TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 Q. Please state your name, business address, educational  
2 background, work experience and present position.

3 A. My name is William J. Wagers. My business address is  
4 4 Irving Place, New York, New York.

5 I graduated from The City College of New York in  
6 1970 with a Bachelor's Degree in Mechanical Engineering.  
7 I received a Master's Degree in Business Administration  
8 from Adelphi University in 1977. In 1970, I joined Con  
9 Edison's System Planning Department and have held positions  
10 of increased responsibility since that date. In 1982, I  
11 assumed my current responsibility as Manager, Small Power  
12 Facilities Planning.

13 Q. What are your responsibilities as Manager, Small Power  
14 Planning Facilities Planning?

15 A. In my present position I am responsible for developing  
16 policies and plans for all forms of small power facilities,  
17 including cogeneration, in the Company's service area.  
18 The policies and plans must be developed considering the  
19 economic impacts on the small power producer, the Company  
20 and the Company's ratepayers, environmental impacts, tax  
21 impacts and national and local concerns regarding scarce  
22 energy resources.

23 Q. What is the purpose of your testimony?

24 A. The purpose of my testimony is to explain the Company's

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 position that contrary to contentions made by others  
2 in this proceeding, natural gas fired cogeneration  
3 facilities cannot be counted on to replace a large part  
4 of the capacity lost if the Indian Point plant is  
5 shutdown.

6 Q. Please explain what you mean by natural gas-fired cogenera-  
7 tion facilities.

8 A. My testimony covers two types of natural gas-fired  
9 cogeneration - natural gas diesel cogeneration and an  
10 experimental small scale facility called TOTEM.

11 Q. Please explain why you feel that these facilities cannot  
12 be counted on to replace Indian Point.

13 A. There are three reasons which make natural gas fired  
14 diesel cogeneration an unlikely replacement for Indian  
15 Point. First, estimates of diesel cogeneration potential  
16 in Con Edison's service area indicate that considerably  
17 smaller amounts of load reduction from cogeneration are  
18 economical than would be needed to replace Indian Point.  
19 Second, the potential will be limited by physical con-  
20 straints, such as air pollution problems and natural gas  
21 supply problems which would occur if large numbers of  
22 customers convert to cogeneration. The air pollution  
23 problems are covered in the testimony of Con Edison  
24 witness Freudenthal and the gas supply problems are

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 covered in the testimony of witness Stewart. Third,  
2 there is uncertainty about when the estimated potential  
3 levels could be achieved since actual installations of  
4 cogeneration facilities have been well below the estimated  
5 levels.

6 With regard to TOTEM plants, these plants have not  
7 had widespread use and it is not clear what market, if  
8 any, these plants could economically serve.

9 Q. Please describe a natural gas-fired diesel cogeneration  
10 plant.

11 A. Diesel cogeneration utilizes a diesel engine (similar to  
12 a truck engine) modified to burn natural gas that drives  
13 an electric generator. Waste heat from the engine  
14 captured through the use of heat exchangers on the diesel  
15 exhaust; jacket water, and oil lubrication system can be  
16 used to provide heat and hot water requirements.

17 Q. Please describe a TOTEM plant.

18 A. TOTEM (Total Energy Module) is a small (0.9 liter) internal  
19 combustion engine more commonly known as the Fiat 127  
20 engine coupled to an asynchronous electric motor which also  
21 serves as a generator. Waste heat is recovered through  
22 heat exchangers integrated into the primary cooling system.

23 Q. Has Con Edison previously submitted testimony before any  
24 regulatory body on the likely levels of natural gas fired

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 diesel cogeneration facilities which might be economical  
2 to build in its service area?

3 A. No. However, testimony was submitted to the New York State  
4 Public Service Commission on two occasions in conjunction  
5 with Case 27574 in which estimates of the economical  
6 potential for oil fired cogeneration were made. The  
7 economic potential for conversions to natural gas fired  
8 diesel cogeneration will likely be close to the estimate  
9 for oil fired cogeneration since both fuels currently  
10 have about the same cost and although a natural gas engine  
11 will have a slightly lower capital cost, it also has a  
12 somewhat lower efficiency.

13 Q. Please describe that testimony.

14 A. Testimony was first submitted in November, 1979 which  
15 presented the details of studies conducted by the Company  
16 to estimate the number of Con Edison customers that have  
17 the economic potential to convert to cogeneration.  
18 Additional testimony was submitted in November, 1980 to  
19 update the original studies.

20 Q. What was the economic potential for conversion to cogenera-  
21 tion found to be in these submittals?

22 A. The initial testimony submitted in 1979 estimated that  
23 395 customers could have the economic potential to convert  
24 to cogeneration with an equivalent of 1086 Mw of coincident

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 peak load loss. The updated analysis, conducted approxi-  
2 mately one year later, estimated an economic potential  
3 of 159 customers with 562 Mw of coincident peak load.

