National SNF Transportation Risk Calculations for Holtec EIS for Single Phase

PAL 12/03/2019

Calculated Population Dose and Health Effects for 500 SNF Shipments by Exposed Population (Person-Sv)

Calculations ----->

Population Dose = Number of Proposed SNF Shipments x Population Dose

Population Health Effects = Population Dose x Health Effects Conversion F

Results:

	Incident-Free Public	Incident-Free Worker	Accident Shielding Intact, No Release
Representative Route-Specific Impact			
Maine Yankee to Deaf Smith Population Dose	0.18	1.26	0.03
Maine Yankee to Deaf Smith Population Health Effects	0.0104	0.07	0.0019
INEL to Deaf Smith, TX Population Dose	0.09	0.49	0.0330
INEL to Deaf Smith, TX Population Health Effects	0.0050	0.03	0.0019

Inputs:

Number of Proposed SNF Shipments	500	Source: Holtec, 2019 (ER)
ICRP Pub 103 Health Effects Conversion Factor	0.057	Source: ICRP, 2007 (Pub 103)

Table 1 Exposed Population Dose Per Shipment Factors Compiled from Results in NUREG-2125 (NRC, 2014)

Representative Route	Exposed Population Collective Doses per Shipment (person-Sv)		
	Incident-Free Public	Incident-Free Worker	Accident Public Shielding Intact, No Release
Maine Yankee to Deaf Smith, TX	3.64E-04	2.52E-03	6.60E-05
INEL to Deaf Smith, TX	1.76E-04	9.73E-04	6.60E-05

Supplemental Information and Calculations for Table 1

Maine Yankee to Deaf Smith. TX ----->
 INEL to Deaf Smith, TX ----->

NUREG-2125 (NRC, 2014, Table 2-15) Collective Doses for Exposed Subgr
 per Shipment , Rail-Lead Cask (Person-Sv)

Residents Along Route	Occupants of Vehicles Sharing Route	Residents Near Stops
2.50E-04	6.10E-05	5.30E-05
6.70E-05	3.20E-05	7.70E-05

Note: values in red are further described below**

NUREG-2125 (NRC, 2014, Table 2-14) Occupational Dose Rates from Incid	
4.30E-09 person-Sv/km	Rail Crew in Transit, R
7.20E-09 person-Sv/km	Rail Crew in Transit, R
5.80E-06 Sv/hr	Rail Escort in Transit,
5.80E-06 Sv/hr	Rail Escort in Transit,

Note: rail inspector average dose per inspection is addressed
 by NUREG-2125 truck inspector average dose in footnote c
 of Table 2-14 (1.64E-4 Sv per inspection-hr); for a long route 3
 4 hour inspections assumed based on NUREG-2125 Table 2-11;
 for shorter (repository) route one 4 hour inspection is assumed.

NUREG-2125 (NRC, 2014, Table 2-11) Classification Stops and In-transit In	
3.00E-05 person-Sv	Railyard Worker, Orig
1.97E-03 person-Sv	Rail Inspector, In-trans
6.56E-04 person-Sv	Rail Inspector, In-trans

Maine Yankee to Deaf Smith. TX ----->
 INEL to Deaf Smith, TX ----->

NUREG-2125 (NRC, 2014, Table 5-4) Collective Dose Risks to Public from M	
6.60E-05	
6.60E-05	

Vehicle speeds (NUREG-2125) (NRC, 2014)	Urban	Suburban	Rural
Truck	60	63	67
Rail	15	25.25	25.25
Trip Distances (NUREG-2125) (NRC, 2014) and Calculated Durations	Urban	total	Sub and Rural
Maine Yankee to Deaf Smith. TX	211	3362	3151
	132	2101	1969
	1.6		
Trip Duration	9		78

INEL to Deaf Smith, TX	Urban	total	Sub and Rural
	40	1913	1873
	25	1196	1171
	1.6		
Trip Duration	2		46

