish systematic sampling locations.

When the data are severely skewed, the value for the mean difference between SU measurements and reference measurements may be above the $DCGL_w$, while the median difference is below the $DCGL_w$. In such cases, the SU does not meet the release criterion regardless of the result of the statistical test. On the other hand, if the difference between the largest SU measurement and the smallest reference area measurement is less than the $DCGL_w$, then the WRS statistical test will always show that the SU meets the release criterion.

In using this test, the hypotheses being tested are:

1. ***Null Hypothesis (H_0)***—The median concentration in the survey unit exceeds that in the reference area by more than the $DCGL_w$ versus the alternative.

2. ***Alternative Hypothesis (H_a)***—The median concentration in the survey unit exceeds that in the reference area by less than the $DCGL_w$

The WRS statistical test was applied to the laboratory sample data via the following sequential steps:

1. Reduce reference area and SU isotopic data to gross SOR using the first equation presented in this section.

2. Add the $DCGL_w$ value (i.e., 1.0) to each reference area SOR value, X_i, to obtain the adjusted reference area SOR, Z_i, where:

$$Z_i = X_i + 1.0$$

3. The *m*-adjusted SOR, Z_i, from the reference area and the *n* SOR, Y_i, from the SU are pooled and assigned a rank in order of increasing measurement value from *I* to *N*, where:

$$N = m + n$$

4. If several SORs are equal (e.g., have the same value), then they are all assigned the average rank of that group of tied measurements.

5. Sum the ranks of the adjusted SOR from the reference area, W_r. Since the sum of the first *N* integers is $N(N + 1)/2$, one can equivalently sum the ranks of the SOR from the SU, W_s, and calculate

$$W_r = \frac{N(N+1)}{2} - W_s$$

6. Compare W_r with the critical value given in Table I.4 in MARSSIM for the appropriate values of *n*, *m*, and α. If W_r is greater than the tabulated value, then reject the H_0 that the SU exceeds the release criterion.

7.0 Final Status Survey Results

A summary of all FSS results are presented below. Complete analytical results are included in Attachment B, and complete GWS results are provided in Attachment C.

FSS included gamma activity scans and sample collection. These surveys were performed as described in Section 5.0.

The summary results for the gamma scanning is provided in Table 7-1. The summary results for systematic soil sample concentrations for SUs 1, 2, 3, and 4 are provided in Tables 7-3, 7-6, 7-9, and 7-12, respectively. The summary results for biased soil sample concentrations for SUs 1, 2, and 3 are provided in Tables 7-4, 7-7, and 7-10, respectively. Finally, a summary of the WRS test results is provided in Tables 7-5, 7-8, 7-11, and 7-14. Note as described in Section 5.7.4 that some sample IDs containing a reference to one SU may now be included in the dataset from a different SU (i.e., Sample ID with "SU03" prefix might be included in the dataset for SU 4).

7.1 Background Reference Area Results

Soil reference data were collected to develop ILs and support statistical testing of soil datasets. There were two reference areas for this project: a surface soil reference area and trench reference area. A 100 percent GWS was performed over both reference areas independently. These data were used to develop the ILs (i.e., three standard deviations above the mean reference area count rate) for the surface soils and trench soil areas. These data are summarized in Table 7-1, and displayed in Figure 7-1.

Eighteen soil samples were collected from the selected soil background reference area and submitted the samples to TestAmerica for gamma spectroscopy analysis for ^{226}Ra (U.S. EPA Method 901.1M) and isotopic thorium analysis for ^{230}Th and ^{232}Th. The reference dataset of 18 soil samples collected from the soil reference area provided a mean ^{230}Th and ^{232}Th of 1.75 and 1.63 pCi/g, respectively, and a ^{226}Ra concentration of 1.46 pCi/g. The data are summarized in Table 7-2. Sample locations are displayed in Figure 7-1.

7.2 Gamma Scan Survey Results

Gamma scans were performed over 100 percent of the surfaces of all SUs as described in Section 4.1. The FSS GWS results are presented in Table 7-1, and displayed in Figure 7-2. Biased soil samples were collected at the most elevated gamma activity locations in each SU. Biased soil sample results for SUs 1, 2, and 3 are presented in Tables 7-4, 7-7, and 7-10, respectively.

7.3 Survey Unit Results

7.3.1 Survey Unit 1

Survey Unit 1 was a Class 1 SU encompassing approximately one-third of the excavated trench area. It consisted of both the excavation floors and sidewalls and had an approximate area of 1,625 m^2. FSS in SU 1 consisted of a 100 percent GWS and collection of 18 systematic surface soil samples. Three surface biased soil samples (SU01-EXB-076-SS-P-01, SU01-EXB-077-SS-P-01, and SU03-S-080-SS-P-00) were collected at the most elevated gamma activity locations.

The FSS GWS results for SU 1 are presented in Table 7-1 and displayed in Figure 7-2. Systematic and biased sample locations are also displayed in Figure 7-2. Systematic and biased soil sample net SOR results for SU 1 did not exceed the DCGLw of 1.0 and are summarized in Table 7-3 and Table 7-4, respectively. The complete analytical results for SU 1 samples are presented in Attachment B. The WRS Test was performed to evaluate the systematic soil sample gross SOR results for SU 1. The SU sample results passed the WRS test, as shown in Table 7-5.

Therefore, H_0 is rejected and SU 1 survey and sample results demonstrate compliance with the release criterion.

