Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Tuesday, November 19, 2019 10:32:38 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

You are not god, so stop acting like that. Stop making decisions for us. You know it in your gut that it's not right!

Sincerely,
Armando Maldonado
El Paso, TX 79907

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Monday, November 18, 2019 10:00:17 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. To do so, despite the highly radioactive risks of GTCC, would fly in the face of decades of U.S. law and regulation, and put at risk public health, safety, and the environment.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Compounding concerns at the WCS site, it is also targeted for irradiated nuclear fuel "interim storage." NRC has done woefully inadequate to no analysis regarding the cumulative impacts of concentrating so much radioactive risk at a single site, one that also happens to be located near to, or even directly above, the Ogallala Aquifer, essential to 8 Great Plains states for drinking and irrigation water.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Countless communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

In the meantime, Hardened On-Site Storage (HOSS) should be required for GTCC, or as close to the point of origin as is safely possible. More than 200 environmental, and environmental justice, organizations, representing millions of Americans in all 50 states, have endorsed HOSS for irradiated nuclear fuel. Given that GTCC is radiologically as high risk as is irradiated nuclear fuel, NRC should require HOSS not only for irradiated nuclear fuel, but also for GTCC.

NRC's mandate is to protect public health, safety, and the environment. In effect deregulating GTCC, allowing it to be dumped in near-surface burial as if it is not highly radioactive, is a violation of NRC's mandate. For this reason, NRC should no longer consider this outrageous

proposal.

GTCC should be required to be disposed of in a safe permanent deep geologic repository, one meeting stringent standards.

Sincerely,
Kevin Kamps
Mount Rainier, MD 20712

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Monday, November 18, 2019 7:25:56 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that GTCC waste is "not generally acceptable for near surface disposal." The proposed rulemaking disregards established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify GTCC waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site was not designed for the isolation of radioactive waste due to the risk of water contamination. The proposed rule change would result in the unsafe shallow burial of GTCC waste.

Nor has the risk of transporting GTCC waste across the country been adequately analyzed. Numerous communities would be put at risk as this dangerous waste is transported across their boundaries.

I urge you to abandon this risky rule-making proposal and instead work to develop a safer long-term solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
L. Watchempino

Date: Saturday, November 16, 2019 1:14:53 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. As a resident of Eunice NM, a small community of 2700, I am concerned with this proposal. At this site there is already low level radioactive waste from around the nation. I am particularly concerned with the impacts of radioactivity and the major industry which is oil and natural gas extraction in this area. I am also very concerned with the push to bring more radioactive waste from all areas of the nuclear cycle to my hometown. I am concerned with more and more threats to my community imposed by corporations out of state that are making my hometown a more dangerous place to raise children and to protect pregnant women. I certainly think a hearing is called for public comments and information on this subject. This community of Eunice NM will continue to bear the burden of storage of this dangerous waste and this community is not well informed of the dangers that keep increasing at the hands of Waste Control Specialists-ISP which is being considered as a possible site.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them. Eunice NM would have each shipment pass through town on its way to the railroad spur, or roads to the site.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Science can find a solution before GTCC waste proliferates in the Permian Basin. It remains again Federal Law to move High Level Nuclear Waste until a permanent repository is created. We know of no permanent repository that has been created. Concomitant with licensing a repository, whether temporary or permanent, one must consider transportation issues to those sites. It is short sighted not to realize hot waste will be driven on roads or railroads to their temporary or final destination. It is imperative that the NRCC consider these risks to the general population. To ignore them is criminal.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial. Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

Sincerely,
David Rosen

Dear Nuclear Regulatory Commission rulemaking,

Just like redrawing the boundaries of the Ogallala aquifer to make it feasible for a company to acquire permits for operating a nuclear waste dump. Reclassifying nuclear waste is just another gimmick to disregard to the public health. Even with the Ogallala aquifer redrawn to accommodate the profits of one company, the cavities left are a superhighway for contamination. A contamination that can outlast the English language itself. If the waste is safe enough to be buried in Andrews, Texas and Eunice, NM, it should be safe to stay where the community that produced it and benefited from it economically. It really amounts to shooting oneself in the foot. There are too many companies operating in the Permian Basin and the Pecos valley to trade for the operation of just one.

Life is more important than any company, any amount of dollars and surely more important than any reclassification. It would be a greed ritual to sacrifice life to the ones and zeros of the financial world with the swipe of a pen.

Water deficits in the aquifers is bad enough and expected to continue. Taking out the Ogallala aquifer, would force mass migration from several states because it covers so many states and it is the main source of fresh water in the nation. My resolution is, you created it, you keep it. No need for diplomacy here.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste, it is trickery and a gimmick.

Thank you for your consideration.

Sincerely,
Ricardo Juarez

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

I gave testimony to the public hearing held in Austin this Fall and I will repeat what I said there: Our Federal Agencies creates this highly dangerous waste stream and the Federal Government and its Agencies are morally, ethically and legally responsible to keep the legacy of nuclear waste, especially transuranic, under strict federal control. This means do not reclassify transuranic wastes just to allow the private, State- regulated, nuclear waste sites to begin to become the long term repositories for the commercial nuclear power plants and the nation's nuclear weapons labs.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Dear Nuclear Regulatory Commission rulemaking,

I am strongly opposed to the NRC proposal to allow shallow disposal of Greater-than-Class-C (GTCC) waste.

It has already been determined that GTCC is “not generally acceptable for near surface disposal.”

This proposed new rule would upend established principles regarding the safe handling and disposal of radioactive waste.

GTCC waste includes waste which requires a long time to decay and can be dangerous for 1,000 years.

For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC should NOT reclassify that waste and allow it to be disposed of via shallow burial.

I am especially concerned about the Waste Control Specialists site in Andrews County, Texas. The TCEQ has concluded that this site is not ideal for disposal of radioactive waste because of risk of water contamination.

Also, the risks of transporting GTCC waste across the country are serious and unacceptable.

I urge you not to proceed with this rulemaking and to develop some other, safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your time.

Sincerely,
David Smith

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Friday, November 15, 2019 2:39:38 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose NRC's proposal to allow near-surface disposal of Greater-than-Class-C radioactive waste. This rule change seems designed to allow inadequate disposal of this waste through shallow burial and it's clear that the eventual plan is for this waste to end up at WCS in Andrews Texas—an incredibly irresponsible and bad idea.