******Note: values in red above were corrected from values reported in NUREG-2125 (NRC, 2014). RADTRAN outputs results in person-rem which is a factor of 100 greater than person-Sv. The crew values in the NUREG-2125 Table were labeled person-Sv but were found to be actually in units of person-rem and were therefore corrected by dividing the report crew dose values in Table 2-14 (for Rail-lead cask) by 100. The mislabeling in the the report was evident from the calculated occupational doses using intermediate results presented in NUREG-2125 (calculation results herein agree w/ reported values with the correction) and from review of the similar output information reported in Table B-27 of NUREG-2125 (note the Rail-lead urban crew dose entry in B-27 appears to have an additional typo in the exponent as there is no reason that this individual result would be over 10 times greater than the preceding rural/sub value in that table nor the following rail-steel crew dose values in that table where the ratio of urban to sub/rural results is 1.66). No other/similar discrepancies were identified in these tabulated results in NUREG-2125.

Per Shipment Factor
Factor

Accident with Release
See Table 1
See Table 1
See Table 1
See Table 1

Note: Loss of shielding dose-risks were calculated in NUREG-2125 but are not included here because the low probability of the accidents severe enough to cause loss of sheilding result in far lower dose-risks than accidents with shielding intact that were included here.

(health effects/person-Sv)

Accident with Release
N/A for Rail-Steel
N/A for Rail-Steel

Note: Rail-Steel cask is for canistered SNF; NUREG-2125 analysis concluded no release from canistered SNF in an accident; Holtec proposed transportation involves canistered SNF

Groups	Note: External dose estimates for Rail-Lead cask were used because in NUREG-2125 the dose rate for that cask was set to the regulatory maximum

SCIENTIFIC NOTEBOOK # 1333

Holtec Consolidated Interim Storage Facility EIS Supporting Calculations

by

Marla Morales
Patrick LaPlante
Bradley Werling

Southwest Research Institute
Center for Nuclear Waste Regulatory Analyses
San Antonio, Texas

September 25, 2019

INITIAL ENTRIES

Scientific Notebook: # 1333

Issued to: Marla Morales

Issued Date: September 25, 2019

Printing Period: 6 months

Project Title: Development of the EIS for the Holtec Consolidated Interim Storage Facility in Lea County, New Mexico

Project Number: 23700.08

Project Staff: Marla Morales, Patrick LaPlante, and Bradley Werling

This electronic Scientific Notebook follows the CNWRA QA procedure outlined in QAP-001. The notebook will be printed every six months.

Qualification requirements for this project are: structural analysis, thermal analysis, structural design, and numerical modeling with ANSYS Mechanical V18.1 computer code.

1.1 Objectives

This scientific notebook documents CNWRA staff transportation and air quality calculations and supporting documentation used in the development of the Holtec Consolidated Interim Storage Facility (CISF) Environmental Impact Statement (EIS) for the U.S. Nuclear Regulatory Commission (NRC). Staff providing input include Patrick LaPlante, Bradley Werling, and Marla Morales.

1.2 Computers and Computer Codes

Microsoft® Excel 2013 will be used to aid in calculations.

1.3 Air Quality Calculations

Section 1.3 Entry Date: October 9, 2019

Section 1.3 Entry Made by: Bradley Werling (BAW)

I generated two categories of air quality calculations for the Holtec air quality analyses: regional annual air emissions and project level non-greenhouse gas air emission levels. For both of these calculations I used Excel 2013.

1.3.1 Regional Annual Air Emissions

1.3.1.1 Background

Region defined as the Lea County, Eddy County, and combined Lea and Eddy Counties annual emissions

I downloaded the regional estimates from EPA's 2014 National Emission Inventory. PDF of webpage included in this scientific notebook entry. Full reference citation is

EPA. "2014 National Emissions Inventory (NEI) Data." Washington, DC: U.S. Environmental Protection Agency. 2018. <https://www.epa.gov/air-emissions-inventories/2014-national-emissions-inventory-nei-data> (Accessed 2 August 2018).