4 Q. Did any other parties in that case develop estimates of  
5 the potential for on-site generation.

6 A. Yes, the staff of the New York State Department of Public  
7 Service submitted testimony at the same time Con Edison  
8 submitted its updated testimony. In that submittal it  
9 concluded:

10 "potential exposure to a loss of customers  
11 to on-site generation is low; less than 25  
12 customers having a coincident peak load of  
13 less than 100 Mw."

14 Q. Has the Company conducted any recent studies of the  
15 economic potential to convert to diesel cogeneration?

16 A. The Company updates such estimates periodically. The  
17 most recent analysis conducted in July, 1982 indicated an  
18 economic potential of 72 customers with 296 Mw of coincident  
19 peak load. It should be noted that even though the 296  
20 Mw of potential is considered to be significant to  
21 the Company, it only represents a small portion of the  
22 Indian Point capacity.

23 Q. Please explain the changes in the economic potential.

24 A. The original study was based on estimated capital, fuel

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 and operating costs which prevailed in 1979. The updated  
2 analysis presented to the Public Service Commission in  
3 November, 1980 reflected 1981 cost estimates and included  
4 a number of revised assumptions, some of which were  
5 suggested by the PSC Staff. Two of these revisions are  
6 worth noting. The first was to increase the capital cost  
7 of a cogeneration facility to reflect the difficulty in  
8 retrofitting a cogeneration plant into buildings with  
9 space limitations and tall flue requirements which could  
10 be required in some New York City office buildings. The  
11 second was to reflect the fact that earlier estimates of  
12 the potential assumed that New York City would not assess  
13 additional property taxes on these facilities. The  
14 updated estimate included higher estimates of assessed  
15 property taxes based upon statements made by New York  
16 City Taxation officials that they would

17 "develop valuations for generating equipment at  
18 a level consistent with comparable installa-  
19 tions owned by public utilities."

20 The most recent estimates also reflect updated assumptions,  
21 primarily with regard to the price of capital costs and  
22 operating expenses.

23 Q. Are you aware of any other recent studies where estimates  
24 were made of the economic potential for cogeneration in

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 the New York City area.

2 A. Yes. A draft report dated January, 1983 and entitled "On-  
3 Site Generation in New York City" has recently been prepared  
4 by Entek Research, Inc. for the New York City Energy  
5 Office. In it, Entek has found:

6 "The Moderate potential includes approximately  
7 366 Mw of cogeneration capacity while the High  
8 potential includes approximately 1514 Mw."

9 I should also note that the New York City Energy Office  
10 requested that Con Edison review this report, and Con  
11 Edison suggested that several corrections to assumptions  
12 be made which would lower both the Moderate and High  
13 potential estimates.

14 Q. Are you aware of any other estimates of the potential for  
15 on-site generation?

16 A. Yes. The State Energy Office in its State Energy Master  
17 Plan issued March 1982 estimated the potential for cogenera-  
18 tion facilities in the New York City area to be 380 Mw.  
19 The Plan notes, however, that because of capital  
20 availability and fuel use problems, only 200 Mw is assumed  
21 to come on line through the 1996 time period.

22 Q. Have any estimates been made of the additional potential  
23 for conversions to cogeneration which could occur as a  
24 result of the shutdown of Indian Point?

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 A. No such estimates have been made. All estimates of  
2 potential have been developed assuming Indian Point  
3 remains in service. Any cogeneration which is assumed to  
4 replace Indian Point must only be that which occurs in  
5 addition to the existing cogeneration estimates which  
6 will occur independently of the proposed shutdown of  
7 Indian Point. Since existing levels of cogeneration are  
8 estimated to be on the order of several hundred Mw, it  
9 is unlikely that a substantial portion of the Indian  
10 Point capacity could be replaced by additional cogenera-  
11 tion.

12 It should be noted that both the proposed shutdown  
13 of Indian Point and conversions to cogeneration will  
14 cause rates to remaining consumers to increase. In case  
15 27574 this increase was estimated to be 1-3 for each 140  
16 Mw of load lost to cogeneration. This concept was also  
17 contained in the draft cogeneration report prepared by  
18 ENTEK for the New York City Energy Office which stated:  
19 "The comparisons indicate that in all of the cases examined  
20 ratepayers will pay a higher rate for electricity as a  
21 consequence of the load losses brought about by other  
22 customers shifting to on-site generation."

23 Q. Aside from economics are there any other factors which  
24 will effect the potential for conversions?

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 A. Yes. Air pollution problems could severely limit the  
2 number of conversions to cogeneration as discussed in  
3 the testimony of Con Edison witness Dr. Freudenthal.  
4 Also gas supply constraints discussed in Mr. Stewart's  
5 testimony could limit the potential for conversions.  
6 In addition, other constraints such as lack of space,  
7 unavailability of capital, noise problems, or an un-  
8 willingness to assume the risk of operating and owning  
9 a cogeneration plant would also tend to limit the potential  
10 for conversions.