If nothing else, the continued storage—with no end in site—of the explosive WIPP, mixed transuranic waste drums at the WCS site in Andrews Texas should prohibit the acceptance of either Greater than Class C waste or High Level Waste there. One of these drums already exploded at WIPP, leaving these drums "orphaned" at WCS indefinitely.

These drums have already had to have their storage configuration changed once under emergency conditions because they started to heat up—the first step to exploding. The drums are contaminated with nitrates and have been described by nuclear scientists as being "the perfect bomb." Nitrate contaminated waste like this exploded in the Urals leading to a huge radioactive mixed waste fire and the biggest radioactive release before Chernobyl.

As long as these drums are stored at WCS, it should be out of the running for any HLW or Greater than Class C waste---period. To allow these types of radioactive waste to be stored or disposed of there would really be not only negligent, but criminal.

An existing Environmental Impact Statement for GTCC waste determined that it is “not generally acceptable for near surface disposal.” This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. Shallow disposal of this waste is not only reckless and irresponsible but criminal.

It is clear that NRC has no care for the people of this country and especially for the people of my state, New Mexico. Risks clearly seem to be irrelevant to you even though you are supposed to be protecting us. People are already dying in Lea County--the county right next to WCS in Texas and the county into which WCS is discharging from it's facility--at a rate not to be seen anywhere else in the state. Life expectancy for women there is the lowest in the state as well. To add yet more extremely dangerous waste to a facility built practically in the water table is stupid and reckless.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration

Sincerely,

Dear Nuclear Regulatory Commission rulemaking,

As a citizen concerned with the future safety of all people and our posterity effected by solutions to address nuclear waste disposal - ie: for our children's children's children - I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Kevin Killeen, Atty at Law (Ret.)
Slinger, WI 53086

Date: Monday, November 11, 2019 10:05:40 AM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC') sloppy proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial. We have seen the negative health effects of other shallow buried radioactive waste, and it has been largely unsafe.

The Aquifer and Radioactive Contamination of Water Resources

this proposal would allow GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

The NRC is better than this.

Please retract the rulemaking and to develop a safe solution for the handling and disposal of GTCC waste.

Kind regards,
Stephen Merrill Smith, J.D.

Dear Nuclear Regulatory Commission rulemaking,

Storing radioactive waste near a major water supply is the height of irresponsible, let alone dangerous. And letting an unlicensed waste disposal company handle this waste is also extremely dangerous. One accident would endanger anyone living in the vicinity for generations!

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. Date: Saturday, November 09, 2019 5:10:04 PM

Dear Nuclear Regulatory Commission rulemaking,

I'm a Ph. D nuclear Physicist and have been concerned for decades with the problems of the disposal of high level nuclear waste. Much of my research has dealt with the problems of how to safely dispose of such waste. Near surface disposal is not the way!!! The safest ways involve further transmutation of the longlived waste with high fluxes of neutrons, converting the long lived isotopes into much shorter lived ones.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Saturday, November 09, 2019 3:28:23 PM

Dear Nuclear Regulatory Commission rulemaking,

As a physicist who has worked in radiation protection for the Department of Energy and has dealt with the storage and disposal of radioactive waste materials, and as a west Texan who is familiar with the geology of Andrews county, I can attest to the importance of adhering to proper storage procedures in the hands of experienced radiation waste management companies.

I adamantly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste has determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for well over 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to human or other forms of life in the region. The NRC's proposal would reclassify this waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been accounted for adequately. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
John Stokes

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

I've been aware for decades of foolish ways to dispose of nuclear waste. By now we should be more aware of what might actually work more safely!

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Date: Saturday, November 09, 2019 1:50:34 PM

Dear Nuclear Regulatory Commission rulemaking,

As a concerned American, I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial, creating an unacceptable level of risk.

I am also concerned that this proposal is intended to allow for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality specifically demonstrated that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial at this site.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge the NRC not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration in this regard.

Sincerely,
Kent Borges

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Friday, November 08, 2019 7:28:21 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial. Obviously, this change will most definitely impact the community where the waste will be disposed. Is it not clear that it takes 1,000 years?

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial. Also, proof has been produced that this company DOES NOT HAVE A LICENSE. It is totally unethical that the NRC would change their rules to allow Waste Control Specialists to dispose of radioactive waste. This is not how the United States does business, or is it???? Putting the communities in jeopardy is unforgivable.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Anita Sutton

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Friday, November 08, 2019 3:41:42 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them. Even one accident would be a disaster.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
James Shuta

Dear Nuclear Regulatory Commission rulemaking,

Nuclear waste is extremely dangerous and needs to be handled with utmost care to protect the environment from contamination.

The U.S. Nuclear Regulation Commission 's goal should be to require safe conditions.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Friday, November 08, 2019 2:34:36 PM

Dear Nuclear Regulatory Commission rulemaking,

I don't have a personal relation to radioactive waste or the disposal thereof. People make jokes about New Jersey, my state of longest residence, and its status as a toxic waste pit, but honestly I don't have anything to do with radioactive waste, and neither does anywhere that I live or have lived in the past.

That being said, even without a personal connection, I have to say:

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." When you deal with transuranic wastes- one of the categories covered by GTCC classification- you're dealing with material that takes so long to decay that it will still be dangerous a thousand years from now. The proposed handling company, Waste Control Specialists, is not fitted to just chuck this stuff into a shallow pit near the largest aquifer in the United States. I can't believe you'd seriously consider endangering the lives and health of the people of the great state of Texas this way.

Only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

The proposed Waste Control Specialists site in Andrews County is completely and utterly inadequate. This isn't being said as an East Coast liberal bleeding heart whatever name you feel like calling me; this is a reference straight back to data out of Texas itself. A study by the Texas Commission on Environmental Quality showed that this site is not suited at all for disposal of radioactive waste because of risk of water contamination. This rule change seems deliberately designed to allow inadequate disposal of this waste through shallow burial. It feels- forgive me- like a Captain Planet villain wrote it.

And I *hated* that smarmy, preachy, blue-skinned green-haired freak.