Sector Summaries - Criteria and Hazardous Air Pollutants by 60 EIS emission sectors

The following queries allow for generating custom data files and the results will be displayed on-screen with various options to download. The queries are used to generate subset summaries of either Sector or Tier aggregations

*To use the multiple selection boxes hold CTRL and click on options you would like to include in your query. To select multiples in order, click your first option then hold SHIFT + click the last selection to highlight everything in between. To deselect options use the same method as with selecting. Please allow time for large queries to process (i.e. county aggregated for all pollutants, all regions, selected sector).

National / State / County or Tribe	Geographic Aggregation
<input type="text" value="County or Tribe"/>	<div>Region 1</div> <div>Connecticut</div> <div>Maine</div> <div>Massachusetts</div> <div>New Hampshire</div>

Pollutant	Sector
<div>CAP</div> <div>Ammonia - NH3</div> <div>Carbon Monoxide - CO</div> <div>Elemental Carbon - EC</div> <div>Lead - 7439921</div>	<div>Agriculture</div> <div>Crops and Livestock Dust</div> <div>Fertilizer Application</div> <div>Livestock Waste</div> <div>Dust</div>

Submit Query *Query results will be displayed below.

Tier 1 Summaries - Criteria Air Pollutants only by 14 major tiers

LAST UPDATED ON JULY 19, 2018

Pollutants quantified are

- Carbon monoxide (CO)
- Hazardous Air Pollutants (HAPS)
- Nitrogen dioxides (NO_x)
- Particulate matter PM₁₀ (PM₁₀)
- Particulate matter PM_{2.5} (PM_{2.5})
- Sulfur dioxide (SO₂)
- Volatile organic compounds (VOCs)

1.3.1.2 Spreadsheet File Information

The spreadsheet file titled “NEI 2014 download for SN 1333”

- Available in the same folder as this electronic scientific notebook: M:\Environmental\Holtec CISF EIS\Scientific Notebook 1333\NEI 2014 download for SN 1333.
- Contains the download of the NEI 2014 annual emissions for individual pollutants for the entire state of New Mexico by county. Each pollutant has a worksheet with the state wide emissions. The prefix for these worksheets is the pollutant (e.g., SO₂) and the suffix for these worksheets is “all”. For example, the worksheet with the statewide annual sulfur dioxide emissions is titled “SO₂ all”.
- Next I generated a worksheet for each pollutant for each county (Eddy and Lea) by copying the statewide emissions worksheet and deleting all sources not from the counties of interest. The prefix for these worksheets is the pollutant (e.g., SO₂) and the suffix for these worksheets is the county. For example, the worksheet with the Eddy county annual sulfur dioxide emissions is titled “SO₂ Eddy”.
- If the units for data from the EPA was in pounds, then it was converted to short tons in these county level worksheets.
- Then I generated the worksheet titled “Regional Table” which consolidated the pollutant information from all of the county worksheets (e.g., SO₂ Eddy) and generated a table that contained the annual pollutant levels for each county. Then I added the Eddy and Lea County emissions to generate the annual pollutant levels for both counties combined. For inclusion in the EIS description of the affected environment (i.e., EIS Chapter 3), the original short ton values were converted to metric ton values in this “Regional Table” worksheet.

1.3.2 Project Level Non-greenhouse Gas Air Emission Levels

1.3.2.1 Background

Source for emission estimates and input for earthmoving activities is the follow-up RAI Responses (Aug 2019). Currently this document has not been assigned an accession number for the NRC’s Agencywide Documents Access and Management System (ADAMS). When this becomes available another entry will be made in this scientific notebook with this referencing information.

Source emission levels were expressed in both pounds per hour (pph) and short tons per year (tpy).

