

ORIGINAL

CIVIL ACTION
NO. 80 CIV.
1683 (R.O.)

-against-

Defendants.

Continued deposition of THE BABCOCK

& WILCOX COMPANY, by BERT M. DUNN, taken by Plaintiffs, pursuant to adjournment, at the offices of Kaye Scholer Fierman Hays & Handler, Esqs., 425 Park Avenue, New York, New York, on Tuesday, April 7, 1981, at 9:20 a.m., before Joseph R. Danyo, a Shorthand Reporter and Notary Public of the State of New York.

1
2 B E R T M . D U N N , having
3 been previously duly sworn, resumed and
4 testified further as follow:

5 EXAMINATION (Continued).

6 BY MR. SELTZER:

7 Q Your testimony today continues to be
8 under oath. Do you understand that?

9 A Yes.

10 MR. SELTZER: I would like to mark as
11 GPU Exhibit 110 a letter from D. R. Patterson,
12 Chief of the Mechanical Engineering Branch
13 of Tennessee Valley Authority, to Mr.
14 McFarland at B&W, April 27, 1978, subject
15 "Emergency Core Cooling System - Small
16 Break LOCA Analysis N4M-2-14(AR)," with a
17 copy indicated to Mr. Dunn.

18 (Letter from D. R. Patterson to Mr.
19 McFarland dated April 27, 1978, marked
20 GPU Exhibit 110 for identification, as of
21 this date.)

22 BY MR. SELTZER:

23 Q Is GPU Exhibit 110 a copy of a
24 letter which you received in the regular course
25 of business in or about May 1978?

2 A I don't recall receiving it.

3 Q Have you had a chance to look through
4 it to refresh your recollection?

5 A Yes, I believe I am familiar with this
6 memo or letter.

7 Q When you say you are familiar with
8 it, what do you mean?

9 A I have seen it before.

10 Q In what connection have you seen it?

11 A At the first time that I actually read the
12 Michelson Report. This was a cover letter to a
13 body report which followed, and I have seen the
14 two of them together most of the time. I don't
15 believe I have seen them separately, except in this
16 deposition.

17 Q Have you met with Mr. Patterson, the
18 author of GPU Exhibit 110?

19 A Not since the issuance of this memo.

20 Q Have you discussed the contents of
21 GPU Exhibit 110 with Mr. Patterson or others
22 from TVA?

23 A I recall one telephone conversation in
24 which we were discussing the contents of this
25 memo and the contents of the Michelson report

2 with TVA. I am not sure who was the TVA
3 representative on the phone call.

4 Q Have you discussed the Michelson
5 report with Carlyle Michelson?

6 A I don't believe so.

7 Q Have you discussed any subjects
8 relating to emergency core cooling with
9 Michelson?

10 A Sometime after Three Mile Island, Michelson
11 was appointed as an adviser to the ACRS. We have
12 had presentations before ACRS during that time
13 frame in which he was an advisory member. Those
14 presentations dealt with the emergency core
15 cooling, loss of coolant accident predictions.

16 Q Have you had any meetings with
17 Carlyle Michelson since he has assumed his new
18 post in the NRC?

19 A No.

20 Q Do you know what his new post is?

21 A It is my understanding, it is something
22 dealing with equipment, but that could even be
23 wrong. No, I don't know.

24 Q You don't know that he is in charge
25 of an office that deals with analysis of operating

1
2 experience of nuclear plants?

3 A No, I did not.

4 Q When you saw him after the Three
5 Mile Island accident, did you tell him you thought
6 he had done a nice job on his report?

7 MR. FISKE: Which report?

8 MR. SELTZER: The report that Mr.
9 Dunn has referred to as the Michelson
10 report.

11 MR. FISKE: I object to the form of
12 that question. Ask him whether he had a
13 conversation about the report.

14 BY MR. SELTZER:

15 Q Did you say anything to him about the
16 report?

17 A I don't believe so. I believe we talked
18 about what happened that day.

19 Q Is it your best recollection that you
20 have never talked to Carlyle Michelson about the
21 Michelson report?

22 A Yes.

23 Q Is it correct that for certain small
24 break loss of coolant accidents, the steam
25 generators are relied upon to remove a portion

2 of the decay heat?

3 A In terms of the licensing evaluations, yes.

4 Q In GPU Exhibit 110, TVA says at the
5 beginning of the third paragraph on the first
6 page, that for small break LOCA's up to five-
7 hundredths of a square foot, steam generators
8 must remove a significant portion of decay heat.

9 Is that statement accurate?

10 A No, I think the sentence is reasonable. I
11 don't think the way you paraphrased it and cut
12 it short was accurate.

13 Q You think the steam generators must
14 remove a significant portion of the decay heat
15 during the initial phase of the loss of coolant
16 accident? Is that right?

17 A You should complete the sentence.

18 Q Adding what?

19 A "Otherwise reactor coolant system
20 repressurization occurs since the break is
21 too small to remove all of the decay heat."

22 Q Do you agree with the next sentence
23 which says, "Repressurization or even prolonged
24 high pressure operation could seriously limit
25 high pressure injection makeup during blowdown

1
2 and thereby adversely influence the peak clad
3 temperature for those cases wherein the core
4 uncovers during the blowdown"?

5 MR. FISKE: I object to that unless
6 it is couched in terms of what Mr. Dunn
7 thought at the time he saw the memorandum.

8 Q What did you think when you saw the
9 memorandum about the validity of that statement?

10 A That it was in essence wrong drawing from
11 combining two different accidents that cannot
12 physically combine.

13 Q What two accidents?

14 A One of the larger small breaks which has an
15 opportunity for uncovering the core and the smaller
16 breaks which do not.

17 Q You said that for licensing, you do
18 rely on the steam generators for removal of a
19 significant portion of decay heat, is that
20 right?

21 A Yes.

22 Q Is it correct that in order to take
23 licensing credit for decay heat removal through
24 the steam generators, you have to assume in
25 certain instances continuation of natural

1

2

circulation?

3

A No.

4

5

6

Q If there is not operation of the reactor coolant pumps, do you have to assume natural circulation?

7

8

A Not by the definition that most people use for natural circulation.

9

10

Q What definition is that?

A Solid water.

11

12

13

Q What do you mean? I know what solid water means. Getting back to your answer, not by the definition most people use.

14

15

16

17

18

19

20

21

22

A My definition of natural circulation is an unforced process of mass transport from the reactor core to some cooling mechanism, typically the steam generator, during which energy is also carried. That can occur in a reactor by three mechanisms. The latter two are thought by most people not to be included in the term "natural circulation," although they are natural and they are in fact unforced.

23

Q What are the latter two?

24

25

A A bubbly two-phase froth mixture in the hot leg that enhances the density difference between

1
2 the colder regions of the system, the hotter
3 regions of the system, which transports both
4 liquid and steam to the steam generators, and a
5 mode of operation termed boiler condenser today,
6 and at one time after Three Mile Island
7 inappropriately termed reflection boiling.

8 Q How does boiler condenser circulation
9 or convection work?

10 A The circulation mechanism is by boiling
11 steam in the reactor core passing the steam through
12 whatever suspended mixture may be above the
13 reactor core out in the hot legs where it would
14 separate from the mixture region of the system,
15 be transported as steam up the hot leg over the
16 top of the candy cane down into the steam
17 generator and condense on the secondary liquid
18 surface.

19 Q Does the NRC for licensing purposes
20 accept that as a method of natural circulation?

21 A The NRC accepts that as a method of providing
22 energy transport during small break loss of
23 coolant accidents.

24 Q Does B&W take credit for that
25 as a means for heat dissipation in loss of

coolant accidents for licensing purposes?

A Yes.

Q Has the NRC accepted it?

A Yes.

Q On page 2 of GPU Exhibit 110, would you look at the point that is numbered 3.

Do you see the second sentence in point 3 that begins with the words "Decay heat removal"?

A Yes.

Q It says, "Decay heat removal by condensation will cease when the water level inside the steam generator tubes exceeds the secondary side water level."

At the time you received this document and read it, did you believe that was an accurate statement?

A It is accurate, and I am talking about a state of knowledge at the time, but it does tend to infer a necessity that a necessity remains for heat transfer to the generator and in that fashion, it intones something that is slightly inaccurate.

I would like to put on the record, too,

2 that the time at which I first read these and
3 formed the conclusions I have been giving you
4 is after Three Mile Island.

5 You said at the time I received this.
6 I want to make it clear that I did not recall
7 receiving this at the time it was issued.

8 Q When you saw this after the Three
9 Mile Island accident, is that the first time you
10 believe you got a copy of GPU Exhibit 110?

11 A I believe that is true.

12 Q It says in the last paragraph on page
13 2, the seventh line down, the sentence beginning
14 "Also associated." It states, "Also associated
15 with operation in each of the above conditions
16 is a concern that the pressurizer level is not
17 a correct indicator of water level over the
18 reactor core. Because of the loop seal on the
19 pressurizer, it may be possible to have a full
20 pressurizer while the core is partially
21 uncovered."

22 At the time you read GPU Exhibit 110
23 for the first time, did you believe that those
24 sentences made statements which you found
25 accurate?

2 A The intonation about the loop seal being
3 of importance, I would not find accurate. The
4 concern about the possibility of the pressurizer
5 being full while the primary system is partially
6 voiding or as they have expressed it that the
7 pressurizer level is not a correct indicator of the
8 water over the reactor core, I would find true.
9 I did find true.

10 Q You still find it true, right?

11 A Yes.

12 Q That fact that you could have a full
13 pressurizer while the core is partially uncovered
14 is one of the things you took some time to explain
15 to others at B&W on the afternoon of the Three
16 Mile Island accident, is that right?

17 MR. FISKE: I don't remember Mr. Dunn
18 giving any testimony about pressurizer
19 water level in relation to the afternoon
20 of the accident.

21 MR. SELTZER: We have introduced his
22 notes in which he had written that he had
23 explained that. GPU Exhibit 97.

24 MR. FISKE: He can answer the
25 question.

1
2 A The answer to the question is that we
3 took some time to explain the consistency of a
4 pressurizer containing water while low levels
5 of coolant existed in the reactor coolant system.

6 Your statement related to a
7 partially uncovered core, and I am not exactly
8 sure that we treated it as a partially uncovered
9 core in those discussions. We were talking
10 about the need for high pressure injection.

11 (Continued on following page.)
12
13
14
15
16
17
18
19
20
21
22
23
24
25

1
2 Q Let me show you again GPU Exhibit 97
3 and specifically Page 2 of your notes in 97,
4 where you say -- I'm sorry, it starts on Page 1.
5 "We asked for a charge rate of around 400 gallons
6 per minute and started explaining to management
7 how an uncovered core was consistent with full
8 pressurizer level."

9 Are those your notes?

10 A Yes.

11 Q Does that refresh your recollection
12 that you had written that at your meeting on
13 the afternoon of the day of the Three Mile
14 Island accident, you explained to management how
15 an uncovered core was consistent with full
16 pressurizer level?

17 A Not really. The way I remember it is
18 explaining a need for high pressure injection
19 with the possibility that the water levels in the
20 core were not guaranteed; and that is pretty
21 much how I remember it today. I don't deny I
22 wrote those notes.

23 Q When you wrote those notes, were you
24 attempting to put your best recollection of the
25 day of the Three Mile Island?

1
2 A Yes.

3 Q And your recollection was fresher
4 when you were writing these notes than your
5 recollection is today; is that right?

6 A Yes.

7 Q Would you turn to the last page of
8 GPU Exhibit 110.

9 The TVA author states there: "We
10 assume that the situations and concerns which
11 have been identified above and in the attached
12 draft study have been considered in your own
13 in-house loss of coolant analysis and analysis
14 work."

15 As of the date that this is written,
16 which is April 1978, had the situations and
17 concerns which are discussed by TVA already been
18 considered in B&W's loss of coolant analysis work?

19 MR. FISKE: I think that is a pretty
20 broad question, if you are really intending
21 to ask him separately about each one of the
22 items that was covered in this letter and
23 in the report.

24 MR. SELTZER: If he would like to
25 take it item by item and tell me which ones

2

had been considered and which ones hadn't,
that's fine. I didn't mean to lump them
together unfairly.

3

4

5

6

7

8

MR. FISKE: ...I just want to know
whether you have any particular situation
or concern that you are interested in
which might save us some time.

9

10

MR. SELTZER: Let's take the three
numbered concerns on Page 2.

11

A You want me to just answer?

12

Q Yes.

13

14

A The first issue was considered in
determining the nature of the spectrum to be
utilized for licensing purposes. The accidents
which would have a potential to cause this effect
are not severe and did not involve core uncovering
and thus did not challenge the emergency core
cooling system.

15

16

17

18

19

20

Q Had you analyzed whether the

21

formation of a steam bubble at the top of each

22

steam generator could interrupt natural

23

circulation?

24

A Not specifically. Our analysis of the

25

situation went a little different.

1

2

Q So you hadn't analyzed that?

3

4

A In terms of computer evaluation or a specific case, no. I remain with my contention that it is in the licensing basis, the point.

5

6

7

Q What do you mean, it is in the licensing basis? It is bounded?

8

A Yes.

9

10

11

Q You mean bounded the same way you had thought the discharge pipe break was bounded until you studied that specifically, right?

12

13

MR. FISKE: I object to the form of the question.

14

15

Q You thought that the discharge break was bounded until you studied it, didn't you?

16

17

18

A Yes, we felt we had determined the worst case to be located for the smaller breaks at the pump suction as opposed to pump discharge.