7.3.2 Survey Unit 2

Survey Unit 2 was a Class 1 SU encompassing approximately one-third of the excavated trench area (primarily the deeper excavation). It consisted of both the excavation floors and sidewalls and had an approximate area of 1,153 m^2. FSS in SU 2 consisted of a 100 percent GWS and collection of 18 systematic surface soil samples. Two surface biased soil samples (SU02-EXB-078-SS-P-00 and SU02-EXB-079-SS-P-00) were collected at the most elevated gamma activity locations.

The FSS GWS results for SU 2 are presented in Table 7-1 and displayed in Figure 7-2. Systematic and biased sample locations are also displayed in Figure 7-2. Systematic and biased soil sample net SOR results for SU 2 did not exceed the DCGLw of 1.0 with the exception of systematic sample SU02-EXB-051-SS-P-01, which has a net SOR of 1.04. Systematic and biased sample results are summarized in Table 7-6 and Table 7-7, respectively. The complete analytical results for SU 2 samples are presented in Attachment B.

For every systematic or biased sample location within an SU where the Net SOR is greater than 1.0, an elevated measurement comparison was made.

Net SOR_{EMC} is calculated using the $DCGL_{EMC}$ as follows:

$$\text{Net SOR}_{EMC} = \sum_i \left[\frac{(\text{Conc}_i - \text{B}_i)}{DCGL_{EMC}} \right]$$

Expanding the equation results in the following:

$$\frac{^{226}Ra_{Conc}}{^{226}Ra\ DCGL_{EMC}} + \frac{^{230}Th_{Conc}}{^{230}Th\ DCGL_{EMC}} + \frac{^{232}Th_{Conc}}{^{232}Th\ DCGL_{EMC}} = Net\ SOR_{EMC}$$

The area of elevated activity is approximately 60 m^2 (Figure 7-2), which was conservatively rounded up to 75 m^2. The area factor for Th-232+D of 2.05 is the lowest area factor for the ROCs (see Table 6-2). Substituting actual values for sample SU02-EXB-051-SS-P-01 in the equation yields:

$$\frac{1.05}{5.2} + \frac{0.39}{14.4} + \frac{0.56}{4.0} = 0.37$$

Since the result is less than 1.0, the area of elevated activity is less than the $DCGL_{EMC}$.

The WRS Test was performed to evaluate the systematic soil sample gross SOR results for SU 2. The SU sample results passed the WRS test, as shown in Table 7-8.

MARSSIM Equation 8-2 is used when an isolated area of elevated activity is identified in a survey unit to demonstrate the dose or risk is less than the release criterion. EA adjusted the equation as described in Section 5.7.3 of this report as follows:

$$\frac{\delta}{1.0} + \frac{(average\ SOR\ in\ elevated\ area - \ \delta)}{Area\ Factor} < 1.0$$

Where, δ = estimate of the average SOR in a survey unit

Applying adjusted MARSSIM Equation 8-2 for an area of elevated activity up to 75 m^2 including SU2-51 produces:

$$\frac{0.12}{1} + \frac{(1.04 - 0.12)}{2.05} = 0.57$$

The value of 0.57 is less than 1.0, so SU 2 demonstrates compliance with the MARSSIM Equation 8-2 unity rule.

As a result, H_0 is rejected and SU 2 survey and sample results demonstrate compliance with the release criterion.

7.3.3 Survey Unit 3

Survey Unit 3 was a Class 2 SU encompassing a buffer area around the excavation and a path of travel from the excavation to the on-site location of the fuel tank. It consisted of surface soils and had an approximate area of 1,953 m^2. FSS in SU 3 consisted of a 100 percent GWS and collection of 22 systematic surface soil samples. A surface biased soil sample (SU03-S-082-SS-P-00) was collected at the most elevated gamma activity location.

The FSS GWS results for SU 3 are presented in Table 7-1 and displayed in Figure 7-2. Systematic and biased sample locations are also displayed in Figure 7-2. Systematic and biased soil sample net SOR results for SU 3 did not exceed the DCGLw of 1.0 and are summarized in Table 7-9 and Table 7-10, respectively. The complete analytical results for SU 3 samples are presented in Attachment B. The WRS Test was performed to evaluate the systematic soil sample gross SOR results for SU 3. The SU sample results passed the WRS test, as shown in Table 7-11.

Therefore, H_0 is rejected and SU 3 survey and sample results demonstrate compliance with the release criterion.

7.3.4 Survey Unit 4

Survey Unit 4 was a Class 1 SU (see Figure 7-2). It consisted of both excavation floors and surface soils and had an approximate area of 1,913 m^2. FSS in SU 4 consisted of a 100 percent GWS and collection of 18 systematic surface soil samples. No biased samples were collected in this SU.

The FSS GWS results for SU 4 are presented in Table 7-1 and displayed in Figure 7-2. Systematic sample locations are also displayed in Figure 7-2. Systematic soil sample net SOF results for SU 4 did

not exceed the net DCGLw of 1.0 with the exception of systematic samples WR-720, WR-742, SU03-S-087-SS-P-00, and SU03-S-088-SS-P-00. A single area of elevated activity was established in SU 4 that includes all four elevated soil sample results, along with sample WR-721. The area of elevated activity is approximately 339 m^2, which was rounded up to 500 m^2 for selection of a $DCGL_{EMC}$.

Systematic sample results are summarized in Table 7-12. The five sample results included in the area of elevated activity are provided separately in Table 7-13. The complete analytical results for SU 4 samples are presented in Attachment B.

For every systematic or biased sample location within an SU where the Net SOR is greater than 1.0, an elevated measurement comparison was made.