That being said, let's include the fact that the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them. Derailments of transport trains are all too common. So are truck turnovers and spills, assuming they'd be considered as a transport option. I'd suggest a visit to [truckspills.com](#) but that hasn't updated since 2017- nevertheless, my point stands: this proposal doesn't include the dangers unaccounted for in terms of transportation issues. Waste isn't gonna teleport itself to Texas.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Jessica McGeary

Dear Nuclear Regulatory Commission rulemaking,

Are you crazy?? I strongly OPPOSE the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in *nuclear reactors*, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is NOT a threat to all life. The NRC's reckless proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this dangerous proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is NOT ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has NOT been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

Do NOT proceed with this irresponsible rulemaking and develop a SAFE solution for the handling and disposal of Greater-than-Class C waste.

Would you want this radioactive waste buried near YOUR home??

Sincerely,
Maria Farina

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." And yet this proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them. It is illogical to attempt to shortchange the difficult and time consuming process of developing safe transport methods and rules because the lawsuits after the fact will be much more costly than any amount of analysis and deliberative process.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste. The time and cost involved is well worth the investment. In addition to courting lawsuits over damages that may yet be avoided, this proposed rule would lead to national loss of productivity and standard of living as large scale health impacts hit the workforce.

Thank you for your consideration.

Sincerely,
Janet Thomas

Date: Friday, November 08, 2019 10:51:53 AM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of extremely dangerous and toxic Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. Why is the NRC making this CHANGE? The answer to that question lies in "follow the money". GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years!) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the completely compromised and pandering Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial, thus polluting the scarce (and getting scarcer) water in Texas.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I expect you NOT to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Tria Shaffer

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Friday, November 08, 2019 9:03:55 AM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) DISASTROUSLY DEADLY proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An ALREADY existing Environmental Impact Statement for GTCC waste CLEARLY determined that it is "not generally acceptable for near surface disposal." This INSANELY proposed rulemaking would upend established principles regarding the OVERWHELMINGLY NECESSARY safe handling and disposal of DEADLY radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only EXTREMELY deep geologic disposal will SOMEWHAT ensure that this waste is not a threat to humanity. The NRC's HEINOUS proposal would DEVIANTLY reclassify that waste and GROTESQUELY allow it to be UNCONSCIONABLY disposed of via TOTALLY INSUFFICIENT shallow burial. IT COULD EASILY BE ACCIDENTLY UNWITTINGLY EXPOSED BY SOME INNOCENT PERSON, CLIMATIC EVENT OR NATURAL DISASTER IN THE FUTURE!

I am also GRAVELY concerned that this ILL-CONCEIVED, MANIACAL proposal is paving the way for GTCC waste to be IMMORALLY dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not, IN ANY WAY WHAT-SO-EVER, ideal for disposal of radioactive waste because of DEADLY risk of water contamination. This POLITICALLY-MOTIVATED, DESTRUCTIVE AND INCREDIBLY IGNORANT rule change seems PURPOSELY designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the EXTREME risk of transport of GTCC waste across the country has not AT ALL been adequately accounted for. Numerous communities would be UNNECESSARILY put at GRAVE risk as this dangerous waste passes through them.

I STRONGLY urge you not to proceed with this BLATANTLY ILL-CONCEIVED rulemaking and to IMMEDIATELY develop a COMPLETELY AND PERMANENTLY safe solution for the RISKY handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Long complaint short this seems like a deliberate gutting of regulations to benefit a few companies at the expense of risking millions of people's health and well-being.

Thank you for your consideration.

Sincerely,
John Clary
Garland, TX 75040

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Friday, November 08, 2019 4:37:06 AM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste, and near a large aquifer.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Transporting this down-graded, but still hazardous nuclear waste across the country has not been adequately thought through or accounted for. Numerous communities would be put at risk as this dangerous waste passes through them. heaven forbid a train derailment. This would be far worse than fossil fuels and fracked fuels.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

However, if you do proceed with the rulemaking in its present form, place this near-surface radioactive waste near your home, or schools and hospitals and drink from the water near the aquifer where it is stored. Measuring your choices against this sort of rubric might give the prudent pause. Please be prudent. Find a long-term and safe solution. This change is not to benefit one company's profit margin.

Thank you for your consideration.

Sincerely,
Julie Kanoff

Dear Nuclear Regulatory Commission rulemaking,

I STRONGLY OPPOSE THE U.S. NUCLEAR REGULATORY COMMISSION'S (NRC) PROPOSAL TO ALLOW NEAR-SURFACE DISPOSAL OF GREATER-THAN-CLASS-C (GTCC) WASTE.

Here we go again. Is there anything that your agency will not do to make it easy for corporations to wreck our planet and the health of our people and places?

You know all the threats yet you insanely try again to allow our country to be a hazardous waste dump.. An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

This proposal is a ploy, paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. This site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change is expressly designed to allow inadequate disposal of this waste through shallow burial.

The hazards of transport of GTCC waste across the country has NOT been adequately thought out. So many people and towns would be in the crosshairs of catastrophe as this dangerous waste passes through them.

Don't do this reckless, irresponsible thing. Develop a safe solution for the handling and disposal of Greater-than-Class C waste.

No one should have to be writing letters of protest. You should be doing your real job, not running interference for criminally negligent nuclear industries.

Sincerely,
Larry McFall

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. The NRC's proposed rule change appears designed to allow disposal by means of shallow burial.

An existing Environmental Impact Statement determined that GTCC waste is "not generally acceptable for near surface disposal." The proposed reclassification would eliminate established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors and transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years). Only deep geologic disposal will ensure that these wastes are not a threat to humanity.

I am also concerned that this proposal will allow GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A Texas Commission on Environmental Quality study showed that this site is not suitable for disposal of radioactive waste due to the risk of water contamination.

Furthermore, the dangers of transporting GTCC waste across the country have not been considered. People living near the routes along which these wastes would be transported would be exposed to unacceptable risks.

Please do not proceed with this reclassification. Instead, develop safe methods for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Dorothy Brown

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

This proposal would break with necessary safety regulations now in place. Radioactive waste is dangerous and should not be treated casually! Some types of such waste can be dangerous for 1,000 years! I believe that only deep geologic disposal will ensure that this waste is not a threat to humanity. The proposed change would reclassify that waste and allow it to be disposed of via shallow burial.