19

20

21

Q It wasn't until you studied pump discharge breaks specifically that you learned that was a worst case, is that right?

22

23

24

A For that particular plant. We had studied discharge breaks for that plant, but in the wrong break size range.

25

Q Since April 1978, has B&W in ECCS

1
2 Analysis specifically analyzed the possibility of
3 a steam bubble forming either at the top of a
4 candy cane or at the top of a steam generator
5 and thereby interfering with natural circulation
6 and decay heat removal?

7 A Yes.

8 Q Who did that work?

9 A ECCS.

10 Q Was there any particular individual
11 in your unit that was responsible for that?

12 A The work has been done on several
13 occasions for several reasons. I would say there
14 are about four people, five people, significantly
15 associated with it.

16 Q Who in ECCS Analysis is most
17 knowledgeable about that work?

18 A Probably Mr. Bob Jones.

19 Q Have any formal reports been written
20 on the subject?

21 A At least one.

22 Q When was it written?

23 A May 7, 1979.

24 Q What is the title of that?

25 A The blue books.

1
2 Q Turning to point 2 on Page 2 of GPU
3 Exhibit 110, had the situation and concerns
4 stated there been analyzed by B&W prior to
5 April 27, 1978?

6 A I make the same statement on that that I
7 made to No. 1. The condition is bounded within
8 the licensing evaluation. There was no
9 particular analysis in the form of detailed
10 computer work done of such an event.

11 Q Since April 1978, has analysis been
12 performed specifically on that situation?

13 A Yes, it would be the same analysis
14 mentioned in response to Item No. 1.

15 Q Turning to Item 3, had work been done
16 in-house at B&W on Item 3 before April 27, 1978?

17 A From the standpoint of seeing ourselves
18 that such events did not pose a compromise to
19 core safety, the point had been considered and
20 a certain way evaluated. Repressurizations were
21 not computed in those evaluations; so we were not
22 finding that repressurization would occur.

23 The majority of this paragraph seems
24 to deal with long-term accident recovery, which
25 was not specifically evaluated by ECCS at that

1
2 time.

3 Q You did work subsequent to this on the
4 level of water that should be maintained in the
5 secondary side of the steam generator following
6 a loss-of-coolant accident, didn't you?

7 A Yes, we had done such work.

8 Q In fact, you came up with a
9 prescription to change the level of water that
10 should be maintained on the secondary side, didn't
11 you?

12 A We have altered the level for the 177
13 plants. Design work is proceeding on the level
14 for the 205 plants. The work I was talking about
15 was the design work.

16 Q You altered the level for the 177
17 plants after the Three Mile Island accident;
18 right?

19 A Yes.

20 Q You increased the level from 50
21 percent to 95 percent?

22 A That's correct.

23 Q When was the work done that
24 supported the change from 50 percent to 95
25 percent?

1
2 A Generally, within a few months of Three
3 Mile Island.

4 Q Before or after Three Mile Island?

5 A After.

6 Q What if anything was perceived as
7 the advantage of raising the level to 95
8 percent instead of leaving it at 50 percent?

9 MR. BENEDICT: By Mr. Dunn?

10 MR. SELTZER: Yes.

11 A A guarantee that whatever condensate was
12 available in the steam generators would have an
13 opportunity to return to the reactor vessel
14 and a better assurance of steam generator heat
15 transfer during post-accident situations.

16 Q You wanted to increase the decay heat
17 removal, right, in post-accident situations?

18 A No. I would say we wanted to assure that
19 certain masses, i.e., the condensate in the steam
20 generators, could return to the core. It was more
21 a mass concern than a decay heat removal concern.

22 The other part refers to keeping the
23 steam generator in a mode in which it can control
24 certain aspects of the primary system such as
25 pressure. Decay heat removal itself I did think

1
2 was a main concern.

3 Q Isn't the principal objective in
4 recovery from a loss of coolant accident keeping
5 the core cooled?

6 A Probably not at this phase of the accident.

7 Q What phase are you talking about?

8 A Post-accident recovery. Probably the
9 principal concern was control of the plant systems.

10 Q At what point are you in post-accident
11 recovery?

12 MR. BENEDICT: In what sort of
13 accident are you talking about?

14 MR. SELTZER: The one that Mr. Dunn
15 has been referring to.

16 MR. BENEDICT: Do you have a specific
17 accident in mind?

18 Q Do you, Mr. Dunn?

19 A I am talking about loss-of-coolant
20 accidents.

21 Q When does a loss-of-coolant accident
22 go into post-accident recovery phase?

23 A At such point as the break in the
24 high-pressure injection system can assure core
25 cooling.

2

Q The present prescription by B&W for response to small break loss-of-coolant accident is to terminate operation of the reactor coolant pumps within the first two minutes of the accident; isn't that right?

3

4

5

6

7

8

9

10

11

12

13

Q The mode of core cooling that follows termination of reactor coolant pumps involves natural circulation; right?

A At sometimes.

14

15

16

17

Q Immediately after the reactor coolant pumps are terminated, doesn't the circulation of water shortly thereafter depend upon natural circulation?

18

19

20

A For certain break sizes, depending on when the reactor coolant pumps specifically are tripped.

21

22

23

24

25

Q For those break sizes that depend on natural circulation, when the pumps are tripped shortly after the start of the accident, does the maintenance of a 95 percent level on the secondary side of the steam generators play a role in heat

removal?

A No. We're talking about 177 plants now.
It helps.

Q What do you mean, it helps?

A It makes the situation better.

Q Are you saying that you would have
effective core cooling in the 177 plants even
if the level were down to 50 percent?

A That is what the analysis shows.

Q Do you have a high degree in those
analyses?

A Yes.

(Continued on Page 870.)

1
2 MR. SELTZER: I would like to mark as
3 GPU Exhibit 111 a memorandum from Mr. Bailey
4 to Mr. Levandowski, subject "Small Break
5 Report," May 25, 1978.

6 (Memorandum dated May 25, 1978 from Mr.
7 Bailey to Mr. Levandowski on the subject
8 "Small Break Report," was marked GPU Exhibit
9 No. 111.)

10 BY MR. SELTZER:

11 Q Who is Mr. H. Bailey?

12 A Henry Bailey who, at that time, was a member
13 of the Generic Licensing Group. Unit, I guess it is
14 a unit.

15 Q That was a unit that reported to Taylor,
16 is that right?

17 A Yes.

18 Q Who is Mr. F. J. Levandowski?

19 A It refers to Frank Levandowski. At this time,
20 I am not sure what he was doing.

21 Q What is "Manager SLU"?

22 A SLU doesn't mean much to me today.

23 Q Is Frank Levandowski still at B&W?

24 A Yes.

25 Q In GPU Exhibit 110, the last exhibit

2 that we saw, on the bottom of page 2, the next to
3 the last sentence concluded with the words "...it
4 may be possible to have a full pressurizer while
5 the core is partially uncovered." The paragraph
6 goes on, "This could lead to incorrect operator
7 actions."

8 In GPU Exhibit 111, which is Bailey's
9 memo to Levandowski of May 25, 1978, he says
10 "A more valid concern may be the subject of
11 operator action and the potential for erroneous
12 pressurizer levels."

13 Prior to the Three Mile Island
14 accident, were you aware that TVA had raised as a
15 subject of concern the fact that erroneous pressurizer
16 level could lead to incorrect operator actions?

17 A Yes.

18 Q How would you become aware of that?

19 A Mr. Bob Jones had received from our Project
20 Management Team associated with TVA a report on
21 small break phenomena. That report has since
22 been termed the Michelson Report.

23 In his review, he became aware that
24 TVA was writing statements, this statement here,
25 the other statements that are contained in the

2 remainder of the report, and he informed me that
3 TVA was concerned on that issue.

4 Q At the bottom of page 1 of GPU Exhibit
5 111 --

6 MR. BENEDICT: Are you going to ask
7 Mr. Dunn whether he has ever seen this
8 before?

9 MR. SELTZER: I wasn't planning to.

10 MR. BENEDICT: I am not sure we should
11 ask questions about it. Why are you asking
12 him a question about a document that you have
13 not identified yet?

14 MR. SELTZER: I have identified it for
15 the record.

16 MR. BENEDICT: You have noted it for
17 the record, but you have not identified it
18 as being something that he knows something
19 about.

20 BY MR. SELTZER:

21 Q At the bottom of page 1, it says: "No
22 addition communication with TVA has occurred on this
23 matter and ECCS analysis has taken no action on this
24 report. Bert Dunn plans to start looking at the
25 report next week to see what's there and to

2 consider what action or investigation should be
3 pursued (if any)."

4 Had you talked with Bailey in or about
5 May 1978 regarding the Michelson Report?

6 A I do not recall doing so.

7 Q Had you told anybody in or about May
8 1978 that you planned to start looking at the
9 Michelson Report to consider what action or
10 investigations should be pursued as a result of
11 the contents of the report?

12 A By that you mean personally look at it?

13 Q No, I give you a more royal presence.
14 You or your unit.

15 MR. BENEDICT: Could you read back the
16 question?

17 (Record read)

18 A I am not sure of the timing. Bob Jones had
19 read this report at some time. We had decided
20 there was not anything critical on it and to handle
21 it as the remainder of the work load within the
22 unit allowed. That is pretty close to my total
23 recollection.

24 Q Did there come a point when the work
25 load of the unit allowed time to do further analysis

2 of the Michelson Report?

3 A The first responses to TVA were, I believe,
4 around Christmas, either before or shortly after,
5 1978.

6 Q Were those responses in writing?

7 A Yes.

8 Q Was there anything in the response
9 about the pressurizer level not being a correct
10 indication of water level over the reactor core?

11 A Yes.

12 Q What did you say?

13 A We agreed with TVA.

14 Q Who prepared the written response to
15 TVA that you say was sent out about Christmas
16 1978?

17 A Bob Jones.

18 Q Did you review it before it was
19 sent out?

20 A I cannot recall reviewing it. I believe
21 it is my understanding that I did sign as a
22 reviewer.

23 Q What does it mean if you signed saying
24 reviewed and approved for conclusions drawn?

25 A Then I probably reviewed it. I did review

2 it.

3 Q And approved it?

4 A Yes. I think I would like to, if we can,
5 produce that.

6 Q Sure.

7 Did it occur to you prior to sending
8 TVA the response that Bob Jones drafted that you
9 could send them the substance of your February
10 1978 memorandum on operator response to
11 pressurizer level?

12 A Can I have it back again?

13 Q I will restate it.

14 In February 1978, you had written
15 to Jim Taylor that the operators at Toledo Edison
16 had inappropriately terminated high pressure
17 injection in response to rise in pressurizer
18 level, right?

19 A Yes.

20 Q When you heard of TVA's concerns over
21 operators acting incorrectly in response to
22 pressurizer level, you made an association, I
23 think you already testified, between what they
24 were writing about and what you had previously
25 written to Taylor about, isn't that right?

2

A That's correct.

3

4

5

6

Q After you became aware of TVA's concerns, did you say to anybody "Why don't we send them the substance of what I have already written to Jim Taylor in February 1978"?

7

A No.

8

9

10

11

Q Did you say to anybody, "Maybe we should check and make sure that Customer Service has sent out the instructions that I drafted in February 1978"?

12

A No.

13

14

15

Q Did you write to anybody and suggest that they check to see if your February 1978 instructions had been sent out to customers?

16

A No.

17

18

19

20

Q Did anybody tell you in the course of discussing TVA's concerns, "Don't worry about that, we already sent out Bert Dunn's February 1978 instructions"?

21

A No.

22

23

24

25

MR. SELTZER: I would like to mark as GPU Exhibit 112 Jones to Lightle, signed by Mr. Dunn, subject "Response to TVA Letter K-5020," January 19, 1979.

2

(Memo dated January 19, 1979 from R.

3

C. Jones to R. E. Lightle re "Response to

4

TVA Letter K-5020" was marked GPU Exhibit

5

No. 112 for identification as of this date.)

6

BY MR. SELTZER:

7

Q Is GPU Exhibit 112 a copy of the

8

response prepared by Jones that you were referring

9

to in your testimony several minutes ago?

10

A Yes.

11

Q You reviewed and approved this

12

response, right?

13

A Yes.

14

Q Do you know whether your employer ever

15

sent this response to TVA?

16

A Yes.

17

Q Did they?

18

A Yes.

19

Q Did they send it in exactly the form

20

that appears here, to the best of your knowledge?

21

A I don't know.

22

Q If you don't know whether they sent

23

it in this form, how do you know they sent it?

24

A We had telephone conversations with TVA after

25

this, in which the subject matter of a transmittal

2 was discussed.

3 Q Did you discuss the response with Jim
4 Taylor?

5 A I don't recall.

6 Q Did you discuss it with Bailey?

7 A I don't recall.

8 Q Would you turn to the last page of
9 GPU Exhibit 112.

10 In the next to last paragraph, you
11 and Jones have stated: "As far as the
12 appropriateness of the operator using pressurizer
13 level indication to trip the HPI pumps, B&W agrees
14 that the level indication is not a reliable
15 indication of the state of the RCS. However, use
16 of the pressurizer level indication, along with
17 system temperature and pressure measurements to
18 ensure that the system is still in a substantially
19 subcooled state, will provide sufficient guidance
20 for operator action."

21 That statement about insuring that the
22 system is still in a substantially subcooled state
23 is not nearly as extensive as the instructions
24 that you had drafted on February 16th and sent to
25 Jim Taylor, are they?