Net SOR_{EMC} is calculated using the $DCGL_{EMC}$ as follows:

$$\text{Net SOR}_{\text{EMC}} = \sum_i \left[\frac{(\text{Conc}_\text{i} - \text{B}_\text{i})}{DCGL_{EMC}} \right]$$

Expanding the equation results in the following:

$$\frac{{}^{226}Ra_{Conc}}{{}^{226}Ra\ DCGL_{EMC}} + \frac{{}^{230}Th_{Conc}}{{}^{230}Th\ DCGL_{EMC}} + \frac{{}^{232}Th_{Conc}}{{}^{232}Th\ DCGL_{EMC}} = Net\ SOR_{EMC}$$

The area of elevated activity is approximately 339 m^2 (Figure 7-2), which was conservatively rounded up to 500 m^2. Substituting actual values for the SU 4 elevated area in the equation yields:

$$\frac{0.16}{2.5} + \frac{3.15}{6.9} + \frac{0.38}{2.6} = 0.67$$

Since the result is less than 1.0, the SOR for the area of elevated activity is less than the $DCGL_{EMC}$.

The WRS Test was performed to evaluate the systematic soil sample gross SOR results for SU 4. The SU sample results passed the WRS test, as shown in Table 7-14.

MARSSIM Equation 8-2 is used when an isolated area of elevated activity is identified in a survey unit to demonstrate the dose or risk is less than the release criterion. EA adjusted the equation as described in Section 5.7.3 of this report as follows:

$$\frac{\delta}{1.0} + \frac{(average\ SOR\ in\ elevated\ area -\ \delta)}{Area\ Factor} < 1.0$$

Where, δ = estimate of the average SOR in a survey unit

Applying adjusted MARSSIM Equation 8-2 for a single area of elevated activity up to 500 m^2 including WR-720, WR-721, WR-742, SU03-S-087-SS-P-00, and SU03-S-088-SS-P-00 produces:

$$\frac{0.49}{1} + \frac{(1.038 - 0.49)}{1.35} = 0.90$$

Where, the area factor of 1.35 was conservatively selected (see Table 6-2) to represent all ROCs for this area of elevated activity.

The value of 0.90 is less than 1.0, so SU 4 demonstrates compliance with the MARSSIM Equation 8-2 unity rule.

As a result, H_0 is rejected and SU 4 survey and sample results demonstrate compliance with the release criterion.

Final Status Survey Report
WR111 Little Mountain Test Facility Magnesium-Thorium Disposal Trench, Hill Air Force Base, Utah

NOTES:
Data from Area “R” (reference area) is the sum of the ratios of the individual radionuclide concentrations to the derived concentration guideline levels (DCGLs) in Table 2-1. Adjusted data from Area “R” is the data column plus 1.0.
Data from the Area “S” (systematic samples from the survey unit) is the sum of the ratios of the individual radionuclide concentrations to the DCGLs in Table 2-1.
The ranks are the ranking of each value in the Adjusted Data column from lowest to highest.
The RA Ranks are the ranks of the reference area samples only.

Final Status Survey Report
WR111 Little Mountain Test Facility Magnesium-Thorium Disposal Trench, Hill Air Force Base, Utah

NOTES:
Data from Area "R" (reference area) is the sum of the ratios of the individual radionuclide concentrations to the derived concentration guideline levels (DCGLs) in Table 2-1. Adjusted data from Area "R" is the data column plus 1.0.
Data from the Area "S" (systematic samples from the survey unit) is the sum of the ratios of the individual radionuclide concentrations to the DCGLs in Table 2-1.
The ranks are the ranking of each value in the Adjusted Data column from lowest to highest.
The RA Ranks are the ranks of the reference area samples only.

8.0 Survey Quality Assurance/Quality Control

Activities associated with this FSS were performed in accordance with written procedures and/or protocols to ensure consistent, repeatable results. Topics covered in project procedures and protocols included proper use of instrumentation, QC requirements, equipment limitation, etc. Implementation of quality assurance measures for this FSS are described herein.

8.1 Instrumentation Requirements

The Project Health Physicist was responsible for selecting the instrumentation required to complete the requirements of this FSS. Only instrumentation approved by the Project Health Physicist was used to collect radiological data. The Field Site Manager was responsible for ensuring individuals are appropriately trained to use project instrumentation and other equipment, and that instrumentation met the required detection sensitivities. Instrumentation was operated in accordance with either a written procedure or manufacturers' manual, as determined by the Field Site Manager. The procedure and/or manual provided guidance to field personnel on the proper use and limitations of the instrument.

8.1.1 Calibration Requirements

Instruments used during the FSS had current calibration/maintenance records kept onsite for review and inspection. The records included, at a minimum, the following:

- Name of the equipment
- Equipment identification (model and serial number)
- Manufacturer
- Date of calibration
- Calibration due date.

Instrumentation was maintained and calibrated to manufacturers' specifications to ensure that required traceability, sensitivity, accuracy, and precision of the equipment/instruments are maintained. Instruments were calibrated at a facility possessing appropriate NRC and/or Agreement State licenses for performing calibrations using National Institute of Standards and Technology (NIST) traceable sources.

8.2 Instrument Quality Control Source and Background Checks

The following subsections describe the techniques that were used to evaluate accuracy and precision of measurements obtained with project instrumentation. Daily instrument response check data and calibration certificates for each instrument are provided in Attachment A.

8.2.1 Sodium Iodide Gross Gamma Systems

Ludlum Model 44-20 NaI gamma scintillation detectors coupled to a Ludlum Model 2221 rate meter, equipped with RS-232 data download port coupled to Trimble Pathfinder Pro XRS/XH GPS, were used to perform GWSs. Instruments were calibrated at least annually at a facility possessing appropriate NRC and/or Agreement State licenses for performing calibrations using NIST-traceable standards.