I do not want this waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. The Texas Commission on Environmental Quality showed that this site is not appropriate for disposal of radioactive waste because of risk of water contamination. Do not risk such an event.

The risks involved for communities through which this waste would be transported is yet another risk that should not be taken.

Thank you for your consideration.

Sincerely,
Margaret Joseph
San Antonio, TX 78228

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Friday, November 08, 2019 1:17:25 AM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

My husband worked at a nuclear plant for almost 30 years in chemistry, physics, and radiation protection coordinating with area hospitals, governments and FEMA. We were comfortable with safety at the plant, and confident that the NRC and Congress would work out the concerns about waste. I believe this has been seriously sidestepped as plants have been decommissioned and less in the public mind. Lately talk of entering back into nuclear fission power has resurfaced without a plan for what waste we already have.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial. Multiple governmental agencies have already set rules allowing for additional water degradation by corporate agriculture, coal ash, oil drilling and pipelines.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Susan Lanes

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 11:53:13 PM

Dear Nuclear Regulatory Commission rulemaking,

As a New Mexican living near the proposed interim storage locations for this waste, I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rule would contradict established principles regarding the safe handling and disposal of radioactive waste.

GTCC waste includes some of the most dangerous radioactive waste imaginable: waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial in my backyard.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas, as well as the Holtec site in New Mexico. A study by the Texas Commission on Environmental Quality showed that the Andrews County site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities, including my own and those of my friends and family members, would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste, rather than just reclassifying it as "safe" and dumping it in shallow pits in New Mexico and Texas.

Thank you for considering my comments.

Sincerely,
Kristina Fisher
Santa Fe, NM 87501

Date: Thursday, November 07, 2019 11:44:51 PM

Dear Nuclear Regulatory Commission rulemaking,

We are strongly opposed and absolutely appalled at the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

We are also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

Therefore we urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste. Such a solution **MUST** be confirmed safe by actual scientists, not politicians. Our country deserves real solutions that are based on evidence and analysis, not wishful thinking that saves money at the expense of our environment and quality of life.

Thank you for your consideration.

Sincerely,
Doug & Mary Wylie
Arvada, CO 80004

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 11:29:10 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration, and I hope you have a good day!

Sincerely,
Brendan Johnson

Dear Nuclear Regulatory Commission rulemaking,

The U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste is grossly inappropriate and I oppose it strongly.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." The current proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. Dear Nuclear Regulatory Commission rulemaking,

Radioactive waste needs to be handled properly.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

Only deep geologic disposal will ensure that GTCC waste is not a threat to humanity. The NRC's proposal to reclassify that waste and allow it to be disposed of via shallow burial is foolish and short-sighted.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. High level radioactive waste should never be disposed of in a shallow pit near an aquifer!

The risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes across the country -- and Kansas City, as a transportation hub in the central US, would be more at risk than most places.

Do not reclassify GTCC waste and work to develop a truly safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you.

Sincerely,
Amrita Burdick
Kansas City, MO 64111

Dear Nuclear Regulatory Commission rulemaking,

Stop making radioactive waste because what the he!! are you going to do with it? You're going to turn the New Mexico part of it over to Holtec, an associate of SNCLavalin a proven corrupt liar of a company? Holtec, itself, seems incapable of telling the truth about the nuclear waste at San Onofre. This petition says, "Don't allow unsafe disposal of radioactive waste." To this could be added, "Don't allow unsafe transportation of radioactive waste," the idea that it can be transported safely being an oxymoron itself.

Nuclear waste should be placed in thick stainless steel casks with an overlay of concrete. Then placed inside a bunker for protection against earthquakes, crazy weather and military attacks. It should be placed as close to the place it was created as possible. Never, ever transported long distances.

These on-site locations will have to be watched and guarded in perpetuity, and the spent fuel swapped out when the casks and the concrete show the inevitable signs of age -- which will be greatly increased because of their radioactive contents.

We have taken the wrong course with the nuclear project. Now we have all this waste and there is no good solution to its disposal. Would you buy an apartment house where they forgot to put in the toilets?

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

We need to protect our land and water, not damage our Earth by mismanagement.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

The area in Andrews County, Texas should not be used for waste disposal, given that it has already been studied and rejected for this purpose. Water is necessary for life. Nuclear waste needs to be put where it will not damage our water.

This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

I don't know where the waste is located now. I do know that neither trucks nor trains can be guaranteed to be perfectly safe - perfection is not humanly possible. Places between the current location(s) and Andrews County should not be put at risk for a dangerous disposal method and site.

Rather than continuing with the new and dangerous proposal, I suggest you act to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Mary Stewart
Wilmington, CA 90744

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 8:24:35 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

It has been many years since we were first assured that there would be "safe" disposal techniques developed for nuclear waste. This has still not happened, and this dangerous material does not belong anywhere near the surface or in close proximity to an aquifer. Once pollution with radioactive material has occurred, it is much more difficult to try to clean up the mess than to prevent it from happening in the first place. Harm to human and animal health is not repairable.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Marilee Meyer

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking will overturn established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal ensures that this waste is not a threat to humanity. The NRC's proposal reclassifies that waste and allows it to be disposed of via shallow burial.

This proposal seems to be paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of the risk of water contamination. The rule change seems designed to allow inadequate disposal of this waste through shallow burial.

In addition, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities will be put at risk when this dangerous waste passes through.

Please do NOT proceed with this rulemaking. Develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Sincerely,
Susan Bannister
Columbia, MD 21045

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 7:38:27 PM

Dear Nuclear Regulatory Commission rulemaking,

The U.S. Nuclear Regulatory Commission's (NRC) should not adopt the proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial near an aquifer.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately counted in the assessments. Numerous communities would be put at risk as this dangerous waste passes through them.

Please do not proceed with this rulemaking and instead develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
MaryRose Randall

Dear Nuclear Regulatory Commission rulemaking,

As a retired environmental specialist with the Department of Energy, I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. I believe this material belongs in a more secure, well engineered, structures in deeper strata with low permeability, little faulting, etc., so that any potential leaks can be contained by careful management and containment.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. Dear Nuclear Regulatory Commission rulemaking,

I very much oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal. What is going on?

An existing EIS for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. Nuclear is nuclear. It is with us basically forever. There is really no place for it, certainly not shallow.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport come on guys....