11 Q. What has been the Company's actual experience with  
12 conversions to cogeneration?

13 A. Actual levels of cogeneration conversions have been  
14 much lower than estimated levels.

15 Q. Do you have an exhibit which shows the actual conversions  
16 that have taken place?

17 A. Yes. Exhibit (WJW-1), entitled Actual Cogeneration  
18 Conversions, shows the actual number of conversions and  
19 Mw load loss that have occurred in each year over the  
20 last ten years.

21 Q. Please describe Exhibit (WJW-1).

22 A. Exhibit (WJW-1) shows the actual conversions to  
23 cogeneration which have taken place for each year from  
24 1974 through 1983 based upon Company records. The exhibit

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 shows the number of customers who converted in each year  
2 and the total peak load reduction in each year.

3 Q. What conclusions have you reached based on the actual  
4 conversions?

5 A. Actual levels of conversions are far below the level of  
6 estimated economic potential. In 1979 for example the  
7 estimated potential was 395 customers with a peak load of  
8 1086 Mw. The actual conversions in that year were four  
9 customers with a total peak load of 5.5 Mw. In 1982 the  
10 estimated potential was 72 customers with 296 Mw of load,  
11 while the actual experience was one customer with 0.1 Mw  
12 of load. This demonstrates that other factors may be  
13 involved such as uncertainty over future rates, and the  
14 other constraints previously mentioned, which make the  
15 task of estimating the time frame over which the conver-  
16 sions will occur difficult.

17 Q. What is the current application of TOTEM's within the  
18 United States?

19 A. Fiat of Italy manufactures three TOTEM Models i.e.,  
20 Standard, Independent and Standby. The Independent and  
21 Standby models are not available in the United States at  
22 this time. Brooklyn Union Gas (BUG) markets the Standard  
23 TOTEM and three are currently in operation on an experi-  
24 mental basis within BUG's service territory. Con Edison

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 has been receiving data from BUG on these systems.

2 Other states on the East Coast have reported some use of  
3 TOTEMS for application at dairy farms.

4 Q. Please describe the TOTEM system in greater detail.

5 A. As currently marketed the engine itself lacks a throttling  
6 valve; therefore, fuel consumption and engine speed (6000  
7 RPM) must be kept constant. The engine has a nominal  
8 life of about 10,000 hours of operation before a major  
9 overhaul is required. Minor maintenance is required  
10 every 1500 hours.

11 The motor-generator is an asynchronous machine which  
12 requires excitation from a magnetic field obtained through  
13 a parallel interconnection with a utility or other  
14 alternators of which one must be synchronized (of common  
15 frequency). Such a machine has a number of drawbacks  
16 such as the inability to be completely isolated from the  
17 utility, a lack of voltage support and uncontrollable  
18 frequency.

19 Each TOTEM unit is capable of producing a maximum of  
20 15 Kw of electricity and thermal energy of 134,000 Btu per  
21 hour.

22 Q. What is the installed cost of a TOTEM unit?

23 A. The installed cost is approximately \$10,000 in 1983  
24 dollars. An additional cost of \$10,000 will be needed if

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 backup TOTEMS are required to operate when the primary  
2 unit is out of service.

3 Q. In your opinion, what applications are best suited for  
4 installation of TOTEM?

5 A. As with most applications of cogeneration systems, key  
6 factors are higher plant load factors that improve the  
7 potential for an economic application, and a high  
8 coincidence of electrical and thermal requirements. For  
9 these reasons TOTEM would be most applicable to the  
10 industrial and agricultural sectors when energy is needed  
11 day and night and in both the summer and winter.

12 Because of the Company's limited experience with  
13 TOTEM plants it is difficult to predict what market, if  
14 any, these plants will ultimately serve in the Company's  
15 service area. Until more data has been obtained on TOTEM  
16 plants and they have demonstrated their practicality,  
17 estimates of their market potential must be viewed with  
18 skepticism.

19 Q. What are your conclusions about the potential for natural  
20 gas-fired cogeneration to replace Indian Point?

21 A. Current estimates of the economic potential for cogenera-  
22 tion conversions are low, indicating that it is unlikely  
23 that Indian Point or a substantial portion of its capacity  
24 would be replaced by cogeneration.

TESTIMONY OF WILLIAM J. WAGERS  
ON BEHALF OF  
LICENSEES

1 With regard to the TOTEM plant, that plant should not  
2 be considered a proven technology, and until it demonstrates  
3 its applicability it should also not be relied upon as a  
4 replacement for Indian Point.

5 Q. Does that conclude your testimony?

6 A. Yes.

## CONSOLIDATED EDISON COMPANY OF NEW YORK INCORPORATED

ACTUAL COGENERATION CONVERSIONS

<u>Year</u>	<u>Number of Conversions</u>	<u>Peak Load-Mw</u>