2 MR. FISKE: I think I am going to
3 object to the form of the question.

4 A It is not as explicit.

5 Q Did you ever consider when you were
6 reviewing GPU Exhibit 112 or any earlier draft of
7 it, did you ever consider inserting explicitly and
8 in full text instructions that you sent to Taylor
9 on February 16, 1978?

10 A No.

11 Q You didn't even consider it?

12 A No.

13 Q Did you discuss with Jones sending him
14 those instructions?

15 A I don't believe so.

16 (Recess)

17 MR. SELTZER: I would like to mark GPU
18 Exhibit 113, a memorandum from J. D. Carlton
19 to Alan Womack, subject "Small Break LOCA
20 Auxiliary Feedwater Requirements," May 17,
21 1979.

22 (Memorandum dated May 17, 1979 from J.
23 D. Carlton to E. A. Womack re "Small Break
24 LOCA Auxiliary Feedwater Requirements," was
25 marked GPU Exhibit No. 113 for identification
as of this date.)

16

17

18

19

20

21

22

23

24

25

Q Is GPU Exhibit 113 a copy of a memorandum from Carlton to Womack attached to which is a description of auxiliary feedwater flow required which you and Carlton prepared?

A It is a copy of a memo on auxiliary feedwater from J. D. Carlton to E. A. Womack; and on the final page where the table is shown, my initials are contained on the bottom.

Q Did you and Carlton prepare the last three pages of GPU Exhibit 113, which is what Carlton says in his cover memo to Womack?

A I remember working with Jim in this area in this approximate time frame, so I will say probably.

Q In the first page of the attachment which you probably worked on, would you look at paragraph 3. It talks there about how auxiliary feedwater flow is controlled to a specific level on the secondary side of the steam generators.

Is that a correct description of how auxiliary feedwater is automatically controlled?

A For the 177 plants, yes.

(continued on next page)

2 Q As a result of this automatic
3 control of auxiliary feedwater, if the level
4 of primary water were the same or greater than
5 the level of the secondary water, would that
6 result in automatic shutoff of the auxiliary
7 feedwater?

8 A No.

9 Q Would it end up reducing the demand
10 for auxiliary feedwater?

11 A In some cases.

12 Q In what cases?

13 A In the case where that level had already
14 been reached.

15 Q What level?

16 A The shutoff level for auxiliary feedwater.

17 Q What is the level that shuts off
18 auxiliary feedwater, and how does it relate to
19 the level of primary?

20 A It does not relate to the level of primary
21 at all. The level is presently 25 feet. Excuse
22 me. Ninety five percent on the operate range.

23 Q Before you changed the operate range
24 to 95 percent, what was the level at which
25 auxiliary feedwater was cut off?

2

A Fifty percent on the operate range.

24

25

MR. SELTZER: I would like to mark for identification as GPU Exhibit 114 a memo from Mr. Dunn to Mr. Duerson, subject: CPR Work on RELOAD Contracts, January 18, 1978.

(Memo from Mr. Dunn to Mr. Duerson, subject: CPR Work on RELOAD Contracts, dated January 18, 1978, was marked GPU Exhibit 114 for identification, as of this date.)

Q Is GPU Exhibit 114 a copy of a memo that you sent to Duerson on or about January 18, 1978?

A Today I cannot recall sending this. That is my signature. I have no reason to believe that it is not.

Q In fact, you have some pretty good reasons to believe that it is, right?

A . . .

Q What was Duerson's role and specifically why were you writing this particular memorandum to him?

A Not recalling generating it at this time,

1
2 I would have to speculate and let the memo stand
3 for itself.

4 Q You called Duerson a name here. You
5 said he was the Generic Project Manager. What
6 does that mean?

7 A Generic Projects is the name for the
8 organization of project management which we have
9 referred to previously in the deposition as a risk
10 group.

11 Mr. Duerson was a Project Manager
12 within that organization responsible for
13 arranging for the evaluation of certain types
14 of product concerns.

15 Q When you say "arranging for the
16 evaluation," you mean securing funding within B&W?

17 A Yes.

18 Q Were you writing to him in GPU
19 Exhibit 114 to seek funding for further
20 evaluation of pump discharge breaks?

21 A It is not clear from the memo. Again I
22 have to speculate.

23 Q As you reread this memo, do you
24 understand that you were asking Duerson to
25 reconsider finding funding for small break in

2

the pump discharge line to be analyzed?

3

MR. FISKE: This is something we

4

have been through before. Mr. Dunn can

5

testify as to what his understanding of it

6

was at the time he wrote it. I have no

7

objection to that. But he doesn't recall

8

it now.

9

I don't think it is proper to ask

10

him to try to read it now and guess or

11

surmise what his purpose was.

12

MR. SELTZER: Would it help if I told

13

you your partner, Bob Wise, has been

14

asking a GPU witness within the last

15

couple of weeks what documents mean today?

16

MR. FISKE: I don't know whether it

17

helps or not. I don't think it changes

18

what I am saying to you.

19

MR. SELTZER: You think it is improper

20

for Bob Wise to ask our witnesses for their

21

present understanding?

22

MR. FISKE: You know you are not

23

going to get me into a discussion of whether

24

questions Mr. Wise is asking, which I don't

25

know the contents of, are improper or

2

proper. All these things have to be based
on the individual questions.

3

4

I am just telling you what my position
is with respect to this memo.

5

6

MR. SELTZER: I thought you were
enunciating a more generic position.

7

8

MR. FISKE: I am simply stating the
same thing I stated the last time this
came up with Mr. Dunn.

9

10

11

MR. SELTZER: But you are espousing
it as a generic proposal, that it is not
right to ask him what a document is today,
if they don't have a recollection of what
it meant when they first saw it or wrote it.

13

14

15

16

MR. FISKE: I said it in the context
of two particular documents that you have
shown to Mr. Dunn. Whether that has a
broader application or not, I don't know.
I just take them one document at a time.

17

18

19

20

21

MR. SELTZER: I think this document
is not of sufficient interest to me to
press the point, but I want you to be on
notice that you are creating a precedent
which we may apply.

22

23

24

25

2

I daresay I vehemently disagree with the principle you are espousing. I think it is phooey.

3

4

5

MR. FISKE: You can call it anything you want. Maybe some day some judge will decide whether you are right.

6

7

8

MR. SELTZER: A lot of judges have decided I am right on that particular point. I think after you exhaust the witness' recollection about what something meant at the time he wrote it, you can advance to what does it mean today.

9

10

11

12

13

14

MR. FISKE: We obviously disagree.

15

16

MR. SELTZER: You instruct the witness not to answer that question?

17

18

MR. FISKE: Yes. I think that is what I did the last time.

19

20

MR. SELTZER: I wanted to make sure we joined the issue.

21

BY MR. SELTZER:

22

23

24

25

Q The small break in the pump discharge line that you are referring to in GPU Exhibit 114 is the same break that you had sought funding for through the risk group in April 1977, is that

2 right? I show you your April activities
3 report, GPU Exhibit 104, if you want to refresh
4 your recollection.

5 A Yes, I think these are the same.

6 Q Would you turn to point 3 on the
7 second page of GPU Exhibit 114. In the first
8 sentence you say, "In your decision to ask our
9 customers to pay for the two above analyses, I
10 would like you to consider the following
11 concerns."

12 "Your decision" refers to a decision
13 made by Duerson or the risk group at B&W, right?

14 A Again, not recalling the circumstances
15 under which I wrote the memo or writing the memo,
16 I have to say that is an interpretation which
17 could be given.

18 Q An interpretation which you would
19 give it?

20 MR. FISKE: I object to that.

21 MR. SELTZER: He is writing to
22 Duerson. He says "in your decision." I
23 am asking does the "you" refer to Duerson
24 or to Duerson's risk group.

25 MR. FISKE: Or obviously drawing your

2 own conclusions from that, which may not
3 be right.

4 MR. SELTZER: That is why I have a
5 witness here who is sworn to tell the
6 truth. I am asking if that is his
7 conclusion.

8 MR. FISKE: The whole point of this
9 exercise, if Mr. Dunn doesn't recall the
10 circumstances itself, while he certainly
11 will give you the truth, his truth is no
12 more relevant than your truth as to what
13 that means. I don't think the fact that he
14 has taken an oath has a great deal to do
15 with this.

16 MR. SELTZER: Let's not descend to a
17 petty level.

18 Would you let him answer this question?

19 MR. FISKE: I think we can all read
20 the memo. Why don't you proceed from there.

21 MR. SELTZER: The question is whether
22 the "your" refers to Duerson or his group.

23 MR. FISKE: Mr. Dunn has told you he
24 doesn't recall writing it. We can all
25 speculate as to what it means. You can

2

draw your inference. I can draw mine. I

3

suppose he can draw one, too.

4

MR. SELTZER: That is what I want.

5

His inference of words that he has written.

6

MR. FISKE: I am not going to let him

7

answer, not that I think it is particularly

8

crucial with respect to this point. I

9

think in this particular case, I think we

10

would all agree what it means.

11

MR. SELTZER: You want to have a show

12

of hands.

13

MR. FISKE: Why don't you go on to

14

the next question.

15

BY MR. SELTZER:

16

Q You say "we have been aware of the

17

concern of the pump discharge break for nearly a

18

year. It is possible that NRC would consider

19

our reporting of the concern untimely."

20

Did B&W eventually report the pump

21

discharge break concern to the NRC?

22

A Yes.

23

Q Did you report it to the NRC sometime

24

after January 1978?

25

MR. FISKE: I think there has been a

1
2 lot of testimony about this earlier
3 already. I think Mr. Dunn testified quite
4 thoroughly on that whole subject in one of
5 the earlier days of this deposition.

6 Q At the time that you communicated the
7 pump discharge concern to the NRC, did you
8 indicate that you had been aware of the concern
9 for nearly a year?

10 MR. FISKE: I think you are misstating
11 the testimony. Mr. Dunn -- I don't believe
12 Mr. Dunn ever testified that he communicated
13 the concern to the NRC.

14 MR. SELTZER: I am asking him whether
15 he ever communicated that they had the
16 concern for a year or more.

17 MR. FISKE: Did he ever communicate
18 that to the NRC?

19 MR. SELTZER: Yes.

20 MR. FISKE: You can answer that
21 question.

22 A I am not absolutely sure, but I don't
23 believe so.

24 Q Do you believe that anybody else at
25 B&W told the NRC that you had been aware or

2

anybody at B&W had been aware of a concern over
a pump discharge line break for more than a year
prior to the reporting to the NRC?

3

4

5

A I don't know.

6

7

8

Q You wrote in January 1978 that "It is
possible that NRC would consider our reporting of
the concern untimely."

9

10

11

At the time you wrote GPU Exhibit 114,
what was your understanding of when the NRC
expected you to report concerns such as that?

12

13

14

15

16

17

18

A I don't know that I have had at that time
a clear understanding of when the NRC would have
expected us to have reported this type of a
concern. The NRC would have expected prompt
reporting of the concern once it had been
validated or upgraded from its existence at this
time, if it remained a concern.

19

20

21

Q You wanted Duerson to consider three
concerns, four concerns, that you were raising,
right, A, B, C and D?

22

23

A Again, that would be a conclusion that
could be drawn from the memo.

24

25

Q Why did you want him to consider the
fact that B&W had been aware of the concern of

2 the pump discharge break for nearly a year in
3 making up his mind as to whether to ask
4 customers to pay for analysis of that break?

5 A I think I would have to speculate or
6 interpret to give you an answer.

7 Q Why don't you interpret?

8 MR. FISKE: No. This is a question
9 where either he remembers why or he doesn't.
10 If he doesn't, I don't think it is useful
11 to have him speculate at this point.

12 MR. SELTZER: I don't think it is
13 speculating. He said he could interpret it.
14 I think to get the author to interpret is
15 important.

16 I also think it is something bordering
17 on a cover-up for you to be putting wraps
18 on this witness at a time when I am trying
19 to explore why for a year B&W would not pay
20 for an analysis of an ECCS concern, and
21 after a year, when this man honestly thinks
22 it might be untimely to let the NRC know
23 about it, B&W saying, let's throw this one
24 onto the customer to let them pay to bring
25 this plant in conformance.

2

3

4

5

6

7

8

9

10

11

12

13

14

15

16

17

18

19

20

21

22

23

24

25

MR. FISKE: You are totally misstating the record. I am compelled to respond to your statement.

MR. SELTZER: Why not let the witness respond to it?

MR. FISKE: I am responding to your comment which is totally inconsistent with the facts. The facts are that this was reported to the NRC. This has nothing to do with the Three Mile Island accident. This is another one of a number of totally extraneous matters that have prolonged this deposition far beyond any reasonable termination point, and one of the reasons we go on day after day is you persist in pursuing these irrelevant areas.

Now we have a situation where you have an irrelevant memorandum that the witness said he can't recall what was in his mind at the time he wrote it, and now you are asking him to speculate why he would have said something in this memorandum when he can't remember today the reason.

It is clear he is not required to

2

answer that question. A speech in which you mischaracterize the facts is not going to help you get an answer.

4

5

6

7

8

MR. SELTZER: I would like to mark for identification as GPU Exhibit 115 an April Activities Report from Mr. Dunn to Mr. Roy dated May 2, 1978.

9

10

11

(April Activities Report dated May 2, 1978 was marked GPU Exhibit 115 for identification, as of this date.)

12

BY MR. SELTZER:

13

14

Q Is GPU Exhibit 115 a copy of your April Activities Report for 1978?

