Docket Nos. 50-247 SP
50-286 SP

TESTIMONY OF

NEW YORK STATE

WITNESS JAMES M. PARMELEE

ON COMMISSION QUESTION SIX

April 11, 1983

1 Q. Will you please state your name, title and affiliation?

2 A. My name is James M. Parmelee. I am employed as an Electric Energy
3 Planner by the New York State Energy Office (SEO), Agency Building #2,
4 Empire State Plaza, Albany, New York 12223.

5 Q. Would you please describe your education and experience?

6 A. I received a Bachelor of Science in Nuclear Engineering from
7 Rensselaer Polytechnic Institute in 1977, and a Masters of Engineering
8 in Nuclear Engineering from Rensselaer Polytechnic Institute in 1978.
9 I also completed the Advanced Electric Utility System Planning
10 Training Program at General Electric in 1979, and completed the
11 Advanced Techniques in Power System Generation Planning course at the
12 Continuing Education Center at the University of Berkeley in
13 California. I have completed the course work for a Doctorate in
14 Electric Power Engineering at Rensselaer Polytechnic Institute.

15 I have testified on electric generation planning matters in
16 proceedings before the New York State Energy Planning Board on the
17 Draft 1979 and 1981 State Energy Master Plan and Long-Range Electric
18 and Gas Reports (SEMP), issued pursuant to Sections 5-110 and 5-112 of
19 the Energy Law of New York and in a proceeding before the Federal
20 Energy Regulatory Commission on the siting of the proposed Prattsville
21 pumped storage project.

22 I am a member of the IEEE and the IEEE Working Group on
23 Long-Range System Planning. I have presented or published the
24 following papers:

25

1 Impacts of Electric Heat on Time Dependent Demand,
2 1978 Winter Meeting IEEE-PES, New York.
3 Published in IEEE Energy Development IV.

4 Impacts of Electric Heat on Generation and Primary
5 Fuel Requirements, 1978 Summer
6 Meeting IEEE-PES, Los Angeles. Published
7 in IEEE Transactions on Power Apparatus and
8 Systems, July-August, 1979.

9 Impacts of Solar Heating Options Upon Electric Power
10 Systems, 1979 Summer Meeting IEEE-PES , Vancouver, B.C.

11 Potential Impacts of Wind Electric Generators
12 Upon Electric Power Systems, 1980 Winter
13 Meeting IEEE, New York.

14 I joined the State Energy Office in February of 1979 and have worked
15 as an Electric System Planner since that time. My present
16 responsibilities include supervising and conducting electric system
17 studies for the State Energy Office. Prior to joining the SEO, I was
18 employed as a Research Assistant for the Center for Technology
19 Assessment of Rensselaer Polytechnic Institute. In that capacity, I
20 conducted studies for the New York State Energy Research and
21 Development Authority which involved analyses of the electric power
22 system in New York State.

23 Q. What is the purpose of your testimony?

24 A. I will briefly describe the status and purpose of the State Energy
25 Master Plan (SEMP) in New York State energy matters and its principle
26 elements, summarize the electricity generation plan contained in SEMP,
27 and provide estimates of the operating cost and oil consumption
28 penalties that would result if the electricity generation plan were
29 modified by shutting down Indian Point Units 2 and 3 in 1984.

30 Q. What is the status and purpose of SEMP in New York State energy
31 matters?

1 A. It is the policy of the State to conduct energy planning in an
2 integrated and comprehensive manner through development of a
3 long-range State Energy Master Plan. On March 25, 1982, following
4 legislative and adjudicatory hearings as mandated by the State Energy
5 Law, the Energy Planning Board issued an Opinion & Order approving the
6 1981 Draft SEMP as modified therein (SEMP II). A copy of the 1982
7 update of the New York State Energy Master Plan and Long-Range
8 Electric and Gas Report which contains the Opinion & Order is attached
9 as Exhibit No. ____ (JMP1). The findings of the SEMP serve a variety of
10 purposes, principally:

- 11 o Public and Private Sector Planning. SEMP provides "the framework
12 for energy-related decisions made throughout the State" (Energy
13 Law, Section 5-110). In addition, the Plan controls "all
14 energy-related decisions made by the State and will be the guide
15 for energy-related decisions in the private sector." (Governor's
16 Memorandum of Approval, McKinney's 1978 Session Laws, p. 1838).
- 17 o Public Service Law Article VIII and Article VII Decisions. The
18 specific findings with respect to projected electric demand in the
19 Report are binding on the State Board on Electric Generation
20 Siting and the Environment (Siting Board) with respect to any
21 determination of need for future steam electric generating
22 facilities under Article VIII of the New York Public Service Law
23 (Energy Law, Section 5-112 (3)(c)). In addition, the Siting Board
24 must find that a proposed facility is consistent with the

25

1 "long-range planning objectives for electric power supply in the
2 state" established by the Plan before it may grant an application for
3 a certificate under Article VIII (Public Service Law, Section
4 146(2)(e)). Moreover, the specific findings with respect to
5 projected electric and gas demand are binding on the Public
6 Service Commission with respect to any determination of need for
7 major electric and gas transmission facilities under Article VII
8 of the Public Service Law (Energy Law, Section 5-112(3)(c)).

9 Q. Would you please summarize the principle elements of SEMP II.

10 A. SEMP II consists of:

- 11 o A list of specific state energy policies.
- 12 o A fifteen year forecast of New York State energy requirements.
- 13 o A summary of the plans for meeting forecasted energy requirements
14 including an electricity supply plan.
- 15 o Recommendations for administrative and legislative actions to
16 implement State energy policy.

17 Q. Would you please summarize the electricity supply plan for the
18 1981-1996 period approved by the State Energy Planning Board (EPB) in
19 its March 1982 Opinion & Order?

