Page 1 of 1

During normal operation while establishing the drywell to torus differential pressure required by Technical Specifications, the torus water level exceeded the maximum vent pipe submergence limitations as contained in the Technical Specifications Appendix A, Paragraph 3.7.A.1. The water level was out of specification high for a period of nine minutes and the maximum level was 0.33" above that allowed by the specifications. Therefore, the event did not represent any significant hazard to the public health and safety.

Operations personnel immediately initiated pump down of the torus to return the level to normal. In addition, Operations personnel were counseled in the importance of maintaining the water level within specifications during activities such as the establishment of the drywell to torus differential pressure.