15

A Yes.

16

17

18

Q By April 1978 your unit had begun to analyze the pump discharge break referred to in GPU Exhibit 114, right?

19

20

A Yes, that is indicated by the progress report.

21

22

23

Q Is April 1978 the first time that any extensive examination had been performed by your unit on the pump discharge line break?

24

25

MR. FISKE: I think you ought to clarify what you mean by "extensive."

1
2 Q The first time there had been a
3 serious investigation of the concern that you
4 had been voicing for over a year?

5 MR. FISKE: You can answer that.

6 A Sometime before April 10. April 10 is
7 given as the date we filed the PSC, although it
8 appears at that time it may have been referred
9 to as a PSDR, so we would have performed an
10 evaluation sometime before that.

11 Q Is the evaluation you commenced
12 sometime shortly before April 10 the first time
13 you had done a serious investigation of the
14 concern over pump discharge line break?

15 MR. FISKE: He didn't say that it
16 started shortly before April 10.

17 Q How long before April 10 do you
18 believe you began work on the pump discharge line
19 break?

20 A I am not absolutely sure. I do recall it
21 proceeded reasonably rapidly once funds were
22 identified for the project.

23 Q You worked two shifts a day, right,
24 ten to 12 hours a day, for nearly two and a half
25 weeks, isn't that right?

1
2 A It seems like you are reading that.

3 Q Yes, page 3 from your writing, GPU
4 Exhibit 115.

5 MR. FISKE: I don't know what time
6 period you are referring to in your
7 question.

8 Q Do you see the last paragraph on
9 page 3?

10 A Yes.

11 Q Did you write there that "In
12 obtaining our present status ECCS personnel
13 worked in two shifts, averaging 10 to 12 hours
14 per day, for nearly two and a half weeks"?

15 A Yes.

16 Q You were referring to the analysis
17 that had been done by your staff on the pump
18 discharge line break, right?

19 A Yes, and the analysis after April 10.

20 Q How much if any analysis had been
21 done before April 10?

22 A Again I am not absolutely sure, but it was
23 I believe a single case which upgraded the concern
24 in terms of its validity and led to the filing of
25 the PSDR.

2 Q Did that analysis verify the concern?

3 A I think at the time we proceeded into that
4 analysis we did not believe that the
5 consequences would be as severe as the analysis
6 showed us, so it did not really verify it. It
7 actually made it something that was in a fashion
8 new.

9 Q Who performed that analysis for one
10 case?

11 A I don't recall.

12 Q Was it a computer-assisted analysis?

13 A Yes.

14 Q About how long did it take to run?

15 A As I mentioned before, I believe that once
16 we obtained funds, we proceeded reasonably
17 rapidly. I think it was on the order of a month
18 to get through it.

19 Q A month to do the one case?

20 A Yes, from the time that it was funded to
21 the time when all the boundary conditions were
22 determined and the computer actually ran and the
23 results reduced and examined from the standpoint
24 of their validity. You can't just accept the
25 output of a computer. You have to determine that

2 it has done its job right.

3 Q As soon as you finished that month
4 of analysis, did you and Jones proceed to
5 prepare the PSC?

6 A Yes. That is my recollection.

7 Q So if the PSC is dated April 12,
8 1978, and you proceeded to write the PSC
9 immediately after the one month's work, is it
10 correct to conclude that the one month's work was
11 done in or about March 1978?

12 A Yes.

13 Q And the work done in March was the
14 first time you had proceeded to do serious,
15 detailed analysis of the concern that you had
16 had over the pump discharge line break, is that
17 right?

18 A For the 177 plant, yes.

19 Q That was the first time you had done
20 serious, detailed work, even though you had
21 articulated that concern at least as early as
22 April 1977, is that right?

23 MR. FISKE: I think maybe the problem
24 in your question is, you keep using these
25 adjectives like "serious" and "detailed"

2 and "extensive."

3 The document that you referred to,
4 which has been previously marked as an
5 exhibit, itself reflects that work was
6 initiated in performing this analysis back
7 at the time in April 1977. So the document
8 itself shows that work was done back in
9 1977.

10 MR. SELTZER: But apparently not any
11 serious, detailed work, because this
12 witness has just sworn that the first time
13 they did serious, detailed work was March
14 1978.

15 MR. FISKE: I don't know whether he
16 said that was when they first did serious,
17 detailed work or not, but I think the
18 problem --

19 MR. SELTZER: I think you are also
20 mischaracterizing the document. It says
21 work was initiated on performing small
22 break analysis, and now he is seeking funds
23 to perform the analysis. When they
24 couldn't get the funds, apparently the
25 plant dried up and died and they were never

2

able to do the serious, detailed work that
was necessary.

3

4

5

6

7

8

9

10

11

12

MR. FISKE: I think maybe it would
be useful, instead of trying to deal with
these adjectives which one person can
construe one way and someone else would
construe another way, just ask him the
progress that was done on this matter. I
am sure he will tell you. Then we can all
decide afterwards whether that is serious
or detailed or whatever.

13

BY MR. SELTZER:

14

Q Would you look at page 3 of GPU

15

Exhibit 115.

16

17

18

In the paragraph just below the chart,
the third sentence, that begins with the words
"To be blunt."

19

A Yes.

20

21

22

23

Q Correcting the typographical error,
I think you stated there, "To be blunt, the
high pressure injection system on 177 or lowered
loop plants is undersized."

24

25

Is that a correct reading of what you
were saying?

2 A No, I think I said "underdesigned."

3 Q I am sorry.

4 What did you mean by "underdesigned"?

5 A Did not provide sufficient flow to
6 mitigate the consequences of licensing accidents.

7 Q Did you ever tell the NRC that?

8 A I don't think I ever used the phrase "to
9 be blunt" with the NRC.

10 Q Did you ever tell them the high-
11 pressure injection system was underdesigned?

12 A I would say that was the essence of what
13 we were communicating at that time. That there
14 was insufficient flow provided by the high-
15 pressure injection system for these accidents.
16 I don't know that the word "underdesigned" was
17 used.

18 MR. SELTZER: I would like to mark as
19 GPU Exhibit 116 a memo from Mr. Dunn to
20 Ed Kane in Licensing, subject: Telephone
21 Conversation with Zoltan Rosztoczy on May
22 15, 1979 on Stuck Open PORV With Pumps
23 Running and No Auxiliary Feedwater,
24 May 29, 1979.

25 (Memo dated May 29, 1979 from Mr.

2 Dunn to Ed Kane in Licensing, subject:
3 Telephone Conversation with Zoltan
4 Rosztoczy on May 15, 1979 on Stuck Open
5 PORV With Pumps Running and No Auxiliary
6 Feedwater, was marked GPU Exhibit 116 for
7 identification, as of this date.)

8 Q Is GPU 116 a copy of a memo you sent
9 to Kane on or about May 29, 1979?

10 A Yes.

11 Q Turning to page 2, the first full
12 sentence, you stated, "As an over-riding concern,
13 I pointed out that there is no intention within
14 the operating guidelines to cause an RC pump trip
15 during the transient and that this is true
16 regardless of pump performance variables. In
17 other words, I restated our position that at
18 least one pump per loop will run until it dies.
19 I confirmed that my experience with RC pumps
20 running in high void systems has shown no
21 problems with their performance and that our
22 pump experts indicate no concern in pumping a
23 two-phase fluid."

24 You previously testified the reactor
25 coolant pumps could continue pumping with up to

2 and including a 100 percent void fraction, right?

3 A Yes.

4 Q You also said you understood that the
5 pumps could continue running with a 100 percent
6 void fraction for a matter of days, at least, is
7 that right?

8 A Yes, I expressed my expectation of the time
9 frame in the day frame.

10 Q In the days frame, is that what you
11 are saying?

12 A Days.

13 Q You weren't sure how many days, but
14 it was several days, right?

15 A Yes.

16 Q Have you seen any reports at B&W that
17 enunciate that finding or conclusion?

18 MR. FISKE: You mean on how long they
19 could continue running?

20 MR. SELTZER: Yes, namely, that the
21 reactor coolant pumps can continue to run
22 for a matter of days at a 100 percent void
23 fraction.

24 A I am not sure whether the Cudlin memorandum
25 addresses that time period or not. Other than

2 that, I don't believe I have seen any reports.

3 Q How do you spell "Cudlin"?

4 A C-u-d-l-i-n.

5 Q Who is Cudlin?

6 A Joe Cudlin.

7 Q Is he a B&W employee?

8 A Yes, he is a Manager of System Analysis
9 Technology.

10 Q What is the Cudlin report?

11 A It is a memo that indicates the
12 capability of the pumps to pump two-phase fluids.

13 Q When did Joe Cudlin write that?

14 A I believe it was sometime after Three Mile
15 Island.

16 Q You testified that you knew before
17 the Three Mile Island accident that the reactor
18 coolant pumps were capable of continuing to pump
19 with up to 100 percent void fraction. What was
20 the source of your knowledge before the Three
21 Mile Island accident?

22 A There had been experiments in which pumps
23 had been involved in a two-phase testing in which
24 they had run for considerable lengths of time
25 during the testing procedure.

2

Q Had the pumps been tested up to 100

3

percent void fraction?

4

A At least in one set of experiments.

5

Q Are these experiments that had been

6

done at B&W?

7

A No.

8

Q Were they experiments that were done

9

for B&W?

10

A One of them.

11

Q Did the experiment that went up to

12

100 percent void fraction get performed for B&W?

13

A No.

14

Q Who performed the experiment running

15

the pump up to and including 100 percent void

16

fraction?

17

A The NRC.

18

Q When was that done?

19

A I am not sure. I put it in the '74 time

20

frame.

21

(Continued on next page.)

22

23

24

25

1
2 Q Are you aware that at the time of the
3 Three Mile Island accident, B&W had issued limits
4 and precautions that were instructions on the
5 operation of B&W supplied equipment?

6 MR. FISKE: I object to the form of
7 the question.

8 Q Have you heard the phrase "limits
9 and precautions"?

10 A Yes.

11 Q Are you aware B&W had issued limits
12 and precautions before the Three Mile Island
13 accident?

14 Let me make it a simpler question.
15 Have you become aware at any time that B&W had
16 been issuing limits and precautions for its
17 nuclear plants prior to the Three Mile Island
18 accident?

19 A No, I think you are going to have to get
20 somebody more intimately involved with that
21 process to answer the question. I don't know.
22 I know that on certain pieces of equipment I
23 have become aware that we issued some types of
24 instructions.

25 Q Did you know that B&W has issued

1
2 some types of instructions for the operation of
3 reactor coolant pumps?

4 MR. FISKE: You are asking him before
5 the accident?

6 MR. SELTZER: He can have the
7 awareness at any time.

8 Q But are you aware, including up to
9 today, that B&W had issued instructions for the
10 operation of reactor coolant pumps to its operators
11 prior to the Three Mile Island accident?

12 A No.

13 Q Do you know that as the void fraction
14 increases, the vibration on the reactor coolant
15 pump shaft increases?

16 A No.

17 Q Have you ever known that as void
18 fractions in the reactor coolant system increase,
19 vibration on the frame of the reactor coolant
20 pump increases?

21 A No.

22 Q Have you ever come to know that during
23 the Three Mile Island accident, shaft and frame
24 vibration on the reactor coolant pumps were
25 increasing as the void fraction was increasing?

1

2

A Yes.

3

4

5

6

Q Had you forgotten about that when I asked you the previous questions about knowing that shaft and frame vibration increase as void fraction increase?

7

A No, I had not forgotten that.

8

9

10

Q Do you have any knowledge to the contrary that negates your experience from Three Mile Island?

11

12

13

14

15

16

MR. FISKE: I object to this. You are asking him now a question which is asking for his present knowledge, and that is objectionable in and of itself, but beyond that, this is clearly an area in which Mr. Dunn has no expertise.

17

18

MR. SELTZER: That is quite an admission. The head of ECCS Analysis?

19

20

MR. FISKE: On the vibration of the pumps.

21

22

23

MR. SELTZER: If the operation of the pump is important to continue the emergency core cooling.

24

25

MR. FISKE: There is no point in debating whether the core could be

1
2 cooled by the pumps or HPI or whatever.

3 BY MR. SELTZER:

4 Q I think you are a very good expert.

5 MR. FISKE: The question is not
6 whether he is a good one or bad one. The
7 question is whether he is one.

8 Q Other than the Three Mile Island
9 accident, do you have any experience with
10 other situations in which you have heard reports
11 or seen reports of pump vibration as void
12 fraction increased?

13 A Yes.

14 Q What other reports have you
15 received?

16 A Pump vibration occurred in the Bingham
17 pump tests.

18 Q Were those tests that were being run
19 at various void fractions?

20 A Yes:

21 Q Was there more vibration on the pump
22 when it was pumping two phase fluids as
23 contrasted with solid water?

24 A That is my opinion generated from the
25 communication I have gotten on that testing.

1

2

3

4

5

6

7

8

9

10

11

12

13

14

15

16

17

18

19

20

21

22

23

24

25

Q Have you received any reports which showed no increase in pump vibration as the pumps began handling increasing void fraction as contrasted with operating with solid water?

A No.

Q So all of your experience is consistent with a conclusion that pump vibration increases as the pumps are handling increasing void fractions as contrasted with pumping solid water, is that right?

A No.

Q Do you have any experience to the contrary?

A Yes.

Q What experience is that?

A Outboard motors.

