<div> <div>01</div> <div>EVENT DESCRIPTION AND PROBABLE CONSEQUENCES</div> <div>10</div> </div>																			
<div> <div>01</div> <div>On separate occasions the backup function of the Isolating and Transfer Diodes</div> </div>																			
<div> <div>02</div> <div>in the 125 VDC Instrumentation and Control System was disabled for all four</div> </div>																			
<div> <div>03</div> <div>channels on all three Ocone Unit's. The only place that a single failure could</div> </div>																			
<div> <div>04</div> <div>occur that would affect both batteries of any Ocone Unit's I&C DC system would</div> </div>																			
<div> <div>05</div> <div>be in the battery room. It should be noted that the normal period of time for</div> </div>																			
<div> <div>06</div> <div>the units to be separated is less than 1 hour. Therefore, the probability of</div> </div>																			
<div> <div>07</div> <div>a failure during this short time period is quite low. Thus, the health and</div> </div>																			
<div> <div>08</div> <div>safety of the public were not endangered.</div> </div>

<div> <div>12</div> <div>CAUSE DESCRIPTION AND CORRECTIVE ACTIONS</div> <div>36</div> </div>																			
<div> <div>13</div> <div>The apparent cause of the incident is a misinterpretation of Technical Specifici-</div> </div>																			
<div> <div>14</div> <div>cation 3.7 when the procedure was originally written in 1974. The immediate</div> </div>																			
<div> <div>15</div> <div>corrective action was the initiation of a proposed change to Ocone Technical</div> </div>																			
<div> <div>16</div> <div>Specification 3.7 which would allow the separation of all three units' I&C, DC</div> </div>																			
<div> <div>17</div> <div>system via the isolating and transfer diodes for a period not to exceed 24 hours.</div> </div>																			
<div> <div>18</div> <div>A change to the "Normal Power" procedure will be processed.</div> </div>
