Washington, D.C. 20006

Dear Mr. Conner:

In The Matter Of
PHILADELPHIA ELECTRIC COMPANY
(Limerick Generating Station
Units 1 and 2)

Docket Nos. 50-352
and 50-353

AWPP's (Romano) 6th Request re Interrogatories Concerning Contention VI-1

Pursuant to the Board's Order concerning formal discovery, Air and Water Pollution Patrol requests the following re Contention VI-1 (Quality Assurance/Control). AWPP requests specific material that will not require searching through voluminous records.

AWPP does not want a treatise on all aspects of safety related welding of stainless steel piping in the Limerick reactors, it only wants answers to the following specific questions:

- (1) Is there any stainless steel safety related piping used at Limerick?
- (2) Was any stainless steel piping used, or to be used at Limerick's boiling water reactor manufactured by the same manufacturer as supplied to the Vermont Yankee nuclear plant?
- (3) Whether or not from the same manufacturer, would such piping be equally susceptible to intergranular stress corrosion as occurred at Vermont Yankee?
- (4) Provide (records) quality assurance records of heat-affected zones of welds made on all safety related stainless steel piping to insure that Limerick stainless steel does not have the same intergranular stress corrosion or other adverse effect.
- (5) What test methodology and/or quality assurance actions were used in checking possibility of stainless steel piping defects from welding or otherwise.