Instruments were response checked daily for QC by comparing the instrument response to a designated ^{60}Co source. Response checks consisted of a 1-minute integrated count of the ^{60}Co source positioned in a reproducible geometry (i.e., a jig). The acceptance criterion for these instrument response checks is within +/- 20 percent of the mean response generated using 10 initial source checks and 10 measurements of ambient background. A response check outside these criteria will be cause for evaluation of conditions (e.g., instrument operation, source/detector geometry). The response check was repeated once prior to field use of that instrument. Instruments that failed the second response check were removed from service. During daily response checks, instruments were inspected for physical damage, battery voltage levels, current calibration, and erroneous readings.

Background checks were performed daily for each instrument. These checks were performed to monitor fluctuations in ambient gamma background that could impact the interpretation of the gross gamma measurements, not to monitor the performance of the instruments. The results of the background measurements were recorded and presented on a control chart.

8.2.2 MicroRem Meter

A Bicron MicroRem tissue-equivalent scintillation detector was used to provide gamma dose rate information during performance of area radiation surveys. The instrument was calibrated at least annually by a facility possessing appropriate NRC and/or Agreement State licenses for performing calibrations using NIST-traceable standards.

Instruments were checked daily for QC by comparing response to a designated ^{60}Co source. Response checks will consist of exposing the instrument to a designated ^{60}Co source positioned in a reproducible geometry and location. The acceptance criterion for these instruments is response within a +/- 20 percent of the mean response generated using 10 initial source checks and 10 measurements of ambient background. A response check outside these criteria is cause for evaluation of conditions (e.g., instrument operation, source/detector geometry). The response check was repeated once prior to field use of that instrument. Instruments that failed the second response check were removed from service pending evaluation. During daily response checks, the instrument used to obtain radiological data was inspected for physical damage, battery voltage levels, current calibration, and erroneous readings in accordance with Cabrera procedures.

8.2.3 Global Positioning System

GPS quality control checks were performed as described in Section 5.7.1 of this report.

8.3 Detection Limits

Samples were submitted to designated offsite laboratory, TestAmerica, and analyzed for Isotopic Thorium (^{230}Th and ^{232}Th) by EML HASL 300 Modified and ^{226}Ra by EPA 903.1 Modified. In accordance with MARSSIM, analytical techniques should provide a minimum detection level of 25 percent of the individual radionuclide $DCGL_W$ for all primary contaminants, with a preferred target minimum detection level of 10 percent of the individual radionuclide DCGL. Table 8-1 presents the target detection limits for each ROC.

Fifty-eight samples (63 percent of all samples) achieved the target detection limits listed in Table 8-1. Thirty-five samples (37 percent of all samples) did not achieve the target detection limits for ^{226}Ra listed in Table 8-1. Although these samples exceeded the target detection limit (10 percent DCGL), 100 percent

of the sample detection limits were less than the maximum detection limit (25 percent DCGL). The quality of the analytical data was not affected. None of the sample results were non-detect and all reported MDLs were below the project DCGL.

8.4 Quality Indicator Sample Measurements

As a part of project requirements, quality indicator samples (QIS) were collected as part of field and laboratory QC measures and submitted to an offsite laboratory for analysis. The QIS was used to evaluate the usability of data. The identity of duplicate QC samples was held blind to the analysts, and the purpose of these samples was to provide activity-specific, field-originated information regarding the homogeneity of the sampled matrix and consistency of the sampling effort. These samples were collected (and/or analyzed by the offsite laboratory) with the primary environmental samples and equally represent the medium at a given time and location. QIS consisted of the following types: laboratory control sample (LCS), FDUP, method blank (MB), MS/MSD, and tracer samples. They were analyzed at a rate of 1 per 10 samples or per batch for each analysis performed. The following sections summarize QC processes that were used to evaluate the usability of the sampling results.

8.4.1 Standard Traceability

Calibration/LCS standards must be traceable to a reliable source (e.g., NIST). The offsite laboratory utilizes a traceable reliable source (e.g., NIST, International Atomic Energy Agency) for calibration, daily QC, LCS, MS, and tracer evaluations.

8.4.2 Laboratory Control Sample

The purpose of the LCS was to monitor the accuracy of sample preparation and analysis. LCS evaluation was performed for ^{226}Ra, ^{230}Th and ^{232}Th. Preparation and analysis was performed under the same conditions as a regular project sample. Three primary and one secondary acceptance criteria were considered during this evaluation as follows:

1. The LCS concentration should be at 20 times the laboratory's Minimum Detectable Activity.
2. The MDC for the LCS should be less than the project specified Required Detection Limit.
3. The primary acceptance criterion for LCS percent recovery is 75-125 percent.
4. The secondary criterion for LCS is based on Z-statistics (Z_{LCS}) as follows:

$$Z_{LCS} = \frac{x - d}{\sqrt{u_c^2(x) + u_c^2(d)}}$$

where

x = Measured result from the spiked sample
d = Spike concentration added
$u_c(x)$ = Combined Standard Uncertainty (spike sample)
$u_c(d)$ = Combined Standard Uncertainty (spike).

The calculated Z_{LCS} statistic(s) should be between -1.96 and +1.96. Calculated Z_{LCS} within the performance range were considered acceptable. Calculated Z_{LCS} outside the performance range require

further evaluation. All calculated Z_{LCS} were within the performance range with the following exception:

- LCS 160-257496/2-A produced a Z_{LCS} of 2.31 for Th-230. All primary acceptance criteria were met. QIS results are provided in Attachment C.

LCS performance is acceptable and meets acceptance criteria.

