Oconee Nuclear Station, Unit 1
Docket No. 50-269 / Renewed License No. DPR-38

Subject: Oconee Unit 1, Refuel 30 (O1R30) Inservice Inspection (ISI) and Steam Generator
Inservice Inspection (SG-ISI) Report, Fifth 10-Year ISI Interval

Ladies and Gentlemen:

Pursuant to the 2007 Edition through the 2008 Addenda of the American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code, Section XI, IWA-6000, Duke Energy is providing its Inservice Inspection (ISI) Summary for Oconee Nuclear Station (ONS), Unit 1, Refuel 30 (O1R30). This is the only refueling outage in the second inspection period of the fifth ten-year interval for Oconee Unit 1.

Enclosure 1 contains the O1R30 ISI summary report.

Pursuant to the Steam Generator (SG) Program described in Technical Specification (TS) 5.5.10, the ONS Steam Generator Inservice Inspection (SG-ISI) report is being provided to the NRC in accordance with TS 5.6.8 for the O1R30 outage.

Enclosure 2 contains the SG-ISI report for O1R30.

This submittal contains no regulatory commitments. Should you have any questions concerning this letter, or require additional information, please contact Art Zaremba, Manager – Nuclear Fleet Licensing, at 980-373-2062.

Sincerely,

A handwritten signature in black ink that reads "Sheila Dalton". The signature is written in a cursive, flowing style.

Sheila Dalton
Manager – Nuclear Support Services, Oconee Nuclear Station

CERTIFICATE OF INSERVICE INSPECTION

I, the undersigned, holding a valid commission issued by the National Board of Boiler and Pressure Vessel Inspectors and the State or Province of South Carolina and employed by OneCIS Insurance Company Lynn, MA have inspected the items described in this Owner's Activity Report, and state that, to the best of my knowledge and belief, the Owner has performed all activities represented by this report in accordance with the requirements of Section XI.

By signing this certificate neither the Inspector nor his employer makes any warranty, expressed or implied, concerning the repair/replacement activities and evaluation described in this report. Furthermore, neither the Inspector nor his employer shall be liable in any manner for any personal injury or property damage or a loss of any kind arising from or connected with this inspection.

Oconee O1R30 Steam Generator Tube Inspection Report

Pursuant to Oconee technical specification 5.6.8 the following information is provided:

a. The scope of inspections performed on each SG

The scope of the inspections performed on both 1A and 1B steam generators (SG) included 100% of the in-service tubes in each Replacement Once Through Steam Generator (ROTSG). All in-service tubes were inspected with bobbin probe. In addition, an array probe inspection was performed in the both steam generators of the periphery tube five (5) tubes deep up the 1st support plate.

Special Interest (array coil) inspections were also performed on selected indications.

All plugs were visually inspected.

Foreign object search and retrieval (FOSAR) was performed in both steam generators.

b. Degradation mechanisms found

Tube wear at support plate locations were the only degradation mechanisms found.

c. Non-destructive examination techniques utilized for each degradation mechanism

The Non-destructive examination techniques utilized bobbin coil for the detection of tube wear. The array probe was utilized to characterize selected wear indications and the periphery inspection.

d. Location, orientation (if linear), and measured sizes (if available) of service induced indications.

The complete listing for service induced indications is attached.

A total of 22,253 indications of tube support plate (TSP) wear were identified in 9,341 tubes in the 1A SG. A total of 17,676 indications were identified in 8,809 tubes in the 1B SG. The number of indications greater than or equal to 10 % TW increased in the 1A SG, while the number of indications greater than or equal to 10 % TW decreased in the 1B SG. The largest indication observed was 58% TW. The average and 95/50 growth rate are shown below.

| <i>Tube Support Plate Wear Growth Rates</i> | | | | |
|--|----------------------|----------------------|----------------------|----------------------|
| | <i>1A SG</i> | | <i>1B SG</i> | |
| | <i>EOC-30</i> | <i>EOC-29</i> | <i>EOC-30</i> | <i>EOC-29</i> |
| <i>Average growth rate (% TW)</i> | 0.8 | -0.1 | -0.4 | 0.6 |
| <i>95/50 growth rate (%TW)</i> | 3.2 | 1.9 | 1.1 | 2.7 |

A total of twenty -five (25) indications of wear at the fourteenth (14th) TSP drilled-hole locations were identified in twenty-three (23) tubes in the 1A SG. A total of two (2) indication in two (2) tubes were identified in the 1B SG. All of these indications was confirmed with the array. The deepest indication was at 26% as measured by the bobbin probe. Growth rates for these flaws ranged from -0.5 to 3.8%TW per EFPY.

e. Number of tubes plugged during the inspection outage for each degradation mechanism