Q What brand of outboard motor are you talking about?

A I think I would say generally.

Q Have you run experiments on that?

A No.

Q How have you determined whether the vibrations are increasing on outboard motors as the void fraction increases?

1
2 MR. FISKE: Are you suggesting that
3 Mr. Dunn's experience with outboard motors
4 has something to do with the Three Mile
5 Island accident?

6 Q Do you think your experience with
7 outboard motors has anything to do with the
8 Three Mile Island accident?

9 MR. FISKE: I don't think Mr. Dunn
10 is required to draw that conclusion.

11 MR. SELTZER: Then I will proceed
12 since he has injected his experience with
13 outboard motors as being relevant.

14 MR. FISKE: He answered a question
15 that you asked him which may or may not
16 be a relevant question. Go ahead. Answer
17 this. It is probably easier to let you
18 answer it than debate it for five minutes.
19 It is no further removed than any of
20 the other issues.

21 A No.

22 Q What was the question?

23 A Whether or not my experience with outboard
24 motors had anything to do with the Three Mile
25 Island accident.

2 Q When did you get the Bingham results
3 that showed increasing vibration as void fraction
4 increased?

5 A I would have to go back and look. I
6 believe it was before Three Mile Island.

7 Q Are you aware that B&W instructions
8 to Met Ed set an upper limit on the permissible
9 mils of vibration that could be experienced on
10 a reactor coolant pump?

11 MR. FISKE: I object to the form of
12 the question and also Mr. Dunn said a
13 minute ago that he wasn't aware any instruc-
14 tions had been issued. I think he answered
15 it.

16 MR. SELTZER: This may be a subset
17 of the previous answer.

18 A No.

19 Q In saying that your position was that
20 at least one pump per loop will run until it
21 dies, did you mean that the reactor coolant pump
22 should be left running regardless of the level of
23 vibration observed on it?

24 MR. FISKE: I object to that. I think
25 what he said is perfectly clear.

1
2 Q You may answer.

3 MR. FISKE: Let me read this
4 paragraph before you answer.

5 (Record read.)

6 MR. FISKE: I object to that question
7 unless you make clear what set of
8 circumstances you are contemplating in
9 putting that question to Mr. Dunn.

10 MR. SELTZER: During a transient.

11 MR. FISKE: Any transient?

12 MR. SELTZER: During a transient as
13 he has used that word on page 2 of GPU
14 Exhibit 116. In the same sentence that
15 I have been reading from, "As an overriding
16 concern, I pointed out there is no intention
17 within the operating guidelines to cause a
18 reactor coolant pump trip during that
19 transient."

20 MR. FISKE: Now the question is?

21 (Whereupon, the record was read by
22 the reporter as follows:

23 "Q In saying that your position
24 was that at least one pump per loop will
25 run until it dies, did you mean that the

1
2 reactor coolant pump should be left running
3 regardless of the level of vibration
4 observed on it?")

5 A Yes.

6 Q Did you also mean that it should be
7 left running regardless of the void fraction
8 in the reactor coolant system?

9 A No, I would have meant in voided circum-
10 stances, where there was reason to question
11 their results after termination of reactor coolant
12 pump, and the system had returned to a subcooled
13 status and there was a reason to take the reactor
14 coolant pumps out of service, I would have allowed
15 that.

16 Q You previously testified that effective
17 core cooling would continue so long as reactor
18 coolant pumps remained on with void fractions
19 up to and including 100 percent, right?

20 A Provided that there is some heat sink
21 available to keep the superheat content of the
22 steam from becoming significant.

23 Q Have you ever run an analysis or
24 case in the following situation: A pilot
25 operated relief valve stuck open, little or no

1
2 high pressure injection flow, reactor coolant
3 pumps on at least one pump per loop.

4 Let me add as a condition. AFW
5 being supplied to the steam generator.

6 A No.

7 Q Has your ECCS unit ever studied such
8 a situation? Have you or your ECCS unit ever
9 studied such a situation?

10 A Yes.

11 Q When?

12 A At the time that we performed the pumps
13 running small break evaluation, the 205 plants,
14 I think it was in the early spring of 1979 or
15 the winter of 1978. It could be timed earlier
16 in the deposition in relationship to some Toledo
17 issues that came down and focused on whether or
18 not we had considered the pumps running case as
19 the worst case. We checked it, and post-Three
20 Mile Island, we also considered it.

21 Q I thought Toledo has a 177 plant
22 and not a 205?

23 A It does.

24 Q Did you study it for the 177 plant
25 also?

1
2 A No, we considered the evaluation performed
3 to be generic.

4 Q How long could the core remain or
5 be maintained effectively cooled with those
6 criteria prevailing?

7 MR. FISKE: Let's state the criteria
8 again. You are asking him what was shown
9 by this analysis that he testified was done?

10 MR. SELTZER: Yes.

11 A What the analysis showed was that for pump
12 steam flow, clad saturation, temperatures, and at
13 a pressure of approximately a thousand pounds,
14 the rise in temperature across the core --
15 excuse me. The rise in the temperature cladding
16 was less than 100 degrees Fahrenheit. We had
17 concluded that almost any pumped steam media, if
18 the superheat did not get out of control, would be
19 able to provide effective core cooling. We have
20 not done the work to tell exactly how long that
21 situation could be maintained.

22 Q From the analysis that you have done,
23 what is the order of magnitude that the analysis
24 shows effective cooling could be maintained?

25 A I don't think the analysis can give you

1
2 that.

3 Q From the analysis, what is a minimum
4 time that the analysis would show you would still
5 have effective core cooling?

6 MR. FISKE: Can you answer that?

7 THE WITNESS: No, not for this
8 parciular case.

9 Q For what case would you be able to
10 make such a statement?

11 A The actual case that was evaluated which was
12 a different break size in the PORV.

13 Q Was it larger or smaller?

14 A I believe it was somewhat larger.

15 Q So you would have less mass loss
16 through a PORV break than you would through the
17 break that you studied, right?

18 A Yes.

19 (Continued on following page.)
20
21
22
23
24
25

2 Q So that if in the case that you studied,
3 the plant could have effective cooling for seven
4 hours, the PORV break would have effective cooling
5 for a longer period, is that right?

6 A Yes.

7 Q What is a conservative figure which
8 the analysis shows you would maintain effective
9 cooling for the case you studied?

10 A I believe that analysis progressed no
11 further than approximately one-half hour. It had
12 also not arrived at 100 percent void fraction.
13 The work on the 100 percent void fraction was a
14 hand calculation.

15 MR. FISKE: I think I should note here
16 that I have no objection to these questions
17 in terms of general discovery. Obviously,
18 in terms of anything probative, the report
19 itself or the analysis itself is going to
20 have to be relied upon.

21 Q Who did the analysis that you have
22 been describing?

23 A Which one? We have two on the board now.

24 Q What are the two?

25 A The hand calculation which showed that the core

2 could stay effectively cooled with poor steam
3 flow, and the computer evaluation which indicated
4 the nature of the transient with the pumps running.

5 Q Who did the hand job?

6 A I am not sure.

7 Q Was it someone in your unit?

8 A Yes.

9 Q Who was responsible for the computer
10 calculation?

11 A Nehru Shah.

12 Q For what purpose was the computer work
13 done?

14 A Internal questions had been raised about our
15 assumption that pumps running was a better case
16 than pumps off or that the significant challenges
17 to the high pressure injection system and other
18 parts of the ECCS system would occur for the
19 pumps-off case as opposed to the pumps-on case.

20 Q Have you ever discussed with anyone
21 what the results at Three Mile Island would have
22 been if the reactor coolant pumps had been left
23 on so there was at least one pump per loop in
24 continuous operation?

25 A I think so.

2

Q I think the records show that the

3

blocked valve was closed two hours and 20 minutes

4

into the transient.

5

From your discussions and the reports

6

that you have read on the subject of pumps running,

7

would the core have remained effectively cooled if

8

the reactor coolant pumps had been kept on through

9

the time that the blocked valve was closed?

10

MR. FISKE: I object to that

11

question, because you are asking Mr. Dunn for

12

his present opinion.

13

MR. SELTZER: No, I am asking whether

14

he has discussed that or whether any of the

15

analyses that he has done have --

16

MR. FISKE: You are asking him from the

17

question to put together several analyses

18

that he has done.

19

MR. SELTZER: Let me take it in smaller

20

steps.

21

BY MR. SELTZER:

22

Q You said you have discussed with others

23

what would have happened if the reactor coolant

24

pumps, at least one pump per loop, had remained on

25

the day of the Three Mile Island accident?

2

MR. FISKE: He said he thinks he did.

3

MR. SELTZER: Yes. That is what I want,

4

what he thinks.

5

BY MR. SELTZER:

6

Q With whom do you think you have had

7

such conversations?

8

MR. FISKE: I object to that unless it

9

is based on a recollection.

10

MR. SELTZER: Why don't you horsewhip

11

him outside of the room. I find it

12

embarrassing to see it happen right in front

13

of me.

14

He testified he thinks he had a

15

conversation. I think you are trying to

16

scare the pants off him, make him think

17

"Oh, God, now we are getting into something

18

serious, don't testify to it."

19

MR. FISKE: Maybe a bell goes off every

20

hour where you feel compelled to make some

21

saber rattling speech. It doesn't help very

22

much.

23

You know the rules by which depositions

24

are conducted. Just because you shout and

25

scream periodically doesn't change the rules.

2

I have no objection to Mr. Dunn, as I have said, testifying about his recollection about conversations. I say that again.

3

4

5

6

7

8

9

10

11

12

13

14

15

16

17

18

19

20

21

22

23

24

25

MR. SELTZER: He is a grown man, responsible manager at B&W. I am sure he understands that he is sworn to tell the truth, and he is going to testify to things that he only recalls and he is not going to tell me about his dreams or fantasies.

When I ask him who he met with, I assume he is going to tell me who he met with.

MR. FISKE: That is precisely what I suggested he do.

BY MR. SELTZER:

Q Could you answer the question.

A We are talking about seeing?

MR. FISKE: You are talking about recall.

A I recall where I think I discussed it.

Q Why don't you testify to that?

A In the Kemeny Commission depositions and as a preventive measure when we formulated the

2 instructions to keep the reactor coolant pumps
3 operating.

4 Q What is your best recollection as to
5 what you said would have been the effect on the
6 Three Mile Island accident if at least one reactor
7 coolant pump had been kept running per loop?

8 MR. FISKE: I think he said he
9 testified in the Kemeny Commission. Why
10 don't we get out the testimony and see what
11 he said. Certainly, you wouldn't quarrel
12 with that, I assume.

13 Q Is that the only time you think you
14 said anything to anybody about what would happen
15 at Three Mile Island if the reactor coolant pumps
16 had been left on?

17 A I allowed the other circumstances, too. Yes,
18 when we determine, it is based on a recollection.

19 Q With whom else do you have a
20 recollection of discussing it?

21 A The question is have I had discussions about
22 what would have happened at Three Mile Island if
23 the reactor coolant pumps had kept running.

24 I said -- how did I say it?

25 MR. FISKE: I believe you said you

1
2 thought you testified about that before the
3 Kemeny Commission.

4 A I thought I testified about that before the
5 Kemeny Commission, and in the form of the
6 preventive measure. I recall I think I talked
7 about it during the meeting with Taylor and Norm
8 Elliott when we decided to write the instruction
9 to keep one pump operating, but that was in a
10 short time frame, not necessarily all that
11 happened at Three Mile Island.

12 Q The instruction to keep the pump
13 running was an instruction that was sent out just
14 after the Three Mile Island accident, right?

15 A Yes.

16 Q In the context of discussing the
17 advisability of sending out a pumps-running
18 instruction, you and Elliott and Taylor discussed
19 what would have happened at Three Mile Island if
20 they had left the reactor coolant pumps running?

21 MR. FISKE: With the HPI off?

22 MR. SELTZER: With the HPI doing
23 whatever it was doing. Ceterus parabus.

24 A I said I think we discussed it in the short
25 time frame.

2 Q What is the short time frame?

3 A Not an hour afterwards. Not from the
4 standpoint of considering all the other things
5 that happened at Three Mile Island following that,
6 but that the pumps were tripped in the condition
7 where we still had two-phase fluid in the plant,
8 and that is the time in which we expected things
9 started to really go favorably, and keeping the
10 pumps running could have extended that time.
11 That is why the instructions --

12 Q Let me try this, and then we will
13 adjourn for lunch. The blocked valve was closed
14 at two hours and 20 minutes into the Three Mile
15 Island accident.

16 Have you ever discussed with anybody
17 whether there would have remained enough liquid
18 or steam inventory in the reactor coolant system
19 up to the point of two hours and 20 minutes to
20 keep the core effectively cooled, if the reactor
21 coolant pumps had remained on at Three Mile
22 Island?

23 Have you ever discussed that with
24 anyone before today?

25 MR. FISKE: The question whether the

2

core would have continued to be cooled up
to that point in time you referred to?

3

4

MR. SELTZER: Yes. Cooled within the
criteria that you and Taylor and others talk
about effective core cooling.

5

6

7

A I indicated, I think, -- O.K. I see the
difference.

8

9

What I believe occurred in the Kemeny
Commission --

10

11

MR. SELTZER: That is relevant.

12

13

MR. FISKE: I object to Mr. Dunn trying
to paraphrase what he said in the Kemeny
Commission. Whatever he said there, he
said there.

14

15

16

MR. SELTZER: Fine. Now we want to
find out any other.