8.4.3 Laboratory Duplicate/Replicates

The purpose of the laboratory duplicate/laboratory replicate (LDUP/LREP) is to monitor the precision of the analytical method, provided the sample is fully homogenized prior to preparation and analysis. For sample and LDUP/LREP result pairs, a Duplicate Error Ratio (DER), which is functionally equivalent to the normalized absolute difference, was calculated by using the following equation:

$$DER = \frac{\left|(x_1 - x_2)\right|}{\sqrt{ku_c^2(x_1) + ku_c^2(x_2)}}$$

where

x_1 = First sample value (regular sample).
x_2 = Second sample value (duplicate sample).
$u_c(x_1)$ = Combined Standard Uncertainty (regular sample).
$u_c(x_2)$ = Combined Standard Uncertainty (duplicate sample).
k = Coverage Factor representing the 95 percent Uncertainty Level.

The calculated DER results will be compared to an acceptable performance range of from -1.96 to +1.96. Calculated DER results within the performance range are considered acceptable. Calculated DER results outside the performance range are investigated for possible discrepancies in analytical precision. All calculated DER results were within the performance range and meet acceptance criteria. QIS results are provided in Attachment C.

8.4.4 Matrix Spike

The purpose of the MS is to measure the effect of interferences from the sample matrix that will hinder accurate quantification by the instrument. One primary and one secondary acceptance criterion were considered during this evaluation as follows:

1. The primary acceptance criterion for MS percent recovery is 75-125 percent.

2. The secondary criterion for MS is based on calculation of Multi-Agency Radiological Laboratory Analytical Protocols Z statistics (Z_{MS}) as follows:

$$Z_{MS} = \frac{x - x_o - d}{\sqrt{u_c^2(x) + u_c^2(x_o) + u_c^2(d)}}$$

where

x	=	Measured concentration from the spiked sample.
x_o	=	Measured concentration from the un-spiked sample.
d	=	Spike concentration added.
$u_c(x)$	=	Combined Standard Uncertainty (spiked sample).
$u_c(x_o)$	=	Combined Standard Uncertainty (un-spiked sample).
$u_c(d)$	=	Combined Standard Uncertainty (spike).

The calculated Z_{MS} statistic(s) should be between -1.96 and +1.96. Calculated Z_{MS} outside the performance range require further evaluation. All calculated Z_{MS} were within the performance range. No MS samples were analyzed with this sampling campaign.

8.4.5 Method Blank

The purpose of the MB is to monitor the presence of external sources of contamination for parameters of interest in the sample preparation and analysis process. The MB is a laboratory-generated sample of the same matrix as the analytical samples but in absence of the parameters of interest.

Primary Acceptance Criteria for MB are <MDC (95 percent Control Limit) or <1.96 $u_c^2(x)$. If either primary acceptance criterion is met, the MB is considered acceptable. When both primary criteria fail, a secondary MB acceptance evaluation will be performed by calculation of a Z-blank (Z_{BLANK}) statistic with Warning and Control Limits of +/-2 and +/-3 respectively. The formula for calculation of the Z_{BLANK} is as follows:

$$Z_{BLANK} = \frac{x}{u_c^2(x)}$$

where

x	=	Reported MB result.
$u_c(x_1)$	=	Combined Standard Uncertainty.

All calculated Z_{BLANK} were within the performance range. With the following exceptions:

- MB 160-257496/1-A, MB 160-264618/1-A, MB 160-266564/1-A, MB 160-266565/1-A, and MB 160-266566/1-A Th-230 MB results failed both primary acceptance criteria. MB results were above the method detection limit but below the reporting limit. MB 160-257496/1-A and MB 160-266566/1-A Z_{blank} results were above the warning limit. MB 160-264618/1-A, MB 160-266564/1-A and MB 160-266565/1-A Z_{blank} results were above the control limit. Associated sample results were above the MDL and had “J” qualifier applied.

- MB 160-266485/1-A failed both primary acceptance criteria. The Z_{blank} result was above the control limit for Th-230. Associated sample results were above the MDL and had “J” qualifier applied.

- MB 160-263537/1-A Z_{blank} result was below control limit for ^{226}Ra. Primary acceptance criteria were met. No corrective action was required.

- MB 160-309374/1-A Z_{blank} result was above the warning limit for Th-230. Primary acceptance criteria were met. No corrective action was required.

MB results are acceptable with qualification. Results are provided in Attachment C.

8.4.6 Tracer Yield

A tracer is defined as a radioactive isotope introduced into the sample preparation/analysis process that will behave chemically similar to the analyzed isotopes of interest. Tracers provide a means of evaluating chemical separation. The activity of the tracer detected at the end of analysis compared to that of the spiked amount is used to calculate the percent recovery. The acceptance range for tracer percent recovery is 20-110 percent. All calculated tracer percent recoveries were within the acceptance range. QIS results are provided in Attachment C.

8.4.7 Field Duplicate

The purpose of the FDUP/field replicate is to monitor the precision of the entire sampling and analysis process, provided the sample is fully homogenized prior to preparation and analysis. The criteria selected for initial evaluation is the relative percent difference with an acceptance criteria of ≤ 50 percent and a formula presented as follows:

$$\%RPD = \left| \frac{(x_1 - x_2)}{0.5(x_1 + x_2)} \right| * 100$$

where

x_1 = First sample value (regular sample)
x_2 = Second sample value (FDUP sample)

For duplicate pairs that fail to meet the primary acceptance criteria of ≤ 50 percent; the DER ratio will be calculated with an acceptance criterion of ≤1.96 by using the following equation:

$$DER = \frac{|(x_1 - x_2)|}{\sqrt{ku_c^2(x_1) + ku_c^2(x_2)}}$$

where

x_1 = First sample value (regular sample)
x_2 = Second sample value (FDUP sample)
$u_c(x_1)$ = Combined Standard Uncertainty (regular sample)
$u_c(x_2)$ = Combined Standard Uncertainty (FDUP sample)
k = Coverage Factor representing the 95 percent Uncertainty Level

The purpose of the DER calculation in this case is to assess whether a discrepancy identified by the relative percent difference is primarily attributable to normal analysis uncertainties. Result uncertainty is not a consideration in the relative percent difference calculation. The calculated DER results were compared to an acceptable performance criterion of ≤ 1.96. Calculated DER results within the performance range are considered acceptable. Calculated DER results outside the performance range are investigated for possible discrepancies in analytical precision. FDUP QIS results are provided in Attachment C.