Emission level were estimated for

- Phase 1 (500 spent fuel canisters) and subsequent expansion phases 2-20 (500 spent fuel canisters for each subsequent phase)
- The various stages (construction, operation, and decommissioning).
 - Phase 1 construction varied from subsequent expansion construction because Phase 1 construction emissions included initial facilities and were greater than subsequent construction which entailed just more storage pads.
 - Operations emissions were at the same levels no matter how many phases were active.
 - Decommissioning emissions varied if it was just decommissioning (NRC regulatory decontamination) or reclamation (demolition of facilities and restoring land to initial conditions).
- Peak Year emissions.
 - For phase 1, no stages overlap
 - For phases 2-20, operations and subsequent construction overlap
 - Operations won't start until phase 1 construction is complete.
 - Decommissioning won't start until the spent fuel is shipped off the CISF (i.e., operations done).

1.3.2.2 Spreadsheet File Information

I generated a spreadsheet titled "Holtec air quality calculations for SN 1333". This file is available in the same folder as this electronic scientific notebook: M:\Environmental\Holtec CISF EIS\Scientific Notebook 1333\ Holtec air quality calculations for SN 1333. This file contains the following worksheets

- Worksheet "Phase 1 Const TPY"
 - Contains the phase 1 construction stages emissions in short tons per year
 - I estimated the emission levels for the earthmoving activity and the inclusion of a second concrete batch plant as documented in this worksheet. This calculation is contained in this worksheet.
- Worksheet "Phase 1 Cons PPH"
 - Contains the phase 1 construction stages emissions in pounds per hour
 - I estimated the emission levels for the earthmoving activity and the inclusion of a second concrete batch plant as documented in this worksheet. This calculation is contained in this worksheet.
- Worksheet "Phases 2-20 Cons TPY"
 - Contains the phases 2-20 construction stages emissions in short tons per year
 - Applicant estimated phases 2-20 construction emissions would be 15% of the phase 1 construction emissions. This calculation is contained in this worksheet.
- Worksheet "Phases 2-20 Cons PPH"
 - Contains the phases 2-20 construction stages emissions in pounds per hour.

- Applicant estimated phases 2-20 construction emissions would be 15% of the phase 1 construction emissions. This calculation is contained in this worksheet.
- Worksheet “All Phases Ops TPY”
 - Contains the operation stage emissions for all operations stages (i.e., a constant value) in short tons per year
 - Copied values from source document and I did not make any calculations.
- Worksheet “All Phases Ops PPH”
 - Contains the operation stage emissions for all operations stages (i.e., a constant value) in pound per hour
 - Copied values from source document and I did not make any calculations.
- Worksheet “Phases 2-20 Overlap TPY”
 - Contains the emission levels in short tons per year for years when subsequent construction phases emissions (from worksheet Phases 2-20 Cons TPY) occurs at the same time as operation emissions (from worksheet All Phases Ops TPY).
- Worksheet “Phases 2-20 Overlap PPH”
 - Contains the emission levels in pound per hour for years when subsequent construction phases emissions (from worksheet Phases 2-20 Cons PPH) occurs at the same time as operation emissions (from worksheet All Phases Ops PPH).
- Worksheet “Decom”
 - Contains no calculations or estimates
 - Applicant assumed decommissioning levels (that is reclamation which the applicant commits to) would be similar to Phase 1 construction levels.
 - NRC decommissioning regulations (just decontaminate the site and leave facilities in place) would generate much lower emission levels.
- Worksheet “Phase 1 emissions”
 - Construction values from worksheets “Phase 1 Cons PPH” and “Phase 1 Const TPY”
 - Operation values from worksheets “All Phases Ops PPH” and “All Phases Ops TPY”
 - Decommissioning values from worksheets “Phase 1 Cons PPH” and “Phase 1 Const TPY”
 - Peak year values
 - For phase 1, no stages overlap
 - Peak year values vary for pollutants
 - Operation stage had peak year emissions for CO₂, CO, and HAPS
 - Construction and decommissioning stages tied for peak year emissions for all other pollutants
 - For inclusion in the EIS description of the proposed action (i.e., EIS Chapter 2), the original English units were converted to metric units in this worksheet.