17

18

MR. FISKE: Other than that in
reference to the closing of the blocked
valve.

19

20

21

A Let me try it another way.

22

MR. FISKE: Just answer the question.

23

24

MR. SELTZER: I am sure he is trying
to.

25

THE WITNESS: Repeat the question.

2

(Record read)

3

A Based on my recollection, if I did, it was in the Kemeny Commission.

4

5

Q Did you keep a copy of the hand

6

calculation that you were referring to earlier?

7

A No.

8

Q When is the last time you saw the hand

9

calculation?

10

A I don't remember.

11

Q Does your analysis of pumps running

12

with high void fractions confirm that if there

13

were any void fraction up to but less than 100

14

percent in the reactor coolant system at the time

15

the blocked valve was closed that the core would

16

remain effectively cooled thereafter if the

17

reactor coolant pumps stayed on?

18

MR. FISKE: I object to that question

19

because that is asking him for a present

20

opinion.

21

MR. SELTZER: I am asking whether the

22

analysis shows that.

23

MR. FISKE: No, you are asking him

24

whether to apply the analysis to that situation

25

which, I think, is asking him for his present

opinion.

I object.

(Luncheon recess: 12:30 p.m.)

(AFTERNOON SESSION)

(Date: April 7, 1981)

(Time noted: 1:40 p.m.)

B E R T M. D U N N, resumed, having
been previously duly sworn, was examined
and testified further as follows:

EXAMINATION (Cont'd.)

BY MR. SELTZER:

Q Where would you look at B&W today
if you wanted to find any reports or data on
the Bingham pump tests?

A I would talk to two individuals first,
Dr. Joe Cudlin and Mr. Bob Winks.

Q Winks?

A Yes.

Q How do you spell Winks?

A W-i-n-k-s.

Q Anybody else that you would speak
to to locate the Bingham test results?

A No. I am pretty sure that would be
adequate.

Q Who at B&W, to your knowledge, is
most knowledgeable about the ability of reactor
coolant pumps to operate at high void fractions?

2 A I think you would have to define the word
3 "ability" to me.

4 Q Let's say the performance of pumps
5 at high void fractions. Who is most knowledgeable
6 at B&W about the performance of pumps operating
7 against high void fractions?

8 A Dr. Cudlin. I think Dr. Cudlin would be
9 the most knowledgeable person.

10 Q Where would you look if you wanted
11 to get a copy of the documents that relate to
12 Nehru Shah's analysis of core cooling with high
13 void fraction?

14 A I would ask Nehru for a reference number.
15 If that wasn't available, I would look in my own
16 unit files.

17 Q What do you mean by reference number?

18 A The calculation was documented in what we
19 term a calculation file and it has a unique number
20 assigned to it that would make it easier to find
21 it if I could determine in advance the number.
22 If not, we can find it in the files.

23 Q Would the same file or similar file
24 include the hand calculations that you referred to?

25 A I don't know.

2

Q Where would you go if you wanted to

3

find the hand calculations?

4

A I'm not sure.

5

Q Whom did you say you thought did

6

the hand calculations?

7

A I didn't recall who did the hand

8

calculations.

9

Q You have no idea how you would go

10

about trying to find them?

11

A I would probably ask some people.

12

Q Who?

13

A Bob Jones, Nehru Shah, Bill Bloomfield.

14

Q How would you refer to the

15

calculations that you were looking for?

16

A As back-of-the-envelope estimations on

17

the cooling possible with steam-only flow at pump

18

flow rates.

19

MR. SELTZER: I would like to mark

20

for identification as GPU Exhibit 117,

21

Mr. Dunn's January 1979 activities report.

22

(Covering memorandum dated

23

January 31, 1979 from B. M. Dunn to E. A.

24

Womack enclosing January Activities Report

25

marked GPU Exhibit No. 117 for

identification, as of this date.)

Q Is this a copy of a monthly activities report which you sent to Al Womack on or about January 31, 1979?

A Yes.

Q On page 3, under the heading "Unscheduled Activities," does that refer to the hand calculations on pumps running that you were just describing?

A I'm not sure.

Q From reading your monthly report, does it appear to you that this could be another analysis that you did on pumps running with steam cooling?

A It appears that that is possible.

Q Do you know who did this hand calculation referred to in GPU Exhibit 117?

A No.

MR. SELTZER: I would like to mark as GPU Exhibit 118, a memorandum from Jones to Taylor with a copy to Mr. Dunn dated June 7, 1979, subject "Pumps Running Analyses - Record of Telecon."

(Memorandum dated June 7, 1979 from

2

R. C. Jones to J. H. Taylor, subject

3

"Pumps Running Analyses - Record of Telecon"

4

with a copy to Mr. Dunn, among others,

5

marked GPU Exhibit No. 118 for

6

identification, as of this date.)

7

Q Is GPU Exhibit 118 a copy of a

8

memorandum which you received in or about mid-June

9

1979?

10

A I recall the issue, not the memo.

11

MR. SELTZER: I would like to mark

12

as GPU Exhibit 119, a memorandum from

13

Taylor to Distribution, copy to Dunn,

14

subject "Longer Term Work Expected by

15

NRC," June 8, 1979.

16

(Memorandum dated June 8, 1979 from

17

J. H. Taylor to Distribution, subject

18

"Longer Term Work Expected by NRC," with

19

a copy to Mr. Dunn, among others, marked

20

GPU Exhibit No. 119 for identification,

21

as of this date.)

22

MR. SELTZER: I also would like to

23

mark a memorandum H. A. Bailey to

24

Distribution, in Mr. Dunn, subject

25

"Small Break LOCA with Reactor Coolant

Pumps - PSC," June 8, 1979.

(Memorandum dated June 8, 1979 from H. A. Bailey to Distribution, subject "Small Break LOCA with RCP's - PSC," with a copy to Mr. Dunn, among others, marked GPU Exhibit No. 120 for identification, as of this date.)

Q Is GPU 119 a copy of a memorandum which you received in or about mid-June 1979?

A I don't recall it.

Q You don't recall it?

A No.

Q Is GPU Exhibit 120 a copy of a memo which you received in or about early June 1979?

A I don't specifically recall this.

Q Prior to the analyses that were being done in 1979 on pumps running cases, what guidance had B&W given the operators on when to have reactor coolant pumps on and when not to have them on during the loss of coolant accident?

MR. FISKE: I object to that question.

MR. SELTZER: I will try to rephrase

2 it.

3 Q Are you aware of any instructions
4 that B&W was giving operators prior to June 1979
5 on the operation of reactor coolant pumps during
6 loss of coolant accidents?

7 A No, not one way or the other.

8 Q Have you ever learned what, if any,
9 instructions B&W was giving operators prior to
10 June 1979 on whether to leave reactor coolant
11 pumps on or not on during the loss of coolant
12 accident?

13 A No.

14 Q Would it be fair to say even though
15 you were the ECCS Unit Manager, you were not in
16 the general flow of information going from B&W
17 to operators on how to handle their equipment?

18 A Yes.

19 Q Was anybody in your unit, to your
20 knowledge --

21 MR. FISKE: I think he answered all
22 these questions once before but go ahead.

23 Q Was anybody else in your unit
24 reviewing instructions that B&W was giving
25 operators on how to run their equipment prior to

2 the Three Mile Island accident?

3 MR. FISKE: I object to the form of
4 the question. You can answer it.

5 A No.

6 MR. SELTZER: I would like to mark
7 as GPU Exhibit 121, a memorandum from
8 Cartin to Womack, copy to Dunn, subject
9 "Small Breaks Guidelines," June 22, 1979.

10 (Memorandum dated June 22, 1979
11 from L. R. Cartin to E. A. Womack, subject
12 "Small Breaks Guidelines;" with a copy to
13 Mr. Dunn, among others, marked GPU Exhibit
14 No. 121 for identification, as of this
15 date.)

16 Q Is GPU Exhibit 121 a copy of a
17 document which you received in or about late
18 June 1979?

19 A I don't recall the actual receiving.

20 Q Are you familiar with the document?

21 A Yes.

22 Q Would you turn to page 3. In the
23 first full paragraph, it begins with the statement,
24 "As indicated in Table 3, the assumptions regarding
25 equipment availability are different than those

2 in standard licensing submittals," et cetera.
3 Then it lists three assumptions.

4 Below that, it says, "The above
5 failure assumptions cannot be justified under
6 known regulatory rules for the operating plants
7 without design changes."

8 In what way did you understand when
9 you read this that these three failure assumptions
10 could not be justified under known regulatory
11 rules?

12 A I don't recall.

13 Q You said you were familiar with
14 GPU Exhibit 121. From what are you familiar with
15 it?

16 A A great deal of the work contained in the
17 exhibit was generated within ECCS Analysis. The
18 operating guidelines given at the end in
19 Attachment 4 were prepared in conjunction with
20 ECCS Analysis and the ECCS was participating in
21 the whole effort at the time that the memo was
22 generated.

23 Q Did you know that assumptions
24 regarding equipment availability were being made
25 in the small break analyses that were different

2 from those used in the standard licensing
3 submittals?

4 A In some of the analyses, yes.

5 Q Which assumptions were different
6 from those used in the standard licensing
7 submittals? Let me ask you -- I will withdraw
8 that.

9 Under the heading "Single Failure"
10 on page 3, the second item says, "If a failure
11 occurs which prevents an emergency steam
12 generator blowdown, 2 high pressure injection pumps
13 are assumed available."

14 Do you see that?

15 A Yes.

16 Q That assumption that two high pressure
17 injection pumps were available is different from
18 what is assumed in standard licensing submittals,
19 is that correct?

20 A That's correct.

21 Q What is assumed available in the
22 standard licensing submittals?

23 A One HPI is assumed available. One HPI
24 train. The subject of emergency steam generator
25 blowdown is not treated.

2

3

4

5

6

7

8

9

10

11

12

13

14

15

16

17

18

19

20

21

22

23

24

25

Q In order to demonstrate effective core cooling, was it necessary for your analysis to assume that both or two HPI trains were available?

MR. FISKE: Which analysis?

MR. SELTZER: The analyses that were done in support of GPU Exhibit 121.

A No.

Q Why, if you know, were two HPI pumps assumed available?

A To provide some chance that the analysis would produce the expectation of cladding temperatures within the five criteria of 10 CFR 50.46.

Q "To provide a chance," what does that mean?

A At the time this work was done, I don't believe that we were under the impression that even with two high pressure injection pumps operating, that we could assure that the peak cladding temperatures could be held below 2200 degrees Fahrenheit, and we had strong indications that they couldn't be held below those values for one HPI.

2

Q What did the analysis eventually

3

show?

4

MR. FISKE: You mean as reflected

5

in this exhibit?

6

A I would really prefer being able to check.

7

Q What would you like to have at your

8

disposal to check? Table 5?

9

A Yes, Table 5.

10

Q What is the answer?

11

MR. FISKE: What is the question?

12

(Record was read back.)

13

MR. FISKE: As to what?

14

MR. SELTZER: Whether even given

15

the chance the assumptions that were

16

less conservative than the licensing

17

standards, the plans could achieve

18

effective core cooling.

19

A The resultant temperatures are indicated

20

in Table 5 and they indicate for the .075 square

21

foot break, the case with no steam generator

22

blowdown, two HPI's operating, it is expected

23

to exceed 2200 degrees Fahrenheit. The steam

24

generator blowdown treatment with one HPI

25

available also expected to exceed 2200 degrees

2

Fahrenheit. A combination of steam generator

3

blowdown and two HPI pumps available is indicated

4

to exceed approximately 1600 degrees Fahrenheit

5

and was believed to be below 2200.

6

Q Subsequent analysis confirmed that

7

it is below 2200?

8

A The way the general evaluation proceeded

9

after this was to install a pump trip as opposed

10

to utilizing steam generator blowdown. I don't

11

believe any subsequent analysis on that particular

12

point has been made.

13

Q Install a pump trip to trip which

14

pumps?

15

A Reactor coolant pump trip.

16

Q Would you turn to page 6 of GPU

17

Exhibit 121. Do you see just above the middle

18

of the page where it says, "In summary, the results

19

from this preliminary analysis indicated the

20

following"?

21

A No. Yes.

22

Q Item 2 of the summary says, "If an

23

arbitrary reactor coolant pump trip at the worst

24

time must be assumed, compliance to 10 CFR 50.46

25

cannot be shown with present plant equipment,

2 realistic operator actions, and a single failure."

3 Is that conclusion a correct summary
4 of the analysis?

5 A I would not say so today.

6 Q Did you believe it was a correct
7 summary of the analysis at the time it was written
8 in June 1979?

9 A I don't know that I asked that question that
10 way.

11 Q If the peak clad temperature exceeds
12 2200 degrees, then it has exceeded the limits of
13 10 CFR 50.46, right?

14 A Yes.

15 Q Table 5 showed that for two of the
16 three cases, peak cladding temperature did exceed
17 2200 degrees, right?

18 A Yes.

19 Q Was this the first time that the ECCS
20 Analysis Unit had apprised itself of peak cladding
21 temperatures for termination of reactor coolant
22 pump in the middle of a transient?

23 A This is the first time we had performed
24 in-depth analysis on accidents which involved the
25 termination of the reactor coolant pumps during

1
2 the course of the accident and had reasonable
3 high pressure injection flow.

4 Q Before doing these analyses,
5 ECCS Analysis had assumed that no pumps running
6 was a worst case, isn't that right?

7 A We had assumed there were two conditions
8 which had to be included in the licensing base,
9 no pumps and continuous pumps.