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you.

Sincerely,
Rebecca Wiinanen

Date: Thursday, November 07, 2019 5:53:25 PM

Dear Nuclear Regulatory Commission rulemaking,

Are you out of your mind? This is one of the most absurd and dangerous ideas EVER.

If you think this nuclear waste is so harmless, then how about letting them bury it in your own personal back yard, instead of risking the contamination of the largest underground water supplies in America?

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Adriana Guastavino

Dear Nuclear Regulatory Commission rulemaking,

As a research scientist, I use radioactive materials and am responsible for safe handling and disposal. The requirements for handling the tiny quantities of relatively harmless isotopes that I use are far more stringent than the proposed disposal plan for high-level waste.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 5:45:27 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

There is a reason why Nevada strongly oppose the use of Yucca Mountain for the storage of nuclear waste. It is because of the danger associated with it because of the centuries required for the radioactivity to decay and the danger that in the meantime it will leach into water and land endangering life forms from microbes to humans. Thus it is obviously extremely dangerous to dispose of nuclear waste in a shallow pitch where it will be extremely likely to spread. The fact that the company licensed to handle this waste is choosing to bury it near the nation's largest aquifer is even more disturbing.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rule change would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them. This was also a central issue when Yucca Mountain was being considered as a potential site for burying nuclear waste.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,

From: [Katherine Meyer](#)
To: [RulemakingComments Resource](#)
Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 4:49:12 PM

Dear Nuclear Regulatory Commission rulemaking,

I am writing to in strong apposition to the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. I live in Santa Fe, New Mexico, through which much of the radioactive waste would travel from Los Alamos to a shallow burial in Texas. This radioactive waste would be transported by a company that has no license for or experience with handling this type of waste.

Established science shows that GTCC waste cannot be safely stored in near-surface disposal. The proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. The Texas Commission on Environmental Quality's own study showed that this site is not suitable for disposal of radioactive waste because of risk of water contamination. The site is on top of a major aquifer. This rule change seems designed to allow inadequate disposal of this waste through shallow burial. Making it easier to dispose of radioactive waste does not translate to disposing of it more safely!

Again, I live in New Mexico on the route that would presumably be used to transport this toxic waste. My community and many others would be put at horrible risk as this lethal waste passes through our neighborhoods.

I urge you in the strongest possible terms not to proceed with this rulemaking, but, instead, to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you very much for your consideration of these facts.

Sincerely,
Katherine Meyer

Dear Nuclear Regulatory Commission rulemaking,

Please don't cave into the lying, fascist, traitorous, rapist Donald Trump and his partners in crime against humanity and the environment, Fox "News", the propaganda arm of the Fascist Party, aka RethugliKKK Party.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
tomas herndon

Dear Nuclear Regulatory Commission rulemaking,

Are you serious??? I am and I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. How much of a lack of common sense does it take that we have to demand that radioactive waste be disposed of properly? Apparently the NRC has no common sense at all.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. Dear Nuclear Regulatory Commission rulemaking,

I have felt for many years that nuclear power isn't worth the dangers it embodies with the lengthy half life of nuclear particles. It's bad enough that the nuclear plant in Japan is still leaking into the Pacific Ocean as far as I know, without making it even more likely to have leakage.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

As a retired Nuclear Medicine physician, I am very aware of the dangers posed by radioactive materials and the risks to which the general population would be exposed if this rule change is implemented.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
David Seldin
Laurel, MD 20723

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:34:54 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

When I lived in Alaska, barrels of toxins from the oil industry that had been buried years prior were found to be leaking. A map indicating the location of all these barrels was found to be wrong and many barrels were never located. Something may seem like an acceptable idea at the time but come back to bite you in the ass later. We're human and make mistakes regularly. This is a mistake you and this country can't afford to make. It's always better to be safe than sorry on such a critical decision.

Thank you for your consideration.

Sincerely,
Nancy Richardson

Dear Nuclear Regulatory Commission rulemaking,

HAS THERE EVER BEEN A TIME WHEN WE HAVE LOOKED AT OUR ENVIRONMENT AND SAID, "GEE, WE HAVE BEEN TOO CAREFUL. WE HAVE BEEN TOO PROTECTIVE OF THE NATURAL WORLD?" NO! HUMANS HAVE REPEATEDLY LOOKED AT OUR ENVIRONMENT AND SAID, "I WISH THE PEOPLE WHO CAME BEFORE US HAD BEEN MORE CAREFUL OF OUR CLEAN WATER, CLEAN AIR, AND NATURAL RICHES." THE RULES GOVERNING THE HANDLING AND TRANSPORT OF RADIOACTIVE WASTE ARE BASIC SAFETY REGULATIONS TO PROTECT OUR EARTH AND OUR LIVES. DON'T CHANGE THEM BECAUSE ONE GREEDY CORPORATION WANTS TO MAKE MONEY WITHOUT FOLLOWING ALL OF THE REQUIREMENTS OF THE RULES. I FEEL THAT YOUR PRIMARY JOB IS TO KEEP US SAFE AND KEEP OUR WATER, AIR AND LAND SAFE. PLEASE DO NOT WEAKEN THESE REGULATIONS

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Nuclear radioactive waste is a frightful public hazard, and even more so when it is buried near the surface. It should be stored in very safe, very deep underground storage units.

And please do not bring it to Texas. We Texans do not want it!

Thank you for your consideration.

Sincerely,
Susan Cooper
Richardson, TX 75081

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 3:24:08 PM

Dear Nuclear Regulatory Commission rulemaking,

Radioactive waste is dangerous if wrongly handled. It must be disposed of in as safe a manner as possible.

Therefore, I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

As you know full-well, an existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site, if used for radioactive waste disposal, will create a risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial, negating the current rule which is considerably safer.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I ask you not to proceed with this rule change and to be certain that you develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Mary Duerksen

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Let's be crystal clear about something. The NRC, like all government regulatory agencies, have been taken over by special interests, fossil fuel lobbyists, corporate insiders etc who are completely unqualified for these positions. Their only purpose is to increase the profits of industries who are in the pro earth destroying industries at the expense of all life on earth. These American traitors will be held accountable at some point either by karma, or even possibly the law. Not counting on that in the most corrupt nation to ever exist, the United States of Corporate America.