- Worksheet “Phase 2-20 emissions”
 - Construction values from worksheets “Phases 2-20 Cons PPH” and “Phases 2-20 Cons TPY”
 - Operation values from worksheets “All Phases Ops PPH” and “All Phases Ops TPY”
 - Decommissioning values from worksheets “Phase 1 Cons PPH” and “Phase 1 Const TPY”
 - Peak year values
 - For Phases 2-20 the subsequent phase construction stage and operations stage overlap
 - Overlapping (combined) subsequent phase construction stage and operations stage from worksheets “Phases 2-20 overlap PPH” and “Phases 2-20 overlap TPY”
 - Peak year values vary for pollutants
 - Overlapping (combined) subsequent phase construction stage and operations stage had peak year emissions for CO₂, CO, and HAPS
 - Decommissioning (reclamation) stage had for peak year emissions for all other pollutants.
 - For inclusion in the EIS description of the proposed action (i.e., EIS Chapter 2), the original English units were converted to metric units in this worksheet.
- Worksheet titled “CISF vs Regional”
 - I generated a table which compared the CISF emission levels to the regional emission levels
 - I calculated the Contribution (Percentage) of the CISF annual emissions compared to regional annual emissions by dividing the CISF annual emissions by the regional emissions and multiplying by 100.
 - For inclusion in the EIS description of the cumulative impacts, conversion from English units to metric units was not needed because percentages are unitless.

[PL, 12/09/2019]

1.4 Calculations of the Potential Radiological Impacts to Workers and the Public from the Transportation of SNF to and from the Proposed Holtec CISF

Section 1.4 entries made by Patrick LaPlante (PL)

1.4.1 Objective

Develop, execute, and supplement the documentation of the radiological impact calculations for the proposed SNF transportation in a series of Excel spreadsheets.

1.4.2 Technical Approach

The technical approach to implementing the SNF transportation impact calculations scales prior NRC SNF transportation risk assessment results (for single shipments of SNF along representative routes) that are documented in NUREG-2125 by the number of proposed shipments to calculate dose-risks (impacts) to workers and the public that are expected to reasonably bound the impacts from the proposed transportation. The transportation risk assessment calculations in NUREG-2125 utilize the RADTRAN 6.0 code. RADTRAN transportation risk calculations are acceptable for use in the current impact analysis because the model was developed for the purpose of assessing risks to workers and public from the transportation of SNF to support analysis under NEPA and the code has been the established model for conducting such calculations for decades. Regarding the RADTRAN code NUREG-2125 states the following:

The RADTRAN computer code (Taylor and Daniel, 1977) is used in this chapter to estimate risks from routine transportation of SNF. Sandia National Laboratories initially developed RADTRAN for the NRC's NUREG-0170 risk assessment. During the past several decades, the calculation method and RADTRAN code have improved to stay current with computer technology and supporting input data have been collected and organized. The basic RADTRAN analysis approach has not changed since the original development of the code, and the risk assessment method used in the RADTRAN code is accepted worldwide; about 25 percent of the 500 RADTRAN users are international. RADTRAN 6.0, integrated with the input file generator RADCAT (Neuhauser et al., 2000, Weiner et al., 2009) is the version used in this study. The incident-free module of RADTRAN, the model used for the analysis in this chapter, was validated by measurement (Steinman et al., 2002), and verification and validation of RADTRAN 6.0 are documented in Dennis et al., 2008.

The NUREG-2125 calculations are particularly applicable for the impact analysis calculations because they are the most recent NRC technical analysis of national SNF transportation risks and the results are presented in sufficient detail and in "modular" form that allows scaling to match project-specific characteristics. In fact, NUREG-2125 includes descriptions of how results can be scaled to support specific analyses (see Appendix B example calculations and the "unit risk" approach). Because the original calculations in NUREG-2125 are detailed and resource-intensive to complete, applying these documented results from NUREG-2125 to new analyses by scaling as is done in the calculations documented in this notebook is an efficient approach that produces results that are the same as they would be if the same scenario were run in the model.

