EVENT DESCRIPTION AND PROBABLE CONSEQUENCES ⑩

On four occasions between October 8, 1979, and October 15, 1979, primary coolant oxidants (sum of water, carbon dioxide, and carbon monoxide) exceeded 10 parts per million with average core outlet temperature greater than 1,200°F. This is operation under a degraded mode permitted by LCO 4.2.10 and is reportable per Technical Specification AC 7.5.2(b)2. No effect on public health or safety. Similar occurrences reported in RO 77-36, 78-12, 78-18, 78-37, 78-39, 79-01, 79-02, 79-24, and 79-30.

CAUSE DESCRIPTION AND CORRECTIVE ACTIONS ⑳

Cause of first occurrence was residual moisture outgassing due to a previous dryer bypass. Load was decreased to maintain LCO limits. For other occurrences, increases in core outlet temperature and/or moisture levels were the cause of degraded mode operation. No specific corrective action was required.