Thank you for your consideration.

Dear Nuclear Regulatory Commission rulemaking,

It's not that I did not know it existed, and close to me, but it is so hush hush, that the county does not explain the physical dangers of being close to and swimming in radioactivity and radioactive waste. I'm in a part of Holiday Florida which, as I now understand it, is dangerous to your health because what's been tossed into the river and the Gulf is breaking down. It's in the air and I'm also fairly close to a Microwave tower.

The whole thing angers me, because if I'd had any part in the actual decision-making process to allow or nix these *new clean technologies* I never would have okay'd them. They wonder why Social Democracy has begun to have greater appeal? Taking people's agency away by buying it, will never be appealing. The ignorance in it is tragic. ~Elaine Dolan

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the proposal of the U.S. Nuclear Regulatory Commission (NRC) that will allow for near-surface disposal of Greater-than-Class-C (GTCC) waste.

Only deep geological disposal of this waste material will protect our waterways, soil, and environment. To irresponsibly work around this obvious need for caution, the NRC is trying to reclassify this waste, which includes harmful radioactive waste from nuclear facilities.

We have credible science to inform us of the need to take all precautions to safeguard our environment for the present and ahead through the hundreds of years for which some of this waste material may remain toxic to humans, wildlife, and plant life. We need to use good science and our best intelligence to act with the interest of people and our environment.

This is not the time for shortcuts.

An existing Environmental Impact Statement for GTCC waste determined that it is “not generally acceptable for near surface disposal.” This proposed NRC rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. From: [Karen Burtness Prak](#)
To: [RulemakingComments Resource](#)
Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 2:23:49 PM

Dear Nuclear Regulatory Commission rulemaking,

I am horrified by the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste, and strongly oppose this ghastly proposal.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal."

The NRC's proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste, waste which endangers us all. GTCC waste includes waste produced in nuclear reactors, transuranic wastes -- those which take much longer to decay and can be dangerous for 1,000 years -- and other types of nuclear waste. Because they will be extremely dangerous for such a very long time, only deep geologic disposal will ensure that it cannot be a threat to humanity either now or in the future. The NRC's proposal to reclassify such dangerous waste and permit its shallow, insecure, burial endangers not only us humans but all future life.

I am also concerned that this proposal pves the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that disposing waste there risks water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

But it is not only the dangers of contamination from shallow burial which disturb me. Transporting GTCC waste long distances creates further risks, and imperils numerous communities through which the waste will pass on the way to its inadequate disposal site.

I urge you to abandon this reclassification and, instead, to work with experts to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you!

Sincerely,
Karen Burtness Prak
Menlo Park, CA 94025

Date: Thursday, November 07, 2019 2:23:37 PM

Dear Nuclear Regulatory Commission rulemaking,

NO to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is “not generally acceptable for near surface disposal.” This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC’s proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
katie fagan

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 2:23:33 PM

Dear Nuclear Regulatory Commission rulemaking,

I OPPOSE the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determines that it is "not generally acceptable for near-surface disposal." The proposed new rules would upend the established principles ensuring the safe handling and disposal of radioactive waste.

GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be lethal for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to the living world.

The NRC's proposal would reclassify the above types of waste, allowing it to be disposed of in shallow pits.

Further, this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists' site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site, due to risk of water contamination, is unsuited to disposal of radioactive waste.

Additionally, the risk of transporting this dangerous GTCC waste through numerous communities across the country has not been adequately assessed.

Please do NOT proceed with this rule-changing, and please DO develop a VERY safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Peggy Drake
Steuben, ME 04680

Dear Nuclear Regulatory Commission rulemaking,

Unsafe disposal of radioactive waste will hopefully only harm those who selfishly and hatefully decide to go forward with such a deplorable scheme. If anyone who disagrees with this evil plot is harmed, then those who are responsible shall suffer even worse lack of health than those who they torture. Such members should stop participating and seemingly profiting from such heinous disregard for the health of the people and planet we inhabit. I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." Date: Thursday, November 07, 2019 2:23:10 PM

Dear Nuclear Regulatory Commission rulemaking,

It is really important for our future and children's future that we keep radioactive waste from contaminating the soil, water, and air that we need on earth. We need to make sure that radioactive waste is disposed of properly in storage containers deep below the soil. If our soil and water become contaminated there will be no hope for humanity. Think of the seven generations.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not good for disposal of radioactive waste because of risk of water contamination. We have already seen what happened in Fukushima. This rule change seems designed to allow inadequate disposal of this waste through shallow burial. This is a disastrous idea.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them. This is also a horrendous idea. We have seen what happens when there are accidents and spills.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Nancy Martin

Dear Nuclear Regulatory Commission rulemaking,

Radioactive waste is not ordinary garbage and must be treated with proper care and respect. As a Texan I am concerned that changes would allow residents of my state and others to be exposed to dangerous materials in transit and also possible contamination of ground water. Radioactive isotopes with half-lives in the hundreds or thousands of years make errors irreversible.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Nuclear waste presents an additional risk because it takes special instruments to detect it. It is not like a flood or a fire hazard. People can be exposed to it without knowing. This has happened numerous times effecting residents near nuclear facilities with unreported leaks, military members cleaning up in Iraq, and even uranium miners.

I urge you to stop adding risks to nuclear exposure to all of us by containing the wastes and monitoring the areas carefully.

Thank you for your consideration.

Sincerely,
Betty McElhill

Dear Nuclear Regulatory Commission rulemaking,

First off, I'm concerned with any regulatory change that would allow nuclear waste storage in Andrews County TX where fracking activities can cause "seismic activities" that could release the nuclear waste into the air and ground water etc.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
John Young

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." The NRC's proposed rule would upend established principles regarding the safe handling and disposal of radioactive waste.

-- GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which can be dangerous for 1,000 years) and other types of nuclear waste.

-- For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity.

-- Instead, the NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

This proposal also could pave the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is NOT ideal for disposal of radioactive waste because of risk of water contamination.

-- This proposed rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Further, the NRC did not assess the risk adequately if we transport GTCC waste across the country. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you to END this rulemaking and to develop a SAFE solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Stephen Makovec

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

Nuclear technology has given humanity many positive things - but as every positive thing has a negative side, so does nuclear technology and we must handle this waste in a responsible manner. Nuclear technology saves corporations/consumers a great deal of money. Money from these savings should be earmarked to pay for responsible disposal of this material. There is an insanity in our country now that too many people in power believe the most important this is to make the greatest profit possible - regardless of the risks. That is insane! Nothing is more important than our health and our lives!

