EVENT DESCRIPTION AND PROBABLE CONSEQUENCES	10
On 12/22 while testing the "1B" HP	

tripped while it was being off loaded. The diesel was restarted and the diesel speed,

varied between 400 and 900 RPM. The plant was shutdown at the time of the occurrence,!

and HPCS was not required to be operable. Therefore, safe plant operation was not

affected.

CAUSE DESCRIPTION AND CORRECTIVE ACTIONS

1. CAUSE IDENTIFICATION AND CORRECTIVE ACTIONS (27)  
The cause for the fluctuating speed was a bad connection at the "Run" solenoid. When

When the solenoid is de-energized, the governor shuts off fuel supply to the diesel. The

bad connection at the solenoid allowed it to de-energize/energize every few seconds.

The connection was reconnected. This connection will be inspected as part of

LES-DG-101.
