EVENT DATE

REPORT DATE

02 While performing QIS-6, High Drywell Pressure Scram Calibration and Functional
03 Test, pressure switch PS-2-1001-88D was found to trip at 2.2 psig which is 0.2
04 psig higher than the Technical Specification limit in Table 3.1-3. This was
05 of minimal consequence since the other three pressure switches in the one-out-
06 of two-twice logic circuit were found to be in calibration and would have
07 initiated a Reactor scram upon detecting high Drywell pressure.

1 0 | The cause of this occurrence was instrument setpoint drift. The pressure switch

1 1 | (Static-0-Ring, Model 12N-AA5-PP) was recalibrated and functionally tested.

1 2 | These switches do display some tendency for drifting, however, the frequency

1 3 | of occurrence is low for any one switch. Therefore, no other corrective action

1 4 | is necessary at this time.