20 A. The electricity generation plan (1981-1996) approved by the EPB is
21 shown in Exhibit No. ____ (JMP2). Major features of the generation plan
22 include:

- 23 o Completion of 2,518 Mw of generating capacity now under
24 construction in the State and another 2,350 Mw of generating
25 capacity that has been licensed for construction in the State.

- 1 o Construction of a 1,000 Mw pumped storage facility targeted to
- 2 start operation in 1987.
- 3 o Conversion of almost 3,600 Mw of oil capacity to coal.
- 4 o Development of small hydro, cogeneration, solid waste and wind
- 5 capacity totalling 1,552 Mw by 1996.
- 6 o Importation of Canadian power.

7 This plan also assumed the continued operation of all plants,
8 including Indian Point 2 & 3, over their expected useful lives. In
9 the case of Indian Point 2 & 3, the useful life is expected to extend
10 beyond the 15 year planning period.

11 Q. Has the potential for conservation been considered in the development
12 of the electricity supply plan?

13 A. Yes. The potential impact of reasonably foreseeable conservation
14 actions, both mandated and price induced, was considered by the Energy
15 Planning Board in connection with its development of the electricity
16 energy and demand forecasts. These forecasts were then used by the
17 Board in the development of the electricity supply plan approved by
18 the Board.

19 Q. Have you analyzed the fuel and economic impacts of shutting down
20 Indian Point Units 2 and 3?

21 A. Yes, I have analyzed these impacts using the General Electric
22 Optimized Generation Planning (OGP-5) electric system simulation
23 model.

24 Four major scenarios were analyzed. They are:

25

- 1 1. A base case using the electricity generation supply plan
- 2 identified in Exhibit___(JMP2).
- 3 2. A case similar to the base case but with Indian Point Unit 2
- 4 assumed not to be in operation in 1984 and thereafter.
- 5 3. A case similar to the base case with Indian Point Unit 3 assumed
- 6 not to be in operation in 1984 and thereafter.
- 7 4. A case similar to the base case but with Indian Point Unit 2 and 3
- 8 both assumed not to be in operation in 1984 and thereafter.

9 Q. What are the major assumptions you used in your analysis?

10 A. The principle source of the assumptions used in my analysis is the
11 State Energy Master Plan (SEMP II). I used the electricity generation
12 expansion plan shown in Exhibit No.____ (JMP2) which is the plan
13 approved by the EPB in its Opinion and Order of March 25, 1982.
14 However, the most recent estimates of the New York Power Pool with
15 respect to Canadian electricity imports as shown in Exhibit No.____
16 (JMP3) were used in the analysis. Minor slippage in the assumed
17 installation dates of some coal conversions were also assumed in the
18 analysis. Additionally, fuel, O&M and discount rates were adjusted to
19 account for more recent trends. The study period is 1982 to 1996.
20 The projected energy growth rate of approximately 1.7% per annum and a
21 peak load growth rate of approximately 1.5% per annum were assumed. A
22 capacity factor of 57.7 percent was assumed for the Indian Point Units
23 for the study period.

24 Q. What are the estimated cost impacts that would result from shutting
25 down the Indian Point Units? *

1 A. Exhibit No.____(JMP4) shows the production costs and oil use that would
2 result under each of the four scenarios described earlier. There
3 would be an 10.1 percent increase in cumulative present worth
4 production costs from 1984 to 1996 which represents an additional \$2.3
5 billion in 1982 present worth costs, if the Indian Point Units 2 and 3
6 are shut down in 1984. The cumulative present worth production costs
7 would increase through 1996 by \$1.1 billion and \$1.2 billion if either
8 Unit 2 and 3, respectively, is shut down.

9 Q. What are the estimated oil consumption increases that would result
10 from shutting down the Indian Point Units?

11 A. An additional 154.2 million barrels of oil would be consumed over the
12 period 1984-1996 if both Units 2 and 3 are shut down. The increase
13 would be 72.8 or 81.1 million barrels if either Unit 2 or Unit 3,
14 respectively, is shut down.

15 Q. What impact would the shutdown of Indian Point Units 2 and 3 have on
16 the price of electricity in Consolidated Edison's territory?

17 A. I estimate that electricity production costs for Consolidated Edison
18 in nominal year dollars would increase by an average of:

19 o 1.19¢/Kwh in 1986.

20 o 1.48¢/Kwh in 1991.

21 o 2.35¢/Kwh in 1996.

22 Q. Did you evaluate what the economic and fuel consumption impacts would
23 be if the Indian Point Units were to operate at capacity factors other
24 57.5 percent?

25

1 A. Yes. A case was run with the capacity factors of Indian Point Units 2
2 and 3 set at 47.1 percent and another case was run with the capacity
3 factors set at 68.3 percent.

4 Q. What are the results of your analysis based on the 47.1% and 68.3%
5 capacity factors?

6 A. The production cost increase and the oil consumption increase that
7 would result from shutting down Units 2 and 3 are shown in Exhibit
8 No. ____ (JMP5).

9 Q. In summary, what conclusions can be reached from your analysis?

10 A. There are likely to be significant economic and oil penalties
11 associated with the shutdown of one or both of the Indian Point
12 facilities, under various assumed capacity factors ranging from 47.1%
13 to 68.3%.

14 Q. What would be the impact on your analysis of delaying or cancelling
15 one or more of the planned oil to coal conversions or new coal plants
16 included in Exhibit No. ____ JMP-2?

17 A. Cancellation or delays of one or more of these oil to coal conversions
18 or new coal plants will result in increased cost penalties and
19 increased oil use penalties associated with shutting down the Indian
20 Point facilities.

21 Q. Does this complete your testimony?

22 A. Yes.

23

24