1.4.3 Work Plan for Developing SNF Transportation Calculation Spreadsheets

1. Define conceptual models consistent with the scope of the SNF transportation radiological impact analysis. This includes impacts to workers and the public from the national transportation of SNF by rail.
2. Implement and document dose calculations in Excel spreadsheets
3. Document the calculations and results in the EIS.

1.4.4 Documentation and Analysis of Results

The documentation and analysis of results is in the draft EIS milestone report. The included spreadsheet files provide supplemental details of the calculations described in the EIS milestone report and in this scientific notebook.

1.4.5 File Archive

All files referenced in this scientific notebook have been archived on CNWRA computer drives and will be copied to appropriate media that will be associated with this scientific notebook. The file structure of the archive is as follows:

National_SNF_Transportation_Risk_Calculations_Holtec_EIS_Full_Buildout.xlsx
National_SNF_Transportation_Risk_Calculations_Holtec_EIS_Single_Phase.xlsx

Total	1532.8	3.78	0.01	8.21	2.11	17.65	0.01	9.24

If a second batch plant is used SwRI assume the cement plant PM emissions double resulting in total emissions of 2.31 pph for PM2.5 (2.11 + 0.20) and 18.85 pph for PM10 (17.65 + 1.20)

Earthmoving Activities emission estimate generated by SwRI staff

Input from Applicant in followup RAI responses (Aug 2019)

2028 annual hours of land disturbance

PM2.5 is 10% of PM10

PPH of PM10 (1 batch plant) = (16.34 tpy)/(2000 lb/1 ton)(1 year/2028 hours) = 16.11

PPH of PM10 (2 batch plant) = (18.97 tpy)/(2000 lb/1 ton)(1 year/2028 hours) = 18.71

Phase 1 Construction Emissions in Short Tons Per Year (equivalent of ER Table 4.6.2)

Source	CO2	CO	HAP	Nox	PM2.5	PM10	SO2	VOC
Construction Equipment	989.2	2.53	0.01	5.67	0.20	0.20	0.01	0.68

Other VOC (Paint and Fuel)	0.00	0.00	0.00	0.00	0.00	0.00	0.00	3.41
Total	2473.56	7.92	0.01	9.93	2.16	16.34	0.03	4.85

If a second batch plant is used SwRI assume the cement plant PM emissions double resulting in total emissions of 2.59 tpy for PM2.5 (2.16 + 0.43) and 18.97 tpy for PM10 (16.34 + 2.63)

Earthmoving Activities emission estimate generated by SwRI staff

Input from applicant in followup RAI responses (Aug 2019)

Emission factor is 0.22 Tons of PM10 per acre-month (no mitigation)

60 acres disturbed per year (5 acres per month rather than all 60 acres at once)

PM2.5 is 10% of PM10

TPY of PM10 = (0.22 tons per acre-year)(12 months)(60 acres/12 months/year) = 13.2

Phases 2-20 Construction Emissions in Pound Per Hour (pph)

Applicant assumes this is 15% of initial phase 1 construction

	40	1913	1873
	25	1196	1171
	1.6		
Trip Duration	2		46

******Note: values in red above were corrected from values reported in NUREG-2125 (NRC, 2014). RADTRAN outputs results in person-rem which is a factor of 100 greater than person-Sv. The crew values in the NUREG-2125 Table were labeled person-Sv but were found to be actually in units of person-rem and were therefore corrected by dividing the report crew dose values in Table 2-14 (for Rail-lead cask) by 100. The mislabeling in the the report was evident from the calculated occupational doses using intermediate results presented in NUREG-2125 (calculation results herein agree w/ reported values with the correction) and from review of the similar output information reported in Table B-27 of NUREG-2125 (note the Rail-lead urban crew dose entry in B-27 appears to have an additional typo in the exponent as there is no reason that this individual result would be over 10 times greater than the preceding rural/sub value in that table nor the following rail-steel crew dose values in that table where the ratio of urban to sub/rural results is 1.66). No other/similar discrepancies were identified in these tabulated results in NUREG-2125.