10 Q Did you think that no pumps and
11 continuous pumps bounded the case of pumps
12 terminated in the middle of a transient?

13 A No.

14 Q Are you saying that before you did
15 the analysis that is reflected in GPU Exhibit
16 121, you did not consider that you had bounded
17 the case of pumps being terminated in the middle
18 of a transient?

19 A That's correct.

20 Q Had you ever discussed within
21 B&W why the pumps terminated in the middle of
22 a transient case had not been analyzed prior to
23 June 1979?

24 A Prior to approximately June 1979, it was
25 the established practice within the industry that

1
2 a loss of outside power would occur at the time
3 the plant was removed from the grid, and if the
4 loss of outside power did not occur at that time,
5 or reasonably quickly thereafter, power would be
6 available.

7 Q Was anything available to operators
8 that you know of prior to the Three Mile Island
9 accident that would alert them to the fact that
10 terminating pumps in the middle of a transient
11 might be a worst case than terminating pumps right
12 at the start of a transient or leaving pumps on
13 throughout a transient?

14 A Nothing was available that I know of.

15 Q On page 6, item 3 says, "If an early
16 pump trip is utilized, this action must be
17 completed quickly (1 to 2 minutes after ESFAS
18 actuation)."

19 Does that refresh your recollection
20 that one to two minutes after emergency safeguards
21 actuation was the time within which B&W concluded
22 the reactor coolant pump should be tripped?

23 I think you testified this morning
24 that you couldn't recall exactly how many minutes.

25 MR. FISKE: You mean concluded as a

2

result of this analysis? You are talking
of this time frame of June 1979, right?

3

4

MR. SELTZER: Yes, after the Three
Mile Island accident.

5

6

A This sentence indicates one to two minutes.
Our evaluations have consistently indicated that
trip action is needed early. As to whether our
past or present decisions on what the exact time
might be, this does not assist my recollection.

7

8

9

10

11

For the record, that sentence is
obliterated on the official copy or the first
line of it.

12

13

14

Q You said it was industry-established
practice that either you were disconnected from
the grid at the moment of the start of the
transient or you had off site power throughout
the transient.

15

16

17

18

19

Do you know what competing NSS
manufacturers were prescribing before June 1977
with respect to pumps running or pumps off?

20

21

22

MR. FISKE: You mean June 1979?

23

MR. SELTZER: Yes.

24

A No, I do not.

25

Q You don't know that Westinghouse

2 previously had been prescribing shutting off the
3 reactor coolant pumps at the onset of a transient?

4 A No, I do not.

5 Q Do you look at the topical reports
6 of your competitors?

7 A Not frequently.

8 Q Do you make it a practice to ask
9 people in your unit to review competitors' topical
10 reports?

11 A Not frequently.

12 Q Is there some reason why you do not
13 think those are a source of useful information?

14 A Yes.

15 Q Why?

16 A They are mostly blank.

17 Q Why, because data is proprietary?

18 A Yes.

19 MR. SELTZER: I would like to mark
20 as GPU Exhibit 122, a memorandum from
21 Cartin to Luken, subject "Toleco Edison
22 Company Status Report," December 19, 1978,
23 with a copy to Mr. Dunn.

24 (Memorandum dated December 19, 1978
25 from L. R. Cartin to R. C. Luken, subject

1
2 "TECO Status Report," with a copy to
3 Mr. Dunn, among others, marked GPU Exhibit
4 No. 122 for identification, as of this
5 date.)

6 Q Is GPU Exhibit 122 a copy of a
7 memorandum which you received?

8 A Again, I don't recall the receiving.

9 Q Are you familiar with it?

10 A I'm familiar with the subject matter
11 discussed. Certain parts of it.

12 Q Are you familiar with the subject
13 matter discussed in item 6?

14 A Yes.

15 Q What is the dual setpoint control
16 logic that is referred to here?

17 A The steam generator setpoint control for
18 the level of auxiliary feedwater was to have been
19 one level for non-LOCA events and an alternate
20 level for LOCA events.

21 Q What did that have to do with the
22 pumps running case?

23 A At one time, it was suggested that the
24 key for switching from one setpoint to another
25 value could be the status of the reactor coolant

1
2 pumps.

3 Q Is this what triggered your study
4 of pumps running case?

5 A Evaluation of the pumps running case on the
6 205 plant was performed because of concerns
7 generated by Integration, concerns which to some
8 extent center out of Toledo issues at that time
9 and the Integration personnel were Mr. Cartin,
10 on the one hand, and Mr. Swanson on the other.
11 I think that is about as much as I know.

12 Q Is the answer yes?

13 A No, the answer is what I said.

14 Q I thought you said Cartin and
15 Swanson and Integration pushing for this study was
16 an outgrowth of Toledo Edison's concerns?

17 A Yes, but as to whether they were the
18 particular ones mentioned in this section here --

19 Q Do you see the note that ends item 6?

20 A Yes.

21 Q There is something referred to
22 there as a "FOAK analysis." Do you see that?

23 A Yes.

24 Is FOAK B&W's secret code for "first of a
25 kind"?

2 A Yes.

3 Q The note writer says, "The customer
4 should not be informed of the ECCS Analysis
5 efforts to examine the pumps running case. It
6 is imperative that B&W be totally prepared to
7 defend an FOAK analysis of this type or to have
8 a planned course of action if results are
9 unacceptable."

10 Is it correct that as of December 19,
11 1978, ECCS Analysis had not studied the effects
12 of the pumps running case?

13 A No, I don't think that is fair.

14 Q What had you done as of this date on
15 the pumps running case?

16 A We had reached a judgment on the issue.
17 The judgment had been consistent since a time frame
18 on the order of 1973, that in the pumps running
19 case, a small break -- in a small break, the core
20 would be cooled by a flow process, and working
21 with the individuals involved in the Toledo effort,
22 there were questions in their mind about that
23 judgment.

24 Q There is a reference to B. M. Dunn
25 in the middle of item 6. Do you see that?

1
2 A Yes.

3 Q The sentence that surrounds the
4 use of your name says, "This course of action
5 will require identification of funding (B. M. Dunn
6 to secure) to resolve this unanalyzed small break."

7 What did you understand they were
8 referring to when they said "an unanalyzed small
9 break" for which you were going to obtain the
10 funding?

11 A The resolution, chosen resolution, for the
12 concerns raised by these individuals was to do a
13 computer evaluation of a small break and to
14 demonstrate that* the pumps running situation was
15 not more severe or did not pose as significant a
16 challenge to the core cooling system as the pumps
17 off case.

18 Q So that was an ECCS analysis of a
19 small break with pumps running that had not been
20 analyzed before?

21 A That was to computerize it.

22 Q It had not been computerized before?

23 A I'm not sure. At this time, we could not
24 recoup any computerization of such an accident.

25 Q After you got Cartin's note saying,

1
2 "The customer should not be informed of the
3 ECCS Analysis efforts to examine the pumps
4 running case," did you then keep your work quiet
5 from Toledo Edison?

6 MR. FISKE: You mean did Mr. Dunn
7 tell them?

8 MR. SELTZER: That's right.

9 Q Or did you keep it a secret?

10 A I don't recall whether Toledo was informed
11 of this or not. I don't believe I did any
12 informing.

13 Q You did not leak it to them?

14 MR. FISKE: I object to the form
15 of the question.

16 A I did not respond to this note, if that is
17 what you are talking about, or any implication that
18 anybody there can make me keep my mouth shut if I
19 don't want to.

20 (Continued on the following page.)
21
22
23
24
25

1

2

Q The blue book was issued when, May 7?

3

A Approximately.

4

Q 1979. Were any new analyses performed in order to generate what is the blue book?

7

MR. FISKE: What do you mean by

8

"new"? New after when?

9

MR. SELTZER: After the Three Mile Island accident.

10

11

Q Or was the blue book based on things that you already knew at least qualitatively?

12

13

MR. FISKE: You are sort of qualifying the question. I am not quite sure where it is now.

14

15

16

Are you asking him how much if any additional work was done after the Three Mile Island accident before the blue book was issued?

17

18

19

20

MR. SELTZER: No. That is a different question.

21

22

Q Does the blue book rest on any

23

knowledge that was generated after the Three Mile Island accident?

24

25

A In that the blue book contains specific

1
2 numbers created by computerizing simulations of
3 certain events, it in part rests on information
4 put together after Three Mile Island.

5 Q You have referred in your testimony
6 to conclusions which you knew qualitatively. As
7 you have used that phrase, did the blue book
8 contain anything which you had not known
9 qualitatively prior to the Three Mile Island
10 accident?

11 MR. FISKE: Number one, I don't
12 remember Mr. Dunn using the phrase
13 "qualitatively," but I might be wrong .
14 In any event, I think it requires some
15 definition before he answers this question.

16 Q In discussing ECCS, you have
17 referred from time to time to understanding
18 something qualitatively, haven't you?

19 A I don't know whether I have done that in the
20 deposition or not right now. I have done it
21 outside of the deposition.

22 Q What does that mean?

23 A I think it can have a great many meanings.

24 Q For example, as you use it, could it
25 mean knowing that the pumps ought to be turned

2

off promptly but not knowing whether "promptly"

3

means one minute, two minutes, or four minutes.

4

MR. FISKE: I object to the form of
that question.

5

6

If you are asking him if he reached
that conclusion before the Three Mile
Island accident, I will let him answer that.

7

8

9

MR. SELTZER: I am not using that as
a specific example of something he knew
qualitatively. I am just saying that
that is what I mean by "qualitatively."
You couldn't put a quantified judgment on
something, but you more generally
understood it.

10

11

12

13

14

15

16

Q Do you understand what I have just
said, or is that still confusing you?

17

18

MR. FISKE: It is still confusing me.

19

Q You said that the only new analysis
that was incorporated in the blue books was on
computer generated numbers. Were all of the
concepts that were in the blue book concepts
that you had developed before the Three Mile
Island accident?

20

21

22

23

24

25

A The entire blue book is not mine. Nor is

2 it ECCS Analysis'.

3 Restricting my comments to Chapter 6,
4 which contains the analytical contributions by
5 ECCS Analysis, the basic model utilized for
6 those evaluations was model developed prior to
7 Three Mile Island. Certain alterations were made
8 in the model to demonstrate, or rather to
9 quantitatively evaluate specific transients.

10 The term "quantitative" is used
11 because it was desired to compute numbers, and
12 the conclusions of those evaluations were
13 consistent with the assumptions and beliefs of
14 ECCS analysis prior to Three Mile Island.

15 Q What is the B&W Comprehensive
16 Business Plan?

17 A It is a high-level report generated by
18 the top officials of the company and meant to
19 communicate the general direction of the company
20 over the period indicated in the report.

21 Q How frequently is a comprehensive
22 business plan generated, to the best of your
23 knowledge?

24 A To the best of my knowledge, which is based
25 only on the periods of time in which I have been

2 involved in it or come in contact with it is
3 once a year.

4 Q Do you receive a copy of the
5 comprehensive business plan?

6 A I would say not normally.

7 Q Have you been asked for your comments
8 on any B&W comprehensive business plan?

9 A I don't recall being asked for any comments
10 on the comprehensive business plan.

11 Q Why did G. E. Anderson give you his
12 comments on the B&W comprehensive business plan
13 in November 1979?

14 MR. FISKE: Which document is that?

15 MR. SELTZER: Anderson to Dunn,
16 November 21, 1979, subject: Comments on
17 B&W Comprehensive Business Plan. It is
18 going to be GPU Exhibit 123.

19 Q Do you know why he gave you his
20 comments?

21 MR. FISKE: I object to the question
22 unless it is limited to something Mr.
23 Anderson said to him.

24 Q Do you know why Anderson was sending
25 you his comments on the B&W comprehensive

1
2 business plan?

3 A I believe I do.

4 Q Good. Tell us.

5 MR. FISKE: I don't object as long
6 as it is not speculation.

7 A At one time, Dr. Don Roy sent a document
8 around which was like a comprehensive business
9 plan. It was, however, no more than Don Roy's
10 support work for a B&W comprehensive business
11 plan. Employees in the company were asked to
12 comment on Dr. Roy's paper and provide feedback.
13 I believe this is feedback on that and
14 mislabeled as the B&W comprehensive business
15 plan.

16 I have not asked for feedback on a
17 B&W comprehensive business plan.

18 (Continued on next page.)
19
20
21
22
23
24
25

2 Q On page 2, Anderson tells you that --
3 MR. SELTZER: Let's mark that.

4 (Two-page memo dated November 21,
5 1979 from G. E. Anderson to B. M. Dunn, re
6 "Comments on B&W Comprehensive Business
7 Plan" was marked GPU Exhibit No. 123 for
8 identification as of this date.)

9 BY MR. SELTZER:

10 Q You see opposite page 13, Anderson
11 comments that "The details of 10 CFR 21 have not
12 been passed down to everyone in B&W Engineering."

13 10 CFR Part 21 is the portion of the
14 NRC regulations that require people who have
15 knowledge of defects in nuclear equipment to
16 notify the NRC and owners, right?

17 A Yes.

18 Q Did you ever talk to Anderson about
19 why he believed that the details of that Federal
20 regulation had not been passed down to everyone
21 in B&W Engineering?

22 A No, I don't believe I did.

23 Q Did you keep a copy of Don Roy's
24 draft to which you believe Anderson is commenting?

25 A I don't know.

2 Q Anderson is the representative from
3 your unit who you say regularly gives lectures
4 at training sessions for operators, is that
5 right?

