## EVENT DESCRIPTION AND PROBABLE CONSEQUENCES (10)

On 6/22/82, during steady state reactor operation, while performing quarterly surveillance test 8.M.2-2.2.2 "Recirculating Jet Pump Riser Differential Pressure" switches 261-12 A&B were found to actuate at 1.65 PSIG and 2.2 PSIG, increasing, respectively. The Tech. Spec. limit for these switches is 1.5 PSIG. These switches contributed to the RHR (LPCI) break detection/loop selection logic. These switches are ITT-Barton, Model 288.

## CAUSE DESCRIPTION AND CORRECTIVE ACTIONS (27)

A search of records has found that no previous setpoint drift of these switches has been determined to be outside T.S. limits. The switches were immediately reset to within T.S. limits. No future corrective action is planned for this isolated event.