All FDUP percent relative percent difference (% RPD) results were within primary acceptance criteria with the following exceptions:

- Duplicate pair SU01-EXB-034-SS-P-00 and SU01-EXB-034-SS-DUP-00 produced a Th-230 RPD result of 63.44 percent. The corresponding DER result was 3.01. Associated sample results were above the MDL and had “J” qualifier applied.

- Duplicate pair SU01-EXB-049-SS-P-00 and SU01-EXB-049-SS-DUP-00 produced a Th-230 % RPD result of 101 percent. The corresponding DER result was 4.56. Associated sample results were above the MDL and had “J” qualifier applied.

- Duplicate pair SU01-EXW-047-SS-P-00 and SU01-EXW-047-SS-DUP-00 produced a Th-230 % RPD result of 73 percent. The corresponding DER result was 3.11. Associated sample results were above the MDL and had “J” qualifier applied.

- Duplicate pair SU01-EXW-047-SS-P-00 and SU01-EXW-047-SS-DUP-00 produced a Th-232 % RPD result of 50.27 percent. The corresponding DER result was 2.15. Associated sample results were above the MDL and had “J” qualifier applied.

9.0 Conclusions

The objectives of the radiological remediation and FSS at Site WR111 were to:

- Perform remediation activities outlined in the WR111 Little Mountain Test Annex Magnesium-Thorium Disposal Trench Remedial Design/Remedial Action Work Plan (EA 2015a)
- Remove and dispose of radioactively-contaminated soil and debris to meet the site-specific $DCGL_W$s
- Verify the adequacy of the remediation by performing a FSS
- Demonstrate through the FSS process that Site WR111 is suitable for unrestricted radiological release.

9.1 Final Status Site Survey

FSS and sampling of impacted land areas at Site WR111 have been completed in accordance with the requirements specified in the FSSP (Appendix D of the Decommissioning Plan [EA 2015b]). All SUs have been properly classified, surveyed, and sampled. The results were then used to verify the DQOs were achieved for each SU. The results support the design objective, which is to ensure that the site meets the established dose-based release criteria and is suitable for unrestricted radiological release.

9.2 Conclusions

As a result of the FSS at Site WR111 it is concluded that the applicable $DCGL_W$ has been achieved for all SUs. This assures compliance with 10 CFR 20.1402 which states:

> *A site will be considered acceptable for unrestricted use if the residual radioactivity that is distinguishable from background radiation results in a TEDE to an average member of the critical group that does not exceed 25 mrem per year, including that from groundwater sources of drinking water, and that the residual radioactivity has been reduced to levels that are ALARA. Determination of the levels which are ALARA must take into account the consideration of any detriments, such as deaths from transportation accidents, expected to potentially result from decontamination and waste disposal.*

As indicated, the Site WR111 FSS and the contents of this report demonstrate compliance with the above requirement for unrestricted release of the Site.

9.3 Recommendations

No further action is required to address radiological contamination in the site soils.

CERTIFICATE OF CALIBRATION

Electroplated Alpha Standard

S.O.# 7267
P.O.# 13-0065

Description of Standard:

Model No. DNS-11 Serial No. 5648-06 Isotope Th-230

Electroplated on polished SS disc, 0.79 mm thick.

Total diameter of 4.77 cm and an active diameter of 4.45 cm.

The radioactive material is permanently fixed to the disc by heat treatment without any covering over the active surface.

Measurement Method:

The 2pi alpha emission rate was measured using an internal gas flow proportional chamber. Absolute counting of alpha particles emitted in the hemisphere above the active surface was verified by counting above, below, and at the operative voltage. The calibration is traceable to NIST by reference to an NIST calibrated alpha source S/N 75322-201

Measurement Result:

The observed alpha particles emitted from the surface of the disc per minute (cpm) on the calibration date was:

8,090 ± 404

The total disintegration rate (dpm) assuming 1.5% backscatter of alpha particles from the surface of the disc, was:

15,900 ± 797 (0.00718 μCi)

The uncertainty of the measurement is 5 %, which is the sum of random counting error at the 99% confidence level, and the estimated upper limit of systematic error in this measurement.

CERTIFICATE OF CALIBRATION

Electroplated Beta Standard

S.O.# 7286
P.O.# 13-0166

Description of Standard:

Model No. DNS-12 Serial No. 5634-05 Isotope Tc-99

Electroplated on polished SS disc, 0.79 mm thick.

Total diameter of 4.77 cm and an active diameter of 4.45 cm.

The radioactive material is permanently fixed to the disc by heat treatment without any covering over the active surface.

Measurement Method:

The 2pi beta emission rate was measured using an internal gas flow proportional chamber. Absolute counting of beta particles emitted in the hemisphere above the active surface was verified by counting above, below, and at the operative voltage. The calibration is traceable to NIST by reference to an NIST calibrated beta source S/N 75323-201.