6 A Yes.

7 MR. SELTZER: I would like to mark
8 as GPU Exhibit 124 a memo from Mr. Dunn to
9 Mr. Parks, subject "Technical Training Program
10 for B&W," April 7, 1980.

11 (Memo dated April 7, 1980 from B. M.
12 Dunn to C. E. Parks, re "Technical Training
13 Program for B&W," was marked GPU Exhibit No.
14 124 for identification as of this date.)

15 BY MR. SELTZER:

16 Q When I referred to Anderson's
17 participation in training programs, that is
18 participation that he has had since the Three Mile
19 Island accident, right?

20 A Yes.

21 Q Is GPU 124 a copy of a memo that you
22 sent to Parks on or about April 7, 1980?

23 A Yes.

24 Q Is the Anderson who sent you the
25 attached memorandum the Anderson who gives training

2 courses on behalf of ECCS?

3 A Yes.

4 Q Since April 1980, has he been given
5 a chance to improve his background in thermodynamics?

6 MR. FISKE: Who, Mr. Anderson?

7 MR. SELTZER: Right.

8 A I don't know. I don't share his opinion.

9 Q You don't share his low opinion of
10 his background in thermodynamics?

11 MR. FISKE: I object to the form of
12 the question.

13 Q What opinion of Anderson's don't you
14 share?

15 A That his background in thermodynamics has
16 hampered his working efficiency.

17 Q Have you ever told him that?

18 A I don't know.

19 MR. SELTZER: I would like to mark as
20 GPU Exhibit 125 a memorandum containing
21 statements by someone and additions by Mr.
22 Dunn, Mr. Bingham, and no date.

23 (Memorandum undated, containing
24 statements by someone and additions by Mr.
25 Dunn and Mr. Bingham was marked GPU Exhibit

2 No. 125 for identification as of this date.)

3 BY MR. SELTZER:

4 Q This was produced very recently from
5 your files.

6 Can you identify the GPU Exhibit 125?

7 A GPU Exhibit 125 is the notes from a creative
8 decision-making process performed several years
9 ago on the general subject of what will happen
10 within the overall area of ECCS in the next few
11 years.

12 Q Who attended this consciousness raising
13 session?

14 A I attended it. Bill Bingham attended it.

15 Q Bob Jones?

16 A I don't know. I am trying to place the
17 other person that I know of. I think it was Said
18 Farrek. There were approximately seven or eight
19 people in attendance.

20 Q From what group were those seven or
21 eight people drawn?

22 A In such a seminar, we draw from a wide
23 variety. We had some ECCS personnel, some systems
24 analysis technology personnel, and some people
25 from unrelated fields.

2 Q All from B&W?

3 A I believe they were all from B&W.

4 Q Would you turn to page 4, at the top
5 of the page.

6 What is item 16 at the top of the
7 page, "We should eliminate the Cat & Mouse
8 relationship between NRC and B&W"?

9 MR. FISKE: That is one of Mr. Bingham's
10 additions?

11 MR. SELTZER: No, that is under item
12 27, further discussion, just before "We
13 should hire a sexy pulic relations person..."

14 A In the creative decision-making process, and
15 I am not sure if you are familiar with the process,
16 any and all ideas are put down as raised by an
17 individual. No accounting that the individual
18 raising the idea is made, no negative comments
19 about any idea is allowed. This process took
20 place several years ago. I could only guess what
21 that means.

22 Q Was that your suggestion?

23 A No. I believe I was operating the process
24 and not allowed to make suggestions.

25 Q Why do you and Bingham have items

2 that appear as Dunn additions and Bingham
3 additions?

4 A I think that -- I do not know actually. I
5 don't recall it that much. I was speculating.

6 Q Was there any follow-up after this
7 list of ideas was generated?

8 A No.

9 As I recall, I wanted to follow up
10 with it and do something with it, make some use
11 of it, but my time became not available.

12 Q Do you do this often?

13 A Not as structured as this.

14 Q On page 78, in the lower right-hand
15 corner, --

16 MR. BENEDICT: Page 478.

17 Q -- you see item 18 at the top?

18 A Yes.

19 Q "We should engineer the plant before
20 we sell it."

21 Do you know whose idea that was?

22 A No.

23 Q Did you think it was a good idea when
24 it was said?

25 A This process was several years ago. I don't

1
2 know what I thought at the time it was said.

3 Q What is the Hatchet Committee?

4 A I recall the words "Hatchet Committee," the
5 title, but I don't recall what it was or is.

6 Q Don't people in your business talk
7 about being hatcheted by the NRC?

8 A Yes.

9 Q What does that phrase mean?

10 A It can mean one of two processes. The most
11 prevalent use of the word refers to the
12 identification and working of one vendor through
13 a process and saving the other two for later.
14 Within the vendor definition here, I am thinking
15 of mainly the PWR's. Some problems would
16 involve the PWR's as well. Saving the other two
17 vendors, reaching a resolution to some extent
18 with the first vendor, going after the second
19 vendor following that, and going after him to a
20 more severe level of compliance, and I am speaking
21 of it as a vendor issue which certainly also
22 involves all the vendors' customers.

23 The second use of the word is just
24 plain arm twisting by the NRC.

25 Q GPU Exhibit 125 reflects a serious

2 effort to generate good ideas for future
3 operations, is that right?

4 A Yes, it did. At the time it was generated,
5 I felt it was a serious effort to develop some
6 insight into what may be occurring over the coming
7 years in ECCS-related matters.

8 MR. SELTZER: I have no further
9 questions at this time.

10 Your witness, Mr. Fiske.

11 MR. FISKE: I don't think we have any
12 questions for Mr. Dunn.

13 (Time noted: 3:45 p.m.)

CERTIFICATE

STATE OF NEW YORK)
 : ss.:
COUNTY OF NEW YORK)

I, JOSEPH R. DANYO, a Notary
Public of the State of New York, do hereby
certify that the continued deposition of
BERT M. DUNN was taken before
me on April 7, 1981 consisting
of pages 845 through 964;

I further certify that the witness had
been previously sworn and that the within
transcript is a true record of said testimony;

That I am not connected by blood or
marriage with any of the said parties nor
interested directly or indirectly in the matter
in controversy, nor am I in the employ of any
of the counsel.

IN WITNESS WHEREOF, I have hereunto set my
hand this _____ day of _____, 1981.

Joseph R. Danyo

oOo

Dunn - Volume 8

847-880

TVA Communications / Michelon

848-49 - recalls phone call ^{with} which TVA ltr & Michelon report were discussed

850 - doesn't think he ever spoke to Michelon about report

850-51 - for certain SBLOAs, SGs are relied upon to remove decay heat

851-52 - Dunn ^{statement is:} theorizes & problem of repress'n in compelling HPI is wrong: draws from 2 different accidents which can't physically combine

853-54 - explains boiler condenser mode of NC, such NRC accepts as a method of providing energy transport during SBLOAs

855-56 - agrees that DH removal via condensation ceases when wtr level in SG tubes exceeds secondary side wtr level; read this & drew this conclusion after TMI-2 accident; Dunn DNR receiving when issued

857 - disagrees with eng'rs of loop seal, agrees Lpor could be inaccurate indicator of inventory

858 - on 3/28/79, took time to explain consistency of p2r containing wtr while low levels of coolant existed in RCS; not saw treated situation as a partially covered core

859 - read from Dunn's DCA notes re: consistency of uncovered core and full Lpor

86/82 accidents causing repress'n not severe, had no core recovery, didn't challenge ECCS; didn't specifically analyze whether steam bubble atop each OTSG'd interrupt NC, the Dunn says it's a lie;

823
bases - bounded - this has since been analyzed by
ECCS, the basis has been in 4/78

→ 865-⁶⁶ did work subsequently on SG level and altered
level for 177-FA plants; raised to 95%; work was
done within a few months after TMI - advantage of this
is that any condensate in SG will be available to
return to vessel & give better assurance of OTSG heat xfer

866-67 - more concern that DH removal concern:
assure condensate will return to core

867 - by this phase of accident, prime concern is
control of plant systems

868-69 for certain break sizes, after pump trip, water
circulation depends upon NK; in 177-FA, 95% level
helps, but analyses show effective core cooling even
at 50%

870-72 - GPO III, Bailey memo: Dunn aware prior to TMI
that TVA had raised concern over erroneous op action
based on Lp; Jones told him

873 - unit had decided nothing critical in CM's
report and will handle it as work load allowed

874 - first response was in Christmas '78 - agreed w/ TVA on
Lp - Jones prepared response; Dunn on recall recovery,
then told he did & signed approval

875-76 - associated TVA concern w/ his 2/78 memo -
didn't say should send TVA his memos or check to see if
Cust Service had sent out instructions; nobody told him
his instructions had been sent

877-78 - GPO II 2 - 1/9/79 response to TVA - reviewed & approved by

880-901
Secondary Water Level/
Pump Discharge

by Dunn

878-79: Statement to TVA on 4p not as explicit as
Dunn's 2/78 instructions; never considered inserting
his instructions

880-81- ^{1st} if primary level \geq secondary level, no auto shut off
of AFW; shut off for AFW not related to primary side,
shut off is 95% of operate range

882- prior shut off was 50%

890- when PDSBLOCA problem reported to NRC, B&W didn't
report it had been aware of issue for a year

891- no clear understanding of when NRC expected rpt'g of
concern; NRC wld have expected prompt rpt'g once it
had been validated

895-96- when PDSBLOCA problem identified, ECCS when a
double shifts to solve problem

897- analysis showed problem to be worse than previously
thought - more than just validation of concern

898- Mar '78 was first detailed analysis of PDSBLOCA.

900-901- GPU115 - "177 FA HPI system undersized":

do it deliver suff' flow to mitigate consequences of
leaking accidents. - told this to NRC

901-954 Pumps Running

901-02- GPU116- B&W memo ~~from~~ re 'open PORV w/o AFW and
with pumps running

902-03- pumps I run at 100% void fraction for days

903-04- Cullen memo, post-acc, addresses ability of
pumps to function

- 904-05 pre accident, had been ^{experiments} in pumps on a 2-phase flow & ran for considerable lengths of time
- 905- BW did some pump experiments; NRC did the 100% void exp't
- 907- Sum not aware of limits & precautions for RCP op'n; DNK that vibration increases w/ void fraction
- 908-09 - then says he knows of vibration at M1; pump vibration also occurred in Bingham's tests.
- 909 - Sum's 4's: more vibration as 2 phase flow being pumped
- 912 - thanks to know this pre-M1 - not aware of BW vibration limits
- 913-14: meant in memo (600816) that RCP shd be kept on regardless of vibration during a transient.
- 914 - RCP shd run at 100% void as long as a heat sink to prevent too much superheated steam
- 914-15 - ^{one} never analyzed PORV open, no HPI, RCPs in at least 2 bays, STAFU - ECCS unit studied such a situation; ^{from} when did pumps on situation in early Apr '79 or winter '78 - called it for PECO and also considered it after accident
- 916 - analysis showed rise in cladding temp to be <100° ^{about} any pumped steam media w/ effectively cool con. as long as superheat under control; haven't done w/ to tell how long that cd be maintained
- 917 - analysis used break size larger than PORV, at ^{more} ~~low~~ was lost than ~~for~~
- 918 - STAFU bl w/ less effective cooling for longer than in analyzed break -; analysis progressed no further than 1/2 hr and didn't get to 100% void; work on 100% void was a hard case
- 919 - computer analysis done bc it raised about assumption that

pumps or was a better case

922-23: discussed effect of keeping pumps on at TMI in Rdepts and as a preventive measure when sending out RCPs or instructions after accident

924 - thinks talked about it w/ Taylor & Elliott

934

~~928~~ - prior to June '79, Dunn not aware of any instructions from B&W on how to operate RCPs during SBLOCA; Dunn not a the gen'l flow of info from B&W to ops on how to handle eg 't

934-35: knows of no one in his unit who was reviewing such instructions

935th GPU 121: 'SB Guidelines': assumptions regarding eg 't availability different than his 3 submittals

936-37 - Dunn knew these assumptions were different; for ex. 2 HPI pumps assumed instead of one

938 - assumed 2 pumps so as to provide "some chance" that analyses wd produce acceptable PCTs; strong indications RCPs cld 't be held below 2200°

939th for indicated breaks, PCTs > 2200°, except 2 HPI plus SG blowdown, which was below 2200°

941-42. this was first analysis of transient w/ RCPs turned off in middle

942 - Dunn didn't think pumps or 4 pumps off bounded pump term'd in mid-transient

943 - Dunn knows of nothing available to ops prior to TMI to alert them that turning pumps in mid-transient not be the worst case

943-44 - analyses indicated had to turn off RCPs after 1-2 minutes of ECCS activation

945 - DWK that (u) prescribed pumps off at onset

945-46 - OPO 122 - 12/19/78 Carter memo on RLB

946-47 - was suggested that key for switching AFW setpts wd be cond'n of pumps; pumps on eval'd on 205's etc, to some extent, if concerns from Toledo

948 - Deane on pump on analysis done, says judgment since '73 had been that if pumps on, flow ok cool core

949 - chosen resolution was to do computer eval - for SB & to show pumps on when it was severe

954 - basic analytic models in blue bks generated pre-TM1; certain alterations made to quantitatively evaluate specific transients

954 - 957 Pt. 21

957 - ^{OPO 123} Deane never talked to Anderson about why he that details have't been passed down to everyone in Engineering