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. Date: Thursday, November 07, 2019 1:21:22 PM

Dear Nuclear Regulatory Commission rulemaking,

My counter proposal is to dispose of high-level radioactive waste no matter how the NRC decides to classify it in your back yard, not mine in a shallow pit near our nation's largest aquifer. I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste in Texas and New Mexico; however, they might want to consider Kentucky and Alabama as prospective sites. We could rid ourselves of at least a few Trumpers. The Texas company (Waste Control Specialists) should consider relocating to these states and let them handle the inevitable Superfund sites.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Respectfully submitted and Thank you for your consideration,
RBP

Sincerely,
Ray Pasini

Dear Nuclear Regulatory Commission rulemaking,

Improper disposal of high level nuclear waste is a grossly negligent plan. This is a serious health danger and there is absolutely no reason to put it in near surface locations where contact blowing earth and rain can spread it around. Only in Texas could such a proposition be contemplated.

This is too risky. This is unprecedented. This is not well thought out. Do not proceed.

An existing Environmental Impact Statement for GTCC waste determined that it is “not generally acceptable for near surface disposal.” This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 1:20:38 PM

Dear Nuclear Regulatory Commission rulemaking,

This proposal is another attempt by the U.S. Nuclear Regulatory Commission's (NRC) to favor corporations over citizens by allow near-surface disposal of Greater-than-Class-C (GTCC) waste for the benefit companies like Waste Control Specialists and others.

Why change the implementation of the existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal."? This statement is based on established principles regarding the safe handling and disposal of radioactive waste.

As you well know, GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take MUCH longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. So, of course, its disposal should be very deep to not be not a threat to humanity over time.

I can't believe (well, maybe after so many other protections for citizens have been taken away, I can) the the NRC's proposal would reclassify that waste and allow it to be disposed of via SHALLOW burial. Are you hoping we aren't watching and keeping tabs on what you are doing?

As a Texans, I am particularly concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. Is this a favor to the Texas Commission on Environmental Quality and Gov. Abbott? Again, you and I know that a study by the TECQ showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination!!!

OK, then we get to how this noxious stuff gets from place to place. What protections have you put into its progress through many communities?

NO! to this rulemaking. Come up with a safe solution for the handling and disposal of Greater-than-Class C waste and let us know when you have done that.

Thank you for your consideration.

Sincerely,
Liz Wally

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 1:20:34 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

We need to stop doing things that put people at greater risk.

Thank you for your consideration.

Sincerely,
Melissa Hathaway

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 1:20:32 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. I question this proposal as MORE DANGEROUS to the community it would be placed in, and MORE ADVANTAGEOUS to Waste Control Specialists which is UNLICENSED to handle such waste.

Why?

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." Yet this proposal would upend established principles regarding the safe handling and disposal of radioactive waste.

Why? What is the rationale for loosening of these established standards?

Who benefits?

You must be aware that GTCC waste includes waste produced in nuclear reactors; transuranic wastes, which take much longer to decay and can be dangerous for 1,000 years); and other types of nuclear waste. For these reasons, only deep geologic disposal will ensure that this waste is not a threat to humanity. Your proposal would reclassify that waste and allow it to be disposed of via shallow burial.

Why? What is the rationale behind this loosening of standards? Who benefits?

I am also concerned that this proposal could pave the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. So why would you deliberately endanger a community by allowing inadequate disposal of this waste through shallow burial?

I believe you are also ignoring the risk of cross-country transport of GTCC waste. EVERY COMMUNITY along the GTCC waste route will be put at risk as this dangerous waste passes through them.

Why would the NRC allow that?

Who would benefit from this rule change?

The NRC is paid for through taxpayer money. YOU work for the American people--not American companies like Waste Control Specialists. Have you forgotten that fact?

Thus I DEMAND that you curtail this travesty of handing a big government contract to Waste Control Specialists which is NOT equipped or licensed to dispose of such lethal byproducts of nuclear fuel. Instead, I INSIST that you develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
C Saul

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

So a company wants to foster profit by harming humans, ecosystems, water tables.....and NRC actually declines to have a spine and say 'no'? Your job isn't to kowtow to a disposal company. Your job is to regulate that disposal safely. They don't want to do it safely, they want to do it as cheaply as possible, and damn the consequences.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Fay Payton

Dear Nuclear Regulatory Commission rulemaking,

The disposal of nuclear waste is a critical step that requires strong consideration safeguards that will protect lives. At no time should industrial and/or corporate interests supersede those considerations. It is clear that industry will take shortcuts in order to enhance profit. As mentioned below, water sources and ground contamination would be the likely outcome of near-surface disposal.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 1:10:09 PM

Dear Nuclear Regulatory Commission rulemaking,

The U.S. Nuclear Regulatory Commission's (NRC) should drop its proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. Its plan to reclassify this type of high-level radioactive waste does not make it safer, it only gives license to irresponsible handling of highly toxic waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." The current proposal would subvert these established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. Only deep geologic disposal will ensure that this waste is not a threat to humanity.

This proposal appears written for the specific purpose of allowing GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination and further migration of the radioactive waste. The risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

NRC must not endanger the public by allowing highly risky shallow disposal of Greater-than-Class C waste.

Sincerely,
jess zelniker
north hollywood, CA 91601

Dear Nuclear Regulatory Commission rulemaking,

With my experience as a USEPA regulator of mixed hazardous and radioactive waste it is apparent that this proposal would allow the management and disposal of highly radioactive waste in a manner which poses an unacceptably grave threat to humans and the environment both in the present and very far into the future where it may even pose a greater threat by contaminating potable groundwater as well as endangering persons and environment in the direct area of disposal which far in the future may become both more exposed and less apparent over time as warnings inevitably will fade into forgetfulness with the passage of long periods of time. Difficult as it may be a permanent SAFE solution must be developed for all of the nation's highly radioactive waste. It is our responsibility to protect human health and the environment from the grave hazards of these materials both for the sake of ourselves and that of generations far into the future if we are to leave a habitable planet which is our moral imperative.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

People who refuse to listen to Scientists about climate have ZERO business 'reclassifying' Anything! Particularly Scientific definitions.

