EVENT DESCRIPTION AND PROBABLE CONSEQUENCES (10)

On 6/19/81 at 1654 hours with reactor power at 99%, the auxiliary flow path to the 1A Steam Generator was isolated for the repair of a leaking feed flow transmitter instrument line penetration into the "A" aux feed flow header. Power operation continued under the guidelines of Technical Specification 3.7.1.2. There were no safety implications and in the event of a safety injection or the loss of normal station power there would have been slightly reduced auxiliary feed flow to the 1A Steam Generator due to the leak.