Thirty-eight (38) tubes were plugged in the 1A SG, all due to wear all were plugged due to wear. Fifteen (15) tubes were plugged in the 1B SG, all were plugged due to wear. The following is a list of tubes plugged in OIR30.

| Count | 1A SG | | 1B SG | | Reason |
|--------------|--------------|-------------|--------------|-------------|-------------------------|
| | Row | Tube | Row | Tube | |
| 1 | 59 | 6 | 76 | 1 | TSP Wear \geq 40 % TW |

- f. **Total number and percentage of tubes plugged to date, and the effective plugging percentage in each steam generator.**

| <i>Steam Generator¹</i> | <i>1A</i> | <i>1B</i> | <i>Total</i> |
|------------------------------------|--------------|--------------|--------------|
| <i>Prior to EOC-30</i> | <i>180</i> | <i>167</i> | <i>347</i> |
| <i>EOC-30</i> | <i>38</i> | <i>15</i> | <i>53</i> |
| <i>Total</i> | <i>218</i> | <i>182</i> | <i>400</i> |
| <i>% Plugged</i> | <i>1.39%</i> | <i>1.16%</i> | <i>1.28%</i> |

¹=There are 15631 tubes per steam generator

The effective plugging percentage is 1.39% in 1A SG and 1.16% in 3B SG.

- g. **The results of condition monitoring, including the results of tube pulls and in-situ testing.**

The cumulative SG EFPY for EOC-27 was 7.88, EOC-28 was 9.74, EOC-29 was 11.58, and EOC-30 was 13.44.

As of EOC-30, the Oconee Unit 1 steam generators had operated 12.21 EFPY since the first in-service inspection after replacement. In total, the Oconee Unit 1 steam generators had operated 13.44 EFPY since replacement.

Condition Monitoring structural and accident induced leakage integrity was demonstrated for tapered, flat, and drilled support wear.

A NDE maximum depth call of 68.4 %TW or less for tapered wear is sufficient to demonstrate a minimum degraded tube burst pressure of 3ΔP, 4125 psi, at 0.95 probability with 50% confidence. The worst case depth call for tapered wear observed during the Oconee 1 EOC30 inspection was a NDE depth of 58 %TW. This particular flaw was inspected with array so that the flaw could be profiled to confirm its shape parameters. The ratio of the structural depth to the maximum depth was 0.87 which is consistent with what was assumed in the development of the CM limit for tapered wear. This gives a structural bobbin depth of 50.5%TW. The structural length for this flaw, however, exceeded the 0.4 inches used for the CM limit for tapered wear. Since this flaw had a structural length of 0.69 inches, the CM limit for flat wear was used. This limit is 53.1%TW for a flat flaw with a length of 0.8 inches. This can be done since the sizing technique is the same for both tapered wear and flat wear. Since the structural depth (50.5%TW) and length (0.69 inches) for the limiting flaw are less than 53.1%TW and 0.8 inches, respectively, condition monitoring structural integrity was demonstrated for the preceding cycle for tapered wear at tube support plates throughout the Oconee Unit 1 steam generators.

Wear with a relatively flat profile (uniform depth) occurs in the inspection port regions of both generators. A NDE maximum depth call of 53.1 %TW or less for flat wear is sufficient to demonstrate a minimum degraded tube burst pressure of 3ΔP, 4125 psi, at 0.95 probability with 50% confidence. The maximum flat wear depth seen in either steam generator was a NDE depth of 21 %TW.

Some of the 14th TSP holes near the periphery are drilled instead of broached. Wear indications at the drilled holes are of interest because the circumferential extent can be greater than 135 degrees. Axial pull test results of tubes with partial depth circumferential EDM slots show that gross sectional yielding is required before wall penetration develops for a 54 %TW maximum depth circumferential slot with a circumferential extent of 0.98 inches. The corresponding

condition monitoring limit for this very specific wear scar profile is 47.1 %TW. This is less than the condition monitoring limit calculated using the burst pressure equation of Section 5.3.2 of the EPRI Steam Generator Degradation Specific Management Flaw Handbook for 360 degree thinning with limited axial extent. Since the maximum depth recorded for flaws at the drilled holes was 26%TW and the maximum circumferential extent was less than 0.98 inches (180 degrees), condition monitoring structural integrity was demonstrated for the previous cycle for this mechanism.

Twenty-five (25) objects were found in bundle in the 1A SG and 21 were removed. The remaining 4 metallic objects were evaluated and left in service. Thirteen objects were found in the 1B SG and all were removed or dispositioned. No metallic objects remain.

No degradation was detected in the plug visual inspection

No bowl cladding inspections were performed this outage since they were inspected every two years, a higher frequency of cladding inspection than most plants.

No in-situ tests or tube pulls were performed.