An existing Environmental Impact Statement for GTCC waste determined that it is “not generally acceptable for near surface disposal.” This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Thomas van de Steeg
Saint Petersburg, FL 33703

Date: Thursday, November 07, 2019 1:08:27 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

As Greta Thuneberg has said, "I don't want to believe that you are simply evil." Nuclear waste is a nightmare-- it should be properly and carefully disposed of- and NEVER used again. Wind and Solar Power do not kill the environment, or people. Be sensible and not INSANE.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them. Humans transport those deadly wastes. And as you know, humans and machines, and vehicles are subject to ERROR. (Have you seen the HBO film "Chernobyl"? It CAN happen here.

I urge you NOT to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste. Do not waive the science. Do not enable dangerous materials to be produced or used in the production of EXPENSIVE energy that can destroy the planet. Sounds sensible to me, and I hope for your grandchildren and great grandchildren.

Thank you for your consideration.

Sincerely,
Andrea Fuhrman

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 1:08:26 PM

Dear Nuclear Regulatory Commission rulemaking,

I write in strong opposition to the NRC's proposal to allow near-surface disposal of GTCC waste.

First, this proposal would fly in the face of established principles regarding the safe handling and disposal of radioactive waste, and GTCC waste requires especially careful measures. Only deep geologic disposal will ensure that this waste is not a threat to humanity.

I am also concerned that this rule change seems to be designed to enable the dumping of GTCC waste at the Waste Control Specialists site in Andrews County, Texas, where there would be a high risk of water contamination.

In addition, transporting GTCC waste across the country poses a high risk to the many communities that this dangerous waste would have to pass through.

I call on you to withdraw this proposal and to work to develop safer solutions for the handling and disposal of GTCC waste.

Sincerely,
Judith Fletcher
Bronx, NY 10463

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 1:08:02 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the NRC proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An Environmental Impact Statement for GTCC waste has already determined that it is "not generally acceptable for near surface disposal." The proposed GTCC rulemaking would reverse established principles for safe handling and disposal of radioactive waste. Since GTCC waste includes waste transuranic wastes that can be dangerous for 1,000 years, only deep geologic disposal can prevent it from becoming a threat to people. The NRC proposal to reclassify that waste and allow its disposal by shallow burial is therefore unacceptable.

I am also concerned that this proposal paves the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality shows that this is a poor site for radioactive waste disposal due to the risk of water contamination.

In addition, the risk of transporting GTCC waste across the country has not been given adequate weight. Many communities would be put at risk as this waste passes through them.

I urge you to terminate this rulemaking and develop a safer solution to handle and dispose of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Ann Randall

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 1:07:15 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial. Residents of this area will find out that law makers are making it legal to dump this waste near their water supply, and they will not accept this. I'm going to wager that this company has donated to the campaigns of people with ties to the NRC or has ties of some sort, that create a conflict of interest. People are not going to sit back and let their water poison them and let cancers overtake their community for one corporation's financial gain. There is no way to justify what is being proposed. It is harmful for every single person who lives in the area.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them. I, for one, will not tolerate this material moving through my community when there are safer, less impactful choices. No one is ever going to believe this is happening for anything other than money.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Jennifer Graham-Henderson

Date: Thursday, November 07, 2019 1:06:21 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste. This proposal is a disaster in the making. There is no sure way to clean up radioactive contamination. The only sure way is prevention by due diligence. Due diligence would dictate "no near surface disposal"

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial. This action is unconscionable.

Specifically, I am concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial. Certain to contaminate water for those nearby.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
Donna Seabloom

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rule would upend established principles regarding the "safe" handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years), and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not an immediate threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial, deliberately endangering human and environmental health and safety.

I am also outraged and disgusted that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is a bad place for disposal of radioactive waste because of the risk of water contamination. This rule change obviously is designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been accounted for. Numerous communities would be deliberately and needlessly put at risk as this dangerous waste passes through them.

I urge you not to proceed with this intentionally bad rulemaking and instead to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

I would thank you for your consideration, but I already know you won't consider anything but the most dangerous, destructive course of action. That's the Trump Reich's specialty, after all.

Sincerely,
Susan Hathaway

Subject: [External_Sender] Docket ID No. NRC-2017-0081 - don't allow unsafe disposal of radioactive waste
Date: Thursday, November 07, 2019 1:04:54 PM

Dear Nuclear Regulatory Commission rulemaking,

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste.

GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity.

The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is not ideal for disposal of radioactive waste because of risk of water contamination.

This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

We have NO right to be irresponsible about this tough waste disposal issue!

Thank you for your consideration.

Sincerely,
Sister Mary Schmuck RSM
Belmont, NC 28012

Dear Nuclear Regulatory Commission rulemaking,

You cannot be serious! If anything, we need greater controls and regulations of Nuclear Waste.

I strongly oppose the U.S. Nuclear Regulatory Commission's (NRC) proposal to allow near-surface disposal of Greater-than-Class-C (GTCC) waste.

An existing Environmental Impact Statement for GTCC waste determined that it is "not generally acceptable for near surface disposal." This proposed rulemaking would upend established principles regarding the safe handling and disposal of radioactive waste. GTCC waste includes waste produced in nuclear reactors, transuranic wastes (which take much longer to decay and can be dangerous for 1,000 years) and other types of nuclear waste. For this reason, only deep geologic disposal will ensure that this waste is not a threat to humanity. The NRC's proposal would reclassify that waste and allow it to be disposed of via shallow burial.

I am also concerned that this proposal is paving the way for GTCC waste to be dumped at the Waste Control Specialists site in Andrews County, Texas. A study by the Texas Commission on Environmental Quality showed that this site is NOT appropriate for disposal of radioactive waste because of risk of water contamination. This rule change seems designed to allow inadequate disposal of this waste through shallow burial.

Furthermore, the risk of transport of GTCC waste across the country has not been adequately accounted for. Numerous communities would be put at risk as this dangerous waste passes through them.

I urge you not to proceed with this rulemaking and to develop a safe solution for the handling and disposal of Greater-than-Class C waste.

Thank you for your consideration.

Sincerely,
C. M. Pyle