Measurement Result:

The observed beta count rate from the surface of the disc per minute (cpm) on the calibration date was:

6,170 ± 308

The total disintegration rate (dpm) assuming 25 % backscatter of beta particles from the surface of the disc, was:

9,860 ± 493 (0.00444 μCi)

The uncertainty of the measurement is 5 %, which is the sum of random counting error at the 99% confidence level, and the estimated upper limit of systematic error in this measurement.

Gegenstand *Object*	**Alpha Wide Area Reference Source**
Hersteller *Manufacturer*	**Eckert & Ziegler Nuclitec GmbH**
Typ *Type*	**TZRB6470**
Strahler-Nr. *Source number*	**AC-2446**
Auftraggeber *Customer*	**Eckert & Ziegler Analytics** **Atlanta, GA 30318** **United States of America**
Auftragsnummer *Order No.*	**CO00155161**
Anzahl der Seiten des Kalibrierscheines *Number of pages of the certificate*	**2**
Datum der Kalibrierung *Date of calibration*	**25 July 2013**

Dieser Kalibrierschein dokumentiert die Rückführung auf nationale Normale zur Darstellung der Einheiten in Übereinstimmung mit dem Internationalen Einheitensystem (SI).
Die DAkkS ist Unterzeichner der multilateralen Übereinkommen der European co-operation for Accreditation (EA) und der International Laboratory Accreditation Cooperation (ILAC) zur gegenseitigen Anerkennung der Kalibrierscheine.
Für die Einhaltung einer angemessenen Frist zur Wiederholung der Kalibrierung ist der Benutzer verantwortlich.
This calibration certificate documents the traceability to national standards, which realize the units of measurement according to the International System of Units (SI).
The DAkkS is signatory to the multilateral agreements of the European co-operation for Accreditation (EA) and of the International Laboratory Accreditation Cooperation (ILAC) for the mutual recognition of calibration certificates.
The user is obliged to have the object recalibrated at appropriate intervals.

Alpha Wide Area Reference Source

Source no.	AC-2446
Drawing	VZ-628-001
Nuclide	Thorium-230
Activity	2.21 kBq
Alpha surface emission rate	1.08E03 s^{-1} in 2 π steradian
Reference date	25 July 2013 at 12:00 UTC
Dimensions of active surface	150 mm x 100 mm
Overall dimensions	150 mm x 120 mm x 3 mm
Leakage and contamination test	The amount of the removable activity does not exceed 10 Bq. (Wipe test according to ISO 9978, no. 5.3.1)
Wipe test passed on	30 July 2013
Construction	Th-230 is incorporated into the surface of an anodized aluminium foil of 0.3 mm thickness. The thickness of the activated layer is approximately 6 µm. The activated foil is mounted into a holder.
Measuring method	The activity was determined by comparison with a reference source of the same construction. The alpha surface emission rate was measured using a windowless proportional counter.
Traceability	Additional to the direct traceability to the PTB through the DAkkS this product complies with the requirements for traceability to NIST specified in the American National Standard "Traceability of Radioactive Sources to the NIST and Associated Instrument Quality Control (ANSI N42.22-1995)". As a requirement of the ANSI N42.22-1995 Eckert & Ziegler Nuclitec GmbH participates in the NRMAP/NIST Measurements Assurance Program of the Nuclear Power Industry.
Uncertainty	The relative uncertainty of the activity is 3 %, the relative uncertainty of the alpha surface emission rate is 3 %. The reported uncertainty, determined according to the DAkkS-DKD-3 report is based on the standard uncertainty multiplied by a coverage factor of k = 2, providing a level of confidence of 95 %. (Ref. NIST Technical Note 1297/"Guide to the Expression of Uncertainty in Measurement" ISO Guide, 1995)
Radioactive impurities	Related to Th-230 (equal 100 %) the following radioactive impurities were detected: none
Quality assurance system	The quality assurance system of Eckert & Ziegler Nuclitec GmbH was certified by Lloyd's Register Quality Assurance (LRQA) according to ISO 9001, issue 2008. Isotrak products meet the requirements of 10CFR50 Appendix B in the USA.
Uniformity	The uniformity of the surface emission rate is better than 10 %.
Remark	This is an EZN Class 2 reference source. Ref: PO#3950/SO#32561, End User Ref: PO#13-0185

NIST TRACEABLE EQUIPMENT AND STANDARDS USED DURING CALIBRATION

MODEL: 2221 SERIAL #: 202370 CAL. DUE: 06/29/17

SOURCE #: 99-1816 ISOTOPE: Cs137 ACTIVITY: 1.23 uCi ASSAY DATE: 08/12/99

GEOMETRY: Jig upside down with source underneath, activity side up.

Physical Condition: (●) Sat ( ) Unsat

Efficiency From Last Calibration: 12.31% Previous HV Set Point: 800 V

Counts (CPM)	Background (CPM)	Net CPM:	AF Efficiency:
240770	19910	220860	12.05%

Is the AF efficiency within 20% of the efficiency from the last calibration? (●) Yes ( ) No

Reproducibility: 240770 245760 243260 Average: 243263.33

Are the individual counts within 10% of the average? (●) Yes ( ) No

High Voltage:	Source Response (CPM):	Background (CPM):	Net CPM:
650	204000	14060	189940
700	212110	17960	194150
750	221070	19230	201840
800	239300	20220	219080
850	246970	20520	226450
900	249730	20020	229710
950	249210	19820	229390

HV	RESPONSE	BACKGROUND	NET CPM	Efficiency:
900 V	245050	21290	223760	12.21%

REMARKS:

Does Instrument Meet Final Acceptance Criteria?: (●) Yes ( ) No

Calibration Sticker Attached?: (●) Yes ( ) No

Date Instrument is Due For Next Calibration: **11/02/17**

CERTIFICATE OF CALIBRATION

Electroplated Beta Standard

S.O.# 7096
P.O.# 11-0181

Description of Standard:

Model No. DNS-2 Serial No. 7139-10 Isotope SrY-90

Electroplated on polished Ni disc, 0.79 mm thick.

Total diameter of 3.18 cm and an active diameter of 2.54 cm.

The radioactive material is permanently fixed to the disc by heat treatment without any covering over the active surface.

Measurement Method:

The 2pi beta emission rate was measured using an internal gas flow proportional chamber. Absolute counting of beta particles emitted in the hemisphere above the active surface was verified by counting above, below, and at the operative voltage. The calibration is traceable to NIST by reference to an NIST calibrated beta source S/N 75323-201.

Measurement Result:

The observed beta count rate from the surface of the disc per minute (cpm) on the calibration date was:

5,710 ± 171

The total disintegration rate (dpm) assuming 40 % backscatter of beta particles from the surface of the disc, was:

8,170 ± 244 (0.00368 μCi)

The uncertainty of the measurement is 3 %, which is the sum of random counting error at the 99% confidence level, and the estimated upper limit of systematic error in this measurement.

Attachment A

Quality Indicator Sample Measurements

A.1 Laboratory Control Sample (LCS)

LCS evaluation was performed for ^{226}Ra, ^{230}Th and ^{232}Th. Three primary and one secondary acceptance criteria were considered during this evaluation as follows:

1. The LCS concentration should be at 20 times the laboratory's Minimum Detectable Activity.
2. The MDC for the LCS should be less than the project specified Required Detection Limit.
3. The primary acceptance criterion for LCS percent recovery is 75-125 percent.
4. The secondary criterion for LCS is based on Z-statistics (Z_{LCS}). Calculated Z_{LCS} within the performance range of -1.96 to +1.96 were considered acceptable.

The following table lists the Z_{LCS} as reported by the contract laboratory.

SDG	#sys_sample_code	lab_method	analysis_date	chemical_name	% recovery	Z_{LCS}

160-22372	LCS 160-309374/2-A	A01R	6/8/2017 19:02	Thorium-230	102	0.33

LCS 160-257496/2-A produced a Z_{LCS} of 2.31 for Th-230. All primary acceptance criteria were met.

A.2 Laboratory Duplicate / Replicate (LDUP /LREP)

The purpose of the laboratory duplicate/laboratory replicate (LDUP/LREP) is to monitor the precision of the analytical method, provided the sample is fully homogenized prior to preparation and analysis. A Duplicate Error Ratio (DER) is calculated between the LDUP/LREP result pairs. DER acceptance limits are -1.96 to +1.96 .

The following table lists the ZLCS as reported by the contract laboratory.

SDG	#sys_sample_code	Method	chemical_name	Replicate #sys_sample_code	DER

Duplicate Pair SU01-EXB-076-SS-P-00 and SU01-EXB-076-SS-P-00-LR produced DER values for Th-230 and Th-232 above acceptance criteria of 1.96. The laboratory noted the non-homogeneity of the original sample.

A.3 Matrix Spike / Matrix Spike Duplicate (MS/MSD)

The purpose of the MS is to measure the effect of interferences from the sample matrix that will hinder accurate quantification by the instrument. One primary and one secondary acceptance criterion will be considered during this evaluation as follows:

1) The primary acceptance criterion for MS percent recovery is 75-125 percent.

2) The secondary criterion for MS is based on calculation of Multi-Agency Radiological Laboratory Analytical Protocols Z statistics (Z_{MS}). The calculated ZMS statistic(s) should be between -1.96 and +1.96.

No Matrix Spike samples were analyzed with this sampling campaign.

A.4 Method Blank

The purpose of the MB is to monitor the presence of external sources of contamination for parameters of interest in the sample preparation and analysis process. Two primary and one secondary acceptance criteria are considered.

Primary Acceptance Criteria for MB are <MDC (95 percent Control Limit) or < 1.96 $u_c^2(x)$. If either primary acceptance criterion is met, the MB is considered acceptable. When both primary criteria fail, a secondary MB acceptance evaluation will be performed by calculation of a Z-blank (Z_{BLANK}). Z-blank acceptance criteria -1.96 to +1.96. The following table presents the Z_{blank} values.

160-22327	MB 160-309374/1-A	A01R	Thorium-230	2.39	Note 3

Note: 1) MB result was above the method detection limit but below the reporting limit. Associated sample results above the detection limit "J" qualified.

2) MB result exceeding the reporting limit. However, because the MB result concentration was less than 1/10 the sample concentration measured in the associated samples, no corrective action was necessary.

3) MB Z_{blank} above acceptance criteria. Primary acceptance criteria met and no corrective action was necessary.

A.5 Tracer yield

The activity of the tracer detected at the end of analysis compared to that of the spiked amount is used to calculate the percent recovery. The acceptance range for tracer percent recovery is 20-110 percent. The following table presents the tracer yield recovery values.

Lab ID	Client ID	Th-229 % recovery
160-17797-1	WR111-REF-001-SS-P-00	90.6

All calculated tracer percent recoveries were within the acceptance range.

A.6 Field Duplicate

The purpose of the FDUP is to monitor the precision of the entire sampling and analysis process, provided the sample is fully homogenized prior to preparation and analysis. The primary acceptance criteria is relative percent difference (RPD) with acceptance criteria of ≤ 50 percent. Samples that fail to meet primary acceptance criteria, the DER ratio will be calculated with an acceptance criterion of ≤1.96. the following table presents the %RPD and DER values.

SDG	#sys_sample_code	Method	chemical_name	DUP #sys_sample_code	%RPD	DER
